616. Had all those that were in the office when you went there passed the Senior Examiner, Mr. Holden? I think the majority of them had been examined by Mr. Holden.

617. The practice was for Mr. Holden to take them first? Yes.

618. Were there any of Mr. Smart's applications amongst them? Yes, a batch of applications; six or seven, I think, in number.

619. Did you investigate them? I looked at them at first cursorily, and with the view of investigating them subsequently should the necessity arise; but afterwards, on consideration, I thought it better not to report upon them, considering the relationship existing between myself and Mr. Smart, and that I was only temporarily employed in the department; accordingly they were put on one side.

620. Have you any idea how many titles you passed during the three months? No, I never kept any memoranda of the applications which I reported upon. I should think I must have examined sixty or seventy at all events. There might have been about a dozen that I left under requisition, or affected by some fatal difficulty or defect.

621. Did you hear, during the time you were there, any complaints made that titles could not be got through? None were made to me, nor did any come to my knowledge.

622. With reference to arrears left by Mr. Burton—did the packages which contained the deeds contain any memoranda from Mr. Holden showing that he had examined the titles, and had found certain objections to them? The majority of them, I think, had annexed to them memoranda made by Mr. Holden.

623. Did you take the title up and examine it with Mr. Holden's paper before you? Yes, generally I did. I wanted to get rid of these arrears as soon as possible, and his memoranda containing, as they did frequently, a kind of history of the title, would necessarily be of great assistance to an Examiner.

A. Oliver,  
Esq.  
24 Aug., 1869

624. As you examined these titles, did you and Mr. Holden confer together? We conferred as to any difficulty or any difference of opinion that might arise upon the documents deposited in support of any application, or the facts disclosed during its investigation. Then the requisitions were sent out. With regard to applications that came in when I was acting for Mr. Burton, many of these I examined in the first instance, and then passed them to Mr. Holden; so that the rule was not always followed that Mr. Holden, as Senior Examiner, should first examine the title. Mr. Lander frequently brought applications to me where the title-deeds had not been examined by Mr. Holden.

625. Supposing a batch of titles came before you, and there were ten easy ones and two difficult ones, the latter coming first in order of application, would you keep back all the easy ones until the difficult ones were investigated? I always thought it advisable to get rid of the simple titles at once. Generally the difficult titles were those upon which a solicitor would be employed, and they very nearly always represented large and valuable properties. There was rarely that necessity for urgency with regard to them which there often was in regard to simpler titles.

626. Supposing a title had been investigated before, and had passed this office, would you consider it necessary to go through the whole title again, if an application came before you based upon the same deeds, and in which there may have been only a conveyance to a different person? No, I would assume the prior examination to have been correct as to the basis of the title. I believe that was the practice of Mr. Dick; I know it was of Mr. Holden.

627. Did you find that any delays took place in the drafting branch, or down-stairs with Mr. Ward? No, certainly not.

628. Did the application come promptly up to you? Yes.

629. Do you think there would be any advantage in the appointment of a third Examiner? It does not seem to me that such an increase in the number of the Examiners would be advisable, if the three Examiners are to possess equal and co-extensive powers as between themselves. I should be disposed to think that by vesting a larger authority in the Senior Examiner the same object might be better attained.

630. From your experience in the office in conjunction with Mr. Holden, do you think Mr. Holden is as careful and accurate an Examiner of Titles as could be found in the profession, or have you reason to think Mr. Holden is more lax than a strictly accurate professional solicitor would be? I think it impossible for any person familiar with Mr. Holden's method of investigating titles to accuse him of laxity as an Examiner of Titles; on the contrary, he is, if anything, rather strict. That certainly is the opinion I have formed from having worked with him.

631. *Mr. Pell.*] Do you happen to know whether the profession generally hold the same opinion? I do not know. I may say, so far, that I have never heard anything from any member of the profession indicating the least suspicion of laxity in Mr. Holden.

632. *Mr. Slade.*] Were there any cases of opposition of view between Mr. Burton and Mr. Holden when you came? I think there had been with respect to some applications; and as I felt that I was placed in a delicate position with regard to them, I left them over for Mr. Burton and Mr. Holden to decide, as I was simply Mr. Burton's *locum tenens* for a few weeks.

633. Putting aside the cases of Mr. Smart, you had the opportunity of contrasting the course adopted by Mr. Holden and Mr. Burton? Much more so with regard to Mr. Holden than Mr. Burton. I was in constant communication with Mr. Holden, whereas the only materials upon which I can form an idea of Mr. Burton's method were the memoranda he left attached to various applications.

634. Had you an opportunity of observing his style of requisitions? Yes; but little value can be attached to my opinion in this matter, because it is necessarily based upon insufficient materials. I think that Mr. Burton may have been more precise than was absolutely necessary. I gather this from the memoranda before mentioned.

635. *Mr. Holdsworth.*] His objections were rather microscopic at times? That is perhaps the term that might be applied to them.

636. Fine-drawn? Fine-drawn.

---

Robert Mead Pearson, Esq., called in and further examined:—

R. M. Pearson,  
Esq.  
24 Aug., 1869

637. *President.*] You are anxious to supplement the evidence you gave the other day? Only with reference to a remark I made attributing the delay in passing titles to a want of method, as being the cause of so few cases passing the Board now than there used to be. Mr. Dick always had a sheet of foolscap every Monday morning with between twenty and thirty cases on it, showing, in each case, the application number, the applicant's name, and why it was delayed. These were all cases that were ready for the Board, or nearly so. Mr. Dick would take each case, and whatever might be the cause of the delay he would get it removed at once, if possible. Sometimes it might be a question of boundary, sometimes a legal difficulty requiring a conference between Mr. Holden and himself; or should the impediment rest with the applicant or his attorney, he would if possible have a personal interview, and often in this way remove the obstruction. When difficulties were all removed, a blue or red pencil line would be run through the case on the before referred to list as being ready, and the application sent to Mr. Holden to draw the report for the Board. Those on the list that were not completed would go into the next weekly list, and any new ones added. In this way he would have twelve or fourteen cases for the Board nearly every week, by constantly looking them up; and he looked them up so regularly that there was no possibility of any case being wrongfully left untouched. No such measures are now taken, and the want of them is what I referred to in my previous examination. Of the sixty or seventy cases waiting requisitions, once or twice a month Mr. Dick would take every one out, see the cause of the delay, and send reminders to the applicants or their attorneys, in the shape of a short circular, requesting them to attend to the requisitions, and if they did not do so after the second or third circular, he would send a peremptory letter to withdraw the case or proceed.

638. *Mr. Holdsworth.*] That prevented matters sleeping? Yes, as he used to say—"We will never allow any cobwebs to collect upon them." In that way he kept us all going.

639. *President.*] I think you distinctly told us there was no delay in passing applications from your department to the Examiners? None whatever.

640. After they pass the Examiners and the Commissioners, is there any delay in putting the diagrams upon the certificates? No, not at all; we are scarcely ever more than two or three days over the last day of advertising, or when caveat may be lodged.

R. M. Pearson,  
Esq.

641. Then there is no delay after the passing of the title? Not any unnecessary delay.

24 Aug., 1869.

642. *Mr. Pell.*] Witnesses have complained that in some cases they have been obliged to wait a month for the certificate—Can you account for that delay? Very often there are dowers to be got rid of, mortgages to be completed, and leases to be noted, or something of that kind, and the fault is with the applicant himself or his attorney, and not with us.

643. *Mr. Holdsworth.*] You have the diagram on the certificate before those are satisfied? Yes.

644. Do the diagrams in all cases give the bearings of the lines—a witness here suggested that full descriptions should be inserted in the body of the certificate? That is quite impracticable with the amount of business we have, and quite unnecessary. We give exactly the same information as is given in the Crown grant—we do not alter it in any particular; but the description is not put in, because it would take so much more time. We have never had but one gentleman complain of it, and for him we have always added it if he wished it. It would take at least three times longer to do it in our branch, and in the engrossing branch also. We leave out now the description in Crown grants only, but show all the information in the diagram. We often have a dozen grants to be issued in one certificate; many of the pieces of land are not conterminous, and others are separated by roads or rivers. In each of these pieces we should have to write a separate description, which would immensely swell the cost of engrossing and the time taken in the preparation of the draft certificate.

645. *Mr. Jaques.*] You think from the diagram, a person of ordinary capacity might easily discover and locate himself upon the ground? Most decidedly. The description does not give him the assistance that the diagram does. There are very few people who readily can realize the shape of a piece of ground from reading a description of it, therefore to the many the diagram is the most valuable.

646. *Mr. Pell.*] Could you not from the diagram write the description? Yes, very easily. It would be very much more difficult from the description to make a plan, than from the plan to write a description.

647. Any intelligent person could do it? Yes.

648. *President.*] It is to the absence of method that you think the delay is to some extent attributable? Yes. Mr. Lander and I try hard to get cases pushed on for the Board, but without the co-operation of one of the Examiners we are helpless; we can only get them to a certain stage, where they mostly stick.

649. It is generally the Junior Examiner to whom you have referred? Yes.

650. Have you found Mr. Burton less accessible to you than Mr. Dick used to be? Yes, because he objects to being troubled upon small matters, as they interfere with his legal duties.

651. You have no difficulty with Mr. Holden? No.

THURSDAY, 26 AUGUST, 1869.

PRESENT:—

Mr. Rolleston, President.

Mr. Holdsworth, | Mr. Jaques,  
Mr. Pell.

Edward Grant Ward, Esq., called in and further examined:—

652. *President.*] We understand you wish to give some explanation in reference to a case mentioned by Mr. Want? Yes. The case referred to was a certificate of title to Adelaide Irving, on which a caveat was lodged, dated 16th February, 1867. The caveat was lodged by Macdonald, Smith, & Co., of Sydney, on behalf of certain persons interested in a suit in the Court of Chancery in England. The land was subsequently sold, and before the transfer could take place the caveat had to be withdrawn.

E. G. Ward,  
Esq.

26 Aug., 1869.

653. *Mr. Jaques.*] It was entered under a power of attorney? Yes.

654. *Mr. Pell.*] Was this after the certificate had been issued? Yes.

655. *President.*] Can a caveat be entered after a certificate has been issued? Yes, to prevent dealings. They wished to withdraw the caveat, in order to allow the transfer to be registered, and produced the power of attorney for the purpose of showing that they had power to withdraw it. But it turned out that inasmuch as the suit in England had terminated, the power of Macdonald, Smith, & Co. to withdraw the caveat had ceased, and therefore the caveat remained on the certificate without any power to have it removed. Then it was proposed by Mr. Holden that they should go to the Supreme Court to obtain a Judge's order to remove the caveat; but as that would involve lengthy and expensive proceedings, I suggested the propriety of accepting the transfer and giving Macdonald, Smith, & Co. notice that if they did not object to it in twenty-one days I should register it. That was under section 82 of the Real Property Act. After the twenty-one days had expired, Captain Smith came to the office to withdraw the caveat, as he said. The Counter Clerk was away, Mr. Holden was in my office, and Captain Smith was informed that he could not withdraw the caveat; but inasmuch as the twenty-one days had expired during which he had had the opportunity of taking objection to the transfer, we should proceed to register it, but we should require a document from him stating that he had received the notice, and that the persons for whom he was interested had no further claim. Mr. Holden advised me not to register until that had been obtained. Captain Smith came here on the 10th March, and signed this document on behalf of himself and co-caveators. On the same day I registered the transfer, which the document proves. I cannot understand why Mr. Want has lodged a complaint, for we suggested to him a mode of getting over the difficulty, much easier, less expensive, and much quicker than would have been the case if he had gone to the Supreme Court.

656. *Mr. Pell.*] I did not understand that that was Mr. Want's complaint. I understood that he said it was a case in which a title was brought into the office, and, after the time had elapsed for entering caveats, there was delay in issuing the certificate? I think he imagined that after the lapse of the twenty-one days we ought to have registered instantly without waiting to receive this paper from Captain Smith. Mr. Holden told me it was a peculiar case, and that to be on the right side we should have this acknowledgment from Captain Smith that he had received the notice; and so soon as Captain Smith signed this acknowledgment, on the same day I registered the transaction; so that there was no delay on

E. G. Ward, my part. There was, no doubt, some misunderstanding between Captain Smith and his solicitor; he came up to withdraw the caveat, misunderstanding the meaning of the transaction he had to carry out.

Esq. 657. *President.*] You were engaged for some years with Mr. Torrens in the working of the Real Property Act in South Australia? I was.

26 Aug., 1869.

658. Mr. Torrens, as Registrar General, had a practice, had he not, of requiring from the Examiners a weekly or monthly list of all cases which were in their hands? I think he had a monthly return.

659. And he required from them an explanation of the reasons why there was any delay? There used to be a column for that purpose, if I recollect rightly.

660. Was that practice a good one, and did it facilitate and expedite the passing of applications through the office? I think it was a good practice.

661. Has such a practice ever been established here? Never.

662. Was it not the case that Mr. Dick, during his tenure of office as an Examiner, voluntarily assumed that position—that he looked up all the cases weekly or monthly? He always did.

663. He had a list of them all brought to him? Yes, he used to look them up periodically—every fortnight, I think.

664. He assumed that duty himself, and kept the whole thing afloat? Yes, and not only so, but he had circulars printed in order to remind people that their applications were in a certain stage, and requesting them to proceed, when the delay rested with them.

665. You think that had a good effect upon the office? Certainly.

666. But since his death or retirement that has fallen into abeyance? No such list has been kept since, to my knowledge.

667. Then neither the Registrar General nor the Deputy Registrar General exact from the Examiners any account of cases in their hands? None.

668. Therefore they may delay them for years, and not be called to account by any authority in the office? Except on complaint, in which case I think the Registrar General would make inquiry.

669. Do you not think it desirable that a rule or system of that kind should be kept up? I think so.

670. It is as important in reference to the Examiners' Branch as any other? Yes. Mr. Lander could keep up such a return very well; he has every facility for doing so.

671. *Mr. Holdsworth.*] Had Mr. Dick the same amount of clerical assistance that the present Examiners have? Exactly the same.

672. *President.*] After a title has passed the Examiners, does any delay occur in the preparation of the certificate, either in your branch or the Draftsman's branch? I do not think so. There may be perhaps a week's delay, as a rule—there may be cases that take longer; but if people want their certificates, as they often do, in a great hurry, they can get them the very same day; in fact I have had them sent down to sign before the time has expired.

673. Then there are no just grounds for complaining of any delay in the issue of these certificates in your branch or the Draftsman's branch? I do not think there is any cause of complaint.

Edmund Burton, Esq., called in and further examined:—

E. Burton, 674. *President.*] After titles have passed the Commissioners, do they again come under your cognizance? Yes.

Esq.

26 Aug., 1869.

675. You have to initial the certificate for issue? Yes.

676. Is that with the view of ascertaining whether the description is accurately put in? I do not practise it for that purpose; it would be quite impracticable.

677. Does it detain the certificate? Five minutes, there being a bundle of them. I may say that on the first day of my entering on the duties of my office, 6th July, 1868, I had a large mass of draft certificates brought in to me by the Draftsman in order that he and I might examine them; we did examine them, and passed the whole or nearly the whole afternoon in so doing. I demurred decidedly to such a practice as that; I said a little boy at 15s. a week could do that work quite as well as I, or better. The Draftsman said that Mr. Dick used always to say the time would come when it would be quite impossible for an Examiner to do this work, and I thereupon at once determined that I would always pass them for the future on the Draftsman's examination. He assured me that he examined them, and that I might rely on his doing so; it was clearly impracticable for me to examine them. What I now attend to, in initialling certificates, is the question of succession duty. One of the clauses of the Stamp Act makes the succession duty a charge on the land in certain cases; and therefore, what I attend to before I initial a certificate is, by inquiry or assurance as to facts, or by personally looking into the point of law—when I find there is one to be sufficiently satisfied—that there is no succession duty chargeable on the land. There are many cases in which the succession duty is not a charge upon the land, and it is very seldom a certificate has to be stopped for it. When I made a point about this succession duty, which I thought we were bound to note as an incumbrance whenever it really was a charge, Mr. Holden prepared this notice, which I will hand in, and which I believe has been of great use to the Government. It is a notice for the benefit of the Stamp Office. (*Handed in.*) If an Examiner did anything at all with certificates he should draw them. Any accurate person may be trusted to copy and to examine a certificate, but occasionally the drawing of it is a little difficult. There was recently a case which showed that. It was M'Mahon and Henderson's certificate, transfer No. 3681. My attention was called to that by our clerk, and I advised that the form of certificate which had been prepared should be altered, and that before signing the certificate a memorandum should be signed by both proprietors on the transfer. That happened on the 10th July. If it were practicable it might be a very excellent thing for all certificates to be drawn by an Examiner, and it would be much easier work than examining titles; but at the same time I do not see how, having regard to the other business, it would be practicable for him to do it.

678. It is not done by an Examiner? No, I believe the Draftsman does it.

679. *Mr. Pell.*] Is it not a thing which any intelligent person might do? Nine times out of ten it is; perhaps ninety-nine times out of a hundred; but in some cases it is not. Speaking from recollection, the point of difficulty in the case which I have mentioned was as to whether the parties were to be tenants in common or joint tenants; and the transfer was not prepared in a proper manner. Under the circumstances I thought,

thought it might be practically rectified by the course which I have indicated. Then at other times the preparation of a certificate of title is really a difficult matter, and in such cases it is drawn by an Examiner. Mr. Holden drew two, I think, lately. One of them was founded on Ingall's special transfer.

E. Burton,  
Esq.

680. *President.*] Are you putting these cases to show that there must be delays? No, I am doing it by way of giving information on the general subject. 26 Aug., 1869.

681. *Mr. Pell.*] We are merely concerned with the question of delay? With very great deference I venture to suggest a contrary opinion.

682. *President.*] We are not asked to report upon the Act itself theoretically, but upon the practical working of it in the office? Then I need not say anything further about that. One thing, however, bears certainly upon the subject of delay; and that is, the unfavourable position in which Examiners are placed with regard to titles, as compared with solicitors in private practice. Solicitors in private practice, when they have to do with a difficult title, are very commonly absolutely prevented from entering into the difficulties. Their clients buy under conditions of sale which prohibit a certain part of the title from being inquired into, or prescribe that the recitals in certain deeds shall be taken as evidence of the facts, or, at the very commonest, and in the very easiest titles, provide that what evidence the purchaser wants he shall pay for. None of these provisions can apply to the Examiners. There are no special conditions to protect them. They are bound absolutely to investigate the title, and it is remarkable that the Legislature has been very particular indeed as to the evidence of title which the Examiners shall require. The Legislature requires the Examiners to be content with nothing short of perfect evidence; that is, in all ordinary cases. Section 16 is a section intended for ordinary cases, section 17 for extraordinary ones; and one of the extraordinary cases provided for by section 17 is where it appears that the evidence of title set forth by the applicant is imperfect. So that I take it, before the Examiners can be justified in reporting under section 16, they must have perfect evidence; at any rate they must have such evidence as the expression "imperfect evidence" cannot fairly and reasonably be applied to. Of course they will never arrive at mathematical demonstration, but they are plainly bound by the Act to require what must be reasonably understood by perfect evidence. The first five lines of section 17 show that. I may mention an occurrence which shows the very great necessity for a very high degree of caution on the part of the Examiners. It is one which I personally had nothing to do with; but thanks to Mr. Holden's caution, the Assurance Fund has been saved a probable loss of £1,150 and costs. In case 1,679, Byrnes applied for land valued at £1,150. After other matters, not necessary to occupy the time of the Board in detailing, a letter was written, on the 29th July, 1867, asking for compliance with one of the three following requirements:—First, the recovery and production of an original power of attorney; second, a confirmatory letter or memorandum with Edwards' own signature duly verified; third, proof of personal service of special notice on Edwards, fixing the time for objection or caveat. In that case an action of ejectment has been commenced, and is now pending. The plaintiff has come hither from Ireland, and alleges that he is the real John Edwards, and that he was personated by a man who executed the power of attorney. The applicant, Byrnes, is defending the ejectment as landlord, but the action is likely to be compromised by the applicant paying £600 to Edwards. Now, if Mr. Holden had not been so thoroughly cautious as he was—if he had been satisfied with an attested copy of the power, without the production of the original, or if he had relied on any statutory declarations made in the case, it does appear that Edwards would have lost his land, and that the Assurance Fund would have lost its value and also the costs of the necessary proceedings.

683. That you put forward as showing the importance of requiring original documents, and not being satisfied with attested copies? I do, and of caution generally. I put that forward as an instance of the necessity of great caution, and I would say also of the necessity of habits of great caution; because if habits of caution be not maintained, a man is in danger of not being cautious when caution is absolutely necessary. Of course an honest applicant, being thoroughly convinced that there is nothing improper in connection with his own title, may be very unwilling to be subjected to the examination which is necessary for the detection of such things as that just referred to; but unless the rule of caution were acted on in all cases, it would be impracticable to act upon it in any. The suspicion of the Examiners might not be excited in the right cases, and if it were excited it would be very offensive to manifest it. I refer to the preamble of the Act as showing that the object of the Legislature was to provide for the declaration of titles to land, for the authentication of actually existing titles, and not for the creation of new titles, except so far as section 17 warrants the latter, when cases are brought under it. Section 14 requires every applicant, in his application, to state the nature of every estate or interest held by any other person, whether at law or in equity, in possession or in futurity, or in expectancy. That shows that the Examiners were to have regard to the rights of persons other than the applicant. That section also contains a reference to another very important matter. The applicant is to state whether the occupancy be adverse or otherwise. This leads me to an enormous power possessed by the Commissioners and Examiners. They can take away from any man his land, of which he and his family have been in possession for any number of years, and of which he is still in peaceable possession; or at least they can drive him to maintain the possession which he has, by means of active legal proceedings to be instituted by himself. This has been decided by the Supreme Court. Such a case as that of actual deprivation of the land is not altogether impossible to occur in regard to land at some distance from Sydney, the occupancy of which is but little known. If a person make an application to this office for a title, grounded on statutory declarations, showing possession by himself and those through whom he claims for a long period of years, it might occasionally be impossible to do other than grant the application, and yet these declarations might turn out to be untrue, or only partially true, as not disclosing some important fact sufficient to preserve the title of the real owner.

684. *Mr. Pell.*] They might forge deeds in the same way? No doubt. No doubt advertisements are, in some cases, a check upon such an occurrence, and very grave and important cases of the sort indicated are not very likely to occur with any frequency. But there was recently a case, No. 2,073, Woods' case—a first-class case, I believe—in which a certificate of title was granted in pursuance of the application, and in which another person afterwards made complaint that his possession of twenty-five years had been overruled. I instance this as showing the necessity for proper caution.

685. *Mr. Jaques.*] Might I ask whether that claim was substantiated? I do not know. It was a claim made by a namesake of mine, not a relative—Mr. John Burton. I do not know whether his claim is well-founded or ill-founded, or what is happening about it. Then there was another case, No. 1,985, Beaumont's—I have heard there was a prosecution in that case—personally I know little or nothing about it; but I have been

E. Burton,  
Esq.

26 Aug., 1869.

been informed that a person named Lee was convicted in that case of making a false declaration, and sentenced to a term of imprisonment.

686. *President.*] Great caution is required in that particular? Great caution is requisite, no doubt, in cases where a title by possession is set up; yet we have many such cases, in some instances coming from very respectable persons; and no doubt in many instances the titles are very good and undeniable, but great particularity has to be exercised, amongst other reasons because of two English and Colonial enactments, one of each, which render it almost impossible to rely upon a title by possession, where there is a mortgage which cannot be shown to have been satisfied, because a payment on account of such mortgage, within twenty years, is made sufficient to preserve the rights of the mortgagee, and of all persons claiming under him—for instance, a purchaser under power of sale. I think the public should bear these things in mind—that they should recollect that, pleasant as it is to get titles as fast as possible, and although at the time of making application they very naturally think of nothing but getting their certificates as fast as possible, yet that it would be very unpleasant to have taxation increased by reason of the money required to make up the deficiency of the Assurance Fund; and especially while the contribution to that fund is at the rate of only one halfpenny in the pound, which allows for the making of one mistake out of 480 opportunities of erring—a rate of mistake-making which I suppose the most cautious man who ever lived must certainly have reached in spite of all his caution. I think it should be borne in mind that, especially with this low rate of assurance premium, it becomes absolutely necessary for those who are employed to protect the Assurance Fund to proceed with caution, therefore with deliberation, and with what some persons may call delay. If any serious mistake and any great loss were made, there would be very great complaints against the Examiners, and the Examiners would be the only persons in the department that could be blamed at all. No one else would have had anything to do with the matter. The applicant is not responsible, unless he be guilty of some falsity or suppression of truth in his application, or the like. The Registrar General is not responsible. The unofficial Commissioners are not responsible. The Examiners may not be responsible in an action, but of course they would be responsible to the Government and to the public. It is remarkable, too, that this Act has cast upon the Assurance Fund a greater liability than rests upon solicitors who examine a title in private practice. That is shown by section 119, the first three lines of which proceed to give a remedy to any person sustaining loss or damage through any omission, mistake, or misfeasance of the Registrar General, or any of his officers or clerks, in the execution of their respective duties under the provisions of this Act, or by the registration of any other person as proprietor of such land. I suppose that the Examiners are included under the expression, the Registrar General's officers. Now it is very well known that an attorney is not liable except for gross negligence, and that a barrister investigating a title is not liable at all. It should be remembered too that the proceedings of the Examiners are necessarily *ex parte*. In very many cases there is no other side to be heard. In a Court both parties would be heard—both parties would assert their rights; therefore there would not be the danger of a dormant right to be brought forward and compensated subsequently.

687. *Mr. Pell.*] If a title were such as could not be forced in equity upon an unwilling purchaser would you reject it—is that the standard you propose to yourself? No.

688. Not so high a standard? No, I do not.

689. *President.*] You consider that extreme caution should be exercised on account of the indefeasibility which the Act confers on a title sanctioned by the Examiners? Yes, so far as practicable. At the same time I express my meaning more fully by saying that extreme care should be taken in the investigation, and then, when the investigation has been performed as well as possible, the Examiners may and must be content with something short of perfection. I think that a reasonable meaning must be given to the expression "imperfect evidence," in section 17. My view of the duties of an Examiner is, that he should make first the most thorough investigation practicable, and secondly that he should come to the most reasonable and safe judgment possible; that he should by no means unnecessarily endanger the Assurance Fund, on the one hand, and that he should not deny to an applicant, on the other, the benefit of a point of law making in his favour, although the point may be very difficult, and although the risk involve a considerable sum of money to be made good by the Assurance Fund in case the point of law should have been wrongly decided. I think that when either an English or Colonial Court has decided a point of law, the applicant is generally speaking entitled to have his application granted, if it depend upon that point, although the Examiners themselves, without the advantage of that decision, might never have come to the conclusion which the Court has come to. Such a case as here indicated actually exists in Woods' case, No. 1,693, already referred to.

690. In your experience in the office, have you had reason to complain of a want of promptitude in persons answering the objections or the requisitions which you have made to them—has there been great delay on the part of applicants themselves or their solicitors in providing you with the information you have required? Yes.

691. As a rule is it so? It is difficult to say as a rule. There are instances of very great delay indeed.

692. I want to ascertain whether there is not a want of promptitude generally in answering these requirements? I think it is very common.

693. Then the cause of delays rests very often with themselves? For months together. In case 2,029, on 8th July, 1868, two days after my appointment, a letter was drafted which was forwarded next day. I received that case again, after an interval of nearly a year, namely, on the 7th July, 1869, and I signed a report in its favour the same day, a declaration having been furnished to meet the requisition made in July, 1868. I have put together some remarks upon the subject of a third Examiner; I do not know whether the Board will care to hear them.

694. Of course we shall be happy to receive them? First of all I may say that, if either the Legislature or the Government should think fit to direct both Examiners to pass or to recommend the passing of a title whenever either of them is satisfied, a great saving of time and labour might certainly be effected, but effected I think at the expense of safety. Great advantage might, however, result from the appointment of a third Examiner, if it were at the same time provided that approval by two Examiners should be sufficient to pass a title. It should, I think, also be arranged that one of the three Examiners should specially apply himself to the investigation of cases considered short or summary. On his finding himself ready to sign a report in such a case, he should forward it to one of his colleagues, and the Examiner so invoked, taking a proper view of the case, would of course agree with the first who had dealt with it, if it were

were a case proper to be dealt with as short or summary. The report would then be signed by both, and the remaining Examiner need not be interrupted while proceeding with difficult cases. If, however, the two Examiners who had first examined a case should not find themselves at liberty to pass it either as a short and summary one or as a difficult one, after due consideration, recourse might be had to the other Examiner. Thus every applicant would have the advantage of requiring only to satisfy any two out of three Examiners. This remark applies equally to cases confessedly difficult and complicated. Such cases might be assigned, in the first instance, to one of the three Examiners, or divided between two of them. The Examiner first dealing with such a case, on becoming satisfied, would invoke its consideration by one of his colleagues, and on a favourable view being taken by the two the title would be passed. If the Examiner first seised of a case, whether considered easy or difficult, should say, I cannot accept this title on such information and evidence as the applicant has furnished and is willing to furnish, then the applicant might be at liberty to have the case struck out from that Examiner's list, and placed on the list of one of the others. If that Examiner should decline also to accept the title, it would not be right that it should pass; but if the applicant should satisfy him, the concurrence of either of the other Examiners would be a warrant for the passing of the title. That plan is, I think, as liberal as right-minded applicants could themselves desire. In addition to which, I think it should be open to applicants to procure counsel's opinion and forward it to the Examiner in charge of the case. I think a fee should be paid to the Government on placing a case on the list of any Examiner, and that that fee should not be in any event returned. That arrangement would tend to discourage over hasty removal of cases from one Examiner's list to another's, because the Examiner may have made some requisition with which the applicant is unwilling to comply. The plan indicated would, I think, save time in another particular. The established rule at present is, that both Examiners should concur in every letter or set of requisitions written on behalf of the Land Titles Office. The letters and requisitions commonly state in so many words that they are written at the instance of the Examiners, or to that effect. There is no occasion for that. The letter might commence, "I am instructed by the Senior Examiner," or "Examiner A." or "B.," "who has charge of this case, to intimate as follows." The letter might be signed by, and the reply addressed to, the Clerk to the Examiners.

E. Burton,  
Esq.

26 Aug., 1869.

#### ADDENDUM.

A document has been put in headed "Applications to bring land under Act quarterly since 1st January, 1863."

Of that document I will only say that a comparison of the first two quarters of the years 1867 and 1868, with the first two quarters of 1869, shows that, whereas in the first period 159 applications were made, and in the second period 144, there have been no fewer than 163 made in the first two quarters of 1869. Of these two quarters, the one ending 30th June, 1869, is that in which the larger number (eighty-three) were made, and it is clearly a quarter during which the operation of the delays attributed to myself had full scope for deterring, as is suggested, many persons from making applications to bring properties under the Act.

In fact, however, more applications were made in the second quarter than in the first of 1869, and more applications were made in those two quarters conjointly than in either the first two quarters of 1867 or the first two quarters of 1868.

Again, during the last two quarters of 1868 there were 176 applications, whereas in the last two of 1867 there were only 175.

Another document is headed "Abstract of the state of business in the Land Titles Office."

The first line states that Mr. Holden and Mr. Dick during four years and five months disposed of 1,414 cases of the first and second classes. It does not mention how many were of the first class, in which the work would be about nothing at all. It appears to assert also, that from the commencement to the present time no third-class case, that is, no case falling under section 17, has ever been disposed of. That section was evidently intended by the Legislature to be used in extraordinary cases. I can hardly believe that it never was used before my time. I know that since my appointment one applicant is proceeding to obtain evidence, &c., in order to bring his case under that section, and that I have suggested its use by two others, one of whom is Mr. Smart. See minute of 9th June, in Mr. Smart's cases.

This first line also states that Messieurs Holden and Dick left 141 cases remaining. Whatever was the number of first-class cases disposed of by those gentlemen, it may certainly be presumed that they did not leave any of that class remaining.

The second line states that Messieurs Holden and Pennington left nine cases remaining on 30th June, 1868. My appointment took effect on 6th July, 1868. I am sure that there were more than nine cases in arrear then; in fact I have passed more than nine of such arrear cases. I can supply an easy test. The first application brought into the office after my appointment took effect was No. 2,034. All cases passed since and bearing lower numbers were arrears when I entered the office. What I suppose the document really means is, that Messieurs Holden and Pennington left an arrear of nine cases in addition to the arrear of 141 left by Messieurs Holden and Dick, thus making, in fact, 150 cases in arrear on 30th June, 1868, and rather more than 150 when I entered on 6th July. What can this document be intended to show? That Mr. Holden and Mr. Pennington were better Examiners than Mr. Holden and Mr. Dick, on the ground that Mr. Holden and Mr. Pennington left a smaller proportionate number of cases in arrear? The document may on the face of it suggest such an inference, but the inference is an absurdity which the public voice would reject, even if supported by all the statistics that have ever been compiled.

The third line professes to state the number of cases of which Mr. Holden and I disposed of up to 30th November, 1868. It is not quite accurate as to dates; it says from 1st July. I did not become an Examiner till 6th July; but the error of a few days does not make a great difference, and I disclaim the judgment of these statistics, whether accurate or inaccurate. One difficult case will properly occupy an Examiner as long as six or perhaps as twenty or more easy ones.

The 4th line professes to state the number of cases disposed of by Messieurs Holden and Oliver. I need not attempt to depreciate any credit which may be due to those gentlemen. I hope that the work which I had done, in some of the cases which they afterwards passed, was useful.

The 5th line professes to give the number of cases disposed of by Mr. Holden and myself between 8th March and 9th August, 1869; it also states that there are seventy-nine cases now under requisition. If such statistics are to be used, it is comfortable to reflect that the Examiners are waiting for the applicants in so many instances.

I have not altogether done with this document. It professes to give evidence upon the comparative merits or demerits of other Examiners and of myself. It is impossible however, on the present occasion, to re-examine the titles which have been disposed of by those others and by myself, and to ascertain in detail what care has been taken by them and by me respectively. If what I will term the comparative issue be a reasonable one, that is the way in which it ought to be tried. There is indeed another mode of trial, but which will require many years to decide. If, in the lapse of years, more claims against the Assurance Fund should be established in connection with cases decided by one set of Examiners than shall have accrued from those decided by another, that set of Examiners which shall be found to have done the less mischief will prove to be entitled to some comparative commendation. That trial however cannot be completed for years to come. At present, indeed, no claim whatever has been substantiated. Still, as it has been well said by Mr. Holden, "it may be premature to boast too confidently of the non-existence of any claim on the Assurance Fund for indemnity against loss consequent on error."

E. Burton,  
Esq.

26 Aug., 1869.

In one particular, indeed, the comparative issue can be easily tried. What decisions of the Supreme Court have there been for and against the office? What Examiners, by their work or advice, led to the unfavourable decisions, and what Examiners led to the favourable ones? The answers to these questions must be of that character which nothing but the commencement (not by me) of a comparison between others and myself could justify me in furnishing.

During all the time before my appointment as an Examiner, the Supreme Court decided once in favour of the office and twice against it. (See *ex parte Burnell*, 3rd Supreme Court Reports, 148; *ex parte Hamilton*, 3rd Supreme Court Reports, 311; *ex parte Smart*, 6th Supreme Court Reports, 188.) In my time there has been but one decision. That arose out of the stand which I made against entertaining applications under power of attorney. I advised that such applications ought not to be received. The Supreme Court decided that I was right; a contrary practice however had prevailed for about five and a half years. To dispose of cases is one thing—to dispose of them legally and properly is another.

Statistical reasoning seems to me to fail in application to the examination of titles in like manner as to the trial of causes at law; one of which may necessarily occupy three weeks, and be very ably tried, while two or three may be also very well or very ill tried in one day.

For my own part I am quite prepared to submit my work to the review of a real property lawyer; and I very respectfully propose case 2,352 as a sample, as well of the character of work presented to the Examiners as of the manner in which I have handled it.

E. BURTON.

1870.

---

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

---

LAND TITLES UNDER REAL PROPERTY ACT.  
(RETURNS RESPECTING APPLICATIONS FOR.)

---

*Ordered by the Legislative Assembly to be Printed, 15 September, 1870.*

---

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated 24th August, 1870, That there be laid upon the Table of this House,—

“ A Return of all Applications for Certificates of Title under the Real Property Act, from 1st January, 1869, to 30th June, 1870, setting out the date of each Application and the date of each Certificate issued.”

(*Mr. King.*)

---

LAND TITLES UNDER REAL PROPERTY ACT.

RETURN of Applications received into Land Titles Office, from 1st January, 1869, to 30th June, 1870, shewing the date of receipt of each Application, and the date of issue of Certificate of Title when issued.

1870,

NEW SOUTH WALES.

VACCINATION.

(REPORT FROM MEDICAL ADVISER TO THE GOVERNMENT, FOR THE YEAR 1869.)

Presented to both Houses of Parliament, by Command.

THE MEDICAL ADVISER TO THE GOVERNMENT TO THE COLONIAL SECRETARY.

Medical Adviser's Office,

1 October, 1870.

Sir,

I have the honor to forward Returns of Vaccinations performed by the public Vaccinators in Sydney, its suburbs, and in the country districts of New South Wales, during the year 1869.

In the city and its suburbs 1,568 children under one year, 2,893 above one year and under five, and 803 under ten years,—have been reported as successfully vaccinated.

In the country districts 2,679 children under one year, 7,989 above one year and under five, and 5,687 under ten years,—were vaccinated.

The total number of successful cases during the year was 21,507, nearly twice the number vaccinated in 1868.

The fear arising from the existence of small-pox in Melbourne during the first half of 1869, was the chief cause of the increased number of vaccinations. It is not the objection to vaccination, nor the distrust in its benefits, but the apathy that exists, particularly in the absence of immediate danger, and the want of forethought in the use of protective measures, when the danger is distant, that causes the neglect of vaccination.

Even the presence of disease does not enough stimulate people to resort to measures of personal safety. During epidemics of cholera it had been found that after the stage of collapse, treatment was very doubtful in its results, but it had been shown that premonitory diarrhoea existed in almost all cases, and that the diarrhoea was amenable to simple treatment. On the outbreak of cholera in any locality the symptoms of the diarrhoea were described, the medicines for its treatment were easily procured without payment, and the information was placarded about the infected districts. But this was not enough, and house to house visitation had to be resorted to, to find out the cases of diarrhoea and take the medicines to them. If such is the sluggishness of people, when an acute disease like cholera is among them, is it probable that they will be more energetic in procuring vaccination for their children, to protect them from a disease not at the time existing?

It is still a matter of great regret to see the large number of children under one year of age not vaccinated, for at that age if attacked with small-pox the mortality is greatest. It is well to call to mind the dangers of small-pox. Sir Gilbert Blane stated that before the discovery of vaccination small-pox was one of the greatest embarrassments to the operations of armies, and obliged ships of war occasionally to quit the seas, whereas on an average of the six years, 1859 to 1864, the annual death was less than one per ten thousand among the soldiers, and somewhat more than two per ten thousand among the sailors.

The effects of vaccination in saving life may be judged of by a comparison of what took place in the four following periods.

Periods compared.	Annual deaths by small-pox in England and Wales	Annual rate per million of the Population.
1. Average of thirty years previous to introduction of vaccination, estimated by Dr. Letson and Sir Gilbert Blane	.....	3,000
2. Average of three years (1838-40), when vaccination had become to a great extent diffused, but before any public provision was made for its gratuitous performance	11,944	770
3. Average of nine of the years (1841-53), when public vaccination was gratuitously provided, but vaccination was not obligatory	5,221	304
4. Average of the twelve years (1854-65), during which vaccination has been to a certain extent obligatory	3,967	202

The proper vaccination of the people cannot be effected without a Compulsory Vaccination Act, and it is to be hoped that this Session of Parliament will not close without legislating on this subject, for if delayed until small-pox appears among the people it may be impossible to stamp it out by the use of the utmost vigilance.

I have, &c.,

E. S. P. BEDFORD,

Medical Adviser.

ANNUAL RETURN of Children vaccinated by the Government Vaccinators in Country Districts, in 1869.

E. S. P. BEDFORD,  
Medical Adviser.

1870-71.

## NEW SOUTH WALES.

## VACCINATION.

(REPORT FROM MEDICAL ADVISER TO THE GOVERNMENT, FOR THE YEAR 1870.)

Presented to both Houses of Parliament, by Command.

THE MEDICAL ADVISER TO THE GOVERNMENT TO THE COLONIAL SECRETARY.

Medical Adviser's Office,  
1 June, 1871.

SIR,

During the year 1870, the Returns furnished by the Public Vaccinator show that, in Sydney and its Suburbs, there have been 3,368 successfully vaccinated, and in the Country Districts 3,716, making a total of 7,084.

The numbers during the year 1870 were not as numerous as when the people were excited by the presence of small-pox in Melbourne, and are much below the number that ought to be vaccinated.

Estimating the births in Sydney and the Suburbs at 5,364, we find that 1,291 children under one year have been successfully vaccinated by public Vaccinators. Taking the same number as vaccinated by private practitioners, it would leave 2,782 unprotected against small-pox. In the Country Districts, the births may be reckoned as 13,789. Making the same proportionate allowance for vaccinations by private practitioners, 11,829 are left unprotected. It is the absence of a compulsory Vaccination Act that allows of this state of things. In an old community where the population is too great, humanity and self-preservation call for such protection. Not only ought this influence to act in this community, but the loss of a large portion of the people would be severely felt in a Colony that only requires population for the development of its great resources, and a compulsory Vaccination Act is necessary to prevent this. For, that small-pox will come is certain; the more rapid passages made by steam-vessels renders the danger more imminent, and there is no safety but in the vaccination and revaccination of the people. If it is objected that it will entail expense, it must be borne in mind that it is not alone the loss of life, the suffering, the expenses of long and severe illnesses (for the small-pox is the introducer of a train of physical ills and disabilities), but when considering the expenses attending vaccination, they would be less than the funeral charges from a fully-spread epidemic of small-pox.

The recent outbreak of small-pox in England has directed public attention to the protective influence of vaccination, and facts prove that vaccination in infancy, and revaccination after fifteen years of age, protects from small-pox, as fully as a prior attack of small-pox itself. There is not a doubt in the mind of those who are competent to form a judgment on the subject, that vaccination and revaccination would entirely prevent the spread of small-pox. It is also as strongly shown that the objection to its performance as introducing disease by vaccination is futile, the dangers really being infinitesimal. The history of the Small-pox Hospital shows that among its attendants, who are all revaccinated, no case of small-pox has taken place for thirty years.

When a compulsory Vaccination Act is passed, it will be necessary, at the same time, to make provision in the Registration Act, that on registering a birth, the parents should be furnished with a paper informing them of the penalties they are liable to under the compulsory Vaccination Act, and directing them where to apply to for the vaccination of the infant. It will be necessary to provide not only for primary vaccination, but also for revaccination; but until the law compels vaccination, it is not possible to make any alteration in the present arrangements with any benefit to the public interests.

At the Hampstead Small-pox Hospital, near London, out of 800 cases admitted during the recent outbreak, 591 were vaccinated, and 209 were not. Among the vaccinated were included those who had marks on their arms. In Dr. Greeve's paper, March 8th, 1871, he mentions the benefits of vaccination over subsequent small-pox: it modifies it when it does occur, so as to change it from one of the most loathsome and fatal of all zymotic diseases, into a comparatively mild attack; and when death occurs in a vaccinated case, the cause most frequently lies in some constitutional defect. Of the 591 vaccinated cases, 58 died; of the 209 unvaccinated, 96 died. In the vaccinated cases, they were on an average twenty-four days in hospital; in the unvaccinated, thirty-five days.

I have referred to the virtue of revaccination as a complete preventative in the Small-pox Hospital. The Hampstead Hospital, as far as its history goes, proves this. Out of sixty officials constantly connected with the sick during three months, not a single case has occurred; and out of the 800 patients, not one could prove that he or she had been revaccinated.

The lymph, which arrives from England by every alternate mail, has often lately failed, both in the hands of the public Vaccinators at Sydney, and also with other medical gentlemen. I would suggest that the Agent should be requested to forward supplies, both from the Vaccine Institution and the Small-pox Hospital.

I have, &amp;c.,

E. S. P. BEDFORD,  
Medical Adviser.

## LABOUR BILL OF 1870.

(PETITION—CERTAIN ARTISANS AND OTHERS.)

*Ordered by the Legislative Assembly to be Printed, 28 September, 1870.*

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of the undersigned Artisans, Manual Labourers, and others of the Working Population of the Colony,—

SHOWETH:—

1st. That a limited number of your Petitioners have during thirteen years past enjoyed the privilege of an eight-hour per day system of labour, although the greater number of your Petitioners are still compelled to toil for a longer period each day than is compatible with their physical health or their intellectual and moral culture.

2nd. That your Petitioners respectfully pray your Honorable House to consider the many beneficial results that have followed the abridgment of the hours of labour, even by a section of the community; and we further pray your Honorable House will take such steps as you may in your wisdom deem most expedient for the purpose of eliciting the vast amount of moral and social benefits that have accrued to employers as well as employed wherever the eight-hour system of labour has been adopted.

3rd. That your Petitioners further pray your Honorable House to authorize that all public works carried on under the direct control of the Executive Government shall be in accordance with the system of eight hours per diem; and that, in all future contracts, a clause should be inserted in the specification to secure the performance of the contract in accordance with the system of eight labouring hours per day.

4th. Your Petitioners likewise pray that your Honorable House will also take into consideration, not only the advisability, but the necessity of passing a measure which shall recognize and constitute eight hours the maximum of a day's labour wherever practicable in New South Wales, and also of limiting the hours of labour in manufactories and workshops, wherein youth of tender years are compelled to work from twelve to fourteen consecutive hours each day; a practice which, if not checked, cannot fail to undermine the physical stamina of our youth, and in addition to producing most disastrous results upon the bodily health, must impair and lower the moral habits of those so employed.

5th. Your Petitioners, in conclusion, most respectfully submit their case to your Honorable House for consideration, in the full belief that the subject matter is one which vitally affects the physical, intellectual, and moral status of the entire population of this Colony, but in an especial degree the welfare of that section of society to which your Petitioners belong.

And your Petitioners, as in duty bound, will ever pray.

(PETITION—CERTAIN INHABITANTS OF NEWCASTLE.)

*Ordered by the Legislative Assembly to be Printed, 29 September, 1870.*

## Eight-hours Extension.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of the undersigned Artisans, Manual Labourers, and others of the Working Population of the Colony,—

SHOWETH:—

(1.) That a limited number of your Petitioners have, during thirteen years past, enjoyed the privilege of an eight-hour per day system of labour, although the greater number of your Petitioners are still compelled to toil for a longer period each day than is compatible with their physical health or their intellectual and moral culture.

(2.) That your Petitioners respectfully pray your Honorable House to consider the many beneficial results that have followed the abridgment of the hours of labour even by a section of the community. And we further pray your Honorable House will take such steps as you may in your wisdom deem most expedient for the purpose of eliciting the vast amount of moral and social benefits that have accrued to employers as well as employed wherever the eight-hour system of labour has been adopted.

(3.) That your Petitioners further pray your Honorable House to authorize that all public works carried on under the direct control of the Executive Government shall be in accordance with the system of eight hours per diem; and that, in all further contracts, a clause should be inserted in the specification to secure the performance of the contract in accordance with the system of eight labouring hours per day.

(4.) Your Petitioners pray that your Honorable House will also take into consideration not only the advisability, but the necessity of passing a measure which shall recognize and constitute eight hours the maximum of a day's labour, wherever practicable in New South Wales, and also of limiting the hours of labour in manufactories and workshops, wherein youth of tender years are compelled to work from twelve to fourteen consecutive hours each day; a practice which, if not checked, cannot fail to undermine the physical stamina of our youth, and in addition to producing most disastrous results upon the bodily health, must impair and lower the moral habits of those so employed.

(5.) Your Petitioners, in conclusion, most respectfully submit their case to your Honorable House for consideration, in the full belief that the subject matter is one which vitally affects the physical, intellectual, and moral status of the entire population of this Colony, but in an especial degree the welfare of that section of society to which your Petitioners belong; and your Petitioners humbly pray that you will be pleased to take the premises into consideration, and afford such relief as may in your wisdom seem fit.

And your Petitioners, as in duty bound, will ever pray.

---

LABOUR BILL OF 1870.

(PETITION—INHABITANTS OF SYDNEY, IN PUBLIC MEETING ASSEMBLED.)

---

*Ordered by the Legislative Assembly to be Printed, 4 October, 1870.*

---

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of the Inhabitants of the City of Sydney,—

SHOWETH:—

That at a Public Meeting held in the Adelphi Theatre, York-street, on Wednesday, the 21st September, 1870, the following Resolutions were unanimously passed:—

First. That in the opinion of this Meeting, the system of long hours of labour tends to demoralize a people, by incapacitating them from the proper cultivation of their moral and intellectual faculties.

And secondly, that this Meeting is in favour of eight hours becoming the maximum of a legal day's labour in this Colony, and would therefore urge the passing of the Eight-hour Labour Bill now before the Legislative Assembly; and further, that the Chairman be authorized to sign this Petition on behalf of the Meeting, and the same to be forwarded to the Honorable the Legislative Assembly of New South Wales.

Your Petitioners therefore humbly pray that you will be pleased to pass into law the Bill now before your Honorable House.

And your Petitioners, as in duty bound, will ever pray.

WILLIAM BROOKES,  
Chairman.

1870.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

LABOUR BILL OF 1870.  
(PETITION—CERTAIN INHABITANTS OF WEST MAITLAND.)

*Ordered by the Legislative Assembly to be Printed, 4 October, 1870.*

To the Honorable the Speaker and the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of the undersigned Residents of the Borough of West Maitland, &c.,—

HUMBLY SHOWETH :—

1. That your Petitioners view with feelings of great satisfaction the Bill now before your Honorable House for the promotion of the eight-hours system.

2. That your Petitioners would respectfully urge upon your Honorable Assembly the great necessity of passing this measure in its integrity, as it is their unanimous opinion that eight hours should constitute a day's work; and that such a system would be best guaranteed by an Act of Parliament applicable to such a movement.

3. That your Petitioners believe that the passing of this Bill will have a salutary effect in a social and moral point of view on the Colony at large.

4. Your Petitioners therefore humbly pray your Honorable House to sanction the passing of the Bill into law at as early a period as convenient.

And your Petitioners will ever pray.

LABOUR BILL OF 1870.

(PETITION—MR. STEPHEN BROWN, AS CHAIRMAN OF A PUBLIC MEETING OF OPERATIVE STONEMASONS.)

---

*Ordered by the Legislative Assembly to be Printed, 7 October, 1870.*

---

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the undersigned,—

HUMBLY SHOWETH :—

That at a Public Meeting of Operative Stonemasons of the City of Sydney and Suburbs, held on September 29th, at Mr. Hinchey's Hyde Park Hotel, corner of Castlereagh and Bathurst Streets—Mr. Stephen Brown in the Chair—the following resolution was unanimously passed :—That the Chairman be authorized to sign the following Petition on behalf of the Meeting, for the purpose of presentation to Parliament.

1st. That your Petitioners having enjoyed, by mutual arrangement with their employers, the privilege of working eight hours per day for the last fourteen years, your Petitioners have great pleasure in testifying to the cordial relations which have always existed on the question between your Petitioners and their employers.

2nd. Your Petitioners having experienced the many beneficial advantages which have accrued to them as a body, both morally and physically, since the introduction of the eight-hour system, earnestly desire that its advantages be extended to all classes of the community wherever practicable.

3rd. Your Petitioners would humbly bring under the notice of your Honorable House the fact that your Petitioners are excluded from working on any works which may be under the immediate control of the Executive Government, or the various Municipalities, in consequence of their strict adherence to the old system of ten hours per day.

4th. Your Petitioners, having considered the Eight-hours Bill, introduced to your Honorable House by the Honorable J. B. Wilson, on September the 9th instant, are of opinion that it will, to a great extent, carry out the wishes of your Petitioners.

And your Petitioners would therefore earnestly pray your Honorable House to pass the said Eight-hours Bill.

And your Petitioners, as in duty bound, will ever pray.

Signed on behalf of the Meeting,—

STEPHEN BROWN,  
Chairman.

LABOUR BILL OF 1870.

(PETITION—HUBERT WHITLOCK, CHAIRMAN OF A PUBLIC MEETING OF BRICKLAYERS.)

---

*Ordered by the Legislative Assembly to be Printed, 19 October, 1870.*

---

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the undersigned,—

HUMBLY SHOWETH:—

That, at a Public Meeting of the Bricklayers of the City of Sydney and Suburbs, held on October the twelfth, one thousand eight hundred and seventy, at Mr. Seal's Hotel, corner of George and Goulburn streets, Mr. Hubert Whitlock in the Chair,—the following Resolution was unanimously passed:—That the Chairman be authorized to sign the following Petition, on behalf of the Meeting, for the purpose of presentation to Parliament:—

1st. That your Petitioners having experienced the many beneficial advantages which have accrued to them as a body, both morally and physically, since the introduction of the eight-hour system, earnestly desire that its advantages be extended to all classes of the community wherever practicable.

2nd. Your Petitioners would humbly bring under the notice of your Honorable House the fact that your Petitioners are excluded from working on any works which may be under the immediate control of the Executive Government, or the various Municipalities, in consequence of their strict adherence to the old system of ten hours per day.

3rd. Your Petitioners, having considered the Eight-hour Bill introduced to your Honorable House by the Honorable J. B. Wilson, on September the ninth proximo, are of opinion that it will to a great extent carry out the wishes of your Petitioners; and your Petitioners would therefore earnestly pray your Honorable House to pass the said Eight-hour Bill into law; and your Petitioners, as in duty bound, will ever pray.

Signed on behalf of the Meeting,—

HUBT. WHITLOCK,  
Chairman.

**LABOUR BILL OF 1870.**

(PETITION—WILLIAM CHAPMAN, CHAIRMAN OF A PUBLIC MEETING OF CARPENTERS AND JOINERS.)

---

*Ordered by the Legislative Assembly to be Printed, 20 October, 1870.*

---

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the undersigned,—

HUMBLY SHOWETH :—

That, at a Public Meeting of Carpenters and Joiners of the City of Sydney and its Suburbs, held on the 3rd day of October, 1870, at Mr. Tidswell's, "Albion Hotel," Campbell and Elizabeth streets, Mr. W. Chapman in the Chair,—the following Resolution was unanimously passed :—That the Chairman be authorized to sign the following Petition on behalf of the Meeting, for the purpose of presentation to Parliament :—

1st. That your Petitioners, having enjoyed by mutual arrangement with their employers, the privilege of working eight hours per day, for the last nine years, your Petitioners have great pleasure in testifying to the cordial relations which have always existed on the question between your Petitioners and their employers.

2nd. Your Petitioners, having experienced the many beneficial advantages which have accrued to them as a body, both morally and physically, since the introduction of the eight-hour system, earnestly desire that its advantages be extended to all classes of the community wherever practicable.

3rd. Your Petitioners would humbly bring under the notice of your Honorable House the fact that your Petitioners are excluded from working on any works which may be under the immediate control of the Executive Government, or the various Municipalities, in consequence of their strict adherence to the old system of ten hours per day.

4th. That, in the opinion of this Meeting, the system of long hours of labour is detrimental to the physical and moral development of the labouring classes.

5th. Your Petitioners, having considered the Eight-hour Bill introduced to your Honorable House by the Honorable J. B. Wilson, on September 9th, are of opinion that it will to a great extent carry out the wishes of your Petitioners, and do receive our warmest support for the passing of the same.

And your Petitioners would therefore earnestly pray your Honorable House to pass the said Eight-hour Bill ; and your Petitioners, as in duty bound, will ever pray.

Signed by

WILLIAM CHAPMAN,  
Chairman, on behalf of the Meeting.

LABOUR BILL OF 1870.

(PETITION—WILLIAM GILLESPIE, CHAIRMAN OF A PUBLIC MEETING OF UNITED AND OTHER LABOURERS.)

*Ordered by the Legislative Assembly to be Printed, 20 October, 1870.*

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the undersigned,—

HUMBLY SHOWETH:—

That, at a Public Meeting of the United and other Labourers connected with the Building Trades of the City of Sydney and Suburbs, held on October the 14th, 1870, at Mr. Smith's, Burrangong Hotel, George-street, Mr. William Gillespie in the Chair,—the following Resolution was unanimously passed:—That the Chairman be authorized to sign the following Petition on behalf of the Meeting, for the purpose of presentation to Parliament:—

1st. That your Petitioners having enjoyed, by mutual arrangement with their employers, the privilege of working eight hours per day, for the last thirteen years, your Petitioners have great pleasure in testifying to the cordial relations which have always existed on the question between your Petitioners and their employers.

2nd. Your Petitioners having experienced the many beneficial advantages which have accrued to them as a body, both morally and physically, since the introduction of the eight-hour system, earnestly desire that its advantages be extended to all classes of the community wherever practicable.

3rd. Your Petitioners would humbly bring under the notice of your Honorable House the fact that your Petitioners are excluded from working in any works which may be under the immediate control of the Executive Government, or the various Municipalities, in consequence of their strict adherence to the old system of ten hours per day.

4th. That your Petitioners having considered the Eight-hour Bill introduced to your Honorable House by the Honorable J. B. Wilson, on September the 9th instant, are of opinion that it will to a great extent carry out the wishes of your Petitioners.

And your Petitioners would therefore earnestly pray your Honorable House to pass into law the said Eight-hours Bill.

And your Petitioners, as in duty bound, will ever pray.

Signed, on behalf of the Meeting,—

---

**LABOUR BILL OF 1870.**

(PETITION—CERTAIN ARTISANS, MANUAL LABOURERS, AND OTHERS, OF WEST MAITLAND.)

---

*Ordered by the Legislative Assembly to be Printed, 27 October, 1870.*

---

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Prayer and Petition of undersigned Artisans, Manual Labourers, and others of the working population of the Colony,—

SHOWETH:—

First—That a limited number of your Petitioners have during thirteen years past enjoyed the privilege of an eight-hour per day system of labour, although the greater number of your Petitioners are still compelled to toil for a longer period each day than is compatible with physical health or their intellectual and moral culture.

Secondly—That your Petitioners respectfully pray your Honorable House to take into consideration the many beneficial results that have followed the abridgment of the hours of labour even by a section of the community. And we further pray your Honorable House will take such steps as you may in your wisdom deem most expedient, for the purpose of eliciting the vast amount of moral and social benefits that have accrued to employers, as well as employed, wherever the eight-hour system of labour has been adopted.

Thirdly—That your Petitioners further pray your Honorable House to authorize that all public works carried on under the direct control of the Executive Government shall be in accordance with the system of eight hours per diem; and that, in all future contracts, a clause should be inserted in the specification to secure the performance of the contract in accordance with the system of eight labouring hours per day.

Fourthly—Your Petitioners likewise pray that your Honorable House will also take into consideration not only the advisability but the necessity of passing a measure which shall recognize and constitute eight hours the maximum of a day's labour wherever practicable in New South Wales; and also of limiting the hours of labour in manufactories and workshops, wherein youth of tender years are compelled to work from twelve to fourteen consecutive hours each day; a practice which, if not checked, cannot fail to undermine the physical stamina of our youth, and, in addition to producing most disastrous results upon the bodily health, must impair and lower the moral habits of those so employed.

Fifthly—Your Petitioners humbly pray and respectfully submit their case to your Honorable House for consideration, in the full belief that the subject matter is one which vitally affects the physical, intellectual, and moral status of the entire population of this Colony, but in an especial degree the welfare of that section of society to which your Petitioners belong.

And your Petitioners, as in duty bound, shall ever pray.

LABOUR BILL OF 1870.

(PETITION—CERTAIN BRICKMAKERS AND INHABITANTS OF ST. PETER'S AND WATERLOO.)

*Ordered by the Legislative Assembly to be Printed, 8 November, 1870.*

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of the Brickmakers and Inhabitants of St. Peter's and Waterloo,—

SHOWETH :—

That at a Public Meeting held at St. Peter's, on October 28th, the following Resolutions were unanimously passed :—

- 1st. That in the opinion of this Meeting, the system of long hours of labour tends to demoralize a people, by incapacitating them from the proper cultivation of their morals and intellectual faculties.
- 2nd. That this Meeting is in favour of eight hours becoming the maximum of a legal day's labour in this Colony, and would therefore urge the passing of the Eight-hour Labour Bill now before the Legislative Assembly; and further, that the Chairman be authorized to sign this Petition on behalf of this Meeting, and the same to be forwarded to the Legislative Assembly of New South Wales.
- 3rd. Your Petitioners having considered the Eight-hours Bill, introduced to your Honorable House by the Hon. J. B. Wilson, on September the 9th, 1870, are of opinion that it will to a great extent carry out the wishes of your Petitioners.

Your Petitioners therefore humbly pray that you will be pleased to pass into law the Bill now before your Honorable House.

And Petitioners, as in duty bound, will ever pray.

Signed on behalf of the Meeting,—

Eight-hour Extension.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of the undersigned Artisans, Manual Labourers, and others of the working population of the Colony,—

SHOWETH:—

1st. That a limited number of your Petitioners have, during thirteen years past, enjoyed the privilege of a eight-hour per day system of labour, with great advantage to their physical health and their intellectual and moral culture.

2nd. That your Petitioners pray your Honorable House to further increase these benefits, by adopting measures for those not in possession of the advantages which have been found to attend the eight-hour system wherever adopted.

3rd. That your Honorable House will in their wisdom adopt the eight-hour system in all public works under the direct control of Government, and that in all future contracts a clause be inserted to secure that object.

4th. Your Petitioners pray your Honorable House to pass a measure which shall recognize and constitute eight hours the maximum of a day's labour wherever practicable in New South Wales, and to restrict the hours of labour in manufactories and workshops, where youths of tender age are employed from twelve to fourteen hours each day, to the injury of their health and the deterioration of their moral habits.

5th. Your Petitioners, in conclusion, pray your Honorable House to take the subject into your serious consideration, in the full belief that it is one vitally affecting the physical, intellectual, and moral status of the entire population of this Colony, but in an especial degree the welfare of that section of society to which your Petitioners belong; and therefore they pray that the Labour Bill now before the House may receive the sanction of your Honorable House; and your Petitioners will ever pray.

(PETITION—ARTISANS AND LABOURERS OF GOULBURN.)

*Ordered by the Legislative Assembly to be Printed, 17 November, 1870.*

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Prayer and Petition of the undersigned Artisans, Manual Labourers, and others of the working classes of Goulburn and its vicinity,—

SHOWETH :—

1st. That a limited number of your Petitioners have during thirteen years past enjoyed the privilege of an eight-hours per day system of labour, although the greater number of your Petitioners are still compelled to toil for a longer period each day than is compatible with their physical health or their intellectual and moral culture.

2nd. That your Petitioners respectfully pray your Honorable House to consider the many beneficial results that have followed the abridgment of the hours of labour, even by a section of the community. And we further pray your Honorable House will take such steps as you may in your wisdom deem most expedient, for the purpose of eliciting the vast amount of moral and social benefits that have accrued to employers as well as employed, wherever the eight-hour system has been adopted.

3rd. 1870.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## MR. AUSTIN FORREST WILSHIRE.

(PETITION.)

*Ordered by the Legislative Assembly to be Printed, 28 September, 1870.*

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of Austin Forrest Wilshire, of Winbourn, Mulgoa, in the Colony of New South Wales, Esquire,—

SHOWETH :—

1. That in the year one thousand eight hundred and five, your Petitioner's late father, James Wilshire, of Sydney, having become the owner of a piece of land situated between George and Pitt streets, near Liverpool-street, Sydney, erected thereon, at a considerable expense, certain plant, machinery, and buildings, for the purpose of carrying on the business of a tanner, fellmonger, parchment manufacturer, soap-maker, and candle-maker.

2. That at that period the locality mentioned was thinly populated, and that the then existing Government, as your Petitioner is informed and believes, gave encouragement to your Petitioner's father in carrying on his business, as instanced by the fact that in consequence of a memorial presented to the Crown by him, the Crown granted to him an additional piece of land in that locality to enable him to carry on the said business.

3. That the said business was carried on on the same premises by your Petitioner's father until his decease, and thereafter by your Petitioner and his late brother, James Robert Wilshire (as devisees under their said father's will), until the year one thousand eight hundred and sixty.

4. That on the eleventh day of October, one thousand eight hundred and forty-nine, a Bill was introduced in the Legislative Council of the Colony for the express purpose of preventing the slaughtering of cattle in the city of Sydney; and that an amendment was made in this Bill (in which form it became law), whereby it was enacted, amongst other things, that any business of a soap-boiler, tallow-maker, tripe-boiler, tanner, or currier, then existing within the limits of the city of Sydney, should not be carried on within the limits of the said city after the first day of January, one thousand eight hundred and sixty.

5. That while the Bill aforesaid as so amended was before the Legislature, your Petitioner and his late brother, foreseeing that their property would be greatly injured by such an enactment, petitioned against the injustice which they conceived would be done to them, such Petition having been presented by Mr. Lowe, now Her Majesty's Chancellor of the Exchequer.

6. That shortly before the said Act came into operation, your Petitioner and his said brother, still suffering under the injury inflicted upon them, petitioned the Honorable the Legislative Assembly, praying that the said Act might be amended so as to exempt tanners and curriers from the operation thereof.

7. That on the death of your Petitioner's said brother, in the year one thousand eight hundred and sixty, his interest in the said land, plant, and machinery, and in the said business, survived to your Petitioner.

8. That in consequence of the passing of the Act hereinbefore mentioned, your Petitioner was obliged to discontinue the said business, which up to that time had been his principal source of income; and the valuable plant, machinery, and buildings, used for carrying on the said business, having become useless to him, he was obliged, at considerable expense and loss, to destroy the same.

9. That the land where your Petitioner's business was carried on had been specially selected for the purposes of the said business, and, except in connection therewith, was not suitable for ordinary building purposes.

10. That under the circumstances hereinbefore stated, your Petitioner was subjected to great pecuniary loss.

11. That on the twenty-second day of March one thousand eight hundred and sixty-five, your Petitioner for the third time petitioned the Legislature for redress, setting forth the facts hereinbefore stated, and humbly praying the Honorable House then existing to take the premises into favourable consideration.

12. That subsequently this Petition was referred to a Select Committee, which Committee, after taking evidence upon the subject, brought up its Report on the eighth of June following, stating that the case of your Petitioner was one that deserved to be taken into consideration by the Government.

13. That on the tenth day of November, one thousand eight hundred and sixty-five, the said Report was adopted by the Legislative Assembly without a division.

14. That in the year one thousand eight hundred and sixty-eight, the Government having placed upon the Estimates the sum of two thousand pounds, as compensation to your Petitioner in respect of the subject matter of his Petition, submitted that sum for the vote of the then existing Assembly, which vote was negatived in a thinly-attended House.

15. That your Petitioner feels aggrieved that, after the Legislature had adopted the Report of a Select Committee recommending the case of your Petitioner as aforesaid, the sum proposed as compensation to your Petitioner should have been refused to be granted to him.

And your Petitioner therefore humbly prays your Honorable House to reconsider the case of your Petitioner, and to take the premises into favourable consideration.

And your Petitioner, as in duty bound, will ever pray, &c., &c.

A. F. WILSHIRE.

1870.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

MR. JOSEPH PALMER ABBOTT.  
(PETITION.)

*Ordered by the Legislative Assembly to be Printed, 3 November, 1870.*

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of Joseph Palmer Abbott, of Murrurundi, in the Colony of New South Wales, Solicitor,—

SHOWETH:—

1. That on the twentieth day of April, A.D. 1835, His Excellency Major-General Richard Bourke, then Governor-in-Chief of the Colony of New South Wales, under his hand and under the Seal of the said Colony, did grant to one Samuel Onions, for and in consideration of the sum of forty-one pounds sixteen shillings, all that piece or parcel of land containing nineteen acres of land, situated in the county of Cumberland and Colony aforesaid, parish of Hunter's Hill, at the entrance of Lane Cove, at the north-east corner of an allotment of 11 acres applied for by C. H. Jenkins, and bounded on the west by that allotment, being a line south seven chains to the Parramatta River; on the south by that river to an allotment of  $8\frac{1}{2}$  acres, applied for by Edwards; on the east by that allotment, being a line west four chains and forty links, and again by a line north, eleven chains to Lane Cove; and on the north by that cove to the north-east corner of the 11-acre allotment applied for by C. H. Jenkins as aforesaid, reserving a road of a chain wide through the centre from the north-east to the south-west, which is exclusive of the quantity, being the land sold as lot 32, in pursuance of advertisement of 14th October, 1834, saving and reserving to His Majesty, amongst other reservations, all land within one hundred feet of high-water-mark on the sea-coast.

2. That the said piece or parcel of land was sold by the said Samuel Onions, and conveyed by him according to the said description as contained in the said grant.

3. That after many sales and conveyances of the said piece or parcel of land according to the said description, the late Mr. John Abbott (the father of your Petitioner) purchased the same from one Adolphus William Young, Esquire, and the same was conveyed to him by the said Adolphus William Young, according to the description contained in the said deed of grant.

4. That on or about the 11th day of November, 1842, the said John Abbott departed this life, having first duly made and published his last will and testament, whereby he devised all his property to his wife and his sons; and under and by virtue of such devise the said piece or parcel of land passed to Frances Amanda Abbott, the widow of the said deceased, and to your Petitioner, and William Edward Abbott and Thomas Kingsmill Abbott, being the sons of the said John Abbott, all of whom, together with the said Frances Amanda Abbott, are still living.

5. That recently the devisees under the said will caused the said piece or parcel of land to be surveyed for the purposes of selling the same, and it was then found that there was a large deficiency in the quantity stated to be granted according to the deed of grant hereinbefore mentioned.

6. That according to the said deed of grant, nineteen acres of land were granted by the Crown; but according to reliable surveys made, there actually exists, according to the descriptions in the said deed of grant, only seven acres and twenty-two perches of land.

7. That the said John Abbott was deceived in his purchase of the said piece of land, by reason of placing reliance upon the correctness of the description contained in the deed of grant duly issued by the Crown.

That your Petitioner therefore humbly prays that your Honorable House will take the circumstances stated in this Petition into your consideration, and do justice in the premises.

And your Petitioner will ever pray, &c.

JOSEPH P. ABBOTT.

22nd March, 1870.

1870.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

---

MR. SAMUEL GORDON.

(PETITION.)

---

*Ordered by the Legislative Assembly to be Printed, 8 November, 1870.*

---

To the Honorable the Legislative Assembly of the Colony of New South Wales, in Parliament assembled.

The Petition of Samuel Gordon, of Newcastle,—

HUMBLY SHOWETH :—

That a few years back some reprehensible traffic was carried on at Newcastle by a revenue officer, in the goods cast ashore from the "Cawarra" steamer; and your Petitioner having inserted a very mild notice of these transactions in one of the local prints, the revenue officer contrived, by the exercise of some influence with the owner or conductor of the paper (but what that influence was Petitioner never could learn, except that he was told some of the boxes of clothes, &c., which came ashore were opened for a particular purpose) to get a counter-notice inserted that the previous one was a falsehood, although one of the transactions to which that first notice referred took place in the presence of hundreds of people on the north shore.

That immediately after, one of the satellites of the revenue officer adopted a practice of following Petitioner through the town, using abusive language to him; and Petitioner observed that although the police were then very active in watching any old apple-woman or others using what they called obscene or indecent language to each other, and bringing them before the Magistrates, they listened with grins and smirks to this person calling Petitioner "a b—— informer."

That Petitioner employed a solicitor in Sydney to deal with the case, and he has had much annoyance and some expense with these parties.

That the practice of revenue officers trafficking on such occasions is calculated directly to involve the lives and properties of Her Majesty's subjects; and he had abundant reason to know that the revenue officer was encouraged in his various proceedings and manœuvres about these transactions, by the parties connected with the revenue department in Sydney.

That Petitioner was so far from wishing to involve the person who followed him through the streets using abusive language, that Petitioner had actually refrained from writing the notice for the newspaper until the traffic had been as it were legalized by sales made by the revenue officer, and when he was at least secure by the fact of such bargains and sales having been made by a person bearing Her Majesty's commission; and he did not even mention his name in the newspaper, nor point to him, nor any other person having those dealings.

That Petitioner even heard the late Sub-Collector of Customs at Newcastle encouraging the person to whom he has referred, by using approving language when the other was using abusive language against Petitioner in his hearing.

Petitioner respectfully submits that it is the duty of the representatives of the people to call those officials to account; and Petitioner therefore prays that your Honorable House may be pleased to inquire into these transactions.

And Petitioner will pray.

SAMUEL GORDON.

1870-71.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

**DENNIS DWYER.**

(PETITION.)

*Ordered by the Legislative Assembly to be Printed, 8 March, 1871.*

To the Honorable the Speaker and Members of the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of Dennis Dwyer, of Wamberall, in the District of Brisbane Water, formerly a Sergeant in Her Majesty's 4th, or King's Own, Regiment of Foot, and late Chief Constable of Gosford,—

MOST RESPECTFULLY SHOWETH :—

That Petitioner arrived in this Colony as a Sergeant in the above Regiment in the year 1832, and was shortly afterwards stationed at Emu Plains, in charge of the ironed gang then employed making the road over Lapstone Hill; and upon his return to Sydney he was appointed by Major England as Stockade Sergeant over the ironed gangs stationed at Carter's Barracks, where he remained until discharged in July, 1837—the said discharge being granted as a special favour for good conduct.

That Petitioner, immediately after his discharge from the Army, was appointed Chief Constable of Gosford and the District of Brisbane Water, which office, in conjunction with those of Inspector of Distilleries, Inspector of Slaughter-houses, and Bailiff of the Small Debts Court, he held for a period of twenty-two and a half years.

That Petitioner was charged before the Bench of Magistrates at Gosford, in the year 1859, with being intoxicated in his own house, and at a time when he had no special duty to perform, and was offered by the President of the Bench, before any hearing of the charge took place, his choice of either tendering his resignation of the offices held by him, or of being dismissed if the charge was found proven against him; the President also informing Petitioner that in the event of his resigning, it was the intention of the Bench of Magistrates unanimously to strongly recommend him to the Government as a fit person for either a pension or a gratuity, on account of his long service and hitherto good conduct.

That Petitioner having previously been injured in the execution of his duty, by being thrown from his horse and trampled upon, whereby he sustained great bodily injury, and being moreover greatly influenced by the promise of the Bench of Magistrates made through their President, did there and then resign the offices held by him, but has not as yet received anything from the Government, although he is certain the recommendation was duly forwarded.

That in consequence of the various injuries sustained by Petitioner in the execution of his duty he is now unable to earn his living as a labouring man, and is consequently in great distress, and humbly begs to lay his case before your Honorable House for consideration. Having faithfully and zealously performed his duty, both as a soldier and a police officer, for a period of thirty-two and a half years, he cannot resist the impression that he has been very hardly dealt with, in being deprived of all reward for such long and arduous services for one single fault (and that one fault not proven against him) committed in the course of a tenure of services extending over half an ordinary lifetime.

That Petitioner prays your Honorable House will take his case into your merciful consideration, and will grant him such relief as to your Honorable House may seem meet.

And your Petitioner, as in duty bound, will ever pray.

DENNIS DWYER.

1870-71.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

MR. JAMES EDWARD WARBY.

(PETITION.)

*Ordered by the Legislative Assembly to be Printed, 2 June, 1871.*

To the Honorable the Legislative Assembly of the Colony of New South Wales, in Parliament assembled.

The Petition of James Edward Warby, of Hay, in the Colony of New South Wales, wholesale wine and spirit merchant,—

HUMBLY SHOWETH :—

That your Petitioner is duly licensed for the sale of spirituous liquors, wholesale, within this Colony.

That he is also the owner of a steamer, the "J. H. P.", plying on the River Murrumbidgee, whereof Mr. Allan Lakeman is supercargo.

That your Petitioner, on or about the seventh day of August, 1870, took and executed an order for a case of gin (containing not less than two gallons), to be forwarded to a Mr. Stratfull, a publican at Narandera, on the Murrumbidgee River, which case was delivered by the said Allan Lakeman, as such supercargo, from the said steamer in an open and public manner.

That for such delivery of spirituous liquor the said Allan Lakeman was, on the 30th day of September, 1870, fined by the Bench at Wagga Wagga in the sum of thirty pounds, which had to be paid by your Petitioner.

That your Petitioner appealed to the merciful consideration of His Excellency the Earl of Belmore, Governor of the Colony, for a remission of the said fine, but the said Bench reported against same.

Your Petitioner therefore humbly prays that your Honorable House will address His Excellency the Governor on your Petitioner's behalf, or that the whole matter may be referred to a Committee of your Honorable House.

And your Petitioner, as in duty bound, will ever pray, &c.

JAMES EDWARD WARBY.

EXTRACTS FROM THE VOTES AND PROCEEDINGS OF THE  
LEGISLATIVE ASSEMBLY.

---

VOTES, No. 9. THURSDAY, 25 AUGUST, 1870.

7. Claims of Mr. Bartholomew Rush ("Formal" Motion):—Mr. Lackey moved, pursuant to amended Notice No. 1 (*Other Business*),—

(1.) That a Select Committee be appointed, with power to send for persons and papers, to inquire into and report upon the claims of Mr. Bartholomew Rush to compensation for damages sustained by him at law as Contractor for the Northern Line of Telegraph Extension from Blacktown Road, *viâ* Wiseman's Ferry, to Maitland and Newcastle.

(2.) That such Committee consist of Mr. Byrnes, Mr. Leary, Mr. Macleay, Mr. Farnell, Mr. Tunks, Mr. Driver, Mr. Egan, Commander Onslow, Mr. Nowlan, and the Mover.

(3.) That the Progress Report from the Select Committee of Session 1867-8, on the same subject, together with the Minutes of Proceedings of, and of Evidence taken before, and papers referred to, that Committee, be referred to this Committee.

And Mr. Morrice requiring that the said Committee be appointed by Ballot,—

Question,—That a Select Committee be appointed, with power to send for persons and papers, to inquire into and report upon the claims of Mr. Bartholomew Rush to compensation for damages sustained by him at law as Contractor for the Northern Line of Telegraph Extension from Blacktown Road *viâ* Wiseman's Ferry, to Maitland and Newcastle; and that the Progress Report from the Select Committee of Session 1867-8, on the same subject, together with the Minutes of Proceedings of, and of Evidence taken before, and papers referred to, that Committee, be referred to this Committee,—put and passed.

Whereupon the House proceeded to the Ballot, and the Speaker declared the following to be the Committee duly appointed:—Mr. Driver, Mr. Egan, Mr. Byrnes, Mr. Farnell, Mr. Lackey, Mr. Nowlan, Mr. Tunks, Mr. Leary, Mr. Macleay, and Commander Onslow.

**CLAIMS OF MR. BARTHOLOMEW RUSH.**

---

---

**REPORT.**

---

THE SELECT COMMITTEE of the Legislative Assembly, appointed on 25th August, 1870, with power to send for persons and papers,—to inquire into and report upon the claims of Mr. Bartholomew Rush to compensation for damages sustained by him at law as Contractor for the Northern Line of Telegraph Extension from Blacktown Road, *viâ* Wiseman's Ferry to Maitland and Newcastle,—to whom was referred, on the same date, the Progress Report from the Select Committee of Session 1867-8, on the same subject, together with the Minutes of Proceedings of, and of evidence taken before, and papers referred to, that Committee, have agreed to the following Report:—

Your Committee have carefully considered the case of Petitioner, Bartholomew Rush, and, after perusal of the evidence given before a former Committee, find that in March, 1859, Petitioner became Contractor for the construction of a Telegraph line from Blacktown Road to Windsor, thence *viâ* Wiseman's Ferry to Wollombi, West Maitland, Maitland, and Newcastle,—the work to be done under the direction of a Superintendent to be appointed for that purpose. That Mr. Mooney was appointed for this purpose.\* That wherever timber was required for the erection of this line it was taken without demur until the line reached the property of Mr. A. W. Scott, at Woodford, near Hexham. That Mr. Mooney, the superintendent, directed the men employed by Petitioner to enter the lands of Mr. Scott, and remove such poles as were required; and it is stated that there was no other place within 20 miles where suitable timber could be procured. Mr. Scott complained of the removal of his timber; but the Superintendent (Mr. Mooney) believing he was justified by the Act of Parliament, 20 Vict., No. 41, being an Act to establish and regulate Electric Telegraphs,† insisted upon having the said trees, in order that the erection of this line of Telegraph might not be delayed. That Mr. Scott thereupon instituted proceedings against Petitioner and Mr. Mooney, the case having been tried at Maitland, in March, 1860, before His Honor Sir J. N. Dickinson, when a verdict was returned for defendants. That a new trial was moved for, and granted, which took place in March, 1861, at Maitland, before Mr. Justice Wise, when a verdict was returned in favour of plaintiff, with £95 damages. That Petitioner's expenses, legal costs, and costs of witnesses must have amounted to a very large sum—Petitioner states upwards of £700.

Your Committee are of opinion that the case of Petitioner is one of great hardship, seeing that the practice had been up to this time to fell such timber wheresoever it was found suitable for the purpose, and the Act before-mentioned furnishing conclusive authority in such cases. They therefore beg to report to your Honorable House that the case of Petitioner is one deserving the favourable consideration of the Government.

JNO. LACKEY,  
Chairman.

No. 3 Committee Room,  
Sydney, 23rd September, 1870.

PROCEEDINGS OF THE COMMITTEE.

WEDNESDAY, 14 SEPTEMBER, 1870.

MEMBERS PRESENT :—

Mr. Lackey,  
Mr. Farnell,

Mr. Macleay,  
Commander Onslow.

Mr. Lackey called to the Chair.

Entry in Votes and Proceedings, appointing the Committee, *read* by the Clerk.  
Committee deliberated.

[Adjourned until Wednesday next, at *Eleven o'clock*.]

WEDNESDAY, 21 SEPTEMBER, 1870.

In the absence of a Quorum the Meeting called for this day lapsed.

FRIDAY, 23 SEPTEMBER, 1870.

MEMBERS PRESENT :—

Mr. Lackey in the Chair.

Mr. Farnell,  
Mr. Byrnes,

Mr. Nowlan,  
Mr. Macleay,

Mr. Egan.

Committee deliberated.

Chairman submitted Report.

Same *read*, as follows :—

“YOUR Committee have carefully considered the case of Petitioner, Bartholomew Rush, and after perusal of the evidence given before a former Committee, find, that in March, 1859, Petitioner became Contractor for the construction of a telegraph line from Blacktown Road to Windsor, thence *via* Wiseman's Ferry to Wollombi, West Maitland, Maitland, and Newcastle, the work to be done under the direction of a superintendent to be appointed for that purpose. That Mr. Mooney was appointed for this purpose.\* That wherever timber was required for the erection of this line it was taken without demur until the line reached the property of Mr. A. W. Scott, at Woodford, near Hexham. That Mr. Mooney, the superintendent, directed the men employed by Petitioner to enter the lands of Mr. Scott and remove such poles as were required, and it is stated that there was no other place within 20 miles where suitable timber could be procured. Mr. Scott complained of the removal of his timber, but the superintendent (Mr. Mooney) believing he was justified by the Act of Parliament 20 Vict., No. 41, being an Act to establish and regulate Electric Telegraphs,† insisted upon having the said trees, in order that the erection of this line of telegraph might not be delayed. That Mr. Scott thereupon instituted proceedings against Petitioner and Mr. Mooney, the case having been tried at Maitland, in March, 1860, before His Honor Sir J. N. Dickinson, when a verdict was returned for defendants. That a new trial was moved for and granted, which took place in March, 1861, at Maitland, before Mr. Justice Wise, when a verdict was returned in favour of plaintiff, with £95 damages. That Petitioner's expenses, legal costs, and costs of witnesses must have amounted to a very large sum—Petitioner states upwards of £700.

“Your Committee are of opinion that the case of Petitioner is one of great hardship, seeing that the practice had been up to this time to fell such timber wheresoever it was found suitable for the purpose, and the Act before-mentioned furnishing conclusive authority in such cases. They therefore beg to report to your Honorable House that the case of Petitioner is one deserving the favourable consideration of the Government.”

Question proposed,—That the Report, as *read*, be the Report of this Committee.  
Committee divided.

NEW SOUTH WALES.

## AGENCY OF THE COLONY.

(LETTER FROM COLONIAL TREASURER TO MESSRS. LLOYD, BELLBY, &amp; CO., UPON THEIR RESIGNATION.)

*Ordered by the Legislative Assembly to be Printed, 21 October, 1870.**[Laid on Table in accordance with answer to Question No. 2, in Votes and Proceedings No. 38, Wednesday, 19 October, 1870.]*

THE UNDER SECRETARY FOR FINANCE AND TRADE TO MESSRS. LLOYD, BELLBY, &amp; CO., LONDON.

The Treasury, 12th January, 1860.

GENTLEMEN,

I have the honor to acknowledge receipt of your letter, dated London, 18th November, 1859, and in reply am directed to inform you that the Postage-plate mentioned therein has been duly handed over by Messrs. G. A. Lloyd & Co., of this City.

I am also instructed to state that it affords the Treasurer much pleasure to observe the satisfactory result of your account with this Government, on the 17th November last, as exhibited in the account current forwarded by you.

I am to take the opportunity of conveying to you Mr. Samuel's approval of the business-like manner in which the Commercial Agency has been conducted by you, and at the same time to express his regret that the connection between the Government and your house should have necessarily terminated so abruptly.

I am requested by Mr. Samuel to return you his thanks for your offer to render to your successors in the Agency (Messrs. Willis, Merry, & Co.) any co-operation and advice that they may stand in need of.

I have, &amp;c.,

HENRY LANE,

Under Secretary.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## THE FIJI ISLANDS.

(PROPOSED ANNEXATION OF, TO NEW SOUTH WALES—PETITION—REV. J. D. LANG, D.D.)

*Ordered by the Legislative Assembly to be Printed, 27 September, 1870.*

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of John Dunmore Lang, Doctor of Divinity,—

HUMBLY SHOWETH:—

1. That the Fiji Islands—one of the groups of the Western Pacific Ocean—have for years past, but especially of late, been attracting much attention on the part of the inhabitants of the Australian Colonies, as being a peculiarly eligible field for commercial enterprise, as also for the settlement of a people of British origin for the growth of intertropical productions, the land being exceedingly fertile, and the climate highly salubrious.

2. That the estimated area of the Fiji Islands is forty thousand square miles, that is, considerably larger than the Kingdom of Portugal, and one-third larger than Scotland; while the white population, which consists chiefly of emigrants from the Australian Colonies, with about one-fourth of the whole number Americans and Germans, is now rapidly increasing, and already amounts to nearly three thousand souls; the natives, who are of the Papuan negro type, being roughly estimated at two hundred thousand.

3. That the exports of the Fiji Islands, consisting principally of Sea Island cotton of the first quality, are estimated at eighty thousand pounds sterling for the present year, while the imports, chiefly British goods and manufactures, are of considerably larger amount; the Islands in question thus presenting a field of indefinite extent for the growth of the great staple of the manufactures of England, and a highly promising market for her trade and commerce.

4. That the Fiji Islands are at present held by a number of petty chiefs, all of whom exercise sovereign and irresponsible power in their own limited districts, there being no lord paramount or king, to whom other chiefs of inferior position could ever be expected to yield submission.

5. That although the natives of these Islands are generally well-disposed towards white men residing among them, such a state of things as this condition of the Islands implies must necessarily lead to occasional if not frequent acts of aggression, violence, and bloodshed, together with much lawlessness, social injustice, and irremediable wrong-doing, while it has actually given rise to an earnest desire in both classes of the population for the establishment of a regular Government in the Islands by some civilized nation.

6. That Her Majesty's Government having declined, about ten years since, although strongly solicited by the native Chiefs, to annex the Fiji Islands as a British Colony, and being now still less likely to do so after the recent withdrawal of the Imperial Troops from the Australian Colonies and New Zealand, these Islands are liable at any moment to be seized and annexed by some sovereign power in Christendom other than Great Britain, proposals having been actually put forth by interested parties in the Islands, for their annexation either to the United States or to the North German Confederation.

7. That the occupation of the Fiji Islands by any foreign power in Christendom would be exceedingly detrimental to British interests in the Pacific Ocean, as well as calamitous in a very high degree to this Colony, with which from its geographical position and vicinity to the Islands, as well as from the common origin of their European inhabitants, these Islands will always be intimately connected.

8. That in the opinion of your Petitioner, there is ample and sufficient authority for annexing and re-establishing a regular Government in the Fiji Islands as a dependency of New South Wales, in the Commission issued by the Imperial Government to Captain Arthur Phillip, R.N., the first Governor of this Colony, in the year 1787; that Commission defining the territories over which Governor Phillip and his successors were to exercise jurisdiction, as extending from Cape York in latitude  $11^{\circ} 37'$  south, to the South Cape in latitude  $43^{\circ} 30'$  south, and inland to the westward as far as  $135^{\circ}$  east longitude, *comprehending all the Islands adjacent in the Pacific Ocean, within the latitudes of the above-mentioned Capes.*"

9. That the only Island adjacent in the Pacific Ocean that was ever taken possession of and annexed under this Commission, till a comparatively recent period, was Norfolk Island, which was occupied and settled by the Governor in the year 1788, immediately after the founding of this Colony.

10. That in the year 1837 a Company, of which the late Earl Durham was Chairman, having been formed in London, for the colonization of New Zealand, a Bill with that object was submitted to the Imperial Parliament in the year 1838, but that Bill was successfully opposed and thrown out, through the adverse influence of the Church of England and the Wesleyan Missionary Societies, who alleged that colonization of New Zealand would be disastrous and ruinous to their missions in that Island, as also to the natives themselves, and that the Colonial Office, in the persons of Lord John Russell and his successor the Marquis of Normanby, was strongly opposed to the measure.

11. That your Petitioner having arrived in England from New South Wales shortly after the rejection of the New Zealand Company's Bill, and having touched at that island on his way thither, published a pamphlet in London entitled, "New Zealand in 1839," in which, while he strongly recommended the immediate colonization of New Zealand by Her Majesty's Government, as a measure of urgent necessity at the time, he also proved, not only to the satisfaction of the New Zealand Company, but to that even of the Colonial Office, that no Act of the Imperial Parliament was necessary in the case, that the original Commission of 1787 was then still in force, and that New Zealand could therefore be colonized at once under that Commission, as a dependency of New South Wales.

12. That all this was done accordingly, the Marquis of Normanby being reluctantly obliged, through the pressure of the New Zealand Company, to authorize the Governor of New South Wales, in the year 1840, to take the requisite steps for annexing New Zealand, and setting up a regular Government in the Island as a dependency of New South Wales, in virtue of the original Commission addressed to Captain Phillip, the first Governor of this Colony, of date 1787.

13. That this Commission is still in force, and has never been either abrogated or repealed, although certain portions of the territory which it originally included have since been disjoined from New South Wales, and constituted separate Colonies, by the Imperial Government, viz.:—Van Diemen's Land or Tasmania in the year 1824, South Australia in 1837, Victoria in 1851, and Queensland in 1859; these Colonies having therefore no rights to plead under the Commission of 1787—all such rights being now vested in the Government of New South Wales.

14. That the Fiji Islands group being *islands adjacent in the Pacific Ocean, within the latitudes of the above-mentioned Capes*, that is, Cape York and the South Cape, may therefore be taken possession of at once by the Government of New South Wales, without any fresh authority from the Imperial Government, all the territorial rights of the Crown having been formerly ceded to New South Wales by the Constitution Act of the Imperial Parliament, in the year 1855.

15. That the annexation of these Islands to New South Wales, and the setting up of a regular Government in the group, under the Commission of 1787, would not only be a measure of great commercial importance, but one of equity and justice to this Colony, as it has only been through the expenditure of British money in New South Wales, and the efforts and enterprise of the people of this Colony for the last eighty years and upwards, that the colonization of any Islands in the Pacific Ocean has been rendered at all practicable for any Power in Christendom.

16. That the waste lands of the Fiji Islands, if duly administered by a regular Government assuming the right of pre-emption over all future purchases of lands from the natives, and establishing a Court of competent jurisdiction to investigate and decide upon all alleged past purchases, besides ensuring a sufficient extent of eligible land for the natives, and protecting them in the enjoyment of their possessions against the cupidity and chicanery of unprincipled Europeans, would form an eligible field for the settlement of tens of thousands of the redundant population of the Mother Country, and secure us an ample security for whatever funds might be required in the first instance for their importation.

17. That, in the estimation of reputable persons, well acquainted with the condition and prospects of the Fiji Islands, the European inhabitants of these islands would be both able and willing to defray the whole cost of a regular Government, so as not to subject this Colony to any expense whatever, either for the erection of such a Government or for its future maintenance and support.

18. That the natives of the Fiji Islands being scattered, for the most part, on a number of moderately sized islands, under their respective Chiefs, are incapable of combining like the Maories of New Zealand in any common effort against Europeans, and that there is therefore no likelihood of any war with the natives, especially under a Government that would do them justice, and recognize and respect their rights.

Your Petitioner therefore humbly prays that your Honorable House will take this matter of extreme urgency into your consideration, and do whatever in your wisdom may facilitate the establishment of a regular Government in the Fiji Islands, as a dependency of New South Wales.

And your Petitioner, as in duty bound, will ever pray, &c., &c.

JOHN DUNMORE LANG, D.D.

Sydney, 22nd September, 1870.

1870-71.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

---

**THE FIJI ISLANDS.**

(PETITION—WILLIAM NEILL, J.P., CHAIRMAN OF PUBLIC MEETING OF CITIZENS OF SYDNEY.)

---

*Ordered by the Legislative Assembly to be Printed, 26 April, 1871.*

---

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the undersigned, the Chairman of a Public Meeting of the Citizens of Sydney, assembled on the invitation of the Right Worshipful the Mayor, on the 13th April, 1871,—

HUMBLY SHOWETH :—

1. That the Fiji Islands, one of the largest groups of the Western Pacific, situated between the fifteenth and twentieth parallels of south latitude, have, within the last few years, become a peculiarly interesting field for commercial speculation, as well as for agricultural settlement to the Australian Colonies generally, but especially to the City of Sydney as the head quarters of their trade; the white population of the group, which consists almost exclusively of British subjects, although including a few Germans and Americans, being now rapidly increasing, and already numbering upwards of three thousands souls, while the native population is variously estimated at from a hundred to a hundred and fifty thousand.

2. That the political condition and prospects of these Islands are at present exceedingly unsatisfactory, and a source of much anxiety to the well-wishers and promoters of Christian civilization in the Pacific Ocean, there being no provision for the administration of justice either among the white population, or between them and the native inhabitants, while Her Majesty's Government having declined to proclaim the Fiji Islands a British Colony, notwithstanding the earnest desire of their principal inhabitants, both native and European, they are liable, at any moment, in the event of any disturbance or civil war among the natives themselves, to be annexed by any maritime power other than Great Britain, a consummation which, in the opinion of your Petitioner, would be detrimental in a very high degree to British interests throughout the Pacific Ocean; but more especially to the interests of all these Australian Colonies, in view of the immediate establishment of a line of mail steamers between Sydney and San Francisco, for which the Fiji Islands will be the principal station in the Southern Pacific.

3. That recognizing it as a principle of Imperial policy that no British subjects can found any Colony or Colonies without the express authority of the Crown, your Petitioner would most respectfully submit that, in view of the actual state of the Fiji Islands, as well as the Isles of the Western Pacific generally, such a modification of this principle as would enable the Government of New South Wales to make the requisite arrangements for establishing the administration of justice in these Islands, but so as not to subject the Imperial Government to any responsibility or expense in carrying out such arrangements, is at present a matter of absolute necessity.

Your Petitioner would therefore humbly pray that your Honorable House will be pleased to bring this matter of peculiar urgency under the notice of the Imperial authorities, that the requisite measures may be taken for the establishment of the administration of justice in the Fiji Islands, and that British and Australian interests throughout the Pacific Ocean may thereby be conserved and maintained.

And your Petitioner, as in duty bound, will ever pray.

(Signed)

WILLIAM NEILL, J.P.

1870-71.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## BOTANIC GARDENS.

(REPORT ON PRESENT CONDITION OF ESTABLISHMENT.)

Ordered by the Legislative Assembly to be Printed, 31 May, 1871.

THE DIRECTOR OF THE BOTANIC GARDENS TO THE UNDER SECRETARY FOR LANDS.

Botanic Gardens,  
Sydney, 24 May, 1871.

SIR,

I have the honor to submit a General Report on the present condition of this establishment, in which attention is specially directed to the more recent alterations and improvements made in the Gardens and Domains.

## THE UPPER GARDEN.

The arrangement of the grounds for the most part by straight walks and square divisions is such as to preclude any very effective change being made in its general appearance. The efforts lately made to improve this part of the Garden have been mainly confined to enriching the beds with fresh soil, obtained from Hyde Park and the University Paddocks, to the removal of unsightly or useless plants, and to replacing these by new, rare, or more beautiful kinds, obtained in exchange from various quarters of the World. By this means a general improvement in appearance has been effected, and the interest of the Garden greatly increased. This Garden, being the oldest and best protected, contains the greatest number of species; and as every part is thickly planted, a very large number of the Natural Families of Exogens are here represented by many of their most beautiful members. Some of these which are of a robust habit have unfortunately to be restricted in their growth, and in some instances have had to be removed altogether; otherwise they would have occupied too much space, and robbed the smaller plants of their proper nourishment. This cause has led to the removal, from time to time, of many old plants of large growth, which have now representatives in the Lower Garden, where they can have more spaces. The two largest trees of the Norfolk Island Pine (*Araucaria excelsa*), situated in the centre of the grounds, do not appear to affect any of the plants growing near them, although they are the largest and oldest of the trees, and are really magnificent specimens—doubtless the finest by far of any in cultivation. Both are said to have been planted in 1818. The one in the centre of the main walk, which has of late years scarcely increased in height, has greatly improved in appearance by the growth and increase of its lateral branches; the other, growing near it, is not so well furnished, but has steadily advanced in height, and is now 120 feet high.

In the border next to the wall, the soil of which was specially prepared, a large number of rare and beautiful Rhododendrons was planted; but notwithstanding every care taken of them, nearly all the kinds have perished, although the situation is the most shaded and coolest of any that could be selected for them. This failure is much to be regretted, as when in flower they are the most charming description of plants. Many of the species and varieties which perished here have been grown with advantage in some of the gardens near the city, where the soil is of a boggy or stronger kind. Azaleas, however, which are very nearly allied to the Rhododendrons, and require the same soil and treatment, succeed admirably here, and flower every year most profusely.

On the western side, usually denominated the "Old Garden," the system of straight walks has been departed from, and the grounds laid out into more irregular forms. Advantage has been taken of this to group together plants having the same general character or properties. On the upper side of the main dividing walk, there are fine examples of some of the trees which constitute the brush or jungle forests of our Coast Districts, collected and planted here principally by my predecessors, Cunningham and Fraser. Among these are the first discovered plants of some now very widely distributed and well known trees, viz., the "Silky Oak" of colonists (*Grevillea robusta*), and the so-called "Moreton Bay Pine" (*Araucaria Cunninghamii*), and others. Adjoining these are some fine Proteaceous trees, principally *Rhopalos* from S. America, and *Banksias*, *Stenocarpus*, *Helicia*, and *Hakea*, natives of this Country. On the other or northern side is a small group of *Abies*,—a class of Conifers which as a rule do not succeed well in this Garden.

Garden. The largest and oldest of these, planted about fifteen years ago, are not more than about 15 feet high; *A. Khutrow*, *A. Smithiana*, and *A. orientalis*, being the best examples. Several species of the genus, although tried in various parts of the Garden, grow very slowly or perish soon after being planted out. These last nearly all belong to the *Picea* section. The Japanese species seem better suited for our climate; *A. yezoensis* and *A. firma* having grown very freely,—a plant of the former being now 25 feet high, and beautifully furnished. This was planted out about seven years ago. The *Dammara*, another and a noble genus of Conifers, growing near to these on the side nearest to the creek, form a very fine group. With one exception (*D. macrophylla*, indigenous to Vanicola or La Pérouse Island), all the known species of the genus are here represented; *D. robusta*, from Queensland, and *D. Moorei*, from New Caledonia, showing the greatest luxuriance of growth. Both of these were planted in the same year,—1853; the former being now 53 feet high, and the latter nearly the same height. In the centre of this part of the Garden is a collection of Palms, which give a very pleasing effect, and are perhaps the most attractive feature of any part of the grounds. The first plantation of these was made in 1862, and nearly all were of the more hardy kinds. These succeeded so well that about two years ago an adjoining portion of ground was cleared and well trenched, the natural soil, which is of a very sandy character, being well mixed with town manure and vegetable mould. In this a new plantation was made of other and more tender kinds. Most of these have grown sufficiently well to prove that they will stand exposure without any protection. The only failures, have been species from Assam and the warmer parts of India. Among the exotic kinds, the most successful have been *Cocos plumosa*, several species of *Phœnix*, *Areca madagascariensis*, *Livistonia olivæformis*, *Latania Borbonica*, *Areca rubra*, *Elais guineensis*, *Caryota urens*, *Hyphorbe indica*, *Chamærops martiana*, and *Copernicia cerifera*.

Near the gate going out to the Lower Garden, as much ground as could be spared for the purpose has been lately cleared and planted, the one side with a selection of plants valuable for their commercial products, and the other with plants having medicinal properties. Of neither class is the collection yet extensive; but as other kinds of each description are procured, they will be added, and will eventually prove a source of great interest to the public.

#### THE LOWER GARDEN.

This Garden is now almost as complete as it can be made at present. Within the last few years, by extension and by the necessary alterations of boundary, such improvements have been effected in the grounds as to render them as diversified in character, and as picturesque in appearance as those of any public establishment of the kind in this or, perhaps, any other part of the World. Originally of a barren, undulating, rocky nature, advantage has been taken of the irregularities of surface, by quarrying away rock, by the introduction of large quantities of fresh soil, and by judicious planting, to create throughout the whole extent features of the most pleasing description. This has required a lengthened period of time and an immense amount of labour to accomplish. Unlike the Upper Garden, with its straight walks and regular compartments, every part of this is laid out in a more or less irregular form, clumped with plantations, with the larger growing trees dotted over the extensive lawns, composed of the "couch" of colonists (*Cynodon dactylon*), or the "buffalo-grass" (*Stenotaphrum glabrum*), which, for compactness of growth or beauty of appearance cannot be surpassed. This, the more modern method of laying out grounds, readily admits of new plantations being formed for the accommodation of new plants, as the collection increases, as well as other improvements being made, without injury to existing trees or affecting the general character of the Garden. The principal alterations recently made have been continuations and completion of the borders on both sides of the walk formerly the road which divided the two Gardens, extensions of the plantations near the Sun-dial, and the relaying out of the upper part of the Garden near the Eastern Lodge, by the formation of new walks and plantations. Previously this immediate locality was rather unsightly and barren, in consequence of its rocky nature; now it is one of the most beautiful parts of the Garden.

At the western end, near the Bathing-house, the sea-wall has been raised by about 4 feet above the surface for a distance of 130 yards, as a protection against the strong north-easterly winds, which had a most blighting effect on all kinds of vegetation in this very exposed situation. This, together with the extension of the main walk to the extreme end, as well as the levelling and top-dressing the ground adjoining, has given this end of the Garden that finished appearance which it much required. These alterations will be more clearly understood upon reference to the accompanying plan, on which they are indicated by green colour.

The reclamation of ground from the Cove, now in progress, has proved a most tedious work, and is in its present condition very unsightly. It will yet take a very considerable time to fill in the entire space enclosed; and, when this is accomplished, the labour of preparing the ground for planting will be far greater than any similar work hitherto done here. The material with which the reclamation has been made is generally of the worst description, and very unsuitable for cultivation. Stiff blue clay from the bottom of Darling Harbour, and shell *débris*, forming at least three-fourths of the whole. In the ground formerly reclaimed from the Cove, and now one of the most ornamental parts of the Garden, the soil was nearly all pure silt deposited from the sewers, rich in some respects, and easily worked into condition. As yet very little silt of this kind has been sent here, the greater part being taken out to sea, which is much to be regretted, as it is almost the only stuff taken up by the dredge that can be readily rendered fit for the growth of plants. In the absence of this, the only way by which the poor material now being employed in reclamation can be made suitable for garden purposes will be, to largely incorporate it with street sweepings or with manure, of which a constant supply may be obtained, should the proposition of bringing the manure and other refuse from the Abattoirs to the Garden be carried into effect.

Both Gardens have suffered greatly by the late and former heavy rains of the past season: much soil has been washed from the beds occupying the more sloping positions, and the walks greatly denuded of their gravel, and in many places deeply furrowed by the action of the water. To replace the soil, and provide suitable materials for the walks and put them again into good condition, will require a considerable outlay of money, as well as much time and labour. Every effort will be made, however, to accomplish these objects without seeking for any addition to the sum originally proposed for the ordinary maintenance of the Garden.

By the accession of the grounds (about 5 acres in extent) formerly attached to Government House as a kitchen garden, an additional annual expenditure of at least £100 has been incurred. At present this garden is used as a nursery, and for growing greenstuff for the animals and birds now in the Garden;

Garden; but should it be considered advisable to turn it into a more integral part of the Botanic Gardens, a large expenditure will first have to be made in the preparation of the soil and proper formation of the grounds; and when complete in this respect, the expense of maintenance will necessarily be increased.

Although the climate and sheltered position which the Garden occupies permit of a most varied collection of plants being cultivated in the open air, yet there are many most interesting kinds which cannot be grown with success. Most of the tropical fruits have been repeatedly tried, and very many failed, as, for instance, nearly all the *Anonas*, or "custard-apples," the "breadfruit," and "jackfruit," two species of *Artocarpus*, the "alligator pear" (*Persca gratissima*), the "Durian" (*Duria zibethinus*), the "mangosteen" (*Garcinia mangostana*), the "cashew-nut" (*Anacardium occidentale*), the "Brazil" or "Paranut" (*Bertholletia excelsa*), and others. A similar want of success has attended the attempt to grow the "Gutta percha" (*Isonandra gutta*), the "nutmeg" (*Myristica moschata*), the "clove" (*Caryophyllus aromaticus*), &c. To illustrate these and a vast number of other plants of a similar character, a large Conservatory is much to be desired, as the present accommodation for plants of a tender nature is exceedingly limited. The Glass-house and the fine collection of plants lately presented by T. S. Mort, Esq., will prove a great acquisition in this respect, but its size will not be sufficient for plants of a large growth, and a house of much greater dimensions will be still urgently required.

Sugar having now become an important product in the Colony, considerable attention has been devoted to the introduction of sugar-cane from various countries, with the view to obtaining the kinds most suitable for cultivation in this Country. Mr. John Caldwell, the Agent for the Mauritius Government, lately on a visit here, contributed many fine varieties from New Caledonia and Tahiti. The Colonial Sugar Company, through Mr. Melmoth Hall, sent a large number of different kinds obtained from Java and adjoining islands, and all the sorts exhibited by Mr. Walter Hill, of the Brisbane Botanic Gardens, at the last show of the Agricultural Society, have been procured from that gentleman. All these and the cane previously in the Garden form a rather extensive collection, and a further addition is shortly expected from Jamaica and other islands in the West Indies. Mr. Melmoth Hall has done a very important service in supplying examples of the cane grown in the various localities in the Northern Districts, with the names attached, in every instance, by which they are known, in order that hereafter, when fully established, a proper description of each may be given, and a general nomenclature arrived at, as well as the exact number of kinds ascertained; it being well understood that the same kinds of cane are now in cultivation under two or more different names.

Silk, another valuable product, may, with a little encouragement, soon become one of very general interest and importance to colonists. Throughout the length and breadth of the land, the various kinds of mulberry—the principal food of the silkworm—may be cultivated with the most perfect ease and success. No climate can be more suitable than this for the growth of these trees, and, once established, they may be considered as permanent. There are now in this collection, in addition to the common black mulberry (*Morus nigra*), six varieties of the white (*Morus alba*), cuttings of all of which will be distributed to the public on application.

The Aviary continues to be a source of much attraction to visitors. It has, however, been found to be expensive and difficult to keep up the interest of the collection, in consequence of the losses sustained by deaths and the mysterious disappearance of some of our rarest native birds. Donations to this department have been of late comparatively few, although in exchange donors are entitled to such plants as can be spared. Under the circumstances, resort has been had to purchasing, from dealers and others, such birds and animals as might be required—otherwise the collection would have dwindled down to perfect insignificance. The more recent donations, for which thanks are due, have been, viz. :—

| 1 white hawk, by Mr. Graigg.                           | 4 black ducks, by do.                        |
| 1 king quail, by Mr. J. Algar.                         | 1 golden pheasant, by Mr. Edward Lee         |

During the past year the Garden has been enriched by the introduction of a vast number of new and rare plants, which have been contributed from Europe, Africa, India, the neighbouring Colonies, and other Countries. Special mention may be made of those from Dr. Hooker, C.B., Royal Botanic Gardens, Kew; Dr. Moore, Royal Botanic Gardens, Dublin; Messrs. Veitch, nurserymen, London, who, as usual, have been most liberal; Mr. A. Henderson, nurseryman, London; Mr. J. C. Schmidt, and Messrs. Haage and Schmidt, Erfurt, Prussia; Dr. Reichenbach, Botanic Gardens, Hamburg; Mr. A. Dallièrè, Ghent, Belgium; Mr. McKen, Botanic Gardens, Natal; the Superintendent, Botanic Gardens, Cape Town; Mr. Clarke, Botanic Gardens, Calcutta; Dr. Thwaites, Botanic Gardens, Ceylon; Dr. Schœffer, Botanic Gardens, Java; Mr. C. M. Ware, Japan; Dr. von Mueller, Botanic Gardens, Melbourne; Mr. Brunning, nurseryman, Melbourne, Mr. Abbott, Botanic Gardens, Hobart Town; Dr. Schomburgk, Botanic Gardens, Adelaide; Mr. Hill, Botanic Gardens, Brisbane; the Rev. Mr. Whitmere, Tonga Island; and the Rev. Mr. Baker, Samoa Island.

Valuable additions continue to be made to the Library, which now contains many of the best standard works on Botany, and also to the Herbarium. Both of these afford a ready and most useful means of reference to those who desire to consult them.

The condition of nearly all the buildings connected with this establishment is a subject which requires the early and best consideration of the Government. The office or library, the quarters of the Bailiff and Propagator, adjoining the store rooms, the Overseer's house, and even that in which I reside, are all unsightly. With the exception of the latter, all are old, badly built, in wretched condition, damp, most unhealthy, and quite unworthy of the place. To level every one of these with the ground and replace them by others more suitable, in better positions, and lay out the ground which they now occupy in an ornamental manner, are works which urgently require to be done, and which doubtless the public would view with the utmost satisfaction.

#### THE DOMAINS.

There are now very nearly four miles of carriage roads, and upwards of four miles and a half of footpaths, in the Domains. To keep all these in proper condition requires constant supervision and a large expenditure of money. Formerly the carriage roads were repaired by means of gravel, obtainable in the Outer Domain, and the ground excavated for this purpose filled in with town refuse, which soon becomes covered with a thick coating of grass, and in time makes excellent soil for plantations. There is now very little good gravel to be procured, and such as remains is required for the footpaths, and for blending blue metal now used for the repair of carriage roads instead—a much more expensive but a far more suitable material. Much extra labour has been expended lately in bringing all these roads into as nearly as possible one uniform width, and new side footpaths made when practicable. This work could not, however, have been performed without an enormous outlay, but for the kindness of the late and present Mayor of the city, both of whom directed that the greater portion of street sweepings and other town rubbish should be carted into the Domain and deposited wherever it was wanted, without any charge. In addition to filling up hollows on the road-sides, this town stuff has been largely used for covering many bare rocky places, particularly near Mrs. Macquarie Point, opposite to the eastern and main entrances to the Garden, and the slopes facing Woolloomooloo. In the Inner Domain a very great quantity was trenched in with the ordinary soil, and with excellent effect, in sloping off the ground facing the Lower Garden, where, during the early part of last year, some thousands of tons of rock were quarried, in order to carry out the improvements which were so much required in this part of the Domain.

The native trees, mostly Eucalypts and Banksias, which a few years ago grew so thickly in all parts of the Domains, are fast disappearing from natural decay. However much the loss of these trees is to be deplored, there was no means of saving them. To replace these by others of more permanent growth has been an object steadily held in view for some years past. Towards this end, new plantations have been made, and isolated trees planted in situations where they would be likely to succeed; and unless this be continued, the Domains will not possess that shade so desirable in this climate, nor present that ornamental appearance which would naturally be expected in a place of such great public resort.

I have the honor to be,

Sir,

Your most obedient servant,

CHARLES MOORE,

Director.

## IMPORTATION OF FRUIT TREES.

### No. 1.

THE DIRECTOR OF THE BOTANIC GARDENS to W. TUNKS, Esq., M.L.A.

Botanic Gardens,  
Sydney, 27 August, 1866.

SIR,

A proposition has been made that I should take charge of and arrange the products of this Colony, at the ensuing Paris International Exhibition. In the event of this being finally approved of, I shall proceed to Europe about the latter part of the year; and while there, it has occurred to me that it might prove of much advantage to this Colony, but more particularly to very many of your constituents, if I were to visit Portugal, where the orange is most extensively cultivated, and inquire into its management, and especially to learn if the plant there suffer from any similar or analogous forms of disease to those with which it is affected in this country, and to make an early report to this Government on the subject. With this object in view, I have thought it right to address you, both as Chairman of the Select Committee on the Orange Disease, and as representative of the largest growers of that fruit in this Colony; in order that, if you consider such an inquiry as that suggested advisable, you will on public grounds move the Government to authorize me to make it.

I have, &c.,  
CHARLES MOORE.

The instructions given by the Government to the Director of the Botanic Gardens were verbal, and strictly in accordance with the proposition contained in that gentleman's letter to the Chairman of the Select Committee on Disease in Fruit Trees.

### No. 2.

#### STATEMENT OF THE NUMBER AND DESCRIPTION OF FRUIT TREES RECEIVED AT THE BOTANIC GARDENS.

The fruit trees received from Senhor José Do Canto were different kinds of oranges, forty-seven plants of which reached this Colony alive. They arrived in August, 1868, but not in a sufficiently healthy state for being propagated, and were not increased in number while in the Botanic Gardens. As soon as they were strong enough for removal, they were divided into two lots, and distributed, by giving one lot containing the largest number of plants to James Pye, Esq., of Rocky Hall, Parramatta, and the other to the Hon. the Speaker. The original plants are therefore in the possession of these gentlemen, to whom they were given on the distinct understanding, in both cases, that any person desirous of scions of any of the kinds would be entitled to obtain them on application. This arrangement was made with the entire approval of the then Minister of Lands, W. Forster, Esq., in consequence of it being well known that orange-trees do not succeed well in the Botanic Gardens.

Mr. Moore's expenses, while engaged in the Orange inquiry were £92 10s. There was no expense connected with the importation of the oranges into this country, the plants having been carried free.

### No. 3.

The plants sent in exchange to Senhor José Do Canto were,—

<p>Calamus australis Palm (from Port Denison) Echinocarpus australis Croton sp. (from N. Caledonia) Capparis mitchellii Gardenia chartacea, v. latifolia Sloanea australis Dammara, sp. (from N. Caledonia) Cupania xylocarpa Acmena elliptica Araucaria intermedia Podocarpus sp. (from N. Caledonia) Sterculia lurida Flindersia oxleyana Botryodendron latifolium Gardenia chartacea (2) Croton sp. (from N. Caledonia)</p>	<p>Alstonia sp. (from Queensland) Sterculia quadrifida Scelopora brownii Helicia youngiana Memecylon sp. Aehras australis Macrozamia denisonii Oxera pulchella Ackama hillii Cupania anacardioides Tarrictia carronii Cargillia pentamera Pisonia grandis Panax colensoi Tarrictia actinodendron Kentia gracilis.</p>

## No. 4.

SEÑOR JOSE DO CANTO to THE DIRECTOR OF THE BOTANIC GARDENS.

"WITH regard to the disease of the orange in the Azores, I am enabled from personal observation, to give you some information. The disease was first observed in our gardens about the year 1836, but it is probable that for a year or two previous it must have been not inactive, inasmuch as the consequences we then observed were very general and disastrous. At first we noticed that our orange trees were dying one after another, and were wholly unable to divine the cause; ere long, we found it was our best and oldest trees that were thus disappearing. At that time we had trees producing from 6,000 to 20,000 oranges a year,—trees that were as much as 200 or 300 years old. By degrees we began to observe that all the trees affected with the disease produced a very large crop exactly in the year the disease manifested itself; that the leaves became yellowish, and fell off in great quantities; and that on the trunks or stems near the ground (and sometimes beneath the ground) the bark opened, and drops of a kind of yellow gum exuded. As this last-named fact was in all cases observable where the trees were so diseased, and as the drops of gum took the shape of *tears* (*lagrimas* in Portuguese) the disease was called by us the "*Lagrima*,"—the name by which it is still known amongst the Portuguese orange-growers. At first many orangeries were quite destroyed and had to be replanted, so that a remedy for so great a misfortune was most earnestly sought for. Opinion as to the cause of this disease was very much divided. Many thought it must be that the orange tree had but a limited period for its existence, and that this limit being reached the tree must naturally decay. As the only way which we then had for propagating orange trees was by layers, we thought that the proposed explanation was not an unreasonable one; but later it was found that new *seedlings* were attacked in the same way, although not with so much violence. Then again, others thought that it must be something in the atmosphere which prevented the free circulation of the sap and other fluids, and supposed that this must be the origin of the disease. The great point, of course, was to find an easy and practical mode for remedying the evil. Gradually, after repeated trials, we found that superabundance of moisture in the soil was one of the worst conditions for the disease, and every kind of drainage was the best way for improving the health of the trees. Soon afterwards we found that the destruction of all the diseased bark and wood in the stem of the tree affected was the best method for us to adopt in trying to save the tree. Now the disease still exists in our gardens, but it has ceased to cause us uneasiness. From the month of February till August a skilled horticulturist visits, month by month, every tree in an orange plantation, inspecting the stem near the ground; and, at the slightest sign of any exudation of gum, he cuts the bark across, so as to allow the gum to run freely out. If he finds the disease in a more advanced state, both the bark and the wood must immediately be cut out until that which is sound shall have been reached, the earth being at the same time withdrawn from contact with the stem, and the largest roots left quite exposed to the air, free from any of the soil, to the distance of from 1 foot to 2 feet from the stem. The small roots on the side where the gum has appeared are carefully examined, and every decayed portion of them cut off. Great care is, moreover, taken to prevent the accumulation of rain-water near the stem where the roots are exposed. If the attack of the disease be discovered at an early stage the tree, by this treatment, is soon restored, and even when the disease is more advanced, the tree, by following out this treatment, generally recovers. When they are long in recovering we find it more profitable to plant a new orange-tree; and to provide for such contingencies we have always numerous supplementary orange-trees in our plantations. Although the disease continues to exist, our gardens now look very prosperous, for the remedy is known, and the disease causes no such ravages as it did for the first seven or eight years after it made its first appearance. Orange-trees take very easily by transplantation, and we always keep our plantations fully supplied. The only and great difference which our orange gardens present is this, that we have no longer old and large trees in our plantations; you can no longer count upon handing your orange-trees over to your children.

"A great revolution has taken place in consequence of this disease in the culture of our orange trees. In old times the orange-trees wanted no culture at all. The old trees produced abundant crops of the most beautiful thin-skinned fruit, well ripened by exposure to the sun and a free circulation of the air. Since the appearance of this disease, however, we shelter our orange-trees very much against the winds, and this shelter (procured by the plantation of rows of large trees) prevents, as a matter of course, the free circulation of the air, the free passage of the light, and the direct action of the sun. We manure our gardens with common court-manure [stable dung], sea-weeds, and lime; and we trench underground a green crop of white lupins, which promotes a considerable amount of vegetation. We also dig the ground under the trees once every season, and so on. The consequences are a great development of the productive power of the tree—abundant crops, but of a very inferior kind. The oranges are no longer thin-skinned, and no more of that deep golden colour and inviting aspect which formerly distinguished them. They have also lost much of their reputation in the English markets, and the durability of the fruit has been lessened. Forty years ago we could send our fruit to Norway and to Russia, and now our fruit will scarcely arrive in England in good condition after a fortnightly passage.

"So we are returning once more to some of the old traditional culture. We are clearing the shelters, pruning the interior of the trees for the admittance of air and light, are less liberal with supplies of manure, and do our utmost to get the ground under the trees free of all weeds, except when we want to excite vegetation. We have abandoned the propagating by layers, and graft good chosen kinds upon seedling stocks. For shelters we give preference to trees that have not a thick foliage, and take care not to let them grow too high.

"I shall be very happy to find that any of these kinds have proved to be of any use to you.

"As to the varieties now prepared for culture, we give our preference to some of the Brazilian varieties, and to some good ones obtained from seedlings. The good qualities of our old oranges were, I think, more due to the old age of the trees and complete exposure to the air, heat, and light, than to any peculiarity of the usual variety. Some of the Brazilian varieties are truly good, and keep their qualities through any culture.

" I have had the pleasure to forward to you, through Mr. Veitch, five boxes with a dozen of each of the most approved kinds. Mr. Veitch has detained them for some time in London, under the supposition that their roots were not good enough for a long voyage ; but I hope they will now have arrived, and will soon produce such fruit as may serve to confirm the good name which they have gained amongst us.

" I have, &c.,  
JOSE DO CANTO."

1870.

## NEW SOUTH WALES.

## S I L K.

(CORRESPONDENCE RELATING TO CULTIVATION OF.)

Presented to both Houses of Parliament, by Command.

THE HON. SECRETARY, ACCLIMATISATION SOCIETY, NEW SOUTH WALES, to THE COLONIAL SECRETARY.

Acclimatisation Society of New South Wales,  
Sydney, 7 June, 1870.

SIR,

This Society having exerted itself to promote the establishment of silk culture in this Colony, has recently received from His Excellency the Viceroy of India, a valuable stock of silkworms, and most useful information relative thereto. I wish to submit the despatches containing this information for your personal inspection, in the belief that in the interests of the Colony you may think proper to publish a selection from the papers.

To direct attention and impart a knowledge of facts about the rearing of silkworms, the present time seems very appropriate. First, the extremely critical condition of all European breeds gives the gravest reason to fear that if they experience adverse weather another year the whole may become utterly extinct, or for all practical purposes so unreliable for stock to breed from, that all the principal European silk producing countries will of necessity be compelled to have recourse to importations of eggs from other countries where the disease affecting the silkworms does not exist, or is less severe. Secondly, the well known operations of Mr. Brady in the Colony have already caused considerable attention to be directed to Australia; and the very remarkable system originated by that gentleman, and carried on from time to time during several years under the observations of this Society, of producing a succession of daily broods and crops of silk during a great part of our long season, is highly encouraging. This very important fact, so honorable, and, if rightly understood, so calculated to do good to the Colony, was thus commented on by Mr. Dickins, President of the Silk Supply Association of London, at a public meeting held at Coventry,—“the fact of producing silk day by day was most wonderful, and was what was not done in any other part of the world”; and Mr. Chadwick, M.P., at the same meeting took occasion to say, in reference to this Australian plan, “that the daily production exhibited an improvement in the production of silk which would be as important a fact as ever occurred in the silk trade.” Thirdly, there are now most excellent varieties of silkworms in the Colony, from which beginners could be supplied, wherewith to commence the creation of a new export.

It seems, therefore, that the dissemination of the requisite instruction only is yet wanting to implant this lucrative occupation in Australia; cognizant as this Society is of the advantages we possess in soil and climate, and of the value of the information and means at our disposal, as well as inducements to profit thereby, I am desirous of urging upon you very strongly the policy of adopting measures to bring practical knowledge on the subject within reach of the colonists.

I have, &amp;c.,

GEORGE BENNETT, M.D.,  
Hon. Secretary, Acc. Soc. N. S. Wales.

Simla, 13 August, 1869.

MY DEAR LORD BELMORE,

Enclosed is a letter written under my orders in Council, to Dr. G. Bennett, Honorary Secretary to the Acclimatisation Society of New South Wales, in reply to an application made by him for a supply of silkworms and seeds from India. I shall feel very much obliged by your causing the same to be delivered to that gentleman.

It will afford me very great pleasure to assist the Acclimatisation Society as far as may be possible in the direction indicated.

I remain, &c.,  
MAYO.

[Enclosure.]

No.

From E. C. Bayley, Esq., Secretary to the Government of India, to G. Bennett, Esq., M.D., Honorary Secretary to the Acclimatisation Society of New South Wales.

Home Dept.  
Public.

Simla, August, 1869.

Sir,

I am directed to acknowledge the receipt of your letter, dated the 16th June last, containing a request on behalf of the Society for a supply of silkworms and seeds, for acclimatisation in the Colony.

2. In reply, I am desired to state that His Excellency the Viceroy and Governor General in Council will be very glad to afford the Society every assistance in his power, in the direction indicated, and that immediate inquiries will be made with a view to compliance with the Society's wishes.

I have, &amp;c.,

E. C. BAYLEY,  
Secretary to the Govt. of India.

Simla, September, 1869.

MY DEAR LORD BELMORE,

In continuation of my letter of the 13th ultimo, I enclose a copy of a pamphlet by Captain Thomas Hutton, entitled "Remarks on the Cultivation of Silk in India." A copy of the pamphlet has also been despatched to Dr. Bennett.

I remain, &amp;c.,

MAYO.

[Enclosure.]

REMARKS on the cultivation of Silk in India, by Captain Thomas Hutton, F.G.S.; C.M.Z.S., Corresponding Member of the Agri-Horticultural Society of India.

(From the Journal of the Agricultural and Horticultural Society of India. Vol. I, part 4; new series.)

To the Secretary of the Agricultural Society of India,—

MY DEAR SIR,

In answer to your call to make a few observations on the cultivation of silk in India, and with special reference to the Conference on this subject, as reported in the Journal of the Society of Arts for 9th April, 1869 (No. 855 of Vol. 17), I now do myself the pleasure of sending a few remarks in support of the many papers I have already published upon this subject; but as from former hard work, care, and sickness, I have become a somewhat prematurely feeble old man, I must beg of the Society to kindly overlook the poverty of detail, on the plea that "*non sum qualis eram*" and can no longer so fully enter into the subject as I might have done some few years since.

Keeping in view the fact, as I believe it to be, that the present movement in England regarding silk, has for its object the opening up in India of new localities for the introduction and cultivation of the silkworm, it appears to me that the first thing to be done is to raise a warning voice, founded on the failures that have already, in many districts, taken place, against rushing headlong into speculations which from the very nature and constitutional condition of the insects could only end in disappointment. The fact that many such failures have already occurred, furnishes valid evidence of the truth of my declarations, long since made, that such would assuredly be the ultimate result. My remarks however only then served to provoke the displeasure and sneers of sundry individuals, on the ground that I was only a meddling naturalist, and not a practical cultivator; and it was further hinted that even as a naturalist I was foolishly endeavouring to establish the existence of several distinct species of *Bombyx*, while in reality, as they sapiently insisted, there was but one. On this point, however, events have fully justified my views. Thus naturalist or no naturalist, since one of my opponents factiously and elegantly remarked, "that the proof of the pudding was in the eating," facts have in both instances declared that "*magna est veritas et prevalebit*;" while the peculiar pudding that my friend was concocting, turned out by some mistake to be—a hash.

I was not, however, the first to point out that the climate of the North-western Provinces was unsuitable to the constitution of the mulberry silkworm, Dr. Royle having come to the same conclusion long previous to the time when I entered upon the subject.

As the subject of silk cultivation in India is of vast importance, both to this country and to England, and Mr. P. L. Simmonds not having fully exhausted the subject, I shall endeavour to add what little information I may have picked up since the publication of my last papers on the cultivation of silk.

Experience having shown that while the hot lowland plains are wholly unsuited to the constitution of the annuals, and that the *multivoltine* species on the other hand are checked by the want of leaves for a longer time during the winter season than their period of rest can meet, so that the young worms again appear before there is a sufficiently abundant supply of food, it is clear that the efforts of cultivators should be confined only to those parts of the country in which the worms have thriven well and profitably; so that while Bengal should redouble her efforts to increase the stock and quality of the silk of the *multivoltine* species that have hitherto, in spite of much mismanagement and want of proper care, manifested their ability to ensure good returns, the annuals should be altogether confined to suitable elevations in the hills from Sylhet upwards to the Indus. Experimentalists who know little or nothing of the constitution and actual condition as to health of the species they would introduce, and who set common sense and experience at defiance, are simply acting upon the *sic volo sic jubeo* principle, and are certain in the end to throw away their capital. Even in an elevated position there are many points to be considered before entering upon such a speculation: 1stly, plenty of capital; 2ndly, the nature of the climate of each district, for it does not follow that the same elevation will be equally suitable to the worm at Simla in the north, and at Darjiling to the eastward; the elevation may be the same, but owing to a difference of latitude the climates cannot be the same; 3rdly, the species of worm best adapted to each climate; 4thly, the prospect of a remunerative return upon the outlay, founded upon sound logical and inductive reasoning, and not as hitherto upon mere surmise and guesswork. It must be borne in mind that although good silk may for a time be produced while the health of the insect is unimpaired, even in a climate which will eventually prove injurious to the worm, yet the out-turn will never be what it ought to be in a climate fully adapted to the constitution of the insect. Good silk was no doubt produced both in Oudh and in the Punjab, but in neither case was the yield commensurate with the outlay and expectations of the cultivators.

Therefore, I ask "*cui bono*"—For if you can only produce good silk with an outlay of double the value of the crop, what kind of a fortune are you likely to make? In short no yield of silk that does not fully cover every item of expense, leaving the insect in its original strength, and bringing in a really profitable return, is worth the trouble of cultivation. For the question to be solved is not so much whether a district will for a time produce good silk, but whether it will do so permanently, without having recourse to annual importations of fresh seed; and also whether from a given number of worms it will produce a return equal to that from a similar number of worms, and at no greater outlay, as Bengal or Cashmere. Facts, we all know, are stubborn things, and they have already solved the question by proving that the Upper Provinces are wholly unsuitable to either annuals or multivoltines.

A

A word likewise must be said regarding the quality of the food upon which the worms are reared. Much has been said on the score that the facility of rearing mulberry trees proves that India is a country adapted generally to the successful cultivation of silk; yet this is entirely a fallacy supported by very indifferent logic, for the worms are not generally fed upon *indigenous* trees, but upon trees from time to time imported from foreign countries possessing climates often quite at variance with that of India. That such importations apparently grow well and look healthy, furnishes no proof whatever that the constitution of the plant is sound, and that the nourishing properties of the leaf remain unimpaired by the change of climate; no experiments have been instituted to ascertain this point, but the logic seems to be that a mulberry leaf is a mulberry leaf, and as the natural food of the worm is the mulberry leaf, therefore they must thrive equally well upon every species. Yet when we reflect that multivoltines prove themselves to be the creatures of warm climates, while annuals are restricted by nature to the north, is it not reasonable to inquire whether each individual species may not originally in its native climate have been furnished with some particular tree upon which it thrives better than upon others? It must at least be evident that the annuals of the north could not have been nourished upon trees that are peculiar to the south, and *vice versa*. To feed the northern worm upon the finer leaf of the southern tree would be nothing better than a silly attempt to destroy its constitution by slow starvation.

That some leaves are preferred to others, every cultivator must have seen, and during my experiments to restore the health of *B. mori*, I often found that although sometimes when pinched by hunger some of the multivoltines would sparingly eat of the leaves of the coarse wild mulberry of the hills, yet on the supply being intermixed with the leaves of the China mulberry (*Morus Sinensis*), the former were at once abandoned for the latter; while as to *B. mori*, although a northern species, it would never touch the wild leaf at all. Nor does the above opinion appear to be wholly unsupported by facts, for the wild silkworm (*B. Huttoni*), of the north-western Himalaya, must have been wholly restricted to the coarse leaves of the indigenous trees previous to the introduction of the cultivated Chinese plants, and indeed in many parts of the hills they are so still. That they readily eat the leaves of other mulberry trees is nothing to the purpose, the question being, did nature restrict them to any particular tree? The answer being—undoubtedly she did, until man interfered to upset the arrangement. Another point to be considered in the rearing of northern worms upon southern leaves is the fact that, from their thinness, twice or thrice the quantity will be required to properly nourish the worm, and this increases the outlay; besides which, the longer the time consumed in feeding, the less repose does the insect receive, and this is injurious to its well being.

But supposing, as is most probably the case, that the leaves of imported trees in an uncongenial climate are deficient in proper nourishing constituents, the worms and consequently the crop of silk must likewise be affected, and the very same thing arises from the injudicious method practised in Bengal of constantly cutting down the bushes for the nourishment of the worm; for in such cases the leaves are wholly immature, watery, and poor, and therefore do not furnish the worm with the necessary constituents for producing good silk, while the quantity must likewise be reduced. Doubtless the natives will tell us that this is the cheapest method, and they can afford no other, and this may be true, but the purchaser of cocoons should be wiser in his generation and remember that as *veal* is not *beef* so in like manner are young mulberry shoots inferior as an article of food to the mature leaf. The niggardly policy that would put every shilling into the pockets of the cultivators and bestow nothing upon the worm and its produce, is the very worst that could be adopted, and is decidedly one of those causes which have hitherto led to such lamentable and disastrous results. A thorough revision and alteration of the prevailing system is absolutely necessary, and if the purchaser of cocoons does not strenuously endeavour to repair the mischief which is manifested in the failing constitution of the multivoltines of Bengal, he will soon have reason to bewail his negligence.

Now it appears to me that the great number of mulberry feeding silkworms now known to exist, amply warrants the conclusion that a corresponding variety of trees has been furnished for their nourishment, each probably being modified to suit the climate and other conditions under which the worms themselves may have *originally* existed. Some perhaps may have been restricted to one species only, while others may have had a wider range, for had not something of this kind been intended why has such a variety of mulberry species been created? If all worms thrive equally well upon the same species of tree in every climate in which indigenous, why create such a number of other species, many of which probably differ in specific properties? It would seem to prove only a waste of power and resources, and be consequently inconsistent with nature's laws and usual course of procedure, which is never to act redundantly.

Granting then that the variety of trees corresponded with the variety of the insects, it would appear that we, with our conceited notions of *improving* upon nature, have at last so intermixed and deteriorated the quality of the natural food of each, that our boasted improvements, as Mr. Bashford called them, have nearly ended in the destruction of the worms.

It may probably be said that there is now no remedy for this state of things, as so much time has elapsed since the introduction of the insects that no one now remembers upon what trees they were originally fed, and even in some instances from whence the worms themselves were procured. The objection I think is scarcely valid, and if we are really seriously inclined to repair as much as possible the evils and mismanagement of the past, it behoves us manfully to push all difficulties aside and commence *de novo* upon a sounder system. The French appear to find no difficulty in procuring eggs from foreign lands,—then why should we? Practised hands could surely be despatched to China and its isles, in search of stock, and the *indigenous* (not imported) trees of the district. These once obtained would fairly replace the cultivator upon his legs, and instead of making the supplies over to the natives, each cultivator of silk should have his own plantations, and all other necessary requirements in his own hands and under competent European Superintendents. The present native system should be rooted out, for it is nothing but a patent method of reducing the yield of silk and gradually starving the worms. It is of no use crying to Jupiter to give you better crops,—you might just as well invoke the Saints with a farthing rushlight;—the speculator must himself gallantly put his own shoulder to the wheel, and so earn a right to the aid of Jupiter. But seriously to sit down and pursue the present system can only gradually and surely tend to the eventual destruction of the insects.

I have treated the subject as a naturalist, because he, from his knowledge of the habits and requirements of the insects, ought to be the proper person, in the first instance, to lend a helping and a guiding hand to the cultivator. More than this I cannot do as I am not sufficiently versed in commercial politics to enable me to step forward as a practical sericulturist.

Some have imagined that as the annual worms of Cashmere cannot be successfully cultivated in Bengal, it would be wise to cross them upon the monthly worms in the hope of thus obtaining more than one crop of cocoons of a superior size, a method which has always appeared to me to be a patent way of destroying the good qualities of both. For the blood (so to speak) of the annual Cashmere worm being as it were prepotent over that of the multivoltines will speedily reduce the cross to annuals, and so destroy their good qualities, while at the same time the inferior size of the monthly worms, as compared with the cocoons of *B. mori*, acts injuriously in reducing the size of the cocoons of the latter. Mr. Bashford, on whom well merited praise is bestowed by the Conference, was for a time perfectly unreasonable on the subject of crossing, and became highly indignant at my declaring, what eventually proved to be true, that all would sooner or later revert to their own natural characteristics, or be swallowed up in the stronger annuals. "Look," said Mr. Bashford, "at our breeding establishments in England,—horses, fowls, sheep, &c., &c.; everything is most successfully crossed, and the improvements are permanent."\*

Yet this is after all but idle talk, displaying a decided want of knowledge of the subject, since no "*improvements*" either are, or can be, *permanent*, unless the crossing is from time to time renewed, and the animal kept up to some required standard. If this be not attended to, the animal, be it what it may, when once left to nature will gradually revert, and all the boasted improvements become obliterated,—and why? simply because the standard is wholly an artificial and not a natural one. Mr. Bashford however appeared to be surprised to see his worms revert, and that nature, abhorring all crosses, exercised a greater influence over the worms than he did. I will quote a portion of his concluding remarks, placing those parts which support my argument, in italics. "On my return from Europe I found a good supply of healthy looking eggs of the different sorts, and have continued the experiments this year (1856) with unabated perseverance; they began hatching early in January, *but just as irregularly as before*, a small quantity only came out daily, and did not cease till May. The early worms were all good, fed and thrived as well as I could desire, and cocoons from them were very fine.† I had an opportunity of again comparing the pure French cocoons reared by me, with the different crosses, and the choice *was greatly in favour of the pure*; but the cross cocoons were vastly superior to those of Bengal, and what I reeled off in the filature, gave a most beautiful silk, and a yield in quantity more than twice as large as the common cocoons of this country, which we were then reeling in the filatures. Thus much of the intrinsic value of the French cocoons remained, but none of their original shape. I supposed now that I had so much reduced the original nature of the frequent crosses, as to be nearly certain of their now assimilating in habits, &c., &c., with our country worms, and *I did not reduce them by further crossing*, but allowed the moths to couple with themselves.

Great

\* Note on Hutton's remarks on the improvement of silkworm

† This cross was effected with French, Italian, and China females of *Boro-pooloo*, upon *Madrassee* and *dasse* stock.

Great was my astonishment to find after the eggs had been deposited three days that most of them turned black, indicating that they still had too much French nature; a few remained yellow and hatched after ten days; how to account for this freak of nature with regard to the rest, I cannot understand, but I had still to be more surprised after this. I have to wait of course until next year to see the result of the black eggs, but those that hatched gave me ample occupation for the time, and I watched and cared for them with the greatest interest; the young worms looked healthy, ate and thrived well, and in due time gave cocoons; the white colour alone proved the China portion, and the superior size of cocoon and fibre, and lighter colour of some, with less floss than with our common sorts, shewed the French and Italian cross. I was on the whole satisfied with this crop, and trusted my labours had met with success, but great was my astonishment, after the pairing, to see more than half of these eggs again revert to annuals, though there had been a complete break in their nature by their having hatched in January, given cocoons in February, eaten out in due time, paired in themselves, deposited eggs that ten days after hatched, and now to fall back not to hatch again until the ensuing January of 1857, *I fancy is extraordinary in the extreme*. I have many pounds of eggs of the different crosses still retaining the nature of annuals, but as I have spent three years in trying ineffectually to engraft a superior nature, and invigorate our common stock without changing their nature of hatching, I feel discouraged, and would gladly have the opinion of naturalists as to the probability of my object ever being attainable, and the proper steps to be taken for realizing it.\*

It was in consequence of this pathetic appeal to naturalists that I wrote to Mr. Bashford a letter which he published in your Journal, and which ended in obtaining me the honor of a *snub* because my opinions were not in accordance with his wishes. Yet subsequently he acknowledged the utter failure of his endeavours, and that the worms had all reverted to annuals.

The parts italicised in the foregoing extract are these:—

*First*—"The irregularity of hatching," showing that the cross was already acting injuriously upon the eggs.

*Secondly*—"The choice between cocoons of pure French stock and those of the cross was altogether on the side of the former"—Proving the *unmixed* to be the best.

*Thirdly*—Fondly imagining that he had succeeded in amalgamating or fusing the two natures, he did *not reduce them by further crossing*,—and what was the result? Simply that from the moment when crossing ceased, nature stepped in and asserted her authority by again casting out the effects of the cross, and causing the hybrids to revert to annuals. In this likewise we perceive the folly of declaring that "everything is most successfully crossed, and the improvements are permanent." I can only suppose, if this be the fact, which however it is not, that there were *no improvements* in these hybrids to become permanent.

*Fourthly*—The dark colour of the eggs "indicated that the hybrid had still too much French nature;" that is to say, that the influence of the stronger *Boro-pooloo* (*B. textor*) was prepotent over the weaker monthly worms, and had reverted them to annuals.

*Fifthly*—The worms became annuals "after there had been a complete break in their nature." The fact is otherwise: There had been no break in the nature of either species, but simply dire confusion for a time, succeeded by reversion to their natural condition, by which the temporary union was dissolved and again contemptuously cast out.

*Sixthly*—Mr. Bashford thought it a very extraordinary thing that reversion should have succeeded to what he considered the accomplishment of his wishes; yet there was nothing extraordinary throughout these changes; they were simply indications of a struggle between nature and Mr. Bashford for the mastery, the one being determined if possible to preserve her species pure, and the other if possible to destroy them by the application of what he termed "*the arts and sciences*." However the long and the short of the matter is, that all these experiments signally failed, as fail they always will, and I therefore advise the cultivator, if he wishes to possess good silk, to eschew all crossing, and to busy himself with a more careful management of the pure races. Such experiments are well enough in the hands of a naturalist who wishes to learn what can possibly be effected by such crosses, but for a practical sericulturist to enter into them will ever prove but time and labour thrown away.

Let us now consider the subject of silk cultivation in India from another point of view. The first thing that appears to arrest attention is the ardent wish in England to extend the cultivation of the worms generally over districts where at present none exist. I have however already shown that this desirable object cannot be obtained; all efforts, and they have been zealously pursued, having failed with considerable loss. Let not the sometimes over earnest advocate for such extension run away with the very erroneous impression that all parts of India enjoy the same climate and are equally favourable for the growth of silk, for nothing can be farther from the truth. The very geological features of the land will at once point out that from the coast line upwards, for more than 1,200 miles, the climates must necessarily be modified by outlying hills and mountain ranges of considerable elevation. These mountains are often densely clothed with forests and other vegetation; at other times are bare and rocky; and while well adapted in many parts for the larger wild species, such as the Tussar (*Antheraea paphia*) and its congeners, are totally unsuited to the growth of the finer silks. Yet these wild species are by no means to be despised, and excellent silk is even now turned out at Beerbhoom, Palamow, Bhagulpore, and lately at a place near Sasseram. The cocoons of Palamow, especially, are sometimes of very large size, and in all these, and such like localities, careful management in reeling appears to be all that is necessary to insure a very profitable return. The worms are wild, and are fed upon the forest trees at no expense to the cultivator, who consequently does not experience the same temptation to turn rogue and starve the worm, as is the custom among the Bengal cultivators of the monthly Bombyces.

The group of silk spinners of which I now propose to speak differs widely in form, in habits, food, and silk from the Bombyces proper; they are all wild species, and what is a great advantage, are all indigenous to this country and widely diffused wherever there are hills. The type of the group is the well-known Tussar Moth (*Antheraea paphia*) which occurs not only at the places already mentioned, but likewise along the coast line from Bombay through Pondicherry, and eastward to Bengal, and thence through Cachar, Assam, Darjiling onwards through the Dehra Doon, and even to the Punjab. The insect therefore has already indicated to us the various localities in which it may be expected to thrive; there is no need of experimental trials, for nature has declared that wherever her species are indigenously placed, that is the locality in which they are certain to thrive best, so that knowing this, all that the sericulturist has to do, after the selection of the district in which he proposes to reside, is careful attention in the selection of cocoons, and the finest manipulation in the reeling. At present this silk as an article of commerce is altogether in its infancy.

All the species of this group (and there are several) are wild, and, as a rule, when left entirely in a state of nature, appear to be only annual, or single-brooded, yet such is the curious effect even of a semi-domestication that no sooner do they become subject to man's control than this habit is completely changed, and from two to five broods a year may be obtained. The occurrence of a strong sharp-pointed horny spine at the shoulder of the wing in *Actias Selene* and others of that genus, and its presence likewise in *Antheraea*, sometime ago suggested the propriety of ranging these in a separate family, under the name of *Plectropteroidæ* and genus *Plectropteron*, but as the suggestion appeared to meet with little favour I did not venture to make the alteration. The mere fact of *Actias* possessing long narrow tails to the lower pair of wings, while there are none in *Antheraea*, would not, I conceive, have sufficient weight to prevent the amalgamation of the two genera which, in other respects, present but few if any generic differences; for the very same thing occurs in the *Papilionidæ* or butterflies of the genus *Papilio*, between which no difference is made on that account. As we are not, however, here concerned with the tails but with the produce of the insects, and their capability of being turned to good account as silk producers, we may for the present let the scientific question rest.

In all the members of this group the cocoon is firmly closed all round, and the fibres, especially in *Antheraea*, are strongly and compactly glued together so as to render the action of the wing-spur necessary for the separation of the threads. The head of the cocoon therefore being first moistened as in *Bombyx* by a liquid secretion from the mouth of the insect, the wing spines are then alternately brought into play in making a cross cut, or it may be perhaps in separating the threads without cutting, a sharp grating sound being plainly heard the while, until the moth effects its exit. The silk, when reeled, although from the great size of the insects, coarser in the fibre than that of *Bombyx*, is nevertheless a valuable product, and with good reeling would soon command a very profitable price.

In *Actias* the cocoons are by no means so full of silk as those of *Antheraea*, but what there is has been well spoken of as "strong, tenacious, elastic, and brilliant." At Mussooree the worm of *Actias Selene* is found in a wild state upon the *Andromeda ovalifolia*, *Coriaria Nipalensis*, *Xanthoxylon hostile*, *Bradlea ovata*, *Carpinus bimana*, *Cerasus pucidum* (the wild cherry), *Pyrus kythul* (wild pear), the walnut and others, so that there should be no difficulty in rearing it on the cherry, pear, and walnut either in France or England, and as it will yield three or four crops in the year an abundant supply of silk might be obtained, the worm being as easily reared in the house as on the trees. In India it has wide range, occurring along the coast line from Pondicherry, eastward, along the base of the Himalaya, even to the Sutlej in the North-west, and it has been found also in Central India, so that there can be no question of its being rendered otherwise than productive in this country.

Of

\* A few remarks "On Experiments with Silkworms," by F. Bashford, Esq. *Journal A. and H. Society of India, Vols. IX and X.*

Of the Tussar I have already spoken, and shall only now remark that in the whole family of the Lepidoptera there is perhaps no insect so variable in the imago stage in point of colouring as this; so much is this the case that a novice would scarcely believe the varieties to be all of one species. I have a cabinet now before me of silk spinning moths, in the drawers of which there are no fewer than a dozen variations chiefly from Palamow. There is likewise a species (for I am much inclined to regard it as such) from the Sonthal jungles, some miles to the westward of Colgong, and procured through the kindness of Mr. Barnes. I have received it from no other part of the country, and have provisionally named it *Antheraea nebulosa* from the cloudy bands on the wings. The cocoon is in all respects like that of the common Tussar. I have also some which, if not crosses between *Anth. paphia* and *Anth. Fritillii*, must be new also.

*Antheraea Assama*, of Assam, occurs also sparingly in the Dehra Doon, and could a brood be once procured would doubtless soon become a very profitable speculation. The great difficulty however is to find persons capable of discriminating and willing to assist the experimentalist in procuring eggs and cocoons from various districts. If we had but a Mr. C. Brownlow, a Mr. Barnes, and a few other equally liberally-minded men in every district, what a glorious harvest might be made.

In parts of the Himalaya, and more especially in the north-west about Mussooree and Simla, there occurs a fine species known as *Antheraea Roylei* feeding on the oak, the silk of which is also excellent and could easily be reared in considerable quantities by tying the females out at night, or placed in coarse gauze tents or cages, the wild males being almost certain to visit them before the morning.

In 1867 I received from Dr. Wallace, of Colchester, a few eggs of *Antheraea Yama-mai* of Japan; very few hatched, and although they gnawed at the oak leaves (*Q. incana*) for two or three days, the worms then shrivelled up and died. I have now a small batch of the same received from M. Guérin Menéville, but none have yet hatched, and from their appearance at present I fear that none will do so;—*Mais nous verrons*.

Of the Eria group (*Attacus*) little need be said save that the Ailanthus worm, *Attacus Cynthia*, is abundant at Mussooree, and occurs along the Terai region through Kumaon, eastward to Cachar; it is the species which I formerly named *A. Canningi*, and which the French persist in calling by that name, although it is nothing more than *Attacus Cynthia*. This might be reared in any quantities either on the *Ailanthus glandulosus*, or on our native plants such as *Coriaria Nipalensis*, *Xanthoxylon hostile*, the woodbine, and other species, but some difficulty would probably be experienced in the reeling. As to *Attacus Atlas*, I scarcely think now that anything can be done with it on account of the difficulty in procuring eggs; the worms thrive well when found and taken from the jungle, but I never could induce the moths to breed. At Mussooree however we appear to be on the confines of its range, but it is abundant in Kumaon and extends eastward to Cachar. Here it is found chiefly, if not as I suspect altogether, upon the long milky leaves of *Falconeria insignis*, while in Kumaon the barberry appears to be its favourite food. As with *A. Cynthia*, the difficulty of reeling will be somewhat troublesome, but the silk is decidedly good.

Here surely is range enough for the cultivation of silk, for it literally carries us throughout the country; there is no need to institute experimental trials as was done with the Chinese Bombyces; the sericulturist has but to select the locality in which he finds the worms abundant and labourers at hand, and then by strict attention to the proper rules of feeding and reeling, he can scarcely fail to realize good profits. But beside this, how many as yet wholly untried species are there to be brought under cultivation for the first time; some even whose existence is only as yet suspected, and which will have to be carefully sought for by an experienced eye. Some years ago, when I asked permission to start upon such an errand, the Government answered that "the subject was far too scientific to be entertained," and my application was consequently refused.

Now I am somewhat too old and shaky to carry out the wishes of those days to their full extent, and yet if those worms are to be sought after and cultivated, somebody will have to do the work, or half the resources of the country in this branch will be cast away. There is no reason however why the question should be "too scientific" for a practical sericulturist, because it was so for the government officials of those days. If the cultivation of silk in India is to be extended in earnest, it is with these wild worms that the game must be played, for we already know that nothing can be gained by introducing the Bombyces of China into localities where experience has shown us that they cannot thrive.

As when the trumpet sounds the old war-horse is said to sniff the battle from afar, so the trumpet you have sounded in my ears has in some measure reawakened a wish, if possible, to be of use in this important matter, and temporarily shutting my eyes to the disgust engendered by the treatment I have hitherto received from various Governments as the reward of my long continued endeavours to assist the sericulturist, a disgust which tempted me to cast to the winds the experiments of several years, I shall still be happy if by my advice and the little assistance I may be able to give, I can in anywise promote the views and wishes of those who are now bestirring themselves in the matter of silk cultivation in India. In saying this however, I must frankly confess that I am now but "the miserable remains of an ill spent life," and have no longer either the health or the strength to enter into much field work, and yet if I could procure good living samples either of the eggs or cocoons of the various species of *Antheraea*, such as *A. paphia*, of Palamow, and of the district round Colgong, of *A. Fritillii*, *A. Helferti*, and *A. Assama*, I should be very much tempted to begin my experiments again; with Bombyx I will have no more to do, for I am convinced that if anything worthy of the name of *silk extension* is to be effected it must and can be done only with the aid of the hitherto too much despised and neglected wild species. Old friends, however, who some years since most liberally assisted me in procuring what I wanted, have either left the districts from which my best specimens were procured, or, as in several instances, have departed as I hope to happier hunting grounds.

*Antheraea Assama* in particular is a worm in which I have always had great faith, and still think that it might become of the greatest value, yet I have never been able to procure its eggs or cocoons in sufficient quantities to enable me to judge from actual experiment what might eventually be effected. As to Mr. Moore's imaginary species, which he has named *Antheraea mezanckoria*, its existence as a species distinct from *A. Assama* is in my opinion altogether apocryphal, the word "*mezanckoree*" being applied by the Assamese not to a worm distinct from *A. Assama*, as he has been led to suppose, but to a particular quality of the cocoon and silk of the latter, precisely as in Boerboom the assorted cocoons and silk of *A. paphia* bear different distinguishing names, though all are procured from the same species.

A parting word now with respect to the cultivated Mulberry Bombyces.

1. The common mulberry silkworm or type of the northern worms is the well known *B. mori*, the largest of the genus known in India, and generally called in this country the Cashmere worm, although equally well known throughout Afghanistan, Bokhara, Persia, Syria, and all Europe. If this be one of the species which it may be thought advisable, in spite of experience, to introduce into the Plains, I say again beware, for the result of such an attempt will only prove the truth of the old adage that "*a fool and his money are soon parted*." In the hills of the North-west no doubt suitable localities and elevation may be found, but I confess I do not consider Mussooree either sufficiently elevated or far enough north to enable anyone to work the worm with full success, or extract from it all that it is capable of yielding. The district of Kunawur, I should imagine, would be as fine a field for the cultivation of this species as any locality in India, or throughout the Himalaya. The lower part of the valley experiences far lighter rains during the monsoon than are experienced in the lower hills near Simla, while the upper part, towards the Tartar frontier, is altogether out of the reach of the monsoon. It is precisely because this is the case that the district yields such good grapes, while in the Sub-Himalaya they are acid and watery, and of little worth. Hops doubtless would there thrive equally well; they grow luxuriantly even at Mussooree, but there the heavy rains act injuriously in preventing the formation of the seed; the plants flower well, but as the better principle resides most strongly in the seed the value of the hops is almost nil. Like the grape, however, the plant might in Kunawur arrive at full perfection, and be rendered serviceable to the brewers in the lower hills. Why then should not such a district be equally favourable to the growth of silk? The elevation and the temperature might be selected according to the requirements of the insects, for the valley is a wide deep trough, through which the Sutlej flows, and with shelving sides and fields cut out in steps; here too the worm would be actually on the confines, as to latitude, of its native land—the Chinese districts from which it originally came, lying, as does this Himalayan tract, between 32° and 34° of north latitude. Cashmere might likewise receive a helping hand.

2. *B. textor* (Hutton), the Boropooloo of Bengal, and which is apparently fast fading away, being likewise an annual, would no doubt thrive equally well in the same district. The cultivator however might be surprised to find that the crop of silk derivable from these, although at first of a silvery white, had now all turned to a golden yellow, the effect as I maintain of returning health and strength.

3. No monthly species could of course be expected to thrive in such a land, and consequently would not be introduced. These must be left entirely to the climates of Bengal and the western coast line.

The object to be gained by the cultivation of all these species should not be their extension into other districts where they have never yet been found to yield a successful crop, but to rouse the sericulturist from his present sleepy state of apathy, and teach him that silk can only be increased in quantity and improved in quality by a proper attention to the condition of the food upon which the worms are fed; if he is too idle and supine to do this, and positively insist upon an improved

improved system among the natives from whom he obtains cocoons, then farewell for ever the expectation of ever profitably introducing the cultivation of silk in India.—change the name of Bengal into that of “*Sleepy Hollow*,” and let those valuable insects go dwindling downwards step by step until the whole are either lost or worthless. The present system is altogether wrong; in saying this I feel that I am again travelling along a road that formerly was productive only of sneers and ill-will, but that I little heed; my wish is, if possible, to benefit those who are now or who may hereafter be engaged in the cultivation of silk, and therefore I am determined to speak only that which I believe to be the honest truth. Improvement in the method of producing food—improvement in the quality of the food itself—the improvement in the actual quantity of food furnished to the worms, and which a native will always stint—improvement in the smoky, dark, ill ventilated huts in which the worms are reared, and which like Irish cabins appear to contain a regular Noah's Ark. These are at least some of the improvements to be effected before any increase in the quantity of silk can be expected. There is in truth no difficulty in this beyond that which the pig-headed native obstinacy of the rearers opposes to all improvement. What then? Is your silk to stand ever at the same low standard, because an avaricious grasping ignoramus is determined to pursue that course alone, which an equally ignorant “*Papa*” pursued before him? Go to; you must entirely “*changez tout cela*,” and take every branch of the system into your own hands—the trees, the mode of cultivating them, and the rearing houses; in short from first to last everything pertaining to the growth of the finest silk must be taken over *in toto* by the sericulturist, whose money, whose common sense, and energy of mind and body, must all be invested in the speculation. It is the “*Master's eye that makes the horse fat*,” and the very same principle applies equally well to the cultivation of silk. Pursue this system if you wish to thrive; if otherwise, then you must be content to remain, as the drill sergeant says—“*as you was*.”

4. The wild mountain species known as *Bombyx Huttoni* is in some seasons found in thousands; every mulberry tree, whether wild or cultivated, being literally covered with them. The worm is double brooded, and the eggs remain exposed to the inclemency of a mountain winter, securely glued to the bark of the tree. The silk is decidedly first-rate, and of an ashy white colour, but the insect is so intractable that it will not submit to domestication, and must therefore be reared upon the trees, a method which must always render the crop precarious. I have repeatedly tried to introduce this species into France and England, but always unsuccessfully, the reason being that while our worm hatches in early March, when the young mulberry leaves appear, in England there is not a leaf procurable until May. I therefore propose (D.V.) if alive this coming autumn, to convey a bundle or two of cuttings to my friend Dr. Wallace, of Colchester, of the wild mulberry tree, in the hope that they may find a congenial climate somewhat resembling our own in this “*Ultima Thule*,” and so continue to put forth their leaves at the season when the worms are hatching; it may be considered as a wild attempt and forlorn hope, but nevertheless the value of the ultimate results in case of success proclaim it a venture well worth trying.

I have lately read, although I cannot at this moment remember where, that what are termed the perforated cocoons of the Bombyces, that is of cocoons from which the moths have effected their escape, are contrary to received opinions, quite capable of being reeled off like the others, the silk not having been cut but only pushed aside. If such be the case the cocoons of other species may likewise be turned to profitable account, and a large additional quantity of silk be saved.

In the Supplement to the *Oudh Government Gazette* for May 29th, 1869, appeared a communication from “The Silk Supply Association of London,” upon some portions of which I propose to make a few observations for the benefit of those who are far more prone to be led astray by the sophistry extant in high quarters, than to be guided by hard facts and the experience of the past. Gentlemen in England are very apt to take a purely English view of silk cultivation in India, and appear to think the natives of this country are such a docile and teachable people that they will readily lay aside “the superstitions of ages,” as upheld by their ancestors, and adopt the suggestions of foreign speculators, who in many instances are as far from pointing out the proper course to be pursued, as the natives are slow in adopting it. Thus Messrs. Chadwick and Dickins, at a meeting in London, convened by themselves, propose first “to stimulate the production of silk by cottage cultivation and otherwise, in every country where the mulberry tree is capable of giving food to silk-worms.” In this first clause, as stated by the Association, there are two points to be considered, which appear to me more likely to prove injurious to the worms than to extend the growth of silk. These are, first—“The production of silk by cottage cultivation,” and secondly—“the introduction of silk-worms wherever the mulberry is capable of giving food to the insects.”

Now if by “cottage cultivation” is meant the rearing of silk-worms by cottagers in Europe, the thing may probably be feasible enough, because the people, being of cleaner habits and more alive to the absolute necessity of attending strictly to the welfare of the insects in the matter of food and ventilation, than are the obstinate and caste-enclained ryots of India, would at once adopt those modes of treatment which were pointed out and insisted upon by competent instructors. But on the other hand when we come to urge “the mild Hindoo” to adopt a better system than he has hitherto pursued, we shall at once be met by the declaration that his poverty and dislike of innovation will prevent his making any alteration; he cannot afford to cultivate the mulberry in any other manner than that which his respected forefathers pursued; giving the worms more food and of a better quality would increase his expenses so much that he would be compelled to raise the price of the cocoons. To this the purchaser would object, and a system of “pull devil, pull baker,” be introduced which would effectually keep all real improvement at a stand-still. The native cultivator however must not only alter the quality and quantity of the food, but he must be compelled to erect more suitable rearing-sheds, free alike from the dirt, smoke, and malarious influences arising from neglect of free ventilation and the non-adoption of common sense sanitary principles. Dirt to a poverty stricken native is second nature, and you cannot wean him from it, nor from his determination to squeeze as much profit out of the worms as he can, at the very least expense to himself,—not considering in his blindness that the more he saves in the feeding and rearing, the less he gains on his cocoons? The cottage system therefore that is to say what is so considered in Europe) is the one of all others when applied to India the best calculated to insure a bad supply of cocoons; in short it is the present Bengal system, and ought to be extinguished. If the quantity of silk cultivated in Bengal is to be increased, and the quality improved, it can only be done by restoring the worm, through a better system of feeding, to renewed health and vigour; this the ryots will never effect, and the sericulturist in Bengal must consequently do it for himself. But how, he may ask, am I to do so if the natives persist in thwarting me? Simply, I reply, by sending the native to Jericho until he comes to his senses; and in the meantime, as I have repeatedly pointed out, the European sericulturist must take the entire system of cultivation into his own hands; he must in short become in truth a practical cultivator himself, instead of remaining, as now, a mere purchaser of bad cocoons, or being compelled to shut up his filature; at present he has none other than “*Hobson's choice*,” had cocoons or none at all. He will probably tell me that he can reel an excellent silk from these cheap cocoons, and doubtless this is true enough, but the real question is whether he gets as much silk and of as good a quality from these cocoons as he would have done had they been more judiciously attended to, and here I answer for him that he certainly does not. Then why not have the best cocoons by putting his own shoulder to the wheel and forming a plantation from which he may derive *ripe* leaves containing in perfection in their juices the best material from which the purest silk gum can alone be secreted by the worm? The lands now occupied by the mulberry bushes in which the natives put such faith should be thoroughly ploughed, manured, and then replanted with young healthy trees or cuttings of the very best description procurable, taking due care that such trees are, if possible, *indigenous* in those districts of China, Japan, or elsewhere, in which the monthly worms are themselves either indigenous or extensively cultivated, for by so doing you may fortunately apportion to the insects the very trees, or some of them, upon which they in the first instance existed. Then as to the rearing-houses; they too should be solely under the control and supervision of the capitalist himself, with an intelligent European superintendent under him, the ryots being employed under his eye, in picking and bringing in the leaves, as frequently and in such quantities as the case requires; let there be no stinting, but see that the work is properly attended to, for a saving in the feeding will be a loss on the cocoon. By this method the health of the worms would be improved and the cocoons become well stuffed with silk of a superior quality; ventilation, cleanliness, temperature, all being properly attended to, the yield of silk in the hands of the sericulturist would in all probability be double what it now is. The greatest difficulty to contend against would no doubt arise from the dislike to introduce a new system. Yet this I am confident will be the only means of putting the present vicious system on a better and more remunerative footing. It may be said that it is advisable to “let well alone,” but unfortunately the present hue and cry and stir at Home for the extension and improvement of Bengal silk at once proclaims that there is very little that is good enough to be let alone. A radical change must be effected, for after all it simply comes to this, that if you wish to increase the quantity of silk you will never be able to do so under the present faulty system of feeding and rearing; consequently you must either change it for a better, or be content to remain as you are at present. Let your efforts, however, be confined to Bengal and Southern India, for if you attempt to introduce the monthly worms into the Upper Provinces, nothing but failure and loss of capital will be the result, and as you cannot with all your skill “make a silken purse out of a sow's ear,” so neither can you force these worms to thrive in localities and climates whose nature has decreed that they shall not thrive.

By the term "extension of silk cultivation in India" I apprehend is meant a more general diffusion of the worms, a greater quantity of silk from a given number of worms, and greater attention in the reeling; if such be the case I warn the sericulturist against the diffusion of the monthly worms beyond Bengal, for the reasons already given,—while with respect to the Boropooloo, or *B. textor*, it should be at once removed from Bengal, where it is said to be fast dying out, to a colder climate in some parts of the Subhimalaya, where it could be profitably cultivated side by side with *Bombyx mori* from Cashmere.

It is an utter fallacy to suppose that the silkworm requires a climate free from moisture; it is the want of humidity in the climate of the Upper Provinces that enfeebles the worm and makes it languid and limp, thus rendering it incapable of yielding a full crop of silk. This has been well proved this season (1869) at Mussooree, among the wild silkworms (*B. Huttoni*), for while last year this species was found in hundreds on every tree, there is now, from the great heat and want of rain and humidity, not one to be seen. The eggs of last autumn still remain upon the trees; a few have hatched and the worms have been literally shrivelled up by want of rain and by the prevalence of scorching heat, while other eggs are still unhatched in June and are waiting for the setting in of the periodical monsoon. If then the heat thus injuriously operates upon the indigenous worms in our climate, what must be its effect in those scorching districts which are subject to the furnace-like blast of the hot winds? Where the speculator possesses "more money than brains" the best possible way of equalising the two will be to attempt silk cultivation with Chinese worms in the North-western Provinces of India. Taking it for granted, however, that the majority of our sericulturists are something superior to mere blind speculators acting on "the rule of thumb," and simply following their noses with nothing but the doctrine of chances to guide them, I think we may safely predict a rapidly approaching time when prejudice and red tape will be cast aside, and a new era be ushered in. The time for more experiments has passed away; the mulberry worms have been introduced into districts where they had previously had no fair trial, and in every instance signal failure has been the result; we have now hard facts and experience before us as a guide, and if we do not profit by what we have thus learnt there will be nothing but failure in the future.

Secondly, with regard to "the introduction of silkworms wherever the mulberry is capable of giving food to the worms,"—I view the doctrine simply as a piece of claptrap, calculated only to spin out a speech and lure the sericulturist to destruction. Wherever the mulberry is found it is no doubt "capable of giving food to the silkworms"; this is a mere truism,—but does it follow as a natural consequence that where the mulberry is capable of growing there the worms must necessarily thrive upon its leaves? The logic of the argument runs somewhat thus,—"John Bull is fond of beef, and in a climate suited to his constitution will thrive upon it," but it does not therefore follow that he will thrive upon it in a climate injurious to his constitution? It is a well known fact that the food of mankind varies in every climate of the world; the coldest regions require the most nourishing and stimulating food, but in tropical climes that same nourishment would be productive only of disease. Man can exist in every climate, but as a species he does not thrive equally well in all; and so is it with the mulberry tree; it will grow, but it does not therefore follow that in every clime it will yield the same quantity and quality of aliment; to grow is one thing but to thrive is quite another; the leaves will everywhere be "capable of giving food," because that consists of the fibrous portion of the leaf, but if those substances which go to the production of silk be wanting either wholly or in part, little or none will be furnished for the fabrication of the cocoon. I have already stated above that where the leaves are deficient in silk producing properties the worms will require more frequent supplies, and that the rest of the insect being thus interrupted and greater labour imposed upon it, the effect must eventually be deterioration. To support my argument I invite the practical sericulturist to look round on nature that he may see with his own eyes how, after feeding, every animal seeks repose. Why is this? Simply because it is ordained that continued exercise after feeding impedes digestion. This was many years ago well proved by an experiment tried upon a brace of greyhounds; both were well fed; then one was chained up and left at home, while the other was taken to the field and coursed. When the coursing ceased both dogs were killed, and it was then found that the sleeping dog had nearly digested his food, while that of the other remained *in statu quo*.

Again, we know that every part of India will nourish mulberry trees, but at the same time we at present know positively nothing in regard to the quality of the leaves, except that from the repeated failure of the worms wherever they have been introduced we are entitled to infer that the quality of the nourishment afforded, together with the heat, are alike unsuited to the worms. Even with respect to the indigenous trees, their existence does not prove the districts in which they grow to be suitable to them; imported worms; on the contrary, nature herself, by having placed no indigenous species upon such trees, at once gives warning that she never intended them to exist there. In the Himalaya she has acted on another principle, having furnished the indigenous trees with a species peculiar to them and the climate in which they grow, by which means she has proclaimed these districts to be adapted to the production of silk, and backs the assertion by the further evidence derivable from the existence of eleven other species of the Bombycidae, nourished upon various indigenous trees. What plainer speaking man can desire I am at a loss to conceive. If then nature has placed indigenous species upon the indigenous trees of the Himalaya, while she has placed none upon those of the lowland mulberry, are we not fully justified in declaring that as the book of nature was intended to be man's earliest guide and primer in appropriating to himself the wisdom of his Maker, so it must be mere wilful folly to attempt by artificial means to obtain results which nature plainly tells us are contrary to her plans and the wisdom displayed around us. At the same time, however, although she refuses to introduce the mulberry worms of other climes, she does not leave the lowland provinces a blank, but on the other hand points out that perfect suitability for the cultivation of those other wild species which she has everywhere bountifully scattered over the length and breadth of this vast and generally neglected Empire.

These are points which probably none but a naturalist would take into serious consideration in the treatment of this important subject, and yet it is absolutely essential for the sericulturist to know how nature acts and what she wills should be, for it is only by the rational study of her works that he can ascertain how far she may feel inclined to assist him, and if he wilfully shuts his eyes to facts and determines to pursue an unnatural system of his own by acting in opposition to her *dictum*, he will only have himself to thank should his efforts eventually end in total failure. "Go to the ant, thou sluggard; consider her ways, and be wise." In the present instance let us go for wisdom to the mulberry feeding Bombyces, and we shall find them answering to our inquiries that "Nature by not placing any of them upon the indigenous trees of the lowland provinces proclaims aloud that she does not consider their climates suitable to their constitution, and therefore located them in different latitudes and climates, upon trees there previously provided for their nourishment; therefore be wise and profit by the warning and advice thus given by a Master Mind, rejecting the illogical doctrine that wherever the mulberry grows there too ought silkworms to exist and thrive; or if you will not be guided by such evidence as their non-existence in those provinces affords, at least let the frequent failures in the attempt to introduce them arrest your steps in time to save you from an otherwise inevitable loss."

I have no expectation that my croaking views will be more readily attended to now than formerly, while yet I believe it to be my duty to my fellow men to speak out boldly what I consider to be the honest truth. "*Hinc illa lachrymæ.*"

I may be asked what species of mulberry tree I would recommend for the rearing of the worms, and I would certainly reply that this must be regulated by the nature of the species under cultivation, and the climate in which they are situated. In Bengal where alone in India the monthly worms are capable of being cultivated with any prospect of success, the trees selected should come from the districts from whence the worms themselves were originally procured, while the annuals of the north should be reared on the leaves of northern trees. I have tried at Mussooree the Philippine mulberry (*M. multicaulis*), the large leaved *Morus cucullata*, the Chinese *Morus Sinensis*, and several other species, and invariably found that the silk was both more abundant and of better quality when the worms were reared upon the leaves of *Morus Sinensis* and *Morus nigra* than upon any others; while worms fed upon the leaves of *M. multicaulis* and *M. cucullata* produced nothing but a thin flimsy web, through which the pupa was distinctly visible. It is to be remarked however that this experiment was tried upon northern worms, and with the trees growing in a northern climate, so that the advantages were all on the side of the northern species, and against the southern trees. In Ondh, however, where the southern *M. cucullata* might be supposed to possess an advantage over the *M. Sinensis*, the very same results were observed, as my son, Mr. A. R. Hutton, of the Oudh Commission, who conducted an experiment under the orders of that Government, informs me that when he first entered upon the experiment with *Bombyx Mori*, *B. textor*, and *B. Sinensis*, it was found with respect to the latter worm that it was in such a weakly condition as to be unable to gnaw the epidermis of even so thin a leaf as that of *Morus cucullata*, and it was found necessary to chop the leaves very finely for them during the first stage, when, instead of eating the fibrous portions, they contented themselves with the sap exuding from the edges. Placed upon the unchopped leaf, they wandered about and died, being unable to pierce it; in the following year he changed the leaf for that of *Morus Sinensis*, and found that his worms had improved, and that in the third year they had improved still more. From this it was somewhat hastily inferred that if the experiment had been continued the worms would have annually improved until they had reached the Bengal standard, when nothing more would be needed, and the experiment would have been successful. Unfortunately, however, when we look further

further into details, we find that this inference was entirely a false one, there being in point of fact no real improvement in the worm at all, except that it was healthier when fed upon the more solid leaf of *M. Sinensis* than upon those of the thin watery leaf of *M. cucullata*; moreover, there was no improvement upon the worms of the first year, for these died off in such vast numbers as to render a fresh importation from Calcutta necessary, so that it was only annually commencing the same experiment *de novo*. To establish an improvement in the worm required that the worms of the first year should have perpetuated themselves, and then gone on annually improving, and this they did not do; in short, the experiment never advanced at all, but annually recommenced with the importation of fresh ones from Calcutta. The fact that the worms annually imported thrived better on *M. Sinensis* than the first batch had done on *M. cucullata* is *à propos* to nothing, as it only shows that the worms thrive better upon good than upon bad food. Besides which it appears that the alleged improvement was entirely the exception, the majority of worms dying off, and leaving a few good ones to prove the rule that the climate was inimical to the species. As to *B. mori* and *B. textor*, they are acknowledged to have been a failure.

In conclusion then, permit me to say one more word on the crossing of species. Darwin has stated that if a plant's own pollen be brought on a brush it will invariably prove prepotent over that of a foreign species, that is to say, that nature rejects all crossing so long as a plant's own pollen is available.

Now if we apply this natural law to the silkworm, it will at once show why the progeny of two different species when crossed invariably, sooner or later, revert to their original state, or more commonly to that of the strongest species. We cross *B. fortunatus* upon *B. mori*; the moths produced have, so to speak, the blood of both species; but when they couple there is a struggle for the mastery between the two, each striving to cast out the other, and the blood of the stronger species will prove prepotent over that of the weaker, and consequently, unless the latter be recrossed by its own species, it must by the law of nature revert to an annual. Here the stronger blood of *B. mori* in the male moth meeting with an equal portion of the same blood in the female proves prepotent over the two parts of the blood of the weaker *B. fortunatus*, and casts it out by reverting to annuals.

These two species at Mussooree, when the crossing is judiciously kept up, produce a very excellent silk of a golden colour, the cocoon being much larger than that of *B. fortunatus* of Bengal,—but when once the crossing ceases *B. mori* invariably reappears. But it is time to stop, for methinks I hear you cry—"Ohe, jam satis."

---

THE HON. SECRETARY OF THE ACCLIMATISATION SOCIETY OF NEW SOUTH WALES TO HIS EXCELLENCY  
THE VICEROY OF INDIA, SIMLA.

Acclimatisation Society of New South Wales,  
Sydney, 24 February, 1870.

MY LORD,

I have the honor to acknowledge receipt of despatches from your Excellency, No. 3749, dated 13 August, No. 555, 22 September, and 4771, 20 October, and to express the warm thanks of the Council of this Society for the pains taken in virtue of your Excellency's instructions to comply with our desire for silkworms' eggs and seeds.

The valuable paper of Captain Hutton and the other enclosures have been very carefully read, and have furnished this Society with important information, for which we feel greatly indebted to the gentlemen who have furnished the same.

I have also to acknowledge receipt of the package of eggs and seeds from Dr. De Vecchy, of Mysore, and have the great satisfaction of saying that they arrived in most excellent condition; they were immediately placed under the care of Mr. Charles Brady, F.L.S., of Manly, our most experienced silk grower. I enclose copy of Mr. Brady's report, and am happy to add that I am assured of the continued well doing of the silkworms which have turned out quite healthy, and prove a most valuable acquisition to this Colony.

The Council of this Society is gratified by the promise of silkworms' eggs and seeds from Mr. Henry Cope, of Umritour; these though announced as having been forwarded, have not yet arrived, but will be most thankfully received.

In that part of my letter, dated 16 June last, referring to wild species of silkworms, I solicited your Excellency's aid to obtain certain specified sorts, indigenous more particularly to Bengal and Assam; we are greatly impressed with the opinion expressed by Captain Hutton as to the value of these neglected races. Captain Hutton's views are so much in accord with the opinions of our most expert and well informed men here, that fortified by his judgment this Society is very anxious to pursue the experiment in this Colony, of growing silk out of doors; our range of climate seems admirably adapted and inviting to make the essay, and the Council earnestly hopes your Excellency will continue us your powerful assistance, and cause a few hundred cocoons to be forwarded of the species named in my letter, and of any others procurable; for the Eria, the Tusseh, and the Joree, we are well provided with food, and the moment appears most opportune.

Should your Excellency, upon consideration of the great present importance of applying the aids of science to the efforts of industrial enterprise in such a widely diffused and financially important a matter as the production of silk, determine that your Government should undertake experiments, or sanction assistance being rendered towards improving or enlarging the sources of silk production in India, as urged by the Silk Supply Association of London, this Council will most gladly and freely place at your Excellency's disposal any assistance this Society can render. Situated as we are in a new country, under circumstances entirely different to those of any and every other country, our enterprises not infrequently (rejecting the shackles of old habits) achieves results unlooked for elsewhere; hence science giving her instructions and aids to industry in this very matter of silk growth produces many crops of silk instead of one in a year, to an immense economy of labour and capital as well as risk. We feel diffident in saying much more to your Excellency, as your desire to improve the condition of the people under your rule, as well as to benefit your countrymen elsewhere, is so well understood, but it may not be impertinent for me to say that in many ways parts of the empire may act and react on each other with mutual advantage, and it is very evident that with judicious encouragement England and her possessions may enjoy a very large share of the most profitable trade in silk.

The Council of this Society trusts your Excellency may be pleased to direct that Captain Hutton be made aware of the sense of obligation the Society feels to him for his paper, and also to Dr. De Vecchy, for his valuable packet.

I have, &c.,  
GEORGE BENNETT, M.D.,  
Hon. Secretary, Acclimatisation Society of N. S. Wales.

[Enclosure.]

[Enclosure.]

Charles Brady, Esq., to Dr. G. Bennett, Hon. Secretary, Acclimatisation Society of New South Wales.

Dear Sir,

I have carefully examined the parcel of silkworms' eggs just arrived from India, and have the pleasure to say that although the varieties are in part similar to some of my own, they form a very desirable and valuable addition to the useful sorts which Australia is now acquiring. The society may be congratulated on the success which has in this instance attended the Viceroy's efforts to assist the difficult enterprise of introducing the silk industry into Australia; the eggs were admirably packed, and arrived in perfect condition.

A portion of the eggs was already hatched so that a further short delay would have been fatal, but there is every probability of saving enough of each breed for reproduction in the Colony.

There appear to be two, if not three, separate varieties—one a high class race from Italy, by way of India; a second unnamed; the third Japanese green (apparently different to that already imported by the Society) partly acclimatised in India by Dr. De Vecchy, from whose estate also the Italian eggs were obtained.

At present the young worms appear healthy though small and pinched—it will probably take two or three generations to bring them up to our standard; indeed pretty well all my experience goes to convince me more and more that the fresh food and new climate both operate powerfully towards restoring the natural vigour which, for now so many years, appears to have deserted the finest stocks of silkworms in Europe—and there are not wanting symptoms that even the pure and clean races of Japanese varieties may shortly become more or less desolated by the same scourge which has deprived several millions of people in France and Italy of their most alluring and profitable occupation.

What I mean by our standard, is simply that degree of health and physical vigour in the silkworm, which, for three consecutive years, gives it power to commence, under ordinary circumstances, its natural course in due season, and not before, and passing through all its changes without disproportionate casualty (its management without unusual difficulty or special pains), to consummate its progress in forming a firm, stout, and clean cocoon of moderate size, and whose moth neither too bulky nor too attenuate, is perfect in its form, development, and covering of down. This standard is attained by continued and assiduous attention, first to cleanliness, second to rigid selection, and thirdly to judicious use of various kinds of mulberry as food plants, according to season—one kind being used from first to last (or at any rate during the last two stages at least) with the males, and a different mulberry with the females. Pure races bred in and in this way soon acquire additional vigour, and are afterwards much more manageable than I have found them on their first introduction.

I remain, &amp;c.,

CHARLES BRADY.

January 8, 1870.

From LIEUTENANT-COLONEL WILLIAM AGNEW, Officiating Commissioner of Assam, to the Secretary to the Government of Bengal—(No. 331, dated Gowhatty, the 7th December, 1869.)

SIR,

In compliance with the instructions conveyed in your letter No. 3086, of the 2nd September last, I have the honor to submit a memorandum, drawn up from the reports of the district officers of this division on the silkworms of Assam, and embodying the information asked for by the Acclimatisation Society of Australia.

2. With regard to the question of despatching cocoons to Australia, I would beg leave to point out that of the three species cultivated, viz.,—the Moogah, the Pat, and the Erie, the two latter are found in Bengal, and I therefore think it would be better to send their cocoons thence than from this more distant province.

3. I have great doubt as to whether it will be possible to ensure the safe arrival of specimens of the moogah insect. From the enclosed memorandum it will be seen that the chrysalis does not remain dormant for any length of time as is the case with some species; but after the cocoon is formed, the moth soon emerges and lays its eggs, which again are hatched in a few days. The difficulty, however, may be overcome if the method of packing described in the 5th paragraph of Dr. Bennett's memorandum operates to retard the hatching of the eggs. The best time for sending the cocoons would be the winter season, as heat accelerates all the stages of development. The month of December is perhaps to be preferred for all reasons.

4. I shall be able to collect and despatch as many cocoons as may be required if I am furnished with perforated zinc cylinders (which I cannot procure here) of the description recommended by Dr. Bennett, and should I be desired to procure cocoons I request I may be informed by what route and to what address I should send them, so that by despatching them direct loss of time may be prevented.

5. I shall despatch by bhany post specimens of the various kinds of silk, raw and manufactured, as requested in your 2nd paragraph; and eggs of all the varieties shall also be sent packed in the manner described by Dr. Bennett, and also in bottles as suggested by Mr. William Becher, who at one time cultivated silk extensively here. I have desired the district officers to collect seeds of as many of the trees mentioned by Dr. Bennett as possible, and these I shall also forward to you on receipt.

#### Memorandum on the Silkworms of Assam.

*Mooga*.—(Otherwise 'Moogah, Moonga, or Mungah') *Antheraea Assama* or *Saturnia Assanensis*. This is the commonest silkworm in Assam, and its produce is second in estimation, that of the "pat" worm being superior. It is bred and treated in the following manner:—On the third day after the cocoons have been completed, the cultivator sets apart a certain number for breeding, choosing those which were commenced on the day when the greatest number of worms began to spin. These are kept in open-work bamboo baskets in a dark, secure place in the house; and in a certain number of days, varying from ten to twenty, according to the state of the weather—heat accelerating and cold retarding the development—the moths emerge. The males, known in the cocoon by the sharpness and length of the "tail" of the cocoon, and in the moth stage as being smaller than the females, are left with the females for a day, and all are then placed on bunches of grass, generally the "ooloo" grass, in pieces of 18 inches in length and 3 in circumference, or on strips of bamboo fastened to a rope and suspended from the roof, and the females are tied to the grass or bamboo by their wings with pieces of thread. In about three days the eggs are laid and remain attached to the bundles of grass. The cultivator only keeps those laid in the first three or four days, the rest are supposed to be useless. In about ten days—the period varies with the weather as above-mentioned—the young worms appear, and in some places are fed for a day or two in the house with tender leaves, and then—or in places where this practice is not resorted to, immediately on the worms being hatched—the bundles of grass are taken out and tied on the trunks of sooloo or soom trees. Great care

is taken previous to this to clear the soom groves of ants and other insects inimical to the mooga, for which purpose all undergrowth is destroyed, and the ants, &c., having been collected by baits of molasses, plantains, decomposed fish, &c., &c., are burnt wholesale. The worms, crawling up the trees, feed first on the smaller and afterwards on the larger leaves, and are prevented from coming down by a band of plantain or other smooth leaf, over which they are unable to move, fastened round the trunks of the trees. They remain on the trees about twenty-six or twenty-seven days more if the weather is not favourable, and then leave off eating and descend, and are gathered in the evening, and taken to the cultivator's house, where they are placed in parcels of clean dry leaves, mango or plantain, and commence their cocoons, which they finish in about five or six days; and the same series of changes then commences anew.

From the time the young worm is placed on the soom tree till it commences spinning, the greatest care and attention are required to preserve it from its numerous enemies. Birds of all kinds, crows especially, devour it by day; and bats, owls, and rats are equally destructive by night. Men are always, day and night, on the alert with bows and arrows, pellet bows, and slings, and with the aid of these, and constant shouting, manage to prevent the birds, &c., from doing much harm, but the worms are still destroyed in numbers by wasps, ichneumon flies, and other insects. Hot, dry weather, is the most favourable to the mooga worm, but excessive heat is often fatal to those which are moulting. Rain, unless it fall in very heavy showers, does not injure them as they find shelter under the leaves. If the rain, however, be very heavy it washes them off; and in this way sometimes a large proportion is destroyed.

The mooga is generally spoken of as yielding five crops of silk in the year, which are designated as follows from the season or month in which they are yielded:—

The Jarooah crop (cold weather)	January, February.
„ Jettocah „	(Jeyt) May, June.
„ Aharooah „	(Ahar) June, July.
„ Bhodia „	(Bhadro) August, September.
„ Kotia „	(Kartik) October, November.

Of these the first two and the last are considered superior to the others. Sometimes a larger number of crops is obtained if the weather is more than ordinarily favourable.

The duration of the existence of the worm under ordinary circumstances may be taken to be—

From the laying to the hatching of the egg	... ..	10 days
From that time till the fourth moulting	... ..	20 „
From the fourth moulting to the commencement of the cocoon	... ..	10 „
In the chrysalis state	... ..	20 „
As a moth	... ..	6 „
Total	... ..	66

In the hot weather it is sometimes as short as six weeks; in the coldest as long as twelve weeks.

It is difficult to obtain reliable statistics as to the amount of silk produced by each worm. The commonly accepted idea is, however, that from 4,000 to 5,000 worms produce 1 seer (2 lbs.) of silk, the value of which varies from 6 rupees to 15 rupees. A "dhoti," 18 feet long by 3 feet broad, is worth from rupees 12 to rupees 20, the price varying with the excellence of the silk, and of the manufacture. Breeding cocoons are generally sold at rupees 2 per 1,000. The silk is of a yellowish colour.

*Pát, or Pát Pooloo (Bombyx mari).* This is identical with the mulberry worm of Bengal. It is never found wild in Assam, and is cultivated entirely indoors. Its produce is white and highly esteemed; formerly indeed its use was restricted to royalty, and now only the "Jogi" caste raise it. Its culture is as follows:—The cocoons selected for breeding are kept in a loosely tied cloth so that air can reach them, and put in a quiet, clean place. In some twenty or twenty-five days (more or less according to the weather) the moths emerge and are left together a short time, and are then removed either to slender sticks of bamboo, or to pieces of cloth, where the females are tied by the wings with thread. In a short time they lay, and the eggs, if laid on cloth, are carefully packed up as they are; and if on pieces of bamboo, are not touched for some days, and then are removed to earthen pots or bamboo baskets, and kept with care till the hatching season, which in Upper Assam is generally the end of December, and in Lower Assam the end of January. The eggs are then taken out and exposed to the air; and as soon as the young worms appear they are placed on round shallow bamboo trays, which are sometimes lined with cloth, and fed with tender mulberry leaves (the "noonee" tree). The cultivators are particularly careful that the place where the worms are kept is very clean and free from all obnoxious smells. Dirt of any kind is supposed to be fatal to them. The worms are sorted after six or seven days, the larger being separated from the smaller; and the size of the leaves given to them is gradually increased as the worms grow. When the worms evince disinclination to eat they are removed either to bundles of clean, dry leaves, or to bamboo trays with matting divisions about 2 inches apart, where they spin their cocoons, which they complete in five or six days.

The duration of the breed may be taken roughly as follows:—

From the hatching of the egg to commencing the cocoon	... ..	30 or 40 days.
In the chrysalis state	... ..	10 to 20 „
As a moth	... ..	3 or 4 „

From the laying to the hatching of the egg, about ten months, or altogether one year. The cocoons required for use are put in the sun three or four days, and then boiled in a solution of potash obtained from the stalks of rice plants. The silk is worth 20 or 25 rupees a seer and is more valuable than any other, partly on account of its whiteness, partly its fineness, and also from the fact that but one crop is obtainable in the year, which makes it scarce. The fabric woven from it much resembles the "tusseh" silk of Bengal, and the worm is, I believe, identical with that from the silk of which "tusseh" is made.

There is another description of pát called the chota, or small pát, the culture of which is the same, but the silk is not quite so good. It is but little reared.

*Eria, Eria, Eri, Eree, Arrea, or Arindee (Phalœna cythin).* The treatment of this worm is similar to that of the pát pooloo, except that it is fed on the castor-oil plant, instead of on the mulberry. It yields a coarser silk than either the pát or moogah, and is cultivated generally by lower-caste Hindoos, Cacharies,

Cacharics, and Meekirs. It is reared entirely in the house, and the duration of its existence is from six to eight weeks, less in the hot than in the cold weather, and its produce is better in quality and quantity in the former than in the latter season. Cocoons for breeding are selected in the same manner as are moogah cocoons, and for the rest they are treated much as are pát pooloos, except that so much care and attention to cleanliness are not necessary. When the worms are rather old (after the second moulting), they are generally induced to crawl into bundles of leaves suspended from the roof, which saves the trouble of feeding in trays. They are allowed to form cocoons in bundles of dry leaves. There are said to be seven breeds in the year. The thread of the "erie" silk is worth from 2 to 3 rupees per seer, and the fabric made from it, which is warm, thick, and durable, fetches about 14 or 15 rupees for a piece 15 feet by 4½ feet. This worm is found in Bengal.

*Kootkooi* or *Kootkooi Moogah* is a wild species of silkworm found in the jungles of Upper Assam; no use is made of its silk, and the natives say that it is in fact worthless.

*Megankooi* is the name given by the Assamese to the produce of the moogah when fed on the adakoori-tree instead of the soom. The silk of the adakoori fed worm is lighter in colour and therefore more highly valued. Among worms fed entirely on the soom, however, some will always produce lighter coloured silk than others, and this, being set apart, is generally called "megankooi." There is no distinct insect known by that name. The *joree* is not known to any of the district officers.

---

From H. A. COCKERELL, Esq., Officiating Commissioner of the Presidency Division, to the Secretary to the Government of Bengal, General Department—(No. 77, dated Fort William, 30th October, 1869.)

SIR,

The only district in this division in which silk is grown is Kishnaghur, and there only to a very limited extent. Mr. Scott Moncrieff, of Salgamoodia factory, has, however, been good enough to favor me, through the collector, with a very complete report on the subject, copy of which I submit for the information of Government, with reference to your letter No. 3086, dated 2nd September. I also forward the two specimens of silk sent by that gentleman.

---

From R. SCOTT MONCRIEFF, Esq., to H. LATTMAN JOHNSON, Esq., C.S., Joint-Magistrate, Kooshtea—(Dated Salgamoodia Factory, the 4th October, 1869.)

SIR,

As requested in your note of 25th ultimo, I have carefully perused the copies which accompanied it of letter of 2nd ultimo, to the Commissioner of the Presidency division, from the Government of Bengal, and of the memorandum by Dr. Bennett, referred to therein, on the subject of the supply of silkworm eggs for the Acclimatisation Society of South Australia, and I have much pleasure in submitting the following observations on the subject; premising that my chief authority for them is Mr. P. Veyrin, who superintends my small silk filature here,—a gentleman conversant from his youth with the rearing of silkworms and manufacture of silk, and who was employed for some years by a few of the leading firms in Lyons in the purchase of silk-worm eggs in the Caucasus and Persia, and in transporting these to France.

2. *Wild Cocoons*.—We have very few in this district, and do not manufacture silk out of them. Mr. Veyrin has personally superintended experiments with them, and has watched the manufacture of silk from them in the districts of Bancoorah and Beerbhoom, and in the province of Assam, in which as well as in many other jungle districts of Bengal they are very abundant. A large quantity of silk is made from them, but entirely for native consumption and of very inferior quality. The value ranges from rs. 2 to perhaps (but very rarely) 5 per seer (2s. to 5s. per lb). The well known *tusser silk* cloth of Bhaugulpore is made from silk of the wild cocoons, and is generally in demand for export to Europe. Mr. Veyrin is of opinion that the silk of some kinds of the wild cocoons is of such very desirable quality for certain classes of silk manufactures, that if it could be produced of a quality suitable for the purpose by the same simple and inexpensive process as that followed in spinning ordinary Bengal silk, the produce would prove a very valuable commodity for export, but the cost of manufacturing the silk of the required quality proves prohibitive at present. This remark especially applies to silk of the Moongah cocoons of Assam, made by the ordinary native process; it is wholly unsuitable for the European market, but it could not be manufactured to suit the latter at a cost which buyers for that market could afford to pay. There is such a quantity of gummy matter in the wild cocoon that the thread of it cannot be unwound without much more difficulty than is met with in spinning the thread of the yellow cocoon from which Bengal raw silk is made; and as yet no experiments for unwinding the former by any other than the native methods have proved successful.

3. The eggs of the *wild silkworm* could easily be procured for export; but Mr. Veyrin fears that unless the worms from them can be fed on leaves of the trees on which they feed in this country, they would perish. In Assam the Moongah cocoon is fed solely on the tree known to botanists as the *Jetran-tena quadrifolia*, called by the natives the *soom* tree. From this cocoon is made the bulk of the silk used by the natives of that province. Their priests use cloth made of silk of the Mezan koonee cocoon, of a quality much better than that of the Moongah. Another kind of silk is made by them from the Erea cocoon, fed on the castor-oil tree. This cocoon is of a very large size when full-grown; the silk is not unwound from it, but is taken much as cotton is taken—from the pod—of very short fibre. The wild cocoons of Bancoorah and Beerbhoom are fed entirely on the sâl tree, which abounds throughout the jungles.

4. The breed of silkworm from which the silk known as Bengal raw silk is made is the *Bombyx Mari*, and is reared very extensively throughout the cultivated districts of Lower Bengal. There are two distinct families of this worm; one of these propagates its species only once in a year, but of the other six or seven generations successively are produced in one year from one pair of moths. The former is the kind from which silk is produced in Europe, Japan, and China; the latter seems peculiar to Bengal, and is the only kind of worm from which Bengal silk is made, as a rule, though the other is not unknown in the province, but is so much less productive that the natives find little inducement to rear it. Though much more silk is produced from the worm which propagates the more frequently of the two, its cocoons are in every way inferior to those of the other family, and the silk made from them is never equal in point of quality to that of Europe, Japan, and China.

5.

5. From natives intimately acquainted with the process I have the following particulars descriptive of the method followed in producing cocoons:—A native considers one pound weight of eggs sufficient to commence with, for which he pays two or three shillings, if he requires to buy them. The eggs are made over to the women of the family, who alone are permitted to attend to them. These women while thus employed are required to exercise the strictest personal cleanliness (and to confine themselves to certain kinds of food even in some families). The eggs are ranged on shelves in dark rooms during the first week after they are hatched. The worms are fed with very young mulberry leaf. At the end of the second and third weeks they receive older and stronger leaf; in the fourth week they are considered full-grown, and are supplied with abundance of full grown leaf. During the first three weeks a light is kept in the room, but for one night only in each week. During the fourth week a light is burned every night and a fire is kept up if the weather is cold. Towards the end of the fourth week the worms become gorged and refuse food, a sign that they are ready to spin. They are then put out in the sunshine for a few hours, or near a fire, if the weather be cold and cloudy, and soon commence work. In about two days the worm has finished his cocoon, and in about seven days he commences cutting his way out at one end of it. If he succeeds, he emerges as a small white moth, but the cocoon is rendered useless by being cut. In order therefore to prevent this the cocoons are baked before the worms commence to liberate themselves, and this kills them in the cocoons; the latter are then placed in hot water and the silk is reeled from them very easily. The best cocoons are generally reserved for breeding purposes. From these the moths are allowed to escape, and they breed almost immediately; then eggs are laid and hatched within two days, and from these a new supply of cocoons is obtained within five weeks. Under ordinary circumstances, from one pound weight of cocoons reserved for breeding 100 pounds of cocoons are produced, and very frequently 200 and even 300 pounds are the result of one breeding.

6. The worms are fed exclusively on mulberry leaves gathered, not from trees as in Europe, but from plants very carefully cultivated in fields set apart for them; the leaves are plucked five or six times in one year from each plant, and the owner so arranges as to have always ready leaf of different growths suited for the worms of various growths which are reared in his house.

7. In Mr. Veyrin's opinion, an insuperable difficulty is presented to the transport to Australia of eggs of the family referred to in paragraph No. 5, in this,—that even if the hatching of the eggs could be delayed by keeping them very carefully from the air in transit, as they would hatch immediately on exposure to it; after arrival, the worms would perish without a supply of food of the tender leaves of the mulberry, and in Australia it would be impossible probably to command a supply of such food for every new generation of worms. He states that eggs of the species breeding annually have been conveyed to Europe very successfully from Cashmere, where they are abundant, by his agents, Messrs. Wattenbach, Heilgers, and Company, of Calcutta, who will be happy to procure a supply for Government if requested to do so.

8. I have the pleasure to forward herewith a skein of silk made here from the Moongha cocoon of Assam as an experiment. It is of a light brown color and glossy appearance, and silk of this description would fetch ten shillings per pound in the Calcutta market probably. I also enclose a skein of fine Bengal silk equal in quality to the finest made at this season of the year, and worth twenty-two shillings per pound in Calcutta.

The annexures received with your note are returned herewith.

From J. P. GRANT, Esq., Collector of Bancoorah, to the Commissioner of the Burdwan Division—(No. 124, dated Camp, Sonamookhy, the 16th November, 1869.)

SIR,

I have the honor to reply to your memorandum No. 134, dated 25th September, 1869, on the subject of silkworms.

2. The private rearing of silkworms is not practised in this district; but as it is practised in a tract only just over the border, *i.e.*, in the Bograh (Midnapore) pergunnah of the Gurbettah sub-division, and as the raw silk thus spun is largely manufactured into fabrics in the district, I have considered it useful to lay before you the information received by me from Baboo Ruttun Lal Ghose, the deputy collector of Gurbettah, although you have in all probability already received it through the collector of Midnapore.

3. The deputy collector has evidently, from the terms of his report, understood the inquiry of Government to extend only to the domesticated silkworm. As, however, the Australian memorandum appears to refer exclusively to *wild* silkworms, I have added such remarks as I have been able to collect on the culture of the *tusser* silk moth, which is to a limited extent carried on in the jungles of this district, and to a very much greater extent in the jungles of the neighbouring district of Maunbhoom. I may here remark that the second name in the list given in the Australian memorandum of worms sought for from India is evidently that of the Indian *tusser* moth, disguised in atrocious typography.

4. Of the silkworms proper, *i.e.*, of the domesticated breed, the Baboo describes two species, one very much larger than the other, but both reared in houses, on trays and *machans*, and fed upon cut mulberry leaves. There is however a vast difference between the two species in point of prolificness; the smaller kind being reproduced in constant succession every six weeks or two months, while the larger kind breed only once a year. I have been unable to secure any specimens of the silk of the larger kind, but I forward specimens of the smaller kind, both in cocoons and in skein. It seems that both species give a produce of a varying colour, from a flaxen white to a golden yellow.

5. The *tusser* moth can hardly be looked upon as a domesticated silk moth, inasmuch as it is never privately reared. It does, however, undergo a rough kind of culture in the following way. A number of wild cocoons are collected by the speculator, generally a Sontal, who has already fixed upon a patch in the jungle containing a number of young *sal* or *assun* trees, but not more than his family can watch. As soon as the moths are hatched they are turned loose in quantities on these trees, where they lay their eggs, which are hatched in due course, the young caterpillars being reared upon the growing leaves. No kind of interference is practised with them, and all that the cultivator and his family have to do is to take care that the worms are not carried off by the birds, which do not fail to find out the cultivated trees from the vast number of moths which they bear. When the cocoons are sufficiently formed to be handled, they are detached, packed in baskets, and are taken to the nearest bazaar for sale. The cocoon is of a dirty brown colour, and larger than a hen's egg. I have been unable to obtain specimens either of the cocoons or of the skeined silk.

6.

6. The cocoons of all these species appear to be in the months of Magh and Falgoon, or February and March. Being now encamped at Sonamookhy, the centre of the silk and *tusser* manufacture of the district, I have made arrangements for the procuring of a number of cocoons, as well as of the eggs, of all the species employed in the district.

From BABOO RUTTEN LALL GHOSE, Deputy Collector of Gurbettah, to the Collector of Bancoorah—  
(No. 98, dated Gurbettah, the 8th November, 1869.)

SIR,

With reference to your memorandum No. 189, of the 29th September, 1869, received immediately before the last Dusarah vacation from Bood-Bood, I have the honor to report on the following points connected with silkworms and cocoons mentioned in the Government order No. 3086 of the 2nd September last, on a copy of which your memorandum was endorsed:—

1st. What varieties of worms are obtainable?

2nd. What is the mode of supporting and treating them, and the quality of silk produced therefrom? (Specimens to be sent if possible.)

3rd. Is there any difficulty in procuring silkworms for despatch to Australia?

4th. At what time should cocoons and eggs respectively be sent?

2. What varieties, &c.? There are two sorts of worms which people in this part of the country breed; one large and two smaller, or those of the ordinary size. The large worms' cocoons are larger in size; they are thrice as large as the cocoons of the smaller or ordinary size. All worms and cocoons are of two colours, white and yellow.

3. What is the mode, &c.? In the intensity of the cold of the months of Aughran and Pous, *i.e.*, about December and January, the worms here die. People therefore go to the villages in the vicinity of Tumlook, in the district of Midnapore, and to villages near Moorshedabad, for the purchase of worms (within cocoons) in the latter end of Magh and beginning of Falgoon. The worms, confined in cocoons of the smaller or ordinary size, are kept in *handis* (earthen vessels) made air-tight by some means or other, for eight days. On the ninth day, generally, butterflies come out from the cocoons. These butterflies are preserved in large drawers of bamboo, kept on bamboo shelves, in a hut closed up in such a manner as would protect the worms, &c., from ordinary flies which are their great enemies. Butterflies then give eggs in the course of one day. The eggs are innumerable of the white colour and very small in size. One butterfly gives upwards of 250 eggs; and they all die no sooner the eggs are given. On the eighth day young caterpillars come out from the eggs. They are then distributed into the numberless small compartments of the bamboo drawers, each containing about 3, 4, or 5, moths, as they chance to fall in the distribution. Of these moths some have yellow and others white colour. *Tbat* leaves cut into very small particles are given to them every second or third day for their eating. They grow in one month sufficiently developed to spin cocoons. In three days the cocoons are made of the size sent herewith as specimen. Some of these cocoons are kept, from which again the butterflies and eggs are produced. The process, described above, is repeated; and at the end of every month and half or so a fresh set of cocoons are produced by the smaller worms. The huts where they are kept are made almost air-proof in the rainy season, and are so closed in all other seasons that no flies can enter therein and destroy the moths. Next, I observe, that the treatment and breeding of the other sort of worms are a little different from what have been described above. The butterflies which come out from the larger cocoons are preserved on a few yards of cloth laid over the bamboo drawers. On the cloth the eggs are given; and these wrapped in the said cloth, are carefully kept in an air-tight *handi* (earthen vessel). The *handi* is not opened, not even touched by anybody, till the fifth day of the month of Maugh next year. By that day the eggs give birth to the moths; and if they are not hatched by that time the *handi* is again left closed for a few days more. The time the eggs take in giving birth to the worms is generally one year. These moths are kept for thirty-two to thirty-six days in the manner described above. They then become sufficiently old to prepare their cocoons in three days. The quality of silk produced by both sorts of insects is nearly the same. These generally produce silk in the month of Chaitra; and Chaitra silk of the smaller worms of white color is whiter than the silk of other months. Large cocoons could not be procured by me; a few of the smaller ones, together with two skeins of silk produced therefrom, are herewith submitted as specimens.

4. Is there any difficulty, &c.? Cocoons can be easily sent from the places mentioned above, from which people of this part of the country procure them in Magh and Falgoon, to Australia or other distant places in the manner indicated in the memorandum annexed to the Government letter.

5. Cocoons and eggs should be sent in Magh and Falgoon, *i.e.*, part of January, the whole of February, and part of March every year.

6. Price of the silk sent herewith is rupees 14 per seer of 80 tolahs.

7. The annexures to your memorandum are herewith sent back.

From J. H. HENDERSON, Esq., Deputy Collector, for Collector of Burdwan, to the Commissioner of the Burdwan Division—(No. 548, dated Burdwan, the 15th December, 1869.)

SIR,

In answer to your letter No. 134, dated 25th September, 1869, calling for a report on the mode of treating silkworms and cocoons, I beg to lay before you the following statements:—

1. No silkworms are obtainable in the Rancegunge sub-division. Silkworms are imported from Maunbhoom into Bood-Bood and Ausgram, and from the silk produced by them *tusser* cloth is manufactured. In Cutwa the trade in silkworms is carried on on a limited scale, the domesticated polloo being introduced there. In Katoogram the varieties are the domesticated chukkan, the neto, and the madrassie. In Culna the burra and chota polloo are imported.

2. The cocoons of the domesticated, otherwise called the chota polloo, are imported from Beerbhoom. They are placed in open baskets in a warm dry room. In cold weather the moths emerge on the eleventh or twelfth day, in hot weather on the eighth or ninth day. The males and females at once copulate; and after the lapse of three or six hours the males are taken away and die. The females are put on flat baskets,  
and

and the eggs are laid during the night. The eggs are hatched on the eleventh or twelfth day in cold weather, and the eighth or ninth in hot weather, and the caterpillars are fed on the leaves of the mulberry-tree. On the eighth, fifteenth, and twenty-first day after leaving the egg the caterpillars are dormant and require no food, but after the twenty-first day they have an abundant supply of leaves for fifteen days, at the end of which period they are placed on bamboo shelves with divisions. The caterpillars form cocoons which must be placed in the sun for three mornings successively. In hot weather the chrysalises are killed by the sun, in cold by boiling water. It is most essential that the room in which the caterpillars are placed should be clean, warm, and free from insects.

3. The chukkan breeds in December, and the eggs must be kept in a warm room for eight days. After the eggs are hatched small bits of leaves should be sprinkled over the young caterpillars for seven days, and after that whole leaves should be given three times a day for eleven days. The caterpillars then form cocoons, which must be put in the sun four days for three, six, nine, and twelve hours respectively, after which they are placed in a warm room and are ready for use.

4. The eggs of the burra polloo are kept suspended in an earthen pot in a closed room for twelve months, after which they are treated like the eggs of the chota polloo.

5. The value of the silk produced by these silkworms is as follows:—

Chota polloo ... ..	Rs. 16 to 20 per seer
Madrassie ... ..	25 "
Chukkan ... ..	14 "
Neto ... ..	9 "
Burra polloo ... ..	25 to 26 "

The breeding time of the madrassie is in January, and that of the neto in July.

6. The Deputy Collector of Cutwa is of opinion that the silkworms cannot be exported; but the Deputy Collector of Culna thinks that the eggs and cocoons of the burra polloo might be exported successfully.

7. There would probably be little difficulty in procuring a supply of silkworms for exportation.

From C. S. TURNBULL, Esq., to R. V. COCKERELL, Esq., Magistrate and Collector of Hooghly—(Dated Ghattal, the 7th October, 1869.)

SIR,

I have the honor to acknowledge receipt of your office memorandum No. 440, dated 30th ultimo, enclosing copy of a letter from the Government of Bengal, with memorandum received from Dr. Bennett, descriptive of the mode of treating silkworms and cocoons in the exportation to Australia, and calling for any information I can give on the subject.

1. The varieties of cocoons obtainable in this district are burra polloo (annual), madrassie, and dasee and China (monthly).

2. They are fed on mulberry leaves, and the quantity of silk produced from a maund of cocoons of passable quality is 2 seers 12 chittacks to 2 seers 4 chittacks,  $2\frac{1}{2}$  to 2,  $2\frac{1}{2}$  to  $2\frac{1}{2}$ ,  $2\frac{1}{2}$  to  $2\frac{1}{2}$ , respectively. Specimens of silk and cocoons will be forwarded in due course when the cocoons come to maturity, except the burra polloo, which is an annual, and the cocoons won't be in before the middle of March. I may as well also add that eggs of the burra polloo were sent to Captain Hutton, Mussoorie, and he got two crops of cocoons, whilst in Bengal such a thing is unknown.

3. I think it will be impossible to send eggs from the monthly cocoons to New South Wales, as they will hatch on the voyage, and will die for want of food.

MEMORANDUM regarding certain kinds of Indian silk-yielders, domesticated and wild, for introduction into Australia, by Captain Thomas Hutton, corresponding Member of the Agricultural and Horticultural Society of India.

WITH regard to Dr. Bennett's inquiries, I begin by noticing the confusion among the names of the species of silkworms required for Australia.

1. The name of *Bombyx Arracanensis* (Nobis) was given only provisionally (not *Arracauniris*) to the Arracan worm, which may probably prove to be either *B. posi* or *B. fortunatus*.

2. *The wild silkworms*.—The eria or arindy worm, which feeds on the castor oil plants at Dinapore (? Dinagepore) and Rungpore, is the domesticated *Attacus ricini*. The wild *Attacus cynthia* is a distinct species, found at Mussooree and eastward to Cachar, feeding on various trees and shrubs, and now largely cultivated both in France and in England, where it is reared upon the Chinese tree *ailanthus glandulosus*, which grows well in any soil; this worm, or *Attacus ricini*, has already been introduced into some parts of Australia; at Mussooree *A. cynthia* is common upon several trees and is an annual. Cocoons would only be safe in the cold weather.

3. The tusseh (not *Jusseh*): The *Bughy* of Beerbhoom and the *Rolisurra*, of the Deecan, are one and the same species, or *Antheræa paphia* (not *pappia*).

4. The *Kootkooree Mooga* of Assam: The mooga of Assam, feeding on the *Soom* (not *Loom*), and the *Mezankoooree* of Assam, are all the same, or *Antheræa Assama*. These different names being applied by the natives to different qualities of cocoons and silk; in Beerbhoom the same distinction is made with the silk and cocoons of the tusseh.

5. The *Joree* worm, called by Dr. Helfer *Bombyx religiosus* (not *religiosa*) is suspected to be no *Bombyx* but an *Ocinara*, a very small species, whose cocoon is not worth the trouble of cultivation.

Then, with regard to Dr. Bennett's second paragraph, cocoons and eggs can only be sent off with due regard to the time of eating out and of hatching. I do not consider it safe to despatch any species until the winter or cold season, as all then take their longest rest. The eggs of all the *Bombyces*, if sent off earlier, would assuredly hatch *en route*, and until the cocoons of the last brood of all the *Antherææ* and *Attacæ* are procurable; the moths would also certainly break out and be lost. If packed in perforated metal cylinders, as Dr. Bennett recommends, the ends of such cylinders should be simply covered with a strong piece of gauze, and all the cylinders packed in a strong wooden box with perforated sides; these may be placed close to each other to keep them steady in the box, but no cotton or any other packing stuff likely to promote heat and prevent a free circulation of air should be used. No shaking of the slightest consequence would occur, because the cocoons in the cylinders would steady each other, and the cylinders

cylinders in the box would act in the same manner to each other. As to leaving room for the moths to come out the great and most desirable object in my opinion is to prevent all hatching, for, without a very large and inconvenient space, no moths would couple in the box, nor would have space to do so. If it could be managed, I would recommend an outer cylinder containing ice, in order to retard hatching; but care must be taken to prevent any moisture reaching either eggs or cocoons. I do not see, however, how this can be done without excluding air, and that must be admitted. Again, on no account ought the boxes to be placed in the hold of the ship, or they will certainly ferment and rot; they must be kept between decks, where air can freely circulate without exposure to sun or rain. I have always packed cocoons in perforated boxes without suspending them at all; and indeed as the boxes are almost certain to be turned bottom upwards, or on their sides during transit, suspension with room to move becomes perfectly useless. The chief thing is not to squeeze them into the cylinders, but simply lightly touching each other.

The eggs of the *Bombyces* usually hatch from eight to ten days after being deposited, so that all would certainly hatch *en route*, unless the eggs of the last brood were selected; for as yet, I believe, we have discovered no method of transmitting packets by the telegraph wire, and even if we had there is no wire between India and Australia, so that Dr. Bennett's plan of despatching eggs, as soon as laid, would never answer, while even annuals, whether in cocoon or the eggs, will often hatch at improper seasons whenever they experience a suitable temperature; and as there would probably be many such changes during so long a journey, the changes are greatly in favour of many worms and moths hatching *en route*.

As regards the fifth paragraph, the eggs may be made into packets without fear of injury, but I would certainly not advise their being wrapped in cotton, tow, or anything of the kind, as all are heating and liable either to hatch the eggs, or to rot them by the steam engendered.

Let each packet of eggs be placed in a perforated tin box, and these boxes be enclosed in a perforated wooden box; there could then be no undue pressure upon the eggs, unless the packets were smashed. A better way, however, is to place each kind of eggs, whether on cloth or loose, in a separate unperforated cylinder, with the ends merely closed with fine open gauze for the sake of ventilation, and these cylinders being duly labelled, could then be placed in a perforated wooden box. A little shaking rather does good than harm, as it prevents the eggs from sticking together should sweating occur.

In recommending what species should be selected, one requires first to know what kind of nourishment has been provided, for there is no use in sending the insects until an ample provision has been made for feeding them; mulberry trees, for the *Bombyces*; *Bicinus communis* for *Attacus ricini*; *Ailanthus glandulosus* for *Attacus cynthia*; species of *Tetranthera* for *Antheræa Assama*; of *Zyziphus* and other trees for *Antheræa paphia*, and so on. Supposing, however, that such provision has been made, the best species of *Bombyx* to import would probably be *B. cræsi*, *B. fortunatus*, and *B. arracancensis*, while as an experiment *B. Huttoni* might be added with strict injunctions to leave it entirely on the trees, for it cannot be cultivated in the house,—like a true Highlander preferring coarse fare and liberty to the daintiest treatment in captivity.

Of the wild species, I should recommend *Attacus ricini*, *Attacus cynthia*, *Antheræa paphia*, *A. Assama*, and, if the oak has been introduced, *A. Roylei*, of Mussooree; whether or not the last named would thrive in such a climate as Australia remains to be proved; I should have little hope of *Bombyx mori* and *B. textor*, unless a tolerably cool climate can be found.

Mussooree, September, 1869.

From G. E. MACKILL, Esq., Officiating Collector of Howrah, to the Commissioner of the Burdwan Division—(No. 840, dated Howrah, the 6th January, 1870.)

SIR,

In compliance with your circular No. 134, dated 25th September last, I had the honor to forward, on the 31st December and 4th instant, two cases—one case containing forty cocoons of the yellow variety (lal poka), and another containing the same number of the white variety (shiti); and I now forward two samples of the silk produced by the former (one finer quality and one coarser), and one of that produced by the latter, reeled in the native manner. Of the cocoons twenty of each sort have been procured from Shampore in the south of the district, and an equal number from Ampta in the west. As the species of worms appear the same in both places, I thought it needless to multiply packages by sending them separately. The samples of silk sent from Ampta have also alone been sent for the same reason.

2. The culture of the worms is carried on solely in the native manner; no artificial means for incubating the eggs are used. They are laid on the same bamboo trays where the rearing process takes place, and thus placed, they are hatched in two days, or three at the most. The rearing house is a common hut without windows, the door darkened with a curtain, and the uprights on which the stages are supported are placed in basins of water to prevent ants reaching the worms. The trays are plastered with dried cowdung.

3. From the time when they commence feeding to the completion of their growth, they feed without any intervals of rest, until the twentieth or twenty-seventh day, according to the heat of the season, when, having attained their full growth, they are dormant for three days. They are then placed on trays of matting, on which strips of bamboo are fastened in concentric circles about an inch apart, and these mats are placed at an oblique angle to the sun along the sides of a shed, so as to give plenty of air and light, without exposing them to the direct rays of the sun. The completion of the cocoons occupies about three days. The chrysalides, not intended for propagation, are destroyed simply by being exposed to the full heat of the sun. The others are stored in the darkened chamber in an airy situation.

4. The period during which they are dormant varies in this climate from twenty days in the hot weather to one month in the cold. The total period of evolution thus takes from six and a half weeks to nine weeks, according to season, and there are six or seven such periods in most years. Eight is unusual. I am told that the silk produced in February, June, and November, is usually considered the best, that at other times being inferior. The two specimens of yellow silk sent are both of the November produce; the difference in class being due to preparation from inferior cocoons.

5. The packets of eggs are expected to be ready in a fortnight at furthest.

A.

A. H. BLECHYNDEN, Esq., to DR. G. BENNETT, HON. SECRETARY OF ACCLIMATISATION SOCIETY OF  
NEW SOUTH WALES.

[Per Steamer "Hindustan."]

Agricultural and Horticultural Society of India,  
Metcalf Hill, Calcutta, 11 April, 1870.

DEAR SIR,

In continuation of my letter of the 11th February last, I have the pleasure to advise despatch, by this opportunity, per pattern post, registered and paid, of a small perforated tin box, containing eggs of the "Boro Poloo," (*Bombyx textor*) or annual silkworms, and trust they will reach safely and in good order.

Other silkworm's eggs from Assam, the plants the worms feed on, together with seeds of such plants are in course of collection, and will have despatch immediately they are procured.

Yours faithfully,

A. H. BLECHYNDEN,  
Secretary.

CHARLES BRADY, Esq., to THE HONORABLE THE COLONIAL SECRETARY, SYDNEY.

Curl-Curl, Manly,  
17 March, 1870.

SIR,

I desire to call your attention to a subject which, under present circumstances, may become of large and immediate importance to the interests of the Colony.

I believe that some time last year a despatch from Lord Granville made this Government acquainted with the representations of the Silk Supply Association of London, and thereby, both with the urgent necessity in England for a larger import of silk to make up the actual deficiency of raw material for manufacture, and also with the excellent opportunity for Colonial producers to enter the market at the present time, when not only England but every Continental country suffers from the extreme scarcity and high price of this article. The scarcity, owing to the continued devastations by disease of silkworms all over Europe, in all probability may last for years, and it appears opportune for me to request your particular consideration of Lord Granville's despatch, and the contents of this present letter, which may largely conduce to the future welfare of the Colony.

My own personal knowledge and experience in the treatment of silkworms in New South Wales and Queensland for several years justify me in expressing my conviction that this part of Australia at any rate is peculiarly well adapted for the production of cocoons. I began the study of the subject in 1862, and have since devoted myself exclusively to this pursuit in all its relations, particularly to experiments and efforts to take advantage of our brilliant atmosphere, and of various food grown in this climate, to introduce and breed superior races of silkworms, and especially to free them from the dire disease which now for so many years has all but destroyed an industry yielding annually more than thirty millions of pounds sterling to the present cultivators of Southern Europe.

My experiences have been most conclusive and satisfactory, and it is proved that the importance of our proceedings here is not unappreciated in England by persons capable of forming an estimate of their value.

I am well aware that the public mind is prepossessed with the idea that the growth of silk in Australia must prove unremunerative on account of the high relative price of labour in the Colonies, but I have never met with even one person who had investigated the subject, or qualified himself in any way to form an opinion, who held this idea; in fact, there not only is nothing to prevent silk being raised as cheaply in Australia as in France or Italy, but there is very good reason to believe that, favoured as we are by climate and cheap land, we may be in a position to undersell any country in Europe.

When I first engaged in this enterprise I own I myself entertained some misgiving about the cost of labour. It was this very circumstance which set me to work to contrive means to obviate what might prove a serious obstacle to a commercial success in silk growing in these Colonies, and I devised the plan of multiplying the number of crops obtainable in a single season. In every country besides this the most valuable worms (being annual only) give but one brood or crop a year, and this occurring at the most unsettled and precarious period is attended with great risk, and frequently with serious expenses and casualties, it occurred to me to profit by our long season of clear weather, repeatedly to take advantage of our opportunities for providing sustenance during many months continuously for the worms, and by managing to have worms to consume the food at such times as the many different varieties of mulberry are severally in perfection. This is done by employing cold and moisture as well as warmth in the preservation of the grain, and also by having many varieties of mulberry silkworms adapted by their nature to thrive on the different varieties of food plant.

To thoroughly carry out my plan I imported at great expense mulberry plants of every country, the quality of which at all gave hopes of obtaining useful sorts; and I also, at even much greater cost, and after many and repeated failures, succeeded in introducing and rearing in this Colony and in Queensland, all the most celebrated and choicest breeds of silkworms from every silk-growing country. A large number of these have, after years of severe labour and close attention, become thoroughly acclimatised, and many important races, under the influence of careful as well as special treatment, prolonged through several generations, have become freed from the taint of disease, and are now healthy.

I believe the Government has long entertained a wish to afford our settlers in the interior—and more particularly the younger portion—instruction, and the means to profit by the same wonderful source of wealth which renders the rural population in silk-growing countries so prosperous; but there have been available neither the special knowledge nor the food plants, and not even one single species or variety of profitable silkworm has been established in the Colony until I had the good fortune to succeed in introducing and naturalising them. Now the case is different to what it was some years ago, and I submit for your consideration the expediency of the Government at once adopting measures to impart information, and spread the industry, in such districts of the Colony as may offer a fair prospect of doing well.

I would urge upon your attention the financial importance of silk. First, the eggs (grain), small as they are, and prolific as is the animal, it is a well-known fact that Europe in one year paid to Japan alone cash to the amount of £1,250,000, the next year nearly one million and a-half. The last season in Japan was a failure; and, notwithstanding the money was there to pay, enough eggs are only found to take the foreigner's money to the extent of half the quantity demanded. In Europe this spring (April and May), it is estimated that, to supply the demand in France and Italy alone, not less than 7,000,000 ounces of eggs are required, the present money value (an exorbitant one) is nearly £8,000,000; and of these seven million ounces required but six millions are forthcoming, so that in this one item there would be a very large opening for a new export from Australia. I ought, however, to say that it would be preposterous for any one to entertain the idea of supplying such a market without adequate knowledge and the right sort of stock. I may add, as matter of information, that in every country the production of eggs is distinct from the production of silk; and that the producers of silk, as a rule, do not use eggs from their own stock, but purchase every season grain grown by others than themselves. The production of good seed is a special craft.

Cocoons are silk, and in this primitive condition should form a new staple in our exports. It is usually thought necessary to wind or reel the cocoons to render the produce marketable, but such is not the case; the cocoons thoroughly dried (or, more correctly speaking, desiccated) in a proper manner may be packed and pressed with hydraulic pressure. If properly desiccated (the grub inside being pressed into dust), upon unpacking and immersion in water the cocoons resume their original shape uninjured. Cocoons thus treated may be sold to the merchants or to the mills in bulk for proper reeling according to the purpose for which the raw silk is required, but wound or reeled silk, unless so handled or prepared to meet the requirements of the throwster, is merely of value as "waste" and of no value as "raw silk." The markets of Europe are open for illimitable quantities, and the nature of silk being unlike that of any other material there is no danger of a substitute coming into competition but rather that as civilization and trade extend so will the demand for silk increase. It is to the production of *cocoons* that the attention of growers in this Colony should be directed.

There are many districts in the Colony suited to the rearing of out-door silkworms. Among others not yet satisfactorily established I have introduced three different species, the most valuable of their class, now domesticated in the Colony, producing severally one brood, two broods, and three broods in one season—first the "Yama," feeding on common English oak (*quercus* of several varieties) furnishes light green silk of the most superior kind; it is the most valuable of all but the most difficult to rear; the two latter, the "Perry," also feeding on the same kinds of oak as the Yama, and the "Ailant" feeding on *ailantus glandulosa*, find the climate and food singularly congenial, and thrive to perfection. The natural increase of such prolific creatures multiplying two and three times in one Australian season must necessarily yield under proper conditions and intelligent management a prodigious amount of cocoons.

It is manifest that silk growing in these Colonies once established or fairly set going would give lucrative employment to large numbers of persons of both sexes, and tend greatly to elevate as well as to enrich them; time was when the peasants of Europe were at least as unimpressionable and as difficult to receive new ideas as our own wide and thinly spread population is now supposed to be. Such as our colonists are, we may at least consider that if worthy of being entrusted with political power they are not unworthy, by reason of their want of intelligence, of having such attention bestowed on their welfare as may in some degree make up to them for the disadvantages under which people who live in the bush necessarily labour; in truth our distant settlers have but few benefits conferred upon them, and any new export raised in any part of the Colony enriches not only the producers but is capital gained to the community.

Nor is the production of silk in these Colonies without interest in regard to immigration. I have stated in another quarter my conviction that the exhibition of Colonial grown silk and healthy silkworm grain of good quality by authority of our Government at some of the chief seats of this industry in Europe, would have a powerful effect in directing the thoughts of enterprising and energetic people towards these shores. I am sure that authentic information as to our capabilities and reasonable facilities would induce families skilled in many arts and employments, which have yet found no footing here, to come amongst us; not a few would come at their own expense, or at any rate pay part, bringing with them (for silk growers are generally well to do) besides their experience and labour, their tools and appliances, and some capital. We should implant at very small cost amongst us new industries suited to our soil and climate, while the immigrants from whatever country they might come would enjoy the advantages of our liberal institutions and land policy. The first step is to let people know that they may find here fair scope for the particular occupations in which they have been brought up. Silk growers in all countries are generally the most temperate and intelligent of their class. Manufacturers and capitalists are eager for new sources of supply, and would require no other inducement to turn their attention to this country than the demonstration that certain results are obtained. That we can do as well in a general sense as any country cannot be doubted, and in what has actually been done in eradicating disease and in multiplying the power of production it is plain we are in advance of every other; the reputation of Australia is already such as to favourably prepossess enquiring minds.

My operations and experiments have all been carried on by myself, unsupported by any extraneous aid; what I have effected alone and single-handed is work that in every other country, where any parallel success has been accomplished, has been done by Governments, with the resources and at the cost of the State. I take no reproach to myself for not having before communicated with you on this subject; and I think that the very fact of my having effected what I have done without assistance is valid argument why Governments should be very reticent in taking up every likely scheme for promoting new industries; but now that success is a demonstrated fact, and the opportunity so good, I venture to suggest to you that it may be sound policy not to ignore the experience and knowledge gained. There is no secret nor patent in my proceedings or methods. I have been ever ready, and always have shown living stock in every stage of growth at whatever period of the year information has been sought of me; and I have made the mode of operation clear to every inquirer; what I have found out with much labour and difficulty, and by suffering many failures, is plain now, and the way is easy for anyone to follow. It is true I have special qualities, education, training, and opportunities peculiar to myself for the work, but is it social or political wisdom to wait until the masses of untutored minds become spontaneously imbued with craving for knowledge and instruction, and undertake the toil, and incur the anxiety of doing over and over again, each one for himself, that which now once done is done for all?

I therefore shall be happy, should you determine to pursue the matter, to afford you, without reserve, any information you may be in need of, and any personal assistance I can render. The Government already possesses several useful varieties of mulberry and other silk-producing plants at the Botanic Gardens, and I would willingly supply other varieties in my possession in which they are deficient. In regard to the silkworms themselves, the case is difficult; besides myself, there is no one in the Colony, as far as I am aware, qualified to judge of their value. It by no means follows that what succeeds with me will do equally well with inexperienced, and perhaps careless or clumsy hands; hence, I am not disposed to risk the liability to reproach, or to be held responsible for the possible failures of others. Should you, therefore, approve of my suggestion, and accept as a free gift from me such stock as may be required, I will, on timely notice, furnish any quantity of acclimatised silkworms or silkworm's eggs of any varieties, races, or species I possess, that may be needful to spread the culture throughout the Colony. I say as a free gift, as this would relieve me to some extent from discomfort in case of an unsatisfactory result. If the worms perished, or did not turn out well, the loss would be mine; and if, as I think we may reasonably hope, they take a fair hold on the country, I entertain no doubt that a liberal Legislature in due time would mark its sense of service rendered by a private individual, and requite my endowment by a grant of land, or in such way as it may deem appropriate.

I have, &c.,  
CHARLES BRADY.

---

CHARLES BRADY, ESQ., to DR. G. BENNETT, HON. SECRETARY ACCLIMATISATION SOCIETY OF  
NEW SOUTH WALES.

Curl-Curl, Manly,  
1 August, 1870.

MY DEAR SIR,

It is much easier to ask for the information you desire than to give it in a few words. What I have always considered, and which is now demonstrated to constitute a special advantage to silkworm grain producers in this climate and hemisphere for the supply of European markets, is the faculty we possess of obtaining here, grain of the best annual mulberry silkworms, laid several weeks before the great heats of our summer, in fit state for transport to the northern hemisphere, so as to arrive in cool and cold northern latitudes at a season admitting a thorough natural hibernation there before the eggs are again subjected to conditions of spring.

This matter of hibernation is very important, and particularly with regard to the most valuable annual mulberry silkworms; annual worms, strictly so called, are beyond all question the largest givers, individually, of silk, and in quality also they are at the same time much superior to any of the double, treble, or many brooded varieties. With the exception of one single wild or out-door worm, feeding in the open on mulberry trees, every known variety and race is absolutely a creature of domestication, produced by long ages of artificial rearing and treatment, more or less strange to natural conditions. The one wild mulberry silkworm yet extant is understood to be incapable of domestication. I do not vouch for that fact, but from what I have been able to learn of the history and habit of this solitary species which has escaped the influence of man, it seemed to me to indicate most forcibly the necessity of a proper hibernation with all silkworms. I think the double, and many brooded varieties may, in some sort, be considered abnormal and in a certain sense impaired. (See my communication, June, 1868.) It is true, generally, that they are vigorous and prolific, and show indications of health now but seldom (in Europe) seen in the annuals; but the annuals in countries untouched by the disease are much inferior to the annuals of Italy and France, and by no means so highly superior as are both these latter to the double and many brooded. Hence, the great importance of endeavouring to save some of the fine races of Europe before they all become, as many are already, utterly extinct.

I consider it a very proper subject of speculation, whether indeed the stand point of excellence reached in Europe is the ultimate degree of perfection attainable. Centuries ago mulberry silkworms were introduced into Europe from Asia. In progress of time, by change of food and climate, or treatment and management, or by a concurrence of causes, they became greatly superior to Asiatic descendants from the same origin which we are well informed are treated now in precisely the same way as were their ancestors of many hundreds or thousands of years ago. Many high class races were gradually produced, and so to speak, ennobled, by the skill and care lavished on them by the French and Italians. It is possible that the disease which has so suddenly swept away the best European silkworms may have been a resentment of nature, not of improvement having been pushed too far, but of conditions of further improvement not having been maintained or continued, and fresh elements of vigour supplied. It was this idea that led me to urge others to do as I am myself doing, namely, to endeavour to take the highest stand point reached in Europe as our Australian starting point—to obtain the finest silkworm grain obtainable, and treat it systematically for improvement, rather than merely reiterate here the self same treatment to which the worms were before accustomed. If five and twenty years ago (before the disease revealed itself in Europe) good grain of the best kinds had been introduced on to this continent, and treated with judgment and discrimination, how good long ere now would have been the position of Australian silkgrowers; how thoroughly we should now be able to command the markets of the world for grain, as well as of Europe for silk. In all probability the disease would never have made its presence known in this country, for the silkworms reared here would have escaped the causes, whatever they may be, which have been so disastrous in Europe, and these Colonies would now be enjoying the profits of a production, greatly exceeding the aggregate value of all the gold, wool, and other commodities now raised here. The policy, however, of introducing such a wealthy industry was not then, and still is not felt, the statesman is yet to appear, who will take up the subject and deal with it effectively.

We are familiar enough with the phenomena of hibernation, both in the vegetable and animal worlds. In a true sense all nature requires a rest; and yet, during the period of sleep, wintering, or hibernation, very influential causes and processes are at work, which give tone and character to the future course of the organs which determine the greater or less development of every animal or plant. To Englishmen, accustomed in their notions of high culture, whether of animal or vegetable life, to endeavour by selection and well-considered nurture to produce and perpetuate the qualities most desired, and in which all

all experienced persons are very careful not to overstep or overstrain the limits of time or season, it is remarkable that no other people should have paid due attention to this simple but most important matter of hybernation. It is only quite recently (last September, and long after the publication of our doings in Australia) that a French gentleman, highly distinguished by his talents and acquisitions in science, in some experiments with which he was charged by his Government, bethought him of the same notion which had occurred to us, that of artificial hybernation, and his success is announced to the world as a "singular discovery" (*une découverte singulière*). (See the French papers, December, 1869, and January, 1870). The Italians appear to have tried artificial hybernation previously, some ten or twelve years or even longer before this "singular discovery" (as experiment only); while here, in Australia, as you are well aware, we have acted for years habitually throughout whole seasons working by cold and moisture to produce and maintain hybernation. This artificial wintering is the principle with which I started to obtain when required a succession of rearings hatched out at will, day by day through the season, of the annual mulberry silkworm. Perhaps it was my procedure in this respect, so strongly commented on, and the knowledge of it circulated by the Silk Supply Association of London last year, which directed the attention of the French authorities to the subject.

As to the probability of a continued demand for foreign raised silkworm grain in Europe I wish to be very careful in answering such an enquiry. It is generally believed that the entire mass of all the silkworms in all the great silk growing countries of Europe is more or less affected or predisposed to disease, and I therefore think that even under the most favourable circumstances, whether in Europe or elsewhere, a considerable time must elapse before the worms regain their old standard of health; the disease has to be worn out and time or science to reinstate the elements of health and prosperity; but all this while what is to become of the stock now dwindling away? Many years ago in a certain district in England sheep fed for a lengthened period on the same pasture gradually lessened year by year their yield of wool and otherwise deteriorated, until suddenly one season they had no fleece at all. Science was called in and investigation made, when it appeared that for a long period the wool had been exported or deported from the locality year after year, and no representative matter placed in its stead; in short the soil had parted with all its wool, so the sheep had no wool to gather, and dame nature was too hard pressed to be allowed time to collect and replace unaided in the soil the deficient elements; it was recommended to manure the pasture ground with refuse wool from the factories, this was done and in due time the sheep reappeared clothed in fleece. Now I have never heard of refuse silk, I mean silk rags (whatever becomes of the rags is a mystery, for the annual quantity must be enormous), being used as manure for mulberry trees, nor of its chemical constituents being used to make good the drain which for many centuries the land has undergone. We use up cloth and rags of every kind, except silk, again and again in one form or another, but old silk what becomes of it? Is it waste pure and simple? I do not pretend to say that the European silkworm will not recover in its old homes its old vigour and excellence, but I do opine "not yet."

I hope these replies will satisfy you. I am very tired and can write no more at present; but I remain

My dear Dr. Bennett,

Yours very faithfully,

CHARLES BRADY.

P.S.—When I speak of *the* disease in this letter, I mean that *extraordinary* visitation which has destroyed and still ravages what is left of the most valuable stocks in Europe; this disease is of quite a different character to any of the many *ordinary* and often very severe maladies to which the silkworm has been liable for many years. The cause or causes of *the* disease are yet found inscrutable—there is something not yet revealed or at any rate not comprehended, for the plague seems to be heedless of any influences for good, except fine weather and the best food or change of climate, and at best these are by no means effective at once; with bad weather and inferior leaf the process of dissolution is marvellously rapid and the worms perish by millions; this is especially the case when the caterpillars are near maturity.

EXTRACT from the *Sydney Mail* of the 23rd July, 1870.

DR. BENNETT has obliged us with a letter written to him in his capacity of President of the Acclimatization Society, by Mr. Brady, from which we make a few extracts. Mr. Brady gives an account of his twelve months' transactions at Curl Curl, where he is nursing what he supposes to be the germ from which the silk industry of New South Wales is to spring. He says:—

"I have now closed up active operations for the season with all living silkworms (except the moths, a few of which remain); and, as you desire to know the result, as far as concerns the importations of the Acclimatization Society, I have the pleasure of confirming my first report, and informing you that the mulberry worms from India continued to the last to do well. Of course the yield of silk is much inferior in quantity to that from the principal European races, but the quality and lustre are excellent. For my own part, I think the outturn of these small yielding worms, double, treble, or many brooded in the season—taking into account the cost of labour, food, and management, &c., as well as the safety of a profitable result if worked in a proper manner—bears a very favourable comparison with the outturn from the more valuable but much more difficult to rear and precarious-lived single-brooded worms (annuals) of Europe or Japan. In the first case, operations continue for months at any time—spring, summer, or autumn, or for as long or for as short a time as mulberry leaf is available; in the latter only for a few weeks in spring, subject to all the vicissitudes and chances of the most uncertain period of the year, unless indeed the grower adopts my system of bringing the annuals into period by cold and moisture, as well as warmth, whenever they are wanted. If there was any attention given to this subject in the Colony, or it could be made worth while, I could easily manage to supply not eggs unhatched or uncertain, but young living silkworms, of fine kinds, which other persons growing or possessing the food could at any time procure from me, and rear through the rest of their natural course, and thus avoiding expensive preparations, requiring a good deal of skill and management, reap a certain profit from a very small outlay."

Private letters contain information relative to the reception of a packet of silkworm eggs, by the highest silk authorities in Europe, from Mr. Brady's stock raised at Manly. In Italy they were received with great favour. "They were everywhere pronounced to be splendid fertile eggs, which is a point of great importance in France and Italy, as their own native races are so diseased as to be useless for mercantile purposes," says one correspondent. Cocoons of the same race (Milanese) possessed by Mr. Brady pleased them exceedingly, and the writer informs his correspondent that "eggs of that species would find a good market in France and Italy." One of the best authorities in France on silkworms pronounced the samples in fine condition, and greatly admired the system adopted in transporting them. Other distinguished and practical men expressed the same opinion, and stated that "you may at once calculate on my being able to place for you a large amount of eggs." Another letter says, "the eggs were found in excellent order—not a single egg was hatched and not one was crushed." This,

This, then, is the information we get concerning Australian "*grain*" (the technical term by which eggs are now known). Mr. Brady's observations on these facts, in the letter alluded to, is this:—"The result of the first shipment also bears out what I have so often told you and others of the practicability of supplying from here the markets of Europe with better and more reliable grain than can be obtained in any other part of the world."

It thus appears that Mr. Brady's experiments have put us in possession of knowledge with relation to our advantages over the rest of the world as silkworm egg producers, for which we have reason to be very thankful. Our advantages are twofold. In the first place, in our climate the Italian, French, and Japan worms have been produced without any trace of the disease which ravages them at home; and in the second, we are in a position to supply newer seed to the European sericulturists than can be done from any other part, seeing that the "*grain*" season here is December, January, February, which allows of the seed or grain arriving in the cold season, and having no tendency to hatch before the food is ready for it. In Japan and California the grain season is the same as in Europe, and consequently time is lost, and the seed is comparatively old when hatched.

Something should be done in this matter. We can produce cocoons with the assurance of obtaining an active market for them, which never has been the case before; and should Mr. Brady's expectations be confirmed, the climate of New South Wales will enable several crops to be produced in the year. And then, further, for the more skilful we have accorded to us, apparently by geographical position, the speciality of producing eggs for exportation of great superiority.

### Commission.

VICTORIA, by the Grace of God, of the United Kingdom of Great Britain and Ireland, Queen, Defender of the Faith, and so forth,—

To our trusty and well-beloved—

EDWARD ORPEN MORIARTY, Esquire, Engineer-in-Chief for Harbours and River Navigation ;  
 JOHN WHITTON, Esquire, Engineer-in-Chief for Railways ;  
 PHILIP FRANCIS ADAMS, Esquire, Surveyor General ;  
 WILLIAM CHRISTOPHER BENNETT, Esquire, Commissioner and Engineer for Roads ; and  
 MORRIS BIRKBECK PELL, Esquire, Professor of Mathematics, Sydney University ;—

Greeting :

WHEREAS it has been represented to us by a numerously signed petition from the inhabitants of the Hunter River District of our Colony of New South Wales, that great damage is caused by Floods in that District: Now know ye that we, reposing great trust and confidence in your zeal, industry, discretion, and integrity, do by these presents authorize and appoint you, or any three or more of you, as hereinafter mentioned, to make a diligent and full enquiry into the premises, and to report as to the means which in your opinion should be adopted with a view to remedying or mitigating the evils complained of: And we do by these presents give and grant to you, or any three or more of you, at any meeting or meetings to which all of you shall have been duly summoned, full power and authority to call before you all such persons as you shall judge necessary, by whom you may be better informed of the truth in the premises, and to require the production of all such charts, maps, plans, drawings, tracings, books, papers, writings, and all other documents as you may deem expedient; and to visit and inspect the same at the offices or places where the same or any of them may be deposited, and to enquire of the premises by all other lawful ways and means: And our further will and pleasure is that you, or any three or more of you, after due examination of the premises, do and shall within the space of three months\* after the date of this our Commission, or sooner, if the same can reasonably be certified to us in the office of our Colonial Secretary, under your or any three of your hands and seals, certify what you shall find touching the premises: And this Commission shall continue in full force, although the proceedings thereunder shall not be continued by adjournment from time to time; and you or any three or more of you as aforesaid may from time to time, if you shall see fit, without waiting for your full and complete report, certify your several proceedings into our said office, as the same shall be respectively perfected: And we hereby command all Government Officers, and other persons whomsoever, within our said Colony, that they be assistant to you, and each of you, in the execution of these presents: And we appoint you the said Edward Orpen Moriarty to be President of this Commission, and do give you power, at your discretion, to procure such clerical or other assistance as may be absolutely necessary for enabling you duly to execute this Commission.

\* This period has been further extended from time to time until 31st October, 1870.

In testimony whereof we have caused these our Letters to be made Patent, and the Seal of our said Colony to be hereunto affixed.

(L.S.) Witness our right trusty and well-beloved Cousin and Councillor, SOMERSET RICHARD, EARL OF BELMORE, our Governor and Commander-in-Chief of our Colony of New South Wales, at Government House, Sydney, this thirtieth day of April, in the thirty-second year of our reign, and in the year of our Lord one thousand eight hundred and sixty-nine.

BELMORE.

By His Excellency's Command,  
 JOHN ROBERTSON.

Entered on record in Register of Patents, No. 9, pages 415 to 418, this thirtieth day of April, 1869.

HENRY HALLORAN,  
 Under Secretary.

THE SECRETARY, HUNTER RIVER FLOODS COMMISSION, to THE PRINCIPAL UNDER SECRETARY.

Hunter River Floods Commission,  
Public Works Office,  
Sydney, 24 August, 1870.

SIR,

I have the honor, by direction of the Hunter River Flood Commission, to forward herewith, for the consideration of His Excellency the Governor, a Progress Report of the Commission, dealing with the more urgent part of the question, namely, the protection of the Bank of the River Hunter at West Maitland.

I have, &c.,  
GEORGE FAITHFULL,  
Secretary.

---

FLOODS IN THE HUNTER.

PROGRESS REPORT.

To the Right Honorable the Earl of Belmore, Governor and Commander-in-Chief of the Colony of  
New South Wales, &c., &c.

MAY IT PLEASE YOUR EXCELLENCY,—

We, the Commissioners appointed to inquire into and report upon the best means of mitigating or preventing the evils occasioned by Floods in the District of the Hunter River, have the honor to submit the following Progress Report, which, at the request of the Chairman, has been drawn up by Professor Pell.

Finding that without further time it will be impossible to report finally upon the whole subject submitted to us for consideration, we deem it desirable at once to call your attention to the dangerous state of certain parts of the river banks at the town of West Maitland. The recent floods have not only inundated a large portion of the town, but have carried away a number of houses, together with the ground upon which they stood; and others, although above flood-level, are in great danger on account of the close proximity of the river, which has encroached almost to their doors. In some cases there is scarcely any space left between the High-street and the river except the ground upon which the houses stand.

It is probable that if a serious flood should occur before some efficient means have been adopted for the protection of the banks, much valuable property would be destroyed, and that the whole town would be placed in greater danger than on any former occasion. The inhabitants seem much alarmed, and being at the same time determined to do something for the protection of their town, they are waiting anxiously for any recommendations which we may have to offer.

The late repeated floods have protracted our inquiry, by entailing upon us the necessity of taking further evidence, of re-examining the ground, and of collating and considering the great mass of additional information which we have been enabled to collect. The difficulty and complexity of the subject upon which we are engaged, as well as the magnitude of the interests involved, render us unwilling to bring our inquiry to a hurried conclusion.

We have determined therefore, with your Excellency's permission, not to report finally until we have given to every point the fullest consideration, and until we are in a position to lay the facts before you in a clear and systematic form. With respect to the town of West Maitland, however, we have unanimously arrived at one definite conclusion. The inhabitants must look to local works alone, and not to any improvement, or alteration in the channel of the river, or diversion of its course, for their protection. Whatever conclusions we may finally arrive at, and whatever works we may recommend or not recommend to be undertaken, it would be obvious folly to leave the town at the mercy of the river, pending the discussions and delays which will inevitably follow, whatever be the nature of the decision at which we may arrive.

Any improvements of the channel of the river of so extensive a character as would materially relieve the town of West Maitland, and justify any reduction in the magnitude and strength of the local works which we are prepared to recommend for its protection, would involve so large an expenditure, and would bring into collision so many conflicting interests and so many diverse opinions, that it may be doubted whether even if proposed they would ever be carried out. And if no delay should occur through want of zeal, or of unanimity or of money, yet a considerable time would necessarily elapse before the works could be completed; and meanwhile the town would be in constant danger, and might not improbably be severely injured.

In an Appendix will be found an account of the works which we recommend for the protection of the banks, and for excluding the flood-waters from the town. There will be found also a plan of the town, showing the line along which in our opinion the levée should be carried. We profess however to indicate only in a general manner the character of the works proposed.

*The*

*The protection of the banks.*

The experience of the last few months has shown the necessity of something to stop the encroachments of the river, which threaten not only injury but destruction to a considerable part of the town.

The plan described in the Appendix of lining the banks with rubble stone thrown in and allowed to find its own slope, seems the best, indeed the only one which could be adopted with any reasonable prospect of success. The banks and bed of the river consist of a light alluvium, extending to a great depth, as was found in sinking the cylinders for the Belmore Bridge. Anything of the nature of solid masonry is therefore quite out of the question, on account of the practical impossibility of obtaining a secure foundation, without which a solid wall, although far more expensive, would certainly not be more effective than a mass of loose stone.

The ordinary effect of a river in undermining and washing away the banks on the concave side of every bend is greatly increased at West Maitland by layers of sand of varying thickness underlying the whole town, at a level somewhat above that of ordinary high-tide. After a flood, especially so long as the back-water stands at a higher level than the river, water percolates through this stratum into the river, keeping the banks moist and soft, and carrying with it sand and other matter. The banks are by this action gradually undermined, and kept in a tottering condition. The whole substratum seems reduced to a pulpy state, ready to be squeezed out by the superincumbent weight. We do not expect that this action will be prevented by the works which we propose. The water will continue to find its way through, and to carry some of the sand with it into the river; and consequently we expect that occasionally some parts of the bank will subside after heavy floods. We do not however anticipate any danger from this cause, if the levée be kept well back from the river, and no houses stand immediately on the bank. The buildings which are now in that position will require some special works to render them permanently secure.

The stone casing will, we believe, prevent any further encroachment; but if, as we expect, the banks here and there, and from time to time, subside, the loss must be made good by fresh supplies of stone. It is probable however that after some time the whole bank will assume a position of permanent equilibrium, and require no further maintenance.

*The embankments.*

It will be seen by a reference to the plan which will accompany this Report that the proposed levée includes only the more densely populated parts of the municipality. We fully recognize the many advantages of Mr. Moriarty's more extensive scheme as explained in his Report to the Minister for Public Works, dated 9th July, 1868; but the saving of expense, and what is perhaps still more important, that of time, involved in the lesser scheme, are alone sufficient to justify its adoption. There are other circumstances also which have influenced us in arriving at this decision. We did not, until the occurrence of the last great flood, fully realize the magnitude of the torrent which pours into the back country by way of the Long Bridge. A portion of the water thus introduced spreads in all directions over the already submerged lands, but a considerable part makes its way by a nearly direct course to the point between East and West Maitland, which is the outlet on such occasions. An embankment extending around the whole of Louth Park would present a very serious obstacle to the progress and distribution of this water. Even without any artificial obstruction, the level of the water during high flood is considerably higher near the Long Bridge than at the outlet, and would no doubt be raised still more by any impediment to the escape of the water. How far this effect would be produced it is impossible to say. A little addition to the height and strength of the embankments upon that side might perhaps be found to be a sufficient provision against the danger, but we cannot recommend that such an experiment should be tried. If at any future time, under altered circumstances, it should appear desirable to enclose a larger area by levées, the inner line which we advise would not lose its value, for it would afford a second defence to the town itself in case of accident to the outer embankments.

If from the experience of a very extended term of years it were possible to assign a limit to the height to which future floods may rise at Maitland, there would be no difficulty in determining the height to which the levées should be carried. But what has happened during the last thirteen years in the valley of the Hunter, and in many other somewhat similarly situated districts in various parts of the Colony, shows that it is impossible to form any definite and certain opinion as to future flood-levels, and that we must be content to deal with probabilities only. Judging by probabilities, we recommend that the levée on the river side should be made 2 feet above the highest flood-level of this year. On the land side they should be 5 feet above the height of the back-water of 1867, and be securely faced with stone to provide against the action of the waves, which sometimes rise to a considerable height. There seems to us little probability that any future flood will rise above these limits. If the addition of a few feet would turn this probability into a certainty, it would no doubt be desirable to make it; but unfortunately

unfortunately this is a case in which certainty is not attainable. It will be seen by reference to the plan accompanying this Report that the proposed line of embankment does not extend entirely around the town, the natural surface of the ground being itself for a considerable distance more than 2 feet above flood-level. So slight however is the elevation at any point that the addition of a few feet to the height of the levée would involve the necessity of nearly completing the circuit. This would proportionally increase the expense, without adding we think to the safety of the town.

During the height of a great flood a large quantity of water breaks over the right bank of the river at a point near Oakhampton, generally known as Graham's, about  $2\frac{1}{2}$  miles above Maitland, and some also escapes from the river on the same side near Hall's Creek. The whole of this, forming of itself a considerable river, flows by way of the Long Bridge into the valley of Wallis' Creek. From observations made by Mr. Moriarty and Mr. Adams during the late great flood, we estimate the volume of this discharge at about 25,000 cubic feet per second. Partial attempts have been made to prevent this overflow, and projects for effecting the same object are, we believe, still entertained. We think it necessary therefore to point out how dangerous it would be to the town of West Maitland to confine this large quantity of water to the channel of the river. If prevented from escaping by the back of the town, it must come down by the front, with the obvious effect of raising the flood-level there. The circumstances of the case are too complex, and the attainable data insufficient, to admit of any exact calculation as to the extent to which the flood-level would be thus raised; but the following data afford the means of forming something approaching to a definite opinion on the subject:—At the height of the flood of 1861 the discharge of the channel at the West Maitland Bridge was about 83,000 cubic feet per second. At the same place, in the great flood of 1857, the discharge was 105,000 feet, the difference being 22,000 feet per second, while the difference in the height of the two floods was about 4 feet. There can be no doubt then that an additional 25,000 feet of water per second forced back into the channel above Maitland would produce a very serious effect. It is not probable that the additional rise would be so much as 4 feet, because some of this water would escape over the opposite bank; but it would be quite enough to destroy the security which the works that we recommend are likely to afford.

We feel so strong a conviction of the importance of these considerations, that our recommendation respecting the town embankments must be taken as conditional upon there being nothing done to diminish the relief afforded to the river by the escape of the water from Graham's downwards; nothing, at all events, until a corresponding improvement has been made in the main channel, rendering it capable of carrying the additional quantity.

We consider it very desirable that the whole of the High-street, including the Long Bridge, should be raised where necessary to the same height as the levée on the river side. Such a work would be a great convenience in case of accident to the levée, and might be the means of mitigating the disastrous effects of a flood of unusual magnitude, if any such should ever occur.

#### *Early floods.*

We must now consider whether there is any reasonable probability of the recurrence of those terrible floods which in the early days are supposed to have swept over the whole of the present site of West Maitland. On this subject we have the evidence of Messrs. John Eckford, John Brown, and Alexander M'Dougall, and some information furnished by Mr. George Wyndham and Rev. Alfred Glennie.

Mr. John Eckford appears to be veritably the "oldest inhabitant" of the Maitland District. He settled there in 1818, and, as far as we can learn, is the only living witness of the great flood of 1820. His recollections seem clear, and his evidence to be relied upon. He showed us three points at some distance apart, in the neighbourhood of Maitland, to which the water rose on that occasion. Upon connecting them by levels we find that they agree with each other, being about 6 feet above the highest flood-level of this year, corresponding with Mr. Eckford's statement that the flood of 1820 was 6 or 7 feet higher than any which has since occurred, including that of 1826.

Mr. John Brown of Singleton settled in that district in 1823 or 1824. At that time he saw drift left by some flood in the oak-trees on the banks, about 10 or 12 feet above the flood-level of 1857. He witnessed the flood of 1826, but describes it as inferior in magnitude even to those which have occurred more recently. "It broke over the banks," he says, "but not anything to speak of."

Many years ago Mr. Alexander M'Dougall observed near West Maitland traces of some early flood—probably that of 1820—which he believes must have been 4 feet higher than those of 1857 and 1867.

From Rev. Alfred Glennie we learn that his brother, Mr. James Glennie, was a witness of the flood of 1826, at Dulwich, about 8 miles above Singleton, and that its height at that place exceeded that of any subsequent flood. He saw also traces of some former and still higher flood.

In

In 1828 Mr. Wyndham saw drift in a tree at the ford at Dalwood, which he attributes to the flood of 1826, indicating a height 7 feet greater than the maximum of this year.

The evidence respecting the flood of 1826 is so conflicting that it would be idle to speculate upon it. There seems little doubt however that a great flood did occur in 1820, and that the water rose at Maitland to a height of 40 or 41 feet, measured by the gauge now in use, or about 6 or 7 feet higher than upon any recent occasion.

The important question is, whether anything of the same kind is likely to happen again. There has been nothing to diminish the rate at which the flood-waters come down from the high lands, but on the contrary, it is generally admitted that since the occupation of the country the surface of the land has become more hardened, and that the rain-waters flow off more readily.

The area of the watershed of the Hunter River above West Maitland is 7,090 square miles. One inch of rain in twenty-four hours over the whole of this area corresponds to the rate of 190,000 cubic feet per second. The maximum rate at Singleton Bridge during the flood of August, 1857, was about 131,000 cubic feet per second. This was increased by contributions from tributaries lower down, so that we may roughly conclude that a continuous and uniform rainfall of  $\frac{3}{4}$  in. per day over the whole watershed would keep the river in a state of equally continuous high flood.

The total rainfall during the month of March last was about 17 inches, as shown by observations at the Sydney Observatory, at Dalwood by Mr. Wyndham, and near Singleton by Mr. Dangar. The returns are 18.70, 17.52, and 16.45 inches respectively. During nearly the whole of that month the Hunter was bank high. If the rainfall had been distributed uniformly over the whole month, the daily rate would have been about  $\frac{1}{2}$  in., and no serious flood would have occurred. But according to the returns kindly furnished to us by the gentlemen above named, it appears that the average daily rate from the 14th to the 18th was about 1 in., and this caused the great flood which culminated at Maitland on the 20th. We have given these particulars for the purpose of showing how a few inches of rain falling in a few days may produce a great flood, whilst long continued heavy rain may not; and how greatly the difficulty of forming an opinion of what may happen in future is thus increased.

We find that with a rise at Singleton of 12 feet above the flood-level of 1857—the height to which the flood of 1820 is supposed by Mr. Brown to have attained—the present channel would discharge about 182,000 cubic feet of water per second, and the total discharge, including what would not pass under the bridge, would probably not exceed 250,000 feet per second. Accepting however all the evidence that we have respecting that flood, it is by no means certain, indeed very improbable, that so large a quantity of water came down on that occasion. The condition of the channel was probably very different then from what it is at present. Mr. W. C. Leslie, who has resided at Singleton since 1841, and who appears to have been a close observer of everything relating to the river, and who is a most intelligent and trustworthy witness, is of opinion that within his own experience the channel has doubled in width, and been cleared of many obstacles to the free discharge of the flood-waters. From Mr. Alexander Munro also we have some valuable evidence as to the enlargement of the channel near Singleton within his experience, which extends back to the year 1830. It is quite possible then that the great rise at Singleton in 1820 may have been caused by a quantity of water which would now flow harmlessly within the banks. Some of the apparent contradictions in the accounts which we have of the effects of the flood of 1826 at different parts of the river might perhaps be explained, if we had any exact information as to the changes which have since taken place in the magnitude and condition of the channel.

Mr. Moriarty, in his Report to the Minister for Works, has explained so clearly and satisfactorily that the great height of the flood of 1820 at Maitland is attributable probably to the obstacles presented to the escape of the water by the condition of the banks of the river and of the low lands at that time, rather than to the quantity of water which came down, that we have little more if anything to say on the subject. The banks of the river and portions of the adjacent flats were then covered with a dense and tangled scrub, greatly impeding the progress and distribution of the flood-waters. Now that the land is cleared the flood-waters when at their height escape with comparatively little impediment from the neighbourhood of Maitland, the point at which the river in such cases empties itself as it were into a basin. A rise of 6 feet above the flood-level of this year would leave scarcely a dry spot between Dagworth and Dunmore, or from Bolwarra House to Morpeth. The general slope of the surface of the land from Maitland to Hinton being considerable, the discharging capacity of the river when swollen to such dimensions, would be enormous. Such an elevation then, could scarcely be produced with the present condition of the surface, except by a supply of water from above twice or perhaps three times greater than what came down during any recent flood.

Upon a review of all the evidence and of all the circumstances, we are inclined to think that the water came down to Maitland at greater rate during the height of the flood in April last than it had ever done since the settlement of the country. At the same time we know that a steady rainfall of 2 inches a day for five or six days over the whole watershed of the Hunter, or a proportionally greater fall over a part only of that area, would almost double the quantity. It cannot be said that such a rainfall is so much in excess of what is known to have occurred, as to be entirely out of the range of ordinary probabilities; nor can it be said certainly that such a rainfall might not raise the water at Maitland to the flood-level of 1820. We feel bound therefore to point out what would probably be the effect of such a flood upon the town in its present state.

With an addition of 6 feet to the flood-level of this year the waters would cover very nearly the whole site of West Maitland.

With such an increased elevation, the quantity which escapes from the river at Graham's would be enormously increased, and instead of passing round through the back country would break into the town, and being joined there by the main body of the river, would sweep the High-street from one end to the other, and probably leave the town in ruins. We cannot recommend that any attempt should be made to protect the town against such a flood. It would be a dangerous experiment to put an embankment almost directly in the path of the great river which would under such circumstances roll down from Graham's. The town if embanked to a sufficient height would be completely isolated from any high land, and be surrounded on all sides by a raging torrent. If the swollen river, refusing to submit to the impediment thus placed in its path, should break its way through the levées, it would find the inhabitants beyond the reach of succour from without, and with their lives depending on the stability of their houses.

To carry the embankments to any higher level than what we recommend would increase the danger, by tempting the inhabitants to remain in the town after the position had become untenable. When the river shall have risen 2 feet above the level of the great flood of this year, without any symptoms of an immediate decline, it will be time for the inhabitants to seek safety upon higher ground. And although we are of opinion that it is improbable that such an occasion will ever arise, no reasonable man acquainted with the facts can doubt the possibility of such an occurrence.

We feel acutely the painful nature of the subject upon which we are dwelling, and the possible tendency of our remarks to increase the anxiety of those most concerned; but the duty of speaking plainly is imposed upon us, and we could not undertake the responsibility of recommending that the town of West Maitland should be embanked, without at the same time drawing your Excellency's attention to the fact that floods are said to have occurred, and may possibly occur again, from the effects of which neither the works proposed in this Report, nor any others which we are able to recommend, would afford any protection.

We have the honor to be,

Your Excellency's

Most obedient Servants,

(L.S.)	E. O. MORIARTY.
(L.S.)	JOHN WHITTON.
(L.S.)	M. B. PELL.
(L.S.)	WILLIAM C. BENNETT.
(L.S.)	P. F. ADAMS.

## APPENDIX.

THE works recommended for the protection of the right bank of the Hunter River at West Maitland are as follows :—

From near the Falls, a little above the Belmore Bridge, to a point as far down as may be deemed advisable—say to Victoria-street—and thence round the concave side of the bank opposite Potts' Point (in all, for a distance of about 150 chains), the projections and irregularities of the present exposed surface of the river bank should be trimmed down, and the whole brought to a gentle curve, with as uniform a slope or cross section as is attainable without incurring undue expense. The material taken off the prominences may be deposited in filling up the depressions, where it should be well rammed or punned in regular layers.

The face of the alluvial bank should then be covered with a protecting coat of stone tipped in from the top, and left to assume such slopes as the stone will ultimately rest at after having been subjected to the action of the floods. Any slips or subsidences which may take place from time to time (and their occurrence must be anticipated) should be made up by the deposit of fresh stone.

The stones generally should be in as large blocks as can be conveniently handled, but the whole produce of the quarry, large and small, may be used.

The protecting coat of stone will probably require to be about 4 yards in thickness, on an average, varying however according as it is exposed in a greater or less degree to the force of the current.

The external face of the stone-work should present a fair and easy curve to the river, as free as possible from projections and irregularities which might be likely to affect the currents.

Stone of suitable quality, and in sufficient quantity for the work, may be obtained from Campbell's Hill, where the rock crops out on the surface at a place a little to the north of the Hospital.

A sufficient extent of ground for the quarry, together with a strip of land for the railway which it will be necessary to construct from thence to the river bank at the Falls, should be at once secured, so that the stone may be run down in trucks to where it is to be tipped over the bank, at the least possible cost.

From the Falls, the line of rails will have to be continued under the land bay of the Belmore Bridge, and thence behind the houses bordering High-street, on along the top of the natural bank, to admit of the stone being discharged over the slope from side and end tip waggons.

The stone-work cannot be expected to attain anything like stability at first; it must be left for the action of the river to adjust the slope of the mass to such angle as it will ultimately stand at. Care must therefore be taken to provide fresh material whenever it shall be required, and to this end it will be necessary to keep the railway and plant in good order for some years to come.

The cost of this work may be estimated at £45,000.

*The Levée.*

The general course of the levée is shown on the plan which will accompany this Report. It should commence near High-street, about 6 chains to the westward of Charles-street, and be continued thence in a line generally parallel with the right bank of the river round Horse-shoe Bend, past the High-street embankment, along High-street to where the Great Northern Railway crosses, the street itself forming the levée for this distance; thence returning in a course parallel to the railway as far as the intersection of East Melbourne-street; along that street to its junction with Melbourne-street, and along the latter street to Nicholson's Racecourse, curving in across the racecourse, and terminating on the ridge at the railway cutting, about 8 chains to the westward of the Elgin-street Station. It should be kept well back from the river's edge, so as to be out of risk of injury from slips of the bank.

The levée, the core or centre part of which should consist of a wall of well-puddled strong tenacious clay, should be constructed throughout of the best materials procurable. It should be fully 12 feet in width on the top; the slope on outer side should be not less than to 2 to 1, and on the inner side  $1\frac{1}{2}$  to 1.

Where exposed to the waves of the back-water the levée should be faced with heavy stone pitching, not less than 18 inches in thickness, bedded in a layer of clay puddle, fully 2 feet in depth. On Melbourne and East Melbourne-street, where the levée would probably be formed by raising the embankment of the street, the stone facing might be laid in the form of a dwarf wall, well backed with clay puddle.

The levée may be estimated to cost about £12,500.

The embankment at the Falls should be enlarged and strengthened, so as to afford commensurate protection to the upper part of the town.

### Commission.

VICTORIA, by the Grace of God, of the United Kingdom of Great Britain and Ireland, Queen, Defender of the Faith, and so forth,—

To our trusty and well-beloved—

EDWARD ORPEN MORIARTY, Esquire, Engineer-in-Chief for Harbours and River Navigation ;  
 JOHN WHITTON, Esquire, Engineer-in-Chief for Railways ;  
 PHILIP FRANCIS ADAMS, Esquire, Surveyor General ;  
 WILLIAM CHRISTOPHER BENNETT, Esquire, Commissioner and Engineer for Roads ; and  
 MORRIS BIRKBECK PELL, Esquire, Professor of Mathematics, Sydney University ;—

Greeting :

WHEREAS it has been represented to us by a numerously signed petition from the inhabitants of the Hunter River District of our Colony of New South Wales, that great damage is caused by floods in that district: Now know ye that we, reposing great trust and confidence in your zeal, industry, discretion, and integrity, do by these presents authorize and appoint you, or any three or more of you, as hereinafter mentioned, to make a diligent and full inquiry into the premises, and to report as to the means which in your opinion should be adopted with a view to remedying or mitigating the evils complained of: And we do by these presents give and grant to you, or any three or more of you, at any meeting or meetings to which all of you shall have been duly summoned, full power and authority to call before you all such persons as you shall judge necessary, by whom you may be better informed of the truth in the premises, and to require the production of all such charts, maps, plans, drawings, tracings, books, papers, writings, and all other documents as you may deem expedient; and to visit and inspect the same at the offices or places where the same or any of them may be deposited, and to inquire of the premises by all other lawful ways and means: And our further will and pleasure is that you, or any three or more of you, after due examination of the premises, do and shall within the space of three months after the date of this our Commission, or sooner, if the same can reasonably be certified to us in the office of our Colonial Secretary, under your or any three of your hands and seals, certify what you shall find touching the premises: And this Commission shall continue in full force, although the proceedings thereunder shall not be continued by adjournment from time to time; and you or any three or more of you as aforesaid may from time to time, if you shall see fit, without waiting for your full and complete report, certify your several proceedings into our said office, as the same shall be respectively perfected: And we hereby command all Government Officers, and other persons whomsoever, within our said Colony, that they be assistant to you, and each of you, in the execution of these presents: And we appoint you the said Edward Orpen Moriarty to be President of this Commission, and do give you power, at your discretion, to procure such clerical or other assistance as may be absolutely necessary for enabling you duly to execute this Commission.

In testimony whereof we have caused these our Letters to be made Patent, and the Seal of our said Colony to be hereunto affixed.

Witness our right trusty and well-beloved Cousin and Councillor, SOMERSET RICHARD, EARL OF BELMORE, our Governor and Commander-in-Chief of our Colony of New South Wales, at Government House, Sydney, this thirtieth day of April, in the thirty-second year of our reign, and in the year of our Lord one thousand eight hundred and sixty-nine.

(r.s.)

BELMORE.

By His Excellency's Command,  
 JOHN ROBERTSON.

Entered on record by me, in Register of Patents, No. 9, pages 415 to 419, this thirtieth day of April, one thousand eight hundred and sixty-nine.

HENRY HALLORAN,  
 Under Secretary.

COMMISSION to inquire into and report respecting Floods in the Hunter River District.

WHEREAS it is necessary to extend the time by which the Commissioners are to make their report in the above matter: Now, therefore, I do hereby, with the advice of the Executive Council, extend the time, within which the said Commissioners are to make such report, to and for the period of six months beyond the time in and by the said Commission appointed for such purpose.

Given under my hand, at Government House, Sydney, this twelfth day of August, one thousand eight hundred and sixty-nine.

BELMORE.

By His Excellency's Command,  
WILLIAM FORSTER.

Entered on record by me, in Register of Patents, No. 9, page 450, this thirteenth day of August, one thousand eight hundred and sixty-nine.

HENRY HALLORAN,  
Under Secretary.

COMMISSION to inquire into and report respecting Floods in the Hunter River District.

WHEREAS it is necessary to further extend the time by which the Commissioners are to make their report in the above matter: Now, therefore, I do hereby, with the advice of the Executive Council, further extend the time, within which the said Commissioners are to make such report, to and for the period of twelve months beyond the time in and by the said Commission appointed for such purpose.

Given under my hand, at Government House, Sydney, this thirty-first day of January, one thousand eight hundred and seventy.

BELMORE.

By His Excellency's Command,  
CHARLES COWPER.

Entered on record by me, in Register of Patents, No. 9, page 490, this third day of February, one thousand eight hundred and seventy.

HENRY HALLORAN,  
Under Secretary.

COMMISSION to inquire into and report respecting Floods in the Hunter River District.

WHEREAS it is necessary to further extend the time by which the Commissioners are to make their report in the above matter: Now, therefore, I do hereby, with the advice of the Executive Council, further extend the time, within which the said Commissioners are to make such report, to and for the period of fifteen months beyond the time in and by the said Commission appointed for such purpose.

Given under my hand, at Government House, Sydney, this sixteenth day of August, one thousand eight hundred and seventy.

BELMORE.

By His Excellency's Command,  
CHARLES COWPER.

Entered on record by me, in Register of Patents, No. 9, page 534, this seventeenth day of August, one thousand eight hundred and seventy.

HENRY HALLORAN,  
Under Secretary.

PROGRESS REPORTS OF THE HUNTER RIVER FLOOD COMMISSION.

---

THE HUNTER RIVER FLOOD COMMISSION TO THE COLONIAL SECRETARY.

Public Works Office,  
Sydney, 20 January, 1870.

SIR,

As the extended Commission to inquire into and report respecting the Floods in the Hunter River District will expire on the 31st instant, we have now the honor to submit, for the consideration of His Excellency the Governor, the following Progress Report of our proceedings, and respectfully to solicit a further extension of the Commission for a period of six months, to enable us to have the plans and sections required to accompany and illustrate our Final Report, drawn and photo-lithographed. Since the renewal of the Commission on the 12th August, 1869, some of our number have visited the Hunter River District, and made a careful personal survey of the flooded lands in and about West Maitland, East Maitland, Morpeth, Dalwood, and Singleton. We have held meetings at each of the abovenamed places, and have examined numerous witnesses as to the extent and effects of the floods which have devastated the districts, and as to the amount of injury they have occasioned. We have caused notices to be inserted in the local papers, inviting persons, competent to afford us information on the subject of the inquiry, to favour us with their views, and much valuable information on these points will be found in the evidence. Some of the projects for mitigating the floods were advanced with such confident belief in their efficiency, that in order to judge of their practicability or otherwise, we have considered it advisable to have a section of the country, from Wallis Creek to Hexham, and along the Paterson, made, and some additional levels have been taken to show the relative heights of some of the old floods, as compared with those of 1857 and 1867; these plans are now being prepared for photo-lithography, along with the former plans and surveys in the office of the Engineer-in-Chief for Harbours and Rivers.

We have, &c.,

E. O. MORIARTY.  
JOHN WHITTON.  
WILLIAM C. BENNETT.

---

THE HUNTER RIVER FLOOD COMMISSION TO THE COLONIAL SECRETARY.

Public Works Office,  
Sydney, 29 July, 1870.

SIR,

Finding it impossible to complete our Report within the time named in the extended Commission of date January 31st, 1870, we have now the honor to request a further extension of time for, say, three months.

A Progress Report, dealing with the more urgent part of the question, namely, the protection of the banks of the River Hunter at West Maitland, is now nearly ready to lay before His Excellency, but we are unable to complete it before the expiration of the present Commission.

We have, &c.,

E. O. MORIARTY.  
M. B. PELL.  
JOHN WHITTON.  
WILLIAM C. BENNETT.

---

THE HUNTER RIVER FLOOD COMMISSION TO GOVERNOR THE EARL OF BELMORE.

To the Right Honorable the Earl of Belmore, Governor and Commander-in-Chief of the Colony of New South Wales, &c., &c.

MAY IT PLEASE YOUR EXCELLENCY,—

We, the Commissioners appointed to inquire into and report upon the best means of mitigating or preventing the evils occasioned by Floods in the District of the Hunter River, have the honor to submit the following Progress Report, which, at the request of the Chairman, has been drawn up by Professor Pell:—

Finding that without further time it will be impossible to report finally upon the whole subject submitted to us for consideration, we deem it desirable at once to call your attention to the dangerous state of certain parts of the river banks at the town of West Maitland. The recent floods have not only inundated a large portion of the town, but have carried away a number of houses, together with the ground upon which they stood; and others, although above flood-level, are in great danger on account of the close proximity of the river, which has encroached almost to their doors. In some cases there is scarcely any space left between the High-street and the river, except the ground upon which the houses stand.

It is probable that if a serious flood should occur before some efficient means have been adopted for the protection of the banks, much valuable property would be destroyed, and that the whole town would be placed in greater danger than on any former occasion. The inhabitants seem much alarmed, and being at the same time determined to do something for the protection of their town, they are waiting anxiously for any recommendations which we may have to offer.

The

The late repeated floods have protracted our inquiry, by entailing upon us the necessity of taking further evidence, of re-examining the ground, and of collating and considering the great mass of additional information which we have been enabled to collect. The difficulty and complexity of the subject upon which we are engaged, as well as the magnitude of the interests involved, render us unwilling to bring our inquiry to a hurried conclusion.

We have determined therefore, with your Excellency's permission, not to report finally until we have given to every point the fullest consideration, and until we are in a position to lay the facts before you in a clear and systematic form. With respect to the town of West Maitland, however, we have unanimously arrived at one definite conclusion. The inhabitants must look to local works alone, and not to any improvement, or alteration in the channel of the river, or diversion of its course, for their protection. Whatever conclusions we may finally arrive at, and whatever works we may recommend or not recommend to be undertaken, it would be obvious folly to leave the town at the mercy of the river, pending the discussions and delays which will inevitably follow, whatever be the nature of the decision at which we may arrive.

Any improvements of the channel of the river of so extensive a character as would materially relieve the town of West Maitland, and justify any reduction in the magnitude and strength of the local works which we are prepared to recommend for its protection, would involve so large an expenditure, and would bring into collision so many conflicting interests and so many diverse opinions, that it may be doubted whether even if proposed they would ever be carried out. And if no delay should occur through want of zeal, or of unanimity or of money, yet a considerable time would necessarily elapse before the works could be completed; and meanwhile the town would be in constant danger, and might not improbably be severely injured.

In an Appendix will be found an account of the works which we recommend for the protection of the banks, and for excluding the flood-waters from the town. There will be found also a plan of the town, showing the line along which in our opinion the levée should be carried. We profess however to indicate only in a general manner the character of the works proposed.

#### *The protection of the banks.*

The experience of the last few months has shown the necessity of something to stop the encroachments of the river, which threaten not only injury but destruction to a considerable part of the town.

The plan described in the Appendix of lining the banks with rubble stone thrown in and allowed to find its own slope, seems the best, indeed the only one which could be adopted with any reasonable prospect of success. The banks and bed of the river consist of a light alluvium, extending to a great depth, as was found in sinking the cylinders for the Belmore Bridge. Anything of the nature of solid masonry is therefore quite out of the question, on account of the practical impossibility of obtaining a secure foundation, without which a solid wall, although far more expensive, would certainly not be more effective than a mass of loose stone.

The ordinary effect of a river in undermining and washing away the banks on the concave side of every bend is greatly increased at West Maitland by layers of sand of varying thickness underlying the whole town, at a level somewhat above that of ordinary high-tide. After a flood, especially so long as the back-water stands at a higher level than the river, water percolates through this stratum into the river, keeping the banks moist and soft, and carrying with it sand and other matter. The banks are by this action gradually undermined, and kept in a tottering condition. The whole substratum seems reduced to a pulpy state, ready to be squeezed out by the superincumbent weight. We do not expect that this action will be prevented by the works which we propose. The water will continue to find its way through, and to carry some of the sand with it into the river; and consequently we expect that occasionally some parts of the bank will subside after heavy floods. We do not however anticipate any danger from this cause, if the levée be kept well back from the river, and no houses stand immediately on the bank. The buildings which are now in that position will require some special works to render them permanently secure.

The stone casing will, we believe, prevent any further encroachment; but if, as we expect, the banks here and there, and from time to time, subside, the loss must be made good by fresh supplies of stone. It is probable however that after some time the whole bank will assume a position of permanent equilibrium, and require no further maintenance.

#### *The embankments.*

It will be seen by a reference to the plan which will accompany this Report that the proposed levée includes only the more densely populated parts of the municipality. We fully recognize the many advantages of Mr. Moriarty's more extensive scheme, as explained in his Report to the Minister for Public Works, dated 9th July, 1868; but the saving of expense, and what is perhaps still more important, that of time, involved in the lesser scheme, are alone sufficient to justify its adoption. There are other circumstances also which have influenced us in arriving at this decision. We did not, until the occurrence of the last great flood, fully realize the magnitude of the torrent which pours into the back country by way of the Long Bridge. A portion of the water thus introduced spreads in all directions over the already submerged lands, but a considerable part makes its way by a nearly direct course to the point between East and West Maitland, which is the outlet on such occasions. An embankment extending around the whole of Louth Park would present a very serious obstacle to the progress and distribution of this water. Even without any artificial obstruction, the level of the water during high flood is considerably higher near the Long Bridge than at the outlet, and would no doubt be raised still more by any impediment to the escape of the water. How far this effect would be produced it is impossible to say. A little addition to the height and strength of the embankments upon that side might perhaps be found to be a sufficient provision against the danger, but we cannot recommend that such an experiment should be tried. If at any future time, under altered circumstances, it should appear desirable to enclose a larger area by levées, the inner line which we advise would not lose its value, for it would afford a second defence to the town itself in case of accident to the outer embankments.

If from the experience of a very extended term of years it were possible to assign a limit to the height to which future floods may rise at Maitland, there would be no difficulty in determining the height to which the levées should be carried. But what has happened during the last thirteen years in the valley of the Hunter, and in many other somewhat similarly situated districts in various parts of the Colony, shows that it is impossible to form any definite and certain opinion as to future flood-levels, and that we must be content to deal with probabilities only. Judging by probabilities, we recommend that the levée on the river-side should be made 2 feet above the highest flood-level of this year. On the land-side they should be 5 feet above the height of the backwater of 1867, and be securely faced with stone to provide against the action of the waves, which sometimes rise to a considerable height. There seems to us little probability that any future flood will rise above these limits. If the addition of a few feet would turn this probability into a certainty, it would no doubt be desirable to make it; but unfortunately this is a case in which certainty is not attainable. It will be seen by reference to the plan accompanying this Report that the proposed line of embankment does not extend entirely around the town, the natural surface of the ground being itself for a considerable distance more than 2 feet above flood-level. So slight however is the elevation at any point, that the addition of a few feet to the height of the levée would involve the necessity of nearly completing the circuit. This would proportionally increase the expense, without adding we think to the safety of the town.

During the height of a great flood a large quantity of water breaks over the right bank of the river at a point near Oakhampton, generally known as Graham's, about  $2\frac{1}{2}$  miles above Maitland, and some also escapes from the river on the same side, near Hall's Creek. The whole of this, forming of itself a considerable river, flows by way of the Long Bridge into the valley of Wallis Creek. From observations made by Mr. Moriarty and Mr. Adams during the late great flood, we estimate the volume of this discharge at about 25,000 cubic feet per second. Partial attempts have been made to prevent this overflow, and projects for effecting the same object are, we believe, still entertained. We think it necessary therefore to point out how dangerous it would be to the town of West Maitland to confine this large quantity of water to the channel of the river. If prevented from escaping by the back of the town, it must come down by the front, with the obvious effect of raising the flood-level there. The circumstances of the case are too complex, and the attainable data insufficient, to admit of any exact calculation as to the extent to which the flood-level would be thus raised; but the following data afford the means of forming something approaching to a definite opinion on the subject:—At the height of the flood of 1861 the discharge of the channel at the West Maitland Bridge was about 83,000 cubic feet per second. At the same place, in the great flood of 1857, the discharge was 105,000 feet, the difference being 22,000 feet per second, while the difference in the height of the two floods was about 4 feet. There can be no doubt then that an additional 25,000 feet of water per second forced back into the channel above Maitland would produce a very serious effect. It is not probable that the additional rise would be so much as 4 feet, because some of this water would escape over the opposite bank; but it would be quite enough to destroy the security which the works that we recommend are likely to afford.

We feel so strong a conviction of the importance of these considerations, that our recommendation respecting the town embankments must be taken as conditional upon there being nothing done to diminish the relief afforded to the river by the escape of the water from Graham's downwards; nothing, at all events, until a corresponding improvement has been made in the main channel, rendering it capable of carrying the additional quantity.

We consider it very desirable that the whole of the High-street, including the Long Bridge, should be raised where necessary to the same height as the levée on the river-side. Such a work would be a great convenience in case of accident to the levée, and might be the means of mitigating the disastrous effects of a flood of unusual magnitude, if any such should ever occur.

#### *Early floods.*

We must now consider whether there is any reasonable probability of the recurrence of those terrible floods, which in the early days are supposed to have swept over the whole of the present site of West Maitland. On this subject we have the evidence of Messrs. John Eckford, John Brown, and Alexander M'Dougall, and some information furnished by Mr. George Wyndham and Rev. Alfred Glennie.

Mr. John Eckford appears to be veritably the "oldest inhabitant" of the Maitland District. He settled there in 1818, and, as far as we can learn, is the only living witness of the great flood of 1820. His recollections seem clear, and his evidence to be relied upon. He showed us three points at some distance apart, in the neighbourhood of Maitland, to which the water rose on that occasion. Upon connecting them by levels we find that they agree with each other, being about 6 feet above the highest flood-level of this year, corresponding with Mr. Eckford's statement that the flood of 1820 was 6 or 7 feet higher than any which has since occurred, including that of 1826.

Mr. John Brown, of Singleton, settled in that district in 1823 or 1824. At that time he saw drift left by some flood in the oak-trees on the banks, about 10 or 12 feet above the flood-level of 1857. He witnessed the flood of 1826, but describes it as inferior in magnitude even to those which have occurred more recently. "It broke over the banks," he says, "but not anything to speak of."

Many years ago Mr. Alexander M'Dougall observed near West Maitland traces of some early flood—probably that of 1820—which he believes must have been 4 feet higher than those of 1857 and 1867.

From Rev. Alfred Glennie we learn that his brother, Mr. James Glennie, was a witness of the flood of 1826, at Dulwich, about 8 miles above Singleton, and that its height at that place exceeded that of any subsequent flood. He saw also traces of some former and still higher flood.

In 1828 Mr. Wyndham saw drift in a tree at the ford at Dalwood, which he attributes to the flood of 1826, indicating a height 7 feet greater than the maximum of this year.

The evidence respecting the flood of 1826 is so conflicting that it would be idle to speculate upon it. There seems little doubt however that a great flood did occur in 1820, and that the water rose at Maitland to a height of 40 or 41 feet, measured by the gauge now in use, or about 6 or 7 feet higher than upon any recent occasion.

The important question is, whether anything of the same kind is likely to happen again. There has been nothing to diminish the rate at which the flood-waters come down from the high lands, but on the contrary, it is generally admitted that since the occupation of the country the surface of the land has become more hardened, and that the rain-waters flow off more readily.

The area of the watershed of the Hunter River above West Maitland is 7,090 square miles. One inch of rain in twenty-four hours over the whole of this area corresponds to the rate of 190,000 cubic feet per second. The maximum rate at Singleton Bridge during the flood of August, 1857, was about 131,000 cubic feet per second. This was increased by contributions from tributaries lower down, so that we may roughly conclude that a continuous and uniform rainfall of  $\frac{3}{4}$  in. per day over the whole watershed would keep the river in a state of equally continuous high flood.

The total rainfall during the month of March last was about 17 inches, as shown by observations at the Sydney Observatory, at Dalwood by Mr. Wyndham, and near Singleton by Mr. Dangar. The returns are 18.70, 17.52, and 16.45 inches respectively. During nearly the whole of that month the Hunter was bank high. If the rainfall had been distributed uniformly over the whole month the daily rate would have been about  $\frac{1}{2}$  in., and no serious flood would have occurred. But according to the returns kindly furnished to us by the gentlemen abovenamed, it appears that the average daily rate from the 14th to the 18th was about 1 in., and this caused the great flood which culminated at Maitland on the 20th. We have given these particulars for the purpose of showing how a few inches of rain falling in a few days may produce a great flood, whilst long continued heavy rain may not; and how greatly the difficulty of forming an opinion of what may happen in future is thus increased.

We find that with a rise at Singleton of 12 feet above the flood-level of 1857—the height to which the flood of 1820 is supposed by Mr. Brown to have attained—the present channel would discharge about 182,000 cubic feet of water per second, and the total discharge, including what would not pass under the bridge, would probably not exceed 250,000 feet per second. Accepting however all the evidence that we have respecting that flood, it is by no means certain, indeed very improbable, that so large a quantity of water came down on that occasion. The condition of the channel was probably very different then from what it is at present. Mr. W. C. Leslie, who has resided at Singleton since 1841, and who appears to have been a close observer of everything relating to the river, and who is a most intelligent and trustworthy witness, is of opinion that within his own experience the channel has doubled in width, and been cleared of many obstacles to the free discharge of the flood-waters. From Mr. Alexander Munro also we have some valuable evidence as to the enlargement of the channel near Singleton within his experience, which extends back to the year 1830. It is quite possible then that the great rise at Singleton in 1820 may have been caused by a quantity of water which would now flow harmlessly within the banks. Some of the apparent contradictions in the accounts which we have of the effects of the flood of 1826 at different parts of the river might perhaps be explained, if we had any exact information as to the changes which have since taken place in the magnitude and condition of the channel.

Mr. Moriarty, in his Report to the Minister for Works, has explained so clearly and satisfactorily that the great height of the flood of 1820 at Maitland is attributable probably to the obstacles presented to the escape of the water by the condition of the banks of the river and of the lowlands at that time, rather than to the quantity of water which came down, that we have little more if anything to say on the subject. The banks of the river and portions of the adjacent flats were then covered with a dense and tangled scrub, greatly impeding the progress and distribution of the flood-waters. Now that the land is cleared, the flood-waters when at their height escape with comparatively little impediment from the neighbourhood of Maitland, the point at which the river in such cases empties itself as it were into a basin. A rise of 6 feet above the flood-level of this year would leave scarcely a dry spot between Dagworth and Dunmore, or from Bolwarra House to Morpeth. The general slope of the surface of the land from Maitland to Hinton being considerable, the discharging capacity of the river, when swollen to such dimensions, would be enormous. Such an elevation then could scarcely be produced with the present condition of the surface, except by a supply of water from above twice or perhaps three times greater than what came down during any recent flood.

Upon a review of all the evidence and of all the circumstances, we are inclined to think that the water came down to Maitland at a greater rate during the height of the flood in April last than it had ever done since the settlement of the country. At the same time we know that a steady rainfall of 2 inches a day for five or six days over the whole watershed of the Hunter, or a proportionally greater fall over a part only of that area, would almost double the quantity. It cannot be said that such a rainfall is so much in excess of what is known to have occurred, as to be entirely out of the range of ordinary probabilities; nor can it be said certainly that such a rainfall might not raise the water at Maitland to the flood-level of 1820. We feel bound therefore to point out what would probably be the effect of such a flood upon the town in its present state.

With an addition of 6 feet to the flood-level of this year the waters would cover very nearly the whole site of West Maitland.

With such an increased elevation, the quantity which escapes from the river at Graham's would be enormously increased, and instead of passing round through the back country would break into the town, and being joined there by the main body of the river, would sweep the High-street from one end to the other, and probably leave the town in ruins. We cannot recommend that any attempt should be made to protect the town against such a flood. It would be a dangerous experiment to put an embankment almost directly in the path of the great river which would under such circumstances roll down from Graham's. The town if embanked to a sufficient height would be completely isolated from any high land, and be surrounded on all sides by a raging torrent. If the swollen river, refusing to submit to the impediment thus placed in its path, should break its way through the levées, it would find the inhabitants beyond the reach of succour from without, and with their lives depending on the stability of their houses.

To carry the embankments to any higher level than what we recommend would increase the danger, by tempting the inhabitants to remain in the town after the position had become untenable. When the river shall have risen 2 feet above the level of the great flood of this year, without any symptoms of an immediate decline, it will be time for the inhabitants to seek safety upon higher ground. And although we are of opinion that it is improbable that such an occasion will ever arise, no reasonable man acquainted with the facts can doubt the possibility of such an occurrence.

We

We feel acutely the painful nature of the subject upon which we are dwelling, and the possible tendency of our remarks to increase the anxiety of those most concerned; but the duty of speaking plainly is imposed upon us, and we could not undertake the responsibility of recommending that the town of West Maitland should be embanked, without at the same time drawing your Excellency's attention to the fact that floods are said to have occurred, and may possibly occur again, from the effects of which neither the works proposed in this Report, nor any others which we are able to recommend, would afford any protection.

We have the honor to be,  
Your Excellency's  
Most obedient Servants,

(L.S.)	E. O. MORIARTY.
(L.S.)	JOHN WHITTON.
(L.S.)	M. B. PELL.
(L.S.)	WILLIAM C. BENNETT.
(L.S.)	P. F. ADAMS.

---

## APPENDIX.

---

THE works recommended for the protection of the right bank of the Hunter River at West Maitland are as follows:—

From near the Falls, a little above the Belmore Bridge, to a point as far down as may be deemed advisable—say to Victoria-street—and thence round the concave side of the bank opposite Potts' Point (in all, for a distance of about 150 chains), the projections and irregularities of the present exposed surface of the river bank should be trimmed down, and the whole brought to a gentle curve, with as uniform a slope or cross-section as is attainable without incurring undue expense. The material taken off the prominences may be deposited in filling up the depressions, where it should be well rammed or punned in regular layers.

The face of the alluvial bank should then be covered with a protecting coat of stone tipped in from the top, and left to assume such slopes as the stone will ultimately rest at after having been subjected to the action of the floods. Any slips or subsidences which may take place from time to time (and their occurrence must be anticipated) should be made up by the deposit of fresh stone.

The stones generally should be in as large blocks as can be conveniently handled, but the whole produce of the quarry, large and small, may be used.

The protecting coat of stone will probably require to be about 4 yards in thickness, on an average, varying however according as it is exposed in a greater or less degree to the force of the current.

The external face of the stone-work should present a fair and easy curve to the river, as free as possible from projections and irregularities which might be likely to affect the currents.

Stone of suitable quality, and in sufficient quantity for the work, may be obtained from Campbell's Hill, where the rock crops out on the surface at a place a little to the north of the Hospital.

A sufficient extent of ground for the quarry, together with a strip of land for the railway which it will be necessary to construct from thence to the river bank at the Falls, should be at once secured, so that the stone may be run down in trucks to where it is to be tipped over the bank, at the least possible cost.

From the Falls, the line of rails will have to be continued under the land bay of the Belmore Bridge, and thence behind the houses bordering High-street, on along the top of the natural bank, to admit of the stone being discharged over the slope from side and end tip waggons.

The stone-work cannot be expected to attain anything like stability at first; it must be left for the action of the river to adjust the slope of the mass to such angle as it will ultimately stand at. Care must therefore be taken to provide fresh material whenever it shall be required, and to this end it will be necessary to keep the railway and plant in good order for some years to come.

The cost of this work may be estimated at: £45,000.

### *The Levée.*

The general course of the levée is shown on the plan which will accompany this Report. It should commence near High-street, about 6 chains to the westward of Charles-street, and be continued thence in a line generally parallel with the right bank of the river round Horse-shoe Bend, past the High-street embankment, along High-street to where the Great Northern Railway crosses, the street itself forming the levée for this distance; thence returning in a course parallel to the railway as far as the intersection of East Melbourne-street; along that street to its junction with Melbourne-street, and along the latter street to Nicholson's Racecourse, curving in across the racecourse, and terminating on the ridge at the railway cutting, about 8 chains to the westward of the Elgin-street Station. It should be kept well back from the river's edge, so as to be out of risk of injury from slips of the bank.

The levée, the core or centre part of which should consist of a wall of well-puddled strong tenacious clay, should be constructed throughout of the best materials procurable. It should be fully 12 feet in width on the top; the slope on outer side should be not less than to 2 to 1, and on the inner side  $1\frac{1}{2}$  to 1.

Where exposed to the waves of the back-water the levée should be faced with heavy stone pitching, not less than 18 inches in thickness, bedded in a layer of clay puddle, fully 2 feet in depth. On Melbourne and East Melbourne-street, where the levée would probably be formed by raising the embankment of the street, the stone facing might be laid in the form of a dwarf wall, well backed with clay puddle.

The levée may be estimated to cost about £12,500.

The embankment at the Falls should be enlarged and strengthened, so as to afford commensurate protection to the upper part of the town.

**FLOODS IN THE HUNTER.**

---

**REPORT.**

---

To the Right Honorable the Earl of Belmore, Governor and Commander-in-Chief  
of the Colony of New South Wales, &c., &c.

MAY IT PLEASE YOUR EXCELLENCY,—

We, the Commissioners appointed to inquire into and report upon the best means of mitigating or preventing the evils occasioned by Floods in the District of the Hunter River, have the honor to submit the following Final Report:—

At our first meeting, held May 13th, 1869, Mr. Moriarty laid before us his Report to the Minister for Works, dated 9th July, 1868, which has proved a most useful guide in conducting our inquiries. It furnished us at once with a reliable record of facts, and, by indicating the circumstances of the case submitted to our consideration, and the theoretical and practical difficulties involved, has enabled us more readily to determine the course in which our inquiries should be directed.

On the request of the Chairman, Professor Pell undertook to draw up this Report.

In the month of September, 1869, we visited Maitland, Morpeth, and Singleton, for the purpose of taking evidence, and of inspecting the districts liable to inundation. We have sought to gather all the information within our reach upon those points which appeared to us to require elucidation, and have endeavoured also to give to every one an opportunity of communicating to us the results of his observations, and of offering suggestions in furtherance of the objects in view.

Many of the residents upon the Hunter, repeatedly witnessing the deplorable effects of the floods which have so frequently occurred of late years, have naturally been led to speculate as to the possibility of a remedy, and to entertain and discuss schemes by which it is believed that the floods might be wholly prevented, or their devastating effects greatly diminished. Although these schemes have already been reported upon by Mr. Moriarty, we have deemed it our duty to listen to everything to be said in their favour, and to consider the various questions involved, as carefully and fully, as though no such report had been made. To the misery directly resulting from these terrible floods, and the painful anxiety occasioned by the absolute uncertainty as to when and to what extent they may recur, has been added, in many cases, the natural irritation arising from the belief that an obvious remedy has been neglected. We shall endeavour therefore to explain as clearly as we can our reasons for disapproving of various plans which have been proposed.

The question which evidently stands first for determination is, would it be desirable, if possible, entirely to prevent the overflow of the Hunter in times of flood? We find a very general impression existing, especially amongst persons not living in flooded districts, that the fertilizing effects of the flood deposits compensate largely, if not entirely, for the injury and inconvenience occasioned; and that the flooded lands would rapidly deteriorate, and eventually become exhausted, if the mud-bearing waters were prevented from flowing over the banks. It is urged, on the other hand, by persons living in places liable to inundation, that although the flood deposits do undoubtedly sometimes and in some places produce a fertilizing effect, yet in many cases

cases the opposite effect is produced, the land being "scoured," and the soil washed away; that in others, thick deposits are left of sand and other debris, almost destroying the value of the land; that after the land has been under water for a length of time, it becomes so much "sour'd" as to be unfit for cultivation for many months afterwards; and that the soil on the flooded lands is generally so rich and so deep that it may be expected to retain its fertility without any kind of manuring for an indefinite number of years.

After considering the great mass of valuable evidence on this subject which is appended to this Report, and after witnessing the terrible effects of the recent floods, the destruction of property, the permanent injury in some places to the land, and the abject misery occasioned; and regarding the manifest tendency of repeated appeals to public charity to degrade and pauperize the inhabitants, we feel no hesitation in answering this question in the affirmative. It would be desirable, if possible, to keep the waters of the Hunter entirely within its banks. If there were any one element of certainty respecting the inundations of that river,—if they occurred at known intervals, or at certain times of the year,—if they were regular in their duration and effects, so that their occurrence might be anticipated and provided against,—then perhaps, as in other countries, the flood-waters might be a welcome instead of a dreaded visitation; but the occurrence of these floods is so frequent, and their magnitude and duration so uncertain, that the consequent destruction and distress is too great to be counterbalanced by any possible improvement or renovation of the soil.

The value of the lands under consideration would, we think, be much increased by the prevention of the floods, even if it were certain that those lands would in consequence become exhausted, unless artificially manured, within a limited time.

Appended to Mr. Moriarty's Report is a tabular statement of various particulars concerning the quantity of water which passed down the river during the great flood of 1857. Mr. Moriarty has pointed out that, for various reasons, these figures can only be regarded as approximately correct; and we may add that, although observation has shown that considerable reliance may be placed upon the empirical formula made use of, yet its results can only be exact so far as the inclination of the surface has been correctly determined. Where the waters are confined within a channel of variable section, it is obvious that the slope of surface must be variable also, and only to be determined with sufficient accuracy by a number of simultaneous observations at short distances from each other; but when the flood is near its height, and the waters over the banks, it might be expected that the slope of surface would be more uniform and more easily determined. We find accordingly, from observations made by Mr. Moriarty, at West Maitland, in 1861, and by Mr. Wade, at Singleton, in 1867, that the measured velocities at high flood level agree with the results of calculation. We are of opinion, therefore, that Mr. Moriarty's tabular statements of the quantities of water discharged during the great flood of 1857, whilst near its height, may be relied upon as sufficiently accurate for the purposes of this inquiry.

The circumstances under which the low-lying lands from Maitland downwards are inundated may be stated briefly as follows:—The sectional area of the river up to high flood level from Singleton to Maitland, a distance of about 49 miles, is about 13,300 square feet. The average fall of the bed of the river is 1.84 feet per mile, and that of the surface of the water during high floods about 2.08 feet in the same distance. This channel is capable of discharging, and does discharge about 130,000 cubic feet of water per second, without any serious overflow below Singleton. If a channel of the same size and with the same fall could be continued to the sea, no inundation would take place; but at Maitland the fall in the bed of the river almost if not entirely ceases, as shown by the fact of the tidal rise being felt at that place. In the surface of the country from Maitland

to

to Hinton there is a fall of about  $4\frac{1}{2}$  feet per mile, but in the surface of the water in the river there is none but what is temporarily occasioned by the piling up of the flood-waters about Maitland. From Maitland downwards the flood sectional area diminishes until it attains its minimum of 4,417 feet at Narrowgut, 11 miles by the river below Maitland. At the same time, the river follows so winding and circuitous a path from Maitland to Morpeth as almost to destroy the fall which would otherwise be occasioned by the difference of flood-level between the two places. The quantity of water arriving at Maitland being thus far greater than what the channel can carry off, the waters rise and flow over the banks, until the whole valley from Maitland to the neighbourhood of Morpeth and Hinton is filled up; at Maitland to a height of about 33 feet above low-water-mark, and at Morpeth to about 14 feet. As explained by Mr. Moriarty in his Report, the channel of the river becomes under these circumstances almost entirely neutral; the whole valley being converted into a broad shallow river, of which the general slope of surface is considerable, being about 16 feet in  $3\frac{1}{2}$  miles, but the velocity not proportionally great, on account of the small depth, the irregularity of the ground, and the numerous obstacles in the way.

From Morpeth the course of the river becomes more direct, and the sectional area increases, but there is no fall in the bed of the river nor any in the country generally, the banks being in many places very little above the level of the ocean. There is no slope of surface except what is caused by the rise of the flood-waters.

Of the floods which have taken place at the Hunter since the settlement of the country, four may be considered of the first magnitude, viz., those of 1820, of August 1857, of June 1867, and of April 1870. Concerning the first we have not much information. The remaining three occurred under very much the same circumstances. Each was preceded by a long continuance of wet weather, and by a succession of freshes or smaller floods. In each case the ground over the whole extent of the watershed of the Hunter and its tributaries was saturated, and the low-lying parts of the valley of Wallis' Creek and of the Bolwarra Estate had already been wholly or nearly filled up by previous flood-waters, which had not yet drained away. We select for particular consideration the great flood of 1857, respecting which we have sufficiently accurate data, with the results of the calculations therefrom arranged in a convenient form.

At noon, August 20, 1857, there was no perceptible rise of the river at Singleton, the quantity of water discharged per second being estimated at 331 cubic feet. The water began to rise on that evening, and continued to increase in volume until August 23, at about 8 p.m., when the rate of discharge attained its maximum of about 130,000 cubic feet per second. From that time the river fell, and the rate of discharge diminished. On the 25th, at 12 p.m., the rate of discharge was reduced to 100,000, and on the 30th the waters had returned to their ordinary level. The river was in very high flood, near its maximum, at Singleton for about seventeen hours, and during a period of nearly four and a half days was discharging at a rate exceeding 100,000 cubic feet per second. At Maitland the flood was at its highest at 5 p.m., August 23rd, remaining at or near the maximum for about twenty-seven hours. At Morpeth the water was above 14 feet for about twenty-four hours, attaining its greatest elevation of  $14\frac{3}{4}$  feet above high-water at 12 p.m., August 23rd.

At this time then, August 23rd, 12 p.m., three and a half days after the beginning of the flood at Singleton, the river from Singleton to Morpeth was nearly at a stand-still, neither rising nor falling. At every point the water was at about its greatest height. The river, including in that term the whole of the flooded portion of the valley, had worked itself into a condition of equilibrium, so that at every point it was capable in its extended state of discharging the whole of the water then coming down; that is, at the rate of about 130,000 cubic feet per second. This is evident from the fact that the water was nearly at rest everywhere. The river was then in such a state that if the maximum discharge at Singleton had continued indefinitely, the flood levels at Maitland and Morpeth would have remained the same or would have risen very slowly.

Mr.

Mr. Moriarty's table shows that up to the date in question, August 23rd, 12 p.m., the quantity of water discharged at Singleton amounted to 28,250 million cubic feet. The great bulk of this water passed down whilst the river was very high; and the calculated velocity under such circumstances having been verified by observation, we think that this result as to the total quantity may be regarded as a sufficiently close approximation. This water had been disposed of in three ways: one part filled up the channel from Singleton to Morpeth, another was covering the flooded lands above Morpeth, and the third had passed Morpeth. The cubical contents of the channel from Singleton to Morpeth may be roughly estimated at 4,185 million feet. The area of the flooded lands above Morpeth is 19,000 acres. Supposing this covered to an average depth of 9 feet, the quantity upon the land at the hour named was 7,449 million feet. The remainder then, 16,516 million feet, must have passed Morpeth, a part through the channel of the river, but a much larger portion over the adjacent flats.

There was no perceptible rise at Morpeth until August 21st, 6 a.m., and therefore the above quantity of water passed Morpeth in about two days eighteen hours, or at the mean rate of about 69,500 cubic feet per second. The greatest rate during the height of the flood was therefore about twice this, or 139,000 feet per second. This is rather more than the maximum rate at Singleton, on account probably of the water received from minor tributaries between the two places. The discharging capacity of the proper channel at Morpeth in high flood is under 38,000 feet per second, so that the great bulk of the flood-water passed over the adjacent lands.

These calculations are of course of a rude kind, and the results but rough approximations; but still they are real approximations, and confirm to some extent both Mr. Moriarty's estimate of the quantity of water discharged, and our own general conclusions as to the condition of the river at the time when the flood had reached its highest point at Morpeth.

The important points to be observed are, that when the water had risen at Maitland 33 feet, the discharge from that neighbourhood became equal to the supply from above, and that at Morpeth a similar effect was produced when the flood stood at  $14\frac{3}{4}$  feet above high-water. At that time 11,634 million feet had already passed that place, gorging the channel below and covering the low lands, thus impeding the discharge from above, just as the accumulation of water about Morpeth impeded the discharge from the neighbourhood of Maitland.

We have dwelt thus somewhat at length upon what did actually happen in 1857, up to the time when the flood had attained its greatest elevation, in order to form a clearer conception of what would happen under similar circumstances if any of the schemes for dealing with the river above Morpeth were carried into effect.

We will now consider whether it is practicable, following generally the present course of the river, so to enlarge, straighten, and otherwise improve the channel as to carry off the whole of the flood-waters without inundation. From the neighbourhood of Maitland to that of Morpeth no insuperable engineering difficulty occurs. The fall in the natural surface of the country is considerable, and a new channel might be formed or the old one so straightened and enlarged as to carry off the whole of the flood-waters. There would be many difficulties no doubt to be encountered, and many precautions to be taken, in carrying so large and rapid a torrent by a new channel through a loose alluvial soil. But the difficulties might, we think, be overcome, and at an expense perhaps not incommensurate with the extent and value of the relief afforded, if the sea extended to the mouth of the Paterson that the flood-waters having passed Morpeth, would be at once disposed of. But as things really are, such an improvement of the channel above, without a corresponding improvement lower down, would merely have the effect of sacrificing the low-lying lands about and below Morpeth for the benefit of those higher up the valley. We do not think it necessary to enter upon any detailed arguments, or to adduce any figures

figures to show what would probably be the effect in the neighbourhood of Morpeth of bringing down the flood-waters suddenly to the vicinity of that place at a rate four times as great as what the channel as it exists is capable of carrying off. We must consider then whether it is practicable to effect a corresponding improvement of the channel from Morpeth downwards. Here the real difficulty lies. There is no fall in the natural surface of the country as there is from Maitland to Morpeth. There is no possibility of effecting any material improvement by shortening the river. There is nothing to be done to facilitate the discharge of the water from Morpeth except to deepen and widen the channel.

At sec. 38, near Hexham (Mr. Moriarty's Report, page 34), the discharging capacity of the channel at high flood is about 65,000 cubic feet per second, or about half that at Oakhampton. It would be necessary therefore to continue the improvements as far as sec. 38 at least. We have caused calculations to be made of the quantity of earthwork that would be required in forming a channel which would carry the whole of the flood-waters from Maitland to Morpeth; and in so enlarging the channel thence to Hexham as to prevent the floods from rising at Morpeth above their ordinary high-level of 14 feet above high-water; the river to be confined entirely within this channel by means of embankments where necessary. The cost of earthwork alone would be about £2,500,000.

A second calculation has been made of the quantity of earthwork that would be necessary in forming a channel at a uniform slope, following generally as before the present course of the river. This scheme would involve more extensive embankments, for the flood-level would be thereby raised considerably about Morpeth. The earthwork would cost about £1,700,000. In neither case has any account been taken of the flood-waters of the Paterson and Williams, nor of the levées necessary for protecting the banks of those rivers. The cost of earthwork alone would be so great that it is obviously unnecessary for us to enter upon any discussion of the dangers, difficulties, and further expenses which these works would involve, nor of their probable effects below Hexham. We may remark however, that of all the plans which have been suggested for entirely preventing inundation from Maitland to Hexham, we believe that the one last described alone can be regarded as practically possible. To other projects which have been brought under our notice we have however given our most serious consideration.

Inundations of the valley of the Hunter, from Maitland downwards, and of every valley similarly situated, take place whenever the waters gathered upon the higher grounds come down upon the plains at a greater rate than the channel through the low lands can carry off. If the excess of the flood-waters at any time above what the channel can safely discharge, were held back on the high lands by means of natural or artificial reservoirs, and allowed to escape gradually after the rain had ceased, and before the advent of a second flood, no inundation would take place.

It is upon this principle that the French engineers have been endeavouring to deal with the flood-waters of the Rhone, which a few years ago occasioned such extensive devastations. The great advantage of this method is that the water saved may be made conducive to a general system of irrigation. A very little consideration however has convinced us that nothing of the kind is practicable in the case before us. There are no natural reservoirs. In order to dispose in this way of the waters of a single flood, such as that of August, 1857, it would be necessary to form reservoirs on too gigantic a scale to be contemplated with equanimity. And even if the natural features of the country were found to be so extremely favourable for the construction of such works as to enable us to hold back a sufficient portion of the water of a single flood to effect the desired object, yet the experience of many years, and of this present year in particular, shows that the evil would not be cured; for a second flood not only might, but probably would occur, to be followed perhaps by a third, a fourth, a fifth, and even a sixth, before the impounded waters of the first

could be safely allowed to escape. It would never therefore be safe at any time to retain any water in the reservoirs for the purposes of irrigation; and the system is therefore so obviously inapplicable to the circumstances of the case as to render its further consideration unnecessary.

The scheme for carrying off the flood-waters of the Hunter by a canal from Singleton to Lake Macquarie is so evidently impracticable as scarcely to require any remark. If it were determined to construct a channel of sufficient capacity to carry off the flood-waters without inundation, it is quite clear that it would be easier and cheaper to follow generally, if not exactly, the existing valley of the Hunter as formed by nature, than to carry the river by an entirely new channel, through ranges of mountains and across creeks and gullies. We learn moreover that the waters of Lake Macquarie stand permanently at about the level of high-water, and therefore higher than the average at Newcastle.

The proposal to conduct the flood-waters by a channel from some point above Maitland to the neighbourhood of Hexham is of a more modest character and not so obviously impracticable. In order to satisfy the advocates of this mode of dealing with the difficulty, we have caused a section to be made of the proposed line.

A considerable portion of the cutting would be through solid rock, so that the total cost for earthwork would be about £5,000,000. It would not be necessary that the channel should be so large as to carry the whole of the flood, but at the same time it is evident that so extensive a work would not be justified by any result less than a total relief of the districts for whose benefit it is intended. The question is, how much water must be drawn from the river at or near Oakhampton in order to afford the required relief. The maximum rate during the flood of April 1870 was 140,000 feet per second. The discharging capacity of the channel at Narrowgut, where the section is a minimum, was about 18,000 feet per second at the height of the flood of 1857, and is therefore something considerably less, probably not more than 10,000 feet per second, when the river is within its banks. In order therefore to prevent the water from breaking over the banks at all, it would be necessary to draw off nearly the whole of what comes down during great floods. If the new channel were so arranged as to carry 40,000 cubic feet per second the relief would be very imperfect. Such a channel would reduce a flood such as that of April 1870 to about the dimensions of that of 1861, which inundated all the low lands and broke over the banks at West Maitland. If the capacity of the proposed channel were 100,000 cubic feet per second the magnitude of the great floods would be much reduced, but the 40,000 cubic feet per second left behind would be considerably more than the river can carry within its banks, as a glance at Mr. Moriarty's tables will show (Mr. Moriarty's Report, page 35). The valley of Wallis' Creek and other low lands near the river would probably be inundated; but after such a large reduction of the total quantity of water, the remainder might perhaps be kept within bounds by local works at a moderate expenditure. We may safely conclude, however, that the proposed channel would not produce results commensurate with the magnitude of the undertaking, unless its carrying capacity were 100,000 feet per second at the least. The earthwork for such a channel would cost about £3,000,000, and there would be several other heavy items of expenditure. It is clearly unnecessary to discuss the matter further, except perhaps to remark that it is doubtful whether it would be expedient to undertake the works which we are now considering, even if the expense were no obstacle. There would be great danger to the navigation of the river, and some to the harbour of Newcastle, with the certainty that the channel below Hexham could not be kept open without very extensive dredging operations.

Finding ourselves thus reluctantly driven to the conclusion that there is no practicable method by which the Hunter can be prevented entirely from overflowing its banks in the neighbourhood of Maitland, it remains for us to consider the various suggestions which have been made for affording a partial relief. Before entering upon

upon this part of our inquiry, we will offer a few remarks upon an idea entertained by many residents on the Hunter, that the flood-levels might be lowered by drawing off from the river the "top water," as it is called, by means of broad shallow channels. A very erroneous idea is prevalent that this "top water," which does the mischief, is but an insignificant portion of what comes down during the height of a great flood. If by the "top water" is meant that which passes over the land or rises above the banks, then that term would include nearly the whole of the water which passes Singleton at high-flood, for at its minimum section, the channel can discharge but an insignificant portion of the whole. If by the "top water" is meant that portion the withdrawal of which would reduce a great flood to a small one, overflowing the lowest lands only, then, as we have just shown, in reference to the proposed cut to Hexham, the "top water" is 100,000 feet per second out of a total of 140,000. The effect of any new outlet from the upper part of the river in lowering the flood further down would depend entirely upon its discharging capacity in time of need. If it were determined to form a channel to carry off a certain quantity of water per second, one of the things to be first considered would be the form of the section which would effect the required object at the least expense, that is with the least amount of earthwork. It is found that of all the forms that can be suggested, the broad shallow section is the worst, discharging the least quantity of water for a given outlay in excavation.

At many points from Oakhampton downwards, the river might be prevented from overflowing its banks by means of levées, and considerable areas be thus relieved from inundation. There are several ways also by which the channel of the river might be improved or supplemented, affording more or less relief to the upper parts of the valley, at the expense probably, if not certainly, of the lower. It would be very easy in many cases to effect a local improvement, but it seems almost impossible, by any interference with the natural course of the flood-waters short of confining them entirely within the banks, to relieve any one place without danger of a corresponding injury to some other.

The simplest and most promising scheme is that of straightening and improving the channel above Morpeth; and out of this arises the much-vexed and most perplexing problem as to the probable effects of such works upon the low-lying lands in that neighbourhood.

As we have before remarked, we are unable to suggest any material improvement of the channel below Morpeth which would confer any sensible benefit upon that neighbourhood, and improvements higher up must have a contrary tendency. Whatever be done above Morpeth, the flood-waters must and will rise there as usual to a height of 14 or 15 feet, and will do their accustomed injury to all lands below that level. It must be borne in mind that such works would relieve the upper parts of the valley alone, the question before us being whether they can be carried out without danger of increasing the destructive effects of the floods about Morpeth. We have to consider what would be the effect of a new or improved channel of a given discharging capacity from Maitland to Morpeth, and by which a certain portion of the flood-water would be conveyed directly from one place to the other. This is at once the most important and the most difficult question involved in the present inquiry. It is so complicated by a variety of circumstances as to preclude the possibility of exact calculation. We feel however great confidence in the justice of our general conclusions; for they are the result of a careful consideration of the evidence, of repeated inspections of the ground before, during, and after great floods, and of long continued discussion and reflection.

We

We must now revert to what we have already said concerning the great flood of 1857, and consider what would have been the effect on that occasion of an improved channel from Maitland to Morpeth. The resistance, from various causes, to the escape of the flood-waters from the neighbourhood of Maitland was just balanced by the pressure produced by a rise of 33 feet. When that height had been attained, an equilibrium was temporarily established, and the water ceased to rise.

Any improvement of the discharging channel would have reduced the resistance, and would therefore have diminished the height to which the flood would have risen; and therefore, the quantity of water standing upon the land at 12 p.m., August 23rd 1857—the date referred to in a former part of this Report—would have been less. At the same hour a larger quantity of water would have passed beyond Morpeth, in consequence of the supposed improvements. A certain quantity of water, instead of standing upon the lands about Maitland, would have been somewhere below Morpeth, and not very far below; for the new works would have no tendency to accelerate the passage of the waters from that place. A large portion of the water coming down during the earlier part of the flood would, in consequence of the new works, have passed quite out of reach; but considering that the great bulk of the water comes down when the flood is near its maximum, it seems probable that at the crisis the channel and low lands below Morpeth would have been somewhat more gorged; there would have been more resistance to the escape of the waters, and consequently that the flood-level would have been raised at that place, but not to any important extent. The area over which the flood-waters expand after passing Hinton is too large to be much affected by a quantity of water represented by a few additional feet of elevation over the flooded lands in the neighbourhood of Maitland. If at the height of a great flood the river attains a state of equilibrium, or in train, as it is sometimes called, so as to be capable at every section of discharging at the full flood rate, nothing more can be required at any point; so that no improvement at any part of the channel would affect the average height of the flood over any section further down the stream. We have endeavoured to shew, and we believe that the same is true of all great floods, that in August, 1857, the river was very nearly in train, and we are therefore of opinion that an improved channel from Maitland downwards could not very materially increase the average height of the waters of a great flood over the low lands about Morpeth. Such a channel would accelerate the progress of the flood-wave a few hours; and as it is said that the Paterson is generally in flood before the Hunter, so that the waters of one have time to subside before those of the other come down, the proposed channel would, in such cases, tend to bring the rivers more into conflict, and thus increase the difficulty at the junction. We do not however apprehend any real increase of danger on this account, for the acceleration of the flood-wave could not exceed six hours, and would probably be much less.

Although the average height about Morpeth would not be sensibly increased by the proposed works, we quite agree with Mr. Moriarty in thinking that the flood-levels would be considerably raised along the line of any new cut from about Pitnacree to the immediate vicinity of Morpeth. When the flood-waters are rising in a large river, it is found that the cross section of the surface is not level, the height being generally greatest in the middle and least at the edges. The same phenomenon would no doubt be exhibited in a very marked degree by the Hunter River as extended in times of flood, if its waters were partially concentrated by a more direct channel. The excessively tortuous course of the river retards the escape of the water, and at the  
same

same time has the effect of scattering it over the whole surface of the valley, producing a much more uniform distribution than would be effected if the river pursued a more direct course by Pitnacree to Morpeth. During great floods, very little water is brought to Morpeth by the channel of the river. The great bulk of the water sweeps down upon Phoenix Park, in the form of a broad shallow torrent, extending with tolerable uniformity across the whole valley. The rate of discharge of this stream at the height of a great flood becomes nearly equal, as we have shewn, to the maximum rate at which the waters come down, and could not therefore be much increased by any alterations of the natural channel higher up; nor could the average height to which it attains be thereby materially increased. It is a very serious question however, what would be the local effect of concentrating any considerable portion of this torrent upon one side of the valley by a new channel terminating at the only point where it could terminate—the great bend just above Morpeth.

The sectional area of the channel within the banks at Morpeth is about 8,300 square feet. The velocity when bank high, as estimated by Mr. Dye during the great flood of April 1870, was four knots. The rate of discharge was therefore about 56,000 feet per second. On that occasion neither the Paterson nor the Williams were in flood, and the river did not attain to nearly its usual height at Raymond Terrace. The river being thus comparatively clear below Morpeth, the slope of surface, and consequent velocity at that place, was greater than usual. At the height of the great flood of 1857, the discharging capacity at Morpeth was estimated at about 40,000 feet per second, and when bank high only, was probably considerably less; the channel below, on that occasion, having been already gorged by the flood-waters of the Paterson. As we have before observed, the Paterson is said to come down generally before the Hunter, so that the channel at Morpeth cannot be considered as usually capable of carrying more than 40,000 cubic feet per second within its banks. This sets a limit to the extent to which any improvement of the river above Morpeth can be carried. The present contracted and winding river cannot convey to Morpeth, within its banks, nearly so much water as the channel there can carry off; but if the river were straightened, so as to increase its carrying capacity to, say 60,000 feet per second, then in case of a small flood having that maximum rate, no overflow would occur above the bend at Morpeth, but at that place about 20,000 feet per second would be shot suddenly over the banks, producing probably the most disastrous results. Such a flood would scarcely be felt at all at Morpeth, with the river left to follow its natural course. It is clear therefore, that whatever plan be adopted for straightening and improving the river from Maitland to Morpeth, the river or improved channel must not be made capable of carrying, within its banks, more than about 40,000 cubic feet per second. We have thus to consider the advantages, disadvantages, difficulties, and dangers likely to result from carrying out such a limited scheme, and to estimate roughly the probable expense.

One effect of the proposed improvements would be, as we have already remarked, to lower the flood-levels about Maitland, but to what extent it is impossible to predict. From what we have already said, as to the effect which would be produced by drawing off the same quantity, 40,000 per second, by an entirely new channel, it appears very doubtful whether the flood-level at Maitland would be reduced by more than a foot or two. Most certainly we could not anticipate any such marked improvement in this respect as would justify any reduction in the strength or magnitude of the works necessary for the protection of the town.

The

The greatest advantages resulting from the improved channel would be that, during the latter part of a great flood, and after its subsidence, the water would drain much more rapidly off the land, and the river at Maitland would return much more quickly to its ordinary level. The back-water from the valley of Wallis' Creek would drain away more rapidly, even although nothing were done for the special benefit of that most unfortunately situated district. As we have before pointed out, the greatest floods occur towards the end of a rainy season, their destructive effects being to some extent increased by reason of their finding the valley of Wallis' Creek and other smaller receptacles already filled up by former floods. Anything therefore which would assist in draining away the waters of one flood more rapidly would mitigate the effects of the next, and would thus tend to the advantage of the whole district. We must not however exaggerate the importance of these considerations. The whole quantity of water which passes through the back country during a great flood is very large, but the quantity within it at any one time is but small compared with what comes down the river on such occasions. The greater magnitude of the floods which occur after long continued rain, is occasioned far more by the previous saturation of the whole watershed than by the condition of the low lands when the inundations occur.

It appears then that the relief likely to be afforded by an improvement of the channel, limited as it must be by the peculiar circumstances of the case, would be of a very partial kind, and would extend to a portion only of the flooded area. The district extending from Maitland to about Pitnacree would, without doubt, derive some benefit in some cases from such an improvement, but the low lands from Pitnacree to Hinton could derive none, but would, on the contrary, be more liable to injury, especially from minor floods, which under existing circumstances are scattered over the whole valley, but would be concentrated upon one side by a direct channel. It seems impossible to predict exactly what effect would be produced. At present a certain regime has been established. Every flood has its own peculiar characteristics, but still the main features are common to all. The water breaks out of the channel at certain places and breaks in again at others. At some places the land is scoured or washed away, and at others deposits of sand and other debris are formed. The general course and action of the flood-waters is known, and speaking generally, is constant. If however, a new channel were made, not capable of carrying the whole of the flood-waters, everything would be changed, nor is it possible to say exactly what would happen. The currents over the flooded lands would take new courses. Considerable areas probably in the bends of the existing river would be rendered useless, and a number of other novel effects would be produced, the nature of which cannot be determined except by making the experiment.

On the subject of the probable effects of altering and improving the channel above Morpeth, upon the navigation of the river, we extract the following passage from Mr. Moriarty's Report :—

"In conclusion, I would again observe that, in contemplating changes, we must not lose sight of the fact that any violent interference with the regimen of the river above Morpeth must materially alter the existing condition of things, certainly as far down as Hexham, and that no one can predict with certainty what those alterations will be. We must anticipate that the sand-bars at Morpeth and Eales' Flat will be shifted further down, as will probably be also that at Raymond Terrace; but no one can undertake to say positively where they may be redeposited; and one thing is certain, if the cuts-off I have described are made, that we must be prepared for steady and continuous dredging for many years to come, until the river shall have re-established itself. Indeed the whole subject is one of extreme difficulty; no problem in engineering can perhaps be more so. Once we interfere with the existing order of things, we call into operation forces and causes, the effects and consequences of which may be so varied, and at first sight apparently contradictory, as to be difficult of explanation, and impossible of certain prediction."

To these remarks we do not think it necessary to add anything except the expression of our entire concurrence.

In

In estimating the cost of any new channel through the loose alluvial soil of the Hunter District, it must be remembered that it would be necessary to protect the banks by a lining of stone. If a perfectly straight channel were made from Maitland to Morpeth, it would remain straight until the next flood, but no longer. The slightest obstacle on either side, by diverting the course of the current, would cause it to eat into the opposite bank, and a curve being once established, would go on increasing, until after long lapse of time some position of comparative equilibrium would be attained. The current in such a direct channel would be far greater than in the existing river, and without any protection to the banks, the river would encroach upon them at a proportionally greater rate. The total cost, on the most economical scale, retaining as far as possible the existing channel, and excluding the value of the land and claims for compensation, would be not less than £90,000.

We have not thought it necessary to append plans and estimates, for we cannot recommend that any such work should be undertaken.

It has often been proposed to relieve the upper parts of the river, about Oakhampton and Maitland, by cutting a channel from some point near Bolwarra House, to the neighbourhood of Largs. Such a channel would no doubt relieve West Maitland and its vicinity to an extent depending upon its discharging capacity. We have already pointed out in our Progress Report, that during very high floods a quantity of water escapes over the right bank of the river above West Maitland, principally at a place known as Graham's. This water passes under the Long Bridge, and finds its way thence, between East and West Maitland, to Morpeth. The rate of this overflow, in April, 1870, is estimated at 25,000 cubic feet per second. It appears to do no special damage except to the land between West Maitland and Oakhampton. The extent of land thus inundated is 660 acres, of which 402 were under crop. One object proposed to be accomplished by the scheme which we are now considering is the prevention of this overflow. Let us suppose that a channel were cut from Bolwarra, capable of carrying at high flood level 40,000 feet per second; it would, if answering expectations, draw off the 25,000 which would otherwise break over the south bank, and 15,000 more. This quantity would not, as by the projected cut to Hexham, be entirely disposed of so far as concerns its effect upon Maitland, but would be carried directly to the neighbourhood of Morpeth, instead of breaking over the banks and finding its way to that place by a variety of roundabout routes. The effect would, no doubt, be to raise the flood-level somewhat in the lower part of the valley, and so to impede the discharge from Maitland. It is impossible to determine even approximately how far these effects would be produced, but it is certain that the benefit conferred upon Maitland by drawing off 40,000 cubic feet per second by way of Bolwarra, would not be so great as what we have already described as the probable result of withdrawing the same quantity of water by means of a channel to Hexham. It is quite certain then—and this is the conclusion at which we have been aiming—that the withdrawal of anything less than 40,000 cubic feet per second by the proposed channel during high flood would not afford any adequate relief.

The worst part of the natural channel of the river is in the neighbourhood of Largs, the discharging capacity at Narrowgut being only 18,000 feet per second. At this point, in times of flood, the channel soon becomes gorged, and ceases to act at all, on account of its tortuous course. If 40,000 cubic feet of water per second were brought down, as proposed, to the river near Largs, it would find no channel whatever to carry it off, but would be discharged over the adjoining lands, from which it  
would

would probably escape by cutting for itself new channels, of whose number, magnitude, and direction it would be impossible to predict anything. It would therefore be clearly necessary to continue the channel, with the same capacity, to the bend near Morpeth at least. This would involve a cutting fully 3 miles in length, partly through hard ground. It would be far more expensive than an improved channel of the same capacity from Maitland to Morpeth, and at the same time less effective and quite as dangerous. We have not therefore thought it necessary to make any surveys, or to enter upon any calculations in reference to this scheme.

The valley of Wallis' Creek requires some special notice, on account of its extent and value, its anomalous and peculiarly unfortunate position, and the interest which has been occasioned by the unsuccessful attempt which has been made to preserve it from the flood-waters of the Hunter by means of flood-gates.

This valley may be regarded as one of the many anomalies with which this continent abounds. Its total drainage area is 125 square miles, the flooded area is 10,111 acres, or about 15.8 square miles, of which 4,905 acres are occupied, and 2,128 were under crop at the time of last floods. The peculiarity of this district is, that whilst the drainage runs one way into the Hunter, the general slope of the surface of the ground is the other way. The lowest point in the whole valley is of course the bottom of the creek, at or about its junction with the Hunter, whilst the highest point in the natural surface of the ground is at about the same place. There is very little fall in the bed of the creek, and as we have already said, the fall of the surface of the ground is the wrong way. At the upper parts of the creek and its tributaries, the surface of the land is very little, if at all, above the level of the creek itself, or of that of the Hunter at Maitland. In consequence of this peculiar state of things, when the Hunter begins to rise, the water runs up the creek, and gradually overflows its banks. Nearly the whole valley is thus laid under water before the flood in the Hunter has attained to an elevation of more than 20 feet at Maitland, and remains under water until the river has returned nearly to its ordinary level. The chief function of the creek in rainy seasons is not to drain its own area, but to let in the water of the Hunter. We are told that at the head of Fishery Creek, a tributary of Wallis' Creek, there is a considerable area of very rich land, which was under cultivation until 1857, but has since been abandoned on account of the continual intrusion of the waters of the Hunter. Indeed this whole valley suffers most intolerably from the effects of floods; for not only is it inundated by every insignificant fresh, but during rainy seasons like the past, a number of farms and homesteads are under water for months together.

It is not surprising that an attempt should have been made to keep out the waters of the river by means of flood-gates. It would not be impossible of course, nor perhaps impracticable, to erect gates which would stand under any pressure likely to be brought against them. If there was nothing to be provided against but temporary freshes in the Hunter, without great floods or long continued rains, it would be certainly worth while to consider whether some such works might not be advantageously undertaken; but, under circumstances as they exist, we are sure that no such attempt will end in anything but disappointment.

The gates gave way on March 10th, 1870. Let us consider what would have happened if they had remained sound and water-tight during the whole of that month; and to make the argument the stronger, let us suppose that every drop of the Hunter River water had been thereby excluded from the valley of Wallis' Creek.

As

As we have already stated in our Progress Report, the rainfall during the month of March was about 17 inches, the returns from Singleton, Dalwood, and Sydney being respectively 18·70, 17·52, 16·45 inches. It may be concluded then that the rainfall over the drainage area under consideration was about the same during the same time. This would have produced an average depth over the flooded area of  $10\frac{1}{2}$ ft., so that the whole valley would have been inundated notwithstanding the gates.

All the witnesses whom we have examined respecting this particular district are under the impression that the quantity of water which falls on their own watershed is insignificant, and would alone be harmless; but of course a few exact observations are of more value than any number of general impressions of the most trustworthy and intelligent witnesses.

Again, we will consider what would have been the effect of the gates during the late rainy season if no rain had fallen within the watershed of Wallis' Creek, and that the waters of the Hunter had been entirely excluded until the great flood of April. The water which broke over at Graham's, and between that place and Maitland, would have found the valley empty, and would have nearly filled it up, covering the low lands to an average depth of 5 feet, in about twenty-five hours. We hope that the inhabitants may never learn by experience what would be the effects of such a sudden influx of the waters.

It has been suggested that the present mouth of Wallis' Creek might be closed up, and a new channel made between East and West Maitland to Howe's Lagoon, and thence to Morpeth. A carrying capacity of about 30,000 cubic feet per second would be sufficient for the waters of Wallis' Creek, together with what breaks over from the Hunter during great floods. This would not prevent the valley from being inundated during great floods, but it would save it from the effects of freshes, and in all cases would drain away the flood-waters rapidly, and would thus afford very great relief. We see no objection to this scheme excepting its cost. It would be necessary that the banks of the new channel should be lined with stone or other material, for the current through it would be rapid; and without some protection it would probably be enlarged and its course altered by every flood. At present the flood-waters tend to accumulate upon the side of Howe's Lagoon, and a new channel in the course proposed would tend, if not artificially restrained, to become the main bed of the river, and would probably produce the most destructive effects upon the low lands about and immediately above Morpeth. We estimate the cost of carrying out this scheme, excluding the value of the land and claims for compensation, at about £120,000. We are afraid therefore that it cannot be considered as practicable.

There is but one more scheme for relieving the Hunter which requires any notice. It has been proposed to cut a channel from some point near Raymond Terrace to Tilligary Creek, which flows into Port Stephens. The distance is 8 or 9 miles, through what is said to be a low swampy country. Such a cutting, if large enough, would no doubt relieve the Hunter. Tilligary Creek is described as a narrow tidal inlet with low banks, which would of course be inundated if any considerable quantity of the waters of the Hunter were conducted that way. If none of the country through which the new cut would pass, nor the land on the banks of Tilligary Creek, were occupied, or of any value, it might be worth while to consider whether some of the flood-waters of the Hunter might not be thus disposed of. It appears however that some of the country is valuable and is occupied, and that one end proposed to be accomplished by the new channel is to drain this area. It is

desirable of course that this should be accomplished, if practicable, by improving the natural outfall through Tilligary Creek; but it is difficult to understand how the introduction of the flood-waters of the Hunter would assist the process. The distance from Raymond Terrace to the sea is less by way of the Hunter than by Tilligary Creek, and therefore nothing could possibly be gained by the proposed cutting, which could not be more easily and cheaply accomplished by enlarging the existing channel.

We are obliged then finally, however unsatisfactory the conclusion may be to us and to others, to state plainly that, beyond the protection of the town of West Maitland, we are unable to recommend any works for preventing the overflow of the Hunter in times of flood.

Before closing this Report, we have to state one result of our inquiries, and it is the only one which is entirely satisfactory. We very much feared that the increasing heights of the floods at Maitland might be occasioned by a silting up of the channel in that immediate neighbourhood. If such process were going on, it would be progressive in its nature, and extremely difficult to deal with. Fortunately we have the means of setting this question at rest. After the floods of 1857, a number of cross sections of the river were taken at various intervals from Oakhampton downwards. Since the recent floods we caused a number of those sections to be remeasured, and we are glad to find that the channel has not diminished in depth or magnitude but on the contrary, that it has sensibly increased.

We have the honor to be,  
Your Excellency's most obedient Servants,

(L.S.) E. O. MORIARTY,  
PRESIDENT.  
(L.S.) JOHN WHITTON.  
(L.S.) M. B. PELL.  
(L.S.) WILLIAM C. BENNETT.  
(L.S.) P. F. ADAMS.

---

## FLOODS IN THE HUNTER.

## MINUTES OF PROCEEDINGS.

[1st Meeting.]

13 *MAY*, 1869.

PRESENT :—

E. O. Moriarty, Esq., President.

John Whitton, Esq.,  
W. C. Bennett, Esq.,P. F. Adams, Esq.,  
Professor Pell.

Instrument under the Great Seal of the Colony, appointing E. O. Moriarty, Esq., Engineer-in-Chief for Harbours and River Navigation, John Whitton, Esq., Engineer-in-Chief for Railways, Philip Francis Adams, Esq., Surveyor General, William Christopher Bennett, Esq., Commissioner and Engineer for Roads, and Morris Birkbeck Pell, Esq., Professor of Mathematics, Sydney University, a Commission to enquire into and report as to the means which should be adopted with a view to remedying or mitigating the evils complained of,—read.

Report, accompanied with Plans, sections, and other documents on the Flood in the Hunter River, by E. O. Moriarty, Esq., were laid on the Table.

It was resolved that application be made to the Honorable the Colonial Secretary for a copy of the Petition from the Inhabitants of the Hunter River District, on the subject of the floods in that locality.

It was resolved that the President be requested to secure the services of a Secretary.

It was resolved to take the earliest opportunity which the important official duties of the Commissioners would admit, to visit the Hunter River District, for the purpose of inspecting the flooded lands and taking evidence on the spot.

[2nd Meeting.]

5 *JUNE*, 1869.

PRESENT :—

E. O. Moriarty, Esq., President.

J. Whitton, Esq.,

Professor Pell.

The minutes of last meeting were read and confirmed. A letter was read from the Colonial Secretary, enclosing, for the information of the Hunter River Floods Enquiry Commission, a copy of the Petition addressed by certain inhabitants of the Hunter District to His Excellency the Governor, on the subject of the floods in that locality.

As it will be impossible for Mr. Whitton or Mr. Pell to leave Sydney at present, or for some months, by reason of other important duties, and as the Surveyor General is also unable to attend, it was resolved (subject to the approval of the Government) that the Commission will proceed to the Hunter on or about the 30th of August next, and that the Honorable the Colonial Secretary be so informed.

The appointment of Mr. G. E. Faithfull as Secretary was approved, at a salary of £1 per day when engaged on the duties of the Commission.

[3rd Meeting.]

17 *JULY*, 1869.

PRESENT :—

E. O. Moriarty, Esq., President.

P. F. Adams, Esq.,

W. C. Bennett, Esq.

The minutes of last meeting were read and confirmed. A letter was read from the Colonial Secretary, in answer to a letter from the Commission, of date 7th June, 1869, intimating that the members of the Commission will not, under the circumstances therein stated, be prepared to proceed to the Hunter River District before the end of August next, and requesting that the Commission will be good enough to suggest what extension of time they will require for their enquiry and report. The Secretary was instructed to request that the Commission be extended for a further period of six months.

The Secretary was instructed to request that on the renewal of the Commission the Government would be good enough to place the sum of £50 to the credit of the Commissioners in the Bank of New South Wales, towards defraying their necessary expenses.

[4th

[4th Meeting.]

22 SEPTEMBER, 1869.

PRESENT:—

E. O. Moriarty, Esq., President.  
 P. F. Adams, Esq., | W. C. Bennett, Esq.,  
 Professor Pell.

The minutes of last meeting were read and confirmed.

A letter was read from the Colonial Secretary, of date 31st July, acknowledging receipt of a letter from the Commissioners, of date 17th July, requesting that £50 should be placed to their credit in the Bank of New South Wales, and desiring to be informed of the nature of the expenses therein alluded to. (The Secretary stated that the desired information had been forwarded to the Colonial Secretary.)

A letter was read from the Colonial Secretary, stating that the Colonial Treasurer had been invited to place the sum of £50 to the credit of the Commission, in the Bank of New South Wales.

A letter was read from the Mayor of Morpeth, submitting the names of those persons he considered most capable of affording information to the Commissioners respecting the Floods in the Hunter.

A deputation from the Floods Prevention Committee waited upon the Commission, for the purpose of ascertaining on what points the Commission required information, and submitting the names of several persons capable of affording information to the Commission on the subject of the Floods in the Hunter River.

Mr. W. L. Foreman and Mr. Peter Green were examined respecting the Floods in the Hunter.

The Secretary was directed to write to the Rev. J. R. Thackeray, requesting him to obtain for the Commission, an estimate of the total annual value of property in the Municipalities of East and West Maitland and Morpeth, distinguishing those parts affected by the floods.

[Adjourned till Thursday, 23rd September, at 10 A.M.]

[5th Meeting.]

23 SEPTEMBER, 1869.

PRESENT:—

E. O. Moriarty, Esq., President.  
 P. F. Adams, Esq., | W. C. Bennett, Esq.,  
 Professor Pell.

The minutes of last meeting were read and confirmed.

The following witnesses were examined:—Mr. Nainby, The Revd. J. R. Thackeray, Messrs. J. Eckford, Alexander M'Dougall, R. Scobie, J. M'Lachlan, John Murphy, J. Creer, and John Mitchell.

At 4 p.m. the Commission accompanied Mr. Eckford to examine the points to which the water was said to have reached in the flood of 1820.

[Adjourned till Friday, 24th September, at 10 A.M.]

[6th Meeting.]

24 SEPTEMBER, 1869.

PRESENT:—

E. O. Moriarty, Esq., President.  
 P. F. Adams, Esq., | W. C. Bennett, Esq.,  
 Professor Pell.

The minutes of last meeting were read and confirmed.

The Secretary was directed to communicate with the Mayor of Singleton, stating that the Commission will be prepared to take evidence at Singleton, between 10 a.m. and 1 p.m. on Monday, the 27th instant, and requesting him to procure the attendance of persons capable of giving information respecting the floods in that district.

The Secretary was directed to summon Mr. Wade, of Scone, to attend at Singleton on the 27th instant, for the purpose of giving evidence respecting the Floods in the Hunter.

The Secretary was directed to write to the Mayor of Maitland, requesting him to furnish the Commissioners with Mr. Mackay's survey and report as to the capability of cutting a new channel for the Hunter by Oakhampton and Hexham.

The following witnesses were examined:—Messrs. J. Atkinson, John Ewing, J. Bowden, A. Liddle, J. Wright, E. Maitland, G. Lobsey, Wilkinson, J. Shepherd, and J. T. Dee.

At 4 p.m. the Commissioners proceeded, in company with Mr. Scobie, to examine points at Oakhampton, which the water was said to have reached in the Floods of 1857 and 1867.

[Adjourned till Saturday, 25th September, at 10 A.M.]

[7th Meeting.]

25 *SEPTEMBER*, 1869.

PRESENT:—

E. O. Moriarty, Esq., President.

P. F. Adams, Esq.,

| W. C. Bennett, Esq.,

Professor Pell.

The minutes of last meeting were read and confirmed.

A letter was read from the Mayor of Morpeth, stating that he would not be able to attend the meeting of the Commission, on Saturday, the 25th, being obliged to visit Newcastle on that day.

At 2 o'clock the Commissioners proceeded to examine the flooded lands about Wallis Creek and Morpeth, and the points to which the floods of 1857 and 1867 were said to have reached.

[Adjourned till Monday, 27th September, at 10 A.M.]

[8th Meeting.]

27 *SEPTEMBER*, 1869.

PRESENT:—

E. O. Moriarty, Esq., President.

W. C. Bennett, Esq.,

| Professor Pell.

The minutes of last meeting were read and confirmed.

The Commissioners proceeded by train to Singleton, where the following witnesses were examined:—Messrs. Wade, W. Dangar, J. K. Howe, J. Brown, Munroe, and W. C. Leslie.

The Secretary was directed to write to the Town Clerk of West Maitland, requesting him to furnish the Commission with a tracing of the plans of the flood-gates at Wallis Creek, also any surveys or sections in connection with the drainage of Wallis Creek.

The Commissioners proceeded at 2 p.m., in company with Mr. Brown, to examine certain points to which the floods of 1857 and 1867 were said to have reached.

[Adjourned till Tuesday, 28th September, at 10.30 A.M.]

[9th Meeting.]

28 *SEPTEMBER*, 1869.

PRESENT:—

E. O. Moriarty, Esq., President.

P. F. Adams, Esq.,

| W. C. Bennett, Esq.,

Professor Pell.

The minutes of last meeting were read and confirmed.

The Commissioners proceeded to the Court House, Morpeth, where the following witnesses were examined respecting the floods in that locality:—Messrs. D. Simm, O. B. Middleton, G. Keating, R. Pulver, S. Dickson, and E. Jacques.

The Secretary was directed to make a survey and section along the proposed line of canal from Wallis Creek to Hexham; also, to take a section over the proposed line of levée round Maitland, as shown on the plans of the Hunter River Commission, and to connect the various flood-levels shown by the inhabitants of Maitland; also, to take cross-sections of the Hunter River at Dalwood, and to connect the flood-levels shown there, with the railway-levels; also, to take certain cross-sections at Hinton and Eales' Flat, and to run a line of levels along the banks of the Paterson, from Hinton to Dunmore.

[10th Meeting.]

20 *DECEMBER*, 1869.

PRESENT:—

E. O. Moriarty, Esq., President.

P. F. Adams, Esq.,

| Professor Pell.

The minutes of last meeting were read and confirmed.

A letter was read from the Colonial Secretary, stating that authority had been given to the Government Printer to print the evidence taken before the Commission, and also the report of the Commission.

A letter was read from Mr. Henry Fountain, suggesting that a channel to take off the flood-waters of the Hunter should be made, commencing at Myers', near Salt Ash, thence through the moors to Morpeth Swamps and Duckhole Swamps to the Williams River, a mile above Raymond Terrace; from thence, through Scott's Swamps, crossing the Paterson above Dunmore Bridge, to the Hunter, a little above Mrs. Dickson's house. The Secretary was directed to acknowledge the same with thanks.

The

The Secretary was directed to write to the Colonial Secretary, requesting him to give authority to the Government Printer to photo-lithograph the plans of the Commission.

Letters from Messrs. Dangar, Creer, Scobie, and Mackay, conveying information with reference to the floods in the Hunter River, were laid before the Commission and ordered to be printed and appended to the Report.

The Secretary reported that he had completed the surveys which he was directed to make at the last meeting; and laid on the table the following plans and sections:—

- Section from Wallis Creek to Hexham.
- Section for proposed embankment round West Maitland.
- Cross-sections of the Hunter River at Dalwood
- Cross-sections at Hinton, Morpeth, and Eales' Flat.

The Secretary was instructed to calculate the cost of cutting a channel from Oakhampton to Hexham, to take off the flood-waters of the Hunter.

[11th Meeting.]

20 JANUARY, 1870.

PRESENT:—

E. O. Moriarty, Esq., President.

John Whitton, Esq., | W. C. Bennett, Esq.

The minutes of last meeting were read and confirmed.

A draft Progress Report, containing an application for a further extension of the Commission for six months, was read by the Secretary, approved, and signed by the Commission.

The Secretary was instructed to transmit the same to the Colonial Secretary.

[12th Meeting.]

1 APRIL, 1870.

PRESENT:—

E. O. Moriarty, Esq., President.

P. F. Adams, Esq., | Professor Pell.

The Commissioners arrived in West Maitland by the early train from Newcastle, and proceeded at 10 o'clock to Scobie's Tunnel, examining on their way the dam at Hall's Creek, which had been injured by the late floods, and the embankment along the Oakhampton Road. From thence they went to the embankment in High-street, following the bank of the river round the Horse-shoe Bend. The Commissioners then drove to the Pitnacree embankment, inspecting on their way the flood-gates at Wallis Creek, and then returned to Maitland.

[13th Meeting.]

2 APRIL, 1870.

PRESENT:—

E. O. Moriarty, Esq., President.

P. F. Adams, Esq., | Professor Pell.

The Commissioners proceeded by boat from the Railway Station over the lowlands towards Fishery Creek, and down that creek to its junction with Mulbring Creek, thence up the latter as far as Brooks' Flat, for the purpose of ascertaining the amount of damage done by the floods in that district; various soundings were taken to ascertain the depth to which the land was submerged.

[14th Meeting.]

3 APRIL, 1870.

PRESENT:—

E. O. Moriarty, Esq., President.

P. F. Adams, Esq., | Professor Pell.

The Commissioners went by boat from the West Maitland Bridge down the river as far as Largs, from thence by steamer to Morpeth, and up the Paterson as far as the Dunmore Bridge, making careful examination of the rivers on their way. From the Dunmore Bridge they proceeded down the Paterson and Hunter River, as far as Hexham, calling at Raymond Terrace, where they ascertained that the late flood of 1870 was within 9 inches of that of 1867, and then returned by rail to West Maitland.

The Secretary was directed to proceed up the Hunter River, on an early day, for the purpose of connecting the flood-levels of 1867 and '70 at various points, and to obtain as much information as possible from residents on the banks of the river.

[15th Meeting.]

4 APRIL, 1870.

PRESENT :—

E. O. Moriarty, Esq., President.

P. F. Adams, Esq., | Professor Pell.

The Commissioners returned to Sydney.

[16th Meeting.]

11 APRIL, 1870.

PRESENT :—

E. O. Moriarty, Esq., President.

P. F. Adams, Esq., | Professor Pell.

The minutes of the five previous meetings were read and confirmed.

A letter was read from Mr. Bolding, P.M., Raymond Terrace, of date April 6th, suggesting the names of persons capable of giving evidence respecting the floods in the Hunter; also a letter, of date April 7th, making further suggestions.

A letter was read from the Mayor of West Maitland, date April 7th, suggesting the names of persons best qualified to give evidence respecting the floods in the Hunter, and stating that the annual value of rateable property flooded in the Borough of West Maitland is, as near as possible, £25,397 10s. The Secretary was directed to acknowledge receipt of the communication, and to request that the Mayor would be good enough to furnish the Commission with a return of the total assessed annual value of property in the Borough of West Maitland, including flooded and unflooded land.

A letter was read from Mr. Shaw, of Raymond Terrace, suggesting a cutting from Raymond Terrace to Port Stephens, *via* Tillegary Creek, and enclosing a sketch of the same. The Secretary was directed to acknowledge receipt.

The Secretary was directed to prepare a table, showing the area and estimated value of flooded land on the Hunter River, from Oakhampton to Hexham.

The following witnesses were examined respecting the floods in the Hunter:—Messrs. J. Creer, C. King, G. Weakley, J. R. Nowlan, J. Atkinson, E. O. Middleton, J. Kerrigan, J. Bowden.

[Adjourned till Tuesday, 12th April, at 10 A.M.]

[17th Meeting.]

12 APRIL, 1870.

PRESENT :—

E. O. Moriarty, Esq., President.

P. F. Adams, Esq., | Professor Pell.

The minutes of last meeting were read and confirmed.

A letter was read from the Mayor of Morpeth, suggesting the names of persons competent to give useful information to the Commission.

The following witnesses were examined:—Messrs. Myers, J. Hicking, James Dee, Joshua Anderson, J. B. R. Robertson, John Mitchell, Michael Boland, Captain Dye.

[Adjourned till Wednesday, 13th April, at 10 A.M.]

[18th Meeting.]

13 APRIL, 1870.

PRESENT :—

E. O. Moriarty, Esq., President.

P. F. Adams, Esq., | Professor Pell.

The minutes of last meeting were read and confirmed.

A letter was read from Mr. J. T. Dee, of Mount Dee, stating that the flooded area of land, south of West Maitland, is over 20 miles in area. The Secretary was directed to write to Mr. Dee, asking him whether his estimate was based upon any survey, as the Commission are in possession of a plan showing that the area alluded to does not exceed 14½ square miles.

Mr. Joseph Youdale was examined respecting the floods in the Hunter River.

[19th Meeting.]

14 *MAY*, 1870.

PRESENT :—

E. O. Moriarty, Esq., President.

P. F. Adams, Esq.,

W. C. Bennett, Esq.,

John Whitton, Esq.,

Professor Pell.

The minutes of last meeting were read and confirmed.

The President reported that, in company with Mr. Adams, he had visited West Maitland during the flood of 26th April (the highest known in the Hunter River), and observed that the water at the Belmore Bridge was 34 feet 4 inches above low water; at the High-street embankment, 1 foot 4 inches higher than the flood of 1867; and at Morpeth the flood-waters had reached to within 5 inches of the height of the 1867 flood.

*Resolved*,—That an estimate be prepared of the cost of protecting the banks of the Hunter River at the Town of West Maitland, by rubble stone facing, and the probable cost of maintaining the same.

The cost of constructing a levée round that town; also a rough estimate of the size of channel which would be required to carry off the flood-waters of the Hunter, starting at Oakhampton, and assuming such a uniform slope as would be sufficient, down to Hexham, giving cross-sections and heights above surface of ground, at uniform intervals (say of 1 mile).

[20th Meeting.]

17 *JUNE*, 1870.

PRESENT :—

E. O. Moriarty, Esq., President.

W. C. Bennett, Esq.,

Professor Pell.

The Secretary submitted to the Commission the following plans and sections, which have been prepared for lithography :—

1. General plan of the flooded districts around Maitland.
2. Cross-sections of the Hunter River.
3. Diagram section of floods.
4. Section of suggested short cut from Wallis Creek to Hexham.
5. Sections of embankment round Maitland.
6. Diagram showing inclinations from West Maitland to Hexham, by Wallis Creek and Hunter River Valley.
7. Cross-section of river at Eales' Flat, showing total discharging area.
8. Plan of proposed cuttings referred to in the Report of 12th June, 1869.
9. Rough plan of embankment round West Maitland.

Letter from Mr. John Wyndham, accompanying a paper of suggestion, was read. Plans examined, and a lengthened discussion thereon ensued.

[Adjourned till Monday, 20th June, at 10:30 A.M.]

[21st Meeting.]

20 *JUNE*, 1870.

PRESENT :—

E. O. Moriarty, Esq., President.

J. Whitton, Esq.,

W. C. Bennett, Esq.,

Professor Pell.

The minutes of last meeting were read and confirmed.

*Resolved*,—That the general plan of the flooded districts of the Hunter be lithographed.

Discussion ensued as to the effects to be anticipated from shortening and straightening the course of the Hunter River, between West Maitland and Morpeth.

[22nd Meeting.]

21 *JUNE*, 1870.

PRESENT :—

E. O. Moriarty, Esq., President.

J. Whitton, Esq.,

P. F. Adams, Esq.,

W. C. Bennett, Esq.,

Professor Pell.

The minutes of last meeting were read and confirmed.

Discussion resumed as to the probable effect of shortening and improving the channel of the Hunter River, between West Maitland and Morpeth.

*Resolved*,—That the general plan of the town of West Maitland be prepared for photo-lithography when line of embankment shall have been determined upon, also cross-sections of the Hunter River.

[Adjourned till 27th June.]

[23rd Meeting.]

27 JUNE, 1870.

PRESENT :—

E. O. Moriarty, Esq., President.

John Whitton, Esq., | Professor Pell.

The minutes of last meeting were read and confirmed.

Discussion resumed as to the probable results to be anticipated from shortening the channel of the Hunter River, between West Maitland and Morpeth.

[Adjourned till Wednesday, 29th June, at 3 P.M.]

[24th Meeting.]

29 JUNE, 1870.

PRESENT :—

E. O. Moriarty, Esq., President.

W. C. Bennett, Esq., | Professor Pell.

The minutes of last meeting were read and confirmed.

Project for shortening and improving the channel of the Hunter, between West Maitland and Morpeth, further considered and discussed.

Portion of draft Report read and discussed.

[Adjourned till Tuesday, 5th July.]

[25th Meeting.]

5 JULY, 1870.

PRESENT :—

E. O. Moriarty, Esq., President.

W. C. Bennett, Esq., | P. F. Adams, Esq.,  
Professor Pell.

The minutes of last meeting were read and confirmed.

A letter was read from the Under Secretary for Public Works, enclosing a letter from Mr. E. C. Close, of Morpeth, protesting against any alteration being made in the course of the Hunter River. Ordered to be printed with other documents, and attached to the Report of the Commission.

The Secretary laid before the Commission a statement of losses caused by the floods of this year in and about Maitland, Morpeth, and Hinton.

General plan of West Maitland submitted, and line of embankment to be recommended, determined upon, approved, and ordered to be prepared for photo-lithography.

General plan of flooded districts submitted, and line of embankment discussed.

[Adjourned till Thursday, 7th July, at 3 P.M.]

[26th Meeting.]

7 JULY, 1870.

PRESENT :—

E. O. Moriarty, Esq., President.

John Whitton, Esq., | P. F. Adams, Esq.,  
W. C. Bennett, Esq., | Professor Pell.

The minutes of last meeting were read and confirmed.

A letter was read from Mr. John Lee to the Honorable the Minister for Works, on behalf of the Committee appointed at West Maitland, for the purpose of obtaining information as to the best means for securing the preservation of the river bank, and stating that the Committee believed that the Royal Commission appointed to investigate the matter of flood prevention in the Hunter District may recommend some plan for the preservation of the river bank, and requesting him to urge upon the Commissioners the necessity for submitting their Report at as early a date as possible, and requesting him to forward a copy of the Report as soon as possible.

The Secretary was directed to write to the Secretary of the Committee, stating that the Commission would be in Maitland on Saturday, the 9th instant, when they would be glad to take evidence with respect to the above matter.

A portion of a draft Report was read and approved.

The Commissioners determined to proceed to Maitland on Friday.

[Adjourned till Friday, 8th July.]

[27th Meeting.]

8 JULY, 1870.

PRESENT :—

E. O. Moriarty, Esq., President.

John Whitton, Esq., | W. C. Bennett, Esq.,  
Professor Pell.

In accordance with the minute of last meeting the Commissioners proceeded by steamer to Newcastle.

[Adjourned till Saturday, 9th July.]

[28th Meeting.]

9 JULY, 1870.

PRESENT :—

E. O. Moriarty, Esq., President.

John Whitton, Esq., | W. C. Bennett, Esq.,  
Professor Pell.

The Commissioners proceeded up the Hunter River from Newcastle to Morpeth, examining on their way the damage done to the banks of the river by the late floods, arriving in Maitland at 2:30 p.m.

In the afternoon the Commissioners examined the height to which the flood of 1870 reached at the Long Bridge, and inspected the bank of the river near the Falls.

[Adjourned till 10th July.]

[29th Meeting.]

10 JULY, 1870.

PRESENT :—

E. O. Moriarty, Esq., President.

John Whitton, Esq., | W. C. Bennett, Esq.,  
Professor Pell.

The Commissioners proceeded to examine the low ground near Bolwarra, where the river breaks over in flood time, and inspected the site of the proposed cutting from above Bolwarra House towards Morpeth; they then examined the breach in the embankment at Pitnacree and returned to Maitland.

[Adjourned till 11th July.]

[30th Meeting.]

11 JULY, 1870.

PRESENT :—

E. O. Moriarty, Esq., President.

John Whitton, Esq., | W. C. Bennett, Esq.,  
Professor Pell.

The Commissioners proceeded, in company with Messrs. Vindin and J. Lee, up the Oakhampton Road towards Graham's, examining on their way the embankment at Hall's Creek and the height of the flood over the road; they then walked from the Belmore Bridge towards the High-street embankment, inspecting on their way the banks of the river.

Tuesday, 12th July :—The Commissioners returned to Sydney.

[31st Meeting.]

18 JULY, 1870.

PRESENT :—

E. O. Moriarty, Esq., President.

P. F. Adams, Esq., | W. C. Bennett, Esq.,  
Professor Pell.

The minutes of the five previous meetings were read and confirmed.

The Secretary laid before the Commission various cross-sections of the Hunter River, taken since the floods of 1870, and showing the alterations in the bed of the river since the year 1867.

A portion of a draft Report was read and approved.

Discussion ensued on the practicability of embanking West Maitland, and the Commission resolved to send in a Progress Report to the Colonial Secretary, and apply for a further extension of time.

[Adjourned till Friday, 22nd July.]

[32nd Meeting.]  
22 JULY, 1870.

PRESENT :—

E. O. Moriarty, Esq., President.  
John Whitton, Esq., | W. C. Bennett, Esq.,  
Professor Pell.

The minutes of last meeting were read and confirmed.

The Secretary was directed to calculate the cost of cutting a canal from Wallis Creek, a little above Victoria Bridge, to Morpeth.

A portion of a draft Progress Report was read and approved.

The Commissioners determined that the proposed embankment round West Maitland should be raised to a height of (2) two feet above the level of the 1870 flood on the river bank, and (5) five feet above the level of the backwater of the 1867 flood, on the Louth Park side of West Maitland.

[33rd Meeting.]  
29 JULY, 1870.

PRESENT :—

E. O. Moriarty, Esq., President.  
John Whitton, Esq., | W. C. Bennett, Esq.,  
Professor Pell.

The minutes of last meeting read and confirmed.

A letter was read from the Rev. Alfred Glennie, giving particulars of the flood of 1826 in the Hunter River.

A letter was forwarded to the Colonial Secretary, stating that the Commissioners find it impossible to complete their Report within the time named in the extended Commission of date 31st January, 1870, and requesting a further extension of three months.

A portion of a draft Progress Report was read and approved.

[34th Meeting.]  
17 AUGUST, 1870.

PRESENT :—

E. O. Moriarty, Esq., President.  
John Whitton, Esq., | W. C. Bennett, Esq.,  
Professor Pell.

The minutes of last meeting were read and confirmed.

A letter was read from Mr. Darley, giving the heights at various places to which the flood of 1826 was said by Mr. G. B. White to have reached at West Maitland, and suggesting that Mr. White's note-books, made during the years 1826 to 1829, should be procured. The Secretary was directed to inquire if the books are in possession of the Surveyor General.

A letter was read from Mr. Bolding, P.M., Raymond Terrace, to the Commission, on the subject of floods in the Hunter River.

A memorandum was read from Mr. W. B. Wade, stating that in the flood of April, 1870, the water broke over the banks of the Hunter a few miles above the Singleton Bridge, and flowed by another channel into the river; that about 20,166 cubic feet per second was discharged in that way during the height of the flood.

A letter was read from Mr. John Eckford, stating that the flood of 1826 was not so high at West Maitland by some feet as that of 1820, and giving points to which the flood of 1820 had reached.

A letter was read from Mr. John Wyndham, relative to the height of the 1826 flood at Singleton, Maitland, and Raymond Terrace.

The Secretary was directed to apply to the Colonial Secretary for a further advance of £50, to defray necessary expenses of the Commission.

A Progress Report was read and approved.

[Adjourned till Monday, 22nd August, at 3 P.M.]

[35th Meeting.]  
22 AUGUST, 1870.

PRESENT :—

E. O. Moriarty, Esq., President.  
John Whitton, Esq., | W. C. Bennett, Esq.,  
Professor Pell.

The President read a memorandum, which was ordered to be printed, and appended to the Progress Report of the Commission.

The Secretary laid on the table a lithograph proof of a diagram, showing the heights of some of the principal floods of the Hunter River, and the various inclinations of their surfaces.

The Secretary was directed to proceed to Maitland, with the view of ascertaining the encroachments made by the late floods in the Hunter, from the Falls to a little below the High-street embankment; also, what change has taken place in the bed of the river above the Falls.

[Adjourned till Tuesday, 23rd August, at 3 P.M.]

[36th Meeting.]

23 AUGUST, 1870.

PRESENT:—

E. O. Moriarty, Esq., President.

John Whitton, Esq., | W. C. Bennett, Esq.,  
Professor Pell.

The minutes of the two previous meetings were read and confirmed.

The Secretary reported that, in accordance with the minute of 17th August, he had made inquiries at the Surveyor General's Office, and had been informed that the field-books of Mr. White in that office did not give any information concerning the flood of 1826.

A Progress Report of the Commission, dealing with the question of the protection of the bank of the Hunter at West Maitland, was signed, and ordered to be transmitted to the Colonial Secretary.

[37th Meeting.]

12 OCTOBER, 1870.

PRESENT:—

E. O. Moriarty, Esq., President.

John Whitton, Esq., | Professor Pell.

The minutes of last meeting were read and confirmed.

A letter was read from Mr. Chambers, of date August 30th, giving particulars with reference to Wallis Creek being in flood from local rain. The Secretary was directed to acknowledge the same with thanks.

Letters were read from Messrs. Horniman and Hickson, of Melbourne, to the Colonial Secretary, of dates May 2nd and June 7th, on the subject of flood prevention in New South Wales. Also, two letters, of dates March 25th and May 13th, from Mr. Rafter to the Honorable the Secretary for Public Works, on the subject of the improvement, regulation, and utilization of the waters of New South Wales, and the storage of their surplus floods. The Secretary was directed to return the same to the Minister for Works.

A report was read from the Secretary on the loss of crops in the Hunter River District, which was ordered to be printed and appended to the Report of the Commission.

The Secretary laid on the table a table showing rise and fall of water in the Hunter River during the flood of 1870, at Singleton, Maitland, and Morpeth; also, a table showing the relative heights of the floods of 1820, 1857, 1867, and 1870, above low-water, at Maitland, Dalwood, and Singleton; ordered to be printed and appended to the Report of the Commission.

The Secretary laid on the table the following lithographs:—

Maps shewing drainage areas of the Hunter River, and its principal tributaries.

Diagram showing extent of flooded country, Lower Hunter River District.

Diagram section shewing some of the principal floods in the Hunter.

A portion of a draft Report was read and approved.

[38th Meeting.]

24 OCTOBER, 1870.

PRESENT:—

E. O. Moriarty, Esq., President.

John Whitton, Esq., | Professor Pell.

The minutes of last meeting were read and confirmed.

The Secretary laid on the table lithographs of the plans and sections to accompany the Report of the Commission.

The final Report of the Commission was approved.

[Adjourned till Tuesday, the 25th, at 4 P.M.]

[39th Meeting.]

25 OCTOBER, 1870.

PRESENT:—

E. O. Moriarty, Esq., President.

John Whitton, Esq., | Professor Pell.

The minutes of last meeting were read and confirmed.

The salary of Mr. T. W. Keele, at rate of 10s. a day, while employed in preparing the plans of the Commission, was approved.

Final Report of the Commission signed.

*Resolved*,—That the Report of the Engineer-in-Chief for Harbours and Rivers, dated January 12th, 1869, be appended to the Report of the Commission.

[Adjourned till Monday the 31st, at 3 P.M.]

[40th Meeting.]

31 OCTOBER, 1870.

PRESENT :—

E. O. Moriarty, Esq., President.

John Whitton, Esq. | Professor Pell.

The minutes of last meeting were read and confirmed.

Letters from Messrs. Horniman and Hickson, of Melbourne, and Mr. Rafter, on the subject of floods prevention in New South Wales, returned by the Under Secretary for Public Works, requesting to know if the Commission had any remarks to make on them, laid before the Commission. The Commissioners stated that the papers had no bearing on the subject of their enquiry.

Lithograph plans and sections to accompany the Report of the Commission, submitted and revised.

The Secretary was directed to forward the Report of the Commission to the Colonial Secretary as soon as the Appendix is completed.

---

## FLOODS IN THE HUNTER.

MINUTES of EVIDENCE taken before the Commission appointed to inquire into and report upon the best means of mitigating or preventing the evils occasioned by Floods in the District of the Hunter River.

EDWARD ORPEN MORIARTY, Esq., PRESIDENT.  
JOHN WHITTON, Esq.  
PHILIP FRANCIS ADAMS, Esq.  
WILLIAM CHRISTOPHER BENNETT, Esq.  
MORRIS BIRKBECK PELL, Esq.

WEDNESDAY, 22 SEPTEMBER, 1869.

Present:—

E. O. MORIARTY, Esq.,	W. C. BENNETT, Esq.,
P. F. ADAMS, Esq.,	PROFESSOR PELL.

E. O. MORIARTY, ESQ. (PRESIDENT), IN THE CHAIR.

Mr. William Larkin Foreman, called in and examined:—

1. *President.*] Where do you reside? On the Raworth Estate, about a mile on this side of Morpeth.
2. Have you resided there long? I have lived for six years where I now reside, and for twenty-seven years on Narrowgut in the same district.
3. Have you noted the effect of the floods? Yes, I have seen all the floods.
4. Do you remember the floods of 1857 and 1867? Yes, and also the floods of 1861 and 1864.
5. Was there much injury caused by those floods? Yes; in 1864, what with the loss of crops and the expense to which I was put in clearing away the heavy timber and rubbish, I estimate that the damage I sustained amounted to £10 an acre.
6. Could you form any estimate of what your losses were in each of the other floods? No; I lost more in 1867, but then produce was not fetching such a high price.
7. In 1857 were your losses heavy? Yes, I lost a great deal in 1857.
8. And did your neighbours sustain losses in similar proportions to yourself? Some of them suffered losses more severe.
9. Could you form any estimate of the amount of loss done in each of those floods in the neighbourhood of Morpeth? No, I could not say; but I know that most of my neighbours suffered worse than myself. In 1857, although my crops were not so heavy, I lost £500 or £600.
10. *Mr. Bennett.*] Of the 44 acres? No, I had only 23 acres then; I was living on Mr. Close's land at that time.
11. *President.*] Does the water lie long on the land after the floods? No, as soon as the water subsides in the river it draws off the land.
12. Is there a rapid current flowing across your land in time of floods? Yes, when the water reaches a certain height.
13. Is the injury done by the current sweeping away everything from your land, or from the water coming on to it and remaining for a time? By the sweeping away of the produce, the deposit of rubbish and timber, and the washing away of the soil. It cut a gully 5 or 6 feet deep.
14. Does it wash away the soil? Yes, in some places.
15. Does it not on your land and in the neighbourhood leave an alluvial deposit? It is mostly sand.
16. So that the higher the flood the greater would be the injury done to you? Generally.
17. Do you think that if the floods were to rise a foot or 2 feet higher than those of 1857 or 1867 they would do you very great injury? It would not injure the land more I dare say, but it would injure what I have in the barn.
18. Do you think that if the floods were prevented by any means from flowing over the land it would have the effect of increasing the value of it? Yes; I should consider my land worth half as much again as it is, if the floods were prevented from going over it.

Mr. W. J.  
Foreman.

22 Sept., 1869.

- Mr. W. L. Foreman. 19. You do not think that situated as you are you derive any benefit from the deposit left by the floods? No.
20. You think, in fact, that they do not leave any? Yes, they do, but it is mostly sharp sand.
- 22 Sept., 1869. 21. About how long does the flood water remain on your land—a flood, say, like that of 1867? I could not say; I have not noted it down. It does not lie long after the river falls.
22. Speaking generally? I should say it would take two or three days from the time the flood is at its highest, before it was off the land—I mean the greater portion of the land—some of mine lies low. If there is only a very little rain shortly after the flood begins to fall, of course it keeps the river up.
23. Have you formed any opinions as to any practical mode of mitigating the evils of floods? I cannot see how any plan can be adopted to prevent them, except to take the water away in another direction before it reaches Maitland—say to Hexham or Lake Macquarie.
24. But you have no idea as to the practicability of doing so? No.
25. *Professor Pell.*] You say that your land would be raised in value 50 per cent. if some means could be devised to prevent it being flooded? Yes.
26. You say that some part of your property is above the flood-level—that if the waters were to rise higher they would reach your barn? I have had 8 or 9 inches of water on the land, but the barn is raised.
27. If a flood should rise a few feet more it would reach your barn; and your neighbours have no such secure place? I think I am better off than most of them. There are only one or two on Mr. Close's estate whose land is as high as mine.
28. Three or four feet of flood, more or less, would not make much difference to them then? It could not make much difference when it was all over everything.
29. Is that the case with respect to a large number of persons about there? Yes, with respect to most of them.
30. Speaking generally of that Morpeth district, would there be much extra damage done by a flood rising an extra foot or so? I think it would be likely to frighten the people all away.
31. Do you know whether any of the lands in the district are improved by the deposit from the floods? I cannot conceive that they are. There are plenty of places on the same estate on which I am living, from which I suppose 8 or 10 feet of soil have been swept away, and a greater body of water goes through there in flood time than down the river channel. In the flood of 1867, I noticed that there was no current in the river when it reached a certain height. I observed a cask floating about in nearly the same place for three or four hours. It breaks over at Bolwarra, and meets the other current.
32. Do you think much land in the district would be improved as much as yours—50 per cent.—if it could be secured against inundation? I think some would be improved to a greater extent, for there is some so low as to be under water when mine is not, and there are farms where the floods sweep the soil away.
33. Is there much of the land that would be improved? The whole of that which is now liable to be flooded.
34. Are you aware of any particulars of a plan already proposed for saving Maitland from the floods? I have heard it suggested that a canal should be cut through Howe's Lagoon.
35. And that the river should be banked up to Maitland? Yes; and that there should be some cutting below Bolwarra.
36. Have you any objections to that scheme? Yes.
37. What are they? I think if there was a cutting on the road side it would make it a good deal worse for myself; I do not know whether it would for the people on the Bolwarra side below.
38. You think it would let the water down more suddenly? Yes. A good deal of the water of the Williams and the Paterson now gets away before the Hunter comes down. During the last flood in 1867, I noticed at my place that the water was running up very strong 2 or 3 feet above high-water-mark before the Hunter came down.
39. Had that back water begun to recede before the flood water came down the Hunter? I noticed in the *Mercury* that at that time the water had risen 7 or 8 feet in Maitland.
40. Can you remember if the back water from the Paterson had begun to run back before the Hunter came down? No.
41. The two waters met? Yes; I should say about half way between Maitland and Morpeth.
42. *Mr. Bennett.*] If the floods were prevented, what would you think a fair estimate of the increase in the value of the land per acre per annum? I should think it would be worth half as much again.
43. How much more per acre per annum would it be worth in rent? I should think it would be worth £1 per acre more, because now a person is often afraid to put in a crop—there is great uncertainty.
44. *Professor Pell.*] What is the average value of this flooded land per acre? I gave £55 per acre for mine, when I bought it.
45. *Mr. Adams.*] In what year did you purchase? In 1858. My neighbour gave, I think, £70 per acre for his land.
46. Have you any knowledge of the Williams and Paterson Rivers above the low flats? No.
47. *President.*] Have you ever sustained any damage from a flood in the Paterson alone? No.
48. Only from the Hunter River floods? That is all. I have known at one time a high flood in the Williams and the Paterson and very little flood in the Hunter, but I did not sustain any considerable damage.
49. As far as you are aware, was much damage done on the banks of those rivers? A good many of the settlers lost a great deal.
50. By the floods in their own rivers? Yes.
51. On the occasions of which you speak there was no flood in the Hunter to speak of? No; there was only a high fresh.
52. If the Hunter flood had come down at the same time? Then there would have been a very high flood.
53. And still more damage would have been done to the people lower down? Yes.
54. Then on that occasion the people were benefited by the flood in the Hunter being held back? Yes. There was not much flood in the Hunter at that time, and therefore they were not so badly off.
55. Have you noticed generally that the floods in the Paterson and Williams come down before the Hunter? I believe they do generally if not always. I have noticed several times that the Paterson backs up, even to my place, very often before I see any current downwards.

56. From what you have heard, or from personal observation, are you aware whether the floods remain long in those rivers, or whether they run off rapidly? I believe the water does not lie so long on the lands of the Paterson and the Williams as on the lands of the Hunter, except where there are swamps.

57. In the rivers the floods run off very rapidly? Yes.

58. And it is a benefit to the country generally that these waters pass off before the floods of the Hunter come down? Yes.

59. Consequently anything which would have the effect of bringing the flood waters of the Hunter down before the waters of the lower rivers have had time to escape, would be injurious? Certainly.

60. *Professor Pell.*] You say that the land would be worth £1 more per annum rent if it were free from floods? Yes.

61. Would the people be willing to pay £1 per acre more to be free from floods? The tenants would not like to do that. They might be turned off. I should consider it would be the landlord.

62. But you think that a man cultivating his own land would be willing to pay £1 per acre to be sure of full compensation for all damages from floods? I think so. I would myself. I should certainly consider my land worth £1 per acre more to me if there were no floods.

63. Is there anything you would like to add in regard to this matter, as the result of your own thought from time to time? No, I do not think I have anything to add to the observations I have already made.

Mr. W. L.  
Foreman.

22 Sept., 1869.

Mr. Peter Green called in and examined :—

64. *President.*] Do you reside in the neighbourhood of Morpeth? No; in the neighbourhood of Mr. P. Green. Windermere, about ten miles higher than West Maitland. I have resided in this district for above one third of a century.

22 Sept., 1869.

65. Are you interested in the Maitland view of the case, or in that of Morpeth? I am interested in Maitland, having landed property there; but I am also well acquainted with Morpeth. My interest is confined to this place, and to within ten or twenty miles upwards.

66. Can you give us any idea of the depreciation which has taken place in the value of property about Maitland by reason of the inundations to which the land is subject? The floods in this district have made farming pursuits so uncertain, and in many cases so unsatisfactory, that as a landlord I cannot get half as much rent as I obtained in former times. Tenants who have sustained considerable losses from floods, particularly during the last ten or twelve years, have left the district. Some seventeen or eighteen are gone to the Manning, which they describe as superior, because free from floods.

67. You refer specially to the last ten or twelve years—Were not the floods so frequent or injurious before that time? They were not so high; but prior to 1835 there was a flood which is described as being higher than any other. It was said that the water came up to a house called Aaron's, and up to another known as Mrs. Cornelius'. If so, the water must have been higher than it had ever been before or has been since.

68. What year was that in? I am not able to say.

69. I understand that you desire to give to the Commissioners your views in regard to the object for which they were appointed? I feel great deference in offering an opinion; still, I have entertained ideas in regard to the subject which I still strongly advocate, and which remain firmly fixed in my mind.

70. Perhaps you will be good enough to describe, as well as you can, your views? I look upon the Hunter as the draining place of something like 5 million acres of land; hence the great fluctuations in the height of the water in the river. Many parties have advocated a cut through Bolwarra, but I think the effect of that would be to swamp Morpeth and other places lower down the river. I have always looked upon any partial scheme for benefiting the district as insufficient. Mr. Yeomans (an old friend of mine) and myself have often talked on this subject, and we conclude that any partial drainage will be inadequate to the requirements of the district. The question then arises, how can the necessary requirements be met? I submit with all respect that if an Act were passed by the Legislature of the Colony compelling every person who received benefit from the drainage of the land to pay at the rate of one shilling or two shillings per acre, and if such assessment were combined with prison labour, sufficient means would be obtained to accomplish the work on a grand scale in the course of time. Upon this subject, two ideas have occurred to me. The first is that the silt should be taken out of the river, and that the banks should be sloped down so as to make the channel three times its present capacity. I imagine that the embankments might go 150 or 200 feet back, and be sloped at an angle of about 45 degrees, and raised 8 or 10 feet.

71. To what part of the river do you refer? To the whole of it, from where the river begins to overflow its banks, or within a mile or two of that point, down to where the water again flows in the channel without breaking over the banks. I would extend the bank the whole of the distance between those two points, and make self-acting flood-gates or sluices as I came to a creek. The Williams River and the Paterson would have to be protected in the same way. Supposing the embankment were 8 or 9 feet at the mouth of the Williams it might pass off to nothing. The land within the banks might be used in ordinary seasons for depasturing stock, but I would make it criminal to break a sod by the river side. The assessment on the lands would amount to something considerable. The dredging machines and the sloping of the banks should be carried on by prison labour, and the expense of supervision should be paid for out of the assessment. I would suggest that if short-sentence men were employed upon such a work, or upon any other which your wisdom may dictate to accomplish the desired end, it would be a great benefit not only to the Hunter but to the Colony at large. If any plan could be devised by which the Hunter could be drained and freed from floods, it would soon become the garden of New South Wales. People would then get their provisions cheaper, because competition would be keener. Another idea has struck me. This is to leave the river in its present state, and to cut a canal which would clear the Williams and Paterson and also the Hunter. In thinking of that matter, I took into consideration the altitude at Harpur's Hill and at Hexham, and I estimate that there would be a fall, when the river was in flood, of some 40 feet. I would employ the same kind of labour on this work. We should not have to make the same cutting the whole of the distance, because some of the swamps are as low as the river; but then there would be some hills to be cut away. There is a considerable quantity of low-lying land from below Harpur's Hill, going to Hexham or Lake Macquarie. There is some hard rock to be gone through, but I do not know of any engineering difficulties in the way of such a work. Although the inclination is about 40 feet, the cutting would not require to be anything like that, for if you commenced the canal so that it would be 15 feet

above

- Mr. P. Green. above the rise, it would carry off sufficient water to prevent the backing up and flooding which now take place. These are gigantic ideas, but were the prisoners employed as formerly, the work would travel along, and in the course of time it would no doubt be accomplished. Great uncertainty now attends the freeholder. I have a farm for which I used to obtain £115 a year, but now I only get £46 for it.
- 22 Sept., 1869.
72. Where is that? On Wallis' Creek.
73. How long is it since you got £115 per annum for it? Seven years ago. I am to get £52 in consequence of the flood-gates being erected, and perhaps in a few years I may get more. The extent is 46 acres.
74. Where is that farm situated? It joins the town of West Maitland. I have always looked upon the Bolwarra cutting as being effectual only to West Maitland. There would be the same number of feet of water to be got away, and lower down, the flood would inundate the land much earlier.
75. With reference to your farm on Wallis' Creek—you say you obtained £115 for it seven years ago? Yes.
76. And that now you only get £45? With a progressive increase, conditional on putting in lucerne.
77. Does the water lie on that land after the floods? Yes, on some few acres of it.
78. How long does the water remain on the land? Just as long as it lies on the other land in the neighbourhood—generally about two months. The water lies on the farms about Hungerford Swamps for eight or nine months.
79. Do you not think it would be possible to drain those swamps into the natural watercourses? Yes, but not to Hexham.
80. Are you acquainted with any of those farms which are only subject to inundation while the flood is running into the river? I know every farm in the district.
81. How long would lucerne stand being under stagnant water? In winter, perhaps three or four days; in summer, a day or a day and a half. It depends also upon the age of the lucerne. I have had lucerne killed by the rain lying upon it, but then it was only put in this year.
82. *Professor Pell.*] Do you mean that the roots were killed? Yes, the roots were killed.
83. *President.*] With reference to maize—how long will that stand? Maize will not stand water at all.
84. Do you not think that the farms would be worked out by successive cropping if they did not receive the top dressing from the floods? There can be no question that they would, unless they received artificial dressings. The lands are all rich alluvial deposit. You may go down 20 feet on these flats, and yet find good soil. There is no doubt that the flood waters leave a rich deposit.
85. Which is itself beneficial to the land? Yes; but when you consider the great evils floods do, the benefits derived from the deposit are more than counterbalanced.
86. With regard to your farms—would you prefer to keep the floods off altogether and lose the deposit they leave, or to receive the deposit and lose a crop once every five or ten years? There is so much uncertainty in regard to the floods, and having regard to that I would rather have the land enriched by manuring. I might take a different view perhaps if I could be ensured that there would be a flood every ten years, and at no other time.
87. Do you think that manure could be had? The land would last for twenty years without manure.
88. But at the end of that time what would be its condition? You could use the subsoil, plough and turn up the lower land, or you could cultivate two fields and let one rest, and the land would restore itself. But there is plenty of manure here—there are thousands of tons going to waste where I am.
89. When you speak of the element of uncertainty, you must remember that everything is uncertain, and that you are obliged to have regard to probabilities? Then I would give the preference to taking the water away.
90. If you saw that in a long period of years you had a certain average proportion of floods, do you not think it would be reasonable to assume that as the basis of your calculation? It would have great effect with me.
91. And if you found you had been living in a district in which there had been no bad flood for half a century till 1857? We had many bad floods before that. I have seen as much timber underneath the bridge long before 1857 as would take a team two months to cart away.
92. How frequent have dangerous floods been that do mischief? I have not noticed with any degree of accuracy. They seem to me to have occurred a good deal oftener during the last ten years than they did twenty years previously. I am most anxious to see the water removed, so that there shall be no chance of inundation from the river. The back waters will render it impossible to free the lands entirely. I have seen a sheet of water coming down from the Sugarloaf Mountain before the river had backed up.
93. Does not that inundate the back lands? Yes; but not for the length of time, nor to the extent of the floods which are caused by the backing up of the river. I should think it would not be equal to one-fourth. That would be beneficial.
94. In what way? It would enrich the land without destroying it.
95. But if that were done in a greater degree? If it were flooded in too great a degree the effects would of course be injurious.
96. *Professor Pell.*] You have said that your farm is much depreciated in value—Is that the case with most of the flooded land in the vicinity? It is the case with all, without any exception.
97. And to the same degree? I imagine so. People have failed who were well to do twelve years ago. I have seen an immense amount of money among the poor farmers. I was on the Floods Relief Committee.
98. If this farm for which you now get £45 a year were safe from the ravages of floods, what would you get for it? I should get £115—£3 an acre. It is the richest land in the district.
99. It would be worth a man's while, with a farm of that sort, to pay a heavy annual sum for insurance against floods, if he could ensure full compensation? Yes; but no insurance would do it.
100. But if he could be so assured? It would be worth his while to pay double his present rent. I am sure it would be to his advantage; what his inclination might be I know not.
101. How much has house property deteriorated in value in Maitland by reason of the floods? I am not able to say. The district would be altogether a richer district, and rents would be higher, if it were not for the floods. Persons of capital would invest their money in houses, and continue to do so until the thing found its level.
102. A house anywhere in Maitland, if above the level of the floods, is worth more on that account? Decidedly.

103. Do you think it would make 20 per cent. difference in the rent? I think the value of Maitland as a whole would be increased from 25 to 50 per cent. if there were security from the floods. I have always looked upon West Maitland as a place liable to be swept away by the floods, calling to mind the floods spoken of by the black-fellows and the old inhabitants of this part of the country. Mr. P. Green.  
22 Sept., 1869.

104. *Mr. Bennett.*] Do you think the depreciation of property in and about Maitland is altogether owing to the floods—are there not other causes which affect the entire Colony? Yes, but it is in this way:—If I find the small farmers ready to do business my chances are better. A shopkeeper trusts A and B. They seem to be in good circumstances, but a flood comes and ruins them and they cannot pay.

105. But have not the prices of staple products fallen considerably? I do not think they have really, in regard to lucerne and such things. The price is no doubt guided by the Sydney markets, but the facilities of bringing these things to market are much greater by means of machinery for mowing and the railway for transit, so that the profit is not so much diminished as would appear to be the case.

106. Is there much land flooded about Windermere? There is very little land flooded there compared with the land which is flooded here. There was a boiling down establishment swept away one year. At Kaludah there is a long flat piece, but we never complain much of floods there.

107. All the way up to Singleton along the river is there much land that is flooded? Generally speaking the land is higher than it is here, but there are some flats liable to be flooded, lying as they do in low situations.

108. *Professor Pell.*] You think that little damage is done above Maitland by the floods? There is not so much damage done in proportion to the damage done lower down the river. Singleton is subject to inundation.

109. *Mr. Adams.*] Have you ever had an opportunity of estimating the heights of previous floods further up the river away from the flat lands about Maitland? No, never above Windermere. I had some marks there, but I do not know whether they are legible now.

110. How long is that since? Within this last ten years.

111. In that scheme you proposed of banking the river, did you mean to straighten its course? No, I would let the river take its natural course.

112. How do you propose to dispose of the silt and of the heavy matter which would come down the river? The dredging machine would clean the river. The channels are now deeper than they were within recollection at Hall's Flat and below Raymond Terrace, and also at Shellbanks.

113. *President.*] The river has been dredged? Yes; the dredging has done an immense deal of good.

114. I understood you to say that the depreciation of property within the last seven years had arisen principally from the tenants going away and leaving the place? From the uncertainty of being able to get a crop off the land, they are disheartened and miserable.

115. And the consequence is they have left? Several have left. Some are still living there, and some are leaving. There is my tenant's family of four persons, and there are four from Windermere. A long list of tenants have gone from Bolwarra on account of the frequency of floods and the uncertainty of a return for their labour. They went to the Richmond or some other of the northern rivers.

116. Most of those people who left were tenants? Yes, nearly all of them.

117. Do you know of any person having sold his land and gone away? I do not; but the land has gone down very much in value during the last few years.

118. Do you not think that depreciation in the value of land and exodus of tenants may have been brought about by the operation of the Land Acts and the land about those northern rivers being thrown open to free selection? That would no doubt be an inducement to some; but any man that was doing well would be satisfied to remain where he was. The rents have come down tremendously.

119. What is the average rent per acre here? At Bolwarra it is £2 10s. per acre.

120. Do you suppose any man would be willing to pay £2 10s. an acre for land, when by paying as much perhaps for shifting his family he might settle on his own property? I think he would remain if he were doing well. I have had the job of clearing land. It is an immense undertaking. It has cost me about £10 an acre.

121. But then it would become a man's own property? Yes; but I cannot recollect a single instance where a man would go if he were doing well, notwithstanding the great advantage of the "free selection" Act. But when they suffer from floods they try and get their own lands; but the clearing is hard, and costs a great deal of money.

122. As you are so well acquainted with this district, could you point out to us any of the old flood-marks before 1857? In the year 1840 odd, Wolfe & Gorrick's place was mine, and I recollect the water being 7 feet  $1\frac{1}{2}$  inch from the top of the bank, and that is the highest part of West Maitland.

123. Was that as high as the 1857 flood? No.

124. I am speaking of higher up the river? My knowledge extends only to Windermere and Luskintyre, in 1859. I have no knowledge of any flood so high as that of 1857.

125. You suggested that a short cut might be made from Hinton to Lake Macquarie—Are you acquainted with the country through which it would pass? I have been shooting there several times.

126. Are there not ranges of mountains intervening? There is one range, but you could get round that.

127. There are no actual levels that you are aware of? No. At Lake Macquarie there is a river coming for miles towards the mountain, and there is much low country.

128. But the streams that drain into Lake Macquarie rise in the high land near the Sugarloaf? There is an immense flat country about the Hexham Swamps.

129. But if you were higher, how would you dispose of the natural drainage of the country? It would have to be kept back until the flood drained off.

130. Have you ever made any calculations as to the quantity of water you would have to deal with? No, I have not.

131. And you have no idea of the size of the channel which would be required to carry it off? No; I have my own notions upon the matter, but nothing that I would like to submit to the Commission.

132. *Mr. Bennett.*] Do those inundated lands ever suffer from droughts? One portion of them is sandy, and sometimes very dry.

133. Do the farmers ever lose their crops in consequence of dry seasons? Sometimes they do, but it is a great exception; they lose them more frequently from floods.

134. Would it enhance the value of the farms if the occupiers could obtain a plentiful supply of water at will?

Mr. P. Green. will? There is hardly any spot now where they might not have irrigation from the creeks if they desired it. My feeling is that irrigation would be a great advantage; but it is a rare occurrence for farmers to lose their crops absolutely through drought. Droughts very partially affect the crops, but floods destroy them. By the plan I have suggested, a good deal of land might be irrigated. I do not think there are any engineering difficulties in the way. From here to Harpur's Hill there is a nearly level country. 135. *Mr. Adams.*] But how are you to get from Harpur's Hill to the other point; you have about 150 feet of hill to encounter? I do not know.

THURSDAY, 23 SEPTEMBER, 1869.

Present:—

P. F. ADAMS, Esq., | W. C. BENNETT, Esq.,  
PROFESSOR PELL.

E. O. MORIARTY, Esq. (PRESIDENT), IN THE CHAIR.

Mr. Frederick Nainby called in and examined:—

Mr. F. Nainby. 136. *President.*] You are well acquainted with the district about Maitland and Morpeth? Yes; I have been here since the year 1840.

23 Sept., 1869. 137. And you have seen most of the floods that have occurred here during the last twelve or fifteen years? I have seen nearly every flood which has occurred since 1840.

138. And have you paid great attention to their effects? I have.

139. Have you formed any opinion in your own mind as to the best means of mitigating the evils they have caused? It strikes me that some general system of drainage is the most desirable remedy.

140. Would you apply that system of drainage to all the flooded lands? Yes, to all the flooded lands of the district.

141. When you speak of drainage, do you mean the minor system of drainage such as would be carried out by a drainage union? No; I do not mean topical drainage, but a system of drainage for the flood waters.

142. As applied to the river itself? To the basin of the Hunter. The Hunter River drains about ten millions of acres, and it is to that watershed I refer. The whole of the waters that run along the channel of the Hunter require to be drained by a second outlet or some artificial drain.

143. Would you be so good as to describe to us what your views on the subject are? My impression is that there should be an artificial channel to convey the water from somewhere about Maitland (above or below) into the sea, or nearly so, either by the Lake Macquarie route or by that of Port Stephens. Both have been advocated. I am best acquainted with the Lake Macquarie route. I think that would be more effectual than running an artificial drain into the river lower down. It has been proposed to make a cut to Hexham from here, which would be a great relief to this district; but, at the same time, it might be an inconvenience to the land situated thereabouts. The islands about the flats might be injured to some extent; and compensation would have to be given, in the event of their land being injured by such a cutting. Therefore, I think a drain to Lake Macquarie, if at all practicable, would be less injurious and more effectual, inasmuch as it would not be a tidal stream, like the Hunter.

144. Your plan is to make a cut from the Hunter at some point—Have you fixed upon any point where you would tap the river? No, I have not fixed upon any particular point, but it would probably be somewhere above the Falls, at West Maitland. That would have to be determined by survey, I imagine.

145. But you have not examined the country yourself to ascertain whether this project is practicable? No. I have, however, had the opinions of persons better acquainted with the locality than myself. I have been from Maitland to Lake Macquarie overland, and I know that there are one or two courses which might be taken. There is a creek running into Lake Macquarie, a little beyond Cockle Creek. I think the dividing range is about Batti. It would come on the Batti side of the Sugarloaf. After you get over that range there is a creek running all the way to Lake Macquarie.

146. *Mr. Adams.*] How would you get through the mountains? There is a spur which would have to be tunnelled, I suppose; but that would be a question for a civil engineer to determine, having regard to the cheapest method. You would have either to go round it or through it.

147. You cannot get round it? There is a range near Minmi which would have to be cut through, and I think that is the only one.

148. You think the water might be taken to Port Stephens or to Lake Macquarie, and you are in favour of taking it to Lake Macquarie? I am, as far as I know at present. A third plan is to convey the water by a channel to Hexham, and make an outlet for it there parallel with the railway. I think perhaps I was the first to propose that, but it is open to the objection that it would be liable to throw too much water on the lower part of the Hunter and the islands about and below Hexham. If you damaged property, although it might not be very valuable, you would have to give compensation.

149. *Professor Pell.*] Are you acquainted with the scheme proposed by Mr. Moriarty in his report upon this subject? I read his propositions at the time. If I recollect rightly, he proposed to cut off the angles of the river and to make embankments. That would be in some respects advantageous, and in others most objectionable, speaking of the whole district, because it would throw the water on the lower part of the river. What the public interests require is a general system of drainage—something that would benefit the whole district, and not improve one locality at the expense of the rest. The erection of flood-gates and the cutting off of the angles of the river would have a tendency to injure more distant localities.

150. *President.*] Are you aware that that has been taken into careful consideration, with a view of not letting down more water by the cuts than the river could carry off without injury? I do not recollect what it was proposed to do with the surplus. I think I recollect something being said about that to which you now refer; but what would become of the rest of the water?

151. I am speaking now of the lower part of the river, and with reference to the injury you imagine would be done. It was carefully considered that no more water should be allowed to come down, so far as the proposed

proposed improvements could regulate it, than the lower part of the river was capable of carrying off? Mr. F. Nainby.  
In that case we should not sustain any injury; but I do not see how that was proposed to be done by 23 Sept., 1869.  
Mr. Moriarty.

152. By deepening and improving the river lower down, and by embanking? That would necessitate the cutting off of angles, and it would then resolve itself, probably, into a question of expense. The cutting off of those angles would sever private estates and render bridges necessary to make good the means of communication.

153. But do you not think that a very minor consideration in regard to a great scheme like this. If it were ever carried out, the cost of those bridges would be insignificant compared with the cost of the whole work? That could only be determined by survey and estimate. If it should prove less expensive I think it would be desirable to do it, although it would be less effectual than my method. An immense number of bends and angles would have to be dealt with, and when they were cut through it would be found that the soil is so friable in its nature that it would be likely to fall into the bed of the river by the mere washing of the tide or the current of the river.

154. You seem to have forgotten that the report makes provision for properly securing the banks of the river? I mentioned the matter to draw attention to the expense. I was going on to say that that must be provided against.

155. It is dealt with in the report and estimate? It would form a serious item in the cost, would it not?

156. It would; but have you formed any estimate of the cost of the work you propose? No, but I think we might call upon the Government—(I am not an advocate for calling upon the Government to help us beyond what is reasonable)—to grant us the services of a surveyor for six or twelve months to take the levels between here and Lake Macquarie and Port Stephens, and then to make an estimate of the cost and compare it with Mr. Moriarty's scheme.

157. You have not made any estimate of the quantity of water to be disposed of, of the size of the channel which it would be necessary to make to Lake Macquarie or to Port Stephens, or of the probable depth of cutting you would have to encounter in getting through the ranges? No; but I have thought of these things, and that they pertain rather to professional men. If we could obtain the services of a surveyor for six or twelve months, and if he could point out that any one of these schemes is practicable, we could then apply for an Act of Parliament to tax ourselves in order to obtain the means necessary to meet the cost of carrying out such a work.

158. Are you aware what is the permanent level of the water in Lake Macquarie? No; but I infer that it is lower because the water runs into it from the Hunter.

159. The permanent level of Lake Macquarie is at the ordinary high-water level. The tide never recedes in Lake Macquarie. The only effect of a flood tide is to get up to the lake—it never rises in springs more than 3 inches. I know that from surveys made at the entrance. You would drain the Hunter into a basin absolutely higher than the river itself? If that is already known there is an end to the project by that route; but the other remains open.

160. To Port Stephens! Have you ever considered how you would cross the Paterson, or get over the mountain ranges? I am not acquainted with that locality; but Mr. Hunt, Mr. Jacobs, and other Raymond Terrace people are. Mr. Hunt has written on the subject.

161. Have you ever considered the practicability or possibility of crossing these large rivers, and discharging into Port Stephens, which is farther from here than Newcastle—The Williams and the Paterson would run across your channel, and they would bring down and deposit large quantities of sand? I have considered the circumstance of those two rivers being crossed; and I should wish now to mention that in my opinion one reason why we suffer so much from floods is owing to the junction of the Paterson and the Williams at right angles with the Hunter. If they had a diagonal course the water would be less dammed up, and the river would not be so much impeded in its outflow as now. It would be a great advantage to us if we could relieve the Williams and the Paterson at the same time. Those who advocate the cutting of a canal from here to Hexham or Lake Macquarie say that you must also provide for the waters of the Paterson. You might cut a channel from Hinton to Hexham through the swamp crossing the Raymond Terrace Road. It is a level tract of country all the way. There would be no engineering difficulties. They say it would be necessary to let the Paterson cross the Raymond Terrace Road. The Paterson River, under any circumstances, wants relieving, and should be improved at the same time as the Hunter is improved.

162. *Professor Pell.*] Supposing it should turn out, on a survey being made, that the schemes proposed (the taking of the water to Lake Macquarie and Port Stephens, and the carrying of the water from some point above to Maitland and Hexham) are each so expensive as to be utterly impracticable, could anything be done then? Then we should have to fall back on embankments, which are objectionable on many grounds. There are so many bends on the river that the approaches would have to cross the embankments, and thus they would be liable to be broken down and worn away; and besides, we are not sure that they would stand. Embankments in England have broken away, and considerable damage has been done in consequence of the escape of the waters.

163. But supposing the other schemes failed, do you think anything could be done by embanking? It would have to be fallen back upon; but the sides of the river are often undermined.

164. So that you think any plan of that kind would be of doubtful utility? Yes, I think so; but that is a question for an engineer rather than for a non-professional man.

165. Are you acquainted with the value of property, and with the circumstances of the people generally in this district? I am. Alluvial land has been sold as high as £60 an acre within my recollection.

166. And what do you think is the present value? From £25 to £40 an acre for alluvial lands.

167. Flooded lands? Yes; or say from £20 to £45.

168. How much generally do you suppose the value of land would be improved if it were completely drained and saved from floods? I should say that the value would be increased from 25 to 50 per cent.

169. How much per acre would the annual value be increased? At the same rate of course.

170. You think a farmer would be willing to pay 50 per cent. more rent if he were secured from floods? Yes, from 25 to 50 per cent.—according to the extent to which his land is liable to be flooded.

171. Do you remember the period before the flood of 1857? I do.

172. The farmers here were very prosperous before that time, I believe? They were, and so was the Colony generally.

Mr. F. Nainby. 173. And after they had recovered from the flood of 1857 were they still in a state of moderate prosperity? Many of them have never recovered their circumstances since that flood.

23 Sept., 1869. 174. Others took their places in their farms? Others took their places in many instances.

175. And they did pretty well after it? Yes, until the next great flood, which happened in 1864.

176. They were living in comfort, I suppose, during that time, and well supplied with the necessaries of life? Yes.

177. Was there any noticeable difference in the crops grown before and after the flood of 1857? That, I I suppose, brings us to the question in reference to the fertilizing effects of the floods. There are some slight differences, more especially in regard to pastoral lands; but even agricultural land is benefited by the overflow of the River Hunter. The advantages are, however, greatly counterbalanced by the disadvantages. The floods fertilize some places, but they sweep away the surface soil from others. They also bring noxious weeds, and, by the water remaining in little hollows and basins, the land is injured. We have no system of underground drainage.

178. For some little time before 1857, there was, I believe, no flood of a serious nature? There was no serious flood from the year 1840 to 1857, which is the longest time this district has been without heavy floods—seventeen years.

179. Was there any noticeable improvement in the crops after 1857? Agricultural land benefited in some places and deteriorated in others; as where there is an elbow in the river and the current sweeps over it, or where a man has been ploughing to a depth of 6 or 9 inches, the whole of the loose soil would be swept away and replaced by a deposit of sand. In other instances, the floods take away the land from one side of the river and leave it on the opposite bank.

180. Most of those flooded lands have a great depth of good soil, have they not? Most of the land subject to floods is alluvial, from 12 to 15 feet deep.

181. And you think that the land not subjected to currents is benefited? Yes, with the exception of the damage it sustains by being covered with noxious weeds. I could name half a dozen noxious weeds which have destroyed our crops, and which we did not know until 1857. Docks are now spread far and wide, and we have now prairie-grass, which although useful on grazing land is fatal to lucerne paddocks.

182. Are the farmers of the district now prosperous—have they now a ready command of the necessaries of life? Far from it; both the landlords and the tenants are feeling the effect of the floods. Their present condition is owing partly to the floods and partly to the general depression of the times.

183. As much as £2 10s. is given per acre for the rent of land? Yes, £2 10s. is the average price. It was £4. £2 10s. is the average price of good land. With respect to the junction of these rivers. Where the Williams and the Paterson join the Hunter the effects are sometimes very marked. In February, 1868, there was a very severe flood in the Williams. The Williams was in flood then to a greater extent than it had been for years previous, and there was a flood in the Paterson; but in the Hunter we had very little, fortunately. The Paterson where it joins the Hunter at Hinton, and the Williams where it joins the Hunter at Raymond Terrace, came down so strong that the water could not get away, and there was a flood up the Hunter River as far as Mrs. Macdonald's farm—nearly up to Maitland. If at that time the Hunter had been in flood the same as the other rivers, the overflow at this junction would have been fearful; but as it happened, the Hunter was not in flood, and we escaped what would no doubt have been a very serious inundation. I mention this to call your attention to the necessity of providing some relief to those two rivers. The Maitland people of course do not look beyond relieving the district of Maitland. They say—If we can throw the water quickly down to Morpeth we are relieved; but the Morpeth people would suffer in proportion as they were relieved, and so would the people of Raymond Terrace and lower down the river. It is a favourite scheme of the Maitland people to send the water to Morpeth. They appear to forget the harm they are likely to inflict. I think a general system of drainage in relation to the Hunter, the Williams, and the Paterson, ought to claim the attention of competent parties. I have a letter in support of my remarks from a very high authority, Mr. G. B. White, who dwells very forcibly on the subject. The flood of 1820 and that of 1826 were both higher than that of 1864. That of 1820 is the highest we have had within my knowledge. I should like to say a few words about the flood-gates which are being erected at Wallis' Creek. We fear that those flood-gates will inflict great injury upon us. The land from which they are intended to keep back the water (Dagworth and Louth Park) although only a small area, is rather deep in the middle. It is a sort of basin which will hold a great deal of water; and the water flowing there in times of flood relieves Maitland and Morpeth to a very great extent. The water flows into this basin and escapes again into the Hunter by another channel. During the time it is running in and filling up this basin it has been a relief to the Hunter, inasmuch as the water from the Williams and the Paterson escaped very rapidly during the time gained by the filling up of this basin, which was from twelve to thirty-six hours. In 1857 before the water which flowed into this basin found its way through Howe's Lagoon into the Hunter, the Williams and the Paterson had subsided considerably; consequently, it was a relief to the public generally, although it was an injury to the quantity of land covered at Dagworth and Louth Park. But the land injured was very small compared with the land benefited. We who live on the north side of the Hunter fear that we shall sustain very serious injury from the erection of this obstruction in Wallis' Creek. I do not know whether this comes within your province, but it is a matter which seriously affects us.

184. If Wallis' Creek were deepened and improved, and if there were a proper system of drainage at the head, so that when the river subsided the land which had been flooded would be relieved, do you think that would answer the purpose of the flood-gates? I think that flood-gates one-half the height of those now being erected would be sufficient, and that is the impression of most reasonable people. I am an old resident at Maitland, and I used to take a part in public matters. I took part in getting the mouth of this Wallis' Creek altered. Its alteration is said to have a material bearing on this subject. It was twice altered, and I believe that the second alteration was for the worse. It was deepened to such a degree that it caused the flood waters to flow in to a greater extent than previously. It is very much choked up with logs and other things, and wants clearing out.

185. Where do those logs come from? I think they come chiefly from Brooks' Flat.

186. They are washed down the creek? Yes, from the Sugarloaf district. A moderately sized flood-gate at Wallis' Creek about half the height of those now being erected might not injure any of us, and would I have no doubt benefit the people there quite as much; because these flood-gates will have to be raised to let out the back water. In the case of a flood such as I described a short time ago, a great deal of water would come down Wallis' Creek, almost as much as came down the Hunter. When there are heavy rains

rains up the Sugarloaf a good deal of water comes down in that direction which must be let off. As regards the cutting off of the bends of the river, perhaps you will allow me to say that in my opinion it is a scheme which may be adopted. It has its advantages, and may be worth trying in the event of the others failing. Such a scheme however would not be beneficial to the district unless the straightening process were continued far down the river.

187. That is contemplated in the scheme put forth—not that the improvements shall proceed to a certain extent and there stop, but that the matter shall be taken up as a whole. The improvements would begin at the lower end and be carried up, so that whatever additional water might be brought down, the river below would have been rendered capable of carrying it off? That is a very important point. It appears to me that that would be a very equitable scheme. It might do very well, provided the angles were cut off from top to bottom—from Maitland as far as they extend.

The Rev. James Robert Thackeray called in and examined:—

188. *President.*] Have you been long in this district? Nearly fifteen years.

189. You were here during the flood of 1857? Yes, and before that time.

190. You took an active part, I believe, in relieving the distress which then existed? I did.

191. Was the distress serious? It was very serious indeed.

192. And was it the same in 1864 and again in 1867? Yes; I was not Secretary to the Flood Relief Committee in 1867, although I took an active part in the matter. I happened to be in Sydney at the time, and so I worked for it there instead of here.

193. Were there any other floods than those you have referred to which did much damage to the country? There was a succession of floods extending over the period from 1857 to 1867.

194. Could you mention the dates of the floods that did the most damage? Those of 1857, and 1864, and 1867, were the three most serious floods. In addition to those, there was a succession of smaller floods with them—two or three following each larger one.

195. At short intervals? Yes. There were three, for instance, in 1857.

196. The last being the heaviest of all? Yes. They extended over a period of three months.

197. Have you formed any estimate as to the amount of damage in money done to the district by these floods? It is incalculable. It would be quite impossible. One might form something like an approximate estimate, taking a certain space (say the radius of a mile)—that perhaps might assist the Commission. I have taken these figures from our memoranda at the time:—Extending over the radius of a mile, we estimated that there must have been something like 1,309 acres of maize destroyed; of lucerne, 267 acres; of potatoes, 114 acres; of pumpkins, 60 acres; of millet, 10 acres; of gramos, 10 acres; of orchard and vineyard, 8 acres; of melons, 6 acres; of cucumbers, 6 acres; of onions, 3 acres; and of undefined crops, 416 acres. The total is 2,209 acres.

198. Could you convert that into a money value? I should be able to do so by consulting with those who would be able to compute it.

199. Perhaps you will let us have the paper to which you have just referred, with that addition? Yes. This has reference to Dagworth, Fishery Creek, Fairleigh, Oakhampton Road, Louth Park, and Bolwarra, just within about a mile.

200. And those are the districts affected by the floods? Those are the richest districts about here.

201. And affected by the floods? Yes.

202. In places beyond those you have named, was any serious amount of loss sustained? Doubtless.

203. But not to the amount you have named there? No, I do not think the damage done in other places was equal to this.

204. Should you say that the injury done, taking the whole districts about East and West Maitland and Morpeth, amounts to half as much again? It would amount to more than that. I am speaking now of the district immediately around West Maitland only. Taking into consideration Phoenix Park and Narrowgut, and the rich districts about Morpeth, the destruction must have been tremendous.

205. You have no means of giving us a statement of the amount of loss sustained in those districts? No.

206. Could we get such an estimate? I think it possible. I have with me the statistics of the 1864 flood,—as to the number of applicants for relief, and as to the kind and quantity of relief administered by the Committee, together with an estimate of its money value.

207. And have you also an estimate of the money value of the ascertained losses of those people? It has been attempted to be computed.

208. Could we get that? I could get it.

209. Perhaps you would be good enough to furnish it? I will.

210. Did it seem to you that after these floods (allowing a reasonable time to elapse) the people recovered themselves at all? They do after a time, of course.

211. About how long, should you say? They are just beginning to recover now from the flood of 1867. I have known these persons for the most part for a great number of years. They are persons who for the most part live from hand to mouth, and if their crops are taken away by the floods, they must live on credit till they can grow more. They are then in the hands of the storekeeper.

212. Those are tenants? Yes, for the most part.

213. Is that the case with persons farming their own lands—do you think they recover sooner from the effects of the floods? In many instances, although the land may be called their own it is mortgaged, and they have to pay more by way of interest than they would have to pay for rent.

214. But that might arise from a different state of circumstances—from buying land at too high a rate, and not having money to pay for it? It might be so.

215. Should you attribute this condition of things solely to the floods? I remember the state of the district in 1856. It has never been in such a position since. I attribute the change entirely to the action of floods and drought—that is to say, to the distresses of the farmers and their losses, from the fact of their not getting their crops.

216. Have they suffered from want of rain? Yes, in some instances.

217. *Professor Pell.*] I suppose these farmers, when they have good seasons, and get in their crops, are well off? Yes, tolerably well off. It has been a curious problem to me, and I can scarcely make out how it could be, that although in the flood of 1867 something like three-fourths of the produce was swept away,

Rev. J. R.  
Thackeray.

23 Sept., 1869.

away, that which was left was scarcely worth taking off the ground. One can hardly help wondering what would have been the value of the produce had the whole of it gone into the market.

218. You refer to the low price? Yes; I suppose there would have been a corresponding depression if the whole of the produce had gone into the market.

219. That would have had nothing to do with the floods? No; but the price would have been lower, unless they had found a market outside for their produce.

220. But do you not think that that same law has been obtaining since 1857—that there has been a steady fall in the price of produce? 1857 was a very dear period. In 1856 the people had plenty of money, and were well off, but since that time they have had to encounter flood upon flood, and their energies have been almost stamped out.

221. But setting aside the floods altogether, has there not been a fall of somewhere about 100 per cent. in prices? Generally, throughout the Colony.

222. And, of course, here too? Yes.

223. So that the people of the Hunter district have had also to contend with that general depression? Yes.

224. They have suffered from the action of floods and the steady depression of prices? Yes.

225. Their difficulties could not be all traced to the floods? I do not think so.

226. If the fourth part of the produce left after the flood of 1867 was scarcely worth removing, the three-fourths carried away must have been equally valueless? I say it has always seemed a curious thing to me. I have always wondered what the price would have been if the produce had all been gathered, unless a market had been found outside.

227. *Mr. Bennett.*] Is not the general market outside the district itself? Yes, the produce of the district is sent to Sydney, New Zealand, and Melbourne.

228. But a small proportion of the produce is consumed in the district? This portion of the district may be looked upon as the depôt of the northern interior. They obtain supplies from here of almost everything they require.

229. Well, that market would not have been affected by the flood? No.

230. *Professor Pell.*] Can you form any estimate of the proportion in which the value of property would be raised in this district if it were made free from floods? It would be very hard to say. I should think it would be almost impossible to estimate it. If we had been free from floods, I believe that from 1857 to 1867 the population would have been more than doubled.

231. Supposing any scheme could be presently carried out which should entirely relieve the district from floods, could you form an estimate as to how much per cent. the value of property would be raised? I should not be able to form an estimate. It would necessarily raise it very much indeed.

232. Several witnesses, practical men, say they think it would raise it 50 per cent.—Do you think that estimate reasonable? I should think that under rather than over the estimate which might be taken.

233. Under these circumstances, would it not be worth the while of the tenants to pay 50 per cent. more rent to be ensured against floods? Without a doubt.

234. *Mr. Bennett.*] You say that the farmers suffer a great deal from drought—Have the losses by drought borne any considerable proportion to those by floods? I should think not; because in time of flood the whole district has been literally smiling with plenty, and the farmers have been looking forward to the housing of their crops so as to be enabled to pay their way,—and no one has seen more of the abject misery of these people after a flood than I have.

235. But if in addition to having their lands relieved from floods they could also secure water in times of drought, would not that greatly increase the value of the land? Beyond a doubt it would.

236. If you could store the flood-water so that it could be used in times of drought, of what increased value do you think the land would be, in addition to the 50 per cent. by which it would be increased in value by the removal of the floods? I should say that if you could take away the excess of water when there is too much, and supply it at times when there is too little, we might estimate the increased value of the land at certainly 75 per cent.

237. *Professor Pell.*] The lucerne crop is the most important crop in this district, is it not? Yes.

238. Are the lucerne crops ever seriously injured by drought? Yes, but not so much as by floods. The amount of injury it sustains depends entirely on the character of the land. I have lucerne which will not grow at all in times of drought.

239. I suppose it is not flooded land? Yes, it is.

240. *Mr. Bennett.*] What crops suffer most from the drought? I am scarcely able to say. A farmer would be able to give you better information on that subject.

241. But that there are losses to a considerable amount from drought you have no doubt? No doubt whatever. The drought brings caterpillars and all sorts of things. I should think that in any scheme which may be carried out presently, the principal part of the expense should be borne by the landowners—that would be only fair.

242. Are you of opinion that they would be willing to bear any cost equal to say 10 per cent. on the value of their land for such a scheme? I cannot say whether they would be willing to pay to that amount or not; but I am sure the general feeling on the part of the proprietors is in favour of some such scheme if the matter could be regulated by Act of Parliament or something of that kind, so that each one would have to pay his proper quota. I know that a number of associations have been formed for this purpose, but all of them have broken down because some of the larger proprietors, feeling that the work would be done in all probability whether they subscribed or not, kept back. Thus the project has fallen to the ground, not from any want of willingness generally. It is a matter for consideration whether prison labour could not be brought to bear on the subject.

243. That is a mere subordinate matter? Yes.

244. The work would have to be paid for, and the thing would be whether the people would be willing to pay for anything practical? I do not think there would be any general opposition to it, because the whole of the proprietors and tenants feel that it would be the making of the district if the floods could be obviated.

245. *Professor Pell.*] If the rents would be increased 50 per cent., of course the farmers—the landed proprietors—would be willing to pay a very considerable sum if they took a reasonable view of their own interests? Yes. During times of flood the rents are only nominal. The proprietors have year after year to forgive the rent because the tenants cannot pay it. If the floods were obviated altogether, this state of things would not exist and the landlords would get their rent.

246. They would not only let their lands at a higher rate, but they would also actually receive the rent, whereas they are supposed to get the rent now but in many cases do not receive it? Yes.

247. *Mr. Bennett.*] Could you form any idea of the average price per acre per annum they would be inclined to pay? I could not. I should imagine that you would be better able to get that information from an agriculturalist.

248. *Professor Pell.*] Have you ever considered what would be the best course to pursue, if it should appear practically impossible to relieve the district by any general scheme for mitigating the evils produced in time of floods? No; the only thing to do would appear to be what we did before, namely, to obtain as much money as we could, from those able to give.

249. Have you thought of the practicability of any scheme of insurance? No; I do not know whether such a scheme could be carried out, but I imagine that the best thing to do would be to try and get rid of the floods.

250. Of course such a plan would not be considered until other schemes were found to be impracticable; but if the farmer were willing to pay 50 per cent. more rent, to be relieved from floods, he would be willing to pay a considerable annual sum to be insured against them? Yes.

251. And so provide a fund which would be a relief fund in time of flood, and which would be available to him not in the form of charity but as a right? There would be great difficulty in administering such a fund as that—the difficulty would be enormous.

252. *President.*] Supposing that such a thing were started, do you think the people would continue to pay, if they had four or five fine seasons in succession, and the payments were not compulsory? It would have to be compulsory, beyond a doubt.

253. *Professor Pell.*] You think that otherwise they would not pay? It would have to be compulsory.

Rev. J. R.  
Thackeray.

23 Sept., 1869.

Mr. John Eckford called in and examined:—

254. *President.*] You have been acquainted with this district for many years? I was one of those that formed it.

255. How many years ago? I came here in September, 1818.

256. Do you remember any greater floods than those of 1857 and 1867? Yes.

257. In what year did they occur? In 1820.

258. Was there more than one? There were two in 1819, and two in 1820.

259. And in each year which flood was the highest, the first or the second? The second was the highest, in 1820.

260. In what month did it occur? I think it came in June or July, but I will not be sure.

261. Do you recollect when the first one came? It was in June, I think.

262. They came close together? Yes; they were about five or six weeks apart.

263. Could you point out to us any places in the town to which the flood of 1820 reached that the floods of 1857 and 1867 did not reach? Yes, I took particular notice of one place. There was a man left behind in a house. He was calling out all night, and we went the next morning to bring him away. On our way we went by a barn, and I could just see betwixt the wall-plates.

264. Is that barn in existence now? No. It was at this end of the Victoria Bridge—it is gone long since.

265. Is there any point of land on the ground about Maitland where the flood reached to that you could mark? I lived in Melbourne-street, near Mr. Coberoff's large house, in East Maitland; and about where Mr. Cullum's house is, there was then about 3 feet of water.

266. *Mr. Adams.*] At the place where that building is? Yes.

267. *President.*] Is the house you then resided in still standing? No.

268. Could you point out the exact spot where it stood? Yes, within a foot or two.

269. Do you remember any other points to which you could refer, because these are all of great importance? No. I called at the "Angel Inn" (at this time I came across in a boat), and I found that the water was level with the cellar back door.

270. Is that in existence now? Either it or one in its place. I saw one about the same spot.

271. And the 1867 flood did not come up to that point? No.

272. How much higher do you think the 1820 flood was than those of more recent date? I think it was 6 or 7 feet higher than any floods which have been since.

273. Do you know of any point up the river which you can point out to us where you remember that the flood of 1820 reached to? No, I do not.

274. Do you think there is any one at Singleton or anywhere about there who could show us any points reached by the 1820 flood? I should think Mr. John Brown is the most likely man; I think he was there at the time.

275. At Singleton? Yes, at Singleton.

276. Is he there now? I cannot tell you; he is sometimes in Sydney.

277. I suppose that the banks of the river were at that time thickly clothed with timber? It was all timbered except little patches that were cleared.

278. Was it heavily timbered? Yes, some portions of it were thickly timbered.

279. *Professor Pell.*] Was there much scrub? Yes, in the bights of the river, but not on the forest land.

280. *Mr. Bennett.*] It was forest land? Yes, but there was brush land about the river—all those bights were brush land.

281. *President.*] Do you remember whether the channel was pretty clear at that time, or whether it was encumbered by dead timber? There was not much timber in it. There was rather a strange regulation at Newcastle at that time. If any one was found throwing a tree into the river, he had to take it out and was fined afterwards.

282. *Professor Pell.*] Has there been any noticeable change in the channel of the river between here and Morpeth? The banks have been torn away in some places and made in others. One is about adequate to the other. One loses and another gains.

283. The river has always had the same winding course? Always within my recollection.

284. *President.*] Do you remember whether there was any difference between the height of the 1820 flood at Morpeth and the height of the flood of 1867? No, I could not tell.

Mr. J.  
Eckford.

23 Sept., 1869.

- Mr. J. Eckford.  
23 Sept., 1869.
285. Do you think there is anybody who could give us information on that subject? I do not think there is. I do not think there is any one here now except myself who knows anything about the 1820 flood. I do not think there is any one else in existence who came here in 1820 except Mr. Smith of Newcastle, and he was not often here—he came only occasionally—he lived at Newcastle.
286. *Mr. Adams.*] What number of inhabitants were there in East Maitland, as near as you can guess, in 1820? There were only twelve of us. Some were married and some were single. Each had one servant, and one or two had two.
287. Do you mean that there were twelve families? No; twelve persons were settled here first.
288. How many do you think lived on this side of Wallis' Creek? Half lived on each side.
289. Half lived in East Maitland, and half in West Maitland? Yes.
290. And the land on which this building is, and from here up towards the English Church—was that scrub land? No, it was forest land.
291. And where the river now breaks over at Bolwarra—was that forest or scrub land chiefly? Bolwarra, from a little elbow near M'Donald's, was all scrub. From there it was not thickly timbered, nor was it scrub. There was but little scrub between the Falls and Bolwarra.
292. Do you think that the scrub occupied all below a certain level? There was scrub until you came to Morpeth.
293. I mean, did the scrub grow below a certain level all the way from what was known as Wallis' Plains to Bolwarra? It was of various heights and in various places.
294. Did it grow more upon the lower ground than upon the higher? Of course it did.
295. Below a certain level the scrub grew most luxuriantly, and it was generally confined to the lower levels? It was packed closer together.
296. *Mr. Bennett.*] Did it grow on the sloping banks of the river to the water's edge? No.
297. You do not think the river channel was then larger than it is now? No, not generally; in some places it is shallower, and in some deeper.
298. *President.*] Along the flat banks there was a belt of timber and scrub? Yes; I think the river is about the same width as it was, but there have been various shiftings and tearings away from the banks. I lost a good deal of my little farm in one place, and have had it made up to me in sand in another.

Mr. Alexander M'Dougall called in and examined:—

- Mr. A. M'Dougall.  
23 Sept., 1869.
299. *President.*] Have you been long residing in this district? About forty years.
300. And I suppose you have observed the effects of all the great floods? Yes, I have observed them.
301. You reside on the north side of the river—the Durham side? I do.
302. In times of flood the water breaks over on the north side in large quantities? Yes.
303. Does it break over above your place? Both above and below my place.
304. Is your house clear of the floods? It has been hitherto—it has never been flooded just where the house is.
305. Are you interested in the construction of the Wallis' Creek flood-gates? No, I have not taken any part in regard to them. I am against them.
306. Is it your opinion that they will cause a greater flood on the north side of the river? Yes; my opinion is that they will do a great deal of damage, and at the same time that they will not answer the purpose for which they are intended. I do not think they will keep out the floods.
307. You do not think they will keep the floods out of Wallis' Creek? No; I think the flood waters will break over in some other low point. It is possible that they may break away.
308. But whatever water is kept out of the creek will have the effect of injuring other places? Yes.
309. Have you formed any opinion as to the amount of injury (giving a money value) done to this district by the flood of 1867? No, I have not made any calculation of the kind.
310. Do you think it possible for us to get a reliable estimate of it? I dare say it might be got. There have been some attempts to calculate the injury done by the floods, and I have seen some particulars published, but I cannot now remember them.
311. The floods used to break over at Hall's Creek? Yes.
312. But recently that has been banked off? Yes.
313. Was that before the flood of 1867? Yes.
314. Did you observe whether the banking off of Hall's Creek had any influence on the height of the flood at that place? I rather think it had, but the difference was perhaps hardly perceptible. It would be better calculated from up above Hall's Creek. I am told that the water was not nearly so high there as it had been the high flood before, while here it was considered to be higher.
315. Do you know of any person who could give us authentic information on that subject? I think Mr. Scobie would be able to do so.
316. *Professor Pell.*] Did any water break into Hall's Creek during the flood of 1867—did the bank give way? No.
317. The water was all kept in the bed of the river? I think so, but I am not positive that it did not break away during one of the floods. I am not certain which flood it was, but I think it stood the flood of 1867.
318. *President.*] Did you observe that the flood of 1867 rose higher at your place than that of 1857? I think they were somewhere about the same height. It was supposed to be six or eight inches higher, but I cannot say that it was more than six inches higher.
319. You think it was six inches higher? I think it was.
320. *Professor Pell.*] Was the embankment there in 1857? There was an embankment, but the water did not come to the height of the bank I think.
321. *President.*] It broke away? Yes; I think it was in the 1857 flood that it broke away.
322. Have you formed any views as to the schemes for mitigating the evils of floods? I have often said, and I say it still, that nothing could be so easily and cheaply done to relieve Maitland of the flood waters as to make a cut from Bolwarra House to Largs or its neighbourhood.
323. And would you stop there? I would let the water into the river.

324. At Largs? At Largs.

325. And you would go no further with it? No; you could not go further with it so far as I am aware. But the Paterson might be relieved by going across to Batti Swamps.

326. *Professor Pell.*] Can you form an estimate as to how much the value of land in this neighbourhood would be increased if the farms were wholly released from the floods? They would be increased in value very much; but I did not expect such a question would be asked me, and I am therefore not in a position to answer it.

327. But supposing it could be done, to what amount per cent. do you think the value of property would be increased? 25 or 50 per cent. perhaps. But it is impossible to relieve it altogether—we might lessen the height of the floods.

328. But supposing the water can be carried off in another direction, you think the increase in the value of land would be 50 per cent.? I have no doubt it would be considerable.

329. The farmers would be willing to pay 50 per cent. to get rid of the water? They would in many of the low parts.

330. Have you noticed whether the floods improve the quality of any of the land subject to inundation? They do; but it generally happens that they improve those places which do not require improvement. It improves the rich land and washes away the poor land.

331. Do you think there would be danger of the richest land deteriorating in case the floods were stopped? No doubt it would wear out in time. Every flood increased the richness of its course. The land in the neighbourhood of Maitland would be nothing were it not for the floods of former years.

332. This rich alluvial flooded land is very deep I suppose? It is 20 feet deep or more, I believe, in some parts.

333. And you think it would stand a great deal of cropping without any floods? Yes, without any manuring.

334. *President.*] Still that process must arrive at an end some time? No doubt.

335. *Mr. Bennett.*] Do they ever suffer from drought on that land? Yes, occasionally.

336. Do they suffer to any considerable extent? Yes, the drought is sometimes very severe, and all suffer more or less.

337. Water then would be very useful to the farmers if they could get it for the purpose of irrigation? Yes.

338. Do the losses from drought bear any proportion to the losses occasioned by floods? No, they are not so great as the losses suffered in consequence of the floods.

339. Have you any idea of what the increased value of the land would be if the people had water at will? To irrigate?

340. Yes? It is only a season now and then that we suffer from drought.

341. About the same number of times that you suffer from floods? Somewhere thereabouts.

342. *President.*] Do you think it would pay to undertake any large works with the view of mitigating the effects of droughts? I hardly think it would.

343. *Mr. Bennett.*] Not alone, but in combination with measures to relieve the district from floods—might they not then be made to pay? Yes; but relieving us from floods would not make us require any more than we do at present. As to irrigating the land I hardly know what to think about it; I have not suffered much myself from dry seasons. They have lessened the quantity produced, but the price of the article has been improved, so that it has been nearly equalized.

344. *Professor Pell.*] Are the smaller farmers tolerably well off? They were very well off in times past, but these floods have occasioned them very serious losses.

345. But at the present time now that they are recovered, are they pretty comfortable? Yes, many of them are. Some of them since they have been here have made little fortunes.

346. Since what time? Within the last 20 years.

347. And they are still pretty well off in spite of the floods? Those who have made money.

348. They live pretty well? Yes.

349. And they do not deny themselves little comforts? No.

350. Except when the floods come? Some of them are able to live pretty comfortably after the floods.

351. *President.*] The present price of produce is low? Maize is high, but lucerne is low. It is very low—scarcely worth carting away.

352. Do the farmers work their own land? Yes, they do it all themselves.

353. *Professor Pell.*] Supposing they were frugal and husbanded their resources in good seasons, do you not think they could recover their losses from the floods? Some of them could but some could not—those with large families.

354. Speaking generally, do you not think they could? I dare say they might, but I would not say so exactly. Some of them perhaps do not do more than make a living, and it may be only an odd one or two that do so well. You cannot speak generally and say that they make so much money.

355. *Mr. Bennett.*] Your place is above the flood level of the floods of 1867 and 1857? Yes.

356. How much is it above the level of those floods? Not more than a foot, I suppose; I have raised my house about 18 inches above the common level.

357. Is there any definite tradition of any flood having been higher than those of 1857 and 1867? I do not know. The floods were certainly higher before I came here than they have been since. I am certain of that, because I have seen logs of cedar cut by cedar parties and lodged by the floods in places to which the water has never reached since.

358. How much were they higher than subsequent floods? They must have been 4 feet higher than any flood I have seen.

359. *President.*] Could you point out to us any of these spots? Yes.

360. *Professor Pell.*] Are those logs there still? No, the land has been cleared since.

361. But you could point out the spots where you saw them? Yes.

362. *Mr. Adams.*] How long is it since you first built on the spot where your house is now? I think it is about thirty years since I built my house.

363. You were not then deterred by any traditions as to the height of previous floods? No; I knew the place was liable to be flooded, and consequently I raised my house about eighteen inches.

364. Are you acquainted with any one who is likely to know the height of the floods in the river between

Mr. A.  
M'Dougall.  
23 Sept., 1869.

- Mr. A. M'Dougall.  
23 Sept., 1869.
- between here and Singleton? I do not know of any one except it be Mr. Scobie, to whom I was speaking before I came here. He said that the flood of 1857 was the highest up the river by 4 feet.
365. But you have no personal knowledge of it yourself? No.
366. *Mr. Bennett.*] Have you any knowledge of the flood traditions above Maitland? No, very little. I have heard them say that they have seen marks of floods in the forks of trees at heights rather beyond belief.
367. But you know of no definite tradition of there having been higher floods up the river before 1857? No, I do not; but I have no doubt that there had been higher floods before I came to Maitland than any which have occurred since.
368. *Professor Pell.*] How many destructive floods have there been since you have been in the district? I could not say how many there have been. I know that there have been three very high ones and several others.
369. The three high ones were those of 1864, 1867, and 1857? Yes. In 1832 we had a high one. The floods of 1864 and 1867 were very destructive. It is according to the season of the year when they come. That of March, 1832, was a destructive flood, but it did not do the damage about Maitland which has been caused by later floods, because then the land was not so much cultivated.
370. How high was the flood of 1832; was it as high as the flood of 1857? I think it rose to about the same level. It did not appear to me that there was much difference.
371. Was the land below Maitland much cultivated and occupied at that time? No, it was all brush land.
372. Were the banks of the river covered with scrub? Yes, with thick scrub.
373. *Mr. Bennett.*] Was the flood of 1832 as high up the river as that of 1857? I believe it was about the same, from all I have heard.
374. *President.*] The channel of the river in 1832 was a good deal encumbered with scrub and brush timber? No, it was after 1832 that the swamp oaks began to grow in the channel of the river. When I first came here there were scarcely any swamp oaks growing in the channel, but after 1832 they commenced to grow and continued until the next flood.
375. Had there been much clearing going on at that time, after 1832, on the banks of the river? It commenced then.
376. And the growth of the oaks seemed to commence about the same time? About 1832. The beach opposite my house was bare when I went there, and shortly afterwards there grew a perfect scrub of oaks.

Mr. Robert Scobie called in and examined:—

- Mr. R. Scobie.  
23 Sept., 1869.
377. *President.*] You have been acquainted with this district for a long time, I suppose? Yes, since 1839.
378. And you have witnessed the effect of most of the heavy floods? Yes, since that time.
379. Did you notice particularly the floods of 1857, 1864, and 1867? Yes.
380. Did you observe any difference in the effects of those floods arising from any works or operations that had been carried on in the neighbourhood of Maitland? I could not attribute them to that exactly.
381. But did you perceive any difference between them in consequence? There has been a clearance of the channel by the floods. I have been credibly informed that the flood of 1857 was higher above us than the flood of 1867, while in 1867 the flood was higher about 8 inches at Bolwarra than that of 1857.
382. *Professor Pell.*] In 1857, the flood was higher than that of 1867 above Bolwarra, up towards Rutherford? Yes, towards the Rutherford Works.
383. *President.*] And in 1867 the flood was higher at your place by 8 inches than the flood of 1857? Yes.
384. That is the result of accurate measurements? I speak only from what I have been told in regard to the height of the flood above Bolwarra.
385. But at your own place—? I know from observations of parts to which the floods reached in 1857 and in 1867.
386. You are pretty confident of that? Yes.
387. Is that above Hall's Creek? Yes, nearly a mile above Hall's Creek.
388. Where it breaks out from the river? Yes. I attribute it in a great measure to the large quantity of oak trees which were growing up. At first we could scarcely see them at our house over the bank of the river, but in 1857, about seventeen years after, they had many of them grown up 40 or 50 feet, and spread across the bed of the river nearly 100 yards broad. A large accumulation of drift-wood and other matter pressed against them and formed a dam. The current was then turned to the west side of the river and swept away the soil, and the great flood carried the trees off altogether.
389. The oaks were swept away in 1857? Yes; and since that time there has been a deposit on that side, where about 6 feet of soil was swept away by the flood of 1857.
390. *Professor Pell.*] And it is to that you attribute the height of the flood of 1857 above your place? Yes; and to other impediments of the same nature.
391. *President.*] You think that the clearing away of the trees and other obstructions by the flood of 1857 allowed the 1867 floods to escape more readily, and that they did not therefore attain the same height? They did not attain the same height upwards.
392. Do you attribute the greater height of the 1857 flood to the ready escape of the water down here? Yes; and to the fact of there not being a similar clearance below.
393. Do you think it was at all due to Wallis' Creek being banked off? The Wallis' Creek bank was put up a week before the June flood of 1857. It was not sufficiently high, and was carried away. It was open at the time of the large flood in August, 1857.
394. But not in 1867? I think it was carried away in 1867 too.
395. *Professor Pell.*] It has never stood when exposed to a flood? It has stood some floods.
396. But the floods of 1857 and 1867 carried it away? Yes.
397. Is there a large quantity of water when it does break over? No, not very large.
398. Nothing like the water that comes up the creek? No.
399. But there are a good many inlets above that. As soon as the embankment of the creek burst away, did it seem to have any effect in relieving the river? I have heard people living in houses close to us, and about whose houses the water had gathered, say that when the bank went, the water went away from their houses considerably.

400. Can you name any person who could give us distinct evidence as to the amount of relief experienced by them when the bank went away? The people on the other side of the river would be able to give you information. Mr. R. Scobie.  
23 Sept., 1869.

401. Could you give us the names of any? There is William Booth, who lived opposite.

402. *Mr. Bennett.*] You referred to the difference in level about the Rutherford boiling-down works? Yes.

403. Is there any one there to whom you can refer us for further information? Mr. Robert Lindsay was the first person who told me that the flood level was pointed out to him in 1857, and that the flood did not nearly reach it.

404. *President.*] How far is the place to which you have referred, above the place where the oaks grew across the river? It is several miles.

405. Have you formed any views of your own as to the best means of relieving the district from floods? I have, like most other people.

406. Perhaps you would be good enough to give us your opinion on the subject as to what you consider would be the best thing generally for the district? I do not see that there are any other means by which the district can be protected except embankments. It appears to me that the expense of cuttings would be so great, and the advantage to be derived from them so uncertain, that the district would be crippled with the expense for many years to come. From what little I have seen, the effect of embankments has been very beneficial wherever they have been carried high enough to be secure. I have thought that the district might be divided into areas where the high lands abut on the river at each end, and that the people within those areas on that side of the river might be taxed to put embankments up, or have the option of putting them up themselves for their own protection. I would not allow the banks to be too close to the river. The portion from the bank to the river could not be protected, but it would be not less useful than at present for grazing land.

407. You would keep the banks well back? Yes; so as to give space for the flood waters to escape. I think this would have the advantage of causing a forward pressure of the water, which would sweep out the channel and cause it to have greater effect. This is apparent from what has taken place at the Falls embankments, where the water has swept out the crossing-place. Before 1864 there was an embankment put up opposite our place on the Bolwarra side, and the floods in 1864 destroyed the Bolwarra Falls, so that the river was scarcely crossable. Holes were left in the bed of the river, from 4 to 6 feet deep. During the 1867 flood the water broke over the embankment and escaped, and the falls formed as before. If this water had not escaped, the river would have been cleared out, and therefore have had greater capacity for carrying off the water during the flood. The cutting of canals would have an effect the very opposite of embankments. A large amount of mud is brought down with all these floods, and at points where the water is still, it will accumulate to the extent of several feet in one flood. The effectiveness of canals would be very much lessened by that process.

408. You think that the water would be more sluggish if canals were made? In some parts. If a new channel were made, the old one would become more sluggish.

409. Supposing parts of it were filled up by the stuff taken out of the new cuts? It would have increased velocity then, and the new cut would have to be depended on to carry off the whole.

410. And such parts of the old channel as were availed of. The bends would be filled up. Do you not think that would have the effect of carrying off the floods more rapidly? Yes.

411. And in so far as it did so, would it not benefit the country flooded? No doubt it would, if the expense of the work were not so great as to counterbalance the benefits to be derived from it.

412. Do I understand you rightly that your principal objection is on the ground of expense? Yes.

413. Have you any other objection than that of the expense? I think the work would confer a benefit on the country, but the expense would be very great; that is the principal objection.

414. It is possible to estimate the expense of a cutting like that in soft earth, is it not? It would depend upon the depth of the cutting required. If they went below the level of the river the water would flow out, and it would be difficult to excavate.

415. It could be dredged out more cheaply. Have you heard of those projects for carrying the water to Lake Macquarie and to Port Stephens? I have.

416. What do you think of the expense which would have to be incurred to carry out those projects? I have no idea of the expense of carrying out the Port Stephens scheme; but the cost of taking the water to Lake Macquarie would be very great.

417. Do you think it practicable—Have you ever been over that country? I have passed round in what I suppose to be the direction they propose to take the water, and I could see no hollow without passing over very high land.

418. Are there not mountain ranges to cross? There is some high land, at any rate.

419. As I understand your project, it would be simply to embank the sides of the river, keeping the levees so far back and making them so high as to discharge the whole of the water? Yes.

420. Have you made any estimate of the probable quantity of water that would have to be dealt with, and the width and height of the banks which would be required to carry off that water? I could not make an estimate; but I have seen the quantity that comes down and the channel above which contains it all, and it appears to me that a channel could be made to carry it all the way down. There are large tracts about Morpeth that would pay for a continuous embankment. They would not have to be continuous this way, or if continuous, they would be so small in many places as to involve but little expense.

421. Are you aware of the difference between the fall of the river in the upper part and that towards Morpeth—the fall of surface in times of flood? I have seen it stated. The tide flows up as far as our place. I imagine that would ordinarily indicate the level of the river.

422. We have the actual measurement? I have seen it reported in the papers that the rise has been 14 feet at Morpeth when I have known it to be 28 feet up above.

423. You will see from this section (*section shown to witness*) that from West Maitland to Morpeth there is an essential difference in the rate of the fall of the river. The fall is 2 feet in a mile from Singleton to Oakhampton—the flow is therefore very rapid; and it is pretty rapid from there to West Maitland; but when you come to West Maitland you can readily observe how flat the surface of the water gets. The fall is only 1 in 3,246 from West Maitland on and then it is only 6 inches in the mile? Does it require the same fall to give the same speed?

424.

- Mr. R. Scobie. 424. If not the same fall, there must be a proportionate difference in the area of the channel; you see how flat the land becomes, so that you must have a proportionately increased sectional area of the river to make up for the loss of fall? Yes, but the depth has a great deal to do with it. We have a tunnel, and although the river may be high in flood, when there is a large amount of water as soon as the gates are opened, with the pressure from behind, it has a sensible influence over the whole of the land—100 acres.
425. That is in accordance with a well-recognized law. That is one of the elements of discharge; the slope of surface is another. Supposing a general line of embankments were taken such as you propose, have you considered what would be the effect of a flood upon the channel as soon as it overtopped the banks of the river and began to run down between the lines of levées. While the water in the channel would be flowing up, the surface water would be going in an opposite direction? Still it would find its lowest place as best it could.
426. Do you not think it would materially retard the discharge of both? I could not say. I am under the impression that it would still be finding its way to the sea.
427. You would have two currents running different ways? The one where the highest pressure was would go on discharging.
428. But where it came in contact with the lower current it would be seriously retarded? It would only be retarded to find its way to the sea ultimately.
429. Will not the effect of the two currents be to almost neutralize each other? I do not think so; they must press on towards the sea.
430. Do you think they will run across each other without friction? They would no doubt run faster if they ran in a straight line altogether.
431. Would it not be better to try and get rid of the turns in the river and have one channel in the centre of the valley which would discharge permanently in one direction and assist the levées? No doubt it would; but then the expense would be so great that I do not think it could be entertained. I think a good deal of the cutting might be done away with, and that a very large proportion might go to the sea, providing it did not silt up the river. Every heavy flood that takes place washes away more than would be carried off from here.
432. Supposing it could be shown that the amount of excavation taken out would be sufficient to form strong permanent levées such as you speak of? From the inside?
433. Yes; if you could get it from the channel of the river for that purpose, would you object to it? No. I have seen a good deal of the advantages to be derived from these embankments. We have some land where the river used to overflow at Brian's Creek, higher than Hall's Creek. We had that open during the 1857 flood. The water came down with such force, owing to the lagoons being so close to the river, and to the rapid fall, that it swept away the soil to a great extent. The land had been loosened by ploughing, and the flood left large holes in some places; it also carried away an orchard. After that we put embankments up there, and some others higher up; and the flood of 1867 did us less injury than any previous flood which went over the land. Brian's embankment was put up soon after the 1857 flood. There were other places where the water went over 3 or 4 feet that have been filled up a little, and the result has been that we have escaped with much less injury than we sustained in former times. In all those overflows I find that all the soil that is loosened by the plough in the process of cultivation is swept away, and the district is becoming more liable to floods every flood we have.
434. Mr. Bennett.] Have you any idea what the people would consider a reasonable rate per acre to pay to be relieved from the floods? No.
435. Professor Pell.] If the land were permanently relieved from the floods, how much per cent. do you think its value would be increased? It would depend very much on the position of the land. Land at Louth Park, for instance, which is subject to small floods, would be much more benefited than land which is 7, 8, or 10 feet higher.
436. Mr. Bennett.] I speak of the average rate. Of course the degrees of benefit would vary much, according to situation. Do you think they would object to pay £1 per acre per annum taxation to the Government or to anybody, to be relieved from floods? I think they would. These floods are not things which take place every year, and the farmers hope for the old times back again. There were seventeen years during which they had no floods of any consequence, and they would not calculate on the benefits to be derived from any works of this kind as taking place every year.
437. Would they think 15s. or 12s. 6d. too much? Some in certain positions would, and others would not.
438. On an average? I think that would be above the average—I think many would object to it.
439. Professor Pell.] Some of the land in this district is rented as high as £2 10s. per acre, I believe? Yes, good land.
440. Do you not think that tenants would give £3 per acre for that land if it were protected from floods? It is quite possible that they would; but rents are too high now, considering the price of produce.
441. President.] Irrespective of the consideration of floods altogether? Yes; the farmers are now labouring under the same rents they had to pay when produce brought a much higher price.
442. Mr. Bennett.] You do not think they would be inclined to pay more than 10s. per acre to be relieved from floods? No.
443. President.] Do you think they could pay more than 10s. per acre? I think that for a number of years past—since the floods commenced, and the price of produce has fallen, the farmers have had enough to do to live and educate their children; they have had little or nothing to spare; many have been in a worse position than ever they were in before.
444. Having regard to the present price of produce, which is so low, and also to the fact that they are paying £2 10s. per acre rent (which you consider to be the full value), do you think they could afford to pay anything more than that to get a guarantee of relief from floods? They should, but whether they would or not I do not know.
445. Do you think they could? No doubt their present poverty is largely attributable to the overflowing of the river over their lands, and they could possibly if they were protected; but even although they were protected by these different means, the rainfall is so heavy at times that a great deal of crop would be destroyed in the ground, such as potatoes—more especially in the summer months. If we had floods in February, the heat and moisture together would quickly destroy vegetation. The injury would extend just as far as the stagnant water would reach, if it remained on the crops for only one hour. In the winter-time, when the water is cold, they will live through a week of flood.

446. Is that the case with many crops now—I suppose the flood-season may be regarded as from June to August? From February. We have had floods in February, March, April (I do not think we have had one in May), June, July, and August. Mr. R. Scobie.  
23 Sept., 1869.

447. Perhaps the greatest floods we have had were those of 1820, 1857, 1864, and 1867, and I think all those floods came from June to August—Do you think that at those seasons the crops in the ground would sustain a serious amount of injury from being laid under water, if it could be guaranteed that the water should not lie on them for more than a week or so? They would sustain serious damage.

448. Would any less time damage them—say four days? Four days under water would destroy most things.

449. In winter? Yes, even in winter.

450. Supposing the project you have named were carried out, do you think that embankments, unassisted by any very expensive system of drainage in the back lands, would save the crops from injury? They would still be liable to be injured by water from the surrounding watershed. As a matter of course that cannot get away while the river is in flood; but it would not rise to the same height to which it would be raised by the flood-waters in the river if there were no embankments.

451. Are you of opinion that even if embankments were erected there would still be a good deal of land under water? Yes, about the lowest parts.

452. That land must always be laid under water? Always in times of heavy and continuous rain. It could not be avoided except by pumping. I think the rainfall is very much heavier here at times than Mr. Moriarty seems to think, judging from his report.

453. That is based on the Sydney rainfall? I think over a foot of water fell here during the 1867 flood.

454. The total rainfall in Sydney was 58 inches in the year; in the month of March there were 12 inches; in April, 17½ inches; in June, 12½ inches; in July, 8½ inches; and in August, 1 inch. Those are tremendously heavy? At the time to which I have referred we set out a salting-tub, and found in it 11 inches of water.

455. How long was it exposed? Three days.

456. Although the rain might fall so in that one place, it is not to be supposed that it would fall equally heavy all over the Hunter. The chances are that far back over the plain there was nothing like so heavy a fall? The rains were all of a thunder-shower nature. There is a plan proposed for a cutting across Bolwarra down towards Dunmore. I think that would relieve this part of the river, if the canal were commenced 14 feet above the present level of low-water up there.

457. In all these matters you must go upon calculations of the quantity of water with which you will have to deal, and the capacity of the channel by which it is to be discharged; you must also look to the river below the point where you throw the water into it again, and see that it is able to carry off the water you bring down? It has this advantage, that being the top of the overflow the water would be carried off before it came to the dangerous parts.

458. Where would you throw it into the river again? It would require to be carried down by the side of the forest land. It would require to be cut through the highest hill, but after that it would be shallow.

459. *Mr. Bennett.*] The hill on which the village of Largs stands? Yes.

460. *President.*] And where would you take it into the river? Just before you reach Dunmore.

461. Into the Paterson or the Hunter? It is the Hunter there, I think.

462. Do you mean Largs? Close to the foot of the hill at Largs.

463. Then you would have to see what is the capacity of the river below that? The channel here would have the advantage of missing all the dangerous parts here (*indicated on plan*), and then it could commence again below that. There has been a plan proposed in regard to the opposite side of the river; but that would be difficult, owing to the sand and gravel. If the channel were to go at the back of West Maitland it would injure it more than at present, owing to its having a high bank in front of it.

Mr. James McLaughlin called in and examined:—

464. *President.*] You have observed the effects of the floods in the Hunter—such as those of 1857, 1864, and 1867? Yes, I have observed the floods for twenty-nine years. Mr. J.  
McLaughlin.  
23 Sept., 1869.

465. Have you formed any opinion as to what would be the best course to adopt to save the district from floods? I have been of opinion since 1857 that nothing short of a canal—another outlet—would ever effect a cure.

466. Where would you take it to? I would commence above West Maitland at Oakhampton, and take the canal down under Long Bridge, and empty it into Fishery Creek; from Fishery Creek to the junction of Wallis' Creek, and from that to Hexham by the Four-mile Creek and Quart-pot Creek; across the Newcastle Road at Scott's dairy, and into the swamp. It would go into the river between the boiling-down place and Hannel's public-house. I have noticed, in times of flood, that the back-water from Morpeth comes into my garden before the water goes over Wallis' Creek.

467. What sort of channel would you propose to make? If we could take 4 feet off the surface of the river, that would be sufficient. I would have the canal 100 feet wide at the top, 60 feet wide at the bottom, and 14 feet deep. This would enable the water to begin to run off in the canal as soon as it rose in the river.

468. Have you made any estimate of the probable cost of such a channel? Yes, I estimate its cost at about £250,000.

469. *Professor Pell.*] Do you remember anything about the flood of 1832? No; it was before my time. The first flood I witnessed was that of 1851. That flood was not so large as the flood of 1857. The 1857 flood was the largest that came for years. I have heard people say that it was the largest we have had since those of 1826 and 1832.

470. Are you acquainted with the scheme proposed by Mr. Moriarty in his report? Yes.

471. Have you any objection to that scheme? There is one part of it which says (if I remember rightly) that the river from Hexham downwards is not able to take the flood water; and in another part it says that there is abundance of room for whatever flood-water would come. It is 55 miles from the Falls in West Maitland to Newcastle by the river, but it would be only 17 or 18 miles by the canal.

472. *President.*] You think there is a contradiction in the report in regard to the matter you have mentioned? Yes.

473. You are mistaken; there is no such contradiction? I read it once over, but I will not be certain about it. 474.

- Mr. J. M'Laughlin. 474. Have you made that estimate of £250,000 as the cost of the canal on any data? Yes; I calculated the probable number of yards, and I allowed so much per yard for removing the earth.
475. How much did you allow? 2s. a yard.
- 23 Sept., 1869. 476. And was there anything else taken into account besides the mere excavation? No, I did not take the bridges into account.
477. *Mr. Bennett.*] What do you think people would be able to pay in the way of additional rent per acre if they were relieved from the floods? If I were a farmer, and paid £2 per acre for my land, I would rather pay £2 10s. per acre if by the additional payment I could be preserved from floods.
478. Would you consider 10s. per acre per annum the measure of the value of the relief? Some landlords would, no doubt, say it would be worth £1, for they often cannot get the rent at all now.
479. *Professor Pell.*] You think they would get the £3 if the district were relieved from floods? Yes; they cannot get the rent when everything is swept away from the tenant.

---

Mr. John Murphy called in and examined:—

- Mr. J. Murphy. 480. *President.*] Have you observed the effect of the floods in this river in 1857 and subsequently? Yes.
481. They have been very disastrous? Yes.
- 23 Sept., 1869. 482. Have you formed any estimate of the amount of injury which has been done by the floods; could you put it into a sum of money? No.
483. Have you formed any idea of the best means of preventing the recurrence of injuries resulting from floods? I have had an idea upon this subject for a long time. It was first brought forward by the late Mr. Borthwick. I think a canal to Hexham would be the most effectual means of preventing floods in the Hunter.
484. From where would you cut it? From Oakhampton, about Mr. Graham's paddock, there is a natural channel nearly all the way, which with a few cuttings might be made available; when the water runs over into Rathluba it flows along the channel for a mile and a half.
485. Have you formed any opinion as to the probable cost of such a channel? I was making a calculation one night with another person. We were speaking of having a large canal, but I think a "tap drain" would answer all the purpose.
486. To relieve the floods? Yes; because an immense amount of water drains into Wallis' Creek.
487. You think a tap drain would be sufficient to relieve the floods? Yes.
488. Of what dimensions would you propose that the drain should be? Say 60 feet at the top.
489. And how much on the bottom? 40 feet.
490. And how deep would you make it? I do not think it would average more than 14 feet.
491. And what inclination of surface would it have when the water was flowing? I have not made any calculation, and therefore I could not say.
492. Do you not think it necessary to ascertain the fall? There is not the slightest doubt about it.
493. Have you made any estimate of the cost? No, I have not. I made an estimate of the probable cost of the drain about twelve months ago, but I forget now what it was. There was a provision for bridges and so forth.
494. Do you know the greatest depth of cutting you would have to encounter in going through the hills which form the eastern watershed of Wallis' Creek to get to the Hexham Swamps? I think at Four-mile Creek a cutting would be required about a mile in length—that would be the deepest.
495. How high would it be? There would be 18 feet of a cutting. That is the only difficult cutting there would be.
496. You think that would be the best way of getting rid of the evils arising from the floods? I think it would. My reason for advocating this tap drain is because of the great quantity of water which comes from this watershed around Wallis' Creek. It meets the water flowing up the river and comes to a standstill. The water has risen a great deal higher at the place where this tap drain would start from Wallis' Creek than it has three miles on this side of it. For instance, I have known 3 feet 6 inches more water at Wallis' Bridge than at the Victoria Bridge. That would get away by this "tap drain."

---

Mr. Joseph Creer called in and examined:—

- Mr. J. Creer. 497. *President.*] You have been for many years acquainted with this part of the Hunter River district? I have been here fifteen years.
- 23 Sept., 1869. 498. You remember the floods of 1857, 1864, and 1867—in fact all the floods that have done much injury to the district? Yes; I was the second person in the town flooded out in 1867.
499. That has caused you to give attention to the subject of the floods in the Hunter? Yes.
500. Have you formed any plans in your own mind by which you think the injuries done by the floods could be diminished? Yes; I gave a lecture on the subject of "floods prevention" twelve months ago—shortly after your report was issued.
501. And what are your views on the subject? They take up a good deal of your own plan. I quite agree with your cuttings; I have your plan here, with my ideas marked on it.
502. Will you describe to us what your own views are? I believe the cause of the floods is the very serpentine route of the river from this to Morpeth and below Morpeth, and I believe that the distance could be shortened and the river straightened. I have no doubt myself, from what I have read of what has been done in other countries, that if the river were shortened and straightened, and probably deepened in many instances, we should be to a great extent free from floods.
503. Will you describe the points where you would begin to straighten the river, commencing at the upper end? This is a report of my lecture [*printed paper handed in*]; I would have given you the original, but I lent the manuscript to Dr. Liddell, and he cannot find it. This is the report.
504. Is it a report which you wish to be considered as embodying your views? Yes, only that my views on the matter go further than flood prevention. I at the same time took into consideration the making of the river navigable up to West Maitland; although I do not know that that would be advisable at the present time. The main object of the people of the district is to prevent the floods.
505. I suppose you mean the injuries arising from floods—you cannot prevent the floods, I presume? No, but they can be mitigated.
- 506.

506. Would you describe how you propose to attain that end? Where do you propose to commence, above or below? The cuttings I suggested I marked on this plan (*produced*), which shows only from Oakhampton to Morpeth. Mr. J. Creer.  
23 Sept., 1869.
507. What plan is that? It is your own plan. I propose a cutting at the bottom of the Horseshoe Bend, exactly in the same place as the one marked by yourself, and going across the Pitnacree Road.
508. Describe what part of the Pitnacree Road—how many yards from the junction of the bridge? I would make the cutting from the lower part of the Horseshoe Bend, crossing the river about half a mile below Wallis' Creek; thence by a gentle curve crossing the Pitnacree Road between the railway station punt. This would reduce the course of the river from 17 or 20 miles to about 3 miles.
- and Mr. McIntyre's house; thence to Howe's Lagoon, meeting the river again a little above Morpeth.
509. Of what dimensions would you propose to make these cuts? My dimensions are 100 yards wide, with an average depth of 18 feet. I proposed to make it navigable.
510. An average depth of cutting, do you mean? I meant to have it sloped on each side to an average depth of 18 feet.
511. From the surface to the ground? Yes.
512. And what do you estimate the cost of that would be? My estimate of the cost is something like £110,000.
513. *Professor Pell.*] On how many yards of excavation do you base that estimate? I estimated the number of cubic yards to be 1,393,920.
514. *President.*] At how much per yard? 9d. I have allowed a great deal for bringing the cutting into Howe's Lagoon. That lagoon being a watercourse, one third of the cutting would be saved.
515. *Professor Pell.*] What is the total length of cutting? 3 miles.
516. Is that all new cutting? No; I have deducted about one-third.
517. Making it about 2 miles? Yes, taking the course of the river. Myself and the town surveyor went into the measurements.
518. *President.*] You give us that as the result of actual measurement? Yes. Then I propose, higher up, to open the original channel of the river from the now bridge on Macdonald's side, and by some elbow and levée to force the water over so as to protect the street. The river at present is washing away into the town, and if something is not done it will before very long wash High-street away. I remember when the river was a considerable distance from there. My object would be to force the water from the new bridge to its old channel.
519. And cause the river to flow down on the other side as much as you can, and so save the town of Maitland? Yes; and I have estimated that it would cost £10,000 to improve the present channel, from the Horseshoe Bend to Oakhampton.
520. What quantity of water will that new channel which you propose to make carry off? That I have never measured.
521. Have you not computed the quantity it is capable of carrying off? I did some time ago, but I have not the figures by me. I have looked at it this way—that by reducing the length of the present channel and making it straight, the increased velocity will be so great and the distance so much shortened that the water would reach the sea, and not have time enough to accumulate so as to overflow the banks. We do not get the floods all in an instant; the water keeps rising three or four days, and the first flood-wave would be at Newcastle before the other came down.
522. But in matters of this kind it is very desirable to go into figures, and to set aside all vague statements. It is necessary (you seem to have gone carefully into the matter) to estimate the quantity of water this new channel would carry off. We want to try and reduce the matter to some tangible figures? I have not estimated the quantity of water.
523. In point of fact, then, you do not know what the effect of your channel would be? Only from observation.
524. But you cannot know anything of that channel from observation, because it does not exist? Of course. But I believe that if the channel were so shortened and straightened the water would get away so quickly that we should be almost free from floods.
525. But the cuts are not yet made? I am certain that it is the want of those cuts that is the cause of the floods. In the present state of the river the water flows only slowly.
526. Have you measured the velocity? I have seen it done, and timed things as they floated along.
527. And at what rate did you find them going? Sometimes five miles an hour, and at some places only two miles an hour.
528. Will you give us the points from which you made your observations? I do not know whether they would be any guarantee; we have watched the current in time of flood at the embankment in High-street, and have judged that it was travelling past there at something like 4 or 5 miles an hour.
529. But you never measured the velocities? No, not exactly.
530. How do you know what the velocity will be in this new channel—what velocity have you estimated it? I have not brought it into figures any more than judging that it will be increased. If the river be straightened, common sense tells us that the velocity will be greater.
531. A hundred times or twice? More than double I should imagine.
532. How much more? I could not exactly say—perhaps treble.
533. But on what do you base your supposition that it would be treble? Simply on the ground that the water would have a straight course to run. The impediments would be removed, and the water would travel quicker.
534. Those are general statements. I should like to get from you some specific statement on which the Commission could rely as to the actual amount of relief which would be afforded. It may happen that the change would not produce so great a relief as you suggest; or, on the other hand, the plan proposed might take the water off more rapidly and carry it on to the lower parts of the river at a greater rate than they could dispose of it? I cannot give you figures, because I have not gone into figures, either with regard to the quantity of water or the velocity of the stream.
535. Then you do not know absolutely what the effect would be? Not more than what I surmise.
536. On what do you base your surmise as to the actual quantities? I believe, judging from the floods we have had and the river in the state in which it is, that if the course were straightened the water would go out to sea and the damage would be small, because the water would travel so quickly.
537. How quickly? I cannot say how quickly.

- Mr. J. Creer. 538. Do you know the quantities of water you would have to deal with, to begin with? No, only judging from your report. I have not gone into the consideration of the quantities of water.
- 23 Sept., 1869. 539. But do you not think that is essential in dealing with a flooded district?—have you gone into that question at all? No.
540. You do not know the quantity of water with which you would have to deal? No.
541. And you do not know the discharging capacity of your channel? No, only from appearance.
542. Do you not think that is rather a vague way to go to work—You do not know what you are prescribing for, or the effect of the remedies you prescribe? It would be vague for a professional man.
543. Would not an unprofessional man be likely to be more at sea? No; an unprofessional man might judge from appearance.
544. You are arguing from facts as you observe them, to facts which you cannot observe, and the effect of which you cannot know until they are accomplished. From what bases do you infer that you would produce certain results? I rely to a great extent upon what has been done in the Clyde.
545. What were the quantities of water dealt with in the Clyde, what was the fall of the river, and what were the cross actions? I cannot give you the quantity; but from what the Clyde has been and what it is at present we may surmise what would be the result in the Hunter.
546. Are the circumstances similar? Yes, in many instances. The distance from Maitland to Newcastle is about the same as the distance from Greenock to Glasgow. The rise and fall of tide at Glasgow was exactly, to an inch, the same as it is on the reserve on the Horseshoe Bend.
547. But the rise and fall of the tide at Glasgow are totally different now. The rise and fall of the tide at Greenock are totally different from the rise and fall at Newcastle. Do you know what the rise and fall at Greenock is? I cannot give it you now.
548. Do you know what it is at Newcastle? No. On our reserve it is from 12 to 15 inches. I measured it when I was preparing my lecture. As to the river Clyde, at Glasgow, parties have waded through it and it has not taken them up to their knees; but because it was frequently flooded they deepened the river, and since then they have been free from floods.
549. What I want to get at is, what you can really rely on as the probable result of the alterations you propose. You have not made an estimate of the quantity of water or of the capacity of the channel, and how can you tell whether it will take the whole or only a portion? The distance from this to Morpeth at present is 20 miles. If the river were shortened to 3 miles, that would be more than a difference of six times; so that, estimating what would run in 20 miles, we may reckon that six times more would run in 3.
550. I think it varies as the square root of the height and the slope of surface? I am taking a common-sense view.
551. Common sense means knowledge of principles. The question is, whether there are any absolute data to go upon? Well, supposing so many gallons of water run 10 miles in a certain time; if the distance be reduced one-half, double the quantity would flow in the same time.
552. Have you considered what the effect upon the channel of the river at Morpeth would be, if you introduced this unknown quantity of water you propose to introduce into it—The channel is capable of discharging a given quantity of water with a certain height of flood: if you introduce double the quantity in the same time, how much will you raise it? Of course the river would have to be improved considerably lower than Morpeth.
553. Have you named those improvements? No.
554. Would you describe what you propose to do from Morpeth onwards? I propose to make one cut on this side of Raymond Terrace—at the Devil's Elbow, I think they call it; and another higher up. And I believe that the mouth of the Paterson River, instead of running, as now, almost at right angles with the Hunter, should have its mouth turned down the river, so that the water would be discharged obliquely.
555. You think that would enable the waters of the Paterson to discharge more rapidly? Yes; it would do away with the backing up of the Hunter.
556. Do you not think that the velocity of the discharge of the Paterson is due to the inclination of the surface in times of flood—I believe that water falls because its surface is not perfectly horizontal—If the surface of the Paterson is at a given height, and the surface at Hexham is at another height, the water will flow at a certain velocity—By cutting off that elbow, would you so sensibly affect the slope of surface as to cause the waters of the Paterson to get away more rapidly? It would shorten the course much.
557. How much? I cannot tell how much. If the 20 miles were reduced to 3, the channel would have the whole of the fall it has now in 20 miles.
558. But you cannot say what the effect of that would be? No.
559. In dealing with a matter of this kind, do you not think that a person should first make himself acquainted with the principles upon which these calculations are made, and then apply them to each individual project? That is very well when one is capable of doing so; but in a scheme like this even where parties have not the ability to do so, it is well that common-sense views should be taken, and that gentlemen like yourself should put them in a practical shape afterwards. We know that many similar works have been brought into notice by non-professional men, and that professional gentlemen have afterwards taken them up.
560. But when it comes to proposing certain specific projects as opposed to others equally specific, do you not think they should be each based upon certain ascertained facts and acknowledged quantities? I believe they ought, and no doubt when a professional gentleman came to take up these things he would lay them down to their proper principles.
561. But you do not know the quantity of water to be dealt with in any part of this river? No.
562. Do you know the quantity going past Maitland each second when the flood is at its height? No; I take what you say in the report for granted.
563. Supposing it were possible to let the whole of the flood-water on to Morpeth as fast as it comes to Maitland, have you formed any opinion as to what would be the result? I do not think Morpeth would be injured in the least, because we do not get the flood in an instant; it comes down gradually, and the course being shortened to the sea is really the foundation of my conclusion that it will to a great extent free us from the evils of floods.
564. But that is not based on any computations; it is only general surmise? It is general surmise. But it is a fact that the flood-waters come down by degrees. The flood does not rise 20 feet in a day—it requires three days sometimes; but by the third day, if the river were straightened and shortened, the great bulk of the water would have gone to the sea.
- 565.

565. In what respect does your project differ from that which I propose? I propose to carry the water into Howe's Lagoon. Mr. J. Creer.  
23 Sept., 1869.
566. What is your objection to using the channel of the river as far as practicable? Because it is so very crooked, and this is its natural watercourse. The two are the same in principle.
567. It is only a question of detail and expense? That is all.
568. *Mr. Bennett.*] You would perhaps have considerable cutting in Howe's Lagoon? I do not think it would be advisable to do that unless the river were improved below.
569. *Professor Pell.*] If this water were let suddenly down by this short channel would not the flood rise much more unless the river were improved lower down? I do not think it would be advisable to do this until the river was improved lower down.
570. *Mr. Bennett.*] Have you any idea of the difference of level you would get by turning the mouth of the Paterson down the stream? I could not tell you, but there would be a difference. The stream now runs at direct right angles.
571. It is a question whether the cost would be compensated by a fall of 3 or 4 inches? It is a question of cost.
572. *President.*] We have it in evidence that when the floods in the Williams and the Paterson have been discharging for several hours the flood-waters begin to back up the Hunter? I have heard so.
573. Do you think that turning the channel down here would obviate that? Yes.
574. How? Because of the increased stream.
575. The reason the water runs up the Hunter now in times of flood is that it is higher than at the Sixteen Miles; and if it be still higher will not the same state of things obtain? I cannot myself see how it would run up—how is it higher?
576. Because the Paterson is in flood and the Hunter is not? Have you evidence to say that when the Hunter is in flood the water of the Paterson comes up?
577. No; before the flood-waters of the Hunter come down? I have heard that repeatedly, and have no doubt of it; but I do not think if the Hunter were in flood and the Paterson were in flood at the same time that the water of the Paterson would flow back.
578. Then there is another point. Supposing the flood-waters of the Hunter are discharged to a point lower down than the present junction of the Paterson, as you propose, and the Paterson is discharging also, would you not have the same state of things above the junction as below—the same gorging of the river? But with the mouth pointed down the stream it would not be so great as now.
579. Why? Because the tendency of the water would be to go down.
580. The water runs in a river because it is higher at one place than at another, and it runs with a velocity proportionate to the difference of its height. Two or three miles below the present junction of the Paterson and the Hunter the flood attains a certain height; that height must always remain the same, but if the river be improved, it will bring a greater quantity of water on to that point, and the effect will be that of raising the flood level? Yes.
581. So that if the flood rises 10 feet below the junction, when the river is improved it might rise 10 feet 6 inches. Consider what the effect of that will be on the Hunter itself—Will it not be to diminish the present slope of surface, and in consequence its discharging capacity? But I would improve the Hunter lower down—so that the water from the Paterson running into the Hunter would get out so much quicker—by the cuttings at the Devil's Elbow and a little higher up. The river would be shortened 10 or 20 miles, and so much more water would get away. The Paterson would not then have so much effect as at present.
582. Does your project involve anything besides make these short cuts? No.
583. It does not involve any embanking? Yes; I believe there are places along the river which would require embanking, although I am not able to say where, because this plan is the only one I have had to go by. I believe that some parts down the river would have to be embanked.
584. *Professor Pell.*] Would it prevent the water going on to these flats at the back? I believe it would entirely. I do not know that it would in a flood like that of 1857. I would not like to say that in such a flood the back lands would not be flooded; but I am conscientious in my belief that if what I say were carried out, Maitland would be free from floods.
585. But what do you base that belief upon? Mere surmise and my own opinion.
586. Based upon? Based upon what I have read and upon my observation of the floods here.
587. You prefer one line of cutting to another between here and Morpeth? Yes.
588. Did you give us an estimate of its probable cost? Yes, £110,000.
589. Are you prepared to say whether the difference in cost between that and any other general plan of a similar character for shortening the river would be commensurate with the advantages gained, and whether its advantages would be so much greater as to warrant incurring the additional expense? I do not know what the expense of the other plans would be.
590. For instance, that which I suggested? I take up two of your cuts. My idea of taking it into Howe's Lagoon would be a saving simply from its being a watercourse, and it would make the river considerably shorter than your plan would make it.
591. What length do you make it? 3 miles would be the length according to my plan.
592. What would be the length of your cutting? Altogether, 3 miles.
593. Are you prepared to say that the difference in the cost of making those cuttings would be commensurate with the advantage you suppose you would gain? I believe they would if my ideas were carried out. When I suggested my plan, my idea was that the canal should be made navigable, and my measurements were for a navigable river.
594. Is there any reason why the river sketched here [*on Mr. Moriarty's plan*] should not be made navigable just as well, and at far less cost—In fact, if it were deepened in the manner suggested in the report, is there any reason why it should not be navigated? I think these bends [*pointed out by witness on the plan*] would be better if they were out. Those bends would tend to bar the free flow of the water.
595. They would tend in the additional length,—one is 11 and the other 10. You are ten-elevenths of the distance I propose? When the river is in flood, the first sharp corner it comes to it goes over.
596. Did you ever in your life see a straight river? No.
597. Why are rivers not straight? It is not natural.

Mr. J. Creer. 598. You would find if you made that river straight from first to last that it would be as crooked at the end of ten years as at present. There is scarcely a watercourse in England that has not been altered? —

23 Sept., 1869.

599. *Mr. Bennett.*] Would there not be a good deal of rock-cutting in the plan you propose? There would be some rock-cutting in Howe's Lagoon.

600. *President.*] And in the lower part of the work—the railway is through rock-cutting? But this is a long way from the railway.

601. I suppose you would prefer to keep clear of the rock? Yes. Supposing all the land which is useless now about there were purchased to improve the river, a good deal of it would be reclaimed. Look what quantities of land they have saved by improvements in the Clyde.

602. *Mr. Bennett.*] Do you know the Clyde of your own knowledge? No.

603. I think you over-estimate the improvements which were made in the Clyde, and that they were made to facilitate navigation, and not to relieve land from the floods? At the same time they did relieve Glasgow from the floods.

604. But the floods at Glasgow are nothing to the floods here? No.

605. Are you aware that a dam was built over the river Clyde above Glasgow? Yes.

606. How can the clearing of the river below affect that? It does, if we can place any reliance on history. I have read Chambers' Journal, and the Cyclopædia, and everything that could bear upon it. Glasgow, when the thaws set in from the mountains, was flooded.

607. *President.*] Above or below the dam? Below, and there are tablets which show the height of the flood. There are men in this town who remember it. But since the river has been deepened the people of Glasgow have been free from floods.

608. *Mr. Bennett.*] The floods in Glasgow could not have been like the floods we have experienced here? They have had sailing-boats about the streets to carry people away from flooded houses.

609. *Professor Pell.*] How long has Glasgow been relieved from these floods? Perhaps between thirty and forty years.

610. Are you aware that the people here were free from floods for twenty-five years consecutively? I believe they were.

611. This freedom from floods for thirty years may have resulted from the absence of heavy falls of rain? Yes, it may.

612. *Mr. Bennett.*] The improvements commenced about thirty years ago, and they are in progress still? Yes.

613. *President.*] They were made to facilitate navigation? Then there are the improvements which have been made in the fens of Lincolnshire. There is an account of these in the 1st volume of Smiles' "Lives of Engineers."

614. The fens of Lincolnshire were embanked for the purpose of reclaiming land. You are of opinion that the increased length of cutting you would have, namely, nearly a mile and a half, would be justified by the saving of distance to the extent of a quarter of a mile. We have seen that the distance saved would be a quarter of a mile by your proposed cuts? It would be more than that, I think.

615. Yours is ten-elevenths of the distance I propose? I certainly think that the shortening of the distance would be worth the extra expense.

616. The cutting of one would be about double that of the other—double the length, and therefore probably double the expense. Supposing the two projects were put before a company—one involving double the cost of the other, and the saving of distance amounted to only one-eleventh of the whole (a quarter of a mile), do you think they would enter on the greater cost to effect so small a saving? I do not think they would unless they could see compensation.

617. In what form? In the better effect of the work.

618. Do you not think that there might be some advantage in making the cuts in the river so as to have the old channel to deposit the surplus material in? Yes.

619. What would you propose to do with the surplus material? I should put the greater portion on the banks to raise them.

620. Then you would have to purchase the land to throw the "spoil" on? I propose to purchase 120 acres, at £40 per acre.

621. *Mr. Bennett.*] You would want about twice the width of the river course to take the river spoil—100 yards on each side? The 100 yards wide I propose would not be 18 feet deep 100 yards wide, but for only one-third of it.

622. *President.*] That would give a very small discharge proportionately? It would give a great deal smaller discharge.

623. You propose that the channel should be 300 feet at the top; what at the bottom? It would be sloped to one-third—100 feet.

624. And at an average depth of 18 feet? At an average centre depth.

625. *Mr. Bennett.*] It would want the same distance as the top of the channel on each side for the spoil?—

626. *President.*] Having all these things in view, you still think it worth incurring all the additional cost for so trifling a saving of distance? I think it is, looking to what I expect from that channel being navigable.

627. Would not the old channel be navigable? Yes; but I believe the expense would be greater for excavation, on account of the water.

628. Could you not put dredges into the channel? Yes.

629. Do you think getting up the stuff by dredging would cost as much as getting it up by ordinary labour? I do not know.

630. *Mr. Bennett.*] Did you calculate the cost of changing the position of the Pitnacree Bridge and Road? Yes; I calculated for another bridge.

631. And also for compensation for the severance from the water of those who would have the water removed from them, and who would no doubt claim compensation? No.

632. *President.*] You calculate on reducing the level of the floods at Morpeth considerably by shortening the channel? Yes.

633. We will look at the map, and see how much you would shorten it below Morpeth. You will shorten it 60 chains by that cut [*the bend near to the Williams*], and the river from this has a fall of 9 inches to the mile,

- mile, so that you would level it  $6\frac{1}{2}$  inches at the expense of that cut, with probably the risk of shutting up this channel, and stopping the navigation altogether. Nature has provided that junction of the Williams to keep the channel clear? Would it not be kept clear by the cut? Mr. J. Creer.  
23 Sept., 1869.
634. No; it would shoal up, and a spit would be formed which would stop the navigation. Do you know the difference of velocity which would be caused by levelling the channel  $6\frac{1}{2}$  inches? No.
635. It would be the square root of an inch? Do you not think that more water would flow along the straight cut?
636. *Mr. Bennett.*] If you could keep it deep; but when it was silted up, it would be as though the water were running across a weir? I have always been of opinion that the reason our river is filling up is that the river is so crooked that the water cannot scour.
637. But it would be different here, where there is the junction of another river like that? In a short time, if something is not done, we shall be without a river at Maitland. My experience is that it is a very different river now to what it was when I first came here.
638. *President.*] We have been told that there is no difference in the river? Just above the "Northumberland" there was at one time a great depth of water, and now you could walk across the river.
639. Are you not aware that these changes are always going on in every river—that they are the ordinary operations of nature? Yes.
640. And do you think it possible for man to arrest them? I believe we are so important a district that we ought to do what we can to save the district, if we think anything can be done. No doubt there are differences of opinion on the subject.
641. The question of difference involves the difference in value of the various projects? I should be sorry to see my project gone into if the others were the best; but I think that if the river were shortened and straightened, we should be almost free from floods.
642. If anything were attempted, should not the cheaper plan have the advantage over the more expensive, unless it can be shown that the more expensive one has greater merits? Yes, unless some direct proof were given that it would be worth while going to the extra expense.
643. Do you think that a saving of one-eleventh of the distance between Maitland and Morpeth, at the expense of a mile and a half of cutting of the dimensions you have given, would be commensurate with the expense which must be incurred? Perhaps it would not.
644. *Mr. Bennett.*] With the probability of the cutting being through much harder material, and much more difficult to dispose of? Yes.
645. *Professor Pell.*] By either of these schemes for shortening the river you suppose that a much larger quantity of water would come down in the same time? I am satisfied that if either of the schemes were carried out we should be almost free from floods.
646. And would not a larger quantity of water flow from here in the same time than now? No doubt it would.
647. It would go on to Morpeth? And past Morpeth.
648. Could you suggest any improvement of the river below Morpeth to carry off the water—improvements which would be as effectual as those suggested to improve the river above? The river would require dredging out and deepening.
649. To make up for the great difference occasioned by shortening this channel by 10 miles, it would require extensive improvements to carry off the additional water which would be brought down in the same time. The channel at present is not sufficiently large? I do not think they would have to be gigantic improvements. The very force of the water itself would drive it out to sea.
650. It would have no greater force except it were higher at Morpeth, and the water would not get away quicker? It is so sluggish at present getting down to Morpeth that the whole bulk of the water has time to flood the place right up.
651. *Professor Pell.*] Water does not push itself along—it falls according to the inclination of the surface it happens to be on. Because the water went faster from here to Morpeth, it would not therefore travel faster at Morpeth? I had an experiment made upon a board to measure the rate at which water flows.
652. *President.*] Such experiments are dangerous things to generalize from. All that has been done in the most elaborate and perfect manner by scientific men, and they have given us the result of their experience. They have shown us the velocity with which water will flow in different channels. Water will run in a channel only because water at one end is running away, leaving an absence of water which that in the other part of the channel runs to fill up. The water will not escape from Morpeth faster than it does at present until it has established a greater slope of surface from Morpeth downwards. That would be obtained by the water rising to a greater height at Morpeth than it does at present, and producing heavier floods. If you cause the Paterson to back up, it will overflow and flood the country on its banks. You must look at the whole question from first to last, and see the effect which would result from what you propose, in all the rivers.
653. *Professor Pell.*] If the water going from here to Morpeth down the short incline had the power of pushing the water before it at the same speed, it would do very well? But cannot the river below Morpeth be widened?
654. *President.*] No doubt anything is possible so long as you have the money to do it? And could not embankments be thrown along the river where it is likely to break over?
655. All these things are possible, but there is the element of expense to be considered? There has been ten times as much lost in this district as the cost of those works.
656. How much has been lost—what is the actual amount of loss put into figures? I believe over a million of money.
657. *Professor Pell.*] In what floods? In the whole of them from 1857.
658. In the three floods? There have been about a dozen or fourteen. I have been flooded out of my place six times.
659. In fifteen years? Yes; we have had a considerable number of floods.
660. *President.*] Where do you live? In Devonshire-street. The second time I was flooded out I was on the Horseshoe Bend. When I went there no one could have convinced me that my place would ever have been flooded. I have suffered from the floods ever since. I was flooded three times in Devonshire-street with the back-water alone, without the water coming out of the river, but filling up from the back.
661. Have you paid any attention to the proposed dam now in course of construction at Wallis' Creek? I have.
- 662.

- Mr. J. Croer. 662. Can you describe to us generally what it is proposed to do with it? The gates are to be to the height of the underside of the top rail of the Victoria Bridge.
- 23 Sept., 1869. 663. That is above the highest flood-mark? Yes, two feet above.
664. How are these gates to be constructed—to meet in the centre? Yes.
665. What is to be the thickness of the walls on which these gates are to be hung? I think the front wall is to be 9 feet, but I will not be certain; and I think the side walls are to be 5 feet.
666. And how is it proposed to open and shut these gates? By a chain working with a windlass on the top of the walls, the same as lock gates at home are opened and shut.
667. Does any drift wood or dead timber come down in times of flood? The drift wood goes up.
668. Is there none coming down? No; it goes from the river up the creek.
669. *Professor Pell.*] Did you ever see Wallis' Creek flooded when the Hunter was not flooded? No, never. I have asked every old resident living around that creek, and they never knew the land to be flooded from the creek in their lives except when the water came up from the river. I have asked particularly upon that point. The height of these gates was my own proposition, and I have had to bear a good deal of opposition in consequence. Numbers of people were inclined to have only "fresh" gates, and not high gates; and it was on my proposition that they were to be made of the present height.
670. Are you connected in any way with the construction of the gates? I am an Alderman of West Maitland.
671. *President.*] How do you propose to prevent the water from flowing over the level ground when it breaks over the banks? We do not propose to stop it. When the water gets as high as the banks, it will of course then begin to flow over the lands. The object of the gates is to stop freshes.
672. Supposing that the water inside Wallis' Creek is 10 feet high, and that the water of the flood has risen to the level of the bank on the outside, and that then it should rise a foot very rapidly (as we have seen it), and begin to flow round each side of the walls, what do you think will be the effect on the backing of the walls and the soft alluvial banks? We will make provision that when the water rises to the height of the banks it shall not come immediately round the gate and its foundations. We will take care to throw it away from the gates and let it flow into the creek higher up.
673. *Professor Pell.*] But there will be an enormous quantity of water to be carried off? Yes, but we will not let it go into the creek there. We have high banks at the gates. It will get in elsewhere.
674. Will you carry it round by sluices? I do not know how yet.
675. There will be 2 or 3 feet of water over the top of the banks in time of flood? Not there; very little water will go over the banks at the flood-gates.
676. If you have a strong stream of water a foot deep running over a level bank, do you not think there is a risk of its cutting a fresh channel for itself? I do not know. I do not think that the water will do any harm to the flood-gates.
677. All this country is low and flooded? Yes, but the banks are good high banks. The water will be flowing into the basin long before it would rise so high as to go over the banks.
678. But the proposal is to bank out all this, is it not? No. The first place where the water flows in is through the old "Rose Inn" yard. There are 18 inches of water there before it breaks over anywhere else. I know that so well, because during the last flood, as one of the Improvement Committee, I had a body of men there stopping it in with bags.
679. *Professor Pell.*] How deep are the foundations of the walls on which the gates are to be hung? You saw the height they are at present.
680. Yes? That is 5 feet from the foundation. There are 18 inches of concrete and 18 inches of masonry underground.
681. *Mr. Bennett.*] What depth of water was there yesterday on the floor of the lock-gates—leakage water—a foot or so? There would be some.
682. And the floor you say consists of—? 18 inches of masonry and 18 inches of concrete.
683. *Professor Pell.*] Do you think there is any chance of the water working under there? No.
684. *President.*] What sort of a bottom is it—clay? Yes.
685. Is it good clay or alluvial matter—the same as the banks? It is better than the banks. At first it was thought that "fresh" gates would be sufficient to keep out the water, and that it would be necessary to make them only as high as the banks. My reason for proposing the high gates was for the protection of the gates themselves, because if the water were allowed to flow over the top it would wash away the soil.
686. Do you suppose that these gates will always remain perfectly true and not cant in dry weather? That has got to be tested.
687. Supposing they get out of truth. They will not always have the pressure to which lock-gates are subject. If they were to cast after being exposed to the summer's sun, and a flood were to come down, what would be the effect if they did not come together at the foot 8 or 9 inches? I do not think that timber 18 inches thick is very likely to cast. These gates will be 18 inches thick.
688. You mean the frame-work? Yes.
689. But it might cant and get out of truth? I scarcely think that timber-work so heavy and so well framed and braced would cast.
690. Supposing that instead of closing mathematically true, the gates should be jammed at the top and open at the bottom, what do you suppose the result would be? They would let the water in.
691. But what effect would the tremendous jet passing through there have upon the soft ground? I do not think it would affect it.
692. Do you think there is any danger of the drift timber and rubbish getting in between the gates and the mitre-sills? No. In the construction of these gates they have taken up the plan of the Prince's Dock Gates at Liverpool. They are constructed of the same strength.
693. The Prince's Dock Gates have the pressure against them every day to keep them up to the mark? I do not think these gates will cast, but I have not sufficient experience to know.
694. *Mr. Bennett.*] Are there to be any sluices in these gates? No. The impression that Wallis' Creek would be a safety-valve I do not agree with. I think that if it had not been for the floods, by this time our population would have been doubled, and I have no doubt that the revenue derived from the district would also have been doubled.

Mr. John Mitchell called in and examined :—

695. *President.*] You have seen nearly all the floods which have desolated this district? Yes, since the flood of 1840.

696. Was there any large flood between 1840 and 1857? No.

697. The 1864 flood was a bad one, was it not? Yes, the 1864 flood was a very bad one, and so was that of 1867.

698. Was the flood of 1840 a very bad one? It was not so very bad—it was not felt so much as that of 1857—it did not come quite so high up into the town either.

699. Did you observe any peculiar effects connected with these floods which you consider worth describing to us, further than the general fact of the water coming to a certain height—did you observe anything with regard to the set of the floods? I know all the sets of the floods, because I was out in the boats—I know the set of the whole of them.

700. Did it seem to you during the flood of 1857 that the Paterson and the Hunter were at their height about the same time? No, the flood rose in the Paterson in both instances first.

701. And had it commenced to discharge before the flood in the Hunter became bank high? We had the Paterson down before the Hunter, and then the Hunter backed the Paterson up. The Paterson then became quite still, and you could see the sticks drifting up the river as fast as they were drifting down in other places—it was so calm.

702. *Mr. Bennett.*] As far as Dunmore? Yes, as far as Dunmore, and about there. We used to paddle a little canoe about there when the flood was at its height.

703. *President.*] If by any project the flood was raised a little higher at Morpeth than it was in 1857, it would bank up the Paterson still higher? Yes.

704. And would it do a great amount of damage? It would cover the lands about there.

705. So that if anything is undertaken for the improvement of the Hunter and which would have the effect of raising the flood at Morpeth, the effect on the Paterson must be taken into consideration? Quite so. My idea is that the water is blocked about Mount Pleasant. Morpeth gets flooded before any other place. The water rushes down until it gets to Morpeth. It comes in up at Hinton and there it gets checked in the first instance and begins to back up. When the water begins to rise at Morpeth the current decreases.

706. Does it begin to rise at Morpeth the fastest? The water rushes down the Hunter and the Paterson, and meets at Morpeth and blocks up.

707. *Professor Pell.*] Before it rises at Maitland? Before Maitland is very much flooded. It depends upon the quantity of water coming down here; but when it gets to Morpeth, and Morpeth gets flooded, I have always found that the currents here are not nearly so strong.

708. The channel below the junction is not much larger than it is above? I do not think it is a great deal larger.

709. Have you formed in your own mind any project of improvement, so as to get rid of the injuries caused by the floods? I have had an idea about it.

710. Would you oblige us by stating what it is? Yes. I think relief could be given by taking the water by Batti Swamp and then across to Raymond Terrace, either at the back of Raymond Terrace Town, or through the Town, which would be the easiest way, and down to where the water would escape into Port Stephens Bay.

711. What distance is it from Raymond Terrace to Port Stephens? In a direct line, I should say it is about 12 or 13 miles. I have ridden over the land, and know it very well. There is a piece of high land known as Box Hill almost opposite to Hinton, and this seems to be the point where the water is backed from.

712. Do you think there is no obstruction then between Morpeth and Maitland that joins the Hunter? There are several obstructions in the river. There is one place where there is a narrow neck of land between the Hunter and the Paterson—it is so narrow that you could almost throw a stone across it. If the Paterson were eased, a portion of the water of the Hunter would flow past Morpeth sooner than it does now in times of flood.

713. Then you would still allow the water to come down the tortuous channel of the Hunter as far as that point? I think as far as the river is concerned, it affected it very little until some of those dams were put up at Bolwarra. The water has always broken across and been delivered at Largs; but they have altered that by putting up dams.

714. In point of fact, the water takes a straight course from the centre of the valley? Yes; I have in many instances tried to get up there in boats, but I have found that the current is stronger there than it is in the river. A portion of this land on the Paterson is very low.

715. Generally, your proposition would be, to cut a fresh channel for the Paterson, to begin with? I think if there is any cutting done to shorten that river, or any wish to take water out of the channel of the Hunter, there would be more gained by taking it out this way than any other.

716. Rather than allow the waters to come down the present channel of the Hunter, you would prefer cutting a fresh channel? I am hardly prepared to answer that question, because my theory perhaps is rather a strange one. I have always argued in this way,—that the Hunter has generally carried the water almost within its own banks, until it began to block at Morpeth. When it has been blocked back it has overflowed.

717. But do not the floods in the Hunter commence to overflow the land about Maitland long before the flood has attained its height at Morpeth? Not in all cases. The Paterson comes down, and then the Hunter comes down, and there is not sufficient space for the water to get away. The rising of the rivers has been very regular, the Paterson and the Hunter both rising together. We have made rough observations—one man on one river, and another on the other.

718. It is altogether a varying quantity, depending upon the rainfall at various points? Yes; but when there is a general rain, they rise about the same time.

719. In cases such as that, do you find that the floods in the Paterson themselves remain up for any length of time? Very seldom, when the Hunter is not up.

720. Have you known an instance when the Hunter was in flood and the Paterson was not in flood? Yes.

721. What is the effect then at Morpeth? I have not seen the effect at Morpeth. I have only seen the effect on our own river, which backs up and sometimes rises a little. If there is a large flood in the Hunter we are sure to have a flood in the Paterson, more or less.

Mr. J.  
Mitchell.

23 Sept., 1869.

722.

Mr. J.  
Mitchell.

23 Sept., 1869.

722. Do you have the floods at the same time? The Paterson is straighter than the Hunter, and the water has less distance to travel; consequently the water is down in the Paterson, in a general way, before the great body of water comes down the Hunter.
723. As a general rule the flood in the Paterson has pretty well passed off before the Hunter water catches it? Yes, as a general rule.
724. Is the same found to be the case with regard to the Williams? No, I do not think it is. The Williams River comes down slowly in some instances, but on one or two occasions it has come down very fast and very high. A good deal of the Williams water passes away before the Hunter water catches it.
725. Then in your opinion it is the remains of the flood in the Paterson and Williams, assisted by the beginning of the Hunter flood, that causes the great rise at Morpeth? It must affect it, because the water has less room to escape. But I think that if we had a large flood in the Hunter, and neither the Paterson nor the Williams rose, the low land about Maitland would be flooded, and I believe it would flow across even from the Hunter on to a good deal of the low lands of the Paterson.
726. You would prefer relieving the Hunter by a cut below Bolwarra and across to Largs? That would relieve Maitland. The water would commence passing quicker, and would to a great extent clear Maitland and the low lands here; but if provision were not made to take it away as fast in proportion below, the lower portion would suffer as much as it does now.
727. And, in a money point of view, the same injury would be done? The water would block, and the flood would have almost the same effect.
728. So that practically you would derive but little benefit from it? There would be little benefit unless provision were made below Morpeth to carry off the water faster.
729. Having regard to the improvement of the outflow of the river, and to the uncertainty which attends all straight cuts and new cuts, do you not think the safest course would be to confine one's attention to the improvement of the natural channel of the river, rather than attempt any gigantic scheme for the construction of new channels? Perhaps so.
730. I mean from Morpeth downwards? I believe it would be of very great assistance even from Morpeth down; but I have never been to Morpeth much in flood-time, because if you get there you cannot get back conveniently.
731. Do you think there would be any difficulty in draining the back lands of Wallis' Creek by constructing proper open drains for the flood-water, so that it could subside as soon as the river goes down? Up that valley a great portion of the land is very low.
732. Still it is higher than the river? No doubt it could be drained.
733. Do you think it would be possible to protect the town of Maitland by constructing embankments round it, following the Hunter on one side and Wallis' Creek on the other? I do not think it would protect the town much.
734. Not if you made the banks high enough to keep out the floods; I am speaking of the town? The watersheds are so very large.
735. There is no great watershed in the town? If we get a flood here, a continuous flood, the water is kept to a height for a week almost. The accumulation from the back would bring the water round us almost as much as it ever was.
736. But if there were an embankment right round the town, do you not think that would protect it effectually? It would protect the town to a certain extent, but then the district would suffer for the town's benefit.
737. In what way? Every place you shut up to keep the water out would make the flood so much higher in other places.
738. Do you think that the putting of an embankment round the town would make any sensible alteration in the flooded area? I do not think that the banking of the town would make a very great difference, because the water has never been very high upon Maitland; but Wallis' Creek has acted as a sort of easer to the river just at the point where it wanted it. The flood extends back here for miles and miles.
739. Then you are opposed to the plan of constructing these flood-gates? Decidedly, although I have as much interest out that way as on this side of the river.
740. You are a practical man, and I should like to ask you whether, considering that the banks are soft alluvial soil, you think those gates will stand? I do not think they will. The only plan I can see is to face them with rubble stone, either hand-packed or thrown in till they find their own basis.
741. To face the banks? Yes, in places where there will be any wear.
742. Supposing the flood were to rise to a height of two or three feet over the banks of Wallis Creek and flow round by the gates and into the creek again, would it have the effect of undermining the banks? Very little, I think. The banks are generally grassed, and it is astonishing the wear they will take. Where there is no grass the water would soon wear the banks away.
743. Supposing the water in Wallis' Creek were many feet lower than the water in the Hunter, and the water fell in a cataract over the banks into the creek, would it not have the effect of cutting away the banks? No, when the water once began to get into the creek it would find its way in a thousand places at once.
744. Would it not run in very fast over the banks? It would run on both sides some distance away from the creek, and run in where the banks are low. It will not get into the creek where the banks are high. A little distance from the flood-gates the land falls away, and the water would run over these low lying lands into the creek until the creek was full.
745. And what will be the effect of a large body of water tumbling over the bank to fill up the creek? It will be to cut down any alluvial obstruction it comes against. Wherever the water pours on to the alluvial banks it will wash them away.
746. Do you think there is any danger of the washing away of the alluvial soil to such an extent as to form a fresh channel? No, I think not; they would guard against that from time to time.
747. They may protect a hundred feet or so, but the operation I speak of would only be transferred from that point to another. The process of undermining would still go on. You would only transfer the scene of operation? I think their idea will be to make it sufficiently high to protect itself. If they allow the water to come in about their flood-gates it will eat them away.
748. What would be the state of those gates after being exposed to the dry summer weather—Do you think they will cast? I have never seen the plan.
749. They are like ordinary lock-gates, but enormously heavy? If they are well framed they might be built so that they cannot cast.

750. Should you not apprehend that there would be a tendency to cast? I think they should build them with such a substance of timber (say 14 inches thick) as would make it very difficult for them to cast.

751. You would have to depend not on the timber itself but on the tenons? The butts should have as good a retaining power as if they were solid, and if they were well and closely drawn up together I do not think the gates would cast.

752. This is a side view of the gate [*plan shown to witness*].—Is there no chance of that buckling? No, I think not. I have watched the effect of floods upon gates, and I have been astonished at what a small piece of wood would bear.

753. My impression is that they would cast and get out of truth, and have a V-shaped opening at the top or bottom? In all probability there will be a leakage, but I think the gates will answer the purpose of keeping back the principal portion of the water.

754. But if there should happen to be any opening at the bottom, and there is a strong stream of water, will not the effect be to undermine the ground at the bottom of the creek? I think not if they coat the bottom with pitchet and throw in rubble. I put up flood-gates 24 feet high to open from top to bottom. I had only one sill in the centre. I made them of three plies of flooring boards crossed and felted between and pitched. The weight of the water would make them bend and fit pretty closely up to the jambs, but I believe the water could never have broken a single flooring board.

755. *Mr. Bennett.*] Had you 25 feet pressure? I have had about 19 feet on the face and about 2 feet on the back.

756. What were the dimensions of those gates? They were 20 feet high, with 4 feet openings.

757. And they would spring up to the face? Yes, the doors would spring up—I had to loose the hinges.

758. To allow it to adjust itself? So that as the pressure came to the bottom of the gate the hinge would give out a little to the top, and as the weight came more on to the centre the hinge would go back again. My gates were hung from the top.

759. I was going to ask you whether gates framed in that way, and not kept up by the pressure of the water except in times of flood, and exposed to the blazing sun in summer, would not cant and get out of the true line? Yes, they would cant a little in that way. If we hang a common gate out in the weather, and brace it up ever so well, it will cant. In that instance the gates may be for years and not be wet.

760. *Professor Pell.*] Except just at the bottom? Except just at the bottom, where the tide comes. I am thinking whether they could not be braced with iron.

761. *President.*] It is so difficult to brace it on the flat? Yes, it is.

762. You may brace it so as to keep it parallel. Does the tide ever get up to the foot of these gates? I think it will; but there will not be more than a foot, I should think. There will be very little water except when the creeks are in fresh.

763. Are there any cobra in these creeks? I think so.

764. Is it intended to copper the mitre sill of these gates? I do not know. There is any quantity of cobra in all our tidal rivers. We have plenty about Maitland and in the Paterson. If you put a board down as hard as iron, in six months you will find it full of cobra.

765. *Mr. Bennett.*] Have you any idea as to the probable amount the people would be inclined to pay per acre per annum to be relieved from the floods? Not the slightest.

766. Do you think they would pay anything? They would if they were compelled. I have no doubt at all that whichever way you go to work, if you please one you will displease half a dozen.

FRIDAY, 24 SEPTEMBER, 1869.

Present:—

E. O. MORIARTY, Esq., PRESIDENT.

P. F. ADAMS, Esq.,

W. C. BENNETT, Esq.,

PROFESSOR PELL.

Mr. John Atkinson called in and examined:—

767. *President.*] You can afford us some information, I believe, in reference to the subject of this inquiry? Yes, I can; I have had a good deal of experience of the floods.

768. Will you be so good as to tell us what you know about them? Do you mean the heights of the floods?

769. Those are matters of measurement? A wonderful sight of damage has been done by the floods in this district since 1857.

770. Could you give us an estimate of that damage—could you put it into figures, and give us the money value? Not very particularly. I have at times made calculations, as far as I was able. According to my calculation, there has been near upon a million of money lost in this district by the floods.

771. *Professor Pell.*] During the last ten or twelve years? Yes.

772. *President.*] How much of that was due to the flood of 1867? A great quantity.

773. Could you put it into figures? No, not now.

774. Perhaps you would be good enough to furnish us with the statement in writing? Yes, I will do so.

775. And the amount of injury done in each flood that goes to make up the total you have named. What part of the district do you reside in? I reside in West Maitland, close to Wallis' Creek.

776. Then you are one of those interested in the flood-gates at Wallis' Creek? Yes; my view of the flood-gates is that they will be a great benefit.

777. To the country about Wallis' Creek? Yes; I think they will not only benefit Wallis' Creek, but that they will also benefit the whole district. My reason for that opinion is that while the water is coming down it is flowing in at Wallis' Creek and filling it up until it becomes a level, and then when the water overflows—the up-country water which comes down when the place is full—it takes a straight cut to Morpeth. But by the flood-gates being there, the water at first, instead of filling up this place, would flow off to Morpeth, and then afterwards when the water overflowed it would have this place to fill in.

778.

Mr. J.  
Mitchell.

23 Sept., 1869.

Mr. J.  
Atkinson.

24 Sept., 1869.

Mr. J.  
Atkinson.  
24 Sept., 1869.

778. You would keep that as a reservoir? It will make a reservoir in such a flood as that of 1857 or 1867.
779. Is not the object to keep out such floods as those? No, the object of the gates is to keep out lesser floods. We do not expect to be saved from great floods by those flood-gates alone. There must be something done further down the river.
780. Is it in contemplation to do anything more? No, the object of the gates is only to benefit in the time of the smaller floods.
781. *Professor Pell.*] But you think there will be a collateral benefit as well—that the first flood-water will go down the stream before the second wave comes? Yes.
782. *President.*] And you think it will be an advantage to keep that as a safety-valve for the second wave? I think it will be a benefit to the whole district, because when the second wave comes it will have all that place to fill in. The general injury done at Wallis' Creek on this side and further up is after the water begins to fall about Morpeth.
783. And about Maitland? Yes; our damage arises from the fact that the water continues to go up there long after the river begins to fall. I have known it to be running up there three days after the river has fallen. When the river is falling at Morpeth it is breaking over our banks, and it will fill up the whole flat before the river is sufficiently down to prevent it from destroying the whole of the produce.
784. How long does Wallis' Creek continue to discharge after the Hunter has subsided? Six or eight weeks, after a large flood.
785. And is it draining out with a strong stream the whole of that time? Yes.
786. Have you observed whether the flood-waters have any enriching effect on the land there? On some parts of it they have, and on some parts they have not. The floods rob one part and benefit another.
787. I am speaking of Wallis' Creek? I am speaking of Wallis' Creek also.
788. Does the water run with great rapidity over the flats? When it breaks over the river and flows through East Maitland to Morpeth there is a strong stream then.
789. And that you think will always be the case? Yes, until something else is done to benefit the district besides the erection of the flood-gates.
790. That scouring action of which you speak is only due to the water breaking over at other parts and not at Wallis' Creek? The strong current on the flats is not caused by the water flowing up. On this side of Maitland the flooding is worse than anywhere, because it flows through the creek and has to go out through the creek. The water is often on the land for six or eight weeks.
791. But if the land were properly drained, so that the swampy parts might discharge into Wallis' Creek, and if there were sluices on those drains at the outlets to open outwards, do you not think the water would flow off much more quickly than at present? Not much. There are odd parts which are not drained at all, but the principal part of the land is drained, and as soon as the creek is down the water can go off the land. We have tunnels through the bank.
792. You are doing that now? It has been done several years.
793. Is it done sufficiently? It is sufficient to take the water off as soon as the creek goes down.
794. But if the creek were made larger so as to enable it to discharge more rapidly, that would allow the ground to be more quickly drained? Yes; but the greatest difficulty is to get it out of Wallis' Creek; the river keeps it up.
795. *Professor Pell.*] But after the river is gone down? When the river is gone down, the creek is gone down. There is a good deal of land at the back which requires six or eight weeks to drain.
796. An improved system of drainage would take it off more rapidly; would not that be beneficial? Yes, and if the creek were improved. There are many places where the bank has broken down and made dams across it, and there are old trunks of trees stopping the free course of the water.
797. If the same thing were done to Wallis' Creek that is suggested should be done to the Hunter—if the channel were improved so as to discharge the water more rapidly, and if the back lands were drained well into it, would not that be a great benefit? It would be a great benefit.
798. *Professor Pell.*] Are you well acquainted with the value of property in this district generally? I know pretty well what is the value of the land.
799. How much a year per acre are the best lands worth—the flooded lands? The best land is letting from £3 to £4 per acre.
800. What is about the average for the good land on the flats? The rent paid for the good land is from £2 to £2 10s. per acre, taking the whole average of the good land, and if it was not for the floods it would let for £3 an acre.
801. How much more per acre do you think you would get, on an average, if the lands were entirely free from floods? It would make a difference of from £1 10s. to £2 per acre.
802. You are sure that it would make a difference of £1 an acre per annum? It would make a difference greater than that. You could add 30s. with safety if there were no floods.
803. Do you think farmers would pay £1 per acre more to be guaranteed against damage by floods? I would pay £2 per acre if they could guarantee me free from floods.
804. *President.*] Are you a tenant or a proprietor? I am only a tenant. I hold a great deal of land in the flats.
805. About how many acres have these farmers generally? The run of the farms is from 20 to 60 acres.
806. There are not many, more than 60 acres? No, there are not many who have above that quantity under cultivation.
807. You mean that the land under cultivation on the farms generally is from 20 to 60 acres? Yes.
808. *Mr. Bennett.*] Do these lands ever suffer from drought? Yes.
809. Much? Some parts suffer a good deal from drought.
810. If in addition to being relieved from floods the farmers were relieved from drought by a scheme of irrigation which would give them always command of water, what would be the additional increase in the value of the land? Our land is not in such a position that we could possibly do it.
811. But I ask you the question—Supposing it were possible, would it not be a great advantage? It would be a great advantage to us; but our low land does not suffer so much from the drought as from the water.
812. *Mr. Adams.*] You think it would be only a trifling benefit to you to be supplied with water in time of drought? It would be only trifling, because the dry seasons in our flats are our best seasons.
813. You rather like a drought? No; we do not suffer from the regular rains unless they come down with a great dash and the water overflows our banks.

814. *Mr. Bennett.*] But do you not suffer from the want of rains? Yes, we suffer like the rest of the country, but not to any great extent.

815. *President.*] How many crops do you consider you have lost through droughts during the last ten years? I might safely say that I have lost fifteen crops in the ten years.

816. From droughts? No, from floods.

817. But how many crops have you lost from droughts? I have never lost a crop at all from drought. I have always had some return.

818. *Professor Pell.*] And when you get small crops by reason of the drought you obtain better prices? Generally we get a better price, so that we do not suffer much loss.

819. Do you not suffer less from drought in this district than they do in others, in consequence of the lands lying low? Lucerne is a great thing grown in this district, and on a great many of our flats its roots grow down to the water. I have a great flat of lucerne where all the roots go down to the water, and it will supply itself with moisture in the driest summer.

820. *Professor Pell.*] And in those dry summers you get better prices? Yes; but it is not all the land where the lucerne draws the water it wants, but on my land the drier the season the better the lucerne grows.

821. *Mr. Bennett.*] You own some of the lowest-lying land? Yes, but there is a good bit lower than mine. I have noticed another thing since I have been living in this district, and that is with respect to the flood-gates. I have seen the river and the back-water keep the creek nearly at a level, when it would be now flowing up a little, and then flowing down a little, but it has never come near the top of the banks. That has convinced me that the district would never be flooded by its own water.

822. *President.*] You are now speaking of small floods? I am speaking of the rain. When we get our flood-gates up we shall not I think be flooded, because the water that falls in the locality is not sufficient to overflow the banks. It is the water that backs in out of the Hunter that does the damage.

823. You have never known an instance of Wallis' Creek being flooded bank high when the Hunter was not so? I never saw it overflow of itself. It does some six or seven miles back, but the banks are very low there, and the land is grass land. It soon flows over there, but it is soon back again.

824. *Professor Pell.*] Have you ever known Wallis' Creek to be flooded when the Hunter was not? No, nor anything near being flooded.

825. Did you ever find a freshet coming down when there was none in the Hunter? Yes, there have been freshes there when there has been no fresh in the Hunter to any great extent. When the rain falls here it generally happens that some falls about the Hunter, but then the rain may not extend beyond Singleton. In such times it has never come anything near overflowing the banks.

826. Does the stream bring down any timber with it? Very little from that way. Generally, the timber that comes down has been taken up first.

827. *President.*] Have you noticed any difference in your crops a year or so after floods, as compared with your crops the year before—do the floods seem to have any enriching effect upon the land like the manuring of the soil? Supposing we had had a flood this winter, our crops would have been much less in the coming season. The land becomes sour after the floods, and it must have a summer's sun before it is sweetened.

828. If you could get the water off quickly before it stagnates on the land, and you had the advantage of the top-dressing the flood would give it, do you think that in a year or two the land would recover itself? If the water went off quickly the land would suffer no bad effects. It is when the water lies on the land for a considerable time that so much damage is done.

829. *Professor Pell.*] The year after the flood—after a summer—is the land better for the deposit left by a flood? In some parts it is better, and in some parts it is worse. In some places it washes the soil away, but where it leaves a sediment it is richer after a summer's working.

830. Is there not a very small quantity of land liable to be washed in the way you speak of? There is not more than half the land on our side that it benefits—not above a third, and it injures all the rest.

831. *President.*] Is two-thirds of the whole of that area subjected to a rapid current in the time of a very big flood? No; it flows round by the back of Maitland.

832. I understood you to say that it was only where there was a rapid run of water that injury was done? To the land?

833. Yes? No; I mean where the land lies high and the water goes on it for a small depth and washes backwards and forwards—all about there it injures it. It washes a good deal of soil away from there, and takes it further down into the flat. All the land that is washed in that way is the worse for it.

834. Is there much mud brought down—is the water very thick? Yes, in some parts. On this side of Maitland by the flood in 1864 we had a good deal of stuff left on the land.

835. Do you find a thick coating of mud in the houses and other places when the water goes away? There is a very thick surface of mud where there is a current. In some places further back it is about the thickness of a penny piece; in others it is an inch. There is no great quantity only where there is a current. On the other side of the river the flood leaves a good deal in some parts.

836. *Mr. Adams.*] Of what height is the land you have mentioned generally above the low-water level of the Hunter—I mean the land you spoke of as your own? About 7 feet. We dig down 7 feet before we come to water.

837. That you consider to be about the level of low-water in the Hunter? Yes; we find in our wells that the water rises and falls in a day with the rise and fall of the tide. As the creek rises, we find the water rise in our wells, and so we take that as a level.

838. What extent of land do you estimate there is on Wallis' Creek of the same height as that of which you speak? There is a very large quantity, but I could not give you any particular statement of the quantity.

839. Can you describe the localities in which land of that height exists, by their local names? Land like that which I have described lies about Maitland, Louth Park, Dagworth, Brooks' Flat, and Hungerford Swamps.

840. Are there any other places? Yes, several other, but I cannot now remember their names.

841. And that is all from 7 to 9 feet above low-water in the Hunter? Yes, that appears to be something like the level of it.

842. Can you tell approximately what number of days in the year you suffer from the back-water from the Hunter flooding that land? For how many days after we have had a flood?

Mr. J.  
Atkinson.

24 Sept., 1869.

- Mr. J. Atkinson. 843. No; in ordinary years are you often flooded by the waters of the Hunter? No; only when there is a flood. Before the year 1857, so far as I am aware, we never had any damage done. Some years before that I believe the people sustained injury, but I was not then in the country. Since the year 1857 we have scarcely had a free year. One year the land has been washed and soured so that we got nothing, and the next year there would be a flood again. We had three, besides freshes. There were several freshes which flooded the land over there.
- 24 Sept., 1869. 844. Were those freshes from Wallis' Creek? No, they were from the Hunter. We have had a good many floods since that of 1857 which came over the banks; we have had three large ones. They began in 1861 or 1862. We were flooded again in 1864. The land I was on was flooded five times. Then it was flooded again in 1867. Then we had another fresh which flowed in from the Hunter, and flooded us in 1868. We have had scarcely one season since 1857 but we have suffered from floods.
845. All from the water of the Hunter, and not from the water of Wallis' Creek? I have never noted it from the water of our own creek. I noticed once, when the water was quite level, some days it was running up and some days it was running down. That was about the heaviest rain we ever had out this way.
846. *President.*] What year was that? In 1864.
847. Was that during the flood? No, before.
848. *Professor Pell.*] When there was only a slight fresh in the river? Yes.
849. *President.*] Did that inundate any of the lands of Wallis' Creek? There was some surface water.
850. *Mr. Bennett.*] Do you recollect how long it was before the flood—if it was a month or so? If I remember rightly, that was about November.
851. But it was not the same rain that caused the flood? No, the flood came in February.
852. *Mr. Adams.*] You anticipate that the advantage of these flood-gates will be to keep out what you call freshes, which would raise the water 14 or 15 feet? They would keep them out if it rose 20 feet. There have only been three or four floods when these gates would not have been a benefit to us. Those were,—two in 1857, one in 1864, and one in 1867. The flood-gates would be of no benefit in those cases, but in all the others I believe they would have benefited us considerably.
853. *President.*] Can you give us any idea how long the Hunter remains in flood during the freshets you dread so much? Sometimes for a great length of time, and sometimes only for a very short period. It is according to what water there is coming down. Sometimes it will bide a day or two running down—then it rises again, and then it falls. It depends a great deal upon the way the rain has fallen.
854. If the Hunter were improved so as to let off these freshes more rapidly, would that be a benefit to Wallis' Creek? Yes; it is this that has done us the damage.
855. The small freshets? The small freshes have done us more damage than the great floods. The great floods do leave something on the land, but those which only just overflow the banks only sour the land and injure us for years.
856. But if the freshets could be got away rapidly no serious damage would be sustained? No.
857. *Professor Pell.*] Is yours the only part of the country where they suffer much from these freshets? They do not suffer so much below, because immediately the river goes down, the water goes off their land, but in our case when the water has overflowed the banks it has to run away in small channels.
858. Do these freshets flood the land down the river? More than half of them do not affect the farmers down the river at all. They flood us, but not them.
859. How many acres of land up here are liable to be injured in that way by those freshets? I should think 5 or 6 square miles is of that sort of land.
860. *Mr. Adams.*] It is more like 20 square miles? I think it is more than that altogether; but the flat I live on is about 5 square miles. Wallis' Creek will drain it all.
861. But slowly? Yes, very slowly.
862. *Professor Pell.*] You think there would be no difficulty if the Hunter were improved? The creek also would want improving.
863. *President.*] Supposing you had a flood at Wallis' Creek and no flood on the Hunter, would there be much inundation on the back lands anywhere up the creek? I believe about Brooks' Flat they do suffer something from the Wallis' Creek water.
864. Do they suffer for any length of time? No, not for any lengthened period.
865. But if the creek were deepened and straightened, and the bars removed, would not that have a beneficial effect? Yes, those are the greatest hindrances to the water. Some of those bars are caused by the breaking away of the banks.

Mr. John Ewing called in and examined:—

- Mr. J. Ewing. 866. *President.*] You are acquainted with the effects of the great floods in the Hunter? Yes.
- 24 Sept., 1869. 867. Do you reside in the town or near it? I reside in East Maitland, on the other side of the Victoria Bridge.
868. Will you give us your views, if you please, as to the best means of mitigating the injuries arising from the floods? I have been in the district now fifteen years, and have seen all the floods from 1857; and I have never altered my views in the least as to the best mode of preventing the floods. Shortly after the big flood of 1857 I agitated considerably to have the sharp bends cut out of the river betwixt this and Morpeth, as the best means of doing away with the floods, and I have more than once brought the subject before the community in the School of Arts in the way of debates. I always advocated the straightening of the river as the cheapest and the simplest plan.
869. You have advocated the improvement of the river as regards Maitland? As regards Maitland.
870. Have you considered the effect of these works to which you allude on Morpeth? I have considered that subject, and I think it is scientifically demonstrable that the straightening of the river would not at all injuriously affect Morpeth.
871. You think it would not raise the floods there? No. Immediately after Mr. Moriarty brought out his report, I dissented from a conclusion in that report, which was that Morpeth would be injuriously affected by the floods. I brought up the question in the School of Arts whether the straightening of the river would injuriously affect Morpeth; but the people here have not much scientific knowledge and so the matter was not much discussed, but I think it is easily demonstrable that the straightening of the river would not injuriously affect Morpeth.

872. Perhaps you will be so good as to demonstrate it? The circular bends in the river to all intents and purposes operate as dams. There is a large bend at Narrowgut—that is the largest bend; it is about 7 miles round it. At all these bends where the cuttings are shown [on the plan] it is easy to observe, when the river is flooded, how the water is passing over them. At that point 10 miles below Maitland I have observed the water passing over, and I estimated from the current flowing down the ploughed cultivation land that there must be nearly 2 feet of difference between the level of that point and that at Morpeth. Mr. J. Ewing.  
24 Sept., 1869.

873. You estimated a difference of 2 feet in the level? About 2 feet. I have seen the water flowing over what is called Smith's Pig Run. There is a place there that I have estimated it must be about 8 or 10 inches or it may be a foot difference of level from half a mile below Wallis' Creek to the next sharp bend.

874. What do you estimate about that? That there is a difference of level,—that there is from 8 inches to a foot fall of water between the two points when the river is overflowing its banks. I have never noticed this bend [indicated on the plan], but it will follow the same law.

875. What law? The proportion of fall to the distance—the same fall per foot.

876. All these heights have been ascertained by actual measurement? I am speaking now only from my own observation. I am speaking of the surface of the water, not when it is at its extreme height, but when it is just breaking over the banks. When the water is at its extreme height there is very little difference; it is then like one great sea.

877. The level of the bank would indicate that? The bank is so much broken that I think it would be better estimated by the current of the water.

878. *Professor Pell.*] How does that affect the question? I was taking it that these bends act in the capacity of dams. You will easily understand that if in a straight river we place a dam, and impede the water to a depth of 2 feet, that dam floods the country immediately above it from a depth of 2 feet until it runs out to nothing. If the dam was taken away in time of flood when it was full, there would be a little inundation; but after that the stream would be the same as when the dam was in existence, because the same quantity of water had to flow over the dam and form the river below. So that whether the dam is in its place, or whether it is removed, the river is precisely similar.

879. Do you take the element of time into your consideration? Yes. Supposing these bends were cut away and the river straightened, there would not be one particle of water more passing down the river into Morpeth in a given time (say in an hour) than now passes, with all the bends.

880. You think so? The same quantity of water that comes to Maitland has to go to Morpeth, and it matters not whether it goes in a straight line or in a crooked line.

881. *Professor Pell.*] Or quickly or slowly? Granted, if you made a shorter course, it would run quicker and shallower.

882. *President.*] Supposing a stream is discharging a given quantity of water in a second of time at a point we call A, towards another point lower down which we will call B, and that between these two points is an enormous lake,—the water coming down during two days past A is discharging part past B, and the other part is running into this enormous lake? Yes.

883. Well, would you say, under those circumstances, that the same quantity of water passed B that came down past A? When the lake became as full as it could hold, precisely.

884. But supposing in the meantime the flood at A had been distributing part at B and part into the lake, would you say the same height would be attained at B as was reached at the point A? I have looked at it in that way, and I think there would be a little, but very little difference.

885. And supposing the lake was large enough to take the whole of it, how much of the water would come down by the point B? It would stand until it evaporated by the sun, and none would come.

886. But supposing the lake would contain only one-half, how much then would pass the point B? The other half.

887. Therefore, if you can show some place between two points on a river over which the water breaks and flows by allowing it to spread over that surface or lake, you must admit that there will not be the same discharge at the point B as at the point A? I do not think your illustration is exactly similar. I do not think it is exactly analogous with what we have here. The straightening of the river would not reduce the quantity of the water you speak of as a lake. The bends of the river represent your lake.

888. No, they do not; the flooded lands represent the lake? Yes; but the bends of the river represent a considerable part of the lake.

889. *Professor Pell.*] You say that the straightening of the river will not have the effect of raising the water at Morpeth? Yes.

890. And you say that more water will go down in the same time if you have a straight river? Very little.

891. But more water would go down in the same time, surely? Yes.

892. More water would go down per hour? Yes, but very little.

893. What is the object of straightening the river; is it not to make the water run off more quickly? Yes.

894. Then so far as the object is obtained, more water would go down to Morpeth in the same time? Yes; but the quantity more is scarcely worth taking into consideration.

895. *Mr. Bennett.*] Have you calculated the quantities, to ascertain whether it is or is not worth taking into consideration? The number of gallons!

896. *Professor Pell.*] Is not the object of straightening the river, to carry off more water more quickly? Yes, but not so much so as to take off the same quantity quicker.

897. That is the same thing; more water would go down per minute? The "more" is a mere bagatelle. The water that does the damage is not a thousandth part of the whole quantity.

898. Well, we will confine your attention to the water that does the damage; more of that will come down? A little.

899. If it is a very little, then there would be very little benefit? It would go down a little quicker. The water that does the damage is very small in proportion to the whole flood. The main advantage of the cutting would be that the water would come down in a more rapid stream.

900. *President.*] And therefore a greater quantity would come down in a given time? No; it is not exactly the same thing. If you run a hundred million gallons in an hour by a more rapid stream.

Mr. J. Ewing. 901. That is what you want? Yes.

902. *Professor Pell.*] That would be more coming down in the same time? That is not exactly the right way to put it. The "more" is scarcely worth taking into consideration.

24 Sept., 1869.

903. *President.*] Never mind the consideration—let us get at the fact—that which you say can be easily demonstrated? The same quantity would run with quicker velocity.

904. *Professor Pell.*] That is, water which takes an hour to come down now, would take less than an hour to come down then? No, precisely the same quantity would come down in an hour, but it would come more rapidly.

905. More would come then in the same time? No, because the stream would be shallower. If one is running more rapidly than another, and the more rapid stream is the smaller, it is not necessary that more water should come down in the same time.

906. Do you think it makes any difference to Maitland whether the water comes down in a small stream or in a large one? I think it makes a great deal of difference.

907. *President.*] You think that the quantity of water taken away per second would not be increased by these cuts? No, not to any extent worth taking into consideration.

908. Let us take the facts. You say that no more water will be taken away by the new cuts than by the present channel of the river. Is that what you say? Yes.

909. *Professor Pell.*] And yet that it would relieve Maitland? Yes.

910. How? The water would run in a shallower stream.

911. How would it affect the state of things here? The rapid current would extend considerably up the river. The river would fall considerably higher up.

912. You think that straightening the river here would make it run faster up at Oakhampton? Yes, and higher up.

913. *President.*] Permit me to put another case. Supposing you have a quart-pot and a pint-pot, and you are pouring water through an orifice an inch in diameter out of the quart-pot into the pint-pot, from which the water is running through an orifice a quarter of an inch in diameter, what will be the result? The pint-pot will soon fill.

914. And overflow. But will the pint-pot discharge through the quarter-inch orifice the same quantity that would pass through the big hole in the same time? No.

915. Now suppose that the water is pouring down the river up above Maitland (which we will call the quart-pot with the inch orifice), at a given number of cubic feet per second, into the lower part (the pint-pot with the quarter-inch orifice),—as the one cannot discharge as rapidly as the other, what would be the result? It will flood.

916. As it does? Yes.

917. What we want to do is to equalize the discharge between what comes down and what goes away? Yes.

918. And to do that you must enlarge the quarter-inch orifice until it will nearly discharge the same quantity as the large one—is not that the object? Yes.

919. Morpeth is, we will say, at the quarter-inch orifice. Our object is to throw a greater quantity of water out there than it was capable of discharging before, and so dispose of the increased quantity from the larger vessel. Therefore, it stands to reason that a larger quantity of water will pass out after the orifice has been enlarged? Yes.

920. And if, by shortening and straightening the river, you decrease the friction and increase the rate of fall, is not the effect the same as enlarging the size of the orifice? Yes.

921. Therefore you get a greater quantity of water on to Morpeth in a given time? But where is the water to come from?

922. Down the river? But it does not come quicker. We get all the water that comes down from Singleton. All the alteration we can make in the river here would not affect the river at Singleton. We get the water as it comes past Singleton—the same quantity in a given time. There are very few tributaries worth considering between Singleton and this.

923. *Professor Pell.*] Supposing more comes down than you can deal with, that is what causes the floods. The water forces its way through all sorts of places and hangs about for days; but if you can get a better outlet it will flow away? Of course it will. That is what I wish to be done—to make a straighter channel so that the water would get away more freely.

924. More water would go in the same time? I would let the same quantity of water go quicker; I would not speak of more water going in the same time.

925. *President.*] Supposing the large vessel (Singleton) is pouring down water through an inch opening into the smaller vessel with the smaller opening (below which is a place which we will call Morpeth), the smaller vessel not being able to discharge so quickly as the larger, fills and ultimately flows over. If we would prevent that, we must enlarge the orifice of the smaller vessel to allow a larger quantity to flow out in a given time. If we enlarge the orifice of the smaller vessel, supposing Morpeth to be below that opening, will not a greater quantity of water per second go on to it than before? In a given time?

926. Of course? It would be a little more.

927. The quantity will depend upon the size of the opening you make? The word "more" has no right to be applied. It is the same quantity of water run quicker—not more water.

928. Perhaps I did not convey my illustration clearly. Here is a vessel with two openings—a large one leading into it, and a small one leading out of it? Yes.

929. The orifice leading into it is an inch in diameter, and that leading out of it is only a quarter of an inch in diameter. The water keeps pouring in through the inch opening, and is flowing out through the quarter-inch opening—what will be the result after a little time? It will fill the vessel of course.

930. And then? It will flow over.

931. Well, does not that occur here in the case of Singleton and Morpeth—Do you know the quantity flowing in through the large opening here? I could not put a name on it.

932. Do you know the quantity flowing out at the other opening? It is within a trifle of being the same thing.

933. Are you aware of that? Yes.

Mr. J. Ewing.  
24 Sept., 1869.

934. On what do you base your assertion? On the quantity of water that does the damage, which we call flooding. The flood-water is not one-hundredth part of the water that comes down in time of flood.
935. Do you know the quantity of water that comes down per second from Singleton at high flood? No.
936. Do you know the quantity that passes Oakhampton? No, I never calculated the quantities.
937. Do you know the quantity at Bolwarra or West Maitland? No, I have never calculated it.
938. And you are prepared to hazard the statement that the same quantity flows away at Morpeth that comes down to West Maitland, and yet you have never made any calculations? I say this, that it is the same quantity except the small quantity that does the damage.
939. *Professor Pell.*] How do you know that it is a small quantity? I think it is a small quantity.
940. It fills this flat of many thousand acres? ———
941. *Mr. Bennett.*] 86 square miles, 7 feet deep? I see the outlets through which the flood-water passes, and I judge of the size of these outlets compared with the whole size of the river.
942. *Professor Pell.*] According to your supposition, 133,000 cubic feet per second discharge through Singleton in time of flood—how much per second would pass out at the same time at Morpeth—about the same, I suppose, according to your calculation? I would take away the one-hundredth part, and say that the rest would go out at Morpeth.
943. As a matter of fact only 41,000 cubic feet would go; the rest would be held back, and go out at Morpeth in a period extending over several days. Of 133 going into Morpeth only 41 can be let out in the same time. The rest spreads over the country, and is ready to pass out anywhere. These are matters of fact? ———
944. *President.*] Have you looked at this table (*table of figures in Mr. Moriarty's report*)? No.
945. Have you made yourself acquainted with the report? I read part of it, and had the rest read to me.
946. Did you read the figures? I could not contradict the figures.
947. Do you admit them? No.
948. Why do you not? I come to the conclusion ———
949. Which conclusion? As to the relative quantity of water that passes out at Morpeth.
950. *Professor Pell.*] Merely by casual observation? By taking account of the area of the outlets that flood the back-land.
951. Did you make any exact measurements of the outlets. These figures are founded on exact measurements? No, I never made any measurements.
952. Would you put your surmises against actual measurements carefully made by competent persons, and calculations by the most able and experienced engineers of the day? No.
953. Would you dispute the fact of the discharge per second of 133,000 cubic feet at Singleton? No; but it appears to me not to be so.
954. *President.*] As I understand you, you have not looked at this table critically to establish its correctness or to controvert it? No; the only part of the report I dissented from was the conclusion we have just been examining as to whether the water would flood Morpeth.
955. If you let more water in a given time into a channel, would not it raise the height to a greater level than before? Yes.
956. If you increase the discharging power, it will convey a larger quantity of water per second? Yes.
957. If you improve the discharging power of the river, by shortening and straightening it, and widening its area, you will enable it to discharge a greater quantity of water per second? Yes.
958. And you will continue to carry that quantity on to Morpeth, so long as the supply above is sufficient, and the remainder will spread over the lake; but by improving the channel, a greater quantity instead of flowing over the lake, will be carried down past the point B? Yes.
959. Will not that have the effect of raising the water in the channel below B? Undoubtedly, you would have the flood-water extra.
960. The water that now goes over these flats would go on to Morpeth? Of course.
961. Will not that have the effect of raising the river at Morpeth? No doubt of it.
962. *Professor Pell.*] That would be the effect of straightening the river? I should regard the quantity of water as but a trifle.
963. The quantity discharged by the channel at Morpeth is 41,000 cubic feet per second, and anything more than that tends to raise the level of the flood? By straightening the river below Morpeth could not you make it take more?
964. *President.*] You gave us a statement, a short time ago, to the effect that the difference in the quantity of water passing Singleton and discharged at Morpeth was one-eightieth or one-hundredth part? Yes.
965. We find by computing that as spreading over the flooded land, it would produce a flood of only 6 inches deep—We have reckoned one-hundredth part as the difference between what comes down at Singleton and what passes away at Morpeth according to your supposition, and we find it would produce a flood of 6 inches? But you said something about 86 square miles.
966. *Mr. Bennett.*] We have taken only 30 square miles into our calculation? Where are the 30 miles?
967. *Mr. Adams.*] There are 16 miles in Wallis' Creek district; and the Hunter Valley above Morpeth contains nearly 11; and the Paterson Valley, which is also affected by these floods, is nearly 4? Now I can see how you make up the quantity. I only took up the flood matter of the Maitland district.
968. *President.*] But do you not think that in a matter of this kind we ought to deal with the whole question? Certainly. But the straightening of this part of the river from Maitland to Morpeth would not at all interfere with the flooded land below Morpeth.
969. *Professor Pell.*] You assert that, and we maintain the contrary? I see.
970. *President.*] If you let a larger quantity of water per second down on Morpeth, would it not have the effect of increasing the flood there? Oh! now I am beginning to understand you; you would only let down, by straightening that cutting, what is actually contained in that flood?
971. Excuse me—we want to get your views. I have put my views on paper; we should like to get your views in contravention of them or otherwise. As I understand, you propose to straighten the channel? I propose to carry out Mr. Moriarty's scheme.

- Mr. J. Ewing. 972. And while doing so you think it will do no good to Maitland? I think it will do good to Maitland.  
 973. And no harm to Morpeth? No.  
 24 Sept., 1869. 974. And that it would not allow a larger quantity of water per second to go down than at present passes? It would allow all that quantity of water about there to go down more.  
 975. The quantity that now floods the lands? It would allow all the back-water to go down.  
 976. And if that happened to be a very large quantity, would it not raise the level of the flood below? Yes, if it happened to be a very large quantity.

Mr. John Bowden called in and examined:—

- Mr. J. Bowden.  
 24 Sept., 1869. 977. *President.*] You reside in the neighbourhood of Maitland? Yes.  
 978. Do you live on the flooded lands? Yes, on the Bolwarra Estate. I have been living there for the last twenty years.  
 979. Can you give us any idea of the amount of damage done to your property by the floods of 1857, 1864, and 1867—I believe those were the floods that did the most damage? Yes. I made some calculation of the amount of damage done to me by the flood in 1857. I considered that the damage amounted to about £300.  
 980. What was the extent of your land? About 28 acres.  
 981. It destroyed the year's crop, I suppose? A good portion of it. I have not made any calculation of the damage I have sustained since by other floods; but it has been in something like the same proportion.  
 982. Should you say that you sustained as much damage, or half as much, by the flood of 1864? I should say it was about £200, or perhaps not quite so much, because the produce was not so valuable then as it was in 1857.  
 983. And in 1867 what amount of damage did you sustain? A good deal of harm was done then, because that was higher than the other floods.  
 984. The flood of 1867, you think, was higher than the floods of 1857 and 1864? Yes.  
 985. Whereabouts is your property situated? On the north side. My farm is one of the most favourably situated on the Bolwarra Estate. It is on the river-bank, adjoining the Pitnaercc Road.  
 986. Above or below it? Above it. My ground goes down to where the embankment is made.  
 987. How much higher was the flood of 1867 than that of 1857? About 14 inches.  
 988. Was it about 14 inches higher generally at that portion of the river? I think it was, about Bolwarra. There is a great deal of difference in the height of the water further down. There is some cause which makes a great deal of difference. It is not always the same height at Bolwarra as it is below—sometimes it is higher and sometimes it is not.  
 989. But generally, comparing the flood of 1857 with that of 1867, do the people say it was higher here? Yes.  
 990. About how much higher was it on an average? I am sure it was about 14 inches at my place. It has taken away a great deal of land from my farm. We had it measured a few months ago, and found that 3 acres had been taken off it.  
 991. Did you observe any difference between the velocity of the currents in the floods of 1857 and 1867? No, I do not know that I did. I know the river has very little effect upon the water there. It seems to go straight to Morpeth from Hinton.  
 992. Over all the land? Yes, you can see that the current is taking that direction by the straightest course.  
 993. And is there any current in the river to speak of? Not so much as over the land where the straight course is.  
 994. You have observed smaller floods? Yes.  
 995. Do you think the current in the river during the smaller floods is greater than it would be during those high floods, when the water is sweeping over the land? Yes, I should think it is greater when the water is confined in the channel. I have noticed this too,—that where the river is straight (certain portions of it are straight for a considerable distance) the current is stronger than it is where there are bends.  
 996. Where it is straight going towards Morpeth? Yes; in those parts where the river is straight for any distance, the current is a great deal stronger.  
 997. Have you observed in those parts of the river where the channel goes in the direction of the main stream over the banks that the water flows much more rapidly? I am not certain of that, but I have noticed the difference in the straight portions of the river; where the bends occur the current is much slower than it is in the straight portions of the river. Where the river is crooked you will see the way in which objects such as pieces of wood strike against the bank, and go round and round, and I guess that the water does the same.  
 998. What do you consider the value of land down there to purchase it out and out—Supposing any works were undertaken to improve the river where it was necessary, what would be the value per acre? Not less than £30.  
 999. Would you consider that a fair price? Yes, as the value of property is now.  
 1000. *Mr. Adams.*] Do you rent that land? Yes, the portion I have at Bolwarra; but I am not living on it now.  
 1001. *President.*] Did the flood of 1867 seem to do much more damage to the land than the flood of 1857? Yes, because it brought down a great deal of sand, and the banks were carried away a great deal more. I notice that when there is a succession of floods the banks are carried away very much more. The first flood does not do so much harm as those that follow.  
 1002. When the banks are saturated? I suppose that is it.  
 1003. *Professor Pell.*] What do you suppose to be the average rental of these lands? About 50s. per acre. Some of it brings more.  
 1004. How much would that land be improved in its annual value if the floods could be entirely prevented? I do not think it could be much higher, for I think, as times are now, it is about as much as people can do to get a good living.

Mr. J.  
Bowden.

24 Sept., 1869.

1005. But they would do better if there were no floods, and would be able to pay more rent? I do not think they would be able to pay much more than they do now.

1006. Do you think they would be willing to pay any more rent than they pay at present? No. When the floods come there is a great deal of poverty and distress, and a good many of the landowners have to knock off a portion of the rent due from their tenants.

1007. Do you think the landlords would be willing to pay anything per acre to have their lands preserved from flood? Yes.

1008. About how much per acre do you think they would be willing to pay for this good land? I could not say; but I believe they would be willing to pay a good proportion of money for any improvement of that kind which could be made.

1009. You say that by the flood of 1857 you lost £300 off 28 acres—or, speaking roughly, £10 per acre? Yes.

1010. And that by the 1867 flood you lost at about the same rate? Perhaps I lost more in the 1867 flood.

1011. And at other times you have lost something? Yes.

1012. Taking all these floods, your losses would amount to about £10 per acre per annum for ten years? I should think I have lost, taking a rough calculation, £1,000 altogether. I had more land in 1867 than I had in 1857.

1013. Then it would have been well worth your while to have paid £1 an acre to have been relieved from floods—you would have saved £700 by it? Yes.

1014. Looking upon what has occurred in the past, it would be reasonable for you to offer £1 an acre for the next ten years to any one who would relieve you from floods? Yes. If I were to rent the same farm I should be in a better position to give £1 an acre more for the land, if I could be certain of being free from floods.

1015. And your neighbours, would they not also benefit by such an arrangement? It is very easy to see through that. You lose nearly all the year's produce, and your labour goes for nothing. If you have to hire labour, of course the loss is all the greater. I know by the state of things this year what a great advantage it is to be free from floods, and how much better the people are getting on.

1016. In those prosperous years when there are no floods, could not the people afford to pay something more in the shape of rent to be secured against them? Yes.

1017. Your neighbours are somewhat similarly situated to yourself? Yes.

1018. And they have lost about the same proportion? They have lost rather more, perhaps; because, as I remarked, my farm is one of the best—the water is on it last of all, and off it as soon as the flood begins to lower.

1019. We have been told by some of the witnesses that the land about Wallis' Creek is flooded frequently by slight freshets, and that they do more damage on the whole than the great floods. Do these freshets affect the land below here? The lower parts.

1020. The water runs off quickly? Yes; but it destroys the crops.

1021. Even these slight freshets destroy the crops? Yes; some portions of the land are very low, and the water backs on to them out of the river.

1022. Do you think that the damage done by the small freshets bears any proportion to the damage done by the great floods? No, it is in this way; it injures a few people, but then it is an advantage to other parts of the farming population.

1023. *President.*] You get better prices for your produce? Yes.

1024. You are then differently situated from the people up in Wallis' Creek; they are injured by the small floods, and you are injured by the large ones? The Wallis' Creek people are injured by the small freshets more than the people adjoining the banks of the river.

1025. And you, on the contrary, are injured by the large floods more than they are? Yes; the others are injured by the large floods too; but the evil in reference to the Wallis' Creek population is, that the water of the river comes into the creek so long after the flood has begun to go down. It runs into Wallis' Creek three days after the river lowers.

1026. *Professor Pell.*] Supposing the Government say to you,—we are going to tax you £1 per acre, and guarantee you against floods in the same way as you would be guaranteed by an insurance company? £1 a year?

1027. Yes, £1 a year per acre, and pay all damage you may sustain from floods? I do not think it would be necessary to make the rate so high as that, but I should prefer to pay a tax and be free from all floods.

1028. What do you think the people generally would say to that? I could not tell, but I think they would be on the right side of the question.

1029. You think that if they are reasonable they will not object to it? I am sure they would not object. The farming population, from what I know of their circumstances and views, would not object to a fair taxation for such a purpose.

1030. If the rate were found to be more than sufficient it could be diminished? I quite agree with that.

1031. *President.*] Do you think anything in the shape of a mutual insurance society could be got up among the people affected? I should think so.

1032. Just in the same way as companies are sometimes their own insurers? I believe it could be done.

1033. I suppose it would have to be compulsory—that you would have to compel all the people within a given area to come into it? Yes.

1034. *Professor Pell.*] Do you think that would be a good plan if provision were made for it under an Act, and if it were administered on the spot—not by the Government, but in any way the inhabitants might think best? I should think it would.

1035. It would be insuring not one person against another, but one season against another? Yes. The subject has not engaged my attention very much in that way; but the idea of taxing the farmers who would be benefited by the prevention of the floods is one that I would agree to in some shape or other.

1036. This insurance would be only a thing to be considered if it were found impracticable to diminish much the damage done by floods? Yes.

1037. *Mr. Bennett.*] Do you suffer much from the dry weather? Yes, a good bit; but not very particularly since we first came into the country. In the first portion of our coming here we suffered a good bit.

Mr. J.  
Bowden.  
24 Sept., 1869.

1038. Did you lose many crops? No; but sometimes we suffered severely.
1039. You do not think the farmers would be inclined to pay anything to have water at command to put on their land whenever they desired to do so? It is what I have never seen practised—the watering of the land to any great extent.
1040. You do not think the farmers would be inclined to pay anything for it? No; since we have been in the country, sometimes it has been very dry, but it has not been so the whole of the season.
1041. Would you give 5s. an acre to have water so that you could turn it on to your land whenever you liked? I have no idea of its answering. You must cut places from the river.
1042. *Professor Pell.*] But supposing that were done for you, would you then give 5s. an acre to be supplied with water at all times? No; I think the expense would be more than any advantage to be derived from it.
1043. You are never anxious about droughts? Not particularly. I find that if the first part of a season is dry, the latter part is generally pretty productive. The first year or two after we came into the country there was a good deal of suffering on account of the dry weather, but then there was plenty for everybody, and the rents were not so high as they are now.
1044. *President.*] Generally in this district they do not suffer at all from the want of water? Not very much. Sometimes it has been very dry and the people have suffered for want of fresh water a little, I have known the river to be salt as far as the Falls.
1045. But you have not suffered for want of water as regards your crops? No. It is the idea of a good many people that the floods benefit the land, but I do not believe it. I know that the floods do the land a good deal of injury. They have brought large beds of sand on to my land at Bolwarra, and owing to this deposit of sand a good piece of it has been rendered nearly useless. A little sand does no harm to the land, but when it lodges in beds it renders the land useless. And then what it makes on the other side are commonly beds of sand—no good.
1046. That is confined, I suppose, to the land situated about the rapid current which you have described as passing down—Wherever the water is pretty still it deposits some mud? Yes, but then you will find that where it makes a deposit, it takes a year or two before the land is sweetened and becomes of much service. In the year 1864 there was a very poor season, owing to the land not being in a fit state for cultivation because of the deposits left by the floods.
1047. How soon does the land recover? The next year it gets right enough, except in those places where the beds of sand are—they never get right. For my part, I am in favour of straightening the river. My brother and I have often talked about it, and we think that a cutting across the head of Bolwarra would be the thing.
1048. You are in favour of taking out the river above Bolwarra? Yes, so as to take away the surplus water in a straight course to Morpeth.
1049. And where would you throw it into the river again? Somewhere about Largs. I do not think any advantage would be gained by carrying it further.
1050. Would you confine it to the natural channel of the river? I would have it straightened and made larger.
1051. And you would make a second channel through Bolwarra from above Maitland to Morpeth? Yes; then I think this Maitland side would never be flooded.
1052. If the channel were made large enough? Yes, the two channels. I am also in favour of straightening the river, and I believe that one reason why it should be straightened is that if it is not done it will straighten itself. You will find that it will go through some of those bends.
1053. You think it will cut them off in time? Yes, several of them. There is the Pig Run above Mrs. MacDougal's place, just opposite East Maitland, that is one of them.
1054. Have you seen this (*Mr. Moriarty's*) plan before? No.
1055. Would you say that the short cut shown on this plan would meet your approval? Yes.
1056. There is another here at Mr. Dodd's place, just above Pitnacree, should you say that would be a useful cut? Yes; you would save a bridge then. It was nearly through last time. If the water forces its way through those bends (*indicated on plan*) it will make great destruction of land.
1057. And this cut from that lower bend again on to Morpeth, would you say that would be useful? Yes. There is another idea,—to widen the river below Morpeth. If the river is straightened and the water goes down sooner than it does now, they will be injured, it is said; but they overlook this fact, that as soon as the water overflows the banks it goes straight to Morpeth.
1058. Still if you straightened and shortened and deepened the channel, and allowed the water to flow down more rapidly than it does at present, you would bring down more water in a given time than goes down now? But a great deal of the water that runs down will be gone before the river overflows. That which goes down first would go straight away.
1059. The flood would commence discharging sooner at Morpeth, and therefore might not attain to the same height? Yes, that is my idea of it; but I know that there are places below Morpeth which must be straightened.
1060. There has been a proposition to take the flood-waters away through Howe's Lagoon, by the railway? I am not so favourable to that. This is my idea, shown on this plan.
1061. *Mr. Bennett.*] What is your reason for being unfavourable to the other? I think it would be a more expensive affair; and, another thing, you could not bring it through the Pitnacree Bridge; you must have a new bridge.
1062. And do you not think you would have much harder material to excavate? Yes; and that would be a good deal of expense.
1063. *Professor Pell.*] Would that lagoon be of much assistance in forming the channel? Some portions of it are deep enough, but it does not go very far in the right direction.
1064. *Mr. Bennett.*] Is it often dry? Not often, but I remember it being dry.
1065. *President.*] What is the depth of water? It is not very deep. In some places it is not more than 2 feet deep.
1066. *Mr. Bennett.*] I suppose all the people over here would make an outcry about the water being taken from them? There are not many who have an idea of the Howe's Lagoon plan—it is not generally approved of.

1067. *President.*] The people generally are not in favour of it? No; besides a good many would think of the steamers which come up the river and are of great advantage to the settlers.

1068. They could come in either case? Yes, but they would be diverted greatly from where they come now.

1069. But the people would submit to a good deal of inconvenience to be saved from floods? Yes, to almost anything.

1070. *Mr. Bennett.*] Of the two ways of preserving them from the floods, they would prefer that which took the river the least distance from them? Yes, the river is an advantage to them in several ways.

Mr. J.  
Bowden.

24 Sept., 1869.

Andrew Liddell, Esq., called in and examined:—

1071. *President.*] I believe you have witnessed the effects of most of the floods which have occurred about Maitland? Yes, since 1840.

1072. Have you formed any views as to the best means of dealing with the floods? Yes, I have, according to my simple notions. I think that a straight cut down towards Morpeth, and the straightening and clearing of the river down towards that point where you say there is ample room for all the waters, would be most effectual.

1073. That is down below Hexham Swamps? Yes.

1074. You think that improving the river from Morpeth first, and straightening it between Maitland and Morpeth, would be the best means? I think that the cutting should commence at West Maitland.

1075. Would you commence operations at West Maitland, or improve the lower part first? I would commence at the lowest part. I regard it as a matter of great prospective benefit, and though it should take a hundred years to accomplish, I should like to know that steps had been commenced to secure so desirable an object.

1076. Do you agree generally with the report which has been put forward on the subject? I have a great admiration for the report, with this exception, that I think cutting the bends is merely tampering with the matter. Every bend of the river is a source of injury at every flood, and it is a growing evil. I feel that to be the most serious injury to which we are exposed. Wherever the water has escaped from its banks there you find a complete barrier across the river below it, and it would cost more money to remove these bars than to make a cutting.

1077. Would you make a fresh channel altogether, or take advantage as much as possible of the present channel? I would not regard the present channel; I would regard the dry channels, such as Howe's Lagoon.

1078. You prefer taking the channel through Howe's Lagoon? Yes. Wherever you have turns in the river I consider you have a hopeless disease existing, unless you sheath them.

1079. Or protect them in any way? Unless you can make them permanent. I have seen it operate as a law that wherever the water escapes over the banks of the river, immediately beneath the place where it overflows there is a deposit.

1080. If the natural channel between the cuts were deepened and enlarged and otherwise improved, and if the bends were protected from being washed away, would you object to using the natural channel as much as possible? I think it would save a great deal of excavation.

1081. That is the object of it? Yes; but not unless the sides were permanently secured.

1082. If the sides were permanently secured by stone pitching or by a covering of clay, or by roughly throwing down stone, would you object then? No, not if the expense of bridges did not more than counterbalance the advantage which would be gained. I think there would be a good deal of expense for bridges.

1083. But having regard to the existing bridges, would it not be better to keep to the present channel than to make a fresh one which would throw those bridges out of use? I fear that if we were to confine the water to the river the bridges would be injured. It is but a small quantity of water comparatively that keeps in the bed of the river. In 1857 I viewed the floods from the top of my house, and all around was one universal sea. I have a very strong predilection in favour of a straight cut, and not for immediate benefits only, but for prospective benefits in regard to this matter.

1084. Did you observe any considerable interval between the first and the second part of the flood—Is it not generally the case that there are as it were two waves of the flood here? Yes, I observed it very distinctly.

1085. And what is generally the interval between them? I am not able to tell, but it has always been observed during a flood. It is more noticeable in one flood than in another.

1086. Was it a perceptible feature in the great floods that have done most mischief? I think so.

1087. Did the water seem to recede after the first rise before the second wave came down? Yes, it has on some occasions; at other times it has simply stood still.

1088. There has been a great deal of injury, of course, done to the country about here—Have you ever estimated the gross amount of that injury? No; I have observed the estimates made out at the time of and immediately after a flood, but I have no knowledge of that matter myself. I know that the devastation has been fearful, and that the effect on society has been very painful.

1089. Do you know what have been the effects of the different floods on Wallis' Creek; whether the large floods have done as much damage up there as the smaller ones? The smaller ones seem not to injure the town portion—that which you have proposed to circumscribe. The last flood I think was one of about 16 or 18 feet. It was within 4 feet of the floor of Wallis' Creek Bridge, and I found no complaint among the people of Louth Park. I was particular in remarking that.

1090. What flood was that? The last fresh.

1091. A great flood is 2 feet over the floor? Yes.

1092. *Professor Pell.*] You were saying that you would like to have the channel cut straight? Yes.

1093. Do you think it would remain so? Yes. It would be only for a short space, so that we could afford to sheath it everywhere. It is impossible that we could sheath all the river with its present bends—the expense would be so very great. Instead of 3 miles it would be 21 miles from Oakhampton to Morpeth.

1094. The proposed cuts reduce it to 3½ miles? This would strengthen my argument,—that I regard it as a principle that wherever there is a bend it is a progressive thing.

A. Liddell,  
Esq.

24 Sept., 1869.

- A. Liddell, Esq.  
24 Sept., 1869.
1095. *Mr. Adams.*] Look at this map, and tell us whether any of the bends which remain would, in your opinion, be dangerous. At the end of the Horseshoe Bend commences the first cut through a bend of the river, and it passes into another bend opposite East Maitland—then follows the river comparatively straight to near Mr. Dodd's place, where it cuts off another bend? Where there is a natural tendency for the water to go over, and it does go over there.
1096. It then passes between Maitland and Morpeth, making a sort of S-curve, but not very severe, and goes by a direct cut into Morpeth? I believe if the bends were protected by pitching it would be very material indeed. I doubt very much if the bridge at Pitnaecree would permit all the water that escapes to pass through without injury.
1097. *Mr. Bennett.*] The increased velocity would be considerable, but the channel could be protected, and if necessary, enlarged? The cuts would be fewer in number. I would wish to point out that there is a long point (*witness pointed to a bend near Mrs. M'Dougall's house*). I have noticed everywhere along the river that a point like that is most dangerous to the opposite side. They made an embankment there which was not sufficiently long, and the water got to the side of it and formed a cavity, and now there is a new breach. Every time there is a flood, more sand is deposited on the point, and the other side of the river is injured. The town has thus suffered fearfully.
1098. Have the Corporation taken any steps in regard to the matter? No; I have brought the people together, and tried to get them to do it, but they are not able.
1099. *President.*] With reference to the town itself, when these great inundations take place, such as the floods of 1857 and 1867, is there very much sickness? There always is, but I noticed it especially after the flood of 1867.
1100. So that in regard to the public health it would be a matter of immense importance to keep the floods out of the town? It would be of great importance as regards the community. There is a great deal of sickness, and that too at a time when those who suffer cannot receive proper succour.
1101. What is the population of West Maitland? Six or seven thousand.
1102. And how many of the townspeople are affected injuriously in health or property by the floods? Probably one-half—one-third at all events.
1103. Are there many more people than usual in the hospital after the floods? Yes, many people take refuge there; but besides these there are always many sick people.
1104. *Mr. Bennett.*] Fevers and diseases arising from malaria increase? Not only that, but people return to their houses as soon as the water is out of them. It is months before they get dry beneath the boards, and in consequence, there is great disease.
1105. *Professor Pell.*] What kind of disease? Low fever.
1106. And rheumatism? There is a good deal of that among the old people, but the children seem to suffer most here from very protracted and severe fever. That was a distinct result after the last flood.
1107. *President.*] Have you seen a plan for enclosing the whole of the area of the town with an embankment? Yes.
1108. Do you approve generally of that? I do.
1109. Do you approve of the line taking advantage of the high banks along the creek? Yes, I think it could be cheaply done. I pointed out such a plan in 1857.
1110. You would approve of that rather than of an embankment round a more limited area? Yes, in fairness to the people, and in point of economy. The high banks would assist.
1111. And you could obtain material out of the creek for the purpose of raising the banks? Yes. A very small portion of the town might be protected in the same way. Abbot-street stands almost as high as High-street. A part of High-street is under water in time of flood, but not much, for down at the railway crossing there is a dry portion. A line might be continued from there and run up to the creek where there is a slaughter-house. Then taking advantage of the bank of the creek (which could be easily done) the line might be brought up again to the railway station.
1112. Along by the road? Along the road. From Abbot-street it could be continued in the direction of the creek at Nicholson's slaughter-house. Then advantage might be taken of the proposed bank on the creek until you come to Walker-street, if that were elevated as high as the bank of the creek, already partially accomplished by the bank of the sewer.
1113. If you were to come to the high land would not that be better? Yes, but you would have a considerable swampy part to cross.
1114. That might be thrown up at once as an immediate work? I think it would be attended with very great benefit. This (the racecourse) is not built upon, probably because it is partially flooded. It naturally comes within the area of the town. These views passed through my mind frequently when I was a member of the Council.
1115. That is purely a municipal matter? It would be impossible for the Municipal Council to undertake that.
1116. Would it be possible for them to undertake the project you suggest? I think it would be too great for the funds of the Council, but if the work were carried out it would save a great deal of calamity. I do not see the slightest objection to your outline; I think it is a very natural one.
1117. It would give much greater room for the town extension hereafter? And it would be a resting-place in times of flood. I do not mean to say that all that ground is above the reach of the floods.
1118. But it would be clear of the floods if it were properly embanked? The water could be kept out. It would require a few small flood-gates for drains.
1119. You are in favour of the flood-gates at Wallis' Creek? Yes, but not of the height they are being constructed. I should prefer them low. What they contemplate is that they will prevent the destruction of their works. The question I have invariably put is—where do you wish the new creek to be?—for there will be a new creek somewhere else. There will be a fearful current before the water gets behind and fills up, as in the natural way. It used to go by Hall's Creek, but they have filled that up, I think very unskillfully. A great rush of water would take place at the High-street embankment, and there would be a fearful tearing up—not only from the violence, but also from the long continuance of the current. If the gates are so high, there must be a new creek somewhere. But it would be a thousand pities if the back-lands could not be protected in some way.
1120. From the small floods? Yes.
1121. We have it in evidence that it is the small floods that dishearten and injure the people? I think it

it is of great importance that these should be prevented. They are involving the whole town with their high gates, whereas if they had low ones they would affect the town but slightly. I have inquired at Morpeth, and so far as I can learn, the people there would have no objection to gates sufficient to keep out the small freshes.

A. Liddell,  
Esq.

24 Sept., 1869.

1122. Because the river can carry the small freshes off? Yes; as I have already mentioned, a fresh 4 feet from the floor of the bridge seemed to give them no concern. I have a very strong feeling that we should have gates that will allow the water to pass away before it passes over High-street. I do not see why High-street and the neighbouring property should be sacrificed. I think it was wrong to close up Hall's Creek, and that there should have been gates there also.

1123. To allow the back water to escape? To allow it to escape more freely. I have ascertained from the farmers that the water does not get away so freely as before. They say they do not now get the water away for months, whereas before the creek was stopped up they used to get it away in a few weeks.

1124. Then the blocking up of the creek is injurious? It is a benefit to a few; but the water takes a much longer time to get off the land. Those two outlets would be useful for the purposes of protection and irrigation. And with regard to the injury apprehended from the fall of the water about the gates, that difficulty could be got over by using plenty of blue metal.

1125. By pitching the bottom? It might be done on the sides for a considerable distance. But I think there might be a number of slides to the gate, and that they might be drawn upwards and let the water in, so that it need not go over altogether.

1126. I am afraid that in one of those gigantic floods if the water overtopped the gates 8 or 10 feet there would be such a cataract that it would sweep away everything? Could it not go through the slides?

1127. I am afraid that no slides you could get would relieve it? Some of the tunnels have broken in, but the damage has not been irreparable, and a sudden check has been given to the rising of the flood.

1128. When the tunnels have given way? One of the tunnels in Louth Park gave way.

1129. Have you observed the height of the flood of 1867 above Maitland? I know it critically, because it came over some of my property.

1130. Did you observe its height as regards the flood of 1857—which was the highest above Maitland? They were much about the same in regard to height. There is a spot of land of mine where the water goes over all but a portion on which the tenant lives, and he was about 3 feet above the water on each of those occasions, and the people resorted there. At my house in High-street, the flood of 1857 came to just the edge of the pavement and no further. This last flood was only 1 inch over it. The water got over the bank and came down the street opposite, which runs at right angles from the river to my house.

1131. That was from the flood of the back-waters? No.

1132. I mean that it was not the exact level of the river? No; if the water happens to have a narrow conduit it will rise at the end of it, coming direct from the river.

1133. In all the lower parts of the river about Bolwarra and Pitnacree the flood of 1867 was 10 or 14 inches higher than the flood of 1857, and here it was a little lower. What you say about the easing of the river when any of these dams gives way is a clear proof of it? This dam at Hall's Creek gave way.

1134. Did it seem to ease the river? I am not aware individually, but it would account for that. I do not think there was much difference between the two floods. The outpouring at the Falls must have been a great relief in 1857, and that relief was denied in 1867; and as the result of it we have the washing away of a line of houses further down the river. I believe that unless something is done, one side of the town will perish next flood.

1135. That is a municipal matter? Some seem not to think it so.

1136. They can scarcely expect the Government to protect private property in that way? They seem to think that it might be done between the proprietor, the Council, and the Government. They are helpless when they come to the bank of the river, being private property, the Council cannot enter.

1137. *Professor Pell.*] There is a municipal rate paid here? Yes.

1138. How much does that amount to? It is a shilling in the pound, and it amounts to about £2,000 in rates.

1139. How much in the pound would the ratepayers be willing to pay to protect their property from floods? For a very palpable protection?

1140. For absolute protection by damming it all round? They might pay any amount. I think they would pay willingly.

1141. Would they pay 5s. in the pound? For absolute protection?

1142. Yes? I think they might. It looks a large sum, but protection from the floods would greatly increase the value of property.

1143. You think it would increase the value of property 25 per cent. in Maitland? Yes. If it were not for the injuries caused by floods there would be no more flourishing spot in the Colony than Maitland; but the people were almost beggared in 1867; they have had such a succession of disasters that they seemed as though they would never get their heads up again. The first dry season, however, they began to have a little money to spend.

1144. Are they pretty well off in good seasons? Yes, most of them in previous years had amassed little sums of money—six or seven hundred or a thousand pounds.

1145. And they lived comfortably? Yes; many of them had pianos in their houses, and papered walls, and they were very comfortable.

1146. When was that? It was during the gold times.

1147. Did that prosperity extend to between 1857 and 1867, after they had recovered? They never were themselves again.

1148. After the flood of 1857? No; but during this last year there is the first show since of their having a little spirit and a little money. We have had not only floods, but rust and everything to keep us down.

1149. And low prices? Yes, but there is a large community in Maitland that seem to do very well, notwithstanding the low prices.

1150. You think that some of the farmers would be willing to pay £1 an acre to be secure from floods? I am sure of it.

1151. Some say that they would be willing to pay 50 per cent., and some more? I think £1 per acre would be reasonable—that is 25 per cent. They pay £3 for good land; they were paying £4. The greater number of them would be better able to pay the £1 per acre extra if they were relieved from floods.

1152.

- A. Liddell, Esq.  
24 Sept., 1869.
1152. *President.*] What are the flood-gates at Wallis' Creek to cost? £3,000.  
1153. And who has the responsibility—Is the contractor under any liability? No.  
1154. He puts the gates up according to plan? Yes, according to plan.  
1155. Did the people in former years up Wallis' Creek sustain the same amount of damage from the small freshets as they appear to have done of late years? A few years back a good deal of the land was used for grazing only, and some half a dozen people made their fortunes by selling milk and dairy produce, and they did not feel the difficulties we now experience.  
1156. And now that the land has been brought under cultivation, a good deal of it is washed away by the floods? Yes, I remember when all that land was under water. It was a marvel to me when I was able to cross some of those places that are now fertile fields. There was no outcry then about the floods, because when they came, the occupiers of the land could retire and go back when they subsided.  
1157. *Professor Pell.*] Do you say that there are dry lands where it used to be swampy? Yes, that is a fact. These places were filled with water when I came here in 1840, but they were then used for grazing purposes, and they are now used for agriculture.  
1158. Do you think it is worth the while of the inhabitants to go in for a system of drainage? I think it would do great good. I should be glad to see a system of circumvallation and drainage carried out.  
1159. Would you say generally, having in view the whole subject, that much benefit would result from improving the outflow of Wallis' Creek, so as to enable it to carry off more freely not only the water which falls on its own watershed, but also the water which flows on to it in time of heavy floods, and further to undertake a system of drainage to assist it? I think great benefit would result from such a scheme, and that it would be money well spent. I should be glad if there were a compulsory system of drainage to accomplish so desirable an object. If those lands far at the back were worthless, they might be purchased and made a place for storing water.  
1160. For what purpose? For irrigation.  
1161. You would have to go a long way back to get a sufficient height? That would be a disadvantage. The water ran down Wallis' Creek for two months after the last flood.  
1162. Was it running in a pretty strong stream? It was very obvious. You could see it by the piles which the contractor had in the water. It kept running with some degree of force. I feel pretty certain that if the gates were shut entirely those behind would soon be flooded. The people are very sensitive in regard to your observations about the farms being benefited by the floods, and I am inclined to coincide with them. No doubt when the land was in its natural state the floods left a deposit, and now in many places it leaves two or three inches of beautiful soil; but where the surface of the land has been ploughed, the waters, when they recede, sweep the soil away, and I doubt very much whether anything is allowed to deposit. These places were no doubt formed by the deposit of decayed vegetable matter, but it is different now.  
1163. Still, the mere alluvium which is brought down, if allowed to deposit, would reproduce the same soil which was formed there originally? Of course. If the water could be used for irrigation it would be a benefit; but any advantage they now derive from the deposit it leaves is as nothing compared to the losses occasioned by the floods. The water sometimes remains on the farms for three months together.  
1164. As I apprehend, that is the main cause of the evil. If a proper system of drainage were introduced to take off the water almost as rapidly as the river fell, do you think the amount of injury sustained would be as great as it is at present? I think not. In my opinion it would be a very great advantage. In that case you would gradually elevate the surface of the land, and there would thus be a continual improvement. Little farms would be made increasingly valuable by having small canals through them.  
1165. These red lines (*on plan shown to witness*) show the subordinate drains which would be made to drain into the creek, which would be deepened, straightened, and improved? I perfectly agree with it, and I think that in the course of years a very great advantage would be derived from it. I think we are the martyrs of their ring-barking up the country. We are on the delta; and everything which alters the natural features of the country, unless it is done judiciously, injures us.

---

Mr. John Wright called in and examined:—

- Mr. J. Wright.  
24 Sept., 1869.
1166. *President.*] Where do you reside? In East Maitland.  
1167. Do you live in the town? Yes.  
1168. And you have observed the effects of the floods? Yes, I have.  
1169. Did you observe the floods of 1857 and 1867? I have seen the whole of the floods from 1857 up to this time.  
1170. Did you make any critical measurement of the height of the flood of 1857? I saw the measurement made by Mr. Mackay, by order of the Government, in two or three places, but it was not the true measurement. The flood was a foot or 15 inches higher, because the measurement was not taken until the flood had begun to subside. There is a mark on the Victoria Bridge to represent the flood level; but I know it is not the proper height, because the flood covered the arches, but it did not cover the caps of the post.  
1171. Do you mean that it covered the centre arch? No, the two extreme arches.  
1172. How much are the side-arches above the roadway? About 6 feet.  
1173. And was it said that the 1857 flood reached up to there? Yes, 6 feet over the roadway. The mark on the post is 4 feet 6 inches.  
1174. You are certain that the flood rose 6 feet over the roadway at Wallis' Creek Bridge? Yes.  
1175. What part of the side arches did it come up to? Over the sweep of the circle.  
1176. *Professor Pell.*] The inner or the outer circle? It only left the caps of the posts visible, and the spring of the centre arch.  
1177. You could not see the side-arches at all? No.  
1178. *President.*] How much did it get over the top of them? I could not tell you, but they were hidden. The caps of the posts were visible.  
1179. *Mr. Adams.*] Did you see it? Yes; I was taking notes of the whole of the water in 1857.  
1180. *President.*] In 1867 was the flood the same height? It was higher.

1181. About how much higher, do you know? It was a very few inches; it might be 3 or 4.
1182. *Professor Pell.*] Was it over the middle arch? No.
1183. Was it inside of it? I did not take such particular notice of that; I was looking at the other part.
1184. We have been told that it was from 10 to 14 inches higher? I could not say that. I was told that it was in Walli House, and the water was not there in the flood of 1857.
1185. Do you think it might probably have been 10 or 14 inches higher? I do not think so, there.
1186. If any one said it was a foot higher at that bridge in 1867 than it was in 1857? I should doubt it.
1187. *President.*] On good evidence? I should doubt it, from what I saw in 1857 and 1867.
1188. Did you make any measurements which would justify you in contradicting it? I made measurements in 1857.
1189. But not in 1867? No.
1190. What can you tell us with reference to the flood matters generally—There is probably something that has struck you in connection with them which it would be useful for us to know? If I may be bold enough to mention it, it has always struck me from first to last, in seeing the floods, that there is a possibility of preventing them by an outlet from Oakhampton, taking the south side and going through the creek, and meeting the river at some other point.
1191. Where? At the boiling-down place at Hexham, I should say.
1192. What line would that take? From the Oakhampton Road along Hall's Creek to Fishery Creek, thence to Quart-pot Creek and on to Hexham Flats.
1193. Have you not a ridge to cross? Yes. I do not know what would be the depth of the creek, but I have been informed by Mr. Mackay that it is from 12 to 20 feet deep.
1194. Do you know the height of your own knowledge? No. I have always noticed that the flow of the water for several days in time of flood is southward. In 1857 especially it was remarkable. It went in under this bridge for five days before it broke over the road at East Maitland.
1195. It went southward? Yes.
1196. And from that you inferred that it flowed into Hexham Swamps? No, it did not then; it came back again, and after going out as far as Brook's Flat and filling up the low-lying lands it came by the mill at East Maitland and made its way to Morpeth, Narrowgut, and that way.
1197. Do you know anything of the country forming the ridge which separates the Wallis' Creek waters from the Four-mile Creek? No; we delegated the matter to our surveyor. I at one time belonged to the Municipality of East Maitland.
1198. Did he make any survey? Yes.
1199. Is it to be had? I do not know.
1200. Did he lodge it with the Council? That I do not know, but he was instructed to make a survey.
1201. And he made a report? Yes.
1202. Could we get that? I have no doubt of it.
1203. *Professor Pell.*] Was it from his report that you judged the depth of the cutting would be 20 feet? I was told that it was from 12 to 20 feet—that the deepest portion to be cut would be about 20 feet, but I do not know the country myself at all.
1204. We have been told that the lowest part of the ridge is where the railway passes between East Maitland and Hexham? I could not contradict that. I have always been told that there is a lower point to the southward.
1205. *President.*] You propose to make a separate, additional cutting? Yes.
1206. Have you formed any estimate of the cost of such a work? I did at one time, some years ago, but what it was I could not tell you at this moment. Labour is considerably cheaper now than it was then.
1207. Have you formed any idea of the size of the channel? Yes; I would have it 300 feet wide, and 15 feet deep. I do not think anything less than that would answer the requirements of the river.
1208. You merely guessed at that—I suppose you have not made any measurements? No. I measured in 1857 as near as it was possible, to get at the velocity and depth of the water at East Maitland, crossing the road there. More than a quarter of a mile wide, from the "Black Horse" to the mill, was a raging torrent of water 20 feet deep. After the flood they had to go down by the Scots' Church and to come out by the "George and Dragon" until the Government put the road right.
1209. Estimating from that, you thought it would take a channel of the size you have mentioned? Yes, anything less than that would be utterly useless I think.
1210. *Mr. Bennett.*] You measured the velocity? Yes.
1211. What was it—how many feet per minute? I cannot tell you now, but the whole of my investigations at that time were copied into the *Maitland Mercury*.
1212. Could you give us the date when they appeared? It was at the time of the August flood in 1857.
1213. *President.*] Did you sign your name to the paper? Yes. It was a speech I was bold enough to make at the School of Arts, and they asked me for it.
1214. You took the trouble to have some data before you made your speech? Yes; I had measured this before, because it was a meeting held with a view of trying to find out some means by which the floods could be prevented. A good many erroneous opinions, as I thought, were expressed at that meeting, and I was bold enough to contradict some of the gentlemen present.
1215. Is your opinion in favour of improving the natural channel of the river? I should be in favour of improving it, but I doubt whether it would be effective. Assuming that we get the water from Oakhampton, passing the Maitlands, East and West, I have always noticed that when it rises to a certain height at Morpeth it backs up to East Maitland. I feel convinced therefore that the river at Morpeth is not of sufficient area to carry the flood-waters off. I noticed that in 1857 Mr. Cooper caused a culvert on the Morpeth Road to be blocked up, to keep the water from going into East Maitland. In 1867 the culvert was not blocked up and the water went into Day-street—we saw it for days flowing up from Morpeth.
1216. Generally speaking, at the height of the flood there is a strong stream setting down to Morpeth? Yes, but in spite of that the water was backing up to East Maitland. The moment it crosses the high road at the mill there is a fall of about 18 inches; but in spite of all the rushing of the water down there it stills comes back from Morpeth. I believe that as the water fills up the river, the flow is backward. It was well known in 1867 that the flood flowed back in this way.
1217. Do you mean when it was at the top of the flood? Yes.

- Mr. J. Wright. 1218. I suppose you are referring to some eddy? No, it was a steady rise of water all over the flat, comprising the whole of Narrowgut to East Maitland and the railway.
- 24 Sept., 1869. 1219. *Professor Pell.*] Where did it come from? From the river.
1220. How did it get to Morpeth? We could see it breaking over the bank. Looking out of my tower window in East Maitland I could see the water breaking over.
1221. Breaking over where? Over the river's bank; and then we saw it rising and backing into East Maitland.
1222. But did you see the current running up? Yes, most decidedly. It was backing towards the Morpeth Road and setting up by Howe's Lagoon.
1223. The water first ran to Morpeth and then came down by Howe's Lagoon? No, the water bears to the left of Howe's Lagoon when the flood is high; the water from Morpeth comes round eddying by the railway.
1224. At any rate you say that the water went there and came back? Yes, it went there and came back.
1225. *President.*] And the same thing obtains across the Pitnacree Road. I am told that in the last great flood the water flowed up from the Morpeth side through that bridge? I could not say. I know the road was covered 4 or 5 feet deep.
1226. Are you of opinion that any new channel for the river cut down through Howe's Lagoon would not be so beneficial by reason of the upward set of the water? I do not believe it would be beneficial, because I think the river at Morpeth is not sufficiently large to carry away the water. I have always been of that opinion. I have seen the Williams and the Paterson in flood, and I have had occasion to go up and down the river from Newcastle to Maitland in time of flood, and I am firmly of opinion that the river is not large enough to convey the body of water that comes down.
1227. Your view is that it ought to be taken down to a point where the river is larger? Yes.
1228. So long as that end is attained in any way it would meet your approval? Yes.
1229. *Professor Pell.*] If the channel were improved between here and Morpeth, what would be the effect upon Morpeth? I do not think it would harm Morpeth any more than it is harmed now. My impression is that it would convey away a great deal of water which now stops in the two towns, before any harm was done at all.
1230. *President.*] You mean that the flood would commence to discharge at Morpeth sooner than it does now? Yes.
1231. And although you might have the same height of flood at Morpeth as at present, you would have it earlier, and a greater body of water would be relieved from this surcharged channel? Yes.
1232. What is your opinion of the probable effect of the flood-gates at Wallis' Creek? I believe they will be a failure. I do not think they will answer the purpose contemplated, namely, to stop the effects of the floods on the low lands, and I believe they will do great injury to the town of West Maitland.
1233. *Professor Pell.*] Would they not keep the small freshets from those lands? Yes.
1234. That would be a great benefit, would it not? There is a great difference of opinion upon that point. The farmers are not so dissatisfied with the floods as many people would make believe.
1235. The people at the back? Yes; they fancy that they get as much benefit one way as they lose another.
1236. *President.*] In what way? By the sediment which the floods leave. I am not now speaking of the highest floods, but of the freshets that come up for a day or two and are off again; and the farmers I have had conversation with think they get as much benefit as harm.
1237. If Wallis' Creek were deepened, and the channel improved, and the obstructions in it removed, and a proper system of drainage carried out on the flat lands, so as to allow the water to drain into the river more rapidly, would they sustain any serious damage? They would not sustain one tithe of the injury they sustain now.
1238. You would prefer that to flood-gates? Yes.
1239. *Professor Pell.*] Are you acquainted with many of the farmers? Yes, with a good many.
1240. And you think that they are generally of opinion that these freshets which flood their lands occasionally do not do any great injury? They do not do the harm they would make the world believe. They may destroy a crop now and again, but the farmers get reimbursed for their loss in other ways.
1241. Are you acquainted with agricultural operations? No, I am not.
1242. Do not the farmers complain that the floods sour the land? I have never heard them say anything of the kind.
1243. *President.*] Do you think you have really had a good opportunity of making yourself acquainted with their views on the subject? From the farmers themselves?
1244. Yes? No, I would not like to say that I have. It is only from conversation with them from time to time in a general way. I have never troubled myself much about the matter.
1245. Your attention has not been prominently drawn to inquiries into that branch of the subject? No, it has not.
1246. Could you tell us from memory what is the height of the crowns of those arches of the Victoria Bridge, above the hand-rail? I should think that the two side arches to which I have referred might be from a foot to 15 inches.
1247. The probability is then that such a flood as that of 1857 would overtop the present gates? Yes. I will give you another idea; perhaps it may bear out the subject matter. Most of you gentlemen know the fence bounding Mr. Cliff's property, before you come to Walli House, on this side of the bridge: the water was over that fence in 1857, I mean the big brick house near the bridge. In the flood of 1857 the water was over the fence on this side that house. There was a piece of round stuff on the top of the fence, and it washed that out.
1248. They have a mark indicating the flood, on the window-sill of that house? Yes.
1249. *Mr. Bennett.*] They show that the 1857 flood went to the window-sill, and that the 1867 flood was 10 inches higher? I heard that the flood of 1867 was higher than the flood of 1857, but I could not speak of my own knowledge. In 1857 I saw a whaleboat go down the centre of the road to the "Black Horse." From the Post Office, East Maitland, where they loaded the boats, they could go down the centre of the road to West Maitland.

Mr. Ernest Leslie Maitland called in and examined:—

1250. *President.*] You prepared the designs for the Wallis' Creek flood-gates? I did.
1251. Have you got them with you? Yes [*witness produced the designs*].
1252. What is the width of the opening? 28 feet.
1253. What pressure do you expect to have on those gates when the water is at its highest? It is uncertain; it will depend upon the quantity of water inside.
1254. What will be the pressure when the water is at the height of the gates? The pressure varies so much because of the varying height of the back-water. There is always 5 feet of water.
1255. Inside? Inside.
1256. What will be the height of your gates? 30 feet.
1257. And with 25 feet head, what pressure do you think you will have on the gates altogether? I do not remember now, but I got the pressure for the whole 30 feet, supposing it to be dry on the other side.
1258. What was that? I do not remember now.
1259. How many tons of pressure should you say there would be on these gates? It will be merely the pressure of the dead water—there will be no stream.
1260. Well, reckoning it as dead water, what would you estimate the pressure to be? I reckon it would be about 33 tons.
1261. Do you estimate that as the whole pressure? As the usual pressure when the water is in the state it is now.
1262. I want to know what is the greatest pressure they will be required to sustain? There will never be a greater pressure, because whenever there is a flood, the water in the creek rises. It does not rise so quickly, but it continues to rise, and the pressure of that water counterbalances the pressure of the water in front of the gates.
1263. *Mr. Bennett.*] The pressure will be the difference between the two waters? Yes.
1264. What do you think the greatest absolute difference will be? I think it will never be more than 10 feet.
1265. *Mr. Adams.*] How is the water to rise behind? It will be the back-water in the creek.
1266. *President.*] Supposing you have 30 feet of water outside the gates, and 10 feet inside, what pressure do you consider those gates will be subject to; whatever the surface of the gate, there will be a certain pressure per square foot? That is not direct pressure—that is diagonal pressure.
1267. The pressure of water is always direct. Do you think you have sufficient powerful gearing to enable you to open these gates? Yes.
1268. What will be the absolute weight of each gate? They will be about  $8\frac{1}{2}$  tons each.
1269. How many cubic feet of timber is there in them? I do not remember, but we reckoned the timber according to the usual weight.
1270. *Mr. Bennett.*] What are the sizes of the posts? One is 15, and the other 18 inches square.
1271. *President.*] There are some rollers at the foot of the gate, are there not? Yes.
1272. Do they run on an iron rail? Yes; a portion of a circle.
1273. Is there any support under the flooring, in the shape of piles or concrete? There is concrete.
1274. What is the depth of the concrete? 18 inches.
1275. And above that, what have you? There is a floor of hewn stone laid in cement.
1276. What is the thickness? The thickness of the concrete is 18 inches, and the flooring of stone—the upper part of it—is 2 feet, lowered to 18 inches, the difference forming the sill.
1277. What sort of bottom is the concrete laid on? A bluish looking clay; it looks like old mud.
1278. Is it clay or mud? It is clay—very good for making a puddle.
1279. Have you any samples of it? No, but I could easily get some.
1280. The work is being carried out in exact accordance with this plan, I suppose? Yes.
1281. What is the backing composed of here? Rammed clay. It is a clay Mr. Adams knows; it is from William-street, East Maitland.
1282. *Mr. Adams.*] That is the old clay of the coal measures *in situ*. Is not this at Wallis' Creek an alluvial deposit? I should fancy it had been originally, but of very very old standing.
1283. Is there any provision to prevent the floor of the gate from bursting up, in case the side walls should subside at all? No.
1284. It is not laid in the shape of an invert? No.
1285. Do you not apprehend some difficulty in the working of that gate? No; I do not see that any difficulty is likely to arise. There are four windlasses.
1286. Are there to be any sluices? No.
1287. How do you intend to open the gates when the flood has subsided? The back-water will assist in doing that.
1288. You know enough of the river, I suppose, to be aware that a great deal of silt is likely to be deposited in front of these gates? There never has been any silt deposited there. I have seen it after a flood, and the bottom of the creek has been as clean as this floor.
1289. But there have not been gates there. When they are erected all the elements for the deposit of silt in time of flood will exist? No doubt.
1290. Do you not think the gates will jam up? There are four windlasses to open them—two to each gate.
1291. *President.*] To what part of the gates do you intend to attach the chains? About 5 feet from the bottom.
1292. What multiplying gear have you to open them? There are windlasses.
1293. Windlasses or crab winches? Windlasses.
1294. What sort are they—ships' windlasses? Similar to those.
1295. To work with hand-spikes? Yes.
1296. With a vertical capstan? Yes.
1297. And capstan bars? Yes.
1298. What is the thickness of the bars? They are 3-inch circular bars.
1299. There is a very unequal pressure where the hollow plate comes; the whole weight rests on that single stone? The weight is connected by the railway sunk into the stone.
1300. Of what thickness is the bar? It is half an inch I think, but I am not positive.

Mr. E. L.  
Maitland.

24 Sept., 1869.

- Mr. E. L. Maitland.  
24 Sept., 1869.
1301. Have you got the 1857 flood-marks about here? There was one somewhere about the bridge, but I am not sure whether it has been removed or not.
1302. How is that as regards your gates? Oh, we are feet above that.
1303. How many? 2 feet and some odd inches.
1304. Will the water go over the banks round about the gates? No, the water will not go over near the approaches; it will spread all over the country.
1305. And fall back into the channel again? Yes, whenever the water gets higher than the banks the gates will become useless, so far as keeping back the flood-water is concerned.
1306. *Professor Pell.*] When the water is resting against this gate, in what direction will the pressure act upon that post on which it hangs? This [*diagonally*].
1307. Are you not aware that the pressure of the water is at right angles to the gate—Do you know what will be the pressure on the sill in that direction [*direction indicated*]? I do not.
1308. Do you think it will stand a pressure of 20 tons? Yes, it will stand any possible pressure.

---

Mr. George Lobsey called in and examined:—

- Mr. G. Lobsey.  
24 Sept., 1869.
1309. *President.*] You have been acquainted with this district for many years? Yes, for sixteen years.
1310. And you have seen the effect of the great floods that have visited it? Yes.
1311. Do you reside in the town? Yes, just opposite. I have seen some parts of the floods, and felt more.
1312. Did you note particularly the flood of 1867 at the Falls? As it regards height?
1313. Yes? It was higher than any of the previous floods since 1857.
1314. Do you know how much higher it was? No; but in 1857 the paddock at the back of the Northumberland Hotel was dry all over, and the water came over it in 1867, so that I should say the flood of 1867 was at least three or four inches higher than that of 1857, at this point (*the Falls*).
1315. Have you formed any opinion as to the best way of dealing with the floods? I have an opinion of my own.
1316. That is what we should be glad to hear? The opinion I have formed is—that if there was a drain cut above Bolwarra House towards Morpeth that would ease the river. When the water rose in the river 8 or 10 feet, it would commence to flow away in that direction. As the river rose, the volume of water in the channel would increase, and it would ease both places, up and down. That is my opinion as to the safest plan of doing it.
1317. You would commence with the cut at Oakhampton? Yes, above Bolwarra House.
1318. And where would you propose to take the water into the river again? I am not thoroughly acquainted with the river lower down, but I think a little below Morpeth.
1319. Would you make a straight cut right through, or seek to take advantage of the natural channels? There are natural channels part of the way which might be used, and where the new cutting was made the stuff taken out would do to make embankments where they were required.
1320. But you have not formed any distinct plan as to the course you would take after leaving the river above Bolwarra House? No; I would not have it so as to drain the river, but to assist the river in times of flood. If that plan should not be adopted, I have another plan in my mind, and that is to straighten the river.
1321. By cutting off some of the bad bends? By cutting off the corners.
1322. Have you formed any distinct ideas of the corners you would cut off? No. I have seen the river here at many of the turns, and I have seen it again at Largs, but I have never been right down the river. In the part of England I came from we had a river very similar to this, and it was never safe from floods.
1323. In what district? In Lincolnshire—the river Witham. The river was straightened, and we never had floods there afterwards.
1324. *Mr. Bennett.*] But you never had floods there like those which are experienced here? No; but I have seen floods so high as to take away the hay when it was ready for carting.
1325. And there is a much greater rise and fall of the tide on that coast? Yes. The cry of the people of Lincoln was, that if the river was straightened, the water would be let down upon them so quickly that it would swamp them; but they were not troubled.
1326. Perhaps the river was improved below Lincoln? I do not think it was altered at all.
1327. Probably it was sufficient to carry off the water? The water went down before it had time to accumulate and cause a flood, and no damage was done.
1328. Is there anything else you would like to add with reference to your views on this subject? Nothing very particularly.
1329. Generally, your plan is that of taking a cut from above Bolwarra House, or of straightening the river as far as it could conveniently be done? Yes, assisting the river by a cutting above Bolwarra House, or else straightening the river. Some people are greatly in favour of embankments, but I am not. The nature of the soil of this country, I think, is not suitable for embankments. From what I have seen of the operation of the water in different parts of the river in times of flood, I am not favourable to embankments; and then, the greater weight there is on an embankment, the more likely it is to slip.
1330. Instead of banking up the water and keeping it in the channel, you would prefer to give it a free course and allow it to escape? I would let it get to the sea as quickly as possible.

---

Mr. Alexander Wilkinson called in and examined:—

- Mr. A. Wilkinson.  
24 Sept., 1869.
1331. *President.*] You are pretty well acquainted with this district and with the floods? Yes; I have been here about thirty-six years—ever since I was quite a lad.
1332. Was much damage done by any of the floods previous to that of 1857? Yes; in October, 1851, we had a flood that did a good deal of damage. It did not come right over the road, but it came to the crown of the road in High-street. We had a flood also in 1840.

1333. Did that do much damage? The flood of 1851 did more damage than that of 1840, owing to the cultivation being more extensive.

1334. Did you observe any considerable difference between the floods of 1857 and 1867? I live in High-street, and I think the 1867 flood was about 4 inches higher in High-street than the August flood of 1857. Mr. A. Wilkinson.  
24 Sept., 1869.

1335. Your interest is of course in the preservation of the town from floods? Yes; but I have some property a mile or two from the bank of Wallis' Creek outside the town.

1336. Are you favourable to the construction of the flood-gates to keep out the water from Wallis' Creek? I have not given the matter a great deal of consideration, but I think it would protect the farms on the banks of the creek if the flood-gates were erected.

1337. Do you find that you sustain as much damage from the great floods on your property at Wallis' Creek as from the smaller floods? Very nearly the same. The banks are low—not more than 10 or 12 feet high, and a flood half-bank high will go over the cultivation land nearly as much as a larger flood. I do not cultivate my farm; I let it, and have to make a considerable reduction in the rent on account of the floods.

1338. Have you formed any opinions as to the best way of dealing with the floods? I have considered the matter several times, and it is surrounded with a great deal of difficulty. One way of relieving Maitland would be by shortening the bends of the river. I do not think there is anybody who has been about the river more in flood-time than myself. I have thought that if the bends could be shortened, some 10 or 11 miles of distance might be saved, and the water would get away much sooner.

1339. You say you have been a good deal over the place in times of floods? Yes, in a boat.

1340. Where did you observe the principal run of the current? There is a great run of water between the other side of the Victoria Bridge and East Maitland, near the steam-mill. It runs under the railway bridge with great force; so much so, that myself and three others were nearly carried down there in spite of all our efforts.

1341. Where does that water come from? It must come from the river.

1342. It breaks over? Yes. There was a great current round along by the bridge. It came from Oakhampton and along Hall's Creek, which was then open. As soon as it had filled up the basin, it rushed across by East Maitland again, over the rail of the Victoria Bridge.

1343. A large body of water sets in at Oakhampton and flows round? Yes, by the Yarrabun Tannery and up to East Maitland Hatch and back to the river again through the railway bridge.

1344. There seems to be a general depression in that country? Yes; when the water breaks over the bank it has a greater fall, I think, than when it runs in the river.

1345. The embankment gave way in 1867 at Hall's Creek, did it not? Yes, it was quite carried away.

1346. Was there any perceptible difference in the flood in the river after that embankment gave way? No; it did not appear to rise quite so high, but then the river was up 28 or 29 feet.

1347. And the giving way did not make any sensible difference? It did not appear to make much difference. It might have risen an inch or two an hour, and the giving way of this embankment might have checked its rising to an inch.

1348. Or the difference might have been owing to the partial cessation of the water coming down? It might. I observed that the water ran over High-street with greater velocity than it attained during any of the other floods.

1349. The flood was absolutely higher last time? Yes, it was higher by 4 inches near the embankment. It was 2 feet 8 inches in 1867, and 2 feet 4 inches in 1857. I marked several trees, which I pointed out to the Railway Commissioner before the railway was made. The trees are now down; but a gentleman from the railway department had to get on a four-rail fence to paint the mark. The river did not rise higher there than it did in 1857.

1350. That is to say, the back-water did not rise higher in 1867 than it did in 1857, but in the river itself it was higher? Yes.

1351. That was probably due to the fact of the flood not having been allowed to escape so freely? It was all over the bank—there was no impediment to it at that time. From the Bank of New South Wales to the Bank of Australasia the water was nearly all over the road, with one or two exceptions. The crown of the road was just wet.

1352. Have you formed any views as to the best way of dealing with the floods? I fancy that the best way would be, to let the river in at Oakhampton, and carry the water by a canal to Hexham by Rathluba, where there is a depression between there and Louth homestead.

1353. How far is it to the southward of where the railway crosses? Only about a mile or a mile and a half.

1354. Does not the railway follow the depression? There is a large hill in East Maitland.

1355. But is that point of which you speak lower than where the railway has been taken through? I could not say.

1356. However, your view is to improve the river, and to make a fresh cut from Oakhampton, following the general course of Hall's Creek into Wallis' Creek, and thence to the Hunter again at Hexham? Yes.

1357. Have you formed any idea as to the probable cost of such a work? No, I never went into figures. There is a great deal of water from the Four-mile Creek and the One-mile Creek, which runs into Closé's property at Morpeth, and floods Berry Park a little below Hinton and Osterley.

1358. *Professor Pell.*] You say you have some property out of the town? Yes.

1359. Was that property yours in 1857? Yes.

1360. Could you tell us what your losses amounted to in ten years from that time? I was in the habit of getting £40 a year from the tenant; but instead of making him allowances for losses, I made an agreement with him that he was to take all the losses and have the farm at a rental of £20 a year.

1361. It is not first-class land then? Only 15 or 20 acres on the bank of the creek.

1362. How much of it is flooded? 15 or 20 acres.

1363. The rent is chiefly for this valuable part of it? Yes.

1364. *President.*] The flooded part? Yes.

1365. *Professor Pell.*] And the loss occasioned by the floods you estimate at £20 a year on that? Yes.

1366. Speaking roughly, with respect to valuable flooded lands, according to this it would be worth £1 an acre per annum to have them free from floods? It would be worth more than that. 1367.

- Mr. A. Wilkinson.  
24 Sept., 1869.
1367. In the town of Maitland, what do you suppose would be a fair rate to pay to be free from floods—Do you think the people would pay at the rate of 5s. in the pound on the annual value to be rid of the floods? No, I do not think so.
1368. Do you think it would be worth that? Yes. At one time the lower end of the town was nearly deserted; but the people have taken heart again now and gone back.
1369. Do you think they would get 25 per cent. more rent for their houses if they were secure from floods? Yes, if Maitland could be secured by an embankment such as Mr. Moriarty mentions in his report.
1370. You think if that could be done and depended upon, it would increase the value of property 25 per cent.? Yes, if you could make the people believe in the security of it. We had an embankment at the Horseshoe Bend and it gave way, and the place was only three-quarters of an hour filling up.
1371. *President.*] There would not be much risk of the embankment at the back? No.
1372. Do you think, having regard to the public health and the risk sustained in the town, that it would be worth while enclosing so large an area as I show on that plan? Yes, I do. It is noticeable that after the floods there is a great quantity of sickness.
1373. Having regard to the peculiar facilities for obtaining material out of the creek to make embankments, would you prefer taking the embankment along the course of the creek, or take a more limited area? I would take it by the creek of course, because that would be a drain for the other part.
1374. Do you think it would be a good thing to deepen and improve Wallis' Creek—to cut away the obstructions and bars so as to convey not only its natural drainage but also any water that might get into it from the river? I do. It would be well also if the bank of the river were thrown up at the Pig Run, as they call it, about 3 miles down the river. The 1864 flood made a great opening here [*shown on plan*], and here it has deposited a large bed of gravel. The bed is 60 yards further down the river than it was before. It is much narrower here than is shown on the plan, and there [*point indicated on plan*] 10 feet of the bank of the river is gone; and when the river is only half-bank high, the water is over at once—it strikes against the Pitnacree Road.
1375. In point of fact, the effect of the floods recently has been to almost carry out the cut which has been there suggested? Almost.
1376. *Professor Pell.*] You are acquainted with Wallis' Creek and the mouth of it? Yes.
1377. Do you not think that when the gates are finished there will be a tendency to silt up there, and that there will be a deposit against the gates? Yes, a great deal of rubbish goes up there occasionally.
1378. Do you think there will be a large deposit against the gates? Yes.
1379. You have been accustomed to watch the effect of these floods? Yes; I have seen large quantities of stuff deposited 40 or 50 feet from the Victoria Bridge so that you could walk over it. The people carried it away in time for the sake of the timber. Where they propose to make these flood-gates the bank has fallen in on each side.
1380. Inside? Yes.
1381. Supposing it should happen during a very high flood, when the river was at its highest, that these gates gave way,—what would be the effect on Wallis' Creek and the whole of that country? They could not keep out the high floods. When the floods are 4 feet below the bank, from the Bank of New South Wales to East Maitland is under water.
1382. Then, in the time of high floods the gates would be of no use? No; they would only keep out a flood of about 25 feet—a three-quarter flood.
1383. Supposing the water is discharging from the bank to the height you name, and pouring again into the creek, and that the gates were to give way, what do you think would be the effect on the channel and the country round about? I do not think it would be very great. The Louth Park tunnel, during a little fresh, gave way two or three times, and the basin from East Maitland was filled up in an hour and a half. Beyond tearing the ground away for two or three hundred yards, it did not do any damage much. It carried away stones weighing two or three hundredweight a distance of a quarter of a mile. It might carry away the bridge and the houses handy to it.
1384. Then in the times of very high flood it would be necessary to open the gates or to leave them open? The flood would go over the top.
1385. If it goes over in a cataract, will it not be likely to cut up the bed of the creek? Yes. At one time I owned some property in Louth Park, which I got rid of as soon as possible. I was in pretty heavily from the giving way of the tunnel, and I suppose it would have something like the same effect if the flood-gates were to give way. I bought that land for £1,500 and sold it for £800, and it has been sold for £300 since. The same land, if it were safe from the floods, would yield 105 bushels of barley to the acre. I recollect that Louth Park was nothing but a swamp thirty-six years ago. It was drained by Mr. Darvall.
1386. *Professor Pell.*] What do you consider the average value per acre of flooded lands in this district generally? On the banks of the river, if it were protected from the floods, it would be worth £75 an acre. If it were protected from the larger floods as well, I should say you could not buy it at that. It would be worth £50 anywhere.
1387. And if exposed to the floods? From £25 to £50.
1388. It would make a difference of more than 50 per cent. in the value? Yes. I have spoken to a good many farmers, and they say that if they could make certain of five or six years, they could always bear a flood on the seventh year. I suppose the floods must enrich the land by their alluvial deposit.
1389. Do you think it is enriching? Yes. I have known places where it has been a foot deep.
1390. *Mr. Bennett.*] Of good deposit? Yes; but sometimes there is another kind of deposit that is not good. When we get the Goulburn River down in flood before the Upper Hunter comes, we get nothing but sand. If you walk round the Horseshoe Bend, you will see a deposit of 16 inches at least, from the 1864 flood; and if you notice the bank of the river, you will see the layers of sand and mud which have been deposited from time to time, according to whether the flood came from the Upper Hunter or from the Goulburn River.
1391. Do you think you could be certain that was the cause of it—the different floods depositing a different class of material? We can judge from the accounts which we read in the Press, of the rain and the direction in which it has fallen.
1392. The Goulburn brings down a large body of water? Yes. I have been up the Goulburn, and I know that the bed of the river is sand.

1393. Are there any other matters which you wish to add? No. I did not know until yesterday evening that I should be required to give evidence, and I have had very little time for consideration.  
 1394. If anything should occur to you arising out of what you have said, perhaps you will be good enough to put it on paper, and we will have it published in the Appendix? I will.

Mr. A.  
 Wilkinson.  
 24 Sept., 1869.

Mr. John Shepherd called in and examined:—

1395. *President.*] What information do you wish to give us about the floods? If you will ask me any questions, I will endeavour to answer them to the best of my ability. I have been in Maitland since 1846 and have seen all the floods from that time; and nearly all the reports in the *Mercury*—at least the greatest number of them—have been from my observations of the floods, as to the heights and the rise of the water. They always used to apply to me.

Mr. J.  
 Shepherd.  
 24 Sept., 1869.

1396. Do you live on the river? I live near the embankment in High-street.

1397. Did you observe any perceptible difference between the floods of 1857 and 1867? Yes. According to my observation of it, the last big flood was the biggest I have seen here—the greatest quantity of water.

1398. You made some measurement of the height? Yes, there was from 3 to 6 inches difference in the height of those floods.

1399. Did it seem to you that the water was running with greater velocity when the flood was at its height? At times the river runs at the rate of 5 miles an hour, and sometimes it is nearly at a standstill. I could tell that by the pieces of wood floating on the surface.

1400. Does the velocity of the river seem to increase very rapidly after it gets to its highest? I cannot exactly say that. There are times when it is at its highest when it seems to be at a standstill, and then it commences to run again all of a sudden very hard. I have noticed at our corner there, that it runs very hard at times and then stops a little, perhaps for half a day.

1401. How long did the 1857 flood remain at its highest? It would be at a standstill for nearly half a day, neither rising nor falling.

1402. Did you observe the length of time the flood of 1867 remained at its height? About the same time. I plumbed the river after the last heavy flood of 1867, in front of the embankment. The bottom was hard stone, clean washed out. I had a long line, and found it 35 feet deep from low-water. It was a tremendous depth. There was over 50 feet of water in the flood just behind my place.

1403. Did you observe the velocity of the smaller floods? Yes.

1404. Does there seem to be any sensible difference? There is a very great difference. The smaller floods just trickle along. To give you an idea of the quantity of water which must have passed, I may mention that in my cellar at the back of my place, open to the rush of water, about 3 feet of clear sand was left. That would be left when the river was 50 feet high, and it shows that the water at that height had sand in suspension.

1405. Do you think that was due to the flood having sand in suspension generally, or to the washing down of sand from other parts of the bank? I considered that the whole of the water of the river contained about the same proportion. In some places, as over at Mr. Dodd's, it took away the cultivation surface. That was deposited somewhere else, of course. I have a sketch here which I took of the river twenty years ago (*pencil sketch produced*).

1406. There was a good sloping bank then? Yes; it was a very fine bank. This sketch will enable you to see how the channel has shifted.

1407. Did the cutting down of the trees seem to relieve the channel? No; the stumps are covered over with sand. When I took that sketch there were 30 feet of water where there are now 6 or 7 feet of ground above the water.

1408. Have you observed anything noticeable in the rising of the floods,—whether they increase steadily from the beginning, or in two successive rises? I have noticed some of the floods rise at the rate of 16 inches an hour for five or six hours at a run. Sixteen inches is the greatest rise I have seen in an hour. Sometimes the rise has been only 3 inches, sometimes only half an inch, and sometimes a quarter of an inch. I have noticed it by putting a rule at the water's edge.

1409. Did you observe two distinct waves, or one steady rising of the flood from the first? I have observed two waves.

1410. Were they pretty well marked? Not very distinctly. I believe at times that the first wave will come with a great rush, and then there will be a cessation, and the next comes as quick as the first, or quicker.

1411. There is an interval between them? Yes.

1412. Did you notice the interval in the case of the floods of 1857 and 1867? It was not much above five or six hours.

1413. That would probably be due to the difference of the crest of the flood-waves of some of the tributaries? Or the wind blowing up the river would make a difference.

1414. *Mr. Bennett.*] That would not make much difference, because of the sinuosities of the river? The river is making a natural channel for itself almost. It will soon cut through at the Pig Run.

1415. It seems to be carrying out somewhat that proposed new cut there? Yes; the river has a tendency, I think, to run in a straight course. At Pitnacree it has made a great breach, and if about 20 feet of the bank were taken away in a flood it would rush over into Howe's Lagoon.

1416. *President.*] Would you be so good as to mention to us any other matters in connection with the floods which occur to you as worthy of note? There are some things worth noticing. I have noticed that when the water has fallen, that which remains on the back lands oozes through and washes the sand from under the banks of the river. I have seen the water boiling up in the river at times after a flood—nearly in the middle of the river—just as if a spring had burst up, carrying mud with it. This is from the back-waters.

1417. You think it would have great effect in saving the banks if the back-water was prevented from lying so long on the land? Yes, if it were possible to get it altogether away from it.

1418. Have you formed any opinion as to the best mode of dealing with the floods? I have thought over the matter, and my impression is, that if a channel were cut about 100 yards wide and 8 or 10 feet above

- Mr. J. Shepherd.  
24 Sept., 1869.
- above the present height of the water, and carried from Bolwarra to Morpeth and beyond, it would relieve the flood-waters considerably and still be good grazing land.
1419. Do you not think the effect of a heavy flood would be to cut that down nearly to the level of the bottom of the river? I do not think that would be the effect, because the water would run off quicker if it only had to run one mile instead of four.
1420. You would make a pretty straight cut? I would not interfere with the river; I would make a separate channel altogether 8 or 10 feet above the present water-mark.
1421. What would be the line? I would take it by the side of Bolwarra, and have the rocks on one side. The stuff you threw out could be put on to the cultivation land; it would make a very good grazing paddock.
1422. You would not be able to get to Morpeth without crossing the river? I would take it to Dunmore.
1423. You would throw it into the Paterson at Dunmore? Yes, it would go somewhere down there. I would follow the rock on one side.
1424. But you would take it to Dunmore? Yes.
1425. And into the Paterson? You could cross the Paterson there, but it would be expensive. I have no doubt that would relieve the river.
1426. You have not made any calculation as to the cost of such a work? I have never gone into figures. I think that would be the easiest way. If you follow the natural course of the river, you will find that all the points are gaining and all the hollows are losing. The points are biting into the hollows.
1427. Do you not think it would be better to assist them and use the natural channel? What I should fear in that case would be that when a flood came it would wash all that land away, unless the cuttings were preserved.
1428. It is quite possible, is it not, to preserve them? Yes. Anything that will carry the water quicker to Hexham and Newcastle will be a benefit.
1429. So long as you did not do too great an injury to Morpeth and the country about there? Yes.
1430. You understand that leading down the water too fast to Morpeth, although it would relieve Maitland, would have a correspondingly injurious effect at Morpeth, unless some provision were made? You could begin at Hexham and relieve it all the way up. If the water gets down here two hours sooner, the water behind will not be so liable to bank up.
1431. Is there anything else you would like to add? I should like to say that I think the flood-gates will do harm.
1432. Will you mention the grounds of your apprehension? The mouth of the old creek has been filled up to about 30 feet of silt, and with the standing water between the railway cutting and the flood-gates, it would silt up and keep the water in—that is my impression.
1433. In addition to that, supposing the flood to be bank-high in the river, and that by any accident these gates should give way and burst,—what do you think the effect would be on the back country? There would be no accounting for it. It would be fearful, I think. In my opinion, that is where the chief mischief would be. It is bound to break over in some weak part, and when it does it will go with a rush. We had an embankment here in one of the floods, and men were watching it all night long with shovels and a cartful of stuff. If they had neglected it for a minute, and allowed the water to break through, they could not have stopped it—it would have carried houses and everything before it. On the Horse-shoe Bend we kept the water out for a whole day by simply supplying now and then a shovelful of dirt.
1434. But what would be the effect of gates 30 feet deep giving way? The effect would be fearful. The water would rush in when people least thought of it. That is why I think the flood-gates will do more harm than good.
1435. Have you seen the project for throwing an embankment round the town of Maitland? I have, but I do not exactly like it.
1436. What are your objections to it? Those I have stated in regard to the embankment to which I have referred. If the water once made a breach we should be done for—it would come upon the people suddenly, and there would be no stopping it.
1437. Do you think there would be the same risk of the embankment in the rear coming to grief as would attend that proposed to be made on the margin of the river? I do not think you can save the town from floods unless you keep along the bank of the river.
1438. Of course, by going along the bank of the river and extending the same embankment round Wallis' Creek, we may make a circuit round the town? I do not believe in the thing at all—I do not think it would be a wise plan.
1439. You would prefer letting the water in? Yes.
1440. You think if this system of embanking were carried out, the water might in some places break in so suddenly as to do mischief? I have seen its effect.
1441. Do you not think that if the banks were faced with clay, they would be sure to keep out the water? You could keep it from the town; but look at the farming grounds!
1442. They would be no worse off than they are now? I do not think the town itself suffers anything like so much as the farmers.
1443. You do not think there is any sickness or other evils which arise in consequence of people being flooded out? Very little.
1444. *Mr. Bennett.*] You should recollect that the embankment alone is not proposed but in connection with a plan to make cuts to lower the water considerably? Yes, I understand. The object is to ease the river, and to carry the water off quicker.
1445. *President.*] If the proposed cuttings were combined with the plan of embankments, would you then object to it? No, I do not think I should; but I do not think there would be much occasion for the embankments, if the river could be made to run a little quicker than it does.
1446. Still you do not know the quantity of water you are dealing with. It may not happen that allowing the water to escape a little quicker would have any effect on the floods? I came to the conclusion that the quicker the water goes down, the less liable will the people be to suffer from floods.
1447. You have not made any estimate of the real quantities to be dealt with? I have made calculations at different times, but I have not brought any calculations with me. I made a calculation that there were 50 or 60 feet of water. I then estimated the width of the river and the number of gallons it would run in an hour.

1448. And have you compared that calculation with others taken at different points of the river—say at Bolwarra House, Oakhampton, and the West Maitland Bridge, and so on? I have; where I find the difference is where it breaks over the land, as it does at Doyle's. That takes a portion of the water at Oakhampton, and I do not get so much at my place.

Mr. J. Shepherd.  
24 Sept., 1869.

1449. There is the same thing going on lower down? Yes; wherever the water breaks over, of course so much is gone.

1450. *Mr. Bennett.*] Have you measured the velocity? I have not measured it exactly. I have walked along the bank when pieces of wood have been floating on the current.

1451. With a watch in your hand and with a measured distance? No. I calculate that I can walk four miles an hour. I do not believe the velocity is, at the highest, five miles an hour. I have pulled in a good heavy boat against it. There is a hill 20 feet higher than we are now where there are the natural flood-marks, near Oakhampton.

1452. *Mr. Adams.*] At a place near Camden there are oyster-beds 20 feet above high-water-mark? But I mean the fresh-water drift.

Mr. James Thomas Dec called in and examined:—

1453. *President.*] You witnessed the effect of the floods in this district in the years 1857, 1864, and 1867? In 1864 and 1867. In 1857 I was away.

Mr. J. T. Dec.  
24 Sept., 1869.

1454. Those are the floods which did a considerable amount of damage? To the farmers.

1455. Which neighbourhood do you belong to? I live in the flooded district of Fishery Creek.

1456. Which do you the greatest amount of injury there—the large floods or the small floods? The small freshes.

1457. Do you suffer as much from them as from the larger floods? They leave no debris, but the large floods do.

1458. And the object of the flood-gates is to keep out the small freshes? Yes; we would be satisfied with having our land flooded every seven years to have it enriched by the deposit, but the small freshes deposit nothing and leave the land sour.

1459. Have you made any observation as to the height of these freshets that do the injury? Those from 10 to 22 feet do the most injury. They take away the crops and leave nothing behind them. Freshets from 10 feet upwards do us the most injury. A rise of 10 feet injures us more than it did before the new cut was made. It now floods some of the low land for a considerable time, whereas before it never injured the land. Besides, before this new cut was made it took three or four days before a twenty-five feet fresh would overflow the land, and we had time to take off the crops, but now the land is flooded in three or four hours.

1460. To what height would a 20-foot flood rise over the generality of the banks? It comes over the highest portions of the banks now from 1 to 4 feet.

1461. Would it not be possible to construct small levées along the banks to keep out the floods? Yes, it would in certain places.

1462. I am speaking generally? It would at such places as Loughend and Louth Park.

1463. There might be a general system of embanking along the creek? Yes.

1464. And then proper drains to tap the low swamps might be made to let the water off—would not that be a great benefit? I do not see how you could let it off unless you took it to Howe's Lagoon.

1465. There is Wallis' Creek? But the local water would be confined in a very small surface. A great deal of water comes down from the Sugarloaf, and if you were to make those embankments I think our local water would flood us. That system might tend to do good to a certain portion of Dagworth, but it would injure a portion of Fishery Creek. When the water cannot get out it runs round the Fishery Creek way.

1466. But if the Fishery Creek people banked up in the same way? I have spent money on embankments, and I have found the water force its way over the banks in other places and lower the banks in others, and a portion of my land where it was the best has been spoilt. I think any system of that sort would tend to benefit one place and injure another.

1467. What height would a 20-foot flood rise over the banks at your place? 2 or 3 feet. It would rise higher some times than at others, according to the local rains.

1468. And such a flood as that of 1857—what height would it rise over your banks? In some places I think it would rise 10 or 12 feet. I was away during that flood, but I have seen marks on a tree showing its height.

1469. What height did the 1867 flood rise over your banks? The land is higher at some places than in others. In some places it was 14 feet.

1470. Supposing it should happen that the flood-gates at Wallis' Creek were to give way in the time of a high flood when a great body of water was resting against them on the outside, and it were to rush suddenly up the channel, would you apprehend any danger from the effects? No, I cannot see what injury it would do more than the flood; we should be flooded; but I cannot see what injury it would do, except to the banks.

1471. A wave going up with great rapidity would be very different from a steady rise? The place at Hall's Creek broke away in the same manner, but it caused no particular injury. It stopped the rise of the river momentarily, but it rose again soon after, and at Loughend also. I went to see it afterwards. It was something like what the breaking away of the flood-gates would be. It washed away some of the stone for a few hundred yards.

1472. Have you made any estimate of the amount of loss you sustained per acre by the flood of 1867? Yes.

1473. How much was it? I reckon that I lost between £250 and £300, estimating the price of maize at 3s. per bushel; but maize sold considerably higher. That was a medium price.

1474. What extent of land was that off? 25 acres.

1475. You lost about £10 an acre? Yes. It is very rich land, but it is valueless through the floods. I would rather give it away almost than be compelled to live on it any longer.

1476. Did the small floods damage you to the same extent? Yes.

Mr. J. T. Dec. 1477. The large floods do you the most good, by depositing manure? The land requires no manure; it is manure in itself.

24 Sept., 1869. 1478. But it will not last for ever? It is almost inexhaustible; but we shall continue to have large floods from time to time unless something is done to mitigate them. They improve the land considerably, but the small floods only make the ground sour for a year or two afterwards. It will take two years before the ground will grow a good crop. Some years ago I, with others, was very glad to see the new cutting or artificial mouth made to Wallis' Creek. I thought it would be the means of giving us fresh water. I went one day to see what was going on, and some gentleman there (either Mr. Wright or one of his sub-contractors) asked me whether I owned land about Maitland, because if I did he told me I should get up some fine morning and curse this affair, instead of saying it was "a fine thing." He said it would injure Maitland, and that the cutting was made where the river had more velocity than it had at the original mouth of the creek—which I have seen since, for we are flooded now in much less time than it took to flood us formerly. I think the flood-gates will be the means of counteracting this. I can remember that when a schoolboy I have seen floods 19 or 20 feet that did not flood us, but now we are always flooded by a 19-foot fresh. Then we had scarcely any fresh water at the back of where I live, but now all that land is valueless; it is nothing but a common cattle-walk.

1479. Do you not think it might arise from a different cause—You may one season have a continuance of rain to keep a flood 20 feet high for some time, and another season there may be less rain, and the flood may go off in a day? The water now rises in a shorter space of time, and varying from 16 to 19 feet it will remain at a standstill for twenty-four hours. In former years it used to pass off quickly, and we did not lose our crops, but now it is different.

1480. *Professor Pell.*] Why should the new channel let the water in sooner than the old one? A greater amount of water comes up. The original mouth was much larger than the artificial mouth, but by every fresh the artificial mouth has become larger and larger. When the low land is filled up, the water rushes with great force through Howe's Lagoon. The river runs, I think, five miles an hour. I went along the line on a trolley as far as the Court House, at the time of the 1867 flood, to see this place, and it is really astonishing the force the water has on the line between Clift's house and Narrowgut.

1481. *Mr. Bennett.*] If the floods come in quicker, and rise to a greater height in a shorter space of time, they must go away more quickly? No, they go away much slower.

1482. I can hardly realize that. If the water comes in quicker will it not go out quicker? No. The farmers indorse my opinion, and I have watched every flood when I have been in the Colony.

1483. *Professor Pell.*] And you say that they come in quicker and go out slower since the new cutting has been made? Yes; it now remains for three months sometimes. Nine months ago we had a fresh of 9 or 10 feet, and now the water is left in some of the back places where a few years ago it took only four or five weeks to get off.

1484. *President.*] If you deepened and improved the channel of Wallis' Creek so as to allow the water to escape more rapidly you will get rid of it. At present you cannot argue because the channel of the creek is blocked up with the works? Still I cannot help remarking that we get the water much quicker than in former years.

1485. Do you think the obstruction at the mouth is the only one it meets with? In regard to the drainage?

1486. No. Are there not many parts of the creek inside the mouth which are much more contracted than the mouth? The creek has not altered much during the last twenty years, except in a few places, where it has been filled up a little with mud.

1487. The capacity of discharge would be that which is due to the general section of the creek, and not to the mere mouth of it. Increasing the area of the mouth will not increase the area inside, and can scarcely allow a greater portion to flow up? Where the new mouth has been made to the creek, it is larger than at any other place.

1488. Exactly; but all the water passing there appears to be passing under the same conditions as before, and if you made that mouth as big as the Pacific Ocean it would not cause the water to pass through the other part any quicker than before? It is however the case that we are flooded more easily than we were in former years. Since the first fresh after the cutting was made we have seen the difference. There were crops on the ground, and the flood came on so quickly that we could not get them off, whereas we could always do so in former years.

1489. Might not that be consequent on the floods having come in a drier season on previous occasions—When the flats were charged with water, and when the creek also was charged, the flood would naturally rise very rapidly—A 20-foot flood coming after a dry season would not rise so rapidly as one coming after a succession of other floods? One would not rise so quickly as the other.

1490. No, of course not; there would be considerable absorption? Yes.

1491. That might possibly account in some degree for the difference you have mentioned? I scarcely think so.

1492. Assuming that the flood-gates stand, you would be in favour generally of improving Wallis' Creek, so as to allow its own waters, and any that might come in from the river in time of floods, to escape more freely? I should certainly be in favour of the flood-gates and also of improving the creek.

1493. Having regard to its outfall and in other respects? Yes.

MONDAY, 27 SEPTEMBER, 1869.

Present:—

W. C. BENNETT, Esq.,

PROFESSOR PELL.

E. O. MORIARTY, Esq. (PRESIDENT), IN THE CHAIR.

William Burton Wade, Esq., called in and examined:—

W. B. Wade,  
Esq.

1494. *President.*] You are the Engineer in charge of the railway works in this district? Yes.

1495. Were you here during the flood of 1867? Yes, and also during the flood of 1864.

27 Sept., 1869. 1496. Did you make any careful measurements of the heights to which those floods reached? Yes.

1497.

1497. Have you any knowledge of the height to which the 1857 flood reached? Yes, I had it pointed out to me in 1859, when it was comparatively recent. W. B. Wade,  
Esq.
1498. How much was it above the ordinary summer level of the river in 1857? 137·25 is the ordinary summer level. 27 Sept., 1869.
1499. And what was the flood level in 1857? 182·40. There was a difference of 45·15.
1500. What was the level of the 1864 flood? 181·42.
1501. And what was the level of the 1867 flood? 182·26.
1502. *Professor Pell.*] What was the height above the ordinary summer level of all those floods? 45·15, the flood of 1857; 44·17, the flood of 1864; and 45·10, the flood of 1867.
1503. There is very little difference between the three? Very little. I also observed the surface velocities of the several floods in 1864 and 1867.
1504. *President.*] At the bridge? At the bridge I found that my observations scarcely varied a second anywhere. It was about 11 feet per second; 10·08 was the mean velocity.
1505. Ours is computed from the slope of surface, 10·05? It is exceedingly close. Mine was a very careful observation on a length of 5 chains, and repeated a great number of times.
1506. Could you give us the height as regards the levels here or above datum at Aberdeen, so as to give the slope of surface all the way—What is the height above datum at Aberdeen? The flood level in 1857 was 520·28 and the ordinary level 486, at Muscledbrook; and at Aberdeen the flood level was 601, and the ordinary level 577·82.
1507. Could you give us the difference in time at which the floods of 1864 and 1867 culminated at these various points? I am afraid I cannot, but I think the newspaper reports will be found quite correct in regard to those particulars.
1508. Did you observe the surface velocities at either of the other places? No.
1509. *Professor Pell.*] Did the flood of 1864 come over this plain? No; the 1867 flood did.
1510. *President.*] Have you any observations of the flood of 1861? No; but it was not so high, I think, in Singleton, by a good deal, as either the flood of 1864 or that of 1867.
1511. Did the flood of 1857 last up much longer than that of 1864? I was not here in 1857. It is the general impression here that the flood of 1857 was the largest. I imagine that it took longer for the back-water to get round. It was, I think, the largest flood.
1512. And of longest duration? Yes.
1513. The floods break over some few miles above the bridge, and flow by another channel into the Hunter lower down? Yes.
1514. Have you any means of estimating the quantity of water in feet per second which would pass in that way? I could give you pretty accurately the length it ran over the railway when it breached it.
1515. *Professor Pell.*] You have no exact measurement of the heights of the flood anywhere at Singleton, except at one point? No. We could get an exact measurement.
1516. You have no exact measurement above where it breaks over? No.
1517. Where it breaks over is more than a mile above—is it not? I think it is about a mile above. The water leaves the river and returns to it again. There are many instances of the kind between this and Maitland.
1518. It would bring the discharges at Singleton Bridge and Oakhampton so much nearer—There is a difference of a thousand cubic feet? Yes.
1519. You think this break-over would bring those much closer together? No doubt.
1520. Do you think it would be at all appreciable? At the Singleton Bridge it might.
1521. *Mr. Bennett.*] But only for the time the breaking over lasted, and not during the whole flood? No, only at the top of the flood.
1522. *President.*] Would it be a thousand feet per second? Yes, it would be quite equal to 8 or 9 inches at the bridge.
1523. Do you think so—the whole section? Yes.
1524. *Professor Pell.*] You see the total here [*in a tabular statement*] which passes through the bridge per second—do you think it would affect that quantity much? It would scarcely tell on the total quantity, but only on the discharge per second during four or five hours at the top of the flood. It would be only then that it would be appreciable.
1525. *President.*] But it might have the effect of more nearly equalizing the discharge at Singleton and Oakhampton? No doubt it would.
1526. *Professor Pell.*] Because that takes place just where this measurement takes place at the top of the flood? Yes; the top of the Singleton section is 500 feet at 6 inches. That would give 250 feet, which, multiplied by 10 feet per second, would give 2,500 feet per second.
1527. That would make the Singleton discharge more? Yes.
1528. Is there anywhere below where a discharge can take place to relieve the river? Yes, a good deal of water is taken away in the neighbourhood of Black Creek.
1529. Does it break in at the top of the flood? No; before the top of the flood. There may be others, but there is no doubt that Black Creek operates as a moderator to a great extent. It runs out into Anvil Creek, and forms a lake of many square miles.
1530. That would take up the difference? Yes; and I think there is a place a little above Oakhampton, where you have taken your section. There is a large area under water there. The Anvil Creek and the Black Creek Flat form a very considerable flooded area.
1531. That will very likely equalize any discharges at the Singleton Bridge and Oakhampton? Very likely.
1532. Do you remember how long the flood remained at its height here in 1867? About four hours. It was for four or five hours without any appreciable difference.
1533. *Mr. Bennett.*] The flood was in your house—was it not? It came close to it—it was just in the verandah.
1534. *President.*] And did it seem to fall very rapidly when it commenced to go down? Not until some time, when it had got a start of a few inches. Not until the water had resumed the channel pretty well.
1535. Not until the water had drained from the flats into the channel—About what rate did it fall per day after that? Very rapidly. When it was once fairly in the channel it would go down 4 or 5 feet per hour sometimes. 1536.

- W. B. 1536. You were at Maitland during some of the floods there—were you not? Yes.  
 Wade, Esq. 1537. Did you ever think on the subject of relieving the town of Maitland from the effects of the floods?  
 Yes.
- 27 Sept., 1869. 1538. Has any plan of doing so suggested itself to you? It has always struck me that any partial remedy to Maitland would be objectionable. Any partial scheme would only relieve those lands which really benefit by the floods; and the great sufferers, those whose lands the waters reach first and leave last, would not be beneficially affected.
1539. You are referring now, I suppose, to the people up Wallis' Creek? To those generally on the lower lands that get flooded first—from Wallis' Creek to the back of the "Northumberland."
1540. Do you believe that such floods as those of 1857 and 1867 do any good to the flooded lands, generally speaking? I think, generally speaking, they do. In such a district as Singleton, where the water soon runs off the land, no doubt they do. Some of the lower lands may suffer from the scour, but generally I think the lands about Maitland benefit.
1541. With reference to the lower levels—If a proper system of drainage were introduced so as to allow the water to flow off rapidly, do you think there would be the same reason to object as at present? No doubt in theory a system of drainage would put them in a better position, but they will always suffer from scour and the washing away of the fences.
1542. In the run of the current? In the run and the lowest levels.
1543. What is your opinion of the flood-gates at Wallis' Creek? I think they will be effectual in the case of freshes, but in the time of high floods they will make little difference one way or another. They may save a considerable quantity of land from the freshes and probably raise the water below.
1544. From what you know of the country about there and of the nature of the banks, do you think it is practicable to construct these gates so that they will stand in times of high flood? They must be built with great care, and they will require to have sluices to let the water gradually in. If once there is an extreme fall, I should say there would be great danger of their being carried away bodily. It would require great judgment to equalize the flow, as in the case of a canal lock.
1545. Do you think that any arrangement of sluices, seeing the size of the lock that is to be filled up (some sixteen square miles), will be sufficient to let the water in fast enough? That perhaps might be managed by narrowing in the channel and putting a sort of barrier up above. You might form a kind of sectional basin above the flood-gate, so as to make a certain contraction to fill to some extent by sluices, and prevent a great difference of level.
1546. If that is done, how about relieving the Hunter itself—would there be any sensible relief afforded to the Hunter by the spreading of the water over the country? My idea would be to relieve the danger of carrying away the locks, by converting the flood-gates into a weir and letting it all go over the top.
1547. *Professor Pell.*] Have you examined the locality? I know the place.
1548. Are you aware that the flood-water when it attains to a certain level will be over the bank? Yes.
1549. Do you know the system of construction in detail? No. They seem to be putting in a masonry sill across the stream.
1550. You do not know the depth? No.
1551. And you do not express any opinion about it? No; I never saw the drawings.
1552. *President.*] Should you consider generally that it would be better policy to embank the sides of Wallis' Creek, if it could be done at a moderate expense; to throw up embankments along it and cut proper drains in the flooded lands at the back with sluices leading out? Keeping the bank above the height of the floods?
1553. Yes? I think so, decidedly.
1554. With proper drains at the back and sluices through the levée, most of the benefits anticipated by the experimental gates would be secured? A great deal more, provided the levées are kept above the flood level.
1555. *Professor Pell.*] Would that be more expensive than the flood-gates, or would it cost less? I imagine that it would be more expensive. But then a flood-gate is limited to a certain height, and if the water rises higher it is quite impossible to say what loss of property might accrue. The gates themselves might be carried away, and there would be an enormous scour on the lands.
1556. *President.*] If it should happen that these flood-gates are constructed in a manner to render it probable that they would be carried away, they might fail when there was a head of water outside of 25 or 30 feet—Would not their sudden giving way be likely to endanger the railway works? No doubt.
1557. And should you anticipate any disastrous results from such a wave as would be suddenly thrown into Wallis' Creek, rushing up like a vertical wall, 20 feet high? Yes; and perhaps the fancied security of the flood-gates would lead people to prolong their stay, and thus lead to loss of life. Any sudden break of that kind would be very dangerous to the railway works. We had a large piece of embankment carried away, which had to be replaced, by the bridge; and any sudden break, such as you have referred to, would carry away many chains more, no doubt.
1558. If it should happen, from the nature and character of these works, that there is a probability of their being carried away, do you not think steps should be taken to prevent their construction at all? I should think so. I look upon it as inevitable that the flood will be over them some day, and it is hard to measure what may happen.
1559. *Professor Pell.*] Are you aware that the top of the gates will be above flood level? But the banks contiguous to them are below flood level.
1560. *President.*] You would anticipate that there will be a considerable scouring immediately around them, from the water dropping suddenly into the creek? Yes.
1561. And that that would cut probably a fresh channel? Yes.
1562. And if it should be apparent from the general design, that the gates cannot stand the pressure brought to bear upon them, would you say that measures should be taken to insist on their being constructed in a safe way or else not at all? I should say so. It has always struck me that this was a matter in which the Legislature should interfere, and scarcely one of which private people should have the supervision. It may lead to loss of life, and is almost sure to lead to loss of property.
1563. If it were to give way, the effect on the Victoria Bridge would be of course disastrous? No doubt. It would be almost sure to carry that away.

1564. *Professor Pell.*] Is there much damage done here to the farmers by the floods? Only a very moderate amount of damage, I think.

W. B.  
Wade, Esq.

1565. Is there much complaint about these large floods? No; they get a share of the flood relief money up here. It was looked upon as a great farce—farmers coming in and selling ten pounds' worth of farm produce, and getting 5s. of flood relief money on the same day.

27 Sept., 1869.

1566. You think there was very little damage done here? Very little.

1567. Was there any damage done above this? It was very moderate; only to the fences in the immediate neighbourhood of the river.

1568. *Mr. Bennett.*] Is there much flooded land between this and Maitland? Yes, a great deal. The only part I know intimately is that about Black Creek, and there is a good deal there.

1569. Is the flooded land along the margin of the river nearly as extensive between this and Oakhampton as it is below it? No.

1570. Is it half the extent? No, I think not, because just below Oakhampton the country spreads out in every direction.

1571. You do not think that the land between this and Oakhampton is seriously injured? I think not.

1572. Nor the land between this and Muscleebrook or Aberdeen? No.

1573. You do not think that considering the amount of injury done to the land on the upper part of the river and the lower portion of its tributaries, one general system would be justifiable all along the river, in regard to the prevention of floods and the payment of the expense? No, from Oakhampton downward is the only part.

1574. Do you think that to relieve the lands below Oakhampton thoroughly, and also to relieve the towns of Singleton and Muscleebrook, and further to confer the benefit of irrigation, would justify a scheme embracing the construction of reservoirs, for the purpose of impounding the flood-waters? I think that is the way to deal with it.

1575. Do you think there are suitable sites for reservoirs for the receipt of the flood-waters? I think so. I think all the upper tributaries are of such a nature that reservoirs could be made.

1576. *Professor Pell.*] Do you mean that there are facilities for making reservoirs on a large scale? Large or small. You could make large dams in the main stream in its upper parts, or numerous small dams in the small tributaries.

1577. Would the people be willing to pay for a plentiful supply of water in dry seasons, in addition to the relief they would obtain from the floods? There is such a want of population at present in the upper part of the Hunter; but probably if means were devised for storing water, population might be attracted. Now that the railway equalizes the markets, the people higher up the river will have as good an opportunity of disposing of their produce as the people about Maitland.

1578. Do you know of your own knowledge of any sites suitable for reservoirs? Yes, at Dartbrook and Middlebrook, and King's Ponds, there are numerous sites for reservoirs.

1579. *Mr. Bennett.*] You do not think that relief from floods alone would justify any expenditure on the upper part of the river above Oakhampton? It would have to be compared with the cost of any other measure.

1580. You do not think that the people would be willing to pay anything appreciable for relief from floods, above Oakhampton? No.

1581. Any expense incurred above that place would be for water supply? For the storage of water. In this district there has been always great difficulty in getting rents from people in time of flood, I believe. The landlords about here are giving up the letting of small farms, but as long as they are willing to let them people are willing to take them, whether they pay the rent or not. You cannot say that they reduce the value of the land.

1582. *President.*] Have you had pointed out to you the heights of any of the floods previous to that of 1857? I have not received any definite information. There is a rumour of a flood in this district when no land was exposed, except Howe's, on the Kelso Hill.

1583. How much higher would the water be? Another 5 feet would leave nothing to be seen but those two hills. I think that was said to have been about 1828. It was twenty something.

1584. *Professor Pell.*] Is there anybody in the neighbourhood who saw that flood? I think Mr. Howe.

1585. *President.*] Do you know anything of the country between here and Lake Macquarie? Only the general run of the watersheds from the railway survey.

1586. What are the heights of the intervening ridges between here and Maitland? I do not remember them, but I will send them to you.

1587. *Mr. Bennett.*] Are they not such as entirely to preclude the cutting of a canal? Yes; you would have to have a cutting a thousand feet deep.

1588. *President.*] The whole way? Yes, nearly the whole way. It is utterly out of the question.

1589. Do you know anything of the country across to Port Stephens from Maitland? No, but you would have to pass one or two watersheds, I think.

1590. *Mr. Bennett.*] Does not the railway cross the East Maitland Hill at the lowest point anywhere between Morpeth and Fishery Creek? I think so.

William John Dangar, Esq., called in and examined:—

1591. *President.*] Are you acquainted with the heights to which the flood of 1857 rose here? In the town or in the channel?

W. J. Dangar,  
Esq.

1592. Anywhere? I can only speak as regards my own place. It was all over my place. The least depth was a foot and the greatest 10 feet.

27 Sept., 1869.

1593. How about the flood of 1864—was that as high as the flood of 1857, or nearly so? I was away at that time, but from what I heard about it I am inclined to think it was much the same.

1594. And the flood of 1867—how was that as regards the flood of 1857? The flood of 1867 was higher with me a little; but between 1857 and 1867 there was an alteration in the embankment of the railway, and I think it made a difference as regards the flood at my place.

1595. Is your place above or below the railway, on the river? It is below.

1596. Could you say how much higher the flood of 1867 was than that of 1857—Did you make any measurements? No. Judging from casual observation I thought it was about an inch. There were various

various

W. J. Dangar, various opinions about it, but I attributed the height a great deal to this bank. It may not have been so high in the town.

Esq. 1597. In what way would that bank affect you if you were lower down the river? It throws the water back and impedes the other overflow.

27 Sept., 1869. 1598. Your property is near where two channels join? Yes, it is between the two. It prevents me getting out at all when once it comes in upon us.

1599. Was it the general impression that the flood of 1867 was as great as that of 1857? The general impression is that it was greater.

1600. And did it seem to remain as long up as that of 1857? They were much about the same in that respect.

1601. You think there was no very appreciable difference between them? Very little. It might have been a little more with me.

1602. *Professor Pell.*] Is there much damage done by the high floods in this immediate neighbourhood? If a flood happens to come when the crops are growing, there is a good deal of damage done on the rich flats.

1603. Does it destroy the crops? The last time we had a flood the corn was growing, and it was all spoilt.

1604. Would it destroy a crop of maize? Yes. If the water went away in a short time it would not kill young maize, but when the maize is ripe the water rots it.

1605. How long did the water lie on those flats in 1857? Perhaps from the time the river commenced to overflow to the time when the water began to recede it might have been twenty-four hours; but it would remain on a good deal of the low land for some weeks.

1606. Would the water remaining on for twenty-four hours be sufficient to kill a crop of maize? Yes.

1607. What effect would it have on the lucerne? It would kill the lucerne—it would smother it.

1608. Would it kill the roots? It would smother it entirely and kill it, especially the young lucerne.

1609. It would not spring again? No, except just in patches.

1610. Was there much actual loss sustained by the farmers about here in 1867? There were a great many complaints. My tenants made very great complaints of their losses, and I have reason to believe that they did lose a good deal of corn.

1611. Do not they rather make the flood an excuse for not paying their rent? I think many of them do; but I know that there were losses of corn. I lost a great deal of lucerne that I had sown, and the washing away of the fences of course is a great loss, as well as the landslips on the banks of the river. In some instances several acres are gone. I know one place where seven or eight acres went.

1612. Do the losses bear any proportion to those sustained in the low lands of the Maitland district? No.

1613. Do you think the land would be worth more rent if it were relieved from the floods? No.

1614. Nothing appreciable? No.

1615. *Mr. Bennett.*] Do you suffer much from drought? Yes, occasionally.

1616. Do you think the lands would be increased in value much if they were supplied with water in these dry seasons by means of irrigation? I have no doubt of it.

1617. What would be the probable increase per acre per annum in value? I could hardly say; but if it were possible to irrigate, I do not see why it should not be doubled.

1618. The land would be doubled in value? I think so, if it were possible to irrigate it in a proper way.

1619. What do you call the average annual value at present per acre? About 10s.

1620. *Professor Pell.*] What is the average annual value of agricultural land on the flats? It varies so much. Perhaps the very rich land would be worth from 15s. to £1 an acre. I have got that myself. But the average would be 10s. or 12s.

1621. For agricultural lands? Yes. Grazing land is about 5s. or less.

1622. *President.*] Considering the number of droughts you would be likely to have in an interval of twenty years, do you think provision for irrigation would justify an increase of rent to double the present amount—How many droughts have you had during the last twenty years? We have had one every two or three years for the last ten or fifteen years.

1623. And for the chance of getting water in those years of drought, do you think the people would be willing to pay double the rent in all years? I do not think they would—the small tenant farmers; the large proprietors might—they grow grain in excess of their requirements.

1624. But in regard to the whole condition of the country, do you think any large scheme of irrigation would be justified, considering its population and agriculture? Not for agricultural purposes, but for pastoral.

1625. *Mr. Bennett.*] And root-feeding? Yes.

1626. Root-feeding is now an impossibility on account of the uncertainty of water? Yes. If we had a system of irrigation we should probably have a different system of farming altogether, and these low rich lands would become very valuable, I think, for feeding—more so than for farming.

1627. *President.*] Do you think, considering the whole circumstances of the country, that the root-feeding of stock would pay if undertaken to any considerable extent? It would depend upon the expense necessary to raise the roots. If that could be done easily and well, it would pay I think. I do a little in that way now. If the seasons were made more favourable by means of irrigating the land, I could make it pay.

1628. Would you not find great competition from the stock reared in the vast interior in good seasons? I should not be afraid of that—not now especially. I think that in years to come a great deal of the supply will come from these lands. I think that farming will be given up, and that they will take advantage of such seasons as they have on the flats for fattening. It is coming to that fast now. The difficulties of bringing down stock are greater.

1629. Are the facilities not increasing as the railway is extending? They are not at present. The lands are fenced in so that it is nearly impossible from some places to bring down stock at all.

1630. But is not the conveyance of stock one of the benefits we anticipated from railway extension? When it gets to any distance, and it is impossible to bring down stock on the main roads, we must resort to it.

1631. *Mr. Bennett.*] What might we put down as the additional value which would be given to the land, if provision were made for irrigation? I think really that it would be doubled.

1632. *President.*] In every year, or only in the years of drought? Every year. The difference it would make would be enormous. W. J. Dangar,  
Esq.
1633. *Mr. Bennett.*] Then cattle would be bred in the interior, and fattened for market here? Yes.
1634. It would enable us to produce a better article than we produce now? Much better. I think it is improving now, and I think it will continue to do so, independent of irrigation, to a large extent. 27 Sept., 1869.
1635. But not to such a large extent, or with such profit, as if we had irrigation? No, you could not lay out your plans sufficiently well to carry out any system.
1636. *President.*] How much land is there about Singleton that would be doubled in value by a system of irrigation—how many acres? All the alluvial flats.
1637. What should you estimate the extent of that in square miles or acres? I could not give you the figures now, but I can furnish the answer and forward it in a day or two. (*See Appendix.*)
1638. *Mr. Bennett.*] Between Oakhampton and Aberdeen? I think I can find that out—all the land which would be likely to be benefited by irrigation.
1639. Do you know the principal waters of the Wollombi Brook, near the township? No, I do not.
1640. There was a considerable extent of alluvial land injured by the floods there of the same character as that about Maitland—between this and the Wollombi village? The flats are small, but they are very rich and good.
1641. There is a good deal of harm done there by the floods? Yes.
1642. And there is sometimes loss of life? There has been loss of life. In all the floods in that direction (Cockfighter's Creek) a great deal of water comes down. The flats of the Hunter are not very wide anywhere. Perhaps they are as wide at my place as anywhere on the Hunter.
1643. *President.*] What would you say is the average width? I do not think the average width would be more than three-quarters of a mile. I doubt whether it would average a mile. Mine is about 2 miles. All the bends are alluvial.
1644. *Professor Pell.*] All the way to Oakhampton? I should say so. I have not been all the way down, but I know that all the bends are alluvial; but not many of them are as wide as my own place. Some up here are very rich flats.
1645. *President.*] And from here upwards to Muscledbrook and Aberdeen does the valley extend or contract; or is the same average width preserved? About the same average width. The land outside these flats is more precipitous.
1646. But the width of the flats would be much about the same? They would be much about the same width, as far as I have seen. I think they would be found to be very uniform. I have taken the trouble to notice the rainfall since last January with a little thing I got in Melbourne,—it is a common funnel.
1647. About 10 inches in diameter? Yes. As far as I have gone, I think we have only had 20 inches. (*See Appendix.*)
1648. Since when? Since January, as against 38 inches in Sydney. The desirability of having gauges at all the stations has been mooted I believe, by Mr. Nowlan to Mr. Smalley. I think it would be an excellent plan so as to enable us to obtain a correct average. The rainfall has always been taken from Sydney, but there is a great difference. Here is a difference of 18 inches. The greatest rain we have had this year was only 2 inches and a little more, and it made the river rise 12 or 15 feet. It might have been heavier higher up.

Mr. John Kennedy Howe called in and examined:—

1649. *President.*] Have you observed the height to which the floods of 1857 and 1864 and 1867 rose in this district? At my place there was very little difference. The 1857 flood was about a foot higher I think. Mr. J. K.  
Howe.
1650. Whereabouts is your place situated? Within about a mile of here, below Singleton. 27 Sept., 1869.
1651. Is it near the river? It is on the bank of the river. The water was close up to the house.
1652. You say that the 1857 flood was about a foot higher than that of 1867? Yes, at my place.
1653. Did the 1867 flood seem to remain up as long as the flood of 1857? About the same time; but then the railway kept a deal of water back in 1867. It would have been higher I think in 1867 than it was in 1857 if it had not been for the railway. It took a great deal of water down by Mr. Dangar's that we should have got here.
1654. Did you observe the 1861 flood? I was here at the time, but I do not recollect that I made any particular observation.
1655. And the 1864 flood—do you remember that? I could not speak as to the height of the flood of 1864, but I think there is very little difference between the flood of 1857 and that of 1867.
1656. But you made no absolute observations? No, I made no memorandum of it. It was scarcely so high.
1657. But you did make careful observations of the other two floods—those of 1857 and 1867? Yes; I put stakes down. The flood came to the foot of the hill I lived on. There was a dwelling-place that the water reached in 1857 to which it did not reach in 1867; but I believe it varied in other parts of the locality, at least so I have heard them say.
1658. Did you ever hear on good authority of any higher flood than that of 1867? No, I do not think there has ever been any higher flood than that. I was quite a boy when I came here.
1659. *Professor Pell.*] And you have never heard anybody say that there was a higher flood before that time? No; the place had only just been inhabited.
1660. *President.*] You came about 1823? 1823 or 1824.
1661. Do you remember the flood of 1826, or thereabouts? I might not have been here at that time. I did not live here always—I only came out occasionally. I think I was not here in 1826.
1662. *Professor Pell.*] If there had been a very great flood in 1826 would you have heard of it? There was a great flood about that time, but I was on the Hawkesbury at Windsor. On my return I heard how high the flood had been, but I cannot say as to the height of it. From the water it left, and which was on the farm when I came back, I should judge it must have been nearly or quite as high as these late floods.
1663. Have you any reason to suppose that it was higher? I could not say. I only speak from hearsay. All the water had run off that could by the time I came out. The land was all under water about Mr. Dangar's. There was a man drowned at the time; that brings it to my recollection.

- Mr. J. K. Howe.  
27 Sept., 1869.
1664. *Mr. Bennett.*] Do you suffer much from droughts here? We have suffered in former years and during the last five years.
1665. Every year? More or less; that is, it has during a partial drought. We had a flood here last June two years.
1666. Do you remember any of the severe droughts? Yes, perfectly well.
1667. When did they occur? I could not say as to the year. I have seen the river so that you could not get a drink of water.
1668. How then was the town supplied? I mean that there were parts of the river so. It was perfectly dry for miles, but there were holes. There was one hole about a mile long below my place.
1669. If a drought were to occur now, would there be any great inconvenience in consequence of want of water in Singleton? No, there would be always plenty of water in the holes.
1670. How much would it increase the value of the land if you had a supply of water during those droughts? I could not say. It would increase the value very much. I do not think myself that there is any fear of ever being short of water.
1671. But if you had water to flood your lands and water your crops, what would that increase the value of the land? I cannot say anything about that. Being a native of the Colony, it is only by reading and hearing that I know anything about irrigation. I do not know what the value of the land would be if it could be irrigated. It would be invaluable almost.
1672. Do you think it would be more than double its present value? I should think so, as far as agricultural and grazing lands are concerned.
1673. *Professor Pell.*] What is about the average rental of land? From 15s. to 20s. per acre.
1674. *President.*] Have you observed any change to take place in the bed of the river since you have known it? No, the bed of the river has never changed, but the stream has changed.
1675. There has been no permanent observable change? None that I am acquainted with.
1676. There are the same number of sandbanks as before? The banks have fallen in, but I do not think that has changed the course of the river.
1677. You think the river has not undergone any organic change? No. At the crossing-place here the stream has changed from one side to the other.
1678. *Mr. Bennett.*] You know the Wollombi—do you not? Yes, I have been up and down it several times.
1679. There is a good deal of valuable land flooded on the flats? Yes, I suppose all the good land is flooded more or less.
1680. But there is a good deal of it? Between the mountain it is only a narrow belt.
1681. But taking the average? There is a good deal of good land. I have not been much about, but still I know there is a good deal.
1682. *President.*] Do you consider that these high floods, by making a deposit on the land, do it any permanent good? I do not think so. There are certainly small portions where a deposit is left, but they are very small. It is only where there is an eddy. No doubt those lands had deposits formerly, but I do not think they require any more.
1683. Do you not think the land would get worked out unless you had these deposits? The greater part of the land on the Hunter will never wear out. It is a rich black clay. There is very little deposit, as far as my experience goes, except on those spots I am speaking of (we call them cedar brushes here) generally the lower end of the flats.
1684. *Professor Pell.*] Was there any one in Singleton in 1820, do you know? I think that was about the year the Hunter was discovered—in 1819 or 1820.
1685. Mr. Eckford was at Maitland in 1818? I am not speaking of Maitland. My father was the first discoverer of this place.
1686. You do not know any one who was resident here in 1820? I do not know of any one, unless it was my father's establishment and Mr. Singleton's—they were the first.
1687. *Mr. Bennett.*] Do you know any one here now who was here then? Mr. Brown, I think, would be one of the first—Mr. John Brown. I do not know of any one else. I cannot say to the year precisely, but I think it was about the year 1820 when they first came.
1688. Is there any other important matter in connection with the floods that you would like to mention? No.

---

Mr. John Brown called in and examined:—

- Mr. J. Brown.  
27 Sept., 1869.
1689. *President.*] You are a very old resident in this district, I believe? I think I am about the oldest now living.
1690. Were you here in 1820? I was not.
1691. In what year did you come? Either early in 1824 or late in 1823.
1692. About the time of or shortly after your arrival here, did you hear of or perceive any evidence of an unusually high flood? I could see the drifts in the high oak trees along the river where they had been left by the flood.
1693. Comparing those marks with what you have since observed in the floods of 1857 and 1867, did it seem to you that the early flood of which you speak was higher than those? I suppose there was as much as 12 feet of difference.
1694. *Professor Pell.*] You think that the early flood was the highest? Yes. I judge from the drift in the trees—the grass and stuff left in the oaks. It was very noticeable, and from the appearance it had not been long there.
1695. Have you had an opportunity of comparing these marks with the recent floods? I should have no occasion to compare them, because in our own house, the highest flood we have had since I have been here only came in 4 feet, but these marks would be 8 or 10 feet above that.
1696. The marks in your house in 1857 and 1867? In 1857 the water in the house was 4 feet. That would be 5 feet 6 inches above the ground, because the floor is a foot or 18 inches above the ground.
1697. These marks were in trees near your house? Yes. At this time the conveyance of water was by yokes; and people must observe the marks when going for water.

1698.

1698. *President.*] Was the flood of 1857 or that of 1867 the highest you have seen? It appeared to us that the flood of 1857 was higher here than that of 1867, but there was good reason for its not being so high as the early flood. Mr. J. Brown.  
27 Sept., 1869.

1699. To what do you attribute that difference? The embankment of the railway.

1700. Kept it back? It threw the water above Baker's crossing-place, so that it would go above the railway.

1701. *Professor Pell.*] You are speaking of the flood of 1857, and you say that that was higher than the flood of 1867? Yes, but we could well account for that on account of the crossing of the railway.

1702. In the recent flood? Yes.

1703. *President.*] Did the water run over Mr. Dangar's place the same in 1857 as it did in 1867? I could not say, but I should say, from the nature of the fall, that it would be higher at Dangar's because they would have all the water above.

1704. They would have both streams? Yes. The first place at which it breaks over I think is immediately at the back of my own place.

1705. Did you ever hear any remarks as to the 1867 flood being as high as that of 1857 anywhere else about the river? For my own part I think it was quite as high, and if that preventive had not been there we should have had everything as we had in 1857.

1706. You think, generally speaking, that the two floods were about the same height? I think so. It was very high indeed. The last flood I think was quite equal to that of 1857, but we had not so much of the water here perhaps as we should have had only for the railway.

1707. The flood of 1864 was high? Yes, very high. The whaleboat came to my own back door and took some of my family away.

1708. Did it rise in your house? Yes, it was about 4 feet in the house. There was a very trifling difference—they seemed to be about the same.

1709. Did you observe whether the 1867 flood and that of 1864 remained up as long as the flood of 1857? As soon as a change comes, in ten or twelve hours it is down below the bank again.

1710. And does it fall very rapidly? Very rapidly until it gets to a certain pitch.

1711. *Professor Pell.*] You did not see the flood you spoke of as being so much higher than either of these recent floods, but only the marks? No; it was in 1823 I came, and I saw the drift in the trees.

1712. You feel quite sure that that flood was so much higher? I should say it was from 8 to 12 feet higher. We noticed that it was very high, and I was thinking what would be the state of the flats if such another flood should come.

1713. Were you here in 1826? Yes, and I have been a resident here ever since then. I recollect every flood we have had since that time.

1714. How high was the flood of 1826? It broke over the banks, but not anything to speak of.

1715. It was not like the former floods? No. Where Kingston's mill is now, old Ben Singleton's inn was. Between that and our own place it broke over the third rail of the fence. I did not think anything of that.

1716. Did the floods of 1857 and 1867 do much damage to the farmers about here? I do not think they suffered much, excepting those on the false banks. The people are cultivating those banks. On the higher lands I do not think any damage was done.

1717. The flood did not stay on them long enough? No.

1718. The damage suffered was nothing compared to that sustained by the Maitland people? All the damage was the houses getting very damp and a great deal of fencing being swept away.

1719. And a great many crops lost? No, they were not subject to that.

1720. *President.*] Is there much difference between the value of the land that is flooded and the value of the land that is not flooded? The land that is flooded is the most valuable land; the other land is of much less value.

1721. Did the trees you spoke of, as having seen the drifts in, grow near your residence? Yes, on the bank of the river.

1722. So that you can perfectly recollect the circumstance? I know the floor of the house and the height of the trees, and where the water breaks over first; but it was further on than that. This place where it broke through first was not the place where we used to have the water dipped. At that time the oak trees were very plentiful.

1723. Do you suffer much from drought? We have suffered very much at times.

1724. Would the people be inclined to pay for having the water constantly supplied to them so that they could irrigate their land? It is a thing that has occupied my mind for a length of time, that people could well afford to pay a tax; that if they could get facilities for irrigating the lands, wherever people are benefited they should pay for it. It would be one of the greatest blessings that could be possibly secured.

1725. What do you think they could afford to pay an acre as a tax for supplying water? It would fully double the value of the land. It might be that it would treble it.

1726. What do you think is the value of land per acre per annum? We know what good land has been sold for. I do not consider alluvial land worth more than from £5 to £8 per acre.

1727. What is its value per acre per annum? The rent would be very low at present. It would be merely the grazing.

1728. Would it increase the value of the land 10s. per acre per annum? It would increase it more than that, because here at present you could not get more than 10s. an acre per annum for the best alluvial lands in fenced paddocks. If there were facilities for irrigating those lands, double or treble the quantity of grass could be obtained.

1729. How much would it increase the annual value—10s. or 15s. an acre? It would increase it a hundred per cent.

1730. Would it increase it 10s. or 15s. an acre? I am sure it would, and no mistake.

1731. Has any change taken place in the banks of the river since 1820—has there been any clearing away of the scrub, or was there any scrub on the banks? Where the false shelves are was rich brush land, and brush has grown on them.

1732. But a great deal of the brush is now cleared away? Yes, nearly the whole of it.

1733. *Professor Pell.*] Were these flats covered with brush? No, it was like a park in its natural state. There was a tree here and there.

Mr. J. Brown. 1734. *President.*] But has the same sort of thing taken place here that has taken place about Maitland? I know that a great deal of brush has been cleared off about Maitland, because it grows on the most valuable land.

27 Sept., 1869.

1735. It is the same here, is it not? Not to the same extent as at Maitland. We had not so much brush land here; there they have it in hundreds of acres.

1736. Did the same thing take place here on the immediate banks of the river? We never had much brush to speak of as compared with Maitland—from the Maitland side to Morpeth was one brush.

1737. What I want to know is, whether there was any impediment to the free discharge of the old floods, by reason of there being much timber on the banks? I do not think there was much impediment that way. The only difference I could see here would be a break of the bank. At M'Dougall's a great deal of land has fallen in. This side gains, but a little above the crossing-place at Kingston's Hill it broke into that.

1738. Were there many oaks growing in the bed of the river when you came here first? No, not many.

1739. Was the river generally as clear of timber as it is now? Here and there a few oak trees grew in the river and along the banks, but they were nothing to speak of.

1740. And the brush was in patches, and not general? Yes, it was very trifling compared with Maitland.

1741. *Mr. Bennett.*] I think you told Mr. Moriarty just now that on the false banks of the river there was brush growing? Yes, but the distance may be only 30 or 40 rods, and those places were few and far between.

1742. *Professor Pell.*] You think that the water had as good a chance of getting away then as now? Yes; we could see that the water had a free discharge by its carrying off the dead timber. As the river rose it carried the dead timber down the stream.

1743. Was there as much dead timber in the river then as now? In the flood of 1857 an immense quantity of dead timber went down.

1744. I am speaking of snags and dead trees? There was nothing of that kind in the river to the same extent as I read of other places, the river being of a pebbly bottom and sandy.

1745. And as regards the sandbanks you do not see any perceptible change? No, there has been no change—no shifting. There are many places in town where the water did not reach at all. There is Mr. Munro's place, the Presbyterian Church, the Catholic residence down here; it did not reach any of these places, and even a portion of my own land it did not go over.

Mr. Alexander Munro called in and examined:—

Mr. A. Munro. 1746. *President.*] Were you here at the time of the flood in 1857? I remember a flood in March in 1832. I was here in 1830.

27 Sept., 1869.

1747. Do you remember any floods as high as that of 1857, which occurred before that time? I remember that in some parts of the river the channel was narrower.

1748. But as to the height of the floods, was there previously any flood as high as that of 1857? No, not taking it as a general flood.

1749. Did you make any marks in 1857? Yes.

1750. And did you make any marks in 1867? Yes.

1751. And which flood did you find to be the highest? The flood of 1857.

1752. By how much? It did not come within 6 inches of the "Caledonian."

1753. The 1867 flood did not? No.

1754. And how much did the 1857 flood come into the "Caledonian"? It was high and dry. I had a ton of sugar in the cellar. The water came to the end of the house.

1755. What was the difference of level between those two floods? Fully 6 inches.

1756. That of 1857 being the highest? Yes.

1757. The flood of 1864 was a high flood, was it not? It was.

1758. Do you know how high that came? It was not so high as either of the other two.

1759. By about how much? It came to about the level of the floor. There must have been about 4 inches difference between that and the second flood.

1760. You could not estimate the difference in height? It was about intermediate.

1761. You do not mean that it was as high as the 1867 flood, do you? No, the 1857 and 1867 floods were the highest. The highest was that of 1857, then the flood of 1867, and then the flood of 1864.

1762. Was the flood of 1832 as high as the flood of 1857? In some parts it was higher. It made the channel larger, so that the flood of 1857 had more room to get away.

1763. There was a change in the channel of the river between 1832 and 1857? Yes, a great change.

1764. Whereabouts? All along the banks.

1765. Do you think there has been such a change in the bed of the river since 1832 that the flood is enabled to get away more easily than in former years? Yes.

1766. What change do you refer to more particularly—the clearing away of the timber? Each flood making channels for itself.

1767. Have you seen yourself any considerable change of that kind? Yes, I have gone up the bed of the river for a considerable distance when I could not get a drink of water, and the river was much narrower then. Even opposite here at Mrs. M'Dougall's the bank is cutting away on to the cultivation land, and the ford is also getting wider.

1768. Are not other places getting an increase—does not one man gain what another loses? Not here.

1769. Does it not make ground in other places? No. In back creeks, such as Fordwick Creek, where the land is flooded considerably, the floods have taken away a deal of land.

1770. Do you think the river banks being fed over by cattle has aided in allowing the general channel to be scoured out and made wider? No doubt the cattle on the banks in search of herbage crumble them. The timber comes down here very rapidly.

1771. When you first came here was there much timber growing in the river? Yes.

1772. Are the trees growing as numerous now? No, they have been swept away.

1773. There is a perceptible change in the bed of the river since 1832? There has been a great deal of change.

1774. Did the flood of 1867 remain up as long as that of 1857? No, the flood of 1857 staid the longest. Mr. A. Munro.
1775. Had any important change worth noting taken place in the channel of the river between 1857 and 1867, irrespective of the earth-works to which you have referred? No further than that the 1857 flood had made room for itself. 27 Sept., 1869.
1776. There was the same general change going on? Yes, the flood in March 1832 left great holes in Glenlyddon, and the people were leaving there.
1777. Are they living there now? No.
1778. Were they swept away by the floods? No, the land was changing hands. If they had not left for that reason they would have had to remove on account of the floods.
1779. Are you acquainted with the river below Singleton? Yes.
1780. And the same change has been going on there? Yes, but not so rapidly as above, because when the Goulburn water, and the Cockfighter's Creek, and the Wollombi Brook meet, they have great force, but as they go down they have more scope to spread. The flood of 1857 made a great deal of alteration below as well as opposite here.
1781. *Professor Pell.*] Was there much scrub on the banks of the river when you first came? There were a great many oaks, but there was not much scrub.
1782. Do floods such as the flood of 1867 do much damage to the farmers? Yes, a good deal.
1783. Do they lose their crops? Yes, on Scott's Flat, on the Glendon Estate. All on the north side of the river over here have suffered greatly.
1784. But they did not suffer in proportion to the Maitland people? No.
1785. *President.*] Were there here any records of the 1820 flood when you came? No.
1786. You never talked to any of the old residents about it? No.
1787. You knew Mr. Singleton very well? Yes.
1788. Did he describe it? No. I do not think that any white man knew anything of the 1820 flood. The blacks said that the 1857 flood was the highest.
1789. *Professor Pell.*] Higher than the flood of 1820? Yes.
1790. *President.*] Do you think anything the blacks say on a matter of that sort, extending over twenty-seven years, could be relied on? No. The best authority for that would be Mr. G. B. White, because he took more observations than any one with respect to the floods.
1791. Was he here in 1820? No, but I think he was here shortly after.
1792. Did he ever say that he had seen a higher flood than that of 1857? I have heard him say that he had watermarks higher than those of the flood of 1857. While out surveying, he has seen flood marks 14 feet over his head when he was on horseback.

---

Mr. William Copeland Leslie called in and examined:—

1793. *President.*] You are an old resident of Singleton? Yes, I have resided here about twenty-eight years. Mr. W. C.
1794. Have you heard of any authentic records as to any very heavy floods before you came here? As far as I have been able to glean, there have never been any higher floods than that of 1857. This is the opinion of the blacks too. I used to be particular in asking, but I was never able to ascertain that there were ever higher floods than those of 1857. Leslie.
1795. As regards the 1867 flood—was that as great as the flood of 1857? Not by 8 inches at my shop. I measured it. 27 Sept., 1869.
1796. Taking into consideration the duration of both floods, do you think as much water came down in the 1867 flood as in the flood of 1857? No.
1797. Did the 1867 flood run more rapidly than that of 1857? Mr. Wade and I measured the current, and found that it was running seven miles an hour.
1798. Did it seem to subside more rapidly? Yes.
1799. The river could not have been so gorged with water in 1867 as in 1857? I attribute the height of the 1867 flood to the railway. Previously the flood broke over by the railway and over to the flats, but now it is jammed in the river.
1800. You think it ought to have had the effect of raising the flood of 1867? Yes; I believe that the water brought down the river was damned instead of going on to the flat.
1801. *Professor Pell.*] You think the railway had a tendency to raise the flood in town? Yes; that was a strong argument we advanced in favour of that being open. The whole thing was calculated by the Rev. Mr. White, and laid before Mr. Whitton, but Mr. Whitton thought there was a sufficient waterway.
1802. *President.*] You think that although the embankment may have assisted to throw some of the water into another back channel, on the whole it had the effect of raising the flood? It must have raised the river, because the water instead of being distributed over the flat country, was kept to the channel of the river, and it raised it some feet no doubt. If the water had been distributed as it was in the 1857 flood, the 1867 flood would not have come over the banks.
1803. *Professor Pell.*] You think there was less water in 1867? The water was 8 inches lower in my shop in 1867 than it was in 1857.
1804. *President.*] How about the level above the dam—could you get any evidence on that subject? There is only one part above this embankment where it used to break over—a little above Barclay's. It used to go between Dangar's and Larnach's.
1805. It used to do that in former times as well as in 1867? Yes.
1806. Could that have relieved it then? The embankment had been raised, but we had not the same quantity of water in 1867 that we had in 1857. There was not so much rain. There is a public-house where the water stood  $4\frac{1}{2}$  feet in 1857, but where there was not a drop in 1867. The embankment carries it away in another direction.
1807. Are there no marks above the embankment by which we could compare the flood of 1867 with that of 1857? No, I think not. In 1857 the water was coming up Elizabeth-street past the Court House, and this house was in water; but it was not so in 1867.
1808. You think that this flat would have greatly relieved the river if the water had been allowed to spread over it? Yes. 1809.

- Mr. W. C. Leslie. 1809. *Professor Pell.*] A good many witnesses think there was more rain in 1867 than in 1857? It could not have been so. There was not so much rain. I happened to be in a corner, and I measured the height of the flood on my counter.
- 27 Sept., 1869. 1810. From Maitland to Morpeth, and Raymond Terrace, was not the river higher? Below this there are a great many tributaries, as at Black Creek and Westbrook.
1811. Does the water of those creeks bear any considerable proportion to the whole of the water? The proportion is not so great, but there is a large extent of country, and they all take their rise in that range. The rain of 1867 did not go so far up in the interior as the rain in 1857.
1812. *President.*] These rain-tables cannot be of much use in estimating a matter of this kind. They shew that in 1857 51 inches of rain fell, and that in 1867 there were 58 inches.  $12\frac{1}{2}$  inches fell in June, 1867, whereas in August, 1857, only  $4\frac{1}{2}$  inches of rain fell? The rain in 1867 was confined to the coast range, but in 1857 the rain was general all over the Colony. The Namoi and other rivers were flooded as well as the Hunter.
1813. The only inference I draw from this is, that these rain-tables are no guide in regard to this place at all? No. There is sometimes heavy rain at Newcastle when there is not a drop here; the rain does not cross these ranges.
1814. You are disposed to think that the evidence of extraordinary floods in 1820 and 1826 is not very much to be relied upon? I do not think it is to be relied upon at all. When there were very few people here, there were quantities of dead timber and grass in the lagoons, and the rains in former times were longer in coming to the channel. But the river now is twice as wide as it was when I first came here.
1815. *Professor Pell.*] The water has now a better chance of getting off? Yes. I am not at all afraid of floods. I believe that every flood makes room for itself. Opposite my own door half an acre of land has fallen in, and part of the bed of the river; near the opposite bank was a road where you could have driven horses and carts. There has been an immense increase in the size of the channel. The river was, many years ago, full of stumps and debris, but the last two or three floods have washed it quite clean from about here. When I came here first, at the crossing there was a beautiful island, well grassed over, and covered with oak trees.
1816. Near Brown's? Near Brown's bank. Every one of those oak trees has been swept away, and feet and feet of the bank too.
1817. If there had been any flood in 1820 so destructive as that of 1857, when you came here the channel of the river you think would have shown the signs of it? Yes, that quantity of water never could have gone down without making any show.
1818. Were the oaks and the other timber of good size? Yes, but they were all swept away.
1819. *Professor Pell.*] When were they swept away? The 1857 flood I think scoured them all out. Of course I have seen floods previous to that of 1857, but they never came to within 4 or 5 feet of the bank.
1820. Do you think the existence of those trees was a clear evidence that there was no such flood before as that of 1857? Yes.
1821. *Mr. Bennett.*] Could not those trees have grown between 1820 and 1857—were they more than thirty-seven years old? Yes, some of them were a hundred years old.
1822. *President.*] Do you think you can perceive any influence of the general settlement of the country on the floods, irrespective of the rainfall—Would the same rainfall bring down now a greater or a less flood than in former times? It would be brought down quicker. The ground is trodden down by cattle, and grass and dead timber have been cleared away, so that the water runs quicker off the land than it did formerly.
1823. *Professor Pell.*] Do the farmers suffer much from floods such as that of 1857? If they take place when the crops are in.
1824. Did many of them lose their crops in 1867? That was in June. Yes, they lost what they had in June.
1825. And had to sow their land again? The flood only lasts for a day or two.
1826. They do not suffer here from floods anything like the Maitland people? No, some of the farmers here rather like a flood than otherwise.
1827. Do they not suffer almost every year from floods or drought? We suffer more from drought than from floods. During the twenty-eight years I have been in this district we have only had three floods.
1828. And how many droughts? We have droughts from year to year—sometimes two or three years in succession.
1829. If a proper system were adopted to supply water to the farmers in times of drought, how much do you think it would increase the value of land per acre per annum? It would no doubt greatly increase the value.
1830. Would it double the value do you think? Quite that. Instead of growing from fourteen to twenty bushels to the acre, by a proper system of irrigation they could double it.
1831. Do you think the practice of sapping timber has any effect? I believe it has. I have given some attention to that subject.
1832. And what is the conclusion at which you have arrived? I believe there is not the same attraction for rain passing over the country as there would be if the trees were left.
1833. It makes the country drier, and the floods come down more rapidly? Yes.
1834. Have you had any conversation with Mr. G. B. White about the floods? Yes.
1835. Does he not say that the floods were higher previous to 1857? No. He happened to be at my place on the night of the flood of 1857. I said to him, "I have never seen it so high"; and I asked him if it was necessary for me to remove my goods up-stairs, and he said "No, I have never seen it so high." I took his advice, and I lost nearly all my goods. It stood 4 feet in my shop.
1836. *President.*] How long had Mr. White known the district? He came here in 1829 or 1830.
1837. As a surveyor? As a surveyor.
1838. Was it he that laid out this township? No, it was laid out by Mr. Singleton. It was first surveyed by Mr. Rogers, and then by Messrs. Reuss and Browne.
1839. That was in the old time? It was discovered on the 17th March, 1821, from the Sugarloaf Mountain. I commenced writing a history of Singleton at one time.
1840. You have all the data then as far as the floods are concerned? No, I have lost them; but I collected a good deal about the parties coming here, and the settlement generally.
1841. Mr. White surveyed the river here at an early date? Mr. Dangar was the first to come up here. He came in his own whaleboat. 1842.

1842. From where? From Maitland.  
 1843. Was it immediately after a flood then? No.  
 1844. Was the river navigable? It appeared to have been in those days.  
 1845. They would probably haul their boat over the shallows? Very likely.  
 1846. When did Mr. Dangar come here? Very early.  
 1847. If he selected a farm and built himself a house on any part of this river, it is presumable that he would not build below the flood-mark? He did so though, nevertheless. The water in 1857 was running through his house at Neotsfield.  
 1848. *Professor Pell.*] His house is very near the river? Yes. The river stood in 1857 44 feet exactly.  
 1849. You think Mr. White could not have made a mistake in reference to the level, when he spoke of the flood which came into your house? No, he could not have made any mistake. He knew this town from the day the first house was put up, and he knew exactly. The water was close up to the house of Mr. White in 1857.

Mr. W. C.  
 Leslie.  
 27 Sept., 1869.

TUESDAY, 28 SEPTEMBER, 1869.

Present:—

E. O. MORIARTY, Esq., PRESIDENT.

P. F. ADAMS, Esq., | W. C. BENNETT, Esq.,  
 PROFESSOR PELL.

Mr. Duncan Sim called in and examined:—

1850. *President.*] You are for very many years acquainted with the district? I have been in the district many years. Mr. D. Sim.  
 1851. You have observed the floods? Yes. 28 Sept., 1869.  
 1852. Do you remember the flood of 1857? Yes.  
 1853. Did you take any notice of its height? Yes, it rose 15 ft. 9 in. above high-water level.  
 1854. Did you note the flood of 1867? Yes, it was a bit higher. In some places it was less—in some places more. The height seemed to be affected by the rainfall, the wind, and other local causes. I do not think it was above 6 inches higher than the 1857 flood.  
 1855. *Professor Pell.*] You are sure it was not 18 inches? No, I do not think so.  
 1856. *President.*] Not at Morpeth? Not at Morpeth.  
 1857. Do you know how high the flood of 1864 was? No, I took no measurements; the flood of 1857 was the only flood I noticed particularly. I give merely a rough estimate of the heights of the floods of 1857 and 1867.  
 1858. And now, with reference to the time the floods remained up here? I took no notes.  
 1859. Can you remember which flood remained the longest—was there any difference? My present impression is that the flood of 1857 lasted longest.  
 1860. Do you remember about the rise—the time it commenced to rise here? No, I cannot remember.  
 1861. Did it seem to take long to rise? It rose very gradually. If I remember right, the rainfall took place in the lower part of the Hunter, and that part of the district was flooded first from the Paterson and the Williams Rivers. Their waters remained for some time, and then, after a rainfall, the Hunter came down. The rainfall seemed to be heavier in the valley of the Paterson than on the Hunter or Williams. The Hunter rose very gradually, and remained for a long time upon the land.  
 1862. The Hunter did? Yes.  
 1863. Is that a feature of the floods—that the Paterson and the Williams come down before the Hunter? I have noticed that they come down simultaneously, but they remain a shorter time upon the land. I do not quite remember the way in which the flood occurred, but I know that the water was on the land for days and days—for four or five days the lands were covered with water.  
 1864. *Professor Pell.*] Do you remember the time of day at which the rise commenced? No.  
 1865. *President.*] You made no notes upon it? No. I should refer to the extracts in the report published by you to refresh my memory. The report contained a correct record.  
 1866. You made no independent notes that you can now give us? No.  
 1867. Do I understand you to have observed any difference in the times that the floods of the Hunter and the Paterson came down? Well, the Paterson generally comes down first.  
 1868. Is there any great specific difference of time? There is no rule. Sometimes they come down together. On the occasion of the last flood the Paterson only did damage.  
 1869. What flood was that? It was the flood of last year. It was a high flood in the Paterson, but the Hunter did little or no damage. There was much damage done below the Paterson township.  
 1870. Do you know the country above Hinton—Is there any run of water from the Paterson above Hinton to below it—Does the water run at the back of the high ground on which Hinton stands? Yes, the flood breaks from the Paterson.  
 1871. That is below Osterley? Yes [*looking at plan*], it breaks across here. This is principally swampy land. The Paterson River breaks over from below Dunmore, and goes with a considerable rush at the back of Hinton. A large quantity of water comes past Greenrock by way of Batti's Swamps.  
 1872. *Professor Pell.*] Does the rush of water scour the land? No, it does not scour the land, because the width of the flood is very great. The land is all low swampy land.  
 1873. *President.*] Did the floods rise as high as the tops of the fences? I think they did.  
 1874. *Professor Pell.*] A considerable quantity of water escapes then at the place you have indicated? Yes, all the water that comes must go through this gap. I read Mr. Moriarty's report, and saw that he did not come to this gap. If a section had been given, some estimate might have been made of the quantity of water that goes by Hinton from the Paterson River. It struck me that in considering that question this would have been an important point to deal with.  
 1875. Can you describe the place you call the gap accurately? Yes [*indicating it on the plan*], the water runs across to this point.  
 1876. That is below Eales's? Yes, below the place called Eales's.  
 1877. There is a considerable rush of water at these floods? Yes, there is a motion in some places, and it is pretty rapid—sufficient in some places to drive the fences down. 1878.

- Mr. D. Sim. 1878. *President.*] It is rapid enough from the Paterson to drive the fences away? Yes.
- 28 Sept., 1869. 1879. As well as you remember, the period of time at which the floods attained their height is fully and correctly stated in my report? Yes, as far as my experience goes. I should refresh my memory from the report. I could not get the report itself, but in the portion published in the papers I watched to see if you had surveyed this gap.
1880. There are a great number of sections on the plan? I know there are.
1881. About how many miles below Hinton would the direction taken by the waters bring them out? It would be about 4 miles I think.
1882. I have a section 2 miles below Hinton? That would be about the head of Eales's Flat. It is below that.
1883. It would not be 7 miles down? No, it would not be 7 miles.
1884. It would be about midway between the mouth of the Paterson and that of the Williams? It might be 5 miles.
1885. Well, I have not the section taken. We must get one taken. Now, do you think it would be dangerous, in the case of such a flood as that of 1857, to bring the flood waters down more rapidly than they come at present? I think not, if provision was made at the lower part of the river to receive them. The river at the seaboard runs very little above high-water mark. The rise of the flood is always gradual, and I think if cuttings were made to straighten the river, in the way suggested, that the material taken out of the cuttings might be used to raise the bank on each side where required.
1886. Do you think it would be safe, by any works or by any cuttings, to raise the water higher at Morpeth than it was at the 1857 flood—would it be dangerous to the adjoining lands? Of course it would.
1887. Do you think it would be attended by any serious injury to the lands? From what I have learned, some lands would be benefited and some would be injured. In some cases the alluvial soil has been taken away to the whole depth of the plough.
1888. *Professor Pell.*] Do you think there would be a great extra damage if the flood should be about 2 feet higher? There is no question about that at all.
1889. *President.*] Can you estimate the amount of damage that would probably be caused? No, I could not very well. I know that the amount of loss is very difficult to estimate. The farmers give an estimate, but it is a very rough one, and sometimes an exorbitant one—an extravagant one. Every one suffers loss from floods. My own losses, which I cannot estimate, are very great.
1890. Your collateral losses? Yes, my collateral losses.
1891. Are you acquainted with the value of the land about Morpeth? Yes.
1892. How much is it worth per annum? £2 10s. to £3 per acre.
1893. That is the rent? Yes, that is the rent.
1894. Do you think if any project for embanking the river were undertaken, it would be worth while for the farmers to pay an increased rent? It would certainly be worth their while to pay something, say in the form of a drainage tax.
1895. How much do you think it would be worth their while to pay, taking into account the infrequency of these floods? It is very hard to say. It would depend very much upon the weather we had. If they were asked immediately after a flood they would be willing enough to pay, but if we had a continuance of such seasons as prevailed before the floods commenced they would not think it worth while to give anything. For fifteen years we had no floods.
1896. And may not for the next fifteen years? No.
1897. Looking at the question then, in this light, you think they would not be satisfied to be taxed? No; unless there were floods they would not be disposed to pay.
1898. *Professor Pell.*] But looking at the question independently of the feelings of the farmers, do you think a man, taking a rational view of his own interest, would consider 10s. per acre per annum, in addition to his rent, too much to pay—would it be worth his while to pay it? 10s. additional is a large sum.
1899. To be secure against floods it might be worth while to give 10s.? It would be almost too high a percentage. It would be worth while to pay 10 per cent. on the annual value of the land.
1900. If there were no floods to come for the next fifteen years—? It would then be worth while.
1901. Suppose you yourself were a farmer, exposed to loss from floods, would you give 10s. additional to secure yourself against them? I have no doubt the farmers have lost more than that; but 10s. additional rent per acre would be too large a sum to charge.
1902. *President.*] Is there much damage done in these very wet seasons, irrespective of the floods altogether? In the low places there is some damage done, but nothing in comparison to the injury caused by floods. The nature of the crop makes a difference in the loss.
1903. Which crop do you refer to? The lucerne crop—it is one of the most costly crops.
1904. It has to be put in afresh if the land is flooded? Yes, the water rots it.
1905. Would it not spring up again from the roots? No.
1906. Do you know how many days' submersion is enough to destroy a crop of lucerne? It depends entirely upon the season. In hot weather, when the water goes off, the sun scalds the plant and kills it.
1907. Do you think that if any proper system of drainage were carried out, coupled with embanking out the river, that it would prevent the crops from being injured? Yes, I am satisfied of that. You cannot get them to drain readily. The mode of letting the land is not calculated for making improvements.
1908. Do you not think a system of drainage of itself—a proper and judicious system—carried out so as to get rid of the ordinary flood waters, would be attended with great benefit? Yes, principally to the higher portions of the country. When a flood goes over the land, very few crops remain that are not entirely destroyed unless quickly relieved.
1909. How long did the flood of 1857 remain on the land? I cannot tax my memory; it was a long time.
1910. How many days? Something over a week. I have sailed over Phoenix Park Flat for a week or thereabouts; I would not be certain as to the exact time.
1911. When the flood was at its height in 1857 or 1867, did you observe whether there was any perceptible swell as the tide rose and receded? I never could observe the slightest difference. The flow of the water seemed to overcome all influence of the tidal wave.

1912. *Professor Pell.*] Can you give a rough estimate of the amount of damage done in 1867 per acre? I could not give an estimate of value. Mr. D. Sim.
1913. Do you think the amount was £10 per acre, taking into consideration the loss of stock and other property besides crops? Not so much I think—I do not think it would go so far as that. The way some people estimated their losses was by calculating what they had expected to get for their crops. 28 Sept., 1869.
1914. What would be the loss per acre of the lucerne crop? If destroyed entirely it would be worth very little short of £10. The crop is destroyed—it is lost—it takes from £4 to £6 per acre to put it in again, and there is the waiting for the new crop to come. The loss upon lucerne land is the greatest that farmers suffer.
1915. In addition to the loss upon the lucerne, would there not be other losses, say of pigs, poultry, stock, and property in the barns? Yes, but £10 is a very high average. I do not think there would be that sustained on the average.
1916. *President.*] Is there much unhealthiness caused by the floods? No.
1917. No malaria? No, I have observed none. The exposure may perhaps produce colds, but nothing serious.
1918. No fever and ague? No, nothing of that kind.
1919. Have you formed any views of the best means of protecting Morpeth from floods? Yes, every one has formed some ideas. The flood may now rise at Maitland 20 feet above high-water level without doing any very great damage to any part of the river, and I think that the channel of the river might be so improved as to carry off the additional water above 20 feet, without causing any serious damage. The channel could be so improved as to keep the water to the 20-foot level.
1920. How do you propose to do that—by straightening the course of the river and increasing the size of the channel? Yes, and wherever there is a low part of the bank, make use of the earth taken from the cuttings to make that low part up.
1921. Have you any estimate prepared of the size of the channel? No, I could not do so, for want of data.
1922. Now let me ask you this—Do you think your plan would have no effect in increasing the height of the flood? Provision should be made for carrying off the water below. Operations would have to be commenced at the lower part of the river.
1923. *Professor Pell.*] You propose a general improvement—your scheme does not refer to Maitland alone? No. The river rises 12 feet here before it does any damage at this place, and it rises in Maitland 20 feet before it does any damage.
1924. What plan would you suggest for getting rid of the water below Morpeth? I would suggest a cutting from about 4 miles below Morpeth to Raymond Terrace flats, and that the material from the cutting should be used to raise the bank where required.
1925. *President.*] I think you say that in straightening the channel you would take advantage of the natural channel as far as you could? Yes.
1926. Have you seen the cuts suggested in my report? No. [*He looks at them on the plan.*]
1927. *Professor Pell.*] You approve of the recommendations of Mr. Moriarty for improving the river between Maitland and Morpeth? Yes. I think the plan, if carried out, would make the river available for navigation, as well as afford an outlet for floods.

Mr. Osman Edmund Middleton called in and examined:—

1928. *President.*] You have observed the floods of 1857 and 1867? Yes, both.
1929. *Mr. Adams.*] Did you read Mr. Moriarty's report? I read it at the time it was issued.
1930. *President.*] Did you make any marks or accurate observations as to the height of the 1857 flood? Yes. Mr. O. E. Middleton.
1931. And again of the 1867 one? Yes. 28 Sept., 1869.
1932. Which was the highest? The last—1867.
1933. By how much? A foot.
1934. Where were your observations made? At Phoenix Park.
1935. Above or below the Paterson? Above.
1936. Were your observations made upon the Paterson or the Hunter? On the Paterson, at my own residence.
1937. Was the water in the Hunter the same height as in the Paterson? I could not say. I expect it would necessarily be so.
1938. Was there a sheet of water right across? Yes.
1939. Did you observe any difference in the duration of the 1857 and 1867 floods? I cannot say positively. I think the last was the longest—of the greatest duration.
1940. Have you observed in very high floods—those of 1857 or 1867—whether there was any marked interval between the time at which the Paterson came down bank high, and when the flood in the Hunter rose? No.
1941. Were both down at the same time? I can hardly say that, but I can say that there was a very great rise in the Paterson.
1942. Did you observe any difference in the velocity of the current down the Paterson in the early part of the flood from the velocity of the late part of it, that would lead you to think that the flood was due to the waters of the Paterson and the Hunter? There is a great difference in the velocity of the water at times during floods, but the velocity is greatest at the time of great floods.
1943. When they are at their highest? No.
1944. Do you attribute this increased velocity to the want of capacity in the channel to carry off the water? I attribute it to local causes. If the Williams River was in flood, the waters in the Hunter might be much higher without having any fall. On one occasion I remember I was unable to stem the current of the Hunter, although aided by a southerly wind. This was in 1857, and just above the Hinton punt.
1945. *Mr. Adams.*] Was the river then bank high? Not quite.
1946. *President.*] Suppose that by any cause any improvement or attempted improvement in the river, or by a flood of unusual height, the water was to rise 2 feet higher than in 1857, would it make any great difference to the injury done to the lands about Morpeth? Additional injury? Very little more, if the waters rose only as in 1867—it would not be much more. 1947.

- Mr. O. E. Middleton.  
28 Sept., 1869.
1947. *Professor Pell.*] You do not think that it would cause much additional injury? No; everything is destroyed when the water is up.
1948. *President.*] Supposing that any increase of velocity of current resulted from the increase in height, do you then think there would be much additional injury? There would be if there was much increased velocity, but there would not be much with the additional rise you speak of—1 foot.
1949. Additional velocity always creates scour? Yes.
1950. Would not the higher flood cover a considerably greater area? No; it would flood the area deeper, and would encroach upon high lands.
1951. If any works were undertaken to have the effect of raising floods, such as those of 1857 and 1867, would you be apprehensive of the results? I should always object to any rise at all.
1952. You think that would be the general impression of the people? Yes. But a rise of an additional foot, as everything is covered, would be immaterial.
1953. *Professor Pell.*] Supposing that the works proposed to be undertaken were such as to affect Morpeth with an additional 2 feet of water in case of very high floods, but not having a tendency to produce that effect in ordinary floods—would you then entertain any apprehensions for the district of Morpeth? I should object to such works—they would produce a large flood.
1954. You would object to any works that you thought would have the effect of raising the floods here about 2 feet or higher? Yes.
1955. *Mr. Adams.*] Have you made any observations upon the body of water that passes down between Hinton and the high land behind it? Yes, I have.
1956. *Professor Pell.*] From the Paterson? Yes, critical observations, repeatedly.
1957. *Mr. Adams.*] Is the present position of the roadway from Hinton to the high land the highest part of the section across? I should say it was.
1958. *President.*] Is there a very rapid current over the road? Yes.
1959. *Mr. Adams.*] Would you be able to pull a boat against the current? With difficulty. In a light boat I have done so.
1960. At what average depth do you estimate the overflow along the road—the average depth when the road was flooded? You could not cross it at all—it was over the tops of the fences, and over the horses' heads.
1961. What was the width of the channel between the Hunter and the mainland? About a mile.
1962. The average depth—about 5 feet? I should say more—it would be 12 feet in some places.
1963. *Professor Pell.*] A vast body of water flows over that flat in high floods? Enormous. It flows from the high land at the right bank of the Hunter to the low bank of the Paterson, nearly 2 miles in width, and with a velocity that you can scarcely pull a boat against. There is one circumstance I wish to mention. On the left bank of the Paterson the water has never risen to the same level as it has upon the right bank, and consequently it pours like a cataract from one level to the other.
1964. *President.*] If the channel of the Hunter were cut into the Paterson, would it sensibly relieve Maitland? Yes, if it was cut to the proper width. But you would add to the evil at Hinton. The water of the Paterson is nearly all gone before the water of the Hunter comes down. We never would be flooded from the Paterson; it is not the Paterson but the Hunter that floods us. It is the water from the Hunter that fills the river at that point. The Paterson water is still at the Hinton punt, and sometimes flows the other way.
1965. *Professor Pell.*] Does the water back up the Paterson? Yes, it is either still, or flowing upwards.
1966. Are you aware that the flood-water of the Paterson, in the early part of the flood, backs up the Hunter considerably? Yes, it does.
1967. And afterwards the process is reversed? Yes.
1968. *President.*] Now supposing that any works were undertaken on the river which would have the effect of bringing down the Hunter flood early, and making it concurrent with the Paterson flood, would any dangerous consequences arise? I think such consequences would arise.
1969. Then in fact it is a benefit to the country about here that the flood in the Hunter is held back by the form of its own channel until the flood in the Paterson has passed away? Certainly; it is a great benefit that they are not concurrent.
1970. And any works which might have the effect of bringing down the flood in the Hunter more quickly than it at present comes down, would be an injury to Morpeth? Not to Morpeth.
1971. But to the country? Yes.
1972. To the agricultural country? Yes.
1973. And on that account you would protest against such works? Yes. [*The witness reads a letter written for publication after the 1867 flood, and proceeds.*] I wish to make some other observations upon the depth of the water between the highland and the left bank of the Paterson. I was going to point out that the left bank of the Paterson is higher by several feet than its right bank, and consequently forms a barrier like a barrier reef throughout the whole extent from the line where the Hunter strikes it in time of flood.
1974. *Professor Pell.*] The bank does? Yes; and although the water appears to be continuous it only overflows to a very small depth. The bank forms a great barrier to the water getting away, and there are no means more effectual for relieving the Hunter than the removal of about half a mile, or even more, of the left bank of the Paterson, because, in addition to this patent fact that this bank is higher by several feet than the right bank, there is the circumstance that the water on the opposite side never reaches the same level. This must arise from the greater facility of escape for the water on that side of the bank. It is more particularly shown when the waters begin to recede, for it falls away at once from the right hand side, but on the other it does not get away.
1975. *President.*] Do you not think that this circumstance in itself indicates a certain natural operation, namely, that the water flowing over the left bank deposits the debris and wreck matter of the flood in larger quantity upon the left bank than on the right? It does not.
1976. Does not the deposit cause the bank to be raised? Yes, the immediate bank. The stuff does accumulate on the left bank.
1977. Should you not apprehend that the same cause would produce a similar effect, even if the left bank were cut down? No, because there would be such a current as to carry the debris away. There would be such a violence of current as would clear all impediments before it. It would clear everything just as it does in the river.

- 1978. *Professor Pell.*] Is there much valuable land on the left bank of the Paterson, and between that point and Hinton, that is damaged by floods? There is a great deal of valuable land there.
- 1979. Would the cutting away of this bank increase the damage occasioned now by the floods? It would increase the damage in times of small floods, because from the high nature of the bank the ordinary flood does not affect that side; an ordinary flood would then bring a flood in Hinton directly. But altogether you would save a great deal more land, and do a great deal more benefit than injury.
- 1980. It would be necessary to give compensation to owners of land in such cases? Yes.
- 1981. You think the mere cutting away of the bank, and nothing else, would largely increase the quantity of water that would escape? It would allow the water to escape, so that we should never have such floods as we have had.
- 1982. *President.*] On the right or left bank? It would relieve the right bank, and it would add to the flood on the left side. It would relieve Maitland and Bolwarra. The water, in time of flood, makes a clean breach at Largs from the Hunter into the Paterson.
- 1983. *Professor Pell.*] The Hunter, you say, breaks over the bank at Largs, through the Dunmore Estate, and falls into the Paterson, and this takes place before the Paterson is even over the right bank? Yes.
- 1984. And if the left bank of the Paterson were lowered the whole of this water would escape much more readily? Yes. I would like to make a remark. An artificial cut was made in the Paterson, about two miles or less above the point I speak of; the rush made the drain like a river. The effect of the Paterson not being confined within its banks was that it rose 18 feet on the banks of a farm near Mr. Arnold's—below Mr. Arnold's—and only 3 feet at my own place.
- 1985. *President.*] In what flood was that? In several floods.

Mr. O. E. Middleton.

28 Sept., 1869.

Mr. John Keating called in and examined:—

- 1986. *President.*] You have observed the floods of 1857? And all previous floods for twenty-eight years in the Hunter.
- 1987. The flood of 1857 was the first unusually high flood? Yes, the first very high flood.
- 1988. What was the next? 1867, and one in 1864.
- 1989. Was that so high? No, not nearly so high.
- 1990. Did the 1864 flood do much damage here? Yes.
- 1991. Did you observe the difference in the level in 1857 and 1867? The flood of 1867 was 6 inches higher than the 1857 flood. I marked it at the Queen's Wharf.
- 1992. Did you mark both floods at the Queen's Wharf? Yes.
- 1993. Did you observe any difference in the length of time they remained at their height? I think the 1867 flood seemed longest. I think the 1857 flood went away more quickly.
- 1994. Then it appeared that the 1867 flood was the greater flood? It was the greater flood. They were both very disastrous.
- 1995. Could you form any approximate estimate of the money value of the damage done in Morpeth and in the flooded country in the neighbourhood of Morpeth? Yes, confining myself to the district of Morpeth. I was one of those who went over the district—I went over the district on horseback to ascertain the amount of damage.
- 1996. How much did you estimate it to be? £80,000 worth.
- 1997. That is as distinguished from the Maitland district? Yes. There is a great deal of damage done in the Hunter district by the breaking over of the Paterson.
- 1998. Do you mean above or below Hinton? Both.
- 1999. Was that attributable to the Hunter or the Paterson flood? It was chiefly the Paterson flood, which broke across cultivated lands, and went into the Hunter below Hinton.
- 2000. Did you make any mark on the Paterson as to height? No, I did not take any notice, beyond observing that at certain times of the 1857, 1864, and 1867 floods the Paterson broke over at the Narrow Point, at Phoenix Park, into the Hunter.
- 2001. Was that when the Paterson was at its highest? When the Paterson was at its highest. The Hunter was not at its highest then. I can assign a reason why the Paterson was higher than the Hunter. Just below Hinton there are banks that jut out into the river, and when the Paterson flows into the Hunter, these keep the water back. The banks at the junction of the rivers keep the flood back.
- 2002. As a general rule did you observe that the floods in the Paterson come down before the Hunter flood? I do not know that it is the rule, but in the three great floods it has been so.
- 2003. Do you think that if the flood in the Hunter had come down at the same time there would have been more injury done? Yes. If the three rivers had come down all at once, it would have been very destructive.
- 2004. Then this is your opinion—that if by any operations on the river Hunter its flood could be brought down more quickly than it arrives at present, that effect would be injurious? I have endeavoured to think the matter over, as to the rivers' coming down, and have observed, in the course of twenty-five years, that the floods do not all come down at once. Sometimes the Paterson was the highest, sometimes the Williams, and it kept the other rivers back.
- 2005. Anything that would tend to bring the water down at the same time would be injurious? Very much so.
- 2006. In the great floods you did observe, you say that the Paterson flood came down before the Hunter? Yes. I think a great deal of the low-lying land about Maitland was flooded, but sand-banks and mounds of earth in the river impeded the flow of the current. The current is also impeded at Hinton from the same causes.
- 2007. As I understand you, you think the effects of floods would be diminished by improving the channel below Morpeth? Yes, and above to the Falls. Of course I am aware that the river can be deepened with effect to a certain depth; but I think if the sand-banks were removed the floods would get away sooner, especially partial floods.
- 2008. Are you acquainted with the condition of the river below Morpeth? I have taken a large interest in that. Years ago, myself and a few others engaged Mr. G. B. White to take a survey of the river from Newcastle to the Falls—the distance and the depths. Of course it must have changed very much since.

Mr. J. Keating.

28 Sept., 1869.

- Mr. J. Keating.  
28 Sept., 1869.
2009. Have you observed that after heavy floods any alterations have taken place in the width and depth of the channel about Morpeth? Yes, it is continually changing at this place.
2010. What place do you allude to? That place at Hinton, which is very remarkable. Above and below Hinton, on the Hunter, sand-banks are formed by the floods, which could be taken away by the dredge, and the escape of the water would be much assisted by the operation. In times of great floods the river is not adequate to carry away the flood-water. I am persuaded of that from what I have seen. There is a sea of water of about two or three miles in width between Morpeth and Phoenix Park; if that surface is covered at a depth of from 8 to 12 feet, look at the body of water that has to get away. The river is not adequate to carry it off. It follows as a natural consequence.
2011. Now, seeing the enormous body of water you have referred to, do you think any channel of such capacity as could be attempted would afford any relief to that inland sea? Well, the channel that might be made would carry the water away before it had gathered to such an extent. Some of the water would be carried by night and by day as it came. As soon as the water of the river rose to a certain height this other channel would be adequate. A canal has been talked about from West Maitland to Lake Macquarie, and I am inclined to think some such project feasible.
2012. Do you know anything of the country between the Falls, West Maitland, and Lake Macquarie—are there not many ranges of a great height? Yes, there are some ranges.
2013. Do you know anything about the permanent height of Lake Macquarie—do you think it is of the same height as the Hunter at West Maitland? No, we should then go higher up the river—how would it be by Hexham? I was very much pleased with your report, and especially that remark of yours about the flood-gates. I see they are being put up; I think they will be the means of raising the river beyond the usual height at Phoenix Park in time of floods 12 or 15 inches.
2014. You think they will be attended with injurious results? Yes, undoubtedly; and from my experience I am prepared to bear out all that you have advanced, but your estimate was high. I believe that nine-tenths of the people about here will take your view.
2015. Is there anything else you know—Each gentleman has had his own experience, of course, and we do not know exactly what questions to ask? I think if there was a cutting from West Maitland to Hexham it would relieve the bed of the river, which is inadequate to carry off the flood-water.
2016. And you would supplement it by this new channel? Yes, as soon as the waters were risen they would be carried off, and the flood would not rise to the terrible height that it has risen in times past. I have been in Phoenix Park after a flood and found no vestige of a house remaining.
2017. You think that any sensible increase in the height of the floods would be attended with the most disastrous results? Yes.

Mr. Richard Pulver called in and examined:—

- Mr. R. Pulver.  
28 Sept., 1869.
2018. *President.*] You are acquainted with the effects of the floods of 1857 and 1867? Yes, I have experienced both our seasons. In 1857 I was at Raymond Terrace, since then I have lived at Phoenix Park. I have been a great loser by the floods.
2019. Can you form any idea of the amount of injury done by the flood of 1867? I am not prepared to give an accurate estimate. I could speak of my own losses.
2020. How much per acre do you estimate your losses? My losses I should say in 1867 were not less than £300.
2021. How many acres do you farm? 30 acres—I lost £10 per acre.
2022. You were injured to the extent of £10 per acre? That is within the estimate.
2023. Were you flooded out at Raymond Terrace in 1857? No.
2024. Did it come to your knowledge that much damage was done by the flood of 1857? Yes, certainly there was more damage done by the 1857 flood than any other. It was the first of the great floods for many years.
2025. From your acquaintance with the country in 1857, could you say that a flood higher than that of 1857 would have done much greater damage? I could not say. The 1867 flood was higher by some 20 or 24 inches, but I cannot say what the difference was in Raymond Terrace.
2026. You heard what it was? Yes, I merely heard.
2027. And you think the same amount of loss that you sustained was experienced by your neighbours? In 1867?
2028. Yes, in 1867? It would vary according to persons' property.
2029. *Professor Pell.*] What was about the average—You lost about £10 per acre—Did you suffer more than most? I think I suffered more than most people.
2030. *President.*] Do you think that if the flood were to rise 1 or 2 feet more, very much additional damage would be done? I think all the damage would be done when the floods rose to that height; the only extra damage would be from the flood being longer in receding. Some part of my land would be flooded by a fresh and some by great floods. On the parts where the water remains longest everything is destroyed. Lucerne would escape being utterly destroyed if only 24 hours under water. I have witnessed that at my own place.
2031. Where is your farm? At Phoenix Park.
2032. What height was the water on your farm in 1867? About the average?
2033. Yes—What would you say above high-water-mark over the land? 7 or 8 feet. It takes three days in coming to that height, and about three days going off.
2034. Six days the water was on your land? Yes.
2035. Did you hear of much illness arising from the flood of 1867? A few instances, and a death or two.
2036. But generally no illness? No.

Mr. Samuel Smith Dickson called in and examined:—

- Mr. S. S. Dickson.  
28 Sept., 1869.
- 2037.] *President.*] You have been acquainted with Morpeth during the time between 1857 and 1867? I was in Morpeth in 1867 and before it.
2038. Have you observed closely the floods of 1857 and 1867? I took notice of them.
2039. Did you measure their heights? I did not, but I think if there was any difference between the two, that in 1857 was the highest.
- 2040.

2040. Where were your observations taken? At Ballard's near the Queen's Wharf.
2041. Did you make a mark on each occasion? I took notice of the mark I had made in 1857. I think upon consideration that the flood of 1867 was as high as the previous one—I think there was no perceptible difference.
2042. As regards the duration of these floods was there any difference? I could not say.
2043. There was a great deal of damage done? Yes.
2044. Did you form any estimate of the money value of the damage? Yes, as far as we possibly could; but I do not recollect the estimate we formed at that time—I could not exactly say what it was—it was a large sum.
2045. Was it £100,000? Over that.
2046. £150,000? Yes.
2047. Exclusive of Maitland? For this immediate district.
2048. Do you remember how long the flood remained on Phoenix Park country? Before it drained off?
2049. Yes; till the water got down within its banks—how long was it? About seven days.
2050. Did you make any observations of the time when the flood was at its highest here—the 1857 flood or the 1867 flood—what time as regards the height in Maitland? I did not.
2051. If there is anything else connected with these floods that you know, please to mention it—anything that occurred to you at the time worthy of note? There is nothing very particular that I know, except that there was very great distress existing amongst the farmers at that time. At that time I had to get boats to carry farmers away from their places of abode. There was great distress existing upon the lower flats.
2052. Was there any considerable loss of life? No, there was not much loss of life in 1867.
2053. Was there in 1857? I think there was one or two.
2054. *Professor Pell.*] Was there as much damage as £10 per acre done, including loss of crops, grain, and stock? Fully that.
2055. *President.*] Do you think there would have been any serious increase in the loss if the flood had been 1 or 2 feet higher? It would have caused not much greater proportionate loss, because all the low lands were then covered with water, and if it had been a foot or two feet higher it would not have injured them very much more.
2056. Supposing that the river were 2 or 3 feet higher in flood and the current much more rapid, would there be much more difficulty in rescuing people from the flooded lands? Yes, if the current were greater a boat could not get to their assistance.
2057. Do they find any difficulty now in going over the flooded tracts? There must have been difficulty; there was no danger.

Mr. S. E.  
Dickson.

28 Sept., 1869.

Mr. Charles Edmund Jaques called in and examined:—

2058. *President.*] You witnessed the floods of 1857 and 1867? Yes, of 1857, 1861, 1864, and 1867.
2059. They were all very disastrous floods? Yes, each in their character.
2060. Can you give us the height to which each of these floods rose at Morpeth above high-water-mark? Of course. I am taxing my memory to a great extent, and if I make any inaccurate statements when facts are against me you will pardon me. I will give you as near as possible the heights of various floods. I am speaking now of the flood of June 1857; and my impression at that time was that it was about 10 feet above high-water-mark.
2061. *Professor Pell.*] In June, 1857? Yes. The July flood was about 20 inches above that.
2062. *President.*] 11 feet 8? Yes; and in August, 1857, there was one—I think it was 3 feet 6 inches higher than that again. In 1861 I think three floods occurred; but while each of these floods was not so great as the 1857, at least the last of them (I do not recollect the months) was, I think, about the height of the June 1857 one—about 10 feet.
2063. And then we come to 1864? In 1864 there was a flood in February—a high flood. I was in Queensland at the time of the rainy season, but I returned before the flood had subsided, and that flood I considered about equal to the flood of July, 1857.
2064. *Professor Pell.*] About 12 feet? A little less than 12 feet from the top of high-water-mark.
2065. *President.*] Then we come to the 1867 flood? Well in 1864 we had more floods. I think there were two in 1867 that I recollect. One was not a high flood. There was also another one higher than the one in August, 1857, although in some places it did not reach the same level. At the Old Company's Wharf it was not so high; in the New Company's Wharf it was higher. The marks I had to go by in 1857 were not interfered with in 1867—they were on the archway of the two stores. I am enabled to recall the differing heights at the Old Company's Wharf from this circumstance:—In 1857 I was obliged to raise the goods from the store, for the purpose of avoiding damage to them; in 1867 there was no necessity for doing so. The water came upon the floor of the stores in 1857; there was no such apprehension in 1867.
2066. The water did not rise so high? No.
2067. Within a few inches? Yes, within a couple of inches.
2068. And what was the variation at the New Company's Wharf? I think it was 4 or 5 inches higher. I do not know whether it was caused by the set of the currents or not, or the winds. In 1867 a westerly wind was blowing.
2069. Down the river? Yes.
2070. And in the other case? The flood of 1857 was much more rapid than any other, and I attribute that to the strong prevailing winds.
2071. With reference to the length of time that these floods remained up—was 1857 as long as 1867? The flood of August, '57, was on the ground a much longer time—it increased in volume and remained on the ground.
2072. You are of opinion that more water came down in August 1857 than in June 1867? I think there was more water on the land, and it was kept on the land. It was kept backed up by the Williams and Paterson Rivers. There was a greater body of water, because the land all about was saturated.
2073. Can you form any idea of the amount of damage done in the neighbourhood of Morpeth during each of these floods? Value?

Mr. C. E.  
Jaques.

28 Sept., 1869.

- Mr. C. E. Jaques.  
28 Sept., 1869.
2074. Yes, to the crops? Well, I should not like to hazard figures just now. I could arrive, probably, with a little reflection, at an approximate amount, but I would not venture now to state figures. There is no question about the amount of damage sustained; but then whether in part the loss has not been created by personal neglect is another thing.
2075. Is there much apprehension among the people of Morpeth as to the effect of closing Wallis' Creek by the flood-gates? The opinion is divided. Some think that the rest of the lands will be more suddenly immersed than if the creek were left open, and others are of opinion that the gates will neither do much good nor much evil. They think as much water will come inside the gates as outside them, as there is a great watershed there, and that this valley of Louth Park and the low-lying lands in its vicinity are not more subject to inundation from the river than from their own waters.
2076. As a general rule, have you observed any difference in the times at which the Paterson comes down in full flood, and when the Hunter comes down in full flood? I do not think there is any rule to guide it. There may be a larger quantity of water falling upon the mountains above the Paterson township, and then the Paterson sends down its waters at an earlier period than the Hunter. When the water falls in the upper parts of the Hunter, that river comes down, and where there is a great rush of water from the Paterson, directly opposite effects are produced. Sometimes the Paterson will be in high flood and no flood at all in the Hunter, and *vice versa*.
2077. Mr. Bennett.] Have you ever seen the Hunter flooded when the Paterson was not flooded? Very seldom. I have known the Hunter to be 20 feet above high-water-mark at West Maitland, and the Paterson to be risen 3 feet; and then again, the Paterson has risen 17 feet when the Hunter would be only 5 feet at Maitland, in consequence of rainfall in these particular localities.
2078. What do you think the annual value of the damage done would amount to, distributed over a certain number of persons, per acre—what would it be worth while to pay for exemption from floods? You mean, what would be the increased value of the lands, provided they were not subject to floods?
2079. Yes? It is a question that requires consideration. I should be inclined to say that the lands would be of less value if the floods did not come.
2080. You think the lands are increased in value by the floods? Yes. I think the people should be more particular in taking care of their property—in housing their grain beyond the reach of floods.
2081. President.] You are of opinion that as a rule the lands are benefited by the deposits left by floods? Assuredly. The land receives some alluvial deposits from the floods, and although sometimes foreign seeds are brought, they are ultimately eradicated. Altogether the system of farming is much behind the times. There have been complaints, in my opinion, of difficulty and distress made by farmers where there is no distress arising, only from their own want of energy.
2082. Professor Pell.] You said, I think, that the loss was about £10 per acre? No, less than that.
2083. In 1867? No, that could scarcely be. If you take the whole twelve months' crops from the land it would not be worth more than £5 per acre, and then you must consider that £2 10s. per acre is the average rent. If the landlord forgives the rent the actual loss is much diminished. I think £2 10s. would be a fair average of the annual loss per acre of the land under cultivation, because when you come to look over the district there is no more than a third of all the agricultural land that is not very badly cropped indeed. I think, therefore, that £5 would be great excess in value.
2084. President.] Is there anything you think of worthy of note to mention—anything that occurs to you? If there is I will make a note of it and append it to my evidence.

---

MONDAY, 11 APRIL, 1870.

Present:—

E. O. MORIARTY, Esq., PRESIDENT.

P. F. ADAMS, Esq., | PROFESSOR PELL.

Mr. Joseph Creer, Alderman of the Borough of West Maitland, was called in and examined:—

- Mr. J. Creer.  
11 April, 1870.
2085. President.] The effects of the flood which has recently occurred are said to be worse than those of any which preceded it? Yes.
2086. To what do you attribute that? To the length of time during which the water was rising, and partly, of course, to the impoverished state of the district from previous floods. The farmers were in a very poor state before the flood. They had scarcely anything, and what they had was so low in price that it was almost valueless. The season was a very good one; produce was very cheap, and they were just getting round again from the effects of the last flood. I believe that many of the farmers have not a shilling left. A great deal of their crops was mortgaged, and the floods came just as their crops were fit to be gathered in, and washed them all away. I believe that there will be more poverty resulting from this flood than from any which we have ever had.
2087. Have you observed anything in connection with the heights of this flood at different points of the river which might be worthy of notice? No, I have not; but I believe that the velocity of the stream in this flood has been greater than in any other, and I have noticed that the current seemed to be different in many places.
2088. You say it seemed to be different—Did you make any measurements? No, I did not.
2089. You have no doubt given a good deal of thought to the subject of this inquiry, since we last had the pleasure of seeing you, and the occurrence of this flood may have caused you to think of some other matters which you have not mentioned to the Commissioners before. If such be the case, will you be kind enough to state them? I have thought over the matter a great deal since this last flood; but I do not know that there is anything further which I could add. I believe that if the distance of the river is shortened, we shall be to a great extent saved from floods. Your own plan, or any plan that will straighten the river and shorten its course to the sea, will to a very great extent save this district from floods. It is the last three or four feet of a rise that drowns Maitland. We can stand 28 feet, and the rise after that is not more than two inches per hour. If something can be done to take this away we shall to a very great extent be protected from the damage which we now suffer; and there is no doubt that straightening and shortening the channel of the river would do that. I have it on the authority of Mr. Sims,

Sims, of Morpeth, that there was a difference in the height of the late flood at Morpeth and Maitland of <sup>Mr. J. Creer.</sup> 10 feet. The water was 10 feet higher at Maitland than it was at Morpeth, and the distance between the two places in a straight line is only three miles. I can account for it in no other way than from the <sup>11 April, 1870.</sup> circuitous route of the river. The waters are pent back and cannot get away. By your own plan the course of the river is 17 miles, and by the cut which you have suggested you can bring the water to Morpeth in three miles and a half. By the suggestion that I threw out at the last examination it could be done in three.

2090. Have you considered what would be the effect upon Morpeth of producing more of an equilibrium than at present exists between the height of the flood at that place and at Maitland? Yes, I have. I have looked at it in every way that I can think of. [*Plan examined by witness.*] I adhere to the opinions I formerly expressed, after the further experience I have had. The rise in the river from 27 feet upwards is what does us the mischief.

2091. Do you confine that observation to the town, or do you apply it to the whole district? To the whole district. We want the river so improved that it will drain off the increase of water that comes upon us after 27 feet. If the river is straightened I believe that the discharge will be equal to the rise after 27 feet.

2092. That observation applies to the town and to Wallis' Creek? Yes.

2093. Is it also intended to apply to the district between West Maitland and Morpeth? To the whole district from Morpeth right up.

2094. You consider anything over 27 feet is the dangerous limit? When the river rises anything over 27 feet then we are in danger. There is one remark that I have heard circulated, and I should like to take this opportunity of contradicting it, should it be made to you, and that is with reference to the effects of the river with the flood-gates closed. We had the flood-gates closed for a week, I think, from Saturday to Thursday, and I have heard it stated that the water was 7 feet higher at Pitnacree in consequence of the gates being shut.

2095. Seven feet higher? I think so. I think I heard Mr. Mitchell, of Dunmore, state it. Previous to the flood-gates giving way, I marked the height of the river myself on a rail a little below the embankment. I know that the flood-gates were not likely to stand, and I stopped there an hour and a half before they went and three-quarters of an hour after they went. I heard a man state that the river had fallen six inches, and I went back to the very spot, to the place where I had marked the height, and the river had not fallen a quarter of an inch, nor an eighth of an inch. Within fifty yards of the gates there is an out-building there, and the flood did not make a difference of two inches on the caves.

2096. *Professor Pell.*] At the time you made that mark on the post, was the river rising or falling? Rising slowly.

2097. How much? I could not tell you. It was rising. It was not falling at any rate. I cannot exactly tell you the rise now, but it was very little. There is one other remark that I should like to make. I fancy that you will have evidence to prove that the river would do a vast deal of injury about Narrowgut and Phoenix Park in consequence of these gates being closed. The flood-gates were closed from Saturday to Thursday, and on the day they went there was not a drop of water on Narrowgut, and if there is a spot that would be injured at all it would be Narrowgut.

2098. What height was the flood at the Belmore Bridge when the flood-gates gave way? I think about 28 feet, but I am not exactly sure; about 27 or 28 feet.

2099. Before the flood-gates were erected a certain quantity of water flowed up Wallis' Creek, and after the gates gave way a less quantity would be carried up by reason of the walls being there? No doubt.

2100. In what proportion less would you say? I believe that a considerable amount of water was stopped from going up the creek.

2101. Stopped by the wreck? Yes, by the wreck.

2102. Should you think it amounted to one-half? No, I do not think it.

2103. It seems to be quite that? I do not think it. What I wanted to remark was that up to Thursday Narrowgut had not a drop of water on it, nor had Phoenix Park. Now after they went on Friday Narrowgut became flooded, and that goes to show that the effect of the flood-gates was scarcely anything at all. I have always maintained that I do not think there is a man in the country that could tell the difference. Although there was so much water, yet when stretched over an expanse, I do not believe that it would make half an inch difference. The Reporter of the *Mercury* went round specially to make a number of notes on the subject. I allude to Mr. Christie. I am perfectly satisfied in my own mind that if you will shorten the distance to the sea, we shall to a great extent be saved from floods. And with reference to the cost, I have thought of how the money is to be raised.

2104. *President.*] How the money would have to be raised for works which it might be considered advisable to construct? Yes, and these are my ideas on the subject:—

The amount of flooded land in the district is 35,000 acres, which at 2s. per acre	
per year will yield a revenue of .....	£3,500
And a rate of 1s. in the £ per year, or 5 per cent. rental on house property .....	3,500
	7,000
Equal amount from Government .....	7,000
	14,000
For ten years.....	10
	£140,000

Mr. Charles King was called in and examined:—

2105. *President.* Where do you reside? On Fishery Creek.

2106. *Professor Pell.*] How far up the creek? Near Mount Dee. I have been there nineteen years, and I was ten years on the Lower Williams. When the flood comes in at Fishery Creek there is no outlet for the water. I think that the water ought to go the other side of the Black Horse, and down Howe's Lagoon. <sup>Mr. C. King.</sup> <sup>11 April, 1870.</sup>

2107. You think that if the water were taken by Howe's Lagoon it would lessen the floods? I do. It would relieve the floods in this way, that as soon as the river fell we should have the water off from us.

2108. Have you ever known Fishery Creek to be flooded by its own waters? I never did. I have known it to be flooded where I live, and not a drop of rain to fall there. 2109.

- Mr. C. King. 2109. But you have never known Fishery Creek to be flooded without the back water from the Hunter? I never did.
- 11 April, 1870. 2110. *Mr. Adams.*] Have you ever known a week's rain at your place without any flood being perceptible in the Hunter? I have never seen that. If there was a week's rain there the river came round.
2111. Have you seen three days' rain? Yes; but generally if we see three days' rain the river rises. If the river rises 15 feet at Maitland and keeps up long enough we may expect to be swamped. If the water is level with the river here, I calculate that some of those flats are 18 feet under water.
2112. *Professor Pell.*] That is up the creek, some little distance up the creek, where that very low land is? No, but likewise here from Wallis' Creek. If the river keeps up sufficiently long it inundates all that land. This is high land here, and there is no opportunity for the water to flow off the creek. I do not believe that it will be off for three months.
2113. *President.*] Do you think that if drains were cut through the flat lands into Fishery Creek there would be a sufficient fall to take the water off? Except there is a better opening, it would do no good at all. If there were a better opening for the waters, the farmer would be a fool if he did not dig drains into it. I dug a drain when I first came, and it cost me £15. I have only 24 acres.
2114. Is it your own land? It is. I bought it in 1851.
2115. *Professor Pell.*] Have you noticed whether the water is going off faster or slower than usual? These flood-gates are blocking in the water.
2116. Do you think that if Wallis' Creek were improved so as to let the water flow away more freely, the floods would not do you so much damage? It is by Howe's Lagoon where that watershed ought to go; and according to my judgment any man who has eyes and watches it can see that it should do so.
2117. Then what you would propose would be instead of letting Wallis' Creek discharge into the river to take it away by Howe's Lagoon, and let it discharge at Morpeth? That is my idea. During the ten years that I was on the Lower Williams I have had a boat over the land and never lost a crop. I do not mind seeing a flood as long as the water goes away as fast as the flood falls. But here the waters come in and rest for three months before they go off. I do not think that this part will be dry this winter.
2118. *President.*] How long do you think that corn would stand being under water? Ripe corn?
2119. Yes? If corn ever gets under water with the cob on it, it is not fit for market; but if the water goes up to the cob and flows off again directly you can do something with it. I have been over a piece of wheat times and times in a boat, and the water never injured it, because it went off in no time.
2120. Were you on the Williams during the flood of 1857? I was not. I have seen several floods in the Williams and the Lower Hunter. The farmers never suffer there, excepting it is on the low swamps by the salt water. I do not believe that on the high land the water ever reaches their cob, or that it ever damages their wheat or lucerne.

---

Mr. George Wakely was called in and examined:—

- Mr. G. Wakely.  
11 April, 1870.
2121. *President.*] Where do you reside? At Hexham.
2122. Do you reside on the flooded land at Hexham? No, not within the reach of the flood.
2123. You have got some land liable to be flooded? Yes.
2124. Have you observed the effects of the floods of 1857 and 1867, as well as of this last flood? Yes. This flood has taken a somewhat similar effect.
2125. As regards height? This flood has not been so high by from 6 to 9 inches, according as it has varied in different places.
2126. Some 6 to 9 inches difference between the floods of 1867 and 1870? Yes. I forget what was the difference between 1857 and 1867, but there was a considerable difference between these two floods.
2127. The floods of 1867 and 1870? Between 1857 and 1870 there was a difference. The flood of 1867 was considerably higher than the flood of 1857. This last flood was not so high as the 1867 flood, but higher than that of 1857.
2128. Can you tell us how long the flood remained at its height in 1867—did you make any notes of it? No, I did not.
2129. Did you make any notes this time? Not as to the time that the water remained; but it remained longer this time.
2130. Could you give us a general idea as to how long the water remained at its full height? About two days, I should think, at its full height.
2131. Could you fix those days, say exactly what those days were? I did not make any note of them.
2132. How long was the river over its banks—did you observe? About ten days.
2133. Ten days over the banks? About that.
2134. If you remember, there were three distinct floods this time? Yes.
2135. Which of these floods was it that attained the greatest height with you? We were not affected to any amount by any but the last.
2136. But the water had been steadily rising, I suppose? No, it was falling, and we thought that we were clear of the floods until the last rain came on which flooded the Williams, and it is the Williams that floods us. If the Hunter and Paterson are in flood the river will scarcely overflow its banks near us, excepting the Williams also comes in with it. If the Williams comes in with it we are bound to have a high flood.
2137. And you think that this last flood, so far as you were affected by it, was owing more to the Williams than the Hunter? Yes; all the people there expected that we should never suffer at all by the flood, until the last rain set in, when the Hunter and Paterson were in full flood, and the Williams came down at the same time, the waters of the Williams meeting the other waters. This overflows all Miller's Forest, the lower part of Nelson's Plains, Hexham, Ash Island, and the other islands below.
2138. Could you give us any estimate of the quantity of land flooded about Raymond Terrace and thence down to Hexham—agricultural land under crop? There is a large quantity, a very large quantity. About 10,000 acres I should say.
2139. *Professor Pell.*] Under crop? 10,000 acres of cultivation land under crop, that is across from the junction of the Williams, taking in Miller's Forest and Lidney Park.
2140. *President.*] From the junction of the Williams downwards? Yes, all below Osterley. There is only a certain place that the flood waters can get through, and from that downwards they are all subject to be flooded.
- 2141.

2141. And that is about 10,000 acres? Yes, about that.

2142. *Professor Pell.*] Were there 10,000 acres of crops destroyed there by this flood? They were mostly destroyed. The lucerne crops suffered more down that way than they did up here.

2143. I suppose that that would be owing to the water being longer on your land? That is partly the cause, and it arises partly from the nature of the soil. As the water comes out over Oakhampton it leaves its first deposit, which forms a lighter and more open soil about Maitland, and as soon as the water goes off, the land becomes dry and the roots are not destroyed.

2144. Your land is lower? It is more of a mud, clayey soil. The sand and leaf deposit, which is the richest deposit, remains about Maitland, and we get soil of a closer nature which binds round the roots of the lucerne and rots them.

2145. How much an acre, on the average, do you suppose that those crops were worth that have been destroyed? That is a very difficult matter to state—what they would be worth on an average.

2146. We only want a rough approximation? The lucerne is destroyed with us. This is the worst flood that has ever come on our side. It came rather earlier in the season, when I believe the land was hotter, and from that or some other cause the flood has had the effect of killing the lucerne.

2147. The lucerne being quite destroyed, how much loss per acre would that involve? It is very difficult to state, and I could not say without making a calculation. It is destroyed for a long time.

2148. *President.*] Supposing that a paddock of lucerne is destroyed this year, how soon can it be got into fair and equal bearing again—the same as it was before the flood? Four years.

2149. Four years? Yes, it will take four years.

2150. Then you consider that you have lost about two years' crops? Yes, about that.

2151. Together with the cost of ploughing and resowing the lucerne? Yes.

2152. Now, how about the maize? A fresh crop of maize can be put in all right.

2153. Is it too late to do anything with maize this year? Yes.

2154. Can nothing be done with the land, or must it be allowed to lie as it is? It can be sown with barley or wheat.

2155. When could barley or wheat be put in? During the next two months—May or June.

2156. Are they profitable crops? The wheat crop has not been profitable for many years, but I believe that the barley crop is likely to be the most profitable crop a person could put in.

2157. Is it customary as soon as the maize crop is off the land to put in barley or wheat? Of late the farmers have put in barley on account of the rust.

2158. *Mr. Adams.*] Is it not the general practice to put wheat in after the maize is off the ground? The early crop of maize leaves the ground just right for the wheat.

2159. *Professor Pell.*] You get both a crop of maize and a crop of barley in the year? Yes.

2160. *President.*] And it is not too late this year to get a crop of barley or wheat? No.

2161. Will the land have been injured or deteriorated in any way by this flood for the barley or wheat crop? I do not think so. I believe that in general the flooding of the land does it good.

2162. If the floods do not come too often? Yes, if the floods do not come too often. But the people up at this end of the district receive more benefit from the flooding of the land than we do below, because of the richer deposit left here which acts as a manure.

2163. Would the people down your way be disposed to submit to any considerable taxation for the purpose not of wholly relieving them from floods, but of diminishing the ill effects of the floods? I think that they would be against it. I think that they would be very much afraid that they would receive more injury than benefit from such a course.

2164. Do you mean by reason of their land not being flooded? No; I do not think that there are many people there of that opinion. It just depends on the way in which the water is taken. If there were any drains or canals cut, which would let two currents come to Hexham from Maitland, instead of one, the people would be subjected to two floods in place of one.

2165. At the same time? Yes, at the same time. If a canal were cut from Maitland, which would allow the water to escape into the swamp at Hexham, it would take just the same effect upon us as the Williams does when it comes in to meet the river. The Maitland flood would flood us just the same as the other rivers do now. We should suffer more from floods than if the river were allowed to remain in its present state.

2166. In point of fact, you and the people about you are opposed to any tampering with the river? That is the general feeling with us.

2167. *Professor Pell.*] You would rather leave the river as it is? The general feeling with us is to leave the river as it is. The people on our side are in favour of a simple Drainage Act.

2168. To carry off the stagnant water? Yes, to carry off the stagnant water, but not to come in contact with the great floods. It is the general opinion on our side that unless a canal were cut from Oakhampton to Lake Macquarie, anything excepting that would injure us. That would make two channels, and would take the water away from us instead of sending it upon us. The other plan would make two channels for the water to pour down upon us, on those islands, and on Miller's Forest Flat.

2169. Has there been much damage done below you, on Ash Island? Yes, those islands have suffered severely by the floods this time.

2170. The land lies very low there, does it not? It is very low, and a person not accustomed to it could not conceive the way in which the water is there. I have been acquainted with it since 1841; I have been residing in the Maitland district since that time. The flood in Maitland will not raise the river at our place. The river at Maitland may be bank high and overflowing, and it will not raise the river with us more than 18 inches.

2171. You suffer solely, in point of fact, from the Williams? From the Williams.

2172. And you object to the Hunter being brought down upon you at the same time, so as to expose you to both? Yes; we object to two channels being brought down from the Hunter, which would take just the same effect upon us as the Williams' flood does now, and we should therefore be flooded without the waters of the Williams at all.

2173. With respect to that 10,000 acres that you spoke of,—what is about the average rental of it let out to farmers? I suppose it would be something like a pound an acre. About that on an average. Some is worth more, and some is worth less.

2174. It is not such valuable land as some of these flats about here? No.

2175. *President.*] Is the land principally in the hands of tenants or of the owners? Of tenants principally.

2176.

Mr. G.  
Wakely.

11 April, 1870.

- Mr. G. Wakely.  
11 April, 1870.
2176. Of these 10,000 acres that you speak of, the land that you described roughly to be about 10,000 acres, how many acres should you say are in the possession of large proprietors? I am not aware of any but what belongs to the Duckenfield Estate. The other is all let off. Parties on the Miller's Forest are freeholders.
2177. A few small farms at Miller's Forest are freehold, and the bulk of the other land is comprised in the Duckenfield Estate? Yes.

John Nowlan, Esq., M.L.A., was called in and examined:—

- J. Nowlan, Esq., M.L.A.  
11 April, 1870.
2178. *President.*] Supposing for the sake of argument, it should be found that nothing feasible could be done to relieve the districts from floods, do you think that if the people were to give their attention to putting their houses and saved crops upon platforms raised above the reach of floods, a great deal of the loss and destitution which now occur might be avoided? There is no doubt about it I think. The people seem to be most thoughtless with reference to placing their stacks and building their houses. With very little more trouble and expense in many cases they might protect themselves and their crops.
2179. *Professor Pell.*] Very little has been done in that way I believe? Very little indeed, almost nothing in fact. I have heard that Mr. Nainby has raised his place, but I know of only one place at Phoenix Park or anywhere else built on piles. A man named Bolt, at Phoenix Park, near the Largs Punt, is building a substantial house on piles, and it is supposed to be about one foot higher than the flood of 1867.
2180. With every appearance of safety? This flood well tested it, and it was perfectly right.
2181. And has he built any place for his saved crops? I think he has a place for storing his maize and putting his dairy cows and pigs.
2182. Has anything been done with reference to the building of stacks? It is the common practice to build the stacks right on the ground—they do not raise them at all. I have some land down at Phoenix Park which I am thinking of taking into my own hands, and if I do I shall certainly build platforms or something of the kind. At my place in May, 1857, where they had always been in the habit of building stacks, the flood came and carried them all away. Since then I have always had them built on the rising ground, and the only difference is that there is a little more trouble involved in carting the stacks half a mile further. If the people had platforms it would be just as easy to build their stacks on platforms as on the ground. It is an insane thing to build stacks on land liable to be flooded, but in most cases on these alluvial lands, the people have not the power to build stacks out of the reach of the flood unless they erect platforms for the purpose.
2183. It would not cost the farmers very much to build platforms? No.
2184. They could do it with their own labour chiefly? Yes. But in a few weeks after the flood subsides they forget all about it, and they just build their stacks again in the very place from which they have been swept away.
2185. That is very largely a matter of custom? Yes. And I have no doubt that this man Bolt building this house will induce others to follow his example. Bolt has about six acres, and it is his own property that he is building upon. I have no doubt that every landowner would be quite willing to assist his tenants, or to make them an allowance for building these platforms, if they did not do so at their own cost.
2186. *President.*] Are there not some places on Wallis' Creek from which it would be better to shift altogether, on account of the depth of the water which would surround them? I think so.
2187. *Professor Pell.*] Where the water lies long upon the land, would it not be better that land of that description should be held in large holdings? No doubt it would. One cause of destitution in flood-time is that many of these men have not large means. The land is cut up into small areas, and if men have got a team of bullocks, agricultural implements, and rations to last them a few months, they think that they are in a position at once to take a farm. It is not in their power to make improvements, and they trust to chance. At home a considerable capital is considered to be necessary before a man can go on the land at all, but here men take up farms who have no means. They promise to pay the rent, but the floods come and they have nothing to pay with. No doubt there are many places where people ought not to build at all; for instance, at the back of Maitland. We need not go three-quarters of a mile from here to find places where people ought not to build at all unless it is upon platforms.
2188. Have they often much difficulty in getting their cattle off? No.
2189. As long as the land is held by these small farmers it is impossible to graze it? They must live on their land, however subject to flood it may be. People at a distance wonder how it is that the farmers do not put their stacks on rising ground, but on these rich low lands they cannot do it, for in some instances they would have to go miles away to do it. As a general rule of course the banks of the river are the highest parts. At Scobie's there is a narrow fringe of lucerne about ten chains wide saved, and all the rest is as black as the swamp.
2190. It seems to me that it is a most unaccountable thing that they should put their stacks on the bare ground? It is. It is very objectionable.
2191. Do you not think that by taking proper precautions all loss might be saved excepting the loss of the growing crops? I think so. By proper precautions they could keep their saved hay and corn, or whatever they might have harvested. Of course the standing crops, such as the maize and the potato crop which you see on the ground now could not be saved.
2192. The farmers have not lost the whole of their little stock, I suppose, such as their pigs and their poultry? No, I think not.
2193. They have managed to save them? Yes, for the most part.
2194. *President.*] Would not the damage done to the growing crop be compensated in some measure by the increased fertility of the soil? There is no question that these deposits are of great value, for it is by these periodical deposits that the land is made rich.
2195. *Professor Pell.*] Do you think that the land would become impoverished were it not for these floods? No doubt of it. If you go on cropping for thirty or forty years, as has been done, it must be so.
2196. *President.*] You mentioned instances a short time ago where you have seen these deposits? Yes, on my own place.
2197. Will you describe it more particularly? The most remarkable rise is on the river bank, and I think that

that it extends for about a quarter of a mile. At this particular place within the last thirteen years two post and rail fences—two or three rail fences—have been buried, but it has not all been covered by rich alluvial deposit. A portion of the deposit was sand, and this last flood again has left a great deal of good deposit. In 1857 the floods left nearly all raw sand, but the grass crept over it. The 1857 floods covered one fence, and I thought that I would dig out the deposit, but I found that the labour was greater than the cost of splitting new stuff. We put up another fence above, level with the top of the post, and now that is covered.

J. Nowlan,  
Esq., M.L.A.

11 April, 1870.

2198. That would be about eight feet? Yes, and this is on the outer bank of the river. There is a kind of hollow between that and the inner bank which seems to have been the bed of the river many years ago. This flat is gradually filling up between the two banks, and in the lower part of the flat I suppose there are eighteen inches of good deposit.

2199. *Professor Pell.*] Supposing you were to get over the cultivation area such a rich deposit as even a foot, does it not take a long time to sweeten before it is fit for the production of crops? I do not think so. A man on Bolwarra told me that he had sown a crop of lucerne over the deposit. His idea appears to have been that in dealing with the land on which these deposits were left, it was necessary that the soil should be well pulverized and allowed to sweeten before a crop was put in, but he heard some one say that the land could be worked by being scarified with a shim, and so he ploughed some as he had been accustomed to, and some he put in by merely working it with this shim over the deposit. The crop that he put in in that manner turned out thicker and better than the crop he got from land ploughed in the ordinary way.

2200. In places where the water has been for months on the land, does the soil in that case become sour? It might become more sour in that case than in the other, but I could not speak positively as to that. I know that this deposit has most fertilizing properties, and that it takes immediate effect. The Porphry Vineyard on the Williams which belongs to Mr. Carmichael was completely covered by a heavy deposit left by the flood of 1867. The subsequent crop in 1868 was the largest crop they had ever had, and they made double the quantity of wine that they ever got before off the same area. This season of 1869 they had the same promise of a magnificent crop owing to the deposit. Most people who suffer from floods are irritated by their present loss. They say that the land is rich enough, and they do not take into account the value of the deposit as a fertilizer. My idea is that these floods do a great deal of good in the way of enriching the lands by their deposits.

2201. Do you think that there is very extensive damage done by scouring excepting in particular places? In places.

2202. Places of very limited area? I think that they are comparatively few, but where scouring does take place the results are very serious. It is curious how deposits of sand are left in some places more than in others. I cannot understand how it is that the sand is not more equally distributed.

2203. Wherever the current is checked the sand would drop instantly? On my place the best deposit is left where the back water comes up. There is a great fall from the bush land round about, and as the river rises it backs that up. The sand that I speak of is generally lodged on the outer bank.

2204. The lighter stuff goes further in? Yes.

2205. You do not think that any extensive damage is caused by scouring? No; from what I have seen of the country generally, I do not think so. But I have often heard that if a current passes over a piece of ploughed ground it carries away the soil to the depth that the land has been ploughed.

2206. Would a slow current do that? Yes. In the flood of 1864 the water broke over the second bank, in which there was a little depression. A kind of eddy or whirlpool was formed which scooped out an area of about half an acre, and to a considerable depth, say seven or eight feet, and at the bottom of this place there are some stumps of old trees covered seven or eight feet. That is an evidence, I think, of the extent to which the land makes in places.

Mr. John Atkinson was called in and examined:—

2207. *President.*] In what part of the district do you reside? I live in West Maitland, on towards the Louth Park.

Mr. J.  
Atkinson.

2208. Did we not have your evidence when we were down here before? Yes.

2209. Has any matter occurred since then with respect to which it is important that the Commission should be informed? The evidence which I gave before was principally with respect to the flood-gates, and you asked me as to the effect which they would have on the land at the back. I have had good opportunities of becoming acquainted with the river, and I have been boating about at different places in all the floods.

11 April, 1870.

2210. Will you mention anything that you think worthy of note? There is one thing that I have thought a great deal about during this last flood, and it is that we have never seen any great destruction from the river banks until it comes to the bottom of the Horse-shoe Bend. That is the first place it breaks against.

2211. Does the river first break over there? We see it break over further up, but it is below the Horse-shoe Bend where the first serious break is. It has been my opinion that if the river could be taken across there towards Mr. Dodd's place, by Pitnacree and Narrowgut to Morpeth, we should shorten its course from 20 miles down to little more than three and a half miles.

2212. There has been no attempt at draining in this district, has there, to take off the flood-waters on the subsidence of the floods? No; there is no way to draw off the water. If the flood-gates had stood, this side of the district would have been greatly saved, even during this flood.

2213. You think that there is no chance of this back land being flooded from its own watershed? No; it is quite evident, from what we saw while the flood-gates stood, that its own waters would not flood it.

2214. Its own waters had not then flooded it? No.

2215. Are you certain that they would not have done so in the end? It appears that after the flood-gates went, and the water came in over the railway cutting—between that and the flood-gates was the principal part where the water went in—as soon as it began to spread over there and come in at the flood-gates we were flooded.

2216. *Professor Pell.*] How many days had it been raining before the flood-gates went? It had been raining every day for about a fortnight—raining every day.

2217. Was not all the low land up at the back of Mulbring Creek flooded before the gates gave way? Some

Mr. J.  
Atkinson.

11 April, 1870.

Some of the very low land. But it had not begun to overflow the banks of the creek until the flood-gates gave way. Then it rose about 4 feet in one hour up the creek and round our part.

2218. Is your place under water now? Yes.

2219. *President.*] It rose 4 feet in an hour? The creek round from the flood-gates going up to Louth Park bridge rose 4 feet in an hour. I left the gates just when the water broke through. The flood caught me on the bank of the creek, and it rolled down like a tide about 3 feet at once.

2220. Have you ever turned your attention to the propriety of elevating your house and haystacks on piles, so as to place them beyond the reach of the flood? Many of the farmers, by raising their houses and stacks 4 feet would be quite clear of the flood, but with respect to a great many of them the water has gone over their housetops.

2221. *Professor Pell.*] That is almost entirely confined to those places where the flood rises to a great height? There are a great many so situated in Louth Park and Dagworth.

2222. Would there be any difficulty in doing it if the flood did not rise to a greater height than 6 or 7 feet? If we only got small freshes there would be little difficulty. There is one farmer named Christian who has embanked his shed and haystack from 4 to 6 feet, but the water got an opening, and this flood has gone over the embankment and flooded his place. He is now worse off than before.

2223. On the land on the other side of the river where the water does not rise so high, would there be any difficulty in protecting their stacks from floods by putting them on platforms? There are a great many places where they must raise them as high as 7 feet. I built my house on the highest bit of land I had, but the water came about 2 feet 10 inches into the house and rose about 4 feet on the stacks. Out of 60 tons of hay I shall not save 20.

2224. How much would it cost you to build a platform 6 feet high to put your hay on? It would cost more than the settlers are able to pay now.

2225. *President.*] About how much money do you suppose that it would cost? It would cost nearly £100 to make a substantial structure to put that quantity of hay on. With ironbark sleepers and logs, and to slab it in, would cost £100.

2226. *Professor Pell.*] And how much hay had you? 60 tons.

2227. *President.*] 60 tons of hay is worth more than £100? Yes; but if I had not got the money?

2228. *Professor Pell.*] Are you a tenant? Yes.

2229. Do you not think that the landlords ought to make these improvements? Yes, but the landlords do not believe it.

2230. They would get more rent? The discovery of gold did so much in raising the rents that settlers are now in a very bad state to pay them. If since 1857 I had settled down in Maitland and lived on my own money in Maitland I should be far better off to-day—independent of work. But the land is very good, and we cannot but keep trying when the weather breaks up.

2231. *President.*] There has been no attempt to drain the land into Wallis' Creek, so that when the flood falls the land may rapidly become dry? Very little drainage would take place, supposing the flood did go down.

2232. Would the water back up into the cuttings? The water would back up into the cuttings even in the lowest floods. We have the water on the ground about six weeks.

2233. *Professor Pell.*] Would not the local drainage take it off? It has taken it off generally, supposing the river has fallen. We have three channels in our flat to take it into the creek.

2234. If it were not for those channels, the water would be on your land a much longer time? Yes, a much longer time; for the next twelve months.

2235. Has drainage been made general about there? Yes; all the low lands have their channels.

2236. To let the water out? Yes; Louth Park and Dagworth have channels to let the water out, supposing the creek goes down. Our study was to make a sufficient channel to take the water off nearly as fast as the creek went down. Sometimes it has about a fall of a foot, and sometimes it is nearly level, according to the height of the river.

2237. *President.*] It drains off nearly as fast as the river falls? Yes, or at least as fast as the creek falls.

2238. Supposing the creek to be straightened and deepened by clearing out the rubbish, would that give a better out-fall for your drainage? It would be a great benefit in letting the water out, but when there are no flood-gates it would let it in just as fast.

2239. *Professor Pell.*] But it would not make much difference if the water did come in a little faster? It would make a great deal of difference, for when the water comes in so very rapidly, it often overflows before the settlers have time to get anything away. They have their cattle to remove and their things to cart away, and if the water came in rapidly there would be loss of life.

2240. *President.*] It came in rapidly enough this time? I never had any confidence in those flood-gates, but I believe that a flood-gate there would be of great service, and that it is possible to make one that would stand much more water than that. In the part of England where I lived, flood-gates were almost as common as slip-rails.

2241. But not with the same height of flood? Yes, higher.

2242. Where was that? In Lincolnshire.

2243. But you have not floods there as high as 30 feet? There is the Lincoln River which often stands as high as 15 feet, and the Sleaford River, which for six months together has often stood as high as 25 feet against the gates. The Witham River, about two miles from the Lincoln River, is fully 25 feet high, and that water stands to the top of the banks while the bottom of the river is no lower than where we used to cultivate. I lived a good many years by the side of the Lincoln River. I remember one farm particularly that I was on, and the top of our two story house was just level with the top of the river's banks. The waters rolled down, and we slept just as comfortably when the river was full as when it was empty. My father has told me that the Lincoln River was almost as crooked as the Hunter, and it was said by all the old settlers that when they straighten the river all the lives would be lost by it breaking over the banks. There was never a breach in the bank until the year I came away, when there was a break that did not flood any large quantity of land, and which was believed to have been caused by the hole of a water-rat.

2244. *Mr. Adams.*] What sort of pumping do they adopt there? We had simply flood-gates to let water on to the land, but we could not let any out. The inside rivers took it out. These were merely to carry down the up-country waters.

Osman Edmund Middleton, Esq., was called in and examined:—

2245. *President.*] Since you gave evidence on this subject before, have any matters occurred to your mind with reference to the recent flood which you think it would be important that we should place on record? There is one matter which has struck me very forcibly since the last flood which I think should be borne in mind by the Commission, and it has reference principally to the drainage after or consequent upon floods. I find that the elevation of our land at Phoenix Park in my neighbourhood is much below that of Maitland. A very much smaller rise in the water will create a flood there than it will here, while the water is prevented from draining away. Taking into consideration the possibility of some canal or short cut being made with that as a feature, it should be borne in mind that the rapid drainage of the water after the flood is a matter of great moment. If by any action resulting from a straight cut you were to prevent the water from draining from the soil in the Morpeth district, comprising many thousands of acres, you will add greatly to the injury existing—that additional injury being one that would not otherwise arise.

O. E.  
Middleton,  
Esq.  
11 April, 1870.

2246. When you speak of drainage, do you now refer to dealing with the main channel of the river, or merely to subordinate drainage? A very considerable proportion of our best soils lie but very little above high-water-mark. If you keep the water above high-water-mark, you prevent the drainage of these lands into the river. Under the natural condition of things, the level of the river at Morpeth admits the drainage of these soils while the water in Maitland exists at a very considerable elevation. For instance, the water on last Sunday week would be about 16 feet above low-water level in round terms, and the water in our district was about 6 inches above high-water-mark, and consequently drainage took place very rapidly there. But by bringing this aggregation of waters that exists about Maitland by a short cut upon us, you would bring a flood upon us, and would prevent that natural drainage which now takes place from going on, and you would cause a large body of waters to remain on our soils which otherwise would not be there.

2247. Speaking generally, your interest and that of persons similarly situated about Morpeth, you think would be injured by any attempts to interfere with the natural state of things as at present existing? Not by any attempts.

2248. I mean by any attempts to facilitate the discharge of the water from Maitland to Morpeth? By any attempts in the present valley of the Hunter. If you seek a channel to the right or to the left, that would be a different thing. I have a letter with me which I wrote intending to send it to the *Mercury*. This contains my matured opinions. I have read them over, and I do not see anything to differ from in them since I wrote the letter some time ago. Perhaps if I were to read them over some point might arise in which you might desire information. But in connection with my previous observations given here to-day, I wish to say that I think that it is only on certain occasions that we should suffer materially from the short cut. During a flood so long protracted as the late flood, the damage would be so complete that no further injury could arise. But there would be occasions on which we should suffer. Supposing that the river had risen to the extent of 25 or 26 feet in Maitland, we should have a small flood upon us which, if the water were allowed, as it would naturally, to drain off,—for notwithstanding the elevation of Maitland, the fall of a few feet would admit of our water draining off,—consequently the injury that we should sustain would be trifling compared to that which we should have inflicted upon us if by any action the water were to be brought more immediately and directly upon us from Maitland. It takes a much higher rise in Maitland to bring a flood here than it does with us. A rise of 7 feet in the Paterson on its right bank will produce a flood over Phoenix Park, which consists of a thousand acres. A rise of 7 feet with us is equal to a rise in Maitland of more than 20, for it tops our banks.

2249. Have you made any notes as to the time that the flood attained its maximum height, and as to the length of time that it remained up, so that we may be able to compare those circumstances with what occurred at Maitland? I did not in the last flood, but I did so in previous floods. I know that in the flood of 1867, after the water rose about 8 or 9 feet, it continued to rise an inch an hour only, rising eventually to a height of probably 14 feet. After the rise of 8 feet, it rose an inch an hour with the greatest exactness, until it obtained its maximum.

2250. *Professor Pell.*] How long did it stay at its maximum height? I could not tell you that. I had to leave my own house. It did not stay long at its maximum. As to the flood of 1857, I can tell you.

2251. Yes? It obtained its maximum about midnight, and at sunrise next morning it had fallen about an inch.

2252. *President.*] At what rate did it then continue to recede? It receded much faster than it rose.

2253. Have you any observations as to this flood; or, if you cannot give us it exactly, perhaps you can inform us approximately as to the time at which the flood attained its maximum at your place, and as to how long it remained up? No; not having made a note of it, I could not at the present moment say.

2254. It is of great importance to know,—the river being once gorged at Morpeth,—the length of time during which it remains in that condition? My own opinion is that the flood stays a very little time at its maximum elevation. It does not fall very fast for an hour or two, but after that it goes down more rapidly.

2255. Is the fall perceptible within a day? It is perceptible every hour.

2256. During the late floods they seem to have had three distinct flood-waves at Maitland—Were those three flood-waves equally perceptible at Morpeth? Yes, those three rises.

2257. And did each of the three attain to the same elevation? I have not compared them, relatively. I think they were each about the same height, one with the other, as they seemed to be at Maitland. We have had two floods.

2258. During the month of March, 1870, how many have you had? I do not recollect the dates; I identify three.

2259. Were they to any serious extent? Not the third; that was very trifling.

2260. As to the second? The second was the greatest.

2261. I think that that was the one that was nearly as high as the flood of 1867? No, not by a long way. It was  $21\frac{1}{2}$  inches under.

2262. Under the flood of 1867? Yes, under the flood of 1867.

2263. And the flood of 1867 was still under the flood of 1857? No, the flood of 1857 was under that of 1867.

2264.

O. E.  
Middleton,  
Esq.

11 April, 1870.

2264. At Morpeth? Yes; the flood of 1857 was about 1 foot below the flood of 1867.
2265. The flood of 1867 was 6 inches above the highest flood of this year? Yes, something about that. It was higher at all events.
2266. You only suffered from one flood this year? We have suffered from two.
2267. From two? Yes; the first and second.
2268. But not from the third? Not from the third.
2269. And yet at Maitland the third seems to have been higher than the first, and nearly equal to the second? Indeed. That recalls to my recollection the exact height of our elevation in the third flood. The third flood rose about 6 feet at our place.
2270. And it rose about 31 feet 6 inches, I believe, at Maitland? I recollect correctly now. The first rose about 8 feet with us, the next about 11 feet 6 inches, and the next rose about 6 feet above high-water-mark. These are the relative heights.
2271. Can you give us the dates of these—have you any memorandum of them? No, I have not.
2272. Have you any notes as to the length of time that these floods remained up at these respective heights? No. It is a most singular thing that the floods nearly always attain their maximum at night. The extreme elevation of two of these floods took place at night, and of the third, when I was absent. I remember that the extreme elevation of the 1857 flood was attained at night, because as I put my hand out of bed I could tell exactly the rise.
2273. Looking at these last floods, about how long should you say that they remained up—would it be a day, half a day, or two days? I was unable to take any cognizance of them. They occurred in the nighttime. When I last saw them before they attained their maximum elevation they were rising, and when I saw them again they were falling.
2274. What was the interval between the times? Between 9 o'clock and 6.
2275. Between 9 o'clock at night and 6 o'clock in the morning? Yes; when I last saw them they were rising, when I next saw them they were falling. But I can speak from experience, that they do not stay more than an hour at the extreme elevation.
2276. What is the rate at which they fall? I never noticed that, but I should say that is nearly double the rate at which they rise.
2277. Two inches an hour? Yes, two inches an hour, and more than that after they have attained a certain height.
2278. Then two or three days will pretty well work them off? Yes, from our lands.
2279. *Professor Pell.*] If anything were done which would have the effect of keeping these floods on the land for a week instead of a day or two days, would that increase the damage much? If water rises for a day or two with us over the whole surface, it does not matter, so far as the growing crops are concerned, if it then goes off. Two days' inundation will not kill lucerne; four days may, and five will positively kill it.
2280. Then the longer the flood was prolonged, the more injurious would be its effects? Yes. We have floods which do little injury, but if they were to be allowed to remain as long again as they would naturally remain, they destroy the crop.
2281. On the occasion of the highest flood this year, the second flood, how long did the water remain on the land? I think that during the highest flood the water was over the land for about a week.
2282. Then it killed everything? It killed nearly everything.
2283. It would not have done any more damage by staying on another week? It would probably have killed the sugar-cane. Everything else was destroyed, and no doubt it injured it.
2284. *President.*] Suppose for the sake of argument that it might be possible to relieve Maitland by throwing more water on to Morpeth, what height might the water be allowed to rise without doing any serious amount of damage? The water breaks over at about 3 miles above Morpeth, and after a rise of 7 feet it commences to inundate Phoenix Park, consisting of 1,000 acres or more, which is in the form of a basin or a saucer which would fill from the centre until it gradually reaches the rim.
2285. A rise of 7 feet? Yes.
2286. And 7 feet in five days is destruction? At 7 feet the inundation commences.
2287. The dangerous inundation commences? It is dangerous only to the crops.
2288. And five days' inundation is complete destruction to the crops? Yes, complete destruction.
2289. *Professor Pell.*] What is the effect of what they call a 27-foot flood here at the Belmore Bridge upon you, as far as you can judge? I speak simply from recollection; but I think that when the river rises 27 feet here at Maitland, we begin to think something serious of it.
2290. It would not then be over your banks? I think that it just begins to break over at 27 feet.
2291. Do you think it would be correct to say that a 27-foot flood here at Maitland does not do any serious damage to the district? I do not think so. I am simply speaking from recollection—I am not sure. I know that last Sunday week the elevation here was considered to be 16 or 17 feet above high-water-mark, but it was only 6 inches in my place. After a certain elevation it rises foot for foot.
2292. *President.*] Yesterday week we started with a gauge here of, I think, 19 feet—Do you remember what height it was at Morpeth? It was only 6 inches above spring tide at my place. After it attains a certain elevation it comes inch for inch.
2293. It is then discharging over the whole valley? Yes. It has a sufficient space and depth to obtain something like a natural channel.
2294. *Professor Pell.*] Have you floods often occurring which threaten to do a great amount of destruction but do not actually do so? I have lived on Phoenix Park without the flood rising to do any injury.
2295. On recent occasions have there been many threatening floods which turned out to be very disastrous? No; disasters have always been attendant on big floods. We had a flood, I think it was in April, 1867, which would not have done very much injury had it not been followed by a tremendous flood in June.
2296. Any works which would turn a 27-foot flood—which does not now do you much harm—direct upon you, would make it a very destructive flood? As a rule our injury is nearly always attendant on larger floods. Not only Phoenix Park, but the whole of Berry Park, Woodville, and Wallalong would be affected to the same extent, because the water flows upwards. They have dammed the river in some places, and the water flows up from the Lower Hunter for miles as the result of their closing it up.
2297. *President.*] Have you, as a rule, sustained much damage excepting from the floods of 1857, 1867, and 1870? Yes.

2298. Can you particularize the floods from which you have suffered? The flood of February, 1864, was very injurious, because it occurred in the summer-time, and was a very high flood.

2299. *Professor Pell.*] The floods of 1857, 1864, 1867, and 1870? Every flood is attended with mischief.

2300. But you have not been inundated? Two floods came into my house in 1864.

2301. *President.*] Could you give us the dates? In February, 1864, we had a flood which came into my house, and in the same year, I think it was in June, but I am not certain as to the month, we had another flood which came into my house.

2302. Both floods did damage to the crops then on the ground? Yes; but the continued rain at that period would have killed the crops without a flood. To show the continued rainfall, I may mention that from February, 1864, until August of the same year, there was no tidal influence perceptible in the Hunter River as far as the current was concerned. It did rise and fall for a few days, but with that exception the current was downwards. That I believe was a thing unprecedented, and may probably never occur again. At Morpeth the river was continually running downwards, with the exception of about seven days, and that shows how continuous was the rainfall.

2303. *Professor Pell.*] You do not remember any distinct flood coming merely bank high and not doing any damage? I have known them come bank high. The last flood that occurred was bank high at my place.

2304. That flood was in connection with other floods. Have you seen an isolated flood? Yes, I recollect a flood occurring before 1857 which was bank high. The timber coming down would just strike the soil at the top of the bank and would rise about half way out of the water before it went down with the current.

2305. *President.*] What flood was that? It was a flood which came before 1857. I know that the house which I inhabited then and as a child was built according to the flood level taken from the marks left on old charred trees, which were then considered to be the best guide, the charcoal of the burnt tree retaining the sediment. This house was built above the presumed highest level of previous floods, but it was much below the level of floods which afterwards occurred. The flood of 1857 was two feet above it.

2306. *Professor Pell.*] There is no high ground in Phoenix Park at all? Very little. I do not suppose that there is one foot which is 15 feet above high-water-mark—not a single inch.

2307. It is all on a wash with the flood? The whole of it was covered in 1867, and in 1857 I do not think there was an inch not covered. I am certain as to the flood of 1867.

2308. Do you think that much benefit would result from the farmers building their houses on piles, and raising platforms for saving their crops, stacks, and so forth? If each farmer in Phoenix Park were to raise platforms he would save his crops in Phoenix Park, and if the houses were raised 5 or 6 feet in favourable localities they would be above flood level.

2309. Would there be any great difficulty in carrying out such improvements? This district produces scarcely more than any one article besides horse fodder, and that scarcely pays under present circumstances. While this is the case the farmers never will be in a position to spend a single sixpence in improvements of that kind. They are too poor to do it. If they could undertake the cost, however, it would pay in the long run.

2310. It would pay if done by the proprietors? It is a very difficult question. If everybody saved his crops there would be a continuance of over-production, which would cause almost as much suffering. As far as the actual saving of the article is concerned, why of course that would be there.

2311. Are you not then arguing against any means being taken of saving the crops? I am arguing the matter as it strikes me.

2312. The same argument would apply against any means being taken to prevent the land from being flooded? I am arguing on present circumstances. If the farmers continued to grow only horse fodder, as they have been doing, and if you were to ensure the safety of all the crop produced, you would be simply keeping up an over-production of this particular article.

2313. If we were to carry the water all off, your argument would equally apply against that? It would if the same conditions were imposed; but I think that the mere circumstance of there being a possibility of our being exempted from floods would induce a spirit of enterprise in our farmers. It would have this result,—that they would leave off growing only the one article, which seems the most easily available under the flood system. The lucerne crop is destroyed to-day; but by putting in seed to-morrow, or in six weeks' time, you can get a crop in the course of three months.

2314. *President.*] We have had evidence widely different from that, as to the length of time during which the land would be thrown out of useful occupation by the flood. Some people say that it will take about two years before you can do anything with it? That is simple nonsense. I have known lucerne put in in August, and in November to yield one ton per acre. It may be put in from June to August, and from that time it grows rapidly.

2315. How soon would you expect to have a crop in fair bearing? If you put the seed in in August, in land well tilled, you will have a crop in December, and be in fair training for cropping as usual.

2316. *Professor Pell.*] Supposing that in a case such as this, where the water has been standing on the land for some weeks, would it not take longer time than usual to get the land in good working order—would not the land have become soured? It does become sour. The longer the water remains, the more the soil becomes sour. I have had some land that for want of drainage has remained perhaps for six weeks under water; but it only requires to be well tilled, and it will soon grow good crops of anything.

2317. Supposing that you are perfectly satisfied that nothing can be done to prevent high floods from going over these lands at Morpeth, is there anything which you could suggest to mitigate the evil effects of the flood,—platforms for crops, or subsidiary drainage? I am certain that the farmers would be very much obliged to you if by other means than their own you could build houses for them above the flood level, or they would be thankful for platforms; but I can hardly conceive of such a course being pursued, though if it were it would no doubt be a great boon.

2318. Could you suggest any remedy? No, I really do not know of anything. In cases of high floods I believe that everything will be inoperative—whatever you may do, it will be inoperative. I believe that there are times that you could do good to certain localities; but then it would always be at the expense of others.

2319. Supposing that we could not save any of this land from actual inundation between Maitland and Morpeth; but suppose by some works we could lower the height of the flood level a foot or two, and also

O. E.  
Middleton,  
Esq.  
11 April, 1870.

O. E.  
Middleton  
Esq.

11 April, 1870.

cause the water to run off rather more quickly—would that be any great substantive benefit to the district? Do you mean as to its applicability to Maitland?

2320. If you could reduce the level of the highest flood a foot or two here, and cause the water to run off the land rather more quickly than it does now, would that be a great benefit? No. After the flood attains a certain elevation, it matters very little whether it rises another foot or two. If the water only rises to a certain height we know that it will go away again quickly, but if the water remains after a certain time the damage is done.

2321. If 2 feet could be taken off the top of the flood all the way down to Morpeth, it would not do much good? The flood would not deprive us of so much of the crops in stack as it now does every year, but so far as the growing crops are concerned the damage is a question of time, not of depth. I would not care if I had the whole of the land covered 100 feet deep for a day, but if the water covers the land only to the depth of an inch and it remains for a week the result is complete destruction. The question of depth is of importance, however, as far as property saved is concerned.

2322. *President.*] Perhaps you will be so good as to read the letter of which you spoke? (*Witness read letter. See Appendix.*)

2323. You are aware that great improvements have been made in many rivers much larger than the Hunter, by a judicious system of embankment? I have heard that that is the case.

2324. Are you of opinion that that would not be available here? Yes, from the immense body of water and the narrow channel you have to deal with.

2325. The channel below Morpeth? The channel altogether. The whole valley of the Hunter seems to be incapable of taking away the water that inundates it.

2326. *Professor Pell.*] Did you notice whether there was any difference relatively between the height of the flood between your place and Maitland—that it was higher comparatively or lower comparatively than former floods? I should have to take the representations of persons in Maitland. I have not compared them. The information could easily be ascertained. The elevation round about me is perfect. It appears to be in a certain scale relatively. If in 1857 the flood was a certain height a mile above my place, it would be a certain height below me. The same thing is observed in every flood. We have had a great difference in one respect, in that the Paterson came down at an earlier part of the flood.

2327. The Paterson came down earlier this time? Yes, and with less force than in the first time. I compared my notes with the notes made by Mr. Dye as to the relative heights of this and the 1867 floods, and they tallied within an inch.

Thomas Kerrigan, Sergeant in the Police, was called in and examined:—

T. Kerrigan,

11 April, 1870.

2328. *President.*] Where were you stationed during the late flood—at Maitland or Morpeth? In Maitland. I have been in Maitland for nearly seventeen years. I have been engaged in boating in all the floods, with the exception only of a few.

2329. Is there anything in connection with the last flood or with any of the preceding floods which you think it important should be mentioned to us? I may mention that in 1857, the first flood we had here, I was engaged in boating, and at the time the flood was at its height I was in Bolwarra, near the schoolhouse by Mrs. Dickson's. We took that road because we could not get up the river against the force of the current. The water was then breaking over the top of Dickson's paddock, and coming down to the schoolhouse. When we were about half-way up in the paddock, I asked the men what they thought was the difference between this Bolwarra water going on to Dunmore and the water in the river. They thought with me that there was 12 feet of difference.

2330. *Mr. Adams.*] 14 feet? 12 to 14 feet. The water at the schoolhouse was then on a level with Dunmore. It was still water from Dunmore township nearly to Mrs. Dickson's. There was a rise from 12 to 14 feet to the top of the river. The water was then breaking over the bank, and I suppose about 9 inches of water were then coming down the paddock. We had to get a horse to pull the boat up the paddock.

2331. *President.*] That was in the flood of 1857? Yes.

2332. The river did not break over there in 1867, did it? I do not think that it ever broke over since at that particular spot,—the high paddock in front of Mrs. Dickson's house. On that occasion I had been higher up, and as we were coming down, the fury of the current struck the boat against a log, and we were capsized. We got into a swamp oak, and I noticed that on the current side of the river the water was 14 inches higher than on the other. There is a hill out at Dagworth where a man named Grant lives. In the 1857 flood it had 4 inches of water on it, and in 1864 it was hardly covered.

2333. There was a good deal of difference between the level of the river in 1857 and 1864, was there not? I dare say there was. I think the 1857 flood was the highest.

2334. Do you mean 1867 or 1857? 1857. It was higher in 1857 than in 1864. I believe that no flood has ever done more destruction than the present.

2335. That is mainly owing, I suppose, to the season in which it has occurred? Yes; the crops were on the ground. This was one of the finest seasons we ever had in the Hunter.

2336. Do you know anything about the height of the floods at Morpeth? No. But about these flood-gates. Perhaps it would be necessary for me to give my opinion about these flood-gates. I think it is a benefit to Morpeth to have flood-gates. It takes about four days for the flood to rise here, and all that time the water is accumulating and getting into Louth Park. They have embankments at Day's Place, at East Maitland, and when the flood is at its highest they give way, and a great rush of water occurs across the East Maitland Road, and in place of its being any benefit it is an injury to Morpeth, because two rivers are going in at that time. If instead of the water being allowed to accumulate at the back here, it went down to Morpeth on the second or third day, it would not affect Morpeth at the time of the high flood.

2337. Have you ever known the country up Wallis' Creek to be flooded by its own watershed? Never. At the time that the flood was coming up to the top of the flood-gates here, I saw that the front wall was giving way close to the gates, and I said—"This won't stand more than two hours." I started round on horseback to tell the people at Dagworth and Louth Park to clear out at once from the low lands. When returning I did not see any rise in the creek. I rode back to see how the flood-gates were standing; and when within two or three hundred yards of the gates I saw the wave coming down, and I knew that the gates were gone. The creek was not flooded at all before the gates gave way, and there was great rain here at that time.

2338. *Professor Pell.*] Did you go up Mulbring Creek? I went up nearly to the head of Dagworth.
2339. *Mr. Adams.*] Not as far as Brookes' Flat? Close to it.
2340. *Professor Pell.*] Was not the water over the banks then? No.
2341. *Mr. Adams.*] Was Mulbring Creek coming down strong? It was turning into Fishery Creek, and so emptying itself into the Wentworth Swamps—a place about four miles long and one mile wide. It will hold all the waters which come down there.
2342. *President.*] Was the water discoloured in Mulbring Creek then? Yes.
2343. Was it bringing any drift wood down with it? Not much.
2344. Was there much run in it? Nothing much of a current.
2345. Was the water nearly up to the top of the banks? I was not past Dagworth. I went through Louth Park.
2346. *Professor Pell.*] You did not go up to where the creek narrows in? No.
2347. *President.*] But you saw no inundation? I saw no inundation.
2348. Did you observe that the water was coming down Fishery Creek? Yes, it was going down into the swamp.
2349. That is running up? Yes—running up, not coming down.
2350. That was solely the water of Mulbring Creek? Yes, of Mulbring Creek.
2351. Not any of it was from the Hunter? None of the water of the Hunter, excepting that a good deal escaped from the flood-gates.
2352. But would not that be a mere trifle? Yes. After the flood-gates gave way the banks were to be seen for a couple of feet or 18 inches. After they gave way I came up to the gauge on the bridge, and I thought that I would notice that to see if it made any difference in the river for a few hours. It did not make the slightest difference.
2353. What height was the river on the bridge then? 28 or 29 feet. It was rising, before I left, about 4 inches per hour for some hours, and after I returned it continued at the same rise. I think that when the river has reached a height of 32 or 33 feet at the bridge, it would not be nearly as much down at the embankment, because the river breaks over its banks between here and there.
2354. Did you observe any difference between the height of the water at the High-street embankment, this time, and the flood of 1867? I did not notice that.
2355. Do you know whether there has been much sickness and destitution produced in the town by the overflow of the river at the Horse-shoe embankment? No. I believe there was a large number of persons driven out of their houses.
2356. Then it has not come to your knowledge that there is any great amount of sickness in consequence? I know of some cases of sickness caused by this flood.
2357. Down in that neighbourhood? Not exactly in that neighbourhood, but all over the district. I have been out during the flood here, and I have seen where several houses in Louth Park have been carried away, and I saw the furniture floating about.
2358. *Professor Pell.*] Do the people when they see a flood coming take what precautions they can to save their furniture and effects? This year they have been depending on the flood-gates.
2359. As to the people in the town? They generally shift. We give them notice and assist them to shift. There has been more corn destroyed this year than in any previous year.

T. Kerrigan;  
11 April, 1870.

Mr. John Bowden was called in and examined:—

2360. *President.*] Since we last had the pleasure of seeing you there has been a bad flood in the district, and we desire to know if anything has occurred to you since then which you would like to mention in connection with these floods—whether any new facts have turned up which you think ought to be recorded? I see in the first place why the bends in the river should be cut through. My opinion is that a great deal of good might be done by that, and in fact that the river could be made to contain the whole of the water unless it is in the case of a very heavy flood. I remarked the last time I was here, if you remember, that the bends were likely to be cut through by the floods. I can see that that will take place ultimately; but it will destroy a great deal of land, and will not go through in the proper place, but will take different channels.
2361. *Professor Pell.*] Have you observed the river particularly during this flood and since? Yes, I have.
2362. And you have seen nothing to lead you to change the opinions which you expressed when you gave evidence here before? No; but I see several things to strengthen my views in that direction. In one place, in particular, in the road from East Maitland to Dummore, the road has been cut through already.
2363. Has it broken right through? Right through, or nearly so. The water has been running over nearly all the time since it rose to the last day or two. There is another place running across at the back here where it is nearly through.
2364. Do you live at the back, at Wallis' Creek? I do now, but I have been living for twenty years on Bolwarra.
2365. Have you observed anything in relation to the action of the flood-gates that you wish to tell us? If they had answered, they would have been a benefit to the whole of the low lands at the back. The water coming down from other parts would not have overflowed the land to any great extent. When the gates gave way the water came in from the river. The channel of the river above West Maitland contained the whole of the flood, and nearly the whole of the flood water has passed under Belmore Bridge. It appears that it begins to flow out as soon as it comes to the Horse-shoe Bend, and then it goes over in every direction. I do not see any great advantage in putting up embankments, for if you put up embankments on one side it goes out at the other. I have seen the effect of this in the lower part of Bolwarra this time. There is a system of embankment put up by Mrs. Dickson on the Bolwarra side which has stood this last flood. It always went away in previous floods. The water has been nearly as high as it was in 1867; it has been within 10 inches of my house where I used to live.
2366. Do you attribute that to the embankment? Partly, and partly to the place at the fords that stood in the beginning of the flood. As soon as that went away the water never rose afterwards in that immediate neighbourhood, although the river kept rising above. There is always a very great fall wherever the river goes over. At Ford's on the Pitnacree Road I should think there is 3 feet of a fall as it comes over the bank. It only takes the edge off one bend before it is in the river again.

Mr. J.  
Bowden.  
11 April, 1870.

TUESDAY, 12 APRIL, 1870.

Present:—

E. O. MORIARTY, Esq., PRESIDENT.

P. F. ADAMS, Esq., | PROFESSOR PELL.

Mr. Richard Myers was called in and examined:—

- Mr. R. Myers. 2367. *President.*] Where do you reside? Near Fullerton Cove, between the Terrace and Newcastle.
2368. Are you acquainted with the effects of the floods about Maitland? I know nothing about the floods here at all.
- 12 April, 1870. 2369. Or at Raymond Terrace? I have been acquainted with the floods at Raymond Terrace for thirty years.
2370. And you have observed their effects? I have.
2371. Did you make any notes particularly with reference to the last flood? No, I have seen nothing, and only know from what I have heard.
2372. Do you remember the effect of the flood at Raymond Terrace in 1867? I do.
2373. Did you make any notes particularly with regard to them? I did not, but I have seen the notes of others.
2374. In the flood of 1867 was there much of the land below Raymond Terrace, Hexham, and thence on to Fullerton Cove submerged? Nearly the whole of it was under water, but there was not so much damage as in the last flood has been done in that direction; not so much in either the 1857 or the 1867 flood as in this last flood. The high wind on the Sunday blew the water up for miles over the land.
2375. The damage was not solely owing to the quantity of the flood waters, but partly to the wind and the tide? Yes, but the floods came heavier than any I have seen for the last thirty years.
2376. *Professor Pell.*] What part of the river do you speak of? From the Flats up towards Newcastle.
2377. *Mr. Adams.*] How long did that rise in the water last? It rose by the wind on the Sunday. The wind was south, and it blew the water directly from the bay over those flats. It is all on a dead level from the Tillegary Creek to the Hunter, and the wind very nearly drove the water to meet the tide by the Tillegary. From my observations during the last thirty years in that neighbourhood, the water was never so high.
2378. Did the water subside soon after the rain ceased? No. It comes in over from the river, and it remains there.
2379. *President.*] There is no drainage? No drainage.
2380. *Professor Pell.*] Is there much valuable land about there? Yes, very valuable land; but half of it is under water.
2381. *President.*] Which land are you speaking of now? From Fullerton Cove toward the Tillegary.
2382. Where is the Tillegary? It is a creek coming from Port Stephens Heads. It is only about 7 miles by water from the Hunter.
2383. There is no creek going right through, is there? There is the mark of an old creek.
2384. Is there a chain of swamps across there? Yes, all the way.
2385. And the country is no great height above sea level? No, excepting the hills between the coast and these flats.
2386. Does that high land fall away? It comes in bold to the swamps.
2387. It does not extend across? No. I believe that the level is such that a furrow made with a plough would meet the tides.
2388. *Professor Pell.*] Do you know the line of country from Raymond Terrace to the Tillegary Creek? Yes.
2389. Is that level? Yes, all level. The only rise would be to come out about half a mile from the Williams.
2390. After that is the country a dead flat? After that it is chiefly if not entirely swamps. A canal from the Williams to the Tillegary would open up about 50 miles of country, and take away all the flood-water from the Williams.
2391. *President.*] Do you mean that it would open up the land for agricultural purposes? Yes.
2392. *Professor Pell.*] That is by draining these swamps? By making a boat canal. It would take all the overflow from the Williams, and empty it into Port Stephens. I have been living on there for many years. The creek does not rise more than 6 inches.
2393. *President.*] Does that flow into Port Stephens? Yes.
2394. *Professor Pell.*] How far up the Tillegary Creek does the tide come? Within three miles of the Hunter.
2395. Three miles of what part of the Hunter? Fullerton Cove, the head of the Flats as we call them. Some gentlemen from the Terrace have been looking over this line, which would not be more than 9 or 10 miles from there. It is chiefly swamp. The only way of relieving the Williams would be by a boat canal from the Tillegary to the Williams.
2396. Have you ever noticed the damage done between Raymond Terrace and Hexham by the floods? I have only noticed the coast side.
2397. *President.*] None of the waters of the Williams ever do break over and go down that way? No.
2398. *Professor Pell.*] Do the waters of the Williams do much damage? If it comes down before the Hunter, it causes nearly all the damage about the Miller's Forest and down there. If the Williams comes down first it stops the Hunter.
2399. How high must the river rise for it to overflow? I could not answer that question.
2400. But you think that the Williams might be relieved by that cutting? The Williams would be relieved.
2401. *President.*] The cutting would have to be a pretty large one? It would require to be large certainly, to take all the flood of the Williams.
2402. About as large as the present channel of the Williams? I do not think that it would.
2403. *Professor Pell.*] If the cutting were not a large one, and the waters of the Williams got into it, would you not be afraid that it would overflow that low country between Fullerton Cove and the Williams,—that perfectly level country? Yes; but I should not expect that it would do much damage.

2404. *President.*] What rise and fall have you got at Tillegary? 6 feet.
2405. That is an unusual height? It is.
2406. Is there such a height anywhere on the coast? Newcastle is not more than 4½ feet. This creek rises 6 feet close to my door.
2407. It might happen that with a high flood you would have a high tide, and it would then be all the worse for you? I have been there thirty years, and I have never known it rise 6 inches.
2408. That is because there is no drainage into the creek? These swamps retain the water. There is no drainage.
2409. Is Tillegary a narrow channel, gradually contracted? It is.
2410. That always produces a high range of tide? That is my opinion.
2411. *Professor Pell.*] Are the banks of this Tillegary Creek high or low? Low generally.
2412. Is the water at all on a wash with the banks? It does not wash the banks, but there is a great deal of salt marsh.
2413. Is there any valuable land on that creek? Very good land.
2414. Land never flooded by the creek? No; but the rain-waters are retained in the swamps, and it takes a good time to go away.
2415. About how high are the banks? Spring tide overflows the greater part of that country.
2416. Should you not expect that if the Williams were turned into that creek that it would overflow? I do not think that it would do one pennyworth of damage. A canal would make a high road to market.
2417. *President.*] But if the farmers lost their crops? There is no danger of their losing their crops. Drainage is the great thing wanted to improve the land now.
2418. But drainage might be carried out without bringing the Williams down on top of you? Drainage might be carried out in connection with the Hunter for the low lands about Fullerton Cove. There would be an outlet two ways into the Hunter, and also into the Tillegary.
2419. *Professor Pell.*] Would the swamp land be good land if drained? Very rich land indeed. Every inch of it is taken up in the anticipation that it will be drained some day.
2420. *President.*] Taken up by free-selectors? Yes, the greatest part of it.
2421. *Professor Pell.*] How do the people live there? They don't live there; they live on the high land adjoining, and use the other for grazing. The people there are chiefly market gardeners, and they have suffered considerably by this flood, for it has left a coating of mud on the grass and gardens. Cows cannot feed.
2422. *Mr. Adams.*] Was that water fresh or salt water? All fresh water.
2423. In the time of the flood? Yes.
2424. The salt water all goes from Fullerton Cove as well as from the Hunter? Yes. The salt water overflows in these low places at spring tides, sometimes for a mile.

Mr. R. Myers.

12 April, 1870.

---

Mr. John Hickey was called in and examined:—

2425. *President.*] Where do you reside? At Fairlie.
2426. Where is that? On the flooded land at Fishery Creek. Two or three miles off.
2427. Was your land flooded? The greatest part of it was.
2428. Shall you lose the whole of your crop this year? Yes.
2429. And I suppose every flood destroys your crops more or less? When there comes a large flood.
2430. Only a large flood? Only a large flood.
2431. Are you ever injured by the floods in Fishery Creek itself? By our local waters?
2432. Yes? Never. The local waters remain on what we call the swamp—the land we do not cultivate. It never rises across, and even the swamps could be made the most valuable land in the country.
2433. That is, if drained? Yes.
2434. Is it of large extent? It extends for miles and miles.
2435. Is it private or Government land? It is private property, land which was cultivated some thirty years ago.
2436. *Professor Pell.*] Why cannot it be cultivated now as well as then? It could be cultivated if there was less water.
2437. Then it has been more flooded since? Yes. There were no floods in those days; the land was dry. It could be cultivated now as well as then if the water could be kept off.
2438. How much of this good land is there ruined by the flood—how much land has been made useless by the flood altogether? Some thousands of acres.
2439. Do you refer to Hungerford's Swamps? To Hungerford's Swamps, Sparke's Swamps, and to all the swamps at the back and at the head of Fishery Creek.
2440. Do you know anything of the land higher up Mulbring Creek? Yes.
2441. Has there been something of the same sort taking place there? The land up there is nothing compared to these—it is only fit for grass. One acre of the swamp land is worth a hundred of the other.
2442. They are of no use at all? Of no use. The height of the Northumberland Hotel of water now covers them.
2443. I suppose there is always some water upon them? No; last Christmas time they were quite dry.
2444. You are afraid to put crops into them? We know the consequence if we do. Even where we have a little confidence we lose the crops we put in.
2445. To whom does this swamp land belong? To the Hungerfords, Wentworth, Sparkes, and Sawyer.
2446. This land is in the hands of large proprietors? Yes, it is let and sub-let.
2447. They do not fetch much rent, I suppose? I do not know how people come to pay any rent. People could not live in them if they had them for nothing.
2448. In what condition were they last year? Last year was just as bad. There was a flood, and as soon as the land got into good working condition there was another flood.
2449. What would this land be worth if drained? I really believe that these swamps for thousands of acres would be far superior to any part of Bolwarra or Dunmore if they could be relied upon and drained out.

Mr. J. Hickey.

12 April, 1870.

Mr. J. Hickey. 2450. How high must the water rise in the river before it floods the swamps? As soon as there comes a fresh in the river and the water rises 4 or 5 feet it runs out up Wallis' Creek, excepting it is kept back by flood-gates.

12 April, 1870.

2451. Does 10 feet flood these swamps? Yes; the swamps are lower than the river at that height; even at the present height of the river there is a great depth on them.

2452. What is the depth of the water on these swamps, not on the creek, in the deepest part? I could not say.

2453. Is there 10 feet? I am perfectly satisfied that there is twice that.

2454. It would be lower than the bed of the river if that is the case? The water is in after the flood, and cannot come out.

2455. Mr. Adams.] At the top of the flood there would be 20 or 30 feet depth of water? And I think there is not 6 perpendicular feet of water fallen off yet, and it won't fall now for a long time. There is no outlet but the creek.

2456. Professor Pell.] Through these swamps the channel of the creek is quite distinct? It is; but not now.

2457. Are the banks of the creek higher than the swamps? Yes, in places.

2458. Are the banks themselves higher than the swamps? The banks of the creek may be in some places 2 or 3 feet higher than the swamps. The floods come along the creek and leave a deposit on both sides which makes the banks rise a little, but not much.

2459. Mr. Adams.] How far does the tide ever affect Fishery Creek? I have known the tide to go as far as Fishery Creek Bridge; but I have known it to go up Wallis' Creek as far as Dagworth.

2460. Professor Pell.] Do you think that there are 2,000 acres of swamp land? — Wentworth himself has 1,200 acres of swamp land.

2461. President.] All good land? The best land in New South Wales, if it were drained. Besides, I believe there are 300 acres on Ravensford, not counting all the small purchasers.

2462. There are only 280 acres of Sparkes' land? I thought there were 300.

2463. What amount of taxation would you, as a land-owner, be disposed to submit to in order to drain that land and improve it thoroughly? I am taxed now more than I can possibly afford to pay. I am incorporated with the Council, and any further taxation I cannot bear. I might as well leave the country altogether.

2464. Supposing it could be shown that certain works would have the effect of relieving you from floods? If the works were done, and I had time to get a return, I should be satisfied to pay taxes.

2465. How much do you consider that it would be worth to be quit of the injury of floods? It would be worth half-a-crown an acre per annum, but not for it to be an everlasting affair. It would be a very dear business to pay 2s. 6d. an acre as an everlasting tax.

2466. Professor Pell.] Supposing that works were done that did not prevent your lands from being flooded, but that carried the water off quickly? That would do no good. Nothing will do but what will take away the water according as it comes down the river.

2467. Mr. Adams.] Are there any flats in the creek that could be removed? It is nearly on a level, and when the water is 2 or 3 feet high it could run over them as well as anywhere else. That would not have any effect on the crops.

2468. Professor Pell.] When Fishery Creek goes down, are these swamps drained at once? There may not, to your perception, be more than 3 or 4 feet remaining in Fishery Creek, while there is 10 feet on the swamps.

2469. President.] Then Fishery Creek is not deep enough to drain the swamps? It would appear so. There is a narrow strip of land that runs round into Fishery Creek, and if that were cut across, it would straighten or shorten the creek a mile or two.

2470. Straighten and deepen Fishery Creek? Yes; that would be better; but all that could be done to Fishery Creek or Wallis' Creek will never do any good unless there is something done to draw the water off to Newcastle. When the water comes in it cannot get down. When the water rises to a certain height it cannot rise much higher, like as was the case in the 1857 flood; and we may expect many such floods.

2471. I suppose similar obstructions to those which you describe in Fishery Creek exist to impede the discharge of the water from Wallis' Creek? Just the same; but Wallis' Creek is deeper, and carries the water away quicker.

2472. Professor Pell.] More water comes down from the mountains to scour it? It comes down more rapidly.

2473. President.] An essential element of doing anything for you on Fishery and Wallis' Creek would be to improve the outfall of those creeks, to straighten and deepen them, and to improve the drainage into them? If there were 3 feet of water on the swamps the land would drain itself. The land is like a honeycomb.

2474. The subsoil is very porous? Yes. Seventeen or eighteen years ago I put a bank in the creek to keep out the fresh, to save a crop of wheat, but the water began to pour up out of the land like a honeycomb.

2475. Professor Pell.] The water came up like a sponge? Yes, like a sponge. I consider by that that the water would go in the same way that it comes.

2476. President.] What sort of a subsoil have you got up there? It is a reddish ash sort of a soil—quite loose.

2477. Professor Pell.] That is the natural subsoil I suppose? You can go down any depth and get soil just the same as that. When you go down one foot the water will rise up just like out of a pipe.

2478. President.] It is then at all times thoroughly saturated? Yes, according to the season.

2479. It is not peat I suppose? No.

2480. Professor Pell.] Does it differ much from the soil about here? Not much here. It looks reddish on account of some sort of mineral in the water.

2481. Is it more friable? Yes, it is a lighter soil.

2482. President.] More easily worked? More easily worked.

2483. Would it produce good wheat crops? It is the finest land under the sun to grow wheat on. I never saw land equal to it to grow wheat if it could only be kept dry.

Mr. James Thomas Dee was called in and examined:—

2484. *President.*] Where do you reside? On Fishery Creek.
2485. Did you not give us evidence before? Yes.
2486. Has anything occurred to your mind since then which you think ought to be mentioned in connection with these floods? Yes, the cutting of a canal.
2487. Where? Either through Howe's Lagoon or through Bolwarra, but I prefer through Howe's Lagoon.
2488. From where? From Wallis' Creek down from the old Black Horse past the mile, to give a relief channel below so as to keep it from injuring Morpeth, that is to say if it would injure Morpeth.
2489. That of course would be connected with the blocking out the river altogether from Wallis' Creek? We could not do it without flood-gates.
2490. Or a permanent embankment? Yes.
2491. Is your idea to make such a cutting as would carry off the whole of the water of Wallis' Creek in times of flood? The whole of the water from the local watershed.
2492. It is your idea to have a new outfall in point of fact to Morpeth? The water would be down before the first flood when it came down.
2493. You would wholly exclude the flood-waters of the Hunter from Wallis' Creek? Yes.
2494. Have you ever known the country at Wallis' Creek to be flooded by the water of its own watershed? I have never seen the cultivation land flooded by our own water.
2495. You have never had heavy rains without floods on the Hunter? We have been flooded out at my place without a drop of rain at Maitland.
2496. *Professor Pell.*] By the back-water? By the up-country water.
2497. *President.*] Not by your own water? No, by the water from the Hunter, without any rain at all falling at Maitland.
2498. Have you ever had local coast rains here that would flood that country without the Hunter being at the same time in flood? Never, in my memory.
2499. From what you have observed of the channel of Wallis' Creek and Fishery Creek, do you think that the flood-waters are prevented from freely escaping out of those creeks on the subsidence of the flood in the Hunter? They run off very slowly. They rise very rapidly—they rise much faster than in former years.
2500. And fall more slowly? Yes.
2501. How do you account for that? I don't know. From 1840 to 1857 we had considerable freshes in the river, but we were not then flooded by floods such as now. Now we are flooded in less than twenty-four hours. In former years we could get part of our crop off. After three or four days' rain now it is as much as people can do to get away from their habitations.
2502. Have you seen any enlargement of the creek by former floods which would account for that? It has not been enlarged, but it is filled up. The floods from the Hunter seem to have the effect of contributing to block up the channel of Wallis' Creek—it is tending to that.
2503. And so far is deteriorating it as a channel for the discharge of its own waters? Yes.
2504. *Professor Pell.*] How do you account for these floods coming more rapidly? Ever since we had this artificial mouth cut. I was told by one of the sub-contractors, the people of Wallis' Creek would curse this cutting. The least fresh—7 or 8 or 10 feet of a rise—now floods land that would not be flooded by 20 feet of a rise years ago.
2505. *President.*] Was there any contraction at the inlet in former years compared to what it is now? The old inlet was the same as now.
2506. Was it as large as the present inlet or larger? I think it is smaller at the bottom. This new inlet is given to us at a particular point of the river where the water has more velocity than in other parts. At the old mouth of the creek the river is of considerable depth and runs very slowly, but it runs in at the new mouth with great force. I attribute the sudden rise of the water in that locality to this—I think this is the sole cause of it. The river is narrow in that particular part, and it seems to run much faster and bears dead against this new mouth.
2507. It would be higher at the old mouth? There is a little fall.
2508. And therefore you would fancy it would go in much faster, unless some contraction of the mouth had taken place? The old mouth was very narrow, much narrower than the new.
2509. It seems strange that if the water flows up faster it does not come down faster? It does seem strange.
2510. Are you quite certain of these facts? I am quite certain of it. I have seen the proof of it for many years.
2511. Have you compared the operation of these freshes in former times with those of late years, which do not run off so readily? I have compared it in proportion to the height of rise in the river.
2512. You may have a certain rise and the flood runs away very shortly, and you may have a rise that keeps up a long time—Have you any notes of the duration of old floods that drained off more rapidly as compared with recent floods that remain? When the river rises 18 feet or 19 feet we are flooded out. In former times we had only 2 feet of water.
2513. To what times are you referring? To floods before the new cut was made.
2514. *Professor Pell.*] Are you acquainted with the swampy lands about the head of Fishery Creek? Yes; I own land there.
2515. Not much of it is under cultivation? No, it is used more for grazing.
2516. Is it good land, if drained? There could not be better land in the world, if it were drained.
2517. It loses very much of its value by being subject to floods? It was cropped in former years, but since the flood of 1857 there has not been a crop grown on it. Many of the farmers have gone to Richmond River.
2518. About what extent of that kind of land is there? Several thousand acres—ten or twelve sections. All that land between Dagworth Swamps and the Buchanan Swamps—I should say about 6,000 acres.
2519. *President.*] What assessment do you suppose the land-owners would be disposed to submit to if any feasible project of drainage were proposed? I should say 5 per cent.
2520. On the annual value of the land? On the annual rental of land.
2521. *Professor Pell.*] What are these swamps worth an acre? Nothing; they are not worth 10s.

Mr. J. T. Dee.

12 April, 1870.

- Mr. J. T. Dec. 2522. What would they be worth if they were drained? They would be worth £3 an acre; if they were thoroughly drained they would be worth more than any part of Bolwarra.
- 12 April, 1870. 2523. How much do you say the owners would be willing to pay to get £2 10s. an acre more for it a year? I can't say. I would be willing to pay 5 per cent. for any portion of mine.
2524. Would you not pay more than that to increase its annual value by £2 10s. an acre? I would give one-half of the land away to secure the other half. It is no use to me at present. There is not finer land in the world than the Wentworth Swamps. If the flood-gates had stood, there would not have been one-half the water.
2525. *President.*] I see that you take no notice of the drainage from the land itself, but you all seem to attribute the water wholly to the floods of the Hunter? The cultivation ground would not be flooded but for them.
2526. Supposing that the whole area of these creeks is about 100 square miles, and suppose that 16 inches of water falls on that area,—what is to become of that water? Of all the water that I have seen fall for the last thirty years, I have never seen the cultivation land flooded; the swamps contain the whole of it.
2527. *Professor Pell.*] But when the river comes in you can't tell how much water comes down your creeks, and how much flows up them from the Hunter? No; after the river begins to rise you can give no certain idea.
2528. *President.*] Suppose you have 100 square miles of country, and that there are 10 square miles of it flooded land, that is one-tenth of the whole—if 16 inches of rain falls over the whole area, and drains down to the flooded land, you get 160 inches, or 13 feet or 14 feet of water over the flooded land? Yes.
2529. What is to become of that water? —
2530. *Professor Pell.*] Supposing those gates had stood, you would have had 13 feet of water on the average over the whole of this land? In some places you would.
2531. But 13 feet would be the average? On the whole area?
2532. Yes? But there are more than 10 square miles of area in this locality.
2533. We have the map here? I don't think we have a hundred miles of watershed.
2534. You see the extent of the watershed and flooded land on this map? I see by that that our flooded land is not one-tenth of the whole.
2535. *President.*] Take the watershed at 60 miles, would that be a fair estimate? I think that would be fair.
2536. If it is only 60 miles, that would give you an average of 7 feet over the whole? Our flooded area is greater than your area.
2537. *Professor Pell.*] You see by a calculation of this whole area, your watershed is ten times the area of this flooded part? It is not ten times—it cannot be.
2538. Look at it. There are 100 square miles of watershed? And how many square miles of flooded land?
2539. It looks to be 10 miles? It may be that.
2540. That would at least give you an average of 10 or 11 feet over the whole of the flooded land? Yes.
2541. That would fill you right up? It would in places in the Wentworth Swamps and the Buchanan Swamps; but the most valuable part of the cultivation land would not be flooded. The water would never injure the crops, allowing that enormous quantity of rain to fall, and none to go out before the river rose.
2542. Suppose you take the whole of that country from nothing to the deepest part, that being I suppose at the gates—say 25 feet—what would be the average depth over the whole of the flood when it is at its height? About 4 or 5 feet, I should say.
2543. Why half the rain that fell on your own area would have filled you up to the extent that it rose here? I do not see it. Before the flood-gates gave way there was scarcely a drop of water.
2544. That was in the earlier part of the flood? Yes.
2545. *President.*] There were 8 feet of water we are told? There were not 4 feet of water where I live.
2546. But there were 8 feet in the creek? At my place it was not more than 4 feet.
2547. *Professor Pell.*] What was the depth over the whole of the flooded area? There were scarcely 3 inches over Louth Park and Lochend when the flood-gates gave way.
2548. What was the average over the whole of the valley? I cannot say.
2549. It would not be more than 5 feet? I could not say.
2550. *President.*] You must make up your minds to get a great deal of water at times from your own watershed? We are prepared to put up with that if there is no other added to it.
2551. It would drown you? It would be impossible.
2552. If you had waited a few days longer, and these gates had stood, the water would have been just as high at the back as the front? It would have risen, but I think not in any such proportion.
2553. In the earlier part of that flood the rain was as nothing that fell along the coast compared with that which fell on the head of the Hunter. The heaviest rains were before we had any fall to speak of in the coast country, and at that time, during the very first fresh the river had risen, and when the gates gave way there were 8 feet of water inside them? We had a great deal of rain here. It was raining eight or nine days before the flood-gates gave way.
2554. But then the water had been discharging out through the flood-gates? Yes, it had been running out through the flood-gates.
2555. We know the rainfall and the area, and there can therefore be no doubt that the average depth of the flood would be 11 feet? The greater portion of the water that falls on our own area has drained off before the flood comes down. Theoretically you are speaking correctly. I should like to see a cutting made to take this water off before the flood comes down the river; that is, if it would do no injury to another part of the district.
2556. In all these discussions I think that the quantity of water that you have to deal with on your own area has been lost sight of? No. I have watched the creeks for many years. The water has been from Mulbring Creek, and it has gone off in a very few days.
2557. *Professor Pell.*] When the Hunter once flows up, you have no means of judging as to what comes down? No, we have no means of telling that.
2558. If the Hunter were shut out you would find it very different from what you expect, for the area of the watershed and the amount of the rainfall enable us to tell what comes down? Yes.

2559. And you have no means of ascertaining that by observation? No. If the flood-gates had not given way we should have had a very high fresh, but the crops would not have been injured. Mr. J. T. Dec.
2560. But that is merely a general impression? Yes. 12 April, 1870.
2561. Impressions, unless based on ascertained data, are likely to mislead. The impression that very little water comes down this creek seems to be common? Before the flood-gates gave way I had about 3 feet of water.
2562. Did you notice the height of the water at your place when you left? Yes, at about 8 o'clock.
2563. How much had it risen since the night before? At my place?
2564. Yes? Not above 6 or 7 inches.
2565. Within the twelve hours? Yes. The Mulbring Creek.
2566. It was rising then at about the rate of half an inch an hour? A little more than that I should think.
2567. How much was it rising? Nearly an inch an hour; about 2 feet in a day.
2568. When you came into town did you examine the height of the water as shown by the gauge on Belmore Bridge? I did not notice it when I came into town.
2569. You went straight to the flood-gates? Yes.
2570. And you remained there till they gave way? I came to the flood-gates at 12 o'clock, and I stopped there until they gave way.
2571. At what time did they give way? It was after 2 o'clock.
2572. And then you galloped straight up the Belmore Bridge? Yes.
2573. And you noticed that the water had fallen about half an inch? About half an inch.
2574. How did you know that—how did you compare it? By the numbers, and also by the settlement of the water.
2575. Might not that arise from the wash? I saw a certain portion of the number, and I could see a little more of it after the gates gave way. But in less than twenty minutes it was up again.
2576. But there was a perceptible draw when the flood-gates did give way? Yes.
2577. Did you go home immediately? I went home immediately.
2578. And you found that the flood had risen how much? About 1 foot.
2579. About how many hours was that from the time that you noticed it in the morning? About six or seven hours.
2580. Then the flood had risen at the rate of about 2 inches an hour? In the low portions. The bed of the creek is very narrow, and the water rises rapidly at the commencement. It rose very rapidly.
2581. How rapidly did it continue to rise after that? I stopped down the creek a few minutes after I got home, and after that the water came down very rapidly.
2582. The back water? Yes, the river water.
2583. *President.*] Did you notice the rate of rise after that? No, I was busy shifting things.
2584. After the gates gave way, do you think that the rise was about double what it had been before the gates gave way? More than five times the rate.
2585. *Professor Pell.*] You got home before the back-water reached you? Yes.
2586. *President.*] Whatever rise took place between the time of your leaving and coming back was due to your own water? Yes. I was not flooded until twenty-four hours after the flood-gates did give way. There was more water running up through the flood-gates than down our own watershed.
2587. What was the height of the rise in feet after the flood-gates gave way—From the height that you found the water on your return home, to what height did it rise by the next morning? I could not exactly say.
2588. I want to arrive at the ratio before the flood-gates went down and the ratio of the rise after they went down? It rose about 12 feet, over 12 feet.
2589. From what time? From the time the flood-gates gave way.
2590. Until what time? Until about 9 o'clock the next morning, and it spread over a great deal of country besides. I should not have had a drop of water in my place if it had not been for the flood-gates giving way, and I had over 17 feet in some places after they did give way.

Mr. Joshua Anderson was called in and examined:—

2591. *President.*] Do you reside in Maitland or the district? I have resided in Maitland and its vicinity for the last twenty-five years. Mr. J. Anderson.
2592. Where do you live now? On Campbell's Hill. 12 April, 1870.
2593. Does your observation of the floods extend more to the town or to the district? To the entire district. I have applied my mind most assiduously to the subject.
2594. Would you kindly favour us with your views on the matter? I shall be very happy to do that. I came here in 1844. I think that for two years before that it must have been dry, for the lagoons which have been filled with water since 1857 were then covered with a most luxuriant growth of grass. But I was told that in the year 1840 there was a serious flood. Then until 1855 there was no such thing as a flood, and the very lowest land would carry wheat. In those years there was an abundance of wheat and maize; although it was so very dry that cattle had to come in from Ravensfield and all round about to water in the Hunter. We had occasional showers; and with the exception of 1847 and 1848, which years were excessively dry, I do not see that we suffered at all in this district from drought. From 1855 to 1857 the river began to have freshes, but I never could have believed that we should have been so flooded as we were in 1857. Many of the farmers were forced to forego the little homesteads which they had purchased, and there was very great devastation indeed.
2595. Did the same thing occur again in 1867? Yes.
2596. And there was great loss and distress caused by the 1867 flood also? Yes, very.
2597. And the same with this flood? Yes.
2598. Could you estimate the money value of the damage done to the district by this flood? It would require that a list should be taken of the farmers to ascertain that accurately. I had a little farm of 87 acres in Dagworth that I formerly got £80 for, and now I may say that I have reduced the rent to £45.
2599. *Professor Pell.*] Flooded land? It is for the most part liable to be flooded, but there is some high grazing land not subject to flood.

- Mr. J. Anderson.  
12 April, 1870.
2600. How much could you get for it if it were free from the liability to floods? The cultivation land is excellent. It would be worth £2 5s. per acre. One-third only of it is grass land.
2601. It would be doubled in value? It would.
2602. *President.*] Supposing that it would be feasible to do anything to relieve the district from floods, what do you suppose the residents would be disposed to pay in the shape of an annual tax for the construction of the necessary works? I think they ought to be assessed considerably. I think that the whole district should be appraised equitably, and then be enabled by law to borrow money, and should pay an assessment on the rentage value for so many years.
2603. To pay off the interest and the principal? Yes; but a number of years should be given to pay off the principal.
2604. You think that if anything is done it should be met entirely by local taxation? I do think so. What right has the Government to do it?—They ought to enable us by law to borrow the money. If the floods continue for the next ten years as they have been for the last, the district will be in a great measure depopulated.
2605. Does your interest lie on the other side or on this? Up Wallis' Creek and Dagworth.
2606. You would be disposed to give the persons interested authority by Act of Parliament to effect such drainage and other improvements as they thought advisable? Certainly.
2607. And to give them authority to tax the whole of the district affected? Yes, with accurate appraisers sworn to do justice.
2608. You would not be disposed to come upon the inhabitants of other parts of the Colony to pay for your works? No. Why should we?
2609. And you are quite prepared to undertake them yourselves? As far as I am individually concerned; and I believe the land-owners and towns throughout the district, for all suffer directly or indirectly.
2610. Is there anything else that you would like to mention? I cannot but think that there may be many remedies to avert in a measure these floods. In 1857, when the whole district was under water, I could see from the height at the back of Dickson's that it was all surrounded by water.
2611. You would cut through the high land at the back of Mrs. Dickson's house? Yes.
2612. And lead a channel down through Bolwarra? Yes, bounded on the one side by the forest and on the other by the cultivation land. I propose that it should be taken to one of the bends of the river at Largs, and then on through Narrowgut to the Queen's Wharf at Morpeth.
2613. In point of fact you would make a fresh channel from Bolwarra House to Morpeth? Yes; but not have it so low as the bed of the river. Several other plans are proposed, mostly one and all of them practicable.
2614. I suppose that you have merely formed a general opinion, without going into any detailed calculation as to the quantity of water which the river brings down and which these respective channels would carry off? I have not.
2615. Do you not think that that is essential to arrive at any correct conclusion in reference to this important matter? I have had a practical knowledge of drainage works from infancy, and it is that on which I form my opinion. As Mr. Dodds has pointed out, the river is cutting its way and pointing out what is to be done. Nature will in a great measure do what is required in the next ten years. Maitland is in danger of being undermined owing to the action of the river. The sediment of the falls amounts to 6 or 7 feet, owing to the choking of the water there.
2616. A deposit forming on one side causes a falling away on the other? Yes.
2617. And you believe that Maitland is likely to be undermined by the river? Yes. I believe that we are not benefited here at all by floods. It will require now two years to bring the land into a similar state to that which it was in before the floods. The land is ill to work, and if there is a drought it will rise in lumps and be more difficult to work, and if the weather is showery it will be so sticky that it will be like working clay. It is sour from the inundation.
2618. Would not the land be exhausted in the absence of floods? One season's fallowing would do more than twenty years of floods.

---

J. B. R. Robertson, Esq., was called in and examined:—

- J. B. R. Robertson, Esq.  
12 April, 1870.
2619. *President.*] You reside near Morpeth? No; on the Oakhampton Road, about three miles from here. I have had an opportunity of witnessing this last flood and several previous floods.
2620. Perhaps you will be so good as to mention any circumstance which may occur to you as being worthy of recording? I think that this flood has been as disastrous in its consequences as any that I have known since 1857. I believe that it is a great mistake to suppose that these floods do any good. They are too frequent, and I consider them an unmixed evil. If a flood were to come once in twenty years it might be beneficial, but as the floods come now every two or three years, or every two or three months, as they did in 1857, the land instead of being very much benefited is very much deteriorated in consequence for (say) twelve months, until the action of the atmosphere and tillage brings it into a fit state to produce crops. I think that these floods might be greatly obviated. It would be a dangerous thing to dam up the river, even to wall it up on both sides; for if the walls or embankments were to give way, the water would drown the people and wash the whole of West Maitland into the sea. Besides such a work would cost millions of money.
2621. To dam the river up near the township? I disapprove of embanking the town; but I think that we should try and assist all those low-lying places where the water goes over, by making cuttings deeper and wider than at present.
2622. You would improve the outfall of the river so as to carry away the flood-waters more rapidly? Yes. It is at Oakhampton that the first break occurs, but the first low place where the water comes over is the Horse-shoe Bend. I think that that should be deepened very considerably and widened.
2623. Which, at Oakhampton? Yes, the first break in the river bank.
2624. You think that the channel of the river should be deepened and improved there? Yes.
2625. Do you mean to open the place and let it out over the land? Yes, the natural channel.
2626. You approve of the swamps being retained still as a sort of safety-valve for the river? I will tell you presently how I propose to drain them. At this place at Oakhampton where the river breaks over it takes

takes a straight course. The channel of the river forms an angle at that place. The current strikes the mound, and then rushes with more impetuosity across the new channel over the land than it does in the middle of the river—that is, after it rises 31 feet at Maitland.

J. B. R.  
Robertson,  
Esq.

2627. Where does the overflow at Oakhampton go? Down by Scobie's, with a stronger stream than runs in the Hunter.

12 April, 1870.

2628. And thence over this flooded land here? Yes.

2629. Your idea is, that the embankment should be removed, and the water be allowed to flow in? Decidedly. But I think that the principal way of obviating floods would be to cut a canal from Raymond Terrace to Port Stephens. I think that it might be done at an expense say of £50,000 or £60,000, because it is all low swampy land. In about half-way you come into the Tillegary Creek, which itself would be a channel for the water.

2630. That is your main project,—to let the water off from the lower part of the Hunter, below the Williams? Yes, by a canal from Raymond Terrace to Port Stephens.

2631. Have you considered the size of the canal that would be of any use to relieve the Williams? No.

2632. The channel itself is unable to carry off the water? But this would assist it. It would be another channel to the sea.

2633. The channel must be of enormous magnitude to sensibly affect the flood? It would be deepened by the flood. The wider the better, of course.

2634. *Professor Pell.*] Do you know that country? I do not, excepting by report. I have never been over the ground. With reference to the good that some people imagine that these floods do, I find that I have some land in cultivation at Moore Park that is now too rich for wheat.

2635. How long do you think that this alluvial land could be cropped in the absence of floods and without manure? I should say from fifteen to twenty years, by ploughing a little deeper.

2636. Supposing that there had been no floods since this country was settled, do you think that this land about here would begin to be exhausted? I have no doubt about it; but I think that a flood oftener than fifteen or twenty years would be objectionable. Eleemosynary aid is now absolutely necessary for the farmers who cannot pay up their arrears of rent. I have lost thousands of pounds by remitting rents since 1857. At that time I used to get £4 an acre for land that I have now great difficulty in getting £2. This aid must be given, though no doubt it has a bad tendency.

2637. It pauperizes the people? Yes, it demoralizes them, but we cannot do without it. If it were possible to obviate the floods, the people would not be driven to this necessity.

2638. *President.*] Do you think that any relief given to the river so low down as Raymond Terrace would sensibly affect the floods about Maitland? Most decidedly.

2639. What intermediate arrangement do you propose? To cut through all these low places, and give the water full scope; have no embankments.

2640. And you suppose that to do that would prevent floods? I do. I think that it would in a very great measure, excepting in very extraordinary floods, prevent floods altogether.

2641. Have you arrived at that conclusion on any calculations as to the quantity of water that has really to be dealt with? Not as to an estimate in gallons, of course not.

2642. In cubic feet, or any other quantity? No; I speak merely from observations which I have made.

2643. Probably you are not aware of the fall of the river between West Maitland and Morpeth—the diminished fall in the tortuous channel of the river? No, I do not know what the fall is. I do not think that it can be very great, because I know that this level soil on the cultivated lands is from 15 feet, at Phoenix Park, to about 18 feet up here. At my place, at 18 feet I came to a bed of oyster-shells, showing that this has been an arm of the sea at some former period.

2644. If it should happen that it is really impossible by any such short cuts to carry off the flood-waters as fast as they come down, what then would you propose should be done? I know of no other plan—I can imagine no other.

2645. Supposing that it should happen that such is the case, would you be prepared to say that we had better let the whole thing alone, rather than attempt any partial relief? I say most decidedly that it is better to let the whole thing alone, than to commence a system of damming.

2646. That is, of banking the town? Yes; because in an extraordinary flood these embankments might give way and drown the people.

2647. There are many towns in the world embanked? Yes, but perhaps those towns are not in the locality of such an extensive district as this.

2648. *Professor Pell.*] The river is very uncertain? Yes. If we had had two more days' rain, I do not know what the consequences would have been. There would have been a roaring torrent through the town of West Maitland. A difference in the rise of the current 4 or 6 inches makes a wonderful difference in its impetuosity. There is another circumstance to which I attribute these floods, and that is, the filling-up of the bed of the river. I have observed the sand, at Oakhampton, in a moderate stream of clear water in the river, moving bodily along. There are places close by the rocks, where there were more than 35 feet of water, and now there are not more than 3 feet in ordinary times. The bed of the river has been filled up, and continues to be filled up, in a most extraordinary manner. Land-slips help to do it. I think that a system of dredging should be carried out.

2649. Right up the river? As far as Maitland.

2650. Certainly as far as the navigation goes? Decidedly.

2651. *Professor Pell.*] Supposing it should be impossible to prevent heavy floods from going over the land, but that it would be possible to prevent them from rising to such a great height, and to make the water run off more quickly,—would that be of much advantage? I do not think that the water would do much harm if we could get it away.

2652. If we could diminish the height a foot or two, would that be of much advantage? Most decidedly it would.

2653. In what way would it be of advantage? It would save the crops in a great measure. If the water only goes half way up the cornstalks, and goes away in a short time, it does not injure the crop, but if it lies long the crop perishes. It is a remarkable circumstance that less rain produces a flood now than it did some twenty years ago; and I cannot help but think that it is by the filling up the bed of the river.

John Mitchell, Esq., of Dunmore, was called in and examined:—

- J. Mitchell, Esq.  
 12 April, 1870.
2654. *President.*] Did you make any notes as to the height and duration of the flood about your place? No, I did not take notes as to the time, but I took notes of the effect.
2655. We consider it of very great importance to ascertain the length of time that the flood-waters remained up at Morpeth. Could you give us any information if you were to make further inquiries? I could get that. It was on and off twice.
2656. They had three floods at West Maitland—Which floods did they correspond with? Only two went over the banks.
2657. Which were those? The first and second went over the banks.
2658. The third flood was nearly the highest of the lot, was it not? We did not notice the fresh in the river; we did not consider that at all.
2659. Which was that? I think between the two there was a fresh. The waters of the first flood had just gone off, and I know that the river did rise a little, and rose quickly after that.
2660. Could you fix the dates of these rises? There was one flood before you went down to my place, and one after.
2661. Is there anything else that you think we ought to have recorded? I noticed the effect of the floods—the difference between the effect of this flood and former floods.
2662. What was that? It rose, as I imagine, from the river being banked all up here. I have seen every flood from that of 1857, and years before. Since the 1857 flood, I have noticed the difference in the action of the water, since Wallis' Creek and other places have been shut up.
2663. What do you consider the result of the embankment of the river, as far as it has gone? The effect has been very injurious upon us below.
2664. Does it send the water down with greater velocity? It sends the water down with greater velocity.
2665. And greater height? Yes, especially since the Wallis' Creek flood-gates were erected. I believe it has done more injury since than before.
2666. *Professor Pell.*] Before or after the flood-gates gave way? Up to the time that they gave way.
2667. *President.*] Was the water over the lower portion of this land, up to the time the flood-gates gave way? The lower portion of the Hunter had not gone over much.
2668. What do you call the lower portion of the Hunter? Near to Morpeth; before the junction of the Paterson with the Hunter.
2669. *Professor Pell.*] At what part of the river exactly were your observations made? Below Largs—where the water breaks across from the Paterson to the Hunter. But in this instance the water came round on to the lower portion of Bolwarra, and then flowed back, as it were, almost meeting the river again.
2670. The water is there still? Some of it is, but most of it has drained off now.
2671. *President.*] At what height, at West Maitland Bridge, do you consider the river inundates the general run of the country down below about Bolwarra and Phoenix Park? West Maitland Bridge?
2672. What height of water on the gauge of the Belmore Bridge at West Maitland do you consider a warning for you to clear out? When the river reaches to a height of 28 feet or 30 feet it is then time for us to look out. We may then expect the water over us in a short time.
2673. *Professor Pell.*] If the river did not rise above 28 feet, you would not be threatened? We should get a little of it, though not so much as if the river rose higher. 28 feet here would flood us.
2674. Did you notice what difference there was in the height of this flood compared with the flood of 1867 or that of 1857, at your place? There was about 2 feet difference between this flood and that of 1857.
2675. That is, the highest of these last floods was 2 feet lower than that of 1857? Yes, 2 feet lower than that of 1857.
2676. How much lower was it than the flood of 1867? I do not think it was any lower; very little lower if any lower; it may have been a foot perhaps. We have no particular gauges there. We go by certain landmarks, and they vary.
2677. Do you think that the difference in the height of this flood as compared with that of 1857 is sufficiently accounted for by the Paterson not being in flood? We had all the Paterson water down before the Hunter came down. The Hunter in both instances backed the water up the Paterson.
2678. But was the Paterson as much in flood on this occasion as in 1857? Not quite as much in the first portion of the flood, but the water backed up from the Hunter, and stuff was floating up the river instead of down for a considerable time. There are several dams on the Paterson River now which keep the water in the channel of the river. I have no doubt that there was a great deal more water in 1857; but we did not feel the effects so much because it was not banked in.
2679. Did this flood run away very rapidly from Morpeth? I think not.
2680. It hung in the river for a long time? I am quite sure that Morpeth is the place where the water to a very great extent is detained, because in the first flood the lower portions of the Hunter, about Miller's Forest, I believe were not flooded at all. It was perfectly dry in the first flood.
2681. That is the first flood of this year? Yes, the first flood of this year. I was told there was no water there at all until the Williams came down. In the first flood the Williams did not come down at all. When the water gets to Morpeth it seems to be blocked there. They seem to be flooded at Morpeth before we are at Dunmore. Before the embankments were made, the water used to run straight across Bolwarra, meet the Hunter at Largs, and get to Morpeth much quicker.
2682. You say that these embankments raise the height of the water in the river—Could you estimate the height to which in such a flood as this last the embankments have raised the water in the channel of the river? I could not come at it very closely, but I should imagine a great many feet. It must raise it a great many feet, because formerly the water rushed back and flowed into the swamps. The back-water was some time before it came to its height, and it gave the water in the river an opportunity to get away. I do not think that there was anything like the quantity of water fell in this flood that there was in 1857, that is, in the same time.

Mr. Michael Boland was called in and examined:—

Mr. M.  
Boland.

12 April, 1870.

2683. *President.*] Where do you reside? At Fairlie, on Fishery Creek.
2684. About how far up from the junction of Wallis' Creek, or of Mulbring Creek? About a mile and a half.
2685. Is your land subject to inundation by the floods? Yes.
2686. About what depth does the water lie on your land? At present there are about 8 feet of water on the lower paddocks. I have 90 acres of my own property, and 240 acres rented.
2687. The whole of the crops, I suppose, have been destroyed on your agricultural land? Yes; just now I can see the top of the corn stalks. I came into Maitland in a boat.
2688. Did you observe the water in Fishery Creek to be rising before the flood-gates gave way? Yes; the water in Fishery Creek will rise whenever the rain comes on heavily, but our cultivated land is never covered excepting when we get the water in the river. I have been eighteen years there, but I have never known the cultivated land to be flooded except from the river. But at the same time, whenever there is a break in the weather, we should have a reasonable flood on the low lands, without the water from the river.
2689. What do you call a reasonable flood—how high will it rise? If there is a rise of about 3 feet on Wentworth Swamps and Captain Hungerford's Swamps without the river, we never plough within the reach of it. At one time, when the swamps were dry, the water came down from the up-country and took our crops away, and there was no rain round about here at all.
2690. In cases of flood such as this, how long will the water remain? Until next November. The river must be tremendously low before the water goes away. I believe the Wentworth and Hungerford's Swamps are not far from being on a level with the bed of the river. If the flood-gates were securely made to protect us we should never lose a crop.
2691. The water does not drain freely back from your land into the river? Yes, it comes back from Fishery Creek, from Wallis' Creek into the Hunter.
2692. I want to know whether the water drains off freely? It goes away very quietly.
2693. *Professor Fell.*] It will not be off till next November, did you say? It will be next November when my swamps are dry.
2694. *President.*] There is a considerable extent of land injured by the floods there? Yes; we could take a boat and go fishing or fowling for miles on every side of us. I have 240 acres under water to-day, and the water has now gone down a considerable depth. I have had one crop this five years, and that was last year—the corn and pumpkins. In 1855 and 1856 I got excellent crops. In 1854 I bought 90 acres for £1,100, and in 1855 and 1856 I was able to pay the whole off; but in 1857 the flood came and took everything.
2695. Is there no high land where you could put your house on? Yes, my house is on the high land. I have 100 acres of dry ground now, but all the good land out there, where this flood goes, is useless.
2696. You believe that the best means of securing your land from floods is by putting up the flood-gates? That is the very remedy, the only remedy that I can see. I have been there sixteen years. We are able to bear the local rains—the swamps take the local rains—but the river is coming in upon us for five or six days, and it takes a week or more for the river to flow out. If the flood-gates had stood I could have come in with my cart to-day instead of having to come in in the boat. If Howe's lagoon were cut through, the back-water could be taken into the Hunter. The Dagworth, Louth Park, Buchanan, and Fairlie people would get their crops if the flood-gates were up.
2697. Do they think of reconstructing these flood-gates? I don't know; I paid £7 10s. as my part of the assessment. We are pressing them all our might.
2698. Have you ever considered the propriety of draining Wallis' Creek into Howe's Lagoon, and down to Morpeth? I am sure that is an excellently good plan; but without flood-gates we shall never be protected. We must bear the small floods, but we want to be protected against the heavy floods.

Tilmouth F. Dye, Esq., was called in and examined:—

2699. *President.*] Have you had opportunities of observing the floods of 1867 as well as these last floods? T. F. Dye, Esq.  
No, I did not know the district in 1867.
2700. Your observations extend to the last flood only? To the last flood only.
2701. Did you make particular notes as to the rise of the flood? I did.
2702. Your observations were taken at the A. S. N. Company's Wharf at Morpeth? Yes.
2703. Could you fix the date on which the water commenced to rise at Morpeth? It commenced rising slowly on the night of Tuesday, the 8th of March.
2704. About what time of the night? About midnight, as near as possible.
2705. Will you give us your observations as they went on? It rose pretty gradually until noon of Thursday.
2706. What height was it then? 4 feet 6 inches above high-water.
2707. All your measurements are taken from high-water-mark? From high-water-mark.
2708. Ordinary high-water-mark? Ordinary high-water-mark; not spring-tide. It then continued rising at the rate of half an inch an hour, as nearly as possible, until Friday afternoon.
2709. About what time on Friday afternoon? About 2 o'clock.
2710. About what height was it at 2 o'clock on Friday afternoon above high-water-mark? I did not take the height then. It then rose for a short time about 3 inches per hour.
2711. For about how long? Four or five hours; and then it decreased in speed until Saturday at noon, at which time I took the height. It then stood still all Saturday afternoon, Sunday, and Monday—it neither rose nor fell.
2712. Was there much current running down the river? Not a very great deal. It commenced falling about midnight on Monday. It fell gradually too. It kept on falling until Wednesday morning at 8 o'clock, at which time it was only 2 feet above high-water level.
2713. That was on Wednesday morning? That was on Wednesday the 16th.
2714. Then in two days it had gone down? Yes; it then ceased falling, and stood until 10 o'clock on Wednesday night, when it commenced rising slowly, increasing in speed, and was 4 feet 6 inches above high-

T.F. Dye, Esq. high-water by 6 o'clock on Thursday morning. It then rose tolerably steadily, at times as much as 3 inches an hour—sometimes not quite so much, at other times more—until Friday night at 10 o'clock. It was then 11 feet 6 inches above high-water; and from 10 o'clock on Friday night until 6 o'clock on Saturday morning the 19th it rose nearly an inch an hour. During the next twelve hours it rose 8 inches, and from that time, Saturday night, until Sunday morning at 4 o'clock, it rose 4 inches. It then attained a height of 13 feet 6 inches above high-water.

12 April, 1870.

2715. Was there a rapid current in the river at that time? Then there was; a very strong current indeed.

2716. At about what height did you observe the rapid current to set in in the river? The strongest current, I think, was on the Saturday. At that time I was out in a boat at a point of the Paterson. I was for nearly a quarter of an hour in a smart skiff, with two pairs of sculls, and two good men, standing almost stationary, although they were pulling the hardest in their power to get from the Paterson to Phoenix Park.

2717. The water was then rushing from Phoenix Park? From Phoenix Park.

2718. Was there a very strong current in the river at that time? It was running nearly 5 knots.

2719. But the strong current you spoke of was from Phoenix Park? Yes.

2720. The water must have been lower in the river? I take it that it must have been, but it was not observable.

2721. Was there no perceptible drop from Phoenix Park to the river? None. There was a very perceptible current from the Paterson River on the eastern bank.

2722. How long did the flood remain up? It was quite stationary until the Monday at 2 o'clock a.m. It then commenced a scarcely perceptible fall, and by 6 o'clock a.m. on Tuesday morning it had fallen 12 inches. That would be the 22nd, I think.

2723. Was there still a rapid current in the river? Still a rapid current in the river. It then kept on falling pretty steadily until Friday the 25th, when at noon it was exactly 3 feet 6 inches above high-water; and from that time until the 31st it kept falling and rising almost like an ebb and flood tide.

2724. Did it seem to rise and fall with the tide? No, it seemed as if there were some other cause. The tide did not seem to have any effect on it. It was sometimes rising with the ebb tide, and sometimes falling with the flood tide. I noticed that particularly.

2725. Well? On the 31st, at 7 o'clock in the morning, it was falling slowly. It stood still for half an hour, and then commenced to rise; and it went up then for several hours at the rate of 6 inches an hour.

2726. I suppose that that was the last fresh they had here? That was on the 31st. I could compare it to nothing else but a force-pump. You could see it bubbling up, pumping up through the wharf. So suddenly did it come up that it was almost impossible to get the goods away which were close by the wharf. I had the "Coonanbarra" at the side, and commenced coaling her. Before they could put 10 tons into her bunkers the men were standing up to their knees in water, where it was dry before.

2727. How long? Six hours at that time.

2728. At what height was it? 6 feet 6 inches.

2729. That was on what day? On the 31st.

2730. Was there much current in the river then? Yes, there was a strong current.

2731. A strong current down? A strong current down. On the 1st of April it commenced falling; and was down by Sunday the 3rd to 3 feet above high-water. I have not taken any particular notes since then; but the river has been steadily falling, with a very strong current down at times.

2732. It is down to high-water-mark now? Yes, to the ordinary level. The current now at Morpeth is running down steadily at the rate of about a knot and a half an hour.

2733. Is it below high-water-mark at Morpeth now? The water rises now with the flood tide, and falls with the ebb.

2734. Does it fall below high-water-mark? At high-water it only comes up to the ordinary level. It does not go down quite so low as it generally does, but very nearly.

2735. *Professor Fell.*] What is the rise and fall there? The rise and fall at Morpeth is 2 feet 6 inches.

2736. *President.*] Of ordinary tides? Of ordinary tides.

2737. You did not notice when the river got down to high-water-mark again, did you? It has never been down as low yet as ordinary low-water-mark.

2738. But at high-water? At high-water the river does not exceed the ordinary high-water-mark.

2739. From what you observed of that flood, do you think that it would be possible to throw any considerably greater quantity into it without doing much damage to Morpeth? I doubt it very much.

2740. You think that if half as much water again were to be thrown into it, the effects would be serious? The effects would be very disastrous. There is no doubt about it in my mind. I may mention that there is a mark on the Company's wharf showing the height that the 1867 flood came to. I used the spirit-level, and I found that at the highest it was exactly 22 inches below the flood of 1867.

2741. About how much below the 1857 flood? I cannot tell. They have only the gauge of the 1867 flood; but there was not a wonderful difference between the flood of 1857 and the flood of 1867, at Morpeth,—there was very little difference indeed.

2742. Do you think that as much of the crops on the land under cultivation has been damaged as is generally represented? I take it that the whole of the crops on the land under cultivation that have been covered by water have been entirely destroyed. I know that there has been a great deal of hay saved. There had been very heavy crops; and in consequence of the low price of hay the farmers had been stacking it and storing it. In a great many instances a large quantity of hay has been saved; but I believe that the whole of the maize crop around Morpeth has been entirely destroyed. In fact I think that the farmers are not making any effort to take a cob away, for they find it perfectly useless. I think that if the maize could have been got off quickly—if they had had the means of getting into the fields and pulling the maize before the water had entirely subsided, and if they had had some means of artificially drying it—then I think that a good portion might have been saved. But there has been such a constant succession of wet weather, and the water has remained so long upon the land, that the farmers have been unable to do anything. The consequence is that the whole of the maize is growing in the cob, and the lucerne entirely destroyed—quite rotted in the ground.

WEDNESDAY, 13 APRIL, 1870.

Present:—

E. O. MORIARTY, Esq., PRESIDENT.

P. F. ADAMS, Esq.,

PROFESSOR PELL.

Mr. Joseph Youdale was called in and examined:—

2743. *President.*] Where do you reside? In Maitland.

2744. In the town? Yes, in the town of West Maitland.

2745. Have your observations of the floods been confined principally to the town, or have they extended to the country? I was some years living out in the country, farming on Hungerford's Swamps.

2746. What matters in connection with the flood has your attention been principally directed to which it would be well to have recorded—Will you be good enough to mention such things as you consider worth noting? When I went out farming, it was in 1855. I took a lease of a 300-acre farm. I commenced operations, and before I had been there six months all my crops were covered with water. Such a thing had never been seen since I came to the country.

2747. *Professor Pell.*] What water was it flooded you out? The water which runs back up Wallis' Creek. When the river is 10 feet high it begins to spread over there.2748. *President.*] Did you ever observe during the floods which have occurred that the basin of Wallis' Creek, the watershed of that part of the country, had anything to do in causing floods there? Sometimes there has been an enormous quantity of water come down from the heads of Fishery Creek.

2749. And I suppose that there is a similarly large quantity comes down Mulbring Creek? Yes, a very large quantity of water.

2750. Have you ever seen large quantities of drift timber and other material brought down by the floods in Fishery Creek and Wallis' Creek? No, there never is.

2751. Your observation of the last flood has been confined principally to the town as to the height of the flood, has it not? Yes.

2752. Did you perceive any marked difference in the relative heights at different places in the town, of this flood and the floods of 1867 and 1857? I consider that the speed as it passed through Maitland here was higher, considerably higher than what we have been accustomed to see, from the quantity of water coming down from above.

2753. You think that the water was higher in proportion to the rainfall than it was in 1867? Yes.

2754. Do you think that the embankments had anything to do with that? The embankment at Hall's Creek I believe accounts for it.

2755. And the other embankments in the town, the High-street embankment? I observed the river when the flood-gates burst, but I could not see any difference.

2756. Had the water been rising, rising rapidly in the river before the flood-gates gave way? I cannot say.

2757. You do not know whether it had been rising or not? I believe it was rising.

2758. Do you know whether it was rising after the flood-gates burst? I think it did.

2759. When you say that you did not observe any difference, you mean that you did not observe any immediate and sudden fall in the river? Yes, that is just what I do mean.

2760. Is there anything else that you consider it right to mention? Yes, several things.

2761. Perhaps you will be so good as to mention them? In reference to keeping out the water by way of Wallis' Creek, I think that it is all important for the district, for the town and country, both for their sanitary and commercial interests that that should be done. I believe that if the flood-gates had been properly erected that that might have been done; but I consider that the way in which they were constructed was only like child's play—like children playing in the street with mud.

2762. *Professor Pell.*] Do you expect that much sickness will be caused by the flood? There was much sickness caused by the last flood, and I expect more from this.

2763. What sickness do you anticipate will arise from this flood? I believe that there is already influenza through it.

2764. *President.*] Have you heard of any instances of low fever amongst persons residing in the flooded part of the town? I have not as yet.

2765. What other matters would you like to mention? I believe that it is important to Maitland that these swamps should be made dry if possible; but they never will become dry for long together, if only for the rainfall, until Fishery Creek is cleared out.

2766. And the Mulbring Creek too? There is not nearly so much water in that direction as in the Hungerford Swamps.

2767. Would you confine the work of clearing out to the bed of Fishery Creek? From the Junction right down to the bridge the creek should be improved and cleared out. In years gone by, in dry seasons, people were accustomed to make short cuts through to the quarries, and when they came to a soft place in the creek they threw in stones and fallen timber. The bed of the creek has been raised very much. If a few hundred pounds were spent in draining that creek, these swamps would soon run dry.

2768. Even without flood-gates? Even without flood-gates.

2769. *Professor Pell.*] That would be a municipal work I should think? Yes.2770. *President.*] You are of opinion that it would be a great advantage if the beds of Fishery Creek and Wallis' Creek were cleared out, improved and straightened? Yes; if they were only cleared out, if the timber and other obstructions which have stopped up the beds, the swamps would soon run dry and the place would be much more healthy.2771. *Mr. Adams.*] Have you ever made any calculation of the effect of the local watershed of these creeks, or as to how high the water would fill these swamps if the Hunter were kept out? It is very trifling indeed. The water does fall off to some extent when the river is not up to prevent it, but still the width of the creek near Fonhill in some places is not greater than this table, and the creek is not above a foot deep there.Mr. J.  
Youdale.

13 April, 1870.

- Mr. J. Youdale.  
13 April, 1870.
2772. Where is Fonthill? At the commencement of the swamps, where the swamps open out.
2773. The Wentworth Swamps? The Hungerford Swamps.
2774. How high do you think the water must rise in the river before it backs up into these swamps? 10 feet. I have ridden over to Maitland and seen it coming over. There is an abundance of fall for drainage.
2775. What is the distance? I suppose about 3 miles.
2776. It would be more by the course of the creek? I mean by the course of the creek. 3 or 4 miles.
2777. That is when it would be flowing from the surface of the swamps? Yes.
2778. If that be the case, the natural drainage of the water must have been close up to the surface of the swamps when the flood-gates gave way, for we hear that the water was 8 feet high inside? I remember asking Mr. Hungerford the day before, and he said that they were all right.
2779. The day before the flood-gates gave way? Yes.
2780. Have you ever known the water of Mulbring Creek to back up Fishery Creek? I do not think it does. Very little water lies up there compared with other swamps.
2781. *President.*] When you speak of 10 feet high in the Hunter, do you mean above high-water or low-water? Low-water.
2782. *Mr. Adams.*] You mean 10 feet above tidal water? Yes.
2783. *President.*] That would be about 12 feet above low-water? I cannot say whether my observation was made after the tide was up or when it was down. Sometimes we have not a foot difference between high tide and low tide. I know that there is about 10 feet of a fall.
2784. *Professor Pell.*] When once the Hunter River begins to back up these creeks you cannot form any opinion as to how much water after that comes down the creeks? No, unless you are at the head of the swamps.
2785. The people generally living on these farms about here could not tell how much? I do not see that there could be any great amount of water, because it soon begins to fall back the other way to Wollombi.
2786. After the back-water comes up you have no means of judging how much comes down? No; it drives it back—there is a strong current. There are a few other observations respecting the river that I should like to make. I consider that we shall never be relieved from floods in Maitland, but that the river will continue to wash away the banks, until we get a short cut for the water across Bolwarra. I think that if there was a cut under Bolwarra House or behind it, a cutting 90 or 100 yards wide, to take off the water when it rose to about 12 or 14 feet that would effectually relieve us.
2787. It would relieve West Maitland, no doubt? I know there is an opinion that it would be injurious below, but I do not think that it would, and for this reason that the water would drain off so much sooner—twelve hours sooner it is estimated—and would be out to sea. The effect of this cutting would be felt all the way to Singleton. The water would never rise so high, and the cutting would invite it down.
2788. *President.*] We hear that these floods remain up a long time. Do you think that improving the fall for twelve hours would have any sensible effect on the flood when it got to its maximum? If you improve the discharge from here, you cannot get the water down before it comes here in a certain quantity, and from that it commences to rise very rapidly. I believe, as I have just stated, that having the flood so much earlier here, the water would come down more rapidly, and would not accumulate behind as it now does to a great extent.
2789. Have you based that opinion on any calculation as to the quantity of water you would have to deal with? As to the quantity, I think we may always expect as large a quantity as we have had and more.
2790. In dealing with channels, it is reasonable to suppose that when you make a cutting you make it to carry off some known quantity of water per minute, or hour, or day? No doubt.
2791. Supposing it should turn out, after you had made that channel, that you had not gone upon any reasonable data, and your expectations were upset,—would it not be rather a serious matter to discover the mistake then? The thing to be aimed at is to get rid of the water, and I am satisfied that it would do that to a very great extent.
2792. But you are not satisfied on any calculations? No; but this I know, that the water would have a straight course through which would deepen the channel, and very likely that straight channel would ultimately become the chief channel.
2793. Have you ever looked at the channel of the river at Singleton? I have.
2794. Have you ever formed any estimate of its capacity? It is roomy there.
2795. And very deep? Yes.
2796. The river rose there 46 feet in the flood of 1867? I think it did.
2797. Do you know the slope of the surface of the water at Singleton when the river is coming down in flood? No.
2798. Do you know what the fall there would be in the straight cut through Bolwarra to Morpeth? About 2 feet 6 of a fall, judging from the rise of the tides.
2799. That is in 4 miles, roughly speaking? What I was thinking of was that the cutting would only extend from Bolwarra to the crossing of the Largs Road.
2800. When you get to Largs, what do you propose to do with all the water you bring down that far—would it not get jammed by the smallness of the channel? Cut off the angle of the bend.
2801. You do not contemplate stopping at Largs? No; I think that something should be done below.
2802. How far down? To the wharf at Morpeth.
2803. Supposing it should happen that the river there when bank high in the highest flood is only carrying away one-third of the quantity of water which is passing down by Oakhampton in a given time—what would you do then? I do not see how that could be the case; because the river is very deep and very roomy there. We know that there are great uncertainties as to how it can behave down there on account of the Williams and the Paterson.
2804. *Professor Pell.*] They are not necessarily uncertainties. A great deal can be done by measurement and calculation? I do not think that it would raise the flood at Morpeth.
2805. *President.*] Suppose you find that there are 132,000 cubic feet of water passing Oakhampton every second, when the flood is coming down bank high, and suppose you find that at Morpeth there are only 32,000 cubic feet of water per second passing off—the balance being now taken up in inundating this country about here—if you carry on the 100,000 cubic feet per second more than the river at Morpeth is capable of discharging, what would be the effect produced at Morpeth? Of course the flood would be raised at Morpeth. That is a question affecting the flood-gates. 2806.

Youdale.

13 April, 1870.

2806. I am not referring to the flood-gates. If the water flowing down the river gets blocked at a certain point and cannot go further, is it not evident that it must spread out over the low country, which thus becomes a reservoir, until that smaller channel, acting for a longer time, carries the water away? The sectional area of the channel at Morpeth is not more than one-third what it is at Oakhampton, and the fall of surface, instead of being 1 in 2,000 is 1 in 9,000. If you were to bring all that water upon Morpeth which otherwise would be inundating this low country, what would be the effect on Morpeth? Whether the cutting were made for it or the water had to go as it now does, winding round with the channel or over the surface of Bolwarra, it still finds its way to Morpeth, and it would only find its way there by a shorter cut. A straight cut would send it forward a great many hours earlier.

2807. We find in the August flood of 1867, on the 21st, the quantity of water coming down the Hunter here was just as much as the Hunter could carry away at Morpeth, when bank high, up to the highest flood-mark. Well, between that and the 30th, the quantity of water coming down here was about double the quantity that the channel could carry away at Morpeth. You then had an accumulation of water during ten days, to the extent of double the quantity that the channel could carry away. In a case of that kind, what is to become of all that water? Provision must be made for easing it below Morpeth.

2808. Then you contemplate extending the same process below Morpeth? I think that that is quite necessary.

2809. Have you made any estimate as to how far down it would be necessary to operate on the Morpeth side? No.

2810. Have you seen the enormous quantity of deposit that is left after these floods, for instance that on the other side of the Belmore Bridge? I have.

2811. Supposing you were to shoot the whole of that onward by means of these short cuts, what would be the effect upon the channel of the river itself and upon the navigation of the river? I conceive that it would have very little effect, because the deposit is chiefly in still water.

2812. It is not still water at Belmore Bridge? There is a fence there where the mud has settled, and that has been caused by comparatively still water.

2813. When you get down to that flat country about Raymond Terrace where the fall is 1 in 9,000, would you have the same velocity of current as you have about here? No.

2814. If you had not the same velocity, would you not have the same deposit? There would be; but if the channel were banked, increased height would secure increased velocity, and carry the deposit out.

2815. You are convinced that this enormous deposit would be shot out to sea through Newcastle harbour? It would.

2816. What would be the effect upon the bar at Newcastle? There and all the way down to Raymond Terrace the tidal action would prevent the deposit from settling.

2817. But the tidal action is nothing in times of flood? It would be very likely to scour off by tidal action.

2818. We know as a matter of fact that the bar is seriously affected by every flood? Indeed, I was not aware of that.

2819. You must take into your consideration the effect of any proposal upon the whole river? There would be very little deposit if we had a more rapid current. There was very little above about Singleton.

2820. But in that part of the river you have a fall of 1 in 2,000, from here to Morpeth 1 in 6,000, and from Morpeth to Raymond Terrace 1 in 9,000, so that when you get to the flat country you must have a deposit—the stuff would be carried on and left at Morpeth? Unless provision were to be made there by embanking the river and deepening the channel.

2821. But would embanking the river and deepening the channel carry away the flood-water? If the embankments were carried high enough.

2822. Have you formed any estimate as to the height to which it would be necessary to carry them? No. But I have heard of embankments near Lincoln where a straight cut has been made, where the low land has been protected and been in fine cultivation for many years.

2823. Are you speaking now of rivers of the magnitude of the Hunter—is there a river in England of the same magnitude? I do not know.

2824. *Professor Pell.*] Do you know the difference between the rainfall in the valley of the Hunter and the rainfall in England? There is an immense difference. In connection with the cutting through Bolwarra, if that work could be done, I wish to mention that it would find employment for those who are now wanting bread. The work could be done with the plough and scoop.

2825. But the first thing to be done is to determine what is likely to be the effect of your cuttings? Yes.

2826. Is there not a considerable deposit on the land? Yes, in some places.

2827. *President.*] We are told by one gentleman that the depth of two fences has been covered over by this deposit? Indeed.

2828. *Mr. Adams.*] If these straight cuts are made, all the matter that is now held in suspension will be carried down the river, where it will impede the navigation? Yes.

2829. *President.*] In a great matter like this it will not do to look at one small portion of the district merely, but we must consider the effect of any works upon the whole district and upon the navigation of the river down to Newcastle—it will not do to look at the question merely from the Maitland point of view? I cannot see that it would produce any injury below Morpeth, excepting by the deposit; but if embankments were thrown up to prevent the water from spreading out, the deposit would be carried down and out to Newcastle.

2830. When the Williams is bank and bank, and the Hunter also comes down in flood, what will be the state of the river at the junction? I never witnessed it.

2831. That is a thing that will occur? I have observed the effects of the tides there. There is a tremendous whirl which has scooped out the land to an immense depth.

2832. If you get that process exaggerated during the flood, with the tremendous quantity of earthy matter held in suspension, do not you think that you will have a deposit to a very great extent? I think that down there, as regards the channel of navigation, that the tide would take away all deposit, and if it did settle, the tide would carry it all away.

2833. Supposing we find, as a matter of fact, that there is a bank at Raymond Terrace, and that deposits are constantly taking place on that bank,—what then would be the effect of the plan you propose? I suppose that if my views were carried out there would be more deposit there; but then the dredge could  
always

Mr. J.  
Youdale.

always remove that. The land about here is very valuable to the whole country for the growth of lucerne, since it cannot be grown on other rivers to the same perfection.

2834. If these deposits do take place in the bed of the river, the effect will be to raise the bed of the river, will it not? Yes.

2835. And as you raise the bed of the river you diminish its sectional area, and therefore its capacity for carrying off succeeding floods? I believe that with the increased velocity of the current the deposit will be carried forward.

2836. *Professor Pell.*] The channel at Morpeth at the top of the highest flood carries away 40,000 cubic feet of water per second. Suppose by these new cuts you send down 130,000 cubic feet per second—that is, 90,000 cubic feet more flowing down to Morpeth than can get away from Morpeth—what do you suppose would be the effect of that upon Phoenix Park? We should have to create the water in order to try the experiment.

2837. These are figures ascertained by measurement? But the cutting has not been tried. The water arriving here would have gone past Morpeth. It could never rise at such a rate.

2838. But if it comes here, it must go somewhere. We know that it comes here in a certain quantity, and that it passes Morpeth at a certain rate? I believe that with the increased velocity which it would acquire, that the river would never attain anything like the height either here or anywhere else.

## FLOODS IN THE HUNTER.

## APPENDIX.

[Report on the prevention of Floods in the Hunter, by the Engineer-in-Chief for Harbours and Rivers.]

Department of Public Works,  
Harbours and Rivers Branch,  
Sydney, 9th July, 1868.

Sir,

In attention to the verbal instructions of the Honorable the Minister for Public Works, that I would examine the subject of the overflows of the Hunter River at and about West Maitland, with the view of devising, if it be possible, some means of mitigating the injuries and losses they cause, I have now the honor to submit, for his consideration, the following Report, in which I have endeavoured to set forth such information as I have been enabled to procure bearing upon it, as well as the reasonable inferences as to the practicability of any drainage scheme which seem to be deducible therefrom.

The subject of the inundation of the low-lying lands of the Hunter has, since the formation of the Department of Harbours and Rivers, engaged my most serious attention; and I have from time to time collected and endeavoured to classify and arrange all the authentic information bearing on the matter that was procurable, and am thus in a position to give a brief outline of most of the floods which have occurred since 1820. I am mainly indebted to the columns of the local and metropolitan Press for my information; and would here, *in limine*, observe that, without the careful and patient search for facts which they have made, and the clear, correct, and valuable records they have preserved of each flood, any project of improvement must have been, to a great extent, based on conjecture.

Not that it can be asserted that we are now in a position to declare positively what amount of relief will result from any project of improvement that may be considered advisable; but, with a better knowledge of the nature and extent of the forces to be contended against, we can with a more reasonable prospect of success attempt to deal with them. The utmost uncertainty must always attend on attempts to curb and control great rivers, in order to bring them into subjection to what man may consider to be his interest or his comfort; and to look for perfectly certain results from any proposed scheme of improvement is futile. We can only look for approximations, and those none of the closest. Professor Robison, one of the ablest writers on this subject, says—"As to the uniform course of the streams which water the face of the earth, and the maxims which will *certainly* regulate them agreeably with our wishes, we are in a manner totally ignorant. Who can pretend to define the velocity of a river, of which you tell him the breadth, the depth, and the declivity? Who can say what levels will be produced in different parts of its course if a dam or weir were made across its stream, of any given dimensions, or a bridge be carried over it; or to what extent its waters will be raised by turning another stream into it, or how much sunk by diverting a branch for driving a mill? Who can say with confidence what must be the dimensions or slope of this branch in order to furnish the water that is wanted; or the dimensions and slope of a canal which shall effectually drain a fenny district? Who can say what form will cause or will prevent the undermining of banks, the formation of elbows, the fouling of the bed, or the deposition of sands? Yet these are the most important questions."

Every deep pool in a river's bed, every shallow and every bend, every contraction and every widening of its banks, affect more or less its velocity of discharge. Every whirlpool and eddy, every surge and wave on the surface of a swollen river, is evidence of the existence of some force which is retarding the onward passage of its waters. The flow of a river being due solely to the difference of level on its surface, we can easily calculate what its theoretical discharge, if influenced merely by the action of gravity, should be; but flowing in irregular and tortuous channels, trending now to the north, again to the south, the east, and the west, it can be readily understood how great and how many must be the retarding influences to which it is subject—influences which are sufficient to deflect the mass of its waters, destroy their momentum in one direction, and divert them into another. And when it is remembered that these retarding influences increase or decrease as the square of the velocity of the current, which is ever varying, it will easily be understood how impossible it is to attempt to estimate them exactly. The utmost we can hope to do, is to devise some means by which, knowing the depth of the channel of a river, and the rate of the fall of its surface, we can compute approximately the mean velocity of the whole of its waters.

This has been attempted by Dubuat, Venturi, Eytelwein, Robison, Young, Ellet, and a host of other writers on hydrodynamics, who have endeavoured to construct formulæ with which, having certain data given, such as the cross sectional areas of a river, its hydraulic mean depth, and the ratios of inclination of its surface, they professed to calculate, within moderate limits of error, its approximate mean velocity and discharge. But it is evident, from the very nature of things, that these formulæ, when applied to the ever-varying and endless irregularities of a natural river bed, must be received with a good deal of caution.

In each formula the retarding forces are represented by constants, which we know cannot be the case in nature, however accurate when applied to uniform channels.

Venturi has shown conclusively, that when water flows in a channel of irregular width, widening out at one place and contracted at another, the eddies and counter-currents produced by these irregularities greatly diminish the mean velocity of discharge, and maintain the water permanently at a greater height in the river than would be the case were the whole channel reduced to one uniform section of the area of its most contracted part; and as these contractions and enlargements are endless in their variety and dimensions, so must be their retarding influences.

We are, therefore, compelled to accept these formulæ merely as approximations, approaching nearer to, or being further from the truth, as the channel to which they are applied approaches nearer to or is further from uniformity of section.

In calculating the approximate discharges of the Hunter River at the different points in its course, from Oakhampton, above Maitland, to Newcastle, where cross sections have been taken, I have used the formulæ of Dubuat, Eytelwein, Ellet, and Rankine.

Ellet's formula, which was framed on the results of his measurement of the Mississippi and Ohio Rivers, gives lower velocities than that of either Dubuat or Eytelwein; but although in taking the extreme depth, instead of the hydraulic mean depth, his formula may be open to question, still, when applying the calculation to such rivers as the above, whose cross sections are uniform, and where, besides, the influence of the atmosphere on their broad surfaces may be supposed to form a larger item in the amount of the retarding forces than would be the case in rivers of less magnitude,—it is probably correct enough. I yet think that in the present calculations we are safer in using the formula of Dubuat, which is that generally relied on by engineers in calculations of this kind, as it has been found to give results approaching very closely to the velocity of the Po and other large rivers, as proved by actual measurement.

On looking at the accompanying plan and section, it will be seen that there is a fall of 18 feet in the general level of that part of the valley of the Hunter lying between West Maitland and Hinton. The fall on the surface of the river in times of flood is 17 feet, and the average fall of the land is  $4\frac{1}{2}$  feet per mile. The river it will be observed, in its windings, seeks every point of the compass; thus, whilst the general fall of the valley is from west to east at the rate of  $4\frac{1}{2}$  feet per mile, we find the river in places running in the very opposite direction. This makes but little difference while the flood-waters are confined within the banks, and are compelled to travel in the natural channel, having the effect of merely diminishing the ratio of fall, by distributing the actual fall over a greater length. But the condition of things is entirely altered when the river

river attains to such a height as to cause it to overflow the banks, which in very heavy floods it does, to the depth of from 4 to 6 feet. We then have this anomalous state of things:—A strong surface current, with a velocity due to its mean depth and inclination of surface, flowing down the valley from west to east, while in parts the under-current of the river proper is flowing in the very opposite direction, or nearly west. It is plain that at such times the river is, as it were, thrown out of gear, and its velocity of discharge considerably reduced.

The correct estimation of the value of this retarding influence is, in my opinion, the most difficult part of the problem, and yet on it depends to a great extent the question of the possibility of affording relief to Maitland and the surrounding country from inundations, because, necessarily, it must so materially affect the question of the mean velocity and discharge.

I think, indeed, that probably even Dubuat's formula may give too high a rate of discharge when applied to the Hunter; for although it was found to agree with sufficient closeness to the actual velocity as measured on the Po, still it must be remembered that that river for a considerable length of its course is confined within its banks by extensive levées, and that therefore it would not be subject to the same retarding influence which we find in operation on the Hunter, and which, I believe, militates very considerably against the easy discharge of the flood-waters.

It will be seen, when we come to examine more in detail the cross sections of the river, that many of those below Maitland are not half the area of those above the town; and with their diminished hydraulic mean depth and slope of surface they must be utterly inadequate to carry off the waters as fast as they come down in heavy floods; thus the waters are pent up until they break over the banks and inundate the low country, part flowing away into the swamps about Louth Park, Dagwood, and Hungerford Swamp on the one side, and Bolwarra on the other; while another large stream sweeps down towards Morpeth, Phoenix Park, and Dummore, over-running and, as I have said, partly neutralising the current within the channel proper of the river itself.

PART I.

THE earliest great floods in the Hunter of which we have received any authentic accounts seem to have been those which occurred between the years 1818 and 1820, the highest being that of 1820, a short account of which is given in the *Maitland Mercury* of 3rd September, 1857, from which I extract the following description, said to have been given by an eye-witness:—"A large portion of the present site of East Maitland, then a bush, as well as the country around, was flooded." "A small rise at the back of Ogg's was dry, and a small piece of the present Melbourne-street, near the Hunter River Hotel, was also just dry; but, with these exceptions, all the lower parts occupied by the present town were flooded."

"In West Maitland the only houses then existing were a hut nearly opposite the site of the present Waterloo Hotel; another hut, 'nearly on the site of Messrs. Dickson & Co.'s present stores, and a hut built in the rear of the present Angel Inn. The flood was up to the wall-plates of the first hut, touching the shingles, up to the window-sill of the second, and was in the third; but the top of Bourke land, and the high ground extending back from the river near the Fitz Roy Hotel towards St. Mary's Church, were dry," although Mr. Eckford (the gentleman from whom the information is derived) does not speak positively as to how broad or long the dry land was.

The next highest flood after this was that of 1832, which Mr. Eckford thinks attained a height of within 8 feet of that of 1820.

The article then goes on to say—"that if, as we believe, the present flood (*i.e.*, the great flood of August, 1857) was at West Maitland 29 feet above high-water-mark, the June flood (of 1857) was over 26 feet, the 1840 flood was about 26 feet, the flood of 1832 was 29 feet, that of 1826 was less than 29 feet, and the flood of 1820 was 37 feet." The respective heights of the above-named floods may be thus recapitulated, *viz.*:—

At Maitland—		
* 1857—Flood of August .....	29 ft. above high-water.	
"    Do. of July.....	26 ft. 8 in. to 27 ft. " "	
"    Do. of June .....	26 " "	
1840—Do. ....	26 " "	
1832—Do. ....	about 29 " "	
1826—Do. ....	less than 29 " "	
1820—Do. ....	nearly 37 " "	
At Morpeth—		
1857—Flood of June .....	10 ft. above high-water.	
"    Do. of August .....	14.9 " "	
1840—Do. ....	8 ft. " "	
1832—Do. ....	Not given.	

Proceeding with the extract, we find it stated—"every old resident we have conversed with is quite positive that more water came down in each of the 1857 floods than during any former flood within their remembrance; and they account for the lesser height of the river by the great extent of land now cleared as compared with the then densely wooded country, and by the river also being now more clear of obstructions in the way of snags, &c." This explanation of the probable cause of the river not attaining the same height now as formerly is perfectly reasonable, and may, no doubt, be received as correct. When the river now overflows its banks, it has an open valley to spread over; formerly, the dense growth of trees and underwood, bound together and intertwined in an almost impenetrable mass by the vines, offered a barrier to the waters on either side; so that the discharging section of the river being strictly confined to the channel proper, the waters were pent up until they attained such a height as was sufficient to restore the equilibrium. And, in point of fact, supposing the river to attain a height of 8 feet at Maitland above the flood of 1857, as the flood of 1820 is said to have done, and assuming that it rose to 5 feet above that of 1857 at Morpeth, which would be a fair allowance, taking into account the extent of the level country, I find that, with the increased area, hydraulic mean depth, and slope of surface thus allowed, the natural channel would be almost sufficient to carry off all the waters of a flood like that of 1857, as fast as they came, down to Maitland. The calculations give four-fifths; the remaining one-fifth would probably have drained back into the swamps of Bolwarra and Dagworth, as at present.

There is, of course, some difficulty, in the absence of actual measurements, carefully recorded, in determining the precise heights of former floods; but Mr. Eckford's reminiscences of the flood of 1820 may probably be relied upon; and, as referring to the highest known flood since the settlement of the Colony, are very important; because, if it can be shown, as has been asserted, that in the flood of 1857 more water came down in a given time when the flood was at its height than was the case in 1820, we have the experience of forty-seven years instead of ten to guide us in our computations. It is a consideration of very considerable importance in dealing with a subject of this kind, or when designing works on large rivers, to know what height has the highest known flood attained to—a question which we very often find it difficult to get satisfactorily answered.

We are in possession of very full information as to the height, duration, rate of rise and of fall of the more recent floods of 1857, 1861, 1864, and 1867; the last of which is generally admitted to have been amongst the highest since that of 1820. And it will be important, when we come to consider what would be the effect if the river were again rigidly confined within its banks by partial embankments, or by "levées," as they are technically termed, to have these accurate measurements as to floods, which there is good reason to believe have been the severest that have occurred within the last half-century.

Reverting to the accounts of floods as published in the *Maitland Mercury* and other local papers, we find that the years 1856 and 1857 were unusually wet, and that in the month of June in the latter year the Hunter River district was visited by the heaviest flood which had been seen since 1832. The rain commenced to fall heavily on Tuesday afternoon, June 17th, and continued falling during Wednesday. The water rose with unusual rapidity at West Maitland, "commencing at 1 or 2 feet above

* The correct heights, as given by subsequent measurements, are—	ft. in.
At Bolwarra ... ..	32 8
At the Bridge ... ..	30 0
At High-street ... ..	27 2
Mean height, say ... ..	29 10

above high-water-mark, at 5 o'clock on Wednesday morning, the 18th June,—it reached 26 feet before 5 o'clock on Thursday morning, that is in little more than twenty-four hours." The current is described "as vastly more rapid and more sustained than in any previous flood, bringing down a considerable quantity of large timber, much exceeding the ordinary amount of flood timber."

After receding a few inches at West Maitland on Thursday and on Friday in the forenoon, it commenced to rise again on Friday afternoon, continuing until past midnight, when it attained to one inch higher than on Thursday.

By daybreak on Saturday it had again fallen from 1 to 2 inches; by Sunday morning it had fallen 2 or 3 feet; from which time it continued steadily falling till, on Monday evening, the waters had receded about 8 feet.

It may be as well to recapitulate here the substance of the information as above given in connection with the rise and fall of the flood of June, 1867,\* at West Maitland:—

On Wednesday, 17th June, at 5 a.m., flood-level above h.w., 2'. †

On Thursday, 18th June, at 5 a.m., level above h.w., 26'.

Friday, 19th June, say 25'.

Do., midnight, say 26' 1".

Saturday, 5 a.m., 25' 10".

Do., 6 p.m., say 23'.

Sunday, 6 a.m., 23' to 24'.

Monday, 22nd evening, 18'. ‡

The Hunter, the Paterson, and the Williams were all in flood about the same time, and the water attained its greatest height at Morpeth, namely, about 10 feet above high-water-mark, before 8 o'clock on Thursday afternoon. The crest of the flood-wave would thus seem to have taken from twelve to fifteen hours to travel from Maitland to Morpeth, being at the rate of about one and a quarter mile per hour.

At Morpeth the water rose rapidly till 6 p.m. on Wednesday, 17th June. From 6 p.m. to 10 p.m. it rose 6 inches. From 10 p.m. to 4.30 a.m. on Thursday it rose 3 feet. From 4.30 a.m. to 6 a.m. it rose 8 inches, and continued rising throughout the day; at 8 p.m. commenced to recede, at 10 p.m. had lowered 2 inches; on Friday, at 10 a.m. had fallen 9 inches, at 3 p.m., 11 or 12 inches.

It was noticed that the more rapid rise took place between 2 a.m. and 4 a.m. on Thursday, which was about the time, or shortly after, that the water had attained the greatest elevation at Maitland.

This rapid rise must, I think, be solely attributable to the flood-water; the backing up of the tide could have had very little (if any) influence on it, as the tides were at this time at the neaps, and it would have been low-water at Morpeth about 2 a.m., and high-water about 8 a.m.

By Monday afternoon the waters had receded at Morpeth to within about 2 feet of high-water-mark, spring tides.

It may be noted then, that on—

Wednesday, the 17th, the river was rising rapidly at Morpeth till 6 p.m.

6 p.m. to 10 p.m., it had risen 6 inches.

From 10 p.m. to

Thursday..... 4 a.m., 3 feet. 4 a.m. to 6 a.m., 8 inches; at 8 p.m., was 10 feet above high-water; commencing to recede. 10 p.m., had fallen 2 inches.

Friday ..... 10 a.m., 9' 3" above high-water.

3 p.m., 9' 1" above high-water.

Monday, 22nd ..... 2' above high-water.

Raymond Terrace was flooded, and the water rose to the floor of Mr. Portus' mill.

At Singleton, on Wednesday, the 17th,§ it was raining heavily; on Thursday the weather is reported as being fine, but the river was rising rapidly—on Thursday evening it had risen very high. Detailed measurements of the height of the flood at Singleton and the other towns on the Upper Hunter are not given.

On Thursday the Wollombi Brook was running fearfully high.

The foregoing dates and heights would afford the means of calculating approximately the amount of the water brought by the river down to West Maitland, as well as the amount discharged past Morpeth—the difference between the former and the latter being the quantity spilled over the banks between these places, and which went to inundate the adjoining low-lying lands; but I have not made these calculations, it being unnecessary to do so, as the subsequent flood of August, 1857, and the last flood of June, 1867, were higher, and we have more detailed information as regards their levels, velocity, and the quantity of water discharged.

At the time of which I am writing, but few attempts had been made to protect the town of Maitland from the effects of floods, and what had been done seems to have had but little effect, so that when the waters rose to about 20 feet, they commenced flowing in many places over the banks; and as the ground generally falls as it recedes from the river, the flood soon commenced to inundate the swamps and low ground at the back. The Horse-shoe Bend, it is said, was the first point submerged; next, the river overflowed the bank at High-street nearly opposite the Queen's Arms; and as it continued to rise, it found other outlets into the low land about the Racecourse and up the valley of Wallis' Creek.

By this flood a considerable part of West Maitland was laid under water, and nearly one half of the houses were more or less submerged, some having the water up to the eaves. The dam at Hall's Creek burst, allowing a large body of water to flow up that creek and flood the back land. By the waters flowing up Wallis' Creek "the whole of the flat lands on Louth Park, Dagworth, Hungerford Swamps, and for miles further up, were submerged; and so rapid was the inundation, that a great many persons were surrounded by water and cut off from all hope of escape."

At Bolwarra immense loss was sustained. The rapid inundation completely covered hundreds of acres; and while some families who were on the alert escaped, others were surrounded by the flood before they could do so, and were lost.

At East Maitland the damage done was comparatively slight; but from East Maitland to Morpeth the road is said to have been bordered on the left by an almost unbroken sheet of water, while at Morpeth the damage done was said to have amounted to £15,000.

Such is a short account of the first, or June flood of the year 1857, taken from the files of the *Maitland Mercury*, in which paper nearly every fact of interest or importance connected with the floods of the Hunter seems to have been carefully collected, and clearly and ably set forth.

The first rapid rise in the Hunter was clearly due to the flooding of the Wollombi and its other lower tributaries; for we find it bank high at West Maitland on Thursday morning, at which time it had only commenced rising rapidly at Singleton; but the second rise at Maitland at midnight on Friday was probably due to the arrival of the crest of the flood-wave which had culminated at Singleton on Thursday evening, and which had thus travelled down the river at the rate of about 1½ mile per hour.

The next flood in the Hunter was that of July, 1857. §

It commenced raining on Sunday evening, the 26th, continued raining all that night, the following day, and all Tuesday, and in the early part of Tuesday night came down in furious driving showers.

At 8 a.m. on Tuesday the 28th, the river stood at about 1 foot above high-water-mark;||—

By noon it had risen to 3 feet.

5 p.m., 10 feet, being at the rate of 17 inches per hour.

9 p.m., from 17 to 18 feet, or 22 inches per hour. ¶

11 p.m., to 19 feet, rising at the rate of 6 inches per hour.\*\*

Wednesday, July 29th, at 4 a.m. had risen to 23 feet.

7 a.m., 24 feet 6 inches.

Noon, 26 feet.

Thursday, July 30th, still rising.

Friday, July 31st, height 26 feet 8½ inches to 27 feet, at which level the water continued from 9 a.m. to 12 o'clock. By 2 p.m. on Friday the water had fallen ¼ of an inch, by 5 p.m. 2 inches, by 9 a.m. on Saturday, 3 inches. During Saturday night the waters continued falling fast. From Sunday to Monday morning the fall was inconsiderable, and at noon of the latter day the river was almost at a standstill, there being scarcely any current. It

\* Full Moon, 8th June, 3.27 a.m. † Moon, last quarter, 15th June, 7.14 morning. ‡ New Moon, 22nd, 8.8 morning.

|| *Maitland Mercury*, 30 July, 1857.

¶ Broke over the low land at Horse-shoe Bend

\*\* Moon, first quarter, 29 July.

It was remarked that while this flood was at its highest, the rate of current was about 5 miles per hour at Maitland, which is a close approximation to the calculated velocity as given by Dubuat's and the other formulæ.

At Morpeth, at 12:30 on Wednesday, the 29th July, the river stood about 6 feet 6 inches above high-water. On Wednesday evening it had risen to 8 feet above high-water. On Thursday night it had attained its highest level, namely, 10 feet 7 inches above high-water. For a short time, about 2 o'clock on Tuesday, the current at Morpeth was running (if anything) up stream, caused by the flood in the Paterson; but about 4 p.m. the greater body of water rushing down the Hunter bore the smaller stream before it, and re-established the downward current.

It will be observed here, that this flood attained its greatest height at Morpeth earlier than it did at West Maitland. This is, I think, to be attributed to the backing up of the Hunter by the Paterson in the early part of the flood.

In this, as in the former flood, I am unable to observe that the tides had any influence on the rise of the water or the time of the greatest height of the flood at Morpeth, as it would have been low-water of neap tides about 11:30 p.m. on Thursday (about the time that it is said the flood attained its greatest height), so that the flood was falling while the tide was rising.

I have been careful to see if there be any connection between the state of the tides and of the flood at Morpeth, but without being able to discover the slightest.

At Singleton, on Tuesday the river commenced rising; on Wednesday it continued to do so with great rapidity; on Thursday the 30th, at 8 a.m., it was at its highest, being 4 feet above last flood, and 5 feet below that of 1832. At 8 p.m. of the same day the river had fallen 4 feet, or at the rate of 4 inches per hour.

The crest of the flood-wave leaving Singleton at 8 a.m. on Thursday, arrived at Maitland on Friday between 9 a.m. and 12 a.m., showing its rate of descent to be nearly 2 miles per hour.

On the occasion of this flood the waters broke at West Maitland over all the points of overflow of the former flood, inundating the back country to a greater extent than had then occurred, the back water having reached to within 1 foot of the height of the river; and it is surmised that if the river had continued at its full height for another day, the backwater would have risen fully to its level.

On Wednesday morning the water had commenced to pour across High-street at various points, and continued running in a strong stream for two days, till, as we have seen, the back-water on Friday evening rose to within a foot of the level of the river, which at that time had receded 2 or 3 inches. We thus gain some idea of the enormous capacity of the flooded back-country as a compensating reservoir to the river.

In this flood the waters fell faster than they did in the June flood—the river continued falling at the rate of about 1½ foot per day; on Wednesday having fallen to 16 feet, on Friday, August 7th, to 19 feet, from the highest point attained, being then about 8 feet above high-water-mark. The back-water was then fast receding, being rapidly drained off by Wallis' Creek.

We now come to the August floods of the same year (1857), the highest by which the country had been visited since 1820, and which caused such wide-spread desolation over the Lower Hunter.

The rain commenced falling on Wednesday evening, the 19th August,\* on a country thoroughly saturated by the two preceding floods, which had filled every waterhole and swamp, and spread over every plain. Thus, all the natural reservoirs being already filled to overflowing, it is not to be wondered at, when the unusually heavy rainfall is considered, that this flood should have come down with unprecedented rapidity, and have attained to the extraordinary height it did. The flood diagram attached to this Report shows that the total quantity of water which passed down the river, from the commencement to the termination of the flood, amounted to over 88,000 millions of cubic feet, a quantity which would account for nearly 5 inches of rainfall over the entire valley of the Hunter. The total rainfall for the months of August and September was 6.1 inches.

It commenced raining, as I have said, on Wednesday evening, and continued through Thursday and Thursday night, raining heavily, and blowing a gale of wind from the south-east; but it was not till about sundown of the latter day that the river commenced to rise at West Maitland, and a gentle current was perceptible.

On Friday, the 21st, at daylight, the river was seen to be rising, but was not yet very high. At 7:30 a more rapid rise took place, the water being then 11 feet above high-water.

Continuing to rise rapidly, it had reached, by 11 a.m., 19 feet above high-water; by 12:30 it had risen to 22 feet; and by 2:30 p.m. it was about 25 feet. So rapid a rate of rise had never before been observed at Maitland.

Early on Friday, the 21st, the river had commenced flowing through Hall's Creek, on to the low lands on the south and west of the town, which were already partly submerged by the heavy rain. At about 5 p.m. on Friday, the water was running in a strong stream across High-street, opposite the Queen's Arms Hotel, the water being then 26 feet above high-water-mark; but the current in the river at this time was not so rapid as it had been during the June flood. By 7 p.m. the water was pouring into High-street, near the Wesleyan Chapel; by 8 p.m., still raining, though not so frequently, the water had nearly crossed the road; at 10 p.m. it had risen to the level of the July flood, namely, about 27 feet above high-water, and was still rising. On Saturday morning, at 9 o'clock, it had reached to 1 foot above the level of the July flood, or 28 feet above high-water, with a very rapid current in the river. A pause then occurred, and no perceptible rise took place for several hours, till about 5 p.m. on Saturday it commenced rising very slowly, and continued rising until Sunday evening about sundown, when it attained its greatest height, namely, 29 feet above high-water. Shortly after, or about 7 p.m. on Sunday, a slight decrease was perceptible; and by midnight it was obvious that the overflow had diminished. On Monday morning it had fallen 4 inches, and continued to fall steadily during that day and the next; and by Wednesday, the 2nd September, it had fallen 19½ feet from its highest point.

In this, as in the former floods, it was observed that, with a rise of about 20 feet, the water commenced to overflow at one or two points at the Horse-shoe Bend; at 24 or 25 feet, it commenced to overflow at High-street—first below the Rose Inn, then near Russell's; at 26 to 27 feet it commenced to overflow the dams or levées at the Falls, and the line of the bank along the Free Church street and at the foot of Hunter-street.

The points within the town of West Maitland where the overflow from the river was heaviest (sufficiently strong to sweep away houses) was at the Falls, at Russell's, at the Rose Inn, and at Wallis' Creek, where the current of the back-water overflowed and swept in a strong stream towards East Maitland.

About one-quarter of the town remained above water, namely, from a little above the Buck's Head Inn, on the one side, to the Northumberland Hotel on the other, and from the high bank of the river to the flat on which St. Mary's Church and Mr. Baldwin's house stands. A few other small patches were also dry; but the remainder of the town was under water to a greater or less depth.

The information thus collected of the August flood may be condensed as follows:—

	Wednesday evening (August 19th)—commenced raining.
	Thursday, at sundown ( „ 20th*) no signs of rise.
	„ „ gentle current perceptible in river.
Friday,	daylight—river rising.
„	7:30 a.m.—height, 11 feet; rising rapidly.
„	11 a.m.— „ 19 feet, or at rate of rise of 2 feet 3 inches per hour.
„	12:30— „ 22 feet; rate, 18 inches per hour.
„	2:30 p.m.—25 feet; rate, 18 inches per hour.
„	5 p.m.—26 „ „ 5 inches per hour.
„	6 p.m.—26 feet 3 inches.
„	7 p.m.—26 „ 9 „
„	10 p.m.—27 „
Saturday,	9 a.m.—28 „
„	forenoon, water stationary.
„	5 p.m.—recommenced rising.
Sunday,	at sundown, reached 29 feet.

The points where the water broke over the banks of the river, as well as the portion of West Maitland inundated by this and the other floods, as far as they can be ascertained from the accounts given in the *Mercury* newspaper, will be shown on the accompanying plan of the town.

At Morpeth, between 6:30 a.m. on Friday and 3 p.m. of the same day, the river rose 6 feet, being then about 7 feet 5 inches above high-water, and rising at the rate of about 8 inches per hour; the current was not very strong, in consequence,

as

\* New moon, 2:30 a.m., 20th August.

as was supposed, of the waters of the Paterson, as well as of the Williams, being both level with those of the Hunter. About 9 p.m. on Friday the river had risen to 10 feet 7 inches (the level of the last flood); it continued to rise rapidly during the night, and by Saturday morning the whole country on the opposite side to Morpeth was like one inland sea.

The Paterson had come down bank-high on Friday morning before the Hunter, and broke over Phoenix Park and Dunmore.

On Sunday at 11 p.m. the river was at its height, being 3 feet 8 inches above the last flood, and 14 feet 9 inches above high-water.

At 12 o'clock on Sunday night it commenced to fall slightly—by 8 a.m. on Monday it had gone down 2½ inches, by noon only 3½ inches.

The flood, as we have seen, attained its greatest height at West Maitland at sundown on Sunday, and at Morpeth reached its greatest elevation at 11 p.m.,—showing that the crest of the flood-wave took about 6 or 7 hours to travel from the former to the latter.

It was new moon on Thursday, August 20th, at 2h. 29m. 49s. a.m., so that it would have been high-water at Newcastle about 8.45 a.m., and at Morpeth about 3 hours later, that is, about 11.45 a.m., and on examining the state of the tides and of the river on the following day (on Monday at noon), when the water was still 13 feet 11½ inches above its ordinary high-water level, I am unable to perceive that there was any alteration of level which could indicate that the flood was at all affected by the tides; and we also find that lower down the river, at Raymond Terrace, Hexham, and almost as far as Newcastle, even the tidal action seems to be neutralised by that of the flood.

#### Recapitulation of rise and fall at Morpeth:—

Friday, Aug. 21—From 6.30 a.m. to 3 p.m. river rose 6 feet = 7' 5" above high-water.

Rate, 8 inches per hour. 9 p.m., 10' 7" above high-water.

Saturday.....Rising slowly.

Sunday .....11 p.m., 14' 9" above high-water. 12 o'clock, commenced falling slightly.

Monday .....8 a.m., 14' 6½" Noon, 14' 5½".

At Raymond Terrace this flood rose with unusual rapidity, and attained a height of about 5 feet above that of the last flood, or 7.82 feet above high-water.

Tracing this flood downwards from the head waters of the Hunter, we find that at Musclebrook the water reached its greatest height on Friday night at 10 o'clock. At Singleton, Thursday, August 20th, there was no appearance of rise in the river. On Friday, Aug. 21, the river had risen during the night with unprecedented rapidity, about 3 feet per hour. On Saturday it was still rising rapidly, the water breaking over the banks above the town. On Sunday morning, at 4 o'clock, it attained its greatest height (46 feet above summer level), and commenced to fall. On Monday, at noon, the river was falling.

It would thus seem that the crest of the flood or wave was, at—

Musclebrook—on Friday, at 10 a.m.

At Singleton (about 85 miles)—on Sunday, at 4 a.m., having come down at the rate of about 2 miles per hour; the fall being say 3.8 feet per mile.

At West Maitland (49 miles)—on Sunday, at 5 p.m., about 3.8 miles per hour; fall being at the rate of 2.088 feet per mile.

Morpeth 17 miles—on Sunday, at 11 p.m., 2.8 miles per hour; fall, at rate of, say, 1 foot per mile.

Such are the salient features of the great flood of August, 1857, which I have dwelt on at some length, as it and the flood of 1867 form the ground on which I base my calculations as to the quantity of water to be dealt with in any scheme which may be proposed for abating the injuries done by these floods.

By these floods it was estimated that 35,000 acres of land were inundated, four hundred families reduced to destitution, and injury to the amount of £150,000 inflicted on the district, from loss of crops and stock and damage of various kinds.\* These last-named injuries and losses were not caused, however, by the floods alone, for it is pretty generally admitted that during wet seasons, even when there has been no flood of importance, that the rain falling on the surface, added to the drainage from the adjoining ridges, is sufficient to lay under water a considerable extent of the richest and best land in the neighbourhood of the Maitlands; the land in the immediate neighbourhood of the river having been raised by the alluvial deposits of ages to a higher level than that of the back lands, a feature of all large rivers, it follows that the drainage into the river from the back lands is rarely perfect in its natural or unimproved state.

From 1857 to February, 1861, there were occasional freshes in the Hunter, but nothing of sufficient importance to warrant further notice; but, on the latter date the Hunter was visited by another high fresh.

On Wednesday † and Thursday, the 6th and 7th of February, it came on to rain very heavily; and early on Friday night, February the 8th, the river commenced to rise; on Saturday morning, the 9th, at 6 o'clock, it had risen 8 feet above ordinary high-water-mark; by 6 p.m. it had risen to 12 feet. At 6 a.m. on Sunday morning ‡ it had risen to 15 feet, with a very rapid current, and by 2 p.m. on Sunday it attained its greatest height, being then about 16 feet above high-water. The water commenced to recede about 4 p.m., and by Sunday it had gone down about 4 inches.

At 6 a.m. on Monday the water had receded 3 feet, or to 13 feet above high-water, and on Monday evening it had gone down to 11 feet above high-water.

Little or no damage was done to the town by this flood, but a considerable extent of the low-lying land back from the river was inundated by the water, which for some two or three days continued flowing up Wallis' Creek.

We thus observed that a flood 16 feet in height, while it does no injury to the town, is capable of doing considerable damage to the crops on the low lands, in consequence of the absence of any proper system of drainage.

Early in the following month of March there was another fresh in the Hunter, which rose to 15 feet 6 inches above high-water. Commencing to rise on Friday at sundown, it attained its greatest height on Sunday the 3rd, about mid-day, § and commenced falling slowly about an hour or two after; it had gone down 6 inches by sundown, and 2 feet 6 inches by Monday morning. But a second rise took place during the day, and by sundown the river again stood at its highest point—15 feet 6 inches.

This second rise was attributed to the arrival of the flood wave of the Goulburn River—the largest tributary of the Upper Hunter.

The effects of this flood were similar to the last. The town sustained no damage, but the flat country towards the head of Wallis' Creek was again laid under water.

About the later end of April—barely two months after the last described fresh—the Hunter was visited by another flood.

There had been a good deal of rain for the preceding ten or twelve days; but on Saturday and Sunday, the 27th and 28th of April, ¶ it came down with great violence, still further flooding the low lands about West Maitland and Hexham, from which the water left by the flood of March had not drained off.

On Sunday evening, the 28th, the river shewed symptoms of a rise. After midnight it commenced rising rapidly; and by 8 o'clock on Monday morning, the 29th, it had risen from 13 to 14 feet above high-water. By noon on Monday the river had risen to 16 feet, and at about 8 p.m. it had risen to 19 feet, when it became stationary. It then commenced falling slowly, and by 7 a.m. on Tuesday, the 30th, it had gone down nearly 2 feet. But about 9 a.m. it recommenced to rise, and at 2 p.m. had again risen to 19 feet, and continued rising slowly, with a rapid current carrying down much heavy timber, till about 3 a.m. on Wednesday, when it attained its greatest height of 21 feet above high-water. At this level the water remained stationary all day, and until about 7.30 p.m. (16½ hours), at which time it recommenced falling, and at 8.15 p.m. had gone down 1 inch.

On Wednesday night it fell 1 foot. By noon on Thursday it had fallen 2 feet; by sundown, 3 feet; and by daylight on Friday morning, nearly 6 feet; at 1 p.m., 7 feet; at sundown, 8 feet. The river being then confined within its proper banks, no further record of the rate of fall seems to have been kept.

It

\* See debate, Legislative Assembly.

† Moon in last quarter, 2nd Feb., 8.4 p.m.

‡ New moon, 10th, 9.8 a.m.

§ Moon in last quarter, 4th, at 5.20 a.m.

¶ Full moon, 25th, 8.28 a.m.

It was observed of this flood, that, although on all former occasions a rise of 21 feet would have seriously flooded the flat lands in and near the town on the right bank of the river, on this occasion, in consequence of the dams which had been thrown across the creeks leading into the back lands, comparatively little injury was caused by the river water, except by that which flowed up Wallis' Creek, and thence out over the low lands at its head.

On the left bank of the river it was different, the low lands about Bolwarra being all overflowed.

We thus find that at this time a rise of 21 feet in the river, although still inundating all the low-lying lands, had ceased to cause any injury to the town, in consequence of the measures which had been taken by the inhabitants to embank it out.

Some notice was taken of the time which the flood-waters took in travelling from Singleton to West Maitland on this occasion, and it was estimated that the rate of speed was from 3 to 5 miles per hour.

The first rise during this flood at Singleton stopped at 10 feet on Monday morning; but as the first rise at West Maitland culminated at 8 a.m. at 19 feet, it must have been caused mainly by the waters of the Black Creek, Anvil Creek, and other creeks joining the Hunter below Singleton.

The second rise at Singleton commenced on Monday afternoon, and continued until Tuesday morning the 30th. At 8 a.m. it was 18 feet above the usual height, and by 1 p.m. on the same day attained its greatest height.

The second rise at Singleton is attributed to the arrival of the flood-waters of the Goulburn, which passing on, also caused the second rise at West Maitland. The second rise, as we have seen, commenced at Singleton at about 5 o'clock on Monday afternoon, and at Maitland at about 8 a.m. on Tuesday, or about 15 hours later, and attained its greatest height at Singleton at 1 p.m. on Tuesday, and at West Maitland about 3 a.m. on Wednesday—about fourteen hours later; which, the distance being, as I have said, about 49 miles, gives a velocity of about 3½ miles per hour.

It will be observed that in this flood, as well as in each of those of 1857, there was a second rise in the river after it had attained its first elevation and had commenced falling, and during this last-described flood it reached a greater height by 2 feet during the second rise than it did during the first.

The next flood that occurred during 1861 was that of July.

It commenced raining over the valley of the Hunter on Tuesday, July 23rd, \* and continued almost without intermission for the remainder of the week.

The immediate consequences of the local rain was the accumulation of sheets of water in all the hollows about the town, but the river itself did not show any symptoms of a rise till Wednesday night.

At 7 a.m. on Thursday it had attained a height of 7 or 8 feet above its ordinary high-water level; at about 3 p.m. it had risen to 10 or 11 feet, and early on Thursday night it had risen to 14 feet above high-water. During the night it continued to rise rapidly—3 to 6 inches per hour; and at 10 a.m. on Friday it had attained a height of 22 feet.

Continuing to rise slowly, at midnight on Friday it commenced flowing over the river bank at High-street, near Messrs. Hall and Co.'s stores; and by 5 a.m. on Saturday it had reached to 24 feet above high-water, and continuing to rise more slowly, it reached its maximum at about 3 p.m. on Saturday, when it stood at 25 feet 4 inches above high-water-mark, being nearly at the same level as the June flood of 1857.

Shortly after 3 o'clock on Saturday it commenced to fall slowly at first, but then more rapidly. At 3 a.m. on Sunday it had receded 1 foot 4 inches; at 9 a.m. on Sunday it had fallen 2 feet 4 inches from its highest. At 5 o'clock on Monday afternoon it had gone down 8 feet, being then about 17 feet above high-water; and by Wednesday, August 6th, it had receded to within 4 or 5 feet of its ordinary level.

An unusual feature in this flood was the height attained by the river at so early a stage of the rain; and that, when it commenced falling, it went down almost as rapidly as it rose.

#### Musclebrook.

July 26—Friday forenoon,	river at its greatest height.
26—	„ noon, had commenced falling.
27—Saturday,	10 a.m., fallen 12 feet.

#### Morpeth.

July 26—Friday morning,	river over Queen's Wharf.
27—Saturday,	midnight, 9' 0" above h.w.
28—Sunday,	subsiding rapidly.
29—Monday,	noon, 2 feet above ordinary h.w. springs.

This flood, which rose with unusual rapidity, subsided almost as quickly. This perhaps is in some measure attributable to the rain having ceased to fall heavily after Saturday morning, as well as to the circumstance of the Paterson and Williams being but slightly flooded, thus allowing the waters of the Hunter to drain off more rapidly than they would have done had they been pent up by the back water of those rivers, as occurred in some of the former floods.

The rapid subsidence of the water prevented much injury being done to the crops, "even the young wheat was in many cases saved." This fact should be borne in mind when we are considering the question of drainage.

The waters of the Hunter had not returned to their ordinary level after the flood of July, when they again commenced to rise. On Tuesday morning, August 6th,† it commenced raining slightly, gradually increasing to a steady continuous rain on Tuesday night, Wednesday, and Wednesday night, and the following day and night.

#### West Maitland.

August 7—Wednesday,	noon, the river commenced rising slowly, being then 4' or 5' above its ordinary level.
„ 7—	„ at sundown, it had risen to 5' 6".
„ 8—Thursday	morning, within 3' or 4' of the level of last flood, and rising 5" or 6" per hour.
„ 8—	„ 1 p.m., flowing over High-street.
„ 8—	„ at nightfall, rising very slowly—almost imperceptibly.
„ 8—	„ midnight, 25' 6" above ordinary level.

† New Moon, 6th, 10:58 p.m.

- August 9—Friday, 6 a.m., commenced to fall at rate of  $\frac{1}{2}$ " per hour.  
 " 9— " 8 p.m., the water stood at 25' 2".  
 " 10—Saturday—morning, about 25'.  
 " 11—Sunday—River falling steadily and uniformly.  
 " 12—Monday—evening, about 13 feet above h.w.

*Singleton.*

- August 7—Wednesday, 5:43 p.m., river had risen 3 feet.  
 " 8—Thursday, 9:16 a.m., rising 1' per hour, was then 20' above ordinary level.  
 " 8— " 11:38 a.m., 21'.  
 " 8— " 5:52 p.m., rising 3" per hour.  
 " 9—Friday, 10:14 a.m., 24' 9".  
 " 9— " 4:55 p.m., commenced falling, having reached 25' above ordinary level.  
 " 9— " 5:47 p.m., 24' 8".

*Musclebrook.*

- August 7—Wednesday, 5:41 p.m., river risen 3' or 4'.  
 " 8—Thursday, 5:52 p.m., at standstill.\*  
 " 9—Friday, 10:14 a.m., falling.

*Morpeth.*

- August 9—Friday, 2 a.m., river had risen to 11' 2" above h.w., and then commenced falling.  
 " 9— " sundown, 10' 10" above h.w.

*Raymond Terrace.*

August 9—Friday, 2 a.m., river attained its greatest height, being 3 feet below flood of August, 1857—5' 7" above h.w.

By this, as by the preceding floods, the whole of the low land on both banks of the river were laid under water. Louth Park and Dagworth are described as seas, and Phoenix Park, Bolwarra, and Dunmore as being one sheet of water; considerable damage was done to the standing crops, and the town also suffered somewhat, the water rising to the eaves of many of the houses in John-street.

A considerable amount of damage was also caused by this flood to the residents of the Paterson and Williams, on both of which the alluvial flats were flooded.

The rains on this occasion seem to have been principally confined to the coast line and not to have extended very far or very heavily inland; hence, probably, the reason why we find the flood culminating at Maitland before it reached its highest at Singleton.

On this, as on the occasions of former floods, the state of the tides, whether at flood or ebb, springs or neaps, seems not to have had any influence on the height, duration, or rate of rise or fall of the flood-wave at Maitland or Morpeth. In fact, when it is remembered that at Newcastle, during heavy floods, the range of tide is only altered about 1 foot, it is difficult to imagine that it can have any influence on the height of the water at Maitland; and although there is a sensible increase in the velocity with which the flood-waters rush out through the narrows at the entrance to Newcastle at the latter part of the ebb, the tide is not found to affect very sensibly the level of the water as far up as Hexham and Raymond Terrace, between which places and the out-fall at Newcastle there are capacious areas for the water to expand over, afforded by the river itself, the low-lying land upon its margin, and the wide estuary of Fullerton Cove, all of which act as compensating or regulating reservoirs, and are capable of receiving many hours' discharge of the river without sensibly affecting its level.

It will be observed as an unusual thing in this flood, that the highest rise at West Maitland, Morpeth, and Raymond Terrace was almost coincident—the times being at Maitland, midnight, on Thursday, August 8th; at Morpeth, 2 a.m. on Friday; and at Raymond Terrace, the same as at Morpeth.

Such was the last flood of the year 1861; and from that till the year 1864 the district seems to have remained undisturbed by flood alarms.

In the early part of the year 1864 the cycle of wet seasons again came round, and the week previously having been showery, on Wednesday, February 10th, a close, steady rain commenced to fall, which soon made itself felt in the river. Towards the close of that day the water had risen about 1 foot, and continued rising at the rate of 1 foot per hour during the night.

By 9 a.m. on Thursday the river had risen 17 feet above its ordinary level, with a rapid current, bearing on the surface large quantities of heavy timber. The rise continued during Thursday at the rate of about 6 inches per hour, causing successive overflows of the lower portions of the banks and at Wallis' Creek. By Thursday evening it had broken over the bank at High-street. This overflow relieved the river and checked its rapid rise, but nevertheless the water continued steadily, though now slowly, to rise during Thursday night and Friday, and by Friday evening it had attained a height of 28 feet above its ordinary level, being then about 1 foot below the flood of August, 1857, still rising, but very slowly,—and running rapidly.

It was remarkable that some houses and some parts of the town which escaped in the great flood of 1857 were flooded on this occasion (though, as has been stated, the general level was 1 foot lower in this than in the former), and others which on both occasions suffered, were invaded at different periods, as regards the times at which the waters broke over the banks at High-street and at the Falls.

The water still continuing slowly to rise, by sundown on Saturday, the 13th February, the greatest height, namely 28 feet 4 inches, was attained, or 8 inches below the height of the flood of August, 1857.

On Saturday night the river commenced to fall, and continued falling through Sunday; and Sunday night the river again returned within its banks, and by 8 o'clock on Monday morning it had fallen fully 10 feet from the highest level. The fall continued to Wednesday, the 17th, when the water had receded 18 feet.

Although considerable injury was done in the town by the water flowing over the river-bank, and the low-lying lands in the vicinity of the river were submerged to nearly the same extent as during the great flood of 1857 (indeed, in some places of the Horse-shoe Bend it was said to have attained a greater height)—looking across over Phoenix Park from Morpeth, it is asserted that the water was seen, in an unbroken sheet, extending for 4 or 5 miles—yet the much dreaded backwater in rear and to the south of West Maitland did not rise to within some 4 feet of the level of that flood, in consequence of the empty state of the lagoons and swamps previous to the occurrence of this latter flood.

The following will show approximately the time at which the flood attained its maximum height at the undermentioned places:—

*West Maitland.*

- February 10th.—Wednesday afternoon. River commenced to rise, being then 1 foot above high-water-mark.  
 11th.—Thursday morning. River 17 feet above high-water; evening, breaking over High-street, 22 feet above high-water.  
 12th.—Friday evening. 27 feet above high-water.  
 13th.—Saturday morning. 27 feet 6 inches above high-water.  
 Do., about sundown. 28 feet 4 inches above high-water.  
 Do., at night. Commenced falling gradually.  
 14th.—Sunday night. Continued falling—the river being within its banks.  
 15th.—Monday, 8 a.m., it had fallen 10 feet, or 18 feet 4 inches from high-water-mark.  
 17th.—Wednesday, the river had fallen 17 feet, being about 11 feet 4 inches above the ordinary height.

*Singleton.*

\* This gave 8 8 miles per hour as the rate of the speed of the flood when between Musclebrook and Singleton.

† New Moon, 8th February.

*Singleton.*

February 10th.—Wednesday, 5:15 p.m. River rising 1 foot per hour.

11th.—Thursday, between 6 a.m. and 2:15 p.m. River which had risen at the rate of 2 feet per hour, had attained a height of 25 feet, and continued rising at the rate of about 1 foot per hour. 6:15 p.m., river rising at rate of 6 inches per hour.

12th.—Friday, 7:45 a.m. River within 2 feet of flood of August, 1857, or 44 feet 8 inches above ordinary level.

3:15 p.m. Risen 6 inches since morning, or within 18 inches of August flood, 1857—44 feet 6 inches.

6:47 p.m. River just commencing to fall, being within 16 inches of last-named flood, or 44 feet 8 inches above ordinary level.

15th.—Monday evening. River had fallen 35 feet.

*Musclebrook.*

12th.—Friday, 3 a.m. River commenced to fall, being then 1 foot above level of flood of 1857.

Had commenced to fall at Singleton, as before stated, at 6:47 p.m.

*Morpeth.*

13th.—Saturday, 12 p.m. River commenced to fall, having attained to within 2 feet of the height of the flood of August, 1857, or 12 feet above ordinary high-water, and 8 feet above the Steam Company's Wharf.

16th.—Tuesday. River had fallen 8 feet.

17th.—Wednesday. Fallen 11 feet, and continued falling steadily.

In the following month there was another flood in the Hunter. The river commenced rising on Tuesday, the 23rd March,\* and by Friday, the 26th, had risen to about 21 feet above its ordinary level.

On Wednesday, March the 30th, the river, which had receded to about 5 feet above its ordinary level, again commenced to rise, and by 7 p.m. on Thursday, 31st March, had risen 20 feet.

Another flood commenced in June of this year.

The rain commenced to fall on Thursday night, June 2nd,† and early on Friday morning, the 3rd, the river was found to have risen 6 feet above its ordinary level, and continued through the day rising at the rate of about 1 foot per hour; and on Friday evening it had reached to 20 feet above its ordinary level. Continuing slowly to rise, by 2 a.m. on Saturday it commenced flowing over the banks, and by noon it had reached its greatest height, and then stood at from 23 to 24 feet above high-water-mark; and the backwater continuing to rise, by Sunday evening it had spread over every acre of cultivation between Maitland and the range of hills to the southward. "From the Morpeth Road, on Saturday, an extensive view of the flooded land was obtained, the expanse of water gradually increasing as one approached Morpeth, whence for miles nothing but water and partly submerged houses could be seen."

On this occasion both the Williams and Paterson were likewise in flood, and the latter overflowed its banks at various points, submerging all the low lands.

At Morpeth, on Saturday at noon, the water had risen to within 14 inches of the February flood, or (say) 11 feet above high-water.

One of the peculiarities of this inundation was, the great length of time the water remained at its greatest height at West Maitland, namely,—from noon on Saturday, till near Monday morning, at which latter time it had fallen but 2 feet, and was then subsiding very slowly.

At Singleton the flood culminated at 9 p.m. on Saturday, when the river stood at 23 feet above its ordinary level.

The flood having reached its greatest height at West Maitland, 9 hours before it attained its full height at Singleton, shows that the rise at the former place was mainly due to the local rainfall, and the flooding of the Wollombi, and the creeks entering the river between those two places.

It was observed on the occasion of this flood, that the Paterson rose with a rapidity never known before. The river, which on Thursday evening was at its usual level, had risen about 17 feet on Friday morning, and continuing to rise during that day with fearful rapidity, by midnight it had attained its greatest height, and then stood at 40 feet above its usual level, or within 3 feet of the great flood of August, 1857. About two hours afterwards it commenced to recede, and at daylight on Saturday had gone down about 2 feet, and by the evening about 6 feet.

The flood in the Williams, on this occasion, rose to within 3 feet of the height of that of August, 1857.

On the following week to that referred to in the foregoing account, and before the river had had time to go down to its ordinary level, the district was visited by another flood, of even greater severity than the last.

At dawn on Saturday, June 11th, the river, which had subsided to within about 9 feet of its ordinary level, was observed to be again rising (having risen 2 feet during the night); it was then at 11 feet above its ordinary level. It continued to rise rapidly during Saturday. From 6 p.m. on Saturday to 10 a.m. on Sunday the river rose 3 feet 10 inches at the Wallis' Creek embankment; and from that time to 8 a.m. on Monday, June 13th, the river had risen 1 foot 10 inches—a mean average rate of 1 inch per hour. At 10 a.m. the river was 23 feet 6 inches above high-water-mark. At 4 p.m. it had risen to 24 feet 3½ inches, or at the rate of about 1½ inch per hour. At 9:30 p.m. it had risen to 24 feet 9 inches, or about 1 inch per hour. At 6:45 a.m. on Tuesday it had risen 7 inches more, or (say) to 25 feet 4 inches; from this time till about 9:30 the river remained stationary, but it then commenced to rise again at the rate of about ¼ inch per hour until 6 p.m., after which it continued to rise more slowly till at 6:30 a.m. on Wednesday the 15th, when the river stood at 26 feet above high-water.

Continuing still to rise very slowly, at a little before midnight on Wednesday the water was about 26 feet 2 inches above its ordinary level, being then about 2 feet 2 inches below the flood of 1864 (February), and about 2 feet 10 inches below the August flood of 1857. Shortly after midnight the waters commenced to recede.

At Singleton the river rose slowly till about Sunday evening, when it commenced to rise more rapidly; and at about 9 a.m. on Monday was rising at the rate of 1 foot per hour, being then about 34 feet above the usual level. At 1 p.m. it had risen to 36 feet, having been rising at the rate of 13 inches per hour. At 4 p.m. it was at 37 feet above the level, rising 4 inches per hour. At 7:3 p.m. it was 38 feet.

On Tuesday evening at 8 p.m. the river commenced falling, having reached to within 2 feet 8 inches of the February flood, or 41 feet 10 inches above ordinary level.

On Wednesday at 11 a.m. it had fallen about 3 feet.

At Musclebrook it had commenced falling on Tuesday morning; at Singleton, on Tuesday evening; at West Maitland, Tuesday midnight.

During this flood two houses at the Bend in High-street, which had been partially undermined by former floods, were swept away, the inmates of one just escaping, but those of the other house (Mr. Fairfield and his family) were swept away with their house into the swollen river. His wife and another woman were drowned; he himself, with two of the children, were rescued from the wreck, after the house had grounded among some trees.

Scarcely had the flood of June subsided, when, about the middle of the following month, another flood swept over the district.

On Friday, 15th July,‡ the river again began to rise, and continued rising slowly through Saturday, 16th; and about midnight on Sunday the flood attained its greatest height at West Maitland, being then about 25 feet above high-water-mark. For about two hours it remained at that level, and then commenced slowly to recede.

Again, in the following month occurred another flood, though not so severe a one as the last.

On Tuesday morning, August 9th,§ the river began to rise at the rate of about 11 inches per hour. By Wednesday morning, the 10th, it had risen to 19 feet, and by Thursday evening reached to 24 feet above ordinary high-water-mark, and continuing to rise slowly till Friday evening at 8 o'clock, when it reached to within a few feet of the height of the last flood, or about 24 feet 9 inches above high-water.

At Singleton, at 11:45 a.m., the river had risen to 36 feet above its ordinary level, and shortly afterwards commenced falling.

It was my intention to have given a brief summary of all the important floods which have occurred in the Hunter River since the year 1857, at which time public attention began to be drawn to the subject, but I find that my space will not permit me to do so; and as the year 1865 and the following year were comparatively dry—no serious flood occurring until the last year of 1867—I shall pass them over, and come to the last flood of June of that year, which, for height, duration, and

\* Full Moon, 23rd. † New Moon, 4th  
‡ Moon, first quarter, 12th. § Moon, first quarter, 11th.

and amount of injury inflicted, has only been equalled by the great flood of August, 1857. And it is a curious coincidence, that the decennial periods of 1857 and 1867 should be marked by floods of unusual severity, number, and magnitude.

On Monday evening, June 17th, it commenced raining slightly, and continued falling with increased force throughout Tuesday, Wednesday, and Thursday. During Thursday night and Friday morning the rain fell in torrents, accompanied by a heavy south-easterly gale.

Up to Wednesday evening there was little apparent change in the river at Maitland, but on Thursday morning it was found to have risen 9 feet, and at 4 p.m. on the same day had reached to 18 feet above tide level, and at the same hour on Friday afternoon the river had attained a height of 27 feet above its ordinary high-water-level; it was then rising at the rate of about 3 inches per hour, and continued to do so till about 7 a.m. on Sunday, when it reached its greatest height, being then generally about 4 inches above the great flood of August, 1857, or say generally 30 feet above ordinary high-water; in some places it was considerably more, in others less.

It then, after remaining stationary for some time, commenced falling slowly. By 11 a.m. the water had fallen  $\frac{3}{4}$  inch; at 1 p.m. it had fallen  $1\frac{1}{2}$  inch; at 8 p.m. 4 inches, and by 8 a.m. on Monday had fallen about 10 inches.

All this time the river continued steadily pouring over the levées which had been erected at various points to keep it out, deluging the town, and steadily adding to the great backwater which covered the country to the south, on both sides of Wallis' Creek.

Many causes, such as the great height it attained, the rapidity of its rise, the peculiar inclemency of the weather, and the prevalence of sickness amongst many of the poorer inhabitants of the town and surrounding district, combined to render the effects of this flood peculiarly disastrous. It was likewise marked by an unusual amount of injury done to the banks of the river, the caving or slips, from the Falls downwards, being frequent.

At Singleton, at 10 a.m. on Thursday, June 20th, the river had risen 12 feet; at noon, 13 feet 6 inches; at 3 p.m., 14 feet 9 inches; at 6 p.m., 15 feet. At 8 a.m. on Friday, 30 feet; at 12:20 p.m., 37 feet above the ordinary level; at 5 p.m., the river still rising 9 inches per hour; 9 p.m., rising slowly. On Saturday, at 7 a.m., rising 4 inches within the hour, being then above the level of the flood of 1857. About noon on Saturday it must have attained its maximum, when the water stood at 1 inch above the last-named flood.

At Dunmore, on the Paterson, this flood was stated to have risen to a height of 15 inches above the flood of August, 1857; and at Raymond Terrace, to 8 inches above the same flood.

When a river breaks over its banks it leaves the heaviest particles of the drift mud and debris on the immediate banks; and it is only the lighter matter which passes on into the swamps and flat lands in rear. Thus the river banks are always receiving addition to their height in a more rapid ratio than the back lands. Whence it is that large rivers in a flat country are generally bordered by extensive tracts of swampy land, more or less under water after each flood. In such cases the mere banking out of the river is not sufficient; it becomes necessary to have recourse to some system of artificial drainage to facilitate the discharge of the water, whether received from the river or from the smaller creeks. And if a judicious system of local drainage be undertaken, I can imagine that, so far from the inundations caused by overflows of the river being injurious, they would, on the contrary, be in the highest degree beneficial. By the flood deposits those rich alluvial soils have been in the first instance formed, and it is by this same process only that their richness can be maintained. The banks of the Nile, without their annual inundation, would soon be reduced to a desert; and the height of the river in times of flood has for ages been the measure of the favourableness or otherwise of the season, of plenty or scarcity to the people.

In many parts of England the most careful arrangements are made to admit the mud-charged water of the floods to the low lands, where it is allowed to stand until it has deposited the alluvial matter held in suspension, and is then permitted to drain off. There is no reason why the same thing should not be done on the rich alluvial lands of the Hunter; it is the only means by which their extraordinary fertility can be preserved, and, if judiciously carried out, the whole of the advantages of this natural process of "top-dressing" may be secured without very much injury to the growing crops.

On the flood plan of the Hunter, which accompanies this Report, I have sketched out generally the system of drainage I would recommend. It is only a sketch, and does not profess to lay down the exact direction, number, or capacity of the subordinate drains, as I am not in possession of sufficiently detailed information as to the levels of the various parts of the country to enable me to do so.\*

The urgent necessity for some such system of drainage will become obvious on examining the flood plan made immediately after the flood of 1857, by Mr. Adams, who reported the feasibility of preventing a recurrence of the inundations, by excavating a canal which should divert the course of the Hunter through the Bolwarra Estate, and discharge the water again into the river at Largs. I do not question that such a canal might in a slight degree relieve the upper parts of the river, but the extent of relief it would afford is, as I shall endeavour to show when I come to that part of the subject, much over-estimated.

## PART II.

HAVING in the foregoing pages given a brief history of the different floods which have devastated the lower portion of the valley of the Hunter, as far as the facts can be collected from the only records I have been enabled to obtain access to, I shall now pass to the consideration of that branch of the subject which more immediately concerns the object of this Report,—namely, as to the quantities of water passing different sections of the river in given times, and also, as nearly as it can be estimated, the total quantity of water discharged by the river during flood. It is only by a careful consideration and comparison of these that we shall be enabled to gain any clear ideas as to the practicability of applying any remedies to lessen the inundations, as well as of the nature and extent of such remedies.

The quantities of water passing down the river per second at different places, commencing at Singleton and terminating at the entrance of the harbour of Newcastle, during the great floods of 1857, 1861, and 1867, carefully computed by the different formulæ of Dubuat, Eytelwein, and Ellet, will be found in the accompanying tables.

The floods of 1857 and 1867 are so nearly of the same height (as may be seen on the longitudinal and cross sections), that the calculations of the quantities for the former may, without sensible error, be taken as well for the latter; I have therefore only given one column for both.

Commencing at Singleton, which is the highest point of the river at which I have been enabled to obtain any authentic measurement as to its cross section, the height of the floods, and the rate of fall of the surface of the water, I am enabled to get the discharge per second with considerable accuracy. Dubuat's formula gives 131'416 cubic feet per second; by that of Eytelwein it would be 132'260 cubic feet per second; and by Ellet's, 141'819 cubic feet per second.

On the last-named formula I do not, as I have before stated, place much reliance; as, although it may have been found to approximate very closely to the observed velocities in such large rivers as the Mississippi and Ohio, it does not contain the corrections which Dubuat found it necessary to introduce when seeking a formula for smaller rivers, such as the Po, which, in some respects, resembles the Hunter in its lower parts; indeed Ellet himself states that he found it necessary to modify Dubuat's formula, as he has done, to suit the case of such rivers as the Mississippi and Ohio. In this Report I shall therefore continue to use Dubuat's formula, as probably giving the closest approximation to the actual discharges.

I may here observe, that the flood of 1861 afforded a very interesting confirmation of the accuracy of this formula. During that flood I caused very careful measurements to be made of the surface velocities, by means of floats, which gave velocities varying from 6'88 to 8'30, or a mean of (say) 7'60, at the site of the Bridge of West Maitland and a little above; lower down, where the channel widens, the velocity was found to diminish. Dubuat's formula, with the observed fall and hydraulic mean depth, gives 7'97 feet per second for the mean velocity, say  $5\frac{1}{4}$  miles per hour—which is a sufficiently close approximation to the measured velocities.

The tables and diagram accompanying the plans, which have been constructed from the admirable records contained in the *Maitland Mercury*, show the rate of rise, duration, and rate of fall, of the flood of August, 1857. From these I have had an approximate calculation made of the whole amount of water discharged during any given time, from the commencement to the termination of the flood at Singleton, Maitland, and Pittwater.

The

\*The necessity for some such system of local drainage is indicated by the following remarks in the *Maitland Mercury* of the 29th October 1858:—"It has now, we imagine, been proved beyond a shadow of a doubt, that nearly all the low lands in the Hunter River district are flooded, more or less, after rainy weather, and that a few days' rain only has the effect of turning many localities, containing some thousands of acres of crop, into large inland seas, and this irrespective of any addition which may be received from the rivers in times of high flood. It is, therefore, highly necessary, if the district is to be an agricultural one, and its rich soil is to be tilled by the industrious settler, that some scheme of drainage should be devised."

The water commenced to rise at Singleton about mid-day of August, the 20th; it attained its greatest height at 7 p.m. on the 23rd, having risen 46 feet. The calculation makes the total quantity of water discharged up to that time about 26,000 millions of cubic feet.

The water did not recede to its ordinary level until about the last day of September, and the total quantity discharged up to that date is shown to be about 88,000 millions of cubic feet.

At Maitland Bridge section the river commenced to rise on the evening of the 20th August, at 7 o'clock; on the 23rd it had attained its highest, and to that time the calculation shows that about 18,500 millions of cubic feet of water had passed down. The difference between these estimates, namely, about 7,500 millions of cubic feet being taken up partly in filling the channel of the river, which would absorb about half the quantity, or say 3,500 millions of cubic feet,—the remainder, 3,500 or 4,000 millions of cubic feet, being lost by overflow of the banks. This latter quantity would give a depth of about 3 feet over the whole of the flooded lands on Wallis Creek and in the flat country between Maitland and Morpeth.

From August 23rd, when the flood began to fall, until the last day of September, when it had returned nearly to its ordinary level at Maitland, the total quantity of water which had passed down the river was about 56,500 millions of cubic feet, showing that in the first three days of the flood about one quarter of the whole quantity, which amounted to 75,000 millions, had run down.

The total drainage area of the Hunter and Goulburn is 7,320 square miles, and the discharge of the river at Singleton, during the flood, which, as I have shown, amounts to about 88,000 millions of cubic feet of water, would represent a rainfall of about 5 inches over the entire area.

The rainfall of the months of July, August, and September, for that year (1857) was 11½ inches; and, as the rains of July, when there was also a flood, would have thoroughly saturated the country and filled up the water-holes and river-channel, it would seem as if nearly the whole of the rainfall of August and September, or (say) five-sixths of it were carried away by the river during those two months.

Using Dubuat's formula, we find that the quantity of water passing down the Hunter at Singleton, when the flood is at its highest, is, as I have stated, 131,416 cubic feet per second; and coming down the river to Oakhampton, the place where the next section was taken (about 2 miles 34 chains above the site of the new bridge), the quantity of water discharged per second is found to be 132,283 cubic feet, being but a very slight increase (867 cubic feet, or (say) .066 per cent.) in the quantity found passing Singleton Bridge. The accessions which the river receives between those places from tributary creeks would seem to be small, and to be nearly balanced by the overflow which takes place about a mile above Oakhampton, on the south side.

At the next section of the river, at Bolwarra House, one mile lower down, the discharge per second is 123,664 cubic feet, showing that between the former and the latter points 6,619 cubic feet of water per second have been spilled over the banks. The overflow would seem, from Mr. Adams' flood survey, to take place principally on the south side of the river; and most of it, no doubt, goes to form the much dreaded backwater which causes so much injury on the low-lying lands on the south of the town.

Coming down to the falls, at the site of the bridge, I find the quantity discharged by the river to be 105,626 cubic feet per second, showing that between Bolwarra House and this point 20,038 cubic feet of water per second had overflowed the banks and passed away into the flooded lands, partly towards Bolwarra, and partly by Hall's Creek towards Dagworth and Louth Park. A reference to the plan will show the great extent of the flooded land in this direction.

The sections from Maitland down to Morpeth have been taken at distances of about a mile apart, in order to show approximately the quantities of water spilled over the banks at the intervals between them, so that the heights and distances back from the banks at which levées or other protective works (if such be undertaken) must be formed, may be determined.

At section 6, which is opposite the High-street embankment, the discharge per second is 74,682 cubic feet, showing a loss between the bridge and this of 30,944 cubic feet per second; and at section 7, which is about a mile below Wallis' Creek, the discharge per second is given at 68,013 cubic feet; the difference, namely, 6,669, being probably the quantity which is received up the channel of Wallis' Creek, directly from the river. To this extent, that is, about one-tenth of the discharge, Wallis' Creek would seem to act as a sort of safety-valve to the lower parts of the river; and if the project be carried out which has been suggested, of shutting out the floods from Wallis' Creek by means of gates, the effect will be that one-tenth more water will have to be discharged by the river below the junction. I shall refer hereafter more particularly to this part of the subject, and consider more in detail the probable effects of this augmentation, as well as of that which would result from wholly excluding the water which finds its way into the Wallis' Creek basin by other channels.

Proceeding downwards from section No. 7, it is found that, with three exceptions (Nos. 11, 12, 13), there is a steady and very rapid diminution in the cross sectional areas of the river, and in the estimated values of their discharges. At Pitnacree Bridge the sectional area of the river is reduced to 6,516 feet—about half what it is at Singleton Bridge and West Maitland Bridge; and the ratio of fall of the surface of the water, which in the two former were 1 in 2,495 and 1 in 3,246 respectively becomes reduced to 1 in 9,359—not quite 7 inches to the mile; and the discharge per second has fallen from 131,416 and 105,626 to 26,129 cubic feet, or to between one-fourth and one-fifth of the whole quantity of water brought down the river.

This is a fact which must be kept prominently in mind, when considering any scheme for the partial protection of the flooded lands above this point; and care must be taken that, when adopting any measures for their relief, proper provision has been made for carrying off from the lower lands the additional quantity of flood water which will thus be sent down on them, or the consequence to the latter must be most disastrous.

Probably the reason why sections 11, 12, and 13 are greater than the others immediately above and below, is that the water which at other places had spread over the banks is partly confined at these points to the channel, by the piece of high ground which is shown on the plan as extending along the right bank; and the increased scour thus created would seem to have produced a corresponding increase in the capacity of the channel.

At Pitnacree Bridge, as I have stated, we find that not only is the sectional area of the channel reduced to less than half what it is at Oakhampton, but the inclination of the surface of the water, which at the former place was 1 in 2,500, or about 24 inches to the mile, at the latter has been reduced to 1 in 9,359, or about 7 inches to the mile; and as a consequence of this diminished sectional area and rate of inclination, the quantity of water discharged per second is reduced from 132,283 cubic feet at the former to 26,129 at the latter; or (say) about one-fifth of the quantity of water which passes down the river at Oakhampton is carried away by the channel at Pitnacree, the remaining four-fifths having overflowed the banks between these points.

Continuing still further down, we find that section No. 21, at Narrowgut, is only 4,417 feet, or about one-third of that at Oakhampton; so that not more than one-seventh of the quantity of water running down every second of time past Oakhampton is carried off by the channel of the river at Narrowgut.

From Narrowgut down to Morpeth, and thence onwards to Newcastle, with a few unimportant exceptions, the capacity of the channel steadily and almost uniformly increases, caused of course by the tidal action.

At Morpeth the sectional area will be seen to have increased to nearly double what it was at Narrowgut, and to be about one-third greater than it is at Pitnacree, the discharge of water per second, which is proportionally augmented, has increased to 33,161 cubic feet. I wish to draw particular attention to this, as the capacity of the channel for discharging the flood water at Morpeth should be the limit of improvement sought for the upper parts of the river. It would of course be quite possible to relieve Maitland wholly from danger of floods, if a channel sufficiently wide, straight, and deep, could be made to carry off the whole of the flood as rapidly as it is brought down; but then, unless the channel at and below Morpeth be sufficient also to carry it off, we should merely transfer the evil from the former to the latter; and while relieving Maitland should be swamping Morpeth.

It may be said that even now Morpeth is sufficiently afflicted, and that the people of that district should therefore oppose any projected improvements to the river above them, until a corresponding degree of improvement shall have been effected in the river below, so as to ensure the discharge of the additional quantity of water which will thus be brought down on them; and I quite hold with their view, for I believe that any straightening of the channel above Morpeth must have the effect of raising the flood-level there, more or less; and it becomes a question of the balance of interest between the two places, as to how far, while seeking to lower the flood-levels at Maitland, it will be safe to raise them at Morpeth. It must result from straightening the channel, that there will not be a damming up of the water at Maitland to the same extent as at present, and Maitland would probably be relieved to a greater extent than Morpeth would be injured by such works; nevertheless, as I have said, some increase in the height of the floods must be looked for at Morpeth, which, unless protective measures be adopted, such as the construction of levées and the deepening of the river, must be attended with more or less injury to the town as well as the adjoining low lands.

The probable increase of height for any given amount of discharge may be calculated, but I must again guard myself against being supposed to give exact results. The question is not one capable of mathematical accuracy, and I only profess (and no one can do more) to answer it approximately.

At section 31, a short distance below the junction of the Paterson with the Hunter, the capacity of the channel is still not equal to that of the Hunter at Oakhampton, and with an inclination of only 7 inches to the mile. Hence, the channel being still unable to discharge the floods brought down by both rivers, the waters rise above the banks, and inundate the country for miles on either side.

Coming on down to Raymond Terrace, at section 34 where the river has widened considerably, it will be seen that even here the discharge per second, after the water of the Williams has been received, is less than the quantity passing Oakhampton.

From Raymond Terrace down to Hexham, and thence to Newcastle, the river widens and deepens considerably, and branches at below Hexham into two considerable channels. The sectional area has increased to 18,438 feet, and the discharge per second to 67,751 cubic feet; so that from this latter point to the sea, the channel may be considered of sufficient capacity to carry off the floods, if moderately improved by dredging. I may here observe, that the dredging operations, which for some years past have been going on in the Hunter, in removing the shoals at Morpeth, Eales' Flat, Raymond Terrace, and the lower flats, have materially contributed to the freer discharge of the floods, and in so far have been productive of much good in this respect, irrespective of the benefits resulting to the navigation.

It will be seen from the foregoing, that at no part of the river between Oakhampton and Hexham is the channel of sufficient capacity to discharge the whole of the flood-waters as rapidly as they are brought down; hence their overflow of the banks, and inundation of the flat lands on either side.

West Maitland may be considered to be at the head of the delta of the Hunter. The fall of the river, when in flood, from Singleton to Bolwarra, is 102.33 feet. The distance being about 49 miles, gives an inclination of 2.088 feet per mile. At Bolwarra the fall per mile rapidly diminishes to 1.63 feet, and to 0.56 feet per mile where the river is most tortuous, between West Maitland and Morpeth. Below the junction of the Paterson, and between it and the junction of the Williams, the fall per mile again increases to 0.78 feet.

The rapid decrease in the slope of the river below Bolwarra accounts at once for the rapid contraction in the sectional area of the channel. The tidal action is not sensibly felt so far up, and the greater abrading action of the water in the higher parts, due to the velocity acquired from its more rapid fall, which had cut away the sides and bottom of the channel till it established a fixed regimen, or in other words, an equilibrium between the action of the water and the resistance of the channel here ceases. Below Bolwarra, therefore, the sudden diminution of fall is followed by a corresponding diminution in the velocity and scouring power of the water; and being no longer able to excavate a channel sufficient for itself, every obstruction, however slight, tends to divert the current to one side or the other, till ultimately the channel becomes so tortuous as in many parts to be running in a direction opposite to that of the fall of the country. Hence it is, that in high floods which rise much above the banks, the main upper current, which flows over them and across the bends, is, in many cases, in direct opposition to the under-current in the bed of the river. The river is thus neutralised; and it is obvious that, at such times, the waters must rise until the flat country becomes submerged, and the whole valley is converted into a broad shallow river. That this process has been going on for ages is obvious from the depth of the alluvial deposit about Maitland and on the lower parts of the Hunter; and that such must continue to occur, from time to time, and for all time, is, I think, equally certain.

It has been sought to attribute the great height of some floods to the action of the tides and wind on the lower parts of the river; but it will have been observed that even at Morpeth and Hexham the rise seemed to be independent of the state of the tide—that the floods rise as rapidly on the ebb as on the flood, and fall as slowly during one state of the tide as in the other. The great loss of fall and of sectional area of the river below Maitland are of themselves quite sufficient to account for the damming up which takes place, and we need seek for no other cause; however we may improve the river, this damming up must take place to a greater or less degree, unless indeed the whole course of the channel from Maitland to Hexham were widened, straightened, and deepened to a sufficient extent to carry off the whole of the flood-water—a project which, on account of the enormous cost, it is useless here to discuss.

Some of the evil effects of the floods may, as I shall endeavour to show, be greatly mitigated; but to prevent inundation wholly I look upon as impossible, even if it were desirable, which I do not consider it would be. Without these inundations the rich alluvial lands of the Hunter had not existed; and without their occasional recurrence the wonderful richness of the soil could not be preserved. The question then would seem to be how far is it practicable to diminish the evils produced by the floods, while retaining the benefits derived from their fertilizing action on the land?

In reference to this part of the subject, I think it may be laid down,—

1st.—That as respects the town of Maitland it is indispensable, on every consideration of the welfare, health, and comfort of the inhabitants, that the flood-waters be excluded from the houses and streets—in fact, from the entire inhabited area of the town.

2ndly.—That measures should, if possible, be taken to diminish the height and duration of the floods, so that the backwater may not rise so high, or remain so long on the submerged land.

3rdly.—That proper means be taken to facilitate the drainage of the submerged land as the floods subside, so that the water shall not be allowed, as at present, to stand for months on the flats, generating malaria, destroying the crops, and rendering the land useless while it remains on it.

With reference to the first part of the question, it will be necessary to consider what will be the effect upon the river of damming back, by means of *levées*, the large body of water which has hitherto found a vent at this part. Between Bolwarra House and Wallis Creek, a distance of about 3 miles, the river loses 50,982 cubic feet of water per second. I have no means of estimating the proportion of this which used to overflow, or still does overflow on the Maitland side; but judging from the circumstance of its having cut a channel for itself at Hall's Creek, I think we shall not be far wrong in estimating that at least half the above quantity overflowed on that side. If, then, by the construction of *levées* along the right bank, it be sought to exclude the water from the town, it is evident that, unless proper provision be made for its discharge by the river, by so much must it increase the flooding at other places. If to the 25,400 cubic feet of water be added the amount received up Wallis Creek, 6,670 cubic feet, we would have in the river an additional discharge of 32,070 cubic feet per second to be provided for,—a quantity considerably greater than that which passes under Pittacree Bridge at present, and nearly double the quantity passing Narrowgait. These figures will give some idea of the danger of attempting any partial measures, such as those which have been suggested for placing flood-gates at Wallis' Creek, and erecting *levées* along the whole river bank at Maitland. If anything effectual is to be done, it must be dealt with as a whole; and before embanking off the water to any considerable extent from one part, care must be taken that provision has been made for the discharge, in the proper channel of the river, of the additional quantity which will thus be thrown into it. If such be not done, the water so excluded must find an outlet in some other direction, and perhaps cause as great evils as those which it has been sought to prevent.

That these objects may be attained to some extent (not a very great one, however), I am led to think, from one leading peculiarity of the floods in this river.

On reading over the accounts given in the early part of this report, of the great floods of 1857, 1861, 1864, and 1867, it will be seen that in every instance the flood consisted of two distinct waves, the first being due to the lower tributaries—the Wollombi Creek, the Black Creek, Cockfighter's Creek, &c.—which rising nearer the coast, get the rains sooner than the upper heads, and having shorter courses to run, send down their water with greater rapidity. They produce the first flood-waves, which, though rising sometimes very quickly, rarely attain a dangerous height, and soon commence to subside; but before they have had time to flow away, through the contracted and tortuous channel below Maitland, they are overtaken by the second waves coming down from the main heads of the river,—the Goulburn, the Hunter, and the Dart. The result is, that the already gorged channel is utterly inadequate to carry off their united waters; and hence the second rapid and great rise which is observed, by which the banks are everywhere overflowed, and the river channel rendered still less capable of performing its duty. The height to which the waters must rise is simply a question of the continuance of the rains; for the higher the water rises over the banks the more completely does the channel proper of the river become neutralised and inoperative. In this view it would be clearly beneficial, as far as Maitland is concerned, to straighten and shorten the channel, so that it may act as perfectly as possible at all heights of the flood, and get the first flood-wave away, as far as it may be practicable to do so, before the second comes down. It is mainly owing to this circumstance of the whole of the flood-water not coming down in one wave, that we may look to being able to effect any beneficial results by straightening and shortening the channel. The quantity of water passing by Singleton per second, and arriving at Oakhampton, being as I have shown more than the channel

cau

can discharge in the flat country of the delta, the surplus must find vent somewhere. It must be allowed partly to escape as at present, but it may I think without much risk be excluded from the space occupied by the Town of West Maitland, if we facilitate the discharge of the remainder by cutting off some of the bends, so as to diminish the danger of the overflow to the inhabitants of low-lying land on the river banks.

## PART III.

ASSUMING, then, that the cuts-off before spoken of, and which will be hereafter described more in detail, have been in the first instance completed, and that due provision has thus been made for discharging safely the additional body of water which may be confined within the channel by levées, we come to the consideration of the best means of excluding the flood-waters from the entire area of the town. In this the people of Maitland will have to follow the example set by the inhabitants of many towns and villages of the Netherlands, as well as of the Mississippi, Po, and other large rivers subject to similar inundation. As regards Maitland, nature has very clearly indicated the line of circumvallation. A reference to the map will show that the town is almost wholly surrounded by water, having the Hunter on the north and north-east, Wallis' Creek on the east, south, and south-west, and Hall's Creek on the north-west. The line of the river frontage is even now protected to a considerable extent by the levées thrown up by the Corporation. These will probably require to be raised, strengthened, and puddled at such places as the currents impinge upon. They should be kept as far back from the margin of the channel as circumstances will admit, so as not unduly to contract the available sectional area of discharge. The channel of Wallis' Creek should be straightened, deepened, and brought to a more uniform section, to facilitate the more rapid and free drainage of the lands on its banks on the subsidence of the floods. The material excavated in improving the channel should be formed into a substantial levee along the left bank, or that next the town.

The line of circumvallation will, therefore, be somewhat as follows:—Commencing at the upper end of the town, where Hall's Creek joins the river, the line of the levée would follow the right bank of the Hunter down to the junction of Wallis' Creek, thence crossing the railway and running up the left bank of Wallis' Creek to the junction of Fishery Creek, and continuing along the left bank of Fishery Creek to the point where George-street crosses it. Here it might leave the creek and follow the line of George-street, which might be formed into a raised causeway for the purpose, to the head of Hall's Creek, thence down the right bank of Hall's Creek to the starting point at its junction with the Hunter. It may be that the space here proposed to be enclosed is unnecessarily large; but besides the advisability of having ample room for the future extension of the town, it would probably be found that the facility for procuring material to form the embankment or levée which would result from the deepening and improving of the channel of the creek, would render it cheaper if the two works were combined, than would be the enclosure of a smaller area without these advantages. The surface drainage of the town might be discharged either direct into the river, or, following the natural slope of the ground, into Wallis' Creek, if found safer and more convenient; but in either case, the greatest care should be taken in the construction of the outlet sluices through the levées, so that there should be no risk of leakage or of bursting up under the pressure of the floods. As the only material obtainable for the levée is a loose friable alluvium, care should be taken to have a core or wall of well puddled clay in the centre of each, which should be carried down to such depth in the natural soil as may be deemed sufficient. The line of the levées and the space proposed to be enclosed by them, are shown approximately on the accompanying plan. I am not in a position, nor do I profess to give the exact lines the levées should follow, that being a question which must be determined hereafter on more careful detailed surveys of each locality than I am in possession of. I merely venture to indicate, generally, the directions I think they should take.

I have before shown that there is a difference of between 6,000 and 7,000 cubic feet per second in the quantities of water passing those sections of the river next above and next below the Junction of Wallis' Creek, the discharges being 74,682 cubic feet and 68,013 cubic feet, respectively, per second; and that it acts fully to that extent as a sort of safety-valve or compensating reservoir to the river, is shown by the circumstance of the water always flowing up the channel of the creek for two or even three days during heavy floods. The 6,000 or 7,000 cubic feet of water received by Wallis' Creek per second might not, perhaps, of itself very materially raise the level of the water in the river if confined to it by the proposed flood-gates; but, if to it be added the 25,400 cubic feet which it has been estimated is now spilled over the south bank of the river between Oakhampton and it, the effect on the height of the already swollen river will be very great. Greater height implies greater velocity—not only must the water rise higher, but it must flow faster in the channel and over the other submerged lands; and this, as I have said, unless means shall have been adopted in the first instance to secure the discharge of this additional body of water by the channel proper, must find its way by a more rapid and deeper current over the surfaces of the already submerged land. A complete change in the existing regimen must follow; new channels will be formed, lands which are now enriched by the deposition of alluvium will have their soil swept away or be destroyed by a deposit of sand or gravel, the whole condition of things along the banks of the river will undergo a complete revolution. A slight difference in the velocity of the water flowing over the land makes a most material difference in the character of the deposit, a few feet per second making the difference of fine sand, coarse sand, or gravel. I would again observe that too much caution cannot be observed in dealing with this branch of the subject; the equilibrium which nature has established should not rashly be disturbed; if the swollen river cannot find the outlets it has hitherto used, we must be careful to provide others in their stead, or it will take the matter into its own hands in a way that perhaps we should not like, and end by causing incalculable mischief.

Maitland being protected, I repeat that I think Wallis' Creek should still continue to act as a relieving channel to the river; and that the low lands of Dagworth, Louth Park, Hungerford Swamp, and Booth's Swamp should still receive its mud-charged waters. With a proper system of drainage, so far from the floods doing injury, I believe that they would be attended with considerable benefit. What is required is, that on the subsidence of the floods the water shall drain freely and rapidly away—with proper drains they need never be submerged more than a few days at a time; and I believe I am correct in stating that few crops would be injured by a few days submersion, while the soil would in nearly every case be benefited and enriched.

Towards a proper system of drainage the first step would be the improvement of Wallis' Creek and its outfalls, straightening, deepening, and bringing it to a uniform cross section, and next the formation of such secondary drains as may be required thoroughly to relieve the land; these latter I have approximately sketched on the flood plans, but I do not profess to give either their size or exact number or direction, not being in possession of the detailed levels and other information necessary to do so; these details are besides better left for settlement to the local bodies which under the Drainage Act would have the control of such local works.

I now come to the consideration of that part of this question on which everything may be said to depend, namely, as to the best means of improving the channel of the river itself at those places where it is now so contracted and tortuous as to be unable to carry off the water with sufficient rapidity to prevent its overflowing its banks. Various suggestions have been made to this end which I shall now shortly refer to, setting forth as clearly as I can their merits or demerits, their practicability or otherwise.

The first and boldest, and at the same time the least practicable, is that of cutting a new channel from Singleton to Lake Macquarie; a glance at the map of the County of Northumberland will show what such a work would involve. Leaving the Hunter at Singleton, the new channel would have to be excavated through at least five ranges of mountains, forming the watersheds of as many creeks—first through the ridges separating the waters of Munnimba and Jump-up Creek from Black Creek; thence across the valley of Black Creek, which would be throughout on a higher level than the new channel; and on through the range separating the waters of Black Creek from those of Wallis' Creek, across the Wallis Creek Valley, through the Sugarloaf Ranges, and so down into Lake Macquarie. It will be readily admitted that the cost of cutting a new channel of (say) the same size as the Hunter at Pitnacree, for about 50 miles, through ranges of mountains from 500 to 1,000 feet in height in many places, is very much more than the country could afford; and were there not, as there are, other almost equally insurmountable difficulties in the way, such as the disposal of the drainage of the intervening country, the scheme might still be pronounced impracticable.

The next project is that of cutting a subsidiary channel from some point on the river above Maitland to Hexham, leaving the channel at Oakhampton or Bolwarra, and sweeping round to the southward of the town, across the low lands bordering Wallis Creek, and on through the range dividing that creek from Hexham, finally entering the river at the latter point. This scheme, at first sight, has the apparent merit, which some others have not, of supplementing the natural channel where it is deficient in sectional area; but then again, the consideration of cost, as well as the effect on other places, comes in the way. To afford any sensible relief to the river, the new channel would require a sectional area and hydraulic mean depth of 9,600 feet and 27ft. 4in., respectively, for a distance of about 11 miles. Assuming that the level of floods be raised 4 feet at Hexham (which must be done to enable the channel at this point to discharge the whole of the flood-waters of the Hunter,

Paterson,

Paterson, and Williams), we should have a fall from Bolwarra by the new channel of about 24 feet, or say 1 in 2,031, and should require, as before stated, a sectional area and hydraulic mean depth of 9,600 and 27.4, respectively, to carry off the difference between 125,664 and 17,623, the discharges per second at Bolwarra and Narrowgut, that is, in point of fact, to carry off the flood-waters of the Hunter as rapidly as they come down, and prevent accumulation. But then we must consider what would be the effect of this altered condition of levels on the other rivers. If the present flood-level were to be raised 4 feet at Hexham, the effect would be to pen back the Williams and the Paterson to nearly the same extent; so that the inundations which at present occur on the banks of those rivers must be proportionally augmented, and they again would react on the natural channel of the Hunter about Morpeth, and raise the flood-levels there to a greater height than at present. The height to which such a flood as that of 1857 would be raised at Raymond Terrace, would be about 4 feet higher than it then reached, and about the same at Hinton and Morpeth. I have only gone into the calculation of the heights to which the waters would be dammed back, if this scheme were carried out, approximately, the objections to it being so patent as to prevent its ever being attempted, to say nothing of the cost, which could not be estimated at less than 2½ or 3 millions sterling. It will be seen from the foregoing, how dangerous are all partial measures in so-called river improvements; that the effect of shortening and straightening the channel by cutting off bends, is simply to bring down into the lower reaches of the river a greater body of water in a given time than was the case before, and unless those lower reaches are sufficiently capacious to carry it off, the inundations will be merely transferred from one place to another. Hence it is, that in all river improvements, operations should be commenced at or as near the outfalls as may be necessary, and be thence continued upwards, taking care that the lower section shall be sufficient to carry off without injury the waters which would be brought down more rapidly by improvements in the upper parts.

A third plan I have heard suggested, is that of cutting a branch channel from Bolwarra to Largs, or somewhere thereabouts; but this, as I have endeavoured to show, would be merely to partially relieve Maitland at the expense of the country about Largs. The tables of discharges show that in the 1857 flood, while the river at Largs was discharging 31,368 cubic feet of water per second, at a place lower down, called Fisherman's Point, the discharge was reduced to 27,181 cubic feet—so that, if to the 31,368 cubic feet any considerable quantity be added by means of the proposed cut, the overflow at Fisherman's Point and lower down must be proportionately increased. It will be obvious from this, that the new cut to be of any avail must be carried to some point lower down, where the channel will be of sufficient capacity to carry off the water brought down by the new cut as well as by the present channel, regard being had to the difference of level which would result from the change; and, as the table of discharges will show, we shall have to go a long way down before we reach such a point in the river as will meet this condition.

Other suggestions have from time to time been made, with a view to diminish the injury arising from the floods, but they are not, I think, of sufficient importance to require further notice. I now, therefore, come to the consideration of how far it may be possible to effect that object at all.

Referring to the tables of discharges, we find that while 132,283 cubic feet of water per second was coming down past Oakhampton, not more than 37,730 cubic feet per second was flowing away past Morpeth, the difference having been spread over the flat country; and it is obvious that, without raising the flood-level to a dangerous height at the latter, we cannot expect sensibly to lower it at the former. Morpeth is clearly interested in having the river allowed to remain as it is, unless the channel below it be improved to the full extent of any relief afforded to Maitland; and for this reason as little interference with the river as possible should be permitted, and the operations at Maitland should be purely confined to the protection of the town, which alone will throw some 25,000 cubic feet of water per second into the river. This, if the channel between the two be rendered capable of carrying it, will increase the discharge at Morpeth to 62,730 cubic feet per second, which would, probably, if all confined to the channel, raise the level of such a flood as that of 1857 or 1867, about 3 feet. It is a subject for very serious consideration whether this can be safely allowed. The channel below Morpeth is of course capable of improvement, and the dredging operations which have been occasionally undertaken, by removing the shallows and sand-bars, have been so much in the right direction, but they have not, and could not have been sufficient to make up for the increased quantity of water which would be confined in the river by the circumvallation of Maitland. On the supposition, however, that the river below Morpeth shall have been improved to a sufficient extent to warrant the undertaking, and that levees and such other protective works as may be made have been completed, the works I would propose for the intermediate section of the river are as follows:—

The first cutting would commence at Morpeth, a little above the Queen's Wharf, and be continued nearly in a straight line to the Ten-mile Bend, below Pitnaerree; then the present channel of the river would be followed, widening and deepening it where required, to the bend just above the Pitnaerree Bridge; from this a new cut would be made through the narrow neck of land below Mr. Macintyre's house; thence, following again the natural channel to No. 12 section, the new channel would be taken in a gentle curve to the lower part of the Horse-shoe Bend, crossing the river about half a mile below Wallis' Creek. The length of new channel required would be about 1 mile 30 chains; and the total length by river between Oakhampton and Morpeth would be reduced from 16 miles 65 chains to 6 miles 12 chains, effecting a saving of 10 miles 53 chains in the length of the channel.

Another plan by which the shortening of the channel may be effected differs but slightly from that just described; it also would commence at the upper end of the Morpeth reach, but would be carried direct to the Nine-mile Bend, just below the Pitnaerree Bridge; thence upwards the new cuts would be similar to those of the first plan. The length of cuttings would be 1 mile 74 chains, the length of river from Oakhampton to Morpeth would be 5 miles 76 chains, and the distance saved would be 10 miles 69 chains. This plan would be more expensive than the first, as it would involve about half a mile more cutting for the new channel.

A third plan would, at the lower part of its course, be somewhat similar to the first, but would differ materially in the upper portions. It would involve considerably more cutting, and a much greater interference with the natural course of the river. By it the length between the points before referred to would be reduced to 5 miles 71 chains, the distance saved would be 10 miles 74 chains, and the length of new channel would be 1 mile 67 chains.

A fourth plan would be a combination of Nos. 1, 2, and 3. The distance saved would be somewhat greater than by any of the foregoing, but the length of cutting for the new channel would be 2 miles 31 chains.

Two other means are shown on the accompanying plan by which the channel might be shortened, but they would both involve considerably more cutting than Nos. 1, 2, besides necessitating the construction of new bridges at Pitnaerree.

Plan No. 1 is that which seems to combine the greatest number of advantages with that of being the least costly. Taking the floods of '57 and '67, and assuming that the natural channel and the new cuts were made equal in section to that at Pitnaerree, I find that the new channel would, with the increased rate of inclination which would result from shortening it by 10 miles 53 chains, be capable of discharging about 61,800 cubic feet per second, thus more than doubling the present rate of discharge at Pitnaerree, and bringing up the capacity of the channel from 26,129, or (say) under one-quarter, to nearly one-half the whole quantity of water passing Oakhampton. The effect at Pitnaerree Bridge would be to raise the flood-levels about 3 feet 6 inches, and at Morpeth about 3 feet. Supposing the channel then to remain unaltered at Dale's Flat, a rise of about 6 inches above the present flood-level would probably take place. As was shown in a former part of this report, 61,800 feet per second is about the additional quantity of water which will be confined to the river by the embankment of Maitland, and is the full extent to which, in my opinion, relief should be attempted; but we must not forget that the increased rate of fall in the channel which would tend to drain away the water more rapidly from Maitland, would also the more rapidly precipitate it on to the low country near Pitnaerree and Morpeth, unless the increased height attained at these latter places should in their turn so increase the rate of fall from them onwards, as, coupled with the greater sectional area and hydraulic mean depth, would enable them in their turn to carry off the increased quantity brought down from above; in other words a more rapid and at the same time more uniform rate of slope would be established from some point on the river near Oakhampton, in fact, as high up as the improved drainage would be felt, to some other point on the river lower down, where the greater capacity of the channel would enable it to carry off, without sensible increase in height, the additional body of water brought down. This, on the plan I have sketched, may be considered to be about Hexham.

The flood would be lowered by about 6 inches at Maitland, and the town saved from inundation, but the country between it and Hexham must be inundated to a greater or less degree as a consequence, probably, however, not more than I have stated.

The probable cost of shortening the river by the cuts-off shown on the first plan, may be estimated at about £137,000, and for the second plan about £192,000.

In these amounts are not included the cost of the general scheme of minor drainage, which I have described as being necessary to carry away the flood-waters from the submerged lands on Wallis' Creek on the subsidence of the floods, and which should

should, in my opinion, be immediately commenced; their cost would be inconsiderable, and the benefit to the land would be certain and immediate. I have not gone into the details of this scheme, believing it, as I have before stated, to be more a matter for local or municipal action than for the central Government; but if it be desired by the Honorable the Secretary for Public Works, with the information now at my disposal, and a few more levels, I could do so.

In conclusion, I would again observe that, in contemplating changes, we must not lose sight of the fact that any violent interference with the regimen of the river above Morpeth must materially alter the existing condition of things, certainly as far down as Hexham, and that no one can predict with certainty what those alterations will be. We must anticipate that the sand-bars at Morpeth and Eales' Flat will be shifted further down, as will probably be also that at Raymond Terrace; but no one can undertake to say positively where they may be redeposited; and one thing is certain, if the cuts-off I have described are made, that we must be prepared for steady and continuous dredging for many years to come, until the river shall have re-established itself. Indeed the whole subject is one of extreme difficulty; no problem in engineering can perhaps be more so. Once we interfere with the existing order of things, we call into operation forces and causes, the effects and consequences of which may be so varied, and at first sight apparently contradictory, as to be difficult of explanation, and impossible of certain prediction.

These observations must be taken as only applying to the very highest floods. In floods of moderate height the relief which would be afforded to Maitland would probably be unaccompanied by very serious, if any, injury to Morpeth; as the first flood-wave being enabled to get away before the second should come down, by reason of the increased discharging capacity of the improved channel, that penning up of the waters which now takes place would not occur. And as the smaller floods are almost annual, while those like the August '57 or '67 are of rare occurrence, I think a case may be considered as made out in favour of undertaking the works referred to. But I have considered it to be my duty to point out as clearly and fully as I could, what would probably be their effects during very great floods; as were they rashly undertaken, without due regard to the precautions which are necessary to guard against or mitigate the dangers which they may occasion, the consequences may be very disastrous.

I have the honor to be,  
 Sir,  
 Your very obedient Servant,  
 E. O. MORIARTY,  
 Engineer-in-Chief for Harbours and Rivers.

FLOODS—1857 and 1867.

TABLE showing the calculated velocities and quantities of discharge in feet per second, during the extreme height of the Flood of 1857, at the various cross-sections of the Hunter River, between Singleton and Newcastle, according to the formulae of the following authorities.

$$V = \frac{\sqrt{ng} (\sqrt{d}-0.1)}{\sqrt{s-L} (\sqrt{s}+1.6)} - 0.3(\sqrt{d}-0.1) \quad \text{DUBUAT.}$$

$$V = 0.9 \sqrt{ds} \quad \text{EYTELWEIN.}$$

$$V = 0.8 \left( 0.8 \sqrt{df} + \frac{df}{20} \right) \quad \text{ELLET.}$$

[Report from the Secretary on the loss of crops by floods in the Hunter River, from Oakhampton to Tomago.]

Public Works Office,  
Sydney, 28 July, 1870.

To the President of the Hunter River Floods Commission.

Sir,

In accordance with instructions received at a meeting of the Commission held April 11th, 1870, I have the honor to submit herewith a volume containing information relative to the loss of crops, &c., by floods in the Hunter River, under the following heads:—Name of owner; name of occupier; total area of farm, in acres; total area of flooded land, in acres; amount of rent; area of flooded land under crop, in acres; nature of crop; amount of injury done to crops; other losses; how often flooded since 1857.

I have personally collected the statistics in that tract of country extending from Oakhampton to the boundary of the Raymond Terrace district, together with the Paterson as far as the township. Mr. Bolding, P.M., kindly assisted by obtaining similar information in the Raymond Terrace district.

By reference to the volume containing the particulars of the damage done, it will be observed that the produce of the districts about Maitland, Morpeth, and the Paterson, consists chiefly of maize, lucerne, and potatoes; that 9,208 acres of cultivation land were submerged during the height of the floods, and that 8,357 acres of crop were destroyed; the difference being attributable to the fact that a portion of the land was under water for so short a time that the crops received little or no injury therefrom.

Whilst procuring the above information, I found, from careful inquiries, in which the quantities given varied, according to the locality and nature of the soil, from 25 to 80 bushels, that the average yield of maize per acre for the whole district is 45 bushels; of potatoes, 5 tons; and that lucerne produces 1 ton per acre for each cutting, and may be mown from four to five times a year.

Taking these averages as my basis, I find that the special damage to each species of crop in the districts above Raymond Terrace is as follows:—Maize, 3,709 acres, the value of which, allowing 45 bushels to the acre and 2s. 6d. a bushel, is £20,863; potatoes, 686 acres, at 5 tons to the acre, and at £3 a ton, is £10,290; lucerne, 3,964 acres. The damage to this crop is not merely the loss of one cutting, for the roots being in most instances entirely destroyed, the land has to be ploughed up and resown, after which the lucerne is not fit to mow for some months; the farmer therefore loses several cuttings, besides the expense of resowing. I shall not then, I think, be wrong in reckoning the injury as equivalent to the loss of five cuttings, which at the average above mentioned, and at £2 a ton, will be £39,640.

Besides the growing crops, 2,390 tons of stacked hay have been destroyed, which, at an average value of £3 a ton, will amount to £7,170. The damage done to houses and fencing I have estimated to be £3,200; shewing a total of £81,163 for the districts above Raymond Terrace (this does not include the town of West Maitland).

In the districts extending from Raymond Terrace to Tomago, the total area of occupied land under water during the height of the flood was 11,071 acres, of which 4,862 were cultivated. The total value of crops lost is £35,799; of stacked hay, £1,095; and the loss of stock, damage to houses and fencing, is estimated at £529 more, giving a total for these districts of £38,683. The total loss from Oakhampton to Tomago is therefore about £119,846. The loss of live stock has been very trifling, but in the Lower Hunter the destruction of poultry, from which considerable weekly profit was obtained, has been very great. The houses damaged were chiefly slab huts of an inferior description and of slight value.

With reference to the loss of hay, with forms a large item in the total, great neglect has been shown in not providing raised stages; for in many instances, if the hay had been placed on trestles a few feet above the ground it would have been saved, and the increased value would in some measure have compensated for the loss of growing crops.

A considerable portion of the flooded area consists of grazing land, the damage to which it would be difficult to estimate in money; but the grass being destroyed, many of the farmers are put to much expense in buying food for their cattle and horses.

The loss recorded represents only the immediate injury done, as it would be quite impossible to estimate with any degree of accuracy the loss suffered by the farmers through the *souring* of the land, through being compelled to resow or in some instances being obliged to leave their farms unbilled for months until the land becomes sufficiently dry for cultivation, and indeed many having lost their crops have not even the means of buying seed, and therefore the land must remain uncultivated.

I have observed that the "planter's friend" receives little or no injury from the water, and am told that many farmers purpose sowing a few acres next year. If they are successful, no doubt in a few years sugar-growing will be extensively carried on in these districts.

The rent *nominally* paid by tenants, for cultivation land in the Upper Hunter, varies from £1 to £5 an acre; in a few cases more, a fair average would be about £2 5s. On the Lower Hunter a large proportion of the land is not cultivated, but used for grazing, and is let for a lump sum. The average yearly rent is about 17s. an acre. Except in the higher parts of the flooded land, I am informed that after high floods the landlords (with a few exceptions) remit a considerable portion of the yearly rent.

I have not been able to obtain any reliable information as to the number of times that farms in different localities have been flooded since the year 1857. Some of those on low lands are inundated by nearly every *fresh*, whilst others situated on the higher portions are submerged only during extremely high floods, but even in these cases the information to be obtained is vague and uncertain. The farmers generally agree that the floods of 1870 have caused more damage than any previous inundations, owing principally to their occurrence at the time of the year when crops were just fit for harvesting, and from the succession of floods and the length of time over which they spread; for not only have the farmers lost their summer crops, but have been prevented from putting in their winter crops, which I am informed in many cases are the most remunerative.

The returns which I have collected, extending from Oakhampton to Tomago, show the total area of *occupied land* subject to floods to be 26,965 acres, whereas the actual *flooded area* between the same points, calculated from the plan (showing the extent of land inundated), is 47,276 acres, leaving a balance of 20,311 acres of unoccupied land, probably mainly situated in the Hexham Swamps and the swamps at the head of the Wallis' Creek waters.

It will be observed that the accuracy of the information recorded depends upon the truth of the statements made by the farmers; but I have no reason to suppose (except in a few cases) that they have exaggerated their losses; I think therefore, that the above estimate may be taken as tolerably correct.

I have, &c.,  
GEO. E. FAITHFULL,  
Secretary.

[*Report upon a scheme of relieving the channel of the Hunter during floods by a cutting from Oakhampton to Hexham, forwarded to the Commission by A. Dodds, Esq., M.L.A.*]

One of the causes of the flooding of the Hunter is the winding and tortuous character of the channel of that river in its passage from West Maitland to Morpeth; and another and more serious one is the choking up of the passage at the confluence of the Paterson and Williams Rivers. These two rivers are generally in flood and fill the channel before the main body of the Hunter reaches the junction, and the surplus waters are thus dammed up. To avoid the blocking up of the outlet by the meeting of the three rivers, and to provide an extra and practicable run for the surplus waters, one calculated to do the work required effectively is the scheme here proposed.

The route pursued is indicated in the accompanying plan\* of the locality. When the Hunter attains a certain height during flood, a cutting commencing at the bend of the river near Oakhampton, passing along through low lands subject to flood, under the long bridge at West Maitland into the Fishery Creek; thence into Wallis' Creek to Rathluba; at this point a tunnel will be required of say a quarter of mile in length; thence into Quart Pot Creek; thence into the swamps at Hexham; and finally into the Hunter again near Hexham, where the channel is so made that the flood-waters make no perceptible difference in the discharge.

\* Separate Appendix B.

The estimated length is about 10 miles, the cutting to be 100 feet wide, and 6 feet deep, the earth taken from the cutting to be placed along sides, so as to raise the banks that the whole depth may be 10 feet. Such outlet will be sufficient to allow the surplus waters to escape, flowing steadily and without interruption, easing the true channel, and benefiting the low lands through which the cutting passes.

No levels have yet been taken, nor trial sections made, but a rough calculation of the estimated cost is as follows:—Allowing 2s. 6d. per yard cubic for the excavation, there will be in each mile 117,333 cubic yards; or, in round numbers, say 120,000 yards, which at 2s. 6d. will be £15,000 per mile, and for ten miles £150,000.

In this estimate no allowance is made for bridges over roads, but these will be but few. 1st, the Oakhampton Road, a bridge will be required; 2nd, main road to Singleton—here it will pass under the long bridge, requiring no other; 3rd, the railway, a more serious matter; 4th, the Mount Vincent Road—here the channel will be through a tunnel, obviating the necessity for a bridge; 5th, the Maitland and Nowcastle Road, requiring a large bridge; 6th, the railway, again requiring another bridge; but with all these requirements the scheme is the best and cheapest yet submitted to the public, and the trial sections might have the effect of lessening the cost just mentioned—at least the matter is worth a trial.

I have, &c.,  
J. M. MACKAY,  
Council Surveyor,  
Newcastle.

A. Dodds, Esq., M.L.A.

[*Letter from Mr. Creeer to the Commission, on the subject of straightening the Hunter River between West Maitland and Morpeth.*]

To the Hunter River Floods Inquiry Commission.

Gentlemen,

I desire to offer a few additional remarks as evidence on the subject of flood prevention, which have suggested themselves to my mind from the various questions placed before me when giving my former evidence before the Commission. It appeared to me, after my examination, the principal questions involved were,—the effect of any improvements above Morpeth that would tend to shorten and straighten the river, and thus let the flood-waters down quicker on the lands above and below Morpeth, and whether the district is of sufficient importance to justify the cost of such an undertaking.

1st. I would remark that any improvement that will tend to shorten and straighten the river at any particular point, so as to shorten the distance to the sea, will be a benefit to the whole district, both below and above Morpeth.

I will try and demonstrate this by showing the effect of straightening and shortening that part of the river between Maitland and Morpeth, with which I am better acquainted; and if it can be shown that it will have a good effect in this instance, I take it for granted it will have the same good effect on any other part of the river.

The length of the river at present from the Horse-shoe Bend, West Maitland, to the Morpeth punt, as marked on Mr. Moriarty's plan—commencement of first cut—is about 18 miles; and it is admitted, I think, by the Commission, that this distance, by straightening the river, can be reduced to 3 miles. Suppose yourself then to be standing at that point at the Horse-shoe Bend, and you observe the first flood-wave begin to rise, and you throw on the head of the wave a float—how far below Morpeth would the float be, having only 3 miles to travel, instead of travelling 18 miles, as at present, before it reached Morpeth? Would it not naturally be 15 miles below Morpeth, even allowing the 3 miles to be in proportion as crooked as the present 18 miles. Then add to this the increased velocity of the stream, through giving the whole of the fall now in the 18 miles of the most serpentine and crooked river in the Colony into 3 miles of straight running. This then, added to the 15 miles already saved in distance, would I believe send the head of the first flood-wave at least 30 miles below Morpeth in the same time as, under existing circumstances, would be entering Morpeth. Here then is 30 miles of distance from Maitland to the sea, in the length of river, and the beneficial effect of this in preventing floods I think none will deny. Of course the river would require improvement below Morpeth, as far down as Hexham, such as I have already mentioned in my former evidence when before the Commission.

Then again, it has, from observation, always appeared to me that when the river is in flood, that the current or stream of water travels a much greater distance than the usual channel of the river, because of the channel of the river being so very crooked.

When the river is in flood, I have noticed that the timber and debris coming down with the current or stream, instead of following the centre of the channel of the river, keeps travelling in a diagonal course across the river, and bounds from bend to bend, and bank to bank, in its downward course. This is the case more particularly on that part of the river I have been referring to, between Maitland and Morpeth; and thus, in consequence of the channel being so very serpentine and crooked, the progress of the flood waters is very much retarded in its course to the sea; while at the same time the stream, travelling in this diagonal course, adds considerably to the distance it has to travel; so much so, that instead of it having to travel 18 miles, it travels something like 25 or 30 miles.

If all this distance, then, can be reduced to 3 miles of straight running, and all the fall of 18 or 20 miles given to 3 miles, adding to this the increased velocity of the stream—if all this can be established (and I think it can) very much has been done with a view to prevent floods in the Hunter River District.

If the scheme I have already pointed out was adopted, viz., shortening and straightening the river, with these additional suggestions, I conscientiously believe that Maitland, Morpeth, and the lands below Morpeth, would be to a very great extent if not altogether free from floods; because the first flood-wave in the same time it now enters Morpeth would be down very near as far as Hexham, and instead of the river rising to the height it does now in time of floods, simply because the water cannot get away, with the improvements suggested, as the flood waters came down the river would empty them into the sea.

With reference to the cost, you will see how I proposed to raise the money, in the report of a lecture I delivered on this subject, and which I handed to the Commission when giving my former evidence.\*

With reference as to whether the district is of sufficient importance to justify the cost of such an undertaking, I need scarcely say that the importance of the Hunter River District is well known and admitted throughout the Colony; it has for years been the principal source of supply to Sydney, and the revenue derived from its import and export trade with Sydney and the northern districts is larger perhaps than that of any other district in the Colony; so that this district is justly entitled to the favourable considerations of the Government. And it will be obvious to all having the interests of the Colony at large, that any steps that may be taken to prevent floods in this district, and thus confer a direct benefit on this district, will at the same time be conferring a benefit on the Colony at large. I have already pointed out to what extent I think the district ought to contribute; but the Government ought to undertake the work, and I am sure the Hunter River District will do their part. I might, in conclusion, just draw your attention to the losses suffered by the Government by floods in this district, in having, from time to time, large quantities of the railway lines and bridges washed away.

May I therefore express a hope that the Report of the Commission will be of such a character as will point out and show the necessity for the Government to undertake a general scheme of flood prevention for the Hunter River District,—

And remain,

Your humble servant,

JOSEPH CREER.

[*Letters from Mr. Dangar, Singleton, to the Hunter River Flood Commission.*]

Nootsfield, 23 September, 1869.

Sir,

I enclose you, as desired, an epitome of the weather report kept by me since January.

In answer to Mr. Moriarty's question as to the amount of land which might be irrigated, and its value increased thereby, on both sides of the Hunter, from Maitland to Aberdeen, I think about 142,000 acres would be near the thing—averaging the good land at one mile wide.

I might observe that as we have not yet had a simultaneous flood in the Goulburn and Hunter we can only assume that if such occurred the rise would of course be much higher than we have seen it.

I think also that a flood caused by the Goulburn and Cockfighters Creek is quicker in coming down than one from the heads of the Hunter.

I remain,

Yours truly,

W. J. DANGAR.

G. E. Faithfull, Esq.

Rain fell more or less on forty-five days; the greatest fall being on 19th July (2·30), which rose the river considerably.

W. J. DANGAR.

Nootsfield,

\* (*Extract from Report*).—As regards the funds necessary to perform the works he had suggested, he did not pretend to be a financier, but he would give his ideas as to how the money might be procured. An Act of Parliament would have to be obtained forming a River Corporation for the term of ten years, after which period he believed the revenue derived from the navigation of the river would far exceed the expenditure. According to Mr. Moriarty's report 35,000 acres of land were flooded in this district; this, taxed at 2s. per acre, would in ten years yield £35,000. A tax of 5 per cent. on the three towns and house property in the district would bring in another sum of £35,000. If this were supplemented to an equal extent by the Government we should have £140,000, which he believed would exceed the sum required to carry out the improvements he had named, and he believed that in a few years the Government would receive back treble the amount they expended in revenue.

Neotsfield, Singleton, 21 May, 1870.

Dear Sir,

Enclosed is a copy from my book of the rainfall here, from September 1869 to date, as desired by you.

I remain,

Yours truly,

W. J. DANGAR.

Heaviest falls on nights of 17th March and 23rd of April.

Fifteen inches fell from 25th of February to the 21st of March, but did not cause such a flood as the four days in April, and a day and night in May.

Three (3) inches of rain in 12 to 18 hours, if general, would now cause a flood, but four inches in double the time or a little more hardly would I think.

On the 12th and 13th May the Cockfighter was very high, and the rain very general.

W. J. DANGAR.

[Letter from Mr. Fountain to the Commission, on the subject of Floods in the Hunter River.]

Mr. Faithfull,  
Sir,

5 October, 1869.

Seeing a notice in the paper wishing for information respecting the floods in the Hunter River District, I have witnessed too many to my sorrow; I was nearly ruined by them, and I think that it is my duty to give you my opinion, as living at Raymond Terrace upwards of fifteen years, and through industry and hard work saved a little money and took a farm on the junction of the Williams River to the Hunter, Raymond Terrace, and the floods came and swept off our crops. Now my belief is if there was a channel cut, beginning at or near Myers, at Salt Ash—from there through the moors to Morpeth Swamp, Port Stephens—from there to Duckhole Swamp—from there to the Williams River, about a mile above Raymond Terrace—from Williams River through Mr. Scott's Swamp—from there through large swamp above Dummoro Bridge, through the Paterson River, to an elbow in the Hunter, a little above Mrs. Dickson's house—that will relieve all the rivers I think; that would be improving thousands of acres of land that is useless now. At the time of the flood of 1867 my attention was drawn to the coves I thought the water ought to go. I have taken a farm for my son on Bolwarra, and I have been over the ground near which my proposed line runs, and if any one wishes me I would be most happy to point it out to them, as I have got horses at Bolwarra. I think the interest of the Williams River and the Paterson and the Lower Hunter ought to be considered as well as the Maitland; and if that my information and proposed line is taken, that will relieve all the rivers; more than that, it will take the water from Cabbage-tree and Prayden Groves instead of flooding them. I am satisfied that would not take but a very little good land, but be the means of making thousands of acres of swamp land into grazing land; I am fully convinced that it can be done; I gave an essay on it some time ago; I propose a part of it could be done by prison labour, but that I leave to higher power.

I remain yours,  
HENRY FOUNTAIN,  
Market-square, Newcastle.

[Letter from Mr. Scobie to the Commission, on the subject of floods in the Hunter River.]

To the Hunter River Floods Inquiry Commission.  
Gentlemen,

West Maitland, 29 October, 1869.

In accordance with your invitation I venture to address you in reference to floods in the Hunter, with a view to their mitigation. In looking over Mr. Moriarty's able Report on Floods in the Hunter, the third plan mentioned on page 30 does not appear to me to have had the attention bestowed on it that it deserves, as it has several advantages over the other plans suggested. It is the shortest way to Morpeth, it would leave the river at a place where the water in great floods would be several feet higher than at the Horseshoe Bend; it would relieve the river from a point where flood damage begins to be most serious; it would lessen the current in the river at West Maitland, and thereby lessening the destruction of town property along its bank, which the other plans, beginning lower down, would increase, in consequence of the greater rapidity of the stream; its influence would be felt higher up the river, where considerable damage is done, and levées could be made along the course of the river from the first point of overflow, with more safety at least to the place the other plans begin at.

In addressing you now my object is to get a survey and estimate of the cost of a channel by the way I will try to point out, and if after consideration you do not see more serious objections to this than to other plans that may be proposed. The channel I propose should leave the river a little below Graham's on the Durham side, or close to Pearse's house, where the bank is probably about 35 feet above summer level for a short distance only; thence into a lagoon about 600 yards long; then up a gully to the Paterson Road, where the fence on the right hand side going to the Paterson terminates across this road;

road; then down a gully terminating near McFaden's house; from the lagoon to this point is forest land, and some of the cutting would be deep, distance about 900 yards; from McFaden's to the river at Largs, a distance of about 2,100 yards, by a hollow bounded on one side by high forest land, and on the other by cultivation land, with a depth of probably not more than 10 feet above high-tide mark at Largs; then on by the river to near the Largs Ferry; then across a neck of land to near section 16 as marked on plan; then on by the river to Morpeth, a distance altogether of probably less than 4 miles and a half.

If the bottom of this channel on leaving the river was 10 feet above summer level, and of sufficient capacity to carry off say 2 or 3 feet of the extreme height of great floods, then levées could be made with a large degree of safety, for the protection of all property from the point of commencement to above Largs; the river would also require to be widened from Largs downwards, and the material removed in so doing formed into levées for the protection of the adjacent property. In the absence of the necessary knowledge which an accurate survey would supply, I cannot give anything like an approximate idea of the cost of the plan sketched out, but I think it would be less than the others, owing to the less distance to run and the greater height of the water at the entrance; a smaller cut would suffice to carry off the same amount of water than by the more level and longer routs. There would be the cost of bridges, land taken, severance, &c., which would be items in any plan of canals, but probably less by this than any other plan yet proposed. All levées or banks exposed to currents should have a very gentle slope, say 1 in 3 or 4, and be well grassed with small couch grass, and seeping water would not be permanent from the beginning to Largs, most of it, channel and levées included, would be excellent grazing land.

Some objections can be urged against this plan and likely any other that can be proposed. It may be said that the stream would be so rapid that it could not be controlled, and that it would be do much damage to the banks at its outfall in the river; but I would ask your attention to a stream somewhat similar in very high flood, which does little damage in its course if we except the railway, which was built across it; I refer to the overflow from Wallis' Creek through East Maitland, and on into the river just above Morpeth, augmented in its course by overflows from the river. I have reason to believe that this stream in some conditions of floods is equal in volume to all the overflow over the West Maitland side of the river, including also Wallis' Creek. These conditions are when floods are of long duration, at or about their greatest height, the back hollows then become full, and the whole of the overflow upwards escapes by the way mentioned. Mr. Alexr. Wilkinson, who has had perhaps more boating experience during floods than any one else here, states this in great floods to be the most rapid stream about Maitland, still we see no tearing up of the soil in its channel.

Then again it may be said that it will precipitate the water in much greater quantities than would otherwise take place on to the lands about Morpeth. Now, if the object is to prevent the flooding of the lands, and the whole of the water is to be conveyed to the sea, it is for you gentlemen to say what the difference will be, if say two-thirds is conveyed by one channel and one-third by another, or if the whole be conveyed by one.

But putting aside all other considerations, there is one of great weight in reference to the flooding of Morpeth, which is, in these floods which are most dreaded, those of great height and long continuance, when all the hollows upwards are filled, and the whole flood-waters are rolling on to the sea, I say no contrivance of canals upwards could make Morpeth worse.

The protection of the country from Morpeth downwards will have to be accomplished principally by dredging and levées. Levées would not require to be of great height downwards, and ought to be of great use in giving scouring action to flood waters, and help both the navigation and discharging power of the river. Those living down the river object to those above them using means for their protection, while it is as open for those down as for those up to protect themselves. Now floods are destructive to both lives and property, and all should be able to make use of the river in sending flood-waters by it, and thereby protect themselves. We are something like a community living in a country frequented with tigers, where nobody would be allowed to put up protections for their stock or shut their door to save themselves, for fear by so doing the tiger might go further and take some bodies, or somebody else.

I think the discharging capacity of the navigable part of the river is very much under-estimated as compared with the discharging capacity say at Singleton Bridge, where there is a large escape of water at the back of the town and down by Neotsfield; the discharge is not so great at below Windeyer's Island after having received the Paterson and Williams according to the report, while I have tried to show that the full height of the Hunter's flood passes on to the sea in some conditions of floods, and about the conditions that the report professes the discharges to have been taken. When I was examined before the Commission at Maitland, a great deal of weight was attached to the fact that a considerable diminution of fall takes place from Oakhampton downwards; now, while I think that a drawback, I do not think it is so to the same extent where there is constantly deep water in the channel as where it is shallow; where water is deep it does not require so much fall to enable it to discharge at the same rate as if shallow. I will now take the liberty of copying part of an article on rivers from the *Oxford Encyclopedia* which seems in harmony with what we observe. Speaking of the velocities of flowing waters, it states—“That their velocities depends much more on the quantity and depth of the water, and on the compression of the upper waters on the lower, than on the declivity of the bed; consequently, whenever the bed of a river or canal is to be dug, the declivity must not be distributed equally throughout the whole length, but, to give a swifter current to the water, the declivity must be much greater in the beginning of its course than towards its end, where the declivity must be almost insensible, as is the case in all natural rivers; for when they approach the sea their declivity is little or nothing, yet they flow with a rapidity so much the greater as they contain a greater volume of water; so that in great rivers, although a large extent of their bed next the sea should be absolutely horizontal, yet their waters do not cease to flow, and to flow even with greater rapidity, both from the impulsion of the back waters, and from the compression of the upper waters on the lower in the same section.”

I am, &c.,

ROBERT SCOBIE.

P.S.—Sufficient stone would have to be passed through to regulate the quantity of water thought desirable to pass by the proposed channel. Excuse errors, as I am more accustomed to farming than writing.—R.S.

[*Letter from Mr. Shaw to the Commission, on the subject of cutting a canal from Raymond Terrace to Port Stephens.*]

To the Flood Committee,  
Gentlemen,

Raymond Terrace,  
4 April, 1870.

Having been a resident at Raymond Terrace for upwards of twenty years, I trust I may be pardoned for submitting a plan I think feasible for easing the Rivers Hunter and Williams in time of flood, the cost of which would not be very large when compared with other projects propounded. The Lower Hunter has but little to fear excepting when the Williams is in flood, and comes down at same time—when both rivers meeting at right angles, both tend to keep each other up, consequently, the low lands get flooded. My proposal is to cut a canal at the Terrace, through a gap at the back of the town, between Muree and the Quarry Hill, and so reach the sea at Port Stephens, *via* Tillegary Creek, which creek is very wide and salt water—the distance being about 9 miles; whereas the water has now to flow 21 miles to Newcastle before it can relieve itself. The country on the other side of the Quarry Hill is very low and swampy—of no value whatever, consisting of boggy sandy soil, unlocated, and during winter mostly under water. The cuttings would be very slight, not averaging above 8 feet cutting excepting at the Terrace, where the gap would be about 30 feet deep. Nature seems to point out the course, as all the waters on the other side of the Grahamstown Swamp fall eastward.

I have subjoined a rough sketch\* of the course I propose on the other side.

Apologizing for thus long intruding,  
I have, &c.,

W. B. SHAW.

\* Separate  
Appendix A.

[*Appendix to Mr. E. O. Middleton's evidence, read before the Commission, April 11th, 1870.*]

The subject of preventing by artificial means the recurrence of such floods as have lately devastated the Hunter River District has been so often written upon, and so many theories have been propounded, that it will help to explain what my own views are if I first offer objections to those of others.

One favourite idea is that by cutting a canal in this or that place, so as to make the run of the water as short as possible, it would get away more quickly, prevent accumulation, and consequent flood. This is a very plausible theory, but I think in practice would be found entirely futile for the intended purpose. There are places where by making one or more inlets from the

the river to the low-lying portions of the area which eventually receives the overflow waters of the river, that would be benefited by so doing, but at the expense of those upon whose lands such waters would be discharged, but in some instances the effect would be most disastrous.

It has been urged that a canal from the Hunter near Bolwarra House, running through the low-lying portions of that estate, and again communicating with the river below the township of Largs, would act beneficially. So it would at times, to those above and about the point of divergence, but what would be the effect upon those lands favoured with the premature visitation? I will try to point out. By those who have carefully considered the question it will have been seen that there are numerous depressions in the banks of the river, where the rising waters find means of escape from the river channel, the natural tendency being to diffuse it as widely as possible. Hall's and Wallis' Creeks are notable examples of these channels of escape for the waters of the river channel, and the receptacle for them is the vast area at the back of West Maitland. Now to close these two places—part of the Bolwarra canal plan—and cast the additional burden of reception upon Bolwarra, would ruin it as an estate, and Dunmore, Phoenix Park, and adjacent lands, would share in the desolation involved. I am led to these conclusions from the consideration of many facts—among them that while in West Maitland during last flood the maximum of elevation was 30 feet, it was but 15 in Morpeth, and as the distance in a direct line is less than 4 miles, and as it takes several days to attain the greatest elevation, it is clear that the creeks and inlets named, with numerous others of less moment, form safety-valves for the whole district below them.

The temptation to close these places is however ever before the eyes of those who live on the West Maitland side of the river, inasmuch as it is doubtless quite possible by so doing, aided by embankments of no great magnitude on the river bank, to prevent any but high flood water reaching the huge natural receptacle alluded to at the back of West Maitland, and very considerable benefit would be the result to a large section of the community, but it would operate most injuriously to a much larger section, and consequently such propositions are naturally dreaded by those likely to suffer.

To make any inlet from the river is to bring about at once there what might not otherwise arise—a flood; and to close any natural one is to add to the evil elsewhere.

What then is to be done? Is there any means of preventing these visitations? I assert most unhesitatingly there is not any, unless a new channel is sought to the right or left of the present space which conveys the whole body of the water, in flood time, of the Hunter and its tributaries. It is to me quite evident that that space is too limited to admit of any engineering operations which would prove successful, and I will offer the following fact as a proof:—When the whole extent of surface comprised within the high land on the right bank of the Hunter at Morpeth, and the high land opposite on the left bank of the Paterson River at Bowthorne, more than two miles in width, is covered, and with an average depth last flood (June 1867) of probably 8 feet, in many places 12 feet deep, with the channels of both rivers included, flowing with a depth of about 25 feet, it was still insufficient, for the water still rose, and rose long after every spot of earth was covered; and this is the narrowest part which can be found above Hinton, from the point of contact of the waters of the two rivers.

[*Letters from Mr. Wyndham to the Hunter River Flood Commission.*]

Dalwood, 14 April, 1870.

My dear Sir,

I send you some extracts (in two envelopes) from my record of rainfalls and floods. I fear our low-living friends must be content to be visited by water in rainy times. The remedy most in favour about here is to get upon high ground.

My dear Sir,

Truly yours,

GEORGE WYNDHAM.

1856.

1st November about—We had a week's rain, which filled my lagoon, having been dry for years, and washed away the Lochinvar low-level Bridge. The fresh in the river was about 17 feet deep.

28th December to 31st—Heavy rain.

1857.

Jan.—A deal of rain.

Feb.—Very wet.

March—Wet. River always in strong fresh.

April—A week's rain. My creek poured a mill stream to the river for ten days. About this time the *Mercury* came out with an article assuring the low-livers down there that there was no fear of a flood. "Floods were once, no doubt—Troy was for that matter, but never would be again. Mr. Surveyor White was a very respectable gentleman, but he was not the only oracle—there were others, and they sang in a very different key."

June 18—My flat under water; river's maximum, 37 feet.

July 27—Heavy rain; at Parramatta there fell six inches in the two days.

" 28—My creek a great stream—up to the bridge. We drive the milkers across to this side—they swam it.

" 29—Flat under water at sunrise; rose slowly all day.

" 30—Still rising.

" 31—At sunrise had fallen 4 inches; maximum attained, 42 feet.

August 20—Light rain; became heavy at night.

" 21—Heavy rain; creek full bore; river backing up fast; at noon reaches 37 feet; at 2-30 43 feet—rising fast.

canoe. " 22—At sunrise about 50 feet; remains at that till noon; all p.m. rising; we get off Bevis and family in the

" 23—At sunrise 56-4; keeps at that till noon, when it had certainly turned.

" 24—River falling.

" 25—Sunrise, 36 feet, and before nightfall was within the creek; and so ended the river's comment No. 3 upon the *Mercury's* assuring article.

I had not set up a rain-gauge in these days.

At Aberdeen the river was not more than 7 or 8 feet deep; our John crossed it July 11. The Goulburn lower than that, or quite fordable (so we heard.) In August, 1857, there was a great fall of snow, about Mount Royal and Krauni, before August 20; so when the rain began on that day the rainfall and the melting snow all flowed away together. Happily for Maitland, the Mt. Royal waters *via* the Paterson and Allyn had got to the sea before those by Musselbrook got to Hinton, so these last, the channel being unoccupied, could pass on.

1864.

Feb. 11—Creek runs full bore.

p.m.—River is backing up creek.

Feb. 12—River reaches 42 feet; Feb. 13, 46 feet.

May 1 and 2 our creek a full stream.

June 4—River 32 feet at my ford.

12— 30 "

13— 35-6 "

15—The maximum 42-6 feet at my ford.

Then fine weather till July 12.

July 15—Our creek runs full bore.

Wind N.E. and very warm. Our full casks in the cellar drip with condensed moisture.

July 16—S. gale arose; river 35 feet.

17— 35 "

being 2 feet higher than flood of '40.

August 7 and 8—

9—Our creek runs strong.

11—River backing up the creek.

12—River 35 feet; exactly equals flood of last month. So a flood 2 feet higher than the flood of

1840 may be caused by 4 inches of rain, the creeks being full, *i.e.*, the waterholes.

The flood of '67 was caused by the Wollombi, Falbrook, Glendonbrook, Black Creek, &c.; the Hunter Upper and the Goulburn had little to do with it; the creeks hereabouts were very high, and they getting down to the tidal part of the river, already occupied by the Paterson, could not escape, except by the safety-valve, Wallis Creek and those lagoons. Any canal dug down there would be usurped by the Paterson, so would relieve Maitland sometimes—sometimes not.

Dalwood, 6 May, 1870.

My dear Sir,

I sent you some time ago two envelopes full of papers with flood-heights, &c. (ten penn'orth of postage, so I hope you received them). I now send you some heights of the last.

Our good Parson Glennie has lately published in the *Singleton Times* (has been copied by the *Mercury*) extract of a letter from his brother, James Glennie, who witnessed the flood of '26 at Glendon—the flood which I have no doubt, deposited "my drift-stuff." The letter states that he went across to Mr. Dangar's cottage (still in existence), and was shown the height the flood attained to; and Mr. Dangar showed him drift-stuff so many feet higher. I forget the figure, 9, 10, 12; but it is plain that the floods we have seen are mere babies. No doubt "competent engineering skill" and money enough might save Maitland, M. de Lesseps, and ten millions sterling; but practically the only way to save Maitland is to remove it to higher ground.

My dear Sir,  
 Truly yours,  
 GEO. WYNDHAM.

Rainfall of May	7.73		

NOTE.—It is important that the small rainfall of April last be distinctly set forth, for it shows how little rain, when the earth is previously well soaked, will produce a high flood—the highest in fact that I ever saw.

Floods, and Singleton Bridge.

My dear Sir,

In the higher floods all the water of the river does not pass under the Singleton Bridge; a portion of it escapes over a low place at Glenridding, a mile or two above the bridge on the right bank, and finds its way into Munimba Brook, in front of Larnach's house, and so to the river again,—a fair 5 miles from where it broke over. Now I think by a little artifice, and without a navy, the river could be coaxed into making for itself an *ana-branch* at this place.

The *modus operandi*:—First get possession of the suitable strip of land, and let it out to husbandmen, who should plough deep; it is all good maize land. In ordinary seasons they could grow fine crops; and whenever a flood came, away would go the surface-soil. Repetitions of the process might be expected to form an *ana-branch*, and that fine bridge (most important to the district) be placed in comparative safety.

The embankment by which the bridge is approached adds very much to the danger of the bridge, by diminishing the waterway; however, it is an element of safety to the town, and will help in the formation of our *ana-branch*, which last would help the town as well as the bridge—and Singleton is in quite as much danger as Maitland is. The *habitans* do not cry out, because they don't wish to call attention to the danger of the building allotments which they have for sale.

*An ana-branch for Maitland.*

Might not a similar process be set agoing through Bolwarra, &c.? No doubt "Maitland should be saved, and the High-street through it," if it can be; but your navy is a costly gentleman—as little of him as possible. If we could so direct his labour that he should give the river a right direction perhaps Maitland, &c.; otherwise, we may fear the exchequer will fail, and Maitland find itself in the position of many a town on the Indus, *i.e.*, on the contrary side to what it used to be.

Perhaps no evidence as to our highest floods has reached you officially. It is to be had I am sure, provided it were set about cannily. Meanwhile, will you think of the ana-branches?

E. O. Moriarty, Esq.

My dear Sir,

Very truly yours,

GEO. WYNDHAM.

Dalwood, May 23, 1870.

My dear Sir,

Your being Engineer-in-Chief of Rivers must be my apology for troubling you with these most unofficial thoughts. I suspect the authorities are not aware of the trial the Singleton Bridge may be put to—that is, a stream quite 10 feet higher than flood of April last, and that would bring the drift-stuff against the horizontal beams of the bridge, giving a lifting power and a pushing power that the architect did not count upon. The country is full of water—every valley has a trickle running down it. 12 hours' fast rain would leave the valley a wreck.

[*Letter from the Under Secretary for Public Works to the Commission, enclosing copy of a letter from Mr. E. C. Close, protesting against any alteration being made in the course of the Hunter River.*]

Department of Public Works,  
Sydney, 31 May, 1870.

Sir,

I am directed by the Honorable the Secretary for Public Works to enclose herein a copy of a letter from Mr. E. C. Close, protesting against any alteration being made in the course of the Hunter River.

The Secretary to the  
Floods Prevention Committee.

I have, &c.,  
JOHN RAJE.

Mr. E. C. Close to the Colonial Secretary.

Ellalong, 14 May, 1870.

Sir,

Owing to the constant recurrence of floods on the Hunter during the present year, I am aware that great pressure is being brought to bear on the Government by the people of W. Maitland, in order if possible to promote flood prevention there. I acknowledge that in that locality a large population is settled, and that therefore any requirement emanating from them should receive consideration; yet, while I so far admit their claim, and sympathize with them in their calamity, the public are still aware that none of those persons locating themselves on the site of that township were ignorant of its liability to be flooded, but that they settled there with their eyes open, while there were many situations for building purposes safer open to them.

I am also aware proposals are being made wherein straightening the course of the river is advocated, and many are desirous of imposing a tax on the whole Hunter District in order to effect it. Now, as I possess valuable property in a direct line between W. Maitland and Morpeth, and as the proposed straightening tends in that direction, I emphatically protest against any measure which will allow any cutting to be made through it; and I also beg of the Government not to tolerate any proposal which will impose an unjust tax, and a destruction of property on any individual for the benefit of those who have erected, and may still voluntarily erect, dwellings and business premises in a spot well known to be subject to inundation.

I should not so strongly object, had I the smallest hope that the district generally, and Maitland in particular, would benefit by such a process as straightening the river from thence to Morpeth, but from my personal knowledge of the force and volume of the current, I feel justified in saying that two rivers of the size of the Hunter would prove ineffectual in carrying off the superabundant waters in time of flood, were their courses straight from W. Maitland to Nobby's.

If the people of W. Maitland were desirous of building embankments for the protection of their town, and submitting to local taxation for them, then there would be something self-assisting, useful, and independent in their purpose; but the desire with some that the whole Hunter District should be taxed for the protection of W. Maitland would, in my opinion, be both imprudent and unworthy.

I know of no other means of protecting myself than addressing you, and therefore beg of you to place on record this my protest against any interference with the natural course of the river, as well as my protest against any taxation consequent thereon. In objecting I feel satisfied my sentiments will be indorsed by every landholder and owner below Morpeth, on either bank of the Hunter; and further, I need not tell you that if the course of the river is left intact, it will prove a safeguard; interfere with it, and there is no knowing what evils may be the result, and what compensation may be required to compensate.

I have, &c.,  
E. C. CLOSE.

Tilmouth F. Dye, Esq., to G. E. Faithfull, Esq.

Australasian Steam Navigation Company,  
Morpeth, 22 June, 1870.

My dear Sir,

Herewith I beg to hand you Register of Flood in April and May last, taken at the Company's Wharf. I regret I should have been so long sending it, but in the first place having been very busy I forgot all about it, and after receiving your note I could not possibly attend to it just then.

Yours very truly,  
TILMOUTH F. DYE.

TILMOUTH F. DYE.

\* NOTE.—High-water at Morpeth is 47.62 feet above the datum referred to in the plans accompanying the Report.—G. E. F.

[Memo. from Mr. John Wyndham to the Hunter River Flood Commission.]

FLOODS IN THE HUNTER RIVER.

1. It is a fact that the flood of 1826 was higher than is stated by the *Maitland Mercury*. (See the tabular list printed with the heights given by my father, Mr. Wyndham, senior.)
2. Mr. G. B. White witnessed this flood, and marked the height of the water on the hill at East Maitland, near Mr. Day's old house, and he stated to me that this fact is recorded in his old journal, &c.; and I understand that his evidence some time ago was that the 1826 flood was 11 perpendicular feet higher than the highest 1857 flood, i.e., about 10 feet higher than the great flood of April, 1870. Mr. White stated to me that in 1826 there were six consecutive days' heavy rain such as he has never before or since seen during his residence in this Colony.
3. J. Crane witnessed the flood of 1826; he was at Corinda at the time, and saw the waters at Maitland also. He stated to the Rev. Mr. Glennie, of Lochinvar, the other day, that the flood-waters very nearly met across the Great Northern Road (then a track) at the dip in Campbell's Hill, where Turner and King's Tannery now stands.

4. At Maitland agricultural meeting this month, Mr. Carmichael stated to Mr. Nowlan, M.L.A., Mr. Keene, myself and others, that there is an old man now residing up on the Williams River who also witnessed the 1826 flood at Raymond Terrace, and that he states that the flood-waters were high up on the hill where Holdstock's public-house now stands, that the ground where this inn now stands was all under water; and Mr. Keene then said that at that rate his cottage at Raymond Terrace would be entirely under water. (I believe 1857 flood was only 2 feet deep in this cottage.)

5. Lastly, at this place Dalwood, the levels taken in 1831, by Mr. Wyndham, senior, of fresh drift in a tree, evidently of 1826 flood, and this is some 7 or 8 feet higher than any flood since seen. There is also other evidence given of the great height of 1826 flood,\* but this is not all, for there is evidence of another of still greater magnitude.

6. The late Mr. Cunningham, botanist, &c., camped upon the East Maitland Hill in the year 1819 (where Mr. G. B. White afterwards camped in 1826), and witnessed a most terrible flood. He told Mr. White it was far above the 1826 flood, when they were speaking together about it; now we may gather the terrible height of this flood from marks found at other places.

7. Old Mr. Singleton, when he came over from the Hawkesbury, about the year 1819, and before 1826, settled upon Patrick's Plains (now Singleton), and he found fresh drift, logs, &c., up a tree, in the hollow near where Halstead's old inn now stands; and he measured, and found the drift 16 (sixteen) feet above the ground. Young Mr. Singleton told Dr. Glennie and others this as a fact, when taking refuge on Flowerbank Hill, in the high flood of 1857. Arthur Glennie, now at Australian Joint Stock Bank, Newcastle, and others, were present and heard this stated. I was at Flowerbank immediately after this flood in 1857, and hearing this report at once measured the marks in this hollow, about Halstead's (also Holcombe's) old inn, and found that the water did not exceed 18 to 20 inches in depth anywhere, say 2 feet, and this would make the 1819 flood full 14 feet higher than the highest flood of 1857.

8. Many old residents—the late Mr. Larnach of Rosemount for one, and I believe old Mr. Howe and others—have been heard to say that when they came to Singleton there were drift and flood marks round the trees on the tops of both M'Dougall's and Howe's Hills at Singleton, as if the water had been several feet over the highest part of both of them, and see Mr. James Glennie's letter also, the log shown to him by Mr. Dangar at Scotsfield, 11 feet above 1826 flood.

9. The old blacks also bore the same testimony, and it is well known that some of the old blacks of Singleton have stated that they were camped upon these two hills (part of the tribe on each), and that they had to take refuge up the trees on the top of these hills, and that they had to remain in the trees for several days. This was before the white man came there.

10. The blacks also told the late Mr. Robt. Scott and others, that before the white man came they saw a terrible flood that ran over all the river banks, and the high terrace on which Glendon House and stables were built, and that there was only a small little spot out of water. The river drift sand in front of the old stable at Glendon is a witness and further proof of this.

11. Lower down the river, near Corinda, was a drift log up in a large dead gum-tree, which Mr. Bell, M.L.A., tells of, and he says this drift he is sure was about 15 feet above the highest 1857 flood. We have lately looked for this drift-log and tree, but it appears to have been long since burnt down and destroyed, which is unfortunate.

12. The river-marks at Dalwood, at the back of our tenants' farms (Campbell's and Russell's), show that the river has run strong over the high terrace there and down the hollow, within the last sixty years, to all appearance, judging from the age of the trees that must have been bent when saplings.

13. Lastly, there is the blacks' testimony that before the white man came, or thereabouts, there was a terrible flood at Maitland, which drowned all the kangaroos and emus that had been shut in upon the high ground where Wolfe & Gorrick's, and Owen & Beckett's stores are built; and this is evidence that the waters must have been 3 or 4 feet deep at this spot at least, for both kangaroos and emus can still manage to move about in water 2 or 3 feet deep. The very cuts through the high land at back of Baldwin's cottage, near the railway station at Elgin-street, show a deposit or several deposits of alluvial upon the top of the highest point of this hitherto considered dry ridge at Maitland, and such deposits are seldom made except where there are many feet of flood water.

14. I would suggest that before the Commissioners' Report is sent in, that it would be well to try and see old Mr. White, the man Mr. Carmichael mentions, and also that pains be taken to get Mr. Singleton's evidence, and Crauc's evidence, that the Flood Commission may have the benefit of their actual testimony.

JOHN WYNDHAM.

Dalwood, 15th June, 1870.

The Rev. Alfred Glennie to The President.

The Parsonage, Lochinvar,  
26 July, 1870.

Sir,

At the request of Mr. John Wyndham, I beg to send you a few particulars of the Hunter River flood of 1826, which I have gathered from three persons who were eye-witnesses of that great flood.

(1.) The first is the testimony of my brother James (now in Queensland), who was then living at Dulwich, on Falbrook, about 8 miles beyond Singleton. In the month of March last I wrote to ask him if he could give me any particulars, from recollection, of that flood. On the 17th April he wrote to me in reply, as follows:—

"I do not recollect much about the great flood of 1826. I was at Glendon at the time. The ground the cottage stood on, and along as far as the terrace cottage, and the garden and stables, was an island. Corinda, and all the country on the other side, was under water; and after I got away, and went over to Mr. Dangar's, I found the water had been up to the verandah of the hut Mr. William Dangar lived in, and had been all round it; and Mr. Dangar showed me drift wood in a gum-tree in front of his door 11 feet higher than the water had been then. The water was all over Singleton, and the people living there moved off to Mr. A. M'Dougall's hill."

(2.) In reply to a similar inquiry I made of Mr. Helonus Scott, Police Magistrate of Newcastle, he kindly gave me the following information, in a letter dated the 20th May last:—

"The first thing we observed about the floods, and which I recollect distinctly, was seeing, on the first year of our arrival, drift from the river on a small tree 15 to 20 feet high, lodged between the branch and the stem; and I have never seen the flood to the butt of that tree, say within 5 to 6 feet. This was perhaps in a flood in '19 or '20. The drift consisted of dried reeds, leaves, and the roots of a rush, when cut resembling coarse cork. The wind soon carried this drift away. The flood must of course have been higher than the fork of the tree, and probably 20 to 25 feet higher than any flood I have seen. I do not recollect much of the flood of 1826, but I think your brother James' account to be correct, except that Glendon homestead was not an island, but a point; the river forming a boundary, and on the other side the Wattle-ponds extending far up."

I may here mention that I believe the Messrs. Scott settled at Glendon about the year 1822.

(3.) My third informant is Mr. John Crane, a settler now residing on what is commonly termed "the old line of road," near Black Creek. He also was an eye-witness of the flood of 1826, at Maitland. On Wednesday last, the 20th instant, he repeated to me what he had told me on a former occasion, namely, that at the dip in the road on Campbell's Hill, where Turner and King's tannery now stands, the flood-waters nearly met across the road. On asking him what I was to understand by this word *nearly*, he replied that the distance from the road to the water on either side was about the width of the road itself, thus making the whole distance between the waters equal to about three times the breadth of the road. He said, moreover, that if he were on the spot he could point out, within a foot or two, the exact height to which the waters rose.

I am, &c.,  
ALFRED GLENNIE.

\* Bell's drift log in a tree near Corinda, &c.  
† MEMO.—My father believes that the flood of 1819 was fully 18 feet higher than the highest flood of April, 1870; i.e.—in 1870, river at Dalwood ford 58 feet; add 18 feet for 1819; total, 76 feet.

J. Eckford, senr., Esq., to The Secretary to the Flood Commission.

East Maitland,  
12 August, 1870.

Sir,

Mr. John Eckford desires me to acknowledge the receipt of your letter of 9th instant, and to convey to you his replies to your questions contained therein.

1st. Were you residing at Maitland during the flood of 1826? Yes.

2nd. If so, was it a very high flood? Not so high by some feet as the flood of 1820.

3rd. What was the difference in height between the flood of 1820 and that of 1826—say at the Angel Inn, or Victoria Bridge? Have no mark to enable me to state with exactness the difference in height, but that the one of 1820 was the higher of the two I am quite certain. The height of the water, in 1820, at the Angel Inn was up to the back door; at the Victoria Bridge the water, in 1820, was 10 feet over the ground on the spot where Mr. Cliff's house now stands.

Trusting the above replies will be intelligible to you,—

I remain, dear Sir,  
(For JOHN ECKFORD, senr.),  
JOHN LEE.

## EXPLORATION OF WELLINGTON CAVES.

### No. 1.

PROFESSOR OWEN, F.R.S., to THE COLONIAL SECRETARY.

London British Museum,  
23 February, 1867.

SIR,

The enlarged and liberal views of your Administration embolden me to suggest that a careful and systematic exploration of the limestone caves of Wellington Valley, discovered by the Colonial Surveyor in or about 1832, would be a work worthy of your encouragement.

The fossil remains which were then obtained from the caves revealed the important and suggestive fact that the marsupial type of structure prevailed in the ancient and extinct, as in the existing quadrupeds of Australia. Besides the great accession of such evidences as would accrue to the Museum at Sydney from such exploration, most instructive evidence may be expected, bearing upon the antiquity and origin of the aboriginal races of Australia.

Such contribution to human knowledge, initiated and supported by New South Wales, would be gratefully appreciated by all who, in this hemisphere, are devoted to the progress of science, and would redound to the honor of your present Constitutional Government.

I would willingly devote time to the determination and description of such specimens or duplicates as, so acquired, might be transmitted to me for that purpose, or be liberally sent for deposition in the British Museum; and these descriptions would be punctually transmitted to the Museum at Sydney, as materials of its catalogue, or to such address as you might please to indicate in reference to a systematic description of the Wellington Valley Bone Caves.

I feel confident, from personal conference on the subject with the late Sir Thomas Mitchell—who confided to me the fossils he was able to bring over for description in his work, published in 1838—that the results of the proposed exploration, in the hands of one qualified, would amply repay a grant, say of £200 or £300, if placed on the Estimates and sanctioned by the Assembly.

I have, &c.,

RICHARD OWEN, F.R.S.

### No. 2.

THE COLONIAL SECRETARY to PROFESSOR OWEN, F.R.S.

Colonial Secretary's Office,  
Sydney, New South Wales,  
16 June, 1869.

SIR,

With reference to your letter of the 23rd February, 1867, recommending that the Government of this Colony should cause a careful and systematic exploration to be made of the limestone caves of Wellington Valley, I have now the honor to inform you that the sum of £200 has been voted by the local Parliament for carrying out your suggestion, and that the Curator of the Australian Museum has been charged with the duty of making the necessary exploration.

I have, &c.,

JOHN ROBERTSON.

### No. 3.

THE PRINCIPAL UNDER SECRETARY to THE TRUSTEES OF THE AUSTRALIAN MUSEUM.

Colonial Secretary's Office,  
Sydney, 16 June, 1869.

GENTLEMEN,

In transmitting to you the accompanying copy of a letter from Professor Owen, recommending that the Government of this Colony should cause a careful and systematic exploration to be made of the limestone caves of Wellington Valley, I am directed to inform you that the sum of £200 has been voted by Parliament for that purpose, and that the Colonial Secretary approves of the duty being entrusted to the Curator of the Australian Museum, and to request that you will be good enough to instruct Mr. Krefft accordingly.

2. In carrying out the suggestion of Professor Owen, due care should of course be taken that the interests of the institution under your charge, in respect to obtaining fossil remains, &c., are not lost sight of.

I have, &c.,

HENRY HALLORAN.

No. 4.

THE CURATOR AND SECRETARY OF THE AUSTRALIAN MUSEUM TO THE PRINCIPAL UNDER SECRETARY.

Australian Museum,  
Sydney, 4 July, 1869.

SIR,

I have the honor to acknowledge the receipt of your letter of the 16th June, transmitting copy of a letter from Professor Owen, recommending the exploration of the Wellington Caves, and informing the Board that the sum of £200 has been voted by Parliament for that purpose, and that the Colonial Secretary approves of the duty being entrusted to the Curator of the Australian Museum.

In reply, I am directed by the Trustees to inform you that the Trustees will give the necessary instructions to Mr. Krefft to carry out a systematic exploration of the Wellington Valley Caves.

I have, &c.,  
GERARD KREFFT,  
Curator and Secretary.

No. 5.

THE CURATOR AND SECRETARY OF THE AUSTRALIAN MUSEUM TO THE COLONIAL SECRETARY.

Australian Museum,  
Sydney, 16 August, 1869.

SIR,

I have the honor to apply on behalf of the Board of Trustees for permission to include the Rev. W. B. Clarke and Dr. Thomson (if either or both can make it convenient) to join the expedition to the Wellington Caves, for which as you inform the Board a sum of £200 has been voted by Parliament. I beg to refer you to your letter dated June 16th, and to my reply, by direction of the Board, of July 4th, 1869.

I have, &c.,  
GERARD KREFFT,  
Curator and Secretary.

No. 6.

THE PRINCIPAL UNDER SECRETARY TO THE CURATOR AND SECRETARY OF THE AUSTRALIAN MUSEUM.

Sydney, 25 August, 1869.

SIR,

Having laid before the Colonial Secretary your letter of the 16th instant, applying on behalf of the Trustees of the Australian Museum for permission to include the Rev. W. B. Clarke, Dr. Thomson, or both, if they can make it convenient, in the expedition to explore the caves of Wellington Valley, I am directed to state that Mr. Robertson approves of one or both of the abovenamed gentlemen accompanying you; but it must be understood that no more money must be expended than that voted by the Legislature for the above purpose.

I have, &c.,  
HENRY HALLORAN.

No. 7.

[Extract.]

THE CURATOR AND SECRETARY OF THE AUSTRALIAN MUSEUM TO THE PRINCIPAL UNDER SECRETARY.

Australian Museum,  
Sydney, 3 September, 1869.

SIR,

I have the honor to acknowledge the receipt of your letter of the 25th August, informing the Board of Trustees that the Honorable the Colonial Secretary has granted permission to include the Rev. W. B. Clarke and Dr. Thomson in the expedition to explore the caves at Wellington Valley, with the understanding that no more money must be expended than that voted by the Legislature for the above purpose.

In reply, I am directed to inform you that the sub-committee appointed to consider the exploration of the caves have brought up their report, which has been adopted by the Trustees, and Mr. Krefft and Dr. A. M. Thomson, accompanied by one of the skilled workmen of the Museum, will start as soon as the necessary funds are available.

The instructions given in a former letter (June 16th), "That in carrying out the suggestion of Professor Owen due care should be taken that the interests of the institution under the charge of the Trustees, in respect to obtaining fossil remains, &c., are not lost sight of," will be carried out, and all specimens collected are to be deposited in the Australian Museum.

Curator and Secretary.

No. 8.

No. 8.

PROFESSOR OWEN, F.R.S., to THE COLONIAL SECRETARY.

British Museum, London,  
18 August, 1869.

SIR,

I have the honor to acknowledge the reception of your letter of the 16th June, 1869, informing me that the sum of £200 has been voted by the Local Parliament for carrying out the exploration of the limestone caves of Wellington Valley, and to express my deep sense of the honor done to me by the favorable consideration which the Parliament has been pleased to give to my letter on that subject of the 23rd February, 1867. The successful fulfilment of its aim may be confidently expected, from the fact that the experienced Curator of the Australian Museum has been charged with the duty of making the necessary explorations.

I beg to repeat my pledge to give immediate attention to the study and description of whatever specimens may be transmitted to me, either temporarily, or with a view to being returned, named, to the Australian Museum, or as duplicates to be deposited in the British Museum. I may be permitted to add, that I regard this vote as of more importance to the advancement of science than the greatest success in its immediate application, in its relation, namely, as a precedent and example of a recognition by a Parliament of the value of abstract truth irrespective of direct application to material profit.

I have, &amp;c.,

RICHARD OWEN.

No. 9.

THE CURATOR AND SECRETARY OF THE AUSTRALIAN MUSEUM to THE COLONIAL SECRETARY.

Australian Museum,  
Sydney, 4 November, 1869.

SIR,

I have the honor to transmit to you, by direction of the Trustees of the Australian Museum, a copy of the Curator's report of the examination of the caves at Wellington Valley, accompanied by a series of photographs, forty-four in number, representing the most interesting of the remains discovered.

I am also directed to inform you that a trustworthy person is still at work at the caves, and that some very valuable specimens have been received during the last few weeks.

A full report, illustrated by lithographic plates, will be prepared and submitted to you as soon as all the specimens have been thoroughly examined.

I have, &amp;c.,

GERARD KREFFT,  
Curator and Secretary.

[Enclosure in No. 9.]

REPORT of the Curator of the Australian Museum regarding the examination of the caves of Wellington Valley.

To the Trustees of the Australian Museum,—

Gentlemen,

In accordance with your direction, I proceeded, accompanied by Dr. A. M. Thomson and Henry Barnes, to Wellington, to examine the limestone caves of Wellington Valley.

There are four caves in all; but one only contains loose bone breccia, and this cave was thoroughly examined.

Since my last visit to this cave about three years ago, the ground had been much disturbed by stalactite hunters and amateur geologists, but some good ground was at last discovered and a considerable quantity of fossil remains secured.

A shaft was sunk in one of the inner chambers of this cave to a depth of 16 feet without reaching the bottom, and fossil teeth and bones were observed to that depth in small quantities; the attempt to reach the solid rock failed however, owing to the difficulty of disposing of the earth so removed.

We tried, but in vain, to take the breccia in bags to the surface; the approach to the shaft was too difficult, and the result of several days labour was only a few cart-loads of stuff.

After this effort we began sifting the deposit, and thus obtained many valuable specimens.

We continued our labours during a period of fifteen days, banking up the earth as we proceeded, and excavating nearly all the shallower fissures to the bottom rock.

The loose deposit in the cavern is however a great drawback, and to give some idea of the quantity, I may state that Dr. A. M. Thomson, after careful measurements, estimated the quantity at 250 tons.

We obtained many valuable and rare specimens, some quite new to science, consisting of the remains of mammals, birds, and reptiles, which I have the honor to lay before you.

The largest bones and teeth (those of the now extinct *diprotodons* and *nototheriums*) are of a size equal to those of a full grown elephant, others do not exceed those of a mouse.

After completing the examination of the remaining caves in the valley, we put down a shaft in front of the Breccia Cavern, and after a few feet reached the limestone rock.

We then proceeded *via* Molong to Boree. At Molong some fossil shells and corals were obtained; similar specimens we collected at Boree, but we did not meet with the peculiar red bone earth which was observed in the Breccia Cave of Wellington.

I hope to be able to give a more detailed report of the remains discovered, illustrated by photographs or lithographs; and Dr. Thomson has promised to add a full account of the geological character of the country examined by him. I beg to state, that a trustworthy person has been left in charge of the Breccia Cave at Wellington, who will continue to forward the specimens which he obtains from time to time.

I have, &amp;c.,

GERARD KREFFT,  
Curator and Secretary.Australian Museum,  
Sydney, 7 October, 1869.

## List of Photographs of Australian Fossils, for transmission to Professor Owen, F.R.S.

## PLATE I.

1. Left mandible of a *Nototherium*.
2. Sacral vertebra of a *Diprotodon*.
3. Skull from above, *Zygomaturus*.
4. Skull showing palate, *Zygomaturus*.
5. (a) Right mandible, *Sarcophilus*.  
(b) Molar tooth and portion of jaw of a new species of *Diprotodon*.  
(c) Left mandible, *Sarcophilus*.
6. Seven fragments of the lower jaw of several species of Kangaroos, *Macropus* and *Halmaturus*.
7. (a) Right mandible of a new species of Wombat, *Phascolumys*.  
(b) Right mandible of an extinct species of Kangaroo (*M. atlas*).
8. Fragments of jaws of various species of Kangaroos.

## PLATE II.

1. Left side of skull a gigantic Kangaroo, *Halmaturus gigas*.
2. Six fragments of the arm-bone (ulna) of various species of Wombats; the small figures are those of Wombats of the ordinary size.
3. Two phalanges of the foot and six nail-bones (terminal phalanges) of new Australian animals.
4. Three phalanges of the foot, the last of a recent *Macropus major*, and a fractured left upper premolar tooth of a *Thylacoleon*.
5. Six phalanges of the foot of various species of Kangaroos. Large nail-bone of a new animal, seen from below. Side view of another nail-bone, indicating the existence in Australia of a Sloth allied to the American genus *Myiodon*.
6. Phalanges of various species of Kangaroos, Wombats, *Thylacines*, &c.
7. Five phalanges of the hind foot of various species of Kangaroos, and three (first) metatarsal bones indicating a new animal belonging to the Phalanger family, in all probability the thumb-bones of a *Thylacoleon* or a *Plectodon*.
8. Seven terminal phalanges of the hand belonging to various Kangaroos, and eight undetermined metatarsal bones; also the 5th metatarsal bone of a man (recent).

## PLATE III.

1. Right lower jaw, *Diprotodon* (outer view).
2. Right lower jaw, *Diprotodon* (inner view).
3. Femur of gigantic Moa-like bird from the Leichhardt Downs, Queensland.
4. Left side of the skull of a gigantic Kangaroo.
5. Left lower jaw of *Halmaturus Thomsonii*.
6. Fractured left lower jaw of a *Diprotodon*.
7. Fractured arm-bones (ulna) of Wombat and Tasmanian Tiger (*Thylacinus*).
8. Left lower jaw of a *Nototherium*.

## PLATE IV.

1. Large lower incisor of a *Diprotodon*.
2. Right mandible of a gigantic Wombat.
3. Right lower jaw of an extinct Kangaroo, *Halmaturus Scottii*.
4. Palate of a new species of *Zygomaturus*, *Z. Macleayi*.
5. (a) Palate of a large Kangaroo.  
(b, c) Two views of upper rami of extinct Kangaroos, showing the permanent premolar tooth in its alveolus.  
(d) Premolar of an undescribed species of Wombat.
6. Right lower jaw of a gigantic Wombat.
7. (a, b) Two fractured lower incisors of *Diprotodon*.  
(c) First upper incisor, *Zygomaturus*.
8. Sacral vertebra of a gigantic marsupial, *Diprotodon* or *Zygomaturus*.

## PLATE V.

1. Skull of a *Zygomaturus trilobus* with the zygomatic arch removed to show the infra-orbital foramen (bristle passed through).
2. Mandibles of small marsupials.
3. Fractured carapace of a Tortoise allied to *Chelodina longicollis*.
4. (a) Right upper ramus of a gigantic Kangaroo.  
(b) Upper incisor of a species of *Diprotodon*.  
(c) Upper incisor of a gigantic Kangaroo.
5. Left mandible of a *Nototherium*.
6. Fragments of skull of a *Thylacoleon*.
7. (a) Fragments of an arm-bone (ulna) of a Wombat.  
(b) Two nail-bones of a Kangaroo.  
(c) Fractured left mandible, *Sarcophilus*.  
(d) Two molar teeth and right lower jaw of a dog, *Canis dingo*.
8. Fractured rami of gigantic Kangaroos.

## PLATE VI.

1. Fractured rami and teeth of ten species of Wombats, and of a Wombat-like Kangaroo, *Halmaturus Thomsonii*.
2. Rami of small marsupials of the genus *Dasyurus*, *Bolidens*, *Perameles*, and *Peragalea*.
3. Marsupial bones (Wombats and Kangaroos), four fractured collar-bones of Wombats; articulating condyle, fractured scapula and portion of the zygoma of a Wombat. Portions of the sternum, fractured incisor, and tarsal bone of a Wombat.
4. Nineteen fractured rami of a Kangaroo-rat of the genus *Bettongia*, and upper incisor and six lower ones of the same species of Kangaroo-rat.
5. Palates of two species of Wombat.
6. Lower jaw and teeth of gigantic Wombats.
7. Lower incisors of Kangaroos.
8. Terminal phalanx of some unknown animal and teeth of various gigantic marsupials.

## PLATE VII.

1. Femur of a Moa-like bird from Leichhardt Downs, Queensland.
2. Femur of a Moa-like bird from Leichhardt Downs, Queensland.
3. (a) Fractured skull of a *Sarcophilus*.  
(b, c) Upper molar, *Diprotodon* (new species).  
(d) Right mandible of Thomson's Kangaroo, *Halmaturus Thomsonii*.
4. (a) Premolar and molar of the upper jaw, *Diprotodon*.  
(b) Scalpiform incisor tooth of a new animal allied to *Diprotodon*.  
(c) Side view of a terminal phalanx or nail-bone (with the protecting hood removed) indicating some unknown animal allied to the extinct *Edentata* of South America.
5. Fractured skulls of *Thylacinus* and *Sarcophilus*.
6. (a) Fractured rami (3), *Sarcophilus*.  
(b) Molar teeth of a gigantic Kangaroo.
7. Lower jaw (left) of *Sarcophilus*.  
(a, b, c) Three fractured mandibles of a large Thylacine or Tasmanian Tiger.
8. (a) Lower jaw of Creed's Notothere, *Nototherium Creedii*.  
(b) Left mandible of a *Thylacinus* (recent).

## PLATE VIII.

1. Various bones and teeth of a species of *Thylacine*.
2. Five bones of the leg (tibia 3, femur 2) of a kangaroo-rat of the genus *Bettongia*.
3. (a) Proximal portion of a large rib.  
(b) Upper molar of a gigantic Kangaroo.  
(c) Third tarsal bone of a large Kangaroo.
4. (a) Portion of lower jaw of a species of Kangaroo.  
(b) Left lower jaw of a Kangaroo, *Halmaturus Thomsonii*.
5. Four fractured mandibles of Kangaroos.
6. Left lower jaw of a gigantic Wombat, *Phascolumys gigas*.
7. Teeth of various marsupials, *Diprotodon*, *Nototherium*, *Zygomaturus*, *Macropus*, *Halmaturus*, *Phascolumys*, and *Dasyurus*.
8. (a) Fractured fibula of a Wombat.  
(b, c) Distal fragments of tarsal bone, *Macropus*.  
(d, e) Third tarsal bones (perfect), *Macropus*.

PLATE

## PLATE IX.

1. Fractured lower jaw of a new species of *Nototherium*.
2. Right ramus, upper jaw, of a new species of *Zygomaturus*.
3. Lower jaw of *Nototherium*.
4. Palate of *Zygomaturus Macleayi*.
5. Fractured left lower jaw, *Nototherium*.
6. Fractured lower jaw, *Diprotodon*.
7. Right lower jaw, *Diprotodon*.
8. Right lower jaw, *Diprotodon*.

## PLATE X.

1. Palate of *Zygomaturus Macleayi*.
2. Left lower jaw, *Nototherium*.
3. Fractured ulna of a new animal.
4. (a) Upper molar, *Halmaturus Scottii*.
- (b) First tarsal bone, *Thylacoleo*.
- (c) Last molar (lower jaw) of a new genus of the Kangaroo tribe (reversed).
- (d, e) Much worn upper incisors (1st) of *Thylacoleo*.
- (f) Canine *Thylacinus*.
5. Upper incisors of various Kangaroos.
6. Remains of Wombats, *Phascolumys*.
- (a) Lower incisor, *Phascolumys*.
- (b) Fractured mandible, *Phascolumys*.
- (c, d) Molar teeth, *Phascolumys*.
- (e) Premolar of a new species of Wombat, *Phascolumys*.
- (f) Fractured right upper incisor of a gigantic Wombat, *Phascolumys gigas*.
- (g) Fractured left upper incisor, *Diprotodon*.
- (h) Portion of skull and upper incisor, *Phascolumys*.
7. (a) Upper molar, *Diprotodon*.
- (b) Upper molar, *Diprotodon* (new species).
- (c) Palate of a Wombat, *Phascolumys*.
- (d) Left mandible of a Kangaroo, *Macropus ocydromus*.
8. Three fractured mandibles of gigantic Kangaroos.

## PLATE XI.

1. Fractured lower jaw of a *Diprotodon*.
2. Right (fractured) mandible, *Nototherium*.
3. Right (fractured) mandible, *Nototherium* (front view).
4. Ulna of a gigantic Wombat (*Phascolumys gigas*), and above it the ulna of a recent species.
5. Molar teeth of two species of *Diprotodon*.
6. (a, b, c) Molars of *Diprotodon*.
- (d) Molar, *Nototherium*.
7. (a) Left mandible, *Sarcophilus*.
- (b) Molar teeth, *Diprotodon*.
8. Shaft of the humerus or arm-bone of two gigantic animals, with figure of the same bone of a recent *Phalanger*.

## PLATE XII.

1. (a) Fractured mandible and premolar tooth, *Thylacoleo*.
  - (b) Much-worn premolar, showing that this animal could not have been a carnivore or flesh-eater; the surface is flat and not adapted for cutting (*Thylacoleo carnifex*).
  2. Six incisor teeth, *Thylacoleo*. These feeble teeth, with their compressed fangs or roots and but partly enamelled inner surface, are the teeth of a gigantic *Phalanger* closely allied to the genus *Belideus*.
  3. (a, b, c, d, e) Incisor teeth (3rd upper), *Thylacoleo carnifex*.
  - (f, g) Incisor teeth (2nd upper), *Thylacoleo carnifex*.
  - (h, i, k, l, m, n, o, p) Canine teeth (upper series), *Thylacoleo*. These teeth are functionless and never worn, the animal could consequently not be highly carnivorous.
  - (q, r, s) Lower incisors.
  4. (a) Lower premolar.
  - (b, c, d, e, f, g) Upper premolars, *Thylacoleo*.
  5. (a) Portions of palate with two molar teeth and a peculiar tubercular premolar of a Kangaroo.
  - (b) Portion of mandible of a Kangaroo, showing the permanent premolar.
  - (c) Lower incisors, *Thylacoleo*.
  - (d) Portion of palate, *Sarcophilus*.
  - (e, f) Upper incisor, *Thylacoleo*.
  6. (a) Much-worn lower premolar, *Thylacoleo*.
  - (b) Canine and upper premolar, *Thylacoleo*.
  - (c) Upper premolar, *Thylacoleo*.
  7. Dentition of *Thylacoleo*, except the last upper and lower molar tooth. The small tubercular teeth representing the canine and the two first premolars in the lower jaw, are covered by the premolars; the upper 1st and 2nd premolars are also missing.
  8. (a, b, c, d, e) Third upper incisors of a Kangaroo, *Macropus*.
  - (f, g, h, i, k) Third upper incisors of a Wallaby (*Halmaturus*).
- In comparing these teeth, it will be observed that they differ much, and that they are well adapted as distinguishing characteristics between the two animals, the Kangaroo and Wallaby.
- (l) Upper incisor of a gigantic Kangaroo.
  - (m, n, o, p, q) Lower incisors of several species of the new genus *Plectodon* (Krefft), lately discovered at Wellington.
  - (r) Upper premolar (1st), *Plectodon* (?)
  - (s) Upper incisor (1st), *Plectodon* (?)
  - (t) Premolar, *Plectodon* (?)

Australian Museum,  
Sydney, 7 October, 1869.

GERARD KREFFT,  
Curator and Secretary.

## No. 10.

THE COLONIAL SECRETARY TO PROFESSOR OWEN, F.R.S.  
Colonial Secretary's Office,  
Sydney, 21 March, 1870.

SIR,

With reference to your letter of the 18th August last, and previous correspondence, relative to the project of exploring the limestone caves at Wellington Valley, I have now the honor to transmit, for your information, a copy of the report of Mr. Gerard Krefft's exploration of the caves, as addressed by him to the Trustees of the Australian Museum, together with a series of photographs representing the most interesting of the remains discovered.

2. A further report, which has been promised by Mr. Krefft, will be communicated to you when received; and that gentleman has been asked to furnish a list of such of the specimens obtained by him as can be spared for transmission to you, for deposit in the British Museum.

I have, &c.,  
CHARLES COWPER.

## No. 11.

THE PRINCIPAL UNDER SECRETARY TO THE CURATOR AND SECRETARY OF THE AUSTRALIAN MUSEUM.  
Colonial Secretary's Office,  
Sydney, 21 March, 1870.

SIR,

In acknowledging the receipt of your letter of the 4th November last, transmitting a copy of the report of your exploration of the limestone caves at Wellington Valley, addressed by you to the Trustees of the Australian Museum, together with a series of photographs (plates 1 to 44), representing the most interesting of the remains discovered,—I am directed by the Colonial Secretary to request that you will favour me with the further report therein promised, and that you will also be so good as to furnish a list of such of the specimens obtained by you as can be spared for transmission to Professor Owen for deposit in the British Museum.

I have, &c.,  
HENRY HALLORAN.

No. 12.

## No. 12.

THE CURATOR AND SECRETARY OF THE AUSTRALIAN MUSEUM TO THE COLONIAL SECRETARY.

Australian Museum,  
Sydney, 10 May, 1870.

SIR,

Referring to my preliminary report of the exploration of the Wellington Caves, I have the honor to inform you that the joint labours of Professor Thomson and myself have been brought to a close, and that the specimens collected have been examined and a series of duplicates put aside for presentation to the British Museum.

These duplicates comprise specimens of almost every genus observed, and I cannot do better than present to you a catalogue of the collection, which will enable Professor Owen to form some idea of the animals which inhabited the Wellington district during the post-pleiocene period.

I add a description of the caves and the surrounding district by Professor Thomson, in whose opinion regarding the probable death of the animals at the caves I concur. It would have been impossible for the few carnivorous species, such as the dog, thylacine, or sarcophilus, to have brought all these bones together, as their habits are not gregarious. The fossil remains are arranged in the following order:—

## CLASS—MAMMALIA.

## Section—Placentalia.

## ORDER—CARNIVORA.

Genus—*Canis*.

1. Canine of a dog (*Canis*).
2. Molar of dog.

## ORDER?

*Myloodon (?) Australis* (Krefft).

A distal or ungual phalanx of some unknown animal, resembling the same bone of a *Myloodon* (the distal phalanx of the pollex).

The specimen referred to is quite unique, and proves the existence in Australia of a large sloth not unlike the South American genus *Myloodon*; the size of the bone is about 1 inch and 2 lines in length. Another much smaller distal phalanx, also covered by a "hood," is in the collection, but this belongs evidently to either a dog or cat like creature.

## ORDER—RODENTIA.

Genus—*Mus* or *Hapalotis*.

The rats and mice are well represented by numerous bones and teeth, some of which resemble the teeth of living species; vast quantities of red earth, impregnated with the remains of rodents and lizards, occurred in almost every part of the caves, but more so in one crevice where thousands of leg-bones might have been picked out.

It is impossible to distinguish the exact number of species, but they have been estimated at from four to ten. The remains of the Australian beaver-rat of the genus *Hydromys* were not found, though the genus is peculiar to this country at the present day.

## Section—Implacentalia.

## ORDER—MARSUPIALIA.

Family—*Phascologyidæ*.Genus—*Phascologyus*.

The wombats have left many remains, consisting principally of fragments of jaws, loose teeth, and the larger bones of the extremities. The most common fossil species is the western wombat (*Phascologyus latifrons*), now restricted to South Australia, whilst the well-known New South Wales wombat is comparatively rare in the collection.

The total number of species at Wellington is estimated at about ten. Two of these are twice the size of the *Phascologyus platyrhinus*.

Family—*Phalangistida*.Genus—*Phascolarctos*.

*Phascolarctos cinereus*? (Koala):—Of this animal a single first upper incisor tooth was found.

Genus—*Phalangista*.

*Phalangista vulpina*? (Common or Vulpine Phalanger):—Of this species remains are also rare; a few fractured lower jaws is all we obtained.

Genus—*Belideus*.

*Belideus*, spec.? (Sugar Squirrel):—The single specimen found consists of the anterior portion of the lower jaw, indicating a small species.

I class the gigantic extinct marsupials of the genus *Diprotodon*, *Zygomaturus*, *Nototherium*, &c., with the phalangers, because their incisors resemble the teeth of the phalanger more than those of the kangaroo, and because their lower jaws are deficient of the wide excavation at the base of the coronoid process so conspicuous in the jaws of all kangaroos.

The structure of the feet of these large animals will probably be found (when the missing bones are discovered) to have resembled that of the still living phalangers, such as the *Phascolarctos* and *Phalangista*, or the wombats.

Genus—*Zygomaturus*.

A few broken teeth prove the presence of this interesting form at Wellington:—

No. 1 is part of a second upper molar, with slight talon at the base of the posterior eminence.

No. 2 is a right upper premolar, with two long fangs, sharp, triangular, front eminence, with depression behind and the trace of a talon on the side.

There is in the Museum collection a splendid series of fossil remains indicating at least two new species of the above genus, but as the list comprises Wellington specimens only they are not enumerated here.

Genus—*Diprotodon*.

Of this, the largest fossil genus, several species occur at Wellington, but only two portions of jaws with perfect teeth were secured. The other remains are very fragmentary.

After careful examination of the diprotodontoid remains, I have come to the conclusion that three species existed—one identical with *Diprotodon Australis*, and two others smaller in size and new to science.

Genus—

Genus—*Thylacoleo*.

The true position of this interesting animal among the phalangers was pointed out by me some years ago, and the large series of teeth and mandibles discovered during the last exploration of the caves corroborate my former statement. The following specimens are in the collection :—

- A portion of the anterior part of the skull of the right side, with perfect canine (the enamelled surface of which is  $\frac{2}{3}$  of an inch in length), broken off first and second premolars, and perfect third premolar  $2\frac{1}{4}$  inches wide.
- A perfect third premolar tooth (left upper), with portions of bone adhering to it; greatest width,  $2\frac{1}{2}$  inches.
- A portion of the skull (left side), with perfect and much worn third premolar and molar; the worn surface is  $\frac{2}{3}$  of an inch in width in its broadest part.
- A very fine right upper premolar imbedded in hard breccia, but without the posterior fang; this tooth belonged to a young animal and shows little wear.
- Three right upper premolars of young animals without fangs; one of these teeth must have been just cutting the gums, as it is still hollow.
- A fractured much worn upper third premolar of the right side.
- A nearly perfect upper third premolar of the right side, with crown perfect but fractured fangs.
- The anterior half of a left upper premolar without fang.
- A fractured left lower premolar.
- A much worn left lower premolar, with a portion of the jaw adhering to it.
- A fractured right mandible with almost perfect dentition; that is, incisor, sockets of canine, first and second premolar, perfect third premolar, perfect molar, and socket of second (and last) molar.
- A fractured mandible of the left side with socket of incisor, canine, first and second premolar (all very small, occupying only  $\frac{2}{3}$  of an inch in length and  $\frac{1}{4}$  inch in width), perfect third premolar, molar, and tubercular last molar. The length of space occupied by the great premolar and two molars is  $2\frac{1}{2}$  inches. The permanent premolar and molar are much worn, and are smaller than other specimens obtained in the same cavern. It is undoubtedly the type of a new species.
- A fractured mandible of the right side with third premolar and molar (not perfect).
- A fractured mandible of the right side with perfect premolar and molar and sockets of the missing teeth.
- A cast of a right lower incisor fitting into the empty socket of the above specimen prepared before any authenticated incisors of *Thylacoleo* were discovered.
- Three fractured lower incisors of the right side.
- Four fractured lower incisors of the left side.
- Two perfect left upper first incisors.
- Three fractured right upper incisors.
- A much-worn right lower third premolar, with portion of the jaw.

The following teeth were found together. They formed part of a skull and lower jaw, injured in being exhumed; they belong to the right side :—

- A fractured third premolar of the upper series, a canine, and three upper incisors. A lower incisor, third premolar, and molar.
- A very large upper canine of probably a distinct species of *Thylacoleo*.
- A second upper incisor.
- Three fractured lower incisors and a perfect one of a very young animal.
- Seven canines of probably several species (upper).
- Two second incisors (upper).
- Six third incisors (upper), some of which are fractured.
- The crown of a lower molar.
- The crown of a lower molar, much worn.
- A tooth, which in all probability will prove to be one of the upper premolars of the *Thylacoleo*; this tooth is not yet known, but its fang resembles the broken off teeth in some of the Museum specimens.
- Four upper molars of various species of the genus *Thylacoleo*.

Some lower incisor teeth of another new animal allied to the *Thylacoleo* have been found, for which I have proposed the generic term of—

*Plectodon*.

These much fractured teeth are distinguished by a dental fold on the inner side, raised in one specimen about 2 lines above the other portion of the tooth (at the tip), and gradually diminishing. The outer surface is marked by a shallow groove in the middle. The enamel is rugged, resembling the worn-eaten appearance exhibited by the molars of the *Diprotodons*, but the marks are not so deep. The other specimens are very fragmentary, but the commencement of the fold is well marked in each. Besides these relics, a few shaft bones belonging to the first or inner toe of a large phalanger have been obtained, which are referable to either the *Thylacoleo* or *Plectodon*.

## FAMILY—MACROPODIDÆ.

No other group of Australian mammals exhibit so great a difference between the size of the male and female, or so great a change in dentition, as kangaroos at various periods of their existence. It is obvious therefore, that many specimens of teeth would be required (particularly of the front upper incisors), before any supposed new species could be satisfactorily established. Under these circumstances, it will be well to enumerate only the very best and most characteristic examples of the genera discovered, and to reserve the full account of the group till all the specimens from other parts of Australia have been compared with the still living species, of which the Museum collection contains a fine series of skulls and skeletons.

The Wellington relics will be arranged as follows :—

Genus—*Bettongia*.

Numerous remains, including some crushed but otherwise perfect skulls, have been found of perhaps two species of bettongs or kangaroo-rats, the greater portion of which appear identical with the common bettong still living in New South Wales (*Bettongia rufescens*).

Genus—*Ilypsiprymnus*.

The kangaroo-rats proper of this genus are not so common as others; a few lower jaws comprise all the specimens obtained.

Genus—*Halmaturus*.

This term has been adopted for those kangaroos which have a large, compressed, and permanent premolar tooth in each ramus. The following are some of the best specimens in the collection :—

*Halmaturus*, spec. ?

- The left anterior portion of the skull of a large halmaturus with much worn dentition. The first upper incisor is very large—about the size of a (small) horse's upper front tooth; the second incisor is one-third of the first, and the last has been broken off. The space which the dental series occupies is nearly  $7\frac{1}{4}$  inches in length. The premolar is  $\frac{2}{3}$  inch long.
- The anterior portion of the skull of a gigantic halmaturus, with perfect incisors, except the first one of the right side which is broken off. The first is the largest, the second half its size, and the third slightly larger than the second. The two posterior teeth are marked by the deep fold so well exhibited in the common black wallaby (*H. ualabatus*).
- The following series of teeth may be referred to gigantic wallabies of the genus *Halmaturus*. They are mounted on a card (No. 3), and exhibit the characteristic forms of the extinct wallabies' incisor teeth exceedingly well. Nos. 1, 4, 5, 6, 12, and 13 are first upper incisors, and probably all of different species; No. 12 is the largest, still imbedded in breccia, and measures  $\frac{2}{3}$  inch in its widest part; the enamelled portion is  $1\frac{1}{4}$  inch in length.
- Nos. 2, 7, 8, are second upper incisors (No. 7 much worn) also of large size animals. No. 3 is a third upper incisor; and Nos. 9, 10, 14, and 15, are first upper incisors of animals half the size of the previous ones.

Plate 4. Nos. 13, 14, 18, are three molar teeth of large wallabies, more or less fractured.

Plate 8. No. 7 is the distinguishing type of the largest of these molars. It is an upper one of the right side, and the worn surface of the anterior lobe is  $\frac{3}{4}$  inch wide.

Five fractured teeth as large as the previous one.

One upper molar with median ridge between the two lobes, and strong talon at the base nearly surrounding the whole tooth; extreme length,  $1\frac{1}{2}$  inch; breadth,  $1\frac{1}{4}$  inch. This large tooth, though at present arranged with the genus *Halmaturus*, may prove eventually to belong to a new species of *Diprotodon* or *Nototherium*.

Two portions of the lower jaw of a large *Halmaturus*, with two perfect molars.

Genus—*Macropus*.

This genus comprises the kangaroos proper, with feebly developed premolar teeth which are soon shed. True kangaroos with the above dentition were as rare during the post-pleiocene period as they are at present, and the remains appear almost identical with those of the common kangaroo (*Macropus major*), the western kangaroo (*Macropus ocydromus*), the wallaroo (*Macropus robustus*), and the red kangaroo (*Macropus rufus*).

The following are the best specimens in the collection:—

*Macropus*, spec. ?

1. Four (third) upper incisors.
2. Portion of the palate of a gigantic species, with complete dentition on the right side and the two first molars on the left. The premolar has been shed. The space occupied by the four right molars is rather more than  $2\frac{1}{4}$  inches; and between the second molars the palate and teeth measure the same distance across.
3. Portion of the right ramus of the upper jaw of a young animal, with the three first molars, spurious premolar, and the permanent premolar above it.
4. This specimen is distinguished by a very small conical premolar in front of the first and second molars. All the teeth are worn, though not to such a degree that the animal would be classed as aged. Conical, and more or less permanent premolars have not been noticed before in this group of animals. There is a possibility that the form of the tooth is accidental, and the specimen will be classed with those allied to *M. major*.
5. A portion of the right ramus of the upper jaw, with the permanent premolar just breaking through and the three first molars. Allied to *M. rufus*.
6. Portion of the right mandible of the lower jaw, with premolar (not quite through) and three first molars. Closely allied to *M. ocydromus*.

The collection contains many loose teeth and bones supposed to be those of various species of kangaroos, but which it is impossible to distinguish with certainty as such. The permanent incisors and the premolar teeth are the only characteristics on which we can depend, in classifying this group of animals into the two sections of wallabies or *Halmaturi* and kangaroos or *Macropodida*. These specimens only as to which no doubt can arise are mentioned in this list.

Genus?—(Wombat-like kangaroos).

The last group of the series is composed of those animals which have very short heads, broad and powerful promolars, strongly ankylosed mandibles, and feeble lower incisors more vertically inserted than those of the other genera mentioned.

*Halmaturus* (?) *Thomsonii* (Krefft).

This species was obtained at the first examination of the caves in 1866. The typical specimen consists of the anterior portion of a left mandible with perfect first and second molar. The premolar is broken off, and the remaining sockets show that it was a compact powerful tooth. The median ridge of the molars is thin, with many folds on the inner side. The hind part of the second lobe is also strongly ridged or folded, and has a central triangular mark in the middle of the two last molars. The articulating symphysis shows that the mandibles were closely united together, and that the action peculiar to the incisors of modern kangaroos must have been altogether wanting. The fang of the incisor is of moderate size, with the crown tapering, and probably slightly incurved at the tip; the tooth is too much fractured to give a correct description of it.

2. The second specimen consists of a fractured right mandible, with four perfect molars and spurious premolar; the incisor is missing, as is also the permanent premolar, which, judging from the size of the empty socket below the spurious tooth, must have been large and compact.

*Halmaturus* (?) *Scottii* (Krefft).

1. This is an allied species of much larger size, but with a smaller and more compressed premolar which is still imbedded in its alveolus and resembles in form the premolar of *H. atlas*. The specimen referred to is a fractured mandible of the left side, with the last molar breaking through, the three first grinders perfect, and a fractured portion of the spurious premolar; the permanent tooth is exposed beneath.
2. A much-worn molar of the upper series; no other teeth of the upper portion are known to us.

FAMILY—PERAMELIDÆ.

The bandicoots appear to have been identical with the still living species. The few remains in good preservation prove the existence of a bandicoot allied to *Perameles nasuta*, and of another the size of *Perameles obesula*, while a third species is doubtful. Though fractured rami and teeth are scarce in the collection, many bones of *Peramelida* occur; it is impossible however to say more about them as the difference between the two or three species obtained is but very slight.

Genus—*Peragalea*.

This singular genus has not been observed before in any collection of fossils; and only one species occurs, which is larger and probably otherwise differs from *Perameles lagotis*. Of it we obtained only a few teeth and fractured mandibles.

FAMILY—DASYURIDÆ.

Genus—*Antechinus*.

A perfect ramus  $\frac{1}{2}$  inch in length represents the insectivorous section of the genus *Dasyurus*. No other fragments have been found, but owing to the small size of these animals they may have been overlooked. Remains of the genus *Antechinus* have never been observed before.

Genus—*Dasyurus*.

*Dasyurus viverrinus*?—(Native Cat).

Bones and teeth of a small dasyure, probably identical with the present *Dasyurus viverrinus*, have been collected.

*Dasyurus maculatus*.

Larger remains referable to the so-called "Tiger-cat," or Spotted-tailed Dasyure, also occur.

Genus—*Sarcophilus*.

*Sarcophilus ursinus* (Tasmanian Devil).

The remains of the "devil" observed at the caves are identical with the still living black dasyure of Tasmania; a larger species also occurs for which the name of *S. lanarius* has been proposed by Professor Owen. It would be useless to enumerate all the specimens of teeth and bones collected, as they are very numerous and comprise almost every portion of the skeleton of either *D. ursinus* or *D. lanarius*.

Genus—*Thylacinus*.

Of the thylacine or tiger we also noticed two kinds, one about a third larger than the other (Owen's *Thylacinus spelæus*); the smaller one is identical with the still living *Thylacinus cynocephalus*, the tiger or hyena of Tasmania.

These rapacious animals were probably destroyed by the dog as very few of their remains have been discovered. They may have found shelter in Tasmania shortly before volcanic disturbances prevented the passage of their enemies (the dogs) across the Straits. It is a singular fact, corroborating this supposition, that the dog was not known to the natives of Tasmania, and that no remains of such an animal have yet been found there.

## ORDER—MONOTREMATA.

Of the two singular genera belonging to this strictly Australian order, very few remains have been discovered, and none as yet of the *Ornithorhynchus*. The echidna or ant-eater has been observed before, and is represented by a fossil arm bone from Queensland. The caves of Wellington yielded a fractured femur of a species larger than our present *Echidna hystrix*.

## CLASS—AVES.

Remains of birds are so scarce that the genera and species to which they belong cannot now be determined. No flightless bird as large as the *dinornis* of New Zealand has left its bones in the neighbourhood of the caves (judging from our very limited survey of the district), and the greater number of specimens collected indicate species which do not exceed the common bustard (*Eupodotis Australis*) in size. I have noticed emu bones (*Dromaius Novæ Hollandiæ*) from other localities, and have examined a sacrum of such a bird, in the possession of the Rev. W. B. Clarke, M.A., F.G.S., which looks as if it had been found at Wellington, but no further traces of large birds have come under my notice. It may be as well to mention, that a large femur of a bird the size of a moa (*Dinornis robustus*) was found not long ago in Queensland, at a depth of 188 feet below the surface. It is the first specimen of the kind noticed in Australia, and is deposited in the Australian Museum.

## CLASS—REPTILIA.

The bones and teeth of small reptilian animals were numerous in some parts of the cave, but very few specimens are indicated exceeding in bulk our common *Hydrosaurus varius*.

The reptiles noticed belong to the following groups :—

## ORDER—CATAPHEACTA.

Being fragments of bone and the broken carapace of a river tortoise (*Chelodina*).

## ORDER—SAURIA.

The remains of lizards are referable to the

- Genus *Hydrosaurus*.  
 „ *Cyclodus*.  
 „ *Trachydosaurus*.  
 „ *Hinulia*.

## ORDER—OPHIDIA.

A few small vertebra afford the only evidence of the existence of snakes that could be obtained.

This closes my account; and I now add the report of Dr. A. M. Thomson, Professor of Geology at the Sydney University, which will be found of great interest to geologists and others, not only in the Colonies but also in other parts of the world. Dr. Thomson has re-visited the caves since our exploration, for the purpose of preparing a correct plan, and to inspect the excavations of George Porter the miner left in charge. Dr. Thomson expresses himself much pleased with Porter's work, and as I can testify that Porter has discovered many very valuable specimens, it would be well to appoint him to take charge of the caves at a small salary. Professor Thomson remarks as follows :—

“A very full account of the Wellington Caves has been already given to the public by Sir Thomas Mitchell in his ‘Three Expeditions’; still it may be well to add here a few further notes on the subject, chiefly in reference to the recent explorations. The caves are situated on the right bank of the Bell tributary, about six miles south of its confluence with the Macquarie River. They occur in the low ground of the valley, in a stratum of limestone which strikes in a southerly direction, and may be traced up the stream for many miles. The limestone is hard and finely crystalline, of a pale blue colour, and mostly massive, weathering into huge rounded blocks which are minutely furrowed and fluted on their exposed surfaces by the weather, thus giving rise to an appearance which Sir Thomas Mitchell has well described as like half dissolved ice. In places, however, it presents thin and well-defined stratifications, generally with a high dip; and where these crop out at the surface they run for a long distance in parallel lines, like the furrows of a plough. The limestone at Wellington exactly resembles the rock of many other limestone districts of New South Wales, where caves and ‘swallow holes’ are of common occurrence. Though the formation at Wellington exhibits flexures and irregularities in its stratified portions, which stand in the way of measuring its thickness, yet, on the whole, it can be observed to possess a general dip to the west, on which side it is overlaid by quartzite, passing upwards into a vast deposit of hard red conglomerate. This conglomerate is one of the most conspicuous geological features of the district; it forms a rugged and lofty range, extending from Mount Arthur, near Wellington, in a southerly direction, to the Catoubal Hills, and forming the western boundary of the valley of the Bell; its dip is to the west; about three miles west by north of the caves it is overlaid by fossiliferous limestone similar to that beneath it. Excepting a few obscure corals and encrinural stems the limestone at the caves is destitute of fossils. On travelling eastwards from the caves the rocks passed over are vesicular basalt, felspar porphyry, trappean conglomerate, and ash beds, quartzite, and limestone of the same character as at the caves. All these rocks strike north and south. The conglomerates and ash beds indicate that the igneous rocks were originally poured over the sedimentary deposits and contemporaneously interbedded with them. The basalt may be an overlying deposit of a much more recent date. All the sedimentary rocks of the district have a semi-metamorphic character; the limestone fossils comprise *Stromatopora*, *Rospectaculites*, *Favosites*, *Halysites*, *Heliolites*, *Cantites*, *Tentaculites*, *Pontamerus*, *Rhynconella*, *Orthis*, *Spirifer*, *Athyra reticularis* and others, *Strophomena*, *Pterinea*, *Grammysia*, *Loxonema*, *Euomphalus*, *Orthoceras*, *Lituites*; thus indicating that the series at Wellington forms a part of the wide-spread formation which ranges in a meridional direction through New South Wales, and which is referable either to Upper Silurian or Devonian Age.

“The caves at Wellington are about half-a-mile from the river, and their entrance a hundred feet above it. The principal attraction to visitors is the ‘Great Cave,’ which has a steep and rugged entrance leading into a spacious and lofty vaulted chamber, ornamented by one grand stalactite. The floor of the cave is covered to some depth with loose dry red earth; in one spot Sir Thomas Mitchell describes a dry white ashy dust, into which one of his party sunk up to the waist; this is still to be found in a corner behind the stalactite. At the same spot the limestone walls show a fine section of thin flexuous stratification. Elsewhere in the cave the walls and roof are massive and unbroken, and suggest that the whole structure has been excavated out of the solid rock. In 1852 the late Mr. Stutchbury, Government Geologist, examined the caves, but he adopted a view which would not now find support—that the limestone corresponds to an ancient coral reef in which the cave was a space left naturally vacant. The sound and sculptured walls and roof, as well as the arches, pillars, and buttresses of rock which remain, preclude the notion entertained by some observers that the cave is the result of disruption and subsidence, but offer no difficulty to the commonly received opinion that such structures are caused by the dissolving action of carbonic acid water, which has the power of gradually wasting away limestone rocks.

“The dimensions of the Great Cave may be gathered best by reference to the plans given in Sir Thomas Mitchell's work, where all the other features of interest are also shown. Though a few fragments of bone have been found in the Great Cave, no discovery of importance has yet been made there.

“The cave at Wellington, which possesses such great scientific interest, is the ‘Breccia Cave,’ of which the general configuration may be seen on the accompanying plan. Its entrance is a few yards west of the Great Cave. It has more the appearance of a pit or well; from its difficulty of access and very small size, it is much less frequented than the Great Cave. Its mouth is surrounded by masses of limestone, which appear like detached blocks; but this is owing to the peculiar mode in which the comparatively soluble stone wastes away, and not to any former violent disruption such as some observers have considered requisite. A hard red breccia, full of white bones, fills the spaces as if it were a cement, which served to bind the rock-masses together. The cave is entered by a nearly vertical pit, the walls of which present the appearance just described for a depth of 17 feet, where the first landing-place is reached. From this the next descent is for 11 feet, between two nearly vertical walls of rock, landing midway in an irregular fissure extending about north and south. The floor of the fissure slopes away from the entrance in both directions, and consists of loose stones and red earth which have fallen down or been washed in from above; the fissure is roofed in by the irregular rock-masses which form the surface of the ground.

“Leading off this fissure at the south end there is a narrow passage or tunnel in the solid rock, through which it was only possible to crawl; it conducts to a small cavern about 12 feet high, entirely cut out of the solid limestone. Its floor consists of loose dry red dust, in which bones were plentiful, and could be obtained by sifting or washing; several cart loads of it were hauled to the surface under great difficulties, and subsequently washed; under-ground it was sifted and picked through for

a depth of about 4 feet; holes were also sunk in it, so as to test it at various depths; one hole was put down 15 feet, and even then a boring rod could be pushed much further; but as no bones were found at this depth, and the difficulty of preventing the earth falling in increased, the sinking had to be given up. The red earth at this level, which was 53 feet below the surface, was moist, but of the same character as the rest of the deposit. The small cavern was thus proved to be part of a lofty cave, which was filled nearly to the roof with red earth. The passage leading to this cavern was made easier of access by removing the red earth, which covered its floor for a foot or two deep, and in this some good specimens were found. A shaft was also sunk in the floor, at the south end of the fissure, which led to the discovery of the carapace of a tortoise, also some fine jaws of the *Thylacoleo*, with the long-missing incisor teeth. At about 12 feet the sinking was interrupted by large boulders, but the supply of bones had already fallen off. In one part of this shaft a remarkable abundance of small bones in a very perfect condition was met with, a single spadeful of earth affording several hundred rib, thigh, and jaw bones of small rodents and kangaroo rats. From this shaft the rest of the earth in the fissure was dug through and examined as far as practicable. In the north end of the fissure a slight recess in the rock led off on the west side, and terminated in a window-like opening barely large enough to admit the body; this recess opened into the upper part of a small arched cavern; on the inside of the window there was a perpendicular descent of 11 feet before reaching the floor. This cavern contained loose red earth, but much damper than usual, owing to water which was trickling in from the roof. The appearance of this small cavern has been much altered by the necessary excavations; the window by which it is gained has been enlarged by cutting away a stalagmitic crust and an underlying deposit of red breccia. After searching the floor of this cavern with very fair results, though without being able to penetrate through the red earth, a drive was next cut in a mass of red clayey breccia on the south wall; owing to the confined space and the irregularities of the rock it proved a work of some difficulty, but many of the choicest specimens were discovered in this situation. The earth thrown out of the drive has so filled up the cavern that it is now possible to step directly from the entrance window on to the floor. On breaking open a small roundish stalactite upon the roof of this cave it was found to be a mass of the red breccia encrusted with carbonate of lime.

Viewed as a whole the Breccia Cave has the appearance of being an irregular chasm, extending downwards into the earth and filled up for the most part with loose red earth or solid breccia. Near the surface we find hard red breccia, in which bones are exceedingly abundant, but perfect specimens cannot be detached owing to their brittle state and the toughness of the matrix. But underground the deposit is loose and forms either a dry red powder from which the bones can be sifted clean, or else a slightly tenacious clay in which the bones are covered with a hard reddish calcareous crust. On the whole, the bones are more plentiful in the upper portions, and become scarcer as the depth increases, which would lead to the supposition that they were originally deposited near the surface, and there are other appearances which favour this view. Within a few feet of the mouth of the Breccia Cave there lies a circular mass of carbonate of lime, quite different in appearance from the other limestone rocks. Two similar masses also occur 30 yards to the south; their coarsely crystalline texture, white colour, and rounded form, make them resemble the base of an old stalagmite; and if this is really the case, what is now the surface of the ground has formerly been the floor of a cave. It is reasonable to suppose that in this ancient cave, the upper part of which has been entirely swept away, the organic remains may have accumulated; and as the demolition went on, the osseous floor, which was being gradually undermined by the galleries and chambers now forming the Breccia Cave, has either fallen in or been washed down to lower levels mingled with red earth. Such a slight degree of removal would account both for the position now occupied by the breccia, filling up as it does the spaces between the rocks, as well as for the scattered and fractured condition of the bones and their freedom from all water-worn appearance. In the breccia large and small bones are mixed up indiscriminately together, lying in all sorts of positions; there are no signs of stratification; the large bones are mostly fractured but never water-worn; many of the smaller bones and sometimes the minutest processes of the bones are undamaged. In no case were the various bones of a limb, much less those forming an entire skeleton, found lying together in a natural position, though it often happened that several bones belonging to one and the same organ were discovered not far apart. The red earth in which the bones are imbedded is partly composed of the soil of the neighbourhood, which is derived from the hills of trap rock rising immediately to the east of the cave; the rock affords by its disintegration a deep red soil, which is the only kind to be found within a considerable distance of the caves. But a similar red earth containing fossil bones is found in the limestone caves of Molong, Boree, the Coodradigbee River, and other places where the surrounding soil is probably of a very dissimilar character. A large proportion of the earthy accumulation in both the Great and the Breccia Cave is undoubtedly soil which has been washed in.

The removal of the upper part of a limestone cave no doubt implies a great amount of waste, but it is easy to show by reference to other phenomena in the neighbourhood, that denudations of equal magnitude have occurred possibly within similar limits of time. A striking instance of this can be seen in the Cudgegong, an affluent to the Macquarie from the east, and joining the river only 14 miles in a direct line higher up than the Bell. In the valley of the Cudgegong the gravels which mark the former course of the stream, and which now form the "leads" of the gold-digger, deviate widely from the present water channel; for instance, at Two-mile Flat, some distance below Mudgee, the old river described an elliptical course of at least 3 miles round the flat, but having now cut through the barrier of greenstone rock which formerly diverted its course, it makes the same descent in half-a-mile; but what is more to the point, is the occurrence along this river valley of outliers or detached areas of basalt. These have been sunk through and tunnelled under by the gold and diamond miners, and in all cases the igneous rock is found to be an overspreading sheet which covers an old river gravel, and abuts against the rocks which bounded the ancient valley. The basaltic outliers are traceable for a distance of at least 17 miles, though the site of the volcano whence they were poured forth has not been discovered. The thickness of the igneous masses, wasted as they now are, exceeds in many places 30 feet. It is evident that an enormous volume of lava must have poured down this valley in times gone by, to form a continuous sheet even of the limited dimensions which are still traceable. But now all that remains of this once extensive flow are some fragmentary patches of a few acres, each several miles apart. The old gravel which these basaltic outliers overspread rests about 40 feet above the bed of the river, but unfortunately no fossils have yet been found to indicate its exact age.

This illustration may help to show that the changes supposed to have occurred at the caves are paralleled if not exceeded by the denudations in the neighbouring valley of the Cudgegong. Patches of basalt occur at various points along the course of the Bell and even on the Macquarie River below the confluence of the former. It is highly probable that they are the remnants of some late tertiary lava stream which once swept down the Bell valley; though to establish such a point, further investigation would be needed. About half-a-mile east of the caves the rocks consist of vesicular basalt. To the south of the sources of the Bell lie the lofty ranges of the Canobolas, attaining an elevation of 4,600 feet, and forming part of the watershed between the Macquarie and Lachlan Rivers. This mountain, which rises 50 miles south of the caves, is a mass of basalt, and the country around its base is overspread by the igneous rock for many miles. Numerous hills, composed mainly of Silurian rocks, present on their summits a horizontal capping of basalt. A hill of this description can be seen about 5 miles S.S.E. of the caves. One of the most striking features of the Geology of New South Wales consists in the enormous areas which are covered by an overflow of basalt; this igneous material occurs on some of the most elevated parts of the country, capping lofty isolated hills, and whatever its age may prove to be, it must have originated before the existing river system was established. In a few instances basalt is found in the river valleys overlying ancient gravels, and probably derived from some much more recent flow, but the latter mode of occurrence is by no means so general as in Victoria, neither can we here discover the volcanic craters or points of eruption as in the neighbouring Colony. But to pursue this subject further would be irrelevant to this report. I am of opinion, however, that these considerations have the greatest import in connection with the Tertiary Geology of New South Wales.

It has been already stated that the Breccia Cave is now 100 feet or so above the river, and half-a-mile away from it; but at the time when the bones were accumulating the river probably ran much nearer the cave, and the valley wore a different aspect. The caves may have served as slight drainage channels for the rain which fell within a short space around, like many similar hollows in limestone rocks; rainwater now washes into some parts of the caves. A cave situated near the bank of a river which is liable to sudden floods, would not be an unlikely spot to receive such an accumulation of bones as we now find. Animals which had taken refuge in it may have been hemmed in by the waters and drowned. At times too, it may have served as a den for the carnivorous *Thylacines*, whose remains are mingled in abundance with those of extinct wombats and kangaroos, the herbivorous forms on which they preyed. Several bones have been found which showed distinct marks of having been gnawed by a carnivorous animal. Fissures and openings, such as are common in limestone rocks, often serve as pitfalls for the larger animals, but would have proved no source of danger to the smaller creatures whose remains occur here in such abundance. The breccia in its present condition does not afford any clue to the original cause of the accumulation. One supposition which may be mentioned is, that the animals were poisoned by carbonic acid or some other deleterious gases issuing from

from the ground. In a cave or any other confined space, the gas would be even more dangerous than in the open air. In this case the emanation may have risen through the fissures of the hard crystalline limestone. The escape of such gases from the soil is mostly limited to volcanic countries; but in late tertiary times this part of Australia did not possess the same repose from volcanic action as at present. The basalt in the valley of the Cudgong at least shows this. In other parts of Australian animal remains have been found buried in alluvial soil and concentrated in great abundance within a very limited space; this mode of occurrence has given rise to the notion that the area once formed a lake, and the creatures were either drowned there or their carcasses washed into it. Still, the escape of poisonous gases from the spot might equally well explain the occurrence.

"In the caves at Wellington no vestiges of man, whether in the shape of bones, weapons, or works of art, have been discovered.

"In addition to the two caves already mentioned (the Great Cave and Breccia Cave) there are no others, except a few small holes and cavities which are seldom or never entered.

"A little breccia occurs in one of these, situated 50 yards south-east of the Breccia Cave; but no fossils of any importance have been obtained there. There was nothing to be found in the sloping subterranean channel between the Breccia Cave and the river which Sir Thomas Mitchell alludes to in his work."

A large number of duplicates, including 1,000 partly determined specimens, have been dispatched to Professor Richard Owen, F.R.S., for the British Museum; and when all these objects have been examined by the great anatomist, new facts will probably be brought to light, and Australia will maintain its reputation as the "Land of Wonders."

GERARD KREFFT,  
Curator and Secretary.

LIST of Specimens collected by order of the Honorable the Colonial Secretary, at the Limestone Caves of Wellington, New South Wales, and forwarded to Professor Richard Owen, F.R.S., British Museum, London.

<i>First List, per Mail.</i>	
No. 1. Lower jaw, <i>Sarcophilus</i> . 2. Part of upper ditto. 3. Part of upper ditto. 4. Left upper incisor, <i>Thylacoleo</i> . 5. Left lower incisor, ditto. 6. Right lower incisor, ditto. 7. Third upper incisor, ditto. 8. Third upper incisor, ditto.	No. 9. Third upper incisor, <i>Thylacoleo</i> . 10. Third upper incisor, <i>Halmaturus</i> . 11. Third upper incisor, ditto. 12. Right lower incisor, ditto. 13. Left upper incisor, <i>Platifrons</i> . 14. Right upper incisor, ditto. 15. Right upper incisor, ditto. 16. Left lower incisor, ditto.

Sydney, March, 1870.

GERARD KREFFT,  
Curator and Secretary.

### No. 13.

THE COLONIAL SECRETARY to PROFESSOR OWEN, F.R.S.  
New South Wales,  
Colonial Secretary's Office,  
Sydney, 28 May, 1870.

SIR,

Referring to my letter of the 21st March last, and previous correspondence, relative to the exploration of the Limestone Caves at Wellington Valley, I have now the honor to forward a copy of the further report which has been furnished by Mr. Gerard Krefft, Curator of the Australian Museum, together with its enclosures, comprising a copy of Dr. A. M. Thomson's report on the caves, a further series of sixty-two photographic plates of the specimens collected, and a catalogue of duplicate specimens set apart by Mr. Krefft for presentation on behalf of this Government to the British Museum.

I have, &c.,

HENRY HALLORAN,  
For the Colonial Secretary.

### No. 14.

PROFESSOR OWEN, F.R.S., to THE COLONIAL SECRETARY.  
British Museum, London,  
20 May, 1870.

SIR,

I have the honor to acknowledge the receipt of your letter of the 21st March, 1870, enclosing the report of Mr. Gerard Krefft's exploration of the Limestone Caves at Wellington Valley, the locality referred to in my letter of 18th August, 1869, and under separate cover a series of photographs representing the most interesting of the remains discovered in those caves.

The results of the exploration conducted by Professor Thomson and Mr. Krefft, as given in the report, and illustrated by the photographs, in regard to novelty, instructiveness, and number of specimens, surpass my expectations, and afford good ground for continued support and encouragement in the exploration of limestone caves both in Wellington Valley and in other localities of Australia.

Mr. Krefft's collections will form an important element in working out the ancient history of the forms of animal life peculiar to the Australian Continent, and I cannot sufficiently express my grateful sense of the prompt and liberal response made to my original appeal, and for the generous intention to transmit for deposition in the British Museum such specimens as the Trustees of the Museum of Natural History of Sydney may be pleased to spare.

I have, &c.,

RICHARD OWEN.

### No. 15.

THE PRINCIPAL UNDER SECRETARY to THE COLONIAL AGENT IN LONDON.  
Colonial Secretary's Office,  
Sydney, New South Wales,  
15 June, 1870.

SIR,

I have the honor to forward herewith a bill of lading for two cases shipped to your address on board the mail steamer "Malta," and to state that the case containing fossil specimens is intended for Professor Owen, British Museum.

I have, &c.,

HENRY HALLORAN.

1870.

**WELLINGTON CAVES.**

(FURTHER LETTER FROM PROFESSOR OWEN, RELATIVE TO EXPLORATION OF.)

---

 Presented to both Houses of Parliament, by Command.
 

---

PROFESSOR OWEN to THE COLONIAL SECRETARY.

 London, British Museum,  
 27 September, 1870.

SIR,

I have the honor to acknowledge the receipt of your letter of the 28th May, 1870, and also of the further Report by Mr. Gerard Krefft to which it refers, together with the enclosures, comprising a copy of Dr. A. M. Thomson's Report on the Caves, and a further series of sixty-two photographic plates of the specimens collected, and a catalogue of duplicate specimens set apart by Mr. Krefft for presentation, on behalf of your Government, to the British Museum.

I have the further pleasure to announce the safe reception of that valuable series of specimens corresponding with Mr. Krefft's list, all which will be submitted by me to the next meeting of the Trustees of the British Museum. I shall at the same time report to them the wishes of the Trustees of the Australian Museum, Sydney, in regard to specimens for that Museum, notified to me by Mr. Krefft. In the meanwhile I beg to repeat the deep sense which I entertain of the service to science rendered by Dr. Thomson and Mr. Krefft, in their very able reports and explorations, and my obligations for the valuable materials so contributed towards the History of the Fossil Mammals of Australia, to which I am applying all the leisure at my command.

 I have, &c.,  
 RICHARD OWEN.

1870-71.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

BASE LINE FOR TRIANGULATION OF NEW SOUTH WALES.  
(REPORTS FROM SURVEYOR GENERAL, RESPECTING.)

*Ordered by the Legislative Assembly to be Printed, 31 May, 1871.*

THE SURVEYOR GENERAL TO THE UNDER SECRETARY FOR LANDS.

Lake George,  
5 November, 1870.

SIR,

In pursuance of instructions to take charge of the above-mentioned work, in consequence of the death of the late Government Astronomer, G. R. Smalley, Esq., I arrived here on the 13th September, and proceeded to inspect the line, as marked upon the ground and cleared of timber,—also the instruments, tents, and equipment generally.

With reference to the Base Line itself, I found that the country had been recently devastated by the greatest flood heretofore known; and the bridges, which had been erected over Butmaroo and Terrilla Creeks, had not only been destroyed, but in both cases the bed of the creek had been changed and enlarged by the torrent; further, the waters of the lake had risen  $2\frac{1}{2}$  feet over the northern extremity, submerging about one and a half mile of the line. With these facts before me, I found myself obliged to alter the bearing of the line from its southern extremity in a more easterly direction, crossing the creeks higher up their course, and at more favourable sites for the erection of bridges. I made the alteration with some reluctance, as the original line had an advantage in better condition of the triangles over the new one, and because considerable expense had been gone into in the clearing of the old one. As it would have cost more to re-erect the bridge over Butmaroo than the clearing of the new line, I called for tenders (after having cleared about half a mile by day labour), and finding that of Wm. Mainwaring the most reasonable—£13 per mile—I accepted it.

To return to the inspection of the equipment. I found the tents in a more dilapidated state than I had even supposed possible; for the continued wet weather had so affected them that all that were standing were, the large tent erected for the accommodation of Mr. Smalley, and four sections of the measuring tents. The men in charge were living in a bark hut that had been erected, in the winter, for a kitchen. In the large tent were deposited all the instruments. The two theodolites—borrowed from the Royal Society of England, and which it may be remembered were, on their arrival in Sydney Harbour, sunk in the ship "John Duthie," but afterwards recovered—I found in a very bad state from corrosion, arising from that cause, especially so the smaller one by Ertel, a very valuable instrument, of which the principal bearings are of steel. I have therefore determined on returning both these instruments to the Observatory, and sending to Sydney for the largest theodolite in my department—a  $13\frac{1}{2}$ -inch instrument, imported under the auspices of Sir W. Denison. The portable transit, lent to the late Astronomer from my department, was in good order, and I depend on it for accuracy in the straightening and laying down the new line; also for the subsequent astronomical observations necessary to determine the true position of the Base Line upon the earth's surface.

I found the horses in good condition; some of them very serviceable animals.

The waggon is entirely unsuited to the work, and I seek authority to dispose of it, with the harness belonging to it, by sale by auction at Goulburn, together with any other articles that may not be required. There is also an old cart, which only requires some repairs to make it last out the work.

To reconstruct the tents, I ordered from Sydney some 400 yards of canvas, which I obtained at a reduction on the Government contract price, together with some other materials necessary for their reconstruction, and for making a portable observatory, which I found indispensable,—there being nothing at all suitable for the purpose beyond an umbrella tent, which was entirely rotten, and never could have been suited to the work.

On the 15th Mr. Surveyor Betts and his party arrived from the Murrumbidgee District,—he having been instructed to meet me on the ground, and carry out the measurement under my direction.

As soon as the supplies arrived from Sydney, every available person in camp was employed in making up the new tents, moving the old camp to a spot more convenient to the commencement of the work, and in the removal of one of the stone pillars from the old to the new line, and erecting it at the spot fixed upon for the site of the observatory.

On the 28th I was obliged, through the serious illness of Mr. District Surveyor Twynam, who had taken charge of the department in my absence, to return to Sydney; and it was not until the 6th ultimo that I was able to revisit the camp, when I found that the construction of the tents, &c., had so far progressed that those intended for covering the measuring bars while at work, and for the accommodation of the officers and men, had been put up; and that the work of comparing the measuring bars with the standard I had brought with me from Sydney could be commenced as soon as the state of the weather would allow, which however did not occur for several days; and it then appeared that the machines for supporting and giving slow motion to the bars while in the act of measuring was out of repair, and four days were spent in putting them in order and adjusting them. I had fortunately brought with me a number of tools and appliances, in case of accident to any of the instruments, but it was not until the 11th that a comparison could be got, and the result was rather disheartening; for such startling discrepancies appeared between the measuring bars and the wooden standard that I found it necessary at once to despatch Mr. Betts to Sydney with all the bars, in order that the discrepancies might be tested by reference to the iron standard sent from England, and now deposited at the Observatory. During this period, the construction of a little observatory, 7 feet in diameter, of angle-iron, wooden bows and corners, was proceeded with, and the stone pillar prepared for the reception of the transit instrument.

It is my intention to transfer this observatory to the extremities of the line, and to the secondary points or terminals of the first computed base on the hills upon which stone towers have already been erected. The whole can be packed up into parcels weighing only a few pounds each.

On the 15th Mr. Betts returned, reporting that the measuring bars, which are also of wood, and thirty years old, had expanded since they were sent from the Observatory, two years since. I attribute such expansion to the bars having been stowed in a tent; covered from atmospheric influence, but not protected from the exhalations of the earth. This being the case, and a corresponding decrease in length to be expected after exposure to the atmosphere, and uncertain both in ratio and extent, I saw that there was no possibility of ensuring accuracy and certainty short of transporting the iron standard bar to the work; and notwithstanding the danger—the bar being of cast-iron—I determined on doing so, and at once began the construction of an underground vault for its reception; which was absolutely necessary, the bar being so massive that it required several hours of an even temperature of air to bring the same to an equilibrium. This work has occupied many days; but as it has happened, the continued rain would not have permitted the opening out of the measuring bars.

It was not until the 31st ultimo that we were permitted to make a commencement on the line itself in laying the bars.

I enclose extract from my Journal for the following days, *i.e.* :—

“Measured 40 feet and returned to the same point, not succeeding however to our satisfaction.”

“Nov. 1.—At the bars again, measured and retraced 40 feet with the utmost care, and then discovered that the error arose from the bar shifting slightly in the box surrounding it, the referring telescopes being attached to the box. Took the box to pieces and screwed the telescopes to the bar itself, where they had been formerly attached.”

“To-day the men completed the external work of the vault.”

“Nov. 2.—Tried the bars again by measuring and retracing; result better, but not satisfied yet; determined not to adopt any of this day's work for good.”

“Mounted 8-inch transit for aligning bars; carpenter completed observatory.”

“Nov. 3.—Measured outwards 150 feet with greatest care, and moved small transit to a point at right angles to bars, and laid terminal point, discarding referring telescopes. Designing an instrument to assist in dropping vertically from dot on bar to point-carrier.”

“Nov. 4.—Remeasured yesterday's work, intersecting precisely upon the dot of the point-carrier laid yesterday. Completing instrument for intersecting.”

“Nov. 5.—Endeavouring to extend measurement (and verification) to end of first trench, and fix a dot on stone; prevented by heavy rain; designing screw-pile for point-carrier; made clamp to steady microscope on bar; carpenter made pattern for iron screw-pile. Progress report.”

I have entered to a greater length into particulars than I otherwise should have done, in case the question may arise as to how all the time had been employed between the time of my taking charge of the work till the first day that I was in a position to report the performance of any of the actual measurement. Had the last day continued finer, the first section—200 feet—would have been completed and permanently marked.

Notwithstanding the difficulties we have had to contend with, I have never lost hope of complete success and of a fair progress when all the members of the party have learned their work.

I think 1,000 feet per week will be attained.

I believe that the reading microscopes originated by Mr. Smalley will prove very successful, and far better practically, though not theoretically so good as the method used in the measurement of the Board of Ordnance Survey of England, or the graduated wedge method adopted by Captain Clark in the measurement of the Victoria Base. The advantage is entirely practical, and the errors not being cumulative are therefore likely to balance each other. The extreme errors arising from the theoretical defect are shown by experience to be within  $\frac{1}{2}$  an inch per mile; I am therefore satisfied that if there is any failure of accuracy it will not be traceable to this source.

I have, &c.,

P. F. ADAMS.

Submitted, 19th Nov.      Seen.—JOHN R.

THE SURVEYOR GENERAL to THE UNDER SECRETARY FOR LANDS.

Surveyor General's Office,  
Sydney, 18 May, 1871.

SIR,

Since the date of my last report, 5th November, 1870, the progress made in this work has not been satisfactory, in consequence of the unprecedented rainfall; so much so that I have for the present season abandoned further measurement, finding that the cost was so much in advance of what it could have been

been done for in an ordinary season. The number of days on which rain has fallen at Lake George this season must have exceeded that of any other part of the Colony, as it amounted to forty-five out of 110, and only on forty-two days was it at all possible to measure; and the results of many of these days have been found practically useless, from the instability of the ground affecting the position of the bars under the microscopes. Some further loss of time, and also of expense in repairs, arose from the destruction of the framework of the measuring tents, and injury to some of the instruments, in a sudden squall of extraordinary violence. On referring to the Camp Journal, which I supply as an Appendix, it will be seen that notwithstanding the amount of wet weather there has always been employment for the party.

Returning to my report of the 5th November, and reviewing the details of work performed, I find that I omitted to mention the error of the wooden measuring bars, ascertained, on the 13th October, at the Sydney Observatory. The mean error of a 10-foot bar was  $+0.014470$  of an inch; or in other words, the bar was  $\frac{1}{70}$  of an inch longer than it should have been; affecting the length of a measured mile a little more than  $7\frac{1}{2}$  inches.

The bridging of the Turalla Creek proved a more formidable work than was at first anticipated, as it was found absolutely necessary to drive a third row of piles to carry the gangway and make it independent of the other structure. The bridge was 240 feet long, supported on sixty-nine piles. The superstructure is removed, and available for the bridge over Deep Creek, which I purpose erecting by contract. Many persons not acquainted with the subject have blamed Mr. Smalley for the construction of bridges which were swept away by flood; but I can testify that for rigidity they must have been fully equal to, if not better than mine; and, after I found it necessary to drive the third row of piles, the obstruction to flood-waters was so great that mine would have shared the same fate under similar circumstances.

On the 29th November the vault for the reception of the standard bar was completed, and next day ten comparisons were made, showing, as I had anticipated, a great reduction in the length of the measuring bars, caused by the drying up of the wood; the error being then reduced to  $+0.008575$  of an inch per 10 feet, or  $+0.025726$  per series, affecting the length of a measured mile only  $4\frac{1}{2}$  inches. From the magnitude of the original error, and the period (49 days) which elapsed without a comparison with the standard, and the fluctuations since observed in the length of the wooden bars, I have been obliged to reject 1,200 feet out of the 2,200 feet measured during the interval; and should prefer at some future time remeasuring the remainder, notwithstanding the fact of first and second measurements agreeing very fairly. In spite of this partial failure in the commencement, it is reassuring to find that the normal condition of the bars is nearly standard length, thereby lessening the liability to error in the total result by reason of large corrections.

I do not in this report propose to enter fully into the details of either comparisons of bars, computations, or measurement; as, in the first instance, I submit diagrams, one recording in a simple form the actual variations of the iron standard through change of temperature (the corrections for change of temperature were computed in England), and showing also the actual length of each measuring bar at the time of comparison, minus or plus the standard; the other diagram is a record in curves of the deviation of the wooden bars extending over 134 days. This latter was worked out in an endeavour to ascertain if any rate of expansion could be arrived at for either temperature or atmospheric change; but so far nothing at all reliable has been arrived at; however, I propose to continue this investigation, when the measurement is resumed, with addition of a record of wet bulb thermometer, which instrument I did not procure till too late.

It is evident that the changes of condition in the wooden bars are but little due to heat,—the hygro-metric changes of the atmosphere from dryness to moisture being the chief cause; and although much has been done, there is more still to be learned in determining the best times to make the comparisons, in order that the measurement and remeasurement may coincide. The computations will be found on a sheet also showing the comparative results of measurement and remeasurement. The details of the actual measurement are comprised in the field books, certified copies of which are herewith.

Up to the present time 6,796 feet have been completed, in seven sections of varying length, and the difference between measurement and remeasurement in these sections varies in ratios from  $\frac{1}{4}$  to  $\frac{3}{4}$  of an inch to the mile, the total distance checks to 2,485, or at the rate of rather less than  $\frac{1}{4}$ th of an inch per mile.

Notwithstanding the difficulties encountered, I submit that the result is satisfactory; and that the cost, compared with that of similar work in other countries where labour is cheaper, will be found reasonable. I however anticipate that the remaining three-quarters of the work will be completed at less than the first quarter. It must be borne in mind that the measurement of a Base Line, like a new industry in the hands of persons who have not practical experience, cannot be carried out without losses in the outset.

The work commenced in May, 1868, under Mr. Smalley, who expended £2,328; his party averaged five men, at 38s. 4d. each per week.

Under my supervision, an average of eight men have been employed, at 30s. 11d. each per week, and £1,060 spent.

The total cost of the work up to date has been £3,389.

In 1865 I had occasion to invite the attention of the Government to the state of the public surveys, and especially to the impossibility of producing correct general maps, under the present system; and pointed out the necessity for a general triangulation, such as, I believe, will be found in every other British Dependency except New South Wales and Queensland. And though I have no reason to modify the views therein expressed, the depressed state of the Colony appears fatal to any movement sufficient to cope with the entire evil; I must therefore confine my recommendations to something possible, and at the same time capable of expansion should circumstances permit.

The Colony is still without a map of the country surrounding the metropolis; and no attempt can be made to compile an authentic one out of the existing data. At the same time, nearly £2,000 per annum is being spent in surveys within that area, which might be utilized and worked into a triangulation. I would therefore call attention to the desirability of completing the measurement of the Base Line, and extending the general triangulation into the County of Cumberland by the most direct method consistent with accuracy, and making practical use of it as quickly as possible.

I believe that this could be done in two years, at a cost of £2,500 per annum; and if the main points were once fixed, the detail of connecting existing and future surveys could be done by the officers of this department, with only a trifling addition to the cost of the present desultory system: I may say worse than desultory; for, without something definite to refer to, the rarity of coincidence between the work of any two surveyors is well known to most people who have had experience in surveys.

The

The City Survey as a nucleus, and the numerous surveys, from time to time made, for the alignment of suburban municipalities, would, if connected together, soon produce a very valuable map; and one capable of being added to continually, without the uncertainty that now prevails, in the absence of either a unit of measure or standard points of reference.

The actual detail, of both measurement and computation, has been carried out by Mr. Surveyor Betts, assisted by Mr. F. Russell. The computations are almost exclusively the work of Mr. Betts, who has succeeded to my entire satisfaction, although he has had no previous experience in work of this kind.

I cannot close this report without bringing under the notice of the Government that the measurement has been made on the landed property of Messrs. Osborne and Powell; and although the camp has been, from first to last, on Mr. Osborne's property, for nearly three years, no charge has ever been made for grazing of some five or six horses; and, on all occasions, he has offered every facility in his power towards the progress of the work. Mr. Powell has been equally obliging, but the trespass in his case has not been so great.

I have, &c.,

P. F. ADAMS,  
Surveyor General.

## PROCEEDINGS OF THE COMMITTEE.

---

TUESDAY, 13 SEPTEMBER, 1870.

## MEMBERS PRESENT :—

Mr. Samuel,		Mr. Wilson,
Mr. King,		Mr. Brookes,
Mr. Alexander,		Mr. Lloyd,
Mr. Parkes.		

Mr. Samuel called to the Chair.  
 Entry in Votes and Proceedings, appointing the Committee, *read* by the Clerk.  
 Printed copies of Bill *referred* before the Committee.  
 Committee deliberated.  
*Ordered*, that Captain Burns, Captain Trouton, and Captain Shoobert be summoned to give evidence at the next meeting.

[Adjourned until Tuesday next, at *Eleven* o'clock.]

---

TUESDAY, 20 SEPTEMBER, 1870.

## MEMBERS PRESENT :—

Mr. Samuel in the Chair.

Mr. Parkes,		Mr. Hill,
Mr. Wilson,		Mr. Lloyd,
Mr. King.		

Captain Trouton (*Manager of the A. S. N. Company*) called in and examined.  
 Witness withdrew.  
 Committee deliberated.  
*Ordered*, that Captain Burns and Captain Gibbons be summoned to give evidence at the next meeting.

[Adjourned until Thursday next, at *Eleven* o'clock.]

---

THURSDAY, 22 SEPTEMBER, 1870.

## MEMBERS PRESENT :—

Mr. Samuel in the Chair.

Mr. Brookes,		Mr. Hill,
Mr. King,		Mr. Alexander,
Mr. Lloyd,		Mr. Parkes,
Mr. Wilson.		

Captain Burns called in and examined.  
 Witness withdrew.  
 Committee deliberated.  
*Ordered*, that Captain Burns and Captain Gibbons be summoned to give evidence at the next meeting.

[Adjourned until Wednesday next, at *Eleven* o'clock.]

---

WEDNESDAY, 28 SEPTEMBER, 1870.

In the absence of a Quorum, the meeting called for this day lapsed.

---

FRIDAY,

FRIDAY, 30 SEPTEMBER, 1870.

MEMBERS PRESENT :—

Mr. Samuel in the Chair.

Mr. Wilson, | Mr. Alexander,  
Mr. Brookes.

Captain Gibbons (*Commander of the ship Constance*) called in and examined.

Witness withdrew.

Captain Burns called in and further examined.

Witness withdrew.

Committee deliberated.

*Ordered*, That Captain Fox and Captain Smith be summoned to give evidence at the next meeting.

[Adjourned until Tuesday next, at *Eleven* o'clock.]

TUESDAY, 4 OCTOBER, 1870.

MEMBERS PRESENT :—

Mr. Samuel in the Chair.

Mr. Church, | Mr. Lloyd,  
Mr. Wilson.

Captain Smith called in and examined.

Witness withdrew.

Committee deliberated.

*Ordered*, That Captain Fox and Captain Norie be summoned to give evidence at the next meeting.

[Adjourned until Tuesday next, at *Eleven* o'clock.]

TUESDAY, 11 OCTOBER, 1870.

In the absence of a Quorum the meeting called for this day lapsed.

FRIDAY, 14 OCTOBER, 1870.

MEMBERS PRESENT :—

Mr. Samuel in the Chair.

Mr. Hill, | Mr. Wilson,  
Mr. King.

Committee deliberated.

Captain Norie called in and examined.

Witness withdrew.

Committee deliberated.

Re-assembling of the Committee to be arranged by the Chairman.

[Adjourned.]

THURSDAY, 16 MARCH, 1871.

MEMBERS PRESENT :—

Mr. Samuel in the Chair.

Mr. Hill, | Mr. King,  
Mr. Brookes.

Committee met to consider the Bill.

Clauses 1, 2, and 3, read and *agreed* to.

Clause 4 read, amended\*, and *agreed* to.

Clause 5 read and *negatived*.

New clause 5\* submitted by Chairman, read and *agreed* to.

Clause 6 read and *agreed* to.

New clauses 7 to 16\* inclusive, submitted by Chairman, read and *agreed* to.

Clauses 7 to 18 inclusive, to follow new clause 16, and stand 17 to 25 of the Bill,—read and *agreed* to

Clause 19 to stand clause 29 of the Bill, *read*, amended,\* and *agreed* to.

Clause 20 to stand clause 30 of the Bill,—read and *agreed* to.

Clauses

Clauses 21 and 22 to stand clauses 31 and 32 of the Bill,—read, amended,\* and *agreed to*.  
 Clauses 23 to 26 inclusive, to stand clauses 33 to 36 of the Bill,—read and *agreed to*.  
 Clause 27 to stand clause 37 of the Bill,—read, amended,\* and *agreed to*.  
 Clauses 28 to 31 inclusive, to stand clauses 38 to 41 of the Bill,—read and *agreed to*.  
 Clause 32 to stand clause 42 of the Bill,—read, amended,\* and *agreed to*.  
 Clauses 33 to 43 inclusive, to stand 43 to 53 of the Bill,—read and *agreed to*.  
 Clause 44 to stand clause 54 of the Bill,—read, amended,\* and *agreed to*.  
 Clauses 45 to 71 inclusive, to stand clauses 55 to 81 of the Bill,—read and *agreed to*.  
 Clause 72 to stand clause 82 of the Bill,—read, amended,\* and *agreed to*.  
 Clauses 73 to 84 inclusive, to stand 83 to 94 of the Bill,—read and *agreed to*.  
 Clause 85 to stand clause 95 of the Bill,—read, amended,\* and *agreed to*.  
 Clauses 86 to 96 inclusive, to stand clauses 96 to 106 of the Bill,—read and *agreed to*.  
 Clause 97 to stand clause 107 of the Bill,—read, amended,\* and *agreed to*.  
 Clauses 98 to 115 inclusive, to stand clauses 108 to 125 of the Bill,—read and *agreed to*.  
 Clause 116 to stand 126 of the Bill,—read, amended,\* and *agreed to*.  
 Clauses 117 to 128 inclusive, to stand 127 to 138 of the Bill,—read and *agreed to*.  
 Schedules A and B read and *agreed to*.  
 New schedule\* BB, submitted by Chairman,—read and *agreed to*.  
 Schedules C to H inclusive, read and *agreed to*.  
 Motion made (*Mr. King*) and *Question* put,—That the Chairman report the Bill as *amended to* the House,—*agreed to*.

\* Vide Schedule of Amendments.

#### LIST OF WITNESSES.

	PAGE.
Burns, Captain H. ... ..	5 & 11
Gibbons, Captain J. H. ... ..	9
Norie, Captain W. F. ... ..	18
Smith, Captain C. ... ..	12
Trouton, Captain F. H. ... ..	1

#### SCHEDULE OF AMENDMENTS.

Page 2, clause 4, line 32. *After* "Steam-tug" *insert* "Provided that every such ship which shall be employed in trading between any ports of adjacent Colonies shall be deemed to be a Coast-trade ship for the purposes of this Act."

Page 3, clause 5. *Omit* clause 5 *insert* the following new clause instead thereof:—

"5. It shall be lawful for the Governor by letters patent under the Seal of the Colony to incorporate a Board by the name of the 'Marine Board of New South Wales' to consist of *seven* Members that is to say a President and *six* Wardens of which Wardens three may be elected in manner hereinafter prescribed by the owners of Foreign-going and Coast-trade ships registered in the Port of Sydney and the remainder shall be appointed by the Governor Provided always that in the event of no election taking place within the period of *one* calendar month after the time appointed for the holding of such election (which time shall be fixed by the Governor and published in the *Gazette*) it shall be lawful for the Governor to nominate and appoint three persons to be Wardens of such Board And any extraordinary vacancy occurring in the number of the said elective Wardens whether by death resignation disqualification or otherwise shall be filled up within *one* calendar month after it occurs And if any such vacancy shall not be so filled up as aforesaid it shall be lawful for the Governor to appoint any person to be a Warden of the said Board And the present Superintendent of Pilots shall be appointed by the Governor as the first President of the said Board and every succeeding President shall be appointed in like manner."

Page 3, after clause 6. *Insert* the following new clauses:—

"7. Any *three* members of the said Board shall be a quorum.

"8. The Wardens of the said Board shall be entitled to receive for their services any annual or other remuneration not exceeding in the aggregate the sum of £500 per annum.

"9. The first election of Wardens under this Act shall take place on the *second* day of *October* one thousand eight hundred and *seventy-one* and thereafter every election of Wardens shall take place on the *first Monday of October* in every *third* succeeding year and the Governor shall fix the place and mode of conducting all such elections as aforesaid and also in the case of any vacancy the day of election and not less than *ten* days notice of such day shall in every case be given and published in the *Gazette*.

"10.

Incorporation  
and Constitution  
of Marine Board.

Three to form a  
quorum.  
Remuneration of  
Wardens.

Election of  
Wardens.

" 10. Owners of Foreign-going ships and of Coast-trade ships registered at the Port of Sydney shall have votes at the election of Wardens of the said Board according to the following scale that is to say—Every registered owner of not less than *one hundred tons* in the whole of such shipping shall at every election have one vote for each Warden for every *one hundred tons* owned by him but the votes of such owner for any one Warden shall not exceed *ten* and for the purpose of ascertaining the qualification of such electors the following rules shall be observed that is to say— In the case of a ship registered in the name of one person such person shall be deemed to be the owner and in the case of a ship registered in distinct and several shares in the names of more persons than one the tonnage shall be apportioned among the owners as nearly as may be in proportion to their respective shares and each of such persons shall be deemed to be the owner of the tonnage so apportioned to him And in the case of a ship or shares of a ship registered jointly without severance of interest in the names of more persons than one the tonnage shall if it is sufficient either alone or together with other tonnage (if any) owned by such joint owners to give a qualification to each of them be apportioned equally between the joint owners and each of such joint owners shall be deemed to be the owner of the equal share so apportioned to him but if it is not so sufficient the whole of such tonnage shall be deemed to be owned by such one of the joint owners resident or having a place of business at the said port of Sydney as is first named on the register And in making any such apportionment as aforesaid any portion may be struck off so as to obtain a divisible amount and the whole amount of tonnage so owned by each person whether in ships or shares of or interests in ships shall be added together and if sufficient shall constitute his qualification.

Qualification of electors.

" 11. The Collector of Customs shall on or before the *first* day of *August* in the year one thousand eight hundred and seventy-one and in every third succeeding year make out an alphabetical list of persons entitled to vote by virtue of this Act at the election of Wardens of the said Marine Board containing the Christian name surname and residence of each such person and the number of votes to which he is entitled and shall sign such list and cause a sufficient number of copies thereof to be printed and to be exhibited in some conspicuous place at the Custom House for *two* entire weeks next after such list has been made and shall keep true copies of such list and permit the same to be perused by any person without payment of any fee at all reasonable hours during the period last aforesaid.

List of voters to be made out.

" 12. The Colonial Treasurer shall within *twenty-one* days after the *first* day of *August* in the year one thousand eight hundred and seventy-one and in each succeeding *third* year nominate two Justices of the Peace to revise the said lists and such Justices shall between the *twenty-first* day of *August* and the *first* of *September* both inclusive in the year in which they are so nominated revise the list described in the next preceding section hereof at the Custom House or in some convenient place near thereto to be hired if necessary by the said Collector and shall give *three* clear days notice of such revision by advertising the same in the *Gazette* and one or more of the daily newspapers and by affixing a notice thereof on or near to the doors of such Custom House and shall make such revision by inserting in such list the name of every person who claims to have his name inserted therein and gives satisfactory proof to the said Justices of such his right and by striking out from such list the name of every person against the insertion of whose name therein a satisfactory objection shall have been established by proof to the said Justices adduced by any other person named in such list and the decision of the said Justices with respect to every such claim or objection shall be conclusive And the said Justices shall immediately after the completion of such revision sign their names at the foot of the list so revised and such list so revised shall be the register of voters at elections of Wardens of the said Marine Board for *three* years from the *second* day of *October* then next ensuing inclusive to the *first Monday* of *October* in the *third* succeeding year and the said revised list when so signed shall be delivered to the Colonial Treasurer who shall if necessary cause a sufficient number of copies thereof to be printed and shall cause a copy to be delivered to every voter applying for the same.

Revision of Lists.

" 13. The said Collector of Customs if required shall for the assistance of the said Justices in revising the said list produce to them the books containing the register of ships registered at the Port of Sydney and the said Justices may likewise require the production before them for the like purpose of such other registers books or documents in the possession or control of any public officer as they may deem necessary.

Registers to be produced.

" 14. Every person whose name is contained in such revised list shall be qualified to vote at the election of Wardens of the said Marine Board.

Persons named in revised list qualified to vote.

" 15. Every person whose name is contained in such revised list and no other person shall be qualified to be elected a Warden of the said Marine Board and if any person after having been so elected shall after such election at any time cease to be an owner of such quantity of tonnage as would entitle him under the provisions of this Act to a vote at elections as hereinbefore described such person shall be deemed and taken to have resigned and vacated his seat at the said Board and thereupon another member shall be elected in his place.

Qualification of elective Wardens of Marine Board.

" 16. No act matter or thing done or commenced by the said Marine Board shall be invalidated or otherwise prejudicially affected by reason of any irregularity or informality in the election of any Warden of such Board or of any error in the list of voters hereinbefore mentioned or any irregularity in the making or revising of such list or by reason of any person acting as a Warden of such Board who is not duly qualified as hereinbefore directed."

Error in election not to vitiate Acts of Marine Board.

- Page 6, clause 19, line 28. After "may" insert "at all reasonable times"
- Page 7, clause 19, line 4. After "may" insert "with the sanction of the President"
- Page 8, clause 21, line 11. After "shall" insert "during the actual employment of such ship in that capacity"

### SCHEDULE B B.

*Form of Bond to be given by Owner or Charterer and Master.*

KNOW ALL MEN BY THESE PRESENTS That we \_\_\_\_\_ are held and firmly bound unto Her Majesty Queen Victoria in the sum of Five Hundred Pounds of good and lawful money of Great Britain to be paid to Her said Majesty the Queen Her Heirs and Successors to which payment well and truly to be made we bind ourselves and every of us jointly and severally for and in the whole our Heirs Executors and Administrators and every of them firmly by these presents.

Scaled with our seals  
 Dated this \_\_\_\_\_ day of \_\_\_\_\_ 18 .

Now the Condition of this obligation is such that if the Steamship \_\_\_\_\_ whereof is Master is in all respects seaworthy and if all and every the requirements of the Marine Board Act of \_\_\_\_\_ and of any Regulations made by the Marine Board of New South Wales have been and shall be well and truly fulfilled and performed and if the Master for the time being of the said Ship shall submit and conform himself in like manner as a British Subject being the Master of a British Passenger Steamer to the jurisdiction of the Courts and Magistrates in Her Majesty's Possessions which are by the said Act empowered to adjudicate on offences committed against the said Act and the said Regulations and if moreover all penalties fines and forfeitures which the Master of such Ship may be adjudged to pay for or in respect of the breach or non-fulfilment of any such requirements as aforesaid shall be well and truly paid then this obligation to be void otherwise to remain in full force and virtue.

Signed sealed and delivered by the above-bounded in the presence of \_\_\_\_\_

I hereby certify that the above Bond was duly signed sealed and delivered by the said Master of the said Steamship \_\_\_\_\_ and by the said \_\_\_\_\_

(Signature)

(Date)

{ Chief Officer of Customs  
 { of the Port of \_\_\_\_\_

1870.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON THE

MARINE BOARD BILL.

TUESDAY, 20 SEPTEMBER, 1870.

Present:—

MR. HILL,	MR. PARKES,
MR. KING,	MR. SAMUEL,
MR. LLOYD,	MR. WILSON.

THE HON. SAUL SAMUEL, Esq., IN THE CHAIR.

Frederick H. Trouton, Esq., Manager of the Australasian Steam Navigation Company, called in and examined:—

1. *Chairman.*] Have you perused the Bill, which has been referred to this Committee, to incorporate a F.H. Trouton, Esq. Board to be called the Marine Board of New South Wales? I have.
2. Will you state what your views are with regard to a measure of this kind? I may state that I believe thoroughly in the principle, and that it is highly necessary that such a Bill should be passed. I think my actions in past years would go to prove that; and I may refer, as an illustration of the necessity for such a measure, to the difficulty I had in getting an inquiry into the loss of the steamer "Telegraph," a few years ago. I represented at the time, I think, that this was the only spot in Her Majesty's dominions in which a catastrophe of that nature would not be officially inquired into. The Attorney General of the day stated that it could not be done, although in the other Colonies, on both sides of us, such inquiries were constantly being held,—both in New Zealand and Victoria. I may say that I believe in the Act in its main feature; but I think it requires alteration in many instances.
3. You have had considerable experience in connection with the Steam Marine of this port? Yes; and of the other Colonies too.
4. You say you think the Bill capable of improvement;—will you state in what way? I have made some marginal remarks upon the Bill, and I will take them in order. In the first place I think if there are to be four wardens—and I would not wish to go to the expense of appointing a greater number—two of them should be elected by the shipowners of the port.
5. You prefer a partially elected Board to a nominated Board? I do;—I think it highly desirable that there should be members upon it to represent the shipowners.
6. Will you state any reason for that opinion? Because I think the requirements of the shipowners will be better represented at the Board by two of their own body; their grievances would be better attended to. I think that if the Board were nominated it would be too political.
7. Have you considered what should be the qualification for voters in electing members of this Board? I would follow entirely the principle adopted at Home, that the vote should be ratably to the amount of tonnage the shipowner holds.
8. Would you have the representatives of the shipowners [to sit on this Board shipowners themselves? It would not be necessary that they should be shipowners, but they would no doubt be practical men having a knowledge of their business. I do not suppose there are Marine Boards anywhere in existence where shipowners do not sit on them.

- F. H. Trouton, Esq. . . . .  
 20 Sept., 1870.
9. You recommend adhering to the same principles as those embodied in the English Act? I do not know that the principle of the English Act requires that those Boards should consist of shipowners, but I am aware that they are principally composed of such.
10. You are aware that this Board is intended to control the shipowners somewhat? Yes.
11. Do you think the system that prevails in other places, of examining masters and mates, and making them take out certificates of competency, is one that it is desirable to introduce here? Most distinctly.
12. And the same with engineers? Yes. I am so far of that opinion that I send my officers to other ports to get certificates which they cannot obtain here.
13. There is a provision in this Bill for permitting certificates from Marine Boards in other Colonies to have force in this;—do you think that will work beneficially? I do.
14. At present a certificate issued by the Marine Board of Victoria has no force here, but our certificate has force in the other Colonies? I am aware of that. I think there should be reciprocity. But our engineer surveyor should have a right to go on board a vessel at any time, and withdraw the certificate should her equipment not be in accordance with the Act, so that there could be no danger arise on this account.
15. Are there any other portions of this Bill that you object to? The next matter is clause 8, which says that the Marine Board shall be subject to the supervision, control, and direction of the Colonial Treasurer for the time-being. I think the use of the word "control" objectionable; the Board might be under the supervision of the Treasurer without being under his control.
16. In England the Marine Board is subject to the Board of Trade? Yes.
17. This Bill does not propose to establish any Board of Trade? No; but it proposes to put the Board under the control of an individual, which is worse.
18. An individual responsible to Parliament? Yes; but still I think the use of the word "control" is not correct.
19. Have you observed how the duties of the Board are defined? That is in clause 10—"The Marine Board shall be subject to the control aforesaid," and so forth. That also I should strike out. This clause invests the Board "with full powers to carry out the provisions of this Act relating to steam navigation"; I should strike out the word "steam," and make it general.
20. I think that word is in the English Act? I think we should try and improve upon the English Act. I think the functions of the Board should extend over all navigation. I think it very necessary also that this Board should have control over the licensed watermen of the harbour. I find that many lame men take to this occupation now, and I have witnessed myself very many narrow escapes from the inefficiency of watermen; then clause 11 says that the power of the Board shall extend one league to seaward; I should recommend that it should be two leagues. I think at the lesser distance there would be many disputes as to being within jurisdiction. I have nothing to say till we come to clause 19, the first part of which says that every member of the Marine Board and every inspector and surveyor may go on board any ship or vessel for the purpose of examining the hull and machinery, or the boats and equipments. I would recommend following the English and Victorian Acts, that he should only do so at all reasonable times and during daylight, and not within two hours after or two hours before the arrival or departure of any ship, unless he has a special order from the Marine Board, which he must produce to the commanding officer. I have known a surveyor in these Colonies come on board a ship at 11 o'clock at night, just at the very moment the ship was going out, and domineeringly say to the officer, "Take those covers off, and show me your boats," just when the officer was busy receiving passengers' luggage, and so on. I think he should come, as the English Act states, at a reasonable time, and during daylight. If the inspector has any reason to suspect, or has been informed in any way, that the ship, boats, &c., are not in order, he can very easily make such suspicion known to his Board, and procure the special order; but by coming on board at inconvenient times he may disorganize the arrangements of the ship, and prevent her getting to sea with due despatch. I have now in my office written complaints from masters and mates on this very subject.
21. Is it not possible that a steamer might arrive after dark, and start again before daylight? She cannot; she has to deal with the Customs.
22. Does that apply to all steamers? Yes; they cannot come and go as they like.
23. *Mr. Hill.*] It is very often done—is it not? No.
24. *Chairman.*] Do not small coasting steamers very often come in in the evening and go out again the same night? No, they must go and enter their names at the Customs.
25. *Mr. Parkes.*] Does not the steamer "Hunter," running to the Clyde, often come in and go out again almost immediately? I do not think so.
26. *Mr. Hill.*] Have you never known the Hunter River boats to arrive at 4 or 5 in the afternoon and go out again at 11? No, I do not think that is the practice.
27. *Mr. Parkes.*] Have you never known a boat to arrive at 8 and go out at 11? There have been cases where they have been cleared by special order of the Collector. I have myself sometimes gone to the Collector at his house to get a special order; but I am speaking of the general rule. I know it is the custom that a steamer must appear in the Customs' books.
28. But there are circumstances in which a special order can be obtained from the Customs' to admit of a vessel proceeding to sea again immediately? Yes, there may be exceptions; but I think such a time is not a suitable one for the inspector to come on board. I speak more of our own boats running to coast ports. I know it is not the fact that they are at liberty to arrive and depart again the same night; if it was the fact I should not have been under the necessity, as I have been on special occasions, of going to the Collector for permission. I have individually got into a cab and driven out to the Collector's house to get his permission.
29. *Chairman.*] No doubt you cannot do it without the permission of the Customs' authorities; but that permission is very readily granted in the case of steamers. Does not this occur, that very often, when a steamer is expected, permission is asked in anticipation of her arrival, to allow her to discharge and take in cargo after the usual hours? That is the exception, perhaps in the case of a vessel going out with the mail. But we are talking of the custom. I have gone so far as to send a vessel away without a clearance at all. I went to the Collector at midnight, and got permission to send the ship away with the Queensland mails which had missed the ocean steamer, and sent a telegram to the Collector at Melbourne to say she had gone. But that is the exception, and we are talking of the rule. And that, I submit, is an unsuitable time for the inspector to go on board. The captain is under heavy penalties to keep his boats and gear in order, and that should be sufficient to provide for these exceptional cases. I have known an inspector of engines to pop down into the engine-room at the last moment, and ask to have the engines disjoined; and  
 this

this was, I understood, because he had a pique against the engineer in private life; and if such an order should not now be carried out the engineer might be taken by the collar, like a pickpocket, and hauled off to gaol.

F.H. Trouton,  
Esq.

20 Sept., 1870.

30. Have you any other suggestion to make? By the same clause 19, "he may by summons under his hand require the attendance of all such persons as he thinks fit to call before him, and examine upon any inquiry authorized by the said Board," and so on. I should say that power should not be granted to an inspector; I think such a summons should only be granted by the Board, and signed by the secretary, under the direction of the Board.

31. He cannot do that, excepting on inquiries authorized by the Board? I think such inquiries should be carried on by the full Board—that no inspector should be permitted to carry on inquiries of so great importance. The wheel of fortune may so turn that we may see a man who is one of my junior engineers to-day, the Board's inspecting engineer to-morrow; and with his change of circumstances he may wish to lord it over those who are now his superior officers, which the possession of the powers given by this clause will enable him to do. I think the powers given here to the inspector should only be exercised by the Board. Then the clause goes on to say, that any person who shall wilfully impede any member of the Board, or the inspector in the execution of his duty, and all persons aiding or abetting therein "may be apprehended and detained by such member, inspector, or surveyor, or by any person called to his assistance until such offender can be conveniently taken before a Justice." I do not see the necessity for arresting a man as if he were a pickpocket. He is in the service of a citizen of the town, and who can always be found, and there being a heavy penalty imposed for the offence, I do not see the necessity for this power of immediate arrest, nor have I found it in any other Act. I think it very arbitrary, especially when you consider the class of men in whose hands you place this authority. If they were always men of education and position I would not mind.

32. You say there is no such clause as this in other Acts of this kind? I am not aware of it. I have had a copy of a Bill which has been prepared in Melbourne, sent to me, and it does not appear in it.

33. Have you looked at the English Act? I have not got the English Act, but I have the instructions to surveyors from the Board of Trade, and I do not see this power of arrest mentioned.

34. What would you suggest in lieu of this? Simply, that an offender should be proceeded against by summons. Where is the necessity for taking the chief engineer out of the "Coonaubara" for instance, when she is on the point of sailing, because a row occurs between him and the inspector? I could understand such a thing in Portugal or Turkey, or some of those places, but not in an English colony. You will recollect that this Act empowers the inspector to walk to the companion and take down the certificate, and the ship cannot go to sea. That is quite enough punishment for the owner. I would also suggest a proviso to the effect that persons summoned as witnesses should not be obliged to remain, if it should cost them the loss of their situations by reason of their ships sailing before or during any inquiry, but that their evidence may be taken *de bene esse* and upon oath by the Inspector or Member of the Marine Board. I have known an instance where a chief officer was out of employment for many months in consequence of his being required to attend an inquiry, and his ship sailing to London without him. Then clause 21 says that "the owner of every steamship constructed or intended to carry passengers shall cause such steamship to be surveyed twice at least in every year"—I would say "when employed." As the clause stands it would necessitate the survey twice a year of all the vessels I have laid up. Then I think clause 22 should be expunged altogether. The object and history of that I think I may state is that our late surveyor was anxious to get all the surveys done in this port. If a ship went out, say on the 15th June, and was not back until the middle of July, she fell into the hands of the surveyors of other Colonies. But he wished that if she were going away just before the expiry of her certificate she should be fresh surveyed, so that the survey-fee would fall into the hands of the surveyors here.

35. Anticipating the period of its expiration? Quite so.

36. If a vessel were going a long voyage, would it not be desirable if her certificate were expiring, that she should have a fresh certificate—say a voyage to San Francisco? That would be an exception; but if she were going to the Sound, or to Melbourne, there would be no necessity for it. In clause 23, line 36, it says that a certificate may be signed by the Secretary or President of the Marine Board. I would wish to have it so that it might be signed by any member of the Board, with the secretary; for we find great difficulty in getting our certificates signed in the case of ships that come in to-day and are away to-morrow.

37. In the absence of the President some one else might be delegated to do that duty? Yes, that is what we want. Then in clause 25, line 5, referring to the same matter, it gives power to the President or Vice-President of the Board to exercise in cases of emergency all the powers with respect to the grant and issue and suspension of certificates as are conferred on the Board. I think certificates of competency should be excepted. I do not think the suspension of a man's certificate, and the consequent taking away of his occupation should be dealt with in that way. Clauses 23 and 24 refer to ships' certificates, and I think it has been overlooked by the draftsman that the word "certificate," in clause 25, may be applied to officers' certificates of competency.

38. Do I understand you that clause 25 should be made to apply to the ship and not to the officers? Quite so. I think the draftsman meant to apply it so, and not to masters' and mates' certificates.

39. Might it not happen in cases of emergency, when a certificated master or engineer was not at hand, that it might be advisable to issue a certificate to some other person as provided for by the Bill, subject to confirmation by the Board afterwards? No; no man should have a certificate granted to him without undergoing a proper examination. If this Bill be passed there will never be any want of certificated officers. Clause 26 I would expunge altogether, and I would simply refer you to clauses 16 and 20 of the Victorian Bill I have before referred to.

40. Why do you propose to strike that out? It is not necessary in any way. You have simply stated elsewhere that the certificate will be issued for six months, and imposed a very heavy penalty for going to sea when it expires; and I think that is quite sufficient. Throw the penalty on us for sailing without a certificate and I will guarantee we will keep clear of it. With reference to clause 27, I think the fees are very moderate and correct. Clause 31: Penalty on owners for overcrowding passengers. I do not think it is severe enough. I propose making the clause as it stands apply to passengers carried within the limit of a harbour, and imposing a penalty of £50, with a further penalty of 20s. per head for every person carried outside a harbour. I think the penalty here is sufficient for harbour steamers, but if I am getting £10 a head for running passengers to Cleveland Bay, I can quite afford to pay you 5s. a head, and rush off any quantity. Then I would strike out the word "conveniently" in the 2nd section of the 32nd clause, as

to

F.H. Trouton, Esq.  
20 Sept., 1870.

to landing any passenger who may be drunk or disorderly "at any place in the Colony at which he can conveniently so do." That word will only leave an opening for a lawyer to raise an argument. I think also, with reference to the last part of the same clause, that the master should have the right of detaining a passenger's personal effects until his passage money be paid.

41. Is there no power to detain luggage? No, none that I can see. Then there is another important matter that I do not see provided for,—that persons coming on board a ship against the orders of the officers should be fined.

42. Surely there is a provision of that kind? I do not think there is. I think it exists in one of the Acts which this repeals. What I want to provide against is the runners for boarding-houses coming on board, when a steamer comes to the wharf, and upsetting the sailors making fast the ropes. We have had an instance of a man's leg being broken by a warp in consequence. It might be brought under the clause as to anyone impeding the crew; but I think it should be more plainly stated that anyone coming on board against the instructions of the officers should be fined. The next matter is in clause 46. I think a ship should only be compelled to pay pilotage, on her return to port after having put to sea, when she comes back under the guidance of a pilot. I think it very hard that if circumstances necessitate a ship's return to port, she should be compelled to pay pilotage again, after the master has closed his accounts. Rather than do so the master may be disposed to keep to sea when prudence would counsel his return to the shelter of the port; and this may be the last straw that breaks the camel's back; it may cause the loss of the ship. If a man comes in without the aid of a pilot it is a great hardship to make him pay for one. As to clause 47, so far as it refers to whalers, I would have them come free into the port. It would be the means of bringing a great deal of trade to the port, in supplies, whaleboats, cooper's work, and so forth.

43. *Mr. Hill.*] How is it in Hobart Town and New Zealand? They are perfectly free.

44. *Chairman.*] The port charges here are very small, are they not? They are certainly. Then in line 14 of the same clause I would make it necessary to hoist the distinguishing flag when a vessel comes within two leagues, the distance to which I propose that jurisdiction should extend, not *three*, as specified. I have no further remarks to make until we come to clause 93, which provides that in case of collision, ships shall assist each other, and that in case the master of either ship "fails to do so, and no reasonable excuse for such failure is shown, the collision shall, in the absence of proof to the contrary, be deemed to have been caused by his wrongful act, neglect, or default. I see this is in the Imperial Act, but I think it is very dangerous law. The master may be timid or cowardly, and he may run away without making any effort to render any assistance to the other ship, and for that he is to be held in fault for the collision, although it may have been the other vessel which ran direct into him. I think that because the master is weak in that respect that is no reason why the owners should be the sufferers.

45. But you think the Board should have the power to treat it as misconduct? Quite so, but not to touch the pockets of the owners for the master's default in humanity or courage. If A runs into B, and damages B, why, because B runs away, should his owners be cast in damages, perhaps to a large amount? As to clause 94 I would prohibit passenger ships from carrying dangerous cargo at all. I may state that our Company, in their instructions to masters, direct them not to carry any dangerous goods, such as are referred to in this clause.

46. They are expressly prohibited in steamers—this only applies to sailing ships? In what clause?

47. *Mr. Hill.*] Do I understand that you approve of this clause? I more than approve of it. I think these articles should be absolutely prohibited in passenger ships. I know steamers do carry gunpowder now, and we ourselves did so up to the last eighteen months. We have carried it for this Government and for other Governments.

48. *Chairman.*] We must have provision for sailing ships to carry it under certain regulations? I would say passenger ships, not "steamships"; steamships may go off without any passengers at all. Clause 95 is, I think, objectionable, and I would substitute clause 20 of the old Steam Navigation Act of 1852, 16 Vict., No. 46, as a great deal more suitable, practically, to the trade of the port. As to the provision in clause 96, for the swinging of ships, in order to ascertain the deviation of the compasses, I think it is practically useless, excepting in a new ship, or a ship that has had very material alterations. As to swinging the "Collaroy," or any ship of her age, you might just as well swing any wooden ship. I can assure you that for a number of years I have paid the strictest attention to this matter, and that doing so in old vessels is practically useless, and occupies a great deal of time. But I think it highly necessary that you should insist that every steamer should have a compass elevated at least 13 feet above the main deck; it is then above the attraction. After a ship is swung perhaps a thousand bars of newly hammered iron may be placed on board, and that would have a great deal more effect than all the iron in the ship. It should simply be necessary to have one reliable compass out of the attraction of the iron, and for that purpose I think an elevation of 13 feet from the deck is quite sufficient. I would substitute a provision to that effect for the 96th clause. Clause 97 provides that the Board may make loading regulations. That is a very difficult matter, and I think the Marine Board should be allowed a very great margin in coming to a decision on the question. It bears a great deal of argument, and though I have given it a great deal of consideration I do not think I could lay down any rule or guide. I think it is necessary to consider the model of a ship and a great many other things connected therewith before her load water-line can be decided. As a general rule, if I had to name a load-line, I should say no ship should be allowed to go to sea that has not a clear side, from the lowest part of her deck down to the water-line, of a fourth or fifth of the depth of her hold. I think the English Emigration Commissioners require a fourth, and Lloyd's, I believe, require less. In New York I know that in shipping grain, when there are no passengers on board, they require a fourth. Still the trim of the ship has a great deal more to do with it than the load-line. I would rather command a large ship six inches deeper, in good trim, than one lighter and out of trim. There is nothing more detrimental to a ship's safety than being heavily laden, and at the same time out of trim. Then as to the quantity of ballast, I do not think that can be dealt with by the Board at all. I do not think they would be so competent as the masters of the respective vessels to decide upon the proper quantity of ballast to be carried. We might risk the chance of the masters not putting in enough ballast. It is too complex a question to deal with.

49. Is it not the fact that many of the colliers go away insufficiently ballasted? I do not think so. If you take into consideration the numbers that have sailed from this port we have really lost very few. As to clause 101, I think lading ought to be allowed to be discharged into other vessels, and not merely upon dry land or places to be authorized by the Government.

50. *Mr. Wilson.*] I thought the object was to prevent ballast being allowed to fall between the ships? That is provided for by spreading a tarpaulin. Clause 104 is, I think, very arbitrary, making the owner of a sunken vessel raise her, and the means proposed of getting paid in case of his default by levying on his property. I think it a very hard case that if A. runs into B, and sinks him, B should have to raise the ship, especially if he has abandoned her to the insurers. F. H. Trouton,  
Esq.  
20 Sept., 1870.

51. *Chairman.*] If a vessel is sunk in the fairway the onus of raising her must be thrown upon somebody. Would it not be better to do as proposed here, and leave the parties to settle the liability—leave the owner of the sunken vessel to his remedy against the person who injured him;—the Government could not undertake to decide who was in fault. In what way would you suggest that the clause should be altered? I have not made any suggestion; I have only brought my views of the equity of the case before you. I think the public, or any person but the man whose vessel is sunk, should be compelled to raise her. Clause 108—duties of the Harbour Master—I would limit to foreign-trade ships. The Harbour Master will not come on board all the coasting steamers and vessels, and berth them. It means merely that the Harbour Master should keep the fairway clear. Then as to the Harbour Master's powers again, under clause 109, I would make it read so that he may remove ships from any place, except from a private wharf. As it stands, the clause would empower the Harbour Master to come and take away all our vessels from the Company's wharf, or any private wharf.

52. Is not this in the present Act? I do not know; but if it is, I would suggest that it should be altered. I do not suppose it would be put in force, but I do not think such a power should be allowed. Clause 114—I think that is really too paltry to take notice of in a law at all. I cannot conceive how a sailor can scrape barnacles off a ship, and catch them before they fall into the water; and all the barnacles, &c., that ever fell into the harbour from a ship's bottom, from the earliest days of commerce, would probably impede the navigation less than the silt brought down by the water from Margaret-street to-day. Then, in the 7th section of clause 116, in line 8, after the word "owner" I should put in "charterer." Clause 127 compels every master to keep this Act on board his ship. I cannot see why he should be obliged to keep this Act any more than any other law referring to it.

53. Have you any other suggestion? None whatever. I may say, relative to this last, that it affords opportunities for inspectors to annoy those commanders who may not have made themselves agreeable. If the captain has not asked the inspector to take a glass of grog he may compel him to produce the Act. I do object to giving these small openings to individuals.

THURSDAY, 22 SEPTEMBER, 1870.

Present:—

MR. ALEXANDER	MR. KING,
MR. BROOKES,	MR. LLOYD,
MR. HILL,	MR. PARKES,
MR. WILSON.	

THE HON. SAUL SAMUEL, ESQ., IN THE CHAIR.

Captain Henry Burns called in and examined:—

54. *Chairman.*] You are a shipowner, I believe? Yes.

55. You own vessels trading out of this port? I do.

56. And you have had considerable experience, I believe, as a commander of vessels in the mercantile marine? For some two and twenty years, I think.

57. Have you had a copy of this Bill forwarded to you? I have.

58. Have you given it any consideration? I have, in conjunction with other members of the Committee of the Shipowners' Society here. We have gone through it as far as the 50th clause, I believe.

59. What Society do you mean? A Society of gentlemen interested in shipping, who have banded together for mutual protection in such matters, and to address the Government to remove the grievances under which we labour.

60. Will you be kind enough to state your views with regard to the measure now before this Committee? We object, in the first place, to the construction of the Board.

61. In what way? We object to its being based upon the nominee principle.

62. To the whole Board being nominated by the Government? Exactly.

63. You require a certain proportion to be elected? Yes; two-thirds.

64. Will you state why you think such a large proportion of elected members desirable? Our shipping interest here is very large. There are about 650 sail of vessels, steam and all together, out of this port, the aggregate tonnage of which is nearly 80,000 tons, as well as my memory serves me, representing a money value of a million and a quarter.

65. You are aware that one object of this Bill is, to a certain extent, to control shipowners, that is, to exercise a power of supervision over the vessels they own, so far as regards their being properly manned and officered? That we object to. We think that sort of thing ought to be in our own hands, subject to the veto of the Government. We feel that, considering the large amount of property invested in ships here, we have a right to be represented. And at present the whole burden of taxation is on our local ships—a thing we object to.

66. When you say the whole burden of taxation is on our local ships, what do you mean by taxation? You call everything here pilot dues. I think each thing should have a distinct name. Say the ship "La Hogue," a vessel of a thousand tons, visits this port once a year, she contributes to the revenue of this port a sum of £34 6s. 8d., in return for all that is done for her accommodation; whereas a little vessel like the "Jessie Kelly," of 140 tons, trading to New Caledonia, pays annually, in the way of port charges or pilotage—whichever term you please to give it—a sum of £77.

Capt. Henry  
Burns.  
22 Sept., 1870.

- Capt. Henry Burns.  
22 Sept., 1870.
67. The "La Hogue" pays every trip, £34 6s. 8d.? Yes; she makes a voyage once a year. The "La Hogue" gets a consideration for that by the services of a pilot, which she requires; but the "Jessie Kelly" is compelled to pay for a pilot, not requiring his services, when she has a certificated master on board.
68. You talk of the charge as taxation, but does not the Government afford you some service for the charge they make? As far as the light and tonnage dues are concerned I admit it—which ought to be a shilling a ton per annum—sixpence for lights and sixpence for tonnage; but the pilotage is a compulsory thing and no service to us where we have a certificated master on board, competent to pilot our own ships.
69. You do not object to paying a fair charge for light dues, and any other service performed in the harbour, which occasions expense to the Government? Where I receive value I do not object to give an equivalent; but for this compulsory pilotage we receive no equivalent.
70. You rest your proposition for electing the majority of this Marine Board upon the ground that the shipping interest contribute very largely to the revenue? Exactly.
71. You speak of the "La Hogue" paying only £34 6s. 8d. a year;—does she not pay every time she comes to this port? She comes here only once a year.
72. Does she not sometimes pay twice in the same year? She has made but one voyage a year during the last thirteen or fourteen years.
73. You are aware that this Bill proposes to reduce the charge in the case of vessels like the "Jessie Kelly"? Yes, to a small extent; one-half.
74. Is not that a very considerable reduction? Not enough. I say that where we receive no value I do not see why we should pay anything.
75. You will admit that it is an advantage to local ships that pilots should be at hand whenever they may be required? I do not see the advantage if we do not want their services. A steam-tug would be of more advantage.
76. We provide a steam-tug? She is not always there; she is often employed on other service.
77. She is always there in bad weather? We have men here competent to navigate ships to all parts of the world, and holding certificates of their ability to take vessels in or out of the port. Well, you clear a vessel out for New Zealand, and the master is competent to take her out for New Zealand, but because New Caledonia happens to be on her clearance he is not allowed to take her out. So that you impose a charge upon us without an equivalent.
78. Supposing the exemption system were extended to the South Sea Islands, would that be any advantage? I should extend it to all Colonially-registered ships that had certificated masters on board. Compulsory pilotage is abolished in England.
79. Perhaps you will tell the Committee exactly what you do wish with regard to the charges and exemption certificates? What I would suggest is, that we should call things by their proper names. It is only within recent years that the whole charge has been amalgamated together. I should have a distinct charge for pilotage, a distinct charge for light dues, and a distinct charge for tonnage dues. I would subject all local vessels to light and tonnage dues, but I would exempt them from pilotage, where they have a certificated master on board. I should make one charge to those vessels which took pilots, and another charge upon all vessels for light and tonnage dues. In whatever port they should be in at the 31st December and 30th June in each year Colonially-owned vessels should pay tonnage dues, and that should exempt them from all charges and dues along the coast for the remainder of the half-year, from Cape Howe to Point Danger.
80. What expenditure are the tonnage dues supposed to cover? You have to provide wharf accommodation, dredge, and all that sort of thing, and many other expenses about the harbour, in Captain Hixson's department, and many others.
81. Would not these numerous charges rather complicate the difficulties you speak of? Not at all. I have never been in any port where they are all slumped together as they are here.
82. Have you ever been anywhere where the charges are lighter? There is no place where they are so light for strange ships. The whole burden is on our local vessels.
83. Have you considered whether, if the charge be reduced one-half, as the Bill proposes, that will exceed the charge for light dues and tonnage which you propose? I have not gone into it that way; I am only telling you what we wish—I and my colleagues of the shipowners' committee. We want to simplify things, and to know who is to pay. Where people receive value let them pay; but where they receive no value we think they ought not to pay.
84. Would you be kind enough to go through the Bill, and point out what objections you have to it? We agree with the greater part of the Bill, except by whom it is to be worked—who is to have the management of it. We think that in the appointment of the Marine Board this port ought to have the same privilege as any small port in the United Kingdom possesses. Marine Boards in the United Kingdom are formed on the elective principle or mixed principle. The Board of Trade nominates four members, and the shipowners of the various ports elect six, with either the Police Magistrate or Mayor as *ex officio* member. I should say our Superintendent of Pilots here would make a very good member; he is a practical man, and would well represent the Government. This Board, of course, will become a corporate body. I propose you should hand over to this Board all the powers which the Treasurer dedicates to himself here in clause 8. (*Clause read.*) I cannot believe the Treasurer can manage my affairs as well as I can myself. I think, with the finance of the country, and all the rest on his shoulders, he ought to leave this to the corporate body proposed to be appointed.
85. Are you aware that Marine Boards in England are subject to the control of the Board of Trade? Exactly. And we are perfectly prepared to put ourselves under your control, that you should have the power of vetoing anything we do which is opposed to international law or common sense. The next thing is, I think, we are instructed by the Home Government to construct a Board of this sort for the examination of masters, mates, and engineers. This is a very important thing, and hardly to be entrusted to the hands of four nominees. A man's bread and character are entrusted to this Board. Every man tried for his life or his reputation has a right to be tried by his peers; and I hardly imagine that four nominees of the Government would be his peers.
86. Supposing it were determined that there should be five members appointed by the Government and four elected by the shipowners, would that meet your views? No. I think when we came here from England we brought all the rights of Englishmen with us; and in a country like this, governed on the most democratic principles, I do not think we should have them curtailed. Two-thirds of the members of the Marine Boards at Home are elected, and we should have two-thirds elected here. Considering the men most likely to be elected on this Board, I think you may safely entrust these matters to their hands.

87. Are you quite satisfied the best men will be elected? I think they will, as a general rule. We will take our chance of that. Capt. Henry Burns.

88. You think the Government should be represented? Certainly. Of course we expect that the Treasurer will hand over to this Board all the functions he reserves to himself by this Bill; and especially the Shipping Office, because many things require to be amended there. 22 Sept., 1870.

89. In what way does the Shipping Office work badly? I have mentioned before that the whole legislation of this country has been in favour of strangers and against our own shipping. We are aware that according to the Imperial law there is a necessity for a Shipping Office. We are obliged to have one; but it was never intended that our Colonial vessels, employed in our own Colonial trade, should be subject to the supervision of that office. In England no vessels under eighty tons are supposed to go to the Shipping Office at all. The men are never required to attend there. And all vessels employed in what they call the home or passenger trade, similar to vessels employed in our intercolonial trade, are only supposed to attend there twice a year with lists of their crews. On the other hand, our small vessels are put under all the supervision of a thousand ton ship. If a man is going to Newcastle or Port Stephens he has to go to the Shipping Office and give in a list of his passengers and crew. You might as well ask the Manager of the Railway or the proprietors of Cobb's coaches, to send in a list, as these vessels. In foreign-going vessels I admit there is a necessity for these lists, in order to prepare statistical accounts, but that cannot be necessary in the case of vessels going from one port of the Colony to another, while it is a serious annoyance to our Colonial vessels.

90. Do I understand you to say you cannot ship your men without going to the Shipping Office? No. People will say there is a necessity to protect foreign vessels from their men running away. But why make any peculiar law for the foreigner, which is at the same time a great inconvenience to our own. There is free trade in carrying freight. A Frenchman, a German, or a Dutchman, can come in competition with me; and I do not see why the law should be made to enable them to hold their seamen at thirty shillings a month, while I have to pay three or four pounds. If he is able to compete in the freight market, let him do so; but there should be no peculiar laws made to serve him and obstruct me. If his crew all run away he is only in the same position as I am. He has to pay the port wages to supply their places, the same as I have.

91. Do you not think it would be a very serious evil if any law were made that would facilitate seamen leaving their ships when under contract for a voyage? We have nothing to do with that. They make no peculiar laws for these ships in England. If their crews run away they have the same means of catching them as we have—the city police and the water police; and if they do not catch them they are in no worse position than we are.

92. The Shipping Office is not affected by this Bill? No, but we want power to make by-laws for its regulation.

93. Is there anything else you wish to suggest? There is a great want of accommodation in the Port of Newcastle.

94. I would prefer, first of all, that we should deal with this Bill? I am going to show why we should have a corporate body to manage these matters, and why they should have borrowing powers to enable them to provide proper accommodation for vessels at the different ports. I have had vessels lying for twelve or fourteen days at Newcastle waiting for a turn, owing to the want of accommodation, which walks away with all profit from a coal freight. Why should there be that detention when there are means to obviate it? I should say that a corporate body for the management of these matters should be granted to Newcastle for the management of all these matters, and they should have borrowing powers. No doubt we shall have immigration here again, and not a fourth of the ships that come here with immigrants can be loaded for England, so that they will be looking for coal freights, and may be detained for three months—valuable ships worth £25,000.

95. Have you been through all the clauses of this Bill? Yes.

96. Do you approve of the provision for making masters and mates undergo examination for certificates of competency? Yes, certainly.

97. And also for taking away their certificates in case of misconduct? Yes.

98. Perhaps you will be good enough to go through the Bill and offer any suggestions that may occur to you as to the different clauses? As I have said, we think that the powers given in clause 8 to the Treasurer should be handed over to the Marine Board.

99. Are the powers given to the Treasurer greater than the powers given to the Board of Trade in England? No, the Treasurer is entitled to all that, but subject to the Marine Board under him.

100. This Bill gives certain powers of appeal to the Treasurer—are these powers anything beyond what are given to the Board of Trade in England? Pretty much the same thing. Clause 10—we want added to that something to bring the Shipping Office under the control of the Marine Board.

101. *Mr. Wilson.*] As to clause 11, it has been suggested that the jurisdiction of the Marine Board shall extend over two leagues from the coast instead of one? I see no objection to that. In clause 19, third part, we do not know what you mean by "premises"; we would rather say any part of a ship. Then in the fifth part we think the powers proposed to be given to individual members should be confined to the Board collectively. Clause 22: Times appointed for the surveys. We want to expunge four words, "six months preceding date," in the ninth and tenth lines.

102. *Chairman.*] What is your object? Say a steamship's certificate expires on the 31st December, and she does not return to port for a month or two afterwards; she is then surveyed in the interval between 31st December and 30th June; and what we want is that her certificate shall date from the time of survey.

103. That is the case—every certificate has a duration of six months? It does not say that here.

104. *Mr. Wilson.*] You wish that every certificate should run for six months from the actual date of survey? Yes.

105. *Mr. Brookes.*] It virtually means that any survey should determine the currency of the certificate? Yes. The certificate may have a month to run when she leaves the port, and she may be away three months; all we want is that the certificate should run from the date of the next survey. Clause 27: Fees to be paid for certificates. Captain Wiseman suggests that the following should be the scale of fees:—

When the tonnage of such steamship shall not exceed 50 tons .....	20s.	
From 50 to 200 tons.....	40s.	
" 100 " 300 " .....	60s.	
" 300 " 500 " .....	80s.	
" 500 and upwards .....	100s.	106.

- Capt. Henry Burns.  
22 Sept., 1870.
106. *Chairman.*] Captain Trouton suggests that the penalty for overcrowding passengers, provided in clause 31, is not sufficiently high, and that outside the harbour it ought to be £50, and 20s. per head for every passenger over the proper number. What is your opinion? Captain Trouton is more interested in steamships than the majority of our Committee. I would have no objection to that. If people break the law I do not see why they should not pay for it, and we ought to look to the safety of passengers.
107. Captain Trouton also says a Steam Company should have the power to detain the luggage of passengers where they do not pay their fares? I think they ought. Clause 44: Owner or charterer to enter into a bond of £500 before ship cleared out. "Before any foreign-going steamship shall clear out, &c." I think you ought to erase the word going, and make it apply to any foreign steamship.
108. To vessels under a foreign flag? Yes. That is what this bond is required for. It is not necessary in the case of our own steamships going to foreign ports. For instance, the "Wonga Wonga" is a "foreign-going" ship. In the case of foreign-owned steamships we do not object to it. In clause 45 we think there should be something to the effect that the Shipping Office should be under the control of the Board.
109. *Mr. Brookes.*] Have the Marine Boards got the control of the Shipping Offices in England? Yes. Clause 47. We wish to make it read so that all Colonial-owned and Colonial-registered ships should be exempt from pilotage when they carry certificated masters. We want to erase all the words from "trading," in the second line, down to "trade," in the fourth line.
110. *Chairman.*] What is your object? We want to free our Colonial ships from pilotage. We want also, in the same clause, to have a yearly rate of 8d. per ton for light and tonnage dues, instead of a half-yearly one of 4d. We want the pilotage dues expunged.
111. *Mr. Wilson.*] It has been suggested that all whalers should be allowed to enter the port free? Certainly; we propose to strike out the words which apply to them. I think we ought to exempt whalers from all charges. We ought to do everything to encourage them to come here. It is from the Customs, however, that they receive so much obstruction.
112. *Chairman.*] Do you not think it is an advantage to have the dues payable half-yearly? Let it be yearly or half-yearly; all we want is to call it by its proper name. We want to pay for tonnage and light dues 8d. per ton per year, and to do away with compulsory pilotage. It is done away with in England in every port. Clause 50: Licenses to be delivered up when required, and returned on death. We had a great debate whether a dead man's license should be delivered up or not. Perhaps his widow might like to keep it as a memento, and why should she not? We want to erase the words from "license," in the second line, to "Board," in the fourth. In clause 51, erase from "coast-trade ships" to "whaling trade," to make it uniform with the proposed alteration in clause 47. We should exempt whalers from tonnage and light dues, and if they choose to take a pilot let them pay for it. That is one of the objects of making the charges distinct.
113. Do you really believe it would induce them to come here? I know it. I believe that is part of the reason why they do not come; our Customs' regulations are also another objection.
114. What would be the charges payable to the Government by an ordinary whaler calling here? I have here an account of what was paid by a whaler called the "Metaris," either to the Government, or in consequence of the regulations rendering certain entries necessary:—"Paid inward pilotage and entry, £5 2s. 6d." This is twice this ship has paid this year. "Transshipping entry for sperm oil, 5s." That we object to. "Overtime applications, 2s. 6d." That is a thing we object to. "Application to land whaling gear, 2s. 6d." This had paid duty once already. There should be no necessity for making such an application, and therefore no charge. Then as to the overtime, when a whaler comes here he wants to be in a position to work from 6 to 6.
115. Does not the necessity for that application arise from these articles being dutiable? Yes; but they are not imported for consumption. A man is obliged to keep ten or twelve men waiting till the Custom House is opened, and perhaps it is 12 o'clock before he gets the entry. It is the obstruction, the nuisance, the way it impedes trade, that is objected to. "Outward pilotage and entry, £5 2s. 6d.;" "Shipping Office fees and stamps, £5 7s.;" "Clearing Customs and Shipping Office, £1 1s." If we had these things under our control we might be able to effect some retrenchment in the matter.
116. You say the port charges are one difficulty in the way of whalers coming here? They are one difficulty.
117. If they are reduced, as proposed in this Bill, of course that will lessen that difficulty? Yes.
118. Is it not a fact that there is a difficulty in this port of getting whalers' crews? Not the slightest; I can always get men; so can anybody else.
119. Does not that impression prevail among foreign whalers? There was some difficulty during the gold times, but that has passed.
120. Does not the impression still prevail, that there is a difficulty not only in keeping their crews, but in getting practical whalers? Whalers do not look for practical men; all they look for are officers and boat-steerers.
121. We have been told that foreign whalers will not come to this port on account of the difficulties of the port; and I understand you to say the same thing—? The difficulties emanating from the laws and the Customs.
122. Do not foreign whalers dread, when they come to this port, not only that they may lose their crews, but that they will be unable to get other crews? No; nothing of the sort. There is no more difficulty on that account than in New Zealand; and they are aware of it. It is the charges and obstruction through the Custom House they object to—this duty on their oil, which leads to all this surveillance. They cannot open the hatches before 9 and must close them at 4.
123. A great many whalers go to New Zealand? Yes, fifty or sixty.
124. Do not the same difficulties prevail there? No; they are free in New Zealand.
125. Are not Customs' officers placed on board? No; there is no duty on oil in New Zealand.
126. *Mr. Brookes.*] Would not Customs' officers be required for other purposes than because dutiable articles were on board. Under the guise of whalers they might be smugglers? There is no objection to putting Customs' officers on board, but there should be no obstruction to the ship working from 6 to 6. The duty on oil, rendering so much surveillance necessary, is one of the things that prevents the whalers coming here;—the obstruction they receive from the Customs in consequence of this duty upon oil.
127. *Chairman.*] We do not put duty upon oil in transit? No; but you put it under surveillance. They have to ask for permission to work over-time, and so on.

FRIDAY, 30 SEPTEMBER, 1870.

Present:—

MR. ALEXANDER, | MR. WILSON.

THE HON. SAUL SAMUEL, ESQ., IN THE CHAIR.

Captain James Henry Gibbons called in and examined:—

128. *Chairman.*] You are commander of the ship "Constance"? Yes, I am captain and half-owner.
129. You have had considerable experience as a commander? Nine or ten years.
130. You are aware that we desire to introduce into this Colony a practice similar to that prevailing in the Mother country for the examination of masters and mates, and for other matters relating to the management of the mercantile marine. Do you think such a measure desirable here? I do.
131. Have you had a copy of this Bill sent you? I have had a copy; I have just skimmed it over, not having had much time to look at it.
132. You know what the principles of the Bill are? Yes.
133. Have you been frequently to this port? Yes, I have been sailing out of it for the last five or six years.
134. Is there anything in connection with the management of our port that strikes you as defective? I think the pilotage system might be amended a good deal. I think compulsory pilotage for Colonial ships is out of all character—compelling vessels, if they go off the coast at all, to take pilots. If I go to New Zealand or any of the Colonies I need not take a pilot, but if I go to the South Sea Islands, Java, or China, I must take one. I cannot see why that should be.
135. You think that the exemption certificates that are given to masters in the Intercolonial trade should be extended beyond the Intercolonial trade? Yes. I would put it in the shape of light dues.
136. Do you think a number of dues are preferable to a fixed charge? I would make a fixed charge of so much a year upon Colonial vessels.
137. At present you are aware there is only one charge, which includes lights, pilotage, and everything connected with the port? Yes.
138. Do you think it desirable that there should be a variety of charges, such as light dues, pilot dues, and tonnage dues? I would make one charge for light dues and another for pilotage, the same as is done in any other place; and let foreign vessels or English vessels employ a pilot.
139. Do you consider our charges heavy for a ship of your class? No, I consider they are very light.
140. What is the tonnage of your ship? 351 tons register.
141. Is the accommodation of the port such as you think sufficient? It is very good. I have no fault to find with it.
142. Is it not considered an inconvenience, and indeed rather a serious drawback at times, that so long a period as seven days should be given for the entry of goods after arrival of a ship? I think so. It affects vessels in the foreign trade most. I fancy forty-eight hours would be quite sufficient to get entries passed.
143. I presume that when you arrive here, so far as the cargo is concerned, your contract is completed? When it is delivered.
144. You think that parties interested ought to be ready to receive delivery at once? Yes; within a reasonable time—say forty-eight hours.
145. You think forty-eight hours would be ample? Yes.
146. Generally, I suppose, you approve of the principles of the Mercantile Marine Act of the Mother country? Yes.
147. There is nothing, I suppose, in this Bill (so far as you have been able to consider it), that appears to you very objectionable? I think the constitution of the Marine Board is objectionable. I think it ought to be the same as at Home—two-thirds elected by the shipowners, and one-third nominated by the Government.
148. Does it not strike you that two-thirds elected is rather a large proportion? Scarcely. The members elected will probably not attend so regularly as those appointed by the Government, so that there will seldom be more than an equal party on either side.
149. In this Colony shipowners are mostly owners of small vessels? Yes.
150. They do not own the same class of ships as in the Mother country? No.
151. Do you not think that is rather an objection to giving too large a share of representation to the shipowners? I think the shipowners will select the best men they have, and there are some very well informed men amongst the shipowners of the port.
152. Of course the Board is, in a great measure, intended to control shipowners, and to see that they properly manage their ships and appoint proper masters? I suppose you will have examiners as well as the Board, for granting certificates. I certainly would appoint competent men as examiners.
153. If the Board consisted of seven, and three were elected, would not that be a fair proportion? I should say four should be elected and three nominated.
154. Do you think it desirable the Chairman should have a casting vote? I think I should take it by the majority of the meeting, and let the Chairman have a vote the same as anyone else.
155. But you are quite clear it is desirable to have a part of the Board elected? Yes. It is so at Home, and I do not see why it should not be so here.
156. They will have no powers beyond the administration of the law;—you are aware of that? Yes.
157. Is there any suggestion you could offer with regard to the management of the port in any way? I think whalers should be admitted free from all dues, as they are in New Zealand. A large number of whalers call there for supplies, and they are not obliged to pay for pilots unless they require them. No doubt these vessels expend a good deal of money in the ports.
158. *Mr. Wilson.*] Do you think the privileges given to vessels in the Intercolonial trade should be extended to vessels trading to the South Seas? I think so, if they are Colonial-owned.
159. That they should not be looked upon as "foreign-going" ships? No. I think all Colonial vessels should be free from pilotage, unless they choose to take pilots. If a man is competent to take a vessel out of the harbour when she is going to New Zealand, he is just as competent to do so when going to the South Sea Islands.

Capt.  
J. H. Gibbons.  
30 Sept., 1870.

- Capt. J. H. Gibbons. 160. Do you think such measures would have the effect of securing more of the South Sea Island trade? Yes; I believe in free ports, from my knowledge of what takes place at Singapore and Hongkong. I have been in the habit of going to those places for the last seventeen years, and I have seen at Hongkong as many as 290 vessels. Being free ports, ships call there first for information or orders. It costs them nothing but five dollars for light dues; but if they had to pay heavy dues they would be scattered about to different ports.
- 80 Sept., 1870. 161. *Chairman.*] Do I understand you to say that the whole charge is five dollars? Five dollars at Singapore, and the same at Hongkong.
162. Is nothing charged for pilotage? No, not compulsorily. If you like to take a pilot you pay him. The pilots are on their own bottom there, the same as they are at Adelaide.
163. *Mr. Wilson.*] With regard to Colonial-owned ships and coasting vessels, all you would ask them to pay would be light dues? That is all.
164. With regard to foreign-owned and foreign-going ships, would you make the pilotage include the light dues, or would you have two distinct charges? I would make them distinct.
165. You would make foreign ships pay for pilotage and for light dues;—not have the two combined into one? No, I would keep them distinct.
166. Are the members of the Marine Boards in England paid? No, I do not think so. I have two relations on the Marine Board at Newcastle—a brother-in-law and a cousin—and I do not think they get any pay.
167. Are the duties at all onerous? They have just got to meet occasionally, the same as any committee.
168. Do you not consider that the duties of a Board, such as is proposed to be formed by this Bill, would be of a much more onerous character than those of the members of a Marine Board in one of the English ports? No, I do not think so. I think there are plenty of people here, with very little to do, who would be glad of an afternoon's amusement on such a Board as this,—once a fortnight or so. I suppose if the members got a guinea a meeting they would be content.
169. You have no other complaints to make of the charges or treatment in the port? No, except that I think the Shipping Office is a great bother, requiring us to make out a crew-list and passenger-list every trip.
170. *Chairman.*] That is the case in every British port, is it not, that you have to ship your crew in the same way? We have to ship our crew in the English ports, but I do not think we have to give in passenger-lists to the Shipping Office. It is sometimes almost impossible to do it. Say we are to sail to-morrow at 3 o'clock, we clear at 2 o'clock, and we may book twenty or thirty passengers between 2 and 3 o'clock. I do not think that going from one colony to another it should be necessary to have passenger-lists.
171. *Mr. Wilson.*] So far as relates to shipping the crews, would you still adhere to that? The articles might be drawn up in the Shipping Office and stamped, and Colonial vessels might be allowed to ship their crews on board their ships.
172. *Chairman.*] There are no serious difficulties that you have found in connection with the management of our port? No, I have no fault to find.
173. Do you find the facilities for discharging cargo sufficient? No, I do not. This overtime business is a great infliction. I come here with only ballast on board, and they go and stick me in for overtime for the ballast. They seal my hatches up at 4 o'clock, and only allow me to work from 9 to 4.
174. You have to pay over-time if you employ a Customs' officer? We have to pay over-time if we want to work before 9 or after 4 o'clock. No one will attempt to smuggle ballast. It is a duty put on in no other part of the world except this port. This last time I came in here they sealed my hatches up at 4 o'clock. I do not think it is the custom in other ports with vessels discharging ballast—not with coasting vessels at all events.
175. Yours is not a coasting vessel? We trade to New Zealand—Intercolonial. If you would give us from 8 to 5 we should not grumble. Sometimes you will see that one officer has three or four ships to look after, getting half-a-crown an hour over-time from each ship.
176. You have been to the port of Newcastle? Yes, several times.
177. Does anything suggest itself to you in connection with that port? It is rather short of accommodation.
178. *Mr. Brookes.*] What is your impression with regard to the imposition of tonnage dues? I was saying I would have one charge for light dues, and a separate charge for pilotage, and free all Intercolonial and coasting vessels from pilotage, unless they chose to employ a pilot. I would certainly make pilotage compulsory on all English and foreign vessels. As shipowners, we do not object to pay light dues ourselves, but we think these vessels coming long voyages, and visiting here only once in twelve months, should not be on the same footing as we are, because we are here so often.
179. The oftener you sail in and out of the port the oftener you have the benefit of the advantages obtainable? But our frequent trips make the payments amount to a very large sum in the course of the year. If I am going to the Fijis I make perhaps five trips a year, and pay pilotage five times, whereas a vessel to England only pays once in the year; while the fact is that the pilots are kept for the accommodation of these foreign-going ships, not for ours. We can come in and out without a pilot at any time, night or day, having experience of the port. It comes very hard on the small vessels in the South Sea Island trade.
180. In the event of the tonnage dues being abolished, what charges would you suggest to compensate for them? I would charge either 4d. or 6d. a ton for light dues, and 6d. a ton for pilotage on all foreign-going vessels.
181. Is it your impression that the imposition of tonnage dues at Newcastle is prejudicial to that port? Yes, it does it no good. It is a far more expensive port than Sydney. They have tonnage dues there as well as other charges.
182. In addition to all the charges in Sydney, the tonnage dues at Newcastle are extra? Yes.
183. You said the accommodation at Newcastle was defective? Certainly it was when I was there two years ago. It was very deficient then. I cannot speak of it lately.
184. Do you refer to the lightering? It was very awkward for ballast when I was there. We had to go up the harbour to discharge ballast, and we then had to get stiffening and shift to the cranes to get loaded.
185. Are you aware that there are now jetties along Bullock Island, where vessels can go alongside? I have been told so. Newcastle is about the most expensive port in this part of the world, except, perhaps, Melbourne.

Captain Henry Burns called in and further examined:—

186. *Chairman.*] Will you continue your remarks upon the clauses of the Bill before the Committee—anything you object to? Clause 98: "Ship in ballast to carry proper quantity thereof." We propose to alter this clause so as to make it read in this way:—"It shall be lawful for the Marine Board, by such regulations as they shall deem fit, to fix the amount of ballast to be carried by any vessel, whether foreign-going or coast-trade ship; and the master or owner of any vessel proceeding to sea with less ballast than the amount so fixed upon by the said Board, shall for such offence incur a penalty not exceeding £50." I do not see any great importance in the alteration myself; but it was the opinion of the majority of our committee of thirteen gentlemen that it ought to be so altered. The word "shall" in the Bill was what the great stress was laid upon.

Capt. Henry  
Burns.  
30 Sept., 1870.

187. *Mr. Brookes.*] Some vessels are safe at sea with much less ballast in proportion to their tonnage than others? Certainly. There is provision made in the Bill for that—for the construction of the vessel.

188. The Board would have to take into consideration the construction of the vessel as well as her computed tonnage? Yes. There is no such thing as computed tonnage now—only register tonnage. In clause 102 we want to add the words "without proper authority," after the word "shall," in the first line. We ask for proper authority to let lading remain longer than twenty-four hours on a landing-place, if necessary. You may put out in twenty-four hours more than can be removed in that time. The authority, I imagine, we ought to be able to get from the Collector of Customs, or from the Board. Clause 103: "Tarpaulin to be used in taking in lading." We want instead of "lading" to use the words "ballast, coals, or other loose substance," because there are many kinds of lading which would not be in any danger of falling overboard while being shipped.

189. Do you think £5 too small a penalty for allowing anything to go overboard? I dare say it is. I have no objection to fix any penalty you like for a man breaking the law. Clause 104: "Vessels sunk or stranded to be removed; in default, to be removed and sold." We object to having the balance on the sale of any stranded ship removed by the Government, paid into the Treasury. If there is any balance we think the owner of the ship should get it.

190. *Chairman.*] You do not object to the Government having power to remove the ship? No.

191. *Mr. Brookes.*] Would you not consider a vessel left in the fairway like a vessel abandoned by the owner? Yes, she would be abandoned.

192. *Chairman.*] The clause provides also that if the proceeds of the sale of the vessel are insufficient to pay the expenses of raising her, the Government can proceed against the owners for the balance? That is the objection. If you undertake to raise the ship you should not charge the owner for the difference. Clause 106: "Timber, or other bulky articles, not to be left on any pier." We want to put in the words "without authority," after the words "two days."

193. *Mr. Brookes.*] The cases are very rare in which it would incommode anybody to leave timber there? It might, about landing-places like the Circular Quay, where there are wharves reserved for steamers and watermen. The clause is right enough; we only want power to give a little longer time to carry it out in special cases. Then again, we think that the surplus of any sale under the clause should go to the owner instead of to the Consolidated Revenue. We want also forty-eight hours' notice instead of twenty-four, to remove such articles; there may be bad weather or other causes of delay. Clause 108: "Duties of the Harbour Master." We want South Sea Islanders and coasting vessels exempted from this.

194. *Mr. Wilson.*] Would it not meet your object if it read, "whenever any *foreign-trade* ship," in the first line? Yes, that would do. Clause 114: "Scrapings from ships' bottoms not to be deposited in harbours, &c." The shipowners' committee want to erase that clause altogether; but I think, after the amount of money spent by the Government and the Companies in securing deep water, people should not be allowed to scrape the dirt from ships' bottoms into the harbour. But the opinion of the majority is that the clause should be erased. They say, if you give the Board authority to make by-laws, a by-law might be made to meet this.

195. Will you look at clause 127: "Copy of this Act, &c., to be kept on board ship";—is that necessary? I think the Government ought to supply these.

196. Do you think the master of a ship should be liable to a penalty if he is found without a copy of this Act on board his ship? Decidedly not. In all cases, wherever I have been, copies of the harbour regulations are furnished by the Government.

197. *Chairman.*] I suppose the schedules to the Bill are right? Yes, we do not object to the schedules.

198. *Mr. Wilson.*] Have you looked at Schedule F, about the dimensions of sea-going boats? I do not think there is any particular objection to it, because we are bound to carry the same amount of boats to comply with the rules of the underwriters.

199. Irrespective of that, do you think the number of boats here provided is sufficient? I think they are, as far as I have looked into it. These are all good boats, and I think there are quite enough of them—quite equal to what you will find in the P. and O. service, or any other passenger ships.

200. *Chairman.*] Have you any other suggestion to offer? No, I think I have said all I have to say.

201. With reference to the constitution of the Marine Board, do you think the shipping interest would be fairly represented if half the Board were elected? What I would suggest would be that the Government should nominate four members, with the Superintendent of Pilots as an *ex officio* member and chairman. I would not object to the Mayor being an *ex officio* member also. Very probably we may have a shipowner for Mayor next year. The shipowners, I think, should elect six members from their own body; a certain amount of tonnage being necessary as a qualification. At Home the amount is 250 tons, but we think it should be reduced here. The Board ought to elect annually from amongst themselves three nautical assessors.

202. What are to be their duties? To sit alongside a Magistrate when trying a case similar to the case of the "Aurifera," now before the Court. If we had had a Marine Board the master of that ship would not have been brought before a Police Court. The members of the Board should not receive any remuneration for the granting of certificates to steamships, or for granting certificates to masters, mates, and engineers, or for any inquiry instituted by the Government as to the loss of ships, &c.; but when any shipowner or other person may bring any charge against any shipmaster, charging him with drunkenness or any other misconduct, the nautical assessors should receive a fee of three guineas per day during the time they may be adjudicating the same. Should the person fail in proving his charge he should pay the fees;

- Capt. Henry Burns. fees; if the contrary, the Government should pay. They put these fees high so as to prevent vexatious litigation in these matters—to prevent fellows bringing up charges for nothing. There should be paid examiners of navigation, steam, and seamanship, whose appointment should be recommended by the Board to the Government,—the Board to have control of the Shipping Office, but always subject to the veto of the Treasurer. The assessors should sit in the same way as the Trinity Brothers sit beside the Judge in the Admiralty Court. When it becomes the duty of the Government to cause inquiry into the loss of a ship, the Marine Board institutes the inquiry, and if the case comes before the Police Court the nautical assessors would go and sit with the Water Police Magistrate to investigate it.
- 30 Sept., 1870. 203. *Mr. Brookes.*] You are aware that tonnage dues are demanded in Newcastle—4d. a ton? Yes.
204. What is your opinion with respect to that impost? I think it most unjust and heavy upon shipping.
205. Do you believe the imposition of these dues is prejudicial to the trade of the port? Certainly. It has deterred me from sending ships there, because I knew these dues would absorb the whole of the extra freight I would get for going there.
206. What would you suggest in lieu of tonnage dues for revenue? I think a wharfage rate on coal would be a good substitute. The Government have spent a large amount of money for the benefit of the coal proprietors, and it is only just they should pay for it.
207. Would you put a wharfage due on each ton of coal shipped? I would—a shilling per ton. It would make no difference to the coal proprietors, or the people in New South Wales. They would not sell a ton less.
208. You believe that if this impost were removed from the shipping it would have a tendency to encourage ships to go there? Most decidedly.
209. I believe it is the fact that Newcastle can give a cargo at all times, and to any part of the world, when no other port could do so? Certainly.
210. Therefore it is very desirable to give the utmost encouragement to shipping to seek the port of Newcastle? Certainly. There is no doubt Newcastle is about the most expensive port I know of.

TUESDAY, 4 OCTOBER, 1870.

Present:—

MR. CHURCH, | MR. LLOYD,  
MR. WILSON.

THE HON. SAUL SAMUEL, ESQ., IN THE CHAIR.

Captain Charles Smith was called in and examined:—

- Capt. Chas. Smith. 211. *Chairman.*] You are a shipowner, I believe, Captain Smith? Yes.
- 4 Oct., 1870. 212. You have had considerable experience in connection with the mercantile marine of the Colony? Yes.
213. Have you had a copy of the Marine Board Bill sent to you? I have.
214. Have you considered its provisions? I have gone through the Bill very carefully.
215. Do you consider that there is any necessity for such a measure? There is no doubt a necessity for such a measure; but my own opinion is, that as the law is being consolidated in England now—and there is no doubt that the measure proposed there will pass during next session—in order to get a complete law here to work by, it would be preferable to wait and get the English Act. It would be preferable for many reasons. Both with regard to steam and merchant shipping there are many alterations which have taken place, and some of them have been in force since 1862 in England. We should get full details, for instance, as to how a ship is to deal with goods when they are landed, and when they are not taken by the merchant; and other matters. We have been legislating backwards and forwards, and the law is now in such a conglomerate state that no one can tell when he goes to court which is which. But by getting a full and complete law passed at once you will do away with all that.
216. The Bill which it is proposed to introduce into the British Parliament is a consolidation of all the Acts? It is a consolidation of all the Acts.
217. That is of the Customs' Act and the Shipping Act? Yes, and the amended Shipping Act of 1862.
218. And of the Act regulating the mercantile marine? Yes; also with regard to local boards; in fact everything relating to the commerce of Great Britain.
219. But the object which this Bill is proposed to provide for is also one of the objects of that Bill? Yes, and that is the reason why I think there will be clauses in that Bill which will so alter what we have heretofore been working under, as that in some measure it would be desirable to see what those amendments are. It has been very fully discussed all over Britain, and the papers have been full of it for nearly twelve months. And the House of Commons is composed of gentlemen interested in the shipping trade, and matters of this kind are more fully discussed there than here.
220. Is it not of great consequence that we should, at the earliest possible period, provide for the examination of masters, mates, and engineers, in order to protect life and property? No doubt it is very desirable; but at the same time I apprehend that we should not have long to wait before we should have a complete code to go by in all respects.
221. We should lose about a year, should we not? I should think not. The Bill has been a long time before the public, and it has merely lapsed now owing to the session coming to a close.
222. There is one provision in this Bill which provides that the certificate granted by the Steam Navigation Board in Victoria should have force here, and that our certificate from the Steam Navigation Board here should have force in that Colony;—is not that a matter of very great urgency? I think it is very desirable—very desirable.
223. Independently of the objection that you have just now urged—that objection being that it is in your opinion desirable to wait until they have legislated on these matters in England;—are there any clauses of this Bill which appear to you to be objectionable and to require amendment? There are a great many. I may state broadly that my views are that we ought to assimilate our legislation to that of England as nearly as we possibly can, having regard to our own circumstances.

Capt.  
Chas. Smith.  
4 Oct., 1870.

224. Will you state in what way? Yes. The Board here is to be nominated. Now at Home it is one-third nominated and two-thirds elective.
225. Do you think that it is desirable that we should have the elective element introduced here? I think that it is very desirable.
226. In what proportion should it be elective? I think that if it were half elective and half nominated it would meet the case.
227. Half and half? Yes; or the Government might appoint four with the Chairman, and say that six are elected by the shipowners.
228. Do you think that it would be a fair proportion if the Government were to appoint four and a Chairman, leaving four to be elected by the shipowners? I should not object to that.
229. That would be five nominated by the Government and four elected? Yes.
230. Would you make the qualification for the election of representatives of shipowners to this Board in the same way as in England? Not exactly the same way. It is 250 tons which gives a man a vote in England; but that would exclude a great many very good men here, who have got little vessels and who I think should have a vote. If a man owned a vessel of say about sixty tons, I would give him a vote; and I would give a vote for every 150 tons up to ten votes. At Home they get a vote for every 250 tons they own up to ten votes.
231. Do you think that the members of the Board should be paid? I think not.
232. Do you think that we should have any difficulty in getting a quorum to attend if we did not remunerate them? I think that where a Board is elected its members ought not to be remunerated.
233. Is there anything else which occurs to you? Not with regard to that; but there is with regard to the general powers of the Marine Board. I think that the Colonial Treasurer ought to have the power of veto on all acts of the Board; but not that he should have the power to control it.
234. The Board itself has the power of recommending, which is practically giving them the power of appointing? Yes; but we have had experience of the way in which these recommendations may be brought about. I think that the Shipping Office ought to be under the control of this Board the same as it is at Home.
235. It is so in England? It is so in England. The powers which are here given to members of the Board are considered by the shipping interest to be rather large; but I do not myself see any objection to them.
236. The object of the Bill is in some way to enable the Board to control the shipowners? No doubt. They had an objection that one member of the Board could do it. But it is so now. It has always worked well heretofore, and I do not see why it should not work well again. The Shipowners' Association would give the powers referred to in clause 19 of the Bill to the Board, but not to every member of it.
237. Whoever it is that has this particular power must be appointed in accordance with the provisions of this Act? I am quite aware of that; but it says, "every member of the Marine Board," that is every member of the Marine Board shall have the same powers as their own inspector.
238. The clause reads: "Every member of the Marine Board, or of a local Marine Board, and every inspector and surveyor appointed in pursuance of the provisions of this Act, shall have and exercise the following powers, that is to say"—you see he must be appointed in a particular way to do these things;—he must be appointed in pursuance of the provisions of the Act? I see; but there is the objection which I have stated on the part of the Shipowners' Association. I think that the fifth section of the 19th clause should be made to apply to the Board, and not to every member of it. The section should read, "*The Board* may by summons under *their* hands require the attendance of all such persons as *they* think fit to call before *them*" &c. But in doing that it is necessary that power should be given to the Board to appoint one of its members to do all and anything which they may appoint. It is necessary for this reason: We find disputes between the surveyors sometimes, and we arrive at a conclusion much easier when one or two of our own number go and see for ourselves what is really the case. By that means we arrive at a conclusion much more readily than we could do by appointing any man to go and report to us. In the fourth and fifth lines of clause 22 I would strike out the words "*of six months preceding date*," so as to make the clause read in this way:—"In all cases where the same may be possible, such survey shall be made and such declaration transmitted in the course of the thirty days from and after the expiration of the certificate on last survey granted" &c. If the words are retained they make the clause very indefinite.
239. *Mr. Wilson.*] Turning back to the 19th clause, there is one provision with regard to the fifth portion of it which you would amend. The clause reads: "He may summon under his hand," &c.;—you are quite clear that the Board should have that power? I am quite clear on that point, that these powers should only extend to the Board.
240. With regard to the 21st clause, it is to the following effect:—"The owner of every steamship constructed or intended to carry passengers shall cause such steamship to be surveyed at least twice in every year";—would you think it necessary that every steamship should be surveyed, whether employed or not? If a vessel is laid up she is not surveyed.
241. Would she not be under a certain compulsion to get surveyed? No; it is not necessary for a vessel to get surveyed until she clears at the Customs. It may lie twelve months without clearing. Then I turn to clause 27, and I think that it would be better if the clause read from the thirty-second line of the page as follows:—"Where such tonnage exceeds one hundred, and does not exceed *three* hundred, the sum of three pounds. Where such tonnage exceeds *three* hundred, but does not exceed *five* hundred, tons, the sum of four pounds. And where such tonnage exceeds *five* hundred tons, the sum of five pounds."
242. *Chairman.*] That will affect the revenue a little bit—will it not? I do not think that it will do it much harm.
243. *Mr. Church.*] On what grounds do you think that those alterations should be made? I think that they should be made on the ground that they were not equitable before. A vessel of 1,000 tons was done for the same rate as a vessel of 300 tons; and therefore I consider it was not equitable. We all know the rates of tonnage of the principal vessels on the coast, and I have tried to make it as equitable as I can. I turn now to clause 39; that ought to be exploded altogether; it is so now.
244. *Mr. Wilson.*] That is with regard to water-tight compartments? They have got water-tight compartments, but the middle compartments are exploded altogether.
245. *Chairman.*] Are you aware that there is a provision in the Bill at Home the same as this? Partly. It has not got the same provision as this. This is the old law.

Capt.  
Chas. Smith.  
4 Oct., 1870.

246. *Mr. Lloyd.*] Do you know that very serious cases have occurred in which, had it not been for these water-tight compartments, there would have been a painful loss of life and property? There are compartments fore and aft. It has been found that where a vessel is all compartments, there are too many of them. They got filled with water and could not be kept clear. It has been found that the ship could not be saved where the middle compartments were full, under any circumstances. The practice is now to have one at the stern, and one forwards.

247. *Mr. Wilson.*] This 39th clause reads: "The owner of every steamship built of iron of one hundred tons burden, or upwards, the building of which shall have been commenced since the twenty-fourth day of July, one thousand eight hundred and forty-seven, and the owner of every steamship built of iron of less burden than one hundred tons, the building of which shall have commenced after the twenty-eighth day of December, one thousand eight hundred and fifty-two, and all steamships used as steam tugs, the building of which shall have commenced after the passing of this Act, shall cause the same to be divided by transverse water-tight partitions, so that the fore-part of such steamship shall be separated from the engine-room by one of such partitions, and so that the after-part of such steamship shall be separated from the engine-room by another of such partitions."—That is all that this Bill provides for, two compartments—one forward and the other aft? Well that is exactly what it ought to be. I confess that I read it the other way. I was misled by the words of the old Bill, which are in it. Going on to clause 44, it requires the owners to give a bond of £500. I think that the certificate of the Board ought to be quite sufficient as it is now. With reference to clause 46, "Pilotage rates," I would give the Board power to alter or amend, with the sanction of the Government.

248. *Chairman.*] Power to alter the rates? With the sanction of the Government from time to time. You may find it necessary to put on a larger tonnage rate at some time, or to reduce it.

249. You think that the rates should not be imperatively fixed by law, but that the Board should have power at any time to recommend the Government to alter them? Exactly so. The Government ought to have power to control it.

250. *Mr. Wilson.*] Do you think, with regard to clause 46, that all Colonial-owned ships should be free from pilotage? Certainly not. But my idea is that you ought to make the South Sea Islands, within certain limits, together with all the Australian Colonies, home trade.

251. *Chairman.*] That is to say, that the exemption certificate should be made to apply to vessels in the South Sea Island trade? Within the limit of certain latitude and longitude.

252. That might be defined from time to time by regulation by the Government? Yes, or it might be done now.

253. Would you define it under the Bill? I think so; it is not likely to be altered.

254. *Mr. Lloyd.*] Do you not think that it is very desirable that any ship coming in here without a pilot should be free from pilotage—that ships should not be called upon to pay for services they do not require? I think that you have not got power to make such a law. According to the Orders in Council every foreign-going ship is allowed into a British port under the same conditions as other ships, because every British ship is allowed to enter foreign ports on the same conditions as their own vessels are. Were you to make a Colonial vessel coming from London free of pilotage, the Home Government would compel you to make every British or French ship free of pilotage.

255. At San Francisco no vessel is required to pay pilotage unless it takes a pilot. The master must take a pilot or a steamer; but if he takes a steamer he does not pay pilotage dues? The practice here is that if a ship takes a steamer she pays half pilotage.

256. *Mr. Wilson.*] That is done to enable the Government to keep up a sufficient staff of pilots? It is necessary, for the safe conduct of ships, that the Government should have a sufficient staff of pilots. It is necessary that they should be remunerated and that the ships should remunerate them. I personally might not want the pilots, but there may be nine others who may want them. You must draw the line somewhere. If you make the Home trade free where the master has got a certificate, all our masters will get certificates who have not got them now. It would not be equitable to charge pilotage on English or foreign ships while Colonial ships were exempted.

257. *Chairman.*] We have only one charge I believe for pilotage and every other service here? It would be very desirable that this should be separate.

258. Do you think that the charges are excessive for all the services performed in the port? No; I think they are very reasonable.

259. Have you heard any complaints that the charges are excessive? No; I think the charges are very reasonable.

260. *Mr. Wilson.*] Would you admit whalers free? Yes, I would admit whalers free.

261. That is, free from pilotage where they did not employ a pilot? Yes; but it is the petty annoyances at the Customs—arising not from the law, but from practice—that keep whalers out here; the same annoyances as we all felt day by day. Their hatches are sealed up so that they cannot work only from 9 till 4. They will not put up with all the paraphernalia of ages gone by. Such a thing was not dreamed of in any other port belonging to Great Britain, excepting this.

262. *Chairman.*] You are not aware that the same practice is followed at Melbourne? I am aware that it is.

263. Then there are other ports besides this? Yes; but I really cannot see the force of it. You put tidewaiters on board, and if they are not to be trusted in this matter they are not fit to be trusted with the ship.

264. I have made inquiries, and I find that it is the practice in all the Colonial ports? It is a very barbarous practice. There is a man put on board to see that nothing is taken away improperly; and why then not let the ship's work go on?

265. But does not the labour of the officer cease after working hours? He is always there.

266. There is a regulation of the Customs that if the ships pay overtime to the tidewaiters they can work after the usual hours? There is a great deal of vexation in the working of the Customs. A ship comes out from London, and without any manifest the master gets his clearance at the London Customs House; but here he has not only to have a manifest but entries have to be passed four, five, and even six times. I have had to do it in shipping cocoanut oil that I got from the Kingsmill Group. There are a great many checks which I think that if a man of business had the working of, the Customs would be done away. I speak from actual experience in these matters. I have very little to do with these ships, but I can see the annoyance and trouble and the loss of time that takes place for that which I really cannot see is of any advantage to the revenue.

267. *Mr. Wilson.*] There would be no danger of the revenue being defrauded if some of these annoying restrictions were removed? The revenue could not be defrauded. If the captain makes out a manifest of all that he is going to take on board his ship, that ought to be check enough.

Capt.  
Chas. Smith.

268. *Chairman.*] I am assured that there is no practice carried out here at this Customs that is not in accordance with the rules of the Commissioners in England. There was a Board appointed of merchants, in Sydney, competent to deal with these matters, and they made a great many recommendations, all of which, I believe, have been carried out. After a ship comes from London all that is done is simply to see that the law has been complied with, and she is allowed to sail? All that is necessary can be done in ten minutes at the London Customs House.

4 Oct., 1870.

269. According to the English tariff, the duty payable is confined to a very few articles, but here our tariff embraces nearly every article that you can mention? I am speaking of export ships, in the case of which it does not matter to the revenue how much cargo is taken away.

270. In what way are ships retarded by the Customs' entries? The fact is that it takes you more than a day to clear one of these ships going away with a cargo of our produce with perhaps a few things from the islands to London.

271. Are there any other points in the Bill to which you wish to call attention? With regard to the 47th clause I have stated what my views are in respect to what should be the Home trade; and I think that all out of that ought to pay pilotage.

272. *Mr. Wilson.*] Excepting whalers? Excepting whalers.

273. *Chairman.*] And to whalers you would charge pilotage only in those cases where they took a pilot? Exactly so; wherever they took the services of a pilot they should pay. There is in the 47th clause a provision with regard to coasting vessels. The payment of the rate once ought to exempt them from a similar charge in all ports of New South Wales. The practice now is to make coasting vessels pay so much a year for every port which they enter, and that I think is rather hard. A vessel may go to five or six ports during the six months, and in each port she had to pay the half-yearly rate; whereas in England vessels in the coasting trade pay the half-yearly rate once, and that clears them for all the ports of the United Kingdom. China and other countries adopt the same system of paying *once* in six months, which clears all ports on the coast.

274. *Mr. Wilson.*] What rates are you alluding to? The lighting or harbour rate, as we call it here.

275. *Chairman.*] There are various other dues in England? Yes.

276. That a vessel has always got to pay when she goes into the dock? We have no docks here; but a vessel has to pay wharfage dues, which take the place of a similar charge in England.

277. Would you have only one charge? I think that the light dues ought to be separate from the pilotage dues.

278. Do you not think that it simplifies the matter by having only one charge? It simplifies it; but it lets a large ship come into Sydney harbour, which only comes here once or twice a year, at a comparatively small cost, while you are putting it on your own coasters. In fact most of the revenue is derived from coasting vessels, which ought to be in a great measure placed on larger vessels.

279. *Mr. Church.*] Do you think that we should have, as in former times, light dues levied on vessels coming from the north or the south, and that they should be collected at the time the vessel comes in? Yes; or you may charge a half-yearly light rate, but when that rate is paid once in the half-year it ought not to be charged at every port.

280. *Chairman.*] You mean to say, that one charge ought to clear a vessel at Sydney, Newcastle, and all the ports on the coast? Yes; so that a vessel may go to Newcastle, Clarence, Richmond, or any other port, and the receipt that it has paid the rate at Sydney ought to clear it for all other ports. Coasting vessels have to pay very large sums.

281. Does not the exemption certificate clear them from all these rates? From pilotage it does, but not from these dues.

282. Supposing a man has an exemption certificate for half a year or a year, that clears him for the port of Sydney; but is he bound to pay if he takes his ship into Newcastle? If he takes it there he has to pay port dues again; if he goes to the Clarence or the Richmond he has to pay port dues again, and it may all be within two months.

283. Does his exemption certificate enable him to take his vessel into all these places, and dispense with a pilot? Yes; it enables him to dispense with a pilot, but not to get rid of all these dues.

284. His exemption certificate relieves him of pilotage for all the ports? Yes.

285. But he has to pay the port dues at each place? Yes. The custom in England is that you pay that half-yearly charge, and you can go to any port you please round the United Kingdom. I think it would be preferable to have one charge here for six months, and let a man go to what port he pleases on the coast. In clause 50 I would propose to strike out part of the second and the third and fourth lines, so as to make the clause read thus:—"Every licensed pilot, when required by the Marine Board, shall produce or deliver up his license; and any pilot or person failing to comply with the provisions of this section shall incur a penalty not exceeding ten pounds."

286. *Mr. Wilson.*] That is, you propose to leave out the words, "on the death of any qualified pilot the person into whose hands the license happens to fall shall without delay transmit the same to the said Board"? Yes, exactly.

287. *Chairman.*] The object of this clause is to prevent persons from making use of the certificate improperly? I think that the clause would do without the words that I propose to strike out; for it would be making a penalty where it would be hard to keep clear of it.

288. I should like to ask you a question about clause 72: You will recollect that there are two classes of certificates proposed for masters and mates; one is for foreign-going ships, and the other is for vessels engaged in the coasting trade;—do you not think that it would be desirable to have a third certificate for the Intercolonial trade? A certificate of competency, I take it, embraces either one or the other. If a man is examined and found competent to navigate a vessel in a certain trade, the Board will give him a certificate stating what he is competent to do.

289. I think an Intercolonial vessel would here be what is generally known as a foreign-going ship in the meaning of the clause, and of the interpretation clause where it speaks of jurisdiction. A vessel going to Victoria would be considered a foreign-going ship under this Bill; and would it not therefore be desirable to have another class of certificates specially applicable to Intercolonial vessels? You might make a certificate

Capt.  
Chas. Smith.  
4 Oct., 1870.

tificate of competency for Intercolonial vessels. I should think it would be very desirable. There are a number of good men capable of commanding these vessels who could not get service for foreign-going vessels. If these men pass a Board it would be quite competent for that Board to give them a certificate of competency within certain limits.

290. If it is considered desirable, the Bill will have to be altered so as to provide for a third certificate—a third grade? I should think it would be very desirable. In clause 96 you make it compulsory for a vessel to be swung. I would alter the last three lines of the clause so as to make it read: "And any master or owner who may request to have his ship swung for the aforesaid purpose, shall be entitled to do so on payment of the fees chargeable thereon." You make it compulsory and fine the master or owner if he does not do it. I do not think that it should be compulsory. I think that it would be quite sufficient to leave it so that he may swing her or not, as he likes.

291. "It shall be lawful for the Marine Board to make regulations for the swinging of ships, for the purpose of ascertaining and adjusting any deviation in their compasses." You see the clause says that it shall be lawful that they may do it? But the clause makes it compulsory. As soon as this becomes law any policeman can summon the master or owner to the Police Court for not doing it.

292. Do you not think that it would be well to give the Board the power to make a regulation, to be approved by the Government, which is, after all, what the clause provides? Yes; that would do.

293. *Mr. Wilson.*] Suppose you stop at the word "Act," in the sixth line of the clause, it would then be all right? Yes; and in like manner I would stop at the end of the second line of the 97th clause, leaving that clause to stand in this way: "It shall be lawful for the Marine Board to make regulations, fixing the load-water-line of all foreign-going and coast trade ships." I find that by the new Act, which is just about to come into force at Home, all that they propose to do there is to fix the load-water-line. The authorities take a note of that; and if anything turns up by-and-by, that the ship has been overloaded, then it goes against them. But they do not attempt to interfere with the loading of the ship or with the owner in any way. All that the authorities do is to take a note of the condition in which the ship went to sea in; and, if anything happened, they came down upon them. As to the next clause (98), I would give the Board power to make regulations as to ballast; but I would not fix anything or any penalty by the Act. I would omit the words, "and any master or owner of such a ship or vessel who shall proceed, or attempt to proceed, to sea in violation hereof, or of any regulation made hereunder, shall incur a penalty not exceeding fifty pounds," at the end of the clause. Coming to the 101st clause, I would insert the words, "detrimental to the harbour," so as to make the clause read: "The master of any vessel riding, or being in any navigable waters from which any lading *detrimental to the harbour* shall be allowed to fall overboard," &c. Then, in clause 102 I would insert the words, "*without proper authority*," so that the clause should stand: "If from any vessel in any navigable waters any lading shall be discharged *without proper authority* upon any public place," &c. I would alter the beginning of the 103rd clause, and make it read in this way: "If in taking *ballast, coals, or any other loose substance*, into any vessel, or in discharging *the same* from any vessel into any other vessel," &c.

294. *Chairman.*] The interpretation clause shows what lading is? Well, if I am taking in a lot of tallow it may apply to that as well. I wish to limit it to substances that would be detrimental to the harbour. In the 104th clause I would strike out these words, "and if the money arising from such sale shall not be sufficient to defray such charges and expenses, the excess of such charges and expenses beyond the amount of the money arising from such sale shall be chargeable to and against the owner or owners of such vessel; and if not paid within five days after having been demanded by authority of such Justices shall be levied and recovered in manner hereinafter directed."

295. What is the object of that alteration? The object is simply this: If a man loses his vessel in the harbour, and if he gets her up, well and good; but if he does not get her up, and the Board gets her up, that then the Board shall apply all the proceeds arising from the sale of the vessel towards the cost of getting her up. I think it is very hard for a man to be called upon not only to take his vessel out of the way, but also to be sued and fined for doing so. It is not so in the English Act, which provides that there shall be power to do this, and to apply the proceeds of the sale thereto.

296. If the navigation of the fairway is impeded, you would not surely impose upon the Government the cost of removing the obstruction which came there by no act of their own? It may just so happen that it may be my vessel that is run down, and that the man who ran it down is a pauper; I should then be called upon not only to lose my vessel but to go to a very heavy expense in removing her out of the way, and I have no redress.

297. Do you think that the Government should be called upon to do it? I think that the Government should be called upon to remove the vessel instead of me.

298. Suppose that there is a collision in the harbour between two steamers,—that one steamer is sunk, and that the person who owns that steamer does not raise her, but the Government do—Would you give the Government no remedy against anyone for the expense it would be put to if the value of the ship was not sufficient to cover the cost? I go by the Home Act, and there it is not considered necessary. If the Government get the vessel that I think is quite sufficient for the taking of her up.

299. Would it not be hard upon the Government, who are innocent parties, to make them raise her? I think that that is one of those things that the Government ought to be called upon to do. Then in the 105th clause I would omit the words, "the owner or occupier of the land from which such tree or trees shall have been so felled," and I would make it read: "After having been so felled, *the party felling such tree* shall incur a penalty not exceeding ten shillings for every tree so cut and not removed." I may be the owner of land down at the Hastings say, and some one may fell trees without my having any knowledge of it. I think that it would be very hard to fine me under circumstances such as those. I consider that it is the duty of the Government to find out the proper culprit, and make him amenable for his acts. In clause 106 I would insert the words *without authority*—"If any timber or other bulky article be left *without authority* on any public pier," &c. In the eighth line of the clause I would put the word "owner" in the place of "*Consolidated Revenue*." If the goods are sold, and all expenses paid, surely the owner ought to get the benefit of the balance instead of the Consolidated Revenue.

300. *Mr. Wilson.*] It would have to go into the Consolidated Revenue in the first place, whatever was done with it afterwards? In line 9 I would insert the words "*forty-eight*" in place of "twenty-four." I think forty-eight hours' notice ought to be given. Schedule H, referred to at the end of clause

108, apparently relates to the removal of vessels from one place in the harbour to another. I think that the masters of intercolonial ships ought to be allowed to move their own vessels without being made to pay fees.

301. Would not your objection be met by amending the clause so as to make it begin in this way: "Whenever any *foreign-trading* ship shall arrive," &c.? No doubt that would do it. There is also clause 109,—“Harbour Master may remove ship under certain circumstances”—I do not know whether that requires much alteration.

302. Would you make it apply to private wharfs as well as to public wharfs? Yes; I would give the Harbour Master full power all over the Harbour.

303. *Chairman.*] In point of fact the Harbour Master would be acting principally as a member of the Board when this Bill is passed? I would give him full authority over every vessel that comes here, excepting only these intercolonial vessels which ought to be allowed as much freedom as possible—to go about the harbour and do their work without reporting to the Shipping Office and harbour authorities before removal, and all this unnecessary delay.

304. With reference to whalers coming here, is not one of their difficulties this: That they cannot get experienced crews—men who will go on the lay system? They have had some difficulty of that sort, but so far as I can understand it is the petty annoyances which they have to put up with in the way they have been treated by the Customs.

305. Do you think that if whale oil were admitted duty free it would get over the difficulty? It would all help; but I do not think that it would have the effect altogether. As I told you before, the principal grievance is with the Customs.

306. Surely they must have the same regulations in Hobart Town and New Zealand? They have no such hinderances in New Zealand, for there they can work from daylight to dark.

307. That must be at some of the out-ports, not at Auckland? They seldom go into Auckland. They send them a Custom House officer on board, who allows them to work how, when, and where they please; there is no restriction in that way.

308. Are there any other suggestions that you can offer us? I do not think that the throwing overboard of sick or dead carcasses of animals ought to be prohibited? They ought to be allowed to throw them overboard, and be compelled to tow them out to sea. It would give rise to great difficulty if that were not allowed.

309. But you would hardly consider that a breach of the law—throwing them out for that purpose? If they throw them out at all it would be considered a breach of the law. I think that that section of clause 115 requires a little amendment, so as to compel them to take the carcasses to sea, where they won't be a nuisance.

310. Is there any other point to which you wish to call our attention? I would alter the first section of clause 116, so that it should read “Ballast-lighters or other vessels to be employed in ballasting or loading ships with stone or coal, or other material, *may* be licensed in the name of the owner or owners of such vessel from the Marine Board.” Or you may put it *shall* (instead of *may*) be licensed.

311. *Mr. Wilson.*] You think that they ought to be licensed instead of being allowed to work without a license? Exactly. Here it is making it compulsory that they shall not work at all without a license.

312. *Chairman.*] This clause is framed more with reference to the Port of Newcastle than of Sydney; there they throw the ballast overboard, and there is difficulty in dealing with these men? So far as Newcastle is concerned you cannot be too strict, for there is a deal of harm done to the harbour there.

313. *Mr. Lloyd.*] You said in the first part of your evidence that you would be satisfied if the Government appointed five members of the Board and if four were elected;—would you be satisfied that the Government should have a majority as in that case? I see no objection to that.

314. *Mr. Wilson.*] Would you allow the Chairman a double vote under such circumstances? The Chairman must always have a casting vote.

315. *Chairman.*] What I think Dr. Wilson means is, that in the event of the votes being equal, would you allow the Chairman to vote, and then give him a casting vote as well? If the numbers were equal I consider that the Chairman would be entitled to a casting vote.

316. *Mr. Church.*] After having voted once? Yes; but in practice such a thing is very seldom resorted to. The question must be a very strong one to make the Chairman give his double vote.

317. *Chairman.*] After having gone through the Bill, and looking at it as a whole, do you still hold to the opinion that it would not be desirable to make this become law as soon as possible? I think that it would be very desirable; but, as I said before, we should scarcely get into the way of working this measure when we should see a much better and a more complete measure passed into law in England.

318. It may be some time before such a law is passed; and, while the working of this Act would entail some labour on those who had to perform that duty, yet still we could take up the English law afterwards. The Government have urgent applications from the Imperial Government that some provision should be made for certificates. Ships go away from this Colony in charge of officers without a certificate, and very serious inconvenience is found to arise, especially with regard to insurance; I dare say you are aware of that? Yes.

319. Then again difficulty sometimes arises in foreign ports from commanders of ships from this Colony not having certificates of competency, and there is a difficulty in dealing with them in consequence of that? Yes, I am aware that we are all behind the age in dealing with these matters. In this Act of 1862, which I now hold in my hands, the law is laid down so very plainly as to dealing with the goods of a ship where the owner does not pass entry in proper time, that I think we could not do better than adopt it as it is.

320. The Bill now before Parliament does provide for the appointment of a Board? Yes; but it does not go so very fully into the matter as this English Act does.

321. This is an amendment of the Customs' Act? It is shipping and customs together. It goes on to show how the proceeds are to be appropriated when the goods are sold, and everything else.

322. What is the title of the Act? “An Act to amend the Merchant Shipping Act of 1854, the Merchant Shipping Act Amendment Act of 1855, and the Customs' Consolidation Act of 1853. Assented to, 29th July, 1862.”

Capt.  
Chas. Smith.

4 Oct., 1870.

FRIDAY, 14 OCTOBER, 1870.

Present:—

MR. HILL,

MR. WILSON.

MR. KING,

THE HON. SAUL SAMUEL, ESQ., IN THE CHAIR.

Captain William Francis Norie called in and examined:—

Captain  
W. F. Norie.

14 Oct., 1870.

323. *Chairman.*] You have been a commander in the merchant service? I have.
324. You are now engaged, I think, surveying for some of the Insurance Companies? Yes.
325. I believe you have had considerable experience in connection with the mercantile marine, not only here but elsewhere? Yes.
326. Have you had a copy of the Marine Board Bill, which has been referred to this Committee, sent to you? Yes.
327. Have you at all considered the provisions of that Bill? I have read it through once or twice, but I have unfortunately left my copy behind me, and am not therefore quite prepared to give evidence respecting it.
328. Do you consider such a measure necessary? I do—highly necessary.
329. The Bill provides that the Board should be nominated;—do you think it desirable that any portion of it should be elected? I should think a small portion of it, at most one half, might be elected, and that the chairman should have a casting vote. The Bill, as I take it, is to provide some control over owners of ships, a large proportion of whom have been shipmasters here, are opposed to the Bill, and had no share in originating it, and I do not think it desirable that they should have any chance of evading its provisions, or exerting any undue influence in favour of masters who might lay themselves open to charges. There would be no inducement on the part of nominated members to oppress the shipowners or the officers or captains in any way, while, on the other hand, on the part of the shipowners there might be a disposition to be too lenient.
330. With respect to the provisions for the examination of masters, mates, and engineers, I suppose you have considered them? Yes, I have thought for many years past that it has been most urgently required. There is not the least control now on the part of Insurance Companies or others; and no means of hindering a person with no qualification whatever from taking charge of a vessel.
331. Is it within your knowledge that captains are appointed at times who are unfit to command ships? Yes, there are many instances.
332. *Mr. Hill.*] Do not the owners see that the masters they appoint are properly qualified? It does not affect them so much, because the real ownership of the vessel is in the Insurance Companies. The owner often does not care if he can get insured for the amount, or nearly so.
333. Do you mean to say that owners are so careless, as a rule, in their appointments? Judging by experience I must say I do consider so here.
334. *Mr. Wilson.*] Do you think there would be any great difficulty in securing the services of competent examiners in this City? I should think not. There are many seamen here of great experience.
335. *Chairman.*] And great ability? And great ability.
336. *Mr. Wilson.*] There may be seamen of great experience and ability who would not be really good examiners? It is quite possible. I merely allude to seamanship. As to navigation, you would have a narrower range of selection.
337. *Mr. Hill.*] How could an examination in seamanship take place unless at sea? You always suppose cases—the examiners put a case. Suppose a ship were in such a position on a lee shore, and the vessel would not stay, and all sorts of troubles that we get into at sea, what is the proper thing to be done? Certificates of service on the part of second mates to pass as chief mates, and for chief mates to pass as captains, guide the examiners in a great measure at Home.
338. *Chairman.*] What number of members do you think would be sufficient to constitute an efficient Board. Do you think seven would be sufficient—six, besides the chairman? I think eight, besides the chairman, might be better, to provide for absence on the part of some of the members—nine members altogether. The elected members would probably be people who would not care to be tied to their duties too closely.
339. Can you give us any suggestions for the improvement of the Bill? Not having brought my copy of it with me, I am somewhat at a loss just now; but there is one matter I took notice of in clause 53, where it says, that if detention shall have been occasioned “by stress of weather, or other unavoidable cause,” the pilot shall be paid 10s. a day in addition to the ordinary pilotage charge. It appears to me to be rather hard to make the shipmaster or owner pay for that, if it is unavoidable; because if the weather was such as to detain the ship the pilot’s services would not probably be required elsewhere, and there would be no loss to anybody.
340. *Mr. Hill.*] But it would be highly beneficial to the owner of the ship to have a pilot on board? The master would not move in such a case.
341. *Chairman.*] If the pilot were paid by fees it would occasion him a loss? If the pilot were paid by fees it would, but I understand they are not.
342. Have you any other suggestion to make? There is one part about making ropes fast to a ship; the proviso to clause 110, which renders the master or owner of a vessel being removed liable for any damage done by ropes or warps run out to any other ship by order of the Harbour Master or pilot. The master of the ship cannot interfere with the pilot in running out a warp, and I do not see therefore why he should be liable.
343. *Mr. Wilson.*] You think that if the pilot does the damage he should be made to pay? The pilot never does pay, but it seems a hard case on the owner of the ship that he should be made to pay when the master of the ship is merely carrying out an order over which he has no control.
344. *Chairman.*] Do ships ever sustain damage from having a warp fastened to them? Very seldom. They might carry away a belaying pin or something of that sort in blowing weather, or a vessel might pick her own anchor up.
345. Anything else? Clause 93: I do not see why it should be held to show that the master of one of the vessels caused a collision because he neglects to do the best he can after it. I think it must intend to say that the damage by the collision shall be held to have been caused by him, not the collision itself.

346. *Mr. Wilson.*] Do you think the members of the Marine Board should be paid, to ensure regular attendance? I should think so.

347. Of course you would not suggest anything like excessive payment, but just a sufficient sum as an inducement to them to be regular in their attendance? Yes.

348. Do you think, from your knowledge of Boards of Directors of Companies in this City, that where the attendance is not regular, payments are not made? Certainly. I have one other remark to make. It seems to me that the causes for the suspension of a certificate are not sufficiently set out. Perhaps that is meant to be put in the regulations afterwards. Also the payments for certificates of competency appear to me, speaking from recollection, not to be more than half the English charges. I think they should be doubled. It would not be oppressive, considering that it happens only once in a man's career. These sailing directions also—I suppose they are not meant to supersede the Board of Trade rules, which have lately undergone some slight modifications.

349. I rather think these diagrams are only given to illustrate the use of the lights. I do not think there is anything obligatory? I would like to make a remark or two upon them. This arbitrary rule, which is followed by many partially informed sailors porting the helm in almost all cases to avoid collision, is most mischievous in its operation.

350. *Mr. Hill.*] When properly understood? No, but they are too apt to make a mistake. They adhere to the rule too rigidly. If a vessel is even a little on the starboard bow they think they are all right if they port the helm.

351. *Mr. Wilson.*] You would not like any regulations to be too definite or explicit? Not so as to fetter the judgment of the person in charge of a ship.

352. You would like these diagrams to be used more as suggestions than as absolute rules? Precisely.

353. *Mr. Hill.*] When these regulations are properly attended to, with regard to porting the helm, or otherwise, it always exonerates the person in charge, should a collision take place? That is the worst of it. You cannot get them all up to the same pitch of understanding; and they run away with the idea that as long as they can be proved to have ported the helm they are all right.

354. *Mr. Wilson.*] If he ports his helm the captain is exonerated, although by exercising a little judgment if he had not ported the helm he could have avoided the collision? Just so. It often happens. I have known a collision that occurred in the P. & O. Company's Service, where a vessel followed another half round the compass, and came into collision at last, through blindly following the rule; but the captain was exonerated.

Captain  
W. F. Norie.  
14 Oct., 1878.

#### ADDENDUM.

ADDITIONAL evidence desired by me to have been given if I had been better prepared.

Page 21, art. 60. This clause contradicts that at page 38, art. 110, besides being contrary to the common law, which provides that nothing exonerates the master from full responsibility, whether in charge of a pilot or not.

Page 34, art. 98. This clause appears to me uncalled for. Models of vessels and their sea-going qualities differing so much that experience alone can determine the amount of ballast necessary, and this may safely be left to the master and owner.

W. F. NORIE.

EXTRACTS FROM THE VOTES AND PROCEEDINGS OF THE  
LEGISLATIVE ASSEMBLY.

VOTES No. 21. TUESDAY, 20 SEPTEMBER, 1870.

9. Mr. Thomas Scott—Sugar Cultivation (*“Formal” Motion*):—Mr. Brookes moved, pursuant to Notice No. 4,—
- (1.) That a Select Committee, with power to send for persons and papers, be appointed to inquire into and report upon the services alleged to have been rendered to the Colony by Mr. Thomas Scott, of Brisbane Water, in naturalizing the Sugar-cane, and in the manufacture of Sugar.
- (2.) That such Committee consist of the following Members, viz.:—Mr. Bawden, Mr. Dean,<sup>1</sup> Mr. Farnell, Mr. Neale, Mr. Parkes,<sup>2</sup> Mr. Speer, Mr. Dodds, Mr. Sutherland, Mr. Hoskins, and the Mover.
- (3.) That the Progress Report, brought up 24th March, 1869, and the second Progress Report, brought up 4th May, 1870, on the same subject, together with the Minutes of Proceedings and of Evidence, be referred to such Committee.
- Question put and passed.

<sup>1</sup> Unseated on report of Elections Committee, 23 September, 1870.

<sup>2</sup> Resigned, 18 October, 1870.

VOTES No. 102. THURSDAY, 16 MARCH, 1871.

6. Mr. Thomas Scott—Sugar Cultivation:—*Mr. Bawden*, on behalf of Mr. Brookes (Chairman of the Committee), brought up the Report from, and laid upon the Table the Minutes of Proceedings of, and of Evidence taken before, the Select Committee for whose consideration and report this subject was referred, on 20th September, 1870, together with Appendix.
- Ordered to be printed.

 REPORT.
 

---

THE SELECT COMMITTEE of the Legislative Assembly, appointed on 20th September, 1870, with power to send for persons and papers, *to inquire into and report upon the services alleged to have been rendered to the Colony by Mr. Thomas Scott, of Brisbane Water, in naturalizing the Sugar-cane, and in the manufacture of Sugar,—to whom was referred on the same date the Progress Report, brought up 24th March, 1869, and the Second Progress Report, brought up 4th May, 1870, on the same subject, together with the Minutes of Proceedings and of Evidence,—*have agreed to the following Report:—

In the year 1823 the Government of Sir Thomas Brisbane, desirous of finding suitable employment for the numerous convicts at the then penal settlement at Port Macquarie, and being of opinion that the cultivation of the sugar-cane, if it should be found practicable at that settlement, would afford such employment, engaged Mr. Thomas Scott, first on a share of the profits—an arrangement which it was eventually found could not be carried out satisfactorily—but afterwards at a salary of £250 a year, to superintend and manage a Government plantation for the cultivation of the sugar-cane and the manufacture of sugar at Port Macquarie.

Mr. Scott (your Committee have ascertained) had been a sugar-planter on the Island of Antigua, in the West Indies, towards the close of last century, being now ninety-four years of age, and had afterwards, at the close of the American War of 1812, visited the sugar plantations of New Orleans in the United States of America; but, on subsequently arriving in New South Wales, in the year 1816, when on his way to Calcutta, where he had a near relation in high office, Sir David Baird Scott, he was induced to remain in the Colony, chiefly from the favourable opinion he had been led to form of the adaptability of the soil and climate to that branch of cultivation. At the instance, however, of the Agents of the London Missionary Society in Sydney, he accepted a temporary engagement to form and organize a plantation for the growth of the sugar-cane and the manufacture of sugar in the Society Islands; and your Committee have reason to believe that it was the success that had attended his efforts under that engagement that recommended him, on his return to Sydney, to the favourable regards of Major Goulburn, then Colonial Secretary of New South Wales, as a fit and proper person to superintend and manage the proposed sugar plantation at Port Macquarie.

After experimenting on the cultivation of the sugar-cane and the manufacture of sugar at that settlement for a series of years, Mr. Scott had succeeded in raising a crop of seventy tons of sugar in the year 1827, together with a large quantity of tobacco which he had grown at Port Macquarie by convict labour. This amount of produce was forwarded to Sydney and sold by public auction at the Commissariat Store; and it appears from the evidence of the Rev. Dr. Lang, who saw and tested the sugar, of which a quantity had been purchased for sale to his customers by a respectable grocer of this city, that it was of fair marketable quality, and could bear  
 comparison

comparison with the produce of other countries then imported into the Colony. But the greatly increased demand for convict labour by the free settlers of the Colony, and the usual unwillingness of an in-coming Government to patronize and promote the favourite schemes of their predecessors, having led to the breaking up of the penal settlements of the Colony generally, shortly after the arrival of Sir Ralph Darling, who succeeded Sir Thomas Brisbane in the Government of New South Wales, the Government establishment for the cultivation of the sugar-cane and the manufacture of sugar at Port Macquarie was forthwith discontinued and broken up. It was not therefore from any failure in the experiment, or from any want of confidence in the experimenter that the cultivation of the sugar-cane was given up by the Government of the day in the year 1827, but simply from the causes indicated above. It is also matter of history and beyond all doubt that Mr. Scott was the first person who produced from canes grown in the Colony a large quantity of marketable sugar in Australia.

After this result of his efforts and labours at Port Macquarie Mr. Scott settled on a small property of his own at Point Clare, Brisbane Water, where, having formed a small experimental plantation of five acres of sugar-cane, he has been employed since, that is for forty years past, in making experiments on a limited scale on the cultivation of the sugar-cane and the manufacture of sugar, distributing, far and wide, specimens of sugar grown by himself—including twenty-eight pounds to the Paris Exhibition, for which he received a silver medal—and in writing numberless letters to the colonial papers of the day, directing the attention of the colonists generally to the subject, and containing all manner of instructions for the cultivation of the sugar-cane and the manufacture of its juices into sugar.

For a long series of years after the commencement of these efforts and experiments, during which the undoubted success of the sugar-growing plantation of the Government at Port Macquarie had been lost sight of and forgotten, there was almost universal scepticism throughout the Colony as to the practicability of naturalizing the cultivation of the sugar-cane in New South Wales; but first one and then another was at length convinced, by Mr. Scott's letters, experiments, and specimens, that the object was both feasible and practicable, insomuch that the universal scepticism of a comparatively recent period has been gradually succeeded by a general belief and conviction that the cultivation of the sugar-cane and the manufacture of sugar are destined to be one of the most prolific sources of the future wealth and prosperity of this Colony. For when it is borne in mind that not less than half a million sterling is expended annually by this Colony alone for the purchase of sugar grown beyond the seas, it must be evident that this industry must not only prove a mine of wealth for the Colony, in the way of supplying its internal consumption, but an export of incalculable value for its future inhabitants.

There are doubtless some persons who have benefited materially by Mr. Scott's writings and experiments who are now very unwilling to acknowledge the fact, but all the witnesses examined by your Committee agree in regarding Mr. Scott as the pioneer of sugar cultivation in Australia; and it is the general opinion of the witnesses that but for Mr. Scott's long-continued and unwearied exertions in the cause, sugar cultivation would not now have been heard of in Australia. The following questions put to the witnesses examined by the Committee, and the answers they elicited, will place this important point in a very clear light:—

Question 7. Chairman to Dr. Lang: Do you consider Mr. Scott the pioneer in the promotion of this matter in the Colony? Decidedly he is—unquestionably. His own experience was matured from what he had seen at Port Macquarie, where he was very successful in the cultivation of the cane to a very considerable extent.

Question 8. Do you consider that these efforts and this service entitle Mr. Scott to public recognition and consideration? Decidedly so. It has been an acknowledged principle in all Governments that those who originate the forms of industry that are valuable to the State should have their services recognized in some way or other.

Question 64. Chairman to Edward Knox, Esq.: You are aware that Mr. Thomas Scott, of Brisbane Water, has been engaged in this pursuit for a series of years? I am aware he has been writing on the subject and urging the cultivation of the cane for a series of years. I have not personally known Mr. Scott till within the last few months.

Question 66. Do you consider that his experiments in the culture of cane and his efforts otherwise have been highly beneficial in promoting this industry? I think it is very likely that we should not have heard of the culture of the sugar-cane here but for Mr. Scott's persistent efforts to induce people to cultivate it in the Colony.

Question 67. In your opinion, he has been a pioneer in the matter and a consistent promoter of it? He has undoubtedly.

Mr.

Mr. Scott's services in the matter of sugar cultivation, and the opening up of this very important industry to the Colony generally, have been warmly acknowledged by many respectable colonists, particularly at Kiama and the Clarence River, as well as elsewhere in New South Wales and Queensland.

Your Committee would therefore conclude their inquiries with a cordial recommendation to the favourable consideration of the Government of the claims of Mr. Thomas Scott, of Brisbane Water, for his indefatigable and successful exertions, through the Press and otherwise (during a period of forty years), in naturalizing the cultivation of the sugar-cane and in the manufacture of sugar in this Colony.

WILLIAM BROOKES,  
Chairman.

No. 3 Committee Room,  
Sydney, 16 March, 1871.

PROCEEDINGS OF THE COMMITTEE.

THURSDAY, 1 DECEMBER, 1870.

MEMBERS PRESENT :—

Mr. Brookes,		Mr. Bawden,
Mr. Farnell,		Mr. Dodds.

Mr. Brookes called to the Chair.

Entry in Votes and Proceedings, appointing the Committee, *read* by the Clerk.

Committee deliberated, and decided to examine Mr. Thomas Scott, who was present.

Whereupon Mr. Scott called in and examined.

Witness *handed in* correspondence respecting the cultivation of sugar-cane.

*Ordered* to be appended. (*Vide Appendix A 1 to A 4.*)

Witness also produced two samples of sugar.

Witness withdrew.

Committee deliberated.

*Ordered*,—That A. Gyulay, Esq., be summoned to give evidence at the next meeting, and to produce a list of those who contributed samples of sugar to the Paris Exhibition of 1867.

[Adjourned until Thursday next, at *Eleven* o'clock.]

THURSDAY, 8 DECEMBER, 1870.

MEMBERS PRESENT :—

Mr. Brookes in the Chair.

Mr. Bawden,		Mr. Farnell.
-------------	--	--------------

A. Gyulay, Esq., called in and examined.

Witness *handed in* a list of those who contributed samples of sugar to the Paris and Melbourne Exhibitions. (*Vide Appendix B.*)

Witness withdrew.

Committee deliberated, and decided to meet on Wednesday next, at *Eleven* o'clock, to consider Report.

[Adjourned accordingly.]

WEDNESDAY, 14 DECEMBER, 1870.

In the absence of a quorum, the meeting called for this day lapsed.

THURSDAY, 23 FEBRUARY, 1871.

MEMBERS PRESENT :—

Mr. Brookes,		Mr. Farnell.
--------------	--	--------------

In the absence of a quorum, the meeting called for this day lapsed.

THURSDAY, 16 MARCH, 1871.

MEMBERS PRESENT :—

Mr. Brookes in the Chair.

Mr. Bawden,		Mr. Dodds.
-------------	--	------------

Committee met to consider Report.

Chairman submitted *Draft* Report.

Same *read* and considered.

Motion made (*Mr. Bawden*), and Question put,—That the *Draft* Report, *as read*, be the Report of this Committee—*agreed to*.

Chairman to report to the House.

LIST OF WITNESSES.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON

MR. THOMAS SCOTT—SUGAR CULTIVATION.

THURSDAY, 1 DECEMBER, 1870.

Present:—

MR. BAWDEN,		MR. DODDS,
MR. BROOKES,		MR. FARNELL.

WILLIAM BROOKES, ESQ., IN THE CHAIR.

Mr. Thomas Scott further examined:—

1. *Chairman.*] You desire to be re-examined on the question before the Committee, with a view to correct some alleged erroneous statements in Mr. Holland's evidence? Precisely. Mr. T. Scott.
2. Have you read that evidence? I have; it is an untruthful statement. 1 Dec., 1870.
3. Have you had any correspondence with the Rev. Mr. Holland on the subject of sugar cultivation and management? Yes, a very long one.
4. Are you prepared to put in evidence any of that correspondence? I am; but a fraction only, not the whole, some of it having been destroyed.
5. At what period did you become a correspondent with Mr. Holland? In the year 1859. At that time he stated he was perfectly averse to adopting the opinion of the possibility of growing cane in this Colony until he read my letters in the newspapers, and he had also learned from individuals at Port Macquarie the fact that I had made very good sugar at Prospect on the Hastings, as well as a large quantity at Rolland's Plains. He said there was not a cane to be found in his district, and he begged as a matter of favour that I would forward some to him. I did so. In 1862 he again wrote for more canes; and subsequently, when the canes had come to maturity—for I had given him a great deal of instruction—he requested me to instruct him how to make sugar, as although he had been in Jamaica so many years—ten I think—he was then engaged in missionary work, and had been in a boiling-house simply from curiosity.
6. Will you hand in the correspondence you have referred to? I have received various numerous letters from Mr. Holland since 1859, but these are all I have now in my possession. (*The witness handed in the same. Vide Appendix A 1 to A 4.*)
7. Did you send any samples of sugar of your own growth and manufacture to the Exhibitions of Melbourne and Paris? I did.
8. How many samples? Two; one to Paris and the other to Melbourne.
9. Did you receive any recognition of the one you sent to Melbourne? \* I received one recognition only. I was surprised, but never knew how my samples were disposed of until I read Mr. Holland's evidence. I beg to hand in a representation of the two samples I sent to Paris and Melbourne. That, as nearly as possible, represents the sample. The quality of the sample is on record. (*The witness produced a sample of sugar.*)
10. Is that a sample such as you sent to the Melbourne Exhibition? A representation of it.
11. And for which you received no recognition whatever? No.
12. *Mr. Farnell.*] Is this some of your own make of sugar? No, that is a representation of it. I never retained a sample of that. I got that from a grocer in Sydney, and it is as nearly as possible a faithful representation of the quality as described in the public records †

13.

\* NOTE (on revision):—No.

† ADDED (on revision):—as given by the valutors at Melbourne to the sample wrongfully bearing the name of Mr. Holland as the contributor thereof.

- Mr. T. Scott. 13. *Mr. Bawden.*] Is that sugar of colonial manufacture? I understand this is Mauritius.
14. *Chairman.*] Have you reason to believe that the sample you sent to the Melbourne Exhibition was lost or otherwise dealt with? By some mistake my name was put on Mr. Holland's sample, of which this is a faithful representation (*producing another sample*), and his name was applied to my sample. Mr. Holland sent only one sample of 28 lbs.; and my samples were changed surreptitiously or in error. It could not have been by Mr. Holland, but must have been by some of the subordinates. That is open to proof, by a public officer and by public records.
15. You have reason to believe that by some error the names were transposed? Yes.
16. That is to say, the name of Mr. Holland was attached to your sample? The name of Holland was attached to my two samples; and that is to be authenticated, not by myself, but by the more substantial evidence of documents.
17. Did that sample of sugar exhibited under the name of Mr. Holland obtain the prize? He got the gold medal for my two samples, and I got a silver medal for his sample.
18. *Mr. Farnell.*] Are you aware that Mr. Holland has given it in evidence that he sent half a hundred weight of sugar to the Exhibition? I was not aware until I read Mr. Holland's evidence, in which he said he got a gold medal; then I was aware of the wrong that had been done me.
19. Who did you the wrong you complain of? I could not say or think the Rev. Mr. Holland made that change of names upon the respective samples, but I can say he adopted the mistake.
20. However, you are quite certain a mistake was made? Yes; and it will be most fully proved by a gentleman in a high position in the Government employ, who will produce the records confirmatory of the facts I have now stated.
21. Are you growing sugar now? No, I am not. I have consummated, at a very heavy expense, the object I had in view, and the Colony is now supplied with plants. It would cost me double as much to make sugar on a small scale as it would to purchase it,† and I believe Mr. Holland's experience is the same as mine in this respect. I did it to afford a practical demonstration of the truth which I promulgated in the earlier days of my colonial residence—that it was possible to produce a marketable sugar here.
22. *Chairman.*] I infer from what you have just stated that you think it cannot be grown profitably here? Not on a small scale.‡
23. The article can be imported cheaper? It depends upon circumstances. In my case I had peculiar expenses in preparing my sugar for the Melbourne and Paris Exhibitions; for instance, I had to purchase a mill expressly for the purpose. If it were manufactured on a large scale, and with efficient machinery, very considerable profit would result. My friend Dr. Neild writes me that he has realized £40 net per acre for the canes he has. He has been in correspondence with me for the last seven years on the subject of sugar-growing, and I believe him to be the only gentleman in the Colony who has followed out my instructions, and he has succeeded.§ One of Dr. Neild's letters to me, in the hand of Dr. Brookes, states that the sugar he made last crop cost him 2½d. per lb. He, I believe, made three tons sugar to the acre—forty-five tons from fifteen acres.

THURSDAY, 8 DECEMBER, 1870.

Present :—

MR. BAWDEN,

MR. FARNELL.

WILLIAM BROOKES, Esq., IN THE CHAIR.

Albert Gyulay, Esq., examined :—

- A. Gyulay, Esq. 24. *Chairman.*] The object of this Committee in requesting you to attend here to-day is, to ascertain from you some facts with regard to the sugar samples sent to the Melbourne and Paris Exhibitions. I believe you were the Secretary to the Melbourne and Paris Exhibitions? I was.
- 8 Dec., 1870. 25. As such, do you recollect any samples of sugar forwarded to the Exhibition by Mr. Thomas Scott, of Brisbane Water? Yes.
26. Can you give us any account of the number of samples sent, their weight, and quality? I have with me books and papers referring to both Exhibitions (*producing the same*). These are the original instructions of the Royal Commission of New South Wales, a copy of which I sent to my former assistant, who was placed in charge of our exhibits in Melbourne, a Mr. Joseph Dyer. All the exhibits are here enumerated, with the names of the exhibitors, and a copy of this was sent to Melbourne to be published in the Catalogue. It appears from this, but it is also within my recollection, that Mr. Thomas Scott of Clear Point, Brisbane Water, exhibited two samples of sugar made of cane. I have also another list, copy of which I sent to Captain Mayne in London, conveying in the same way the instructions of the Commissioners, and which were afterwards to be put into the Catalogue. Here also, in the Addenda, No. 543, appear two samples. Although they appear under the collective name of "sugar," this will show there were two separate samples sent, Nos. 1 and 2. In your invitation to attend here I have been asked only to furnish the list of exhibitors of sugar to the Paris Exhibition, but that Exhibition and the Melbourne Exhibition were connected and cannot now be disconnected, consequently I have made out a list of both the Paris and Melbourne exhibitors, which I have the honor to hand in. (*The witness handed in the same. Vide Appendix B.*)

27.

\* NOTE (*on revision*) :—Mr. Holland's statement, that he sent half a hundred of sugar to the Commissioners of the Paris and Melbourne Exhibitions, is false. The Government records, a future witness, and his own letters, prove it to be so.

† NOTE (*on revision*) :—I meant with diminutive machinery, when only about 25 lbs. sugar per diem could be made.

‡ NOTE (*on revision*) :—I beg to qualify these remarks by noting that the growers of cane for sale ought to realize a good profit upon small patches; but owners of small and inefficient machinery, with unskilful boilers, will fail in a greater or lesser degree.

§ NOTE (*on revision*) :—When I said that Dr. Neild was the only gentleman in the Colony who has realized a great profit from sugar planting, I ought to have said, nearly the only gentleman. All the failures among the novice sugar planters, in this, their first essays, have originated from a want of colonial experience, and an ignorance of the industry needing a different conduct here to that which is applicable to it within the tropics.

27. Are you aware whether Mr. Scott received a recognition for these two samples of sugar, or only for one? I do not think he received much recognition from the Melbourne Exhibition; indeed I am sure that he did not receive a medal. He received a silver medal from the Commissioners sitting here, struck in the R. Mint, Sydney, off a die which was made in England, for manufacturers in France and England, &c., who worked New South Wales wool into some material. This die was returned here, and the Commissioners had some medals struck in gold, silver, and bronze. These were distributed, not according to merit, but the gold ones more as a commemoration or souvenir of the Exhibition, by the Commissioners among themselves. Some, however, were to be awarded to the most prominent exhibitors, and of that class Mr. Thomas Scott was one, but to him only a silver medal was given. These facts did not come under my personal notice, because at the time I was disconnected from the Commission, had ceased to be Secretary to it, and had become the manager of a public Company.

A. Gyulay,  
Esq.

8 Dec., 1870.

28. Are you aware whether the Rev. Edward Holland sent any samples of sugar to the Exhibition? Yes.

29. How many? One sample.

30. Can you afford the Committee any information as to the quality of that sample? I took great interest in all the products of New South Wales, and I think I could recollect if I saw the samples.

31. Do you consider these fair representations of the samples sent respectively by Mr. Thomas Scott and the Rev. Mr. Holland to the Melbourne Exhibition?

*The witness examined the samples produced by Mr. Scott.*

No. 1.—Not quite. The sample of Mr. Scott was of a coarser grain than this (No. 1) and a little yellower, more like candy sugar in colour (referring to No. 1).

32. Mr. Bawden.] Not so bright? Yes, as bright, but not so light in colour; the granules were larger. Mr. Holland's:—This (No. 2) was also a little lighter than the sample now produced, but it looked so very inferior beside the sample sent by Mr. Thomas Scott and Mr. Nowlan that I did not think it should be sent to Paris; it looked like ration sugar. The first sugar I got was from Mr. Thomas Scott, the next from Mr. Nowlan, and then, I think, some of the other came. I see in the Melbourne Catalogue there is another exhibitor from New South Wales, but his sample did not pass through our hands; it was sent direct to Melbourne, by the Rev. George Mackie, of the Kiama Sugar Company.

33. Chairman.] Have you reason to suppose that one of the samples forwarded to you by Mr. Scott (by accident or otherwise) had been placed against the name of the Rev. Mr. Holland? I am positive that no such accident could have happened here, because I was very careful, and all the letters from the Commissioners, from our Melbourne agent, from the officer in charge in Melbourne, and from Captain Mayne, bore out the fact that everything arrived in perfect order that were sent by me direct.

34. Have you any means of knowing whether subsequently to their leaving here such was the case? It may have happened in Melbourne, because there were many complaints of such things. We received many complaints, and some of the papers referring to mistakes of a similar kind are in the Colonial Secretary's office.

35. You have no doubt then that one of the samples sent by Mr. Scott was superior to this which is said to represent Mr. Holland's sample? I have no doubt in so far as it was a much brighter and a more marketable sugar. The sample sent by Mr. Holland I considered to be a ration sugar.

36. And for which Mr. Holland received a silver medal? I do not know that of my own knowledge, as I had then ceased to be connected with the Commission, but I have been told that the Commissioners here gave him some medal.

37. Mr. Bawden.] Are you aware whether the Rev. Mr. Holland received a medal from the Melbourne Exhibition? I recollect seeing in the papers, and in this official report book (*Official Record Book of Victoria produced*), that he had received a bronze medal. They gave only bronze medals.

38. Can you mention any other articles which were sent from here to Melbourne where the names of the exhibitors were transposed, and the credit given to the wrong persons? If I had received notice of such a question I would have referred to my papers, but I am not now prepared to answer the question.

39. Do you remember in the case of some tobacco, that the names of the exhibitors were transposed—was there not some correspondence about it? I recollect something of the kind about a Mr. Vorbeck and a Mr. Schoefer.

40. Do you remember whether Mr. Vorbeck and Mr. Schoefer were exhibitors of tobacco? Mr. Vorbeck, I think, from the Clarence River, and Mr. Schoefer from Port Macquarie, or somewhere in that direction.

41. You are not able to say whether Mr. Vorbeck exhibited manufactured or leaf tobacco? I can tell that by reference to my manuscripts. (*The witness referred.*) "Leaf tobacco, two samples, and one sample manufactured tobacco; to be sold, and proceeds remitted to him through us." That was the instruction given to Mr. Dyer. Mr. Schoefer also, leaf tobacco and four kinds of cigars.

42. Do you find in your original manuscript that Mr. Schoefer was an exhibitor of leaf tobacco? Yes.

43. Will you refer to the Official Catalogue of Melbourne, and find what he is there represented as exhibiting? "Case of manufactured tobacco, Colonial negrohead, from Clarence River, leaf manufactured by exhibitor."

44. If you will turn to the Awards, you will find what Mr. Vorbeck received an award for? "Leaf—goodness of quality."

45. I would like you also to state what Mr. Schoefer got an award for? In my Catalogue he is an exhibitor of leaf tobacco, and of four kinds of cigars. He got an award of "Honorable mention for manufactured tobacco."

46. I presume it is almost impossible, where there are so many exhibitors and so large a number of exhibits, to avoid some slight mistakes? I should say they ought not to happen.

47. Still it is not impossible for such a case to happen? Of course it is not impossible, for such cases did occur in Melbourne.

48. Do you know by what rules the Commissioners were guided in the distribution of the medals, after you had ceased to be connected with the Commission? I have no idea. A silver medal was sent to me from the Commission, through the Executive Commissioner, for services; and a sum of money (£50) was awarded me by the Commission on a former occasion, as a gratuity for extra work in connection with the Paris Exhibition.

## MR. THOMAS SCOTT—SUGAR CULTIVATION.

## APPENDIX.

[To Evidence given by Mr. Thomas Scott, 1 December, 1870.]

A 1.

Port Macquarie,  
10 March, 1862.

Thomas Scott, Esq.  
Dear Sir,

I have been looking out with some anxiety of late for notice of the formation of a Company for the growth and manufacture of sugar; but I fear there is too much apathy and indifference among our moneyed men. It is difficult to get them to embark in any enterprise that will not afford them quick and large returns. I hope, however, you will not be dispirited, but still keep the matter in agitation. You have gained the ear of the public, and may ultimately succeed.

I am very sorry to tell you that only three of the cane plants you so kindly sent me have come up, though I paid every attention to them. I am ashamed to ask you for a few more; but if you could spare them I should be very thankful, as I should like to see them pretty strong before the winter set in.

With many thanks,—

I am, &c.,  
EDWARD HOLLAND.

How directly contrary to his replies to Nos. 41, 42, 43, and 45.

These remarks prove the untruthful replies he made to the above questions, particularly so to 45. It was I who first supplied him with cane plants, in 1860; see also his letters in your possession. He has by the *proof* of these letters, private and published, misled the Committee, and *heartlessly* endeavoured to wrong me.

T. SCOTT.  
22/8/70.

The Hon. William Brookes, Esq., M.L.A.

A 2.

SUGAR-GROWING.

To the Editor of the Herald.

Sir,

Having recently read an account of Mr. Thomas Scott's experiments at Kiama in the manufacture of sugar, I should like, with your kind permission, to say a few words on the philanthropic nature of that gentleman's labours, and his claims on the Colony for a substantial reward.

Mr. Scott is most *unquestionably* the man of all others who has kept the importance of sugar culture and manufacture before the country, and for many years laboured with his pen and his purse to impress upon our agriculturists and capitalists the enormous advantages to be derived from this new industry. He has pointed out, in the clearest and most satisfactory manner, the way in which the welfare of this Colony can be augmented, and placed on a healthy basis, providing splendid returns on the outlay, and employment of a healthy and superior description for thousands. I have done something in this way myself, but still I feel that the palm belongs to Mr. Scott. Probably during the last ten or twelve years I have manufactured more sugar than either Mr. Scott or any other person in the Colony—some 7 cwt.; but when I arrived here it was with a prejudice against the climate, as regards its suitability for the growth of the cane. The plant I certainly cultivated more as a curiosity, and a memento of the West Indies, till meeting with some of Mr. Scott's letters I felt encouraged to go on, and give the matter more attention; and now, after years of practical experience, I can truly and faithfully assert that Mr. Scott's predictions have been found true to the letter. Yea, more. I believe the whole truth has not been told. The results will be such, I am confident, when this industry has been fully developed, as to convince the most sceptical that a disinterested benefactor has been labouring for the welfare of the community, but justice has not been awarded him. On this point I think it is high time some one spoke out. The Kiama people have covered themselves with honor in the way they acted towards Mr. Scott; but as he is now far advanced in life, and rapidly approaching the period when the praises of his fellow men will affect him not, something should be done to sweeten the sorrows incidental to old age, and afford him the satisfaction of knowing that his labours and writings for the welfare of the Colony have received a just appreciation. I think, therefore, sir, that the Parliament of the country ought to give him a substantial mark of esteem, either in the shape of pension for the rest of his days, or a solid gratuity that will add to his comfort while going down the hill of life. I have no doubt, if this matter were taken up by the Press, and urged upon the Members of the Legislature, this true friend of the Colony would receive that reward which his valuable labours deserve. You would also confer a boon upon the farmers of the Colony by a republication of Mr. Scott's letters on the growth of the cane and the manufacture of sugar—a proposal to which that gentleman, I apprehend, would offer no objection.

Port Macquarie,  
20th November, 1866.

I am, &c.,  
EDWARD HOLLAND.

A 3.

The Rev. Edward Holland to Thomas Scott, Esq.

The Manse, Port Macquarie,  
10 December, 1866.

Dear Sir,

In both *Herald* and *Empire*, I have lately seen from you the promise of making publicly known a new discovery in the art of sugar making, alike inexpensive and profitable, which, if equal to your expectations, will be the greatest boon you have yet conferred upon the Colony. The great drawback to Fryer's process is its expense, which places it beyond the reach of those with limited means who, like ourselves, seek to benefit the land of our adoption. Besides, as there is no apparent provision made for the defecation of the raw juice, I fear the concrete will be turned out a dirty mass. I saw a letter some time ago from one of the firm in Manchester, in which it was honestly admitted that the invention is not yet an established fact, though I have no doubt it will be in time to come, which will effect quite a revolution in the art of sugar manufacture, and cause even temperance advocates to take the matter up, as there is no need for distillation. Your process, from what I can glean from your letters, provided the chemicals are not too dear and can be extensively employed, will be a far greater boon, and place you in the van of public benefactors. I am also of opinion that the benefits conferred should not be *all on one side*. I think in my heart that you are entitled to something more than empty praise. For several days I have been casting about

in

in my mind how this promised discovery could be made beneficial to you as well as the public; and the most feasible plan I can devise, likely to effect the object, I will now mention, and hope you will do me the justice to believe that I have no other desire than to benefit you as far as I can. The plan is this:—Before giving the promised information to the public, enable me to test it privately. I have cane now ready for grinding, and perhaps I can better follow your directions than others. I shall then be in a position to corroborate the fact; and, as I have gained the ear of the public, I intend to make use of it in the following manner:—1. I shall write to all my sugar correspondents, and their name is legion, and solicit help towards a public testimonial. 2. I shall invoke the aid of the Prime Minister, whose confidence I possess, and—3. I shall avail myself of the privilege afforded me by both of the daily papers, to bring the subject before the country and the Members of the Legislature. To many of the latter I have already mentioned your claims. Last year I tried to get them interested so as to bring the matter before the House, but was met on every hand with the cry of an empty Treasury. If you approve of my plan, you will please let me know as soon as convenient, and be unsparing in detailing the directions for carrying out your discovery; but if you disapprove of my suggestion no harm will ensue, as I shall take my own course when the matter is before the public. I am now only anxious to save time, as the season is advancing and the rattoons will be retarded in their growth. Of course I shall promise not to mention a syllable of the matter till your letter is published. I think you may trust me, if it were for no other reason than our former mutual connection with the London Missionary Society. Hoping your valuable life may be long preserved to benefit the Colony, and with best respects,—

I am, &c.,  
EDWARD HOLLAND.

---

A 4.

The Rev. Edward Holland to Thomas Scott, Esq.

Port Macquarie,  
13 May, 1867.

Dear Sir,

I certainly owe you an apology for not replying to your three letters. The chief cause of the delay arose from the *Herald* neglecting to publish your new process of making sugar. I waited week after week expecting to see it in print, intending to direct public attention to it; but as it has not yet appeared I took no steps in the matter, with the exception of writing and speaking of your great and valuable labours to benefit the Colony to private friends. In the interim a large patch of my cane field unfortunately got burned down, sufficient to make two tons of sugar. It was with these canes I intended to try your process. When the fire occurred, great sympathy was expressed, and loud promises were made by the public to reimburse the loss, but it all ended in talk. I have found out, what no doubt has often pained your mind, that it is a very thankless office to try and benefit the public. There is great truth and point in the beatitude of the celebrated Dean Swift—"Blessed is he that expecteth nothing, for he shall not be disappointed."

I sent a memorial to the Government, and had an interview with the Prime Minister on the subject of a bonus, and Mr. Martin seemed favourably disposed. I also enlisted the co-operation of certain leading Members of Parliament, but up to the present with barren results. I also tried to enlist the aid and co-operation of the Sydney Refining Co.; they promised to import one of Fryer's Concretors for me, but required a mortgage on my farm, crop, plant, &c., and interest on all charges at 8 per cent., which I declined with thanks.

The concretor is a grand invention; with it, concrete or sugar to any extent could be manufactured from imphee and sorghum, while the cane was coming to maturity. But the apathy and indifference of the public, especially of farmers and capitalists, are beyond description. For my own part, I am so disgusted with it that I feel at times determined never to say another word on the subject, pursue my own course, and let those who will not take advice suffer. I have written and lectured on the sugar subject till I am tired. I made an impression on a farmer at Rolland's Plains a little while ago, and he spoke largely of what he intended to do, but when I closely questioned I found he intended asking me for half a dozen plants, to try if they would grow in his farm!!!

I think it would be well if you were to send in a memorial to the Parliament when it meets, setting forth your long continued efforts for the welfare of the Colony, and praying for assistance in your old age. I am inclined to think it would be successful. I fear the general public do not care a button about you or any other philanthropist. With best respects,—

I am, &c.,  
EDWARD HOLLAND.

## YASS ROMAN CATHOLIC CHURCH LAND BILL.

---

 REPORT.
 

---

THE SELECT COMMITTEE of the Legislative Assembly, to whom was referred on the 18th April, 1871, for consideration and report, the "*Yass Roman Catholic Church Land Bill*,"—beg to report to your Honorable House:—

That they have examined the \*Solicitor for the Bill and the † witness named in the margin (whose evidence will be found appended hereto), and that the Preamble having been satisfactorily proved to your Committee, they proceeded to consider the Clauses and Schedule of the Bill, in which it was not deemed necessary to make any amendment.

\* J. J. Donovan, Esq.  
† The Rev. P. Dunne.

And your Committee now beg to lay before your Honorable House the Bill without amendment.

MICL. FITZPATRICK,

Chairman.

No. 3 Committee Room,

Sydney, 21 April, 1871.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON THE

## YASS ROMAN CATHOLIC CHURCH LAND BILL.

FRIDAY, 21 APRIL, 1871.

Present:—

MR. DODDS, | MR. FARNELL,  
MR. FITZPATRICK.

MICHAEL FITZPATRICK, ESQ., IN THE CHAIR.

J. J. Donovan, Esq., appeared as Solicitor for the promoters of the Bill.

The Rev. Patrick Dunne examined:—

1. *Mr. Donovan.*] Do you produce the five deeds of grant mentioned in the preamble of the Bill now before the Committee, of allotments numbers 6, 7, 8, 9, and 10 respectively, of section number 17, of the town of Yass? I do. (*The witness produced the same.*)
2. Are William Hampden Dutton, Henry O'Brien, and Cornelius O'Brien, therein named as Trustees, now dead? They are all dead.
3. Did they die on or about the dates stated in the preamble? Yes.
4. Do you produce an indenture of the 27th February, 1871, made between Rebecca O'Brien and the Venerable Frederick Arthur Cecil Lillingston, the executrix and executor respectively of the said Cornelius O'Brien, of the one part, and the Right Reverend William Lanigan, Roman Catholic Bishop of the Diocese of Goulburn, yourself, the Reverend Patrick Dunne, and Morgan O'Connor, doctor of medicine, of the other part, under which the executrix and executor appointed these gentlemen to be Trustees in respect of the lands comprised in the said five Crown grants? I do. (*The witness produced the same.*)
5. The next paragraph of the preamble states that the land described in the schedule hereto, being a portion of the lands comprised in the said five deeds of grant, allotments 8, 9, and 10, of section 17, are not required as a site for a Roman Catholic Church, nor for the enlargement of the present site of the Roman Catholic Church in the town of Yass;—is that statement correct? Entirely correct; we have a superabundance of land in Yass for church purposes, and where the church now stands, on the hill, is the proper site for it.
6. *Chairman.*] The present church does not stand on any of these allotments? Not on any of these allotments, but on allotments 2, 3, 4, and 5, of the same section granted by the Government for the purpose.
7. These allotments, 2, 3, 4, and 5, in fact constitute the land granted by the Crown under Sir Richard Bourke's Act in the usual form as the site for the church and presbytery? Yes, that is correct.
8. And the church stands within these allotments? On one of these allotments. There is a superabundance of room to extend the church in any direction. In fact there are two allotments between where the church stands and any of the allotments named in this Bill.
9. *Mr. Donovan.*] These allotments of which we are now speaking—6, 7, 8, 9, and 10,—are purchased grants from the Crown? They have been purchased I think by subscription.
10. *Chairman.*] Are the other two allotments used for any purpose, or proposed to be retained? This Bill does not affect them; they remain exactly as they are.
11. *Mr. Donovan.*] Do I understand that these allotments, 6, 7, 8, 9, and 10, were originally purchased without any special object further than as an endowment to the church, to be sold or employed in any other way to promote the interests of the church? I believe there was no definite object; it was intended merely that it should be used for the benefit of the church generally, at any future time.
12. And you consider that by retaining these allotments, 6 and 7, there will be ample space for any enlargement of the building or grounds that may be required? There will be ample space for school and church purposes.
13. And that the sale of 8, 9, and 10, will not interfere with the grounds of the church in any way prejudicially? Not in any way whatever.

The Rev.  
P. Dunne.

21 April, 1871.

- The Rev. P. Dunne.  
21 April, 1871.
14. The next paragraph recites that yourself and co-trustees are desirous of selling the said lands, and of applying the proceeds of such sale towards the erection of a Roman Catholic school and teachers' residence in the town of Yass, or in or towards the purchase for that purpose of a building or buildings in the said town, or otherwise in such way in and towards religious and educational purposes, for the benefit of the members of the Roman Catholic Church in the district of Yass, as to the Trustees may seem desirable? That is quite correct.
15. You think that would be for their benefit? I think it would be for their benefit. We are paying rent at present for a girls' school; the boys' school is in very bad repair; and the teacher's dwelling, a little hut, is falling to decay. We want to erect a girls' school, and the funds derived from the sale of this land would be appropriated in part to that purpose.
16. You think the mode of application of the funds derived from the sale of this property contemplated, would be for the benefit of members of the Roman Catholic Church, now residing in the district of Yass? Yes, very much for their benefit.
17. *Chairman.*] In brief then, Father Dunne, the case is this: The site on which the church is built was granted in the ordinary way by the Crown? Yes.
18. And the five allotments were bought at auction generally for the purposes of the Roman Catholic church? Yes.
19. And you propose to retain two for the extension of the church site if necessary, and to sell the other three? Yes.
20. Are those the three allotments fronting Comur-street? Yes, that is the main street of Yass; and the sale will be an advantage to the church and to the public.
21. *Mr. Farnell.*] Were Mr. Henry O'Brien, Mr. Cornelius O'Brien, and Mr. William Hampden Dutton, Trustees of this land for the purpose of the erection of a Roman Catholic church? I think they were Trustees of the land for church purposes, not for the erection.
22. However they were the Trustees? Yes.
23. Then do I understand that this land was purchased for the purpose not only of the church but for the erection of schools, or anything in connection with the church? Anything that would be for the benefit of the church, either for schools or for other purposes.
24. *Mr. Dodds.*] It is quite within the terms of the grant to apply the proceeds as you propose to do under the provisions of this Bill? It is in no way a misappropriation.
25. *Mr. Donovan.*] Is it not the fact that the church edifice was erected before these grants were issued? I believe so. The object and intention of the subscribers generally was that some future good might arise to the church, either from the sale of the land or in some other way. It was in fact a sort of speculation for church purposes.
26. Do you produce any letter from your co-trustees, showing that they concur in the object of this Bill? Yes; I have here a letter from the Bishop of Goulburn, and also one from Dr. Morgan O'Connor. (*The witness handed in the same. Vide Appendix A 1 and 2.*)
27. *Mr. Farnell.*] The Trustees of this land are the promoters of the Bill now before this Committee? Yes.

John Joseph Donovan, Esq., examined;—

28. *Chairman.*] Have you compared the descriptions in the schedule to the Bill with the deeds of grant? I have.
29. Do they correspond exactly? Yes.
30. *Mr. Farnell.*] Do you produce a plan of the allotments? I produce a Government plan of the town allotments. (*The witness produced the same.*)
31. Are those allotments in section 17 the allotments described in these deeds? They are.

## YASS ROMAN CATHOLIC CHURCH LAND BILL.

### APPENDIX.

[*To Evidence given by The Rev. Patrick Dunne, 21 April, 1871.*]

#### A 1.

The Roman Catholic Bishop of Goulburn to The Very Rev. Patrick Dunne.

Goulburn, 20 April, 1871.

Very Rev. dear Sir,

I have read the Bill at present under consideration, to enable the Trustees of certain allotments in the town of Yass, granted to Henry O'Brien and others, as Trustees of the Roman Catholic Church at Yass, to sell a portion of the said land, and to provide for the application of the proceeds thereof.

This Bill has my full concurrence, and I hope you will be able to show the Committee the justice and propriety of such a Bill.

Yours faithfully,  
† WM. LANIGAN,  
R. Catholic Bishop of Goulburn.

#### A 2.

Yass, 20 April, 1871.

I, THE undersigned, being a Trustee for the land for church purposes, situated in Comur-street, Yass, N. S. Wales, do hereby give my concurrence to the Bill for the sale of said land, now passing through the Legislative Assembly of this Colony.

MORGAN O'CONNOR,  
Surgeon, Yass.

Witness—LEOPOLD YATES, J.P.

NEW SOUTH WALES.

---

CUMBERLAND AND CAMDEN BATHURST-BURR AND  
THISTLE BILL.

(PETITION—CERTAIN INHABITANTS AND LANDHOLDERS OF BURRAWANG, KANGALOO, YARRAWA, AND MITTAGONG.)

---

*Ordered by the Legislative Assembly to be Printed, 23 September, 1870.*

---

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of the undersigned Inhabitants and Landholders of the Districts of Burrawang, Kangaloon, Yarrawa, and Mittagong,—

SHOWETH :—

That your Petitioners view with pleasure the proposal to introduce an Act to eradicate and destroy the Thistle and Burr plants in the Counties of Camden and Cumberland.

That your Memorialists, looking at the great advantages which the Act now before your Honorable House will confer on the aforesaid Counties, humbly pray that your Honorable House will take the matter into your favourable consideration.

And your Petitioners, as in duty bound, will ever pray.

THE UNEMPLOYED.

(PETITION—WILLIAM JENNETT, CHAIRMAN OF PUBLIC MEETING.)

*Ordered by the Legislative Assembly to be Printed, 20 October, 1870.*

To the Speaker and Hon. Members of the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the Unemployed Mechanics, Artisans, and Labourers of the City of Sydney and Suburbs, adopted at a Public Meeting held this day on Hyde Park, at which there were two thousand persons present,—

HUMBLY SHOWETH :—

1st. That from the great depression of business existing in Sydney and Suburbs a large number of men are at present out of employment, mostly having large families depending upon them for support.

2nd. That large sums of money have been voted by Parliament for Public Works, which could be effectually and economically performed by the unemployed,—namely, Reclamation of the Blackwattle Swamp, Approaches to Harbour Defences of Port Jackson, &c., &c., which are now rendered indispensably necessary.

Your Petitioners therefore pray that your Honorable House will insist on the Government at once proceeding with the Public Works already sanctioned by Parliament.

And your Petitioners will ever pray.

Signed on behalf of the Meeting,—

WILLIAM JENNETT,  
Chairman.

Messrs. J. HUNT, MICHAEL STACK.

19th October, 1870.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

---

**PROPOSED PUBLIC WHARF AT TAREE.**

(PETITION—CERTAIN RESIDENTS OF TAREE.)

---

*Ordered by the Legislative Assembly to be Printed, 8 November, 1870.*

---

To the Honorable the Legislative Assembly of the Colony of New South Wales, in Parliament assembled.

The humble Petition of the undersigned Residents of the Township of Taree, and others interested in the prosperity of the said Township and neighbourhood,—

HUMBLY SHOWETH:—

That this Township contains a population of nearly four hundred souls, which number is being daily augmented.

That in addition to the large quantity of agricultural produce, timber, stone, bricks, lime, &c., and merchandise that is shipped and received for the township itself, Taree is also used by the majority of the farmers and others resident at Taree Estate, Woolla Brush, and surrounding neighbourhood, as their place of shipment for their produce to Sydney.

That no public wharf or other suitable place for the purpose of shipping or receiving such agricultural produce, &c., exists in the said township, or in fact throughout the river.

That consequently, great public inconvenience, delay, and unnecessary expense, are the results.

That a public wharf erected at the south-eastern termination of Pultney-street, Taree, is urgently required, and would meet the necessities of the case.

Your Petitioners, therefore, humbly pray that your Honorable House may be pleased to take the above matters into consideration, and afford them such relief in the premises as your Honorable House may deem fit.

And your Petitioners, as in duty bound, will ever pray.

NEW SOUTH WALES.

## ST. ANDREW'S PARSONAGE SALE BILL.

(PETITION—CERTAIN PARISHIONERS OF ST. ANDREW'S.)

*Ordered by the Legislative Assembly to be Printed, 2 March, 1871.*

To the Honorable the Members of the Legislative Assembly of the Colony of New South Wales, in Parliament assembled.

The humble Petition of the undersigned Parishioners of St. Andrew's, in the City of Sydney, in the Colony of New South Wales,—

RESPECTFULLY SHOWETH :—

1st. That in the year one thousand eight hundred and fifty-two, your Petitioners, by their Incumbent and Churchwardens, applied to the Government for a grant of land for a Parsonage, and the late Governor Sir Charles Fitz Roy granted the present site in Liverpool-street, on condition of their paying the sum of five hundred and fifty pounds, and that it should remain (being so advantageously situated) as the Parsonage in perpetuity; and, in accordance with usage, the property was vested in the Lord Bishop of the Diocese as sole Trustee, under these conditions, for the exclusive benefit of your Petitioners as the parishioners of St. Andrew's.

2nd. That your Petitioners have seen with alarm that His Lordship is about to submit to your Honorable House a Bill to empower him to make sale of your Petitioner's property, being theirs and their succeeding parishioners solely, and to apply the proceeds thereof to purposes entirely connected with the Cathedral.

3rd. That your Petitioners beg to state, in reference to the building getting out of repair, that until the last few years it was always kept in proper order from the general funds gathered; and during the period alluded to, the means afforded by your parishioners and congregation were so much greater than on any former occasions, that the tenement and property ought to have been in first-class order, had the system formerly adopted been continued.

4th. That your Honorable House will see that what His Lordship proposes amounts to this: that a property purchased by and granted for the exclusive benefit of your Petitioners would be taken from them, sold, and the value thereof (after their paying for the same) to be applied to an object in which they as a parish had no concern.

Your Petitioners therefore humbly beg that your Honorable House will not consent to pass this Bill.

And your Petitioners, as in duty bound, will ever pray, &c.

[Here follow 27 Signatures.]

## ST. ANDREW'S PARSONAGE SALE BILL.

## REPORT.

THE SELECT COMMITTEE of the Legislative Assembly, to whom was referred on the 22nd February, 1871, for consideration and report, *the Bill to authorize the Sale of St. Andrew's Parsonage, in the City of Sydney*,—beg to report to your Honorable House,—

That they have examined the witnesses named in the list\* (whose evidence will be found appended hereto), and that, the Preamble having been satisfactorily proved to your Committee, they proceeded to consider the several clauses of the Bill, in which it was deemed necessary to make certain Amendments.†

\* *Vide List of Witnesses, p. 4.*† *Vide Schedule of Amendments, p. 4.*

And your Committee now beg to lay before your Honorable House the Bill as amended by them.

G. WIGRAM ALLEN,

Chairman.

*No. 1 Committee Room,**Sydney, 1 March, 1871.*

PROCEEDINGS OF THE COMMITTEE.

TUESDAY, 28 FEBRUARY, 1871.

MEMBERS PRESENT:—

Mr. Allen, | Mr. S. Brown.

In the absence of a Quorum, the meeting called for this day lapsed.

WEDNESDAY, 1 MARCH, 1871.

MEMBERS PRESENT:—

Mr. Allen, | Mr. Farnell,  
Mr. Stewart, | Mr. Clarke,

Mr. S. Brown.

Mr. Allen called to the Chair.

Entry in Votes and Proceedings, appointing the Committee, *read* by the Clerk.

Printed copies of the Bill *referred*, and original Petition to introduce the same, before the Committee.

Parties called in.

Present:—The Very Rev. W. M. Cowper, Dean of Sydney (*for the Promoters*).

William Barker, Esq. (*Solicitor for the Bill*).

The Very Rev. W. M. Cowper examined.

Witness *produced* the documents referred to in the Preamble.

Witness withdrew.

E. T. Blacket, Esq., called in and examined.

Witness withdrew.

Room cleared.

Preamble *read* and considered.

Question put,—“That this Preamble stand part of the Bill,”—*agreed to*.

Solicitor called in and informed.

Clause 1 *read* and *agreed to*.

Clause 2 *read* and considered.

• *Vide* Schedule.

Certain Amendments\* made, on motion of Mr. S. Brown.

Clause as amended *agreed to*.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON

ST. ANDREW'S PARSONAGE SALE BILL.

WEDNESDAY, 1 MARCH, 1871.

Present:—

MR. ALLEN,		MR. CLARKE,
MR. BROWN,		MR. FARNELL,
MR. STEWART.		

GEORGE W. ALLEN, Esq., IN THE CHAIR.

W. Barker, Esq., appeared as Solicitor for the Promoters of the Bill.

The Very Reverend William Macquarie Cowper, Dean of Sydney, examined:—

1. *Mr. Barker.*] You are the Dean of Sydney? Yes.
2. And the chief officiating minister of St. Andrew's Cathedral? I am.
3. Do you produce the grant referred to in the preamble of the Bill now before the Committee? This is the grant. (*The witness produced the same.*)
4. The Church of Saint Andrew is mentioned in the grant—Can you say whether the church there mentioned is now the cathedral church of St. Andrew? It is.
5. Do you know the portion of land described in the grant, and the building standing upon it? Yes, I am pretty well acquainted with it.
6. Will you be good enough to inform the Committee as to the character of the building—as to its suitability for the purpose for which it was granted? The house is an old one; it was in rather a dilapidated state when I last saw it, the foundation on one side being insecure; it is too small for the purpose for which it is intended, and it is otherwise inconvenient. The rooms are small, low, and not very healthy.
7. Is it considered to be conveniently situated for the purpose? It is not so, I think, inasmuch as it is in a situation that is not very well known by the parishioners generally; it requires a good deal of inquiry on the part of poorer people to find it out.
8. Can you say whether it is considered by the Chapter of the Cathedral, the Bishop, and the parishioners generally, that it should be sold, with a view to a better building being provided, and more conveniently situate for the purpose? That has been the intention of the Bishop and Chapter for the last twelve months. They consider it to be most desirable that that course should be taken, and are the parties to this Bill.
9. Is there any intention to change the appropriation for which it was intended; that is to say, are not the proceeds to be applied to the very same purpose for which the grant was issued? I consider the purpose is entirely the same. The appropriation will be to the same object for which it was granted,—a suitable residence "for the clergyman duly appointed to officiate in the church" of Saint Andrew.
10. It is intended simply, with the proceeds of this land, to provide a better house in a better situation for the clergyman officiating at St. Andrew's Cathedral? Exactly so. I may say that I hold the license of the Bishop as the officiating minister of that district.
11. Can you inform the Committee whether or not the chief officiating minister of the Cathedral is, or is not, the parochial minister for the parish of St. Andrew? I so regard myself, and am so regarded by the people. I discharge all the duties which are ordinarily discharged by a parochial minister in the city of Sydney.
12. So that you, with a different designation, discharge the duty which would be discharged by the minister who would be entitled to this residence? Exactly so—all the duties.
13. The intention is to build a residence partly upon the portion of land described in the Act passed last Session to authorize the erection of a residence upon a portion of the Old Burial Ground, and partly upon

The Very  
Rev. W. M.  
Cowper.

1 March, 1871.

The Very  
Rev. W. M.  
Cowper.

1 March, 1871.

upon the land granted for the Cathedral? That is the present intention; and it is considered that that will be a site convenient for the residence of the minister, well known and recognized by the people of the parish of St. Andrew, and accessible to them at all times—much more accessible than the old building.

14. Can you give the Committee any information as to what sum is expected to be produced by the sale of this land? It is rather difficult to say. I should think it would produce about £1,000.

15. Can you give any information as to the estimated cost of the building intended to be erected instead of it? I do not think it can be much less than £3,000.

16. How is the building proposed to be sold occupied at present? It is let to a weekly tenant at £1 per week, and would not fetch more.

17. In order to make it fit for the purpose for which it was intended it would require a very large outlay? I should say it would require to be rebuilt, and doubled in extent.

18. And then would not be so convenient for the purpose as the site on which it is intended to erect a building? Decidedly not.

19. *Mr. Stewart.*] This grant is dated 4th April, 1870—seven months ago? Yes.

20. Was it not known at that time that the site was unsuitable for a building for this purpose? That grant is a substitute for a grant that was issued by mistake. Some fifteen years before there was a grant issued by mistake. The land was wrongly described in the grant, which I think was dated 1856, and it was found necessary to apply to the Government for a new grant in lieu of the old one.

21. But eleven months ago it seems to have been thought a desirable site for a parsonage, and it is now found to be inconvenient? No; that grant simply substitutes a correct description of the land which was given to us for a description which was given in error.

22. *Mr. Barker.*] Was it not in consequence of the advertisement with reference to this Bill that the mistake was discovered? Yes, that was the case.

23. *Mr. Stewart.*] You have no evidence to show that the Bishop has authorized the disposal of this land not only on his own account but on that of his successors? I may say that the Bishop gave instructions to his solicitors to take the steps which have now been taken, and has conferred with the Chapter informing them that he was most desirous that the land should be sold.

24. My question has reference to his own power,—whether the Bishop has power to dispose of land granted to himself and to his successors?

*Mr. Brown* objected to the question.

25. *Mr. Clarke.*] Have any objections been made by any of the parishioners of St. Andrew's to the sale of this building? Not that I am aware of.

26. *Mr. Barker.*] The application for this Bill is made not only by the Bishop, but with the concurrence of the Dean and Chapter, who form the governing body of the Cathedral? Decidedly.

27. Are they unanimously desirous that this Bill should pass? I believe I have not heard any objections to the steps which have now been taken.

28. So far as you know, is it also the desire of the parishioners? I should say decidedly, from my intercourse with them.

29. *Chairman.*] I presume the building was not erected for the purpose of a parsonage? It was not erected for the purpose of a parsonage. I believe it was granted by the Crown many years after it had been erected.

30. Was it occupied by the clergyman of the parish of St. Andrew's? Yes; by the Rev. George King for several years, and by the Rev. Canon O'Reilly, under (I must almost say) protest. He informed me that he was only waiting there till new arrangements were made, and that he could not continue to occupy it unless several hundred pounds were expended upon it.

31. He had but a small family? He had but a small family, and was inconveniently pressed for want of room.

Edmund Thomas Blacket, Esq., examined:—

*E. T. Blacket,* 32. *Mr. Barker.*] You are an architect? Yes.

*Esq.* 33. Do you know the building known as St. Andrew's Parsonage, which it is proposed to obtain leave to sell? Yes.

1 March, 1871. 34. Can you say whether that building is suitable for the residence of the chief officiating minister of St. Andrew's? Not now; it was originally, some twenty years ago, when I repaired it; it was then an old building—now it is altogether a ruin.

35. Now you consider it to be in a ruinous state? It is; it will have to come down.

36. Do you consider it unsafe? It was a very flimsy building originally, and at the time I speak of it was strengthened with joists, but it has had its day—it is now a ruin.

37. In order to make it suitable would it not be necessary to pull it down and make it larger? Altogether.

38. Do you consider the site a suitable one for the residence of the chief officiating minister at St. Andrew's? Not in Liverpool-street; it is a close confined place, and too far from the work.

39. The position itself you consider to be inconvenient? Yes, certainly; it was considered so in the first instance, but no other building could be obtained.

40. It has always been considered an undesirable site? Yes. I was present at the negotiation, and it was then considered the best we could get, though still bad.

41. You know where it is now proposed to erect a parsonage? Yes.

42. Do you consider that more convenient and suitable? It is in every way advantageous, being close to the Cathedral, and in an open airy space.

43. Have any designs been agreed upon for a new building? Yes.

44. It is proposed to apply the money derived from the sale of the old grant to the erection of a new building? Yes.

45. Do you think it likely the proceeds will be sufficient for that purpose? Not half.

46. What do you estimate the probable expense? The building will cost £3,000.

47. What do you suppose the land will sell for? Not above £1,000; the building will not realize anything.

48. You say that so long as this land has belonged to the church it has been considered to be inconveniently situated, and that the building is unsuitable for the minister's residence? Yes, and it is past the possibility of repair. E. T. Blacket,  
Esq.
49. Therefore on no ground could you advise the Trustee of the land to pull down the present house and to rebuild it? Certainly not. 1 March, 1871.

William Barker, Esq., examined:—

50. *Mr. Farnell.*] In reference to a question asked by Mr. Stewart of Dean Cowper, as to the power of the Bishop to sell this land—is there any power to sell this land? It is because there is no power that this application is made to Parliament; but I may inform the Committee that, if it were not for the trusts contained in the grant, the Bishop would have had absolute power to sell the land without consulting with anybody. It is not because the grant is made to the Bishop and his successors that any difficulty arose, but because of the trusts on which it is granted, and it is only because of the trusts we come to Parliament. W. Barker,  
Esq.
51. *Chairman.*] And the same trusts will be continued in reference to the property on which this money will be expended? Yes. 1 March, 1871.
52. *Mr. Stewart.*] We have no evidence that the Bishop really wants this Bill? My instructions to apply to Parliament for this Bill were given by the Bishop to me personally. Upon the Bishop's instructions the necessary notices were inserted in the newspapers and in the *Government Gazette*, in accordance with the Standing Orders of the Assembly, and the usual petition was prepared and signed by the Bishop himself; but in consequence of the adjournment of Parliament for a time, the three months within which the Petition ought to be presented after the assembling of the House had expired. In the meantime the Bishop left the Colony. It was assumed that as there was no question about the Bishop having given instructions, he being sole Trustee, that a petition signed by the Solicitors might be thought sufficient; and a petition was presented, signed by the Solicitors for the Bill, as the Solicitors for the Bishop. An objection was taken to that by the Speaker, and in consequence it became necessary to present another Petition, which was signed by parties interested in having the property sold, and so to get over the difficulty raised by the Speaker; but the Bishop, as sole Trustee, may be regarded as the Promoter of the Bill—the proceedings being taken by his express instructions; and it is his desire, as soon as the Bill can be obtained, the property shall be sold, and the money applied in the way the Promoters of the Bill propose.
53. Are then the Dean and Chapter the Promoters of this Bill? Originally the Bishop was the sole Promoter, the Dean and Chapter having no legal control over this property; but they are interested in the Cathedral, and in having a suitable residence for the chief officiating minister, and the Bishop and the Chapter of the Cathedral are really the Promoters of the Bill. The application is made with the entire concurrence of the Bishop, as sole Trustee, and of the governing body of St. Andrew's Cathedral.
54. *Mr. Farnell.*] Has the Bishop left any authority to anybody to act on his behalf during his absence? He has left authority with the Dean of Sydney, who as his Commissary transacts all matters relating to his office that it is possible for any one not being a Bishop to transact.

1870-71.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

---

**AMENDMENT OF THE DISTILLATION ACT.**

(PETITION—FARMERS, MERCHANTS, STOREKEEPERS, AND OTHERS, OF WAGGA WAGGA.)

---

*Ordered by the Legislative Assembly to be Printed, 2 May, 1871.*

---

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of the undersigned Farmers, Merchants, Storekeepers, and other residents of the District of Wagga Wagga,—

SHOWETH :—

That a large quantity of the plant known as the "Planter's friend" has been cultivated this year in the district, with the view of introducing into the district the industry of sugar-making.

That the crop is now nearly ripe for cutting, but having been grown chiefly to test the adaptability of soil and climate for the production of the plant (the result of which experiment we may add, has been entirely successful), no provision has yet been made for the proper appliances for the manufacture of sugar.

That, in consequence, the growers will be unable to turn their crops to any profitable account unless such an alteration be made in the Distillation Act as will enable them to use the abundant supply of juice, which must otherwise be wasted, for purposes of distillation.

That the late Colonial Treasurer, Mr. Samuel, announced his intention last year of introducing a measure to that effect, and that it was greatly in reliance on that promise that the farmers were induced to attempt so largely the cultivation of the plant.

That an excellent spirit can be made from the juice of the Planter's friend; and that the growers having risked considerable outlay in an experiment in agriculture, likely to be of great future service to the country, they should now be allowed to make the most of their produce, and thus be encouraged to prosecute so promising an enterprise.

That licenses to distil are now granted to the proprietors of vineyards upon very similar grounds.

Your Petitioners therefore pray that your Honorable House will be pleased to extend to the case of sugar-growers the privilege to distil and sell spirits from their plantations, already granted by the 13th Vic., 27, and 30 Vic., 12, in the precisely similar case of wine-growers.

And your Petitioners, as in duty bound, will ever pray, &c.

[Here follow 164 Signatures.]

## FURNITURE FOR COMMODORE'S RESIDENCE.

---

### No. 1.

MESSRS. RAPHAEL & Co. to THE COLONIAL ARCHITECT.

Castlereagh-street, Sydney,  
6 January, 1869.

SIR,  
We enclose herewith the amended list of furniture, as corrected by Mrs. Lambert, for furnishing the Commodore's residence, and which comprises everything that we think will be required. We also return Mrs. Lambert's first list with her corrections and additions.

We are, &c.,  
RAPHAEL & CO.

---

### No. 2.

MESSRS. RAPHAEL & Co. to THE COLONIAL ARCHITECT.

Castlereagh-street,  
7 January, 1869.

SIR,  
Respecting your inquiry as to our terms for furnishing (on hire) the house taken by the Government for Commodore Lambert's residence, as per estimate sent in,—we must respectfully inform you that the estimate was based on the supposition that it would be competed for in the usual way, and without any idea of hiring; also that a very large proportion of the items will have to be purchased by us, being goods not usually kept in our business. Under these circumstances, after a very careful estimate and deliberation of the depreciation in value, we cannot offer to hire the furniture, as contained in our estimate, to the Government for less than 30 per cent. per annum for three years; and should the Government purchase at the end of that period we will make a reduction of 20 per cent. off the estimated cost.

RAPHAEL & CO.

---

### No. 3.

THE UNDER SECRETARY FOR PUBLIC WORKS to MESSRS. RAPHAEL & Co.

Department of Public Works,  
Sydney, 29 January, 1869.

GENTLEMEN,

In reference to your offer to furnish the house intended for the Commodore's residence for the amount stated in your estimate, or to rent to the Government the furniture for the purpose at 30 per cent. per annum on that sum, I am directed by the Honorable the Secretary for Public Works to inform you, that the Government will be prepared to give you £250 per annum for three years, for the use of the furniture, on the understanding that the estimated cost, £1,133 15s., shall be placed on the Additional Estimates of this year, and if voted by Parliament shall be accepted by you as the purchase money of the furniture, less any amount that may have been paid for rent of same.

JOHN RAE.

---

### No. 4.

THE UNDER SECRETARY FOR PUBLIC WORKS to MESSRS. RAPHAEL & Co.

Department of Public Works,  
Sydney, 11 February, 1869.

GENTLEMEN,

I am directed to request that you will at once favour me with a reply to my letter of the 29th ultimo, intimating the terms upon which the Government will entertain your proposal to furnish the Commodore's residence.

JOHN RAE.

---

### No. 5.

MESSRS. RAPHAEL & Co. to THE UNDER SECRETARY FOR PUBLIC WORKS.

Castlereagh-street, Sydney,  
12 February, 1869.

SIR,

In reply to your communications of the 29th ultimo and 11th instant, relative to the furniture required by the Government for the Commodore's residence, we beg to inform you that, as the firm of Raphael & Co. we decline the proposal, but that Mr. Edward Flood, of that firm, will undertake the arrangements on his own responsibility.

RAPHAEL & CO.

---

3

## No. 6.

MR. EDWARD FLOOD to THE UNDER SECRETARY FOR PUBLIC WORKS.

Castlereagh-street, Sydney,  
15 February, 1869.

SIR,

In accordance with my promise to yourself and Mr. William Macleay, I undertake to supply the furniture for the Commodore's residence as per estimate rendered by the firm of Raphael & Co., and reduced by Mrs. Lambert to a sum now amounting to £971 12s. 11d. (nine hundred and seventy-one pounds twelve shillings and eleven pence) as per accompanying list, on hire to the Government for a period of three years, at an annual rent of £250 (two hundred and fifty pounds) a year, payable monthly; the said furniture to be returned to me at the expiration of that period in same order and condition, fair wear and tear alone excepted. It being understood that the Government may purchase the whole of the said furniture at any time during the three years, at the price named in the accompanying list.

EDWARD FLOOD.

## No. 7.

THE UNDER SECRETARY FOR PUBLIC WORKS to EDWARD FLOOD, Esq.

Department of Public Works,  
Sydney, 18 February, 1869.

SIR,

I am directed to inform you that the Honorable the Secretary for Public Works has been pleased to accept the offer submitted by you in your letter of the 15th instant, to supply furniture to the value of £971 12s. 11d. for the residence of the Commodore, on the following terms:—The Government to pay you, in equal monthly instalments, the sum of £250 a year for three years for the use of the furniture; the same to be returned to you at the end of that period in as good order and condition as when supplied, reasonable wear and tear excepted.

I am to request that you will now communicate with the Colonial Architect, who has been instructed to see the contract carried out.

JOHN RAE.

## No. 8.

MEMO. ON BACK OF INVENTORY OF FURNITURE.

FURNITURE, glassware, hardware, &c., &c., in the house No. 46 Phillip-street, now occupied by Commodore Lambert, and hired by the Colonial Government from me for the space of three years, at a rental of £250 per annum, from March, 1869.

EDWARD FLOOD.

## No. 9.

THE COLONIAL ARCHITECT to THE UNDER SECRETARY FOR PUBLIC WORKS.

Department of Public Works,  
Colonial Architect's Office,  
Sydney, 18 July, 1870.

SIR,

At the request of the Honorable the Minister for Public Works, I have caused the furniture, &c., at the house in Phillip-street, rented for Commodore Lambert, to be compared with the inventory given at the time of its delivery, and do myself the honor to enclose a list showing the articles damaged and deficient.

JAMES BARNET,  
Colonial Architect.

## No. 10.

MINUTE OF THE SECRETARY FOR PUBLIC WORKS.

COLONIAL Architect to see the proprietor of the furniture, and arrange as to its disposal.—J.S., 28/7/70.

Mr. Barnett, B.C., 29/7/70.—J.R.

## No. 11.

MINUTE OF THE COLONIAL ARCHITECT.

I HAVE seen Mr. Flood, and proposed to him that he should receive rent to the end of the year and take back the furniture. This he declined, and I find that the letter of acceptance does not comprise the last paragraph of the tender, which gave the Government power to purchase at any time during the three years. I then proposed that he should be paid rent for the current month and that the Government should retain the furniture, paying him £515, the sum at which it has been valued. This offer was also rejected. Mr. Flood states that he is willing to accept £1,000, giving up the furniture and cancelling the lease. This sum appears to me too high.—J.B., 19/8/70.

Cabinet.—J.S., 5/9/70.

Cabinet Minute herewith.—7 September, 1870.

No. 12.

## No. 12.

## CABINET MINUTE.

Department of Public Works,  
Sydney, 7 September, 1870.

IN Mr. Flood's proposal of the 15th February, 1869, he offered to sell to the Government certain furniture, enumerated in the accompanying list, for Commodore Lambert's residence, for the sum of £971 12s. 11d., or to hire the same for the sum of £250 per annum, for three years, to be paid monthly, it being understood that the Government could purchase the whole of the said furniture at any time during the three years, at the above-named price. This offer was accepted, and Mr. Flood informed on the 18th of same month.

The Colonial Architect now reports that Mr. Flood has declined to cancel the contract at the expiration of two years, and that he has also declined to cancel it and accept as an equivalent the present value of the furniture (£515).

If the Government want to purchase the furniture before the expiration of three years, Mr. Flood is entitled, according to his agreement, to the original value of the furniture, £971 12s. 11d.

**CAMPERDOWN CEMETERY TRUST BILL.**

---

**REPORT.**

---

THE SELECT COMMITTEE of the Legislative Assembly, to whom was referred on the 21st February, 1871, for consideration and report, the "*Camperdown Cemetery Trust Bill*,"—beg to report to your Honorable House,—

That they have examined the witnesses named in the list\* (whose evidence will be found appended hereto), and that the Preamble having been satisfactorily proved to your Committee, they proceeded to consider the clauses of the Bill, in which it was not deemed necessary to make any amendment.

And your Committee now beg to lay before your Honorable House the Bill without amendment.

WILL<sup>M</sup>. C. WINDEYER,  
Chairman.

No. 2 Committee Room,  
Sydney, 2 March, 1871.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON THE

## CAMPERDOWN CEMETERY TRUST BILL.

THURSDAY, 2 MARCH, 1871.

Present:—

Mr. ALLEN,  
Mr. FARNELL,Mr. LACKEY,  
Mr. STEWART,

Mr. WINDEYER.

THE HON. WILLIAM CHARLES WINDEYER, ESQ., IN THE CHAIR.

Alexander Gordon, Esq., appeared as Counsel for the Bill.

Christopher Rolleston, Esq., called in and examined:—

1. *Mr. Gordon.*] You are the Auditor General? Yes.
2. You are resident at Newtown? Yes.
3. And you are one of the Churchwardens of St. Stephen's Church at Camperdown? Yes.
4. Do you produce a deed of 28th September, 1868, between the Trustees of the Sydney Church of England Cemetery Company of the one part, and the Bishop of Sydney of the other part? I do. (*Deed produced.*)
5. Do you produce also a deed of the 23rd September, 1848, between Maurice Charles O'Connell of the one part, and Thomas Woolley and others of the other part? I do. (*Deed produced.*)
6. Do you produce a letter, addressed by the Bishop of Sydney to yourself, dated 3rd November, 1870? Yes; here it is, posted into the minute-book of St. Stephen's Church, Camperdown. (*Letter produced and read. Appendix A 1.*)
7. Was this letter the result of communications that had taken place between you and the Bishop upon the subject previously? Not between myself and the Bishop, but between Mr. Taylor, the incumbent, and the Bishop. This letter was addressed to me as one of the Churchwardens who called a public meeting upon the subject.
8. In consequence of that was a public meeting called? Yes; a public meeting was convened by advertisement, and public notice given on three Sundays preceding, during Divine Service, to consider the proposal mentioned in the Bishop's letter.
9. What number of persons attended? About forty.
10. You were present? Yes.
11. Who was in the chair? Mr. Taylor, the incumbent.
12. What was done at the meeting? It was moved by Mr. S. C. Brown, and seconded by Mr. H. B. Smith, "That this meeting authorizes the Churchwardens, on behalf of the parish, to accept the offer of the

C. Rolleston,  
Esq.

2 Mar., 1871.

- C. Rolleston, Esq.  
2 Mar., 1871.
- the Church of England Cemetery, made to them by the Lord Bishop of Sydney, and further, to take all necessary measures for obtaining an Act of Parliament, authorizing such transfer." That was carried unanimously. Then it was moved by Mr. William Wilson, and seconded by the Honorable Charles Campbell,—“That the following gentlemen be requested to act as Trustees for the Cemetery, in the event of the Act being obtained :—Mr. C. Rolleston, Mr. William Crane, and Mr. W. G. Sedgwick, the Churchwardens, with Mr. Stephen Campbell Brown and Mr. Thomas Chaplin Breillat.” Carried unanimously.
13. In consequence of what took place at that meeting you addressed a letter to the Bishop? I was requested to write to the Bishop, stating the result of the meeting.
14. Do you produce a letter, dated 19th December, 1870, from the Bishop, in answer to your letter? I do. (*Letter produced and read. Appendix A 2.*)
15. Do you also produce an authority from the Bishop to the Trustees? I do. (*Produced and read. Appendix A 3.*)
16. Are you acquainted with the ground? Yes, quite well.
17. In your opinion is it a suitable place for the erection of a church and parsonage? Very, I think.
18. *Chairman.*] Some portions of the ground have not been used for purposes of burial? They have not. A portion has been reserved for the purpose of building a chapel, and a portion has not been consecrated.
19. And these unused portions are suitable for the erection of a church and residence for the clergyman? Yes.
20. Is Mr. Thomas Woolley dead? I believe so; but I have no personal knowledge of the fact.
21. This is your petition to the House, I believe? Yes, the petition of myself and fellow Trustees.

---

Josiah Richard Treeve, Esquire, called in and examined :—

- J. R. Treeve, Esq.  
2 Mar., 1871.
22. *Mr. Gordon.*] You were Secretary of the Camperdown Cemetery Company? Yes.
23. Do you produce the deed of settlement? I produce the original deed of settlement, dated 12th July, 1848. (*Deed produced.*)
24. Will you look at the first recital in the preamble of the Bill before the Committee;—Does that correctly represent what is contained in the deed of settlement? It does.
25. Does the second recital correctly represent the substance of the deed of conveyance from Mr. O'Connell to the Trustees of the Company? It does.
26. As to the third recital—are you aware whether Mr. Thomas Woolley and Mr. Charles Kemp are dead? They are, to the best of my knowledge.
27. Is the statement in the next recital correct? Yes.
28. Is the next paragraph also correct—that the gentlemen there named were at the time stated, Directors of the Company? Yes.
29. Is the next statement also correct—that the land referred to was set apart for purposes of burial? Yes.
30. Is the statement with regard to an extraordinary general meeting of the proprietors of the Cemetery Company also correct? That is also correct.
31. Is the statement in the Bill of the contents of the deed of the 28th September, 1868, correct? I believe it is.
32. Does the schedule to the Bill agree with the description of the land contained in the deeds of 23rd September, 1848, and 28th September, 1868? Yes, to the best of my belief it does.
33. The parcel of land described in the Bill is the same as that described in these deeds? Yes.
34. *Chairman.*] Is it proposed that the erection of this church and parsonage within the piece of ground known as the Camperdown Cemetery, should in any way disturb any of the ground in which there are graves? No.

[*To Evidence given by C. Rolleston, Esq., 2 March, 1871.*]

A 1.

Copy, Bishop's Letters and Authority.  
The Lord Bishop of Sydney to Christopher Rolleston, Esq.

Sydney Diocesan Registry,  
3 November, 1870.

My dear Sir,

The Trustees of the Newtown Cemetery, having conveyed the land to me, I am prepared to place it at the disposal of the parishioners of Newtown, for the purpose of erecting a Church thereupon, and, if desirable, a Parsonage as well.

It will be necessary for the parishioners to undertake to fulfil the trusts contained in the deed, which I send with this note, that you may see what is required.

I have, &c.,  
F. SYDNEY.

—  
A 2.

The Lord Bishop of Sydney to Christopher Rolleston, Esq.

Sydney Diocesan Registry,  
19 December, 1870.

Dear Sir,

In reply to your letter of the 5th instant, I beg to say that I agree to the proposals contained therein, and hereby constitute as my agents for carrying out the trusts of the Cemetery (such agency to commence on the 1st January, 1871), the Churchwardens for the time-being of St. Stephen's, Newtown, they undertaking to be responsible for all claims that may arise in the care and maintenance of the property, and making arrangements for receiving the fees and granting orders for burial.

And I hereby authorize the Churchwardens to appropriate any surplus in furtherance of the interests of the Church.

I have, &c.,  
F. SYDNEY.

—  
A 3.

To the Trustees of the Church and Parsonage, which it is contemplated to erect on a portion of the Camperdown Cemetery,—  
Gentlemen,

I hereby authorize and empower you to apply to the Legislature for an Act empowering me to convey to yourselves the land and premises vested in me under or by virtue of a certain indenture bearing date the 28th day of September, 1868, and made between the Trustees of the Sydney Church of England Cemetery Company of the first part, the Directors of the said Company of the second part, and myself of the third part,—such land and premises to be held by you upon the trusts of the said indenture, with power nevertheless to erect upon any part of the unused portions of the said land a Church for the exclusive use of members of the Church of England; and also on any un consecrated part of the unused portions of the said land a residence for a Minister of the Church of England, duly authorized to officiate in the said Church so to be erected, together with such other buildings in connection with the said Church and Minister's residence respectively as may be deemed necessary.—Dated at Sydney, this nineteenth day of December, 1870.

F. SYDNEY.
