<i>Privilege—Seat of Dr. William Camac Wilkinson:—</i>		
Motion made (<i>Mr McElhone</i>) that it be referred to Committee to inquire and report whether Dr. Wilkinson, one of the Members for the Glebe, is not disqualified, by reason of holding an office of profit under the Crown as Lecturer in the Sydney University, 46; Report brought up and read by Clerk, 65	1	519
<i>Seats of Mr. Chanter, Mr. Ellis, Mr. Hurley, and Mr. Wall:—</i>		
Motion made (<i>Mr Thompson</i>) that it be referred to, whether these gentlemen are entitled to sit and vote in the Assembly, as they were not sworn in by Mr. Speaker nor by the Commissioners before Mr Speaker took the Chair, and negatived, 58.		
<i>Election Petition—South Sydney—Traill v. Wise:—</i>		
Mr. Speaker laid on Table Election Petition from W. H. Traill, alleging that at some Polling Booths votes were wrongly declared informal and should have been counted in favour of petitioner; that at some booths the ballot-papers were wrongly counted, whereby a larger number of votes were made to appear to be given in favour of Mr. Wise than were so given and that Mr. Wise was declared duly elected, and praying that the return be declared null and void; that a scrutiny of all ballot-papers be made by the Committee of Elections and Qualifications; that Mr. Wise may be declared not lawfully elected; that your Petitioner be declared duly elected:—and such further order and determination be made as may be just, 258, 259; referred to Committee of Elections and Qualifications, 259; Report brought up and read by Clerk, 279.	1	545
<i>Privilege—Seat of Mr. J. C. Neild:—</i>		
Motion made (<i>Mr. McElhone</i>) that having been appointed Commissioner to the Adelaide Exhibition, and having drawn money to pay his expenses, the question whether Mr. Neild has accepted an office of profit under the Crown be referred to the Committee of Elections and Qualifications, 259; Report brought up and read by Clerk, 329	1	529

	VOL.	PAGE.
P		
PRIVILEGE:—		
MR. J. P. ABBOTT:—		
The Speaker's ruling requested (<i>Mr. J. S. Farnell</i>) as to the right of Mr. Abbott to sit and vote without having taken the oath, and before the return of the Writ for Wentworth,— <i>Point of Order</i> , That matter should not be treated as one of Privilege, Mr. Speaker said he was not justified in stopping the debate;—motion made (<i>Mr. Slattery</i>) that this House dissents from Mr. Speaker's ruling, and negatived, 13;—on the question of Privilege Mr. Speaker ruled that there was no legal evidence that the oath could be administered to Mr. Abbott until the Writ had reached the proper authority with his name endorsed thereon, 14; Sir Henry Parkes called attention to the presence of Mr. Abbott in the Chamber, and the Speaker calling upon Mr. Abbott to withdraw—he withdrew accordingly, 14.		
SEAT OF WILLIAM CAMAC WILKINSON, ESQ.:—		
Motion made (<i>Mr. McElhone</i>) to refer to Elections and Qualifications Committee, to inquire and report whether Dr. Wilkinson is disqualified, by reason of his holding an office of profit under the Crown as Lecturer in Sydney University, 46; Report brought up and read by Clerk, 65...	1	519
MOTION FOR ADJOURNMENT OF HOUSE:—		
Motion made (<i>Mr. Want</i>) that the interpretation placed upon the first new Standing Order that the duty was cast upon Mr. Speaker in the first instance to decide whether the subject-matter on which the motion is to be made, is of urgent public importance, is erroneous—and withdrawn, 224		
SEAT OF MR. J. C. NEILD:—		
Motion made (<i>Mr. McElhone</i>) that Mr. Neild having been appointed Commissioner to the Adelaide Exhibition, and having drawn money to pay his expenses in connection therewith, the question, whether he has accepted an office of profit under the Crown, be referred to the Committee of Elections and Qualifications for consideration and report, 259; Report brought up and read by Clerk, 329.....	1	529

TOBACCO DUTY (See "TARIFF.")		
TOBACCO INCREASE DUTY BILL :—		
Ordered (<i>Mr. Burns</i>), founded on Resolution of Ways and Means (No. 8), presented, and read 1 ^o , 295; Message from Governor, 297; read 2 ^o , committed, reported without amendment, and report adopted, 302; read 3 ^o and passed, 306; sent to Council, 307; returned without amendment, 328; Assent reported, 338.	3	431
PETITION PRESENTED FROM :—		
Hugh Dixon, manufacturer, that he views with alarm the proposal of the Government to add 3d. per lb. to the Excise duty on Tobacco, praying the House not to consent to the further duty, and to be heard at the Bar in opposition, presented, 305	3	429
TOLL-BAR :—		
REMOVAL OF, FROM BOTANY ROAD :—		
Motion made (<i>Mr. Stephen</i>) for all correspondence, &c., in connection with, 62; Return to Order, laid on Table, 144	4	1053
TORPEDO DEFENCE (See "MILITARY").		
TRADES CONCILIATION BILL :—		
Motion made (<i>Mr. Carruthers</i>) for Committee of the Whole, 85; Order of the Day, postponed, 151, 193, 227; House in Committee, and resolution agreed to, 238; presented and read 1 ^o , 333; Order of the Day postponed, 361.		
TRAILL MR. WILLIAM HENRY (See "ELECTORAL").		
TRAMWAYS (See also "GOVERNMENT RAILWAYS BILL"; also "SAYWELL'S TRAMWAY BILL"; also "WILLIAM-STREET TRAMWAY BILL"; also "HAY AND DENILQUIN TRAMWAY BILL").		
KOGARAH TO SANS SOUCI :—		
Motion made (<i>Mr. Fletcher</i>) for copies of all correspondence, &c., the names of the applicants, and copies of all agreements in reference to construction of, 30; Return to Order, laid on Table, 167	4	989
Motion made (<i>Mr. Fletcher</i>) for Select Committee to inquire into, &c., 46; leave given to Committee to make visits of inspection, 62.		
ACCIDENTS—CASES AGAINST THE COMMISSIONER FOR RAILWAYS :—		
Return to Order (<i>Session</i> 1885-6), laid on Table, 39	4	979
PARLIAMENTARY TRAMS AND TRAINS :—		
Return in reference to cost of running during Session 1885-6, laid on Table, 45	4	975
Motion made (<i>Mr. Hurley</i>) that the use of, is an unwarrantable abuse of privilege and wasteful expenditure of the people's money, and should be discontinued, and negatived, 47.		
CONDUCTOR :—		
Motion made (<i>Mr. Hassall</i>) for all papers in connection with the recent case of, who was fined £2 for forcibly removing Mr. E. L. Samuel from the platform of a car, 63.		
RANDWICK AND WAVRELEY :—		
Motion made (<i>Mr. See</i>) for all correspondence relating to construction and cost of, with names of parties from whom land was resumed, and sum paid to each, 91; Return to Order, laid on Table, 355	4	1015
MR. JOHN HIGGISON, CLERK IN STORES DEPARTMENT AT RANDWICK SHEDS :—		
Copies of papers relative to the dismissal of, laid on Table, 138	4	987
TRAINING SCHOOL (See "EDUCATION.")		
TREASURY, THE (See "CIVIL SERVICE").		
TREATY OF COMMERCE (See "DESPATCHES").		
TRUANT INSPECTORS (See "EDUCATION").		
TRUCKS (See "RAILWAYS").

ANNUAL REPORT.

TO THE HONORABLE FRANCIS ABIGAIL, ESQ., M.P., SECRETARY FOR MINES, &c., &c.

Sir,

I do myself the honor to submit to you the following Report upon the working of the Department under your charge, and also upon the progress and results of Mining in this Colony during the year 1886.

The following statement indicates to some extent the amount of work performed in this Department during the past year, and shows an increase upon the preceding year.

STATEMENT of the Number of Papers Registered and of Letters Despatched by the various Branches of the Department of Mines.

Branch.	Papers registered.	Letters written.
Mines	15,376	7,653
Forest	12,083	3,502
Rabbit	8,574	5,198
Stock	12,372	4,301
Drills.....	6,467	1,710
Public Watering-places.....	6,112	3,420
Roads	3,987	3,048
Parks	2,210	902
	67,181	29,734*

* Exclusive of printed circulars, notices, &c., &c.

The number of applications to lease Crown lands for mining purposes during the year 1886 was 1,123, being a decrease of 936 as compared with the number of such applications made in 1885.

Of the 1,123 applications so made, 489 were for auriferous land, and 634 for mineral land.

The number of applications dealt with in 1886 was 1,903, which, compared with the number dealt with in 1885, shows an increase of 89. My efforts to reduce the time occupied in dealing with applications to lease have not yet been rewarded with the success I anticipated, still the number of applications on hand has been reduced. For example, in 1885, the number dealt with was less by 245 than the number received, while in 1886 the number dealt with exceeded the number received by 780.

Of the 1,903 applications dealt with in 1886, 329 were for gold-mining leases comprising an area of 2,493 acres, and 1,574 were for mineral leases comprising an area of 54,059 acres.

The area of auriferous land applied for under lease in 1886 is greater than that applied for in 1885 by 942 acres, but the area of mineral land applied for in 1886 is less than the area applied for in 1885 by 30,127 acres.

The following table shows the quantity of land applied for to lease during the year 1886, and the minerals to be mined for therein:—

<table style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th></th> <th style="text-align: center;">a.</th> <th style="text-align: center;">r.</th> <th style="text-align: center;">p.</th> </tr> </thead> <tbody> <tr><td>Diamonds.....</td><td style="text-align: right;">440</td><td style="text-align: right;">0</td><td style="text-align: right;">0</td></tr> <tr><td>Tin and diamonds</td><td style="text-align: right;">840</td><td style="text-align: right;">0</td><td style="text-align: right;">0</td></tr> <tr><td>Tin</td><td style="text-align: right;">6,354</td><td style="text-align: right;">1</td><td style="text-align: right;">1</td></tr> <tr><td>Tin and silver.....</td><td style="text-align: right;">580</td><td style="text-align: right;">0</td><td style="text-align: right;">0</td></tr> <tr><td>Silver</td><td style="text-align: right;">1,792</td><td style="text-align: right;">3</td><td style="text-align: right;">25</td></tr> <tr><td>Silver and copper.....</td><td style="text-align: right;">40</td><td style="text-align: right;">0</td><td style="text-align: right;">0</td></tr> <tr><td>Silver and lead</td><td style="text-align: right;">8,127</td><td style="text-align: right;">3</td><td style="text-align: right;">35</td></tr> <tr><td>Silver, lead, and spar.....</td><td style="text-align: right;">40</td><td style="text-align: right;">0</td><td style="text-align: right;">0</td></tr> <tr><td>Silver, lead, and copper</td><td style="text-align: right;">192</td><td style="text-align: right;">2</td><td style="text-align: right;">32</td></tr> <tr><td>Silver and antimony</td><td style="text-align: right;">20</td><td style="text-align: right;">0</td><td style="text-align: right;">0</td></tr> <tr><td>Copper</td><td style="text-align: right;">260</td><td style="text-align: right;">0</td><td style="text-align: right;">0</td></tr> <tr><td>Limestone</td><td style="text-align: right;">120</td><td style="text-align: right;">0</td><td style="text-align: right;">0</td></tr> <tr><td>Marble</td><td style="text-align: right;">100</td><td style="text-align: right;">0</td><td style="text-align: right;">0</td></tr> </tbody> </table>		a.	r.	p. This

This shows a large aggregate decrease, mainly due to the fact that during 1885 such a large extent of land was applied for for silver-mining; and the want of capital to provide the necessary appliances for treating ores, coupled with the fact that some ores cannot be properly treated by any process known to the mine-owners, has somewhat damped the ardour of the rush upon silver-mines. This is to some extent compensated for by the area of coal and shale lands applied for; also by the increase in the area of auriferous land; while the area applied for to work alum points to a new industry which may prove of great advantage to the Colony.

The following table shows the area of land held under application to lease on the 31st December, 1886:—

	a.	r.	p.		a.	r.	p.

The aggregate area of land held under application to lease on the 31st December, 1886, is less by 30,822 acres than the area so held on the 31st December, 1885. The reduction is due to the fact that the area applied for in 1886 is less, and that the number of applications disposed of in 1886 is greater, than in 1885.

The following table shows the area of land held under lease, and the minerals to be mined:—

Mineral.	Mining Act, 1874.			Mining Act Further Amendment Act 1884			Gold Fields Act, 1866.			Crown Lands Occupation Act, 1861.			Total.		
	a.	r.	p.	a.	r.	p.	a.	r.	p.	a.	r.	p.	a.	r.	p.

*2,300 yards river-bed.

The above table shows a large increase upon the area of land under lease at the end of 1885, the increase being mainly due to the quantity of land leased for the purpose of working deposits of silver. The table also shows that the provisions of the Mining Act Further Amendment Act have been largely availed of. The aggregate increase exceeds 28,000 acres. During 1886, 6 applications were received for special gold-leases under the aforesaid Act, comprising 465 acres.

The number of applications for authorities, under section 28 of the Mining Act, to mine under reserves received during 1886 was 144, being an increase of 28 as compared with the number received during 1885. The number of such applications dealt with in 1886 was 171, being less by 36 than the number dealt with in 1885.

The

The following table shows the areas of reserves, &c., comprised in authorities granted under section 28 during 1886, and the minerals to be mined thereunder :—

	a.	r.	p.
Coal	5,180	1	24
Coal and shale	15,514	1	8
Coal, iron, and shale	30	0	0
Tin	162	2	20
Silver	50	0	0
Tin and emery	40	0	0
Manganese.....	10	0	0
Gold	146	0	0
	21,133	1	12

In the bulk of the cases the authorities in respect of above areas had not issued prior to 31st December last.

The aggregate area comprised in the authorities granted in 1886 is less by 8,233a. 2r. 28p. than in 1885. This is due to the fact that reserved lands can now be leased.

The following table shows the areas comprised in authorities granted under section 28 prior to 1886, and still in force, and the minerals to be mined thereunder :—

	a.	r.	p.
Coal	66,393	1	0
Coal and shale	20,140	0	0
Shale	8	2	32
Tin	243	3	38
Copper	42	3	12
Copper and silver.....	2	2	16
Silver	80	0	0
Silver and lead.....	7	3	5
Limestone	10	0	0
Bluestone and gravel	12	0	0
Marble	5	0	0
Gold	311	1	17½
	87,257	2	0¾

Since the passing of the Mining Act Further Amendment Act numerous holdings under section 28 have been converted into leases.

The following table shows the areas comprised in authorities which were in force on the 31st December, 1886, and the minerals to be mined thereunder :—

	a.	r.	p.
Coal	73,952	2	20
Coal and shale	24,872	1	9
Shale	8	2	32
Coal, iron, and shale	18	2	16
Ironstone	79	3	7
Tin	429	2	23
Copper	42	3	12
Copper and silver.....	2	2	16
Silver	100	0	0
Silver and lead.....	15	3	5
Limestone	10	0	0
Bluestone and gravel	12	0	0
Marble	5	0	0
Gold	316	0	24
	99,866	0	4

The above table shows a decrease, as compared with the aggregate area so held at the end of 1885, equal to 7,399a. 31p.

A return of the holdings under the 28th section, in force at the end of June and December, 1886, was published on the 24th July, 1886, and the 3rd February, 1887, respectively.

In the months of May, July, and October, 1886, and in March, 1887, particulars of gold and mineral leases in force in the several mining districts, for the quarters ending March, June, September, and December, 1886, respectively, were published in the Government Gazette, and copies thereof forwarded to the several Wardens' and Mining Registrars' offices throughout the Colony, in order that the public may know what lands are so held, and the conditions attached to such holdings. The Wardens have been urged to cause all cases of non-work to be reported, and the Inspector of Mines, during his visits of inspection, renders valuable aid in this direction; and such inducements as can be with safety are held out to miners to report breaches of the labour conditions of leases. Notwithstanding these efforts, it is asserted that large tracts of mineral land are held without being worked, and this may in some cases be true, but it frequently happens that upon investigation it is found that the holdings the subject of such complaints are mineral conditional purchases; and as regards these, if the required amount has been expended upon them, they can be locked up from the miner indefinitely. Fortunately the sale of mineral lands as such has been discontinued, and there is now a better chance of enforcing the labour conditions attached to mining holdings.

The foregoing tables do not represent all the land occupied for mining purposes, as they do not include holdings under miners' rights or mineral licenses on Crown lands, nor the lands which have been purchased, and upon which mining operations are being carried on.

GEOLOGICAL SURVEY.

The following records of work done during 1886 by the Geological Surveyor-in-charge and his staff is, I venture to think, highly satisfactory. The Department is fortunate in having at the head of this important branch a gentleman of such high attainments and unremitting zeal as Mr. C. S. Wilkinson, F.G.I., F.L.S. Of Mr. David, his first assistant, I cannot speak too highly—indeed his work bears ample testimony to his ability and industry. Mr. Anderson has, by his work, already justified his selection for the position of second assistant. Mr. Robert Etheridge, junr., as Palæontologist, will be a most valuable addition to the Geological Branch.

The Geological Survey Staff have examined various mining districts, including Bingara, Gunnedah, Jerrara, Hunter River, Molong, King's Plains, Mudgee, Uralla, Sunny Corner, &c.

The Geological Surveyor-in-charge and the Inspector of Mines accompanied me, as members of the Prospecting Board, to the Bingara District, to make arrangements for assisting parties to prospect the district with Government aid.

It was decided to test by boring the deep wet alluvial deposits forming the river flats at Bingara, commencing on the south edge of the flat. Several bores were bottomed, and a little gold obtained; but in the deeper ground the auger could not cope with the loose coarse pebbles in the wet drift. As shallow gold-bearing deposits have proved payable on the adjacent hills, it is believed that a rich lead exists beneath the flats. Two other sites were selected for prospecting the Tertiary drifts which extend from the basaltic Bald Hills towards the "Bobby Whitlow" diggings; but the work on these has not yet been completed. We also inspected the ground on the diamond-field where Mr. Low proposed to put down a diamond-drill bore at his present deep shaft; but, on account of the great thickness of basalt here, and the existence of deeper ground near the creek to the south, where the basalt had been removed by denudation, it was considered that it would be more advantageous to test this deeper ground by sinking. It is probable that both gold and diamonds occur in payable quantity in this lead.

In April the Geological Surveyor accompanied me to the Jenolan Caves, to ascertain what improvements were necessary to be made. We recommended certain improvements, and these have since been completed, and the different caves may now be easily inspected by visitors with safety. Arrangements were made for the electric lighting of the caves. Mr. E. C. Cracknell, Superintendent of Telegraphs, has kindly undertaken the carrying out of this work, which, when completed,* will enable the natural objects in the caves to be seen to great advantage, and enhance their attractiveness, so that a large increase in the number of visitors may be anticipated. The keeper's register shows that 1,140 persons visited the caves during 1886.

Mr. Wilkinson's report upon the auriferous and argentiferous ironstone lodes in the Jerrara district, between Goulburn and Marulan, encourages the belief that payable ore deposits will be opened in that locality.

The Molong District was also reported upon. The remarkable tin and copper lodes at Gumble have not proved very workable, the ore varying much in quality, and being difficult of treatment.

In view of the future development of the gold-bearing reefs at King's Plains, where the Confidence Gold-mining Co. have opened a large auriferous lode, it has been decided, on the recommendation of Mr. Wilkinson, to construct a dam for mining purposes, owing to the scarcity of water on this field. It is believed that quartz-reefing on this gold-field will be permanent. The extensive alluvial deposits that have been worked afford evidence of the existence of gold-bearing reefs that have not yet been prospected.

The Geological Surveyor also examined the Mudgee and Gulgong Gold-fields, and in his report has indicated the localities in which prospecting operations should be conducted. He is of opinion that the gold resources of this district are far from being exhausted, and that diamonds, coal, kerosene shale, and possibly antimony, will also be profitably worked. Hitherto this field has yielded 1,072,752 oz., or over 32 tons of gold, valued at £4,162,550.

A geological examination of the Mitchell or Sunny Corner Silver-mining field has been made. From the mode of occurrence of the silver lodes it is certain that they will vary much in thickness, but will be found to continue to great depths. The more easily worked gossan portions of the lodes occur
within

* *NOTE.*—These works were completed early in 1887.

within about 100 ft. from the surface, and below that level the ores consist of the base ores or sulphides, which will require to be concentrated before smelting. Mr. Wilkinson expresses his confidence in the permanence of the ore deposits, and that with efficient methods of treatment, silver-mining here can be profitably carried on for a long time.

Mr. Geological Surveyor David, is engaged upon a survey of the coal formations in the Hunter River District, and has furnished a preliminary report upon the coal measures of East and West Maitland.

During the progress of his survey he discovered a valuable seam of coal 13 ft. thick, on Deep Creek, 8 miles S.W. from Maitland. The Crown lands embracing this seam were at once reserved for coal-mining, and since then 1,998 acres of the reserve have been leased by Messrs. Smith & Co., who are about to open a new colliery. I entertain the hope that the Geological Staff will ere long be able to undertake a thorough examination of the northern coal-field, and map out all the seams and faults.

Mr. David also examined the newly discovered seams of coal at Gunnedah, and ascertained that two valuable seams occur there of 6 ft. 4 in. and 7 ft. thickness respectively. It is believed that these seams will be capable of affording the supply for the service of the railway lines and towns north of the Liverpool Range. Mr. David also examined and reported upon the Uralla and Rocky River Gold-field, and his report, with geological map, indicates the direction in which the auriferous deep leads trend. He has also furnished a report on the recent gold discoveries at Fairfield, where rich pyritous reefs occur, and he is of opinion that this will become an important gold-field.

A vacancy of Geological Surveyor having occurred, the Agent-General in London was requested to ask the Director-General of the Geological Survey of England to nominate a competent person for the appointment. Mr. W. Anderson, of the Edinburgh University, was recommended and appointed, and commenced duty on the 20th September. He partly surveyed the Mitchell silver-field, and afterwards inspected and reported on the Yarrangobilly Caves and the Kiandra Gold-field, and is now making a geological survey of the Bingera and Inverell diamond-fields.

Mr. J. E. Carne, Curator of the Mining and Geological Museum, has been very assiduous in his duties connected with the examination, assays, and analyses of mineral samples submitted to the department; with the registration and arrangement of the collections of minerals and fossils in the Museum, and with the preparation of collections for the Indian and Colonial Exhibition.

From Mr. Carne's report it will be seen that 1,799 samples of minerals forwarded from various parts of the Colony by prospecting parties have been assayed and reported upon, besides numerous samples that have been examined without assay, for persons seeking information regarding them. Particulars of these assays are inserted under the heads of the several minerals.

The Curator reports that during the year 2,706 additions have been made to the collections, which now include 19,417 registered specimens. Many of the specimens, both of minerals and fossils, are of special interest. Amongst them may be mentioned the large collection of fossil plants from the tin-bearing deep leads of New England, and the splendid specimens of fossil fishes obtained by the geological collector from the Hawkesbury formation at Gosford. The former having been described by the distinguished palæontologist, Baron C. Ettingshausen, of Gratz, now forms a valuable collection for reference; whilst the collection of fishes and other fossils await the examination of Mr. Robert Etheridge, junr., F.G.S., who has been appointed Palæontologist to the Geological Survey of this Colony. Amongst the different series of minerals of commercial value, illustrating the mineral resources of New South Wales, the Museum possesses some rare and valuable specimens.

In the Museum have also been arranged an extensive collection of polished samples of the timbers indigenous to New South Wales. Some of the samples are exhibited in the form of turned articles, &c., showing the suitability of the woods for various purposes. These timber specimens were obtained through the officers of the Forest Branch of the Department.

MINING SURVEYS.

During the year 1886, twenty-one Mining Surveyors were employed, and 1,400 surveys were made by them under the supervision of the Chief Mining Surveyor (E. F. Pittman, Esq.) viz., 311 gold-mining leases, 707 mineral leases, 141 mining tenements, 59 mining permits, 97 tenants' leases, and 85 public watering-places.

The number of surveyors employed and the number of surveys made during 1886 were less than in 1885. Of these surveyors 11 were paid by salaries and fees, and 7 were paid by fees only.

In the Charting Branch 1,817 applications for gold-mining and mineral leases were dealt with, besides 28th section applications and a large number of miscellaneous papers. This is slightly less than the record for 1885, but the number of maps compiled shows a slight increase. Twenty-five maps were compiled and published, and locality maps were kept charted up for the use of the wardens clerks, &c.

I understand that the current work is well in hand, and I am satisfied the Chief Mining Surveyor has spared no pains to prevent the accumulation of arrears.

The following is a list of the maps compiled and published during the year 1886, together with a complete list of mining maps published to date :—

List of Mining Maps compiled and published during 1886.

DIAMOND DRILLS AND WATER AUGERS.

Owing to proposed changes in regard to the work of this branch, during the early part of 1886, the amount of boring performed during the year is considerably less than it otherwise would have been, and the performance of the work was to some extent retarded. Nevertheless, so much energy was thrown into the work, and so much vigilance was exercised by the superintendent, that the result of the year's operations is not altogether unsatisfactory. It is due to the officers of the branch to say that they have ably seconded the efforts of the superintendent. The total depth bored by the Diamond Drill during the year was 6,539 ft. 7¼ in. being 4,786 ft. 3¼ in. less than was bored in 1885. The total cost to the Department in 1886, inclusive of all expenses, was £5,796 7s. 2d., while for the field work alone (that is to say, exclusive of office salaries, store wages, and superintendent's travelling expenses), but including wages, diamonds, materials, wear and tear, carriage, and other field expenses, the cost was £4,899 12s. 5d. The average cost per foot to the Department (including all expenses) in 1886 was 17s. 8½d., which is 1s. 4⅞d. per foot less than the cost in 1885, while the average cost per foot in 1886 (field expenses only) was 14s. 11⅞d., being 2s. 0⅞d. per foot less than the cost in 1885. The total earnings of the drills during 1886 was £6,264 12s. 5d., showing a balance in favour of the Department for the year equal to £468 5s. 3d. The average cost per foot to the persons employing the drills in 1886 being 19s. 1⅞d., as against 16s. 3¼d. in 1885; but the average cost to persons employing the drills in 1885 was reduced by reason of the Minister having in terms of the regulations granted reductions in certain cases. The report furnished by the superintendent shows that a great saving in the cost of wear and breakage of diamonds has been effected. In 1883 the destruction of diamonds equalled 3s. 8d. per foot bored, while in 1884 it was reduced to 2s. 0⅞d. per foot, in 1885 it was further reduced to 1s. 5⅞d., and in 1886 it amounted to only 8¼d. The percentage of core saved in 1886 was 80·07, which is 1·01 greater than in 1885. During the year one of the drills was engaged upon the deepest bore yet put down in the Colony, and though it was not completed by the end of the year, it was finished early this year, the total depth reached being 2,300 ft. These figures I venture to think furnish conclusive proof of the efficiency of this branch and of the ability of the superintendent and the staff under him. I am glad to notice that an inclination to employ the drills in testing metalliferous lodes is beginning to manifest itself.

As regards water augers, eleven were in the field during the year, two of which during part of the year were engaged in prospecting for gold, namely, one at Bingera for a short time, and one at Forbes which is still employed there. The augers engaged in boring for water on the road from Wilcannia to Silverton were not successful and the search has been discontinued. The same result attended the auger at Baringun. The augers at the Mongulla Reserve, Collarindebri, have not yet struck artesian water, and the search there will probably be abandoned. The bore on the Gunbar Road has been so far successful that a valuable well has been formed. At 75 miles from Bourke on the road to Wanaaring, the deepest bore yet sunk by means of a water auger has been completed most successfully, artesian water having been struck at a depth of 942 ft. and the bore having been continued to a depth of 960 ft. A supply of water equal to 33,000 gallons per 24 hours rises to a height of 30 ft. above the surface. The value of such a supply in the dry country back of the Darling can scarcely be over-estimated. It is only fair to Mr. Slee, the superintendent, and to Mr. Carmichael, the foreman, to say that this discovery is due to their energy and perseverance in face of very great difficulties. Efforts will now be made to complete the chain of bores to supply the road from Bourke to Mount Browne with water. If this can be accomplished

a great boon will have been conferred upon stock owners. The number of feet bored in 1886 was only 2,185 ft. 3 in., but this was due to the fact that several of the augers were withdrawn during the year with a view to reduce the expenditure. The average cost per foot of boring in 1886 was (including all expenses) £2 1s. 0½d., exclusive of office expenses but inclusive of carriage £1 12s. 8½d., exclusive of office expenses and carriage, but including all other working expenses £1 7s. 8d. The high average cost per foot is due to delays arising from proposed changes in regard to this branch.

ROADS, STREETS, AND GATES.

The ordinary work done in this branch during 1886 shows an increase upon the work done in 1885 as will be seen from the statement following.

The following is a comparative statement of the work done in Roads, Streets, and Gates Branch for the years 1885 and 1886:—

	1885.	1886.
Papers registered.....	3,858	3,987
Letters written.....	2,660	3,078
New roads and streets.....	133	207
New public gates.....	42	61
Plans sent to Executive Council.....	186	191
Plans and books of reference sent for exhibition.....	168	180

In addition to the ordinary work of the branch, which was most efficiently and expeditiously done under the supervision of the chief clerk (Mr. G. E. Herring), Mr. Ormiston, and the gentlemen under him have performed a large amount of work in preparing returns and papers for Parliament, compiling returns for the Civil Service Board, preparing papers for deputations, issuing and checking advertisements, custody and issue of stores, &c., &c.

I have very great pleasure in again acknowledging the able assistance rendered by the chief clerk (Mr. G. E. Herring). I regret to have to report that Mr. T. C. Binny, who has ably filled the position of Registrar of the Department since its establishment, and who rendered such valuable assistance in connection with the Colonial and Indian Exhibition, has owing to ill-health been compelled to retire from the service. To Mr. Farr, the accountant, and Mr. Primrose, who during Mr. Binny's absence performed most of the duties of Registrar, my thanks are due. I am much indebted to the Geological Surveyor in charge, the Chief Mining Surveyor, the Inspector of Mines, the Curator of the Museum, and the wardens for the valuable assistance they at all times render me.

MINERAL PRODUCTS.

The aggregate value of the mineral products of this colony to the end of 1886 is £69,772,187 8s. 1d., the value of such products for the year 1886 being £2,928,427 19s. 10d., showing an increase as compared with the production of 1885 of £153,352. This increase is mainly due to the larger output of silver, silver-lead ore and shale, and the higher price of tin. Gold, coal, copper, and iron show a decrease. The export of silver-lead ore in 1886 is more than double that of 1885; this may be partly due to increased production, but it is also due in part to the difficulty of treating some of our silver ores in the Colony. The produce of our silver-mines in 1886 exceeds in value that of 1885 by £225,216, which may, in view of all the circumstances, be regarded as highly satisfactory.

The following table shows the aggregate value of minerals the produce of New South Wales for the years 1885 and 1886 respectively compared:—

Minerals.	Quantity.		Value.		Quantity.		Value.		Increase in value.		Decrease in value.	
			£	s. d.			£	s. d.	£	s. d.	£	s. d.
Gold	103,736.36	oz.	378,665	0 3	101,416.82	oz.	366,294	7 7	12,370	12 8

The value of the output of minerals in 1886 exceeds the value of the average annual output by £374,750.

The following Return shows the quantity and value of Gold, Coal, Shale, Copper, Tin, Silver, Silver-lead Ore,

Year.	Gold.		Coal.		Shale.		Copper and Regulus.		Tin and Tin Ore.

GOLD.

The continued decrease in our gold yield cannot, I think, be due to exhaustion of our auriferous deposits, but must be ascribed to lack of energy or means to search for new deposits, or to develop those already discovered. Since the breaking up of the drought there are slight evidences of a desire to prospect new country, and in view of the extent of gold-bearing country it is unlikely that any extensive and persistent explorations would be barren of good results. We may, therefore, be justified in looking forward to the opening of some new fields if those who are inclined to prospect can procure the means to continue operations while feed and water are plentiful. The discovery of an extensive gold-field, though only moderately rich, would, in view of the large number of unemployed, prove especially acceptable at the present time.

The output of gold in 1886 is, I regret to say, less than that of 1885, but the decrease in quantity amounts to only 2,319 oz., and in value to £12,371. Each year I have been hoping that the lowest point had been reached and that the development of our auriferous deposits would have again attracted the attention of capitalists, but, perhaps partly on account of the drought, and partly on account of the general depression, the hope has not yet been realized. During the year, a few discoveries more or less important were made, but with the exception of the deposits at Fairfield, they have not attracted much attention. The late abundant rainfall may, it is hoped, lead the further testing of many of our older gold-fields, which have for some years past been neglected in consequence of the scarcity of water. The following extracts from the Wardens' and Mining Registrars throughout the Colony indicate the condition of gold-mining in the several districts during the past year:—

In the Bathurst District the Wardens' and Mining Registrars report:—At Dark Corner, Cook & Co. crushed 1,100 tons quartz for 660 oz. of gold. Sixty men are working at the Lagoon, 4 miles north of Mitchell, 1,272 oz. of alluvial gold has been sold in the locality. 120 oz. of gold valued at £462 was won in the Burruga division. At Oberon only one mine was working at which ten men were employed; 1,500 tons of stone treated, yielded 975 oz., equal to 13 dwts. per ton, value £3,412 10s. At Tuena, 116 men are working, they sold locally 609 oz. 6 dwts. of gold for £2,300. At Trunkey the Bathurst Company was engaged the whole year sinking a perpendicular shaft, and it is estimated another year will be occupied in sinking before the depth will be reached at which the company expect to cut the reef. Several parties were working alluvial, and Knowles & Co. were sluicing when water was available. Gold to the value of £2,462 12s. was sold in the locality, being 484 oz. 11 dwts. 10 grs. from alluvium, and 150 oz. 18 dwts. 9 grs. from quartz. At Mount M'Donald sixty-seven men were working. From the Bobby Burns mine, 65 tons stone yielded 476 oz. gold; the average from this mine for the year was 7 oz. per ton. Butchers' obtained 680 oz. of gold from 140 tons, and the tributors in the Balmoral mine obtained 491 oz. from 130 tons. The total quantity of gold obtained from quartz during the year was 3,390 oz., valued at £11,899, the average yield per ton for the year being 3 oz. 5 dwts. 19 grs. In the Carcoar division the escort returns show an increase upon those of the preceding year to the extent of 1,537 oz. gold, the quantity sent away being 10,610 oz.; this is ascribed to the abundant rainfall during the latter half of the year 1886. At the mine known as "The Junction," at the junction of the Belubula River and Mandurama Creek two trial crushings were had of 150 and 110 tons respectively, yielding 40 and 46 oz., which, considering the quantity of stone in view and the facilities for working, should pay well. The Brown's Creek mine is said to have paid handsome dividends during the year; the quantity of gold won at this mine being 4,173 oz. 9 dwts. Some good cakes of gold have been sent away from Galley Swamp. At Ophir, in the Orange

Iron, Antimony, Asbestos, and Bismuth produced in the Colony of New South Wales during the last ten years:—

Orange division, the mines are at a stand-still for want of sufficient capital to work on a suitable scale. The Warden is of opinion that with sufficient capital the results from these mines would be surprising. The Forest Reefs and Lumpy Swamp mines are improving. At Lucknow the New Reform Company is adding to the machinery. This company has during the past two years, paid £15,750 in dividends, besides sinking main shaft 100 feet deeper, and paying all expenses connected with machinery, &c. At Carangara, gold and silver are found in large quantities in the copper ore. At King's Plains, the North Confidence Company have sunk their main shaft 260 feet; the deposit is said to be 40 feet wide from the surface down to the bottom of the shaft. 2,000 loads of dirt were raised during the year, the yield of gold being 3 dwts. per ton. The Inspector of Mines reports—at the Gordon mine (the principal mine in the Buckinbah Gold-field) a mass of quartz veins occur in a circular form, containing gold, carbonate of copper, copper pyrites, blend, and molybdenite; at present the mine is worked for gold only, owing to the low price of copper. The monthly crushings average about 150 tons, and the yield of gold varies from 3 to 7 dwts. per ton. Some hills near the Wellington contain surface drifts in which gold is found. It is thought to be auriferous, though in sinking near this creek heavy drifts may be met with. The discovery of a new gold-field may be expected in the vicinity of the road between Buckinbah and Molong.

In the Mudgee District, the Wardens and Mining Registrars report:—At Gulgong some more of the important mines have been abandoned. The Nil Desperandum at the Canadian continues to yield payable gold from the "pug," found in the cavities of the limestone rock; the present depth of the workings is 220 feet, but the company intend sinking 300 feet, or to the slate bottom on which they expect to find payable gravel. At Slasher's Flat some twenty or thirty men are earning fair wages. Payable prospects have been obtained by Fletcher and party in the vicinity of the diamond mines. The quantity of gold won during the year is 1,724 oz. 15 dwts. 5 grs., valued at £6,652. At Apple Tree Flat, in the Mudgee division, some good results have been obtained. Rochester and party obtained a nugget weighing 102 oz., and another party a nugget weighing 20 oz. The quantity of gold purchased locally was larger by nearly 400 oz. in 1886 than in 1885. At Hargraves, most of the claims were abandoned during the year, mainly owing to the want of means to procure machinery. Towards the end of the year some comparatively large areas were taken up by Mr. Coghlan who proposes to test the reefs by boring with the diamond drill. In the Dubbo division, gold-mining is carried on only at Tomingley, where the population and the yield of gold were somewhat larger in 1886 than during the previous year. According to the returns furnished by the owners of the crushing mills, 3,778 tons crushed yielded 2,820 oz. 7 dwts. 7 grs., valued at £10,927.

In the Tambaroora and Turon District, the Wardens and Mining Registrars report:—The Cornelian Company, Hawkin's Hill, raised and crushed 517 tons of quartz for 320 oz. 15 dwts. 16 grs. retorted gold. They also crushed for tributors 222 tons, which yielded 200 oz. 4 dwts. 15 grs., and 103 tons for the public which yielded over an ounce per ton. A main shaft, 8 ft. x 6 ft. has been sunk to a depth of 150 feet, and is to be sunk 400 ft., and it is proposed to construct a tunnel from Oakey Creek to drain the water from the mine at a low level. Some good yields have been obtained from small parcels of stone. The quantity of gold sent from Hill End by escort (including the gold from Hargraves and Windeyer) was 3,375 oz. 14 dwts. 9 grs. Carver and Porter's mine, from which such rich stone was raised, is flooded, and they have not the necessary appliances to keep the water down. The Red Hill Company, at Tambaroora, have sunk a shaft 9 ft. x 3 ft. to a depth of 250 ft. They cut five veins, three showing gold, the last one cut at 240 ft. is 14 inches thick, a trial crushing from which gave 12 dwts. per ton. Since the rain commenced considerable sluicing has been done at Hargraves and Windeyer. At the Root Hog, on the Macquarie, a party of miners have erected a battery to be worked by water-power, the quartz yields from

from 8 to 16 dwts. per ton. At Sofala some good yields have been obtained from small parcels of stone. Grice and Clark obtained 150 oz. 16 dwts. from 7 tons, and Prince & Hibberd, 52 oz. from 10 tons. Mr. Howard discovered a rich vein at Back Creek, 2 tons of stone, from it yielded 15 oz. of gold. Owing to the abundance of water during the last quarter of the year, there was some activity in sluicing, &c. Total yield for the year at Sofala, 2,234 oz. 7 dwts. 21 grs. from alluvium, and 1,520 oz. from quartz. At Ironbarks, Scott's machine crushed 324 tons stone for 176 oz. 15 dwts. retorted gold. At Buckinbah Messrs. Veitch and party crushed 1,480 tons of stone for 384 oz. The Muckerawa Junction Company, on the Macquarie River, erected expensive pumping gear capable of pumping 70,000 gallons per hour, and now seems to be in a fair way to work the deposits in the river bed. The quantity of gold won in the division was 1,549 oz. 4 dwts. 1 gr.

In the Lachlan District the Wardens and Mining Registrars report:— At Forbes the Nil Desperandum Co., on the south lead struck payable wash-dirt from 2 to 3 ft. in thickness, average 6 dwts. per load, from 120 loads. On the same lead the Crinoline Co. have bottomed on wash-dirt, but have not washed, as they were engaged in erecting machinery and buildings. On the same lead the Forbes Alluvial Co., the shaft has not yet bottomed. In all these mines great difficulty has been experienced in sinking through the drifts. On the Britannia Reef a company has raised some stone estimated to contain 2 oz. per ton; but operations are stopped pending the arrival of machinery. If this mine prove payable other miners may be attracted to this reef, which has been traced to a considerable distance, but has not been tested to any great depth. A party on Strickland's Reef has had some stone crushed at Parkes, which yielded 16 dwts. per ton. A plant is being erected to work the old Pinnacle Reef, a shaft has been sunk 70 ft. into the reef showing gold all the way down. The reef is 8 ft. wide at the bottom of the shaft, the average width being 5 or 6 ft. The yield of gold at Forbes during the year was 496 oz. 1 dwt. 19 grs. At Parkes there has been a great improvement upon previous years in alluvial workings, and several new quartz reefs have been discovered. On the Buchanan Reef Quayle and party obtained 1,512 oz. from 504 tons, equal to 3 oz. per ton; and Haselhurst and party obtained 1,755 oz. from 351 tons, equal to 5 oz. per ton; and very handsome returns were obtained from some of the newly opened reefs. There are a number of parties prospecting for alluvial deposits; and some of the claims of newly discovered deposits are payable, and though not rich are likely to provide employment for a number of men. Appliances are being erected for the treatment of tailings; samples from a heap at the Currangong have been tested and found to contain 6 dwts. per ton. The quantity of gold won at Parkes was 5,234 oz. 8 dwts. 1 gr., namely, 655 oz. 12 dwts. 11 grs. from alluvium, and 4,578 oz. 15 dwts. 14 grs. from quartz. There are about twelve miners prospecting about 30 miles from Condobolin; the gold they find is in alluvium, but the quantity is nothing to speak of. At Grenfell there are a few parties prospecting and a few working alluvial and quartz claims. The quantity of gold won from alluvium was 227 oz., and from quartz 193 oz. 5 dwts. The highest average yield from quartz was 1 oz. 5 dwts. per ton from Lawson's Reef; and highest from alluvial was 13 dwts. per ton from Quondong Gully. At Canowindra 629 tons of quartz crushed during the year, yielded 801 oz. 12 dwts. of gold, and 80 oz. were obtained from alluvial workings, chiefly by fossickers. At Paling Yard Creek, about 9 miles from Cudal, a gossan lode has been discovered, the lode varies in width from 6 ft. to 18 in. Six claims are at work upon it. The prospectors had 63 tons crushed, from which they obtained 13 dwts. per ton; another party had 11 tons crushed from which they obtained 11 dwts. per ton; but the lode stuff has to be sent 10 miles over rough country to Cargo to be crushed. The cost of carting and crushing is 25s. per ton, consequently the other parties have a quantity at grass awaiting treatment. At Boney's Rock, near Toogong, 48 tons were crushed for 168 oz. for one party, and other parties are on gold. A party is raising stone from Bevan's Reef, near Toogong, 201 oz. 10 dwts. were obtained from quartz. At Young several companies have been or are about to be formed to work large mines on the Burrangong Creek; these mines have been tested at various points with most satisfactory results, and it is anticipated that these mines when opened up will yield large returns. During the year the quantity of gold won, was 1,654 oz. 16 dwts. 15 grs., being an increase upon the previous year. At Murrumburrah, the Cunningar Quartz Mining Company during the year completed their extensive plant, which with labour has cost upwards of £20,000. The reef worked by this company contains no free gold, the pyrites which contains the gold is concentrated and then smelted, from 100 tons of quartz 138 oz. of gold was obtained. 460 oz. 10 dwts. 7 grs. was won during the year from alluvium. At Temora most of the alluvial mines were flooded during the heavy rains, and after they had been drained it was found that owing to the soft nature of the country the shafts and drives had been destroyed, so that the works had to be started afresh. The quartz mines have been steadily but surely progressing. The South Australian Co's., mine has continued to yield steadily payable returns; at the same time lodes have been disclosed which it is thought will be permanently profitable. Attempts are being made to form companies with capital to work the Hidden Star, Mother Shipton, and other mines at Temora; also the mines at Sebastopol, Muttama, and Barmedman. The quantity of gold which passed through the Gold Receivers' hands at Temora, in 1886, was 7,161 oz.

10 dwt. 5 gr.; this includes gold from Sebastopol and Barmedman. The quantity of gold that passed through the Banks at Temora during the year was 7,547 oz. It is not known what proportion of the gold was from alluvial and quartz mines respectively; but it is known that one of the Banks purchased some 1,360 oz. from alluvial workings, and some 1,431 oz. from the quartz workings, at Barmedman. Owing to the stoppage of the works of the Barmedman United Company, the miners were unable to get stone crushed without sending it to Temora during the first half of the year. In June last the Company sold their mine and plant, which were purchased by Mr. Cassin and other local storekeepers. Since then 1,616 tons of quartz have been crushed, for a yield of 2,054 oz. 10 dwt. 1 gr. The last crushing of 329 tons, taken from thirteen different claims, gave an average of 2 oz. 12 gr. of gold per ton. The whole of the stone raised was taken from above the water level 80 feet. It is regretted that the Barmedman United Co., which had the requisite appliances, did not explore their mine at greater depth, as it is thought that the mine if thoroughly tested below the water level would prove payable. At the "Hard to Find" mine an engine and pumps have been placed on the ground with a view to testing below water level. At Muttama some rich stone was discovered in one of the old workings, and further workings have induced hopes that the locality will prove a valuable quartz-mining district. Sebastopol should be a prosperous mining centre, but the mines have been ruined by bad management and litigation. At Wantiool very little work has been done, the quantity of gold won being 113 oz. 7 dwt. 8 gr. At Mitta Mitta there is a fairly good mine; but it has not been properly opened. At Adelong large tracts of valuable auriferous land have been alienated, which, if open to them, would provide profitable employment to many hundreds of miners.

The New Mount Hope Co. are employing a few men to prospect for gold at Ironstone Hill, near Mount Hope.

In the Albert District the Wardens and Mining Registrars report:—At Mount Brown, on Billy-goat Hill, steady work, with satisfactory results, has been done in the claims where the water was not too heavy, the yield being about 1 oz. per ton. In two of the claims they have not been able to overcome the water sufficiently to ascertain the value of the wash. The Warden thinks handsome returns will be obtained as soon as the miners get machinery to overcome the water. The lead found at the One-mile, at a depth of 16 ft., under cement, has been traced in a southerly direction to a depth of 165 ft. Four claims are on wash which yields from 1 oz. to 4 oz. per load. At the Four-mile one puddling machine has been steadily employed washing surface dirt which yields about 5 dwt. per load. At the Warratta Reefs, the claim of the late Whittabrennah Company has been let to tributors, who, during four months, crushed only 40 tons for 23 oz. It is thought much of the gold is lost owing to the defective machinery. At Tibbooburra the puddling machines are yielding good returns from surface dirt. Thos. Stevenson puddled 2,000 loads of surface, which averaged 1 dwt. to the load. The quantity of gold won was 3,839 oz., valued at £15,164.

In the Wilcannia Division there are about fifteen to twenty men prospecting for gold on the Nuntherungee Run, between Wilcannia and Milparinka; some of them are earning rations by surfacing.

In the Tumut and Adelong District the Wardens and Mining Registrars report:—At Tumbumba the want of water during the early part of the year retarded sluicing operations. A new reef was opened at Paddy's River, but, after testing, was given up, the return being about 6 dwt. per ton. But little prospecting was done. The quantity of gold won was about 1,380 oz. At Albury, the Bungowanah Co. made a valuable discovery of quartz near the falls to Jindera, and north-west from Splitter's Creek. The deposit is an immense dyke reef which has been driven into 25 ft. without touching the opposite wall. The stone is quarried out, and will pay at 3 dwt. per ton, but averages 10 dwt. The Company have erected a 15-head battery, and constructed other important works. The manager estimates that he can crush 250 tons per week. The Soudan Co. has a dyke reef of large size at Splitter's Creek, and are pushing on their preliminary works, but have not yet tested the stone. Several parties are prospecting in the adjoining hills. Messrs. Pye & Wealands, of May-day Hill, Black Range, crushed 75 oz. from 21 tons of stone. Mr. Polkinghorne, of Hawkview, obtained 268½ oz. from 59 tons stone. The quantity of gold obtained in the division during the year was 650 oz. At Adelong there has been much depression, especially at the quartz mines. 2,408½ tons quartz crushed yielded 1,715 oz. 7 dwt. 9 gr. From alluvial mines, 4,085 oz. 9 dwt. 6 gr. of gold was won. Preparations are being made to work Mr. A. D. Shepard's mine by the aid of a hydraulic injector. At Reedy Flat, 760 oz. 4 dwt. 1 gr. of gold was obtained from alluvium. At Tarcutta, 263 tons of quartz crushed yielded 140 oz. 10 dwt. of gold. At Kiandra, during the first seven months of the year, the water supply was insufficient. At Kiandra, the Kiandra Gold-mining Company obtained 1,672 oz. of gold from 6,358 yards of earth. In consequence of the exceptionally dry weather up to the beginning of August, sluicing was not commenced till quite late in the year.

In the Southern Mining District the Wardens and Mining Registrars report:—Messrs. Dunstan & Co. at Diggers Creek, in the Berrima District have recently erected a puddling machine with a view to test their mine for gold and gems. A little gold and some diamonds have been obtained, but the works are not sufficiently advanced to determine the value of the deposit. At the Carrington mine, near Marulan, the lode which is being tested is said to contain gold, silver, galena, copper, and iron; and it is thought it will prove remunerative, but considerable capital will be required. In the Braidwood District the want of water retarded sluicing operations, notwithstanding the spring rains; quantity of gold won at Braidwood, 310 oz. At Araluen, where the deposits can best be worked in dry seasons, there was a slight increase of gold upon the output of the previous year. Races are about to be constructed from the Corang and Shoalhaven Rivers to work some ground in the Nerriga Division; the yield of gold in this division was 400 oz. At Spring Creek a 10-head battery has been erected to work Plum's Reef, which is 14 ft. wide, 370 tons crushed averaged a little over 2 dwt. 12 gr. per ton. Mr. Carter has crushed 630 tons from Dargue's Reef, including surface, for a yield of 68 oz. of gold. He has also treated 20 tons of mundic tailings left by previous owners, from which he obtained 40 oz. smelted gold. Total for Major's Creek Division—500 oz. from alluvium, and 129 oz. 12 dwt. 3 gr. from quartz. The quantity of gold won from alluvium in the Little River Division was 999 oz. At Araluen there was at times scarcely enough water to wash with at the stripping claims, and ground sluicing was practically at a standstill. The quantity of gold won during the year was—Alluvium, 5,500 oz.; quartz, 20 oz. 2 dwt. 9 gr. In the Nowra District the Homeward-bound Co., at Yalwal, obtained 1,282 oz. from 800 tons of quartz; the average is somewhat lower than usual in consequence of the Company having to clear low-class stone out of the way; some of the stone yielded $3\frac{1}{2}$ oz. per ton. The Pinnacle Co. crushed 642 tons for 680 oz. 10 dwt., besides saving pyrites for treatment. The Pioneer Co. crushed 240 tons for 77 oz. 6 dwt. There is a large percentage of silver in the gold from these mines. In the Nerrigundah Division, what is thought to be a payable reef, was discovered in Tom North's Gully. The quantity of gold won during the year was 420 oz. In the Moruya Division a rush of about 200 miners to a flat called Cabbage-tree Creek was caused by the bottoming of a shaft by prospectors, and the finding of about 30 oz. of gold. This was the first shaft that had been bottomed on the flat, owing to the quantity of water. Nothing of importance has since been found, although several parties have made good wages. Some of the quartz reefs show as much as 2 to 3 oz. per ton, but there is no battery on the ground for crushing. The quantity of gold won was 281 oz. At Wagonga there are distinct gold-bearing reefs. The Belle of Australia, which has an average width of 3 feet, has been proved by trial crushings to be payable. It is intended to form a Company to work the three amalgamated claims on this line, and to erect machinery thereon. The battery erected on the Lady Carrington Reef has been enlarged and the latest improvements added, and it is thought the claims when opened out will give employment to a number of miners. The John Forster Reef shows good gold; the width of the reef is 18 to 20 in.; numerous trials of the stone taken from different depths in sinking the main shaft indicate that the stone will yield from $2\frac{1}{2}$ to 3 oz. per ton. At Mount Dromedary no main reef has yet been discovered; the veins, varying from 2 to 8 in., carry gold; as much as 4 oz. to the ton having been obtained. At Tin-pot the Tuross Co. are opening up their mine by sinking shafts and tunnelling; 80 lb. of stone, unpicked, yielded at the rate of $56\frac{1}{2}$ oz. of gold per ton. At the junction of Delegate and Little Plain Rivers, in the Bombala Division, several good stream claims are being worked with good results. The quantity of gold won in this division was 254 oz. 16 dwt. 21 gr. In the Cooma Division, 104 oz. of gold was won from the Snowy, Umaralla, and Murrumbidgee Rivers.

In the Hunter and Macleay Mining District the Wardens and Mining Registrars report:—At Copeland, owing to the want of capital, economy of labour cannot be studied, and in the absence of labour-saving appliances the miners have adopted a primitive process of working, nevertheless the yield of gold for the year shows an increase of 600 oz. As an evidence of the disadvantage under which miners without capital labour, stone containing less than 2 oz. per ton barely pays for raising, carting, and crushing, whereas the tributors in the Hidden Treasure mine, who are able to work systematically, say they can make a good profit out of stone containing 1 oz. to the ton. It is thought that taking all the stone on a face from the working claims on the field, it would yield 15 dwt. per ton, and with proper appliances it could be raised and treated for 12 dwt. per ton. 958 $\frac{1}{2}$ tons of stone crushed from the various mines during the year yielded 1,600 oz. of gold.

In the Bulladelah Division several new claims have been taken up, and payable stone has been found in all of them; but there is no battery in the district for crushing stone. Machinery has, however, been placed on a site on the Coolongolook River, and will be erected as soon as the title to the site is complete. Machinery has also been placed on another site. On the Mountain Maid and Currecki, day and night shifts are engaged trying to overcome the influx of surface water caused by the late rains. The Mountain Maid has 30 tons of stone at grass supposed to be equal to some tons sent to Sydney, which
realized

realized 2 oz. per ton. The Currecki has 5 tons at grass equal in quality to 6 tons sent to Sydney, which realized upwards of 4 oz. per ton. At Bunker's Hill, some 3 miles, and Paddy's Creek, 7 miles, from Coolongolook, good stone has been found.

In the Kempsey Division there are several prospecting parties in the neighbourhood of Mount Sea View, on the various creeks running into the branch of the Hastings known as the Forbes River; rough shotty gold has been found in the washdirt near the surface, but not yet in paying quantities. At Lower Wangat, in the Dungog Division, the Golden Spur Co. crushed 117 tons for yield of 190 oz. 14 dwt. 18 gr.; the deepest level is 300 ft.; the lode is 8 in. wide. At Upper Wangat, Gurr & Co. crushed 93 tons for 74 oz. 16 dwt.; deepest level, 175 feet; width of lode, 12 in.

In the Peel and Uralla Mining District the Wardens and Mining Registrars report:—At Moonan Brook about 230 tons of quartz have been crushed, yielding an average of 1 oz. per ton. Barber & Co. are sinking on Crow's Nest Hill, the highest point of which is nearly 5,000 ft. above sea level. They have raised 10 tons of quartz, estimated to yield $1\frac{1}{2}$ oz. per ton. From another part of the same hill they raised $6\frac{1}{2}$ tons, which yielded 7 oz. of gold per ton, and $5\frac{1}{2}$ tons which yielded 3 oz. per ton. The cost of conveying stone to the battery is so great that less than 1 oz. per ton will not pay. There is any quantity of stone both at Moonan and Stewart's Brook that would yield from 5 to 10 dwt. per ton, but this will not pay under existing circumstances. At Stewart's Brook the battery was idle all the year; but there are about 200 tons of quartz at grass now ready for crushing, 100 tons of which is estimated to contain 4 oz. per ton. Two good reefs were found during the year between Nundle and Bowling Alley Point. From one 70 tons have been crushed for 120 oz. of gold; the width of this reef is 12 inches; from the other no crushing has yet been had, but the stone looks well. From the large reef at the Hanging Rock the results obtained by the prospectors varied from 4 to 14 dwt. per ton. This would pay with crushing machinery near at hand, as the reefs are large and easily worked; but the prospectors have not the necessary capital. The same may be said of the Lady May and other reefs, the stone having to be carted 9 or 10 miles. Mount Ephraim.—The claim has been worked upwards of ten years without having been bottomed, on account of the water; fine gold has, however, been obtained from the surface, to a depth of 70 ft., and to a width of 150 feet. The quantity of gold won was 3,235 oz. 5 dwt., namely, 2,460 oz. from alluvium, and 775 oz. 5 dwt. from quartz. In the Armidale Division, owing to the rainfall, the output of gold has improved, though the heavy rains at intervals retarded alluvial and sluicing operations. The quantity of gold obtained is estimated at 4,000 oz. At the Duval Gold-field a reef has been discovered, from which rich specimens have been obtained, and it will shortly be tested by a battery. The Eleanora Co., having purchased the Isabella mine, has crushed 3,301 tons of quartz for 1,841 oz. 19 dwt 21 gr. of gold. Several parties of prospectors were out searching for gold. Terry and party crushed 85 tons of quartz from a new reef at Tin River; yielded 27 oz. George and party crushed 90 tons from the same reef; yielded 26 oz. At Uralla the heavy rainfall had the effect of increasing the yield of gold obtained by sluicing, the yield for the year being 1,607 oz. At Barraba, 221 tons of quartz crushed yielded 490 oz. 13 dwt. 13 gr., equal to 2 oz. 4 dwt. 10·8 gr. per ton. There were about seventy miners working and prospecting at Wood's Reef, Crow Mountain, and Tea-tree Creek. Some rich ground has been opened up at Wood's Reef. Withers and party succeeded in getting on gold at the Ballarat lead, at Upper Bingara, but were beaten out by an influx of water. The quantity of gold won at Bingara was 600 oz. from alluvium, and 45 oz. from quartz. In the Glen Innes Division, 220 oz. of gold were won from alluvium; total for division, 350 oz., valued at £1,312 10s. Some extensive works have been constructed at Glen Elgin with a view to work a large area of land held under special lease. The Warden is of opinion that the country on the eastern fall of the tableland from Timbarra to Oban presents a promising field for the operation of prospectors.

In the New England District the Wardens and Mining Registrars report:—A number of new reefs and some old ones had been opened at Boonoo Boonoo before the heavy rains set in, and many of the reefs have been proved to be gold-bearing—some good; but none of the stone could be crushed owing to there being no battery on the ground. Since the rain, operations have been much retarded; but it is expected that a battery will be erected as soon as the state of the country will admit of it, and it is thought Boonoo Boonoo will then prove a most important gold-field. At Poverty Point and Timbarra a number of miners are prospecting, and are likely to be successful. A fair amount of gold was obtained by sluicing. At Fairfield a rich deposit of gold was found on private land in March of last year, which led to a great deal of prospecting on Crown lands, the result being that a large area of auriferous country has been opened up. Mount Pleasant, distant about $1\frac{1}{2}$ miles from the property where the gold was discovered, is the chief centre of mining operations, gold having been found in nearly every place that has been tried; but so far only a few tons of picked stone from some of the principal claims have been crushed and treated. The deposits have been traced about 8 miles north of Mount Pleasant, and about 4 miles south. Some rich discoveries have been made at Red Rock, about 8 miles north of
Fairfield.

Fairfield. It is proposed to work a large area of this land as one mine, and to erect a battery on the Cataract River to be worked by water-power. At Violet Creek, between 3 and 4 miles south-east of Fairfield, a number of claims are considered payable. The deposits differ from those at Fairfield and Red Rock, and, according to assays, contain both gold and silver in payable quantities. The veins or lodes are said to vary in width from 6 in. to 20 ft. Very little stone has been crushed, as the only battery on the field is upon the private land on which the gold was discovered, and is employed exclusively upon stone raised from that land. The yield of gold in division was 440 oz. 14 dwt. from alluvium, and 1,333 oz. from quartz. In the Solferino Division some rich patches were found during the year. The gold won from alluvium was 118 oz. 2 dwt. 3 gr., and from quartz 92 oz.

In the Clarence and Richmond District the Wardens and Mining Registrars report:—There are some ten men employed on the reefs at Nana Creek, who raised 164 tons of quartz, which yielded 268 oz. 13 dwt. 4 gr., the highest yield being 5 oz. 5 dwt. 21 gr. per ton, and the lowest 18 dwt. per ton. Some 13 or 14 men were working alluvium in the vicinity of the little Nymboi and Little Plain Creeks, and won about 50 oz. At Dalmorton, 122 tons of quartz were crushed for 32 oz. 8 dwt., and 100 oz. were obtained from alluvium.

The following information has been kindly furnished by R. Hunt, Esq., F.G.S., the Deputy Master of the Royal Mint.

QUANTITIES of gold, the produce of New South Wales, received into the Royal Mint, Sydney, during 1885 and 1886 compared.

	93,990·36	91,854·72

From the above statement it would appear that the quantity of gold sent to the Mint in 1886 was less by 2,135·64 oz. than in 1885.

The following table is compiled from information kindly furnished by the Collector of Customs:—

EXPORT OF GOLD—1886.

Gold.			Quartz tailings and Pyrites.		Total.		
Quantity.			Quantity.	Value.	Quantity.		
Value.				Value.	Value.		
oz. dwt. gr.					oz. dwt. gr.		
6,616 11 0	£24,918		Tailings, 1,616 pkgs	£10,694	9,587 2 0		£35,612

The quantity of gold sent to the Mint plus the quantity exported in 1886 was 101,441·82 oz., but the Deputy Master of the Mint informs me that the gold exported includes 25 oz. which had passed through the Mint and been included in the return furnished by him, consequently the gold yield for 1886 may be set down at 101,416·82 oz., valued at £366,294 7s 7d., which, as compared with the output of 1885, shows a decrease of 2,319·54 oz.

According to the returns furnished by the Mining Registrars the output of gold for the year was less by 10,073 oz. than the quantity sent to the Mint, showing that of the actual output 19,635 oz. is not included in their returns

RETURN of Gold for 1886 from Mint and Mining Registrars compared.

			10,073	

The quantity sent to the Mint exceeds the returns by the Mining Registrars by ...

Comparing the returns furnished by the Mining Registrars of the gold won in 1885 with those for 1886, there is an apparent decrease for 1886 of only 1,735 oz., but it is quite certain that these returns are incomplete.

MINING

MINING Registrars' Returns of Gold for 1885 and 1886 compared.

Less increase.....			7,319
Decrease in yield for 1886	1,735

The following table shows the results obtained from the treatment of certain parcels of alluvium in a few of the mining districts. The returns, I regret to say, contain the results of so few washings that they are almost worthless for purposes of comparison, otherwise the average yield per ton is very high.

COMPARATIVE Statement of Average Yields from Alluvial Mines for 1885-86.

1885.				1886.			
District.	Quantity.	Average per ton.	Yield of Gold.	District.	Quantity.	Average per ton.	Yield of Gold.
	Tons	oz. dwt. gr.	oz. dwt. gr.		Tons	oz. dwt. gr.	oz. dwt. gr.

Albert.....	10,741	0 1 9 86	753 0 0				
	39,061	0 2 21 92	5,690 1 19		12,702	0 8 7 64	5,283 2 0

The following table, showing the yields obtained from certain parcels of quartz crushed, is, I am happy to say, more complete, and indicates greater and more successful efforts on the part of the Mining Registrars in collecting detailed information. The average yield per ton in 1886 is not nearly so high as that of the parcels reported in 1885, but it is a very satisfactory average.

COMPARATIVE Statement of Average Yields from Quartz-mines for 1885-6.

The number of miners engaged in gold-mining in 1886, according to the returns furnished by the Mining Registrars, was 6,767 (which is 856 more than in 1885); of these, 5,750 were Europeans, and 867 were Chinese; 3,942 were engaged in alluvial and 2,675 in quartz mining.

Taking the quantity of gold won, and dividing it by the number of miners employed, the following results are obtained:—Dividing the quantity of gold as returned by the Mining Registrars, the result is 12 oz. 1.7 dwt. per man, valued at £43 10s. 1.67d. Dividing the quantity of gold won, as ascertained from the returns of the Mint and the Customs House, the result is 14 oz. 19.73 dwt., valued at £54 2s. 7.08d., representing, according to this mode of estimating, the average earnings of each man for the year. It must be borne in mind in regard to these estimates of earnings that a large number of those set down as miners are not working as miners continuously during the whole year, but devote considerable time to other pursuits.

Before

The following comparative statement shows that in the Northern District the output in 1886 was considerably larger, both in quantity and value, than in 1885, while in the Western and Southern Districts the decrease was considerable, both in quantity and value. The decrease in the former was probably due to the depression in certain trades; and the decrease in the latter district may be to some extent accounted for by the strike at the Southern mines. The strike in the South probably had the effect of increasing the output at the Northern Collieries.

In the Northern District the average price per ton was 9s. 11⁵d. in 1886, as compared with 9s. 9²9d. in 1885. In the Western District the average price per ton was 4s. 10⁵5d. in 1886, as compared with 4s. 11¹5d. in 1885. In the Southern District the average price per ton was 8s. 1⁰7d. in 1886, as compared with 10s. 1⁹d.

The number of Coal and Shale Mines under inspection, during 1886, was 40 in the Northern District, and 26 in the Western and Southern Districts—total 66, and 4 opening out; whereas in 1885 there were 67 under inspection, and 11 opening out.

During the year there were 72 accidents in collieries; of these, 29 were fatal, and 43 non-fatal. 8 of the fatal accidents occurred at Lithgow Valley Colliery, and 1 at Ferndale. The number of fatal accidents is more by 18 than in 1885, and the non-fatal in 1886 exceed those in 1885 by 3.

During

During the year the Department caused the following analyses to be made:—

COAL.

Fuller particulars concerning the composition of the Coals of this Colony may be found in the Annual Report of this Department for the year 1880.

SHALE.

Though kerosene shale is found in various parts of the Colony, and there appears to be a disposition to open up the deposits in some of the most promising localities, there are only two mines in which this mineral is wrought to any extent. The output from these two mines for the year 1886 is nearly double that of the preceding year, and the average price per ton is very satisfactory. The Warden reports that the owners of the mine at Joadja Creek are engaged in extending and improving the manufacture of the various products extracted from the shale.

The following table shows the quantity and value of Kerosene Shale produced during the years 1865 to 1886.

Year.	Quantity.	Average price per ton.	Total value.	Year.	Quantity.	Average price per ton.	Total value.

SILVER.

Notwithstanding the failure to treat successfully the ores obtained in some of our silver-mines, and the depression consequent thereon in certain quarters, it is very cheering to find that the result of our operations in 1886 shows an increase of more than a quarter of a million in excess of the preceding year. In view of the fact that the treatment of silver ores is new to us, it is no wonder that attempts to treat some of the more difficult ores have not been successful, and it would not be surprising if some of the mines now regarded with disfavour should, as our experience and appliances increase, prove exceedingly valuable.

The Warden's and Mining Registrar's report:—The silver won by the Sunny Corner Company from gossan was 547,589 oz., valued at £123,207, being the yield from 27,501 tons of ore treated. The ores from the lode have been reduced and the bullion, 23,601 oz., shipped to Wales for final treatment. Four hundred men were employed on this mine. The Nevada mine, which had been a long time idle, because the ores were so refractory they could not be treated in the ordinary way, the smelter having been pulled down and rebuilt, was run twenty-four consecutive days, treating 350 tons of ore, from which bullion to the value of £3,000 was obtained. Fifty-six men are employed on this mine. The Silver King mine is idle. 500 tons of gossan were purchased from this mine by the Sunny Corner Company, the return from which was considered good. 2,489 tons of ore was treated on the mine, returning 34,967 oz. silver, valued at £9,480. At Back Creek, Rockley, some work is being done in silver, but the ore is not treated locally. 43 tons of ore sent to Melbourne for treatment yielded 3,700 oz. silver, valued at £740, and 30 oz. of gold, valued at about £112. Land has been taken up between Emu Swamp Creek and Lewis Ponds for working silver ores, and two or three lodes of silver ore have been recently discovered on private property, 3 or 4 miles north-east of Orange, and it is thought that silver-mining will soon be added to the local industries.

In the Silvertown Division very satisfactory progress was made during the year, though most of the mines are in their infancy, and will require a considerable amount of capital and labour to develop them. The magnificent results obtained by the Broken Hill Company have induced a considerable amount of prospecting, which is likely to result satisfactorily. During the year this Company raised and treated 14,750 tons of ore, from which 36½ tons of silver, valued at £228,519 were obtained. To the end of 1886 this Company had paid £64,000 in dividends. Work has been resumed at the Pinnacle's mine, and it is thought that with the aid of concentrating machinery, which is being erected, the Company will be able to treat the refractory ores effectively, and then, with the improved water supply, this mine will be second only to the Broken Hill. This Company had 450 tons of ore left from 1885, and raised during the year 800 tons; of this, 88 tons were sold for £1,100, and 511 tons were smelted, yielding 18,937 oz. of silver, valued at £3,800, leaving 651 tons of ore, valued at £2,604. At the Day Dream the men were engaged prospecting the mine at a greater depth, and they have met with fair success. The Umberumberka Company may now be regarded as established as a first-class mine. This Company raised during the year 1,389 tons of ore, which was sold for £31,026, and added 1,246 tons of second-class ore, valued at £7,476, to their stock. Several of the small chloride veins which are to be found all over the field, especially in the vicinity of Purnamoota, have been steadily worked during the year. Two small smelters are about to be erected at Purnamoota for the treatment of the ore from these veins. The large manganese outcrops at Corona are again attracting attention.

The

The South Australian Railway has been completed to the Border; and it is expected the tramway to Silverton will be completed very shortly, when it is thought a large quantity of low-grade lead ores, carrying from 30 to 40 oz. of silver per ton, will be sent away.

There are now seven smelters on the field.

410,256 oz. of refined silver, valued at £81,910, were sent through the Customs during the year, and the exports of silver ore, lead, &c., brought up the value of the exports to £370,423.

A very full and interesting description of the mines in the Silverton District is given in the report (herewith) of the Inspector of Mines.

At Captain's Flat a large amount of work has been done at the El Capitan mine, and also at the Kohinoor mine. At the former the smelting works were completed early in the year. Smelting commenced in February, and continued, with the exception of stoppages from want of water, &c., until September, with results said to be fairly payable. It is reported that during the period about 100 tons of lead bullion were produced; since then the furnace has not been at work, but work has been continued in the mine. At the Kohinoor mine some 400 tons of ore have been raised, and a smelting furnace similar to the one at El Capitan mine is being erected. The lode in this mine, at a depth of 100 feet below the surface, is 42 feet wide.

At Bredbo, in the Cooma Division, land has been taken up for the purpose of mining for silver and lead; assays made of the ore varied from 20 oz. to 60 oz. per ton.

The Inspector of Mines reports that the silver mines in the New England District are progressing favourably, but no smelting works have yet been erected.

At Well's mine, Vegetable Creek, the lode at the 150-foot level is 7 feet wide. The Company has been engaged two years in testing the lode, which appears to improve in size and quality at deeper levels, and will soon erect machinery for treating the ore, of which they have 900 tons at grass, estimated to contain 30,000 oz. of silver. The ore which has been treated from the lodes at Pye's Creek has proved rich, but the mines are almost deserted, owing to the absence of the necessary plant to treat the ore, and the want of capital to procure the requisite appliances.

The quantity and value of silver and of silver and lead ore exported to end of 1886 has now reached a total of £1,221,939.

TIN.

Though the export of tin and tin ore during 1886 was slightly less than in 1885, the value was greater by nearly £50,000, indicating the improvement in the price of tin. This should have the effect of attracting more attention to our tin deposits, and it is to be hoped will lead to the resumption of work in some of the mines that were stopped some time since in consequence of the fall in price.

The Warden's and Mining Registrar's report:—The tin deposits near Poolamacca Station are now being tested, and there is a strong probability of some good mines being opened up.

The Inspector of Mines reports that several parties are working the deposits of lode tin discovered at Poolamacca, about 60 miles north of Silvertown, and that the granite ridges in the vicinity should be prospected.

In the Tingha Division the higher price of tin has induced more prospecting, and the numerous reefs are attracting attention, and are being tested with good prospects. 1,649 tons of tin were obtained, valued at £89,940.

At Vegetable Creek the quantity of tin raised was 1,894 tons 2 cwt. 0 qr. 13 lb., value £107,964
At Glen Innes, 227 tons 18 cwt. 0 qr. 17 lb., value £12,990 13s.

At Wilson's Downfall only deposits of stream tin have been worked, but prospecting for tin lodes has been carried on. The quantity of tin ore won was 307 tons, valued at £17,800.

The report (herewith) of the Inspector of Mines upon the tin mines in the Vegetable Creek District is worthy of attention.

It is thought that it is due to the fact that almost all the shallow ground had been worked out that the required capital for developing the deep leads was not forthcoming. At the Torrington mine 43 tons 13 cwt. of tin were raised. The width of the lode is 1 ft., the depth of the shaft 116 ft., and the deepest level 100 ft. At the Dutchman Tin Lode Company's mine the quantity of tin raised is about 45 tons; the width of the lode, about 2 ft. 6 inches. The quantity of tin raised at the Great Britain mine was 124 tons. At Kangaroo Flat, Hall Brothers raised nearly 67 tons; at Six-mile they raised about 3¼ tons; at Grampians they raised about 12½ tons; and at Vegetable Creek they raised about 6½ tons. Moore and party, at Y Waterholes, raised nearly 65 tons of tin ore from the reworking of old ground. The Rothschild Company raised about 92 tons, also from old ground. At Rose Valley, Bailey & Co. blocked out 637 ft. in length of the lead by 60 ft. in width, the average depth of wash being 5 ft., the quantity of ore raised being 223½ tons. The Wesley Company in Rose Valley raised about 55½ tons of ore; the depth of the leads varies from 50 ft. to 190 ft., the depth of the wash from 1 to 4 ft., and the width from 3 to 5 ft. Most of the lodes at Nine-mile have
given

given good returns; a crushing of 25 tons of stone gave over 7 tons of tin. From Mr. Cadell's mine, at Y Waterholes, the output was about 230½ tons. Prospecting has been carried on to discover the continuation of the Old Vegetable Creek and Graveyard Creek, but hitherto without success. The Vegetable Creek Company raised 99¼ tons of ore during the year. The Nonpareil Company raised about 12 tons of ore. A large amount of work has been done in prospecting for the deep lead. The quantity of ore received at the smelting works during the year was 1,261 tons, namely,—from shallow workings, 631 tons 1 cwt.; from deep leads, 490 tons 2 cwt.; from lodes, 140 tons; and during the same period 858 tons of refined metal were forwarded to Sydney. The battery was continuously at work during the year crushing stone chiefly from the Ottery reef; the quantity crushed was 2,419¼ tons, from which 79 tons of ore were obtained. The quantity of tin ore obtained in the Vegetable Creek Division during the year was 1,89¼ tons 2 cwt. 13 lb. valued at £107,964, namely,—from lodes, 169 tons 13 cwt.; from shallow workings, 761 tons 1 cwt.; and from deep leads, 962 tons 8 cwt. 13 lb.; and from the shallow workings in the Glen Innes Division, 227 tons 18 cwt. 17 lb. of tin ore were won.

TABLE showing the quantity and value of Tin exported from, and the produce of, the Colony of New South Wales, since the opening of the Tin-fields in 1872.

Year.	Ingots.		Ore.			Total.

Shoalhaven	Black sand from beach	1·65
Stannifer	Lode tin ore	51·70
Tenterfield	Lode tin ore, from near Tenterfield	63·35
"	" " " " " "	33·4

COPPER.

I regret to say the depression in copper-mining continues, owing to the low price of copper, and only the very best mines can, under existing circumstances, be worked at a profit. It is much to be desired that some means or appliances may be devised whereby the cost of raising and treating ores might be reduced, so that the mines now lying idle may again be brought into active operation.

The Burrage mine has been idle since the 30th September, owing to the low price of copper, notwithstanding a splendid face of ore. During the nine months 281 tons of copper, valued at £14,000, was sent away from the mine. From the Belaire mine, in the Wellington Division, 300 tons of ore were raised, yielding 40 tons of copper, valued at £1,720. From the Gordon mine, Buckinbah, 300 tons crushed concentrated ore were obtained, which assayed—gold, 10 dwt.; silver, 2 oz.; copper, 10 per cent.

Notwithstanding the depressed state of the copper market, the Great Cobar Company employed 500 men and boys. During the year they raised 25,887 tons of ore, which, smelted on the mine, yielded 2,044 tons of copper, valued at £80,951. The ore consists of grey oxide and blue and green carbonates, the percentage being 7·88. The Nymagee mine employs 300 men and boys. 14,782 tons of ore were raised and smelted on the mine, yielding 1,478 tons of copper, valued at £60,967 10s. The average of the ore for the year was 10 per cent., and the general average since the commencement of the mine 14 per cent.

A party of four men have sunk a shaft on the Hermitage Plains, about 30 miles east of Cobar, 30 feet deep. At 13 feet they struck some very good ore, consisting of grey sulphides with blue and green carbonates. The width of the lode is about 5 feet, strike north, dipping 1 in 30 feet west. This locality is said to abound in copper ore. It is said that Captain Williams, of the Great Cobar Company, intends shortly to commence work on the land about 6 miles north-west of Cobar, recently occupied by Cohn and party.

At the New Mount Hope mine only a few men are employed opening up, as at the present price of copper it would not pay to resume active operations. The Great Central mine is altogether closed, said to be due to bad management, as the mine is said to be rich, as much as £3,000 a year having been offered for the right to work it on tribute.

Some rich copper specimens have been found at Buddawang Range, about 16 miles from Braidwood, but no lode has yet been found.

The Inspector of Mines reports that at the Gordon mine, Buckinbah, there is about 1,000 tons of concentrated copper ore at grass, which assays 9 per cent. copper and 12 dwt. of gold and 2 oz. silver per ton.

TABLE showing the quantity and value of Copper, the produce of the Colony, exported from the Colony of New South Wales, from 1858 to 1886.

Shoalhaven River	Quartz and grey sulphide of copper	33·85	

IRON.

The production of iron during 1886 is less than during the previous year. This is, no doubt, due to the general depression.

The following analyses of iron and manganese ores were made during the year :—

Locality.	Description.	Analysis.
Colo Vale	Earthy iron oxides, from 3 miles S.E. of Colo Vale.....	Moisture and organic matter, &c. %
		Peroxide of iron
		Alumina
		Silica
		Lime
		Magnesia
		100·00
Muswellbrook	Calcareous magnetite, from Upper Muswell Creek, near Muswellbrook	Gaugue
		Ferric oxide
		Ferrous oxide
		Alumina
		Lime
		Magnesia
		Moisture, undetermined.....
		100·00
Port Stephens District ..	Magnetic and hematite iron ore	Water of hydration
		Ferric oxide
		Alumina
		Manganese
		Silica (gauge).....
		Phosphoric oxide
		Sulphuric oxide
		100·14

*Equal to 48·14 per cent. of metallic iron.

MANGANESE.

Sutton Forest	Earthy, compact, manganese oxide.....	46·64	1·05
Walcha	Manganese oxide	82·85	

ANTIMONY.

The output of antimony during the year 1886 was less than that of the previous year. This is to some extent due to the fact that in some cases where payable gold is associated with antimony the latter mineral is sacrificed. There is a prospect that some of the antimony mines which were idle during 1886 will shortly resume work.

Oppenheimier's mine, in the Bathurst District, was working with satisfactory results. The ore, which contains antimony, gold, and silver, cannot be treated locally, but is sent to Europe for treatment. Dr. Claudet, Assayer to the Bank of England, gives the following result of an assay of the ore:—Antimony, 61·50%; gold, 3 oz. 12 dwt.; silver, 1 oz. per ton. Messrs. Johnson, Mattley, & Co.:—Antimony, 41%; gold, 2 oz. per ton. J. S. Vale, of Sydney:—Gold, 19 oz. 1 dwt. 3 gr. per ton. 116 tons 16 cwt. of picked ore, valued at £1,881, was sent to Europe during the year, and several hundred tons are at grass, not being considered rich enough for shipment.

The following assays have been made during the year:—

ANTIMONY.

Locality	Description.	Per cent.	Per ton.		Per cent.
		Antimony.	Gold.	Silver.	Lead.
Bellinger River ...	Sulphide of antimony, Peckett Hill	69·97	oz. dwt.	oz. dwt.

DIAMONDS.

I regret to say very little is being done at Bingera to develop the diamond mines, but it is to be hoped that the examination by Mr. Geological Surveyor Anderson, of the diamondiferous drifts in that part of the Colony, may lead to the re-opening of some of the mines that have of late been idle. In the Tingha division heavy finds of small diamonds have been made in some of the claims, but it is thought many of the stones are lost through defective appliances.

Some time ago I called attention to the difficulty experienced by miners in finding a ready market for their diamonds, and suggested that advantage might be taken of the exhibit of our diamonds at the Colonial and Indian Exhibition to obtain through the Agent-General some information concerning the prospect of a market in London for the products of our mines. The Agent-General was good enough to obtain and forward the following valuable reports:—

REPORT ON NEW SOUTH WALES DIAMONDS.

To Sir Saul Samuel, K. C. M. G., C. B., Agent-General for New South Wales.

Sir,

London, 16 November, 1886.

In response to your request that we should examine and report to you on the Collection of Diamonds in the New South Wales Court of the Colonial and Indian Exhibition, we have the honor to inform you that we have carefully examined the 285 crystals comprising it, and have fully gone into the literature bearing on the occurrence of the Diamond in New South Wales, so far as known to us.

The mode of occurrence, physical characters, accompanying gems, and the general history of the Diamond in New South Wales have been so ably treated by Messrs. Norman Taylor and the late Professor A. M. Thomson (*Trans. R. Soc. N. S. Wales for 1870*, p. 94), Mr. Norman Taylor (*Geological Magazine*, 1879, vol. vi., pp. 399 & 444), and Professor A. Liversidge (*Trans. R. Soc. N. S. Wales for 1873* [1874], pp. 91 & 102; *Quart. Journal Geol. Soc.*, 1875, xxxi, p. 489), and the equally full description of the deposits yielding the gem, given by the same authors, and Mr. E. F. Pittman (*Annual Report, Dept. of Mines N. S. Wales for 1881*, p. 141), that it is quite superfluous for us to do more than briefly refer to these parts of the subject.

With regard to the crystallographic form, we have recognised all those described by Messrs. Taylor and Thomson and Professor Liversidge. When compared with those of South Africa, we find that the New South Wales forms are more varied, *i.e.*, the crystals partake more of the dodecahedral with its numerous modifications, than of the octohedral habit, which is so marked a feature in those from the Cape. In this respect the New South Wales stones bear a remarkable resemblance to those from Brazil, and also differ from the Indian gems. Another peculiarity of the Cape diamond is the large proportion of cleaved stones, or "cleavage," which appear to be entirely absent in the parcel submitted to us from the Crown Jewel Mine. Speaking of those from Bingera generally, Professor Liversidge says, "no fractured specimens have been detected;" whilst among those from Cudgegong Mr. Taylor remarks, "it is very rare to meet with fractured stones." Again, amongst the Cape diamonds a fairly large number of "macles," or twinned-crystals, are met with, and these, as we have elsewhere pointed out, are found to present difficulties in cutting through the planes of contact. Now, in the present collection, these macles appear to be exceptional, but Mr. Taylor has described twinned-crystals from the Cudgegong, although not obtained in any quantity. Flattened octahedra, known in the trade as "flats," appear to be rare, although we have noticed a few. They are converted into "rose diamonds," a form of cutting formerly much practised in oriental countries, but only used in the case of imperfect stones. It naturally follows that the comparative absence of stones with these crystallographic characters will tend to reduce the cost of preparation, loss of material and necessity for the production of a less saleable gem.

The black specks so frequently met with not only in the Cape, but also in Brazilian diamonds, appear in those from Inverell to be more or less confined to the surface planes, not extending to any depth within the crystals, and would doubtless be eliminated in the cutting without detracting to any great extent from the value of the stones as gems. On the other hand, speaking of the Cudgegong diamonds, Messrs. Taylor and Thomson say that "black specks within the crystals are not uncommon," and Professor Liversidge remarks on those from Bingera, "it is rather common to find them with . . . internal black specks." The above observers have fully described the various colours characteristic of the New South Wales diamond, but in the present parcel we have only noted the colourless, shades of yellow, and a peculiar light yellowish brown, or light cinnamon colour. A small number are so slightly tinged as to practically come within the term "byewaters," whilst a very considerable proportion are of that straw-yellow tint known as "off-colours," but it is satisfactory to note that, as we have elsewhere stated, these off-colour stones far eclipse, when seen by artificial light, those regarded as of pure water.

On analyzing the colour of 275 stones from Inverell, we find the following proportions:—

Colourless	100
Straw-yellow ("off-colours").....	126
Slightly tinted yellow ("byewaters").....	39
Cinnamon-yellow	6
Dirty gray hue ("rejections")	4
	275

Messrs. Taylor and Thomson, Mr. Taylor separately, and Professor Liversidge make particular mention of shades of green as sometimes occurring. Mr. Taylor speaks of "light or dark bottle green" stones, and Professor Liversidge mentions "light green" gems. We have no information what proportion such colours occupy in comparison with the others just enumerated, but we would point out that the commercial value of stones so tinted is enormously augmented, if of any size, and we cannot impress too strongly on those engaged in diamond mining the importance of this point.

We are likewise unfurnished with information as to the quantity of "Boart" yet obtained in the Colony, but considering the numerous uses to which this variety of the diamond has been put of late years, more particularly as applied to the diamond drill, and considering the important part this machine is now playing in water borings throughout the Australian Continent—we would strongly recommend this variety to the attention of the mining community. Several crystals of a dirty grey hue, and known in diamond circles as "rejections," are present in the collection, and these with a few irregular malformed crystals may be taken as types of stones which could be successfully used for this purpose. "One or two opaque black" diamonds are mentioned by Mr. Taylor, and Professor Liversidge cites an example of Boart, which was exhibited in the New South Wales Court, and is said to have been found at Mudgee.* It is described as black in colour, and with graphitic lustre, of the size of a large pea, and with a few small crystallographic processes projecting from the surface, 7.352 grains in weight, and Sp. Gr. 3.56, at 70° F. This description strongly recalls to mind the true Brazilian Boart, which is in such request for diamond drills, and as distinguished from that of the Cape Diamond Fields. The latter consists simply of badly crystallized and dark coloured stones, similar to those previously referred to as of a dirty grey hue from the Crown Jewel Mine. The importance of these facts will be at once perceived when it is remembered that the true or Brazilian Boart consists of more or less spherical aggregations of acicular crystals, radiating from a centre, and possessing an external aspect with which Professor Liversidge's description seems to correspond. We have examined the stone in question, and beyond exhibiting a smoother surface it appears to us to fulfil these conditions. We need not say more on this point than by reminding those interested that the true Boart is now worth 7s. 6d. per carat, and the Cape or false Boart, 3s. 6d.

The lustre of the crystalline faces, which is not to be differentiated from that of Brazilian stones, is chiefly adamantine, but at times somewhat dull, but this in no way detracts from their beauty when cut, the exterior crystal irregularities having little or no connection with the structure below the surface. The dullness appears to be partly due, as pointed out by Mr. Taylor and Professor Liversidge, to certain crystallographic irregularities, and certainly is not owing, as suggested by some, to abrasion or attrition. The rounding of the faces, visible on many of these crystals, is entirely due to the well known peculiarities of diamond crystallization, and that it is not due to attrition is evident by the sharply defined character of the edges bounding these rounded faces.

The equally noticeable pitting of the surfaces of the crystal planes is characteristic of the diamond in all hitherto known localities, and cannot therefore be used as a means of comparison with those of one field as against those of another. The pitting is very irregular both in position and shape, more so in fact than is generally seen in examples from other fields. The colourless stones are not only pitted to a greater extent than the yellow, but the crystal planes are more unequally developed,

* In another place (Liversidge, *The Minerals of New South Wales*, 2nd Edition, p. 122), this is stated to have come from Bathurst.

developed, imparting to the crystals a much more distorted appearance. The brilliancy of the white and yellow stones when the gems are good is about equal, and before cutting this feature is more pronounced the nearer they approach the octahedron in form, a fact holding good both for the yellow and white stones, and one quite in accord with theory.

Some of the colourless are very beautiful stones, and the quality quite justifies the manner in which parcels have been brought into the London market, a fact to be referred to hereafter.

Amongst the stones cut for you by Messrs. Ford & Wright is one of a very peculiar, and, so far as we know, original structure, to which our attention was drawn by their Manager, Mr. L. Atkinson. The prepared facet exhibits triangular markings which appear to correspond with some of the surface pittings. These markings, so far as we were able to judge, seem to extend through the whole of the crystal, and unless removable by polishing, stones of a similar structure to this, judging from a trade point of view, would be of little value, but we are of opinion that this is an isolated instance of a peculiar crystallographic growth.

Hardness is a physical feature upon which much stress is laid by lapidaries and diamond-cutters, and it is stated by Messrs. Ford & Wright that the New South Wales diamonds are much harder than those from the Cape, judging by the time necessary for the preparation of the facets. But, as a matter of fact, in other precious stones the relative hardness depends, to a great extent upon the direction in which a stone is cut with regard to its crystalline form, and until many more careful observations are recorded, we hesitate to pronounce any opinion as to the value of this. If proved, we would call attention to the necessary increase in the cost of cutting the diamonds from your Colony, but, as a set-off to this, the probable increase in brilliancy. One thing is quite apparent, when cut, some of these stones produce most exquisite gems.

Messrs. Taylor and Thomson, and Professor Liversidge also, have determined the specific gravity to vary between the limits of 3.42 (Bingera) and 3.44 (Mudgee), but with an average of 3.42. We find the mean of a series of experiments with the Crown Jewel diamonds to be 3.46. The following table of specific gravities gives a comparison with that of those from Brazil, India, and Borneo, the data of the latter being taken from Mr. Harry Emmanuel's work, and that of MM. Jacob and Chatrain:—

Country.	White Stones.	Yellow Stones.
India	3.524	3.556
Brazil	3.442	3.520
Cape	3.520	...
Borneo	3.492	...
N. S. Wales	3.42	

The analogy in density between the white Brazilian stones and those from New South Wales, irrespective of colour, is at once apparent.

The average weight of the Mudgee stones was estimated at 0.23, or nearly one carat grain each, by Messrs. Taylor and Thomson, and this has received corroboration from Mr. C. S. Wilkinson in the case of diamonds from the Borah Creek Tindirfts (*Mines and Min. Statistics, N. S. Wales, for 1874, p. 79*). On the other hand, those from Bingera are said by Professor Liversidge to be "for the most part small in size." We have made two series of determinations of the weights of the Crown Jewel Mine diamonds, with the following results:—

20 1st size stones (a) =	$16\frac{1}{2} + \frac{1}{16}$ carats	Mean $\frac{3}{4} + \frac{1}{8}$
" " (b) =	$12\frac{1}{2} + \frac{1}{8} + \frac{1}{16}$	" $\frac{1}{2} + \frac{1}{8}$
20 medium stones (a) =	$10\frac{1}{2} + \frac{1}{32}$	" $\frac{1}{2} + \frac{1}{16}$
" " (b) =	$8\frac{1}{2} + \frac{1}{16} + \frac{1}{32}$	" $\frac{1}{4} + \frac{1}{8} + \frac{1}{32} + \frac{1}{64}$
20 small stones (a) =	$3\frac{1}{2} + \frac{1}{8}$	" $\frac{1}{2} + \frac{1}{16}$
" " (b) =	$2\frac{1}{2} + \frac{1}{8} + \frac{1}{32} + \frac{1}{64}$	" $\frac{1}{8} + \frac{1}{16}$

Mr. Harrie Wood, in the Annual Report of the Department of Mines for 1885 (p. 40), gives the total weight of this parcel as 104½ carats. He states that "280 ranged from $\frac{1}{8}$ to 1 carat each in weight, and five from 1 to 1½ carat."

As a fair average of the diamonds found in the Cudgegong field, Messrs. Taylor and Thomson give the following statistics:—

106 diamonds weighed 74½ carats, the largest 1½ carats.
81 " " 19 " " 1½ "
110 " " 26½ " "
16 " " 6 " "
700 " " 151½ " "

Large diamonds appear to be quite the exception in New South Wales; at any rate, definite data are wanting on this branch of the subject. The largest stones of which we have been able to find reliable record are the following:— Messrs. Taylor and Thomson give the largest found at 5½ carats, a perfectly colourless octahedron, discovered in the Cudgegong River, between the "Two-mile-Flat" and the "Rocky Ridge;" another of 3½ carats at the former locality. Two very excellent stones were lately exhibited in the New South Wales Court by Mr. R. H. D. White, weighing, respectively, in the cut form 3 and 3½ carats. Professor Liversidge states that at Bald Hill, Hill End, one stone slightly over 3 carats, and another 1½ carat, were obtained. On the other hand, Mr. C. S. Wilkinson records the discovery in the stream-tin washings of the Borah Tin and Diamond Mining Company, Borah Creek, of a diamond weighing 5.5 carats, and another 7.5 carats at the Bengonover Mine, in the same creek. From the Crown Jewel Mine the largest stones we noticed were the following:—

1 large colourless stone = $1\frac{1}{4} + \frac{1}{16}$	1 large yellow stone = $\frac{3}{4} + \frac{1}{8}$
" " " = $\frac{3}{4} + \frac{1}{16} + \frac{1}{32}$	" " " = $\frac{3}{4} + \frac{1}{16}$

As compared with the stones of other localities, the size is somewhat small, although it is stated that Brazilian diamonds frequently take from 15 to 20 to weigh a carat. This smallness of size is compensated, however, by the fact, as we are informed by an excellent trade authority, that medium sized diamonds are now more in request than large ones, for mounting in conjunction with other gems, such as rubies and sapphires. In form, size, and physical character, the New South Wales diamonds appear to agree better with those of the country just mentioned than of any other; but, of course, they cannot vie in size or quantity with Cape stones. In brilliancy and fire when cut, they are, however, stone for stone, quite able to hold their own with those from the latter Colony. In fact, it appears, from information gathered through most reliable sources, that a large proportion of New South Wales gems have found their way to the London market as Brazilian stones. Otherwise we would ask what has become of the 12,000 which are officially returned as found up to the end of 1885, especially when it is distinctly stated by Mr. E. F. Pittman, Chief Mining Surveyor for New South Wales, that in 1872-73, the Sydney jewellers declined to buy Bingera stones. We are quite aware that some small parcels have reached certain eminent firms in London, in a genuinely open manner, as New South Wales diamonds; but we believe that the other course has been more frequently adopted. If this be the case, what more satisfactory certificate could be adduced in favour of the diamonds yielded by the tertiary drifts of New South Wales.

Whilst preparing the present Report, we have been asked on several occasions two very pertinent questions—questions which appear to us to have a very important bearing on the future development and permanency of the diamond industry in New South Wales. The first of these was, what is the area of the diamantiferous ground, and the approximate thickness of the drift in the several fields? The second and equally important question related to the yield of stones. Unfortunately, beyond the general statement that 12,000 diamonds have been found, we are unacquainted with any official return dealing with such details, and even until within the last two years this subject does not appear as one of the items in your excellent "Reports of the Department of Mines;" and the same remarks may be applied to the question of area. Many statements have appeared in the public press on the first of these points, but they are so utterly unreliable as to be quite useless for statistical purposes.

With

With the view of pointing out how difficult it is for an estimate to be formed, even within several degrees of accuracy, the following brief and imperfect description of the diamantiferous deposits may not be out of place, abstracted from the several excellent authorities we have before referred to.

The diamond in New South Wales occurs in outliers of drift and cement representing old river accumulations of more than one geological age, lying at various distances from the present river channels, and once forming portions of widespread and continuous deposits, resting on the bed rock of the country. The older drifts have been protected from total destruction by cappings of basaltic rock, but the isolated condition of these clearly shows the enormous amount of denudation which has gone on, and the quantity of diamantiferous drift removed. The latter is usually loose and coarse, but in places passes into a compact conglomerate. There are six of these drifts at Mudgee, occupying different levels, resulting from the successive denudations of one another, and we believe all diamond-bearing. At Bingera, on the other hand, the drift is described as a "small-grained siliceous brecciated conglomerate, strongly agglutinated together by a ferruginous cement." The younger drifts have in every case been derived from the destruction by fluvial agencies of the older. Mr. Taylor describes the older drift as a "coarse and heavy deposit—some boulders in it weighing several hundredweights—for the most part loose, but portions of it united into a compact conglomerate. It varies greatly in thickness, from a few inches to 30 feet . . . The newer drift derived from the above is composed of the same contents as the older drift, with the addition of boulders of greenstone and basalt . . . The newer drifts (upper and lower) comprising the present river bed, and older and deeper channels, contain pebbles, boulders, and shingle of the neighbouring sandstones, slates, &c." Throughout these drifts the diamonds are described as occurring in rich patches. The drift at Bingera is said by Professor Liversidge to vary from 3 to 60 feet.

It will be readily understood from this that without a detailed official survey of all the likely diamond bearing drifts, it would be impossible to give even an approximate idea of the areas capable of yielding the precious stones; but that such deposits are numerous throughout New South Wales, is itself evident to any one who has perused the able geological reports of Mr. C. S. Wilkinson and his assistants. It can naturally be roughly ascertained from the geological maps prepared by these gentlemen, but we believe it would greatly stimulate diamond mining if a detailed report could be prepared furnishing the information in question. As an indication to parties interested, we can only refer to what has been done, and for this purpose we quote certain of the ascertained areas of the Cudgegong (Mudgee) Diamond Field, as given by Messrs. Taylor and Thomson, thus—

Name of Claim.	Area in Acres.	Thickness of Drift.
Two Mile Flat	70
Jordan's Hill	40	18 feet.
Miller's Claim	100	12 "
Junction of Reedy Creek with Cudgegong River	100
Rocky Ridge (older drift)	40
Horse-shoe Bend do	20
Hassall's Hill do	340	? 12 to 30 feet.
	610	

Touching the second point—the number of diamonds found—the following reliable data are extant:—

Claim.	Diamonds.	No. per Load.	Carats.	Authority.	Date.
Australian Diamond Mining Company (Mudgee) ...	1,765	From 1 in to 2 loads, to 4 or 5 in 1 load.	Taylor	1867
Messrs. Scott & Allen (Mudgee).....	700	8 to 12 or 15 loads	"	"
Messrs. Cooney and Party (Mudgee).....	1,000	1 to 15 to 1 load, average 5.	"	"
Falk & Co. (Bingera).....	400	From 100 loads	Wood	1883
Gwydir Diamond Company (Bingera)	690	" 34½ "	Liversidge ..	1873
Australian Diamond Mining Company (Bingera) ...	1,193	" 418* "	254	"	1884
Craddock and Party (Bingera)	17	" ½ "	Wood	"
Australian Diamond Mining Company (Bingera) ...	1,134	" 87 "	209	"	1885
Crown Jewel Mine (Tingha)	285	104½	"	"

These, of course, represent but a small proportion of those found, and the numbers are only quoted as indicating the relative richness of average claims. Had all the statements been accepted to which we have had access, doubtless the total of 12,000, given in the New South Wales official catalogue, Colonial and Indian Exhibition (p. 149), could be much exceeded.

The distribution of the diamond throughout New South Wales is widespread. It has been recorded as occurring at the undermentioned places:—

	Authority.	Date.
Turon River	Stutchbury	1851
Reedy Creek, near Bathurst	Hargraves	"
Burrendong	Clarke	1859
Pyramal Creek	"	"
Calabash	"	1860
Suttor's Bar, Macquarie River	"	"
Cudgegong River (Mudgee)	Taylor and Thomson	1867
Bingera	Liversidge	1873
Bald Hill, Hill End	"	1875
Borah and Bengonover Tin Mines.....	Wilkinson	"
Trunkey Creek, Tuena	Taylor	1879
Brook's Creek, Gundaroo, near Goulburn	Liversidge	1882
Lachlan River	"	"
Monkey Hill, and Sally's Flat	"	"
Big River, Auburn Valley, Tingha	Wood	1884
Berrima District	"	"
Crown Jewel Mine, Inverell	C.I.E.	1886

The diamond has likewise been found at a few localities in Victoria, chiefly in Gippsland, and it is said by the late Dr. J. J. Bleasdale to have also been discovered at the Echunga diggings in South Australia (*Colonial Monthly*, 1868, Vol. II, p. 436). At the latter place it is reported to occur in "Itacolomite," but from the description given the matrix is evidently an ordinary auriferous drift.

We

* 5,000 tons of drift were raised, and waiting to be washed.

We have seen it stated that certain claims at Bingera show "good wash of the proper kind, and of the same sort as yields well in South Africa." Now a statement of this kind, if true, would naturally do more perhaps for diamond mining in New South Wales than any other fact which could be adduced in its favour. On the other hand, if erroneous, a corresponding amount of harm will be done by inducing investors to speculate in the hope of obtaining similar gratifying results. We have neither seen or read of any diamantiferous soil from New South Wales having even the faintest resemblance to the peculiar rock forming the matrix of the diamond at Kimberley and neighbouring mines, nor occurring in a like manner. We presume the Kimberley deposit is referred to in such a paragraph as we have quoted, and not the Vaal diggings, which are now comparatively worked out. We cannot too strongly condemn such statements, as having no foundation in fact. We have already briefly described the diamond matrices in New South Wales, which are *drifts*, widely distributed horizontally. In South Africa, on the other hand, the origin of the diamantiferous rock has given rise to much speculation, and is still a subject for discussion, although it probably results in a great measure from a peculiar form of hydrothermal action. Instead of a wide-spread distribution it occupies restricted areas, having no semblance to drift deposits at all, but is an agglomerate filling strange pipe-like depressions, or elliptical cavities extending vertically to unknown depths, the exact nature of which have yet to be explained. This is the celebrated "blue" of the South African miners, and it is a "distinct agglomerate, consisting of fragments of all shapes and sizes of many rocks which vary much in mineral composition, enclosed in a base of serpentinized material, which appears to have largely resulted from the alteration of enstatite and olivine. The enclosed rocks, or some of their mineral constituents, have partaken, to a considerable extent, of the same chemical alteration. The texture varies very much, and depends upon the size and abundance of the enclosed fragments; sometimes it resembles a breccia, sometimes a conglomerate, and sometimes partakes of the character of both. In some parts the blocks are very much rounded, and present the aspect of water-worn pebbles; this is especially the case in many of the doleritic rocks, though we have seen blocks of mica-schist in it which it was difficult to believe were not true pebbles. In others the fragments are more angular, but all that we have seen appear to have had their sharp edges more or less removed by some mode of attrition."* No such rock has ever been described to our knowledge from New South Wales, diamantiferous or otherwise, and to say therefore that the conditions are similar in the two countries is both misleading and erroneous. With the view of showing the relations of the New South Wales diamond matrix, we here append a list of some of the more frequent rocks and minerals constituting those of Brazil, India, Borneo, and the Cape, from which the resemblance it bears to the two former will be at once apparent.

Brazil.—Gold, lydian stone, quartz, red ironstone (siliceous), cassiterite, topaze, spinel, garnet, lazulite, chrysoberyl, carbonado, tourmaline, andalusite, beryl, rutile, anatase, brookite, tantalite, hematite, kyanite.

India.—Quartz, jaspers, hornblende, corundum.

Borneo.—Mostly red clay, which contains pebbles of serpentine, diorite, and quartz, interbedded with marl, containing fossils, magnetite, platinum, black quartz.

New South Wales.—Quartz, quartzites, cassiterite, jasper, lydian stone, topaz, sapphire, ruby, varieties of zircon, spinel (varieties of), gold, tourmaline, flinty slate, shale, sandstone, ilmenite, magnetic iron sand, brookite, rutile (Bald Hill), garnet, osmiridium (newer drift of Mudjee).

Cape.—Garnets, green, ruby-red, and brown; smaragdite, bronzite, enstatite, olivine, ilmenite, zircon, vaalite, hornblende, zeolites, calcite, opal, staurolite, iron pyrites, pegmatite, talc schist, mica schist, augite rock, amphibolite, eclogite, serpentine, gneiss, peridotite, granite, dolerites, basalt, melaphyre (with agates) and others, amounting to over eighty in number.

With regard to the source of the diamond in New South Wales we do not see any other course than to unhesitatingly accept the explanations offered by Mr. Norman Taylor, so far as the facts bearing on this branch of the subject have been yet gathered. He believes that they were chemically formed in the older tertiary drifts, and in support of this view adduces the following cogent reasons:—

1. The older rocks of the various diamantiferous districts have not been proved to be diamond bearing.
2. The older tertiary drifts or cements are derived from the denudation of these, and contain diamonds.
3. The younger drifts are only diamantiferous when resulting from the destruction of the latter, and similarly the recent alluvium again from them.
4. The natural conclusion is that the diamonds have been formed in the drifts, and not derived from any pre-existing rocks.

Mr. Taylor was further of opinion that the "fluctuating yield, small average size of the gems, the expense in extracting the drift from beneath the basalt, cartage to water, and washing effectually, are the drawbacks which have hitherto stood in the way of the successful investment of capital in this direction." We imagine that some of these difficulties will in the future be overcome by stricter attention to the details of at least two of these points. For instance, we have it on record that in certain claims, when chiefly worked for gold only, the lower portions of the drift, or that near the "gutter" was removed, leaving what was perhaps the richest diamond-bearing portion behind. Mr. Taylor distinctly states that the gems do not appear to occur much on the bottom with the gold, and also from the fact, in the Cudgegong field, at least, they appear to be found in "runs" or "veins," at various levels in the drift. It is not improbable, therefore, that in a number of the tertiary deposits which have been explored simply for gold, diamonds have unconsciously been overlooked. We think that a remark of Messrs. Taylor and Thomson's to the effect that—"the mere fact of the not unfrequent discovery of diamonds on the waste heaps round old shafts which were sunk for gold, is enough to suggest that the diamonds may occur in the higher portions of the deposit, since the bottom layer has been invariably carted to the river for gold-washing," to some extent proves this, and even opens up the far wider question touched on in the preceding paragraph. The small average size of the stones, as we have previously pointed out, ought not to mitigate against a successful prosecution of the industry, under present circumstances. On the other hand, the expense of mining and question of water supply are so entirely matters of local detail as to be quite out of place in the present remarks.

Washing effectually can only be carried out by thoroughly good machinery, and there is evidence to show that such is now being introduced. In all probability the machine best suited to the diamond drifts of New South Wales would be a slight modification of the "Washing Gear and Pulsator," as used by the Griqualand West Diamond Mining Company, Dutoit's Pan, in 1885, a model of which was exhibited at the late Exhibition.

In bringing our Report to a termination we beg to emphasize the following conclusions, which the foregoing remarks bear out:—

1. The diamonds of New South Wales in their physical characters are more nearly allied to those of Brazil than any other country.
2. They have been very largely sold in London as such.
3. As regards colour, they differ practically but little from those of other fields.
4. The general absence of "cleavage" and "macles" is a point much in their favour.
5. Stones of the rarer colours assumed by the diamond should be particularly sought for.
6. The greater hardness of the New South Wales gems will probably raise the cost of cutting, but this will be compensated for by their extra "brilliance."
7. "Boart" should be eagerly sought for.
8. Detailed statistics of the area and thickness of drifts likely to prove diamantiferous, and the number hitherto found so, should be prepared officially.
9. All auriferous drifts should be prospected for diamonds.
10. The matrix of the diamond in New South Wales bears no resemblance to that at the Cape.

We are, &c.,

THOS. DAVIES, F.G.S.

R. ETHERIDGE, JUNR.

A

A REPORT TO THE NEW SOUTH WALES GOVERNMENT UPON ITS DIAMONDS.

THE four Australian diamonds selected by myself in the New South Wales Court at the Colonial and Indian Exhibition by the request of Sir Saul Samuel, K. C. M. G., C. B., to make a report upon after being cut and polished, during which process I had thoroughly and closely investigated them with this result that :—

No. 1 parcel contains one diamond which had the ordinary dodecahedron crystallization, the crust or coat of the stone was perfectly naturally polished with very few indentations, and no indication whatever of triangular indentations or markings as so frequently found in the African diamond ; it was cut into the shape most suitable to show to the greatest advantage, and on the polisher commencing to put the first facet on it called the table, it was found on careful examination that there was a triangular formation which is generally found on the outer coat or crust but very rarely indeed right inside the stone, and it is so remarkable that on the heads of the Mineral Department of the British Museum hearing of it and after examining it, expressed a strong desire to possess the stone, as being of such a wonderful and interesting formation ; therefore, I thought it advisable to stop the polishing process of it and submit the stone for inspection with the desire of the Mineral Department of the British Museum, South Kensington.

No. 2 parcel contains the diamonds which were most carefully selected by myself out of the 286 Australian diamonds exhibited in the New South Wales Court at the Colonial and Indian Exhibition, that they might be as near a match as it is possible to get in every respect such as size, shape, colour, and appearance. One has been cut and polished and proves a brilliant of the finest water ; the other diamond is left in its natural rough shape just as it was found, so as to show at once the practical difference between the two diamonds.

No. 3 parcel contains one diamond, which, in its rough state, weighed $1\frac{1}{2}$ carats, the crystallization, a hexakis octahedron of a dull white colour after being cut and polished ; it now weighs the $\frac{2}{3}$, $\frac{3}{8}$, $\frac{1}{10}$ of a carat, and is about as fine a brilliant as it is possible to get, be it from Golconda, Borneo, Brazil or Jagersfontein.

The market price of the Australian diamonds in the rough state is liable, like all other diamonds, to great fluctuations, and on the whole are generally lower than the African diamond, for this important reason that they are a great deal harder to cut and polish ; as, if it were possible to pick out an Australian and an African diamond exactly the same size, weight, shape, and appearance, and given to one man to polish, the African stone would be finished in six days, whilst the Australian stone would take eight days, with this vastly important difference that the Australian diamond would be of greater brilliancy and refracting power than the African stone ; and might I suggest that these cut stones might be handed over to some skilled gentleman who would carefully test in every way the refracting powers and polarization of light in comparison with an African diamond.

There is always a good market open for Australian brilliants, as although they are at present small in size in comparison to the African diamond, with regard to colour in proportion to their production, Australia finds the most white diamonds, and there is always a great demand for fine white stones, and always will be, as being small they are the most suitable to set round all other coloured gems and different kinds of ornaments and decorations connected with jewellery, more especially for the future, as China and Japan are commencing to introduce diamond jewellery into their countries.

The market price at the present time for parcels of diamonds, containing such stones as the one cut and polished in No. 2 and also No. 3 parcels, varies from £8 to £9 per carat.

There is another very great market open for all inferior diamonds, especially rounded stones, commonly called ball boart, as it is used now so universally in large quantities for rock drilling, mill dressing, and for turning all hard metals and stones, and the supply at the present time is not sufficient for the demand, as the inferior diamonds from Africa rarely answer the purpose, being of a softer nature than the Brazilian diamond, which on careful examination, I have come to this most important conclusion, is the same in every respect with the Australian diamond. Australia has a very important market open for its diamonds that are too small to cut and polish, as natural stones are largely used for glass cutting and china drilling, &c.

In examining the different collections shown in the New South Wales Court at the Exhibition, I found one piece of carbon which is the hardest mineral known, and is greatly needed, and for which there is an immense market. I believe that on the diamond mines in Australia being thoroughly and properly worked with the immensely improved machine that we have now, there will be found paying quantities of this stone, and I am also firmly convinced that the deeper the mines are sunk, not only a larger quantity but finer, and most important of all, the diamonds will be found larger in size.

After thoroughly and exhaustively going into the matter, I am so satisfied that there is a large and wealthy industry to be developed in Australia that, although I am in a good position, still if the Government would offer on certain conditions I would willingly go out to the Colony and enter thoroughly into the whole matter ; as, having been connected practically with the cutting and polishing of diamonds for fifteen years, and being the expert and sole manager in directing the whole of the diamond washing at the Exhibition, I know exactly what ground the diamonds are to be found, and could at once see to proper machinery being erected, and I am perfectly satisfied that the result would be a great development of a new industry and a source of wealth to the Colony.

LEWIS ATKINSON,
33, Brook-street, Grosvenor Square, London, W.

The following analyses were made during the year :—

MISCELLANEOUS ANALYSES.

Burra Burra.—Sediment obtained from wood-ash lye.

Analysis.		
Moisture		10·80
Carbonate of potash		53·06
" of soda		5·42
" of magnesia		5·20
Sulphates and traces of phosphates		8·76
Insoluble		3·18
Alkaline chlorides		13·58
		<hr/> 100·00

Southern District.—Beans from the Moreton Bay Chestnut or " Bean Tree " (*Castanospermum Australe*), examined with a view to ascertain the cause of their poisonous effect upon stock.

NOTE.—These beans have been examined, and found to be non-poisonous. Analysis shows that they are composed of digestible fibre, woody fibre, mineral matter or ash, and starch (in considerable quantity), and what appears to be a glucoside, soluble in rectified spirits of wine, but not poisonous. I am of opinion that if any ill effects have been observed in cattle or horses eating them, it has been owing to their very indigestible nature, and not from their supposed poisonous qualities.

W. M. HAMLET, F.C.S.,
Assistant Government Analyst.

Weddin Mountain.—Black substance derived from the decomposition of animal excrement, mixed with sand.

Analysis.		
Moisture		1·31
Organic matter		18·84
Oxide of iron and alumina		8·43
Phosphate of iron		1·02
Insoluble siliceous matter		70·40
		<hr/> 100·00

WATER.

WATER.

Curlewis Station, New England.—Water from H. Pike's well, about a mile S.W. of Curlewis Station, G.N. Railway line; 25 ft. of water in well 150 ft. deep. Used for steam and drinking purposes, but is not very suitable owing to its hardness.

Analysis.	
Total solid matter.....	179·2 grains per gallon.
Soluble saline matter	48·75 " "
Insoluble inorganic matter	14·25 " "
Volatile at a red heat	116·20 " "
	179·20
Chlorine	46·5

NOTE.—This sample of water contains much suspended matter, and was found to be in all respects very unsuitable for household and other purposes. Of course it would be improved by careful filtration, nevertheless it is doubtful whether it could be rendered even passable for ordinary purposes.

Denison Town.—Water from well on Patrick's Station, 20 miles from Denison Town; said to be poisonous to stock.

Analysis.	
Total solids.....	283·82 grains per gallon.
Soluble saline matter	73·50 " "
Insoluble mineral matter.....	80·92 " "
Volatile at a red heat	129·40 " "
	283·82
Chlorine	42·65

NOTE.—The symptoms to which this water gives rise when supplied to cattle are not stated. It is thought however, that they may be due to excess of salts of magnesia.

Denison Town.—Water from a well on Patrick's Station, 3 miles from the above; said to be drinkable, but to affect the bladder.

Analysis.	
Total solids.....	47·00 grains per gallon.
Soluble saline matter	15·60 " "
Insoluble mineral matter.....	28·56 " "
Volatile at a red heat	2·84 " "
	47·00
Chlorine	6·18

NOTE.—So far as regards organic matter, this can hardly be called a bad water for drinking purposes, although it may be unsuitable in particular cases. Boiling and subsequent filtration would improve it.

Mossgiel.—Water from Holy Box Well.

Analysis.	
Total solids.....	437·2 grains per gallon.
Soluble saline matter	408·4 " "
Insoluble matter	25·2 " "
Volatile at a red heat	3·6 " "
	437·2
Chlorine	135·0
Saline ammonia, parts per 100,000	none.
Organic ammonia " "	0·002

NOTE.—This water, when viewed through the standard 2 ft. tube, was clear and bright, but not free from suspended matter. The organic impurity is very small indeed, and were it not for the abnormal quantity of saline matter the water might be used for domestic purposes. The solid saline matter, however, is so great that its use must be prohibited for drinking either raw or as tea. It may be used for boiling vegetables and for washing. Distillation would be the only means of rendering the water drinkable.

In conclusion, I have much pleasure in submitting the following summary of the mineral products up to the end of 1886, the value of which has reached nearly seventy millions.

SUMMARY.

	Quantity.		Value.		Total Value.	
			£	s. d.	£	s. d.
Quantity and value of gold prior to 1st January, 1886						
Quantity and value of gold raised in 1886..	9,673,389·37 oz.		36,102,844	5 3

Department of Mines, Sydney, 14 May, 1887.

HARRIE WOOD,
Under Secretary for Mines.

WARDENS' AND MINING REGISTRARS' REPORTS.

BATHURST DISTRICT—TRUNKKEY, TUENA, BURRAGA, ROCKLEY, MOUNT M'DONALD, BATHURST, OBERON
AND MITCHELL DIVISIONS.

(*Mr. Warden Smith, P.M., Trunkkey.*)

I HAVE the honor to forward my report for 1886. I cannot say that mining has improved during the year, but rather the contrary.

When last I reported Mitchell was apparently at its best, but during this year has not held its own. There seems to have been great difficulty in treating the silver ores.

The silver obtained from the Sunny Corner mine was 547,589 oz., valued at £127,123, being the return from 27,501 tons of ore treated. I am informed that the gossan in this mine has been nearly worked out, consequently the Company have now to work the lode. This has been done by reducing the ores and shipping the bullion to Wales for final treatment. 23,601 oz. have been thus treated.

Four hundred men are employed on this property.

The Nevada mine was for a long time idle. From the start the ores were refractory, and could not be treated in the ordinary way. The difficulty has apparently been overcome. The first smelter has been taken down and rebuilt on a smaller scale; when finished it ran twenty-four consecutive days, and treated 350 tons of ore, the return in bullion being valued at £3,000. Fifty-six men are employed in this mine.

The Silver King mine is idle. There seems to be a mystery about this property. The Sunny Corner Company purchased 500 tons of gossan from the Company; the return obtained from same was considered good. 2,489 tons of ore have been treated on the mine, returning £9,480.

The Silver Queen, Monte Christo, and the Big Hill have all been prospecting, but the results have not been satisfactory.

At Dark Corner, Cook & Co. have crushed 1,100 tons of quartz, for 660 oz. of gold. Alluvial gold has been sold locally to the amount of 1,272 oz. Most of this was got at the lagoon 4 miles north of Mitchell. Sixty men are working here, on payable gold. 122 acres of land have been taken up under gold leases; 337 miners' rights, 110 business licenses, and sixteen mineral licenses have been issued during the year at Mitchell.

Oberon.—Only one mine is being worked, viz., the Homeward Bound lease, held by a co-operative Company. Ten men are employed. The battery is of ten stampers. 1,500 tons of stone have been treated, returning 13 dwt. to the ton; result being £3,412 10s., for which the gold, 975 oz., was sold. Fifty-two miners' rights were issued for the year.

Tuena.—116 men are working about here, who have sold locally 609 oz. 6 dwt. of gold, valued at £2,300.

Burraga.—This mine has been abandoned for the present. Work was suspended on account of the low price of copper in London. A good many men are fossicking about for gold. Eighty-nine miners' rights were issued for 1886.

Bathurst.—111 miners' rights were issued for the year. There is no mining in the immediate neighbourhood.

Trunkkey.—150 miners' rights issued. The Bathurst Company have been sinking a straight shaft all the year. It will take another year to reach the depth at which it is expected to cut the reef that was formerly worked on the underlie. Knowles & Co. have been sluicing when they had water. Rutherford & Co. have been working the lode at Pine Ridge, but the result has not been made known. M'Vicar & Co., M'Kenzie, and several others, have been doing well in the alluvial during the dry weather. Gold has been sold locally to the value of £2,462 12s., but this does not cover more than half of that obtained.

Rockley.—130 miners' rights issued for the year. Back Creek is the only place where work is being done. Silver and manganese are mostly sought after. Several shipments of the latter have been made to England. The Silver mining Co. is not treating the ore locally. Forty-three tons of ore were sent to Melbourne for treatment, the return being 3,700 oz. of silver, valued at £740, and 30 oz. of gold, valued at about £112.

Mt. M'Donald.—Sixty-seven men are working the gold leases here. 141 miners' rights however, were issued. 3,390 oz. of gold have been obtained from quartz, valued at £11,899. The Bobby Burns lease crushed best, viz., 65 tons for 476 oz. gold. Butcher's came next, with 140 tons for 608 oz. Then the Balmoral Tribute; 130 tons yielded 491 oz.

The rainfall for the year was 30.74 inches.

Recapitulation.

No. of Men.	Value, Gold.	Value, Silver
1,243	£26,937 12 0	£135,600 3 6

	{ Gold	26,937 12 0
		£162,537 15 6

BATHURST DISTRICT—ORANGE DIVISION.

(*Mr. Warden J. T. Lane, P.M., Orange.*)

OUR "Parent Gold-field," Ophir, continues a struggling existence. The Bluff Amalgamated Company have ceased operations for the purpose of arranging to increase the means to carry on. If this Company had money equal to the magnitude of their undertaking I believe the results would be something surprising. There are two or three other claims being worked, and this is about all I can say of Ophir at the present moment.

The Forest Reefs are improving somewhat. Inquiries are being made about the Two Mile, and something is being done on one of the old leases.

Lumpy Swamp is looking better, and the shareholders are sanguine *re* the result of their labours. Lucknow is promising great things. The New Reform are adding to their machinery, with the view of extending operations; and they purpose sending their bonanzas straight to Germany in the state in which

which they are blown out. The fact of this Company paying £15,750 dividends, after sinking main shaft 100 feet deeper—in all 400 feet—and clearing all expenses in connection with machinery, pumping &c., &c., during the past two years, says wonders. When the new stampers are completed there will be twenty heads. The financial position of the Company favours the working of the mine in the most efficient manner. £5,000 worth of ore is now in transit, against which no advance has been taken.

The Jack Ass Flat Gold-mining Company are down 150 feet with the new shaft, and the promises are very encouraging.

Carangara is presenting a new feature in gold-mining in these districts. Gold and silver are being found in large quantities in the copper ores. I have been unable to procure particulars as regards the proportions, but I know the precious metals are so plentiful as to inspire Dr. Codrington (the owner of the estate) and the practical workers with bright hopes as to the future.

The other copper-mines are practically dead, and indeed, so are most of the gold-mines. Silver-mining promises to assume an importance amongst our local industries. Several claims have been taken up between Emu Swamp Creek and Lewis Ponds, a few miles north of Byng; and two or three lodges of silver ore have recently been discovered on Mr. J. B. Lane's property, 3 or 4 miles north-east of Orange. The indications at each of these places are considered sufficient to warrant the conclusion that we may have Sunny Corners here as well as on the eastern side of Bathurst. When the harvesting is all out of the way I presume we shall soon hear something of these silver finds.

BATHURST DISTRICT—CARCOAR DIVISION.

(*Mr. Warden Connolly, P.M., Carcoar.*)

I HAVE the honor to forward my annual report of the Carcoar Division of the Bathurst Mining District.

The gross yield of gold from this division for the year 1886, as per escort returns, was 10,610 oz. 7 dwt. and 3 gr., showing an increase of 1,537 oz. on the returns of the previous year.

This gratifying increase must be attributed mainly to the splendid rainfall of the last half of 1886, which has enabled the whole of the crushing plants in this division to continue in constant work, and has induced miners generally to more than usual activity, in view of the certainty of there being no delay in getting their stuff put through.

I am glad to report that the claim formerly known as "The Junction," about 12 miles from Carcoar, on the Belubula River, at its junction with Mandurama Creek, is again being worked, and with most favourable prospects. The present proprietors, Messrs. W. H. Binsted & Co., have removed the crushing plant of the old claim about 400 yards nearer to the waterfall in the Belubula River, and have thereby been enabled to utilise the water-power derived from this fall as a motor for a turbine wheel, which is now capable of driving the whole of the machinery without entailing, as formerly, an immense outlay for fuel, when the crushing was performed by an engine.

Two trial crushings towards the end of the year of 150 and 110 tons yielded respectively 40 and 46 oz. each, which, considering the facility of working the claim, and the immense quantity of stuff in view known to be auriferous, leaves no doubt that the prospects are most satisfactory, and that with improved gold-saving appliances a much larger yield will be obtained.

The assay of the stuff put through lately before crushing was 1 oz. 6 dwt. per ton, showing that more modern appliances are required to save the gold which is at present lost; and there can be very little doubt that with the improved prospects of the Company, these will be soon on the spot.

The Brown's Creek mine, situate on Church and School Lands, which has one of the most complete and powerful plants in the Colony, has also, I am glad to say, during the past year paid its shareholders handsome dividends, with every prospect of a continuance, as the yield of gold seems to be increasing with the depth of the workings.

Some excellent prospects have also been obtained at the Burnt Yards, near the old Prince of Wales claim, from which upwards of £40,000 worth of gold has been taken at various times; and there is a rumour of the persons who have obtained these prospects having sold their claim for a large sum. This locality has always been looked upon as containing the richest gold deposits in the district.

BATHURST DISTRICT—MITCHELL DIVISION.

(*Thomas G. Wright, Mining Registrar.*)

IN forwarding my report for 1886, which has been delayed through not being able to obtain from the managers of the different Companies the required information, as the greater part of the Companies and leases at this place are not represented in any way whatever. Mining in general, if anything, is firmer than when my previous report was forwarded, as everything appears to be on a firmer footing.

There has not been that great rush for land this year as there was last, neither for gold nor mineral. The Sunny Corner Company still employ some 400 men, which is the mainstay of the place. The output of gossan for the year was 27,501 tons, yielding 547,589 oz. of silver, with a small percentage of gold, valued at £123,207 3s. 6d.

The New Nevada Company have started work again, and appear to be doing well, having found the way to treat the ores, which are of a very refractory nature. This Company employs 56 men.

The Silver King Company ran their furnaces for a short time, the results of which were very satisfactory, but, after treating all the refuse that was about the mine, shut down the furnaces in a most mysterious way, and have been idle ever since. 500 tons of gossan out of this mine were sold to the Sunny Corner Company, which gave a good return. The gossan furnished at the Silver King furnaces during their short run was 2,489 tons, yielding 34,967 oz. of silver, with a small percentage of gold, value £9,480.

Cook and party are still working the Paddy Lack, at Dark Corner, which is paying very well, as there is abundance of quartz and easily got. They have crushed 1,100 tons of stone, which yielded 660 oz. of gold.

There is a place about 4 miles in a westerly direction from Mitchell, called the Lagoon, where some good gold has been got. There are about sixty men at work there, the most of whom are getting fair gold.

The amount of alluvial gold purchased by the Banks and storekeepers at this place during the year was 1,272 oz.

There have been seven applications for mineral leases, 205 acres, and eight applications for gold leases, 122 acres, during the year. There

There have been 337 miners' rights, 110 business licenses, and 16 mineral licenses issued during the year. The present population is about 2,500. The want of water is still felt very much during the summer months, no provision having been made for its conservation. The sanitary condition of the place is good.

BATHURST DISTRICT—BATHURST DIVISION.

(*H. H. Hutchinson, Mining Registrar.*)

In forwarding my report for the year 1886, I have to state that very little has been done in my portion of the Bathurst Mining Division during the past twelve months.

At the Napoleon reef, Ainsworth and party have been at work for the past few months, but have only met with indifferent success. Their last crushing was not payable, and they have consequently stopped work for the present.

At the Old Fontana reef, Rumsay and party, who have been prospecting there for some time past, have succeeded in striking a rich leader, some 50 yards distant from the old workings, which they believe to be identical with the old reef worked many years ago, which proved to be immensely rich. From this leader Rumsay sent 1 ton of stone to the Mint in Sydney, which gave a return of 21 oz. to the ton.

At Clear Creek, Cooke and party have erected a 6-head stamper battery, for crushing the stone from a 3-ft. reef on their property, the first and only crushing they have had gave a return of $\frac{1}{2}$ oz. to the ton, which will pay them handsomely.

Suttor and party have had crushings at the Root Hog and Randwick claims, but with only poor results, and at present work on these claims is suspended.

A few miners are still prospecting on Winburndale Creek, but with what results it is hard to say, the miners being very reticent about giving information.

I have issued during the past year 111 miners' rights, 13 business and 13 mineral licenses. I also received 8 applications for gold leases, but none for mineral.

BATHURST MINING DISTRICT—BLAYNEY DIVISION.

(*William Roche, Mining Registrar.*)

I HAVE the honor to submit my report for the year 1886. I took office on the 16th June last, which will account for the small number of miners' rights issued from this office, the miners having been supplied from Carcoar, Orange, and Bathurst.

The prospects of the field are fairly good, and a considerable amount of work done during the past twelve months. At the North Confidence Gold-mining Company, King's Plains, they are down with their main shaft 260 feet, and opened out 222 feet; the lode is 40 feet wide from the surface down to the bottom of the shaft. They have raised 2,000 loads of dirt for twelve months, the average yield of gold being 3 dwt. to the ton. This mine has a great deal of broken time for the want of water. The Company have expended £7,000 in machinery and making dams for the storage of water. There is erected on the ground one 16-h.p. engine, one 12-h.p., and one 20-h.p. Tangey engine and boiler, 19 head of stamps. With the present plant, and a sufficient supply of water, this Company would be able to put through 2,000 tons of dirt monthly, instead of twelve months, which would be one of the best paying mines in the Colony. Tanner and party, in their 10-acre lease adjoining the Confidence, have struck the lode, and it is looking well, and they estimate that it will go 5 dwt. to the ton. They are now driving across the lode to see its width. This lode can be traced for a considerable distance. Now that the Government are about erecting a dam at King's Plains, it will be a great service to miners to test the ground about King's Plains, the great drawback being the want of water. About twenty miners are employed on the old alluvial workings, some doing fairly well. A good deal of prospecting has been done within the last six months on private property with good results. In fact, mining about the locality is looking better than it has been for some years.

The Blayney Copper-mine is still idle on account of the low price of copper in the English market.

Miners' rights issued for the twelve months.....	49
Business licenses " "	Nil.
Mineral licenses " "	Nil.
Gold-mining leases " "	2

BATHURST DISTRICT—ROCKLEY DIVISION.

(*Thomas C. Cromie, Mining Registrar.*)

DURING 1886, with the exception of Back Creek, mining has been very dull in this division. Wiseman's Creek and neighbourhood, which was all bustle and excitement for silver in the latter part of 1885, has after all been a castle in the air. There were over 3,000 acres applied for, for silver; out of that only a very few have been completed for leases, and at present there are now only two men at work. It is said that the South Wiseman's Company will try and float again with English capital.

There have been three applications during the year for gold-mining leases. Owing to such a favourable spring and summer for rain, several parties during that period have made fair wages ground-slucing about Stony and Wiseman's Creeks. During 1886 I have issued 64 miners' rights and 55 business licenses—a decrease on previous year.

There have been twelve applications for silver leases at Back Creek during 1886 by Messrs. Withers, Gibbs, and party, who have now secured a large quantity of land there, and intend to increase their operations during 1887. Up to date they have raised 43 tons of silver ore, which has been sold to a smelting company at Melbourne, and which, when smelted, turned out 3,700 oz. of silver, and 30 oz. of gold; the former valued at £740, and the latter at £112 10s.

The Manganese Mining Company at Back Creek, Rockley, have been at work there since April, 1886, and after doing a great deal of dead work the output has been 300 tons. Two parcels have been forwarded to England, and assayed by Professor Dixon, viz.:—26 tons 10 cwt. and 2 qr., which went 83.3 per cent., and 62 tons 9 cwt. and 3 qr., which went 78.3 per cent., which is considered very favourable. The prospects to date are very favourable, splendid ore going down at No. 1 and No. 2; at No. 3 the quality does not look so rich, but a greater quantity can be raised, as it spreads over the surface for about 3 chains wide. The Company anticipate sending away about 300 tons per month. There is a variety of the manganese ores interspersed in and throughout the lode, which is about 40 feet wide—

if

if a lode it may be called—which is very like a metamorphic dyke. There are specimens of pyrolusite diallogite, rhodonite, manganite, with others. I am much indebted to the manager, James Russell, Esq., for so much valuable information about the Mangnese Mining Company, Back Creek.

During the year 1886 there were 225 oz. of gold bought in Rockley by our local Bank.

BATHURST DISTRICT—OBERON DIVISION.

(*J. O'Connor, Mining Registrar.*)

THE only mine which has been fully at work has been the Homeward Bound Extended quartz claim, ten men's ground, on Blackman's line of reef, near Oberon. The Company crushed during the year 1,500 tons of quartz, yielding a return of 975 oz. of gold. There is little doubt that plenty of gold exists in this claim, but it requires machinery to work it for the purpose of keeping the water down. Twenty acres of land have been applied for during the year for silver, 40 acres for tin, and 5 acres for gold.

BATHURST DISTRICT—MOUNT M'DONALD DIVISION.

(*G. A. Gunning, Mining Registrar.*)

I HAVE the honor to submit herewith my annual report for the year ending 31st December, 1886, and regret it is not as complete as I would wish. Owing to the system adopted during the year by the local batteries of crushing by the hour, instead of at a rate per ton, I am unable to obtain the gross quantity of stone crushed, but from what I have obtained I find the average yield per ton has almost doubled the average of the preceding year, the amounts being—average per ton:—

	oz. dwt. gr.
1885.....	1 14 0
1886.....	3 5 19

During the year there have been several very rich returns, the most notable being from Matheson's Bobby Burns. 5 cwt. of the best stone from this claim has just been treated at the Mint, and returned 37 oz. 9 dwt. 10 gr., or an average of over 150 oz. to the ton. This claim has averaged over 7 oz. to the ton for the year.

The following are the several results for the year's operations:—

	No. of Tons.	oz. dwt. gr.
Hawkins' Tribute	130	491 12 10
Ferguson and Fifield.....	37	28 1 0
Cash and party.....	57	181 12 12
Woolston & Co.....	66	129 3 17
Punch's lease	8	4 8 0
Fitzgibbons's	10	5 0 2
Fifield and Mullen	40	35 12 0
Woman's lease.....	21	28 17 0
Butcher's.....	140	608 3 0
Bobby Burns	65	476 9 10
	574	1,988 9 3

From other claims, including Eureka, Oliver's Company, and Balmoral, 1,402 oz. 1 dwt. 20 gr., making a total for the year of 3,390 oz. 10 dwt. 23 gr.

Work has been suspended on the Eureka owing to the quantity of water. This claim has produced 2,378 oz. 14 dwt. 13 gr., and I feel confident would still prove remunerative if the shareholders went to the expense of purchasing machinery.

I have issued during the year 116 miners' rights and 25 business licenses.

The returns for the past twelve months indicate permanency, and should induce the claim-owners to prove the claims at a depth.

In consequence of the heavy rains and flooded state of Lachlan River very little alluvial digging has been done.

BATHURST DISTRICT—TRUNKY DIVISION.

(*W. T. Lee, Mining Registrar.*)

DURING the year 1886 the revenue from this division amounted to £96 7s. 6d. 110 miners' rights were issued, also 43 business licenses. Generally the mining industry is very much depressed; prospects are, however, brightening. I am indebted to Mr. Licensed Surveyor Ryan for return of rainfall, which was greater than for many years past, being 30.098, but it was so equally distributed that nearly the whole soaked into the land, thus giving very little for sluicing.

BATHURST DISTRICT—CARCOAR DIVISION.

(*W. B. Warner, Mining Registrar.*)

I BEG to forward my annual report for the Carcoar Division of the Bathurst Mining District for the year 1886. The break up of the drought in the middle of the year, and the consequent abundance of water for sluicing and other mining purposes during the latter half of the year, tended very materially to brighten the prospects of our mining population. There has been a considerable increase in the gold yield in consequence, although the total, 10,610 oz., is still much below the product of that very successful year 1884. The last three years the yield has been as follows:—

	oz. dwt. gr.
1884.....	12,040 3 14
1885.....	9,073 6 3
1886.....	10,610 0 0

Of this amount, the Brown's Creek mine returned 4,173 oz. 9 dwt., being, I believe, the largest amount yet returned by that celebrated mine, which is likely to be worked for years to come. The Junction gold-mine, situated on the Belubula River, is now in the hands of a powerful Company, who have lately discovered several new reefs on their property containing enormous quantities of payable stone, easily worked, and within easy distance of the crushing plant of twenty head of stampers driven by a turbine water-wheel. This mine is likely to yield a good deal of gold during the coming year, as the directors seem determined to enlarge their operations and work the mine with vigour. From assays made of the stone

stone in the different reefs, it has been found that a great loss of gold takes place in the crushing operations. Every modern improvement will be taken advantage of to minimize this loss, so as to render productive the large amount of capital sunk in the mine and plant. The Burnt Yards still retains its character for rich patches of gold. One of these was discovered during the year by Owens and party, and it is considered probable that in consequence the mine will be floated into a Company, to the advantage of the fortunate Welshmen. Some good cakes of gold have been brought from Gally Swamp by Digby and party, Lane and party, and others, but there is a feeling abroad that Gally Swamp has, unfortunately, seen its best days, and that the field is nearly worked out.

No copper is being worked in my division. During the year I sold 129 miners' rights and 5 business licenses.

BATHURST DISTRICT—BURRAGA DIVISION.

(*William Ritchie, Mining Registrar.*)

I HAVE the honor to report for your information that mining in this district for the past year has not been prosperous, owing to the low price of copper.

For nine months, ending the 30th September, 1886, there were 281 tons of copper, valued at £14,000, despatched from the Burraga mine. Since then the mine, which shows a splendid face of ore, has been closed, awaiting a rise in the price of copper.

There are a few men mining for gold about the Isabella and Abercrombie Rivers who appear to be making wages.

The revenue collected at this office for the sale of miners' rights and business and mineral licenses for the past year amounted to £35.

BATHURST DISTRICT—COWRA DIVISION.

(*W. G. B. Smith, Mining Registrar.*)

IN forwarding my returns for 1886, I regret to state that mining in all its branches in my portion of the Bathurst District is still in a very backward state, and though there has been a good deal of prospecting during the year, no results favourable to those engaged have ensued. A small rush took place in May last to Wood's Flat, about 16 miles from Cowra. A number of claims were pegged out, but after a few days' work the place was abandoned.

That portion of the district between Cowra and Canowindra has been added to the Lachlan District, thus enabling miners living in the neighbourhood of Canowindra to do business at that place.

TAMBAROORA AND TURON DISTRICT—HILL END, HARGRAVES, WINDEYER, AND SOFALA DIVISION.

(*Mr. Warden Steel, P.M., Hill End.*)

I HAVE the honor to submit for the information of the Honorable the Minister for Mines my report for the past year on the Turon and Tambaroora and Mudgee Mining Districts under my charge.

I regret that I am unable to report any mining discoveries of importance during the year, nor has any improvement taken place in the yield of gold, which has been falling off more and more every year. The inducements offered for earning fair wages at Sunny Corner have attracted many of the old Hill End miners, who still remain here.

Hill End Division.—Since my last report many leases have been cancelled for non-observance of labour conditions and other causes, which has not effected any improvement in mining; in only a few instances has the land been taken up or worked. The Hawkins Hill Consolidated Company, now the Cornelian Gold-mining Company, Hawkins Hill, has been working continuously during the past year. The quartz raised and crushed by this Company has been 517 tons, yielding 320 oz. 15 dwt. 16 gr. retorted gold; the quantity raised and crushed for tributors, 222 tons, yielding 200 oz. 4 dwt. 15 gr. The Company also crushed 103 tons for the public, which yielded over an ounce per ton. The number of men employed during the last half-year and now, is from twenty to twenty-four. The wages paid by the Company amounted during the year to £2,289 10s. 5d. A first-class winding engine, and an air compressor for working rock-drill, &c., have recently been erected. A shaft 8 x 6 feet is being sunk, and is securely timbered in two apartments for a distance of 150 feet, which is intended to go 400 feet. The water is extremely difficult to contend with, partly owing to the adjoining leases not being worked. It is proposed to drive a tunnel in from Oakey Creek, on the west side of Hawkins Hill, to drain one of the leases at a low level, and thus dispense with the heavy cost of pumping, as nothing beats drainage by gravitation through a tunnel. Some of the yields have been barely payable, while others have been very good. Clemens and O'Reilly crushed 4 tons, yielding 18 oz. Again, O'Reilly and party, in the Venus claim adjoining, obtained 40 oz. from about 9 tons. The total amount of gold forwarded by escort from Hill End, including that sent in from Hargraves and Windeyer, was 3,375 oz. 14 dwt. 9 gr. Since the escort from Mudgee has been discontinued very little comes from the latter places. This shows a decrease of 517 oz. 16 dwt. 1 gr. from the previous year. The number of miners' rights issued for the year was 295, being only a slight decrease from 1885.

Carver and Porter's claims, from which so much gold has been taken, are now idle, owing to an influx of water, and the want of necessary appliances to keep it under. The miners have experienced a serious loss by the A.J.S. Bank closing here a few weeks since, and are now dependent on the storekeepers for the purchase of their gold.

Hargraves and Windeyer Divisions.—Nothing of importance has been discovered during the year, and, with the exception of Bond's lease, no other has been worked. Considerable sluicing has been carried on, owing to a plentiful supply of water, both at Hargraves and Windeyer, in a few instances with fair results. Many leases have been cancelled in this division. Bond and party have recently transferred their leases on the old Eureka lead, and from which so much gold has been taken, to Mr. John Coghlan, of Sydney, diamond-drill proprietor, and that gentleman arrived on the ground a few days since with the diamond-drill machinery for the purpose of thoroughly testing it. 289 miners' rights and 14 business licenses have been issued during the year, which includes Windeyer, now collected by the Mining Registrar at Hargraves. Gold-mining leases amounting to 50 acres have been applied for since November last.

Sofala Division.—Owing to abundance of water during the last quarter of the year much activity by sluicing and fossicking has been carried on. The yield of gold from all sources, as far as I have means of ascertaining, has not decreased during the year. The Spring Creek mine is again idle. The old Surface Hill

Hill leases have recently obtained suspension of labour with the object of forming an English Company for working it on a more extensive scale than hitherto; it is believed it will be highly remunerative. The Garnet Wolsley proprietors have formed a Company and will commence work at once.

Oppenheimer's mineral lease, antimony, is working with satisfactory results. Considerable litigation has taken place over this property by Flynn and party, applying for a gold lease, contending that a mineral lease cannot be legally held on a proclaimed gold-field. Some stir has recently been made by the discovery by Howard and party of a rich gold-reef on the Crudine Creek, about 10 miles from Sofala. Very rich specimens have been procured, and several leases have been applied for, for the adjoining land. H. L. Beyers and party are about to erect a crushing plant in the vicinity without which it could not be made to pay.

TAMBAROORA AND TURON DISTRICT—WELLINGTON AND IRONBARKS DIVISIONS.

(*Mr. Warden R. Hare, P.M., Wellington.*)

IN furnishing the annual report on the mining interest in this district I have the honor to intimate that very little change has taken place during the past year. There was a slight rush to Pipe Clay Gully, but the result could not have been satisfactory, as those who obtained miner's rights and worked in that vicinity have left the ground, with the exception of the prospectors who have applied for a two-acre lease. Several parties have been working alluvial grounds on the Macquarie River.

The only quartz crushing machines in this, the Wellington Division, two in number, have been idle during the year, but from what cause I am unable to state. The quantity of copper ore raised in the Belaire Mine will be, no doubt, noted in the Mining Registrar's Report. I trust the mining industry in this division will be more satisfactory during the present year.

In the Ironbarks Division I regret to say that the year just closed has not been a prosperous one. The very heavy and incessant rains during the winter months caused several diggers to resort to ground-slucing on a small scale with not very good results. Reefing during the months referred to was at a standstill, several of the claimholders doing little else except bailing water, whilst others had to avail themselves of the labour extension clause. Only one of the Macquarie River companies did any work—the Muckerawa Junction Company—and this Company through some reason or other, has not been so successful as was anticipated. The Old Perseverance Claim has been floated into a company, chiefly with Victorian capital.

Scott's machine crushed 324 tons of stone for different owners, yielding 176 oz. 15 dwt. retorted gold. Messrs. Veitch and Burney's machine put through 1,480 tons of stone; result, 384 oz. for the owners. As correctly as I can gather the amount of gold from all owners quartz and alluvial, amounted to 1549 oz. 4 dwt. 1 gr. for the year. About 198 miners' rights and 23 business licenses have been issued at Ironbarks during the year.

TAMBAROORA AND TURON DISTRICT—IRONBARKS DIVISION.

(*J. S. Hayes, Mining Registrar.*)

IN submitting my annual report for the Ironbarks Division of the Tambaroora and Turon Mining District for the year 1886, I wish to state that only having entered upon my duties on the 19th June, 1886, I am not as well versed in mining matters as I would desire. The past year has been an uneventful one in this division. The incessant rains during the winter months entirely retarded quartz-mining, as, unfortunately, adequate provision had not been made to overpower the inrush of water to the mines, thereby causing stoppage of work. Some of the claimholders had to fall back upon the suspension of labour clause, whilst others more persevering were unceasing in their efforts to cope with the water, in hopes of keeping their mines dry. Some of the mines had the water running out of the mouths of the shafts.

The well-known Perseverance has lately been floated into a company, a manager from Melbourne being placed in charge. A prominent shareholder in this claim took a block of stone to Melbourne weighing 118 lb., which, having been put through a new pulverising process, gave extraordinary results. The assayers (Messrs. Parker Bros.) assert that this particular species of stone would lose 75 per cent. in the ordinary method of crushing. Three tons of poor stone were this week sent away to undergo similar treatment, and should this turn out anything near the mark a great rush to this field is anticipated. Acting on the strength of the return from the 118 lb. of stone the shareholder just alluded to has taken up no less than nine leases of from five to twelve acres each upon almost every line of reef on this field. The circumstances at present surrounding this field are by no means discouraging.

During the past year nine gold-leases have been applied for, representing 63 acres to be leased.

Scott's machine, twelve-head stampers, ten horse-power, did but little work for the year, only crushing 324 tons stone for 176 oz. 15 dwt. retorted gold.

At the Gordon Mine, Buchinbah, Messrs. Veitch and party put through 1,480 tons for a yield of 384 oz. This machine does not crush for the public.

The Muckerawa Junction Company, on the Macquarie River, is the only claim at present at work on the river. This is a sluicing claim, upon which is erected expensive pumping gear, capable of pumping 70,000 gallons per hour, and now seems to be on a fair way to unearth some of the rich deposits known to exist on the river.

It would be very difficult to give anything like an accurate return of gold won from all sources, inasmuch as miners take their gold to different places—wherever the best returns are derivable from. The total number of ounces of gold won, both quartz and alluvial, as accurately as can be obtained, for the past year, is 1,549 oz. 4 dwt. 1 gr. The number of miners' rights issued was 198 and 23 business licenses.

I may here state that a rush took place on the Nubrygan Creek, 10 miles from here, last winter, which rush, I am sorry to add, ended fruitlessly.

TAMBAROORA AND TURON DISTRICT—SOFALA DIVISION.

(*M. Fagan, Mining Registrar.*)

I HAVE the honor to forward my report relative to the mining interest in this division for the year 1886.

Spring Creek Reef.—On tribute—plant on the ground—25-h.p. engine with crushing pumping and winding gear. Total depth of mine, 300 ft., breaking down stone at various levels. Average width of stone, 7 in. Yield of gold not payable; work suspended for further development of mine.

Sir Garnet Wolsely.—Originally very rich to a depth of 40 or 50 ft.; been unworked for some two years back; now formed into a company. Present depth of shaft in the underlay, about 70 ft. Four men at work at about 60 ft., level. Vein increased from old workings 9 in. to 3 ft., with gold showing freely through stone.

Razorback, Upper Turon.—Under the name of the Turon Gold-mining Company, now being formed; five men at work on a vein of about 18 in.; working from adit covering about 300 ft.; perpendicular depth, about 200 ft. Machinery for crushing about to be erected, and one hundred tons of stone raised.

Box Ridge Homeward Bound Company.—A party of 14 working men.—No work being done at present pending further appliances in piping for one 10-h.p. engine working 2 batteries of 5 stamps each. Water heavy at 130 ft., level, on an 8 in., vein with an average yield 1 oz. per ton.

Wattle Flat, Old Caledonian Reef.—Davidson and party of three men raised about 50 tons at a depth of 100 ft. from a vein 3 ft. in width, averaging $9\frac{1}{2}$ dwt. per ton. Last crushing of 16 tons went 11 dwt. per ton.

Old Surface Hill.—Only small parties of 2 or 3 have been working on small veins during the year. At present no work being done.

Bright's Hill.—On this ground there are no defined reefs or veins. In the small veins averaging about 3 in.—at different shoots or breaks—really rich deposits of decomposed quartz with patches of blue stone, rich in gold, have been obtained, as by following returns:—

William Borifield, during the year, from 3 tons of quartz, obtained 15 oz. of gold.

Grice and Clark, during same time have raised 7 tons in all—having sunk to a depth of 100 ft.; lately working at 80 ft. level. Yield of gold from 7 tons, 150 oz. 16 dwt. Ground now abandoned, two men only have worked on this claim, and the chief portion of the gold obtained has been by hand crushing.

Prince and Hibberd, since Easter, have had 2 crushings at Davidson's engine. Raised about 10 tons altogether from a depth of 80 ft.; yielding at each crushing of 5 tons, 26 oz.; total, 52 oz. Value of gold at this hill, £3 17s. per oz. This is the only party at work at present, although others intend prospecting further after the holidays.

Solitary Creek Gold-mining Company.—Six men have been employed day and night on this mine during the year and have raised 500 tons of quartz, yielding only 150 oz. Value of gold in this mine, £3 14s. per oz. Value of machinery for pumping, winding, and crushing, £2,000.

At Back Creek a rich vein has been discovered by Mr. Albert Howard, and several leases have been applied for in the same line. 2 tons of quartz raised from this vein and crushed at the Sydney Mint, gave the handsome return of $7\frac{1}{2}$ oz. per ton.

Razorback Gold and Antimony Mines.—This property consists of 2 acres gold lease and of 40 acres mineral lease. The mineral lease was applied for in 1885 and issued to Mr. Adolphus Oppenheimer in October last, after which he started work with 13 men on this lease, and soon discovered that the ore (antimony) raised therefrom contained a quantity of gold, in consequence of which he applied to have the lease converted into a gold lease in accordance with the 46th section of the Mining Act. He also applied for a further lease of 10 acres north of and adjoining his 40 acres for the purpose of mining thereon for gold, making a total of 52 acres in all.

Several men have been employed on the 2 acre gold lease during the year. The following quantity of ore has been raised from this lease and shipped to Europe:—Ore containing antimony, gold, and silver, viz., 86 tons 6 cwt., valued at £1,523. This is all picked ore, but variable in quality as to the gold it contains.

Owing to the nature of the ore it cannot be treated in the Colony, but has to be shipped to Europe for treatment.

Some of the assays of the ore shipped are as follows, viz.:—By Dr. Claudet, assayer to the Bank of England, London: antimony, 61.50 per cent.; gold, 3 oz. 12 dwt.; silver, 1 oz. per ton. By Johnson, Makhey, & Co.: antimony, 41 per cent.; gold, 2 oz. per ton. By T. S. Vale, assayer, Sydney: gold, 19 oz. 1 dwt. 3 grs. per ton. Taking the valuation of £1,523 for the 86 tons 6 cwt. shipped during the year, averages close on £18 sterling per ton. Besides the ore shipped there remain at grass several hundred tons of ore and quartz thrown out as not being rich enough for shipment, containing from 15 dwt. to 2 oz. of gold per ton. As to the 40 acres mineral lease which has been converted into a gold lease, 30 tons 10 cwt. of quartz and antimony ore, valued at £358, have been raised from the lease during the month of December, containing, as per assay, 2 oz. 7 dwt. 23 gr. per ton of gold, and 10 oz. 18 gr. of silver. There are about 40 tons of similar ore remaining at grass ready for bagging and shipment. The working expenses paid away during the year amounted to £1,231, as against ore shipped valued at £1,881, leaving an estimated profit of £650.

Mr. Oppenheimer is about to erect extensive machinery at the mines for the effectual working of this valuable property.

At the Crudine, Palmer's Oakey, Wattle Flat, and Upper Turon, there have been several parties of fossickers at work in various old workings, from whom I have been unable to obtain any information as to the amount of gold won, but it is believed that the greater number of them have made good wages.

The following amount of gold from all sources has been transmitted from this division during the year, viz.:—

	oz.	dwt.	gr.
By Gold Escort	2,868	7	21
By other means	886	0	0
Total	3,754	7	21

Market value of same, £14,360 11s.

Miners' rights issued during the same period, viz.....	394
Business licenses	19

Nineteen applications for gold-mining leases have been received by me during the year.

Total value of mining plant in the division, £4,300.

The outlook for the coming year is fairly prosperous.

TAMBAROORA AND TURON DISTRICT—HILL END DIVISION.

(James Watt, Mining Registrar.)

I do myself the honor to submit, for the information of the Honorable the Minister for Mines, the following Report on mining matters in the Hill End Division of the Tambaroora and Turon Mining District.

Excepting the operations of the Cornelian Gold-mining Company, Hawkins Hill, and the Red Hill Company at Tambaroora, mining matters in this District are in a very depressed state.

Owing to the copious rains which fell in the latter half of the year alluvial digging, chiefly by Chinamen and old fossickers, has become a trifle more animated, but as most of the ground has been thoroughly worked and abandoned years ago, the amount gained has been but small.

Adverting to quartz-mining operations, a shaft 250 feet deep has been sunk by the Red Hill Company on the old M'Mahon lease at Tambaroora, 9 ft. by 3, having three partitions. Five veins have been cut, three showing gold. The last one, cut at a depth of 240 ft., is 14 in. wide, from which a trial crushing realized 12 dwts. to the ton.

This mine is unfortunately reported to be making water at the rate of 1000 gallons an hour. Further operations are, of course, suspended.

On a three acre lease taken up by this Company, north-east of the M'Mahon mine, an 80 ft. shaft has been sunk, and a vein met with at that depth 2 ft. wide. Eighty-two tons of quartz taken from this yielded 5 oz. 18 dwts.

Upwards of £1700 have been already expended by the Red Hill Company in machinery, wages, &c., and under the able superintendence of the Manager, Mr. Charlton, good results are anticipated in the near future.

At the Cornelian Gold-mining Company, Hawkins Hill, good work has been done during the year. Several vexatious delays occurred owing to accidents to the machinery, but as 739 tons of quartz have been raised, yielding 521 oz. 0 dwt. 7 gr., and representing £2,084, the result may be considered on the whole as satisfactory.

O'Riley and party of the Venus Claim, Red Hill, Hill End, have been getting moderately rich stone at a depth of 212 ft., yielding at the first crushing 44 oz. to ten tons of quartz. Owing to the foul air (which unfortunately in July last caused the death of one of the party, Patrick O'Riley), an air shaft has been sunk, and the prospects of this claim are considered promising.

A number of other claims have been working, but the results in general were insignificant.

In July last Messrs. Clymo commenced crushing at the Root Hog, with a 5-head stamper water-power battery. The average yield to the ton up to the present time has been about 16 dwt., which is considered satisfactory, as the supply of quartz is steady—obtained by driving into the side of the mountain—and the cost of carriage to the battery is trifling.

Escort return for the year is—3,375 oz. 14 dwt. 9 gr. for 1886, as against 3,903 oz. 10 dwt. 10 gr., for 1885.

The number of miners' rights and business licenses sold was 296 and 12 respectively, as against 304 and 10 sold in 1885.

TAMBAROORA AND TURON DISTRICT—WELLINGTON DIVISION.

(W. Carson, Mining Registrar.)

I HAVE the honor to forward herewith my annual report upon the Mining industry of the Wellington Division of the Tambaroora and Turon Mining District, for the year 1886.

My last report showed an improvement in mining matters during the year 1885, but I regret to say that the only crushing plants in this Division have been idle all the year, and for several years previously. I have also to state that, during the year, one of the two sluicing claims that had been worked for some years has ceased working, the cause apparently being the working out of the ground.

I may however state, that in the month of June a small rush was made to a place known as "The Pipeclay Gully," by a few of the surrounding residents, it being stated that some quartz specimens had been found there, but after a short time the ground was abandoned, since which the prospectors have applied for a two acre lease in the locality.

Copper.—The return of copper for the year is as follows:—Ore raised 300 tons, ore smelted 40 tons—value, £1,720.

From inquiry made I have ascertained that the quantity of gold received in Wellington during the year is 432 oz. 13 dwt. 16 gr.; but I have reason to believe that the whole of it has not been won in my Division, but brought from other parts of the district.

In conclusion I may add, that 55 miners' rights and 2 business licenses, have been issued from this office during the year.

MUDGEE MINING DISTRICT—DUBBO DIVISION.

(Mr. Warden W. S. Caswell, P.M., Dubbo.)

I HAVE the honor to make the sixth annual mining report for this sub-division of the Mudgee District.

The mining interest here is still progressive. The gold won from Tomingley reefs in 1884 was of about the value of £7,000—in 1885, £8,000, and in 1886 it has increased to between £9,000 and £10,000.

No coal has yet been obtained for marketable purposes. The Dubbo Coal Mining Co.'s ground remains unworked pending the results of a diamond drill bore now being made by the Great Western Coal Mining Company on adjoining land. The manager of the latter Company reports, a depth of over 530 ft., at which depth a core of coal 5 ft. 2 in. was brought up. This was resting on a bed of fire-clay 4 ft. 1 in. thick.

The works of the Copper Mining Co., at Girilambone, are still suspended.

The population of Tomingley, including Myall has increased. In 1884 it was estimated at 200; in 1885 at 210; in 1886 at 250. The average attendance at the Public School was 33 for 1886. There are two public-houses, two stores, two butchers, one baker and one bootmaker—all doing fairly well; there is a Post-office, but no telegraph office. A mail coach runs from Dubbo once in each week; but there are cross country mails on horseback which afford sufficient convenience.

The

The water supply for mining purposes is ample. For domestic purposes the miners are dependent on the mill reservoirs, the water in which contains more or less of house drainage. A tank for town and travelling stock use was promised but never constructed.

Of the three crushing machines at Tomingley and Myall two are worked as fitfully as the claims about Tomingley. These latter appear to be taken up for a few weeks at a time by different parties; and held only so long as moderate success crowns their efforts. The best stone is picked, and the mine probably so injured as to deter others from similar attempts.

There were 76 miner's rights issued at Tomingley during the year; and 21 at Dubbo, being a total of 97.

There were 12 business licenses taken out at Tomingley, and one mineral license at Dubbo.

Mining Registrar Farquharson was succeeded by Senior-constable Murphy, who also was removed at the end of the year. These frequent changes furnished the only objection which can be raised against the appointment of police officers as Mining Registrars.

There are only fifty men actually working at the reefs at Tomingley and Myall.

I have obtained returns from the claim holders, the mill owners, and the banks; but as usual there is great discrepancy which I cannot reconcile:—Claim returns, 3,930 tons; yielding 2,962 oz. 13 dwt. 2 gr. of the value of £11,477. Mill returns, 3,778 tons; yielding 2,820 oz. 7 dwt. 7 gr., of the value of about £10,927. Bank returns, 2,486 oz. 7 dwt. 17 gr., of about value of £9,274.

The returns from the several claims as supplied to me are as follows, viz. :—

Tomingley Reefs.

Tomingley Prospecting Claim, 8 men's ground, 4 ft. reef, 160 ft. deep, Croft and party crushing 59 tons, yield 13 oz. 5 dwt. at present unworked.

No. 1 North, Reakes and party, 4 men's ground, width of reef 4 ft., varying, crushed 471 tons for yield of 289 oz. 7 dwt. 17 gr.

No. 2 North, Fenton and party, 6 men's ground, 120 ft. deep, 98 tons crushed for yield of 75 oz. 2 dwt. 12 gr.

No. 3 North, Berry, now Blackwood and party, 70 ft. deep, 9 ft. wide, crushed 477 tons, yield 139 oz. 7 dwt. 7 gr.

Spare ground unworked, 120 ft. deep, 10 ft. wide, containing a little gold.

Tailings crushed by Tomingley Co., 125 tons, yield 25 oz. 4 dwt. 13 gr.

Myall Reefs.

Prospector's Claim, 8 men's ground, Golding and party abandoned.

No. 1, South, Petersen, and party, 3 men's ground, 60 ft. deep, 2 ft. wide, abandoned.

Spare ground, Quirk and party, 4 men's ground, crushing 50 tons, yield 10 oz. 4 dwt., now held by M'Donald and party.

Spare ground adjoining No. 1, North, Mooney and party, 4 men's ground, crushed 1,290 tons, 1,168 oz., 180 ft. deep, 2 ft. 6 in. wide.

No. 1 North, Mooney and party, 8 men's ground, crushed 1,300 tons, yield 1,103 oz. 16 dwt., 140 ft. deep, 2 ft. 6 in. wide.

No. 2 North, Ring and party, 4 men's ground, 10 tons, yield 5 oz. 10 dwt., now abandoned.

No. 2 Block Claim, M'Donald and party, 4 men, 109 tons, yield 91 oz. 17 dwt., abandoned, formerly Horl and party.

No. 3 South Myall, Porter, now Hayes and party, 66 tons, yield 41 oz. 15 dwt. 19 gr., now abandoned.

There are no alluvial workings so far as I am aware in this division (Dubbo.)

The sudden removal of the Mining Registrar will preclude the possibility of his report, and you will not receive any from the Acting Mining Registrar at Dubbo, who has only been here a short time, and has only just recovered from a serious illness.

In conclusion I may state there is every prospect of a bright future for the mining interest in this district.

MUDGEES DISTRICT—MUDGEES DIVISION.

(*R. H. Acheson. Mining Registrar.*)

I have the honor to submit, in the following, my annual report on the mining industry of the Mudgees Division of the Mudgees District, for the year 1886. Compared with the last three years in the division, mining, especially for gold, has, during 1886, rather improved, which fact is probably due to the depression in agricultural and pastoral labour throughout the Colony. Labourers and others have turned to Mining. The number of miners' rights issued by me during the year 1886, viz., 183, compared with the year 1885, during which were issued 150, indicates an increased activity in mining pursuits, as also do the local purchases of gold—3,501 oz., in 1886, against 3,148 oz. in 1885.

During the year some good results have come of the old and well-known alluvial workings at Apple-tree Flat. On inquiry, however, I find the miners reticent as to exact results, but one party, Rochester's, presented to my view a beautiful nugget of 102 oz., unearthed in their tenement, which they have been working with average good results for many years.

The Rhobardah Gold-mining Company, near Cudgegong, has, during the year, re-let its property and valuable plant to Mr. Edward Strike, Mr. Thomas Chappell having relinquished it. Very hopeful prospects were entertained of this mine during 1885-6, but late in Mr. Chappell's management the value of the production lowered until it became quite unpayable. I am glad, however, to be able to state that Mr. Strike's success is much better, but I have not ascertained the result of his crushings to the ton.

In November a slight rush took place to the Reserve at Cullenbone, on the Cudgegong River. I visited the locality during December, and found about twenty men on the ground, working in a stiff cement formation to a depth of from eight to fifteen feet.

Some reported themselves as doing well, and others as only making a living.

The

The well-known diggings on the Meroo and Merrendee yet maintain the old mining population, principally Chinese, but no extraordinary finds have been made known from there during the year.

The Cheshire Copper Mine, near Dungaree, let on tribute to a Mr. Jeakins during 1885, has suspended work, and nothing has come of the leases for silver taken up in Barra and Mullahuddy.

MUDGEES DISTRICT—GULGONG DIVISION.

(*H. De Boos, Mining Registrar.*)

No improvement has taken place in mining matters in this portion of the Mudgee District since my last report, nor does there appear any present prospect of a change for the better.

The Canadian Gold-mining Company, after struggling against numerous difficulties, have ceased working, in fact, nothing has been done on the Company's property during the last twelve months. The plant is now advertised for sale, and the Company is to be wound up, and one more unsuccessful venture added to the records of the Gulgong Gold Field. Scully's Prospecting Reserve is just as it was this time last year, nothing has been done, and from all appearances, nothing is likely to be done with it for some time.

Some work has been done by Fletcher and party on their leases in the vicinity of the diamond mines, payable prospects have been obtained, and it is intended to form a Company and work the ground by means of machinery and requisite appliances.

The Nil Desperandum Mine, at the Canadian, formerly the White Horse Extended Claim, is now owned for the most part by Victorian shareholders. From a mining point of view this claim is a subject of importance and consideration, from being something unusual in the history of Gold Fields. The gold is disseminated through a tenacious clay called "pug" by the miners, and found, not in water channels, but in caverns in the limestone rock, which are of various dimensions and extend to unknown depths, the lowest reached being 200 feet, at which level a monkey shaft was put down to a further depth of twenty feet, through pug, and good prospects obtained. It is the intention of the Company to sink to a depth of 300 feet, when they expect to reach the slate bottom, and anticipate that the limestone will be found to rest on gravel. Should these anticipations be realised, it is the opinion of persons qualified to judge, that a large area of auriferous country will be opened up and so help to the revival of the mining industry of this portion of the gold field. This mine has been in work since the discovery of this field, now about fifteen years ago, and has yielded large quantities of gold, in fact, several of the former proprietors have retired with moderate competencies from the dividends obtained. The mine was purchased by the present syndicate from the last party of miners who owned it for the sum of £2,000.

About six months ago a small rush took place to Slasher's Flat, near Belinfante bridge on the Mudgee River. Some twenty or thirty men are now working there and most of them earning fair wages. The sinking is from twelve to twenty feet.

The Ellan Vannin claim, formerly known as the Britannia, near Home Rule, is not at work at present; but it is reported that steps are being taken to float a company, with a large capital, for the purpose of developing this mine, which is considered, by many who have a knowledge of this locality, as being one of the most promising ventures in this district. The Star Lead has been taken up by a syndicate who intend to start operations as soon as the necessary arrangements can be made for the erection of machinery sufficiently powerful to overcome the heavy flow of water, which has hitherto proved a hindrance to the prospecting of this lead, which is considered by many of the Old Gulgong miners to present better chances of good returns than any ground, immediately adjoining Gulgong, as the Leads from Happy Valley and adjacent country all seem to tend towards the Star.

No mining of any consequence is being carried on in the other parts of this Division of the Mudgee Gold Field. There are a number of men scattered over the district, some making a living and others doing fairly well, and it is to be hoped that as we have had a bountiful fall of rain at intervals during the last six months, prospecting parties will be equipped and some new country opened up, and revive the almost stagnated mining industry.

Eight gold mining leases and two mineral leases have been applied for during the past year, and 218 miners' rights, 11 business licenses and 22 mineral licenses have been issued from this office during the same period.

The amount of gold purchased by the banks for the last twelve months is 1724 oz. 15 dwt. 5 gr.

MUDGEES DISTRICT—HARGRAVES DIVISION.

(*T. O'Brien, Mining Registrar.*)

I HAVE the honor to submit for the information of the Honorable the Minister for Mines, my report for the year 1886, upon the mining industry of this Division of the Mudgee Mining District. Gold-mining here during the year has been all but abandoned as a means of livelihood. None but what is termed old fossickers remaining on the field. Most of the gold-mining leases in existence at the commencement of the year have been cancelled through non fulfilment of the labour conditions. I am of opinion that this was caused by the want of means to provide machinery, as without such nothing can be accomplished in the line of quartz-reefing in this locality, as there is a strong body of water only a few feet from the surface to be encountered.

Notwithstanding the depressed state of mining here during the year, I have hopes that an improvement will take place in 1887, as a diamond drill will in all probability be on this field in January, 1887, for the purpose of boring for gold-bearing reefs.

Mr. Coghlan has bought Bond and party's interest in their prospecting claim, and gold mining leases at Hargraves, and he has applied for gold mining leases amounting in all to twenty acres, on which land he purposes placing the diamond drill at once. Milton and another have taken up twenty-two acres, and Scott and another have taken up eight acres. The above ground has been taken up during the last few weeks of the year 1886. The various persons named are very sanguine as to their success in developing their mines with profitable advantage to themselves.

There has been an increase in the sale of miners' rights and business licenses as compared with the previous year.

I sold 289 miners' rights, and 28 business licenses during the year.

LACHLAN

LACHLAN DISTRICT—FORBES, PARKES, AND GRENFELL DIVISIONS.

(Mr. Warden Sharpe, P.M., Forbes.)

I have the honor to submit, for the information of the Honorable the Minister for Mines, my annual report for the year 1886, on the Forbes Division of the Lachlan Mining District.

The only places where any mining is being carried on at or near Forbes are at the south lead, close to the town, on the Britannia Reef, which is west of the south lead, and very near it; at the Caledonian lead, near the Parkes Road, one mile north of Forbes; at Judd's Reef, which is near the last mentioned lead; at Strickland reef, eight miles north of Forbes; and at the Pinnacle reef, twenty miles south. On the south lead there are three different companies at work. The Nil Desperandum Gold-mining Company holds three leases of 25 acres each in area, and embracing both sides of the river. The main shaft is 215 feet deep to the wash dirt, and a further depth of twenty feet to the bottom. The main drive is 284 feet long, west of the shaft, with a cross drive fifty feet from the shaft, bearing north seventy-eight feet. East drive 120 feet from shaft, driven ninety feet; north drive 150 feet from shaft. At this point two cross drives were opened out east and west. The east drive ninety-six feet; the west drive, eighty-two feet. These last drives are on payable gold. For 140 feet of their length the wash dirt is from two to three feet in thickness, and averaged six dwt. to the load for about 120 loads. The machinery employed on this mine consists of a 20-horse power horizontal steam engine, for winding and puddling; also, two Tange pumps. Twenty-eight men are employed on the mine at present, in three shifts of eight hours each shift. Coming north, on the same lead, is the mine known as the Crinoline Gold Mining Company. This Company holds two extended claims. Their main shaft is sunk 160 feet to wash dirt, through thirty-five feet of sand drift. For getting through the drift, forty feet of watertight boxes of sawn timber were used, at a heavy cost. For the last six weeks the Company have been erecting engine-shed, out-houses, and puddling machines. An 18-horse power boiler is fixed, and a 16-horse power engine is now in course of erection. No wash dirt has been, as yet, taken from this claim, awaiting the erection of machinery for washing, &c.

The third claim at work on the south lead is that called the "Forbes Alluvial Gold Mining Company." The area is 25 acres. The main shaft is sunk thirty feet to sand drift, thirty-five feet through that, and then twelve feet to bottom. In this mine also water-tight boxes had to be used, the men working in a diving dress. The machinery to be used in this mine is one 16-horse power portable engine, one Tange pump, puddling machines and winding gear. To get through the drift the boxes used are single, and all the sand drift had to be raised by divers, using the proper dress for the purpose. The drift to be gone through was forty-five feet in thickness. Now the shaft is down to the clay, sinking should proceed more rapidly. On the Britannia Reef a small crushing plant has been erected, but at present the mine is idle, owing to some dispute among the owners. Some payable stone has been raised from this reef, which is a fair sized one, and, should it come up to expectations, doubtless other claims will be taken up on the same line. The Britannia reef has been traced to a considerable distance, and worked to shallow depths, the deepest shaft being, I am informed, but 100 feet. I am also informed that the Company contemplate getting better machinery for crushing purposes.

At Strickland's reef only one party of miners are at work. They raised some stone and sent it to Parkes. The yield was 16 dwt. This would pay well if machinery for crushing were at or near the mine. I am informed that endeavours are being made with this object. I think this line of reef is well worth the attention of mining capitalists.

At the Pinnacle, Messrs. Nicolas & Raymond have erected, or are erecting, a crushing plant to work the old Pinnacle reefs. They have sunk a shaft some seventy feet on a reef, showing gold all the way down. It is eight feet wide in the bottom, and will average five or six feet. The country is not hard; two men can raise twelve or fourteen tons of stone per week, which it is reckoned should yield 7 dwt. per ton, and this would give satisfactory returns. Messrs. Raymond & Co. have not been afraid of expending capital. They have a ten-stamper battery, with power to make it twenty, if necessary. They have also a 4,000 yard tank, to supply water.

Parkes.

This is the only part of this District where gold is being obtained in any quantity, and the returns from some of the reefs are very handsome. For instance in the claims known as Hazelhurst's and in Quayle and Company's, the fortunate owners obtained in the first mentioned mine 1,667 oz. during the past year, and in the second 1,260 oz. In 1885 these two claims crushed respectively 390 tons and 750 tons, with a result of 4 oz. to the ton. I am informed that on the adjoining land, which is freehold, a considerable amount of capital will be expended in prospecting reefs supposed to be rich.

I presume, because more miners were at work, the alluvial gold obtained during the past year in this division is a good deal more than usual, amounting to 653 oz. 12 dwt. and 11 gr., but the total amount of gold, alluvial and quartz, is considerably less than in 1885. During the year 1886, 5,234 oz. 8 dwt. 1 gr., according to the Mining Registrar's report, were obtained. During 1885, the return was 6,045 oz. 16 dwt. 14 gr., leaving a deficit of 811 oz. 8 dwt. 13 gr.

Still, mining in this division is in a healthy condition and prospecting is always being carried on. During the past year several new reefs have been proved payable, and some of them have given very handsome returns. Several alluvial rushes have also taken place, in some instances without any result except colors, in others a few claims paid wages for a time. On the scrubby plain between Forbes and Parkes, a rather extensive rush took place in June last, about 450 miners being on the ground at one time, the prospecting was carried on with Government aid, and on the 1st of June last, the prospectors reported that payable gold had been discovered by them. The depth of the shaft was 56 ft., and the depth of wash from 3 to 9 in. Mr. Mining Inspector Slee visited the rush, and saw 11 dishes washed for a return of 4 dwt. 6 gr. of coarse gold. He thought the lead was payable, but I regret to have to state that it was not, and in a very short time was wholly abandoned. As regards the facilities for treating quartz raised in or near Parkes, a private company have a battery of 20 head of stampers, with proper apparatus for saving gold, and a very large supply of water for crushing purposes, this has been obtained by enlarging a dam, the carrying capacity of which was found to be insufficient. The Company crush, I believe, at very reasonable rates, and I hear no complaints about losing gold, a fault batteries are seldom free from. This battery is very centrally situated, being near nearly all the reefs from which stone is raised, at or near Parkes.

Grenfell.

Grenfell.

In the Grenfell Division of this District very little mining is being carried on. The gold obtained from reefs during the year 1886 was only 204 oz. 6 dwt., from alluvial, 217 oz. 8 dwt., in all 421 oz. 14 dwt. *Canowindra.*

The Warden's clerk informs me that in this division 629 tons of quartz have been crushed during the past year, for a yield of 801 oz. 12 dwt. of gold. Alluvial mining in this locality is confined to fossicking, mostly at a place called Gum Flat, a few miners are working here and probably they have won about 80 oz. during the year. At the Paling Yards Creek, which is about 9 miles east of the township of Cudal, a gossan lode has been discovered by Messrs. Woodgate and party. The lode is from 6 to 10 ft. wide, and easily worked. The prospectors took 63 tons to Cargo and got an average of 13 dwt. to the ton.

The adjoining party crushed 11 tons for an average of half an ounce to the ton. What is required is a battery near the mine, and capital to provide this should be easily obtained, the prospects being sufficiently encouraging.

At Boney's Rocks, near Toogong, Mallon and party lately crushed 48 tons of stone for the handsome return of 168 ounces. Besides this claim others are at work, and apparently with good prospects. In my last and previous reports I mentioned several places where minerals, chiefly copper, had been discovered. I have heard nothing further of these discoveries, and probably beyond surfacing and prospecting, nothing further has been done to ascertain whether a payable lode exists or not.

In the beginning of this report I had occasion to mention the chief lead at Forbes in the early days of mining, on which were many very rich claims, and which is known as the South Lead. This lead extends for a considerable distance and was worked until drift depth and water made the expenses too heavy. As I have already stated some large claims and leases have been taken up and are being worked, where, I am informed, the lead was lost, or became poor. Should the difficulties attending the working of the leads be overcome and the ground prove payable, no doubt many claims and leases will be taken up and worked, chiefly I expect, as at present, with local capital. The contention of the old miners here is that when the first rush took place all or nearly all, the claims were hastily and imperfectly worked, and that working expenses were very heavy. For instance chaff was £60 a ton; it is now £3 10s., or at most £6. Corn was 30s. a bushel; now it is 5s., or 5s. 6d. There can be little doubt of this, that if the present ventures are not a success, Forbes must look to its pastoral resources for support, and not to its minerals. I may mention before concluding this report that there are very large areas of land in the neighbourhood of Forbes and Parkes which are supposed to be auriferous, and have therefore been reserved from sale. Much of this land has been thoroughly prospected. Much of it contains, in all probability, no minerals of value and only serves as a grazing ground for stock. Many people contend, and their contention is not without reason and strength, that the prosperity of the district would be greatly increased if certain of these reserves, or part of them, were revoked and the land thrown open to selection. Many of these restricted gold-fields are near towns or villages and consist of excellent agricultural and pastoral land, and if available, I feel sure the land would be at once taken up and would support many families. It seems that under the present Land Act there would be little risk in doing this as ample power is given to the Crown to allow prospecting, and if payable gold is discovered to resume the area or part of it.

In conclusion I may state that although no new discoveries of any moment have been made during the past year, still I believe a larger amount than usual of prospecting has been carried on. Many were compelled to take to mining as an employment, because in the depressed state of the colony other work was not obtainable. Perhaps good may come from this and discoveries may be made of importance most probably in quartz reefs which have been only superficially tried, but are now being thoroughly tested, both for depth and quality.

LACHLAN DISTRICT—YOUNG DIVISION.

(*Mr. Warden Robinson, P.M., Young.*)

I HAVE the honor to forward to you a statement of Gold-mining operations in this Division for the year 1886. Any one of my reports for the last five or six years, with 1886 inserted therein, would convey a pretty correct presentation of our mining transactions during the year just ended, with this important and notable difference—that the gold won has quadrupled the yield of the preceding twelve months. Approximately the same number of miners' rights, business licenses, &c., have been issued from this office each succeeding year for the past half of last decade.

About Young some of the original diggers still follow the occupation of gold-mining. At Wombat a few of the old identities are yet to be found sluicing occasionally; and at Murrumburrah there are about a hundred miners doing reasonably well; they are mostly domiciled about Blind Creek.

Our issue of miners' rights shows a total of 454, sixty-four of which go to the credit of Murrumburrah; business licenses, 37, four of them were also taken out at Murrumburrah; mineral licenses, 4; gold-mining leases, 3, comprising 19 acres, and one mineral lease of 40 acres. A review of the above figures shows increase in miners' rights, 55; business licenses, 3; mineral licenses, 3; and a decrease in gold-mining leases of 13, with a decrease in area to the extent of 180 acres.

The gold won in 1885 was estimated at 505 oz. 14 dwt. 23 gr., and of the value, say £1,953 12s. 10d. The yield for 1886—taken from reliable data—amounts to 2,253 oz. 6 dwt. 22 gr., and of the value of £8,737 7s. 3d., showing an increase over the yield of the previous year of 1,747 oz. 11 dwt. 23 gr., and an increase in value of £6,783 14s. 5d.

I may here mention that most of the miners' rights and business licenses taken out in Young are in no way associated with gold-mining; they are simply used as media for land purchases and residences. Notwithstanding this, there are at least two great mining ventures actively at work in this division which have been for some time past prosecuted with much vigour, and backed up liberally with both capital and scientific appliances.

The New Burrangong Gold-mining Company's property and plant are situated about 3 miles from Young, at 'Possum Flat. During the year a fourth and fifth shaft have been put down at the main workings. The old machinery has been replaced by new plant of greater power. Several experts from other colonies have been brought here at great cost to advise in surmounting difficulties connected with working the mine. No doubt at any time has arisen as to the ultimate success of this undertaking. At

twenty different points tests have been taken, and always with excellent results. A Melbourne syndicate—of wealth—and local capitalists are heartily co-operating and working together with a will to perfect the various appliances connected with these extensive works. The monthly disbursement for labour alone amounts to £250; and up to date £9,000 have been laid out upon the works.

The Cunningham Mine at Cunningham Creek is of still greater magnitude. This property is also owned by a Victorian syndicate, and up to date £20,000 have been spent on plant and labour connected with the establishment.

LACHLAN DISTRICT—TEMORA, BARMEDMAN, JUNEE, AND COOTAMUNDRA DIVISIONS.

(*Mr. Warden Baker, P.M., Temora.*)

In submitting my report for the year 1886 of Mining Divisions in my charge I have to ask pardon for apparent delay. Absence from my office several times during January on special Warden's duties, followed by a severe attack of sickness during which my ordinary work was accumulating, &c., has caused the delay which has been unavoidable.

Temora.

Population.—During the year 1886 there has been a decrease in the number of the mining population as shown by the falling off in the number of miners' rights issued in the district. In the year 1885, 516 were issued; in the year 1886, 395 were issued, being a decrease of 121. For the month of January, 1886, there were issued 253 miners' rights; but in January of this year 160 only were issued, or 101 less than in January of the previous year. In the year 1885, 111, and in 1886, 83 business licenses were issued or a decrease of 28. As stated in my report for 1885 the decrease in the number of miner's rights and business licenses issued should not be accepted as correctly indicating the decrease either of the mining population or of the business people about Temora. A considerable number of both kinds of these documents have been held for the purposes of residence and business, and of legally holding the land occupied for these purposes, and as these holdings are converted into freehold the necessity for holding these documents ceases in a proportionate degree. The Kimberley and Tetulpa rushes have taken a few of our miners; but as far as general appearances go the population remains as to numbers about stationary. There is a great desire expressing itself ever and anon for the Narraburra and other reserves to be thrown open for selection, and I think it is a pity that this had not been done some three years ago when I first recommended it. The land is of excellent quality, almost every acre well suited for either agricultural or horticultural purposes, and capable of supporting a large population. At the present time there are some thousands of acres of this fine land lying practically useless. They are truly "waste" lands, and I may add "wasteful" lands of the Crown for while they are not producing anything of a useful character, they are affording excellent shelter for vermin and a home for the pine scrub sifting bush, and yet while we have all this land for cultivation and the labour necessary for its cultivation, we are sending to other districts, and indeed to other parts of the world for a large amount of the bread, the meat, the fruit, &c., consumed by us. We do not even grow our horse feed—surely this is not as it should be.

Gold.—The alluvial miners have been seriously impeded in their work by the frequent heavy rains which have otherwise been so valuable to the country, most of the alluvial workings are in the low lying parts of the district, in other words in the drainage course of the water-shed; consequently when heavy rain comes the workings are soon flooded, and as the country is soft, subsidence soon takes place and the mines are practically shut up for a time, and when the water drains away sufficiently to make mining again practicable, it is frequently found that the shafts and drives are destroyed, so that operations have to start as from the beginning, and it will be readily seen that these circumstances cause a large expenditure of labour, time and money, upon what is called in mining parlance dead work. In quartz mining we have been quietly, but I think surely progressing. The South Australian Company's Mine has continued to yield steady payable returns, while at the same time it has been gradually disclosing lodes which the manager thinks will be very permanent and profitable. This Company has by its steady perseverance rendered good service to this district. It has had in the first place to struggle for existence. When it was first formed in the early days of Temora wild and extravagant hopes were entertained of its richness and prospects, and when sober facts—actual yields—destroyed those wild fancies, despondency and disgust took their place, shareholders who had been expecting to receive fabulous dividends could not brook having to pay large calls. The mine and works had never been put in proper form for economical and effective working. Money was required to enable this to be done, but the shareholders declined to find the money necessary, and the result was that the works had to be carried on from hand to mouth. Mr. Thomas Eyre, the then manager, kept plodding on and on, getting gold where he could find it and developing the mine as best he could as the mine itself yielded the means, and I am told that on more than one occasion he has paid the wages with his own cheque. The difficulties were further increased by legal disputes and litigation with which the Company was beset for a long time. However, through all—want of funds, low yields, and hand to mouth working—the works were kept going and Mr. Eyre was able to give a small sixpenny dividend—and what was, perhaps, even better than the dividend, confidence—to the shareholders. Mr. Eyre, however, resigned, having accepted the management of the Sunny Corner Silver Mine, and Mr. Thomas Elsbury succeeded him. Mr. Elsbury soon found that he was in charge of a mine of great promise and worthy of much better treatment than it had received. I understand that he advised the mine ought to be worked upon a larger and better system and with greater economy, and that its prospects fully justified the necessary outlay. The South Australian management sent a deputation to inspect and report upon the mine and Mr. Elsbury was authorized to work the mine in the manner he had advised, and in accordance therewith he has for some months past been sinking a large main shaft, large enough for winding and pumping purposes, and in a position to well and cheaply work the lodes to a great depth. A winding engine is in course of erection, and it is intended to put up a crushing machine in such proximity to the mine as will enable them to run the quartz direct from the mouth of the shaft to the receiver at the battery; and I sincerely hope everything will go on satisfactorily and to great success. The operations of such companies as the South Australian Company have great influence beyond themselves. While they result in paying dividends to their shareholders they are great indicators—beacon lights—showing, in a practical way, the road to success, and hard plodding and skilful perseverance conquer difficulties. To bring a quartz mine to a financial success involves the expenditure of large capital in preliminary mining operations and in providing suitable appliances and machinery. It also involves

involves good and careful management. There must be a combination of capital and skill to ensure success. By "skill" I mean good business habits, as well as good management of the mine. Neither capital without the skill, nor skill without the necessary funds can succeed. Unfortunately these do not always go together, and herein lies the cause for mining failures in connection with our quartz-mining industry. Under very favourable circumstances the development of the quartz-mining in any district will be slow as compared with ordinary alluvial mining, and when great mistakes are made in management, whether from want of skill or want of funds, or want of both, the results are often fatal to mining progress, and at best seriously retard it. This district has suffered and is still suffering from the bad management of former times, but the development of the South Australian Company's mine, at Upper Temora, is slowly, but I hope surely, causing a growing confidence in the future of Temora as a quartz-mining district. The Hidden Star, Mother Shipton, and other mines have been, to use the ordinary phrase, "sent to England;" in other words, syndicates have been formed for the purpose of getting English capital necessary to work these mines. The same has been done in respect to the Sebastopol, Muttama, and the Barmedman mines. I hope the capital will be obtained and that it will be honestly and judiciously expended in the legitimate development of the mines, and not for the special purpose of inflating the share market. There can be no objection to a good and growing share market, if such be the result of growing prosperity of the mines; indeed, under such circumstances a good market for shares very largely assists mining enterprise, and the two do very well together. But there is always a fear that the "floating syndicates" may make the mine subservient to the market, which is just a reversal of the proper order of things, and is at once both foolish and unjust. To teach as a moral maxim that "honesty is the best policy" is taking very low grounds indeed; nevertheless, as an abstract truth, the doctrine of that old saying is thoroughly sound, and applies to mining with as much force as to any other pursuit.

During 1886 twenty-five gold-mining leases, covering an area of 150 acres, were applied for at Temora office, including land at Sebastopol.

Yield of Gold.—I am indebted to Sergeant Buckley, the Gold Receiver at Temora, for the statement given below. That return includes yield from Sebastopol and Barmedman as well as of Temora.

RETURN showing the quantities of Gold received by the Gold Receiver at Temora during the year 1886.

1886.	oz. dwt. gr.
27 January.....	512 16 15
24 February.....	637 2 20
24 March.....	417 11 9
21 April.....	157 16 11
19 May.....	449 17 0
16 June.....	448 3 0
14 July.....	1,217 17 23
11 August.....	274 7 9
8 September.....	462 14 0
6 October.....	557 9 8
3 November.....	703 10 22
1 December.....	291 16 14
29 December.....	1,030 6 18
Total for the year.....	7,161 10 5

For ready reference and comparison the following table of gold sent by escort from Temora, will perhaps be interesting:—

	oz. dwt. gr.
1881.....	29,652 14 4
1882.....	33,348 0 7
1883.....	17,347 8 6
1884.....	14,351 16 1
1885.....	7,865 15 9
1886.....	7,161 10 5

By the courtesy of the officers of the Bank of New South Wales and the Australian Joint Stock Bank, at Temora, I find there passed through those Banks, during the year 1886, 7,547 oz. of gold, or some 386 oz. more than was sent down by escort. The Bank returns (as do also the Gold Receiver's returns) include gold taken from alluvium and from quartz at Temora, Barmedman, and Sebastopol, but I have been unable to ascertain how much came from quartz or how much from alluvium, or the quantity produced by each of the districts named. I know that one of the Banks purchased some 1,360 oz. of gold taken from the alluvial workings at Temora, and some 1,431 oz. of gold from the quartz workings at Barmedman, and some 76 oz. from quartz workings at Sebastopol, but that does not account for half the gold passed through the Banks; nor am I able to explain the difference of 386 oz. between the amount passed through the Banks and the amount sent by escort. I can but give the figures as they are given to me. The minimum price of gold was £3 15s. per oz., the maximum £3 18s., the average £3 17s.

BARMEDMAN.

This division is so essentially connected with Temora that in dealing with the latter one must of necessity partly deal with the former place. I regret very much the fact that the Barmedman United Gold-mining Company have thought it advisable to retire from this field, and that, too, at a very great loss to themselves. The district has been greatly benefited by that Company's outlay. It has placed in the district one of the largest, and in some respects, most complete plants the Colony can boast of. Three steam engines, one for pumping, one for winding, and one for driving the battery of twenty-five heads of stampers, together with the necessary pumping and winding appliances, including a "Tangye" pumping engine and pumps for surface purposes. I am informed that the Company expended some £5,000 over and above what the mine produced, and that this large amount was nearly all expended on the machinery; and yet the Company sold this valuable plant, and what I venture to hope will yet prove itself to be a valuable mine, at the absurdly low price of £1,050. It is not for me, perhaps, to find fault with Companies for giving their property away, nor should I refer to the matter but for the fact that the failure of the Barmedman United Gold-mining Company, and the heavy losses sustained by its shareholders, may probably

be improperly debited to the district in a way likely to injure it. It is exceedingly difficult to understand upon what commercial principles the Company sold its really valuable plant for the small sum of £1,050. One of its large engines, with its boiler, must have cost about that sum before it left the manufacturer's premises. It is, however, gratifying to note that the present proprietors are meeting with fair success in the mine. The adjoining mines also, Fiery Cross, Hunted to Death, Jackson's, &c., are yielding fairly well, and some of them splendidly. Still they are only "scratching," so to speak. The future of this district, as a permanent mining district, very much depends upon the value of the quartz below water-level. Some time since, I was speaking to one of the best practical mining experts in New South Wales about the Barmedman United Company's mine. He strongly condemned the way it had been managed; that, commercially speaking, there had been great extravagance in the matter of supplies, both as to quantity and price; and, as to mining, there had been but little done worthy the name. To use an expressive phrase, they had been "rooting and scratching," not mining. He specially condemned the non-exploration of the mine at lower depths than the Company had worked, and expressed great faith in the future of the mine, if a reasonable amount of capital were expended in well testing it below water-level; and, as there is on the ground all the mechanical appliances required, I am hopeful that the work will not be much longer neglected.

About the end of 1886 Barmedman was at a very low ebb. The Barmedman United Gold-mining Company's crushing machine, during the greater part of 1885, had been kept idle, for want of fresh water for steaming purposes, and as this battery is the only one in the district, the next nearest, at Temora, about 23 miles away, the quartz-miners at Barmedman were not able to get their stone crushed, and, in consequence, mining operations were all but suspended. Population dwindled away, and the little town began to have a woe-begone, deserted appearance, and, but for the faith, pluck, and enterprise of Mr. Robert Cassin and some other tradesmen, the town as a place of business would have collapsed. In averting this catastrophe Mr. Cassin did grand service. Others would perhaps have done as much if they had had the means. Be that as it may, Mr. Cassin supported a large number of miners, and the mines too, and for some time the commercial clouds were black and threatening. The storm, however, was weathered. Mr. Cassin organized a party to purchase the Barmedman United Gold-mining Company's plant, and succeeded in almost begging it. Then came the cheering rains. The stored stone, what little there was, was crushed, and gave yields which satisfied all parties. Then the miners went to work with more heart, and a goodly number of them have been well, and some others of them excellently well, paid during the year, and at its close it was found that mining and ordinary business told a much better tale than at the close of 1885. A small portable engine and pumps have been placed in position at the Hard to Find for the purpose of pumping out the water. The shareholders think the yields obtained above water-level are sufficiently good to justify giving the lode a good testing below water-level, and if the result should be as good as is expected, it is not improbable that a crushing machine will be erected near the mines in such position as would answer for crushing the stone raised at the Phoenix Reef also. I understand that the gentlemen who purchased the B. U. G.-M. Co.'s plant are large shareholders at the Hard to Find, and that they think of taking ten heads of stampers from the twenty-five at Barmedman and placing them at the Hard to Find. Others advise the erection of the small battery which did duty before the B. U. G.-M. Co. put up its plant. One thing appears to be looked upon as all but certain, and that is that a crushing machine of some kind will be put up.

The following figures, *re* miners' rights, business licenses, and gold-mining leases applied for, have been supplied to me by the Mining Registrar:—

Miners' Rights issued—		
Year 1885	121
„ 1886	107
Issued during January 1885	53
„ „ 1886	66
Business Licenses—		
Year 1885	36
„ 1886	19

During the year five applications for gold-mining leases were received, covering an area of 19 acres, against three applications for 11 acres in the preceding year.

Clarendon Division.

In this division, Muttama, Junee Refcs, Junee, Wantiool, Mitta Mitta, and Sebastopol have been under my charge. At all of these places mining has been at a low ebb during the year. Towards the end of the year, at Muttama, some rich stone was discovered in one of the old workings, and further workings have given great hopes that the district will prove itself to be valuable as a quartz-mining district. Its past history, however, shows that it has been "patchy"; that it contains some very rich and some very poor stone; that its management has not been of the best; that great care should be taken to provide sufficient capital in the first place to put the mine in thorough order, and for providing necessary machinery for economical working, and after that to keep a reserve fund to allow the Company to prosecute its operations with system and vigour during the times it will be working in poor stone. Mr. Travers Jones has taken up two gold leases of 80 acres each. He is a thoroughly experienced practical gold-miner, of some thirty years standing, has resided for many years at, and conducted large mining operations in the district. He has, moreover, the reputation of being a shrewd and honourable man of business. One may, therefore, reasonably presume that the prospects of, and concerning these mines are good, and that they will prove profitable both to those who shall work them and also to the district; indeed, they cannot be profitable to one without benefiting the other. Mr. Jones informs me that he is placing these mines upon the English market for the purpose of raising ample capital for their successful working, and that he has fair prospects that the Company will be "floated."

Sebastopol.

This district ought to be a prosperous mining centre; and in its earlier days one or two gentlemen made large sums of money from the mine now known as the Morning Star and land adjoining, indeed it is rumoured, and I think correctly, that one man netted some £5,000 clear profit. But like most quartz-mines, the stone proved not to be uniform as to richness; the stone became—to use a mining term

term—poor, and the work was abandoned. Since then a good deal of work has been done—enough to prove two things: First, that with, good management, economical working, and necessary appliances, including a good crushing plant, sufficiently near the shaft to permit the stone being run direct from the shaft to the hopper, these mines are likely to pay all expenses and give fair dividends; but, in the second place, enough has been disclosed to show that, unless properly worked, they will not pay expenses. These remarks also apply to the Evening Star and other mines thereabout. The La Mascotte, late "Homeward Bound" mine, is still under the curse of the Fury "Litigation" and is paying the lawyers while it is about ruining the shareholders. When I took charge of this district, over four years ago, the then proprietors were fighting several triangular legal battles. Week after week in one form or other they were working in the Warden's Court, so much so that I was called upon to express an opinion as to what was meant by the words "efficient mining." I stated in a joking way, but with much meaning, that if the shareholders of that claim worked in the mine with as much skill, energy, perseverance and determination as they worked in the Warden's Court, the mine would certainly be "efficiently worked." While they were thus at legal war, the mine was practically neglected. This went on month after month, during which time I had the painful experience of hearing more perjury committed than I had heard in all my life, albeit for some 30 years fairly conversant with mining and other Courts. The proprietary was changed largely, but the incomers took up the fight and so continued. After a time Dembecki bought out all but one other shareholder, and then the fight waxed furiously between these two. Then it was rumoured that Dembecki held the whole mine himself, and had again sold it to one Joseph Tucker who was going to work the ground properly. He had scarcely commenced to work when a dispute arose between him and his manager, then another manager came, and then several quarrels found their way into the Warden's Court, in which proprietor, manager, workmen, tradesmen, &c., were litigants. Then came the third manager, and at the same time Dembecki again turns up, this time as plaintiff in an equity suit against Tucker, in which suit Dembecki claimed half the mine, and the fight went on in the Equity Court, and the mine was closed for several months by injunction, and so the litigation has gone on, and I see by the newspapers the mine is still "in Equity"; and while the two litigants are equitably ruining each other they are iniquitously ruining a good mine and slighting the district. I refer to these matters by way of showing how a really good district can be ruined by bad management, especially when accompanied by litigation. At Wantiool near Junee, very little work was done during the year. At Mitta Mitta there is a fairly good mine, if one may call a number of "scratchings" a "mine." There is, I mean, some ground which with proper working would make a good mine. This is, as far as it is proved on private lands, the property of the Clarke family there. Mr. Dobbys, of Junee, and a Mr. Percy have put up a crushing machine in the neighbourhood, with a view of working this land. But here litigation has put down its baneful foot and stopped for months all progress, and locked good payable country that would, if reasonably well managed, find profitable employment for at least fifty miners.

During the year I, by special instructions, visited Adelong, Tumut and Reedy Flat to report—to put the business briefly—upon the "cause and cure" of mining depression there. The evidence taken by me and my report upon what I heard and saw, I shall furnish in separate form. I shall therefore say but a few words here about it. But this I do say, with all force and emphasis, that the land on the banks of the Adelong Creek, from its source, in the neighbourhood of Reedy Flat, to its junction with the Murrumbidgee, never ought to have been alienated, and that from Grahamstown to the Murrumbidgee both banks of the creek ought to be thrown open to mining by the State resuming a strip of land at least half a mile wide. If this were done I have no hesitation in saying that many hundred men would find not merely profitable but highly remunerative employment. And my report will, I think, show that the State could resume this land, and pay a fair price for it, without any financial difficulty and with actual advantage and monetary profit on the transaction itself, altogether apart from the advantage to the community of a large number of men finding remunerative labour and putting in circulation some thousands of ounces of gold. I say "thousands" of ounces quite advisedly, feeling quite sure the gold is there in very large quantities, and that if the land were open to mining the yield would fully justify my opinion.

LACHLAN DISTRICT—BARMEDMAN DIVISION.

(*Thomas Love, Mining Registrar.*)

THE last crushing ending the 23rd December, 1886, was the best average crushing yet obtained on the field. 329 tons taken from 13 different claims gave an average yield of 2 oz. 12 gr. of gold per ton. The stone was all taken out above water-level (80 ft.). All the claims on the Ada Hill, amounting to about 40 acres, are about to be placed in the English market for the purpose of floating into a strong Company, to get funds to enable the miners to work the stone below water-level.

LACHLAN DISTRICT—JUNEE DIVISION.

(*Alfred Elliott, Mining Registrar.*)

I HAVE the honor to report, for the information of the Honorable the Minister for Mines, that the mining industry here has made very little progress during the past year. Some small attempts have been made to work the reefs at Wantiool, but the want of capital has, to a very great extent, retarded the attempts made.

The amount of gold won during the year (as far as I could ascertain) has been 113 oz. 7 dwt. 8 gr., which was purchased by Mr. Ross, the Manager of the Bank of New South Wales, the minimum price being £3 15s., and the maximum £3 17s. 6d. per oz. I believe several small quantities have been purchased by the Union Bank, but I have been unable to ascertain the amount.

During the year I issued 29 miners' rights and 1 business license, and received 1 gold lease application.

LACHLAN DISTRICT—YOUNG DIVISION.

(*W. Rodgerson, Mining Registrar.*)

I HAVE the honor to report that during the past year some improvement has taken place in mining operations. The Burrangong Mining Syndicate had previously to the date of my last report successfully floated the New Burrangong, and a large and valuable machinery plant has been erected at this mine. A new manager has recently arrived on the scene (Mr. Ryan, late of Shepard's Mine, Adelong), and he, with a number of Adelong miners, is at work, driving on a level with the wash, and hopes of ultimate success in working this undoubtedly rich mine are confidently entertained.

In addition to its interest in the above mine, the syndicate has secured other valuable mining properties, viz. :—The North Burrangong, comprising 64 acres 2 roods 33 perches; the South Burrogon, 30 acres, upon which operations are about to be commenced. This ground has been extensively bored, and the prospects, I am informed, are quite equal to any boring in the New Burrangong. Mr. John Illiffe, the managing director, states that this property will shortly be placed in the market for the formation of a Company.

On the Hidden Star, 10 acres, lying parallel with the New Burrangong, on the opposite side of the creek, a bore has been put down with splendid prospects, but operations are in abeyance until the arrival of the requisite machinery and appliances.

During the year I have issued 390 miners' rights, being an increase of 61 over last year, 33 business licenses, and 4 mineral licenses. The increase in the sale of miners' rights has been caused by a number of persons taking up mining tenements for residence areas.

Through the courtesy of the officers of the Union Bank and Bank of New South Wales, I am enabled to give the following figures *re* gold won :—

	oz.	dwt.	gr.
Union Bank	1,250	0	0
Bank of New South Wales.....	404	16	15
Total.....	1,654	16	15

or a total value of £6,412 9s. 1d., showing an increase of £5,429 18s. over the previous year.

My Warden's report will deal more in detail with the mining operations of the division, so that I have confined my remarks solely to my portion thereof.

LACHLAN DISTRICT—MURRUMBURRAH DIVISION.

(*Charles Cutcliffe, Mining Registrar.*)

I HAVE the honor to make my report for the year ending 31st December, 1886.

The Gold-mining interest in the Murrumburrah Division has improved considerably during the past year, which in a degree may be attributed to the rainfall, which has given a good supply of water. The increase on the previous year has been 346 oz., and value £1,333.

The gold won during 1886 amounted to 598 oz. 10 dwt. 7 gr., representing £2,324 18s. 2d.

The number of miners' rights has been sixty-four, and of business licenses four. The price of gold according to the Bank returns has been uniform—£3 17s. per oz.

The Cunningar Quartz-mining Co., have been busy during the past year, in completing their extensive plant. This Company have spent up to the present upwards of £20,000 in machinery and manual labour, they have erected the most approved and latest concentrating machinery to be obtained in America; and there is little doubt with their present complete appliances for the saving of pyrites, and its after treatment by smelting, that a very prosperous year is before them. There is no free gold in this mine, the gold is all in the pyrites which consist of iron sulphides and arsenic, with a small percentage of galena.

LACHLAN DISTRICT—CUDAL DIVISION.

(*W. H. Souter, Mining Registrar.*)

I HAVE the honor to forward my annual report of the Cudal Division of the Lachlan Mining District for the year 1886.

In addition to the gold reefs reported as being worked during the year 1885 in this division of the Lachlan District, I beg to report that a new reef or lode has been discovered at the Paling Yard Creek, distant about 9 miles from Cudal, in an easterly direction. The stuff being worked is from a lode consisting of decomposed quartz, or as the miners term it "gossan," it runs through the various claims now being worked at a width of from 6 ft. to 1 ft. 6 in., and requires blasting by powder. The prospectors, Woodgate and party, have had 63 tons of the lode crushed at Cargo, averaging 13 dwt. to the ton; Bohringer & Co. crushed 11 tons, yielding 11 dwt. to the ton; other parties have got a quantity of gossan on the grass. There are in all six claims at work. The difficulty to be got over is the want of a crushing plant, the nearest battery being at Cargo, 10 miles distant, over rough country, at a cost including the crushing of 25s. per ton. The prospectors are now arranging to get a battery on the ground, and, as there is plenty of water in the Paling Yard Creek close by, there is no doubt that good returns can be made from the lode. At Boney's Rocks, near Toogong, Mallon and party lately crushed 48 tons for 168 oz.; Hadley and party are now forwarding 16 tons to Canowindra to be crushed, from which they expect a good result, they sent 2 tons to Sydney for trial, which realized 2 oz. to the ton; Spottiswode and party are also on gold; and Shields and party have taken up a claim adjoining. At near Toogong, Falvey and party are working the old reef, known as Bevan's Reef, they have 16 tons on grass, which, from the prospect obtained, they expect will yield a good return. On the whole, mining matters in this division are prosperous, and there is no doubt that the country round will be thoroughly tested for gold, as the prospectors about are steady practical men. Four mining leases have been applied for at this office, two applications for extended quartz claims, and one miner's right during the past year. As this branch of the Mines Department was only opened in September last, nearly all the miners' rights, &c., were applied for at the Mining Registrar, Canowindra.

LACHLAN DISTRICT—CANOWINDRA DIVISION.

(*Wm. Cook, Mining Registrar.*)

I HAVE the honor to report as follows of the mining carried on in this division during the year 1886. There have been no fresh discoveries made during the year, but the mines have yielded better and steadier returns, than during the previous year. The amount of stone crushed is 629 tons for a return of 801 oz. 12 dwt. From alluvial workings the amount obtained was 80 oz., making a total of 801 oz. 12 dwt., as against 303 oz. last year.

During the year there were issued at this office, 139 miners' rights, seven mineral licenses, and four business licenses.

There is every appearance of a still greater increase in the returns for the current year, as several of the mines in the division have been purchased by capitalists who intend to erect machinery and thoroughly test their resources.

LACHLAN

LACHLAN DISTRICT—GRENFELL DIVISION.

(W. H. Hazelton, Mining Registrar.)

I HAVE the honor to furnish my report for 1886, upon the state of Mining in the Grenfell Division of the Lachlan Mining District, and in doing so I regret to say, that I have very little of importance to communicate either in quartz or alluvial mining.

During the first part of the year mining was almost at a stand still, which, I think, may fairly be attributed to the want of proper care not being observed by the miners in making provision for storing water for gold mining purposes.

Alluvial.—In July there was a small rush at the Quondong (an old lead which had been worked about 14 years ago), which turned out to be part of the old lead that had been missed at the time of the first working. Ten or twelve claims were taken up and worked, but only four are paying wages.

At the Seven-mile very little work has been done during the year. At present there are two parties prospecting the lower end of the old Seven-mile lead, but have not reported anything payable as yet.

On the main lead, east of the town, two parties of miners are working. One obtained 40 oz. of gold during the year, the other has not been long at work and has not washed any dirt.

On the Star lead there is one party prospecting.

Quartz.—The Consols, Fitch & Sons, 4-acre lease. From this claim there is very little to report. As reported by me last year, the shareholders tried to form this property into a local Company, but did not succeed. They now inform me that they are going to work the claim themselves, and appear sanguine of success.

The Enterprise Reef, Pettet and party, 3-acre lease. In this claim very little has been done during the year. The shareholders now state that they intend to erect machinery, by which they anticipate good returns.

The Homeward Bound Reef, Matthews and party, Extended Claim. At present this party is engaged in raising stone.

Lawson's Reef, Hinchcliffe and party. This claim still keeps up its reputation. During the year 75 tons of stone were crushed, which gave a yield of 1 oz. 5 dwts. to the ton.

Accidents.—During the year one accident occurred in this division in connection with gold-mining, which caused the death of a lad, named William James Eagar. A full report of the sad accident was forwarded by me to the Department of Mines immediately after occurrence.

During the year I have issued 160 miners' rights and six business licenses.

LACHLAN DISTRICT—PARKES DIVISION.

(W. C. Weston, Mining Registrar.)

I HAVE the honor to forward my annual report for the Parkes portion of the Lachlan Gold-field. I have every reason to believe that Gold-mining is steadily increasing, and that the field has not been in such a prosperous state for the past 10 years.

Mining generally has shown much improvement during the past year. Several new payable reefs have been discovered, notably Dean, Pritchard and party, at the south-west of the Caledonian Hill, and T. A. Fitzgerald & Co., in Possum Gully, near the Racecourse Reserve; both claims have been returning handsome dividends to the shareholders, and show no appearance of falling off. The latter is situated very close to the old alluvial workings, which proves that the old ground is worthy the attention of the prospectors; in fact, the majority of the best paying reefs now working have been discovered either in or near the old alluvial workings.

The returns from Hazelhursts, Quayle and party, Janson and party, Dudley and party, &c., show no falling off; the first named, especially, continues if anything to improve, the last crushing taken out yielding a little over 6 oz. per ton.

Of outside localities, The Macgregors, Cunningham and party, north of the Eight-mile, have proved payable, and the parties are doing well. Several parties, too, are working on Rose's selection, but the stone has not yet borne the test of the battery.

In alluvial mining the improvement has been most marked, as this class of mining industry was practically dead. In the early part of the year several rushes took place to Scrubby Plains, and notably the J. P. Abbott rush, which, though giving every promise of being a payable lead, eventually proved, like its predecessors in that locality, to be nothing more than a patch. Following this was the discovery of a payable patch at the Batchelors, several claims proving payable. The gold here occurs in patches, is of a good sample; and beside the one or two claims which are returning payable results there are a number prospecting, and it is more than probable that, during the coming year, a payable run will be discovered. Later in the year Messrs. Bergin, Tynan & Co., whilst prospecting for a reef which had been left in the old days, near the junction of the Shallow and Bushman's leads, discovered payable wash; the ground was rushed, and a different run of wash was discovered, which though not very rich, will afford work for a number of men, with the chance of a good patch at times.

The Bank returns for the year will show a large increase in the amount of alluvial gold purchases between this and the previous year.

The Parkes Quartz-crushing Company took advantage of their dam being dry at the beginning of the year, and had it cleaned out and the storage capacity increased by additional excavation, so that an almost permanent supply of water is secured, and crushing operations may now be continued as regards water supply. They have also added an additional set of five stampers, with an improved table, making in all (20) twenty head of stampers available. This points to a practicable improvement in the reefing industry here.

Since writing the above I have ascertained that the heap of tailings at the Currajong are to be operated on by the New South Wales Gold Recovery Co., for recovering gold and silver, amalgam and pyrites, from battery and alluvial tailings. Samples of the tailings have been sent to Sydney and passed through Harrison's patent concentrator, at the Pyrites Company's works, Pymont, with a yield of 12 dwts. from two tons. The Company are erecting sheds to receive the concentrators, six of which are to be placed on the ground at once. It is expected they will be in full working-order in about three months from this.

In

In conclusion, I may state more miners' rights were issued in 1886 than in any single year for the last 10 years. The number issued was 503. Twelve business licenses were issued, and 174 claims were registered.

Thirteen applications for gold-mining leases were received at this office.

5,234 oz. 8 dwt. 1 gr. of alluvial and retorted gold were purchased by the Banks, valued at £19,599 Os. 1d.; but this does not, in my opinion, represent all the gold won, as many people take it down themselves.

LACHLAN DISTRICT—FORBES DIVISION.

(*Edmund A. T. Pery, Mining Registrar.*)

I HAVE the honor to submit my report for the Forbes Division of the Lachlan Mining District for 1886.

The amount of gold won in this division last year was 496 oz. 1 dwt. 19 gr., showing a decrease of about 704 oz. on the amount won in 1885. This decrease is chiefly attributable to the Bald Hills Company having ceased work.

The Britannia Reef Company, worked by Snow and party, have, during the past year, been formed into a Limited Liability Company, and at present their operations are stopped pending the arrival of pumping and other machinery. During the year they erected a small crushing plant, which, though totally inadequate for gold-saving purposes, proved the mine to be highly payable, as some of the stone crushed was estimated to average over 2 oz. per ton.

The Nil Desperandum Alluvial Gold-mining Company, situated on the South Lead, near the old South Lead Gold-mining Company's workings, has been in operation about nine months; the plant erected on this claim was brought from the Bald Hills. The shafts bottomed at 215 feet on good, coarse, water-worn gold, with an average of two feet of wash, yielding 5 dwt. from three bags of dirt. Main drives have been opened out some depth below the wash preparatory to "blocking." The only dirt washed from this claim has been from the main drives on touching the wash, which averaged from 3½ dwt. to 8 dwt. per load. This Company expects shortly to have a number of men employed "blocking," when they trust, and have every reason to believe, that their returns will be considerable. The machinery for driving the winding gear and puddling machines is a powerful plant; a pumping plant will also be shortly erected. This Company has also lately been placed under the Limited Liability Act.

The Forbes Alluvial Gold-mining Company (Limited), on the South Lead, Forbes, are at present sinking a new shaft, and they are down about 80 feet, and have met with considerable difficulty in going through the drift, owing to a second layer with heavy water in it. This Company has arranged for the purchase of the plant of the late British Standard Gold-mining Company at Bald Hills. They expect to bottom on good gold on the Western Reef of the South Lead, where they suppose the Britannia Lead joins with the South Lead.

The Crinoline Gold-mining Company (Limited), also on the South Lead, are erecting a large plant for winding and puddling at the old Crinoline shaft, which will be at work during the present month. Good wash has been found close to the shaft which was missed in the early days. From the well-known character of this portion of the South Lead the above Company expect good returns. No washing from the lead has as yet been effected, the Company being determined to have all machinery in place before opening out below.

At Strickland's Reef, on Parkes Road, worked by Ramsay and party, a trial crushing has been sent to Parkes from a new reef which averaged 16 dwt. to the ton. As there is plenty of stone this would be a valuable property if machinery were on the ground.

Judd's Reef, near the Caledonian Lead, on the Parkes Road. A lot of prospecting has been done here, sometimes with encouraging results, but the want of machinery precludes it being profitably worked.

Lawler and party, on the Caledonian Lead, who sunk a shaft but were unable to work with a windlass owing to the amount of water, are now erecting a "whim," and trust to ultimately overcome their difficulties.

Various small parcels of gold have been obtained by "fossickers" amongst the old workings of which I can get no record.

Altogether the prospects of the present year, as regards gold-mining, are more encouraging here than in the last.

Copper.—In June last a 40-acre mineral lease was applied for at Euroa, near Eugowra, but I have heard nothing of any work being done in that direction.

Owing to the present Companies being not yet in working order, I am unable this year to supply statistical information, but trust to send a complete report next year.

Miners' rights issued during year	342
Business licenses " "	15
Mineral " " "	3

SOUTHERN DISTRICT—ARALUEN, BRAIDWOOD, LITTLE RIVER, MAJOR'S CREEK, AND NERRIGA DIVISIONS.

(*Mr. Warden Aldcorn, P.M., Braidwood.*)

I HAVE the honor to state, regarding mining operations in the divisions of the Southern District under my charge, viz.:—Braidwood, Little River, Major's Creek, Nerriga, and Araluen, for the year 1886, that matters have proceeded in very much the same manner as reported by me for 1885, so that it is almost unnecessary that I should now make any report at all.

In all the divisions referred to, except Araluen, the scarcity of water which has been increasingly felt for four or five successive years has prevailed during the past year, for, although in common with other parts of the Colony this district had a fair share of rain in the spring months, the quantity which fell was quite inadequate to creating a good supply of water for sluicing purposes. There was, therefore, no inducement for the miners who have been away for years at work on the railway lines to return to the district.

The dry weather, as I have previously stated, is favourable for the deep workings in Araluen, and operations there have been carried on pretty steadily during the year, with the result that there is a small increase (about 450 oz.) on the quantity of gold won during 1885.

There

There is a decrease of about 600 oz. in the returns from the other divisions referred to, as compared with the previous year, but any increase cannot be looked for until the water supply becomes more permanent.

I may here state that two parties, with outside capital, are about to cut and construct races from the Corang and Shoalhaven Rivers to work some ground in the Nerriga Division. These races will be very expensive. One of them is being cut now, and considerable progress has been made with the work. This race will, I understand, be about 25 miles in length.

As regards quartz-mining, very little has been done. Several parties have come from outside of the district with the view of working the reefs at Little River, Major's Creek, and Bell's Creek. Claims have been taken up, and hopes held out that Companies would be formed to carry on operations, but little or nothing has been done. Capitalists seem indisposed to risk money, although from time to time opinions have been expressed by supposed competent judges that there is a large amount of undeveloped wealth in these localities.

In conclusion, I may add, that there has been very little done in the way of prospecting for minerals. Within the last few weeks a discovery of copper was made near the Buddawang Range, about 16 miles from Braidwood. Some rich specimens have been brought in, but, so far as I can learn, no lode has yet been found.

SOUTHERN DISTRICT—NOWRA DIVISION.

(*Mr. Warden Lovegrove, P.M., Nowra.*)

THE gold-mines in this district have been carried on in an easy-going style of former years, very little scientific work being done. The Homeward Bound again heads the list with 1,282 ounces obtained from their quarry. The average is not so high as before, because they have been clearing low quality stone out of their road by sending it through the mill, but part of it went $3\frac{1}{2}$ ounces to the ton or more.

The Pinnacle comes next with 680 ounces, average 1 oz. 1 dwt. 4 gr. In this case also low stone has followed good quality, and reduced the average, which is, nevertheless, a handsome return. This claim is saving pyrites for treatment.

The Pioneer has got on low quality stuff.

No one has yet taken up the river shaft, or the abandoned copper shaft in the Bundundah Creek.

I now have the pleasure of reporting a new enterprise, which will be of public value at all events.

A Company has been formed to test the shores of Jervis Bay for coal, and under the management of Mr. Sands, has already sunk 559 feet through the following strata:—Sand, 3 ft.; clay, 9 ft.; imperfect shale, 4 ft.; compact shale, 433 ft.; coarse sandstone, 30 ft.; quartzose conglomerate, 80 ft. (similar to the stratum found at Dora Creek, Lake Macquarie, on the surface). Total, 559 ft.

Beyond losing a diamond, nothing unusual has yet happened, and the bore is dry.

No other mineral is being searched for or won within my limits.

The proportion of silver to gold in the Yalwal product is still very marked, reducing the value of the bullion to £3 per oz. and even less occasionally.

SOUTHERN DISTRICT—BERRIMA DIVISION.

(*Mr. Warden Wilshire, P.M., Berrima.*)

REFERRING to your circular of the 3rd November ult., requesting my report for the year 1886 on the mining interests in the division under my charge, I have the honor to inform you that the mining interests of the locality in question are not, by any means, in a very flourishing or progressive condition—rather, indeed, the contrary.

With regard to gold-mining, a small quantity of the precious metal was obtained by a "fossicker" in Bundanoon Creek, near its junction with the Kangaroo River; and a few parties were induced to visit the locality, but nothing came of it; and, beyond being able to get the colour here and there, it does not appear likely that anything more than that will be found there.

Messrs. Dunstan & Co., who hold a gold-mining lease at Digger's Creek, near Mittagong, have recently erected a puddling machine, and are engaged testing the value of their claim, as to the existence of both gold and gems. A little gold and some diamonds have been obtained, but work is not sufficiently advanced to admit of a decided opinion being yet given as to the prospect of profitable workings being carried on there.

With regard to the Carrington Mineral Lease, near Marulan, to which I recently paid a visit, shaft sinking and test-tunnelling is being slowly proceeded with, and with various results, some of the ore giving, I am authoritatively informed, excellent assays—various metals, viz., gold, silver, galena, copper, and iron being found in curious combination. The owners are very sanguine of success, and there does seem, some good reason for believing that this particular mine, with some others in the same lead or lode, will, at least, prove remunerative, if not extremely rich; but owing to the mixture of metals, &c., &c., considerable capital will be required to even thoroughly test its capabilities. The owners are, I believe, endeavouring to sell out to capitalists prepared to run the risk or to float a Company for the purpose. At Wingello Creek a little prospecting is being done, but I have not heard results.

The only other mining worth mentioning is that of coal and shale. Borings for coal, &c., are still being proceeded with near Barber's Creek, but results are not made known; though I hear, and know from inspection, that the coal seams in the locality are pocketty and irregular.

The Berrima Colliery, which opened with such prospects of success some four or five years ago, has now closed, having, among other difficulties, become greatly involved with the Oriental Bank in pecuniary matters, out of which the Directors found it impossible to extricate the colliery.

The closing of this mine leaves the district without a colliery putting out coal; and, although there are several embryo colliers here engaged in preliminary preparations for working, it will be some time yet before the mineral from any of them will be a marketable commodity. The Berrima mine will probably soon start again under new (and it is to be hoped) more favourable auspices; but the keen competition, &c., &c., of the Western Collieries, forms a large factor in the difficulties met with in opening successfully collieries on this (the Southern) line; and it will require a strong back and long purse to contend with the monopoly alleged to exist in connection with this important industry on the Western line.

The Joadja Shale-mine is, I need scarcely say, still flourishing, and the proprietors busily engaged in extending and improving this important manufacture in all its various branches and products.

SOUTHERN

SOUTHERN DISTRICT—BOMBALA AND COOMA DIVISIONS.

(Mr. Warden Giles, P.M., Bombala.)

I HAVE the honor to submit, for the information of the Honorable the Minister for Mines, my report for the year 1886 upon the Cooma and Bombala divisions of the Southern Mining District, of which I am Warden, and which embrace the following gold-fields, viz.:—Kiandra, Crackenback, Snowy River, Collinton, Nimitybelle, Delegate, and Towomba.

As previously instructed, I presume the Mining Registrars and Wardens' Clerks in my divisions, and who are stationed at Kiandra, Cooma, Nimitybelle, Bombala, and Eden, have already furnished their reports for the past year, giving detailed accounts of the various workings, proceeds, &c., also the number of miners' rights, business and mineral licenses issued within their respective divisions, to the 31st December last.

At Kiandra, the gold won during the past year did not exceed 1,200 oz., being considerably less than the yield for 1885.

There were 117 miners' rights issued by the Mining Registrar, but a number of rights held by miners were obtained in other districts.

The continued scarcity of water has interfered materially with the successful working of the mines in Kiandra division, sluicing operations having been suspended for a considerable period of the year.

The mining population of Kiandra, Crackenback, and Snowy River gold-fields may be estimated at 400, consisting of Chinese and Europeans.

Nimitybelle Gold-field.—At Kydea, mining interests have not progressed favourably during the past year, mainly owing to the continued drought.

Collinton Gold-field.—Several mineral leases have been applied for. I anticipate a fair yield of silver will be obtained from the claims at Bredbo. At Michelago, application has been made for permission to search for gold upon reserve 962, under section 23 of Mining Act of 1874.

I have heard of one prospecting party on this gold-field.

Towomba Gold-field.—There has not been any favourable progress made in gold-mining operations on this field during the past year.

Delegate Gold-field.—The aspect of mining business on this gold-field is more promising than it has been for some years past. In the neighbourhood of Quidong, and at Bombala, mineral leases have been applied for, with a view to searching for silver. A Company is being formed to work the land at and near Quidong and Bombala.

SOUTHERN DISTRICT—BRAIDWOOD DIVISION.

(C. E. Oslear, Mining Registrar.)

I REGRET to state that there has been little or no improvement in the mining industry here during the past year. Owing to the continued dry seasons, claimholders have been compelled to avail themselves of the suspension of labour conditions, and no fresh discoveries have been made of anything payable, though I have little doubt, under favourable circumstances, such will be. The late rains will doubtless give this industry an impetus, and will, I trust, enable me during the coming year to give a very favourable report.

SOUTHERN DISTRICT—MAJOR'S CREEK DIVISION.

(John Heazlett, Mining Registrar.)

IN preparing this my statistical report for the year ending the 31st December, 1886, I find that very little progress has been made with regard to alluvial mining within my division during the past year. A succession of dry seasons has prevented the possibility of anything being done in the shape of ground-sluicing.

In quartz-mining there are slight signs of improvement, and in proof whereof may state that the Messrs. Thomas Keyte and party have recently erected a battery of ten stamp heads, at Spring Creek, for the purpose of working what is known as Plum's Reef, or any other reef available which they may find to be payable, and have already put through the battery about 370 tons for a yield of 48 oz. of gold, averaging a little over 2 dwt. 12 gr. to the ton. The reef is about 14 ft. wide, moreover they can utilize the surface, which is easily got at, and is nearly as rich per ton as what the reef is. The party are hopeful that if they can get a permanent supply of water the venture will pay wages in addition to the expense they have been under in the purchase and erection of their plant.

Mr. Robert Carter, whose name I mentioned in my last year's report in connection with quartz-mining, has, during the past year, crushed about 630 tons, some of which was surface from Dargue's Reef, for a yield of 68 oz. of gold, which may be a small return, but, as he does not complain, it may be inferred that he is satisfied. He has also treated 20 tons mundic tailings from same mine, and which was left as next to worthless by former proprietors of the mine, and from which he obtained 40 oz. smelted gold—equal to 2 oz. to the ton; the mode of treatment will be found in tabular form herewith. Mr. D. Stuart and party crushed 27 tons from old workings at Commissioner's Hill for a yield of nearly 13 oz., and which gave them wages; the abovenamed mines are situate on private land.

At Long Flat, the puddling mills have been idle during the greater part of the year, consequent on a scarcity of water, and nearly, if not all, the diggers had to seek employment elsewhere, but during the month of December they returned; yet so little has been done that it is impossible to form even an approximate estimate as to what stuff has been put through their puddling machines, in fact they have no idea of it themselves.

The Major's Creek portion of my division, with one or two exceptions, will only pay for working during wet seasons; and, as the past six years have been very dry, no flooding-off or ground-sluicing has been done, nor can be done, until the seasons alter very much.

During the year 1886 I sold sixty-one miners' rights, being an increase of thirty over and above the number sold in 1885. It is, however, only right to say that a few of these were taken out by miners working at Captain's Flat, it being nearer by 10 miles than what Queanbeyan is.

From what I have already written in regard to mining, generally, within my division, it will appear rather strange that the quantity of gold purchased shows an increase of about 315 oz. in excess of the quantity purchased in 1885. The crushings at Spring Creek would assist only a little, as in 1885 only

48 oz. were obtained from quartz, and in 1886, 129 odd oz. or about 81 oz. over the quantity won during 1885. It is therefore probable that some parcels have been sold here which were produced from without this division, and gold-buyers do not feel inclined to divulge or betray the confidence reposed in them by diggers. On the other hand, some parcels have gone from here to Braidwood, and also to Sydney, for sale, and in which case would be a set-off against the quantity brought here for sale, though obtained without this division. I may therefore, with much show of truth, assert that, notwithstanding the protracted drought, this field has improved a little, both as regards the quantity of gold won, and in the number of miners' rights sold. Some months back a party of miners from Sunny Corner (Mitchell) came here with the view of taking up the Snob's Reef at Big Hill, and on finding it to be in the possession of another person they tested, or got tested, a few samples from the Rise and Shine Reef, Red Hill, and from one piece, obtained from myself, the assay showed a yield of 3 oz. 12 dwt. gold and 36 oz. silver to the ton, and on the strength of which they started work to get out 5 tons, but before this had been completed there occurred a rupture amongst the full party, when work stopped. This mine is now under application for lease by one Gustavus Plater Clayton. The Snob's Reef, Big Hill, has not been worked since 1880, yet has been held for the greater portion of the period by registration for suspension of the labour conditions, and I have heard diggers say that if open to be taken up they were confident that with a party of thorough miners good wages could be made, and would have been, and I am of the same opinion, and that for the reason that good miners would rather work in the mines than on the roads, besides the advantage of being at home.

In conclusion, I will venture to say that by being allowed to hold a good claim for six years without working it is not the way to develop the resources of the gold-fields, and so say many of the miners of Major's Creek.

SOUTHERN DISTRICT—LITTLE RIVER DIVISION.

(P. James Galway, Mining Registrar.)

WHEN I had the honor to make my last report on the Little River Gold-fields I was in hopes that I should have been able in this year to report a marked improvement in mining; but from the continued absence of water men have not been able to prosecute the vocation of diggers to advantage.

With the exception of some thunder showers during the last quarter of the year no rain has fallen, so that during the year ground-slucing has been a thing of the past.

As the Cooma railway is drawing to a finish, and with the exception of the road work there is little if any employment in the district, the probability is that the mining population will once more come back to its old standard.

On the river-bank there are a few claims at work, and back from the river no work of any extent can be done from want of water. The Dawn and Earl Granville Quartz Reefs have been idle during the year, the working shareholders being unable to procure machinery to contend with the water, and it is useless to attempt to induce the monied men of the district to try and develop any mining venture.

An offer has been made to some Sydney capitalists to work the reef, which I have reason to believe will be accepted.

The reefs at Little River are as promising as any in the Colony, and having already given good returns, and being situated in a highly auriferous country, it seems strange that nothing has been done to develop them.

All that is wanted is that a commencement should be made under good intelligent management. Then, should the venture prove a success, which is very probable, from past efforts, there is little doubt but that the whole line of reefs will again be taken up and worked.

Some time back the Homeward Bound Co. took up some 40 acres in different reefs. Having expended a large sum on the surface, and taken out a quantity of surface quartz from the only reef on which any under-ground work was done, and without seeing the bottom of the old shaft by 40 ft., the money being wasted, the leases were abandoned, and the plant for working the reefs, together with the sheds, houses, and tanks, are rotting on the ground.

The discovery of a copper lode in the Buddawang Ranges, about 6 miles from the Little River township, has caused some stir in the district. I am given to understand that the lode assays from 50 to 75 per cent., and ground adjoining has been taken up. The lode has been found on one of the blocks, and assays as well as that in the original find.

SOUTHERN DISTRICT—NERRIGA DIVISION.

(P. James Galway, Mining Registrar.)

I AM glad to state in furnishing annual report for 1886 that a great change for the better in the developing of this division has taken place. The Corang Company having commenced cutting their race from the Corang River to their 25-acre alluvial lease at the head of Sailor's Gully.

The Company also hold 45 acres for sluicing at same place under the Mining Board Regulations.

The length of race will be about 25 miles, and in crossing gully and low ground fluming will have to be erected, which in some places will be 70 ft. in height.

There are eighty men at present employed, and as the entire race is pegged and levelled and the cutting let out by contract, as many parties as wish to take a lot will be put on, the manager wishing to have it completed as quickly as possible.

A reservoir to cover some 200 acres will be erected in a gulch at the head of race, so as to impound all storms that would otherwise go to waste.

The portion of race already cut is first class, being 4 ft. by 2 x 2, and the ground appears well adapted to hold water.

I have visited the ground on which the sluicing operations will take place, and from the prospects obtained have no doubt that with sufficient water the Company have a grand property.

Another water-race from the Little River, about 1 mile above its junction with the Shoalhaven, to a 25-acre sluicing-claim near the Oalin Crossing, Shoalhaven River, is being levelled and laid out for cutting. The length will be 21 miles, and will command the watershed of the Buddawang Ranges, also the watershed of the entire length of the Little River. This race will always have a more permanent water supply than that from the Corang River.

The ground to be worked was before in the hands of a Company, and was worked with a Blake pump and a 30 horse-power boiler. A fine stream of water was raised 90 ft., and the prospects were payable; but bad management or want of experience spoiled the venture. The gold is in the ground, and only requires water and mining skill to pay for an economical expenditure of capital. If those ventures succeed no doubt water-races or pumping machinery will be introduced on many other parts of this division, as there is an almost unlimited supply of ground for sluicing.

My own idea is that raising water by steam-power is the quickest, cheapest, and most certain mode when the height the water is to be raised is under 100 ft.

Some years back I mentioned in the annual report from Little River that some miners bringing water through private ground here charged £50 yearly, this being far in excess of the entire value of the ground.

The Corang Co. have been blackmailed to the extent of £300 for permission to bring a portion of their race through some private land now let to a grazier for £20 yearly.

Should an Amending Mining Bill be introduced this power of extortion should be modified.

The dry year passed has prevented the miners washing up the dirt stacked during last and previous years, and also prevented any prospecting being done. A new discovery of gold was reported from Windellama, but scarcity of water has prevented the further development of the find.

SOUTHERN DISTRICT—ARALUEN DIVISION.

(*E. F. Carlile, Mining Registrar.*)

THE drought during the greater part of the year 1886 prevented a great deal of work being done, ground-slucing having been practically at a standstill, and several of the stripping claims having often not had enough water to wash with. When rain at last came there was not a sufficient downfall to make the lead-races run for more than a day or two at a time. The yield of gold, however, has been larger than that reported for 1885, to the extent of 332 oz., thus verifying the anticipation mentioned in my last report. This increase is to be placed to the credit of the alluvial workings, and an additional 205 oz. besides (total 537 oz.) for the yield from quartz fell off that much during the year. The actual returns are:—Gold won during 1885, 5,187 oz. 9 dwt. (being 4,962 oz. from alluvial, and 225 oz. 9 dwt from quartz), valued at £19,971 13s. 6d.; 1886—5,520 oz. 2 dwt. 9 gr. (being 5,500 oz. from alluvial and 20 oz. 2 dwt. 9 gr. from quartz), valued at £21,252 9s.; showing a gain in favour of the latter year of 332 oz. 13 dwt. 9 gr., valued at £1,280 15s. 6d.

No new ground has been occupied during the year; but at Bell's Creek a fresh Company has been formed for the purpose of extracting gold from pyrites. Some work has been done, and machinery erected in connection therewith, and a trial parcel sent to the Pyrites Works, Pymont, for treatment, the returns from which have not yet been received.

Most of the claims bid fair to maintain the present rate of yield for the coming year.

SOUTHERN DISTRICT—EUROBODALLA DIVISION.

(*Henry J. Lea, Mining Registrar.*)

I HAVE the honor to report that there has been very little progress in this division during the last twelve months.

M'Carthy and party have been prospecting about Nerrigundah for some time looking for reefs. They have come across what they consider a payable reef, situate on Tom North's Gully, Nerrigundah, and are sinking a shaft with a view of testing the stone, which looks well. Should it prove to be payable they will endeavour to erect a battery on the ground; if they do so it will cause a stir. There are a number of diggers, European and Chinese, fossicking about the old ground at Nerrigundah and the Deep Creek.

I sold during the year 36 miners' rights and 11 business licenses.

SOUTHERN DISTRICT—MORUYA DIVISION.

(*H. N. Barton, Mining Registrar.*)

I HAVE the honor to enclose herewith returns for the year ending 31 December, 1886, rendering you as accurate information as I am able respecting the district during the year.

In consequence of a claim, called the Prospectors, sunk at Mogo, on a flat called the Cabbage-tree Creek (a creek, by the way, until this year never bottomed on account of the water), in September last there was a rush of about 200 miners and others, and a good deal of excitement was occasioned in the district, especially when about 30 oz. were unearthed in the prospecting claim, but notwithstanding this find and some small results in the adjacent claim, after turning up nearly all the Cabbage-tree Gully, nothing of any great importance has been found, although good wages have been made by several parties, who still hope for great results. There are now about fifty diggers still on the ground, quite sanguine that with perseverance they will come on payable wash-dirt. This ground has always been patchy, but good finds have been made, and nuggety gold found all over the field at intervals.

All the ground at Mogo and the locality has been very dry for three years, hence the working of the Cabbage-tree, which could not have been touched before.

In the quartz several leases have been granted, and some of the shafts, which are down a considerable depth, show some excellent returns—as much (with primitive crushing) as 2 to 3 oz. to the ton.

One Company has been formed to erect machinery, and two others are talked of. I must say, although no rush has been called for, that mining pursuits in the Moruya subdivision and the district generally look more favourable than last year. The returns of gold through the Bank of New South Wales have been 304 oz. 12 dwt. 6 gr. from the district generally; but this can only be considered a small portion of the gross returns, as there are no means of ascertaining what has come by hand.

SOUTHERN DISTRICT—COOMA DIVISION.

(*D. E. Troughton, Mining Registrar.*)

GOLD-MINING during the past year has been very slack in this division, and confined to operations on a small scale on the Snowy, Umeralla, and Murrumbidgee Rivers. From these sources about 104 oz. have been purchased in Cooma during the year.

Silver and Lead.—Four applications for mineral leases were made at this office during the year, all for ground at Bredbo, for the purpose of mining for silver and lead.

The

The assays made of ore taken from this ground varied from 20 oz. to 60 oz. of silver to the ton. As yet little work has been done, but it seems probable that capital will be forthcoming to work the ground.

Miners' rights issued, 46; mineral licenses, 3.

SOUTHERN DISTRICT—BOMBALA DIVISION.

(*W. A. Dovers, Mining Registrar.*)

I HAVE the honor herein to tender my report as Mining Registrar of this district for the year now past. On the occasion of the last annual report it was with no small regret that I furnished evidence of great stagnation in our local mining industry, and I am pleased to be able on this occasion to refer to circumstances which show evidence of present activity, and clearly point to a further and renewed prosecution of the search for gold here.

The issue of miners' rights and mineral and business licenses is in marked increase on that of the past year, and, which is still more to the point, the amount of gold purchased bears a similar comparison.

Early in the year some excitement was caused by a small party of miners chancing upon good prospects in a creek flowing into the Little Plain River, about half-way between Bombala and Delegate. This discovery has not as yet been fully followed up, owing to the fact that the proposed claims are situated within a reserve, and come within the provisions of the 28th section; some delay, therefore, is inevitable; but I have gathered from the parties that they intend to start work shortly.

Further on, towards Delegate and amongst the old claims in and about China-town, some of the Chinese are working, but not, I think, with very great results.

The best find has taken place quite lately in the beds of the Delegate and Little Plain Rivers, at the point of their junction. In this spot there are several good stream claims being actively worked, and in most instances with markedly good results.

A new Company promising very active and systematic working is in process of establishment, for the purpose of mining for several metals, but principally for gold, on Cambalong Run, distant about 10 miles from Snowy River. The bulk of the land worked will not at first be Crown land. It consists of portions held conditionally or in fee-simple, but this will of course lead to the opening up of the adjacent country, which is at present unalienated. In fact the promoters of the scheme have applied for a lease of 40 acres, which as yet has not been granted, and they are in every way possible completing their preparations for the actual commencement of work. This scheme will undoubtedly give an impetus to our local mining industry, and be directly and indirectly a benefit.

The amount of gold purchased by the Banks in the district during the year 1886 is 254 oz. 16 dwt. 21 gr., at a price of £978 17s. 6d., as against 180 oz. 15 dwt. 9 gr., at a price of £698 11s. 9d., for the year 1885.

This is a marked increase, corresponding with a similar improvement in respect of the issue of miners' rights, &c., during the past year; and I may state that present holders of rights and licenses show every inclination to renew the same with the new year. In 1885, 1 miner's right, 3 mineral licenses, and 16 business licenses were issued; but for the year 1886 the numbers have greatly increased, being as follows: 40 miners' rights, 6 mineral licenses, and 29 business licenses.

Measures have been taken to prevent mining or occupation without right or license; and I hope during the current year to see still greater activity, and intend, if possible, to collect some representative specimens of our minerals for departmental inspection.

SOUTHERN DISTRICT—WAGONGA DIVISION.

(*A. M. Smith, Mining Registrar.*)

I HAVE the honor to forward my report for the year 1886 of the mining industry in this division.

Wagonga.

About 2½ miles from Wagonga River, North Head, there are three distinct gold-bearing quartz reefs. The Belle of Australia, the first that was discovered, with an average width of 3 ft., gives promise of being a remunerative venture under judicious management, trial crushings having proved beyond a doubt the value of the three amalgamated claims held under lease by Mr. E. J. Coman, comprising an area of 12 acres. I am informed that this property is likely to be formed into a limited liability Company, when machinery would be placed on the ground, thereby avoiding the expense of carting stone to the battery erected by Mr. T. Carter, of Sydney, which has lately been greatly enlarged with the latest improvements. Messrs. Carter & Wiley will require the machinery themselves when their claims on the Lady Carrington reef are fairly opened out, which will be about the end of January, and give employment to a number of miners. The John Forster reef, half a mile north-west from the last-named reef, shows good gold. The width of the reef is 18 to 20 in., and although no crushing of any quantity of quartz has as yet been made the numerous trials of stone taken at different depths in sinking the main shaft have satisfied the lessee that it will yield 2½ to 3 oz. to the ton. There are at present three claims at work on this reef. About 50 tons of quartz at grass await the completion of improvements on Messrs. Carter & Wiley's battery.

Mount Dromedary.

No main reef has as yet been discovered on the mountain, the veins, which are very narrow, running from 2 in. to 8 in., carry payable gold, as high as 4 oz. to the ton, having in some instances been obtained from small crushings of about 20 tons of stone. It may be said that the miners are a settled population in constant work, making at least fair wages. It is not a likely place for the investment of much capital, the veins being so narrow as not to allow the employment of many miners to advantage. Why this portion of the gold-fields should be retained as a timber reserve I have been unable to discover.

Tin-pot.

Situated on the River Tuross, 10 miles south-east from the township of Nerrigundah, and about 15 miles north-west of the Dromedary Mountain, Mr. Lomas Smith, of Sydney, the lessee of 14 acres on the Tuross reef, after fairly testing the ground, successfully floated this claim, which is now being efficiently

efficiently worked, in the name of the Tuross Gold-mining Company, under the management of Mr. W. A. Hunt. The present operations are directed to developing the mine by sinking shafts and tunnelling. 80 lb. weight of unpicked stone yielded at the rate of 56½ oz. of gold to the ton. Water-power is available for crushing and pumping—machinery area, dam site, and water-right being secured to the Company.

Rats-head.

At this place alluvial has been worked off and on for the last ten years. The ground is patchy, and not much gold has been won at any time. The gold is coarse, and in value not far below that of Nerrigundah, which maintains its price of £4 per oz. Lately a reef was discovered here upon which a shaft is being sunk. No opinion can be given of its worth at present. All that may be said of it is that the quartz is gold-bearing so far as the sinking has gone.

During the year 100 miners' rights have been issued.

22 gold-mining leases, comprising an area of 117 acres, have been applied for.

In conclusion, I would respectfully submit that before any report be made of payable gold having been discovered to secure a prospecting claim certain conditions should be imposed, such as a stipulated depth from the surface, instead of a few feet, upon which the report has been based (and there is nothing in the Act to prevent it), let it be made compulsory that the test should be taken at a depth of not less than 25 ft., whereby the attempt to mislead would, in a measure, be guarded against. The assay of 1 lb. to 56 lb. of stone is no criterion to go by in estimating the return expected from the treatment of 50 tons; the quantity tested is obviously of the utmost importance in order to form a reliable opinion of the value of a mine.

It is generally believed that, as the mines are beginning to show indications of improvement, more hands will find employment. There is room enough for five times the number of men at present at work. As for alluvial ground, there is none, consequently the whole of this division may be looked upon as quartz-reefing country. Mount Dromedary is a net-work of small veins, no main reef having been discovered, and likely to remain so until the diamond drill is applied; for in no other way can it be proved, the mountain having been worked in all directions during the last twenty years, and still miners hold the belief that there must be a rich main reef at a considerable depth from the apex.

TUMUT AND ADELONG DISTRICT—TUMUT DIVISION.

(*Mr. Warden Vynner, P.M., Tumut.*)

I HAVE the honor to furnish you with my annual report upon that portion of the Tumut and Adelong Mining District under my charge. I regret to say that the mining interests continue in a very depressed state, and there seems to be no probability of any reaction at present. Nothing short of the discovery of new ground of a payable character will bring about a revival, and of that there are no indications observable.

TUMUT AND ADELONG DISTRICT—GUNDAGAI DIVISION.

(*Mr. Warden Gordon, P.M., Gundagai.*)

IN presenting my annual report upon the mining industry in this locality I regret that I cannot announce any improvement during the past year.

Prospecting is still going on in various places, but nothing of a payable nature has been discovered.

Several of the quartz reefs that were supposed to have been worked out many years ago are again being prospected, to ascertain if the gold is to be found at a greater depth.

More capital than the district can provide is required to properly test these reefs, some of which yielded from 5 to 10 oz. per ton in old times.

The number of miners' rights issued during the year was 137, the number of gold leases applied for during the same time being 3 for quartz and 1 special for alluvial.

TUMUT AND ADELONG DISTRICT—QUEANBEYAN DIVISION.

(*Mr. Warden Woore, Queanbeyan.*)

I HAVE the honor to submit, for the information of the Honorable the Minister for Mines, my report for the year 1886 upon the Queanbeyan Division of the Tumut and Adelong Mining District, Captain's Flat.

I inspected the mines at this place on the 6th instant. At Blatchford's leases, now known as the El Capitan mine, the smelting furnace mentioned in my last annual report and an assay furnace and office have been completed, at a total cost, I am informed, of about £3,000.

In February last the Company let the working and smelting on contract, and operations were commenced immediately afterwards, and continued, with occasional stoppages from want of water and other causes, until September, with results said to be "fairly payable."

I am informed that about 100 tons of lead bullion, containing a little gold and silver, a quantity of which I saw on the ground, were produced during the period mentioned.

In September the contractor discontinued operations, and smelting has not been resumed since; but work in the mine has been carried on by the Company.

The main or middle tunnel has been extended 226 feet, and is now in about 526 feet.

The upper tunnel, or 90-foot level, has been extended 134 feet, and is now in about 334 feet. A rise of 146 feet has been made from it to the surface, and a cross-cut is now being driven west with a view of intersecting other reefs.

The lower tunnel, which is about 420 feet long, has not been extended.

At Montgomery's 7-acre lease, now known as the Koh-i-noor mine, a tunnel has been driven 240 feet through rock, at a cost, I am informed, of about £300, cutting the lode at about 100 feet from the surface, where it is 42 feet wide. About 400 tons of ore have been raised for smelting.

A smelting furnace, similar to that at El Capitan mine, has been erected by a contractor at a cost, I am informed, of about £2,500, and is not quite completed.

One of the parties interested in this mine informed me that smelting operations will shortly be commenced.

The present adult population of Captain's Flat, ascertained through the police on the 8th instant, is 103 Europeans and 1 Chinese.

No other mining operations worth mentioning have been carried on during the past year within the division assigned to me.

TUMUT

TUMUT AND ADELONG DISTRICT—TUMBARUMBA DIVISION.

(Mr. Warden Makinson, P.M., Tumbarumba).

I HAVE the honor to report for 1886 that all mining matters have been exceedingly dull in this division. At the Bald Hill the Basaltic Gold-mining Company has been steadily at work proving its ground, and although the manager has from time to time confidently predicted that the property would shortly prove a highly payable one, still the mine is yet an expense to the shareholders. The Comstock Company, at Isabella Reefs, has done but little during the past year, and now no work at all is being done. At Paddy's River, Hulsten and party opened a new reef, and, after crushing about 200 tons, gave it up. The return was about 6 dwt. to the ton. The Burra Sluicing Company had not sufficient water during the early part of the year, and their return was only moderate. At Yarrara (cut off from this division and added to Albury Division a few months ago), the Rangatira Reef Company took out its pumps last November, and abandoned work. No mining of any importance has been going on in that locality, only a few fossickers, working for a scanty subsistence.

The number of miners' rights issued here during 1886 was 173, being less than for 1885. The yield of gold has been, as far as can be ascertained, about 1,380 oz., being a decrease on the 1885 quantity. But little prospecting has been done.

TUMUT AND ADELONG DISTRICT—GUNDAGAI DIVISION.

(Charles W. Weekes, Mining Registrar.)

NEARLY all the quartz leases which were being prospected at the date of my last report have proved unpayable, and many are since abandoned. At the present time there is not a single gold reef in this district proved to be payable. Some prospecting is still going on, but not to a great extent.

TUMUT AND ADELONG DISTRICT—ALBURY DIVISION.

(Charles A. Conley, Mining Registrar.)

I HAVE the honor to report that a marked change for the better has taken place in mining matters, owing principally to a valuable discovery made in the Bungowannah Ranges, near the falls to Jindera, and north-west from Splitter's Creek. This claim is the property of a Melbourne Company, "The Bungowannah Gold-mining Company, no liability." They employ forty men, and have erected a 15-head battery, with all the most modern appliances for saving gold. In addition, they have constructed a very large dam, and are now excavating a check dam. 2,000 ft. of a tramway from tunnel to the crushing machine has been made, the tunnel having been driven 130 ft., the tunnel giving 50 ft. of backs. It is an immense dyke reef, and though they are 25 ft. into the reef the foot-wall has not been reached. The stone is quarried out, and will pay at 3 dwt. to the ton, but averages 10 dwt. Now that everything is in going order the manager reckons he can crush 250 tons per week. The machinery comprises a 15-head battery, driven by one horizontal engine, and works to 20-horse-power; boiler, 23 ft. 6 in. x 5 ft. 6 in., Cornish tubes, with Galloway's tubes, fed by donkey engine.

Another Melbourne syndicate have purchased The Soudan, situated at Splitter's Creek, and have twenty-three men at work. The machinery taken over from the late owners, composed of 5-head battery, being altogether too small. The Company contemplate, if prospects warrant, to erect a 40-head crusher, which they reckon can be kept going, as the Soudan is also a dyke reef, and contains a vast body of stone.

This Company have completed their dam, and are hard at work with their tunnel.

Several parties of prospectors are busy in the adjoining hills, and two or three good shows have been found, but have not yet been proved.

Messrs. Pyc and Wealands, of May Day Hill, Black Range, have had a very good crushing, viz., 75 oz. for 21 tons, which were taken out in sixteen weeks by two men.

Mr. W. H. Polkinghorne, of Hawkesview, has also had two excellent returns—one 135½ oz. from 29 tons, and the other 133 oz. from 30 tons.

TUMUT AND ADELONG DISTRICT—ADELONG DIVISION.

(J. James, Mining Registrar.)

THE year has been noted as one of mining depression. In May last an inquiry was made by Mr. Warden Baker with a view to a possible solution of its causes. Subsequently suspensions were granted to the gold-mining leases held by the Perseverance Company, Great Victoria Company, and the Messrs. Amos Brothers.

Mr. A. W. Molineaux, manager for the above, reports that during the early part of the year a considerable amount of prospecting was done in the Great Victoria and Flagstaff mines, but no encouragement was met with, and the work was stopped since September, till a larger amount of capital can be brought to bear; if such can be accomplished, no doubt there will be better results.

The business transacted during the year consists in the issue of 175 miners' rights and 4 business licenses, the receipt of 5 applications for gold-mining leases; conditional registrations, 22; 4 registrations in tenement register, and 3 in unsurveyed tenement register.

The escort returns are as follow:—

	oz.	dwt.	gr.
Commercial Bank	4,641	18	0
New South Wales Bank	1,158	18	15
Total for the year	5,800	16	15

The crushing returns are as follow:—

	tons	cwt.	oz.	dwt.	gr.
Reefer battery	1,493	0	1,230	13	0

With reference to quartz-mining, the old bunches may be reckoned as fairly worked out to present depths. If there be a future for the lodes to prove the existence of other bunches sinking must be resorted to.

The Challenger, an old contributor, has developed nothing during the year. A party are now following a small leader in the hanging wall in the hope of striking a make of stone.

The Curragong, another old identity, has of late improved. A party of tributors are following a cross leader about 90 feet from the surface. So far it has paid them over wages, and there is a prospect of several small crushings.

On Donkey Hill, at the Band of Hope mining tenement, Barbour and party, and the Hodge Bros.' gold-mining lease, nothing new has transpired. The results of crushings are about the same as that obtained in 1885. An extended claim on the middle line taken up by Rodda and party numbers the third tenement on this hill.

Gibraltar Hill has contributed small lots of stone. At present it does not possess a single durable tenement. Bunches are found and worked out in a short space of time with varied results not exceeding wages.

At the Gap, Adelong, the Crown extended quartz claim, Messrs. Evans and party, in the early part of the year, created a little stir, as a reef in soft ground, from 4 to 7 feet in width, was worked, and about 250 tons, averaging a yield of 1 oz. per ton, were taken out from January to September. The heavy rains setting in caused an excessive inflow of water. Baling with horse-power was ineffectual to subdue the water, and the party sought suspension for three months to obtain and fix a pump. All other claims on the line were flooded, and suspensions were applied for and granted.

The depth of the Crown shaft is 150 feet. There is also a drive 60 feet in length northerly, at level, 140 feet.

While I am writing two claims have amalgamated, viz., Allen and party, and Wiles and party, in order to strengthen the labour on a fixed line, and with a pump and gear ordered to arrive shortly they will be in a position to try the ground at greater depths. Evans and party have commenced to sink a new shaft.

At the Sawpit, an extension of the Gap veins discovered in 1885, another attempt at prospecting was made, but as the party were not backed they had recourse to driving out surface stone. The yields of three lots averaged over 11 dwt. per ton. These were not sufficient, as the cartage to the machine and the crushing barely paid £1 per week per man. The work was abandoned. However, another party has applied of late for the same ground, so that the Sawpit is still held in repute as a hopeful place for the prospector.

Alluvial.

The total quantity of gold obtained is 1,167 oz. 1 dwt. 12 gr. less than that obtained in 1885.

In my last report it was stated that at Mr. A. D. Shepard's lease preparations were being made to work it by a different system, viz., hydraulic injector. The works are now nigh completion. The old system, driving and blocking, has in the meantime gone on, but not with the full-handedness of former years, hence the decrease of gold for the year is to be largely attributed to this cause. The present new system devised by the enterprising proprietor is a costly one, and it is to be hoped all its expectations will be realized.

Mining on private property below Mr. A. D. Shepard's lease about 1 mile is the latest addition.

A test shaft was put down and driven in Mr. Crain's freehold. The speculation proved expensive; and the proprietor now allows a party to work on conditions. They are now following the course of a run of gold in a cross-drive. The ground is alleged to be payable.

Half a mile below Mr. Crain's land, a shaft was put down on Mr. C. D. Bardwell's property. It was done imperfectly, without the aid of a pumping engine. However, the prospects are alleged to be encouraging. A party of twelve have applied to Mr. Bardwell for conditional permission.

The above are practical proofs of the existence of extensive alluvial deposits in the old course of the creek, on purchased land adverted to as lands needing resumption.

TUMUT AND ADELONG DISTRICT—REEDY FLAT DIVISION.

(Henry T. Dixon, Mining Registrar.)

THERE is nothing of importance to report from this place. Mining is very dull. The miners complain that there is no land to mine on, it all being taken up by selection. Plenty of reefs are known to exist, but they are on selected land.

TUMUT AND ADELONG DISTRICT—TUMUT DIVISION.

(Charles J. Lloyd, Mining Registrar.)

I HAVE the honor to report, for your information, that mining in the Tumut Division of the Tumut and Adelong Gold-field is very slack. There is no reef work going on at all; the only workings are alluvial, in old and abandoned ground that has been worked years ago. The local Banks report that they have bought no gold during the last year, the quantities offered being only a few dwts. at a time.

686 oz. 6 dwt. 10 gr. have been escorted from Tumut to Adelong during the year 1886. The Gold Receiver here informs me that over 300 oz. of this amount came from Kiandra.

Fifty miners' rights were issued during 1886. The Tumut Division is a large one, and it is very difficult to find out what the miners are doing; but the amount of gold sent from here through Adelong shows that there is not much found here.

TUMUT AND ADELONG DISTRICT—KIANDRA DIVISION.

(*W. D. Bailey, Mining Registrar.*)

I HAVE the honor to forward my report for 1886. Unfortunately I cannot record any improvement in mining matters.

The number of miners' rights issued was 117.

The amount of gold won was considerably less than in 1885, but I cannot give a full account, owing to the absence of the largest Chinese buyer. In the winter there was no water on the field, and nearly every person was out prospecting, but nothing payable was found. At the Eight-mile two parties were working on tribute—one washed up with fair returns for time engaged sluicing; the other will wash up in about a fortnight. They cannot give an opinion of the result of their labours. No work has been done on either North or South Bloomfield claims, the proprietors having obtained suspension of work.

At the 15-mile claim work was carried on while the water lasted. Result, medium.

Mr. Drummond, manager of the Empress Company, reports:—During 1886 I repaired and extended the head-races, tail-race, and dams, and other preparatory work. We had no water till August, since which time the season has been a fair one for water. I had a wash-up in December with very fair results.

Mr. Pallinson, manager of the Kiandra Gold-mining Company, reports:—During January we began to prepare for working the mine on a larger scale. All the races leading to the mine have been enlarged, and the embankment of the 3-mile dam was also raised 4 ft., making a total height of 44 ft. When full there is a depth of 40 ft. of water. The dam now has a capacity of over five million gallons.

We began sluicing with two nozzles on the 18th of March, but, unfortunately, we experienced a very dry season, and only sluiced 413 hours till the 31st July, but since that time we have had a good supply of water. We have 30 ft. in the dam at the present time. We usually have our general clean up about the end of December, but owing to the very short supply during the first seven months of the year we will not clean up till the first week in February. This accounts for the small yield of gold. In October we cleaned up 300 ft. of boxes for a yield of 386 oz. Since then we have run each nozzle 850 hours, washing away about 222,000 yards of earth.

Henry Hooper and party have applied for two leases on Township Hill—one of 25 acres, the other 14 acres. On this they have driven a tunnel 6 ft. high, 7 ft. wide, 464 ft. into the hill, the last 200 ft. passing through hard silurian slate intermixed with quartz veins. They sunk an air-shaft 50 ft. deep, which tapped the tunnel 180 ft. from its mouth.

No quartz-reefing in this division.

Mining is very dull, several Companies, not getting anything payable, have, to a great extent, suspended operations. One party has taken up two leases on Township Hill, and have tunnelled 400 ft., and they are now engaged putting in a jump-up. The Kiandra Gold-mining Company, at New Chum Hill, and the Empress, at the Nine-mile, are the only hopeful sluicing Company claims at present.

PEEL AND URALLA DISTRICT—GLEN INNES DIVISION.

(*Mr. Warden Martin, P.M., Glen Innes.*)

THE year just closed was a most favourable one for the miner in my division, in so far as an abundant rainfall could assist its operations. Forty-six inches fell at Emmaville during the twelve months, and, as running water was to be found in nearly every depression between the hills, advantage was taken of the supply to sluice much poor ground hitherto unworkable for want of water on the spot. Notwithstanding this favourable condition, however, and the added stimulus of an increased price for tin, the output, as compared with the previous year, fell off by 520 tons 4 cwt. 3 qr.

This falling off was wholly in the lode and shallow workings, the deep leads having slightly increased in productiveness. As bearing upon the present condition of tin-lode mining in this division, the manager of the Tent Hill Smelting Works reports that:—

“Our battery has been continuously at work during the year, principally in treating stone raised from our Ottery Reef.

“We cannot report any improvement in the quality of stone crushed, viz., 2,419 tons 6 cwt. 3 qr., from which we obtained 79 tons 21 lb. of tin ore.

“We are now putting in a large tunnel at the Ottery, which, at the end of the year, was about 200 feet in, and confidently expect to cut the reef at a greater depth than in any of the present shafts.”

The tin ore from all sources won during the twelve months was as under:—

	tons	cwt.	qr.	lb.
Vegetable Creek—Deep leads	962	8	0	13
Lode..... .. .	169	13	0	0
Shallow..... .. .	761	1	0	0
Glen Innes—Shallow workings..... .. .	227	18	0	17
Grand total..... .. .	2,121	0	1	2

Which, at £57 per ton (the average price at the smelting works), gives a value of £120,897 14s. 4d.

The manager at the smelting works reports having received 1,261 tons 3 cwt. 6 lb. of tin ore for reduction during the year, and that the output of refined tin forwarded to Newcastle was 858 tons 17 cwt. 3 qr. 1 lb.

The average number of miners engaged in tin-mining in the division was:—Europeans, 390; Chinese, 472—at wages unaltered from past years.

Silver.

Silver.

Systematic and sustained operations to test the value of the silver-bearing lodes in the division may be said to have been wholly confined to the claims at Little Plant Creek, held by Webb's Silver-mining Company.

The resident manager reports that:—

"Along the reef several shafts have been sunk, ranging from only a few feet to 210 feet in depth, making an aggregate of about 760 feet. Drives also have been extended at various levels to a distance, in all, of about 500 feet. In almost every case payable ore has been met with.

"The deep workings are most encouraging. At a depth of 150 feet the lode has been found to carry a well-defined wall, which continues unbroken to the present deepest point, 210 feet.

"The clearance also of the surrounding country (rock), which above is almost at right angles to the lode, is here almost parallel to it. The ore also holds its own in depth and bulk. Assays are equal to, and sometimes surpass, those which have been obtained nearer the surface.

"All these facts point to the permanence of the lode, and should, in my opinion, dispel all doubts as to the future prosperity of the field. The work hitherto has been strictly exploratory, with a view to testing, as well as developing, the lode in various parts.

"However, 900 tons (nearly) of ore, containing over 30,000 oz. of silver, have been raised and stacked to await erection of reduction works.

"The Company is contemplating the erection of concentrating and reduction plant, and it is hoped that larger returns will be made during the present year."

At Pye's Creek little has been done beyond putting down trial shafts on the various lodes, and work has for some time been in abeyance, pending the issue of attempts being made to float Companies to work the mines.

The lodes are of a most promising nature, and worthy of more attention by capitalists than has been bestowed upon them.

Beyond assay specimens, no silver has yet been produced from any part of the division.

Gold.

Increasing attention has been given to mining for this metal, in consequence partly of the overflow of labour from the tin mines, and partly from the inducement held out to capital under the regulations permitting the issue of special leases over large areas of old or abandoned ground.

At Oban tin and gold are found associated, and about sixty miners (principally Chinese) have been at work there during the year.

At Glen Elgin the Company formed to work the river-bed have been actively engaged in carrying out a well-planned scheme to drain the watercourse, and the managing director, Mr. Alfred Cadell, reports that:—

"The operations of the Glen Elgin Gold-slucing Company (no liability) have been carried on with a view to cutting a channel for the Glen Elgin (or Rocky) River, through a ridge on the eastern side of the watercourse to Curry's Gully, and thereby diverting the river and lowering the water about 10 ft. from the level at which it usually stands at that point, in consequence of being dammed back by hard granite bars. These bars also prevent the escape of sand and accumulated tailings, the result of sluicing for gold in the river before the field was abandoned.

"When the proposed cutting is completed this sand and tailings should be swept through the new channel, leaving but a small stratum in the bed of the river to be removed to get at the gravels, in which payable gold is expected to lie.

"The cutting is being sluiced out by means of a strong head of water raised by a centrifugal pump at the river, and flumed thence about 850 ft. through a pipe 10 in. in diameter, at an elevation of 47 ft. 6 in. above low-water level, to the ridge known as the Red Bank, through which the cutting is being carried.

"From the point where the fluming strikes the ridge a race about 1,200 ft. long, with a depth of about 10 ft., conducts the water to the other end of the cutting in Curry's Gully; and the drift from the cutting is thus carried by the water through Curry's Gully into the river at a spot some miles below that at which the pump is fixed.

"The supply of water from the pump is supplemented from a race known as 'Aked's race,' about 4 miles long, cut to convey the water, which in wet seasons is supplied abundantly from Stebbard's Gully. By these combined streams Curry's Gully is kept clear from all debris sluiced from the cutting."

"To concentrate the force of the water through Curry's Gully the upper part of the gully has been logged up to form a tail-race over 500 ft. in length, and varying in depth from about 5 ft. downwards.

"The stuff from the cutting is thus carried without difficulty through that part of the gully where the least fall exists, and beyond that the fall is more rapid to the river.

"At the Curry's Gully end of the cutting a granite bar was found, which required picking for a width of about 200 ft., and consequently the progress was but slow. After passing that bar, the granitic drift, of which the Red Bank is chiefly composed, was carried away by the water very readily, about 8,000 cubic yards being sluiced out during one month.

"The intention now is to sluice off the upper part of the cutting to a depth of 20 to 25 ft., and then to lower the delivery pipe of the pump to that extent. When at the reduced lift double the quantity of water nearly can be raised by the pump, and conducted by two fluming pipes (each 10 in. in diameter) to the face of the cutting, instead of by one only, as at present.

"With this increased flow the work should proceed much more rapidly, as the present level to which the water is raised is excessive for a 10-in. column. The pump in use is one of J. H. Gwynne's special 10-in. centrifugal pumps, driven by a 16-h.p. engine, and it does its work excellently. (For such high lifts I have found no pumps better than those of that firm's make, No. 3 pattern, with bearings and standards on each side of the driving pulley.)

"The engine is one of Ruston, Proctor & Co.'s 16-h.p. (portable), with all latest improvements, and the increased speed required is obtained by means of intermediate gear.

"The engine stands on bed-logs, and all the appliances are substantially fixed at a level beyond the probable reach of floods. The pump well is timbered and slabbed throughout (depth 21 ft. 6 in.), and a race also secured with timber throughout its entire length (132 ft.), conducts the water from the river to the well.

Engine

"Engine, gear, and pump are enclosed in buildings roofed with galvanised iron. The fluming is supported on trestles (stayed and braced) placed at intervals of 9 ft., and varying in height from about 45 ft. to 5 ft.

"Other buildings have been erected in connection with the works, *e.g.*, blacksmith's shop, manager's house, store-room, &c., and a paddock has been fenced for horses.

"Trial shafts have been sunk along the line of the cutting, and the ground tested with boring rods.

"All is in working order, and the work is being carried on with as many men as can be advantageously employed by the Company.

"Before taking the engine to the works the Company repaired and made the road in sundry spots through a distance of, say, 4 miles, between the Red Bank and Bald Nob Causeway, being constructed over gullies, and some culverts, &c., built.

"The whole of the subscribed capital of the Company has been exhausted in the works, and preferential shares have been issued to provide funds for the completion of the cutting, &c.

"The cutting will contain about 200,000 cubic yards."

About 350 oz. of gold were won during the year, from the alluvial, mostly at Oban—in value at £3 15s. per oz., £1,312 19s. From Timbarra to Oban gold is very generally disseminated in the broken granite country, on the eastern fall of the Tableland, and adventurous bands of miners in the early days of the gold-fields were well rewarded for their enterprise by the discovery of rich patches in the alluvial at Timbarra, Glen Elgin, Oakwood, and Oban.

As the colour can be obtained everywhere in this long stretch of country, it seems singular that none of the numerous reefs have as yet been proved to contain payable gold. Indications pointing to these reefs as the probable source of the free metal are not wanting, and some fortunate prospector may yet discover close at hand a mine of wealth which the average digger is accustomed to look for only in costly rushes to distant and often unhealthy localities. Years ago water-worn pebbles of quartz with gold freely exposed on their rounded surfaces were picked up in the bed of the Mann River, at Newton-Boyd; but although search was made upwards in the wild country through which the river flows the golden matrix whence the pebbles came was never dropped upon.

At Kookabookra a gold-bearing reef was opened, and samples tested at the Mint gave an ounce to the ton.

The stone tested was not rich, but as the deepest sinking was only 30 ft. it is quite within the bounds of probability that a timely assistance of capital might have enabled the needy prospector to reach at a greater depth a more valuable result of his labours.

The discovery of a payable reef on the line I have indicated would do much to open up a rich but neglected belt of mineral country, and it would be well to devote a portion of any money available for prospecting purposes towards a search in the direction I have pointed out.

Bismuth.

At the Kingsgate mine an average of about thirty men and boys have been at work, and the output, according to the returns of ore forwarded to Newcastle by railway, has been 82 tons 12 cwt. 2 qr. 15 lb. This, at the rate of £250 per ton (the ore being averaged at 50 per cent.), gives a total value of £20,656 5s. No reduction of this ore is attempted in the Colony, as it is found more profitable to have the work done in England.

PEEL AND URALLA DISTRICT—BINGERA DIVISION.

(*Mr. Warden Lawson, P.M., Bingera.*)

I HAVE the honor herewith to submit my annual report of the mining industry in the Bingera portion of the Peel and Uralla mining district. Although favoured with an unusually heavy rainfall this season, affording every facility for prospecting, results have not realized expectations. Mining matters are as follows:—

Copper.—The Prince of Wales mine all silent.

Silver.—The eleven leases at Upper Bingera abandoned.

Diamonds.—The machinery and plant of the A. D. M. Company still idle—a few men working testing ground. Only Craddock and party, who hold very good ground, have manifested the perseverance that merits success.

Gold.

Bingera.—H. Miller and party have reopened the All Nations reef on the hill. The returns from the trial tests have been so satisfactory that they intend to erect a battery to develop the reef.

Bobby Whitlow.—Still continues to support a few old residents, small consignments of gold coming in regularly. Tenders are invited for trial shafts on the Prospecting Reserves in this locality.

Upper Bingera.—Very little doing, although a number of leases have been cancelled.

Barraba, Tea Tree.—During the year the Pioneer G.M. Co. have erected a battery. In spite of finding some very rich patches of stone, the general result has not elated the proprietors. Some 3 miles distant Johnson and party struck some rich stone; leases are taken up some distance along the line.

Woods Reef.—Some rich ground has been opened up extending several miles. The Old and New England G.M. Co. have abandoned their lease, now reoccupied by new hands. The adjoining lease has yielded very rich specimens; the proprietors are erecting a battery. Several parties are on payable gold. During the past year more gold has been unearthed than in 1885. Greater activity and vitality exist, especially in the Barraba section.

PEEL AND URALLA DISTRICT—TAMWORTH DIVISION.

(*Mr. Warden Irving, P.M., Tamworth.*)

THERE being Wardens in charge at Uralla, at Nundle, and at Bingera and Barraba, and there being no proclaimed gold-field in my portion of the above mining division, I have but little to report.

Twenty-five miners' rights and three mineral licenses have been issued by me during the year 1886, but I am unable to state how many miners are working in my portion of the mining division.

Gold is occasionally found in the Swamp Oak and Mullah Creeks. No reef deemed payable has yet been found in that neighborhood.

Lately some prospecting for gold has been tried 2 or 3 miles from Tamworth, in the ranges behind the town. I have been shown some gold in minute specks, stated to have been taken from the casing of a small reef in those ranges.

There is no mining for copper now being carried on in this portion of the mining division. There is some mining for tin, I believe, pursued on the extreme border of what may be considered my district; but I have no knowledge of the amount of success such mining has achieved.

I may say the same of some manganese mines.

I regret I have not a better report to make, but I do not hope much, from all I know of the country round Tamworth, as to its being likely to afford employment for a mining population.

PEEL AND URALLA MINING DISTRICT—SCONE DIVISION.

(*Mr. Warden W. F. Parker, P.M., Scone.*)

I HAVE the honor to submit my report of the working of this gold-field for the year 1886, viz., at Moonan Brook and Stewart Brook, distant about 40 miles from Scone. At Moonan Brook about 230 tons of quartz-stone have been raised and crushed during the year, giving an average yield of about 1 oz. of gold per ton. There are only four claims being effectively worked here at present. One of these, Messrs. Williams, Barber, & Co.'s claim, situated on the Crow's Nest Hill (the highest point of which is nearly 5,000 ft. above the level of the sea), commenced sinking a new shaft, and have already raised about 10 tons of quartz, which they estimate will yield $1\frac{1}{2}$ oz. of gold to the ton, and with appearance of improvement. This shaft is distant about $2\frac{1}{2}$ miles from Moonan Brook township, on the brow of a very steep hill, about 800 ft. higher than Moonan. Mr. E. Williams, one of the prospectors, informed me that during the latter part of last year he had raised 12 tons of quartz from a spot on the same hill, distant about $\frac{1}{2}$ mile, $6\frac{1}{2}$ tons of which yielded 7 oz. of gold to the ton, and the remaining $5\frac{1}{2}$ tons 3 oz. to the ton; thus affording strong evidence that if the field was prospected to any extent good average returns would be obtained, and the water-power quartz-crushing machine now lying idle also would be fully and profitably employed. The chief difficulty that the miners here have to contend with is the large amount of labour required in conveying the quartz to the crushing mill, thus making it too costly for anything but good stone that would go at least 1 oz. to the ton. There is any quantity of stone to be raised both here and at Stewart's Brook that would yield from 5 to 10 dwt. of gold per ton, which, of course, would not pay for the cost of labour. The country around here at the present time looks beautiful, an unlimited supply of both grass and water. Messrs. Tegg and M'Laughlin are now engaged in sinking a shaft on Fuller's Reef Hill, being down about 50 ft., taking out stone for crushing, which they hope will yield well.

At Stewart's Brook, distant about 6 miles from Moonan, there are five claims working on quartz-ground, employing ten miners. The water-power quartz-crushing machine here has been idle during the whole year, with the exception of one crushing.

The claim of Messrs. Ahearn and party looks very well. They inform me that out of a small lot of 2 tons of quartz out of this claim 17 oz. of gold were obtained. There are about 200 tons of good quartz-stone at grass now awaiting crushing, 100 tons of which they estimate will go 4 oz. to the ton, and they expect the machine to be at work before the end of this month.

Respecting the prospect of the field generally, I regret to inform you that my anticipations for last year have not been realized; in place of an improvement there has been a falling off. If the quartz-stone raised at Stewart's Brook had been crushed before the end of the year, the yield of gold for the year would have been at least equal, if not in excess, of the return for 1885. As it is, about 300 tons of quartz have been crushed, realizing about 300 oz. of gold. There is no prospecting going on at present. If the claims at Stewart's Brook turn out well no doubt there will be a small influx of miners, which may lead to some prospecting being done. Respecting the other particulars, I beg to refer you to the report of the Mining Registrar forwarded by same post.

PEEL AND URALLA MINING DISTRICT—NUNDLE DIVISION.

(*Mr. Warden Jones, P.M., Nundle.*)

I HAVE the honor to submit my annual report upon the mining industry in the district under my charge, including Nundle, Bowling Alley Point, Dungowan, and the Hanging Rock, in the Peel and Uralla Mining District.

Although the expectations formed by me at the close of 1885 of the progress that would be made in this district during the past year have not been fully realized, I have the pleasure to report a decided improvement in the win of gold from quartz and alluvium, and a slight increase to the mining population, despite the allurements of Kimberley, Teetulpa, Fairfield, and other rushes. A few of the miners did leave this field, almost all of whom have returned, and more impressed than ever that their chances here are better than at any of the places they had visited, taking into consideration the advantages of a knowledge of the gold-bearing localities, a climate that cannot be surpassed in its salubrity, and situated in the centre of a rich agricultural district, insuring cheap supplies, and distant from the metropolis one day's easy travel.

Quartz.

This branch of mining shows an increase in tons crushed of 126 tons, with an increased average in the win of gold per ton of 10 dwt. 17 gr., totalling 287 oz. 10 dwt. in the quartz crushed at the machines, with the further substantial increment of 128 oz. from stone hand-crushed from the small veins near the Hanging Rock and other localities. During the year two very good reefs were found near Madden's Gully, between Nundle and Bowling Alley Point, and are now profitably worked, being situated about $1\frac{1}{4}$ mile from the Marquis of Lorne machine. These reefs are known as the Scandinavian and the Bonny Dundee. From the former 70 tons have been crushed, with a result of 120 oz. of gold of such fine quality that it realized at the Mint £3 17s. 6d. per ounce. The reef averages over 12 in. in width, and at present in easily-worked ground, but from its appearance will ultimately form between hard diorite walls. The Bonny Dundee have not yet had a crushing. From the look of the stone I expect the returns will be almost equal to the Scandinavian.

I regret having to report that a fair prospect of the large reefs found east of the Serpentine at the Hanging Rock has not been made during the past year. This has not occurred from the want of confidence by the miners in their being payable, but solely from the want of means to continue prospecting.

So

So far the returns are from 4 dwt. to 14 dwt. per ton. This would pay splendidly with crushing machinery near at hand, as the reefs are large and in easily-worked ground; but they cannot be prospected by the working miner without the aid of capital. These remarks are equally applicable to the Lady Mary and other reefs where the miner has worked for months to find that the whole returns of his labour have been absorbed in the heavy expenses incidental to quartz-mining, with a cartage of 9 to 10 miles in addition thereto. The miner has then to fall back upon the alluvium, and if fortunate enough to obtain another small rise he will probably return to his abandoned reef to face a lot of dead-work in accumulated water, shafts, drives, &c., fallen in, to end again, from the want of capital, in the previous result. Then, as instances have occurred here of others taking up the ground, being backed with capital, obtaining almost immediately profitable returns, assisted to the result by the unremunerated labour of the original holder.

There is a grand field here for the prospector and the capitalist, and I feel convinced that, after a residence of three years, this place will yet take a leading position in the reefing districts of the Colony.

Alluvium.

Having had a fairly good supply of water during the past six months, this class of mining shows an increase in the win of gold of 172 oz. 9 dwt. 6 gr. upon the year 1885. There has not been any systematic prospecting done in the alluvium, with the exception of Hale and party, on their 10-acre G.M. lease at Anderson's Flat, Bowling Alley Point. They made great efforts to contend against the large influx of water, and with the aid of a powerful Tangye pump succeeded in reaching the wash, and obtained an encouraging prospect of fine gold of good quality. Owing to the heavy rains continuing, it was found their machinery was not of sufficient power, and they were reluctantly compelled to suspend their operations to a more favourable time. I shall be glad to see work recommenced and a fair test given to the ground. It is the opinion of several old miners that if the water difficulty is once surmounted this will become a very valuable mine, open up a good piece of country, and give remunerative employment to a number of miners for many years. No prospecting for the lost rich cement leads has been made. The increase in the win of gold from the alluvium has been obtained principally by the Chinese from old and abandoned creek and river claims; and as they carry on with their workings a substantially constructed tail-race, they are enabled to command a large area of old ground, employing a considerable number of their countrymen beyond what is required by the regulations to hold the ground, but they do not take out miners' rights for the surplus labour; therefore the miners' rights issued do not show the actual number of miners employed on this field. The cement claims (leases): Henderson and party, abandoned their ground for the past four months, owing, I am led to believe, from a divergence of opinion among the shareholders as to the mode of continuing the working, and as neither side would give way, it resulted in the abandonment of the leases. I reported to you the non-compliance of the labour covenants, and recommended the cancellation of the leases. This ground will not be long idle after the cancellation is effected. Mt. Ephraim has been worked during the past year in its usual primitive mode of mining. Mr. Wilkinson's suggestion to sink or drive for bottom (the nature of the ground permitting of either) has not been carried out. This claim cannot, as I have previously reported, be efficiently or profitably worked without the necessary hydraulic appliances and other machinery. The present working shareholders are in the position to incur this expense. This claim has been worked by the present holders for upwards of ten years, and never bottomed. Fine gold has been obtained from the surface to a depth of 70 feet, and to a width of 150 feet.

Copper.

Nothing done in this section of mining with the exception that a good test was given to several tons of ore from the Mount Pleasant mine, Dungowan. It was found auriferous, but not payable.

Chrome-iron.

Mr. J. Balfour, of Sydney, took up 120 acres of abandoned leases, situated at Bowling Alley Point, containing quantities of this mineral upon the surface. Nothing towards the development of this class of mining has been done by the proprietor, either in removing ore or prospecting.

I have the pleasure to tender my best thanks to Mr. Isaacsohn, the largest gold-buyer on this field, to Mr. Paul Prisk, of the Hanging Rock, and to other buyers, who so unreservedly placed the records of their transactions at my disposal, to enable me to accurately estimate the gold won during the past year.

The Mining Registrar will furnish a report from the records of his office.

PEEL AND URALLA DISTRICT—ARMIDALE DIVISION.

(*Mr. Warden C. E. Smith, P.M., Armidale.*)

IN submitting my annual report of the gold won during 1886 in the portion of the Peel and Uralla Mining District under my charge, I have the honor to state my anticipation of a more prosperous season, alluded to in my last report, has been to a certain extent realized by an almost superabundant rainfall, which for considerable intervals retarded alluvial and sluicing workings, and, more or less, nearly all mining operations.

The quantity of gold obtained is estimated at 4,000 oz., and it is alleged that fair wages are earned by miners who are engaged in work at sluicing or in shallow alluvial deposits.

At the Duval Gold-field the find has been small, and too much water has interfered considerably with the work on alluvial claims. A reef has been discovered, and crushing machinery will shortly test the quality of the stone, which, if half as rich as the specimens exhibited, will give a handsome return to the proprietors.

The Eleanora Gold-mining Company having purchased the Isabella mine and plant, have increased the size of their battery by an addition of fifteen stampers, which are now ready for work. The Company report having crushed 3,301 tons of stone for a yield of 1,841 oz. 19 dwt. 21 gr. It is alleged £45,000 was offered for their mine, and refused.

Tin-mining appears to be on the decline, as only 10 tons of ore were raised by two Companies, and work is now at a standstill by all the Companies.

PEEL

PEEL AND URALLA DISTRICT—TINGHA AND INVERELL DIVISIONS.

(Mr. Warden Fraser, P.M., Inverell.)

I HAVE the honor to report on the mining industries in the divisions under my charge for the year ending 31st December, 1886.

The output of tin ore for the past year amounts to about 1,600 tons, being a decrease on the previous year's yield of some 200 tons. The ore thus obtained has been entirely got from alluvial claims. These claims are nearly worked out, and unless fresh finds are discovered our output must still decrease. Our mining population has decreased by the migration of about 500 Chinese miners.

The high price of tin has stimulated prospecting, and the numerous reefs on the field are attracting attention. At Sutherland's, Bull's Gully, the old Boliths, the Butchard, and along the range dividing the waters of Middle Creek from Cope's, the reefs are being tested with good prospects, and capitalists will find a good opening for investments.

The diamond-field in the parishes Mayo, Clare, Auburn Vale, Gum Flat, and Stag, is being largely taken up. Heavy finds of small diamonds have been got in several claims; but from defective appliances many stones are lost. By amalgamating interests and introducing improved machinery this industry should succeed, and result in the employment of a large number of miners. Gold and silver are also found in these parishes.

The average value of tin ore on the mines for the past year has been about £54 per ton.

During the year 675½ acres of land have been taken up at this office under mineral lease applications—chiefly for diamonds. Five miners' rights and fifty-five mineral licenses were taken out. This is exclusive of the business done at the Tingha office, which will appear in the Mining Registrar's report there.

PEEL AND URALLA DISTRICT—GLEN INNES DIVISION.

(Vere D. H. Bernard, Mining Registrar.)

I HAVE the honor to transmit herewith my annual report of the Glen Innes Division of the Peel and Uralla Mining District.

There were sold from this office during 1886, 76 mineral licenses, 75 miners' rights, and 4 business licenses; the numbers issued during the previous year being 41, 85, and 4 respectively.

The break up of the long drought has considerably stimulated mining matters here, 19 applications for mineral leases having been made to me, 520 acres in all having been applied for, as against 3 in 1885, with a total area of 80 acres.

Four gold leases, all at Glen Elgin, were applied for last year—in all 200 acres, 5 having been taken up in 1885, comprising an area of 117 acres.

It will be seen from these figures that a marked improvement exists with respect to mining matters in this division.

The difficulty of obtaining accurate information respecting the yields from mines still continues.

The shareholders in the Glen Elgin 80-acre lease, mentioned in my last report, have not been able, I am informed, to make such progress with the work at the creek as they expected, the difficulties to be overcome being considerably greater than they at first anticipated, but it is stated that there is about £600 worth of machinery on the ground.

PEEL AND URALLA DISTRICT—TINGHA DIVISION.

(W. Norton, Mining Registrar.)

I HAVE to report that during the past year there has been a falling off of 185 tons in the output of tin, though in consequence of the higher price obtained the value of the tin raised exceeded that of last year by £1,908.

In consequence of the working out of the shallow ground attention has been turned to the deep ground. Several shafts are being sunk with every hope of success. A good deal of ground has been taken up for the purpose of diamond-mining, and good results obtained, but the great drawback seems to be that there is no local market for the stones.

PEEL AND URALLA DISTRICT—URALLA DIVISION.

(Henry Roman, Mining Registrar.)

IN consequence of the death of Mr. A. M' Rae, late Mining Registrar, having been appointed temporarily his successor in that office, it devolves upon me to furnish the annual report for this gold-field, which I have now the honor to submit.

During the past year the heavy rainfall, and consequent abundant supply of storm and catch water, has had a marked effect in increasing the yield of gold from this gold-field, which, at the present time, is mainly worked by sluicing operations.

In other respects mining has not been carried on to any great extent.

At the close of the year the Long Tunnel Company decided to wind up its affairs, and the plant, mining tenements, and interests were sold to two locally resident miners.

Kingscote's Company for working Brown's Paddock (private property), is still in abeyance, and has not commenced working; the cause assigned for this is the non-arrival of machinery.

At Maitland Point machinery has been erected with which to rework the bed of the Rocky River. Messrs. Perry & Co., the proprietors, estimate that by their process, with seven men working, they will be able to excavate and sluice 300 tons per day, which, if accomplished, should give them very handsome returns. The machinery is not yet working, but is nearly completed, and in a week or two this party expects to be in full operation.

The official visit of Mr. David, Geological Surveyor, and Mr. Stonier, of the Mines Department, their survey, inspection, and report thereon, has caused some activity amongst the resident miners, and several blocks of ground have been taken up in the direction pointed out by Mr. David as the probable continuation of the Sydney Flat lead by Mount Doherty. One shaft (Rice's) has been sunk into the bottom drift, showing very favourable indications, as also gold. The water, however, is heavy, and pumping gear and machinery must be obtained before the ground can be fully tested and developed. The sinking is heavy (basaltic) and deep.

There

There has been reported a discovery of payable gold at Green Gully, near Uralla, but it proved to be only a small patch, and the prospectors have since deserted the ground. The country in this locality is shallow sinking, with patches of surface gold.

The gold which has been locally sold, so far as can be ascertained, amounts to 1,607 oz., the value of which, at Mint rate (£3 19s.), gives a total of £5,625. Beyond this other gold has been conveyed hence by private hand, the amount of which cannot be obtained.

The number of miners' rights issued during the year was 141; business licenses, 4; and mineral license, 1.

There are at present upon this field about 150 European miners and 25 Chinese miners.

PEEL AND URALLA DISTRICT—ARMIDALE DIVISION.

(Charles S. C. Badham, Mining Registrar.)

I HAVE the honor to submit my report of the operations of this portion of the mining division for the past year.

About thirty men are engaged upon the Tilbuster or Duval field in alluvial gold-mining, and seem to be doing well, and about fifteen are similarly employed at Puddlework.

Ten persons are working at claims on a quartz reef recently discovered at Tilbuster, said to contain very rich stone, but no crushing therefrom has yet been reported.

The following areas of ground were applied for under their headings:—

Gold-mining lease, quartz	27 acres.
Mineral lease	40 „

There were sold during the same period:—

Miners' rights	137
Mineral licenses	10
Business licenses	7

I am unable to quote any particulars of the average yield of gold from claimholders, owing to the reluctance of the miners to furnish such information, and the amount purchased at the local Banks and stores is no accurate guide, as the larger proportion is sent elsewhere for sale.

PEEL AND URALLA DISTRICT—WALCHA DIVISION.

(Edward Marriott, Mining Registrar.)

HEREWITH I have the honor to submit my annual report for the Walcha Division of the Peel and Uralla Mining District for the year 1886.

2. Although the yield of gold in this district during the past year shows very little improvement there has been considerable activity, several prospecting parties having been out searching for gold; many claims have been registered and several leases taken up in various parts of the district, as will be seen from the increase in the number of miners' rights issued, as compared with previous years.

3.—Glen Morrison Gold-field.

From a report received from the mining manager of the Glen Morrison Prospecting Company, I am informed:—“The work done up to the present time by the Company has been chiefly sinking the main shaft to a depth of 185 ft., with the intention of cutting the reef at a deeper level—up to present time unsuccessful.” See appendix No. 1.

The claim is intersected by numerous gold-bearing leaders with traces of silver.

The Company are opening out upon the Golden Bar line of reef on the Glen Morrison claim. Reef, about 2 ft. wide, running E. and W., dipping north; underlay, E.; quality of stone, estimated to yield from 1 oz. to 1½ oz. per ton.

(2) Several other claims were registered in the locality during the year, the principal one being the Walcha Gold-mining Company (James Farrell and party, prospectors). This Company have been working for some time past, and from reports received they appear to have a fair chance of success. See appendix No. 2.

4. Tia River Reefs.

(1) Matheson & McIntyre.—The proprietors of the principal claim in this locality report 12 or 14 tons of stone raised from the new reef, the old reef having taken off, which, after great difficulty in driving and sinking, was ultimately found. No stone has been crushed for the Company this year. Some trial crushings were conducted for the prospectors on a newly discovered reef known as the Sleeping Beauty, particulars of which are given in a report from the proprietors of that mine, as under. See appendix No. 3.

(2) John Jerry and party (prospectors), Sleeping Beauty Reef, Tia River.—In September last the prospectors reported payable gold in their claim, and several other claims and leases were taken up in consequence. Most of these have however been abandoned, whilst a few have registered for “suspension of work.” From various causes the prospectors' claim has changed hands, and the present proprietor (Mr. David George) will resume work shortly. Trial crushings from this mine, amounting in all from 80 to 90 tons of quartz, yielded about 27 oz. of gold, which did not quite come up to expectations. See appendix No. 4. See appendix No. 5.

5. Nowendoc Gold-field.

(1) Mr. Thomas Laurie, an old resident, reports:—“Mining in this locality is almost at a standstill, with the exception of a few of the old hands, who are earning from 20s. to 40s. per week. There is some new gold found about 20 miles east of Nowendoc, some pieces up to 1 oz. in weight having been obtained. Altogether gold-mining at Nowendoc just now is at a low ebb. See appendix No. 6.

(2) Mount Carrington Claim, situate at Nowendoc, on a tributary of the Coopera Curriba River, about 10 miles from Nowendoc Station. Proprietors, Messrs. Henry Whittam and B. A. Moses. Mr. Henry Whittam took up a prospecting protection area in the locality abovenamed some three years back. He has constructed a drive into the mountain about 300 ft. in length, 4 ft. wide, and 6 ft. high, clear of the timber, the drive being timbered right through from the entrance. The ground is of a sedimentary foundation. Whittam is following what is termed an “eruptive dyke,” and so far he has had encouraging prospects. He has done the whole of the work by himself, and he is deserving of every success. See appendix No. 7.

6. During the year 4 gold-mining leases were applied for; 31 claims were registered, and the number of miners' rights issued was 88, as against 29 for the previous year.

See appendix
No. 8.

7. The quantity of gold purchased in town, as far as can be ascertained, amounts to about 54 oz. Average value, £3 12s. to £3 14s. per oz.

PEEL AND URALLA DISTRICT—BINGERA DIVISION.

(*Thomas Connolly, Mining Registrar.*)

I BEG to submit to you my report for the year 1886 for the Bingera Division of the Peel and Uralla Mining District. Mining, on the whole, has been very dull, and the few miners working obtained very little gold, the first part of the year being too dry, and the remainder being too wet. Fourteen mineral leases have been applied for; but no work done. Fourteen gold-mining leases have been applied for; two worked with very good results. Withers and party, Upper Bingera, have succeeded in getting on the gold in Ballarat lead, but were beaten by the influx of water. An engine and powerful pump are now on the road for their claim; and I hope to be able to report next year a large return from this property. At Lower Bingera, Wearne and party are getting a crushing plant, with latest appliances, from Melbourne, for the All Nations reef—the assay from average stone, 5 oz. 12 dwt. 12 gr. per ton. The battery for this belongs to the Dunn Brothers. I have issued 151 miners' rights, 10 mineral licenses, and 2 business licenses for the year; and the gold won, so far as I can ascertain, is 645 oz.

PEEL AND URALLA DISTRICT—BARRABA DIVISION.

(*K. Theo. Garland, Mining Registrar.*)

IN submitting to you my report on the Barraba Division of the Peel and Uralla Gold-mining District for the year 1886 I have the honor to inform you that I have sold 98 miners' rights and 2 business licenses for the past year.

There are at present about seventy miners working and prospecting at Woodsreef and Crow Mountain, also Tea-tree Creek, many of whom are shareholders of leases lately taken up—twenty-seven leases in all. I find it difficult to furnish a complete and satisfactory report owing to the scattered way in which the miners are located, some of whom are free selectors, shearers, &c., seldom or ever to be found at home. At present there is every prospect of a large population coming here, if the rumour be true of the last find of gold, alleged to have been obtained at Woodsreef, 10 miles from here. Woodsreef is an old-established place, where formerly a large number of miners were working. Mr Salter, an old resident of Barraba, is now erecting a quartz-crushing battery there. During the past year the New and Old England Gold-mining Company (late of Woodsreef) sold their battery complete to the Barraba Pioneer Gold-mining Company of Tea-tree Creek, to which place the battery was removed, and is at the present time working there.

PEEL AND URALLA DISTRICT—BENDEMEER DIVISION.

(*L. S. Stumbles, Mining Registrar.*)

I HAVE the honor to report for your information that during the year ending the 31st December, 1886, there have been ten applications for mineral leases received at this office for the purpose of mining for tin, that being the only mineral at present worked in the district. There have been eight mineral licenses, six miners' rights, and one business license issued from this office. The Longford Tin-mining Company raised 5 tons of tin, which was disposed of at £56 per ton; Charles Allan and party raised 5 tons, which was disposed of at £56 per ton. There is no work at present going on at the creek, all the Companies having suspended work, the ground being too patchy to pay.

PEEL AND URALLA DISTRICT—NUNDLE DIVISION.

(*W. Hawley, Mining Registrar.*)

I HAVE the honor to submit my annual report upon mining in this district, with statistics compiled from the records of this office.

There were issued during the past year from this office—Miners' rights, 185; business licenses, 12; mineral licenses, 1; this shows an increase of 12 miners' rights and 3 business licenses upon the previous year. Number of leases applied for—Quartz, 3; alluvial, 3; mineral, 3. This shows an increase of 4 gold-mining leases and 3 mineral leases upon the former year. Number of claims registered—Quartz, 28; alluvial, 11; total, 39. This shows an increase of quartz claims registered of 26, and a decrease in alluvial claims of 12; with a total increase of claims registered, upon 1885, of 14.

Quartz.

Crushed at machines, 546 tons, realizing 647 oz. 5 dwt.; hand-crushed, 128 oz., = 775 oz. 5 dwt., showing an increase of tons crushed, 120; and an increase in the win of gold, 415 oz. 10 dwt.; being an increased average for tons crushed of 13 dwt. 17 gr. Total of gold won:—Alluvial, 2,460 oz.; quartz, 775 oz. 5 dwt.; total, 3,235 oz. 5 dwt. Increase of gold won upon the previous year:—Quartz, 415 oz. 10 dwt.; alluvial, 172 oz. 9 dwt. 6 gr.; total, 587 oz. 19 dwt. 6 gr. Estimated value of the gold won:—3,235 oz. 5 dwt., at £3 14s. 6d. per oz., £12,051 6s. 1½d.

Machinery.

Value of Quartz-mining machinery	£3,420	0	0
„ Alluvial „ „	150	0	0
	£3,570	0	0

This shows a decrease in the estimated value of machinery, in 1885, of £430.

By these returns it is a very pleasing duty to me to be able to report a very great improvement in mining in this district upon that of the previous year. This improvement is the more marked when you take into consideration the small number of miners employed on this field; and it was made under many difficulties in the first place. Alluvial mining, owing to the intermittent supply of water, was greatly retarded. I believe I shall over-estimate the period in which work was actually carried on in the alluvial in stating that the miners were fully employed during the past year for four months.

Quartz-mining

Quartz-mining is languishing from the want of capital. This section of mining is carried on solely by the working miners. I am unable to understand the cause of the capitalist holding off from venturing upon this *bona fide* field of enterprise, as on the only claim in quartz that received aid to develop it (of late years), paid off, in a very short period, the whole amount expended on machinery, &c., and has ever since paid handsome dividends.

I have a thorough knowledge of this district, having resided here for twenty-five years, and I believe that it will yet take a foremost position in the gold-reefing districts of New South Wales.

HUNTER AND MACLEAY DISTRICT—COPELAND DIVISION.

(Mr. Warden De Boos, P.M., Copeland.)

MINING affairs, which have been gradually ebbing for the last four or five years, have during the past year remained at about the same level. Things are dull, but the general aspect of affairs is not by any means so discouraging as it has been during the period I have mentioned. Hardly any outside capital has been brought upon the field, and the miners have been trusting entirely to their own individual and unaided efforts; and I am happy to say that in most instances their trust has not been misplaced. In this mode of working, however, there is, as I have too often had occasion to mention, the drawback that economy of labour cannot be studied, as the men, not having the capital wherewith labour-saving appliances may be procured, are obliged to have recourse to the means at their hands. Even with all the disadvantages attendant upon the primitive process of working, it is a satisfaction to be in a position to state that the yield of gold for the year has increased, whilst the number of miners has decreased, so that in this respect things may be regarded as looking more hopeful.

The tributors on the Hidden Treasure have shown a very good example, not only of energy and enterprise, but also of systematic working; and as they have been rewarded by a good return for their labour it is their intention to adopt several labour-saving appliances, which will be a guide to others who may be in a position to follow the example. This is really the only claim that calls for any notice at my hands, for, apart from this co-partnership of tributors, the work on the field has been entirely carried on by individual miners; and although there may have been a few unlucky individuals the work, on the whole, has been remunerative.

The number of miners' rights issued during 1886 was 126, as against 130 during 1885; but of this 126 about 10 have been issued for the Manning, where some new ground is undergoing trial; but with the number of miners' rights less than in 1885 the yield of gold during the past year has been greater by 600 oz. than in the year preceding.

The return herewith will show by the different localities whence the gold has been procured, how very generally the precious metal is diffused over the field, and how extensive an area is here offered for systematic and intelligent working. As I have pointed out almost yearly in my reports, the individual miner is very heavily handicapped: first, with working expenses, owing to the absence of all labour-saving appliances; and next, with the cost of carting and crushing. So much is this the case that a yield of anything under 2 oz. to the ton is barely payable.

Now the Hidden Treasure tributors assure me that by the system they have adopted of working the ground they can make a good profit out of 1 oz. to the ton, even with the drawbacks they still experience. When these are removed they will be able to make 12 dwt. to the ton payable. Taking the stone throughout on a face from all the working claims on the field, and putting it through the batteries would, I feel convinced, give a general return of 15 dwt. to the ton, with a chance of now and again coming across a rich patch such as those which were met with in the early days of this field.

Only by the outlay of capital could such an end as this be attained, and under the present aspect of affairs to look for capital would be hopeless, as the many small existing leases prevent any Company from obtaining such an extent of ground as would render a large outlay justifiable. The Department has done its utmost to clear away many of these speculative leases, but unfortunately the ground is taken up again and again, almost as soon as it has been declared forfeited.

The number of leases applied for during the past year has been small, as, I am glad to say, the miners have in many instances been working ground held under the Mining Board Regulations, thus showing an honest intention to work rather than to manoeuvre, as is too frequently the case under the lease-holdings.

I may add, in conclusion, that the reefs of the district are, at least, likely to be fairly tested, as a syndicate has taken up eleven 25-acre blocks of Church and School Land, which include the Prince Charlie, the Homeward Bound, and the Mechanics lines of reef. If these are worked under good and intelligent management there are hopes that the result will be such as to lead to other areas being similarly dealt with.

PARTICULARS relating to Mines producing Gold during the year 1886.

HUNTER AND MACLEAY DISTRICT—BULLADELAH DIVISION.

(Mr. Warden Fawcett, P.M., Bulladelah.)

I do myself the honor to report as follows respecting the Bulladelah portion of the Hunter and Macleay Mining District.

Several new claims have been taken up since my last report, and payable stone has been obtained in all of them.

The great desideratum on this field, the means of crushing, will soon be available, as Mr. James Stuart has machinery ready to be erected on M'Rae's old claim, as well as on a machine site applied for by him on the Maclean or Coolongolook River. The machinery on both places will be erected as soon as the claim referred to can be transferred to Stuart, and the machine site has been surveyed.

Suspension of work having been granted on the Mountain Maid and the Curreeki, day and night shifts are at work to master the influx of surface water caused by the almost continuous rain for weeks past. When the workings can be shown in a dry state it is intended that those claims should be amalgamated and placed in the hands of a Company. The former has 30 tons of stone at grass, reckoned to be as good as some tons sent to Sydney which realized 2 oz. to the ton. The Curreeki has 5 tons at grass, equal in quality to 6 tons sent to Sydney which produced upwards of 4 oz. to the ton. Stuart and party have struck rich stone in the cap of the reef, 80 ft. in "Who'd have thought it," and only wait for a lease to continue working.

The Mountain Widow has 30 tons at grass ready for the machine when erected.

At Bunker's Hill, some 3 miles from Coolongolook, good stone has been got, and the same may be said of Paddy's Creek, 7 miles from the same place.

All that is now waited for is the erection of machinery and the issue of leases.

I look forward to this being a prosperous gold-field, and always considered it a place which only required machinery, capital, skill, and economy to make it so.

Its drawbacks are the dreadful state of the road between Coolongolook and Bulladelah, and the want of a second mail in the week between those places. I do not speak of the necessity of a telegraph station, but that, it is to be hoped, will be granted in more prosperous times.

HUNTER AND MACLEAY DISTRICT—KEMPSEY DIVISION.

(Mr. Warden Ducat, P.M., Kempsey.)

I HAVE the honor to submit my annual report for the year 1886 for the Macleay Division, under my charge, and have the unpleasant duty of reporting almost a complete cessation of all mining workings within the division.

1. There are three or four prospecting parties out on the Hastings River, around the neighbourhood of Mount Sea-view, on the various creeks running into the branch named the Forbes River. Gold has been found at various localities, but not in sufficient quantity to be payable or to be reported as a gold discovery. The gold found is from the wash-dirt near the surface, and is of a rough shotty description, indicating a better field somewhere near the neighbourhood. No reef has yet been discovered by any of the parties prospecting.

2. No work is being done at the silver-mines, Warrell Creek, the lease not being yet issued for the ground applied for.

3. Owing to the fall in the price of antimony in the English market the several mines for such ore are at a complete standstill. The Corangula Antimony Company's works have not been worked for more than a year back, all the plant and machinery being laid up perfectly idle.

The fields at Missibotti and on the South Bellinger are likewise unworked, the leases not being yet issued, and the applicants do not see sufficient encouragement in the price for the metal to induce their spending more money and labour to fully develop the reefs and test the yield and quality of the ore.

4. The applicants for lease of ground at Port Macquarie to mine for nickel and cobalt are working and sinking a shaft. A test of some ore brought to grass gave satisfactory results.

Five applications were issued for mineral leases, twenty-two miners' rights, and ten mineral licenses were sold during the twelve months.

HUNTER AND MACLEAY DISTRICT—DUNGOG DIVISION.

(Chas. Graham Smith, Mining Registrar.)

I HAVE the honor to report that in this division of the Hunter and Macleay Mining District there are only two gold-mining claims being worked, viz. :—The Golden Spur Company's claim at Lower Wangat, and Gurr and Company's claim at Upper Wangat.

From the Golden Spur Company's claim 117 tons have been crushed during the past year, yielding 190 oz. 14 dwt. 18 gr., valued at £596 10s. The deepest level is 300 ft.; lode, 8 in. wide; dip, 1 in 4, bearing east and west; strike, north; six men employed.

From Gurr & Company's claim, at Upper Wangat, 93 tons gave 74 oz. 16 dwt., valued at £226 7s. 6d.; deepest level, 175 ft.; lode, 12 inches wide, bearing north and south; strike, east; four men employed.

These claims are 4 miles apart, but probably the same lode is worked in them.

There are two batteries near the workings, of ten and five stampers, respectively, of 14-horsepower, and valued at £1,200 and £600.

The plant of the Golden Spur Company is valued at £150, and that of Gurr & Company at £20.

Seventeen miners' rights have been issued by me from the 1st of this month, but there are only ten *bona fide* miners in the locality. The total population consists of 14 men, 7 females, and between 20 and 30 children.

NEW ENGLAND DISTRICT—TENTERFIELD DIVISION.

(Mr. Warden J. B. Graham, P.M., Tenterfield.)

I do myself the honor to submit my annual report on the portion of the New England Mining District under my control.

During the past year gold-mining has revived to a great extent in this district; rich discoveries have been made, and a great impetus given to prospecting, which has resulted in the opening up of important gold-fields. Early

Early in the year gold was discovered at Drake (or Fairfield), in a portion of private land, the property of Mr. George Smith; it turned out very rich, and a rush took place. A large area of land in the vicinity has been taken possession of for gold-mining purposes, and it being a new gold field, labour, in accordance with the regulations, has been employed. It is estimated that there are now about 700 miners engaged in the field. Several very valuable reefs have been opened. Some of the leases have been purchased by syndicates for the purpose of floating into Companies, and there is every prospect of the development of the mine by the expenditure of capital.

The reefs have not yet been sufficiently developed to enable me to report on them, except that in the majority of cases, as far as they have been tested, they show payable gold, and large reefs, some as wide as 10 feet. The average estimated yield of the principal reefs is about $2\frac{1}{2}$ oz. to the ton.

About 8 miles north from Fairfield another important field has been discovered; it is called the "Red Rock." I have not yet had an opportunity of visiting the place, but the reports are very satisfactory. There is likely to be a large Company floated there, and machinery erected to be driven by water-power. The Red Rock is a perpendicular cliff about 400 feet high, at the foot of which runs the Cataract River, in which there is plenty of fall and unlimited supply of water for machinery purposes. A number of leases have been taken up in this locality, and as the extent of auriferous rock is said to be very great, the cheapness of water-power and convenience of machinery sites should make this a valuable gold-field. There are many other finds in the locality, but the want of machinery prevents their development.

One hundred and two (102) gold leases have been applied for at Fairfield during the year, and 512 miners' rights and 37 business licenses have been issued, and 142 mining tenements registered. I would refer you to the report of the Warden's clerk, in which further particulars will be found.

The next most important find has been at the old abandoned gold-field at Boonoo Boonoo. Some rich gold has been discovered, and a number of leases have been applied for, some on the old abandoned workings, and some on new reefs in the vicinity. This field is also likely to be developed by capital; about 40 leases have been applied for on the field.

There have been 47 applications for gold-mining leases made at Tenterfield during the year. 363 miners' rights, 10 mineral licenses, and 20 business licenses have been issued.

The Surface Hill Crushing Company are carrying on operations at Poverty Point, and the results are said to be good. Ten head of stampers are kept at work, and I understand it is the intention of the proprietors to increase their machinery. The auriferous stone is unlimited; the gold is contained in granite, and the whole range of mountain contains more or less gold. The yield is about 5 dwts. to the ton, and with machinery that can put through large quantities the yield is payable.

Some very rich pockets of gold have been found at Lionsville; but I have not heard of any large or important finds. Very little is doing in any of the other gold-fields in my district. A few men are working at Pretty Gully and Tooloom, in old alluvial, and, as far as can be ascertained, the return of gold from there has been about 200 oz.

The tin-mines in the northern part of the district are still working, but the yield is small. Lodes have been discovered on the Queensland side of the Main Range which show rich stone, and in all probability they will soon be worked. In the event of their turning out profitable it will induce prospecting on the New South Wales fall of the mountains; and I have no doubt, judging from the vast amount of stream-tin ore that has been obtained from the creeks and gullies, heading from the portion of the range known as the "Sugarloaves," rich lodes exist. Nearly all the stream-tin ore found in Ruby, Wilson's Downfall, Wylie, and Cemetery Creeks, on the New South Wales side of the range, and Quart-pot Lode and Sugarloaf Creeks, on the Queensland side, has come from a portion of the range about 1 mile in extent. This portion is well worth prospecting, as the existence of lodes is almost a certainty.

NEW ENGLAND DISTRICT—EMMAVILLE DIVISION.

(*Jno. M. Sheahan, Mining Registrar.*)

I REGRET to have to state that the outlook I predicted in furnishing my last report has not been fulfilled as regards either the tin- or silver-mining industries in this district. I attribute this state of affairs to the fact that almost all the shallow ground having been worked out, the capital required to develop the deep leads has not been forthcoming, a fact much to be regretted, as owing to the high price at which tin has been selling during the last twelve months, I feel confident that in a short time capitalists would be amply repaid for their outlay in developing the deep leads which are well known to exist in this locality.

Another cause of the depression existing during the past year has been the exodus of miners from here to the newly discovered gold-field at Fairfield. Numbers who were making a fair living here, doubtless attracted by the reports of the rich finds at Fairfield, have left for the latter place, a fact which will be shown on comparison of the numbers of miners on this field at present with the number furnished in my last report. Another great drawback to the mining industry is that mentioned in my report last year—the delay in issuing mining leases. Many miners' ardour becomes considerably damped owing to the time they are kept waiting for a title to the land. If the leases were granted in a reasonable time, the ground would be at once tested, but in the present state of things, where a miner has to wait oftentimes more than twelve months for his title, he very often, as I mentioned in my last report, allows his ardour to sink into indifference.

Torrington Tin-mining Company.—This mine is still under the supervision of Mr. H. Marshall. The yield of tin for the past year, 43 tons 13 cwt.; twenty-four hands have been employed. The machinery consists of a 12-horse-power engine, 4 circular buddles, and 5 head of stampers, all valued at £2,000. The depth of the shaft is 116 feet, deepest level 100 feet, and the width of the lode about 1 foot.

The Dutchman Tin-lode Mining Company.—This Company's interests are now under the management of Mr. Alexander M'Gillivray. Twenty men, on an average, have been employed during the past year. The yield of tin has been about 49 tons. The deepest level is about 215 feet in depth, and the average width of the lode is about 2 feet 6 inches. The battery contains five head of stampers, which are driven by a 12-horse power portable engine; the dressing plant consists of 6 jiggers, 4 round buddles, and 1 dead buddle, which are self-acting; a steam-pump raises all the water required from a dam which has been constructed for the use of the plant.

Great Britain Tin-mining Company.—This mine has been worked during the past year on tribute, the number of miners employed being 110 Chinese and four Europeans. The quantity of tin raised amounted to 124 tons.

Hall Brothers, Kangaroo Flat.—A party of tributors, consisting of seventeen Europeans and two Chinese, have been working this mine during the past year, the yield of tin being 66 tons 17 cwt. 2 qr. 11 lb. Owing to a great portion of cement existing in the wash, it has to be manipulated by a battery to obtain the mineral.

Six-mile, Hall Brothers.—This mine has been worked on tribute by six Chinese. The yield of tin has been 3 tons 4 cwt. 2 qr. 27 lb.

Hall Brothers, Grampians.—A party of six Europeans and two Chinese have been working this mine during the past year. The quantity of ore won, 12 tons 9 cwt. 1 qr. 22 lb.

Hall Brothers, Vegetable Creek.—Eight Chinese miners have been employed. Quantity of tin won, 6 tons 9 cwt. 2 qr. 27 lb.

John Moore & Co., Y Waterholes.—This ground has all been worked by the Company. It has been let on tribute during the past year to a party of fifty-four Chinese, who have been employed reworking the old ground. The yield of tin for the past twelve months has been 64 tons 16 cwt. 3 qr. 2 lb. The ore in this mine, owing to the fact of its being impregnated with foreign matter, has to be dressed with a Willoughby machine. This property is still under the management of Mr. Thos. Chandler, Vegetable Creek.

Vegetable Creek and Rothschild Company, Moore & Co.—A party of seventy-three Chinese have been employed reworking the old ground on these two mines. The yield of tin from both mines amounted to 91 tons 17 cwt. 3 qr. and 2 lb.

Bailey & Co.'s, Rose Valley.—About forty men have been employed on an average during the past twelve months. The machinery consists of two engines—one 10-horse power, for raising the wash to the surface; the other a 6-horse power, working a centrifugal pump, for sluicing purposes. During the past year the Company have blocked out 637 feet along the lead at an average width of 60 feet, the average depth of wash being about 5 feet. The drives in different directions amount to about 1,200 feet. Total amount of ore raised during 1886, 223 tons 10 cwt. and 21 lb. Average, about 3 qr. to the load.

Wesley Tin-mining Company, Rose Valley.—This property is still under the supervision of Mr. J. Sales, and has been worked on tribute during the past year by a party of twenty European miners. The amount of ore raised was about 55½ tons. The depth of the deposit ranges from 50 to 190 feet, the height of the wash from 1 to 4 feet, and width from 3 to 5 feet.

Ruby Hill.—This property, which has hitherto been worked by the Ruby Hill Tin-mining Company, under the supervision of Captain Bryant, has lately been let on tribute to Mr. O'Donnell, who is personally supervising the development of the mine. He informs me that the present tunnel is not at a sufficiently low level to drain the water from the workings; the level is now being lowered, and when completed there is a good prospect of a satisfactory return being obtained, the lead of wash being about 14 ft. wide and over 2 ft. in depth, showing good tin.

Nine-mile.—Most of the lodes in this locality have given very good returns. Out of a crushing of 25 tons of stone, Robinson and party obtained over 7 tons of tin. A syndicate have applied for a large quantity of basaltic country in this locality. It is to be hoped that they will prospect the ground thoroughly, so that its value may be proved.

Y Waterholes Mines.—Mineral conditional purchase, 600 acres, formerly Cadell and Mitchell, but now the property of Mr. A. Cadell. During the year 1886 the output of ore was 230 tons 12 cwt. 3 qr. 17 lb., all raised by tributors, European and Chinese, chiefly the latter, who work the ground well, and succeed in making good wages out of land abandoned by European tributors, by their steadily facing out all the deposits, good and poor, frequently discovering rich patches which the inferior washdirt concealed. A large area remains unworked and many parties of men are busily employed in working the leads which still are found at depths varying from 30 to 50 ft. from grass. The mode of working is the same as described in my last report, and the wash raised has produced from 20 lb. to 100 lb. per cubic yard. It is usually dressed to assay 74% (but sometimes as low as 73%), which is easily done with the Willoughby dresser. The average number of men employed has been 13 to 30 Europeans and 60 to 90 Chinese. The claims look promising for the coming year, but the late heavy rains have made the ground rather difficult to work, as shafts have to be slabbed and puddled in some spots, but otherwise all progress satisfactorily.

Vegetable Creek Tin-mining Company, Limited.—No new discoveries have been made on this property, which comprises 1,960 acres, mineral conditional purchase, and several portions under mineral lease. Twelve parties of tributors have been employed, some of whom are simply prospecting either at their own risk or on half wages, with the promise of liberal terms if they strike anything payable. The Company have also their own prospectors employed on wages, but although a large tract of country remains in which deposits may exist all efforts to find a payable continuation of the old Vegetable Creek and Graveyard leads have so far failed. The surface deposits and unworked parts of the present watercourses and gullies have been worked by Chinese and Europeans with more or less success, but are now very poor in tin ore. The Company and their tributors still hope to light upon some new patches, and are searching for such continuously. The engine and working plant are the same as described in my report last year. The ore raised during the year was 99 tons 5 cwt. 1 qr. 5 lb. Average number of men employed, 28 Europeans, 16 Chinese.

Nonpareil Mine, 60 acres, Mineral Conditional Purchase.—This mine, which is the property of Mr. A. Cadell, has been worked by a party of Chinese miners by removing the old tailings which fill the bed of the creek, and, aided by the running water, have obtained sufficient to give them fair wages, although the claim was considered quite exhausted some years since. The number of men engaged has been 5, and the quantity of ore raised amounted to 12 tons 2 qr. 16 lb.

Gordon's Blocks, county Gough, parish Hamilton, 1 to 4.—Messrs. Hart, Cadell, Reid, & Company have systematically prospected parts of these blocks during the past year at considerable expense, but recently have concentrated their efforts in proving portion 4 (near the boundary of Mr. Lennon's conditional purchase, in which Moran and party have been sinking during the past five years to the water-level only). Every shaft sunk by Hart, Cadell, Reid, & Company has been bottomed or tested to the true bottom with boring-rods in tubes, so that a correct sample of the deposits of sand, &c., has been obtained. In two shafts only has washdirt been found carrying tin ore, and this Company are now sinking other shafts on all sides of those in which wash was touched, hoping to find the course of the lead. They sink through basalt and pipeclay, and to the water-level, say about 90 ft. from the surface, and then bore through the pipeclay, sediment, and drift-sand to the bed-rock, another 40 to 42 ft. Upon the result of their operations

operations hangs the future of the deep-lead mining of Vegetable Creek proper, as the continuation of the Vegetable Creek Company's, the Wesley, Bailey's, and Cuneen's lead can pass only through portion 4. The success of this Company's hopes is ardently desired by all the mining population, as nothing of great importance is being found to give employment to those now engaged in working the adjacent claims, which must ere long become exhausted. The cost of this Company's operations in sinking the lead in portions 1 to 4 has been so far about £6,000, and should they be unsuccessful it would be difficult to find the same number of private individuals to again speculate to such an extent in the face of such discouragement. It is to be hoped they will yet be compensated for their perseverance. The number of men constantly employed has varied from 4 to 8. The Company have a steam-pump and appliances ready, should they find sufficient to justify the cost of bottoming any shafts, for the purpose of working the ground.

Gordon's M.C.P., 320 acres, county Gough, parish Arvid.—This property, south of Mr. Wesley's M.C.P., has been steadily prospected, but hitherto without any deposit being found. Mr. Gordon is still sinking trial shafts across the land, and, with a view to bottoming the central rock shafts in the block, has fixed a 12-h.p. portable engine in position at it, and thus will have power at command to pump out the water, which no doubt will be found there (being on the same line as Mr. Wesley's wet shaft). The work is proceeding at considerable expense, but systematically, and it is to be hoped that success will reward the efforts now being made. It is hoped that a lead may be found on the eastern side of the ground at a higher level, and should such be discovered, it can possibly be worked at less cost, and help to pay for the developing of the deeper run, which no doubt will require considerable outlay to get into working order, although it may be rich through having passed through a belt of tin-bearing rocks south of this ground, as shown in Mr. David's geological map of this tin-field.

Glen Smelting Works, Tent Hill.—The quantity of tin ore received at these works during the year amounted to 1,261 tons 3 cwt. and 6 lb., and during the same period 858 tons 17 cwt. 3 qr. 1 lb. of refined metal were forwarded to Sydney. The battery has been continuously at work during the year, principally in treating stone raised from the Ottery Reef. No improvement I regret to say can be reported in the quality of the stone crushed, viz.:—2,419 tons 6 cwt. 3 qr., from which 79 tons 21 lb. of tin ore were obtained.

The ore received at the works may be classified as follows:—

	Tons.	cwt.	qr.	lb.
Shallow workings	631	1	0	0
Deep leads	490	2	0	0
Lodes.....	140	0	0	6

The Company are now putting in a large tunnel at the Ottery, which at the end of the year, was in about 200 ft., and they expect to cut the reefs at a greater depth than any of the present shafts.

Tin obtained during 1886.

	Tons.	cwt.	qr.	lb.
Lode workings.....	169	13	0	0
Shallow workings	761	1	0	0
Deep workings	962	8	0	13
	1,893	2	0	13

Silver.

Webb's Silver-mine.—The deep workings on the occasion of my visit were looking well.

At the 150-ft. level in one shaft the lode is 7 ft. in width, and produces large quantities of ore, from which really good assays are obtained.

At the 200-ft. level in another shaft the lode has a well-defined wall, and appears more permanent than hitherto. The Company for the last two years have employed a large amount of labour for the purpose of thoroughly testing the lode, and I am now informed that machinery will soon be on the ground to treat the ore. This is a matter for much congratulation, as the absence of such works has been the great drawback to the silver-mining industry in this district. No matter how confident people are of the richness of the ground, the absence of the smelting test has had the effect of keeping capital from being invested in silver land in this district.

I am indebted to the manager of the mine, Mr. J. G. Davey, for an elaborate report, which will be found herewith. (Appendix A.)

Fryer's Creek.—This field, which twelve months ago gave every promise of being one of the most extensive silver mines in the Colony, is now almost deserted. Very few even of the leases that were granted have been executed by the lessees. Notwithstanding this apathy, I have every reason to predict a great future for this portion of the district. The ore which has been tested from the different claims has proved very rich. The great drawback to the success of this field is the want of capital. Efforts have been made by different claimholders to "float" their properties, but all have failed, owing to the non-existence of any smelting works in the neighbourhood.

APPENDIX A.

The Mining Registrar, Emmaville,—
Sir,

Webb's Silver-mine, Emmaville, 5 February, 1887.

In compliance with your request, I have much pleasure in forwarding the following brief account of the progress made on the property of Webb's Silver-mining Co., Limited.

The lode, which is situated on the Little Plant Creek, at a distance of about 9 miles in a north-westerly direction from the township of Emmaville, was discovered about two and a half years ago. It has a bold outcrop, and can be traced, without difficulty, for a distance of over 2 miles. It exists in a highly metamorphosed slate formation, and consists principally of felstone, together with quartz, fluorspar, &c. The silver occurs in veins of fahl-ore (grey copper ore), copper pyrites, arsenical iron pyrites, galena, zinc, blende, &c., which vary in thickness from a quarter of an inch to 2 or 10 inches, and are disseminated throughout the lode, which, in its turn, varies from 18 inches to 20 feet in width.

Samples taken from various parts of the reef have assayed from 15 oz. to 1,150 oz. of silver per ton. Fine crystals of fahlerz (tetrahedrite) have recently been discovered in the deep workings, which contain 30 per cent. of copper, and 3·5 per cent., or 1,140 oz., of silver per ton.

Along the reef several shafts have been sunk, ranging from only a few feet to 210 feet in depth, making an aggregate of about 760 feet. Drives have also been extended to a distance (in all) of about 500 feet. In almost every case payable ore has been met with.

The deep workings are most encouraging. At a depth of 150 feet the lode has been found to carry a well-defined wall, which continues unbroken to the present deepest point, 210 feet. The cleavage also of the surrounding "country" rock; which above is almost at right angles to the lode, is here almost parallel to it. The

The ore also holds its own in depth, and bulk assays are equal to, and sometimes surpass, those which have been obtained nearer the surface.

All these facts point to the permanence of the lode, and should, in my opinion, dispel any doubts which may exist as to the future prosperity of the field.

The work hitherto has been strictly exploratory, with a view to testing, as well as developing, the lode in various parts. However, nearly 900 tons of ore have been raised and stacked—to await erection of reduction works—which contain over 30,000 oz. of silver.

The Company is contemplating the erection of concentrating and reduction plant, and it is hoped that during the present year large returns will be made.

Other mines on the same and parallel lodes are, I hear, about to be worked.

NEW ENGLAND DISTRICT—WILSON'S DOWNFALL DIVISION.

(*J. G. Draper, Mining Registrar.*)

I HAVE the honor to submit herewith my report upon the mining industry of Wilson's Downfall Division, which will tend to show that it has not decreased much in the yield of tin ore, compared with that of the previous year. No doubt the increase in the price of ore has given miners very great encouragement, still there is nothing but the stream tin worked in this locality, although applications have been received for leases for the purpose of prospecting for lodes, of which, perhaps, a good account will be given in next report.

At the head of Herding Yard Creek, on Messrs. A. & R. Amos's ground, remarkably rich prospects have been obtained. Other places which have been mentioned before are still worked with various results, with the exception of Maryland Half-mile, where a party of six Chinese are working. They had previously worked in the shallow ground, but are now following the tin into deep ground with improvement.

The mining population in this district is much about the same as returned for 1885, and the quantity of tin ore won during 1886 being 307 tons, valued at £17,800.

I issued during the year ending 31st December, 1886, 68 mineral licenses, 4 business licenses, and 22 miners' rights, and received 4 applications for mineral leases.

NEW ENGLAND DISTRICT—LIONSVILLE DIVISION.

(*Robert Wilkinson, Mining Registrar.*)

I HAVE the honor to transmit my annual report for the year 1886, just closed.

Quartz-reefing has been carried on vigorously by the few hands engaged at it, but very little success has attended the efforts of a greater part of them.

A new discovery was reported to me in latter part of October by a party of the name of Rose, the discovery being about half a mile south of Lionsville; yield 1 oz. loose gold to dish of rubble taken from a mullocky vein, which had also quartz specimens impregnated through it. This party (then two men), after a couple of weeks fossicking, took from out of a small hole some 6 feet deep by 5 in length on vein some three pounds weight of gold, and during this time secured a prospecting claim, and called it Golden Bar. As soon as this discovery became a little known quite a small rush set in for ground adjacent, the line being pegged off for some 6 or 8 chains. It, being new and unworked ground, came under the additional Gold-mining Lease Regulations of 1882, which compelled lease applicants to work from date of taking possession, and therefore most of the claims taken up were under Mining Board Regulations. After most of them sank a few holes and trenched, nothing being got, they were abandoned, and others went in, but most of them could get nothing on surface, and it has now decreased to only two claims, the prospectors' and No. 1 East. The former have two veins about 30 feet apart, and both carrying good gold. On first vein discovered they have sunk a shaft some 25 feet, and good gold so far, but vein is very narrow and into hard country, which requires the use of powder; but unfortunately the prospector (the only miner in it) has been confined to house for last three weeks of the year, and it has retarded the work a good deal, otherwise they should have seen to a depth of 50 feet. Miners are most anxious to see it sunk upon to give an idea of what it is going to turn out to be, a good many fearing it may only be a surface patch.

No. 1 East has been sunk some 30 feet, with every indication of gold, but gives only few colours in washing. Should either of these two claims get on to a good solid reef and carry gold it will revive the locality and give an impetus to others to prospect.

To begin with the old identities, the prospectors, Garibaldi (two men), put through the winze they were busy upon, as per my report of 1885, but did not meet with any gold. Then, stoping small block at 70-foot level, they met with a small patch of golden stone, 180 lb. of which yielded £50 worth of gold; stoped also an underhand piece, at 100-foot level, 50 feet by 10 feet deep, but not finding anything to induce them to go further they started clearing and securing some upper levels to get at some of the blocks that were left, and in shooting out a little of foot-wall (the hanging-wall reef only having been taken out) brought down in the shot some splendid specimens, estimated to turn out £100 worth of gold, and a splendid show still on face, but through them not being prepared to take block out it is left standing till the ground is thoroughly secured, which is, I believe, just completed, and this mine may now turn out some good gold in the ensuing year. There appears to be a good deal of the worked ground where this foot-wall vein is left, and it may turn out to carry the best of gold.

No. 1 North Garibaldi; C. Harkin has been steadily at work all through the year, and has come across some excellent patches, but will not divulge the full extent of same for reasons best known to himself.

The Band of Hope line, Solferino; six claims have been formed into a syndicate, and placed in hands of brokers, with the view of floating same in London market, but it seems nothing has come of it so far, still they are in hopes of it going off shortly, there being three months yet to complete the formation of a Company.

The several proprietors have all been busy engaged either driving, sinking, or stoping, and have come across a few small patches, but none sufficient to make it worth while to realize upon. The only exception, perhaps, may be the prospectors, Adams and party, who have some very good stone or specimens on hand.

On Old Lion, Lionsville, a couple of men took possession of Nos. 10 and 11, where some rich patches were got in early days, but after spending some eight months one of them left, and the other is still sticking to it hoping to come on to a little fortune. The only gold they got was some 3 oz. from a little dab, which is just sufficient to encourage one to try a little longer.

The

The famous Lion mine is still lying idle, it being held under lease application, just granted. Several mining capitalists have been inquiring for it of late, but it being locked up could do nothing. Still, now it is granted, the leaseholders will have to commence operations shortly, or make room for those who are likely to do some good with it.

In alluvial very little is doing, very few hands employed at it in this division, and those who are make from 30s. to £2 a week.

As far as I could gather, there has been won in my division 118 oz. 2 dwt. of alluvial gold and 200 oz. 2 dwt. of reef, valued at, conjointly, £629. This is not by far all the gold, as a good deal goes out of the division of which I can get no account. Price of gold during year has been from £3 to £3 14s. per oz. The number of miners at work are, 10 Europeans and 3 Chinese, alluvial, and 20 quartz miners—total 33. Number of miners' rights issued for the year, 53, being 20 in excess of present mining population, and tends to show how a diggings fluctuates, in its population. Number of applications to lease, 4.

NEW ENGLAND DISTRICT—FAIRFIELD DIVISION.

(*J. P. Curran, Mining Registrar.*)

I HAVE the honor to forward my annual report for the year just ended the 31st of December, 1886, on the present state and future prospects of the mining industry in this division.

In the early part of the year, and for a couple of years past, the mining industry was throughout the division in a languishing state. The mining localities, which had for years past given profitable employment to a number of men were gradually being worked out, and the miners were beginning to turn their attention to other and more profitable pursuits. Early in March this year, however, a healthy reaction set in, owing to the discovery of a rich auriferous deposit on the private land of Mr. George Smith, at Fairfield, which led to a great deal of prospecting in the adjoining Crown land, and has been the means of opening up a very large area of auriferous country in the neighbourhood of Fairfield.

Mount Pleasant, which is distant about $1\frac{1}{2}$ miles from Mr. Smith's property in a north-westerly direction, is the chief centre of mining operations. At the base of Mount Pleasant, on the western and eastern sides of Plumbago Creek, a large and busy town has sprung up. In the town and its environs there are at present about 1,400 inhabitants, and the number increasing daily. A great number of gold leases have been applied for on and around Mount Pleasant, and gold has been obtained in almost every place that has been tried. The value of anything yet discovered must, however, depend upon the result of further development. A few tons of picked stone from some of the principal claims have been crushed and treated, and the results have been satisfactory; but the returns obtained therefrom should not, I think, be taken as a gauge of the whole field. There is no doubt a number of the claims now opened up will in time be proved highly remunerative, whilst a greater number will be found valueless. A very large area of land has been proved auriferous, and has been traced to the north of Mount Pleasant about 8 miles, and south about 4 miles.

At Red Rock, a place distant about 8 miles north of Fairfield, and which takes its name from a bold bluff which overlooks the Cataract River, some apparently rich discoveries have been made. This locality is now attracting the attention of capitalists and mining speculators, and arrangements are being made with the various holders of land under application to lease to form the whole into one large mining syndicate. This locality affords great facilities naturally for carrying on mining on a large scale. The bluff, which has been proved auriferous, stands 400 feet perpendicularly above the cataract flowing beneath. A large mill could be erected at the base, and the whole of the mountain worked in a face.

At Violet Creek, between 3 and 4 miles south-east of Fairfield, a number of persons are in possession of what are considered payable claims. The general formation of this locality, I might remark, differs slightly from the formation of Fairfield proper and the formation at Red Rock on the north; and the veins contain, according to assay, gold and silver in payable quantities.

I shall now proceed to give a description of the principal mines at Mount Pleasant, Red Rock, and Violet Creek. The depth of shafts, width of lodes, quantity of ore raised, I give you in a tabulated form appended hereto.

1st. *Carmichael & Co.'s* is a gold lease of 8 acres of land. On this property there are six distinct auriferous veins, varying from 3 in. to $1\frac{1}{2}$ ft. in width.

2nd. *Shannon & Co.'s* is adjoining Carmichael & Co. on the north, and is held under application for gold lease of 4 acres. In this block there are four distinct veins. In some of the stone gold can be seen without the aid of a glass; and from stone in which no gold is visible fair shows of gold are obtained by crushing and washing.

3rd. *Horton & Co.'s* is the next important mine on the south side of Mount Pleasant, and contains an area of 10 acres, held under application to lease. In this property there are eight distinct lodes or veins, all of them gold-bearing. Five shafts have been sunk on this property, and are described on another form appended hereto.

4th. *Reale & Pinkerton's* adjoins the eastern boundary of Horton & Co., and contains 2 acres, held under application to lease. This, I am informed, is a valuable holding.

5th. *Bourke & Co.*—This is the next most important mine, and is situated on the crown of Mount Pleasant, and adjoins the north boundary of Horton & Co. Contains an area of 6 acres. Several rich veins traverse this land. Mining expert's estimate the average yield of gold per ton at 2 oz.

The holdings referred to, from 1 to 5, have been formed into one Company, and preparations are being now made for the erection of machinery for the purpose of working the property on an extensive scale.

6th. *Dillon & Co.*—This is a block of 6 acres to the north of the claim just described, and is apparently on the same line. At present they are driving a tunnel from the west side of the mountain, with a view to cut Bourke's lode at a depth.

7th. *Sageman & Co.* are the next on this line, and hold the land under application to lease. This party are on the northern slope of Mount Pleasant, and on the same reef that Bourke and party are on, and are driving a tunnel in the face of the mountain about 150 feet below the level of Bourke's claim. At the time that I visited this claim the tunnel had been driven in about 50 feet, and in that short distance seven or eight small veins had been met with, all carrying fair gold.

8th. *Brydon & Co.* are the next to Sageman & Co., on the northern slope of the mountain, but are on a distinct line of reef. This is not a very rich claim, but is nevertheless a promising property.

9th.

9th. *Pyers & Martin*.—This is a prospecting claim held under the Mining Board Regulations, and is considered one of the best properties on the north of the mountain. A number of trenches have been opened along the line of lode, and in each excavation a well-defined reef is exposed. The lode is composed chiefly of zinc blende, galena, specular iron, copper, and arsenical pyrites.

10th. *Strauss & Co.*—This is a 2-acre block held under application to lease. Some very rich samples of ore have been obtained from this claim. Six tons of general ore have been forwarded to Victoria for treatment, and a Company is formed for the purpose of erecting elaborate reduction works in connection with this property.

11th. *Boylard & Co.* have 4 acres of land under application to lease, and have a well-defined lode running through their property, besides many smaller veins which they are not at present operating on. Good prospects can be obtained from any portion of this reef.

12th. *J. W. R. Clarke & Co.* have a 2-acre block with not less than seven gold-bearing veins running across it.

13th. *Smith, Townsend, & Co.* have what is considered the best claim on the north-west slope of the mountain. It is certainly a large reef, but further exploration will prove whether the reports respecting it are correct or not.

14th. *Morgan & Co.*, on the same line, have very fair prospects in their claim, but I have not seen enough of it to say much about it.

15th. *Jordan & Co.*—This is another claim, near Morgan and party, that I cannot say much about, as the holders were away at the time of my visit; but they have a very nice-looking vein of ore in which the gold can be seen very clearly.

16th. *Wann & Townsend's* claim is situated on a spur to the east of Mount Pleasant, and is held under application to lease, and is, I believe, a very good property. Ore is composed of quartz and oxide of iron.

17th. *J. F. Pearman & Co.*, on the south of Wann & Co, are working on a good-looking lode, from which a fair prospect of gold is sometimes obtained. The ore consists of oxide of iron, carbonates and sulphide of copper, and arsenical pyrites.

There are many other claims working in the neighbourhood of Mount Pleasant that I cannot fairly describe, as work being done in connection with them is more of an exploratory nature than otherwise.

At Red Rock there are ten parties at work, and all say they are on gold, of which I give a description herewith.

Name of Company.	Number of Men Employed.	Amount of Ore Raised.	Width of Lode.	Bearing.
Rowan & Co.	2	4 tons	3 ft.	N. and E. 1
Orr & Co.	2	nil	5 to 7 ft.	N.E. and S.W.
Scott & Co.	2	100 tons	20 ft.	E. and W.
M'Guire & Co.	2	30 "	20 ft.	E. and W.
Kingdom & Co.	4	nil	18 ft.	N. and S.
Farrell & Co.	4	40 tons	15 ft.	N.N.E. S.S.W.
Muldoon & Co.	2	60 "	8 ft.	N. and S.
Pat Lee & Co.	2	40 "	8 ft.	N. and S.
Dempsey & Co.	2	50 "	5 ft.	N. and S.
Walsh & Kelly	2	13 "	2 ft.	N. and S.

The above claims are worked in open cuttings from the face of the hill.

From the mining centres outside of Fairfield the returns are small.

At Pretty Gully there are still about twenty men employed in alluvial workings.

The amount of gold won, 190 oz., value £680.

I have received 102 applications for gold-mining leases, and 1 application for mineral lease; and have issued 512 miners' rights and 37 business licenses, and have registered 142 mining tenements.

LIST of Mines, Depth of Shafts, Ore raised, Width of Lodes, &c.

Name of Company.	Men Employed.	Tons of Ore raised.	Depth of Shaft.	Width of Lode.	Dip of Lode.	Bearing of Lode.	Remarks.

I have been, through the courtesy of Mr. Daniel Maher, of Timbarra, supplied with the following valuable information respecting Poverty Point and Timbarra:—
To the Mining Registrar, Fairfield,—

Sir,

During the past year the mining industry has much revived on this old established and at one time prosperous gold-field.

On the old Tableland, the scene of former extensive mining operations, gold-leases have been applied for, and prospecting is carried on to a great extent, with a view to discover the source of the rich alluvial deposits that have been worked out. A number of men are now engaged in this work with every prospect of success. A fair amount of gold is still obtained by means of sluicing.

Poverty Point, Surface Hill: The old Surface Hill Sluicing Company expended a vast amount of capital in their endeavours to bring on water for hydraulic sluicing—their efforts, however, proved abortive in consequence of the continued dry seasons. A new Company, styled the Surface Hill Gold-crushing Company, has now taken up the land.

The new Company have been working steadily under the management of Mr. K. Hutchison. Ten heads of stampers were erected, and it was decided to combine sluicing and crushing operations, and an additional ten heads of stampers are now in course of erection, and should favourable seasons continue there is every prospect of the new Company being rewarded for their outlay.

A short distance from the Surface Hill, Mr. Thomas Horton continued operations for the first half of the year. It is, I understand, the intention of Mr. Horton to resume work very shortly, when work will be carried on on a more extensive scale. It has been proved that there exists in this locality an almost unlimited supply of porphyritic and felspathic sandstone and granite heavily impregnated with gold, and which will yield at least 5 dwt. per ton. Since the wet season has set in small parties of men have been employed on the tributaries of Timbarra River, Nelson Creek, and at Sullivan's Lookout, and all seem to obtain fair wages.

On M'Leod's Creek there are several parties of men at work sluicing, and some searching for reefs. I have not heard of any case in which payable gold has been obtained from any of the reefs.

The population of Poverty Point and Timbarra I estimate at 200 persons. The amount of gold purchased by me for the year is 250 ounces, the smallest amount for the last twenty years.

Yours obediently,

DANIEL MAHER.

NEW ENGLAND DISTRICT—TENTERFIELD DIVISION.

(Frederick Burne, Mining Registrar.)

I HAVE the honor to forward my report of mining operations in this division for the year 1886, which shows a great improvement on that of the year 1885.

There have been 47 applications for gold-mining leases, out of which 40 were located at Boonoo Boonoo. On the majority of these claims work has been carried on more or less up to the commencement of the late heavy rains, which has caused a suspension of work throughout the field.

On the old M'Intyre line of reef six claims are at work, all on the reef, which shows gold in more or less quantities; the work is slow in consequence of the great influx of water. Of the claims on this reef I may state that Pascoe & M'Quaker have two shafts down—one about 40 ft., the other about 60 ft.—with the intention of sinking to a depth of 80 ft. Ellis and party are cleaning out an old shaft, about 50 ft. deep, with the intention of sinking deeper, and then driving to catch the reef again. Egan and party have two shafts down over 40 ft. each, besides having a considerable amount of other work done.

On the old Specimen Gully line of reef there has been a good deal of work done. Of the nine claims on this line of reef, Brown and party are down about 50 ft. in one shaft and 60 ft. in another; J. G. Dickson, about 60 ft.; William Mason, about 80 ft.; and Porritt and party about 30 ft., all on the reef showing good gold.

In Resurrection Gully, Brown and party have found a reef 2 ft. wide showing gold estimated to go 2 oz. to the ton.

On Roper's Gully several claims have been taken up. Peberdy and party are at work on a reef showing good gold. Stevenson and party have two shafts down, about 30 feet each; and Hurtz and party, two shafts; and Ellis and party, down about 20 ft., all on gold-bearing reefs.

There appears to have been no gold recovered as yet, in consequence of the want of machinery, but I am informed it is the intention of a Queensland Company to erect machinery at an early date.

During the past year I have issued 364 miners' rights, 20 business licenses, and 10 mineral licenses, against 32 miners' rights and 37 licenses, for 1885.

NEW ENGLAND DISTRICT—DALMORTON DIVISION.

(William F. Poole, Mining Registrar.)

MINING matters are in much the same position as they were this time last year. Several parties have been working in the river and creeks with varying success. One man got 11 oz. in a few days in Chandler's Creek, but this is the only patch I have heard of.

Quartz-mining.—The Union Gold Mining Company are now winding up. They have crushed during the year 113 tons for 26 oz. gold. In the early part of the year very rich specimens were obtained from the Just-in-time reef, but after sinking 30 ft. and driving about 80 ft. nothing more could be got.

The

The New Bendigo Company, Jackass Creek, have erected a 2-stamper battery (Marcolino's patent), but after a trial crushing, work was suspended.

Sperling & party's lease, adjoining the New Bendigo, has been idle, owing to the death, by accident, of one of the shareholders.

Sellon & party's Scottish Chief is also idle.

Marcolino & Son, Abercrombie Reef, Cunglebung.—A 2-stamper has been erected on this reef, and a trial crushing of 12 tons gave 16½ oz. gold. The stone now being raised is said to be of good quality.

I have issued during the year 39 miners' rights and 2 business licenses; and received 4 gold-mining lease applications and registered 2 machine sites.

CLARENCE AND RICHMOND DISTRICT—GRAFTON AND NANA CREEK DIVISIONS.

(*Mr. Warden McDougall, P.M., Grafton.*)

I now have the honor to send you my annual report as Warden for the Mining District of the Clarence and Richmond.

Mining in the district under my charge has been carried on to so small an extent during the year that I did not consider it necessary to visit either the Nana Creek or Dalmorton mines, and incur that expense. I have therefore obtained the following information from the Mining Registrar at Nana Creek as to that division, but the Mining Registrar at Dalmorton has not yet replied to my letters, requesting him to furnish me with all the information possible; but no doubt he has or will forward you his report for Dalmorton District.

The claims at present being worked at Nana Creek are the Illabo, Matilda, Advance Australia, Waratah, New Year's Gift, and Challenge. Besides these several other reefs have during the year been worked with the most favourable results. One, the Lady Carrington, for which a lease has been applied for by Denning and Dargue, yielded from 17 tons of quartz, 95 oz. of retorted gold. The number of men employed on the said reefs now is ten, and the number of tons of quartz crushed, and the quantity of gold extracted therefrom during the year is as follows, viz.:—16½ tons quartz, yielding 268 oz. 13 dwt. 4 gr. of retorted gold.

During the year there have been about thirteen or fourteen men working alluvial gold in the vicinity of the Little Nymboi and Little Plain Creeks, from 8 to 13 miles distant from Nana Creek township, but there are now only about six or seven at work. In all about 50 oz. of alluvial gold is estimated to have been obtained during the year.

Mr. Marcolini has erected one of his portable quartz-crushing machines at the Nymboi reefs, but after crushing a few tons of quartz, work has been stopped, pending a dispute as to the percentage of the gold-wash received in payment for crushing. The owners of the reef are willing to give men one-fourth of the gold, but he states that less than half will not pay men for carting and crushing &c.

The Matilda is out of repair at the Hidden Treasure reef and has not crushed any stone during the year, nor has the mine been worked.

The number of licenses, &c., issued at Grafton during the year has been 78 miners rights, 1 business license, and 1 mineral license, 1 gold-mining lease application at Chambigne, 2 mineral lease applications from Gordon Brook for chromite, 1 prospecting protection area for alluvial registered, and 1 machine site applied for. At Nana Creek 28 miners' rights have been issued during the year. As before stated, I am at present unable to give the number issued at Dalmorton during the year, but when received from Mr. Poole, the Mining Registrar and Warden's Clerk there, I will forward it on to you.

CLARENCE AND RICHMOND DISTRICT—GRAFTON DIVISION.

(*William Clarke, Mining Registrar.*)

No work of any consequence has been done in my division during the past year.

George Stone applied for a gold-mining lease of 5 acres, at Chambigne Creek, on the 12th of August last, and this lease is now the property of the Columbus Quartz-crushing Company.

But little work has been done. The shaft is down 20 ft., and about 200 tons of quartz have been raised, but no crushing has taken place. The particulars of the machinery are given in my returns.

Taylor and party, at the Mann River, have their shaft down about 60 ft., and have about 50 tons at grass, and a few tons were crushed with a 1-stamper "Dolly," which gave a fair yield.

The price obtained at the Mint for this gold was £3 17s. 10½d. per oz.

I believe the reefs at the Mann River will before long prove payable beyond doubt.

On the 5th April last, Messrs. Lewington and party applied for five mineral leases for chromite, situated in the parish of Yankalkiarra, but they have been abandoned, as the ore tested was not of sufficient value.

An alluvial prospecting protection area was applied for by John Kenny, jun., at Mount Double Duke, but no work has been done, and suspension of work was granted on account of the late heavy rains having rendered it impossible to work.

There is nothing to report about the coal-mining permit at Maclean, and I believe nothing has been done thereon since the "drill" was removed.

The return of gold is compiled from information received from the Banks, and a quantity of it was won outside of my division. The localities whence it was obtained are as follow:—Nana Creek, Cunglebung, Solferino, Mann River, Millera, Dalmorton, and the Clarence River (about 8 miles north of the Heads, and same distance back from the river.)

I issued seventy-eight miners' rights, one business license, and one mineral license. The following tenements were applied for:—One alluvial prospecting protection area, and one machinery area. The miners' rights were chiefly issued to persons interested in claims and leases outside of this division.

CLARENCE AND RICHMOND DISTRICT—NANA CREEK DIVISION.

(*George Geddes, Mining Registrar.*)

For the information of the Honorable the Minister for Mines, I have the honor to transmit my annual report of the condition of the mines that have been and are now being worked, for the year 1886, in the Nana Creek Division of the Clarence and Richmond District.

Illabo,

Illabo, Eleven-tree Creek, about 2 miles from Nana Creek township.—But little work has been done by Alexander Stout in this claim. Only 12 tons of ore from the 107-ft. level were crushed through the year, and that on the 19th June, giving 13 oz. 0 dwt. 4 gr., or 1 oz. 1 dwt. 16 gr. to the ton. Mr. Stout, with others, first worked this claim at the commencement of the year 1883, and only relinquished the undertaking after an immense amount of labour expended upon it, and an expenditure of over £300, in trying to make the venture a success. A good, experienced, and indefatigable miner is thus, I am sorry to have to write it, lost to the field.

Lady Matilda.—This claim is situated at Nana Creek, and was originally owned and worked by F. W. Chapman & Company. Recently, E. F. Sharpe applied for it, and then took out only a few tons of ore, and that from the surface. It requires far too much outlay to work it systematically with any prospect of success, and is, therefore, no claim for a man of even moderate means to attempt to work.

Waratah.—This claim, situated about 2 miles from the Nana Creek Quartz-crushing Company's battery, and adjoining the claim formerly known as the "Nymboi Prospecting Claim," was first taken up by Messrs. M'Leod and Forbes, on the 13th February, but they not having applied for its survey in terms of clause 2 of Regulation 63, they repegged and reapplied for it on the 23rd June. It was surveyed on the 7th September, and has been continuously worked. They sank a shaft about 45 ft., and after getting out valuable stone, some 60 tons—the reef about 12 in. wide, lying north and south—it, through being in loose ground and not sufficiently timbered, caved in. They had only ceased working it for about forty-eight hours when the collapse took place. Another shaft, but a short distance from the former one, has been put down to a depth of about 50 ft., well slabbed from the start. The reef runs north and south, well defined, and is, on the average, from 12 to 18 in. wide. Gold in both shafts got from the surface. A crushing of 52 tons of ore, put through Mr. Paulo Marcolino's battery, of which he is the patentee, was finished on the 5th November, giving a return of 53 oz. 11 dwt., or 1 oz. 0 dwt. 14 gr. per ton. There are some 80 to 90 tons of ore at grass awaiting the starting of the battery. The cause of the delay is that finer screens are being got from Sydney. The lot to go through is considered to be ounce stone. All the reefs, and they not a few, in the vicinity of the Nymboi, are gold-bearing, and deemed payable. All that is needed is the machinery and cheaper carriage. The reefs are distant from the above battery 59 chains 56 links, about $\frac{3}{4}$ of a mile. The result of the crushing was not at all satisfactory to the proprietors, they, from their trial tests, and the general appearance of the quartz, expecting to realize, at the very least computation, 2 oz. per ton, and such was the strongly expressed opinion of many others, and they, old experienced miners. There are, in the judgment of some here, whom I think to be competent of forming an impartial decision in the matter, objections of a *bona fide* character to the battery, they having reference more particularly to the boxes in which the stampers respectively work. They are considered to be much too small to crush large quantities of stone, as, when fed too freely the screens, it is thought, from the action of compressed air, burst, allowing the small pieces of uncrushed quartz, together with a quantity (more or less) of amalgam to escape with a rush through the sluice boxes, and over the ripple tables, the mass lodging in the tailings. Since the crushing a portion of the tailings has been overhauled, and the person who tested them assured me that he got as many as 14 grains of gold to the dish, besides amalgam. He also saw quicksilver scattered pretty freely through the heap of tailings. All this is very discouraging, and before the battery will again command the confidence of the mining community here, the boxes will most certainly have to be constructed upon a different plan to the one now in vogue. The screens also need to be much finer.

New Years Gift and Challenge.—These claims are in the possession of, and being worked by Oliver Anderson. They are situated near Tallewidgen Creek, and about a $\frac{1}{4}$ of a mile from the Advance Australia. The former was held by Messrs. Cooper, Anderson, and Geylic, originally as an ordinary claim, and reported upon for the year 1885. 46 tons of quartz was then crushed for 60 oz. retorted gold. Mr. Anderson applied on the 4th March for a lease of 4 acres of the land, and again on the 18th November for another lease of 4 acres adjoining the former plot, he having every confidence in the reefs examined and tested by him. The works in progress are:—No. 1, original shaft of 45 ft. is now down to 53 ft., and the tunnel piercing the hill along the line of reef on the north-west side, connecting with the shaft at the 45-foot level has been extended from 70 ft. to 86 ft. The reef lies to the east, and is about 18 inches wide. Another tunnel driven at the northern end of the reef is 43 ft. 6 in. in length. There is also a line of reef in an open cutting 16 ft. x 12 ft., and is from 7 ft. to 8 in. wide. Good prospects have been obtained by Mr. Anderson from the reefs, and to further assure himself of their value he sent recently 1 ton 15 cwt. of quartz, taken promiscuously from a stack, to the Sydney Mint for assay. The cost of transit, &c., was as follows:—Cartage to Grafton, £7; freight to Sydney at 15s. per ton, £1 10s.; cartage to Mint 10s., and cost of assay, £4 4s.; total, £13 4s. The Mint return gave 6 oz. smelted gold, value of same at £3 17s. 10 $\frac{1}{2}$ d per oz., £23 7s. 3d., thus leaving a profit of £10 3s. 3d. Survey of the New Year's Gift has been made, but Mr. Anderson being so satisfied of its incorrectness has applied for a resurvey of the ground.

Advance Australia.—This claim is distant about a quarter of a mile from Oliver Anderson's claims on the Tallewidgen Creek. It was first taken up by C. Sperling and party, then, on the 10th March, Geylic and Van came into possession. No. 1 shaft is down 45 ft., the reef being on an average 6 in. wide, and bears nearly north and south. A crushing from this shaft of 17 $\frac{1}{4}$ tons of stone was finished 17th September, yielding 24 oz. 13 dwt., or 1 oz. 8 dwt. 13 gr. per ton. Geylic then left the field, and the claim is now carried on by E. Van and his brother. No. 2 shaft is down to a depth of 30 ft.; the reef here runs north-east and south-west, and is about 6 in. wide; both reefs underlie to the east.

Homeward Bound, Tallewidgen Creek.—Thomas Wilkinson took this up on the 23rd January. The shaft he worked was originally sunk to the depth of 45 ft., but has been increased 15 ft., making it now 60 ft. The reef is about 2 ft. thick, and has borne gold from the surface, yet the results obtained are not looked on as payable, nor can they be when crushing is at £1 per ton, and cartage 27s. 6d. Two crushings on 18th June of 14 tons 16 cwt., yielded 15 oz. 12 dwt., or 1 oz. 1 dwt. 16 gr. per ton, and on the 23rd October 26 tons 9 cwt. yielded 15 oz. 14 dwt., or 11 dwt. 20 gr. per ton. He applied on the 10th May for 2 acres of land contiguous to the claim for a machinery area, but beyond that no steps were taken in the matter.

Nicholson Reef.—This is a prospecting claim taken up on the 30th April by John Nicholson. It is situated near the main Tallewidgen Creek in a westerly direction from the Homeward Bound claim. The shaft is down 34 ft., gold from the surface. The reef bears north-east and south-west, and its average thickness

thickness is 18 in.; 1 ton of surface stone gave 1 oz. 0 dwt. 11 gr., and 2 tons from the reef in the main shaft sent to the Sydney Mint for assay gave 3 oz. 15 dwt. or 1 oz. 17 dwt. 12 gr. per ton. Surveyor's remarks, 10th June:—"The reef in this ground has only been sunk on for about 10 ft., and cannot be said to be well defined at that depth. When reduced, the quartz shows a fair return of fine gold."

Day Dawn Reef.—This also is a prospecting claim, taken up on the 5th May by Andrew Nicholson, and is situated on the west side of Tallewidgen Creek, about $\frac{1}{2}$ a mile from John Nicholson's prospecting claim. In this ground there is a shaft to the depth of 36 ft. The reef about 15 in. thick bears north and south, carrying gold from the surface. Gold in this claim can be traced along the surface for fully 120 ft. 2 tons of quartz were sent to the Sydney Mint for assay, and yielded 1 oz. 12 dwt., or 16 dwt. per ton. Surveyor's remarks, 8th June:—"The reef in this ground has only been sunk on for a short distance, about 10 ft., and a well defined reef is showing, carrying fine gold in, I believe, payable quantity." Both these reefs are within $\frac{1}{2}$ a mile of permanent water in the main Tallewidgen Creek, a suitable site for a battery could, therefore, be readily fixed upon. The working the above prospecting claims up to the 13th September caused an outlay of about £250. The Rise and Shine, Homeward Bound, Red White and Blue, Caledonian, Miner's Bride, and Mountain Beauty claims are within about $1\frac{1}{2}$ mile of the Nicholson's claims, and are all gold-bearing, distant about $5\frac{1}{2}$ miles in a north-west direction from Nana Creek township, where Dargue & Company's battery is erected. The two first-mentioned claims were referred to in my reports for the year 1884-5.

Jones and Willoughby.—Claim unnamed. This was taken up by them on the 23rd June as an ordinary claim. It is distant in a north-west direction, about 60 ft. from John Nicholson's boundary line. Although good prospects were secured during their search, extending over several weeks, there was not sufficient inducement to keep them to the work. They are now prospecting in the vicinity of Back Creek, not far from Kangaroo Creek.

Red White and Blue.—This claim is situated about $\frac{1}{2}$ a mile west of the Homeward Bound, at Tallewidgen Creek, and was on the 21st June applied for by Messrs. Edward and Alfred Sharpe, of Nana Glen. The shaft is down about 40 feet. The reef is about 3 ft. 6 in. in thickness, and the bearing north and south. There are leaders in all directions, and of such a size as to lead one to the conclusion that they are reefs. They are known to contain a fair quantity of gold. Some 20 tons of stone were taken out, and then work had to be suspended for want of a team to cart the stone to the battery. That forced them to register their quartz on the 4th September, and they were unable, until the 10th November, to get a crushing; then they only put through 11 tons, fearing the result might not be favourable. It, however, turned out better than they anticipated, yielding 9 oz. 18 dwt. or 18 dwt. per ton.

Lady Carrington.—This was taken up as an ordinary claim on the 23rd June, by Messrs. Dargue and Denning. It is portion of the ground known as the Nil Desperandum claim, situated about 2 miles from Nana Creek, in a westerly direction. Subsequently they, on the 10th July, applied for a lease of 2 acres of the land, taking in the old shaft. A new shaft has been sunk to a depth of 30 ft., reef 8 in. thick, bearing nearly north and south, traced from the surface, and carrying rich gold. Two crushings of stone from this claim have taken place; one in June, of 17 tons for 90 oz. (some say it was 95 oz.), and the other on the 9th October, of 13 tons 10 cwt., for 46 oz. 5 dwt.; total, $30\frac{1}{2}$ tons for 141 oz. 5 dwt., or 4 oz. 12 dwt. 14 gr. per ton. And yet, with these excellent returns, they have actually abandoned the claim. The claim is nearly at the foot of a very steep hill, about a quarter of a mile in length, a gorge on either side, and the rain water, in its descent, lodges in large holes formed at intervals by the action of the current, and finally falls into a small basin at the foot of the range. Water could be very easily conserved in this locality for crushing purposes. There is also much soakage after heavy rain, and a depth of 12 feet of water has been found in the shaft, after a 24 hours fall of rain. A portable machine in the vicinity of such a claim as this, would quickly return the outlay; and the mine, to men of pluck and enterprise, would, I venture to predict, yield a small, if not a large fortune.

J. Dargue & Company's Battery, Nana Creek.—This has been at work, occasionally, during the year, and a detailed account of the crushings I give below.

Nana Creek Quartz-crushing Company's Battery is situated on Nana Creek, about 4 miles from the township, and about a quarter of a mile from the Hidden Treasure prospecting claim; it has been idle throughout the year. A general meeting of the shareholders was held in Grafton on the 10th November, when the sixth half-yearly report was submitted, from which I gather that the late Company's manager, Mr. James Denning, reports the battery (including the engine and boiler) to be in good order. There are some minor wants excepted, such as the replacement of the shoes and dies with new ones. The reason given for the cessation of operations is, the inadequate water supply, and inability of the management to procure stone for crushing in sufficient quantity. The former cause was, no doubt, a hindrance at times, but the latter reason is not, I think, a valid one, as I am aware that several claim holders offered to guarantee the Company over 200 tons of stone, if the battery was put in working order, and any further quantity that might be brought to grass. The board of management, I understand, purpose putting the battery in order at an early date, and, if they carry out that decision with promptitude, and providing the requisite supply of water be forthcoming, there need be no fear but that there will be an ample supply of quartz to keep the mill going for a time—at all events until more stone can be got out, and the starting the battery will be an encouragement for the miners to do so. There are about 100 tons of quartz in the vicinity of the Nymboi at grass, the owners of which are most anxious to have it crushed. But what most troubles the management is the fact of a number of the shareholders being in arrears with the payment of their calls, to the amount of £364 19s.

Little Nymboi Battery.—This is the property of Mr. Paulo Marcolino, of Grafton, for which he has taken out a patent. It has been erected about three-quarters of a mile, in a south-west direction, from the Waratah claim, at the Nymboi. A machine site of 2 acres was applied for by him, on the 18th August, and surveyed on the 6th September. The battery started work on the 21st October. It consists of four stampers, of 4 cwt. each, working in separate boxes, driven by a 4-horse power engine, No. 5 climax vertical, and boiler by David W. Robertson & Co., of London, and stamper boxes and crushing power by Sands & Co., of Sydney; the remaining portion of the work for saving the gold, has been designed and manufactured by Mr. Marcolino, of which I now attempt a description. In the first place, the screens in the stamper boxes are faced with copper plates, coated with quicksilver, to catch the gold from the pulverized quartz

quartz. Then the tops of the stamper boxes are loaded with quicksilver, and from these the water conveys the crushed ore into wooden boxes, thence through a sluice head into a receptacle, in form much similar to an ordinary cradle, the bottom being covered with small circular holes, rather more than an inch in diameter, filled with quicksilver. From these boxes or cradles (of which there are two), one to two stampers, the water and pulverized ore travel into the sluice boxes; they are about 8 ft. in length by 14 in. in width, and covered with quicksilver. Then there are three ripples charged with quicksilver, and at this point a fall takes place, of about an inch and a half, to another sluice box with a false bottom. This has a length of about 6 feet, and is covered with circular holes, of same diameter as those before mentioned, filled with quicksilver; and upon the bottom of the box are also diamond-formed breaks, which cause a temporary reversal of the water, at certain stages, and to all appearance ensure the arrest of the gold in the wells or holes constructed for its reception. At the foot of each sluice box a blanket is placed, to catch any fugitive particles of gold or quicksilver. It seems next to an impossibility that any gold can pass the many contrivances, to which the patentee has had recourse, in the construction of the tables, &c., in order to secure it.

Water Rate and Water Right.—Mr. Marcolino, to supply his battery with water, applied for the above, on the 1st October. It runs in a northerly direction from the Little Nymboi River, and distant from the Waratah claim about three quarters of a mile.

Alluvial Mining.

William Bourne.—This person, on the 8th November, applied for a creek claim. It is situated on the Dam Gully Creek, and distant about 2 miles, in a northerly direction, from the Nymboi reefs. Gold of an excellent quality has been got in small quantities, but the workings do not warrant the belief that they are likely to be of a permanent character. During the year there have been miners to the number of about twenty prospecting for gold in the vicinity of the Little Nymboi, Little Plain, and Back Creeks, from 8 to 13 miles distant from Nana Creek township. Some have been working near Tallewidgen Creek, and one and all have got gold, but in what quantity I cannot tell; yet, that won, must have been such as to return them fair wages for their labour, and, in many cases, much more. Still, the general opinion here is, that reefing on the whole is more profitable than alluvial workings. One man, a short time since, disposed of 25 dwt. of gold to the local storekeeper. It was coarse, shotty, very clean, of good quality, and should command a good price. The local price is 3s. 6d. per dwt. The sample was unearthed at Tallewidgen Creek, in shallow sinking. One of the pieces weighed over 20 gr. I have no means of ascertaining the exact quantity won in the aggregate, but it cannot be less than 50 oz.; and I feel persuaded my statement, although I am not in a position to prove it, is far below the mark. Some 30 oz. have passed through the local storekeeper's hands, and other lots which I know of, sufficiently justify me in the opinion I have given.

Return of gold won, the crushings in detail, during the year ending the 31st December, 1886, from the following quartz claims in the Nana Creek Division of the Clarence and Richmond District.

76	10 July, ,,	J. Dargue and J. Denning..	2	Left the field a short time after the last crushing, on 9 October.		
77	24 ,, ,,	E. F. Rudder and M'Leod's	7	Very little work done.		
78	12 Aug., ,,	John Wood	3	On the field, but not working the claim.		
*79	18 Nov., ,,	Oliver Anderson	4	Being worked.		

* With reference to Mr. O. Anderson's claims, I deem it only just to state, that in addition to the works already carried out (See page 97), 8 chains of a cutting for a road with 4 chains of clearing, from No. 2 tunnel, has been completed to meet the main road coming to the shaft.

I have issued during the year: Miners' rights, twenty-eight; business licenses, nil; mineral licenses, nil. There is one storekeeper on the field, and he, I am informed, procured his business license from the Registrar, in Grafton.

For

For the purpose of comparison, I tabulate the following particulars, giving the quantity of reef gold won in this division during the years 1882 to 1886 inclusive, and the number of men recorded as being on the field at the expiry of each year :—

Year.	No. of men.	Quartz crushed.		Yield of Gold.			Value.		
		Tons.	cwt. qr.	ozs.	dwt.	gr.	£	s.	d.
1882	50		909	0	1	3,454	4	0
1883	7	445	5 0	534	6	18	2,041	12	0
1884	33	452	10 0	410	4	21	1,374	6	4
1885	16	407	10 0	333	11	9	1,203	9	9
1886	17	164	0 0	268	13	4	940	6	1
				2,455	16	5	9,013	18	2
1883 to 1886		1,469	5 0	1,546	16	4	5,559	14	2

The above does not include any alluvial gold won.

The yield of gold has, it will be observed, decreased each year, still the average yield of 1 oz. 1 dwt. 1 gr. per ton for the years 1883 to 1886 is on the whole an encouraging return, and will, I think, bear favourable comparison with many of the other gold-fields of the Colony. I am, unfortunately, deterred from including the average for the year 1882, not being in possession of the quantity of quartz from which the 909 oz. 0 dwt. 1 gr. of gold was obtained.

The average for this year is 1 oz. 12 dwt. 18 gr. per ton, and that, in many localities, would be a most welcome return; but the great hindrance to success here, is the high price for crushing, and the exorbitant rates demanded for cartage.

A Mr. Alexander Nicholson, who has been a resident of this district for the past 35 years, informs me that he has travelled it repeatedly, and is intimately conversant with the country generally. From him I learn, that in the years 1872-3 there were found, and worked in this division, the following reefs :—

1. *Little Nell*.—Quartz sent to the Mint gave 13 dwt. per ton.
2. *Bushman*, now known as the "Lady Matilda."—Quartz when sent to the Mint yielded 11 dwt. per ton.
3. *Independent*.—Quartz got from this claim at a depth of 30 ft., but was abandoned owing to an influx of water.
4. *Morning Star*.—Quartz sent to the Mint returned 7 oz. odd per ton.
5. *Paddy Fury*.—Quartz showed good gold, but no crushing took place.

In addition, to the foregoing, there are some forty-five proved auriferous reefs on this field.

I am called upon to report the number of square miles of auriferous ground which is being, or may have been, actually worked upon. As to the number being worked, that I cannot tell, although I have made every inquiry; but, having sought to ascertain the boundaries of this division, and the number of square miles therein, I venture to give the result of that inquiry. The starting point is Red Rock, situated 15 miles north of Coff's Harbour, thence west 20 miles to intersect the Nymboi River; thence south 15 miles to Mount Nicholson, at the head of the Bo Bo River; thence east 14 miles to Coff's Harbour; thence north by the Pacific Ocean, to the point of commencement. From the above this division is thought to contain about 255 square miles of auriferous country, gold having been found in all parts of it, even to the Bellinger River.

In conclusion, I am sorry to have to make known the fact, that mining has been anything but brisk on this field during the year under review, and, that it has been retrograding rather than advancing; still, I am sanguine of a reaction yet for the better setting in. The absence of capital and other very necessary appliances is no doubt a serious, if not the chief, obstacle to mining ventures on this field; and, to write plainly and truthfully, there is far from an encouraging prospect here for a struggling digger, for he cannot cope with the many adverse circumstances by which he is met. In the first place, Nana Creek is distant about 50 miles from Grafton, and some 7 miles from a main road, and when the field is reached there is but a succession of ranges, barren almost of feed, and so steep that no ordinary teamster can be induced to travel them. This in itself heavily handicaps the miner in the matter of stores. Again, is the question anent the carriage of quartz to be studied, and that is thought so risky that it is with great difficulty the services of a good teamster can, unless at a heavy rate of carriage, be secured to convey the ore to a battery. The carting distances are from 2 to 8 miles, the exception being from the Waratah and Nymboi claims to Marcolino's battery, of recent erection, the distance about $\frac{3}{4}$ mile, and over the very roughest of roads.

When perusing the undermentioned journal, in which is discussed mining matters and speculations of every kind in all parts of the habitable globe, I incidentally met with a letter which, I think, as referring to mining at Nana Creek, deserves more than a cursory glance; I therefore take the liberty of inserting it, with the editor's introductory remarks and foot-note, in my report. It is one penned in September of this year by a miner, now residing on this field, to a friend of his in England, and from which a slight conception can be formed of what he, in common with many others who have been, and are now, residents of this place, think of the general state of mining here. His assertions are very pertinent and, to my knowledge, stamped with truth.

"Weekly Bulletin": A journal of finance and investment. Edited by Kenneth Ffarington Bellairs.

"ECONOMY."

No. 342. New Series. London, 13th November, 1886.

The following letter from New South Wales, and sent to us by the recipient, shows that the rock must be very rich, to pay a poor man who has neither mills nor appliances with which to work. All would-be emigrants must remember the fact that, although capital with labour may extract the precious metal, labour without capital cannot :—

"I am waiting for one of your epistles, but it does not come, but yesterday a regular shower of papers arrived (six), for which many thanks. I am still in this most stringing reef country, but begin to give up all hope of it doing any good; the poor people here cannot prove the ground. The way they work is like a lot of pigs, scratching about on the surface; they scratch about and find a golden reef, get out a few tons, and if the stone 'pinches out' they try some other place. One man got 95 ounces out of 16 tons, and left his shaft only 12 feet deep. The ground my brother was working is a most curious place, nothing but a network of leaders running to all points of the compass, but cannot find the reef, as we cannot afford

afford to sink, the country being so hard. He sank until he could not do it any longer, then took 17 tons out of some of the leaders, and crushed 1 oz. 14 dwt. per ton, but it was not good enough; expenses of carting and crushing 47s. 6d. per ton. The same leaders have given 2 oz. 10 dwt. per ton. I saw him try a prospect from about 3 oz. stone, and got 15 dwt. 16 gr. of coarse gold, all covered with mundic; obliged to waste and amalgamate it. Now, I think these batteries (only stampers and copper-plates), cannot save the gold from mundic reef, consequently more than half the gold is sent down the creeks. I was thinking of getting a ton or two and sending it to Swansea for treatment. Do you think it would answer, and how should it be sent, and to whom, also probable cost of working it per ton? Nana Creek, 26 September, 1886."

This refers to the Advance Australia. (See page 97.)
This refers to crushing from the Advance Australia of 8 tons 9 oz. in 1885. Average 2 oz. 7 dwt. 12 gr.

Nana Creek must be worth millions with proper mills up.—ED.

ALBERT DISTRICT—SILVERTON DIVISION.

(Mr. Warden Brown, P.M., Silverton.)

I now have the honor to hand you below, for the information of the Hon. the Minister for Mines, my report of the progress made in the mining industry of the Silverton Division of the Albert Mining District during the past year.

I am pleased to state that silver-mining has made steady progress during the year just ended, the work being considerably helped by a most favourable season; but as yet most of the mines in this district are only in their infancy, and will require a considerable amount of capital and labour to fully develop them. The magnificent results from the Broken Hill Prospecting Company's mine have induced prospecting to a large extent to be most vigorously carried on along the same line of country, and from present appearances likely to result in a satisfactory manner to the proprietors. At the Pinnacles, work has been resumed. This mine is considered, by most persons qualified to express an opinion, as second to none on the field, Broken Hill excepted, but hitherto the management has been greatly hampered by a short supply of water, refractory ores, and other evils, which perhaps could not be foreseen. Concentrating machinery is being erected which is thought will put an end to the difficulty experienced in smelting the ore.

At the Day Dream, comparatively little ore has been raised during the past year, the hands employed having been solely engaged in further prospecting the mine at a greater depth, and, I believe, with fair success. It is expected the number of men employed will be greatly increased, and the smelters shortly put in blast, the Company having taken advantage of the rise in the River Darling to secure a good supply of coke. The Umberumberka S. L. Company's property has, I think, fully established itself in the rank of first-class mines. The output has been steady, as will be seen by the manager's report attached. Prospecting by other Companies has been steadily pushed ahead on this line. As regards the small rich chloride veins which are to be found all over the field, more especially in the neighbourhood of Purnamoota, several of them have been steadily worked during the year just ended, more particularly the Lubra, Treasure, Maybell, Maybell North, Kate, Manola, War Dance, and several others. Two small smelters are now being erected at Purnamoota by private enterprise, but by different persons, who each maintain they can effectually treat these ores at a small cost per ton. It is to be sincerely hoped these (or one of them) undertakings will be successful; for until some method is devised by which the working miner can realize on small parcels of these rich ores, either by having them treated or bought on the ground, this branch of the silver-mining industry will be depressed.

The large manganese outcrops at Corona are again attracting attention. 180 acres have been applied for as mineral leases at this office during the last month, the applicants stating their intention to thoroughly test this country.

The tin deposits, near Poolamacca Station, are now being tested, several of these leases having been executed during the past year; all persons interested in these mines believe them to be good properties, but as work has only just been started on most of them only a small quantity of ore has been despatched from the field.

The S. A. Railway is now so far completed that mails, goods, and passengers are conveyed to the Border, some 20 miles from here, and, as the same contractors will continue the construction of the tramway line to Silverton, it is expected to be finished to this town in March next, which will place this field in direct railway communication with Adelaide and Port Pirie, and must cause a great impetus to be given to the mining industry of this district, as the supply of low grade lead ores, carrying from 30 to 40 oz. silver per ton, is unlimited, and with cheaper carriage, I fully expect to see during this year a large number of men employed on the galena lodes of Thackaringa, which, with one or two exceptions, have not been worked during the past year.

When writing my last year's report on this field, there were only two smelters at work; this number has now been increased to seven, and by the end of this year the latter number will be more than doubled.

The appearance of the town of Silverton has been much improved during the year by the erection of several substantial buildings. At present there is a splendid supply of water for all purposes. The population in and around the town, I should estimate at about 2,000.

The township at Broken Hill (official name, "Willyama"), has made rapid strides during the past year, the population in and about it I should say is near to 3,000 persons, the buildings are not so substantial as those at Silverton; this is easily accounted for by the unsatisfactory tenure of the land by the occupants who have settled there since October, 1885, when this land was exempted from occupation under miners' right or business license. This, I must say, with all due respect to the person who suggested this exemption, was a most unwise policy, as it seriously retarded *bona fide* settlement, and I have no doubt was a direct loss to the revenue for the past year, for if settlement had been allowed to go on, some thousands of pounds would have been received at the Treasury in payment for I.P.'s; it is to be hoped this important question will soon be settled, as, with about thirty exceptions, the whole population are merely trespassers; this town is badly supplied with water, and I would strongly urge the necessity of some provision being made by sinking tanks.

During the past year the following licenses were issued by the Mining Registrar:—

Business licenses	650
Mineral	285
Miners' rights	103
Mineral lease applications received	208

The declared value of the mineral exports from this field for the year 1886, kindly furnished me by the Sub-Collector of Customs, is as follows :—

		Value.		
		£	s.	d.
Refined silver	410,256 oz.	81,910	0	0
Silver ore.....	1,711 tons 2 cwt. 3 qr. 16 lb.	67,233	0	0
Argentiferous lead.....	2,556 „ 11 „ 1 „ 12 „	188,486	0	0
Do do via Menindie	474 „ 4 „ 0 „ 5 „	32,725	0	0
Tin ore	2 „ 1 „ 0 „ 0 „	69	0	0
Total value of export.....		£370,423	0	0

In addition to this, there is a large quantity of ore still remaining at the different mines, which has been raised during the past year, but not yet sold or treated, and would add considerably to the total amount of ore won.

I estimate the value of plant and machinery now at work on the field at £45,000.

I think I have now touched on all the principal features of this division, without traversing over the same matter as lately formed the excellent reports of the Inspector of Mines, who lately visited all mining centres on this field. In conclusion, I may state that, from present prospects I consider the field in a sound condition, and fully anticipate the exports at the close of the year (silver, lead, and tin), will reach in value one million sterling.

Accompanying this report are several returns from the different mining managers, giving valuable information as to depths of workings, &c. Some of them I must confess I can hardly understand, few of them showing the amount (which must have been considerable) of ore still at grass.

As the Broken Hill Prospecting Company's mine is, without doubt, the most extensive and valuable silver mine in Australia, perhaps a short resume of its history may not be out of place as an appendix to this report.

In September, 1883, one Charles Rasp, who was then a boundary rider on Mount Gipps station, marked out an area of 40 acres, believing the enormous outcrop of manganese to be tin. On reaching the station at night, he informed Mr. McCulloch, the general manager of the station, also his mates, of what he had done, when it was then and there determined to form a small syndicate, consisting of seven persons, all station hands, each putting £70 into the venture. The first thing done was to apply for a mineral lease of the land taken up by Rasp, together with six other 40-acre blocks on the same line. These seven blocks now constitute the Broken Hill proper, and were originally applied for by the following persons: George McCulloch, George Urquhart, Charles Rasp, James Poole, Philip Charley, David James, and George M. Lind. Work was soon commenced, and assays made for tin, but, I need hardly say, with no beneficial result. It was then decided to sink a shaft, and prospect for silver, which, by this time, had been proved to exist in the district. The country being hard, and the sinking not showing very encouraging prospects, coupled with the fact that the small amount of capital that had been subscribed was exhausted, caused some of the original shareholders to sell to others, Lind being the first to retire, his interest being taken by McCulloch and Rasp, Urquhart being the next to give in. It was now determined to increase the syndicate to fourteen, for the purpose of raising more funds for further prospecting. This arrangement was carried out, and the work continued until the latter part of 1884, when chlorides were first found in Rasp's shaft, at a depth of about 100 feet. Shortly after, rich chloride ore was found in the cap of the lode, at a different part of the mine. I may here state that the cap of this lode is discernible through the seven blocks owned by the Company, being about $1\frac{1}{2}$ mile in length, and rising in places fully 50 feet above the surface, while in the workings below it has been proved, in places, to be considerably over 100 feet wide. About the middle of the year 1885, it was determined by the then proprietors to offer a portion of this enormous property to the public, and on the 10th August, 1885, the present Broken Hill Proprietary Company was floated. The prospectus issued was to form a Company of 16,000 shares, of £20 per share, the fourteen shareholders receiving 1,000 shares each, paid up to £19, the remaining 2,000 were offered to the public at £9 per share paid on allotment, and then to be considered paid up to £19, after which all shares alike were liable to a call of 20s. on formation of this Company. £3,000 was to be paid (in addition to the shares) to the original proprietors, for expenses previously incurred. Thus, it will be seen that, on the formation of the present Company, only £15,000 was available for all purposes. Extensive operations were now commenced, machinery erected, and the first two smelters put in blast in May last, and the result so far, I think, may be considered highly satisfactory. Up to date £64,000 has been paid in dividends, and another of £1 per share is payable on the 19th January. Machinery and supplies of coke, firewood, explosives, &c., now on the mine exceed in value several thousands of pounds; substantial stone buildings have been erected for manager's residence, offices, and other purposes. All this has been paid for by the value of ore won from the mine whilst sinking shafts and driving levels, which, in ordinary cases, would be considered dead work. The supply of ore is, apparently, unlimited. The market value of the mine is now £1,520,000, the latest quotations being £95 per share, and few sellers at that figure. In June and July of 1884, a one-fourteenth in this property was worth about £100, some shares being sold for less than that amount.

Of the seven original proprietors four only now retain an interest in the Company, viz., Mr. George McCulloch, Philip Charley, Charles Rasp, and David James, the former gentleman, I believe, retaining the whole of his fourteenth interest.

By the printed report submitted to the shareholders in December last, I find that the result of a twenty-nine week's run, ending 25th November last, with two smelters, was as follows:—Ore treated, 10,397 tons, for 871,665 oz. fine silver and 1,990 tons 17 cwt. 3 qr. of lead, the average of silver being 83.83 oz. per ton of ore. From the same report I also find that the gross profits from the mine for the six months, from 1st June to 30th November last, were £89,912 11s. 2d.

ALBERT DISTRICT—WILCANNIA DIVISION.

(Mr. Warden Gower, P.M., Wilcannia.)

I do myself the honor to report, that during the past year prospecting operations for alluvial gold have been carried on at the Peak Tank, on Nuntherungee Run, half-way between Wilcannia and Milparinka, which, if successful, will give an impetus to mining in this district, and open up a large area of country. I am informed by some of the men from that locality, that there are now about fifteen to twenty men prospecting, and some of them are earning rations by surfacing, which gives them every hope of ultimately discovering payable ground. The

The season is in every way favourable for prospecting, as there is a quantity of water in most of the holes in the creeks throughout that locality.

I issued ten miners' rights in 1886, and ten up to date.

No other minerals are being prospected for, and I hope that my report for the current year will be a more favourable one.

ALBERT DISTRICT—MILPARINKA DIVISION.

(*Mr. Warden King, P.M., Milparinka.*)

I HAVE the honour to hand you herewith my report on the Milparinka Division of the Albert Gold District.

During the year 1886 12·75 in. of rain having fallen, the miners have been well supplied with water for all purposes, and the yield of gold, so far as can be ascertained, has been considerably increased—2,131 oz. were sent away by escort for the Commercial Bank up to the end of August, since which about 1,000 oz. have been purchased by the storekeepers, and although it was estimated that 600 oz. were on hand at the commencement of the year, it may be assumed that upwards of 3,000 oz. have been gained this year, as several of the puddlers do not sell to the storekeepers.

The number of miners' rights and business licenses issued compares favourably with last year's returns, but there has been a great falling off in the population during the last few months, many having left for the new field lately opened at Tetulpa, in South Australia.

At Mount Brown, on Billygoat Hill, steady work, with satisfactory results, has been done in the claims that have not had water to contend against—the yield being about 1 oz. per ton. Two only of the claims that obtained suspension resumed work, and so far they have not been able sufficiently to overcome the water to ascertain the value of the wash at the bottom of their shafts. Butler's party however perseveringly worked on and traced the lead of gold from the higher ground to the water's edge, about 100 ft., and obtained an average of 1 oz. per ton, but have now suspended work to obtain machinery to overcome the water. I am of opinion that when these claims can be efficiently worked handsome returns will be obtained. The Golden Lake Company have constructed a puddling machine so as to utilize the water from their shaft, and, but that water has been so plentiful at Mount Brown, it would have been much used by puddling surface ground for the public at a reasonable charge of 5s. per ton of wash-dirt. McClure's shaft is also on water, and is at present held only as a water shaft. This underground water is found at a depth of 210 ft.

At the One-mile the lead of gold which Portuguese Joe found at a depth of 16 ft. under the cement has been continuously traced in a southerly direction to a depth of 165 ft. Four claims are on good payable wash, yielding from 1 to 4 oz. per load. Brookway and party tried to pick up the lead further out, but failed. One puddling machine has been doing steady work at the Four-mile washing surface dirt, which returns about 1½ oz. per load.

At the Warratta reefs, the Milparinka Gold-mining Company having purchased the machinery and claims held by the Whittabrinna Company, have let the claim to tributors, who, during four months, have only crushed 40 tons for 23 oz. It is thought that owing to defective machinery more than half the gold is lost in the tailings. In other respects the Warratta is abandoned. During the winter months a little gold was obtained in Evans' gully, about 5 miles north of Warratta, and at this place also a shaft was put down searching for silver, and satisfactory assays said to have been obtained, but nothing further has been done.

The only new ground opened out this year was found by Thomas House in a gully on the south side of a low slaty ridge, about 6 miles north of Milparinka, from which about 20 oz. were obtained of heavy nuggetty gold, but, although the locality was well prospected, nothing further could be found, and it is now abandoned. Good Friday has found employment for about 15 miners, who have met with satisfactory success, ½ oz. per ton.

At Tibooburra, the principal work is now carried on with puddling machines, which are yielding very good returns by puddling the surface ground, and, owing to the good rainfall, they have continued steadily at work.

The rainfall having been so very propitious for the pastoral interests has enabled the Crown lessees to increase their stock very materially; for in 1885, the sheep returns showed 411,519, this year they amount to 525,000. In consequence of the unsettled state of the land question, particularly as regards the Western Division, the pastoral tenants are making no improvements, and consequently employing very little labour, and this causes business of all kinds in the township to be exceedingly dull.

There has been very little sickness in this district, the deaths (16) being mostly attributable to natural causes,—but two men perished for want of water. Twenty-three children have been born, and there has been no mortality among them. This climate, therefore, although so hot in the five summer months, cannot be looked upon as otherwise than very healthy.

I beg to append an extract from my meteorological journal for the year 1886.

ALBERT

ALBERT DISTRICT—MOUNT BROWNE DIVISION.

(Euston C. King, Mining Registrar.)

I HAVE the honour to report, that during the year 1886 I have issued 403 miners' rights, sixty-three business licenses, and thirty-seven mineral licenses. As compared with 1885, there is a decrease of twenty-seven miners' rights, one business license, and twenty-three mineral licenses.

The mining on this gold-field has in some instances slightly improved during the last twelve months, aided by the favourable rainfall of 12 $\frac{3}{4}$ inches, which fell at convenient seasons, leaving a good supply of water in the dams and reservoirs, and an abundant supply of grass.

At Mount Browne, the Billygoat Hill lead has been traced from 30 feet to a depth of 210 feet, at which depth a very large supply of good water was struck in several shafts—so great a supply that the claim owners have had great difficulty in keeping the water down with the ordinary miners' appliances, and have at last been compelled to give up following the lead under the water-level until they can procure machinery. Butler and party have proved this lead to be over 100 feet wide, and the thickness of the wash-dirt to be on an average of 18 inches, and dips 20 feet, almost perpendicular in some places, in others 1 in 6, towards the south and south-east, and yielding from 18 dwt. to 20 dwt. to the ton. M'Kenzie and party, the prospectors of this lead, are still doing well in their claim. The Sons of Freedom party have struck the lead, and driven 120 feet, following it south. The Golden Lake Company have not yet discovered the lead, but have struck the water at 208 feet, and found traces of gold; they are now making use of the water in puddling the surface dirt, which averages up to 3 dwt. to the ton. Howell and party, north of the prospectors, are getting payable gold at 50 feet. Morton and party, and Crammond and party, on this lead, are also doing well, getting gold at 30 feet. Some coarse gold is often picked up on the surface, after a shower of rain, in the vicinity of Mount Browne.

At the One-mile a rush took place in July, owing to a third claim picking up the lead there, and obtained 4 oz to the load at 50 feet. Several parties have since found the lead, and traced it towards a flat, about 300 yards, bearing to the south-east, and dipping at the rate of 1 in 8; but the yield is very patchy, for in one claim the yield is 2 oz. to the ton, and in a neighbouring claim only 8 $\frac{1}{2}$ dwt. to the ton.

A small rush took place in June to the slate ranges, 5 miles north of Milparinka, where a very rich patch of gold had been found by Thomas House, in a gully coming out of the range. This gully was worked out, the yield averaging 1 oz. to the load or ton, but no traces of gold could be found outside the gully, and it only continued about 400 yards down the water-course. Several large nuggets were found at this place, weighing from 1 to 8 oz.

At Albert (The Reefs) comparatively nothing has been done. The Milparinka Quartz-mining Company have let their machinery out on tribute; and the tributors have been crushing stone raised from the abandoned shaft, with the result of 40 tons crushed for 30 oz. Some very heavy coarse gold has also been found close to the reefs, in alluvial ground, at a depth of about 5 feet.

At Good Friday about 20 miners are making a living by fossicking, but up till now no rich lead of gold has been found there.

At Evans' gully, about six miles north from Albert, several small leads have been found, and while the small holes in the creek held water, the few miners there were able to make good wages by washing, but the dirt is not such that can be dry-blown as easily as that about Tibooburra.

At Tibooburra and the neighbourhood mining has greatly improved. There are fourteen puddling machines there, most of which have kept busily at work throughout the year; and, although the expenses of puddling are somewhat heavy, the returns of this year have been considerable, though it is very difficult to ascertain the true particulars. I have been informed that, in some instances, the puddlers made from £20 to £30 a-week. F. Valgoi, a puddler, at Easter Monday, near Tibooburra, has been puddling dirt from the surface, and obtains from 8 to 9 ounces a week, from about 266 loads. Thomas Stevenson has puddled 2,000 loads from the surface, which averaged 1 dwt. the load. Tibooburra is well supplied with water; several large dams and tanks have been constructed by private enterprise, and the rains in December have filled them all.

A little excitement prevailed in April on account of reports from Wompah, close to the Queensland border, of a rich find of silver. Several leases were taken up and applied for, but before any great rush took place it was proved to be a failure.

COBAR DISTRICT—HILLSTON DIVISION.

(Mr. Warden O'Neill, P.M., Hillston.)

I HAVE the honor to state, for the information of the Honorable the Secretary for Mines, that no change has taken place since my last report with respect to mining industries in this district.

At Mount Hope, and especially at the Great Central Mine, there is an abundance of copper, so I am informed; but the low price given for the ore, the cost of carriage, owing to the remoteness of the place from the railway, and the general depression resulting from long continued droughts, have militated against the successful working of the mines for the present. The stoppage of work at Mount Hope threw a large number of men and boys out of employment, and led to an almost abandonment of the locality, causing loss to storekeepers, property holders and others. It is believed that with a return of prosperous times, and under good management, the mines at Mount Hope would out-rival those at Cobar and Nymagee.

No improvement has been made as regards gold operations at Cudgellico. Undoubtedly gold is to be got in payable quantities at this place; but by some bungling in the management, a Victorian affair, and in consequence of disagreements between the directory and the local body in charge, things have been allowed to remain at a standstill. Were it not for farming pursuits in the neighbourhood of the town business interests would long since have been seriously damaged in this locality. Owing to the late floods in the Lachlan, the lake at Cudgellico is now full and steps, in my opinion, should be taken at once for the preservation of this grand supply of water in the interests of the residents in and around the township.

COBAR DISTRICT—COBAR DIVISION.

(Mr. Warden McKell, P.M., Cobar.)

I HAVE the honor to forward herewith my report as Warden and Mining Registrar for the Cobar Mining District, for the year 1886. Gold.

105

Gold.

Nothing has been done during the past year in the way of gold-mining. The number of miners' rights issued at Cobar being 78 less than the previous year.

Copper.

The Great Cobar Mine is still working under the able management of Captain R. N. Williams, and in spite of the very depressed state of the copper market, 500 men and boys are employed, and during the year 25,887 tons of ore were raised, which has been smelted on the works, yielding 2,044 tons of copper, valued at £80,951. The ore in this mine consists of grey oxides and blue and grey carbonates, the percentage being 7.88. The plant, which consists of buildings, smelting sheds, and machinery, appears in good order, and is valued at £85,000.

The Nymagee Copper Mine, which is situated at Nymagee, a township 70 miles south-east of Cobar, is under the supervision of Captain Blackmore, and employs 300 men and boys, being 50 less than last year, and has raised during the year 14,752 tons of ore, which was smelted at the mine, realizing 1,478 tons of copper, valued at £60,967 10s.; the yield being 10 per cent., and the average since the commencement of the mine being 14 per cent. The value of the plant is £82,371.

In June last a party of four men, Messrs. Frost and O'Mahoney, made application for a lease of 40 acres on Hermitage Plains, about 30 miles east of Cobar, on the Nyngan road, and have since sunk a shaft 30 ft. At 13 ft. they struck some very good ore, consisting of grey sulphides, with blue and green carbonates intermixed. The width of the lode is about 5 ft., striking north and south, and dipping one in 30 ft. west. They have about 30 tons of ore to grass, and out of some picked samples tested, a yield of 38½ per cent. was the result. I am informed that this locality abounds in copper ore, and it is the intention of one or two parties who now hold under mineral licenses to apply for leases.

The land known as the C.S.A. 60 acres, about 6 miles north-west of Cobar, originally occupied by Cohn and party, and which was forfeited a few months ago, has been applied for by Captain Williams, of the Great Cobar Company, and I believe it is his intention to commence work with as little delay as possible.

My numerous official duties preclude me from visiting the various mines in the district, so I have to trust to others for any necessary information. In conclusion, I might state that through the low price of copper ruling the last few years, combined with dry seasons, bad state of roads, scarcity of water and grass, and exorbitant rates of carriage, this enterprise has almost been stagnated, in so much so that men had to be dismissed, and wages reduced to a great extent so as to curtail the working expenses; but now that the drought has, to all appearance, broken up—the rainfall for the past season being 20.89 in. (the average for the previous four years being only 11.59 in.), filling all the tanks and drains, and giving an unlimited supply of water, and tenders having been called for the construction of the railway from Nyngan to Cobar, which when constructed will reduce the rate of carriage—there is every prospect of new lodes being opened up, the mining population becoming enlarged, and the whole of the mining industry in this portion of the district, assuming greater proportions than it has for the last few years.

COBAR DISTRICT—HILLSTON DIVISION.

(*M. Hogan, Mining Registrar.*)

PRESSURE of land agency and of other business has prevented me from furnishing you with my report for 1886 before this, and it is with regret that I have to announce that, as far as mining matters are concerned, this district has made no progress during the past twelve months. At the New Mount Hope Copper Mine there are just a few hands at work developing the mine; as, owing to the low price of copper, it would not pay the Company at present to resume active operations. This Company has also got a few men engaged prospecting a gold mine at Ironstone Hill, near Mount Hope.

The Great Central Copper Mine (South Mount Hope) is altogether closed, but I am told that this is due mainly to bad management. The mine is said to be a rich one, and under different management, it would doubtless prove a paying concern. Some time ago, in view of what profits had been made upon the outlay for the two years prior to the closing, £3,000 a year was offered to the Company for the mine, to be worked on tribute, but this offer was refused.

Gold-mining at Lake Cudgellico is at a complete standstill.

During 1886 there were issued from this office 48 miners' rights, and 14 business licenses, and during the same period applications were received for two gold leases of 10 and 8 acres respectively, and for one mineral lease of 40 acres. I would suggest that in any alteration of the Mining Law, the fees for business licenses and miners' rights, taken out to cover residential areas, be increased, as by this means the revenue will be benefited without inflicting hardships upon parties concerned.

During the late drought Lake Cudgellico was perfectly dry and the want of water was severely felt by the residents as well as by teamsters, carriers, drovers, and others. Cudgellico is on the highway to Whitton, and has a splendid common for pasturage purposes, so that for little or no expense to the Government the lake could be locked where the water from the Lachlan runs in, and a permanent supply of water thereby secured for that part of the back country.

COBAR DISTRICT—NYMAGEE DIVISION.

(*E. C. Day, Mining Registrar.*)

THE mining industry in this district has, during the past twelve months, been entirely confined to the copper-mining carried on by the Nymagee Copper-mining Company. This Company, on which the local township is entirely dependent, has, despite determined strikes amongst the wood-carting and smelting departments, kept its miners steadily at work throughout the year. The lengthened stoppage of work at some of the neighbouring copper mines has made many predict the early closing of this, but there does not appear to be any grounds for such an opinion. Undoubtedly a heavy fall in the price of copper would behove the directors to consider the advisability of shortening hands, but this is not at present anticipated.

INSPECTOR OF MINES' REPORT.

IN submitting my annual report for the year 1886, I have the honor to inform you that the following is a list of accidents which have occurred, during the year, in the Metallic Mines of New South Wales:—

No. of Accidents.	Date.	Name of Mine or Company.	Locality.	Persons killed	Persons seriously injured	Occupation	Cause of death or injury	Fatal					Non-fatal		
								Fall of earth	Falling down shaft	Exploded shot.	Fall of bucket on head while in shaft.	Inhaling foul air.	Using steel tamping bar.	Fall of earth.	Exploded shot.
1	Feb 21	No name	Braidwood	. . .	W. Walch	Miner	Using steel tamping bar with powder						1	.	
2	Mar. 3	Grand "Amalgamated.	Mount Macdonald.	A Fun	. . .	"	Killed by fall of earth	1						.	
3	Mar. 9			J Mullins	. . .	"	Killed by fall of earth	1							.
4	May 27	Great "Cobar Copper.	Cobar	T M'Millan	Gus Aubrey	"	Injured by fall of earth						1	.	
5							Killed by explosion of shot		1						
6	"	"	"		T H Walker	"	Injured by explosion of shot							1	
7	June 10	Pine Ridge	Trunkey Creek	J G Edgerton		"	Killed by fall of earth	1						.	
8	Aug. 4	Silver King	Mitchell	H. Trezise		"	Killed by bucket falling on his head				1			.	
9	Sept 7	Scandinavian	Bowling Alley Point, Nundle	G Bonallas		"	Killed by fall of earth	1						.	
10	Oct. 8	Verrisa Quondong	Hill End Grenfell	P O'Reilly		"	Killed by inhaling foul air					1		.

14	"	"	"	T Stewart		"	Killed by fall of earth	1						.	
								7	1	1	1	1	1	1	1

A few accidents of a minor nature may have happened, but the above-mentioned are all on which reports have been received at this Department. During the year, I have inspected the metallic mines in several of the mining districts in the South, North, and West, and herewith furnish my report of the prospects and development of said mining districts.

GOLD.

Commencing with the Adelong gold-field, which for years past headed the list in the produce of gold, and from whose deep quartz mines such great results were expected.—Very little is doing in the development of these mines, owing principally, to want of capital. When this is once forthcoming, Adelong will again become one of the leading gold-fields of New South Wales, not only in quartz, but also in alluvial mining.

At Temora, no fresh discoveries worth any special note have been made during the year.

On Lambing Flat, about 3 miles from the township of Young, mining operations are still carried on with vigour, in the wet alluvial ground. Pumping and other machinery has been erected, and the auriferous drifts are exceptionally rich, but the heavy water-soaked drifts have, hitherto, greatly baffled this undertaking, which is a legitimate mining enterprise.

Grenfell has had a small alluvial rush at the Quondong, and, with the exception of that, very few miners are now employed on this once famed gold-field. Capital may, however, be well expended on some of the quartz reefs, such as the Lucknow or the Consols, and prove very profitable to those who undertake the enterprise. A company was formed in 1872, to test the Lucknow reef at a depth below 400 feet, but the company had not sufficient capital to complete the sinking of a perpendicular shaft; the latter could be enlarged, sunk deeper, and made use of as a main shaft.

Forbes.

Of the quartz reefs, the Britannia reef is the principal one at present at work in the neighbourhood of Forbes. It is situated about half-a-mile westerly of the town of Forbes, at the head of the Britannia lead. Rich quartz was obtained out of this reef some twenty years ago, by Snow and party, but it was afterwards abandoned, and remained so to within eighteen months ago, when another start was made by some of the very men who had abandoned said reef for twenty years. The Company have erected a small ten-stamp battery, which is driven by a 10-h.p. engine. They have crushed several large samples of quartz, with payable results. That from the 90-feet, or deepest level, has, so far, given the best return, viz., 1 oz 5 dwt. per ton. But to work this reef thoroughly, the shaft should be sunk to a greater depth, levels opened out, and back stoping should be adhered to. This reef occurs in the diorite formation, and as quartz veins, in this formation, generally occur in blocks, and the gold in shoots, there is a probability that when a greater depth is reached the country will become more settled, and the blocks of quartz and shoots of gold may greatly increase in extent and value. The diorite dyke in which the Britannia reef occurs, trends in a north-east and south-westerly direction, and it is, most probably, the source from which the several alluvial leads near Forbes derived their auriferous deposits, and if this dyke were thoroughly prospected, other gold-bearing veins, in addition to the Britannia, Fountain Head, Consols, &c., would, no doubt, be discovered, and quartz-mining become a permanent industry in the Forbes district. Judd's reef is at present idle, and on Strickland's reef some prospecting has of late been carried on, but both reefs are awaiting the erection of machinery. The former (Judd's reef), which is situated on the Parkes road, about 1 mile from Forbes, promised well when first discovered. The reef is large, and a crushing taken out yielded $\frac{1}{2}$ oz. of gold to the ton. It is several feet in thickness, and if the above-mentioned yield could be obtained, on an average, the reef ought to pay well. Alluvial.—A few parties are working near the head of the Caledonian lead, but, I am afraid, with not very bright prospects of success. On the Britannia lead, the Crinoline Gold-mining Company have cleaned out and fixed up an old shaft, and expect payable results, as the lead in the neighbourhood of the shaft has been but little worked, or even prospected.

The

The Forbes Alluvial Company (Mr. H. H. Cook, manager), is situated south of the Crinoline mine, and it is intended by the Company to work both the south and the Britannia leads. The depth of sinking is about 200 feet. A contract to sink the shaft has been let, at a cost of £600, the contractor finding all material and appliances. Heavy drifts had to be passed through, and a diving dress of the most improved pattern was made use of while sinking through the heavy flow of water and drifts. The Company's prospects are excellent. The Nil Desperandum Gold-mining Company is situated where the south lead crosses the Lachlan River. This Company bottomed a shaft (which had been partly sunk some years ago), and obtained payable prospects off the bottom. Indications are not wanting to predict this Company a successful career for years to come. Credit is due to this Company for their energy, perseverance, and enterprise, not only in the erection of their steam winding and puddling machinery, but also in the opening of their mine.

Parkes.

Quartz-mining has now become the principal industry of the Parkes gold-field. Hazelhurst, Quails, Stewart, Drummonds, and several others, are still obtaining gold in more than payable quantities, proving beyond doubt that the system adopted by the Mines Department in opposing the alienation of auriferous lands in or near the town of Parkes, has proved most beneficial, not only to the mining population of Parkes, but to the general public. Several new finds in quartz-mining have been made during the year, and indications point to the belief that new reefs will be discovered in future, as they have been in the past.

In alluvial there is nothing new to chronicle. Rushes which took place during the year have either turned into total, or partial failures, and I am sorry to state that the Prospecting Vote for 1885, which was partly expended in 1886, has borne no fruit.

In May last, Ginther and party reported payable gold, stating at the same time that they obtained 2 dwt. of gold per dish of stuff, the depth of sinking being 56 feet. I was instructed to proceed to Parkes, and to take such steps as was thought most advisable to prove the correctness of the report. On arrival on the scene of the prospecting claim, I found from 400 to 500 persons already on the ground, out of which I selected two miners who were disinterested in the prospecting claim, and, in company with them, went below to examine the underground workings and to take out some auriferous drift, to be washed publicly. The thickness of the wash was from 3 to 9 inches, and out of eleven dishes (or say six small tin buckets), 4 dwt. 6 gr. of gold were obtained; the prospectors had previously obtained 10 dwt. of gold out of four dishes, making a total of 14 dwt. 6 gr. of gold, out of fifteen dishes of stuff. I put it to the vote of the miners, whether or not they considered the prospects obtained to be payable, which they carried in the affirmative, and I then declared the valley to payable, and named it the J. P. Abbott Lead (or valley), in honor of a late Minister for Mines, under whose administration the prospecting votes were commenced. Although a great many shafts were sunk in all directions, I am sorry to state that no lead, or even an extensive patch of gold could be traced. The gold was of a coarse nature, impregnated with quartz and cement, and I am still of opinion that although no payable gold to any extent has been discovered in the tertiary drifts in the J. P. Abbott Valley, a narrow reef of gold or rich quartz vein might still be discovered; either in or in the immediate neighbourhood of Ginther's prospecting claim. The alluvial consists of tertiary drifts, and the geological formation of the rocks is diorites and slate.

Several attempts have been made to prospect for alluvial auriferous deposits north of Parkes, but so far with very little success.

Tomingley.

Here the quartz veins still employ a number of miners. Those at Tomingley proper have not yielded large returns, but some very good crushings have been obtained during the year at the Myall reefs, about 1½ miles from Tomingley.

Prospecting for auriferous alluvial deposits has also been carried on both by Government aided and private parties, but without any success, still there is a large area of country between the Myall and the Ten (10) Mile Ridges, which has not been prospected.

Buckinbah.

In September last I proceeded from Forbes *via* Parkes, towards Buckinbah, for the purpose of inspecting and reporting on the Buckinbah gold-field and neighbourhood, and found the principal mine working on the field to be the Gordon Mine, which is situated 5 miles easterly of the Buckinbah (Yowall) township, and is under the management of Mr. James Veitch. The formation in which this mine is situated is granite, and the lode or deposit occurs in an irregular mass of quartz veins in a circular form, which contain gold, carbonates of copper, copper pyrites, blend, and molybdenite. These veins have been taken out and crushed to a depth of 120 feet from the surface. The whole of the workings represents a pit or quarry 120 feet in depth, by about 70 feet in diameter. Everything, whether rock or quartz, has been crushed, and as the bottom of this pit is larger in circumference than the top, the walls or sides are therefore overhanging the lower workings, which gives it a rather dangerous appearance. There is a second circle of veins which appear to be quite distinct from the first, but whether they will join the first circle can only be proved by development. A main fissure or dyke about 40 feet in width, also traverses the Gordon Mine, trending for a considerable distance in a north-westerly direction. Although this dyke contains no gold from the surface down to the deepest or 120 feet level, it contains traces of other minerals, intermixed with quartz, and when greater depth is reached the mass of circular veins above-mentioned may be found to be connected with the main fissure, and form a valuable mineral lode. For the present the mine is being worked for gold only (copper being too low in price), the monthly crushings averaging about 150 tons, and the yield of gold from 3 dwt. to 7 dwt. per ton. There are also about 1,000 tons of concentrated copper ore lying near the crushing machinery. Mr. Veitch, the manager, informed me that assays from the said ore gave 9 per cent. of copper, 12 dwt. of gold, and 2 oz. of silver per ton. The machinery consists of a twenty-stamp battery, of which ten heads are only of late in use, a 25-h.p. engine, and four grinders, self-taking concentrating ties, constructed by the manager. Unfortunately the crushing machinery was idle at the time of my inspection. The machinery is erected near the Little River, and connected with the mine by a tramway about three-quarters of a mile in length. A National rock drill, driven by compressed air, is also at work.

Several other lodes have been partially worked in this district, such as the Buckinbah, the Upper and Lower Trinity copper, the Burgess, Bonfields, and other gold mines. A few crushings taken out of the

the above-mentioned reefs have returned payable results. The geological formation near the Buckinbah township is granite, some of which is likely to be stanniferous. About a mile from Buckinbah, near the Wellington road, and in granite formation, there are some hills on which gold has been discovered on the surface, in drifts or wash dirt, consisting of angular and round pebbles, ironstone, and conglomerates. Several dishes of this drift were washed in my presence, all containing more or less gold, and even such primitive appliances as a puddling machine, long tom, or a large-sized common cradle might be sufficient to prove, at least some of these deposits, payable. The Buckinbah Creek, which contained a fine stream of water at the time of my inspection, seems also to be auriferous, but probably in sinking near this creek heavy drifts and flow of underground water would have to be contended against. Auriferous indications can be traced in a southerly direction for a considerable distance, and there are likely-looking hills and gullies, with not one shaft in them; and, in addition to gold, very probably precious stones, such as diamonds, topaz, &c., will be discovered in this neighbourhood. On the Molong road, the granite disappears within three miles of Buckinbah, and then Devonian sandstone, slate, and conglomerate succeed, until Yallandry, about 9 miles from Buckinbah, is reached, where the Devonian rocks disappear under the basalt. From here the road passes over basalt, Devonian sandstone, slates, dykes of diorites, and porphyry, and conglomerates, and on a place known as the Gap, the road passes through a very steep, but narrow, range of red Devonian sandstone. After leaving this gap, the sandstone is the principal formation, until the limestone formations of Molong are met with. By indications on the surface, the discovery of a new gold-field may be looked forward to in the vicinity of the road between Buckinbah and Molong.

Lucknow.

The mining operations on the Lucknow or Wentworth gold-field are still progressing very satisfactorily under the able management of Mr. H. W. Newman, J.P. Additional and extensive winding, pumping, and crushing machinery has been added during the year. Other improvements, such as dams, have been erected, in addition to which the Company have been able to pay several dividends. Fully 100 men are employed in connection with these mines. Mr. Newman has also constructed new dams, which have increased the capacity for water storage very considerably. Eight additional stamps are now in course of erection, which will enable the Company to crush and treat several additional hundred tons of stuff per annum. The main shaft has been sunk and substantially timbered to the depth of 400 feet.

A full description has been given by me, in former reports, as to the veins and geological formation, and I have only to add that the Industry vein has now been worked down to the 370 feet level, but still shows well underfoot. It will, however, probably take another twelve months before the Perseverance vein is worked out from the surface to the 370 feet level. This vein also shows well underfoot.

The winding, pumping, air-compressing, ventilating, crushing, and concentrating machinery is all in good order. There are now on the field, under Mr. Newman's immediate supervision, two 25, two 20, two 16, one 10 and one 6 horse power engines at work, and, in all, thirty head of stampers, twenty in the Reform Gold-mining Company, and ten stamps in Frederick Valley Company. The whole of the works are carried on in a satisfactory manner, and every possible care is taken by the management to prevent any accident in or about the mines.

Mount M'Donald.

This gold-field still supports a population of about 200 persons. It is an essentially quartz-reefing district; the gold occurs in shoots through narrow quartz-veins, which is one of the reasons that individual miners succeed better than large companies. Some very rich quartz and payable crushings have of late been obtained out of a mine known as Matheson's, which had been formerly held but abandoned, by a company.

Trunkey Creek in the west, and Bingara in the north, were also inspected by me, but nothing of any importance has occurred on these gold-fields during the year.

SILVER.

In October last I started from head office for the purpose of making a thorough inspection of the silver and other mines in the Silverton District. The first mines inspected by me were those of Broken Hill.

The Broken Hill Proprietary S. M. Co.'s mine, which is under the general management of S. Wilson, Esq, and under the mining management of Captain R. Piper, is at present the best dividend-paying and the most extensive silver-mine in New South Wales, and on the future development and skilful management, both in the working of the mine and reduction and treatment of the ore, will greatly depend the future development and prosperity of this rich and extensive mineral district.

The hill on which this mine is situated rises about 150 ft above the level of the plains which stretch on each side, the lode forming the crest of the highest peak of a rugged ridge, and can be traced with an occasional break for about 2 miles, after which it runs into several lodes or branches. Course of lode north-east and south-west, and consists of iron coated with manganese, carbonates of lead, gossan, felspar, quartz, quartzite, and ferruginous drifts; some of the latter is very loose, and will require extra skill to secure, as it will give undoubtedly extra trouble, for the safety of persons employed in the mine.

Chlorides of silver in payable quantities are being raised from several parts of the mine; it is also well distributed in the southern part of the mine through the kaolin formation. In the northern part of the mine, out of a shaft known as Rasp's, carbonate of lead is being raised from an extensive deposit, and is associated with very high percentage of carbonates, oxides, and grey sulphides of copper ore, which occur in the shape of boulders, and which may be estimated to contain from 40 to 50 per cent. of copper, in addition to silver. The lode, as far as opened out, forms a striking similarity to those top levels of the Great Cobar Copper Mine, with the exception that the Broken Hill is argentiferous, whereas the Great Cobar deposit is cupriferos. No correct estimate can at present be formed as to the real value of this undoubtedly rich mine.

The first furnace started to work on the 6th May, 1886, and was run for sixteen weeks, after which two furnaces have been running. Up to the date of my inspection, the first week in November, 8,612 tons of ore had been raised and treated, yielding 1,731 tons 15 cwt. of lead, and 740,480 oz. (22 $\frac{3}{4}$ tons) of silver, to the value in round numbers of £148,000. Two more furnaces have since been completed and set to work, resulting in a large increase of the yield of silver.

There are five shafts and two tunnels on the mine, and the lode has been opened in different parts from north to south a total length of 2,092 ft., viz., Rasp's to M'Culloch's, 440 ft.; M'Culloch's to Broadribb's, 1,148 ft.; Broadribb's to Jamieson's 308 ft.; and Jamieson's to Knox's shaft, 196 ft. The whole of these shafts are, however, not as yet connected with each other. Nearly the whole of these shafts are down on the water-level. Rasp's shaft is 288 ft.; M'Culloch's shaft, 327 ft.; Broadribb's, 132 ft.; Jamieson's, 212 ft.; and Knox's, 196 ft. in depth. The contour of the country makes the apparent difference in depth of water-level.

Machinery

Machinery.—The Company has steam boilers equal to 100-h.p., and eight steam engines equal to 72-h.p.; also, four steam pumps equal to 24-h.p. They have also excavated a large tank, from which they obtain their water-supply; but which, unfortunately, is also the receptacle of all the filth and dust of the township. They have also erected substantial buildings, covering about 12,000 ft.; and their reducing plant is now equal to about 1,200 tons per week. About 500 men, inclusive of some boys, are directly employed on or about the mine and furnaces. This is exclusive of fuel getters, carriers, &c. The mine was inspected by me on the 8th and 9th instant, and I found ladder-way, and everything in connection with the mine in as safe a state as could be reasonably expected, considering that the rough timber in use for the securing of the mine cannot be obtained nearer than Menindie on the Darling, a distance of 90 miles.

The Broken Hill South Silver-mining Company, under the mining management of Captain Moorish, has several distinct lodes or branches, and is situated on the southern boundary of the Broken Hill Proprietary Mine. Some eight shallow shafts have been sunk, but sinking is now carried on in three shafts only. No. 1 shaft north was down 132 ft. on the eastern lode; No. 3 shaft 110 ft., on the bottom of which was a strong galena lode; and No. 8 shaft, intended for the main shaft of the mine, on the middle lode. The latter seemed greatly improving in depth, and if the shaft was made larger the three already known lodes could be worked by cross-cutting, and capital could be saved by discontinuing the many small shafts.

Nutt's Broken Hill, under the same mining management as Broken Hill South, and situated north-easterly of the Broken Hill Proprietary Mine, may be termed a prospecting company. A shaft is being sunk to the water-level, probably 160 ft. in depth, and a large lode consisting of iron, manganese, galena, and a small percentage of silver, has been discovered in the kaolin formation.

Very little prospecting has been done southerly of the Broken Hill South, with the exception of the Rising Sun, about 3 miles south-westerly from Broken Hill. Here the Rising Sun Silver-mining Company, under the management of Mr. Logan, is sinking a shaft on a promising iron capped lode; the depth of shaft is intended to be 180 ft. before cross-cutting is proceeded with, to intersect three different lodes known to exist, and out of which I was informed payable assays had been obtained.

Pinnacle Mines.

These mines are situated about 9 miles westerly of Broken Hill. Several shafts have been sunk on the Pinnacle Group Silver Mine, of which the deepest is 157 ft. Apparently there are two main lodes, the galena and the Minnie More lode. These lodes are 15 ft. apart on the surface, and 5 ft. in thickness, but at the greatest depth reached, there are indications that both lodes are likely to junction into one. There are also five (5) parallel branches or lodes, which appear to junction near the Minnie More, where a main shaft 10 ft. x 4 ft. is now being sunk. The length of lode so far proven, is about 850 ft., and the thickness varies from a mere film up to 30 ft. There were about 1,500 tons of ore at grass. I noticed that very lately great improvements had been made in the under-ground workings, as well as other parts of the mine, and that the mining manager, Mr. Edgar Rossman (for many years mining manager of the Catherine Mine, Sandhurst, Victoria), was getting the mine and everything in connection therewith in a safer and more systematical state.

An addition to the reducing and smelting plant was in course of construction in the shape of concentrators, as so far the treatment and smelting of the Pinnacle ores has been very unsatisfactory; but whether the ore can be successfully treated in the district or not (the scarcity of fuel and water will always be a great item against local treatment) I nevertheless think that it is only a matter of time before the Pinnacle Group Mines will become second only to the Broken Hill Proprietary Mine. There is ore sufficient in quantity and quality to pay, and if it cannot be treated with advantage on the spot, other methods may be adopted.

The Pinnacle South, Mr. Walter Granville, manager.—This Company is only driving a tunnel, which at the time of my inspection was 290 ft. in length in hard granite. By indications on the surface there are no better prospects ahead, but a lode of great width had been crossed about 60 ft. from mouth of tunnel; this lode, if sunk upon, would most likely bring better results than the farther driving of the tunnel is likely to do.

The Sterling Hill Mine is situated about 4 miles north of the Pinnacles. Two large outcrops of argentiferous deposits are observable on the surface, having a strike N. by E. with easterly underlay. These outcrops have been sunk upon, but to no great depth, and some very high assays have been obtained. The lode consists of iron gossan, siliceous clays, carbonates of lead, and ferruginous crystalline quartz; the geological formation being schist intersected by a hard belt of diorite. Considering the general indications, the lode should improve and the Sterling Hill become a valuable mine.

The Thackaringa Mines, situated about 15 miles south-westerly of the Pinnacles, have been greatly neglected of late. Three years ago they were the principal lodes opened up in this district and some thousands of tons of galena were forwarded to Europe.

There were only about four mines at work, viz, the Gipsy Girl, the Outward Bound, and two others. The Gipsy Girl Mine was 115 ft. in depth on the underlay, on the bottom of which is a galena lode about 18 in. in thickness; other mines have really excellent prospects, but the system at present adopted seems to be only to hold sufficient labour on the leases to comply with the conditions of the lease.

Rock Well Paddock.

These are apparently new discoveries, situated on the Kinchega Station, parish of Soudan, county of Yancowinna, about 9 miles easterly of Broken Hill, with which it runs almost parallel. The lodes occur in altered sandstone, schist and micaceous slates, several feet in thickness as seen on the surface. They are lenticular lodes of gossan, galena and carbonates of lead, some of which have yielded high assays of silver. In the Rockwell Paddock Silver-mining Company's land, these lenticular veins can be traced on the surface, having the appearance of three distinct lodes. A shaft was being sunk and had reached the depth of 90 ft., of which 20 ft. was not in the lode, the latter apparently having dipped to the westward; and it will be found after greater development that faults will occur in these lenticular lodes, both in depth and length, but that by careful observation and prospecting both in sinking and driving, blocks or bunches of ore will be met with probably as rich and extensive as near the surface. There is a large quantity of ore all along the surface.

Wright and Company, on the Alma Lode, have a shaft down 63 ft. in depth in a lode 30 ft. in width, the ore being of a similar character to that in the Rock Well Company's Mine.

Several leases have been applied for northerly of this, of which Maiden and Co.'s is the principal. In one of these leases they have a well defined quartzite lode in the micaceous schist formation, out of which I was informed high assays of silver had been obtained. Scarcity of fuel and water is a great drawback to the development of this part of the silver-field.

North

North of the Broken Hill Proprietary Silver-mining Company's mine, is the Junction mine. The latter has been prospected to the depth of 100 ft., which is on the water-level. It appeared to me at the time of my inspection that the cap of the lode had only been reached, and that the prospects of this mine would greatly improve when once the works are carried down to a greater depth, where the country is more settled, which is not the case above the water-level; and just before the water-level was reached, patches of chlorides, and high percentage of other silver ores were met with. This mine has therefore excellent prospects, and is most likely to come to the front as a payable mine. Mr. James Giles is the mining manager.

Broken Hill North S. M. Co., Mr. Zebina Lane, manager. This, like the Junction mine, is on the water-level at a depth of 150 ft. (the contour of country makes the apparent difference in depth). Several lodes are cropping up on the surface, which return high assays of silver.

Broken Hill Victoria Cross S. M. Co., Mr. J. H. Ellis, manager, has down two shafts, 75 ft. and 78 ft. respectively; both shafts are on the water-level. Several lodes are cropping up on the surface, and when deeper sinking and cross-cutting is adhered to, the Company's prospects may improve very considerably. The latter two Companies had it under consideration to conjointly sink a main shaft on their boundary, and to erect steam and pumping machinery on same. About 3 miles in a north-east direction are the Round Hill mines; the principal of which is the Round Hill S. M. Co., Captain W. H. Matthews, manager. Sinking in three shafts was being proceeded with at the time of my inspection, from which shafts it was intended to cross-cut into the lode at the depth of 100 ft. from surface. A large outcrop of the lode can be traced along the surface; this outcrop consists of patches of galena, carbonates of lead, gossan, and stains of copper. The prospects of this mine appear to be good, but a reliable estimate of the value of the mine cannot be obtained until it has undergone greater development.

The Consolidated S. M. Co.'s blocks or leases adjoin the Round Hill S. M. Co.; some excellent samples of galena ore were obtained from this mine by the manager, Mr. Lane, at a depth of 80 ft. from surface. Work was also carried on at the Copper Blow under the management of Mr. Harsen. By indications on the surface a payable silver lode is likely to be discovered here.

About 6 miles north-east of Round Hill is situated the Broken Hill United S. M. Co., Mount Gipps, Captain Dick, manager. Two shafts of 50 ft. each have been sunk on a large lode cropping up on the surface, and can be traced for a considerable distance.

The May Bell North, Mr. James Foster, manager, is the principal mine near Mount Gipps; it is situated about 2½ miles north-west from Mount Gipps Station, and has been at work for the last two years, during which time £15,000 have been paid in dividends. 215 tons of silver-ore have been shipped to Europe, out of which 70 tons of ore were in transit. Lately the value of the ore has reached £130 per ton. The vein containing the silver consists of iron gossan, galena, carbonates of lead, carbonate of copper, and little chlorides. It is from a mere film to 6 in. in thickness (the average being about 4 in.), and it lies rather flat. The greatest depth sunk upon is 200 ft. on the underlay, which is, however, only about 60 ft. perpendicular from the surface. On the southern boundary of the May Bell North, is the Kate mine, which is similar in formation to the former, but has not given such favourable results. 19 tons of ore have been shipped to Europe, valued at £80 per ton.

On the East and South May Bell, Rise and Shine, Caledonian, and others, there is very little work being done.

Purnamoota.

This part of the Silverton district is at present suffering from the reaction consequent on the over-excitement of two years ago. At that time every mineral lease which could embrace an outcrop of rock on the surface was thought to be the very Eldorado; expectations were rife and enormous dividends were looked forward to, but at the present time there is not one dividend-paying mine, and a great many of the mineral leases are either under suspension, have only sufficient men employed to comply with the labour conditions of the leases, or are abandoned. The consequence is that the population of Purnamoota has considerably dwindled down, and the township is only a remnant of its former prosperity, and the Black Prince, Terrible Dick, Lubra, Nolan's Treasury, Christmas, and one or two others, are now the only ones at work. At the Black Prince, a new contract had been let to sink the shaft below the depth of 190 feet. The lode consists of galena and carbonate of lead, from 8 inches to 2 feet in thickness, but, like the characteristics of the whole field, pinching out at times. At the Terrible Dick mine (Mr. W. H. Stanfield, manager), pumping and winding gear was in course of erection, which, owing to the total absence of local timber fit for mining and machinery purposes, is likely to cost, in erection, more than its original value. The greatest depth obtained in the mine is 50 feet, on a heavy flow of water. Very rich slugs and high assays of silver have been obtained from the lode; the latter averages from 3 to 6 feet in thickness. £2,000 worth of ore has also been shipped to England.

The Lubra mine, Mr. James Morgan, manager, is the only mine near Purnamoota which at present is clearing expenses. The ore occurs in bunches of galena, carbonates of lead, horn silver, steffinite, &c., &c., which varies from a mere film to 6 inches in thickness. The greatest depth obtained in this mine is 420 feet, on the underlay, or about 300 feet perpendicular from the surface. A heavy flow of water has been struck on the bottom of the underlay shaft. Considering the great cost of mining timber, Mr. Morgan takes all reasonable precautions for the safety of his men and benefit of all concerned.

Nolan's Treasury mine, which promised such great results on the surface, and from which some very rich slugs of carbonate of lead and other silver ores were obtained, is now only worked by two (2) men.

At the Christmas mine, I only found one man at work. There were no men at work on the One Tree and several other mines visited by me.

Smith & Co., the Kaiser, Second to None, and one or two other mines were at work, at the Nine-mile. Smith and Co. drove, from the bottom of their 50 feet shaft, on to a lode of galena and mispickel. At the Kaiser mine they were sinking, and intended driving under an outcrop, consisting of iron gossan, silicious clays, &c., &c.

The Day Dream, Hen and Chicken, Appollyon, and Juno, are in close vicinity of Silverton.

The Day Dream mine, Mr. James Buchanan, manager, is now carrying on simple prospecting works, which should have been done when the mine was paying dividends; but as it is, Mr. Buchanan has the satisfaction that his ability and practical knowledge, which were brought to bear on the prospecting of the Day Dream mine, for second shoots of ore, is likely to meet with favourable results. The mine has turned out a large quantity of silver, has paid several dividends, is in one part 450 feet in depth, on the water-level, and has now excellent prospects, and likely soon to become, once more, dividend-paying.

Prospecting

Prospecting works are also carried on at the Hen and Chicken and the Juno, but the Appollyon and a few other mines in this neighbourhood, were idle.

The Uumberberka mine, situated about 2 miles west of Silverton, Mr. Charles H. Wilson, manager, has paid some dividends, and is at present clearing all working expenses. The lode varies in width from 2 feet to 12 feet, but the ore only occurs in small bunches, consisting of iron gossan, carbonate of lead, galena, and antimonial galena, with a percentage of sulphites. The hanging wall of the lode is well defined, and coated with a black, glossy clay, or, to use a miner's phrase, black slate with greasy heads, very much resembling serpentine rock. Greatest depth obtained is 375 feet. During the half-year ending 30th September, 764½ tons of ore have been shipped. There were about 3,000 tons of second-class ore on the surface, which, if concentrated or jigged, would give payable returns. The average assay of the ore shipped from the mine yielded 50 per cent. of lead, and nearly 100 oz. of silver per ton; the future prospects of the mine are good. There is a 22-h.p. winding engine at work, and the Company are about to erect jiggers to concentrate their poorer ores, and use, for that purpose, the water in their underground workings. Mining timber is very scarce and dear, but the manager is doing his best for the safety of his men and the economical working of his mine. There are several other mines in this neighbourhood prospecting, but so far without payable results. Credit is due to the several mining managers throughout the district for the manner in which they have carried on the workings of their respective mines, in face of the scarcity of fuel, timber for mining purposes, and other difficulties they have to contend against.

In my report, August, 1883, on the Barrier Ranges Silver Mines, I stated that the strike of some of the lodes was in all directions of the compass, but that north-east was likely to be the strike of the most permanent lodes on the Barrier; and that when these deposits were more systematically worked, it would be found that they are not continuous lodes, but shoots or blocks, and bunches (lenticular veins) of ore going down a certain depth, trending along the line of lode a certain length, and then pinching out, or bulching and pinching; but miners should not be discouraged by these features, but sink and drive for fresh blocks, bunches, or shoots of ore. I have now visited, during the year, every mine of any note on the Barrier Ranges, and in every instance found that the opinion formed by me three years ago has, by practical development of the mines, and consequent results, proved correct. For years past I have advocated that when a mine is paying, advance works, such as sinking and driving, should be carried on; and that the system often adopted by companies, to take out all the rich stuff without prospecting ahead, for the mere sake of declaring large dividends, must ruin the very best of mines. In such cases, the scrip generally rises to a very high market value, and drops down correspondingly, the shareholders become disgusted, and the general public afraid to enter into even legitimate mining enterprises; hence the whole of our mining industry suffers. This system also places the mining manager in a false position; it gives him no justice, or opportunity to bring his ability and practical knowledge to bear on the true development of his mine. Companies should, therefore, carry on advance works while their mines are paying, and thereby not only retain the confidence of the general public, but advance their own interest. If a company were formed to buy up ore on a fair assay both for buyer and seller, all the smaller mines now idle would again be worked by individual miners, or small co-operative companies, because, as stated before, the ore occurs in shoots or bunches all over the field, which vary in size in accordance with the thickness of the lode.

In conclusion, I beg to state that, notwithstanding all the failures and disappointments, the Silverton District is the richest and most extensive silver-mining district so far opened in New South Wales; that it is permanently established, and will support a large mining population. The principal townships—Silverton, Broken Hill, Round Hill, and Purnamoota compare very favourably with some of our principal mining towns in the older mining districts of New South Wales. The town of Silverton has been formed into a municipality, which proves beyond doubt that the inhabitants of Silverton have great faith in the permanency of the silver mines. Broken Hill township, or as it is now named Willyama, is also most likely to be permanent, provided a water supply is obtained for the inhabitants, who of late had to undergo great sufferings and privation on account of the scarcity of water. The supply could be obtained by the sinking of wells and excavation of deep tanks.

The Poolamacca District, which is situated about 50 to 60 miles from Silverton, near the Euriowrie Mountains, is likely to form a distinct mineral field from that of Silverton, and that some of the Corona deposits, occurring as they do in large outcrops of iron and manganese, will sooner or later yield gold, silver or copper, probably richer than any mineral deposits hitherto worked in the Silverton District.

I also inspected the Sunny Corner Silver Mines, but as Mr. C. S. Wilkinson's (Chief Geologist) report will appear in the Annual Report for 1886, I will only add that the managers of the Sunny Corner Mines use every reasonable precaution to prevent mining accidents.

The silver mines in the Vegetable Creek District, New England, are progressing favourably. Several progressive works are carried on at the Plant Creek (Webb's) and other silver mines. Pye's Creek is also being prospected for silver. No smelting or reduction works have as yet been erected, but good results in the output of refined silver may be expected in the New England District during next year.

TIN.

As considerable interest has of late been taken by the general public in the stanniferous deposits discovered some 60 miles northerly from Silverton, in the county Farnell, about 16 miles from Poolamacca Station, near the Euriowrie Mountains, I thought it advisable, in the public interest, to make a personal inspection, which was done by me in the latter end of November. Here dykes of coarse granite (pegmatite) traverse the schist formation in which the ore occurs. These dykes vary in thickness from 1 to 6 ft., and can be traced for a considerable distance along the surface, with a general strike of east 35 north, showing the tin ore in patches. A large number of leases had been taken up but only about seven parties were at work. The principal deposit is that found two years ago by Messrs. Hodgson & March, but now held by Messrs. Pearson & Co., where the ore occurs in large crystals through the granite and in large flakes of white mica with quartz and felspar. There are also the Lady Don Mine, which is now raising tin to grass, similar in character to Pearson's; the Cobar Mine, where the deposit occurs as oxide of tin; Broadribb's, Sinclair & Murray's, Arnheim's, Gibson's, and one or two others, more or less bearing the same features. I was informed before my visit that stream tin had been found, and that basalt in large masses could be seen on the edge and on the large undulating plains; but I hardly think that stream tin in payable quantities will ever be discovered there. I could find no basalt, and am certain none will be found in the neighbourhood. As far as the present discoveries are concerned, there is nothing to

to warrant the outlay of costly crushing and tin-saving machinery and appliances; but the several lodes could be tested if a small battery (say) of four stamps were erected near Pearson's mine, and if this proved payable more extensive machinery might then be erected. The surrounding country, especially in the granite ridges, is well worthy the attention of the energetic, persevering prospector, as more extensive tin discoveries may be found.

New England Tin-fields.

Vegetable Creek proper still continues to be worked by Chinese principally, with payable results to themselves and the owners of the land

Y Water-holes, A. Cadell's property, still continues to yield handsome returns.

Moore & Co. are also working with payable results.

Rose Valley Deep Lead.—The Wesley mine continued to employ a few parties of tributors during the past year, with various results. One party have been prospecting all the year, and have cut wash-dirt, which they believe will repay them for their labour.

Reid & Co. (17 acres) have cut out the greater portion of the bottom level with wages men, and have now let the mine upon tribute.

Bailey & Co. have during the year erected improved working plant, which has considerably facilitated the working of their mine, and largely increased the profits. This party raised 223 tons of stream tin ore during the year, the bulk of which has been despatched to Sydney.

Cummins & Co. have obtained about 80 tons of ore during the year, and have done a great deal of propecting in the face of many difficulties, consequent upon the water being so heavy; they are now raising wash from their shallow dry levels.

Moran and party are driving in the bottom to tap the water, preparatory to the erection of their engine and baling plant.

Cadell & Co., Gordon's Land.—Several shafts have been sunk during the year through hard basalt to the water-level, and with the aid of boring rods, have tested the bottom in three shafts. In one of these shafts payable tin has been found. For the great energy and perseverance displayed by this Company, independent of capital spent, they deserve every possible success.

The Chance Company wound up during the year. It would have been much better for the owners of this mine to have given a little more consideration to this Company than they have done, and proved whether or not the main lead passed through their land, as it is evident the Chance Company were never on the main lead.

Barrie & Co. have met with a little success after a long spell prospecting, and are now raising payable wash.

Wesley & Co., off Three-mile, resumed work during the year, and appear to have got in the vicinity of the lead in the upper level of wash, at a depth of 250 ft. from surface. This shaft had been sunk to the depth of 297 ft. and not bottomed, basalt being still under foot. Another shaft has also been sunk to a depth of 80 ft. in basalt, on which work is at present suspended. An engine and winding gear has been erected during the year at this shaft.

Hall Brothers, Kangaroo Flat, have continued working during the year with payable results, they having raised 66 tons of stream-tin ore during the year.

Table Land.

On Dutchmen's lode, only prospecting works have been principally carried on to gain depth on lode, consequently only a moderate quantity of stone has been treated, yielding an average of 15 per cent. of ore.

A fair amount of work has been done at the Torrington lode during the year, but like most of the lode properties of this district, suffers from want of capital for development. The same remarks apply to the Butler and Dalcoath lodes.

The Ottery lode is still working with fairly payable results.

Cope's Creek.

Nothing fresh to note during the year. A great deal of tin is still obtained from the district, principally by Chinese labour.

I have, &c.,

W. H. J. SLEE,

Inspector of Mines.

COAL AND SHALE.

TABLE compiled from Reports furnished by Owners of Collieries, showing the quantity and value of Coal and Shale won during the year 1886, and the number of Men employed in the Collieries.

Not at work ¶ Sinking † Sinking for steam ¶ On strike since 13th September § Boring

REPORT of the Examiner of Coal-fields for the Colony of New South Wales for the year 1886.

In accordance with the provisions contained in the 26th section of the Coal Mines Regulation Act, 39 Vic No 31, I have the honor to submit reports from the Inspectors of Collieries, with this my general report, for the year ending 31st December, 1886. The report would have been furnished at an earlier date if it had not been delayed through my time being so fully occupied with the inquiry, &c, into the recent Bull Colliery disaster, and other urgent matters.

The information I have the honor to submit in respect to the condition and progress, &c, of the various coal and boghead mineral mines under my supervision during the year 1886 is as follows —

Number of accidents in 1885 and 1886

The number of lives lost is, I regret to say, more than those of the previous year by eighteen, and the non-fatal accidents exceed those of last year by five. In the year ending 31st December, 1885, there were eleven fatal and forty non-fatal accidents.

Two of the fatal accidents happened through "falls of stone", the third, fourth, fifth, sixth, seventh, eighth, and ninth by "falls of coal", the tenth by fall of a prop, and eleventh by being run over by a truck. Two of the non-fatal accidents occurred through falling from a trolley the third to fifteenth inclusive by "falls of coal", sixteenth and seventeenth by a fall from screens, eighteenth and nineteenth by a locomotive engine, twentieth to twenty-seventh inclusive by loaded skips, twenty-eighth to thirty-third inclusive by blasting powder, thirty-fourth through being crushed between buntings when in a cage in shaft, thirty-fifth and thirty-sixth by falls of stone, thirty-seventh by a waggon, thirty-eighth and thirty-ninth by empty skips; and fortieth by the explosion of a shot.

In the year under notice (1886) seventy-two notices of accidents were received, twenty-nine of them being fatal (eight of them resulting from the Lithgow Valley Colliery disaster, and one from the flooding of the Ferndale mine) and forty-five non-fatal accidents, all of which have been inquired into, the scene of the accidents inspected, inquests attended, and reports made thereon and forwarded for your information.

The names and occupations of the persons who died from injuries received and those who have been seriously injured, as well as the names of the collieries where the accidents occurred, are given in the following summary

SUMMARY showing the number of fatal and non-fatal accidents in 1886, the names and occupations of the persons

Total in 1886	61	355	281,229 0 0	68,615 15 0
„ 1885.....	60	309	311,762 16 0	76,836 13 3
Increase in 1886	1	46
Decrease in 1886	30,533 16 0	8,220 18 3

From these returns we find that in the Northern District, in the year under notice, there has been an increase of 64,743 tons in the quantity of coal raised, and an increase of £51,650 in the value of it, whilst in the previous year (1885) there was an increase of 58,030 tons, and in the value of the coal raised £20,971.

In the Southern District there has been a decrease of 82,898 tons and £80,478 in the value, owing to a strike at most of the collieries, which lasted about four months. In the Western District there has also been a decrease of 30,534 tons, and in the value of £8,221, which was caused by a general depression in trade, railway traffic being less, and brickworks not taking so much coal as in the previous year.

The following table shows comparisons between the year under notice and two preceding years, as regards the exports of coal to foreign and intercolonial ports; the quantity used for home consumption; total output and value; tons of round and small coal raised for each person employed in and about the collieries;

collieries; value of round and small coal raised for each person so employed; and the quantity of coal raised for each life lost.

1886.....	2,830,175	0 9 2-53	1,308,164	2,830,175	364	7,847	1,303,164	169 17 10	7,847	2,830,175	97,592	29
	8,458,146	0 9 3-98	3,946,452	8,458,146	399	21,171	3,946,452	186 8 7	21,171	8,458,146	156,632	54

From the above it will be seen that in the year under notice (1886) we exported 35,851 tons more coal to Intercolonial ports than in the preceding year, and 56,432 tons less to Foreign ports, owing no doubt to the general depression in trade; and that there has been a decrease of 28,191 tons in the Home consumption. There has been an increase of 84,136 tons shipped from Newcastle to Victoria, and a decrease of 14,254 tons to New Zealand, and of 23,788 tons to Queensland.

It will be seen that the quantity of coal raised during the last three years for each person employed above and under ground at the collieries has averaged 399 tons of round and small coal per year; and that each person so employed added £186 Ss. 7d. per annum to the wealth of the Colony. In the years 1884, 1885, and 1886, fifty-four lives were lost for 8,458,146 tons raised, viz., 156,632 tons were raised for each life lost. These figures may, perhaps, be sufficiently explanatory in themselves, so far as a comparison of our export trade and home consumption, &c., for the whole Colony is concerned; but it will no doubt interest each district to know the proportion the accidents and deaths bear to the persons employed, and the quantity and value of coal raised for each person employed in and about the mines, &c., which is as follows:—

NORTHERN DISTRICT.

Number of persons employed in and about the mines	6,133
Number of persons employed underground	5,044
Quantity of coal raised in tons	2,178,116
Number of non-fatal accidents	36
Number of lives lost by accidents	19
Persons employed per each non-fatal accident	170
Persons employed per each life lost	323
Tons of round and small coal raised per each non-fatal accident	60,503
Tons of round and small coal raised per each life lost	114,637
Tons of coal raised per each person employed in and about the mines	355
Tons of coal raised per each person employed underground	432
Value of coal raised	£1,084,554 17 1
Value of coal raised per each person employed in and about the mines	£176 16 9
Value of coal raised per each person employed underground	£215 0 4

SOUTHERN DISTRICT.

Number of persons employed in and about the mines	1,298
Number of persons employed underground	947
Quantity of coal raised in tons	370,830
Number of non-fatal accidents	7
Number of lives lost by accidents	2
Persons employed per each non-fatal accident	185
Persons employed per each life lost	649
Tons of round and small coal raised per each non-fatal accident	52,975
Tons of round and small coal raised per each life lost	185,415
Tons of coal raised per each person employed in and about the mines	286
Tons of coal raised per each person employed underground	390
Value of coal raised	£149,993 12 0
Value of coal raised per each person employed in and about the mines	£115 11 1
Value of coal raised per each person employed underground	£158 7 9

WESTERN DISTRICT.

Number of persons employed in and about the mines	416
Number of persons employed underground	355
Quantity of coal raised in tons	281,229
Number of non-fatal accidents	nil.
Number of lives lost by accidents	8
Persons employed per each non-fatal accident	No non-fatal accident.
Persons employed per each life lost	52
Tons of round and small coal raised per each non-fatal accident	No non-fatal accident.
Tons of round and small coal raised per each life lost	35,153
Tons of coal raised per each person employed in and about the mines	676
Tons of coal raised per each person employed underground	792
Value of coal raised	£68,615 15 0
Value of coal raised per each person employed in and about the mines	£167 6 1
Value of coal raised per each person employed underground	£193 0 0

The

The following table shows comparisons between the year under notice and the preceding year, as regards the proportion the accidents and deaths bear to the persons employed, the quantity and value of the coal for each person employed in and about the mines and underground, in the Northern, Southern, and Western Districts.

	Northern District		Southern District		Western District	
	1885	1886	1885	1886	1885	1886

The following statistical return, furnished me by Mr W. R Logan, the Collector of Customs at Newcastle, shows that the greatest increase in the export of coal from that port has been:—To Victoria, 84,136, San Francisco, 36,279, Honolulu, 6,951, Mexico, 6,548, Singapore, 5,565, Fiji, 5,092; Portland O, 4,094, New Caledonia, 4,044, Wilmington, 3 807, and Iqui Iqui, 2,271. And the greatest decrease to New Zealand, 14,254, India, 38,875, Java, 27,538, Queensland, 23,788, South America, 19,237, Manila, 18,194, Guiana, 8,456, Hongkong, 7,623, China, 6 938, Japan, 3,748; and South Sea Islands, 3,814 tons

Complaints made of deficient ventilation, &c.—I have, as usual, inquired into many complaints made with respect to deficient ventilation and non-compliance with the provisions of the Coal Mines Regulation Act, 1876. Proceedings, where necessary, have been taken to enforce the provisions of the Act, and reports furnished thereon.

NEW MINES OPENED OUT OR IN COURSE OF DEVELOPMENT DURING THE YEAR 1886.

Stockton Colliery.

On January 15th.—Mr. John Evans, manager, notified that the sinking of the above Company's air-shaft commenced on Tuesday the 12th of January.

Morriset Point, Lake Macquarie.

On January 30th.—Mr. David Murray, for D. and P. Murray & Co., owners, notified having commenced to work their coal-mine at Morriset Point, for the purpose of supplying the Government dredge with coal.

South Waratah Colliery.

On March 25th.—Mr. James Hunter, colliery manager, notified that he intended reopening part of the workings of the South Waratah Colliery.

South Cumberland Coal-mining Company, Illawarra District.

On June 2nd.—Mr. C. Harper, manager, notified that the contractors commenced sinking the shaft at Camp Creek, for the above Company, with one shift of men and horse, until engine is fixed, when full shifts will be employed.

A.A. Company's Sea Coal Pit, Newcastle.

On June 8th.—Mr. William Turnbull, manager, notified having commenced to sink a new pit, near the old F pit, and at present only putting it down some 30 or 40 feet, to get a solid foundation for building the walls of a shaft upon, after which sinking will cease until a sinking engine is up.

The above new sinking will be called the "Sea Coal Pit."

Anvil Creek Colliery.

On June 19th.—Mr. Charles Horsfield, colliery manager, notified that he had commenced operations to open the Anvil Creek Estate, for the purpose of raising coal and shale, and putting down a shaft to the deep, from the old workings, and are now 30 feet down with the sinking.

Quarry Tunnel Colliery, Waratah.

On July 21st.—Mr. M. Thornton, for M. Thornton & Co., notified that they had cut a tunnel near Whiteman's Quarry, to work the old Waratah seam of coal.

Brown's

Brown's Colliery, Minni.

On September 4th.—Mr. J. Croft, manager, gave notice of having commenced to open out headings at tunnel, near Back Creek, in connection with the abovenamed colliery.

Reedy Creek, near Hartley Vale, Western District.

On September 19th.—Mr. John M'Mullen notified that he was driving two tunnels into a coal-seam, on his C. M. purchase, Reedy Creek, about 3 miles north of Hartley Vale township, parish of Lott, county Cook,

Young Wallsend Colliery, near Wallsend, county Northumberland

On October 30th.—Mr. Joseph Hardy, mining engineer to the Company, gave notice that sinking operations were begun at the abovenamed colliery.

East Waratah Colliery.

On November 16th.—Mr. James Hunter, colliery manager, notified that the abovenamed colliery will henceforth be worked by tribute, for the Company, by Thomas George Griffiths.

SECTION of the Newcastle Coal Company's Borehole Coal-seam, taken at 60 yards from their B pit.

SECTION of the Borehole Coal-seam sunk through by the Waratah Coal Company at a depth of 460 feet at their Flaggy Creek shaft, near Charlestown and Raspberry Gully Colliery.

In addition to my usual duties, I have visited numerous localities for the purpose of examining and reporting upon applications to mine coal from under Crown lands, the number of men and quarterly work afterwards employed and done thereon, checking and reporting on all quarterly royalties due for coal wrought from under Crown lands, and obtaining information for the Crown Solicitor, and giving evidence respecting the value of coal-lands resumed by the Government for railway and other purposes. And a considerable portion of my time has been occupied at the scene of the Lithgow Valley Colliery disaster, and in examining and reporting on the undermining of roads, streets, and railways by persons who, having extracted coal from under them, have, in many cases, caused damage to the surface thereof. I, however, hope that before another year elapses the Legislature will have passed a stringent Bill that will severely punish those who in future extract coal from under roads, streets, or railways, &c., without first having obtained permission to do so.

I have compiled plans of the Newcastle, Western, and Southern Districts, with sections thereon, showing the position and area of lands held by colliery owners, and the outcrops, thickness, and dip of the coal-seams where worked or opened out by them. Also a section of coal seams and strata, placed in their relative positions, and measured by me, where they outcrop in the Lake Macquarie cliffs, fronting the Pacific Ocean, and from a diamond rock-drill borehole put down on the southern side of the entrance to Lake Macquarie, and below the lowest coal-seam outcropping there.

In conclusion, I have only to add that there were 66 collieries under inspection, and that notices have been received of 11 new mines having been opened out, against 67 under inspection in the preceding year, and 11 opening out; and that the year's returns show an increase in the Northern District of 64,743 tons of round and small coal raised, and £51,650 in value; in the Southern District a decrease of 82,897 tons, valued at £80,477; and in the Western District a decrease of 30,533 tons, valued at £8,220.

I have, &c.,

JOHN MACKENZIE, F.G.S.,
Government Examiner of Coal-fields.

THE Half-yearly Report of the Inspector of Collieries for the Northern District in New South Wales, and Accidents therein, investigated by said Inspector, for the six months ending 31st December, 1886.

The Examiner of Coal-fields, Sydney,—
Sir,

Glebeland, 10 January, 1887.

Pursuant to the provisions of clause 26 in the Coal Mines Regulation Act, 1876, I have the honor to transmit to you this my six-monthly report on the state of the various collieries in the Northern District, for the half-year ending 31st December, 1886.

The total number of collieries under inspection in the Northern District during the term embraced in this report is 40. Burnley's Clay Cross Mine has not been worked during the term, owing to a labour dispute. The Great Northern, Teralba, West Wallsend, Young Wallsend, Hetton, and New Ferndale, are new collieries opening out.

PRESENT STATE OF MINES.

A.A. Company.—About 720 men, &c., are employed in this colliery during the day-shift, and the total quantity of air introduced into the mine per minute is about 100,000 cubic feet. The face-workings are divided into sixteen splits, each split being served with a separate and distinct current of fresh air. The Act is also complied with in other respects. This Company has now commenced a new winning to the east of the present colliery workings. Two large pits are being put down, and all the surface erections appear to be of a most substantial character.

Wallsend.—There are about 880 men, &c., employed in this colliery on both shifts; and the total quantity of air introduced into the mine per minute is about 170,000 cubic feet. In connection with the face-workings, there are eleven splits, each split being supplied with a separate and distinct current of fresh air. None of the splits are overcrowded. The requirements of the Act are also complied with in other respects.

Lambton.—About 420 men, &c., are employed in this colliery on both shifts, and about 70,000 cubic feet of air per minute are introduced into the mine. The splits are in accordance with the Act, and the Act is also complied with in other respects.

Newcastle Co.'s Colliery.—There are about 350 men, &c., employed in this mine on one shift, and the total quantity of air circulated in the mine is about 70,000 cubic ft. per minute. The face-workings are divided into eight splits, each being supplied with a separate and distinct current of fresh air. There are not more men in any split than the Act allows. The Act in other respects is also complied with.

New Lambton.—About twenty men, &c., are employed in this mine. Most of the miners are engaged in working pillars. A small shaft has lately been sunk for ventilating purposes, and the Act is now complied with in every respect.

New Lambton C. Pit.—About 120 men, &c., are employed in this colliery on one shift, and supplied with about 21,000 cubic ft. of air in two separate currents. In the tunnel in connection with this colliery about twenty-six men, &c., are employed, and supplied with about 5,000 cubic ft. of air per minute. The Act is also complied with in other respects.

South Waratah.—About twenty men, &c., are employed in the Charles and Flaggy Creek pits driving a communication cross-cut between the two places. The ventilation is good, and the Act complied with in other respects also.

East Waratah.—About eighty men, &c., are employed in this colliery, and supplied with about 11,000 cubic ft. of air per minute in one current. The provisions of the Act are complied with in other respects also.

Old Waratah.—About twenty men, &c., are employed in the three tunnels. The ventilation is good, and the Act complied with in every respect.

Hill

Hill End.—There are about nine men, &c., employed in this mine. The ventilation is good, and the Act is complied with in other respects also.

Goose Colliery.—About eight men, &c., are employed in this mine. The ventilation is good, and the Act carried out in every respect.

New Duckenfield.—About thirty-nine men, &c., are employed in the two mines in connection with this colliery. The ventilation is good, and the requirements of the Act fully carried out.

Tighes Hill.—There are about seventeen men employed in this colliery. The requirements of the Act are carried out, both as regards the ventilation and other matters.

Co-operative Colliery.—About 350 men, &c., are employed in this colliery on both shifts, and the total quantity of air introduced into the mine per minute is about 45,000 cubic ft. The ventilation of this colliery has been seriously interfered with during part of the six months, owing to a very extensive subsidence of roof which took place on 2nd September last. This unexpected crush completely altered the then existing ventilating arrangements which were fast nearing completion, and which would have been productive of splendid results. Since the crush took place a large sum of money has been spent in order to restore the ventilation, and it is expected that in the course of a short time the colliery will be in first-class condition. The number of splits are in accordance with the Act. The requirements of the Act are complied with in other respects also.

Brown's Colliery.—There are about 250 men, &c., employed in this colliery on both shifts, and the total quantity of air introduced into the mine is about 58,000 cubic ft. per minute. The face districts are according to the Act. In the little tunnel there are about seventeen men, &c., who are supplied with about 8,000 cubic ft. of air per minute in one current. The Act in other respects is also complied with.

Duckenfield.—There are about 220 men, &c., employed in this colliery on both shifts. The total quantity of air introduced into the mine per minute is about 45,000 cubic ft. The face-workings are divided into five splits, each being served with a separate current of fresh air. The requirements of the Act are complied with in other respects also.

Ferndale.—This is a new winning in the vicinity of Wickham, where sinking operations are being carried on. About thirty persons are employed, and the provisions of the Act are complied with.

Pride of Ferndale.—About seventeen men, &c., are employed in this mine. There are two distinct openings to the surface. The ventilation is good, and the Act complied with in other respects also.

Wickham and Bullock Island Colliery.—There are about 140 men, &c., employed in this mine on both shifts. The amount of air per minute introduced into the mine is below the requirements of the Act; but steps are being taken to remedy the matter as soon as possible. The Act in other respects is complied with.

Maryville.—About eighty men, &c., are employed in this colliery. The ventilation at the present time is barely up to the requirements of the Act. The second shaft in connection with this colliery has not yet been sunk, therefore sub-section 1, section 12, of the Coal Mines Regulation Act is not complied with.

Brookstown.—About fourteen men, &c., are employed in this colliery on the day-shift. The ventilation is good, and the Act complied with in other respects also.

Burwood.—There are about 227 men, &c., employed in this colliery. The total quantity of air circulated in the mine per minute is about 30,000 cubic ft. The face-workings are divided into four separate and distinct splits. The second opening to the surface has been completed, and preparations are being made for the erection of a large furnace for ventilating purposes. The Act in other respects is also complied with.

Stockton.—About 150 men, &c., are employed in this colliery on both shifts. The total quantity of air introduced into the mine per minute is about 50,000 cubic ft. The face-workings are divided into three separate splits, none of which are overcrowded. The second opening to the surface has been made, and arrangements are being completed in order to comply with the requirements of section 12, sub-section 1, of the Coal-mines Regulation Act.

Hillside, Burwood.—There are five men, &c., employed in this mine. The ventilation is fairly good, and the Act complied with in other respects also.

Dunkirk Colliery.—About thirty men, &c., are employed in this mine. The ventilation is good, and the Act complied with in other respects also.

Lymington.—Operations are at present suspended at this new winning, further than keeping the water out of the shaft. Only a limited number of men are employed. Everything in connection with the shaft appears to be in good order.

Great Northern.—About ten men are employed in this mine. As yet only winning work is being driven, but arrangements are being made to increase the output at an early date. The ventilation is good, and the Act is also complied with in other respects.

Teralba.—This is a new winning, and a splendid shaft is being sunk. About forty men are employed in connection with the sinking operations. Everything in and around the shaft appears to be in good order and fitted up with a view to safety.

West Wallsend.—Sinking operations are still being carried on at this place, and it is expected that the seam of coal will be reached at an early date.

Young Wallsend.—Sinking operations at this new winning are at the present time suspended until the necessary machinery is erected.

Hetton.—A very large shaft is being sunk in connection with this colliery. The rock has been reached, and there is now a fair prospect of striking the seam of coal at no distant date. Everything in connection with the shaft appears to be in good order.

Thornley.—There are eight men employed in this mine. The ventilation is good, and the Act complied with in other respects also.

Sunderland.—There are four men employed in this mine. The Act is complied with in every respect.

Rathluba.—There are six men employed in this mine, and the provisions of the Act are fully carried out.

Greta.—In this colliery there are about 230 men, &c., employed on the day-shift. The total quantity of air introduced into the mine per minute is about 30,000 cubic ft. The face-workings are divided into four distinct splits, none of which are overcrowded. The requirements of the Act are also complied with in other respects.

Anvil Creek.—About twenty men are employed in this colliery. The ventilation is good, and the Act is complied with in other respects also.

New Park Colliery, Singleton.—About fourteen men, &c., are employed in this colliery. The Act is complied with both in regard to the ventilation and other matters.

Ellesmere.—In this colliery there are about twenty-seven men, &c., employed. The ventilation is good, and the Act complied with in every respect.

Rix's Creek.—Only one man and boy employed in this mine. No cause for complaint.

Rosedale.—There are only two men employed in this mine. No cause for complaint.

ACCIDENTS IN MINES.

The accidents investigated by me in connection with the collieries in the Northern District of the Colony during the six months ending 31st December, 1886, are twenty-seven in number, nineteen of which I fully reported on at the time, and eight of which I did not report, as they were not considered serious.

Of the nineteen accidents in the annexed tabulated list, five, I regret to say, proved fatal—three by falls of coal, one by a collision of skips, and one by a blow from a prop which was knocked out by a fall of coal.

Some of the non-fatal accidents in the same list were of a serious nature; others were not so serious as they at first appeared.

The first of the fatal accidents happened to a young man named Thomas Leach, who was employed as a brakesman on a self-acting incline in the Wallsend Colliery. On 29th July last, he (Leach) was engaged in bringing some damaged skips up the No. 1 tunnel to the surface after drawing-hours, and whilst proceeding along the tunnel was met by some runaway skips loaded with bricks. The consequence was a collision, and the infliction of fatal injuries on the unfortunate young man. On the following day the Maitland District Coroner, A. Vindin, Esq., J.P., held an inquest on the body of deceased, at Wallsend. I attended the inquest and heard all the evidence, and fully agree with the verdict of "Accidental death."

The second fatal accident happened to a miner named William Lewis, by a fall of coal in the Wickham and Bullock Island Colliery, on 30th July last. The Maitland District Coroner held an inquest on the body of deceased, at Tighe's Hill, on the day following the accident. I was also present at this inquest, and after having heard the evidence fully agree with the following verdict as given by the jury:—"That the deceased's death was caused, on the 30th July, 1886, by an accidental fall of coal in the Wickham and Bullock Island Colliery, at Bullock Island."

The third fatal accident happened to a miner named Robert Young, by a fall of coal in the Lambton Colliery, on 27th August last. This poor man lingered in terrible suffering for about thirty-five hours after receiving the accident, and died at about 10 p.m. on the following day. The Maitland District Coroner held an inquest on the body of deceased, at Lunn's Hotel, New Lambton, on Monday 30th August. I attended the inquest and heard all the evidence, and fully agree with the verdict of "Accidental death."

The fourth fatal accident happened to a miner named John Virgo, by a fall of coal in the Wallsend Colliery, on 1st October last. This poor man lingered about twelve hours after receiving the accident, and expired at about 11:30 p.m. on the same day. The Maitland District Coroner held an inquest on the body of deceased, at Wallsend, on the day following the accident. I was present at the inquest, and heard all the evidence, and fully agree with the verdict of "Accidental death."

The fifth fatal accident happened to a miner named Andrew Watson, by a blow from a prop which was knocked out by a fall of coal in the Greta Colliery, on 17th November last. On the day following the accident the Maitland District Coroner held an inquest on the body of deceased, at the Court-house, Greta. I attended this inquest also, and fully agree with the verdict of "Accidental death" as returned by the jury.

The first of the non-fatal accidents happened to a miner named James Jones, by a fall of coal in the Wallsend Colliery, on 8th July, and resulted in severe fracture of the right ankle.

The second happened to a miner named William Stevenson, by a fall of loose stones from a dirt-box, in the Pride of Ferndale shaft, on 19th July,—the result being very severe injuries to back and chest.

The third was a thigh fracture to a miner named Charles Quiding, by a fall of coal in the A.A. Co's. No. 2 pit workings, on 20th July.

The fourth was by the same fall of coal as above-mentioned, and resulted in very severe internal injuries to a miner named Edward Pascoe, who was working with Quiding at the time.

The fifth resulted in compound fracture of right leg, to a miner named Hugh Montgomery, by a fall of coal in the A.A. Co's. No. 2 pit workings, on 21st August.

The sixth happened to a miner named James Dodd, by a fall of coal in the Wallsend Colliery, on 2nd September. Result, very severe internal injuries.

The seventh was a leg fracture to a miner named Alexander M'Leau, by a fall of coal in the Wickham and Bullock Island Colliery, on September 9.

The eighth happened to a miner named John Hindman, by coal blown from a shot in Brown's Colliery, Minmi, on 4th November, and resulted in fracture of thigh.

The ninth resulted in leg fracture and severe wound to a wheeler named Thomas Hunter, by a squeeze between the horse-limbers and a loaded skip in the Stockton Colliery, on 19th November.

The tenth happened to a miner named William Lewis, by a fall of jerry in the A.A. Co's. No. 2 pit workings, on 24th November, the result being very severe bruises on right leg.

The eleventh resulted in compound fracture of both bones of right leg, to a trapper boy named Barrass Robinson, by a loaded timber trolley in the Wallsend Colliery, on 1st December.

The twelfth happened to a miner named David Reid, by a fall of morgan in the A.A. Co's. No. 2 pit workings, on 2nd December, the result being a fracture of both bones of left leg and dislocation of left ankle.

The thirteenth happened to a boy named William Bowditch, whilst engaged taking the rope off a loaded train of skips, in the East Waratah Colliery, on 23rd December, and resulted in the dislocation of right hip and other injuries.

The fourteenth, and last, happened to a miner named Cuthbert Davison, by a blow from a prop in the Wallsend Colliery, No. 3 tunnel, on 23rd December, the result being severe fracture to ribs on left side.

The usual tabulated list of accidents is hereto appended.

I have, &c.,

JOHN DIXON,

Inspector of Collieries.

THE Half-yearly Report of the Inspector of Collieries on the state of the various Collieries in the Southern and Western Districts of the Colony of New South Wales, and Accidents therein, for the half-year ending 31st December, 1886.

The Examiner of Coal Fields, Mines Department, Sydney,—

Wollongong, 12 January, 1887.

Sir, In compliance with the requirements of clause 26 in the Coal Mines Regulation Act, 1876, I have the honor to transmit to you this my six-monthly report on the state of the various collieries for the half-year ending 31st December, 1886.

The total number of collieries under inspection in the Southern and Western Districts during the last six months is twenty-six. The two prospecting mines at Avondale (near Dapto) and the two at Ruined Castle (Katoomba) are not included, no work having been done in them during the term of this report.

Western District	12 coal-mines and	1 shale-mine
Berrima ,,	2 ,,	1 ,,
Southern ,,	10 ,,	...
	24	2 = 26 collieries.

PRESENT STATE OF MINES.

Mount Kembla Colliery.—During the last four months the original miners who wrought in this colliery have been out on strike, on account of the hewing rate of coal being reduced 2d. per ton. During the term of the strike heavy falls of roof have taken place in the long-wall and No. 6 division of workings. The manager, Mr. Evans, has had great difficulty in connection with these falls of roof interfering with the return air-ways; but to overcome this, a new air-crossing has been constructed, and the return air-ways have been opened out so far that on my inspection I was (with difficulty) enabled to travel through them.

From the effects of the falls of roof referred to, and the heavy rains, a large quantity of water found its way through the falls into the dip-workings; this water has now been pumped out by means of a small pumping engine. An average of sixteen non-union men are employed underground, and served with about 5'200 cubic feet of air per minute.

The above number of men are unskilled coalminers, but the larger portion profess to have wrought on the gold-fields. And I find the timbering of the bords in general is very carefully attended to; and the management likewise exercising every care to ensure safety. The Act in other matters complied with.

Mount Pleasant Colliery.—The original miners at this colliery have been on strike during the last four months.

The dispute was caused by the manager discharging two miners from the colliery. The miners insisted to know the reason why these two men had been discharged. The manager would give no reason, but claimed the right or power to employ or discharge whomsoever he thought proper, whereas the miners, believing the two men were victimized on account of taking a leading part in the Miners' Union, refused to work until the two men were reinstated.

At present eighty non-union men are employed underground, and served with 13,500 cubic feet of air per minute, in two separate splits, viz.:—No. 1 tunnel, sixty-four men and horses employed, and supplied with 9,000 cubic feet of air per minute; Cantrill's heading, sixteen men, and served with 4,000 cubic feet of air per minute. On making my inspections I have insisted upon the management carefully examining the bords several times a day to ensure safety for the men, seeing that a large portion were unskilled miners. The manager informed me that the underground officials visited the bords several times a day to see that the timbering and other matters were attended to.

On my last inspection I found the bords were well timbered up to the working face. The Act in other matters complied with.

Bulli

Bulli Colliery.—The miners have been on strike for the last four months, owing to a reduction of 2d. per ton on the hewing rate of coal. Five men are employed underground doing general repairs.

During the strike heavy falls of roof have taken place in several districts of the colliery, obstructing the principal return air-ways. I drew the manager's attention to the condition of these air-ways, and he, the manager, informed me he could not get men during the strike to work and keep them (the air-ways) in repair; but as soon as the strike was settled it would be his first business to have the return air-ways put into a condition that persons could travel therein. A new ventilating furnace has been built, about 43 chains from the entrance of the tunnel, which has 100 square feet of heating surface. The air-shaft in connection with this furnace is 320 feet in depth, and 10 feet in diameter. The Act in other matters complied with.

South Cumberland Coal-mining Company.—The above Company are sinking a shaft at Camp Creek, parish of Heathcote, situated on the Illawarra Railway, 28 miles from Sydney. The surface arrangements are very substantial for sinking operations. The shaft is sunk to a depth of 315 feet, is 16 feet in diameter, and walled off with 9 in. brickwork and cement, to a depth of 28 feet from the surface. The ventilation is supplied by means of a fan wrought by a belt from the engine, with 6 in. diameter pipes. Sinking operations are carried on by three shifts of sinkers, eight sinkers being on each shift.

North Illawarra Coal-mining Company—No. 2 tunnel.—Thirty men are employed underground, and supplied with 8,000 cubic feet of air per minute. The surface arrangements are almost completed. The Company intend to ship coal from their new jetty about the month of February. The jetty is 850 feet long, and has a depth of water at high-tide of 25 feet. The Act complied with.

Broker's Nose Colliery.—About eight men are employed underground, and served with 1,000 cubic feet of air per minute.

Coal Cliff Colliery.—About 100 men and horses are employed underground, and supplied with 10,400 cubic feet of air per minute, in two separate splits. The north division of workings are supplied with 7,000 cubic feet of air per minute for eighty men. No. 6 heading, twenty men and horses, and served with 3,400 cubic feet of air per minute. The colliery throughout in general good condition, and the Act complied with.

Bellambi Colliery.—Four men employed underground, and supplied with 10,000 cubic feet of air per minute. The Act in all respects complied with.

WESTERN DISTRICT.

Carlo's Gap Colliery.—One man employed getting a few tons of coal weekly, no sale being for the coal.

Hermitage Colliery.—Six men employed underground, and served with 3,000 cubic feet of air per minute. Travelling roads and working faces safe. The Act in all respects complied with.

Zig Zag Colliery.—Seventy-five men employed underground, and supplied with 17,500 cubic feet of air per minute in one current. The colliery in a healthy condition throughout. The Act in all respects complied with.

Vale of Clwydd Colliery.—About seventy men and horses employed underground, and supplied with 14,000 cubic feet of air per minute, in one current. During the last six months a large ventilating furnace has been built at the bottom of the air-shaft. The Act in all respects complied with.

Esk Bank Pit.—Seventy-one men and horses are employed underground, and served with 14,500 cubic feet of air per minute in one current. The ventilation good throughout the colliery. The Act in other matters complied with.

Esk Bank Old Tunnel.—About twelve men employed underground, and supplied with 8,000 cubic feet of air per minute. The ventilation good in every bord. The Act is also complied with in all respects.

Cooverwill Mine.—One man employed getting coal. A new air-shaft has been sunk, and a travelling road made on the east side of the tunnel. The Act in all other matters complied with.

Lithgow Valley Colliery.—Sixty-two men employed underground, and served with 12,000 cubic feet of air per minute in one current. A new air-shaft has been sunk in connection with the No. 2 cross-cut. A travelling road has been made from the working faces to the shaft; a ladder is placed in the shaft from the bottom to the top, so that persons may travel at all times, thus making three separate and distinct ways to the day. The Act in all other respects complied with.

Main Camp (Hartley Vale).—Twenty men employed underground, and served with 12,500 cubic feet of air per minute. The colliery safe and well ventilated throughout. The Act in all respects complied with.

New South Wales Shale Mines (Hartley Vale)—No. 3 Tunnel.—Forty men employed, and served with 10,000 cubic feet of air per minute in one current. Twenty men are on pillar work. The pillars are being taken out systematically; both manager and miners are very careful as to the timbering of the bords. The Act in all respects complied with. *Western Tunnel.*—Fourteen men employed underground, and served with 5,100 cubic feet of air per minute. *No. 1 Tunnel.*—Eight men employed underground, and supplied with 4,000 cubic feet of air per minute. The Act in all respects complied with.

Retort Coal Mine (Hartley Vale).—Seven men employed underground, and supplied with 4,000 cubic feet of air per minute. The Act complied with.

Katoomba Colliery.—Sixty-two men are employed underground, and supplied with 10,500 cubic feet of air per minute in one current. A new furnace has been built during the last six months; also a new travelling road, driven out on to the mountain side at the extreme end of the working faces, thus making three separate and distinct openings to the day.

BERRIMA DISTRICT.

Mittagong Coal-mining Company.—Four men employed underground, and served with 4,000 cubic feet of air per minute. Only a few tons of coal going away weekly to Mittagong township. The Act complied with.

Berrima Colliery.—Six men employed underground, and supplied with 4,000 cubic feet of air per minute. The Act complied with.

Australian Kerosene Oil Company (Joadja Creek).—Sixty men are employed underground, and supplied with 12,000 cubic feet of air per minute. The colliery in a safe and healthy condition throughout. The Act complied with in all respects.

ACCIDENTS

ACCIDENTS IN MINES.

During the last six months I have investigated five separate accidents, one of which was fatal.

The first of the non-fatal accidents happened to a wheeler named David Thomas, at Bellambi Colliery, on the 25th September. His leg was broken by his horse stumbling and driving him against the side of the main tunnel.

The second and third accidents happened to two miners who were working mates, at Coal Cliff Colliery, on October 28th, named William Walker and John Collins, by a fall of roof, while engaged filling a skip at their working face. Walker was bruised about the head and chest, and Collins hurt about the back.

The fourth non-fatal accident happened at Mount Kembla colliery, on November 17th, to a surface labourer named C. Parker. He had his back bruised, by a loaded truck breaking away from the top of the incline.

The fatal accident happened on the 20th November, to a miner named Felix Murphy, at Mount Kembla Colliery, by a fall of tops from the roof. Three of his ribs were broken, and he was otherwise bruised about the head and shoulders. From the effect of the injuries received and shock to the system he gradually sank, and expired on the 24th of November, in the Wollongong hospital. The deceased was an aged man, about sixty-eight years of age, and it was his first day's work in the colliery. An inquest was held at Wollongong, as touching the death of deceased, by the District Coroner, C. F. Smith, Esq., which inquest I attended. The jury returned a verdict of accidental death, with which verdict I fully agree. The usual tabulated list of accidents is hereto appended, and a section of Mr. M'Mullen's coal-seam.

I have, &c.,
JAMES ROWAN,
 Inspector of Collieries.

The above is a section of the coal-seam recently opened out by Mr. M'Mullen.

The mine is situated about 3 miles from Hartley Vale, in the county of Cook, parish of Lett. Two adits have been driven 50 yards into the mountain.

The lower portion of the section marked A is good marketable coal.

From the nature of the floor, roof, and other surroundings, I would judge it to be the same seam of coal as that which is being wrought in the Lithgow District.

TABULATED List of Fatal and Non-fatal Accidents in the Southern and Western Districts of New South Wales Collieries investigated by the Inspector of Collieries during the half-year ending 31st December, 1886.

No.	Date.	Colliery.	Sufferer.	Occupation.	Remarks, &c., on the nature and extent of injuries.	Leg broken by a skip.	Bruised by a fall of roof.	Bruised by a fall of roof.	Bruised by a loaded truck.	Fatal injury by a fall of roof.	Fatal.	Non-fatal.

GEOLOGICAL SURVEY OF NEW SOUTH WALES.

Report of Progress for 1886 by the Geological Surveyor-in-charge.

Sir,—

I have the honor to submit the following report of progress of the geological survey for the year 1886.

The various mining districts examined include Bingera, Gunnedah, Jerrara, Hunter River, Molong, King's Plains, Mudgee, Uralla, Mitchell, Fairfield, &c.

I accompanied the Under Secretary for Mines and the Superintendent of Drills; members of the Prospecting Board, to the Bingera District to make arrangements for assisting parties to prospect for gold with Government aid.

The Gwydir River Valley, at Bingera, has been eroded through a belt of gold-bearing reef formation, and has subsequently been partly filled up with drifts and alluvial deposits, which form the wide alluvial flats on which the town stands. As the shallow drift deposits in the adjacent tributary valleys have been profitably worked for gold for some years past, it is considered that the deeper drifts under the Gwydir River flats must also contain extensive auriferous deposits. Various attempts have been made to prospect these; but owing to the heavy influx of water the work could not be carried out. It was, therefore, decided to test the deep wet ground by means of the water-auger. Several bores were bottomed near the southern edge of the flat, and a little gold obtained; but in the deeper ground it was found that the auger could not cope with the coarse boulders in the wet loose drift. Two other sites were selected for prospecting the tertiary drifts which extend from the Bald Hills towards the Bobby Whitlow diggings. These drifts are the remains of an ancient river-course which drained from the high lands on the east, and in the Pliocene period was overwhelmed by a flow of basaltic lava. The subsequent denudation of the country has in places left only patches of the basalt, such as those forming the Bald Hills, where the old river pebble-drift is seen cropping out from under the basalt on the sides of the hills, and resting on altered slate rocks with quartz veins. It is intended to drive in on the slate rock bottom to search for the deeper channel of the old lead. Two of the adjacent shallow gullies have been worked for gold, and it is evident that the gold has been derived from the denudation of the tertiary drift. At one place the Tingha Company had some time ago sunk a shaft about 75 ft. deep, passing through 15 ft. of columnar basalt and a little drift on altered shales; but this shaft appeared to be on the eastern shallow side of the lead. The other prospecting site is about 2 miles further to the north-west, near the head of Long Gully, where the tertiary drift, the continuation of that from the Bald Hills, comes to the surface without a covering of basalt; but as the bed-rock is not exposed the deep ground must here be tested by sinking one or more shafts. It is important that this locality should be thoroughly tested, as the old lead must extend for many miles in a westerly direction. The diamond-field was next inspected. Near Butler's Farm, Mr. Lowe had put down a deep shaft on a high basalt ridge (970 ft. by barometer above Bingera), and he desired to continue his prospecting on the same site by means of the diamond drill. But on examining the ground for about a half a mile to the east it was found, as seen in section in a deep gully, that the basalt was 300 ft. thick, underlaid by 80 ft. of tertiary clays resting on altered Devonian slates; and as there appeared to be deeper ground to the south, where the basalt had been removed by denudation, it was considered that it would be more advisable to test the lead in that direction by sinking. It is most important that this should be done, for this lead occupies what was, in the Tertiary period, the main drainage valley of the district, and as it has crossed the above-mentioned belt of gold-bearing formation, which extends southerly from Bingera, when traced out a short distance to the east, near to this belt, it may be found richly auriferous, as well as diamond-bearing. It is doubtful whether the deposits which have already been worked for diamonds, though evidently forming part of this Tertiary lead formation, really occupy the deepest channel, or are on the main lead. However, to determine this, Mr. W. Anderson is now engaged in making a geological survey of the field.

The country from Bingera to Inverell consists of altered, partly jasperoid, Devonian slates and sandstones, granite and basalt; the latter is in places covered by ferruginous volcanic ash, which, in its decomposed state, produces rich agricultural land. It forms, generally, the highest land in the district, attaining at 5½ miles from Inverell a height of about 2,500 feet above sea-level. Mr. MacDonal, of Myall Creek Station, showed me some bituminous coal, which occurs 8 miles west from the station; also, from the same locality, fossil bones of *Diprotodon*, &c., found in an old boggy spring deposit. At Dangar's Gate, about 16 miles west from Inverell, there is a massive outcrop of coarse porphyritic granite, with black mica and veins of eurite; it is probably stanniferous.

From Inverell to Glen Innes, the road passes over altered sedimentary (probably carboniferous and Devonian) formations, granite and porphyry, covered in many places with basalt; the denudation of the latter has given rise to the notorious "black soil," which so extensively covers this district and the plains to the westward.

With the Under Secretary for Mines, I inspected the Jenolan Caves, to ascertain what additional improvements were necessary to be made. These have since been completed, and the different caves may now be easily inspected by visitors, and with greater safety than formerly. Arrangements are now being made for the electric lighting of the caves. Mr. E. C. Cracknell, Superintendent of Telegraphs, has kindly undertaken the work, which, when completed, will enable the natural objects in the caves to be seen to great advantage. During the year 1,140 persons visited the caves.

I examined the gold- and silver-bearing ironstone lodes in the Jerrara District, between Goulburn and Marulan; my report thereon will be found in Appendix A.

The Molong District, in which the copper and tin lodes of Gumble occur, was also examined by me, and is described in my report herewith. (Appendix B.)

I inspected the King's Plains Gold-field, and recommended the construction of a dam for mining purposes, on account of the scarcity of water on the field, and to promote the development of the gold-bearing reefs. (See Appendix C.)

In my report (Appendix D) upon the Mudgee and Gulgong Gold-field I have chiefly made reference to those mineral resources which may be of commercial value—coal, kerosene shale, antimony, and diamonds, in addition to the gold which the district has yielded up to the end of 1886, 1,072,752 ounces, or over 32 tons, valued at £4,162,550—and have pointed out the localities which should be further prospected.

The Mudgee District presents several features of special geological interest. The base-rocks, or "bed-rocks," of the district consist chiefly of Upper Silurian and Devonian conglomerates, sandstones,

schists, and limestones, which have been much indurated and otherwise metamorphosed. These have been here and there intruded by granites, diorite, and porphyry. The auriferous veins are always more or less associated with the intrusions of diorite, occurring either in the diorite or in the adjoining altered sedimentary rocks; consequently, where these formations have suffered denudation, the derived gravels, whether of carboniferous age or of more recent date, are often payably auriferous. With the exception of the summits of some of the higher ranges, the whole district was at one time covered with the carboniferous formations, about 300 feet thick, containing seams of coal and kerosene shale, and overlaid by the Hawkesbury sandstone formation, also about 300 feet thick. The enormous amount of denudation that followed has not only eroded valleys through these formations, but has in places completely swept them away, laying bare the older base-rocks over large areas; while, in some localities, patches of the carboniferous gravels or conglomerates, and at the head of Cooyal Creek these pass under the coal-measures, and the Hawkesbury sandstones, which form high precipices of the same appearance as those in the Blue Mountains valleys. This vast denudation continued through the Tertiary period to the present day, and therefore, as we should expect, we find the various successive Tertiary deposits marking the relative time of their deposition in the valleys, as the latter were gradually eroded and deepened, or as they were partly filled up by outbursts of lava, which at different times flowed into some of them. I say some of them; for whereas a large stream of lava descended from the mountains on the east, flowing in the Cooyal Creek Valley, near Gulgong, thence into the Cudgegong Valley, covering up the river channels of the pliocene period. The upper part of the Cooyal Valley, where the Home Rule and Canadian leads occur, escaped this flood of molten lava. In the mode of occurrence these diversified formations may be plainly read the geological history of the districts, which is, therefore, one of peculiar scientific interest, as it is also one of considerable commercial importance, from its rich mining, agricultural, and pastoral resources.

About $4\frac{1}{2}$ miles north-east of the Bara Reef occurs a large intrusive mass, about a mile in width, of white felsite, containing angular boulders of quartz porphyry. In its structure it exhibits fluxion lines, and it is evidently an old volcanic agglomerate, probably of palæozoic age. It will be of interest to trace out the connection between these ancient igneous rocks and the coal-measures, for the transmutation effected by the intrusion of the former amongst the coal-bearing strata may have induced chemical conditions, under enormous pressure and heat, favourable for the formation of diamonds.

Another important geological question which may be determined in this district is the relation of the Devonian and the Silurian strata. This will necessitate the careful mapping out of the strata along a line running easterly for about 3 miles from the main road, near the Mudjee racecourse. This section would include the purple Devonian sandstones and conglomerates, overlying thick beds of marble limestone, beneath which appear the Silurian clay shales and altered sandstones. A similar favourable locality for working out the order of sequence of these formations is at Ilford. A line of section run for two miles east and west through the town of Ilford would embrace not only the Silurian and Devonian formations, but also the over-lying carboniferous and Hawkesbury strata. The marble limestones appear to form the uppermost beds of the Silurian series.

Assisted by Mr. Anderson, I made a geological examination of the Mitchell, or Sunny Corner, Gold-field, with special reference to the modes of occurrence of the silver-bearing lodes. My report thereon is given in Appendix E.

On 24th September, with Mr. W. H. J. Slee, Superintendent of Drills, I witnessed the boring through the 4-foot seam of coal which had been struck at a depth of 2,228 feet, in the diamond-drill bore, at Holt-Sutherland, near Port Hacking.

Mr. David, Geological Surveyor, has been chiefly engaged during the year upon a survey of the coal formations in the Hunter River District (Appendix F). From his preliminary report upon the coal-measures of East and West Maitland (Appendix G) it will be seen that during the progress of his survey he discovered a valuable seam of coal, 13 feet thick, on Crown lands, about 8 miles south-west from Maitland. The land was at once proclaimed a reserve for coal-mining, and has since been taken up, under lease, by a Company who are about to open a new colliery. Mr. Stonier, who was appointed field assistant, has been assisting Mr. David.

Mr. David has also examined and reported on the discovery of two workable seams of coal near Gunnedah (see Appendix H); the Uralla and Rocky River Gold-field, indicating the direction in which the deep leads trend (see Appendix I); and the Fairfield Gold-field (see Appendix J).

On the recommendation of Dr. Geikie, F.R.S., Director-General of the Geological Survey of Great Britain, through the Agent-General in London, Mr. William Anderson, of the Edinburgh University, was appointed Geological Surveyor to fill the vacancy on our staff. He commenced duty on the 20th September, and after assisting me on the survey of the Mitchell silver-field, inspected and reported on the Yarrangobilly Caves (see Appendix K) and the Kiandra Gold-field (see Appendix L).

Mr. J. E. Carne, Curator of the Mining and Geological Museum, has been most indefatigable in his duties. Besides conducting the correspondence regarding the examination, assays, and analysis of the mineral samples submitted to the Department, and the registration and arrangement of the Museum collections, he has been much occupied with the preparation of the collections for the Indian and Colonial Exhibition. During the year, 1799 mineral samples have been assayed, and numerous samples have been examined without assay, for persons soliciting information regarding them. There are now 19,417 registered specimens in the collections of the Museum. For detailed information, see Mr. Carne's report herewith (Appendix M).

At the request of His Excellency the Governor, Mr. H. T. Wilkinson proceeded on 5th July to Norfolk Island to investigate the matter of the proposed transfer of the Island to the Government of this Colony; his mission has not yet been completed. Owing to his absence my staff has been short-handed, and being put to inconvenience in consequence I have had to obtain assistance from another branch of the Department.

I am pleased to report that Mr. A. H. Taylor has been most assiduous in his work, and always willing to perform urgent work after office-hours, when required.

Some important palæontological discoveries have been made during the year. Mr. J. H. Maiden, Curator of the Technological Museum, forwarded to me a large fossil shell that had been found in the excavation for the new Government Docks at Biloela, Cockatoo Island. This being the first fossil shell found in the Hawkesbury sandstone formation, I submitted it to Mr. Robt. Etheridge, jun., F.G.S., assistant palæontologist to the British Museum, whose remarks thereon are given in Appendix N. I examined

examined the excavation in which this fossil had been discovered, and observing, from the occurrence of fossil plants, and the drift deposits resulting from contemporaneous erosion in the sandstone strata, that other fossil remains might be found, I sent our collector, Charles Cullen, to make further search, with the result that he brought to light a most interesting fossil, which Professor Stephens has identified as one of the thoracic plates of a *Mastodonsaurus*, and very similar to a specimen from Stuttgart in the collection of the Sydney University. The discovery of this *labyrinthodon* is of much scientific importance, as proving the Triassic age of the Hawkesbury formation. Soon afterwards other *labyrinthodon* remains were found in the Wianamatta Shales, near Bowral, by Mr. B. Dunstan, and in the Hawkesbury beds, near Gosford, by Mr. C. Lambert (see Appendix O). Professor Stephens kindly undertook the examination of these fossils, and he has described them in a paper read before the Linnean Society. See Proc. Linn. Soc., Vol. I (second series), Part III and IV.

At Gosford our geological collector found that the fossil, which had been obtained from a heap of rubble stone, had originally come from a lenticular bed of shale in the sandstone formation, where a quarry was being opened in connection with the construction of the Great Northern Railway. This bed of shale was about 4 feet thick, thinning out in a short distance on either side, and from it Mr. Blunt, the railway contractor, had already obtained specimens of fossil fishes, some of which he kindly lent to this Department. Our collector afterwards obtained over 400 other specimens of fishes, including some more *labyrinthodon* remains. This splendid collection is now in the Museum, and awaits the examination of Mr. Robt. Etheridge, who has been appointed Palæontologist to the Geological Survey of this Colony.

The large collection of fossil plants from the Eocene Tertiary deep leads of the New England tin-fields, which had been sent to Baron C. Ettingshausen, of Graz, has been returned by that distinguished palæontologist, and now forms a valuable collection for reference in our museum. The Baron's description and figures of them will shortly be received and published.

All of the mineral resources of the Colony are represented in the collections displayed in the Mining and Geological Museum; but owing to the small size of the museum, it is only possible to exhibit a few of the more characteristic specimens in each series of minerals. More room is urgently required, for the greater part of the collections which we possess has to be packed up and stored away, which is a source of great inconvenience when specimens for collections and exhibitions have to be prepared, the necessary unpacking entailing much loss of the time and labour of the Curator and his assistant. I trust that early provision may be made for more accommodation.

A second edition of the "Mineral Products, Geology, &c., of New South Wales" is now in the Government Printer's hands; and I am making arrangements for the publication of Professor de Koninck's and Dr. Feistmantel's works, with those of other authors, on the Palæontology of this country. Mr. David's voluminous report on the Vegetable Creek Tin-field will shortly be issued from the press. His large coloured geological map of that field has already been published.

I have, &c.,

C. S. WILKINSON,

Geological Surveyor-in-charge.

APPENDIX A.

The Geological Surveyor-in-charge to The Under Secretary for Mines.

Report on the Gold- and Silver-bearing Lodes at Jerrara.

Sir,

Department of Mines, 6 May, 1886.

In accordance with your instructions, I have examined the country about 12 miles east from Goulburn, in the direction of Marulan and Bungonia, where some gold- and silver-bearing lodes have been discovered.

The geological formations consist of altered Silurian clay slates and sandstones, having a general westerly dip; and on the Jerrara Creek there are some interbedded masses of coralline marble limestone, which have for years past been worked at Jobson's limekilns.

In a N.N.E. direction from this limestone, and for a distance of about 7 miles, with a width of from a half to one mile, the Silurian strata have been fissured in places, and the fissures filled with iron and arsenical pyrites and quartz. These fissure deposits constitute the lodes which crop out at the surface as masses of hydrous hematite, magnetic iron oxide, and a little quartz. They extend for only a few yards in length in some places, in others up to 200 and 300 yards, varying in width from a few inches to 60 ft., so that they are very irregular in shape, and are not continuous, though they outcrop at intervals along a general northern course.

The Carrington Company's shaft, sunk by Messrs. Tait, Grant, and party, gold lease No. 1, is at present the deepest that has been put down in any of these bores. It is 100 ft. deep, and from this level a cross-course has been driven through the lode, which dips west at an angle of about 70°, having clay slates on both sides.

The foot-wall is well defined with clay fluccan between it and the slate rock, and from it the lode-stuff, consisting of earthy brown hematite and magnetic iron oxide, with occasional patches of quartz, is 19 ft. thick, passing into 9 ft. of mixed iron ore and pipeclay to the hanging-wall. Some patches of undecomposed pyrites occur in the lode, and these will no doubt become more frequent at greater depths until the water-level is reached, when the lode will consist chiefly of unoxidized sulphides. A sample of the pyrites yielded on assay at the rate of a trace (under 2 dwt.) of gold and 4 oz. 1½ dwt. of silver per ton. An average sample of ore taken across the lode yielded a trace (under 2 dwt.) of gold per ton, and no silver; and a sample from near the foot-wall gave a trace of gold and no silver; and from the hanging-wall a trace of gold and no silver.

In the upper part of the lode porous quartz with arsenical pyrites occurs; and at the surface, a few yards to the north-east from the shaft, similar ore crops out, which gave on assay—gold a trace, and no silver. Further to the north-east, about 150 yards, the lode shows again as a massive outcrop of brown hematite and magnetic iron ore; and in the next claim beyond it is about to be opened by Rankin & Company. About 2 chains south from the Carrington Company's main shaft, a dyke of decomposed quartz porphyry occurs upon the line of the lode. The intrusion of this porphyry into the Silurian strata has probably been the primary cause of the formation of the lodes. On both sides of the Jerrara Creek, near the limekilns, are several ironstone gossan lodes of similar character. About half a mile north of the creek there are two well defined—one of them, the eastern lode, cropping out above the surface in

huge

huge blocks of iron ore for 200 yards in length: a small shaft has been sunk upon one side of it, but it has not been driven into. A sample taken from the surface yielded on assay neither gold nor silver. The western lode is now being opened from a shaft 35 ft. deep on the Iron Duke Company's ground, where it outcrops from 30 to 40 ft. wide, consisting of porous brown hematite or gossan and a little ferruginous quartz. An average sample taken from near the surface gave on assay—gold, a trace (under 2 dwt. per ton), and no silver. The lode outcrops for about 10 chains, narrowing in places to only a few feet. About half a mile to the north, and upon the same line, a lode of porous quartz from 1 to 4 ft. thick, containing arsenical pyrites is seen for about 10 chains; it has only been opened to a depth of 2 feet from the surface; a sample of it assayed at the rate of 3 oz. 5 dwt. of silver per ton, and gold a trace (under 2 dwt. per ton).

To the south-west of the Iron Duke shaft there is an outcrop of sandy ironstone about 45 feet wide and 100 feet long, which has not yet been tested. Adjoining the Iron Duke Company's ground on the south a massive ironstone lode, partly traversing limestone and schists, occurs in Mr. Leonard's portion 160 on Jerrara Creek: it also has not been opened. And for about a mile on the south side of the creek several more lodes outcrop. The principal amount of prospecting here has been done by Daniels and party, who have sunk a shaft 45 feet deep into their lode, which consists of ferruginous clay enclosing patches of brown hematite. An average sample gave on assay neither gold nor silver. On this Company's ground there is another lode to the west, consisting of siliceous brown hematite, which also assayed with like results.

About a mile east from the Carrington Company's mine occurs a gossan lode, the No. 2 Carrington said to be 30 feet thick, and sunk upon to a depth of 60 feet. I did not see this lode, but the prospectors' gave me an average sample of the ore, consisting of brown hematite, which yielded on assay, gold a trace (under 2 dwt. per ton) and no silver.

From the above it will be seen that the assays in each case give unfavourable results. This is somewhat surprising, seeing that six samples of precisely similar ore previously sent by the prospectors yielded on assay from traces of gold and silver in one case up to as high as gold 2 oz. 16 gr. and silver 6 oz. 18 dwt. 12 gr. per ton, the latter return being from a sample of yellow gossan with arsenical pyrites. It is also the more surprising, for the pyritous and general nature of the gossan lode-stuff, and the general formation of the country which the lodes traverse, would lead one to expect more favourable results; and I would recommend that the prospectors send large average samples to some works where the ore can be efficiently treated in bulk, and more reliable results obtained than by assay. It is to be hoped that this will be done, especially as the ore occurs in large quantities.

I have, &c.,

C. S. WILKINSON,

Geological Surveyor-in-Charge.

APPENDIX B.

The Geological Surveyor-in-charge to the Under Secretary for Mines.

Report on Mineral Reserves, Molong District.

Sir,

Department of Mines, Sydney, 23 August, 1886.

In accordance with your instruction I have the honor to submit the following report upon the tin and copper lodes and other geological features in the Molong District.

In this district very little mining, other than prospecting, is at present carried on.

At Gumble, 12 miles south-west from Molong, Mr. J. E. Kelly and the Messrs. Delaney Bros. have done a considerable amount of work in opening a lode which contains tin, copper, and silver, besides traces of gold and antimony. The lode commences at the junction of granite and altered Silurian shales, and traverses the latter for about 100 yards in a north 30° east direction. It varies in width from 1 to 8 ft., and consists of ferruginous felspathic and siliceous lodestuff, more or less impregnated with green and blue carbonates, grey sulphide and red oxide of copper, brown oxide of tin, and magnetite. The tin ore principally occurs in the central and southerly portion of the lode. The lode has been opened in three places. The north and middle shafts have been sunk to a depth of 100 ft., and connected at that level by drives, and the south shaft is being sunk to 60 ft. In a drive at the 100-ft. level on the eastern side of the lode, for a distance of 15 ft. the country rock, altered rubblely shales, with serpentine in the joints, is found to be impregnated with native copper in bright crystalline small grains and scales; and on the west side, at the 60-ft. level, the rock, for a distance of 14 ft. from the lode, is, in places, stained with copper carbonates. It is thus evident that the rock on both sides of the lode has been more or less affected by the agencies, probably thermal water holding minerals in solution, which formed the lode.

In the north shaft, at a distance of 60 ft., a singular cavity in the lode was met with, and at the 100-ft. level it is seen to pass near a mass of limestone, and to have been partly filled with rubble. It is a drainage passage for water from the surface, and may run through the lode to a considerable depth; the sides of it are coated with a film of hydrous oxide of iron. The lode is nearly vertical, but at the 60-ft. level it underlays for a few feet at a lower angle to the east.

Seven average samples taken by myself across the lode at different places yielded on assay at the rate of:—Copper, from traces up to 2.85 per cent.; tin, from traces to 0.50 per cent.; and silver, from traces to 4 oz. 1½ dwt. per ton, and no gold.

A sample of the country serpentinous rock, showing native copper, assayed 4.2 per cent. of copper, with traces of tin and silver; and one picked sample of brown ore, showing tin oxide and carbonates of copper, from the lode at the 60-ft. level, south drive, in the middle shaft, yielded, on assay: Copper, 3.85 per cent.; tin, 58.70 per cent.; silver, at the rate of 8 oz. 19½ dwt. per ton; no gold. It is thus seen that the ores occur in patches, and not disseminated regularly through the lode. The ores would, therefore, have to be sorted. The tin oxide might to a large extent be separated by first crushing the lodestuff and washing it in a buddle; but its complete separation by mechanical methods will be difficult; probably the conversion of the copper ore into soluble sulphate of copper by a wet process would be the most advantageous.

It is impossible to form an opinion as to whether the lode can be profitably worked until average bulk samples have been operated on. I understand that it is intended by Mr. Kelly, when the lode has been opened out from the middle of the south shafts, to have such bulk samples sent to England to be tested. There are now on the surface at the mine several tons of good ore showing both oxide of tin and green and blue carbonates of copper, with red oxide of copper. About

About half a mile north from the Gumble mine, at the Red Hill, there is a large mass of porous iron ore or gossan, situated upon the same line of junction of the granite and altered Silurian. It can be traced for about 200 yards, and in one place it crops out about 50 ft. wide; but towards the north end it narrows and changes into a ferruginous quartz reef. Near its south end a shaft has been sunk upon it to a depth of 40 ft. A sample of the gossan which I took from the heap on the surface gave, on assay, traces of tin, and neither gold nor silver; but I was informed that a sample of it previously assayed gave at the rate of 60 oz. of silver per ton. This lode should be further prospected.

About 100 yards to the east is another small lode of silicious gossan traversing altered Silurian shales.

Three-quarters of a mile south from the Gumble mine, and at the line of junction of the Silurian and granite, the Messrs. Sloggett Bros. are prospecting a lode somewhat similar to the Gumble lode. Two shafts have been sunk in it to depths of 33 ft. and 49 ft. respectively. It consists of soft felspathic lodestuff with yellowish green silicate of iron, silicious "clinker," and hard quartzite with quartz veins containing pyrites and a little fluorspar, together with carbonates and sulphides of copper. In the 33-ft. shaft a vein of porous brown iron ore has been struck, a sample of which, on assay, gave only traces of tin and bismuth. Two other samples of different ore gave the same result.

About 20 chains further south occurs another outcrop of quartz containing carbonates of copper and fluorspar, which should be prospected. Half a mile again to the south, Mr. Sloggett has sunk two shafts upon veins of magnetic iron in altered slate; but the ore is of no value.

Between Sloggett's and Gumble, several reefs of quartz occur in elvan granite, and much resemble the bismuth reefs near Glen Innes. I could not detect any metal of value in them.

About a mile west from Gumble there is a large quartz reef 25 feet wide in granite, and near it the granite is overlaid by Tertiary quartz pebble-drift, which does not appear to have been prospected.

Immediately north of the Red Hill the Silurian formation is cut off by a belt of granite; but about 1 mile further north a narrow strip of Silurian shales and limestone comes in again, striking N. 5° W. These rocks have been much altered by the intrusive granite, the limestone being partly converted into silicate of lime. Some of the beds contain carbonates of copper, but not in sufficient quantity to be of value; they also contain greenish garnet rock and ferruginous quartz-veins.

A few miles to the north the Silurian formation widens out, and is traversed by dykes of elvan, diorite, and felspar porphyry; and at its junction with the granite, 2½ miles east from Delaney's farm, occur altered silicious limestones and chloritic rocks dipping W. at 75°, and containing a little grey sulphide and carbonates of copper, the presence of which has tempted prospectors to sink several shafts; but the copper-ore does not exist in payable quantity. The adjoining porphyritic granite is of a pink colour, and in one place contains a patch 3 ft. in diameter of felspathic quartzite, containing numerous plates of molybdenite. In such reefs bismuth is likely to occur.

One mile east from this we leave the granite and come on to slate rocks overlaid by Tertiary-rounded quartz-drift which has accumulated in a valley about ½ mile wide; this drift deposit should be prospected. On the east side of the Killonbutta Creek there is an extensive deposit of this old drift containing water-worn boulders 2 ft. in diameter. A few holes have been sunk upon it, but I do not consider that it has been sufficiently prospected. I saw several dishes of the drift washed, and in one dishful eleven fine specs of gold were obtained. If water, which is now scarce in the locality, were stored, I believe that the drift would pay to ground-slucce. The deposit rests upon Silurian clay shales dipping W. at 57°. Between here and Molong, a distance of 8 miles, the country consists of hills of Silurian schists and limestones, and Devonian grits, purple shales, flagstones, and conglomerates; but in the valley of the Mandadgery Creek there is another deposit of Tertiary drift. The hills on the north side of Nora Creek, at Downey's Farm, are capped with similar drift and ironstone cement. Mr. Downey has sunk several shafts into it and obtained a little gold. Underneath it are Silurian limestone and shales, very fossiliferous.

The limestones are extensively developed in the town of Molong, where they dip W. at 33° to 50°, and, with a few interbedded shales, are about 1,500 ft. in thickness. Some of the beds consist of crystalline marble of various colours, from white, fawn, and dove colour to dark grey, with white markings of fossil shells and corals. The stone would take an excellent polish, and could be cut into slabs for mantel-pieces. These limestones appear to form the uppermost beds of the Silurian series.

Two miles west from Molong, at Bryan's Flat, on the Parkes Road, some of the Devonian beds yield flagstone of good quality. There are two beds, each about 3 ft. thick, which readily split into flags 2 ft. square; some flags have been obtained 6 ft. long, and with an even surface. The stone is fine-grained, hard, and far more durable than the Sydney sandstone flagging. Two miles further west, on the main road, another quarry has been opened in hard silicious sandstone, from which large flagstones may be obtained from 4 in. to 12 in. thick, and over 10 ft. long; but their surface is not quite smooth, being ripple-marked; yet for culverts and other purposes where large and durable flags are required this stone will prove very serviceable.

In many places in the Molong District, as on Mr. J. Rubie's land at Gara, &c., large masses of brown iron-ore are seen at the surface. At first sight they might be mistaken for the gossan caps of pyritous lodes, but on close examination they are seen to be associated with water-worn pebble-drifts, and to form part of the Tertiary deposits, and are therefore not indicative of lodes like those in the neighbourhood of Copper Hill, upon which I have previously reported.

Remains of the Tertiary drifts are to be found in all of the principal valleys, in which they were deposited by the ancient streams. In some instances, as at Molong, the present valley has not been eroded to the level of the older one, and therefore the lead or bed of the old water-course still exists, and wells sunk into it yield a large supply of water. In Molong it runs almost through the centre of the town, passing at the back of the Court-house. It is sure to be gold-bearing, but whether payably so can only be proved by prospecting.

In other instances the present valleys have been eroded deeper than those of the Tertiary period, and the drift deposits of the latter are seen cropping out on the sides of the hills. Some of these are very noticeable on the east side of the Bell River, about 10 miles north-east from Molong. In this locality there appear to be several leads connected with a main one which runs from near Sam's Mount and past Hyland's farm, where it is now being prospected. Should this lead prove payable it will be an important one, for it can be traced for several miles through the ranges. In one place, near Sam's Mount, it consists chiefly of very water-worn quartz-drift, filling a channel 150 yards wide, and at least 50 ft. deep, which

which has been eroded in Silurian schists and limestones. The Silurian rocks are traversed by some ferruginous quartz reefs; and in the alluvial, near one prospected by Mr. Millgate, gold has been found. A sample of this reef has been taken for assay.

Much of this country has been covered by basalt, which appears to have flowed from Mount Canobolas, near Orange. This ancient volcano rises to a height of 4,565 ft. above the sea, and forms one of the most conspicuous mountains in the Western District. When in eruption it must have presented a magnificent sight. On its summit are jagged masses of lava and scoria. It is sometimes covered with snow in the winter season. The railway from Molong to Orange passes over the northern slopes of it.

For about 3 miles east from Molong the formation consists of intrusive hornblende porphyry, in which the gold- and silver-bearing copper and gelsena lodes occur about Copper Hill.

The denudation of the old trap rock, together with that of the basalts, Silurian schists and limestones, and the sandy Devonian and Tertiary formations, has produced most fertile agricultural soils covering large areas in this district.

I have, &c.,

C. S. WILKINSON,

Geological Surveyor-in-charge.

APPENDIX C.

The Geological Surveyor-in-charge to The Under Secretary for Mines. Report on the King's Plains Gold-field.

Sir,

Department of Mines, Sydney, 31st August, 1886.

In accordance with your instructions, I have inspected the King's Plains Gold-field. My report on the water supply required for mining purposes you have already received.

The gold-field is situated about 8 miles north-east of Blayney. It is said to have been discovered about nineteen years ago, and that at one time there were about 500 miners upon it, who worked the shallow alluvial deposits (from 2 to 30 feet deep), in four small gullies which drain the eastern side of the dividing ridge between the Belubula River and Fitzgerald's Creek. The gold in these gullies has been derived from the denudation of some quartz reefs, which extend in a north and south line along the ridge for about a mile. Water for mining purposes on this field has been scarce, which is, no doubt, the reason why so little attention has been devoted to the reefs. The Confidence Gold-mining Company, however, under Mr. G. H. Newman, of Lucknow, as general manager, holds a 20-acre lease, and has gone to a large outlay in the erection of a battery of nineteen head of stampers, and the construction of three dams; but, owing to the long season of drought, water has only been available for crushing at intervals. The mine is a remarkable one. The quartz veins, from an inch to 4 feet thick, are found to intersect in an irregular course, but generally about east and west, a soft ferruginous silicious and felspathic dyke, which is from 15 to 45 feet wide, and runs north and south. Gold occurs both in the dyke and in the quartz veins, and the whole dyke mass, with the veins, is taken out and put through the battery. I was informed that 7,160 tons crushed had yielded at the rate of about 3 dwt. per ton. The dyke, being soft, is easily worked. Quite a large open quarry-like excavation, from 20 to 60 feet deep, and about 80 yards in length, has already been made, and at the bottom of it a shaft has been sunk, 170 feet deep, and several gold-bearing veins proved, of which samples showing free gold and pyrites were given me for the Mining and Geological Museum. A main shaft for working the mine is now being sunk to a depth of 220 feet. The country rock consists of Silurian clay shales, sometimes talcose. There is little doubt but that this dyke could be similarly worked along its whole course for about a mile, and that it would afford employment for a large number of miners if a good supply of water were made available. Other quartz reefs are seen cropping out in the same locality.

On the north side of the Bathurst Road, $4\frac{1}{2}$ miles from Blayney, gold has also been worked, some years ago, but on private property. This is near a creek which runs through an alluvial flat into the Belubula River. It is probable that a payable lead exists in this flat; the sinking, however, would be wet. The flat extends along the river to Blayney, and, as it passes over formations consisting of Silurian schists traversed by diorite and quartz reefs, it is likely that the bed of the old water-course, which the thick alluvial deposit has covered up, would be payable in places.

I have, &c.,

C. S. WILKINSON,

Geological Surveyor-in-charge.

APPENDIX D.

Report on the Mudgee and Gulgong District. (By S. C. Wilkinson, Geological Surveyor-in-charge.)

Department of Mines, Sydney, 29 December, 1886.

THE Mudgee District consists chiefly of metalliferous and coal formations, over which large areas are covered with rich soil most suitable for agricultural purposes. It is therefore essentially a mining, farming, and pastoral district.

The metals found are gold, copper, silver, tin, antimony, iron, and manganese. Of these the most important is gold. The country within miles around Mudgee, including Gulgong, Canadian, Home Rule, Hargraves, Two-mile Flat, Log Paddock, Pipeclay, Apple-tree Flat, &c., has been one of the principal gold-producing fields in New South Wales. According to the official returns, it has yielded no less than 1,072,752 oz. of gold, or over $44\frac{1}{2}$ tons, valued at £4,162,550. The Cudgegong River flows through the centre of it, with Lawson's Creek, Reedy Creek, and other smaller streams as tributaries.

The gold has been obtained from two sources—reefs and alluvial deposits, but chiefly from the latter.

The reefs occur in the Silurian formation, as at Hargraves, where the celebrated "Hundred-weight" nugget of reef gold was found in 1851, and also in diorite, where this igneous rock has in dyke masses intruded the Silurian, as at Red Hill and Specimen Hill, near Gulgong, old Gulgong reefs, and Mount Blatchford and other places.

Very little work other than prospecting is at present carried on in reef-mining. Mr. S. Blackman, at Cooyal, is about to work on his private property a well-defined promising reef, which traverses Silurian clay slates, and from which rich specimens, containing coarse pieces of gold, have been taken. It has been traced for a length of 250 ft., and sunk into for a depth of 30 ft., and where it is about 6 ft. thick, and dips

dips W. 5° S. at 24 ft. Other reefs not yet proved are seen cropping out at the surface in this locality; they are worthy of attention, as the alluvial deposits in the neighbourhood have yielded gold.

At Specimen Hill, near Gulgong, a little work is being done in raising quartz from some of the numerous veins which here, for about 2 chains wide, traverse a bed of altered schists, striking N. 30° W. From time to time rich patches of gold-bearing stone have been obtained from these, and there are doubtless others to be won. The belt should be proved at a depth by sinking into and driving across it in a N.E. and S.W. direction. It is on the edge of a spur from the main line of hills, which runs S.W. from the Red Hill, near Gulgong, south-easterly between Canadian and Goree, and forms the watershed of the Three Mile and other gold-bearing leads which trend westerly through Rouse's Paddock to the Cudgegong River, and of those going easterly through Canadian to Home Rule in the Cooyal Creek Valley. The formations of these hills are altered Silurian sandstones and limestones, with dykes of diorite, which are traversed by numerous quartz reefs, several of which have been found gold-bearing, such as those at Red Hill, old Gulgong reefs, and about the Three Mile. The rich deposits of gold in the leads derived by denudation from these formations prove that many of the reefs must be auriferous, and there is, therefore, reason to anticipate that some of them will yet be found payable. I have already described the auriferous deposits of this part of the Gulgong Gold-field in the Annual Report of the Department of Mines, 1876.

About Broombee, south of Mudgee, the Silurian sandstones, slates, and limestones have also been much disturbed by intrusive dyke masses of diorite in a north-westerly line; and in the gullies which have been eroded across this line of disturbance much gold has been got from the alluvial deposits—evidence of the occurrence of reefs from which the gold has been derived. Several of such reefs have been discovered and worked to some extent, as the Prince of Wales reef, on the Sydney Road, 7 miles from Mudgee, and a little beyond the old Broombee reef; these are now unworked. But at Mount Blatchford and Mount Norris, 10 miles from Mudgee, near the main road, some gold-bearing quartz veins and gossan lodes are now being prospected by Mr. Clarke and others of Mudgee. The Mount Blatchford reef was first opened some years ago, and consists of several ferruginous quartz veins up to 5 in. thick in whitish diorite, containing arsenical pyrites, galena, and free gold; but a sample I took of the pyritous part of the reef gave on assay neither gold nor silver. It dips E. 40° N. at 57 ft.; and in the direction of the dip it has been again opened at about 95 ft. lower level in a tunnel driven 250 ft. into the hill. Here it is from 6 in. to 12 in. thick, dipping N. 20° E. at 55 ft., and is well defined. As it appears to be a permanent reef it is worth trying, and I understand the Company are about to take out a sufficient quantity to crush to give it a fair trial.

A little up the hill another reef crops out for about 5 chains, dipping E. 10° N. at 47 ft., and is from 4 in. to 12 in. thick, but in places dividing into thinner branching veins. It contains sulphides of zinc, lead, iron, and copper, a sample of which gave on assay only 1 oz. $1\frac{1}{2}$ dwt. of silver per ton, and no gold.

Near this a porous gossan and quartz lode, about 10 ft. thick, crosses the range in an east and west strike; it has not been prospected.

About 10 chains S.W. from this is another silicious gossan lode, 1 ft. thick, containing galena and grey sulphide of copper and calcite; an assay of a sample of it gave neither gold nor silver.

Further to the S.W. are other similar lodes, in one of which gold is said to have been found; and it is no doubt from the denudation of these that the gold found in the alluvial in the gullies below has been derived. This, therefore, is a locality which should be prospected.

Within 20 chains north from the abovementioned tunnel occur four other gossan and quartz lodes, containing pyrites and galena, which have only been tested at the surface. From the most northerly of these, near M'Dermott's farm, a sample, containing galena, gave on assay—silver, 4 oz. 18 dwt. per ton, and no gold.

In Mr. Bell's paddock, near Broombee, some prospecting shafts have been sunk on the outcrop of some short ironstone lodes, striking N.N.W., at the junction of the diorite and limestone, but they have not succeeded in striking payable stone. Samples of the iron-ore lodes gave on assay neither gold nor silver. I would not advise further prospecting of these.

Crossing's reef, 3 miles N.W. from Mudgee, was worked some years ago to a depth of 78 ft., and I was informed that about 1,200 tons of quartz had been crushed from it, yielding from 3 dwt. to 30 dwt. per ton. It dips E. 30° S. at 65 ft., in porphyroid rock, and near the surface is from 6 in. to 12 in. thick. About half a mile east another reef, not opened yet, crops out near the junction of the altered schists and diorite. These reefs present favourable indications, and should receive the attention of miners.

Accompanied by Mr. Wall, M.P., and Mr. Stacy, both of whom take much interest in advancing the mining interests of this district, I inspected the gold-bearing locality about Budgee and the Pipeclay, where some reefs are being prospected; one of these consisting chiefly of quartzite, traversed by hard white quartz veins, has been sunk into for a depth of 60 ft. and driven upon. It is 11 ft. wide, very pyritous, and dips west 20° S. at 70 ft. It contains also blende and galena, of which I took a sample, giving on assay 2 oz. 14 dwt. of silver and 3 dwt. of gold per ton. The shaft is sufficiently deep to prove the reef, and before prospecting further it would now be advisable to have a bulk sample of say two tons treated for gold and silver. The reef, varying in width, can be traced on the surface about 100 yards on its northerly strike; and to the east of it a similar reef crops out. Half a mile to the north of these reefs is Walford's Gully, in which a lead of gold-bearing alluvial has been worked, so that auriferous reefs, probably the extension of the abovementioned, may be found in this locality, which lies in a line running northerly from the Pipeclay diggings to the Cooyal rush. Close to the deep lead in the Budgee paddock there occurs at the surface a quantity of broken angular quartz, evidently derived from reefs close by, from which the gold in the lead may have been derived. I expect that payable reefs will be found about the head of this lead; also at the Pipeclay diggings, especially near the head of Humbug Gully, where much alluvial gold-mining has been done in shallow (20 ft.) sinking for a distance of about 20 chains. In the hill, on the west side of the gully, are large outcrops of quartz, one being 30 ft. wide and 100 ft. long; also lodes of ironstone cropping out 4 ft. wide and 5 chains long. It is reported that a nugget weighing 40 oz. was got in this gully. On the east side of the gully also occur quartz reefs, with red jasperoid rock, pieces of which are seen in the gold-bearing gravels. A few miles from here, in a south-easterly direction, there are several quartz reefs in altered slates, near Bara Creek, just above where the gullies have been worked for gold, which has evidently been derived from these reefs. One of the reefs is being prospected by Pott's party. I consider it a very favourable locality for payable reefs.

At

At Bara Gap, altered slates and diorite occur traversed by quartz reefs and quartz-gossan lodes. One of the lodes, 18 in. to 2 feet wide, contains carbonate of lead; a sample of it gave on assay 11 oz. $8\frac{1}{2}$ dwt. of silver per ton and gold a trace; these lodes are too small to warrant further prospecting. A sample from one of the quartz reefs near them, 6 ft. thick of porous ferruginous slate quartz, yielded, on assay, neither gold nor silver.

A large amount of deep alluvial mining has been done on the Log Paddock lead, near and almost parallel with which runs a lode of iron or quartz veins. It crops out in places 4 ft. high above the ground, and is of irregular thickness up to 90 ft., thinning out at times. It is highly probable that this lode has been one of the chief sources of the gold found on the deep lead, for the alluvial drift in the gullies, such as Sapling Gully, immediately below where they cross the line of lode, has been worked for gold. In one place, on J. Tierney's farm, where the lode is 15 ft. or more wide, a tunnel has been driven into it, and the lode-stuff found to be a brecciated iron ore with patches of manganese oxide. Three samples of the lode-stuff I collected yielded, on assay, neither gold nor silver; notwithstanding these unfavourable returns, I am of opinion that the lode should be further prospected, especially in the parts where it is intersected by quartz veins.

On Tallewang Creek, about 12 miles north of Gulgong, occur massive outcrops of magnetic oxide of iron; the largest of these is an irregular oval-shaped mass about 200 yards long and 190 ft. in its greatest width. It lies partly within Mr. R. Rouse's, partly on Crown lands, where it has been secured by Mr. Mat. Orlovich to work for gold. From the various lodes I took five characteristic samples, which, on assay, yielded neither gold nor silver.

At the head of Ford's Creek, 6 miles south from Gulgong, three small breccia lodes or short "blows," containing sulphide and oxide of antimony and a little quartz, have been opened to a depth of 5 ft. They occur in irregular fissures formed where the strata (Silurian clay-slates and sandstones, S. 10° E. at 25 ft.) have been fractured. The antimony ore occurs in irregular branches; and as it is impossible to determine the extent of the rupture of the strata without sinking upon it the probable value of the lodes can only be ascertained by actual prospecting. A sample of the breccia lode-stuff gave on assay 36.37 per cent. of antimony, and neither gold nor silver; but the lode-stuff after crushing might be concentrated to yield about 60 per cent. of antimony. The large cost of carriage to Sydney, however, would, I fear, for the present militate against the profitable working of these lodes. Near the antimony lodes are several promising-looking quartz reefs, not yet prospected, and the alluvial in the creek from this point downwards has been worked for gold. It is probable that some of the gold may have been derived from these reefs.

In regard to alluvial gold-mining this has been a very extensive and important yield; not only has gold been found in the numerous localities in the recent shallow deposits, but also in the older Tertiary deep leads, which have yielded very rich returns. The former occur, as a rule, amongst the slate and diorite hills about the gullies or tributaries to the main creeks; while the latter occupy the ancient water-courses of the deep valleys, and are covered in places with several hundred feet of alluvial deposits, and sometimes with a great thickness of basalt, which, in a molten state, flowed down some of the valleys. These leads have been followed until working has been stopped by the heavy influx of water, or by the drift being not sufficiently rich to raise. In a previous report I have described these old alluvial deposits, but I may here point out several of the places which are specially worthy of the attention of prospectors. Near Gulgong the continuation of the Star lead to its junction with the Black lead should be tested. At the Standard claim the sinking is about 180 ft., passing through 60 to 70 ft. of basalt. Then the prospecting reserve on which Scully & Co.'s shaft has been sunk is a favourable position for proving the Black lead, which evidently extends under the basalt to the west of the old No. 44 claim, and enters Mr. Rouse's paddock, where it turns to the south-west and passes between two slate hills, crossing the Gulgong and Tallewang Road about 15 chains south-east from the south-west corner of the paddock. This would also be a good site for testing the continuation of the lead though the bed-rock formations in the hills on either side of it in the absence of diorite dykes do not present such favourable indications as do those about the Red Hill at the head of the Black and the Happy Valley lead. Then again the outlet of the leads through Mr. Rouse's woolshed paddock has not yet been proved, but here it is all in private property.

Along the valley of Cooyal Creek there is a large extent of unproved ground through which the deep leads from Canadian and Home Rule must pass to join the Black lead. In many parts of it prospecting shafts have been sunk, and a few runs of gold-bearing wash obtained, but the main drainage channel does not appear to have been struck.

In the east side of this valley the Ellan Vannin Company has sunk a shaft 203 ft. deep and struck one small lead; but the drive is being continued to the north-east, in which direction it is believed the David Buchanan lead will be met. Owing to the wide extent of the alluvial deposit, it is impossible without actual prospecting to determine with certainty the direction that the leads have taken in this locality. The bed-rock is soft chloritic schists with pyritous quartz veins.

At Home Rule the granite formation commences and extends up the Cooyal Creek to about a mile beyond Mr. S. Blackman's station, where altered Silurian schists again appear. Within the granite area, between the station and the schists formation, some payable leads have been worked for gold. These leads all run into the main Cooyal Valley, in which the alluvial flat, about $\frac{1}{2}$ mile wide, lies between granite hills.

The flat on the south side of the creek, opposite the Cooyal Station, would be a favourable site for testing the deep ground, for it has not only received the drainage from the Cooyal leads, but also from Stony Creek Valley, in parts of which occur promising deposits of Tertiary drift.

Near Mr. Lowe's Log Paddock, 4 miles north from Mudgee, it would be advisable to prospect the old channel leading out of Sapling Gully. This gully drains westerly from high slate hills, across which the above-mentioned large ironstone lode runs, and the alluvium along its bed has been worked for gold until it enters a wide alluvial flat, in which occurs the Log Paddock deep lead, which it must join, though its connection has not yet been proved. The shafts put down by Mr. Franca and others show that the alluvial at the mouth of Sapling Gully suddenly deepens from about 40 ft. to 120 ft., and at this depth the bottom not reached. In sinking, alternate strata of ferruginous clay and gravel were passed through, and in several of the layers of gravel a little coarse gold is said to have been found. It is probable that the bed of the old channel, which has received the drainage from Sapling Gully, will prove to be payable. The ground is private property.

The Log Paddock lead is evidently a tributary to the main drainage channel of the Cudgegong River Valley, and this main channel appears from the foundations not to run near the town of Mudgee along the course of the present river channel, but to have passed about $2\frac{1}{2}$ miles east of the town, and thence in a north-westerly direction, under the flat country near the race-course, between Mudgee and Pipeclay Creek, where there is a wide deposit of waterworn drift. Several prospecting shafts have been sunk in this deposit; but to prove the deep ground systematically a series of shafts should be put down along a line N.E. and S.W. across the gully. This would be a favourable locality to prospect, as it lies in the belt of auriferous country extending north-westerly from Cudgegong through Log Paddock and Canadian to Gulgong.

A very remarkable feature in connection with the deep lead is the deposit of auriferous wash in limestone caverns at the Canadian. Here some massive beds of marble limestone occur, and in the tertiary pliocene period contained caves into which the ancient river drained, just as the streams do at the present day at the Jenolan Caves and elsewhere. At length these old caves became filled up with the gold-bearing gravel and silt, and the valley also, to a level of about 80 ft. above that of the caves. At the White Horse claim, which is under the able management of Mr. Thompson, a shaft has been sunk below the level of the old river-bed or lead and into the cave deposit, to a depth of 236 ft. from the surface, without reaching the bottom of the cave. In one part the cave is oblong, measuring 110 ft. by 43 ft. and funnel-shaped, diminishing in size downwards with uneven walls, and smaller caves leading into it. It is filled with a stiff ferruginous clay, called by the miners "pug," and occasional floors or layers of wash with limestone boulders and a little quartz. The top layer at about the 80 ft. level is said to have been the richer, but the whole contents of the cave are sent to the puddling machine, and the manager informed me that the yield of 8,400 loads averaged 1 dwt. 21 gr. of gold per load; and that at the lowest level a piece of gold weighing 1 oz. 7 dwt. was found. I do not think that the cave will continue more than 50 ft. deeper, as this depth would be below the level of the valley which probably received the outflow from the caves. A deposit of drift, richer in gold than the overlying sediment, may be expected to be found at the bottom of the cave; but, judging from other cave deposits, it will be irregular and not extensive; yet it will probably pay to mine, and should therefore be sought for. A similar cavern deposit has been worked in the Canadian Prospecting claim, which is situated about half-a-mile S.S.E. from the White Horse claim.

Sedimentary deposits of the carboniferous period occupy an extensive area in this gold-field. They usually consist of coarse conglomerates, composed chiefly of pebbles and large boulders of altered sandstone, and in this respect differ much from the tertiary drifts, which consist almost entirely of waterworn pebbles of quartz. The latter are principally of fluvial origin, and have filled river channels, while the carboniferous deposits appear to be marine or lacustrine, and have filled irregular saucer-like hollows, and have been spread out over wide areas; consequently it is only where the deposits have been concentrated in such hollows, or formed alongside some auriferous reef that has been extensively broken up by denudation, that payable gold is likely to be found in them, and they will always be "patchy" deposits. These carboniferous conglomerates occur under the coal measures and sandstone hills on the north-east side of the Cooyal Creek, at Mr. Blackman's run, and in the Cudgegong Valley, resting on the silurian slates, from near Mudgee down to the junction of Reedy Creek with the Cudgegong River, and where the erosion of the present valleys has cut through them down to slate foundations, the gold derived from them has been redistributed and concentrated in the river gravels, which have been profitably worked. But there are places, as at Mr. George Rouse's station, Beau Desert, and near the Reedy Creek junction, where the conglomerates are *in situ* below the level of the present river bed, and as they here lie in a narrow valley between silurian hills, it is probable that the gold is sufficiently concentrated to pay for working.

At the Tallewang diggings not only have the conglomerates *in situ* been mined for gold, but also the tertiary and recent drifts derived from them have been extensively worked. For many years to come payable patches will from time to time be found in the sedimentary deposits of carboniferous age; but from the nature of their formation, unless discovered accidentally, they may be regarded as a permanent source of gold supply.

Some sixteen years ago attention was given to mining for diamonds on the Cudgegong River, from its junction with Reedy Creek down to the Two-mile Flat gold diggings. The diamonds, of which about 7,000 are estimated to have been found at the time, were obtained in washing the tertiary and recent drifts, of gold. Mr. Norman Taylor, F.G.S., whose report on this diamond-mining field was published in the *Geological Magazine*, 1879, and who, in conjunction with the late Professor Thompson, also read a paper before the Royal Society of New South Wales in 1870, in referring to the operations of the Australian Diamond-mining Company at Reedy Creek junction, says that the shafts were originally worked on a false bottom at a depth of 29 ft., where the best gold was obtained, but were afterwards worked by the Company on a true bottom at 35 ft. At first the ground yielded at the rate of 4 to 5 diamonds to the load, and 4 dwt. of gold to the load, but afterwards fell off to 1 to 2 loads; and there is no doubt but that numbers of diamonds were thrown out of the machines (Hunt's patent) by careless manipulation, and lost in the tailings; over a thousand tons of which were swept away by the disastrous floods of April, 1870. The total number of diamonds obtained by this Company, while operations lasted, was 1,765. At the Reedy Creek junction and south of the river were situated the works of the Mudgee Gold and Diamond Company. This Company had all their endeavours frustrated by the continuous floods, which destroyed their dams, races, and at last their machinery.

The diamond itself is distributed rather sparingly and rather irregularly through the older drifts, and does not appear to be confined to any particular level in the drift; though the lower 5 or 6 ft. are generally taken out by miners, in consequence of the certainty of finding gold in that portion.

The fact of the very frequent occurrence of diamonds on the waste heaps around the mouths of the old shafts sunk for gold, is enough to suggest that diamonds may occur in the higher portions of the deposit, since the bottom layers only have been carted away to the river for gold washings. One diamond (*in situ*) occurred 3 ft. from the bottom, embedded in a mass of loosely cemented quartz pebbles. As regards the weight of the diamonds the following parcels afford a fair average:—160 diamonds weighed $74\frac{1}{2}$ carats, largest, $1\frac{1}{2}$ carat; 81 diamonds weighed 19 carats; 110 diamonds weighed $26\frac{1}{2}$ carats; 16 diamonds weighed 6 carat; 700 diamonds weighed $151\frac{1}{2}$ carats; giving an average of 0.23 carats, or nearly one carat grain. The largest gem discovered was a colourless perfect octahedron, weighing $5\frac{1}{2}$ carats;

carats; it was found in the river between Two-mile Flat and the Rocky Ridge, at a spot where the older drift had been discharged in gold washing.

During the first five months of systematic washing, over several thousands more were afterwards discovered; but, as the collectors were generally rather reticent as to their finds, the exact number could not be ascertained.

Of late years the work has been abandoned, but I am glad to see that a Sydney Company has recently started operations on the land below the Reedy Creek junction; for I am of opinion that with efficient saving machinery, and under careful management, diamond-mining in this locality, especially in connection with working for gold also, will become a paying industry. Near the junction a remnant of the tertiary lead is indicated by a covering of basalt. A miner showed me a diamond and some sapphires which he had found in the gold drifts near the Cudgegong River, at Slasher's Flat.

Copper has been found in several places in this district, but, with the exception of the Balara Mine, not in sufficient quantity to work. Tin ore of the concretionary variety, called "Toad's eye," has been obtained in small quantities in gold-bearing leads in the granite country, on Mr. S. A. Blackman's Cooyal Station. Manganese oxide occurs about three miles N.E. of Mudgee, but the ore hitherto found is of inferior quality. Seams of coal crop out in sides of the ranges at the Cooyal diggings, where also the prospectors' shafts passed through a coal seam in sinking for the auriferous conglomerate beneath. Kerosene shale is said to have been found in the same coal measures. The carboniferous formation, with coal seams, extends from the western coal-fields of Lithgow and Wallerawang past Rylstone and the head of Cooyal Creek, almost without break to Tallewang, Spicer's Creek, Ballimore, and Dubbo. Near Rylstone a seam of coal occurs within a few miles from the railway line.

Iron ore occurs in many places, the largest deposit being the above-mentioned lode of magnetite at Tallewang. Another may be seen on the Cooyal Station; this should be prospected, as it may contain other metals.

Limestone is abundant in the district; at Broombee it is full of encrinites, which are well seen on the weathered surfaces of the rock. At Mr. Bell's Melrose Station, at the foot of Mount Frome, are massive beds of grey and yellowish white marble limestone, which would be suitable for mantelpieces and other ornamental purposes; these beds of limestone are together about 500 ft. thick.

Apart from its agricultural soils and mineral resources, the Mudgee district is one of special interest to the geologist. It embraces sedimentary formations, some of them containing numerous fossil remains, of the Silurian, Devonian, Carboniferous, Hawkesbury, Pliocene, Pleistocene, and Recent periods; and its igneous rocks include granites, diorites, and basalts with their associated minerals; while it affords splendid instances of the formation of lodes and veins; intrusion of igneous rocks, metamorphism of rocks, deposition of marine and fresh water strata, including the carboniferous great boulder beds, which appear to be partly of glacial origin; the effects of denudation and weathering of rocks, and of the origin of the many varieties of soil, from the poor silicious granite soils to those rich alluviums, which, derived from diorite, basalts, sandstones, shales, and limestones, form the fertile flats along the Cudgegong Valley, or cover the chocolate-coloured farm lands on the hill slopes about Gulgong. This is a most instructive field for the student of geology and agriculture; and no wonder that it proved a source of great attraction to the late Rev. W. B. Clarke and his congenial friend, the late Mr. C. B. Lowe, whose son, Mr. Herbert Lowe, of Goree Station, near Mudgee, now possesses the interesting collection of minerals and fossils, some of the fruits of their geological researches.

At the Canadian Lead, Mr. William Thew, a miner, kindly gave me for the Mining and Geological Museum, a collection of fossil bones found by him in the gold-bearing wash at a depth of 130 ft., in one of the buried limestone caverns in the prospecting claim. Among the specimens Dr. Ramsay has identified bones of the great horned lizard, megalania, kangaroo, birds, and of a gigantic echidna, or porcupine. Casts of these have been forwarded to Sir Richard Owen for determination. It is hoped that miners will always save, and transmit to Sydney, any fossils they may meet with, as they have such good opportunities of finding them; for in doing so they may greatly aid in making known the ancient life history of this continent.

I also visited the antimony mines of Razorback and Crudine, in the ranges between Ilford and Sofala. At Razorback an auriferous quartz reef, containing iron pyrites and sulphide of antimony, traverses black slate country, it occurs like the Eleanor mine near Armidale, with a trap dyke, and varies in thickness up to 3 ft. 6 in., dipping W. 25 degrees S. at an angle of 1 in 6. As it follows the trap dyke it will probably be permanent in depth. It has been traced not continuously, but at intervals for a distance of about 25 chains, and a considerable amount of work has for some years past been done in working it for gold, 10 shafts having been sunk along the line of reef, the deepest being about 130 ft.; but Mr. A. Oppenheimer, who now holds the greater portion of the line of reef, is having a shaft put down to 160 ft., with the expectation of striking the shoot of gold-bearing stone said to have been worked in No. 5 shaft.

A mixed sample of reef stone from the 130 feet level, where the reef is 18 inches thick, consisting of quartz, calcite, black slate, pyrites and sulphide of antimony, gave, on assay, at the rate of gold 3 dwt. per ton, and metallic antimony 4.1 per cent.; but this not being of a bulk sample cannot be considered as an average test, as the ore is irregularly distributed through the reef, causing portions of it to be poorer or richer than others. The gold is sometimes visible in the antimony, and the stone containing antimony is sorted and bagged up and forwarded to Europe for treatment. Mr. Oppenheimer informed me that a parcel of 96 bags, weighing about 5 tons, was culled from about 20 tons, and that two average bulk assays of it gave at the rate of 5 oz. and 7 oz. per ton, and the parcel was sold at the rate of 6 oz. per ton; it contained about 45 per cent. of antimony. The balance of 15 tons is said to have yielded about 1 oz. of gold per ton. Mr. Oppenheimer states that he has despatched from the mine 2,278 bags of ore, weighing 116 tons 16 cwt., which realized £1,881. Mr. Oppenheimer is taking a judicious course in having a quantity of ore crushed at the Atlas Company's works in Sydney, and passed through two of the Frue concentrators previous to the erection of these appliances, if found suitable for treating the ore, at the mine.

O'Brien and party are sinking on their claim which adjoins Oppenheimer's on the south; one of their shafts being 75 feet deep, on similar reef-stone, containing antimony ore.

The antimony mine, near the Crudine Creek, occurs in a line of fault of silurian shales. It is a breccia lode from 8 inches to 3 feet thick, with quartz veins, and the ore, sulphide, and oxide of antimony occur

occur in it in lenticular patches. It has only been prospected to a depth of about 30 feet. I was informed by Mr. Oppenheimer that from a quantity of about 65 tons of ore raised, there were culled 15 tons of oxide and 2 tons 18 cwt. of sulphide of antimony, yielding respectively 70 and 60 per cent. of metallic antimony. A sample which I took of the breccia lode-stuff gave on assay, metallic antimony 48.8 per cent., and neither gold nor silver. This return would of course have been higher had the lode-stuff been concentrated. The lode dips S.W. at 40 degrees in shales, which dip W. 5 degrees S. at 32 feet. 50 feet N.W. from where the antimony ore was raised, a shaft has been sunk 30 feet deep on ferruginous quartz veins, a sample of which gave, on assay, at the rate of 3 dwt. of gold per ton. This antimony lode, though varying much in thickness, will, I believe, continue to a great depth.

Approaching the deep valley of the Turon, from the Crudine Ranges, the silurian strata are observed to be highly altered and intruded by dyke masses of diorite and traversed by quartz reefs. Splendid sections may be seen in the road cuttings on the road from Hill End to Sofala, and especially in the natural cliff sections at the Wallaby Rocks, where the road crosses the Turon River, contortions in the strata are well exhibited. Only a little fossicking in the old alluvial workings is now carried on along the Turon, from which in the early days of the gold-mining era of the country so much gold was raised. Near the head of a gully in the ranges, about 6 miles east of Sofala, a quartz reef called the Little Razorback, is now being worked. The reef has been traced for a length of 10 chains across the gully, on the south side of which three tunnels (one 100 feet long) have been driven at different levels along the reef, which dips E.N.E. at 75 degrees with a well-defined foot wall, and is formed of several veins in a reef channel from 15 inches to 27 inches wide. Gold is visible in the crystalline cavities in the quartz as well as in the solid stone, and the reef has a permanent appearance. I was informed that 45 tons crushed from it yielded about 23 dwt. of gold per ton.

In the foregoing report the mineral resources of the district examined have been more particularly mentioned. The geological features will be referred to in greater detail in my annual report.

I have, &c.,

C. S. WILKINSON.

APPENDIX E.

Report on the Silver Lodes at Mitchell.

The Geological Surveyor in charge to the Under Secretary for Mines.

Sir,

Department of Mines, Geological Survey Branch, 14th December, 1886.

In accordance with your instructions I have examined the formations in which the silver-bearing lodes occur at Sunny Corner, in the Mitchell Gold-field, and I have the honor to submit the following observations thereon.

The primary or oldest formation of the district consists of sedimentary rocks, altered sandstone, and shales. These have been upheaved and intruded by igneous rocks composed of quartzitic elvan and quartz porphyry, which have burst through the sedimentary strata in various directions, but principally north and south, as masses 20 chains wide or as narrow dykes only 4 ft. thick, consequently the line of junction between the formations is most uneven and irregular. After the eruption of the igneous rocks, fractures or displacements in the rocks took place on at least two different occasions, resulting in the opening of irregular fissures from a few inches to 40 ft. wide, in which were deposited the gold and silver-bearing sulphides of iron, copper, lead, zinc, and arsenic and quartz, constituting the lode-stuff now worked.

Evidence of these displacements or movements in the rocks may be well seen in the Sunny Corner mine. A dyke of the elvanite has been split in two and the fissure filled with clay, showing that the fracture took place after the intrusive rock had solidified; then again the sedimentary formation has in places been displaced from its contact with the igneous rock, appearing to have slipped or moved bodily over the igneous rock, causing, where the original line of junction was curving or uneven, the projecting surface of the one formation to abut upon a projecting portion of the other, the intervening concave surfaces forming the irregular cavities now filled with lode-stuff, and, of course, where the line of junction was even or straight, the upper formation has moved upon the other without producing any cavity; consequently where this occurs the so-called lodes pinch out, though a well defined fissure joint continues containing a thin seam of clay fluccan.

In the Great Western mine the two different sites of fissures are very clearly seen. We here see that along the line of fracture the surface of the rock has been grooved or striated by the friction or movement of one rock upon the other, and the fissure filled with fragments of the crushed rock. In this fissure-deposit argentiferous sulphides of lead, copper, iron and zinc, have been formed in patches. The fissure then opened again and became filled with clay, which, in one place is 20 ft. thick, and somewhat resembles a decomposed feldspathic basalt rock. Then shrinkage cracks formed in the clay-lode and were filled with carbonate of lead, probably derived from the decomposition of the galena in the breccia lode.

On account of the irregular manner in which the intrusive rock has been intruded, it is of course impossible to indicate where the hidden line of junction between the formations is uneven; and, therefore, the whereabouts of any cavities filled with lode-stuff can only be ascertained by actual prospecting along the lines of fracture. But we have a general guide in that the sliding movement of the upper formation has taken place towards the north-west; for the ore deposits already discovered occur chiefly upon the north-western slopes of the intrusive formation. This is an important feature, for it affords us assurance that in a north-westerly direction, below the deposits already opened, other similar irregular lodes are likely to be found.

From the nature of the formation of the lodes, it will be apparent that there is no probability of the occurrence of *one main lode* in this district; but only of such as those which are at present known and which are so variable in extent and thickness, notwithstanding that they are true fissure lodes.

The New Nevada lode is somewhat different from the above-mentioned lodes in being more regular in its course, though it has resulted from the same movements which have produced the others. It is a well formed lode, dipping E. to E. 10° S. at from 50° to 73°, and occurs in a fissure formed by a fault in the sedimentary strata. The lode is worked from a tunnel, and where the tunnel has pierced it, is about 30 ft. wide, but split in two by a "horse" 9 ft. wide, which, about 170 ft. to the north, thins out and the lode is 21 ft. wide with slate walls. The lode-stuff is soft and consists of pyrites, galena, and copper pyrites,

pyrites, intermixed with irregular patches and veins of porous crystalline quartz, with masses of hard compact pyrites and galena scattered through the mass, especially within 18 in. from the black slate foot-wall, where the ore is sometimes richer in silver than the rest. A band of hard sulphide is sometimes seen in contact with the hanging wall of the slate "horse" in No. 1 south drive. The whole lode-stuff appears to have crystallized from thermal solutions containing the sulphides which have in places segregated into hard masses. In the south drive at 160 ft. from the tunnel, the lode narrows to a seam of slickenside clay or fluccan 6 inches thick, produced by the movement of the uneven walls. As the movement of the rock on the hanging wall side has, I think, here taken a downward course towards the north-east, the argentiferous sulphide lode-stuff will probably be found to continue gradually to lower levels in a northerly direction. The main tunnel was continued to the east for a further distance of 160 feet, and another lode 10 feet wide struck, which, when followed south for about 50 feet, thinned out into a fissure filled with clay; and 15 feet north from the tunnel it changed into chalcedonic quartz, with cavities containing white silicious clay. If sunk upon, this lode might be found to form into sulphides, as it is near the junction of the altered shales and the intrusive elvanite, veins of which occur in the slates at the end of the tunnel. On the range immediately to the east the intrusive rock comes to the surface for a width of about 5 chains.

An analysis (No. 1) of an average sample of the lode-stuff, taken from the whole width of the lode at the end of the north drive, gave as follows:—

	No. 1.	No. 2.
Oxides of iron and alumina	24·18	26·31
Insoluble silicious matter (gangue)	46·63	51·02
Lead	9·34	6·25
Copper	5·06	4·02
Bismuth.....	·88	trace
Antimony	·43	do.
Arsenic	·90	do.
Sulphur	12·42	9·32
Manganese.....	trace	trace
Chromium.....	do.
Undetermined, loss, &c.....	·16	4·08
	<hr/> 100·00	<hr/> 100·00

No. 1. Fine silver at the rate of 13 oz. 12 dwt. per ton; fine gold, a trace (under 2 dwt. per ton). No. 2. Fine silver at the rate of 2 oz. 14½ dwt. per ton; fine gold, a trace (under 2 dwt. per ton). No. 2 is an analysis of a similar average sample taken from a stope in the south drive, near the 90 feet shaft, where the lode-stuff is more oxidized and contains less sulphides than in the lower level from which sample No. 1 was taken.

These analysis show that the lode-stuff, not being sufficiently rich in silver to be smelted as taken out *en masse*, must first be treated for concentration of the sulphides; for the gangue which could be separated by concentration amounts to over 63 per cent. of the whole lode-stuff, and the remaining sulphides would yield from about 37 oz. to 9 oz. of silver per ton, in addition to about 12 per cent copper, and 2 per cent. of lead. As there is promise of the lode being permanent in depth and chiefly composed of the ore described in No. 1 analysis, with patches of richer ore, this mine, with efficient reduction appliances, should prove a payable one.

The Nevada is the most northerly silver mine on this field, and due south from it, about 1¼ mile, is situated the Sunny Corner mine, which is the oldest and most productive of the silver mines. The lode, consisting of porous siliceous gossan, was worked for gold as far back as 1875, and though at that time the ore was known to contain a good percentage of silver, it was not until the Pacific smelters were introduced upon the field, by Messrs. Lamont and Kahlo, in 1885, through the enterprise of Messrs. Newton and Co., that mining for silver commenced. Since then this mine has produced 1,169,454·164 oz. of gold and silver bullion, of which 562,987 oz. were obtained from 27,231 tons of ore smelted during the year ending 31st October, 1886. The lode varies considerably in thickness, and has been opened at five different levels, by tunnels driven in a southerly direction from the northern slope of the hill. At the top, or No. 5 level, which is about 190 feet above the lowest or No. 1 tunnel, a large excavation open to the surface has been made in the lode, which here attains a thickness of 40 feet of gossan, covered in places with gold-bearing porous quartz, and passing downwards through No. 4 level into undecomposed sulphides, or "base ore," 19 feet thick. From some of the gossan rich specimens of native silver, in beautiful arborescent forms, have been obtained; specimens of it have been presented to the Mining and Geological Museum, Sydney. In No. 3 level 147 feet above No. 1, richer ore has been struck, yielding, it is said, 70 oz. of silver per ton, and averaging from 1 to 2 feet thick; it consists of galena, with iron and copper pyrites. But this ore will be found to vary much in its yield; for one sample gave on assay 12·74 per cent. lead, 0·85 per cent. copper, and 4 oz. 18 dwt. of silver per ton. No. 2 level, 75 feet above No. 1, has been driven along the line of lode, which in one place is from 7 feet to 15 feet thick, then narrowing opens again at the end of the tunnel to 2 feet, consisting of finely crystalline galena and pyrites. An assay of a sample of this ore gave:—Copper, 1·65%; lead, 14·60%; silver, 37 oz. 10½ dwt. per ton; gold, 4 dwt. per ton. The hanging wall dips W. 10° S. at 58°. This ore should be followed down.

In No. 1 tunnel no defined lode has been found, but a block of good sulphide ore, 7 feet thick, was struck, the hanging wall dipping W. 10° S. at 58°, which is almost the same angle of dip as that in No. 2 level. It is probably due to the greater regularity in the walls of the fissure that it has here not formed large cavities, such as those formed in the higher levels, where the containing walls of the fissure are very uneven.

It will thus be seen that larger ore deposits occur in the higher levels than in the lower, which, as above mentioned, appears to be due to the fissure walls being more regular or even in the latter than in the former. As it is unlikely that the regularity has continued for any considerable distance there is every probability that in following the fissure walls, other large and valuable ore deposits will be discovered from time to time. The most favorable places for searching for them are on the north-western and western face of the elvanite rock; that is where the line of junction between the igneous and sedimentary rocks curves round from a southerly course to the west. Such places occur in G. L. 1, below the present workings in the Sunny Corner mine; in the south-eastern half of G. L. 10; in M. L. 56, below

below the present workings in the Tonkin mine; in M. L. 70, below the main lode in the Great Western mine; in the central and northern portions of M. L. 8, of the Victoria mine; on the northern boundary of the elvanite M. L. 53, of the Silver Hill mine; and in places where the altered sedimentary rocks rest on the elvanite in M. L. 52, of the Silver King mine; and in M. L. 58 of the Sunny Corner mine.

At the entrance to No. 3 level there is an elvanite dyke 10 feet wide, with a clay fissure 3 feet thick in the centre. This should be followed, for, about 20 yards to the west, the dip of the strata is reversed from being westerly, to E. 20° N. at 22°, indicating a point of disturbance, where it is probable that a deposit of ore may be formed.

The Silver King mine adjoins the Sunny Corner, and the lode-stuff is of a similar character, viz. auriferous quartz gossan near the hanging wall, of irregular thickness from 1 to 5 feet, with gossan underneath it passing downwards into undecomposed sulphides of iron, lead, and copper. The lode varies considerably in thickness; at the southern tunnel it is over 20 feet, having filled an irregular cavity in the elvanite near its junction with the altered shales overlaying it. In the No. 3 drive to the north the gossan pinches out where the walls of the two formations come together and turns from the usual dip of the hanging wall, W. 12° N. at 42°, to N. E. at 80°. This line of junction should be followed down, and also to the north-west, as it might be found to reopen and the lode to make again. At the end of the main drive, which has been carried east beyond the lode fissure, the elvanite contains small seams and bunches of sulphides of iron, copper, and lead, a sample of which gave on assay, copper 8·10 per cent., lead 8·13 per cent., 4 oz. 18 dwt. of silver per ton, and gold a trace. As these small ore masses are sometimes mixed with soft clay, it is probable that they may be connected with the main lode fissure; this could be ascertained by driving to the north to strike the fissure.

A shaft has been sunk about 60 ft. below the level of the southern drive, and I was informed by the underground manager, Mr. Lemon, that the lode of "black ore," consisting of galena and iron and copper pyrites, has been sunk into and driven upon, and is 14 ft. wide; it pinched out a short distance to the north, but continued well-defined along the drive to the south. The shaft contained water, and so I could not see the lode. According to the assays made by the Company's assayer, Mr. Cossins, as quoted in the report on the Silver King mine, by Messrs. Cox and Seaver, this "black ore" gave (average of nine assays) 5 oz. 10 dwt. 18 gr. of silver, and 3 dwt. 7 gr. of gold per ton, which are poor returns for silver; but it is stated that the drive was taken along the foot-wall of the lode, which has been the poorest part in the gossan, and so a higher yield may be anticipated on an average, when the whole of the lode is taken; and it is worthy of note that some of the ore carries as high as 9 per cent. of copper to assay. In the same report it is stated that the average yield of 2,489 tons of the gossan ore smelted, was 13 oz. 8 dwt. 5 gr. of silver, and 5 dwt. 15 gr. of gold per ton, equivalent to about 19 oz. of silver per ton, allowing that each dwt. of gold is equal to an ounce of silver.

In the Tonkin mine, which adjoins the Sunny Corner mine on the south, a tunnel has been driven E. 10° N. 500 ft., passing through altered shales and sandstone into elvanite. At 40 ft. from the mouth of the tunnel, the elvanite was first met with a little gossan at the line of junction, which is nearly vertical; at 133 ft. in, a pyritous quartz reef was struck, 12 ft. thick and dipping W. 25° S. at 64°; its hanging-wall merges into the elvanite, while the foot-wall is of soft broken slate and clay; and 8 ft. east this changes into a fluccan clay mixed with fragments of slate and elvanite 59 ft. wide, and containing small irregular patches of galena and pyrites, an assay of which gave 8 oz. 3½ dwt. of silver per ton, and gold a trace. The foot-wall is nearly vertical, inclining a little westerly, and shows stains of carbonate of copper. Near this a shaft was sunk 85 ft. deep, and on the foot-wall a lode of sulphurets, said to be 10 ft. thick, was found; an assay of a sample given me by the mining manager, Mr. G. R. Fearby, yielded 16·47 per cent. copper, 6 oz. 10½ dwt. of silver per ton, and 4 dwt. of gold. The very broken ground from this foot-wall westerly to the above-mentioned quartz reef, indicates an irregular fissure lode, which should be further prospected to the north and south, and at greater depths, for it may be found to contain large masses of sulphuret ore. At 225 ft. in the tunnel, a vein of carbonate of copper 6 in. thick was passed through; and at 321 ft. in, a joint fissure was struck dipping W. 5° N. at 73°, containing copper ore on the foot-wall, which is sandstone 6 ft. thick, 2 ft. of which contains patches of copper ore; a sample of this ore gave on assay at the rate of 45·67 per cent. of copper, 22 oz. 1 dwt. of silver, and 3 dwt. of gold per ton. The next 12 ft. consists of a jumbled mass of fragments of crushed elvanite and ferruginous clays with a foot-wall of elvanite. This is a lode which ought to be prospected further, both in depth and laterally. Beyond this, to 480 ft., the elvanite contains the same sulphurets scattered through it, sometimes in lenticular patches a few inches long and 1 in. thick. I do not think it advisable to drive further east into the elvanite, for any large ore deposits are only likely to be found in the fissure lodes just mentioned, about the junction of the elvanite with the sedimentary rocks.

The Great Western Silver-mine adjoins the Sunny Corner mine on the north. The country rocks consist of the same intrusive elvanite and altered sandstones and shales, which have been much broken and fissured. A main tunnel has been driven into the range for a distance of nearly 600 ft. in a direction E. 20° S., and two principal fissure lodes have been cut through, besides several other metalliferous veins. One of these lodes, called the galena lode, is from 7 to 20 ft. wide, dipping E. 12°-15° N. at 15°-45°, and has been followed along its strike towards the south, until it turns easterly and then northerly. At this bend the surface of the hanging wall is striated vertically, and appears as though it had slid down upon, and moved away in a northerly direction from the foot-wall, leaving between the walls the above-mentioned brecciated metalliferous lode-stuff of crushed fragments of rocks, and after a further movement, the clay dyke formed, which is here 20 feet thick. It is in the stopes above the south drive that the native silver and native copper have been found in the joints, in both the elvanite rock and the clay, where the lode has been much oxidized; these metals have, no doubt, been precipitated from solution from the decomposed sulphides in the brecciated portion of the lode. The clay dyke is also traversed by the veins of carbonate of lead previously mentioned. An assay of this carbonate of lead gave metallic lead 65·5 per cent., and neither gold nor silver; and a sample I collected of the undecomposed galena ore which, with zinc blende, occurs in irregular patches up to 12 inches thick in the breccia lode-stuff, yielded 60·08 per cent. of lead and 4 oz. 1½ dwt. of silver per ton. The returns, kindly supplied me by the manager of the Great Western Silver-mining Company, of twenty-six assays, chiefly of galena ore, yielding in the highest 34 oz. 6 dwt. of silver per ton, and 80·9 per cent. of lead, gave an average yield at the rate of 7 oz. 0 dwt. 16 gr. of silver per ton, and 37·19 per cent. of lead.

The galena lode will, I believe, be found to continue from the bend in the south drive to the east and

and north, and connect with the other breccia and fluccan lode, 5 feet thick, passed through in the main tunnel: it would be important to prove whether they be connected. Near this lode is a copper pyrites vein, from 4 to 9 inches thick, dipping E. 5° 8 at 60°, this on its strike to the S.S.W. also probably connects with the galena lode. The hanging-wall rock for 13 feet to near the end of the tunnel, is traversed by irregular veins, up to 2 inches thick, of copper pyrites, of which an assay gave 4.75 per cent. of copper, silver 3 oz. 5 dwt. per ton and gold a trace. About 40 feet in from the tunnel entrance a lode, 3 feet thick, containing galena, was cut through dipping E. 25° N. at 30°. Instead of continuing the tunnel further, I think that the exploratory work should be devoted to these lodes, of which the above-mentioned galena lode is the principal, and evidence of much disturbance in the country rocks having taken place, there is, therefore, a probability of the existence of large ore deposits in it. Besides following it from the south drive to ascertain if it be connected with the 5 feet breccia lode, it should be sunk into near the main tunnel, and also driven along in a northerly direction from the tunnel.

Immediately north of the Great Western mine, the Victoria Company have sunk a shaft 50 feet deep, on a lode said to be 20 feet wide. It dips E. 30° N. and consists of brecciated porous silicious gossan, containing a little sulphide of copper and lead. A tunnel has been driven towards this lode, from the side of the hill, passing through altered sandstone and elvanite, containing crystalline quartz and copper and iron pyrites. The lode did not appear to have been struck yet. About 7 chains west from the shaft, a dyke of elvanite, 10 feet wide, traverses the altered shales in a northerly course, with a small gossan lode at the junction.

The great central mass of the intrusive elvanite occurs in portion 53, the property of the Silver Queen Company, and forms at the flagstaff hill, the highest point in the district, attaining a height of 4,068 feet above sea-level, or 270 feet above the town of Mitchell. A shaft has been sunk on this hill, showing the elvanite to contain small crystals of pyrites scattered through its mass, but not in sufficient quantity to be of value. The main shaft of the Silver Queen Company has been sunk to a depth of 224 feet, upon a breccia lode about 4 feet wide, containing galena with sulphides of zinc, copper, and iron, of which a mixed sample gave on assay, lead 5.12 per cent., silver 16 dwt. per ton, and gold a trace. The lode strikes N. 20° W., and in that direction, about 6 chains from the main shaft, it appears to be of a more promising character, consisting of brecciated gossan and quartz, 15 feet wide, with purple shale on the western wall, and a narrow dyke of elvanite on the east. It has been opened to a depth of 17 feet, and this would, I think, be the most favourable place for testing the lode to a greater depth. To the south of the main shaft the lode becomes more feldspathic, with red and white breccia of elvanite and quartz porphyry, containing a little pyrites, and is well seen in the shaft on the Silver Prince Company's ground; but it does not present favourable metalliferous indications. On the eastern side of the hill a tunnel has been driven west for 380 ft. to strike the lode at about 90 ft. below the surface; the tunnel passed through altered pyritous sandstone, strike about N.N.W., and greenish feldspathic elvan. No work was being done here, but Mr. Robinson, manager of the Silver Queen mine, informed me that, at 310 ft. in, a small patch of sulphide of copper with quartz was struck.

In portion M.L. 18 a shaft has been sunk 60 ft. deep on a quartz vein 2 ft. thick, striking N. 12° W. in altered slate country; it contains much iron and copper pyrites, a fair sample of which gave on assay only 2 oz. 9 dwt. of silver per ton and a trace of gold. In the Great Extended Company's ground, portion 20, a shaft has been sunk 180 ft. and driven west 110 ft. with the hope of finding a lode at the junction of the altered slates and quartz porphyry formations, but the work was not successful.

In portion M.L. 86 a shaft has been sunk upon a gossan lode known as Tasker's lode, which is about 3 ft. thick, dipping E. 20° S. at 40° in sandstones and shales. It can be traced southwards for a considerable distance. Two samples from it yielded on assay neither gold nor silver. Samples from two other lodes, the British Lion and Frieberg Tunnel, in the same locality, gave similar returns on assay; but to prove such gossan lodes, bulk samples should be tested; for assays made of small samples of gossan ore do not always give reliable results.

About $\frac{3}{4}$ mile S.W. from the town of Mitchell is the Monte Christo mine in M.L. 129, where, under the direction of Mr. Marshall, a quartz reef has been opened by a shaft on the underlay to a depth of 115 ft. The reef, which is well defined and has a hanging-wall of indurated pyritous shale or "spotted rock," and the foot-wall of feldspar and quartz porphyry and pyritous jasper rock, dips S. 35° E. at 40° and is from 1 to 4 ft. thick. The quartz contains copper, iron, and arsenical pyrites with sulphides of zinc and silver, of which a sample I collected yielded on assay silver 9 oz. 7 dwt. per ton. When burnt the quartz shows freely particles of metallic silver. A few feet north of the shaft the reef turns a little and narrows to 6 in., then widens again, and can be traced on the outcrop for about 7 chains. It will, I believe, prove a profitable reef. A few yards to the east another similar reef, 6 in. thick, dipping east, crops out at the surface; and about 100 yards to the west are other ferruginous veins traversing porphyry which were to some extent worked for gold, it is said, about twenty years ago.

It will thus be seen that the primary formation of this district consists of siluro-devonian sandstones and shales, which have been upheaved and penetrated by elvanite and quartz porphyry; that, subsequently, movements of the rocks took place, resulting in the production of the fissures in which the metalliferous ores were deposited, chiefly about the line of junction of the sedimentary and igneous rocks; that these movements having affected the rocks to a considerable extent, the fissures will continue to great depths, though, owing to their irregular form, the ore deposits in them will vary much in thickness; that as these lodes are explored in depth, similar large patchy deposits to those already discovered, are likely to be found; that the gossan or oxidized portions of the lodes occurring within about 100 ft. from the surface, must soon be exhausted; that the less easily worked unoxidized or sulphide ores will be the permanent class of ores to mine; and that, as these usually are less rich in silver than the gossan ores, weight of ore considered, special appliances for concentrating the sulphides must be employed, especially as the ores are not rich in silver and will necessitate the most economic methods of treatment, not only for the extraction of the silver, but also of the lead and copper which are sometimes present to a large extent in the ore.

At the Sunny Corner mine, which is under the able direction of Mr. Thos. Eyre, mining manager, smelting operations are very successfully carried on by means of the "water-jacket" furnaces, of which an accurate description by Mr. E. F. Pittman, Chief Mining Surveyor, has already been published in the Annual Report of the Department of Mines, 1884; but the large Probert furnace at first erected has been discarded in favour of the smaller furnaces which are much more conveniently worked. Mr. Woodgate, the smelting manager, has, by judicious fluxing, succeeded in reducing the loss of silver in the

the slag to an average of 1 oz. 17 dwt. per ton for four months run, as against an average loss of 2 oz. 19 dwt. for the previous five months run. He is also successfully smelting in the "water-jacket" furnace the base ores into "matte," and from experiments he is at present conducting further improvement in the reduction of the base ores is anticipated. It is said that ore yielding 16 oz. of silver per ton can be profitably worked by the present process. During the half year ending October 31st, 11,647 tons of ore were smelted at these works, giving an average yield of 23.56 oz. of gold and silver bullion per ton; the bullion is worth on account of the gold contained in it about 5s. per oz. The Sunny Corner Company has recently erected an amalgamation plant for treating the old tailings from the battery, which are said to contain an average of 35 oz. of silver, and about 2 dwt. of gold per ton.

At the "Nevada mine," the large "Probert" furnace has also been discarded, and two smaller German furnaces substituted, which are believed to be more suitable for the reduction of the ores of this mine, and to consume less fuel than the "water-jacket" furnace. The Nevada Company has also a Frue concentrator, a large reverberatory furnace, and the manager, Mr. Edwards, is constructing appliances for the treatment of the wasted cuprififerous ore by lixiviation.

The Silver King Mining Company has two 20-ton "Gafford" water-jacket smelters, which, I was informed, have worked well, especially in the treatment of the mixed gossan and base ores by the "matting" process, introduced by the Company's assayer, Mr. Cossins. It is said that without the use of lead, Mr. Cossins can work his process on 14 oz. of silver per ton.

Mr. J. F. Waller, the general manager in Sydney for the Silver King Company, has been good enough to place at my disposal the following results of a "matting" experiment conducted by Mr. Cossins at the Company's smelting works:—

	tons.	cwt.	qr.	lb.
The ore treated consisted of gossan	13	9	1	4
Black ore	11	3	3	20
	24	13	0	24
	tons	cwt.	qr.	lb.
Coke used	4	10	3	6
Limestone	2	15	1	0
Matte obtained	1	3	1	22
Assaying—				
	oz.	dwt.	gr.	
Silver	307	1	8	per ton
Gold	3	5	8	"
Copper				23 per cent.

Mr. Cossins states that the loss of silver in the slag by this process, would not exceed that shown by the three following assays of the slag made during the trial,—4 oz. 13 dwt. 2 gr., 3 oz. 6 dwt. 23 gr., 2 oz. 13 dwt. 21 gr., which is about equal to the ordinary loss of silver by the old method. The "matte" was sent to Swansea and realized £130 2s. 11d., equal to £5 5s. 6d. per ton of the original mixed gossan and base ores; the total cost of raising, smelting, transit, and other charges amounted to about £2 9s. per ton, thus leaving a net profit of £2 16s. 6d. per ton of ore. The largest item in the cost of production was that of the coke, which amounted to £18 3s. 3d., equal to 14s. 8d. per ton of ore, notwithstanding that the quantity of coke was 6 per cent. less than that used in the old process. In the Sunny Corner and the Nevada smelting works, the quantity of coke in the charge varies from 20 to 50 per cent. of the weight of the ore. The price of the Newcastle coke delivered on the ground is £4 per ton.

The large charge of coke required in the water-jacket smelter is partly due to cooling of the furnace by the circulation of the water round it; this effect is said to be lessened in the German smelter, around which the air blast, instead of water, is made to circulate. Some more efficient method for economizing the fuel is much required. And I would suggest that the lowering of the temperature in the water-jacket furnace might to a considerable extent be prevented by injecting hydrogen gas into the molten charge. The increase of temperature would be great, and a saving, probably, of one-half of the present charge of fuel would be effected. The gas might be simply made by sending a current of steam through a heated retort containing charcoal, whence it might be conducted into the furnace through small pipes laid in the nozzles of the existing tuyeres; so that no alteration in the furnace would be needed, and the appliances for generating the gas from steam would be of small cost. I have seen auriferous pyritous quartz successfully treated in a blast furnace partly heated in this manner by hydrogen gas.

The only other smelting works on this field are those of the Mitchell Company, which include a German air-jacket furnace, constructed by Mr. Icke; this is now out of blast, owing, I understand, to the difficulty of getting suitable firebricks.

The Sunny Corner Company are using the diamond-drill for prospecting; the bore at present in progress is down about 200 feet into the hard elvanite rock. Sulphides of iron, copper, lead, and zinc in small crystalline masses occur disseminated through the elvanite; but as they do not afford any indication of the existence of payable masses of ore, it would be useless to continue this bore. Throughout the field the elvanite is observed to be more or less charged in the same manner with these sulphides; and I am of opinion that it is from thermal water permeating this intrusive rock that the metalliferous deposits in the fissure lodes have been derived. Instead of boring far into the elvanite, the drill might, with prospect of success, be employed in exploring the line of junction of the igneous and sedimentary formations about which, as I have above mentioned, the ore deposits are likely to be found.

The position of these formations, also of the lodes and gold-bearing quartz reefs, have been indicated by Mr. Anderson, Geological Surveyor, and myself, on the accompanying map.

In regard to gold-mining, a quartz reef, called the "Paddy Lackey reef," is now being worked at Dark Corner, about 4 miles north of Mitchell. The shaft is on M.L. 78, and has been sunk vertically to a depth of 170 ft. The general course of the quartz reef is from N. 10° W. to S. 10° E., and from the bottom of the shaft, north and south drives have been driven along the reef, which dips at a high angle to the east. The walls are well defined; the hanging-wall consists of a greenish talcose rock, while the foot-wall is composed of elvanite rock containing blebs of quartz; in some places the elvanite occurs for a short distance on the hanging-wall as well.

The northern drive is 170 ft. in the reef. At its northern end it takes a slight curve to the east. In the course of this drive the reef attains its greatest width, 10 ft., but only for a short distance, when it

it begins to divide into two. The westerly branch has been followed to its pinching out, which takes place within a few yards. The easterly or principal branch continues gradually thinning off, till, at the end of the drive, it is only 2 ft. wide. In the stope here the reef is seen to take a bend over, and now dips slightly to the west at a high angle. A short distance from the bottom of the shaft the reef gave out, but on following the hanging-wall it was found to make again.

The south drive has been driven 150 ft. In this direction the reef is gradually thinning out until, at the end of the drive, it is only a few inches thick. They are stopping upwards on the reef at intervals along both drives.

In the centre of the reef the quartz is very hard and crystalline, and does not show much mineral, but towards the walls it becomes seamed with thin greenish layers containing iron pyrites. Galena also occurs in the quartz, and gold can be seen in fine specks generally surrounding a nucleus of other mineral. The average yield of gold from the crushings of this reef is 15 dwts. to the ton. The quartz is crushed at a battery consisting of five stampers, a few hundred yards to the north of the shaft.

On the mineral lease immediately to the north of 78, there is another party sinking a shaft on the line of the reef, but they have not yet struck the reef. This is called the Advance Mine.

Many years ago the quartz reefs in the neighbourhood of the source of Mitchell's Creek were extensively worked, and a large quantity of gold obtained from them.

The reefs occur on both sides of the creek, to the north on the Big Hill, and to the south on the Little Hill, both of these being riddled with the old workings. They traverse a series of beds of shales, sandstones, and coarse grits, which have a general north and south strike; and which have been much tilted. The reefs, as a rule, lie nearly flat, or with a slight westerly dip, and the only workings at present being carried on are by Messrs. J. Shepherd, M.P., and Johnson, who are driving a tunnel into the western face of the Big Hill. This tunnel has been driven for 240 feet through the sedimentary strata, in the direction of S. 60° E., and they expect to strike the reef after driving 300 feet. This reef was at one time worked from the outcrop, which is a considerable distance higher up the slope than the tunnel. The working of this reef at the tunnel-level will probably lead to the further development of some of the other reefs. There can be no doubt that the alluvial gold which has been got in such abundance in the bed of Mitchell's Creek, has been derived from the denudation of these quartz reefs on the Big and Little Hills.

On the hill between the new town of Mitchell and Bob's Creek, there are a few quartz reefs. This hill and the Sugar Loaf Hill to the east of it, both consist of quartz porphyry. The reefs are, as a rule, very small, with the exception of one near the Catholic church, which is of considerable thickness. None of these reefs have ever been very extensively worked, although it must have been from the denudation of them that the gold was deposited in the alluvial in Bob's Creek, the bed of which has been much turned over, and a good deal of gold obtained from it. No gold was got by washing higher up the creek than the quartz reefs on the Sugar Loaf Hill, where five reefs have been more or less worked; they are from 4 inches to 8 inches thick, dipping E. 10° N. at 45°, in quartz porphyry. No work is at present carried on here, but I think that the reefs deserve further prospecting.

In conclusion, I consider that silver-mining on this field will be a permanent and important industry; but its development, which must necessarily be gradual, must to a large extent depend upon—1st, the concentration of the sulphide ores, for they are generally of low grade; 2nd, more economical methods of smelting the sulphides, which will be the permanent class of ore to operate upon; judicious exploration of the lodes, for as the ore deposits are very irregular in thickness, having originated, as I have already described, in fissure cavities of varying extent, it will be necessary that the prospecting of the lode should be kept well in advance. The gossan, or oxidized portions of the lodes, occurring within 100 feet from the surface, must soon be exhausted, but the depth to which the undecomposed sulphide ores may be found is practically unlimited.

I have, &c.,

C. S. WILKINSON,
Geological Surveyor in Charge.

APPENDIX F.

Progress Report by T. W. E. David, B.A., F.G.S., Geological Surveyor.

Sir,

I have the honor to furnish you with the following progress report of the work done by myself, and the field assistant, Mr. G. A. Stonier, during the year 1886. From the commencement of the year until the end of January, I was employed at the office in Sydney, completing my report on the Vegetable Creek Tin-fields.

On February 1st I proceeded to Heathcote, on the Southern line, to witness the boring through of the upper coal seam, struck in the diamond drill bore, which was being made by the North Cumberland Coal Company.

Owing to a slight accident to the machinery, the bore could not be proceeded with at that time. I was enabled, however, with the help of Mr. J. T. Pearson, the engineer in charge of the drill, to get a complete section, from the cores, of the strata passed through from the surface to the top of the coal.

This section has already been published in the Annual Report for the preceding year.

On February 18th I proceeded to Newcastle, and witnessed the boring through of a coal seam at the No. 12 diamond drill bore, on the Homebush and Waratah Railway, my evidence being required by the Crown Solicitor.

On February 20th I returned to Sydney, and gave evidence as to the nature of the core on February 22nd.

On March 15th, as instructed by you, I went to Gunnedah, to examine and report on a newly discovered seam of coal on Mr. J. Pryor's selection, at Springfield, near Gunnedah. My report on that seam, and also on a seam on Mr. Darcey's property, 1 mile distant, is appended, with some additional notes. (*Appendix H.*)

On April 19th, in accordance with your instructions, I left Sydney for Maitland, with the field-assistant, Mr. G. A. Stonier, to commence a preliminary examination of the great Northern Coal-field.

From that date until May 10th, I was employed in measuring the cliff sections between Newcastle and Redhead.

On May 10th, as instructed by you, accompanied by Mr. Stonier, I left Maitland for Uralla, to report on the Rocky River Gold-field. My report, with plans and sections, is appended. (*Appendix I.*) We returned to Maitland on May 22nd.

From

From that date the Assistant and I were employed in geologically examining the coal-measures between Maitland and Greta, until July 13th, when I proceeded with Mr. Stonier to Upper Muswell Creek, near Muswellbrook, to examine some beds of iron ore and limestone. My report on these is appended. (Appendix F 1.)

On July 15th we returned to my camp at Farley, and resumed our geological exploration of the neighbourhood.

On August 3rd I discovered a seam of coal at Deep Creek, near Bishop's Bridge. The existence of coal near the spot had been known to local residents for many years past, through the occurrence in the bed of the creek of drifted pieces of coal; but, as far as I can ascertain, the seam itself had not previously been discovered. Observing that the coal seam dipped into Crown Lands, I at once communicated the information to you, and on your recommendation a reserve was made for coal-mining, comprising an area of about 100 square miles, in the direction of the dip of the seam.

About 2,000 acres of this reserve has lately been leased, and the coal seam has been proved, by prospecting shafts and bores, to be at least $13\frac{1}{2}$ feet thick, of which I consider $11\frac{1}{2}$ feet to be workable. This seam should yield, after deducting one-third for waste in getting, faults, &c., about 8,700 tons of large coal, and 2,900 tons of small coal, per acre. My report on this coal seam, together with a "Preliminary report on the East Maitland and Stony Creek Coal Seams," is appended. (Appendix G.)

From this date I was occupied with field-work, near Maitland, until October 16th, when I proceeded, according to instructions, to the New Lambton mine, near Newcastle, to examine the Borehole seam, at the point where the Homebush and Waratah railway passes through that property, my evidence as to the nature of the coal being required by the Crown Solicitor.

From that date I was occupied with field-work near Maitland, until November 2nd, when, by your instructions, I proceeded to Fairfield, near Tenterfield, and examined that gold-field. My report thereon is appended. (Appendix J.)

On December 4th my leave of absence commenced, extending for three weeks from that date.

On December 17th I went to Piercefield, near Muswellbrook, by your instructions, to report on an unworked coal seam, exposed in the left bank of the Hunter River.

I returned to Maitland on December 20th. My report on this seam is appended. (Appendix F 2.)

During my leave of absence, and on previous occasions, when not required to accompany me, Mr. Stonier was employed in mapping the alluvial deposits, which cover the coal-measures in the neighbourhood of Maitland. His work will form part of the geological map of the Maitland District, on which I am now engaged.

During the time I have been in camp, Mr. D. Grant, collector and camp labourer, has assisted in collecting specimens of rocks, minerals, and fossils, from the different parts of this coal-field, to which my examination has extended; and he has prepared a number of sections of local rocks for microscopic examination. The former have been forwarded to the Mining and Geological Museum, for exhibition to the public.

I have, &c.,

T. W. EDGEWORTH DAVID, B.A., F.G.S.,
Geological Surveyor.

APPENDIX F 1.

Report on the Iron Ore and Limestone, near Upper Muswell Creek, Muswellbrook.

Sir,

In accordance with your instructions, I proceeded to Muswellbrook, accompanied by Mr. G. A. Stonier, on July 13th, and examined the beds of iron ore and limestone at the heads of Lincoln's and Limestone Creeks, near Upper Muswell Creek. The country in which these minerals occur is rather broken and deeply eroded, though not precipitous; and is well timbered with stringy bark, red and blue gum, and oak. The deposits of iron and limestone are 5 and 6 miles distant, in a north-easterly direction, from the Grass-tree platform on the Great Northern Railway; and occur at levels varying from 850 feet to 1,250 feet above that of the railway at Grass-tree, and between 1,447 and 1,847 feet above sea-level. The geological formations consist of igneous and sedimentary rocks. The former are chiefly felsites, for the most part rendered slightly porphyritic by crystals of pink orthoclase. The latter are sandstone, greenish-brown sandy shale, black carbonaceous shale, conglomerate, oolitic limestone, and two beds of ferriferous sandstone.

The dip ranges from N. 20° E. to E. 20° N., the prevailing dip being north-easterly at 20° , the highest dip observed being 36° , and the lowest 10° .

The occurrence of an abundant fossil fauna, near the N.W. corner of portion 33, in the parish of Herschell, proves the beds to be probably of lower carboniferous age. Among the fossils are a number of spirifers, large specimens of productus, and a few trilobites.

The deposits of iron ore, of which I was shown four outcrops, appear to belong to two distinct beds which are interstratified with the palæozoic rocks. The outcrops 1 and 4 (*see* plan), belong probably to a lower bed, and 2 and 3 to an upper. No. 2 outcrop, $\frac{1}{4}$ mile distant S.E. from the S.E. corner of portion 32, parish of Balmoral, county of Durham, consists of a bed of tuffaceous and slightly calcareous sandstone, of a dark greenish-brown colour, highly impregnated with hæmatite and magnetite. The dip is about E. 33° N. at 20° . The bed, which is here about 2 feet in thickness, can be traced in a north north-westerly direction for 6 or 7 chains. Its further extension in this direction seems then to be interrupted by a mass of felsite; but $\frac{1}{2}$ mile further it reappears near the east boundary line of portion 159, parish of Balmoral. This part of the upper bed (No. 3 outcrop on plan), consists of laminated greenish brown, slightly calcareous sandstone containing iron ore for a thickness of 6 feet, the upper 2 feet being rather poor in ore. The dip is E. 18° N. at 28° . The bed is rich in ore for a distance of 2 chains, and its outcrop can be traced for about 6 chains. The lower ore bed, at the point where the fourth outcrop is marked on the plan, in portion 154 Balmoral, is similar in character to the upper bed, and has a thickness of about 3 feet. Its dip is uncertain.

No. 1 outcrop near the S.W. corner of portion 41, parish of Herschell, is similar to the preceding, but neither the thickness nor dip could be ascertained.

The composition of the ferriferous sandstone is given in the following analysis, to which is subjoined a short report by the Assistant Government Analyst, Mr. William Hamlet, F.C.S.

No. 1 sample from Muswell Creek, near Muswellbrook :—

	In 100 parts.
Gangue.....	30·70
Ferric oxide (Fe ₂ O ₃)	45·61
Ferrous oxide (Fe O)	7·53
Alumina	8·52
Lime.....	1·80
Magnesia.....	3·13
Moisture and undetermined	2·71
	100·00

These samples are poor iron ores of no commercial value. The other two samples were similar in composition. The three samples were assayed and found to contain neither gold nor silver.

This analysis shows that the iron in the ore is present in the proportion of about 24 per cent. of magnetite to 29 per cent. of hæmatite, the total percentage of metallic iron being about 37·77 per cent. The high percentage of silica contained in this ore renders it unfit for smelting.

Limestone.—A mass of limestone, known as the Yellow Rock, occurs in portion 139, parish of Balmoral, county of Durham, at a level of about 1,630 feet above the sea. The rock lies in thin even beds from 3 to 6 inches in thickness, the lines of separation between the beds being marked by soft partings of argillaceous lime from $\frac{1}{4}$ to 1 inch thick. The dip is N. 20° E. at 18°. The total thickness of the limestone seen was about 38 feet. The rock is rather soft, of a bluish-grey colour, composed of lime, sand and clay, has an oolitic structure, and contains numbers of joints of stems of enerinites.

The following is an analysis of the rock, made by the Government Analyst, from a sample selected by myself :—

	In 100 parts.
Hygroscopic moisture	1·10
Combined moisture	1·29
Carbonate of lime	66·55
Carbonate of magnesia	1·66
Alumina and oxide of iron	7·65
Silica	21·75
Phosphoric acid (P ₂ O ₅)	strong trace
	100·00

The analogy between the composition of this limestone, and that of the hydraulic limestones in Europe, at once suggests its suitability for making Portland cement. It may be interesting to quote here, for the sake of comparison, an analysis of a hydraulic limestone belonging to the Lias formation from Holywell, in North Wales.

*Analysis of hydraulic limestone from Holywell, North Wales :—

	In 100 parts.
Carbonate of lime	71·55
Alumina and silica	23·60
Water	0·50
Carbonate of magnesia.....	1·35
Oxide of iron	2·21
Alkalies	0·79
	100·00

* See "Portland Cement, its Manufacture and Uses," by Henry Reid, p. 57.

The important feature to be noticed in connection with the Yellow Rock limestone is the comparative absence of crystalline structure in the lime. The great difficulty to contend with hitherto, as far as I can ascertain, in procuring suitable raw material for Portland cement-making in this Colony, has been to find a limestone, in which the lime was so far free from crystallization as not to necessitate the "double kilning process." This process has to be resorted to in the case of hard crystalline limestones, such as the carboniferous and Devonian limestones of Europe, and would have to be adopted in the case of our crystalline siluro-Devonian limestones, such as occur at Marulan, Wallerawang, Bathurst, Jenolan, Tamworth, Kempsey, &c. As a proof of this I am informed by Mr. Owen Blacket, C.E., that when conducting some experiments in making Portland cement from raw materials procured in this Colony, he and his party used the Marulan limestone, and failed to make good cement by the direct process, owing to the crystalline state of the lime. They then proceeded to burn the limestone, and slaked it with water, so as to destroy the crystals, and then burnt it over again, with a much better result. This was simply adopting the "double kilning process" commonly practised in Europe, in places where only crystalline limestones are available. Obviously the double burning of the lime is a serious increase in the cost of manufacture, so that it is a question of prime importance to secure a limestone in which the lime is in a more or less amorphous condition. The quantity of silica and clay in the stone is of less consequence, as this can easily be brought to the proper proportion by a judicious mixture with other siliceous and argillaceous rocks. The Yellow Rock limestone, near Muswellbrook, is therefore specially adapted for making hydraulic lime and Portland cement; and considering the large quantity of Portland cement annually imported into this Colony, it would be a matter of great importance to test as soon as possible the cement-making properties of this limestone.

My thanks are due to Mr. James Glendenning, of Uralla, for having called my attention in the first instance to the existence of these deposits, and to Messrs. John, Alexander, and Robert Glendenning for kindly accompanying me to the above-mentioned localities.

I am, &c.,

T. W. EDGEWORTH DAVID,
Geological Surveyor.

APPENDIX F 2.

Report on a Coal Seam at Piercefield, near Muswellbrook.

Sir,

In compliance with your instructions, I went to Piercefield, near Muswellbrook, on December 17th, 1886, and have the honor to submit to you the following report:—

The seam outcrops in the left bank of the Hunter River, near Piercefield, distant 9 miles W. 36° S. from Muswellbrook, and is about 90 feet below the level of the railway at Muswellbrook, that is about 385 feet above sea-level. The surveyed railway line from Muswellbrook to Merriwa and Cassilis passes over the point where the coal outcrops.

The geological formations in the neighbourhood consist of yellowish-grey, fine-grained sandstone, cherty in places, and containing numbers of large white branching fossil plants, from $\frac{1}{2}$ -inch to over one foot in diameter, fossilized by white wood-opal; thin-bedded yellowish-grey mudstones; blueish-grey clay shales, crowded with leaves of glossopteris; and dark carbonaceous clay shales. Between Muswellbrook and Grass-tree these strata have been much disturbed by the intrusion of basaltic and other igneous rocks. At 190 yards easterly from the 76-mile mark, Great Northern Railway, and within a distance of less than 200 yards further, I measured no less than 5 *stepped reverse faults*, each throwing down the coal measures in an easterly direction from $1\frac{1}{2}$ to $9\frac{1}{2}$ feet.

At Piercefield, where the Hunter River has laid bare the coal, the seam is faulted, being thrown down to the north to the extent of about 11 feet. As the river bank here runs nearly S.S.E., and the seam dips about W. 25° S. at 10°, a double outcrop of the seam is exposed.

The following is a rough descending section of the coal seam and the overlying strata, as far as I was able to get them by sinking a hole $4\frac{1}{2}$ feet deep on the outcrop close to the river, and calculating the remainder from the exposed section of the seam:—

Feet.	Inches.	Description
0	2	Clayey sandstone, yellowish and blueish grey on thin even beds.
1	0	Clay, shale, slatey-blue.
0	9	Mudstone, yellowish-grey, crowded with impressions of glossopteris leaves
1	1	Clay shale, grey.
1	1	Dark crumbling shale, forming roof of coal.
1	1	Coal, bright, bituminous.
0	$4\frac{1}{2}$	Band of brown and white fireclay.
0	$8\frac{1}{4}$	Coal, laminated, bright, black, and dull layers alternating.
0	$0\frac{1}{4}$	Band of brown clay.
2	5	Coal, finely laminated, bituminous. (In the last foot of coal irregular flattened oval concretions of earthy limonite, about 6 inches long and 1 inch thick.)
0	3	Band, clay shale, ferruginous.
1	0 (about)	Coal, laminated, bituminous.
0	$1\frac{1}{2}$ to 2	Band, grey fireclay.
1	5	Coal, chiefly bright bituminous.
<hr/>	<hr/>	
7	$4\frac{1}{2}$	

Floor of dark shale resting on fine-grained whitey-grey, crumbling sandstone.

The coal in quality appeared to me to resemble the East Maitland seams, especially those worked at Marshall's Thornley Colliery; though that at Piercefield contains less splint coal.

The following is an analysis of the coal made by the Government Analyst, from a sample selected by me:—

	In 100 parts.
Moisture (at 100° C.)	4.26
Volatile hydrocarbons	28.85
Fixed carbon	54.31
Ash	12.58
	<hr/>
	100.00

Coke, 66.89 per cent.; sulphur in coal, .45 per cent.; specific gravity, 1.305; colour of ash, white

It must be stated that these samples are hardly a fair test of the quality of the coal in the seam, as they were slightly damaged by exposure, and it is unsafe to express an opinion as to whether the coal is workable or not, until a shaft or tunnel is made in the coal, so as to give a true section of the solid seam.

I am, &c.,

T. W. EDGEWORTH DAVID,
Geological Surveyor.

APPENDIX G.

Preliminary Report on the East Maitland and Stony Creek Coal Seams, and a newly-discovered Coal Seam at Deep Creek, $8\frac{1}{2}$ miles south-westerly from West Maitland.

Geological Survey Camp, Farley, near West Maitland,
November 2, 1886.

Sir,

In accordance with your instructions, I have the honor to report to you on the above-mentioned coal seams.

The East Maitland and Stony Creek coal seams belong to two distinct series of coal-bearing strata, separated from one another by a mass of rocks of marine origin which are not coal-bearing. The East Maitland series are believed to underlie the Newcastle coal-beds, while they certainly overlie the Stony Creek coal seams. They may therefore be termed Middle Coal Measures.

Underlying these four series is a second group of marine beds not coal-bearing. The five series may therefore be provisionally grouped in descending order as follows:—

5. *Upper Coal Measures*.—Newcastle Series.
4. *Middle Coal Measures*.—East Maitland Series.
3. *Upper Marine Beds*.
2. *Lower Coal Measures*.—Stony Creek Series.
1. *Lower Marine Beds*.

Between Lochinvar railway station and Newcastle the general dip of the strata is easterly or south-easterly, while between the former point and Rix's Creek, near Singleton, the general dip is westerly.

westerly. This change of dip proves the existence of a great anticline or dome between Newcastle and Rix's Creek, the summit of which must have been situated somewhere above the present site of Lochinvar. Previous to the formation of this dome, the coal seams were probably continuous and approximately horizontal from Newcastle to Rix's Creek, the Greta seams being the equivalents of the Stony Creek seams, while the Rix's Creek seams may be the equivalents of the East Maitland or Newcastle seams. The horizontality of the beds was subsequently disturbed by the formation of the great anticline, whereby the beds at Lochinvar were raised many thousands of feet into the air. The subsequent wearing down of this dome by the denuding forces of nature has entirely removed all the seams belonging to the Upper, Middle, and Lower Coal Measures between Farley and Greta.

To the south, however, where the anticline appears to have died out, the seams have consequently suffered less from denudation, and there is some probability, as pointed out by yourself, that the outcrops of all the series may be traced without a break from Newcastle and Maitland to Greta and Rix's Creek. The shape described by the outcrop of the seams would be that of a V, or horseshoe, the thin end of the V being situated at some point considerably south of Lochinvar.

The character and strike of the coal seam recently found in Deep Creek confirms this supposition.

The coal seams at Greta and Rix's Creek on the west side of the V, or anticline, will be described by me in a subsequent report. The present report relates to the seams on the east side of the anticline.

Between Farley and East Maitland the Middle Coal Measures, Upper Marine Beds, and Lower Coal Measures show the following stratigraphical features:—The Stony Creek series, which consists of sandstones, conglomerates, clay shales, and coal seams, has a total thickness at Stony Creek of about 280 feet.

At Stony Creek the strata dip easterly at 16° ; but east of the Homeville Colliery, near Stony Creek, the dip increases gradually towards West Maitland to an angle of 60° . The intermediate rocks are fine, clayey sandstones, conglomerates and boulder beds, belonging to the Upper Marine series, not coal-bearing, their aggregate thickness being not less than 2,000 feet.

Between West and East Maitland the carboniferous rocks are hidden by alluvial deposits, and where they re-appear at East Maitland dip south-easterly at an angle of 8° , showing that they flatten out as they recede from the sharp curve at West Maitland.

In the East Maitland series the strata, chiefly of fresh-water origin, consists of thin-bedded whitish-grey sandstones, and sandy clay shales with seams of clay ironstone 3 inches to 1 foot in thickness. Cherty beds occur at intervals, and are quarried for road metal. The seams principally worked are three, viz., the top and bottom seams worked at the Four-mile Creek, and Marshall's Thornley Colliery, and the Rathluba seam worked at Taylor's Colliery.

The Four-mile seams overlie the Rathluba seam, and are separated from it by about 300 ft. of rock. At the Thornley Colliery, about 1 mile south-westerly from the Four-mile, two seams of coal are worked. The pit, which is about 60 ft. deep, gives the following descending section of the coal-seams and intermediate strata.

	Ft.	in.	
	1	0	Clay shale, crowded with glossopteris leaves; forms roof of seam.
	1	4 $\frac{3}{4}$	Coal, bright, bituminous.
	0	3	Coal, inferior clayey.
	0	0 $\frac{1}{2}$	Band of brown pyritous clay strata.
	0	5 $\frac{1}{2}$	Coal, dull black, splinty.
	1	0	Coal, soft bituminous.
	0	1	Coal, inferior.
	0	1	Band of brown clay shale.
Top seam.—	0	6 $\frac{1}{2}$	Coal, soft, bright, bituminous.
Thick-	0	4	Band of dull black rotten stony coal.
ness of	0	8 $\frac{1}{2}$	Coal, firm bituminous.
coal	0	0 $\frac{1}{2}$	Band of clayey coal.
worked,	0	4	Coal rather inferior.
6 ft. 7 $\frac{1}{2}$	0	8	Coal, bituminous and splint.
in.	0	2	Coal, dull black splint.
	0	1	Coal, inferior.
	0	4	Coal, dull black splint.
	0	6	Coal, soft, bright, bituminous.
	0	1 $\frac{1}{2}$	Coal, dull black splint.
	1	4	Clay shale, with films of bituminous coal.
	0	7	Hard dark grey mudstone.
	0	4	Grey clay shales, with films of bituminous coal.
	1	9	Hard dark grey mudstone.
	1	0	Crumbling clay shales, with films of bituminous coal.
	0	10	Coal, bright, black bituminous, left to form roof.
	0	0 $\frac{1}{2}$	to 1 in. Band, dark clay shale.
	0	1 $\frac{1}{2}$	Coal, dull, splinty.
Bottom seam.—	2	2 $\frac{1}{2}$	Coal, fairly hard, bright bituminous.
Total	0	4 $\frac{3}{4}$	Band of inferior clayey coal.
thick-	0	2	Coal, rather soft, bright bituminous.
ness of	0	5 $\frac{3}{4}$	Coal, dull splint.
coal	0	0 $\frac{1}{2}$	Band, dark brown clay shale.
worked,	0	6 $\frac{1}{2}$	Coal, soft bituminous.
5 ft. 1 in.	0	0 $\frac{3}{4}$	Band, dark brown clay shale, thinning out in places.
	0	4 $\frac{1}{2}$	Coal, splinty.
	0	1 $\frac{1}{2}$	Band of coaly shale.
	0	0 $\frac{3}{4}$	Coal, soft, bright bituminous.
	0	1 $\frac{1}{4}$	Band, coaly shale.
	0	7 $\frac{3}{4}$	Coal, dull splinty.
	0	6	Coal, soft, bright bituminous.
	12	0	Ferruginous mudstone.
	2	9	Coal (not seen by me).
	0	6	Coal, inferior (not seen by me).
	20	0	Rock.
	3	0	Coal (not seen by me.)

This coal is used chiefly for household and blacksmith purposes. The seams dip S. 34° E. at $41\frac{1}{2}^\circ$.

At the above-mentioned thickness of coal worked, the upper seam contains, after allowing for waste in getting rolls, &c., about 5,234 tons of large coal, and 1,744 tons of small per acre, and the lower seam 4,016 tons of large coal, and 1,338 tons of small coal per acre. At

At Four-mile Creek, Mr. Tulip is working out some pillars at the Sunderland Colliery from a seam identical with Marshall's bottom seam. At about 20 ft. below the seam worked here, a seam of coal is said to occur 2 ft. 9 in. thick, identical with the seam of the same thickness at Marshall's.

Rathluba Colliery (Taylor's) is about $\frac{1}{2}$ a mile north-westerly from the Four-mile. The seam, which is chiefly composed of a bright bituminous coal, gave the following section:—

	Ft.	in.	
	0	10	to 1 ft. Coal, bituminous.
	0	1 $\frac{1}{2}$	Band, soft clay shale.
	0	0 $\frac{1}{2}$	to 1 $\frac{1}{2}$ in. Band, grey fire clay.
	0	1	to 1 $\frac{1}{2}$ in. Band, coaly shale, forms roof.
Total thick- ness of coal worked, 4 ft.	{	1	0 $\frac{1}{2}$ Coal, brittle, bright, bituminous.
		0	3 to 4 in. Band of clayey coal.
		1	11 Coal, brittle, bright, bituminous.
		0	1 to 2 in. Band, dark, coaly shale.
		1	0 $\frac{1}{2}$ Coal, brittle, bright, bituminous.

Taking the workable portion of this seam at 4 ft. thick, and after allowing for waste in getting, &c., it would yield about 3,161 tons of large coal, and 1,053 tons of small coal per acre.

A seam of coal, probably identical with the Rathluba, was worked about thirty-five years ago in East Maitland at a spot about 10 chains E.N.E. from the east corner of Newcastle and King Streets. The seam is stated to have been 4 ft. thick.

In No. 4 diamond drill bore at Maitland Gaol a seam of coal was pierced at 124 ft. from the surface, giving the following descending section:—

	Ft.	in.	
	2	6	Coal, with 1 in. band.
	1	7	Pipeclay and blue clay.
	4	2	Coal.

(*Vide* Annual Report of Department of Mines for 1884, p. 179.)

This seam is probably about 200 ft. below the Rathluba.

Stony Creek Seams.—Five seams of coal have been proved in this series. The furthest point north to which these seams have been traced, is about a $\frac{1}{4}$ mile north of the old toll-bar on the main northern road, some 2 miles from West Maitland. Two shafts have been sunk here, and a tunnel driven on the outcrop of one of the bottom seams. The following descending section is to be seen in the tunnel:—

		Ft.	in.	
				Conglomerate.
		0	6	Black, very carbonaceous clay shale.
		1	1	Ferruginous, sandy clay shale.
		0	0-6	Nodules of clay ironstone.
		3	3	Finely laminated grey sandy clay shales.
Total thick- ness of seam, 2 ft. 0 $\frac{1}{2}$ in.	{	0	1 $\frac{1}{2}$	Coal, dull cannel.
		0	11	Coal, hard, bituminous.
		0	0 $\frac{1}{2}$	Coal, clayey.
		0	0 $\frac{3}{8}$	Band, coal and shale.
		0	5	Coal, rather clayey, resembling "jerry."
		0	1	Band, dark clay shale.
		0	3 $\frac{1}{2}$	Band, coal and shale mixed.
	0	1 $\frac{1}{2}$	Coal, inferior.	
				Floor, grey clayey sandstone with streaks of dark clay shales.

This seam is probably an equivalent of the Cannel Seam, though greatly inferior to it in quality and thickness.

One quarter of a mile south of the preceding, five seams of coal have been worked in this series by the late Hon. Bourne Russell, on the Rutherford and Homeville Estates. These old workings, as well as those now in progress at Homeville, show that the seams are very variable in character and thickness. The lowest seam in the Homeville property has an average thickness of about 3 ft. 5 in. in the area north of the railway. Taking the specific gravity of the coal at 1.270, the seam contains, after allowing one-third for waste in getting, rolls, &c., about 2,892 tons of large coal, and 964 tons of smalls per acre. The thickness of this seam varies from 2 ft. 9 in. to 4 ft. 8 in. A band of clay shale from $\frac{1}{2}$ in. to 1 in. in thickness occurs intermittently at about 4 in. below the roof of the seam. The coal is of an excellent quality for steam, gas, and household purposes, and from its very hard nature is well suited for shipment. The following is an analysis of the coal by the Government Analyst:—

ANALYSIS.		In 100 parts.
Hygroscopic moisture.....		2.10
Volatile hydrocarbons.....		40.27
Fixed carbon		51.80
Ash.....		5.83
		100.00

*Coke, 57.63 per cent.
Sulphur, 0.890 per cent. Specific gravity, 1.270.

At about 50 ft. above this lowest seam is a seam of bituminous coal from 1 ft. 4 in. to 3 ft. thick, and at from 2 to 4 ft. above this is a seam known as the Cannel Seam, having an average thickness of 4 ft. Taking the specific gravity of the coal as 1.35, this seam would yield, after allowing for waste in getting, &c., about 373 tons of large coal, and 1,251 tons of small per acre. The following is an analysis of this coal by the Government Analyst:—

ANALYSIS.		In 100 parts.
Hygroscopic moisture.....		2.27
Volatile hydrocarbons.....		35.39
Fixed carbon.....		53.91
Ash.....		8.43
		100.00

Above

Above this cannel seam and separated from it by from 7 ft. to 9 ft. of clay shale and fireclay, is a seam of coal known as the Fireclay Seam. Near the present workings the seam shows the following descending section :—

Ft.	in.	
0	5	Coal, bituminous.
0	7	Clay shale.
2	0	Coal, hard, streaky, bituminous.

The sections given in the Rev. W. B. Clarke's "Sedimentary Formations" show that this seam varies in thickness from 1 ft. to 4 ft., so that it is impossible even to approximate the quantity of coal contained in the seam. The same remark applies to the top seam, which overlies the preceding, being separated from it by from 7 ft. to 10 ft. of clay shale. This seam is 5 ft. 7 in. thick at the northern end of the property, but is only a few inches thick near the present workings. Like most seams which have coarse conglomerate roofs, it has probably suffered in places from contemporaneous erosion. The seams have an average dip of $15\frac{1}{2}^{\circ}$ E. 6° N., or about 1 in $3\frac{1}{2}$. Brickworks have lately been erected on this property to make bricks from the white fireclay which underlies and overlies the fireclay seam.

At Font Hill, about 18 chains southerly from the Homeville boundary, cannel coal has been worked from a seam identical probably with the Homeville cannel seam; the workings, however, being flooded, I was unable to see the seam.

Deep Creek Coal Seam.—At Deep Creek (called Swamp Creek on the parish maps) $8\frac{3}{4}$ miles south-westerly from the West Maitland Railway Station, a seam of coal was discovered by my party on August 3rd last. The following is a section of the seam :—

Ft.	in.	
		Roof, Clay-band.
3	6	Coal, very hard, streaky, bituminous.
0	$0\frac{1}{4}$ to 2	Band of grey fireclay.
1	11	Coal similar to preceding coal.
<hr/>		
5	5	Total thickness of coal.

The following is an analysis of the coal made by the Government Analyst :—

Hygroscopic moisture.....	2.35
Volatile hydrocarbons	40.79
Fixed carbon.....	52.76
Ash	4.10
	<hr/>
	100.00

Specific gravity, 1.243. Coke, 56.86° per cent. Sulphur in coal, .83.

The coal will yield a coke of a good quality, and is a good coal for gas-making.

The seam dips from S. 23° W. to S. 20° E. at from $2\frac{3}{4}$ " to 5", the average dip being about 1 in 20. This seam would yield, after allowing one-third of its contents for waste in getting, &c., about 4,088 tons of large coal and 136.2 tons of small per acre.

Appended is a tracing showing the position of the coal seams described in my report :—

I have, &c.,

T. W. EDGEWORTH DAVID, B.A., F.G.S.,
Geological Surveyor.

Additional notes on the Deep Creek Coal Seam, near Bishop's Bridge.

Sir,

As instructed by you I went to Deep Creek, accompanied by Mr. G. A. Stonier, on February 25th, 1887, to further inspect the seam since the completion of a prospecting shaft sunk on the seam by a syndicate. In my "preliminary report," dated November 2nd, 1886, I stated that the seam (as far as proved in a small shaft sunk by my party in the bed of the creek, on September 2nd and 3rd, 1886) was 5 ft. 5 in. thick. Some months subsequent to this, after the reservation of the land for coal-mining, a syndicate made a bore in a bar of sandstone in the bed of the creek, about 50 yards above where my shaft was put down, and passed through about 7 ft. of coal, but probably discontinued the bore at the top of the thick band in the centre of the seam, taking it for the floor of the seam. At 4 chains east from this last bore-hole a shaft had been sunk on the seam at the time of my visit of February 25th, 1887, to a depth of about 29 ft. The influx of water from the seam was so strong that the men were unable to bale it down to within less than 2 ft. of the bottom of the shaft, so that I was unable to make sure that I measured to the bottom of the seam. The seam was described to me as being $14\frac{1}{2}$ ft. thick, but my measurements make its thickness $13\frac{1}{2}$ ft., though it is possible for the reasons above given that my measurements are a foot short.

The following is the section measured by me :—

Ft.	in.	
5	0	Alluvial sandy soil } from information.
5	0	Soft conglomerate } from information.
4	7	Dark pebbly carbonaceous sandstone.
5	11	Coal, hard bituminous, with pitchy black lustre, rather pyritous.
Details of the 5 ft 11 in. of coal above-mentioned.)		
1	1	Coal, hard, streaky, bituminous, with pitchy lustre.
2	0	Coal, similar to preceding, but rather pyritous, concretions of pyrites $\frac{1}{8}$ to $\frac{1}{4}$ in. thick
0	10	Coal, like top coal, with minute streaks of pyrites.
2	0	Coal, clean, like top coal, with $1\frac{1}{2}$ in. of cannel coal.
<hr/>		
1	8	Coal and bands, not workable; dull, black, stony coal, with clay bands.
2	1	Coal, hard, streaky, bituminous, with pitchy lustre.
0	$0\frac{1}{2}$	Band of brown clay.
1	$8\frac{3}{8}$	Coal, similar to preceding coal.
0	$0\frac{1}{2}$	Band, brown clay.
2	0	Coal, similar to preceding coal.
<hr/>		
13	5	Total thickness of coal seam.

Out

Out of this total thickness of 13 ft. 5 in., I think that about 11 ft. 8 in. might be workable, though, as the coal near the top of the seam is rather pyritous, like the "brassy tops" at Greta, some of it would probably have to be rejected. Taking the thickness of workable coal at 11½ ft., and the specific gravity as 1.243, and allowing that one-third of the coal would be lost in getting, and through faults, &c., and that one-quarter of what remains would be small coal, it should be possible to exploit from this seam about 8,700 tons of large marketable coal, and 2,900 tons of small coal per acre.

The seam dips in a S.S.W. direction at about 1 in 18. This low amount of dip will be a great help towards working the seam economically. The seam is distant 8 miles in a direct line from Farley railway station, on the Great Northern Railway, from which it bears S. 30° W.

From the very hard nature of the coal, it is well adapted for shipment, and it is useful for steam, gas, and household purposes.

I have, &c.,

T. W. EDGEWORTH DAVID, B.A., F.G.S.,
Geological Surveyor.

APPENDIX H.

Report on Coal recently discovered near Gunnedah.

Sir,

Department of Mines, Sydney, 29 March, 1886.

In accordance with your instructions, I proceeded to Gunnedah on March 16th ultimo, and having inspected the coal seam on Mr. J. Pryor's selection, I have the honor to report as follows:—

This seam is situated in portion 53, parish of Black Jack, county of Pottinger, and is distant by road 5½ miles southerly from Gunnedah, and 4 miles 50 chains from the railway at the nearest point, which is 190 miles from Newcastle. The road from Gunnedah to this seam passes over alluvial and volcanic flats, and gently sloping hills of coal-bearing sandstone and shale. The level of the surface of the ground, at the spot where the coal has been discovered, is 350 ft., as measured by aneroid, above that of the railway at Gunnedah, and 1,224 ft. above sea-level. The coal-bearing strata here dip at an angle of from 9° to 12°, in a direction varying from N.W. to S.W., the dip close to Pryor's shaft being W. 10° N.

The workable coal was struck, in sinking a well, at a depth of 72 ft. 3 in., and extended downwards to 78 ft. 7 in., the total thickness of clean coal being 6 ft. 4 in. The following descending section of the seam was measured by me in this shaft:—

	Ft.	in.	
Analysis A.	0	5	Bright black bituminous coal.
	0	2	Soft coal.
	1	2	Firm bituminous coal.
	0	2	Soft coal. (Analysis B.)
Analysis C.	0	8	Firm bituminous coal.
	0	1	Soft coal.
	1	3	Firm bituminous coal.
	0	2	Soft coal.
	0	11	Firm bituminous coal.
	0	1	Soft coal.
Total	6	4	

The bottom of the coal rests on a floor of sandy shale. The top of the workable part of the seam passes first into a black stony coal, and then into hard shale; and is separated by a thickness of about 17 ft. of shale and decomposed sandstone, from basalt 50 ft. thick, which here overlies the coal-bearing strata. The following analyses of the coal have been made by the Government Analyst from samples selected by myself:—

A. Mixed sample representing upper half of seam.

	In 100 parts.
Hygroscopic moisture	3.00
Volatile hydrocarbons	29.50
Fixed carbon	58.80
Ash	8.70

Sulphur in coal, 0.61%. Specific gravity, 1.291.

B. Sample of soft coal:—

Hygroscopic moisture	1.75
Volatile hydrocarbons	14.75
Fixed carbon	76.76
Ash	6.74

Sulphur in coal, 0.64%. Specific gravity of coal, 1.255.
Neither of these samples yielded true coke. Ashes were yellowish grey.

C. Mixed sample representing lower half of seam:—

Hygroscopic moisture	2.80
Volatile hydrocarbons	30.47
Fixed carbon	56.83
Ash	9.90

Sulphur in coal, 0.52%. Specific gravity of coal, 1.278. Coke, 66.73%.

The coke was of a fairly good quality, though the percentage of ash is rather high. The colour of the ash was yellowish-grey.

These analyses show that the layers of soft coal are composed chiefly of carbon, so that as far as relates to their chemical composition they rather add to than detract from the value of the seam. The seam, therefore, consists of free-burning, as well as caking bituminous coal, quick lighting, and suitable for steam, gas, and other purposes.

Coal

Coal has also been found on John Darcey's selection, $\frac{3}{4}$ mile south-easterly from the preceding, in portion 16, in the same parish. Darcey's coal, the level of which is 170 ft. below Pryor's, probably belongs to a lower seam; but this cannot be definitely asserted, as the surrounding strata have been much disturbed by volcanic agency. The general dip here is about W. 20° S. The top of the seam, which has a good sandstone roof, is 93 ft. 9 in. below the surface of the ground. The part of it visible above the water in Darcey's well showed a thickness of 4 ft. 9 in. of firm clean coal, and I am informed that the seam extends 2 ft. deeper (below the water). Its total thickness in this case would be about 7 ft.

The following analysis of the coal has been made by the Government Analyst from a sample selected by myself:—

	In 100 parts of coal.
Hygroscopic moisture	3.10
Volatile hydrocarbons	39.60
Fixed carbon	48.23
Ash	9.07
	100.00

Sulphur in coal, 0.78%. Specific gravity, 1.281. Coke, 57.3%.

The coke was of a fair quality. The colour of the ash was yellowish-grey. The coal is therefore a caking bituminous coal, quick lighting and useful for gas, steam, &c.

Probable yield of coal per acre.—The clean coal at Pryor's shaft being 6 ft. 4 in. in thickness, and the specific gravity of the coal 1.283, the quantity of coal contained in the seam per acre would be about 9,800 tons.

Deducting one-third for waste in getting, and assuming that one-quarter of the remainder would be small coal, it should be possible to exploit from this seam about 4,900 tons of large, and 1,600 tons of small coal per acre.

Assuming Darcey's seam to be 5 ft. thick (the thickness is probably about 7 ft.), the specific gravity being 1.281, the total quantity of coal per acre contained in the seam would be about 7,800 tons; and the same allowance as before being made for waste in getting and for small coal, the seam should yield about 3,900 tons of large, and about 1,300 tons of small coal per acre.

If therefore Darcey's seam is distinct from Pryor's, as seems probable, ground containing the two seams should produce about 8,800 tons of large, and about 2,900 tons of small coal per acre.

I have, &c.,

T. W. E. DAVID, B.A., F.G.S.,
Geological Surveyor.

Additional notes on the Gunnedah Coal-field.

GUNNEDAH being situated between the plain country and the hilly tableland of New England presents a mixture of mountain and plain scenery. Broad flats of red soil, well grassed and sparsely timbered with white box, alternate with rolling pine-clad hills of sandstone, and plateaux of dense black basalt rising over 1,000 feet above the plains. The wide valley flats have been formed by the partial filling up of pre-existing valleys of erosion, partly by lava streams, and partly by extensive deposits of silt. The following sections show the character of these strata, which are probably of tertiary and post-tertiary age:—

No. 1. Section of Pryor's Well, in portion 53, parish of Black Jack, about 1,224 feet above sea-level.

Post-tertiary and tertiary: 20 feet of surface rubble and decomposed basalt. (The latter is intersected in an adjoining creek by a dyke of hard basalt, containing flakes of black mica 1 inch in diameter.)

Tertiary: 33 feet 7 inches. Hard, partly decomposed basalt, requiring blasting.

Tertiary: 8 feet 5 inches, yellow clayey sand; 2 feet 5 inches, pipeclay, nearly white.

Palæozoic, Permian (?): 3 feet, carbonaceous shales passing into; 4 feet 10 inches, black stony coal (inferior); 6 feet 4 inches, coal, workable; 2 feet, blueish-grey clayey sandstone.

No. 2. Section of Darcey's well, in portion 16, parish of Black Jack, about 1,089 feet above sea-level.

Post-tertiary and Tertiary: 60 feet 9 inches, basalt chiefly; perhaps some alluvial at top.

Palæozoic, Permian (?): 28 feet 3 inches, sandstone. (A bed of "concrete"—tufaceous limestone (?) said to occur in this sandstone, about 10 feet above the coal). 7 feet (?), coal (4 feet 9 inches seen).

Fine clayey sandstone and grey clay shale for a considerable depth.

No. 3. Section of a well 180 feet deep, in portion 14, parish of Black Jack, 1,069 feet above sea-level.

Post-tertiary and Tertiary: Red soil; basalt; fine sand and gravel.

Palæozoic, Permian (?): Sandstone, carbonaceous.

No. 4. Well, between portions 19 and 20, parish of Black Jack, about 80 feet deep, 1,109 feet above sea-level.

Tertiary: 60 feet, (about) basalt.

Palæozoic, Permian (?): 20 feet of loose conglomerate, composed of well rolled pebbles of quartz and black Lydian stone, from $\frac{1}{2}$ -inch to $1\frac{1}{2}$ -inch in diameter, bedded in white sandstone.

A tertiary age has been provisionally assigned to the basalts on stratigraphical grounds, though no definite palæontological evidence was obtained. There is, however, abundant proof of their having intruded the coal-bearing rocks, which, as will presently be shown, are probably of the same age as the East Maitland or the Newcastle series. The basalts are therefore probably of later age than the permian. These basalt sheets are very thick, in places, as at Black Jack, about 390 feet thick, though it is possible that this thickness is made up of more than one flow. Specimens taken from $\frac{1}{2}$ a mile west of portion 17, parish of Black Jack, were so crystalline that hand specimen might easily be mistaken for diabase. The points of eruption of these lava sheets may be divided into two classes:—

1. Lava cones.
2. Conical hills, chiefly fragmental.

The

The conical basalt hill adjoining Mount Digby, in the parish of Digby, belongs to the first of these types. The top is about 900 feet above the general level of the valley flat, 700 feet above the surrounding sandstone, and about 2,000 feet above sea-level. The summit is oval, with a slightly convex surface, measuring 2 chains from N. to S., and 35 yards from E. to W. to the E.N.E., where the slope is most gradual, the inclination is 17° ; to the South 31° ; and to the West 37° . Large masses of sandstone occur between 200 and 300 feet below the summit of the cone; but I was unable to determine whether they were portions of the solid underlying sandstone upturned or disrupted fragments of the same.

The points of eruption of the second-class are very remarkable, and form several low dome-shaped hills, near the west boundary lines of portions 36, 37, and 38. The sandstone here has apparently been completely wrecked by the explosions accompanying the eruptions of the basaltic lava. These hills so formed are composed of shattered angular fragments of flaggy sandstone averaging 5 inches in diameter, some of the larger pieces being 2 feet in diameter. These fragments have been bleached or reddened by the heat of the basalt, and many of them are partly coated with it. Masses of laminated sandstone occur at the summit of these hills, interlaced with veins of basalt in such a manner as to render it doubtful whether they have been fractured in position or have been disrupted from the underlying rock. Therefore it is difficult to determine how far the hills are fragmental. Whether they have been formed, as they now stand, by the bursting and shattering of the sandstone by volcanic explosions, or subsequent to the intrusion of the basalt, by the accumulation of debris, resulting from the degradation of the basalt and sandstone round the volcanic pipes, cannot be definitely determined without further investigation.

Specimens of this breccia, formed of broken pieces of sandstone cemented together by vesicular basalt, are to be seen in the Mining and Geological Museum, Sydney.

The coal-bearing rocks, through which the basalt has burst, are chiefly sandstone, yellowish-grey and greenish-grey, diagonal bedded; fine-grained, blueish-grey, clayey sandstone; blueish-grey shale with a few fossil plants; conglomerate and tufaceous limestone. (?)

The dip of the strata, as might have been expected in so disturbed a district, varies considerably. The general dip is westerly, ranging from N.N.W. to W. 30° S. The dip close to Pryor's seam is W. 10° N. at $9\frac{1}{2}^\circ$, the general amount of dip being 10° . In Darcey's well I was unable to ascertain the dip with accuracy, but it lies between W. and W. 30° S. The coal in Darcey's well is about 156 feet below that in Pryor's, and from their relative positions as well as from the observed dips it would appear, unless faults intervene, that Darcey's seam is considerably below Pryor's, probably not less than 200 feet. That the seams struck in the two wells are distinct from one another is also implied by the difference in the quality of the coal, as well as by the difference in the nature of the rock forming the roof of the coal in the two wells.

As regards the age of the coal-bearing rocks, the occurrence of *Glossopteris* in clay shale in a creek 7 chains below Pryor's coal-well, shows that the rocks belong to one of three great coal-bearing series, the Newcastle, East Maitland, or Stony Creek, and Greta series. The absence of marine fossils at Black Jack, taken into consideration with the fact that here the strata are dipping off beds, which at Somerton, about 27 miles to the east, contain marine carboniferous fossils, favours the supposition that the Gunnedah coal belongs to the East Maitland or to the Newcastle series. The quality of the coal, especially the occurrence of thin layers of "Mother of Coal," supports this inference.

T. W. EDGEWORTH DAVID,
Geological Surveyor.

APPENDIX I.

Report on the Rocky River and Uralla Goldfield.

Mr. Geological Surveyor David to the Geological Surveyor-in-charge.

Geological Survey Camp, near West Maitland,

Sir,

17 June, 1886.

In accordance with your instructions received on May 7, I proceeded to Uralla on May 10, accompanied by Mr. G. A. Stonier, Assistant Field Geologist, and inspected the Rocky River and Uralla Goldfield, and have the honor to furnish the following report on the three points to which my attention was specially directed in your instructions:—

1. *General Geological character with special reference to the Metalliferous deposits of value.*

The Rocky River Goldfield, which embraces the town of Uralla, and lies principally to the west of it, has an area of $22\frac{1}{2}$ square miles. The field is situated on the western watershed of the Dividing Range, and at the nearest point is only one mile distant from the main line of water-parting. The Dividing Range is here so flat that it is impossible to tell with the unaided eye in which direction the surface slopes. This evenness of surface is chiefly due to the filling up of pre-existing valleys by extensive flows of basalt. Tabular hills, composed of basalt and laterite, rise in places to a height of 150 feet above the general level of the country. At a distance of from 1 to 3 miles west of the main line of water-parting, the basalt has been denuded by the deeply-croded valleys of the Rocky River and its tributaries, leaving bare the underlying granite and altered Siluro-Devonian claystone.

The local formations may be divided into six classes:—

Quaternary Tertiary: 6. Recent alluvials; 5. Basalt and laterite; 4. Tertiary alluvials; 3. Quartzite; 2. Granite hornblende and intrusive, with associated dykes of quartz-porphyr and eurite. Siluro-Devonian: 1. Claystone and granitoid.

Quaternary: 6. *Recent alluvials*.—These consist chiefly of quartz-sand and quartz-gravel intermixed with greenish micaceous soapy clay, derived from the waste of the granite. The thickness varies from a few feet to 20 feet. Pieces of subangular quartz are occasionally found 6 inches in diameter. The sandgrains in these alluvials are more or less angular or subangular, but contain rounded grains and pebbles, derived from the Tertiary alluvials, of quartz, zircon, spinel, and litaniferous iron. Litaniferous iron (= ilmenite) is abundant at Wallaby Gully, where a pebble of that mineral has been found 2 inches in diameter. The gold associated with these beds is coarser and more angular than that contained in the Tertiary alluvials. This formation is principally developed along the banks of the Rocky River and its tributaries, Kentucky and Uralla Creeks, and Green, Cabbagetree, Wallaby, Post-office, Mount Welsh, and Sawpit Gullies, &c. Volcanic bombs of glassy basalt, called locally "buttonstones," are plentifully distributed through these beds, especially near the junction of the Green Gully with Kentucky Creek.

The bombs are spherical discs, shaped like a doubly convex lens, from the size of a sixpence up to that of a penny. The under surface shows spinal grooves, while the upper is cellular. Many of the bombs have delicate rims curved slightly upwards so as to form tiny saucers, and the edges are translucent.

Tertiary: 5. Basalt and Laterite.—This formation occurs in oval patches at the outliers of Mts. Mutton, Beef, Welsh, Harris, and Monopoly, and at Cherrytree Hill, and in a wedge-shaped mass at Mt. Jones and Sydney Flat, widening to the N.E., where it becomes united at Doherty's Hill to a sheet, $1\frac{1}{2}$ miles in width. Its thickness ranges from 15 to 140 feet. The color varies from dark-green to dark-blue. In some places this rock can be pierced with a pick, while in others it is so hard as to require blasting powder for its removal. Columnar structure is prevalent, especially at the outlier close to Uralla, called Mt. Beef, where a fine section is exposed in a quarry. At the No. 2 Bullion shaft the basalt, which was soft and friable, contained large erupted fragments of granite, some of them being tons in weight. The granite blocks are roughly rounded, and were described as being rudely bedded in the basalt as though tipped from a cart, the beds dipping steeply northwards.

The succession of strata in this shaft is remarkable. The shaft was $147\frac{1}{2}$ feet deep. From the surface to a depth of 100 feet the sinking was through rotten greenish basalt, with occasional beds of erupted granite blocks. At one point a block of granite was met with of such size, that it formed a complete floor to the bottom of the shaft. At a depth of a 100 feet from the surface the basalt became very hard and dense, and no more granite blocks were found. From here to a depth of 137 feet the basalt was full of irregular hollows, $2\frac{1}{2}$ feet long by $\frac{1}{2}$ foot deep, with clear stalactites hanging from the roof, described as being like icicles, and probably of zeolite material. The basalt continued down to the bed rock, where it was much intermixed with pulverized granite and black clay. The granite, forming the bed rock, was traversed in all directions by veins of basalt.

Laterite, composed of red volcanic dust and fragments of decomposed erupted basalt, forms the capping of the Sugarloaf, near Doherty's Hill, of Doherty's Hill and of a hill near Mount Butler, in portion 26, parish of Ellon. The summits of these hills have a cindery scoriaceous appearance, and have certainly been points of eruption.

4. Tertiary Alluvials.—The sands, gravel, and clay of the deep leads. These beds are mostly capped by basalt though not co-extensive with it, as has been proved by several shafts in which the basalt has been found resting directly on the granite. The alluvial beds, as shown on plan No. 2, were found to lie in long hollows in the granite. The width varies from 5 to over 40 chains, and the thickness from a few feet up to 114 feet. The average thickness on the main lead, between Mount Jones and Doherty's Hill, was about 30 feet. The greater part of the beds is composed of a very fine yellowish grey quartz sand, much rounded; and near the bed rock the sand becomes much coarser, passing into a fine gravel, composed of rounded doubly hexagonal quartz crystals, locally called "hailstone gravel." The gravel immediately overlying the wash is cemented in places by brown iron ore, so as to form a hard crust about an inch in thickness. Round lumps of greenish decomposed dolerite (a variety of coarse crystalline basalt) are found in this gravel at Mount Jones, in Mr. French's new tunnel, and at Mount Mutton. These blocks, which are from 3 inches to 2 feet in diameter, are not waterworn, but erupted, and resemble those found in the laterite at Doherty's Hill, and do not therefore imply that the leads in which they occur are younger than those which do not contain such fragments. The gold gravel is usually rich near these blocks, owing probably to eddies having formed round them, in the water by which the gold was drifted.

It is a feature worthy of notice, in connection with the occurrence of these alluvials under outlying patches of basalt, that the bed rock on which they rest has a slight dip on all sides towards the centres of the hills, from which it may be inferred that the preservation of the outliers is due to the fact of their lying in slight hollows, where they would be less exposed to denudations than at higher levels.

The clays are pale greenish grey, yellow, and black. The black and yellow varieties often contain fossil leaves. One of these, given me by Mr. W. Cleghorn, is identical with one of most common occurrence in the deep leads of stream-tin at Rose Valley, near Emmaville. In the long tunnel, a bed of grey clay was noticed by me, over 5 feet in thickness, and with the exception of a few interstratified seams of fine sandy clay, was remarkably pure and free from grit; and being strongly plastic, might form a good pottery clay, though this could not be determined without actual experiment.

Its soapy nature is probably due to the large quantity of decomposed mica present. Gold is found sprinkled through the base of the sand and gravel, chiefly next to the bed rock, and for 3 inches above it. The grains are finer and more waterwoven than those in the recent alluvials.

There is not sufficient evidence afforded, by the Rocky River lead, to determine whether the tertiary alluvials are of marine or of freshwater origin. The shape of the worked lead is suggestive of an old river channel, with tributaries; but the fineness and clean character of the drift, and the smallness of fall in the bed rock, favour the inference that it is a deposit partly of marine origin, though no marine fossils have ever been found in the beds. There is, however, the most conclusive evidence that the alluvials under Doherty's Hill were laid down on a land surface, as is proved by the great quantities of fossil leaves and wood preserved in dark clays, which were found in sinking the Phoenix, Parker, and Edmonds' shafts, &c., north of Doherty's Hill. From the width of the alluvials at the Bullion shafts, and from the great thickness and persistence of the black carbonaceous clay lying next to the bed rock (37 feet thick at No. 4 Bullion, and about 30 feet in No. 5), as well as from the rapidity of the fall into this deep ground from Sydney Flat, it would appear that this part of the deposit is of lacustrine origin.

Probably all the leads in this neighbourhood were brought into their present positions by the agency of fresh water only, though much of the material in them may have been derived from marine beds.

The main lead appears to have been laid down by one or more rivers, or by one river flowing at different levels at different ages, running from Mount Welsh to Mount Jones, and through Sydney Flat to Doherty's Hill, and thence into a small lake, on the west margin of which was worked the "Sons of Temperance" lead. At Mount Welsh, the bottoms of the channel at both ends of the outline are so nearly on a level, that it is difficult to determine the direction of the flow; and Mr. W. French, who worked part of the lead here, is of opinion that the fall is here from east to west, but the general fall of the main lead is in the direction already indicated.

3. Quartzite.—Locally called "White Billy." This term is applied to a rock of frequent occurrence in the district, and of very variable character. The rock is chiefly composed of silica, with a small proportion

portion of clay, and is found in lenticular patches from 1 to 10 acres in extent, and from 1 to 15 feet thick. The greater part of this rock is a true quartzite composed of sand grains cemented together by silica, and is evidently an altered tertiary sand, the consolidation of which into a compact rock has been effected by the infiltration of silica from hot springs, connected with the tertiary volcanic eruptions. In other places the rock has more the appearance of a white jasperoid chert, opaque, excepting on thin edges, and infusible before the blow-pipe. In the last respect it differs from porcelain-jasper and artificial porcelain, its infusibility being due to its highly siliceous nature, and its whiteness and opacity to the presence of a small percentage of Kaolin. The most remarkable variety of this rock was noticed in Wiggin's selection, in portion 241, parish of Arding. A low hill here is capped with a white siliceous breccia, resembling the white chert just described, but enclosing angular fragments of white jasperoid claystone, some as much as 8 inches in diameter. The whole hill appeared to be built up of broken pieces of claystone, and the bed of white breccia at the summit is certainly of volcanic origin, resembling a chrysolite breccia in appearance; but judging from the infusibility of the rock, more closely allied to chert. The relation of this quartzite to the drift is obscure. At Sydney Flat it underlies the basalt, and forms an intensely hard covering, from 1 to 2 feet in thickness over the gold sands. In other places, as in portion 271, parish of Arding, it appears to overlie the basalt. At all events the points where it is chiefly developed are along the margins of the basalt sheets, between them and the edge of the bar rocks. It belongs certainly in many cases to the tertiary sands and represents their outcrop. Expectations, however, of great bodies of drift in its immediate neighbourhood are not always realized.

2. *Granite*.—The granite is of a medium coarseness of grain, composed of quartz, felspar, dark mica, and hornblende. The mica is occasionally aggregated into nests, from $\frac{1}{2}$ to 2 inches in diameter. The granite is jointed in a direction 32° E. of N. and W. of S.; and is intersected by veins of eurite, coursing N. to S., and 15° N. of E. and S. of W., from $\frac{1}{2}$ to 1 foot wide, and by dykes of felspathic and micaceous trap rock. The strike of these dykes is 10° N. of W. and S. of E. The largest dyke observed, in Mount Welsh Gully, is 8 feet wide, and strikes at 20° S. of W. and N. of E., and is highly micaceous. A dyke of trap rock at the S.W. end of Mount Jones contains a little pyrites, but the actual presence of gold in the dyke has not yet been detected. Dykes of quartz-porphry, probably connected with the granite, have cut the claystone and granitoid on the west side of the main deep lead, in portions 238, 241, and water reserve, 338, parish of Arding. The granite is slightly intrusive at its line of junction with the granitoid. Veins of quartz traverse the granite in places, chiefly composed of white milky quartz, barren of any metal excepting iron. A promising looking reef of porous ferruginous quartz, near the junction of Jackson's Gully with the Rocky River, is $2\frac{1}{2}$ feet wide, and strikes 36° E. of N. and W. of S. A sample of stone selected by me, and assayed by the Government Analyst, showed only a trace of gold under 2 dwts. per ton. A large barren quartz reef about 5 feet wide, and having an E. and W. strike, occurs 1 mile W. of Uralla, about the point shown on the plan.

The only reef in the district in which gold is said to have been found is one situated in portion 91, parish of Devon, at the point shown on the map. From the general non-auriferous character of the quartz veins where the alluvials are richly gold-bearing, and from the fact that the bed-rock in places for a radius of more than a mile from the gold-bearing alluvials, is composed of granite as well as from the fine and crystalline nature of the gold itself, it would appear that the gold was originally derived from the granite.

Siluro-Devonian (?): 1. *Claystone and granitoid*.—The Palæozoic sedimentary rocks, which have been slightly intruded by the gold-bearing granite, are dark-blue to brownish claystones passing towards the margin of the granite into a fine-grained greenish-brown crystalline rock, in appearance resembling basalt. This rock is seen at O'Brien Sugarloaf, extending thence to the head of Wallaby Gully, and in the parish of Arding in portion 244 (James Bishop's) near Mrs. Bullen's house in portion 90, &c., striking south-easterly across the main road from Uralla to Armidale. It is a true bed-rock and it is useless to search under it for alluvial gold. A shaft has, however, been sunk to a considerable depth with such an expectation in Wiggin's selection, portion 241, parish of Arding.

Gold.—The character of the Rocky River gold is rather peculiar. Most of the particles are very small, averaging about $\frac{1}{8}$ inch in diameter, and are chiefly shotty, while a few are piliform (= wire-gold), or scaly. Many of the particles show definite faces of crystals, chiefly those of the orthohedron, proving that the fine state of division in which the gold is found is due more to its manner of crystallization in its original matrix than to mechanical disintegration by the agency of water. The coarsest fragments are found in the recent alluvials of Cabbage Tree Gully, where small nuggets are often met with about $\frac{1}{4}$ -inch in diameter. The gold in the recent alluvials is coarser and less water-worn than that in the Tertiary.

The average mint value is £3 18s per oz. The present price given by the branch of the Bank of New South Wales at Uralla is £3 15s. per oz.

II. *Mining operations at present carried on, and the probable prospects of the field.*

Gold-mining as at present carried on in the district is of the desultory kind commonly termed Fossicking. The Long Tunnel Company have temporarily suspended active operations, and have let part of their ground on tribute to a party of six. In 1877 this Company undertook the gigantic enterprise of tunnelling through the granite from the lower end of Sydney Flat near Mount Jones for the distance of three-quarters of a mile to Doherty's Hill, at a sufficiently low level to drain the wet unworked lead which is known to extend for some distance under that hill. The main tunnel has now been pushed forward for a distance of about 1,800 feet, and a considerable amount of work has been done in driving a cross-cut and making jump-ups at intervals through the roof of the tunnel, and tapping the worked gold-sands of Sydney Flat.

It was hoped that the gold obtained from the worked sands of Sydney Flat would be sufficient to pay for the expense of driving the tunnel. These expectations have, however, not yet been realized, as the worked gold-sands at present are stated to produce only from 1 to 8 dwts. per load, 8 dwts. being about the richest yield. The drift here is a fine ferruginous quartz-sand with some clay. The ultimate success of this Company will, of course, depend on how far the unworked portion of the lead under Doherty's Hill is payable, as the Company have conclusively proved that the percentage of gold in the worked deep lead ground under Sydney Flat is, by itself, quite inadequate to pay the expenses of extending the tunnel. A great deal of work has been done at Mount Jones by Mr. W. French, and he is at present engaged

engaged single-handed in the great task of putting a tunnel into Mount Jones at a level of about 70 feet above that of the Sydney Flat gold-wash, to strike what he believes will prove an upper lead of payable auriferous gravel under the basalt of which Mount Jones is formed. Mr. French has already tunnelled into Mount Jones at its N.W. end for a distance of 700 feet, and proved that there exists, between the granite and the basalt a considerable body of fine quartz sand containing a little gold. The sands are composed of clean, well-worn quartz grains, showing current bedding, which, in Mr. French's old tunnel, dip in a direction S. 20° E., as though the currents by which they were deposited flowed from N.N.W. In Mr. French's new tunnel large rounded lumps of dolorite basalt are of frequent occurrence in the sand, and rest immediately on the granite. Similar lumps were observed by me in the gold wash at Mount Mutton, and in the red laterite on the top of Doherty's Hill. They are quite unlike the overlying basalt, though clearly of volcanic origin, and indicate that Mr. French's lead is as old as that at Mount Mutton. Fragments of true basalt tuff are associated with them in the drift in this tunnel. Mr. French is doing a valuable work in testing the payability of these high level auriferous sands. At Fiddler's rush, on Sydney Flat, Mr. John Anderson is working the deep lead sands on the northern edge of the Sydney Flat lead in an open cutting. At Mount Jones, Mr. Klindest is working on the edge of the old Mount Jones lead, his shaft being 46 feet deep, giving the following descending section—35½ feet basalt; ½ foot sandy clay; 5½ feet fine yellow clayey sand; 4½ feet fine current bedded quartz sand, resting on a bottom of rotten granite.

At Mount Welsh, Mr. James Young is working the recent alluvials in Mount Welsh Gully, and at the S.W. end of Mount Welsh Mr. W. Herbert is tunnelling into the hill. The Messrs. Tebbs are working the gold gravel at the N.E. end of Mount Mutton. The tertiary alluvials here consist of fine red sands and grey sandy clay, with intensely worn pebbles of granite quartz ¼-inch in diameter. The payable auriferous part of the drift (wash) lies next to the red rock, having a thickness of 3 inches, and is composed of fine quartz gravel (= "hailstone gravel.") A great deal of mica is mixed with it, making it soapy to the touch. Round lumps of rotten dolorite are found in the wash here as at French's tunnel; and round pebbles of smoky quartz and grains of red and yellow zircon are not uncommon. Above the wash comes reddish brown sand and grey clayey sand; the total thickness of the alluvial beds being about 9 feet, though towards the centre of the hill, as much as 20 feet. The whole is capped by dense columnar basalt, having a thickness of about 45 feet.

The above work is all I saw in progress at the time of my visit; but we were informed that in wet seasons, when the supply of water is good, a great deal of work is done in the recent alluvials. The number of miners employed on the field fluctuates considerably, as in dry seasons many leave for the Tingha or Vegetable Creek tinfields, returning to the Rocky when there is a sufficient supply of water for sluicing. The approximate number is 100 Europeans, and 40 Chinese.

The amount of gold won in 1884 is stated by the Mining Registrar, Mr. J. M. Shehan, to have been 863 oz. 11 dwts. 18 grains—valued at £1,238 9s. 1d.; and in 1885.

To convey any idea of the probable future prospects of the field it will be necessary to recapitulate briefly the work already done.

According to an article which appeared in the *Armidale Express* on May 14th, last, gold was worked in the recent alluvials of the Rocky River some years before its discovery in the Deep Leads, in 1856. The occurrence of gold in the deep lead at Mount Welsh is then stated to have been predicted by the Rev. W. B. Clarke. In his Report on the geological characters, and probable extent of the Hanging Rock Gold Diggings, published in 1852, Mr. Clarke says:—"It may be satisfactory to enumerate in this place such localities as have hitherto proved to be more or less auriferous in addition to those already proclaimed as such. Near Walcha, Newton Boyd, the neighbourhood of Armidale, north and west of Salisbury, the banks of the Buntarre, Rocky River, and some distance down the Namoi, are localities which my prospecting correspondents represent to me as supplying some gold. I have reason to believe that the Rocky River will turn out rich, and that on both sides of the Dividing Range, near Salisbury, gold will be found." But it was not until the beginning of 1856 that the actual discovery was accidentally made by Mr. Jones, who found gold in a natural outcrop of sand at Mount Jones (named after him.) The gold sand was found to extend under the basalt which here caps the hill, and the tracing of it in this direction by the prospectors ultimately led to the development of the rich Mount Jones lead. The lead at first had a width of about 2 chains, and was worked in an easterly direction for the first 35 chains at depths varying from 20 to 60 feet. (See plan No. 2.) The average thickness of the wash was 8 inches, averaging 1 oz. of gold per load, the richest yielding 2 oz. per load. At the last point the lead branched, the main lead trending north-easterly and the branch east. The latter had a width of from 1 to 3 chains, and was followed easterly for ¼ mile. The wash averaged about ½ oz. per load. Returning to the point where the leads diverge, the main lead, which here has a width of about 6 chains, when followed towards Sydney Flat widened to 10 chains, and the sinking deepened to 70 feet. The yield of the wash diminished in proportion as the lead widened; but where the lead again became contracted the wash became correspondingly richer. At the foot of Doherty's Hill, the lead was spread out over a width of 10 chains, and again became somewhat impoverished, though still payable. This is the furthest point to which the lead was systematically worked, the increased depth of sinking (130 to 190 feet) and the quantity of water in the sands much impeding further operations. The total length of the lead worked, inclusive of the branch, is about 1 mile 30 chains; the total area worked being between 40 and 50 acres. The estimated average yield has been about 6 dwts. per load for a thickness of about 18 inches above the bed-rock. Assuming the area worked to be 45 acres, the yield should have been about 30,000 ozs., valued at £117,000 (mint value.) A rich, deep lead has also been worked at Sawpit Gully, ½-mile E.S.E. from Doherty's Hill. This lead was worked for ¼ mile for a width of from 3 to 5 chains.

Another lead has been worked at Digger's Ridge, ½ mile north-west of Doherty's Hill. The level of the bed-rock here is higher than that at Sydney Flat, and the sand is much poorer.

At Mount Brisbane, a spur of the main sheet of basalt, 1½ miles northerly from Doherty's Hill, a number of shafts have been sunk and a tunnel driven into the hill. Gold was found in the sand and was worked on a small scale, but was scarcely payable. The sand is very fine and angular, or sub-angular. No hailstone gravel was found here. The bed-rock is approximately on the same level as that at Sydney Flat, but it is about 60 ft. higher than that in the Bullion ground.

The

The outliers of Mount Welsh and Mt. Mutton have also yielded a large amount of gold, Mount Welsh being the richest locality on the field, and having produced about 10,000 oz. of gold. Both these outliers have, however, been practically worked out.

The most important questions at present connected with the prospects of the field appear to be:—

- (a) Does the main Sydney Flat lead continue to be payable beyond Doherty's Hill?
- (b) If so, in what direction should it be prospected for?
- (c) Is it possible to increase the present water-supply for sluicing purposes?

(a) The main Sydney Flat lead was almost exhausted in a single year by the labour of 3,000 diggers. Since then many attempts have been made to prove the continuation of this lead, the most successful being those conducted by Mr. J. Anderson and others, which led to the discovery of the Sons of Temperance lead. (See plan No. 2.) At the base of Doherty's Hill a bar in the bed-rock split the lead, sending one branch easterly and the other northerly. The northerly branch was proved by the Esperanza tunnel, and was picked up further north and followed for a distance of nearly $\frac{1}{2}$ -mile in the Sons of Temperance lead. The sinking here was through basalt, and about 130 feet deep. The lead was from two to three chains wide and the wash from 2 to 3 in. thick, stated as yielding sometimes over 1 oz. per load. The bed-rock was very flat. At Haythorne's shaft, however (No. 14 on No. 2 plan), a perpendicular fall was found in the bed-rock of at least 5 ft. The lead proved payable and was worked up to the edge of the fall. The miners were unable to get down to the bed-rock beyond, owing to the great quantity of water in the sand. The Phoenix shaft (No. 10 on plan No. 2) was sunk in the hope of striking the right branch of the E side of the bar. The shaft was bottomed on to granite at a depth of 166 ft. and then sunk in the granite to a depth of 182 ft. A drive was then put in in an easterly direction at a level of 179 ft. from the surface, which tapped the drift and proved the bed-rock to be still dipping. A monkey-shaft was then sunk in the bottom of the drive, and a second drive put in at a lower level which cut the drift again at a distance of 20 ft. from the main shaft, proving that the bed-rock dipped 24 ft. in that distance. The workings were choked with running sand and water before the prospectors could get down to the bottom of the channel. Parker and Edmond's shaft (No. 9 on 2 plan) was sunk to a depth of 96 $\frac{1}{2}$ ft., through 86 ft. of basalt, 2 $\frac{1}{2}$ ft. of carbonaceous clay, with fossil leaves, and 8 ft. of compact sand. Water then rose in the shaft so rapidly that the men barely had time to escape, and had to leave their tools behind them. The shaft was subsequently bottomed by Mr R. Roberts with boring rods at a depth of 106 ft.

To the N. and E. of Parker and Edmond's shaft the Bullion and Long Tunnel Companies have sunk several deep prospecting shafts, but without success. The bed-rock at No. 2 Bullion shaft is at a lower level than any hitherto proved on the field, though borings at Nos. 4 and 5 Bullion shafts prove the bed-rock there to be within a few feet of the same level. A little gold was got in the Bullion shafts Nos. 1 and 5, but not in any payable quantity.

Gold has been won in small quantity 2 $\frac{1}{2}$ miles north-easterly of the bullion shafts in a well in Patrick O'Sullivan's portion No. 13, parish of Arding.

The Sydney Flat lead does, therefore, extend beyond the point up to which it was last worked, and the probability of its being payable may be estimated from the following facts:—

- (1.) The lead was payable up to the last point to which it was systematically worked, viz., the base of Doherty's Hill.
- (2.) The bed-rock on which the gold gravel rests has a slight fall towards Doherty's Hill.
- (3.) A payable lead—"The Sons of Temperance"—has been worked for nearly half a mile N. of the unproved ground at Doherty's Hill (on its W. side), and this lead is said to have been the richest on the side next to the deep improved ground.
- (4.) At Mount Brisbane, 1 $\frac{1}{2}$ miles northerly from Doherty's Hill, the deep lead alluvials contain almost sufficient gold to be payable, and this, too, when it would appear from the angular character and fineness of the drift that it belongs to a tributary lead rather than to the main channel.

There is a certainty, therefore, that payable patches must exist in the deep ground under Doherty's Hill.

(b) *To what points should prospecting operations be directed?*

The rule that the deepest ground is also the richest is not always true. High level alluvials are in some cases payable when the low levels are not so, because the former are enriched with the products of a more extensive erosion than that which formed the latter. Also in the case of a river debouching into a lake, the deep ground forming the bottom of the lake, which would probably be covered by wide thick beds of fine silt, would be less likely to contain gold in payable quantity than the higher level river channel, where the lead would be more confined, and the drift, owing to the stronger rush of water, would be composed of coarser material.

In the Rocky River deep lead, as long as it maintains its fluvial character the payable ground follows the deepest hollows in the bed-rock. The absence of payable drift from the deep ground between Nos. 2 and 5 Bullion shafts may be explained on the lacustrine theory of the origin of this part of the tertiary formations, or by the steepness of fall in the bed-rock in this direction from Doherty's Hill. The amount of fall in the bed-rock from Sydney Flat to the Nos. 2, 4, and 5, Bullion shafts are about 60 feet. No sand, however, was got in either of these shafts next to the bed-rock, which was covered by thick sheets of black clay, as already stated.

Considering the clayey nature of this deep ground it appears to me that it would be better to leave the deepest part of it alone for the present, and to prospect across its south-western edge from the last point where the lead was proved. The furthest point north to which the lead was found to be payable was at Haythorne's shaft. The bed-rock there was found to have an abrupt fall of at least 5 feet, in a northerly direction, and payable gold drift was worked up to the edge of this fall. It seems to me, therefore, that the best point for prospecting would be along a line drawn from Haythorne's shaft to a point 10 chains east of the Phoenix Engine shaft. The exact locality of the most promising ground might be ascertained by boring and drilling. The question as to whether or not it is payably auriferous could be proved subsequently by sinking a shaft. Another favourable point for further testing the lead would be along a line running south-east and north-west from a shaft 40 feet deep, not bottomed, shown on the geological sketch map in portion 23, parish of Arding, towards the bed-rock at the nearest point, as shown in the preceding map in portion 244, in the same parish. This line would cross an old prospecting shaft sunk in the south-west corner of portion 102, in the same parish. This shaft is said to be over 100 feet deep,
and

and is not bottomed. The surface here is about 20 feet above the surface at Sydney Flat, so that the bottom of the shaft is already about the level of the bed-rock at the latter place. A considerable area of unproved basaltic country lies to the south-east of Uralla.

"Bourke's Nob" is a basaltic hill forming a spur connected with a large sheet of basalt which extends for at least two (2) miles south-south-east, then turns more easterly towards Gostwyck. At Bourke's Nob there is a small outcrop of worn quartz pebbles, and in a shaft sunk 25 feet deep, gold was found in this drift at the rate of from 6 to 15 dwt. to the load. The hill is worthy of further trial.

Worn sand also occurs in small quantity near the point where the road from Uralla to Gostwyck crosses the Dividing Range, near the south-west corner of portion 454, parish of Uralla. Similar worn quartz pebbles and gem sand were observed along the margin of a patch of basalt, overlying granite at Cherry Tree Hill, $3\frac{1}{2}$ miles southerly from Uralla.

(c) *Is it possible to increase the present supply of water for sluicing?*

The proximity of this gold-field to the Dividing Range, and the consequent absence of perennially flowing creeks and rivers, occasions a scarcity of water.

The rainfall for 1885, according to records kindly placed at my disposal by the Rev. W. G. Hugill, was 33.35 inches.

This rainfall is partly stored in:—

- (1.) Surface lagoons, swamps, and waterholes.
- (2.) Tertiary alluvials capped by basalt.
- (3.) Granite, where it is much decomposed and jointed.

The last is not of much importance as regards mining, as the cost of raising the water from wells in the granite would be too great. It is nevertheless interesting to note that at Uralla, as at Byrock, the granite is so decomposed in places as to become a pervious water-bearing rock. For instance, at Mr. Lonsdale's well, 70 feet deep, near the east corner of portion 16, in the village of Uralla, the water makes at the rate of at least, 12,000 gallons in twelve hours.

(1.) Lagoons are the most important kind of natural storage for water belonging to this class. There are three lagoons of importance near Uralla:—Salisbury Lagoon, Racecourse Lagoon, and Bailey Fields. Salisbury Lagoon, when full, has an area of about 126 acres, and is said to be from 6 feet to 7 feet deep in the centre. In the early days of the field, a race was made by Mr. Roman from this lagoon to the ground above Uralla, $1\frac{1}{2}$ miles in length. For the first seven (7) furlongs, the water is conveyed in a covered race, the bottom of which is on the average about 11 feet below the surface of the ground. The race, of which the sides and top are of wood, is 1 foot 8 inches wide, and $2\frac{1}{2}$ feet deep. For the remainder of the distance the water used to flow in an open race, and for two or three consecutive years the supply is stated to have been equal to from four to five ground sluice leads daily (the measurements of a ground sluice being 12 inches wide, and 1 inch deep, with a fall of 1 inch in 12.)

This race has not been used now for many years, and would need a considerable amount of repair and some alteration before water could again be brought on by its means.

Racecourse Lagoon, about half a mile north-west of Salisbury Lagoon, is a saucer-shaped depression in the granite, more or less filled with water, except in unusually dry seasons. It has an area of about 56 acres, and when quite full is about 11 feet deep. At the time of my visit this lake was dry, for the first time for thirty-five years previous.

The Bailey Fields Lagoon is a shallow pond having a surface area of about 14 acres. Thirty years ago a race known as Francis was cut from this lagoon to bring water on to the gold-field in the neighbourhood of Sawpit Gully, the total length being about 2 miles.

(2.) *Tertiary Alluvials* form a vast subterranean reservoir in which a practically inexhaustible supply of water is stored under the line of water-parting of the Dividing Range. Owing to these beds being hidden under thick sheets of basalt, it is impossible to estimate their exact extent. Some idea of it may be formed from the following already ascertained facts. To the north of Doherty's Hill, these beds are water-bearing for a width of at least half a mile, and vary in thickness from 10 to 70 feet. Their length is to be estimated in miles. Numerous wells have been sunk at intervals through the basalt covering, these alluvials for over 3 miles northerly from Doherty's Hill, and with few exceptions have struck good supplies of water in the underlying alluvials. At the No. 2 Bullion shaft, the water is 69 feet deep; at the No. 4 Bullion shaft, 70 feet; and at Parker and Edmund's shaft, 38 feet. At the No. 2, Bullion shaft, the flow of water was so strong that a plunge and lift pump, throwing 3,000 gallons of water per hour was barely able to lower the water. As future mining operations on this gold-field will be centred on the deep leads, it appears to me that it should always be possible to obtain water in sufficient quantity for mining purposes from the water-bearing beds contained in the leads. When the leads are worked, it will be obviously necessary to constantly pump large quantities of water to the surface, to drain the mines, and the water so raised might, without further expense, be utilised for sluicing, as was done so successfully by the late Mr. T. Flannery on his tribute area to the Wesley Company, at Rose Valley, on Vegetable Creek, and is now being done here on a small scale by the Long Tunnel Company.

III. I have reported elsewhere on the modification of the present boundaries of the Rocky River and Uralla Gold-field Reserve.

Every assistance was rendered by Mr. Stonier and myself, by Mr. James Glendenning, Secretary of the Miners' League, and Mr. W. Cleghorn, J.P., supplied much valuable information. I have also to acknowledge the kind help afforded by the following residents:—Messrs. John Anderson, Dewson, W. French, J. D. Lace, R. Roberts, H. Roman, A. P. Smith, Tebbs Bros., J. Young, and others.

I have, &c.,

T. W. E. DAVID,
Geological Surveyor.

APPENDIX J.

Report on the Fairfield Gold-field.

Sir,

Geological Survey Camp, Farley, 8 December, 1886.

In accordance with your instructions, I have examined the Fairfield gold-field, and have the honor to report thereon as follows:—

Fairfield is 33 miles distant by road from Tenterfield, and is situated on the main road from that town to Grafton.

Gold-mining is being carried on principally at four localities, all lying in a line running N.N.W. and

and S.S.E. (1) Yellow Creek, at the extreme S.S.E.; (2) Fairfield, $1\frac{1}{2}$ mile N.N.W. from Yellow Creek; (3) Mount Carrington, 1 mile N.N.W. from Fairfield; and (4) Red Rock, at the extreme N.N.W., 7 miles from Mount Carrington.

Yellow Creek and Fairfield are within the Timbarra gold-field, while Red Rock is within the Boorook and Lunatic gold-field.

Fairfield is about 7 miles due south from the Lunatic gold reefs, and about 10 miles E.S.E. from the silver and gold reefs at Boorook. For about 24 miles from Tenterfield, the Grafton Road passes chiefly over granite, which is rendered very coarsely porphyritic in places by pink crystals of feldspar. For the remainder of the distance to Tenterfield, the formations are dark green dioritic rocks, diorite, greenish-grey gneiss, chlorite schist, felsite, and felsite breccia. The country is rocky and deeply eroded, well timbered with stringy bark, spotted gum, mahogany, &c., and well watered.

Gold was first discovered at Fairfield about the end of January last, by Mr. John Castor. He communicated the discovery to Mr. George Smith, the owner of the property, and as the gold proved payable, capital was raised to work the ground, and a rush set in on a small scale to Fairfield, which resulted in the additional discoveries of Mount Carrington, Yellow Creek, and Red Rock.

At Yellow Creek (called Violet Creek on the Government maps), bearing about E. 30° S. from Fairfield, $1\frac{1}{2}$ mile distant, three gold and silver veins are being prospected. The surrounding rocks are diorite, a greenish felstone, and banded felsite.

At M'Phee's claim are two veins in felstone. The northern veins strikes N. 35° W. and S. 35° E., dipping W. 35° S. at 85° . Its average thickness is 4 feet 3 inches. The veinstone is bluish and greenish quartz, with sulphides of iron and zinc. A mixed sample taken by me from this reef has been assayed by the Government Analyst, with the following result:—

	oz. dwt.
Fine gold.....	1 $1\frac{1}{2}$ per ton
„ silver.....	32 $7\frac{1}{2}$ „

The southern vein, $1\frac{1}{2}$ feet thick, dips E. 10° S. at 74° . The vein stuff is a bluish cellular or solid quartz, with iron pyrites and galena. The veinstuff is not bounded by defined walls, but merges gradually into the country rock.

At Golland and party's claim, about half a mile from the preceding, a vein of quartz, 6 inches thick, dips W. 10° S. at 85° . The rock casing this vein is a very hard dark green diorite. The veinstone contains galena, blende, and carbonate of copper. The sample taken by me from the vein has been assayed by the Government Analyst, with the following result:—

	oz. dwt.
Silver	19 12 per ton
Gold a trace	(under 0 2 „

Fairfield.—Gold occurs here in numbers of thin veins of quartz, traversing a felsite breccia, and the latter also is auriferous for several feet on either side of the quartz veins. Diorite occurs about a quarter of a mile S.E. from the Prospectors; and in Hynde's shaft, on the south side of the Grafton Road, adjoining the Prospector's, a dyke of quartzose diorite rock was cut in the west drive. The dyke strikes N.W. The felsite breccia is variable in character. At a short distance from the ore deposits it is very hard, and consists of angular fragments of opaque whitish-grey felsite from $\frac{1}{4}$ inch to 1 foot in diameter, set in a quartzose or felsitic base. In other places, as at Harkness and party's claim, a quarter of a mile N.N.E. from the Prospector's, the breccia is more dioritic. In the vicinity of the ore deposit, the breccia is very much decomposed, being comparatively soft to a depth of 35 feet from the surface, and is of a prevailing reddish purple colour.

The principal ore deposit is confined to one oval patch about 12 chains long and from 1 to 2 chains wide, the longest axis of which runs about N. 6° W. and S. 6° E. The whole of the rock within this area is more or less auriferous, but the richest part lies towards the centre of the patch, where an irregular vein of porous ferruginous quartz can be traced striking N. 30° W. and S. 30° E., and dipping W. 30° S. at 65° . The quartz passes gradually into the felsite breccia on either side of it, and the latter is richly auriferous for about $1\frac{1}{2}$ ft. on either side of the main vein. At present the deposit is being worked by stoping out all the stone for a width of 4 ft. in the direction of the strike of the irregular quartz vein, keeping it in the centre of the stope. The ore so obtained is chiefly feldspathic, resembling rather half-burned bricks, and is mixed with porous quartz, the whole being charged with oxides of iron, and containing carbonate of copper, and an earthy black powder, resulting from the decomposition of sulphide of zinc. The deposit is not bounded by true walls, and its lateral extent has not yet been fully proved. The natural "faces" of rock met with in the workings are joints rather than true walls, for the rock on either side of them has been proved to be auriferous for at least 20 ft. to the east and west of the main deposit, at right angles to its strike.

At a point about 6 ft. northerly from the centre of the Prospector's main working shaft a branch vein leaves the main vein, about $2\frac{1}{2}$ ft. wide, striking towards Kelly's claim, and dipping S. 18° W. at about 54° .

At Kelly's, a mass of ore somewhat similar to the Prospector's, but harder, is being stoped out for a width of 9 ft. The stopes follow "faces," or joints in the rock, which dip from 10° to 30° S., and W. at 66° .

At the Prospector's the zone of decomposition extends to a depth of 38 ft. from the surface, while at Kelly's the sulphides of iron and zinc were met with at a depth of about 23 ft. A mixed sample selected by me from the Prospector's, to represent the width of 4 ft. of the ore deposit which is now being worked out for crushing, has been assayed by the Government Analyst with the following result:—Fine gold, 5 oz. $8\frac{1}{2}$ dwt. per ton; fine silver, 1 oz. 18 dwt. per ton.

A sample from the east cross-cut, at a distance of 20 ft. from the eastern margin of the main ore body, assayed as follows:—Fine gold, 4 dwt. per ton; silver, a trace.

A sample of quartzose veinstone, containing iron and copper pyrites and sulphide of zinc, taken by me from Kelly's claim, assayed as follows:—Fine gold, 4 dwt. per ton; silver, a trace.

There is therefore a large body of gold-bearing stone at the Prospector's, and at Kelly's. At the Prospector's the ground has been proved chiefly at the north and south end of the property, altogether for a horizontal distance of about 80 ft. If the intermediate 600 ft. prove equally auriferous, there can be no doubt that the mine will pay very well as long as the ore treated is the oxidised veinstone above the water-level. When the sulphides are reached at a depth of about 38 ft., the difficulty of treating the ore will of course be greatly increased, as, although some of the gold is free, the greater part of it is held by the sulphides of iron, copper, and zinc. The specific gravity also of the sulphide-bearing veinstone will be considerably higher than that of the oxidised portion, so that although the yield of gold per cubic yard

yard may be approximately the same, the yield per ton in the sulphide ore will be proportionately reduced. This has been proved already by the assays made by the Government Analyst of samples of ores from different parts of the field, the oxidized ores, as a rule, giving slighter returns than the sulphides.

At Mount Carrington, one mile north-westerly from Fairfield, upwards of 40 chains are held on lease, making a total area of over 180 acres. Mount Carrington is a rocky ridge rising to a height of about 600 ft. above Fairfield, and trending N.W. for about $\frac{1}{4}$ mile, then northerly for another $\frac{1}{4}$ mile. The sides are steep and the summit is only from 2 to 3 chains wide. Five different varieties of rock occur here, (1) felsite breccia, of a greenish grey or reddish purple tinge; (2) greenish felsite; (3) banded white felsite; (4) bluish-grey argillite (?); (5) dark green dioritic rock, probably an altered sedimentary rock. At the north end of Dillon's claim, portion 9, the felsite dips S.E. at about 70° .

The argillite (?) which occurs principally at Real and Pinkerton's claims has a slaty cleavage and dips about N. 10° W. at 55° . The veins occur chiefly in the felsite breccia and felsite, but some traverse the diorite rock. There are about 15 distinct veins of importance varying in thickness from a few inches to 11 ft. The strike and dip of the veins is also very variable; but of 37 veins examined at Mount Carrington, the prevailing strike was found to be N. 30° E. and S 30° W. Three-fifths of these dipped westerly, and two-fifths easterly, the amount of dip varying from 30° to 90° . The mean thickness of the fifteen veins was found to be 2 ft. Nine of these were 3 ft. or upwards in width, the widest being 11 ft. 4 in. In three cases a "clay-dig," or "flucan" was observed, viz.: at the Gladstone, Strauss, and Real and Pinkerton's claims.

Most of the veins have no true walls, but adhere firmly to the country rock, and pass into it gradually.

The water-level and zone of decomposition is reached at a depth of about 40 ft. near the summit of Mount Carrington, and on its sides and base at depths of from 10 to 20 ft. From the surface to the water-level the ores consist of porous ferruginous quartz with cubical cavities resulting from the removal of dissolved iron pyrites; and in some cases they show minute specks of gold. Carbonate of copper and decomposed sulphides of zinc are also present in the oxidized ores. Below the water-level the veinstone becomes hard, and contains iron and copper pyrites and sulphide of zinc. Some fine specimens of the last mineral, enclosing coarse pieces of gold, have been obtained at Strauss' claim.

The thick veins are not auriferous throughout their whole width, as they enclose slices of the country rock, which have been so thoroughly silicified as to make it difficult to distinguish them from the quartz veins. These silicified portions of the country rock enclosed between contiguous parallel quartz veins have been included by me in the total width of the veins, when estimating their thickness. As a rule, however, they contain but very little gold. The following section of Sageman's vein may be taken as typical:—

A mixed sample from this vein has been assayed by the Government Analyst, with the following result:—Fine gold, 3 dwt. per ton; silver, a trace.

Straus's vein, described as being 7 ft. wide, consists of nine quartz veins with intermediate silicified portions of the country rock, the aggregate thickness of the quartz veins being $2\frac{1}{2}$ ft., as shown on the following section:—

A sample from this reef consisting chiefly of sulphide of zinc and carbonate of copper has been assayed by the Government Analyst, with the following result:—Fine gold, 4 dwt. per ton; fine silver, 1 oz. $12\frac{1}{2}$ dwt. per ton.

Fogwell's ore, also composed of sulphide of zinc and carbonate of copper, assayed as follows:—Fine gold, 3 dwt. per ton; fine silver, a trace. As a rule the veins are richer in the felsite breccia than in the solid felsite.

The felsite breccia is most extensively developed at the top of Mount Carrington. Bourke's big reef, the most important vein here, consists of porous ferruginous quartz, 4 ft. wide, passing gradually at its sides into ferruginous quartzose felsite. Gold shows freely in this stone, and the sample taken by me and assayed by the Government Analyst yielded:—Fine gold, 15 dwt. per ton; fine silver, 8 dwt. per ton. Amongst other samples which gave good returns were—(a) Sample of ferruginous quartz from vein 4 in. thick, Shannon's claim, yielding:—Fine gold, 1 oz. 18 dwt. per ton; fine silver, a trace; (b) Sample from yellowish-white friable quartz, vein 5 in. thick, Dillon's claim:—Fine gold, 11 dwt. per ton; fine silver, 2 oz. $14\frac{1}{2}$ dwt. per ton.

There are a number of promising veins here, in addition to those already described, as Carmichael's, Horton's, Scott's, Williams's, Jones's, the Gladstone, &c. At Mount Carrington the veins have been proved to be auriferous at levels which differ from one another by 300 ft.

As before mentioned, the upper or oxidized portions of the veins are the richer, while the assays made of the undecomposed sulphides from lower levels have given returns of about 4 dwt. of gold per ton, but the yield of this ore would be considerably increased if the sulphides were to be concentrated.

Red Rock.—The auriferous area at Red Rock is situated at the junction of the Crooked Creek with the Cataract River, on the left bank of Crooked Creek, 7 miles north-westerly from Mount Carrington, and bears E.N.E. from the Boorook silver-mines, $3\frac{1}{2}$ miles distant. The country is rocky and very steep, especially along the frontage to the Cataract River, where there is an almost precipitous fall of 750 ft. from the Red Rock to the bed of the Cataract River.

About 70 acres were held under lease at the time of my visit, and upwards of thirty men were employed upon them.

The geological formations consist of—(1) Felsite breccia and quartzose felsite similar to that at Mount Carrington. The latter is white in places, resembling quartzite, but is more often stained by iron oxides and carbonate of copper; as at the Red Rock; (2) Dark green chlorite schist, and a rock composed of quartz and chlorite without schistose structure, the quartz being present in the rock in the form of grey cellular patches. The latter group of rocks are seen in the bed of the Cataract River. There are about ten veins here belonging to two sets, which intersect one another at a high angle. The prevailing strike of the principal set is N. 27° E., which approximates to that of the Boorook silver veins, of which

the prevailing strike is stated to be N. 22° E. Five of the veins dip easterly, and four westerly, at from 30° to 90°. The prevailing strike of the other set is N.W. and S.E., the dip being easterly at 70'. The mean width of the veins is 2 feet 9 inches, four being 3 feet or upwards in thickness; and the thickest 6 feet; the prospectors, Farrell and party. The veinstone is chiefly porous ferruginous quartz, containing in places, as at Hyndes's claim, carbonate of copper. The sulphides have not yet been reached at most of the claims. A few small specks of gold were seen by me in the veinstone at Pollard's claim, and I also saw a prospect washed from a sample selected by myself, from the prospectors' claim, which should have yielded gold at the rate of from 2 to 3 dwt. per ton. Of the four samples selected by me from the Red Rock reefs, assayed by the Government Analyst, one showed traces of gold and silver, another traces of gold, but no silver, and two contained neither gold nor silver. A few assays such as these do not afford conclusive evidence as to the non-payable nature of the stone, but they show at any rate that the veins here are not auriferous throughout. The veins being of considerable extent, and of a very promising appearance, deserve to be thoroughly tested; but if the surface stone does not prove payable, the hard nature of the country rock at the low levels, as seen in the natural sections, does not offer any encouragement to the supposition that the reefs will improve at a depth.

Workings.—The ore deposits are being prospected by means of shafts, tunnels, and open cuttings.

The steep falls in the ground at Red Rock and Mount Carrington offer great facilities for tunnelling, and a great body of vein-stuff can be obtained cheaply in this way. The deepest shafts do not much exceed 60 feet. The aggregate amount of feet sunk is about as follows:—At Mount Carrington, 700 ft.; at Fairfield, 350 ft.; at Red Rock, 150 ft.; at Yellow Rock, 130 ft.

As the gold in the stone is generally invisible, even when the ore is examined under a lens, miners are obliged to test their ores by first crushing them up very fine with a pestle and mortar, and then washing the powder in a dish in the usual manner. The mortars in use at most of the claims are wrought-iron mercury bottles with the necks cut off. These empty bottles are obtained from the crushing batteries, where, of course, a considerable quantity of mercury is constantly being used. A good pestle and mortar are indispensable articles to a prospector's outfit in this district, for as the gold is "free" in the gossan ores a quantity of the ore crushed and washed will always give very reliable results, in many cases of more practical value than those obtained from assays.

Machinery.—Two crushing batteries have been erected—one by the Fairfield prospectors, and the other by Carmichael and party. The former is within 5 chains of the northern end of the prospectors' ore deposit, and about 8 chains distant from Plumbago Creek. The plant comprises 15 stamps, 5 of 6 cwt. each and 10 of 5½ cwt.; copper-plate tables; 7 amalgamating pans; 22 settling boxes, &c.; and a horizontal engine of from 25-to 30-horse-power, which drives the battery and pans, and pumps water from Plumbago Creek. This battery should be able to crush the soft ores at present being mined at the rate of 200 tons a week. Carmichael's battery is situated on the left bank of Plumbago Creek, about 50 chains south-easterly from the south-east end of Mount Carrington, this being the nearest point to the mountain, where a good supply of water can be obtained. The plants consist of 5 stamps of 5 cwt. each, with fittings for five more; electric copper-plate tables, and a portable engine of 10-horse power, which drives the stamps, and pumps water from the creek. This battery should crush from 40 to 50 tons of the Mount Carrington ores per week.

The evidence already adduced shows that the veins are very irregular in strike and dip; and the manner in which the veinstone in most cases passes gradually into the country rock without the intervention of defined walls precludes them from being classed with those fissure veins, in which there is evidence of considerable vertical displacement. They rather resemble shrinkage cracks which have been filled with auriferous metallic sulphides and quartz. The veins at the top of Mount Carrington will prove auriferous to a depth of at least 300 feet, as is proved by the natural sections. At this depth the veins will be better defined, but probably more contracted, and the country will become harder. As already stated, there are two kinds of ore to be treated—(1) the oxides and (2) the sulphides. The latter are by far the most important, as the former, on the average, do not extend for more than 30 feet below the surface. The oxidised ores in such a vein as Bourke's will certainly pay well for working down to the water-level.

As regards the main question as to whether the ores can be worked to advantage below the water-level, the yield of the sulphides from the veins lying near the base of Mount Carrington is so small (4 dwt., according to assay) that it will not leave sufficient margin to pay for the extraction of the gold from the sulphides of iron, zinc, and copper, unless, as pointed out, the sulphides in the ores be concentrated by machinery. At the higher levels, near the top of Mount Carrington, the veins, as a rule, are wider, and there is a great body of stone which the returns by assay have shown to yield from 4 dwt. up to 2 oz. Experience alone will prove whether a large body of easily won stone with this yield can be worked profitably when it contains ores so difficult of treatment as sulphides of zinc and copper and iron pyrites.

At the Prospectors', Fairfield, the stone is so rich as to admit of its being profitably worked when the sulphides are reached. Here there is every prospect of a permanent paying mine.

At Yellow Creek the gold and silver in M'Phee's vein are in payable quantity, but it has not yet been proved whether this vein is of any considerable horizontal extent.

At Red Rock there is an immense body of easily worked auriferous veinstone, but up to the present there is not sufficient evidence to show that it is payable, but from the favourable nature of the formation it deserves to be well tested.

Speaking generally of the field it may be said that on account of the variable character of the veins, and the unevenness of the distribution of metals in them, there is sure to be a great fluctuation in their yield. Some deposits will widen, and others become contracted, when followed horizontally or vertically; and it does not follow that a property will contain any auriferous deposits simply because it is on the line of strike of and not far distant from some known deposit. This is an important point for the consideration of mining companies, for it shows the necessity for extensive prospecting, and testing of the ores before laying out much capital in erecting machinery.

Though colours of gold may be found near the surface in many places no payable alluvial gold has yet been found on the field. On the whole, though the yields of the veins will fluctuate considerably, as above mentioned, I am of opinion that this will become an important gold-mining field.

I have, &c.,

T. W. EDGEWORTH DAVID. B.A., F.G.S.,

Geological Surveyor.

APPENDIX K.

APPENDIX K.

Mr. Geological Surveyor Anderson to The Geological Surveyor-in-charge.

Report on the Yarrangobilly Caves.

Sir,

Department of Mines, Sydney, 3 January, 1887.

In accordance with your instructions, I proceeded to the Yarrangobilly Caves on December 6th, and I have now the honor to submit a report on these caves.

The caves are situated on the Yarrangobilly Creek, a tributary of the Tumut River, in the county of Buccleuch, and lie about 40 miles to the south of Tumut, and 12 miles to the north of Kiandra.

There are two principal routes to the caves—one by Gundagai and Tumut, and the other by Queanbeyan, Cooma, and Kiandra.

By the former route a coach runs as far as Tumut, and from this point to the foot of Mount Talbingo, a distance of about 20 miles, there is a fairly good buggy-road, although some parts of it are a little rough. It is extremely difficult to take a buggy up Mount Talbingo, the ascent being 2,080 ft. within a distance of 3 miles, and the present track being very bad; but this difficulty having been surmounted, there is a passable bush-track on to Mr. Gibbs' station, within 8 miles of the caves. These last 8 miles can only be performed on horseback or on foot, and in wet weather many of the sidlings are very dangerous. This route from Tumut passes through a very mountainous and picturesque country, and some of the views obtained from points of vantage, such as the top of Mount Talbingo, are very fine, while on striking the Yarrangobilly Creek a splendid view is obtained of the limestone cliffs and the great arch which forms the entrance to the two principal caves.

The second route is by Queanbeyan, Cooma, and Kiandra, all of which are connected by coach. For 8 miles from Kiandra there is a buggy-road across the Kiandra Plain, but from here a bridle-track has to be followed which goes to a selection within half a mile of the caves. At various points on this route glimpses can be obtained of the Snowy Mountains, which, even within a fortnight of midsummer were dotted over with patches of snow. By the former route visitors could drive to the foot of Mount Talbingo, within 20 miles of the caves, while by the latter route they could drive to within 4 or 5 miles of them.

The Yarrangobilly Creek has a general course from N. to S. The rocks of the district consist of nearly vertical beds of the older palæozoic shales, sandstone, and limestone, whose outcrop is also in a N. and S. direction. The limestone in which the caves occur is a very thick bed forming the eastern slope of the valley of the Yarrangobilly Creek, and all along its course it forms high cliffs, in which openings may be seen, some of which no doubt lead into chambers in the limestone hitherto unvisited. This limestone contains the remains of fossil corals in considerable abundance.

The two principal and best-known caves go under the name of the Glory Hole Caves, while the cave higher up the creek is called the Yarrangobilly or Copper-mine Cave.

The Glory Hole Caves have a common entrance by the great arch. Immediately on getting inside the arch a large opening is seen passing away to the left; this is the Left-hand Cave. Going still further into the arch the roof is seen to have an immense egg-shaped hole in it, the fallen material from which has formed a small hill on the floor of the archway. On gaining the summit of this rising ground the archway is seen gradually to diminish in size to form the entrance to the Right-hand Cave.

The Left-hand Cave.—The entrance to this cave is very lofty and of considerable width. It is here that visitors usually camp who remain over-night at the caves. From the roof hang pink and green-tinged stalactites, exhibiting very irregular forms, and in the inequalities of which nestle tufts of maiden-hair ferns, which produce a very pretty effect. For about 40 yards in from the mouth of the cave the passage is nearly 40 ft. high by 30 ft. wide. At this point it widens out into a large chamber, the sides of which are thickly coated with layers of carbonate of lime, which assumes great variety of forms, while from the roof hang numberless yellow-tinged stalactites. On the floor are three large masses which have no doubt fallen from the roof, and become coated over with stalagmitic growth from the water dripping upon them. At the far end of this chamber there are the remains of a mass of stalactites, which must at one time have had the appearance of a frozen waterfall. It can be seen coming from a hole in the roof, and its lower end must have hung free, probably in a series of points; but now it has partly been destroyed by being broken across, and the lower part of it carried away. This chamber is about 60 yards in length where it begins to narrow, and afterwards it forms a gradually contracting gallery, in the centre of which stands an isolated pillar of stalagmite, about 8 ft. in height, which, however, is much disfigured by the pencilling of names on its surface. To the right of this pillar stands a large group of stalagmites, which at the floor form a single mass. As they rise each one gradually tapers off out of the mass, until only the single central stalagmite reaches the roof. The sides of the chamber are thickly coated with stalactites, which in many places form pillars which stand out a little distance from the wall. The roof is a dense mass of large and long stalactites. Passing to the end of this chamber there is nothing seen but a forest of pillars formed by the union of stalactites and stalagmites with a few dark holes between them. On getting into one of these holes a passage is entered which is flanked on either side by rows of pillars, between the bases of which are stalagmitic basins full of water. This avenue of pillars extends for about 25 yards, when the cave again widens out into a large and beautiful chamber called the "Queen's Chamber," which is about 50 yards long by 35 yards wide. From every part of the roof hang a perfect forest of stalactites, many of which are over 4 ft. in diameter at the base, while between these larger forms hang the smaller and more delicate stalactites. The floor has a number of large stalagmites standing up from it, and among these lie many stalactites which have fallen from the roof. It is also in many places strewn with well-rounded and water-worn boulders and pebbles, the presence of which show that at one time a stream of water had flowed through the cavern. This chamber narrows slightly, and then widens out again into another large chamber somewhat similar in general aspect to the Queen's Chamber, the roof being covered with large pendant stalactites, forming pillars towards the sides of the chamber, while the floor is covered with stalagmites, which in some places form large groups. A little further on in this direction the cave comes to an end, by being blocked by a sloping talus of debris, consisting mostly of large blocks of limestone. Near the end of the Queen's Chamber a passage goes off to the left, which winds in a very tortuous manner for a considerable distance, its course being mostly between walls of limestone, there being little or no deposit of carbonate of lime on them. By a little climbing the end of this passage is found to open out into a very large cavern, the roof of which is very high. In one corner is a beautiful mass of stalactites, which much resemble a frozen waterfall, but this is the only deposit of stalactites there is in the cavern. A great fall of rock from the roof of this chamber precludes further progress.

The

The Right-hand Cave.—The great archway may be taken as the entrance chamber of this cave. Viewed from the opposite side of Yarrangobilly Creek it is seen to be nearly a perfect arch. The large hole in the roof is somewhat egg-shaped, and stretches nearly the whole breadth of the arch. Some distance in from this it narrows down to a passage about 20 ft. in height, in which stand numerous isolated stalagmites which are very massive. This passage opens out into a large chamber, which is one of the finest in the caves. When seen from the entrance it presents a mass of stalagmites, some standing alone, and others in large groups, the whole bringing to the mind the spires and turrets of some great cathedral. Several large stalactites have recently fallen in this part of the cave, though the fractures are hardly fresh enough to have been caused by the shock of the recent earthquake. By a little climbing visitors can move about among these groups and pillars of stalagmite for considerable distances, but in many places there occur stalagmitic basins on the floor, some of them containing water to the depth of a few feet. There are many passages through between the stalagmites of this chamber to the entrances into the next chamber. The chief of these entrances is the Blow Hole, which is a small crooked hole through which it is a little difficult to squeeze. There is always a very strong draught blowing through it, so that the light is generally blown out. On passing through this blowhole the largest chamber yet discovered in these caves is entered. This is an enormous cavern. Its floor is covered with immense boulders, most of which have now a coating of stalagmite over them. The surface of this stalagmitic covering very much resembles the rough and jagged surface of a coral reef. Some of these blocks are so large that it is almost impossible to get over them. This enormous cavity goes in for a long distance, and near its furthest end it must attain its greatest height, for there is a point where far overhead a small dim spot of light can be seen. This seems to show that this great cavity has a small opening somewhere high-up on the hill side. It is very probable that there are other chambers in connection with this one whose entrances are not yet known. At the far end of this large chamber are one or two small cavities with very pretty stalactitic growths in them. The termination of this great cavern is a talus-heap of limestone blocks, which slopes upwards to the roof.

About 4 miles higher up the creek there is another cave, called the Copper Mine or Yarrangobilly Cave. In the neighbourhood of this there is a quartz reef containing copper ore, and hence the name of the cave. A stream of water flows out of the mouth of the cave, but it is possible to get into the cave when the water is low by stepping on the ridges of stalagmites which rise above the water. It extends for a considerable distance at one spot as a somewhat narrow passage, and at another widening out into a large chamber. So far as I saw the stalactitic growths were not of particular beauty or interest, though I did not get into every part of this cave. The bridle-path, up the side of the creek, between these caves, has a few sidlings which are somewhat dangerous looking, but the views obtained on the way of the limestone cliffs and the Yarrangobilly Valley are very fine.

The deposition of carbonate of lime in the form of stalactites and stalagmites in these caves has been more rapid than in the case of the Jenolan Caves. Here the stalactites are larger and more massive, and in many parts of the caves both these and the stalagmites are coated over with a thick layer of soft pulverulent deposit which easily rubs off. In many cases they assume the most fantastic shapes, forming crooked and irregular masses. The prevailing colour tint is yellow, although pure white and green are not uncommon. The fine and delicate forms of stalactite are not so common, but they do occur in clusters between the larger stalactites as small delicate white or yellow tubes. Although very many of the stalactites have been broken and otherwise disfigured by former visitors to the caves, there still remain some beautiful specimens of stalactitic growth, particularly in the Left-hand Cave and the middle chamber of the Right-hand Cave. The other features of this latter cave is its inmost chamber, which is well worth seeing, because of its vast size, and the enormous blocks of limestone which strew the floor.

In some of the smaller and drier cavities in these caves the floor is found to be covered with the bones of small animals. No bones have as yet been found cemented in the stalagmite of the floors of any of the caves, although it is quite probable that if search were made some such remains might be found. In Britain and some parts of the Continent of Europe there occur limestone caves which have yielded the remains of extinct animals, which have proved of the greatest scientific value; while, in a few instances, traces of prehistoric man have been discovered in these caves, such as layers of charcoal, which are the remains of his fires and the occurrence of his weapons and implements, under the stalagmitic floors. We have, in the Jenolan Caves, deposits of stalagmite containing fossil bones, which, however, have not yet been examined; and doubtless bone breccias occur in other caves in the Colony, which, if worked out, might give results of peculiar scientific interest, for it is very probable that some of our caves at least may have been open to the external air for ages. But apart from the scientific interest of these caves, as preservers of the remains of some of our ancient fauna, they have also a public interest in that they would well repay the visitor, both by their own natural beauty and by the magnificent mountain scenery which is to be seen by either route.

In both caves there has already been much damage done by former visitors breaking off the stalactites, and disfiguring those that are left by pencilling their names on them. To prevent any further damage of this kind from taking place it would be necessary either to put an iron gate across the mouth of the Great Arch, or else a gate across the entrance of each cave; but I think the former would be preferable, and also to have a guide and keeper, who would show visitors through the caves and see that no damage was done.

Inside the caves the improvements necessary for the safety of visitors would not require to be very extensive. In the Left-hand Cave there is a good path in as far as the beginning of the Avenue of Pillars mentioned above. At this point three steps would be a convenience, while the whole length of the avenue, about 25 yards, would need to be levelled by filling up the hollows. At the further end of it a couple of steps, with a short levelling, and then three more steps, would make progress easier. Through the Queen's Chamber and the one adjoining it a path can easily be cleared by the removal of a few broken stalagmites and the fallen stalactites which strew the floor. At the commencement of the passage which goes off from the Queen's Chamber to the left a number of steps would need to be cut, while at the end of the passage a ladder would be necessary in order to allow of visitors seeing the chamber at the end of it. In the Right-hand Cave steps would have to be cut or a ladder placed for a considerable distance among the groups of stalagmites, to get easily from the Middle Chamber to the Blow Hole. The Blow Hole itself, or some other of the openings, would require to be enlarged to enable visitors to pass into the Great Cavern. To make a path through this cavern it would be necessary to cut the tops of the boulders flat, which

which came in the way, and fill up the hollows between them with cement. If this were done, it is probable that in some parts of its course the path would require to be fenced in with iron-wire rope and netting. The course which this path would take through the Great Cavern would have to be fixed only after an examination of the whole area of the floor, as the boulders are so large and lie in such confusion. With regard to the site for an accommodation house and a horse-paddock, there can be no difficulty about these. Little over a $\frac{1}{4}$ of a mile down the Yarrangobilly Creek, where it takes a bend to the east, there is a piece of good land which would be very suitable both for the site of an accommodation house and a paddock of almost any size. This land is bounded on the west and south by the Yarrangobilly Creek, and on the east by what is called the Warm Spring, which at this point is a strong flowing creek, the waters of which are tepid. A path could easily be made up the side of the creek from the accommodation house here to the caves. The only spot nearer the caves than this where there is sufficient level ground for a house is within a few hundred yards to the south of the caves, but here there would be no water except what was carried up from the creek, 300 ft. below.

With reference to the appointment of a keeper to the caves, I have to state that while I was at the caves I met Mr. James Murray, of Kiandra, who knows the caves well, and seems otherwise well fitted to fill the post of caretaker and guide to the Yarrangobilly Caves.

I have, &c.,

WILLIAM ANDERSON,

Geological Surveyor.

APPENDIX L.

Mr. Geological Surveyor Anderson to The Geological Surveyor-in-Charge.

Report on the Kiandra Gold-field.

Department of Mines, Sydney, 11 January, 1887.

Sir,

In accordance with your instructions, I have inspected the auriferous Pliocene and Pleistocene deposits which are being hydraulic sluiced and otherwise worked for gold in the neighbourhood of Kiandra, and have the honor to submit the following report thereon:—

The late Mr. Lamont Young, in his report on the Kiandra Gold-field, published in the Annual Report of the Department of Mines for 1880, has given such a good account of the general features of the district, both physical and geological, that it will not be necessary for me to go into details regarding them.

At the present time the only hydraulic sluicing being carried on is by the Kiandra Sluicing Company, at the New Chum Hill claim, about $\frac{1}{4}$ of a mile to the N.W. of the township. The New Chum Hill is situated in the angle of junction between the Eucumbene River and Bullock's Head Creek. It is a "made" hill, and its summit is a heterogeneous mass of loose basalt blocks. At no point on this hill did I see the bed of basalt *in situ*. The workings are on the S.E. side of the hill. The most westerly of the two open cuttings has been formerly worked but is now stopped. The other large cutting to the east is the one which the Kiandra Sluicing Company are at present engaged on. The exposed face in this cutting ranges in height from 105 to 120 ft. The beds which form this section are as follows:—1st, wash-dirt; 2nd, clay; 3rd, carbonaceous clay; 4th, pipeclay; 5th, lignite; 6th, clay; 7th, basalt. The bed-rock consists of nearly vertically bedded Silurian rocks which have a meridional strike. Some of them contain a large amount of iron pyrites. Their colour varies much, and many of them are much decomposed, some into a pink and others into a yellowish clay. The surface of these slates on which the wash-dirt rests is very irregular. In some places there are from 1 to 2 in. of cement or iron ore between the slate and the wash-dirt, and some patches of this cement have proved very rich in gold, which is in the form of small water-worn pieces. Wherever the bed-rock is blue coloured there is no cement, but the wash-dirt has a blue tinge. The wash-dirt itself has an average thickness all round the exposed face of 10 ft. In some places it is quite loose, but in others it is somewhat cemented together. Lenticular patches of lignite, sand, and clay occur throughout it. The boulders and pebbles in the wash consist mostly of Silurian slates. Quartz pebbles do not occur in any great abundance, but some large boulders of quartz have been obtained which showed large patches of gold on them. In some places the cement occurs on the top as well as below the wash, but in this position it never contains payable gold.

The beds of clay and pipeclay are mostly of a white colour, but some parts of them are brown, pink, and yellow. As a rule they are fine-grained, except the upper beds, which are very gritty, being largely made up of small fragments of quartz. These clays show evidences of false bedding.

There are two beds of the so-called lignite. The lower of these is a chocolate-coloured carbonaceous clay, which contains the remains of much vegetable matter, in the form of stumps, branches, and leaves of trees, mostly in a good state of preservation. The bed is finely laminated, and easily splits up into fine layers, disclosing the fossil leaves in great profusion. This leaf-bed is of considerable thickness, and at one spot shows a beautiful example of contemporaneous erosion and deposition, where it has been entirely eroded through by a streamlet, and the old channel is now filled up with white clay, similar to the bed above it. In another part of the section occurs a second example of this, where the clay-bed below is eroded, and the leaf-bed rests immediately on the wash-dirt.

The upper bed of lignite is a hard black coaly-looking bed, almost entirely composed of vegetable matter, in the form of branches, twigs, and leaves of trees, all lying more or less horizontally, and as a rule well preserved.

With an average rainfall sluicing operations can be carried on at this claim almost all the year round. A constant supply of water is obtained from a dam which the Company have made in the Three-mile Creek. The water is conveyed by a race for a distance of 3 miles to the workings. The race comes in on the top of the face, and the water is conveyed from it, first in 22-inch pipes, and then in 15-inch pipes, to the bottom of the cutting, where the pipes are reduced to 13-inch, and this size of pipe carries the water to the nozzle, whose diameter at the point is $5\frac{1}{2}$ in. The pressure of the water at the nozzle point is 120 lb. to the square-inch. It can throw a stream of water a distance of 150 ft.; but to do work the distance must be from 100 to 120 ft. There are two sets of pipes from the race to the bottom of the workings, and two nozzles are at work placed at some distance from each other. The nozzles are movable in all directions, so that they can play on the bed-rock from a few feet in front of them to the face of the cliff, and on the cliff itself for a considerable distance on either side. The method of working is as follows:—The stream of water from the nozzles is applied to the wash-dirt at the base of the section, and as this is washed out the cliff is undermined, and as a result great masses of it fall. They sometimes effect

effect this by driving a tunnel in through the wash, and firing a large shot at the end of it. The nozzle is allowed to play upon these masses brought down from the cliff face, and all the loose material is washed away, leaving the larger lumps of clay and lignite. These are blown into small pieces by means of blasting, so that most of these clays and lignites are washed away along with the gold-bearing gravel. For the collection of the gold there are from 15 to 1,600 ft. of wooden boxes, which carry the muddy water from the workings to the Eucumbene River. The material which falls from the cliff along with the finer wash-dirt and gold is carried by the stream of water from the bottom of the cutting into the boxes, which are paved with stones. When the gold is to be collected from the boxes this false bottom of stones is taken out, and the amalgam of mercury and gold is removed and retorted. In 1885 the amount of gold obtained was 1,100 oz.

Township Hill lies to the west of Kiandra, and is separated from the New Chum Hill by the Bullock Head Creek, which proved very rich in gold for nearly a mile above its junction with the Eucumbene River. This gold had been washed out of the lead, which was cut across at this point by the creek in the formation of the valley. The hill itself has a capping of basalt, and the exposed sections and old shafts show that the clay-beds and lignite occur beneath it. Only one party are at present at work here, driving a tunnel into the hill to strike the wash. The tunnel is situated a little to the N.W. of the town, and at a slightly higher level. It has been driven 433 ft. through the slate rock. At the entrance the rock was somewhat soft, probably due to decomposition; but it gradually got harder until now at the end of the tunnel it is very hard and compact, and full of small veins of quartz. The direction of the tunnel is westerly, and they have every prospect of shortly striking the wash-dirt, which in all likelihood will be very rich.

The deep lead will no doubt be found under the basalt tableland which stretches from the Township Hill on to the Four-mile Creek, which is the next point southward where it has been worked. At North Broomfield, on the west side of this creek, the section in the cutting is composed of the same succession of beds as are found in the New Chum Hill workings. On the opposite side of the valley is another open cutting, and still further to the south are the South Broomfield workings. Sluicing operations are now stopped at all of these places. The only work being done is by a party who are engaged working the redistributed deep-lead gravels in the valley of the Four-mile Creek.

Nine-mile Diggings.—There are still one or two parties working in the redistributed gravels in the Nine-mile Creek.

The deep lead itself has been worked here as the Empress mine, and sluicing operations have been carried on until lately. The beds seen in the face are similar to the New Chum Hill beds, except in their thickness, which varies much in the different localities where they have been exposed. The wash here is thicker than at the New Chum Hill, and the gravel is not so coarse, while patches of sand, impregnated with iron, are more numerous. The upper bed of carbonaceous clay or lignite is not shown in the section exposed in the face. The pebbles in the wash are mostly quartz, and they are much smaller than in New Chum Hill.

Fifteen-mile Diggings.—They lie in a southerly direction from Kiandra, to the south of the Tumut River. Sluicing has been at a standstill here for some time. The section is essentially the same as in the other cuttings, except that here the carbonaceous clay is more shaly and harder than in the other localities, and in some parts the wash is in the form of a hard conglomerate. Some of the plant-remains in the hardened shaly clay are particularly well preserved.

Three miles further south there is some work being done in a small gully, with fairly good results. Between this point and the Fifteen-mile Diggings the basalt can be traced all the way.

Six-mile Diggings.—These are situated about 6 miles out from Kiandra on the north side of the Kiandra Plains. The wash-dirt here is much cut up by layers of sand. For a considerable distance further into the hill than has been worked there is very little thickness of clay above the wash-dirt, although higher up the hill the other clay and lignite beds come into the section, so that the gravel could be easily worked here for some distance. In all the workings the bed-rock is Silurian slate, having a N. and S. strike, with a high dip to the east, so that in this part of its course the old river had flowed approximately parallel to the strike of the slates.

This deep lead can be traced at intervals for over 20 miles in the neighbourhood of Kiandra, the basalt forming flat tablelands along the tops of the ridges. In some places the bed of basalt itself is seen, with its upper surface weathering out into rudely columnar blocks, while in others the soil is full of the basalt boulders.

The clay-beds in all the localities are remarkably uniform, both as to their succession and texture, and consequently they could not have been laid down by a strong flowing stream such as deposited the gold-bearing gravels below them. But I think that after the gravels had been deposited by the old stream, it is probable that during the deposition of these clay-beds lacustrine conditions must have prevailed. The occurrence of false bedding would show that there had been currents present, while the evidences of contemporaneous erosion and deposition in the lower carbonaceous clay-bed point to the fact that either its upper surface must have been, for a time at least, a land surface, probably a marshy one, or that it had been covered by only a small depth of water, which, gradually increasing in depth, allowed of the deposition of the clay-beds above it. There can be no doubt, I think, that the upper bed of carbonaceous clay or lignite was formed under conditions somewhat analogous to those which obtain in the formation of peat. After this there must have been a considerable depth of water in which the overlying beds of clay were deposited. In none of the sections did I see the bed of basalt resting on the bed below it, but it must have flowed down the valley as a stream of lava, covering up the deposits which had been forming there, and by its presence preserving the gold-bearing gravels and beds below it from being washed away by the denuding agents which have swept away the hills which formed the boundaries of the old river valley, leaving now as hills the deposits which were laid down in the bottom of the valley.

The great drawback to the working of this deep lead in the neighbourhood of Kiandra is the want of a sufficient supply of water for sluicing operations, although the work at the New Chum Hill can be carried on for most of the year. There is no doubt that from the number of places at which this deep lead has been proved to be payable the other parts of it will be equally so, and I believe that this lead will yet prove a very rich source of gold.

I have, &c.,

WILLIAM ANDERSON,

Geological Surveyor.

APPENDIX M.

APPENDIX M.

The Curator of the Mining and Geological Museum to The Under Secretary for Mines.
Report of the Curator of the Mining and Geological Museum.

Sir, Mining and Geological Museum, Department of Mines, 7 January, 1887.

I have the honor to submit the following report upon the examination, assays, and analyses of specimens submitted to the Department of Mines during 1886; returns of donations and other additions to the Mining and Geological Museum and Library; collections prepared for institutions and individuals; and progress made in the arrangement of the collection for display.

EXAMINATION, ASSAYS, AND ANALYSES OF SPECIMENS.

The increasing number of specimens submitted for examination each year affords practical evidence of the value to the public of the work being done in this way.

In addition to the samples assayed or analysed—of which particulars are given—numerous others have been personally submitted and verbally reported on after blow-pipe or other tests.

At the beginning of the year, upon your instructions, I undertook the correspondence in connection with results of assays, &c., as well as the bulk of the preliminary examinations, a course which I am pleased to report has resulted in the dispatch of the results to the senders either upon the day received from the Government analyst or the one following, in the majority of cases on the former, thus doing away with the unavoidable delay caused in submitting them in the usual way.

I desire to bear testimony to the promptness with which the Government Analyst and his officers have performed the great amount of work submitted to them. The following record reflects great credit upon the capability and energy of Mr. Mingaye, the officer who, under the Government Analyst's supervision, has performed the great bulk of the work.

2,211 samples were received in the ordinary way for examination. Of these 404 were deemed sufficiently tested by blow-pipe or other simple tests, and the senders informed.

1,807 were, after preliminary examination, submitted to the Government Analyst for treatment; of these 1,799 were completed by the end of the year, necessitating 3,647 separate tests and 51 complete analyses.

GOLD.

1,657 tests were made for gold, and resulted as follows:—

274 samples yielded from 2 dwt. to 884 oz. of gold per ton.

330 samples yielded from a trace to 1 dwt. 23 gr. of gold per ton.

1,053 samples yielded no gold.

LOCALITIES.

Localities and description of ores from which the best results were obtained,—

Locality.	Description.
Albury	Pyritous quartz.
Abercrombie Ranges	Gem sand.
Armidale	Quartz and breccia, associated with sulphide of antimony.
Bongongolong	Quartzite and pyrites.
Bundanoon	Gossan and compact iron ore.
Boro	Ferruginous carbonate and sulphide of copper.
Bombala	Quartz and massive pyrites.
Bellubula	Black sand associated with gem stones.
Bingera	Ferruginous quartz.
Bungonia	Ferruginous porous quartz and a little pyrites.
"	Quartz and iron ore showing free gold.
Bermagui	Quartz with free gold.
Carangera	Tailings.
Clear Creek	Blanketings.
Cudal	Ferruginous gossan.
Coolongolook	Quartz with pyrites and free gold.
Cowra	Ferruginous gossan.
Captain's Flat	Quartz with pyrites and specular iron.
Capertee	Ferruginous quartz.
Dromedary Mountain	Brown iron ore.
Fairfield	Ferruginous porous quartz with free gold.
"	Copper and iron pyrites with a thin film of black oxide of copper.
"	Ferruginous claystone.
"	Ferruginous, brecciated, felspathic vein-stuff.
Gundagai	Quartz and mispickel.
Goulburn	Pyritous quartz showing free gold.
Green Swamp	Quartz with iron pyrites.
Gulgong	Quartz showing free gold.
Glen Innes	Quartz with iron pyrites.
Hanging Rock	Ferruginous quartz and free gold.
Howlong	Quartz containing iron and arsenical pyrites.
Jerrara Creek	Porous silicious iron ore.
Lewis Ponds Creek	Ferruginous quartz, with a little carbonate of lead and clay fluccan.
"	Porous, friable, brown iron ore.
Lucknow	Iron pyrites (concentrated.)
Marulan	Brown iron ore.
"	Sulphide and oxide of antimony, with lead and quartz.
"	Quartz containing carbonate and sulphide of lead, a trace of antimony, and arsenical pyrites
Muttama	Concentrated pyrites.
"	Quartz, iron pyrites, and galena.
Mudgee	Ferruginous quartz and mispickel, showing free gold.
Mitchell	Quartz, with a little pyrites and galena.
Major's Creek	Quartz, with copper and iron pyrites and galena.
Nana Creek	Quartz.
Orange	Porous ferruginous quartz and iron pyrites.
Paling Yard Creek	Ferruginous gossan.
Sebastopol	Quartz, with iron pyrites and galena.
Turon River	Ferruginous quartz.
Tuena	Ferruginous carbonate of lead.
"	Massive iron pyrites, with black oxide of copper in lode-stuff.
Trunkey	Black sand, principally magnetic iron ore.
Urana	Ferruginous quartz.
Wagonga	Ferruginous quartz.
"	Ferruginous quartz with pyrites.

SILVER.

SILVER.

1,659 tests were made for silver, with the following results:—161 samples yielded from 10 oz. to 7,872 oz. 13 dwt. of silver per ton; 589 samples yielded from a trace to 9 oz. 19 dwt. per ton; 909 samples yielded no silver.

Localities.

Localities and character of ore from which the most favourable returns were obtained were:—

Armidale	In ferruginous carbonate of lead galena.
Barrier Range	Ferruginous quartz with galena and carbonate of lead.
Braidwood	Crushed sample.
Back Creek	Ferruginous schist and quartz veins.
Bingera	Ferruginous quartz.
Cooma	Galena.
Deepwater	Carbonate and sulphide of lead.
Ennerville	Ferruginous claystone and oxide of iron.
"	Fahlerz, galena, and pyrites, and a little quartz.
Emu Swamp	Porous, silicious, brown iron ore.
Fairfield	Porous ferruginous quartz.
Goulburn	Arsenical pyrites, and a little black oxide of copper.
Grafton	Crushed ferruginous sample, with galena.
Lewis Ponds Creek	Earthy carbonate of lead.
Marulan	Sulphide and oxide of antimony, with lead and quartz
"	Porous gossan and arsenical pyrites.
Mt. Grosvenor	Galena and quartz.
Mitchell	Galena.
Newbridge	Crushed sample.
Ophir	Porous ferruginous quartz.
Pye's Creek	Sulphide of antimony and lead occurring in nodular pieces.
"	Claystone and quartz, with fahlerz.
"	Galena and carbonate of lead.
Peelwood	Porous silicious gossan, with carbonate of lead.
"	Ironstone and quartz.
Tuena	Ferruginous carbonate of lead.
"	Porous iron ore.
"	Galena, carbonate of lead, and brown iron ore.
Tenterfield	Carbonate and sulphide of lead.
"	Galena.
Wiseman's Creek	Earthy veinstone, chiefly quartz.

COAL.

Twenty-one analyses were made of samples of coal. The best samples were from James Pye's 6-ft. seam, at a depth of 72 ft., in portion 53, parish of Black Jack, county Pottinger. A good sample was also obtained from Darcy's Well, in portion 16 of the same parish.

From the diamond drill bore at Heathcote, from a seam 4 feet 8 inches, at a depth of 1,513 feet.

From block 16, parish Wallarab, county of Northumberland.

From Lake Macquarie, from an unworked seam, and from Deep Creek, Bishop's Bridge, West Maitland.

SHALE.

Four analyses were made of samples of kerosene shale from the Mudgee Railway Line beyond Capertee, Rylstone, and Port Stephens, but in each case the amount of ash was excessive.

TIN.

Eighty-nine tests were made for tin; eighteen of the samples yielded from 1.25 to 70.3 per cent.; seventy-one from nil to a trace of tin per cent.

Localities.

Localities and character of ore from which the best returns were obtained were:—

Ashford	In greisen.
Bendemeer	Stream-tin ore.
Bundarra	"
Gilgai	Lode-tin ore.
Inverell	Stream
Gumble	A fine sample, obtained by crushing and washing lode-stuff, at Gumble Tin and Copper Mine—felspathic lode-stuff, with tinstone and carbonate of copper.
Moree, 40 mls. NE. of	Stream-tin ore.
Stannifer	Lode-tin ore.
Tenterfield	"

COPPER.

Seventy-three tests were made for copper, eighteen yielded from 20.5 per cent. to 72.05 per cent.; fifty-five from nil to 20 per cent. of metallic copper.

Localities.

Localities and character of ore from which the best results were obtained were:—

Bombala	Ferruginous grey and yellow sulphide of copper.
Barrier Range	Grey sulphide and traces of green carbonate of copper.
Bermagui Biver	Copper pyrites and traces of green carbonate of copper in quartz.
Cobar, 3 miles from ...	Blue and green carbonate of copper.
"	Green carbonate, from 70 miles west of Cobar
Fairfield	Crushed sample of iron and copper pyrites, coated with a thin film of black oxide of copper.
"	Ferruginous grey sulphide of copper.
Gulgong	Ferruginous carbonate and sulphide of copper.
Gundagai	Red oxide of copper and a little quartz.
Molong	Yellowish earthy felspathic lode-stuff with carbonates of copper.
Mitchell	Carbonates of copper from Tonkin's silver mine.
New England	Green carbonate and grey sulphide of copper, from Lottery Creek.
Razorback, 6 mls. from	Ferruginous copper gossan.
Shoalhaven River	Grey sulphide of copper in quartz.

ANTIMONY.

169

ANTIMONY.

Twenty-three tests were made for antimony; sixteen yielded from 10 per cent. to 70·4 per cent., and seven from nil to 10 per cent. of metallic antimony.

Localities.

Localities and character of ore from which the best returns were obtained were:—

Bellinger River.....	Sulphide of antimony.
Coolongolook.....	Sulphide of antimony in quartz.
Carangula.....	Sulphide of antimony and a little quartz; sulphide and oxide of antimony.
Crudine.....	Breccia with sulphide of antimony.
Gulgong.....	Oxide of antimony, from Ford's Creek.
Macdonald River.....	Sulphide of antimony and a little quartz.
Razorback.....	Oxide and sulphide of antimony and a little quartz.
Sofala.....	Sulphide of antimony and quartz.
Shoalhaven.....	do do
Talbragar.....	Oxide of antimony.
Temora.....	Sulphide of antimony in quartz.

LEAD.

Eighty-three tests were made for lead; forty-eight of them yielded from 20 per cent. to 76·5 per cent.; and thirty-five from nil to 20 per cent. of metallic lead.

Localities.

Localities and character of ore from which the most favourable returns were obtained, were:—

Binalong.....	Sulphide of lead and a little quartz.
Bombala.....	Ferruginous sulphide of lead, quartz, and calcite, with sulphide of lead, copper pyrites, and a little green carbonate of ditto; ferruginous galena and carbonate of lead.
Burrowa.....	Crushed sample.
Barrier Range.....	Ferruginous carbonate of lead; ferruginous carbonate of lead and quartz.
Bathurst.....	Galena and pyritous quartz.
Braidwood.....	Schist rock with carbonate of lead.
Cooma.....	Galena (sulphide of lead).
Emmaville.....	Ferruginous felspathic gossan with galena; galena and carbonate of lead; galena and a little quartz and decomposed felspathic rock.
Fairfield.....	Ferruginous carbonate of lead galena.
Lewis Ponds Creek.....	Earthy carbonate of lead.
Mitchell.....	Ferruginous carbonate of lead galena.
Severn River.....	Galena carbonate and sulphate of lead.
Tenterfield.....	Carbonate and sulphate of lead.
Tuena.....	Ferruginous carbonate of lead.
Yass.....	Galena.

BISMUTH.

Eleven tests were made for bismuth, yielding from nil to 11·76 per cent., the latter being from the Gumble Mine, near Molong.

IRON.

Five analysis of iron ores were made—one from Port Stephens, yielding 48·14 per cent. of metallic iron; the others were of inferior character.

MANGANESE.

Twelve tests were made of manganese ores, yielding from 23·67 to 91 per cent. of manganese dioxide. The samples submitted were all various qualities of the ordinary black oxide of manganese, the best results were obtained from ores from the following localities:—

Localities.

Bendemeer, Bowning, Newbridge, Newcastle District, Pentecost Island, Sutton Forest, Walcha.

COBALT.

Eighteen tests were made for cobalt; fourteen yielded from 0·5 per cent. to 5·8 per cent. of sesquioxide of cobalt.

Localities and character of ore from which best results were obtained, were:—

Bungonia.....	Concretionary manganese oxide grit, cemented with oxide.
Bombala.....	Concretionary manganese oxide.
Glen Morrison.....	Porous do
Lake George.....	Concretionary do
Lismore.....	Decomposed felsite with joints, coated with slickensides of black oxide of manganese.
Port Macquarie.....	Earthy manganese oxide.
Sutton Forest.....	do do
Trial Bay.....	do do

NICKEL.

Five tests were made for nickel, but little more than a trace was found in them, and associated with cobalt in manganese oxide.

ZINC.

Four tests were made for zinc, yielding from 18·17 to 69·98 per cent. of metallic zinc—from the following localities:—

Localities.

Bredbo.....	Carbonate of zinc (the first discovery, as far as I am aware, of this ore in the Colony.)
Fairfield.....	Sulphide of zinc.
Pye's Creek.....	do with copper pyrites.

CHROMIUM.

Four tests were made for chromium, yielding from 28·44 per cent. to 47·70 per cent. of sesquioxide of chromium; the samples were chromite, and came from the Grafton District.

TUNGSTEN.

Two assays and one analysis were made of wolfram ores, yielding from 47·9 per cent. to 74·41 per cent. of tungstic trioxide, from the following localities:—

Localities.

Armidale.....	Scheelite (tungstate of lime.)
Peelwood.....	do do
Severn River.....	Wolfram (tungstate of iron and manganese).

PLATINUM.

Two tests were made for the presence of this rare metal, but without result.

LIMESTONE.

Four analyses were made of samples of limestone from the following localities, and yielding the accompanying percentages of carbonate of lime :—

Bungonia	86.70	per cent.	
Ben Bullen.....	95.32	"	
Myall River	52.52	"	} An argillaceous limestone, likely to be of use in the manufacture of hydraulic cement.
Muswellbrook	66.55	"	

GYPSUM.

An analysis of a sample of gypsum from Lake Tank, 20 miles north of Bourke, yielded :—

Sulphate of lime	75.66	per cent.
Water of crystallization and Hygroscopic moisture	20.20	"
Sulphate of magnesia61	"
Oxide of iron and alumina60	"
Silica	2.90	"
	<hr/>	
	99.97	per cent.

This mineral is reported to occur in considerable quantity.

WATER.

Four analyses were made of water for the purpose, in two instances, of ascertaining the cause of reported poisonous effects of water from Patrick's Station, near Denison Town, upon stock; in another the deleterious effects upon the human bladder, of water from Pike's well, near Curlewis Station, G. N. Railway line; and in the last, to ascertain whether a sample of water from Holy Box well, near Mossgiel, was becoming more potable.

MISCELLANEOUS.

Fifteen analyses were made of miscellaneous samples from various parts, and for various purposes.

MINING AND GEOLOGICAL MUSEUM.

108 donations were received during the year for the Mining and Geological Museum; the most important being a collection of Permian and Cretaceous fossils from the Royal Mineralogical and Geological Museum of Dresden, presented through the director, Dr. Genitz. Fossil fish, portion of ribs, jaw, and teeth of labyrinthodont, lamellibranchs, and plant remains from the Wianamatta shales at Bowral, by Mr. B. Dunstan; three specimens of diamonds in tertiary drift, and samples of diamondiferous wash from the Crown Jewel Mine, Inverell, by Mr. W. Brown; antimony ores from Mr. Cochran's property at Carangula, by Mr. W. H. Buckley; blue and white topaz and rock crystal from Cooyal, by Mr. S. Blackman; silver and copper ores from Wiseman's Creek Silver and Copper Mine, by Mr. T. A. DeWolf; tertiary fossil leaves and fruits from Mount Pleasant, Nundle, by Mr. J. Henderson; tin and copper ores from Gumble Tin and Copper Mine, by Mr. J. E. Kelly; the original fossil fish *Cleithrolepis granulatus* Eg. described by Sir Phillip Egerton, Bart., M.P., F.R.S., V.P.G.S., &c., in the Quarterly Journal of the Geological Society of London, 1864, Vol. XX, presented by the Reverend Canon King; chessylite from new Mount Hope, by Dr. M'Queen; metallic antimony in calcite, auriferous mispickel, &c., from New Reform Gold-mine, Lucknow, by Mr. H. W. Newman; chloride of silver from Northern Queensland, by Dr. Robertson; volcanic ash, stones, and scoriæ from the recent eruptions at Mount Tarawera, in New Zealand, by Mr. T. S. J. Rigg; diamond crystal from the Sydney Diamond Mining Company's property at Inverell, by Mr. T. Walters, manager.

In addition to the above, the collection has been augmented by specimens collected by yourself, Mr. Geological Surveyor David, and the Collector Mr. Charles Cullen, of which particulars are appended.

Mr. Cullen has been fortunate in discovering at Cockatoo Island, a portion of the first labyrinthodont found in Australia. It was identified by Professor W. J. Stephens, M.A., as being closely related to *Mastodonsaurus robustus* of the Trias of Stuttgart. The discovery of this interesting fossil, so closely resembling that from Stuttgart, even to the mineralogical character of the strata in which it is embedded, should, if the two formations yielding similar fossils can be classed together as homotaxial—though probably not geologically contemporaneous—set at rest the hitherto undecided question of the exact chronological age of the Hawkesbury series.

Following this discovery an almost perfect specimen of a smaller species of the same family was obtained from the same geological horizon at Gosford, and secured for this Museum. From the overlying Wianamatta shales at Bowral, portion of a jaw and teeth, and of a vertebra and ribs of a similar animal were discovered by Mr. B. Dunstan, and generously presented to the Museum.

The Museum has been further enriched by the addition of a large collection of fossil fish secured by Mr. Cullen, at Gosford. Many of the fossils are in a splendid state of preservation, and embrace—in addition to several known species—others that appear new to science. They were obtained in quarrying sandstone ballast for the railway line in course of construction at Gosford.

This discovery is particularly interesting and valuable, as hitherto, but few remains of fishes have been discovered in the Colony; and, with the exception of those found at Bowral, almost isolated specimens only. The majority of these were in the collection of the late Rev. W. B. Clarke, destroyed with the Garden Palace.

It is interesting to note that the only shell—a univalve, belonging to the Bellerophonidæ—as yet discovered in the Hawkesbury formation, should afford yet another example of the prolongation of the existence of an ancient type at the Antipodes. It was obtained in excavating the Government Dock at Cockatoo Island, and Mr. Robert Etheridge, jun., who has recently described and named it *Tremanotus Maideni*, states that it has affinities with a similar type in the Upper Silurian, and with a single (?) specimen discovered in the Cretaceous, of Europe (?); but is more closely related to the former. Its occurrence, therefore, in the Hawkesbury sandstone affords no evidence of the age of the beds.

The number of specimens registered amounted to 2,706, making the total to date 19,417.

From this total must deducted 1,056 specimens used for collections, leaving a balance of 18,361 in hand.

LIBRARY.

LIBRARY.

Sixty-one donations were received for the Library; amongst them being valuable reports of the geological surveys of the United States, India, Canada, and New Zealand; progress reports from the Secretary for Mines and Water Supply, Victoria, and reports of the proceedings of various scientific institutions abroad.

Nineteen collections, numbering 1,261 specimens, were prepared upon your instructions for the different institutions and individuals given in Appendix.

During the first quarter of the year a considerable amount of time was taken up in the arrangement and dispatch of the balance of the mineral exhibits for the Indian and Colonial Exhibition in London, which has just now closed.

From the reports published, the Mineral Court at the Exhibition fully sustained the reputation of New South Wales, being one of the most favoured of British possessions in the variety and extent of its mineral resources.

I am glad to be able to report that the Mining and Geological Museum is now sufficiently arranged to allow of the admittance of the public.

Owing to the limited space, specimens from other Colonies and countries have necessarily been curtailed, chief prominence being given to the minerals and fossils of the Colony.

No systematic arrangement has been aimed at other than the grouping of the various minerals and ores, and the stratigraphical arrangement of the fossils, owing to want of room, and to allow of additions and alterations from time to time as specimens are obtained.

In view of a more commodious building being obtained in the future, it is extremely advisable to obtain for the Museum a complete collection of minerals and fossils from Europe, as many breaks occur in our collection, the value of such would be unquestionable.

As I venture to think that a detailed description of the specimens in the Museum comes more within the scope of a pamphlet for distribution, I refrain from entering into it here, and briefly state that advantage has been taken of all the best specimens in hand, so far as space would allow, and that in the present year just begun, as show cases can be procured, the passages will be still further encroached upon, and other and more appropriate labels substituted, as the work can be performed at the Government Printing Office.

In concluding my report, I have to acknowledge the ready and willing assistance I have always received from my assistant, C. Hildebrandt, junior, since his appointment.

I have, &c.,
JOSEPH E. CARNE,
Curator.

Specimens obtained by Officers of the Department of Mines during 1886:—

APPENDIX N.

Remarks on a Univalve Shell from the Hawkesbury Sandstone. By R. Etheridge, Junr., Palæontologist to the Geological Survey, New South Wales.

THE Hawkesbury Series, so largely developed around Sydney, has up to the present time proved quite barren of any traces of an invertebrate fauna. The discovery, therefore, of a univalve shell in the Hawkesbury Sandstone, near Sydney, by Mr. J. H. Maiden, Curator of the Technological Museum, is a fact of much importance, the organic remains hitherto consisting only of fish and plants.

The shell in question may belong to either one of two genera—*Bucania*, Hall, or *Tremanotus*, Hall—precisely as certain points in its structure are interpreted. Both these genera are members of the extinct family Bellerophontidæ, and nearly allied to *Bellerophon* itself. The family became extinct at the close of the Palæozoic Period, with the exception of one genus, *Bellerophina*, which appeared and died out in the Cretaceous Epoch. If the present shell is determined to be a *Bucania*, we have here simply a survival from the underlying Carboniferous rocks, at the termination of which period the genus ceased to exist. On the other hand, should the controversial point of structure, shortly to be touched upon, be maintained in favour of *Tremanotus*, we cannot help regarding the Hawkesbury fossil as a very interesting reappearance of a peculiar Upper Silurian type of Gasteropoda. *Tremanotus* occurs in the Niagara Group of North America, and in the equivalent horizon in Europe, the Wenlock Series; and although *Bucania* is not known in Australian Carboniferous rocks, notwithstanding its otherwise wide geographical range, representatives of the family Bellerophontidæ are found in the Upper Marine series of New South Wales.

The view of Dr. O. Feistmantel as to the Triassic age of the Hawkesbury series appears to be now generally accepted, based on the nature of its flora, and has been adopted by Mr. C. S. Wilkinson.* Accepting this view as probably the correct one, so far as our knowledge of the Hawkesbury flora at present exists; and, looking to the firmly established position of the group of beds above the Carboniferous series, we are constrained to regard the occurrence of *Tremanotus* in the Hawkesbury Sandstone as a reappearance of a member of the Bellerophontidæ, similar to that of the little *Bellerophina* in the Cretaceous period. I do not otherwise perceive how it is to be accounted for, when we remember that the Carboniferous fauna, of which the Bellerophontidæ form an important factor, died out at the close of the Upper Marine Series, almost completely, and that between this horizon and that of the Hawkesbury rocks we have the whole of the Upper Coal-measures without an invertebrate fauna. With the view of arriving at a more accurate conclusion, let us examine the characters of the two genera more minutely. *Bucania* was established † by Professor James Hall, of Albany, "to include several species of shells of a peculiar form, usually referred to *Bellerophon*, but from which they differ in having all the volutions visible, and gradually increasing in size. The *Bellerophon cornuarietes*, of Sowerby (Min. Conch., Tab. 469., f. 2) will fall under this genus." The name is derived from βυκωνη, a trumpet, which exceedingly well exemplifies the form of the shell, the whorls enlarging rapidly, with an expanded aperture, the last one being carinate along the median line of the back. *Tremanotus* is described thus ‡ by the same author: "Volutions apparently in the same plane; umbilicus on both sides; aperture expanded; the dorsal line pierced by several oblong perforations." On the species *Tremanotus alpheus* he remarks: "The specimen is a cast of the interior of the shell, and along the periphery presents a range of elongated oval prominences which have apparently been perforations in the shell, arranged at equal distances from each other." Now, a comparison between the characters of the two genera and those of the Hawkesbury fossil will indicate its resemblance to *Tremanotus*, rather than to *Bucania*. In all three the volutions are in the same plane, there is an umbilicus on both sides, and a much expanded trumpet-shaped aperture; but in *Bucania* the back of the body whorl is simply carinate, whereas both in *Tremanotus* and the Hawkesbury shell the carina bears traces of a series of oval apertures extending along its course—a very important structural difference. An inspection of the accompanying sketches will at once illustrate these distinctive features. The opinion has been advanced by Mr. S. A. Miller § that the "supposed openings on the cast represent the spines upon the back of the anterior part of the last whorl of the shell, and the fossil is a true *Bucania*." On

* Official Record, Sydney International Exhibition, 1879 (1881) p.p. 56 and 64 N. S. Wales Official Catalogue, Colonial and Indian Exhibition, 1886, p. 166. † Pal. New York, 1847, l. p. 32. ‡ 20th Annual Report, Regent's Univ. State New York, Cabinet Nat. Hist., 1867, p. 347. § Cat. American Pal. Foss 2nd Edit., 1885, p. 304.

On the other hand, the late Mr. F. B. Meek, in an able article, "Note on the affinities of the Bellerophonidae,"* used the row of isolated oval openings in *Tremanotus* as an argument for placing the family amongst the Prosobranchiate Gasteropoda. He says: "Now, as we have no examples, so far as known to the writer, either amongst the Heteropoda or Cephalopoda, living or extinct, of a shell with isolated siphonal openings, while we have many such examples amongst the Prosobranchiate Gasteropoda—such for instance as in the Haliotidae, Fissurellidae, and Pleurotomariidae—the bearing this feature in the newly discovered type has on the question respecting the affinities of the Bellerophonidae, will be readily understood. In other words, it indicates for the family a position near the Fissurellidae and Haliotidae, and between those groups and the Pleurotomariidae." Again he adds: "It will be seen that the shell under consideration (i.e., *Tremanotus*) presents exactly the form of *Bucantu*, from which it only differs in the peculiar and interesting character of having along the middle of the dorsal side a row of isolated oval siphonal openings."

It is manifest from these remarks that Mr. Meek did not for a moment regard the markings on Professor Hall's *Tremanotus* as "casts representing the spines on the back of the outer part of the last whorl," as suggested by Miller; but rather as genuine siphonal openings. If any further proof is wanting, it can be obtained by an inspection of the beautiful figures of *Tremanotus longitudinalis*, from the Wenlock beds of Gotland, given by Dr. G. Lindström,† in which the shelly matter of the mollusc has been retained, and the siphonal openings preserved in great perfection. Even a little more attention on Mr. Miller's part to American palæontological literature would probably have convinced him that these markings were not spines. In the "Geology of Canada," the late Mr. Billings figured‡ an example of *Bellerophon angustata*, Hall, in which the siphonal openings are even better shown than in Professor Hall's original delineation of *Tremanotus*, extending along the whole of the middle line of the back of the last whorl. Mr. Miller refers *Tremanotus alpheus*, Hall, to *Bucania Chicagoensis*, M'Chesney; but although Professor M'Chesney included his figures§ of the former, under the name of the latter, he was careful in his revised paper § to point out that they really represented *Tremanotus alpheus*, and the casts of the apertures are distinctly visible. Siphonal openings occupying this position are not alone confined to *Tremanotus* in the Bellerophonidae. For instance, in the genus *Salpingostoma*, F. Roemer||, from the Lower Silurian Boulder Drift of East Prussia, a single long slit-like aperture occurs on the median line of the back in a similar manner to the oval and more numerous one of *Tremanotus*. Lastly, in the genus *Tubina*, Barrande ¶, from the Upper Silurian Series of Bohemia, the periphery is ornamented with a row of apertures and an additional row on each side flanking the median series, all extended into curved hollow spines.

Accepting, therefore, the united opinions of Messrs. Meek and Lindström in favour of retaining *Bucania* and *Tremanotus* as separate genera, it necessarily follows that the Hawkesbury fossil has a greater affinity with the latter than the former. Furthermore, it must also be admitted that we have here a most interesting reappearance of a genus supposed to have closed its existence during the Upper Silurian.

As the shell found by Mr. Maiden is clearly distinct from any hitherto described species, I shall take much pleasure in describing it in his honour as,—

Tremanotus Maideni, sp. nov.

Sp. Char.—Shell discoidal, strongly trumpet-shaped, thin; whorls, five or more, visible on both sides, elliptical in section, the last one sub-angular at the sides, but the inner whorls with the flanks much more rounded; apertural expansion much prolonged upwards, but not greatly expanded laterally; the anterior or outer lip reflected backwards, and the slit, if present, not visible from imperfection of preservation; inner lip apparently not much reflected; siphonal openings numerous, close together, oval, and situated on rather raised, oblong prominences, which give to the periphery a rather broken-keeled appearance; surface of shell ornamented with spiral fluctuating lines, parallel to the dorsal keel, and which on the expanded outer lip become coarser and more plait-like. Length 4 in., breadth 2 in.

Obs.—This unique shell is quite distinct from either of the Gotland species, but is nearer to *T. alpheus*, Hall, or *T. angustata*, Hall, as figured by Billings, agreeing with the former especially in the broad plait-like ribbing on the back of the outer lip, and the apparent absence of much lateral expansion of the same.

I am not in possession of any information regarding the discovery of this interesting shell beyond the locality, but the suggestion may be thrown out that it perhaps came from one of the ironstone bands, which are described by the Rev. J. E. T. Woods** as forming "a characteristic feature in the Hawkesbury sandstone"; this is, however, a question which Mr. Maiden can satisfactorily settle. The fossil is decidedly surrounded by a matrix of Limonite, such as arises from the decay of organic matter. Mr. C. S. Wilkinson has mentioned †† the occurrence of boulders in the Hawkesbury series, but had he not described them as undoubtedly derived from the associated shale beds, I should suggest the possibility of the present fossil having been derived from a travelled boulder of some older formation. At any rate I should not be inclined to base any discussion as to the age of the Hawkesbury series on the occurrence of *Tremanotus Maideni*.

Locality and Horizon.—New Government Docks, Biloela, Sydney; Hawkesbury Sandstone, at a depth of 25 feet from surface. (*J. H. Maiden, Esq.*)

The following list of species of *Tremanotus* known to me may perhaps be of interest to those who care to pursue this subject further:—

Tremanotus alpheus, Hall, Twentieth Regent's Report State Cab. Nat. Hist., N. York, 1867, p. 347, t. 15 (6), f. 23 and 24.

Tremanotus angustata (Hall), Billings, Geol. Canada, 1863, p. 344, f. 352.

Tremanotus compressus, Lindström, Kongl. Svenska Vet.-Akad Handlingar, 1884, Bd. XIX., heft 2, no. 6, p. 87, t. 4, f. 8-12.

Tremanotus longitudinalis, Lindström, loc. cit., p. 86., t. 3, f. 39 and 40, t. 4, f. 1-7.

The following species may belong to the genus—

Tremanotus? (*Bellerophon dilatatus*), J. de C. Sby., Murchison's Sil. System, 1839, p. 627, t. 12, f. 23 and 24.

Tremanotus (Bucania) trigonostoma, Hall and Whitfield, Report Geol. Survey Ohio, 1875, vol. II., pt. 2, p. 146, t. 8, f. 5.

 APPENDIX O.

Report on the Discovery of Fossils at Gosford and Bowral.

Soon after the discovery of remains of the gigantic Labyrinthodon, *Mastodonsaurus*, in the Hawkesbury sandstone formation at Cockatoo Island, the Mining and Geological Museum has received other specimens of one of these ancient Amphibians from Mr. B. Dunstan, an energetic geological student, who collected them from the Wianamatta Shales, near Bowral. Since then Mr. Joseph Thompson, solicitor, of Pitt-street, on being shown some fossil fishes found in a railway cutting near Gosford, by his clerk, Mr. A. Lambert, who is also an enthusiastic geological collector, advised him to submit them to me. I at once recognized amongst them the remains of another of these remarkable "frog-lizards."

Professor Stephens kindly undertook to examine this fossil, and in his elaborate paper on it, recently read before the Linnean Society, has described it under the new generic name *Platyceps*. I sent Mr. Cullen, the collector, to explore the excavation at Gosford, and he succeeded in obtaining not only more labyrinthodon remains, but also a magnificent collection, numbering over 400 specimens, of fossil fishes, ganoids and placoids, several of which are of remarkable forms, and appear to be new to science. Splendid impressions both of fishes and labyrinthodons are to be seen on the same piece of rock, and it is interesting to find thus associated the remains of these ancient types of fishes with those of the amphibian class, the next higher in the scale of the animal kingdom. This valuable collection is now in the Museum. Mr. Blunt, railway contractor, also obtained from the same quarry, at Gosford, a large slab of stone showing no less than eighteen fish impressions. This fine specimen Mr. Blunt has lent to the Department.

C. S. WILKINSON.

SUPERINTENDENT OF DRILLS' REPORT.

Superintendent of Drills to the Under Secretary for Mines, reporting on the workings of the Diamond-drills and Water-augers for the year 1886.

Sir, Department of Mines, Diamond-drill Branch, Sydney.

In submitting my annual report on the workings of the Diamond-drills and Water-augers for the year 1886, I do myself the honor to attach to said report the following Appendices:—

Diamond-drills.

Appendix A.—Return showing the locality, strata, depth bored, percentage of core extracted, value of diamonds used during the year, and rate per foot, exclusive of office salaries, store wages, and rent, also Superintendent of Drills' travelling expenses.

Appendix B.—Summary of diamond-drills, showing the number of feet bored, total working cost to the Department, average cost per foot, and amounts receivable for the year 1886.

Appendix C, Nos. 1 to 10.—Sections of boring during the year 1886.

Water-augers.

Appendix D.—Return showing the locality, depth bored, and rate per foot, exclusive of office salaries, store wages, and rent, also Superintendent of Drills' travelling expenses.

Appendix E.—Summary of water-augers, showing the number of feet bored, total working cost to Department, average cost per foot, and amounts receivable for the year 1886.

Appendix F, Nos. 1 to 12.—Sections of boring during the year 1886.

Appendix G.—Map of Colony of New South Wales, showing positions of wells and bores, as published last year, with additions.

Appendix H.—Index to wells and bores.

Appendix I.—Balance-sheet for diamond-drills.

Appendix J.—Balance-sheet for water-augers.

The diamond-drill work has not progressed so favourably as I anticipated it would do when I took charge of this work during the latter part of 1885. This, however, is owing to causes over which I had no control. In April last it was decided by the Honorable the Minister for Mines that in future all boring for coal must be done by private enterprise; after which all the applications for Government diamond-drills to bore for coal were refused, and those drills in the field were removed into the Diamond-drill Stores, Sydney, on completion of contract.

In June last application was made by the Sunny Corner Silver-mining Company, Mitchell, for the use of a diamond-drill to bore for a silver lode. This request was granted, on condition that the Company pay £10 per week for the use of drill, including diamonds and wear and tear of machinery, also to pay direct for all carriage in connection with the drill, and pay fortnightly the wages to the engineer and men, which terms the Company accepted, and a drill was forwarded accordingly. The terms accepted by the Sunny Corner Silver-mining Company were also open to the general public, but seem not to be appreciated by the latter, as no other applicants have accepted such terms, but they prefer to pay by results (at per foot).

Through the above-stated action only five drills were at work at the end of the year, viz.:—No. 3 drill, Bundanoon, in charge of Engineer Fryer; No. 7 drill, at Clarence Siding, in charge of Engineer Goodare; No. 10 drill, at Ballimore, near Dubbo, in charge of Engineer Richards; No. 11 drill, at Holt-Sutherland, in charge of Engineer Pearson; and No. 13 drill, at Sunny Corner, in charge of Engineer Roy.

No. A drill, which had bored to a depth of 1,020 feet at Clarence Siding, has been replaced by No. 7 drill; the former however, is still at Clarence Siding. Nos. 2, 4, 5, 6, 8, and 9 drills are in store.

The most important bore put down during the year is that at Holt-Sutherland, about 16 miles from Sydney.—2,242 feet 4 inches; still boring.*

This bore is the largest in diameter (being 3 in.) and deepest bore in the southern hemisphere, viz., 2,307 ft. In the year 1883 this bore was commenced and put down to the depth of 1,003 ft., and abandoned at that depth; but in April last No. 11 drill was forwarded by me and erected on the old bore, and active boring operations commenced, which, with the exception of an occasional breaking of a rod, progressed steadily. At the latter part of the boring operations the weight of the rods hanging down the bore was about 10 tons, and at times these rods would break and tear asunder by their own weight. Taper taps, which were always at hand, were then lowered into the broken rods, and the latter were quickly recovered. Coal was struck on the 21st December, and pierced through on the 24th December, the delay occurring in substituting a complex for an ordinary bore-barrel and the silting of the bore, as it frequently took eighteen hours to lower the rods, and six hours to hoist them to the surface; and, although there was a continual pressure of water from 125 to 150 lb. to the inch forced down the rods, it took fully two hours before the silt or coal dust would rise from the bottom of the bore to the surface. The first seam of coal proved to be 4 ft. 2 in. in thickness, at a depth of 2,228 ft. from surface. Boring operations were again proceeded with, and the second seam of coal was tapped 65 ft. below the first seam, which proved to be 5 ft. 3 in. in thickness.

Analysis of coal from the top seam struck in the Holt-Sutherland Estate by Government diamond-drill, at the depth of 2,228 ft.; thickness of seam, 4 ft. 2 in.:—

Moisture	0·67
Volatile hydrocarbon	13·06
Fixed carbon	70·70
Ash	15·16
Sulphur	0·41
	100·00

Specific gravity, 1·48; coke, 85·86.

Analysis

*Depth bored to 31st December, 1886, 2,242 feet 4 inches. Bore completed, 1st February, 1887, 2,307 feet 8 inches.

Analysis of coal dust brought up by drill water from same seam :—

Moisture	1·43
Volatile hydrocarbon	14·61
Fixed carbon	77·36
Ash	6·08
Sulphur	0·52
	<hr/>
	100·00

Specific gravity, 1·32 ; coke, 83·44.

53.—No. 1. Sample of coal from second seam struck in diamond-drill bore at Holt-Sutherland Estate, about 16 miles southerly from Sydney :—

Moisture	0·36
Volatile hydrocarbon	13·52
Fixed carbon	70·96
Ash	14·72
Sulphur	0·44
	<hr/>
	100·00

Specific gravity, 1·44.

54.—No. 2.

Moisture	0·24
Volatile hydrocarbon	14·03
Fixed carbon	73·96
Ash	11·16
Sulphur	0·61
	<hr/>
	100·00

Specific gravity, 1·34.

55.—No. 3.

Moisture	0·68
Volatile hydrocarbon	12·21
Fixed carbon	69·92
Ash	16·80
Sulphur	0·39
	<hr/>
	100·00

Specific gravity, 1·36.

NOTE.—The coke of No. 53 (85·68 per cent.) was black, not swollen, and rather soft. The coke of No. 54 (85·12 per cent.), No. 55 (86·72 per cent.), and 56 (86·56 per cent.) were all swollen slightly, firm, but dark coloured.

The ashes in all were dark grey. These coals are all short-flamed steam coals; the average ash is 13·8 per cent., which is $\frac{1}{2}$ per cent. more than Bulli coal. They are all, however, noticeable for the small amount of volatile hydrocarbon and the high percentage of fixed carbon, and should therefore give good results under boilers built to consume Welsh coal.

W. A. DIXON, F.I.C., F.G.S.

I stated in my last annual report that the Government diamond drills ought to be made self-supporting, and this, I am glad to be able to state, has been the case during this year, notwithstanding the obstacles and difficulties I had to contend against, such as the withdrawal of the majority of the drills from the field into the store, the enforced idleness of the drills at Clarence Siding and Dempsey Island, and other causes.

Taking all these circumstances into consideration, I have still cause to be thankful for the results obtained and credit gained to the Department of Mines, viz., that the Diamond-drill Branch is self-supporting.

It may, however, be thought or said that since the Diamond-drill Branch has been put on a footing of self-support the general public have had to pay more for the use of Government diamond-drills than formerly, but such is not the case, as the rates of boring per foot have been fixed lower on new applications during this year than formerly. In fact, while the public have obtained better terms, the expenditure has been reduced, and the earnings of the drills increased.

When I took charge of the Diamond-drill Branch, on the 14th September, 1885, in connection with my duties as Inspector of Mines, there were seven (7) clerks in the branch, viz. :—Messrs. Barden, Dalrymple, McNeil, McCulloch, Tuck, Spalding, and Mr. Draftsman W. S. Leigh. At the end of this year Messrs. McNeil, Dalrymple, and McCulloch are the only three clerks remaining, and I have no doubt with them the clerical work of the branch will be satisfactorily carried on. To specify one from the other would in my opinion be wrong, as they have all three assisted me very considerably by taking special interest in their official duties; and helped me to make the office work more simple and effective, which enabled me to bring the diamond-drill work to a successful issue. The loss sustained by this branch through the transfer of Mr. Draftsman W. S. Leigh to the Stock Branch will no doubt prove beneficial to the latter, he being an energetic and efficient officer.

I also thank Mr. J. S. Leigh (the storeman) for his unremitting attention to his work in connection with the diamond-drill store.

Three engineers were discharged by me during the year, namely :—Archibald, Hampshire, and Gretten; and Engineer Alexander Roy, who was very trustworthy and capable to do his work, had, to my sorrow, to leave the service on account of serious illness, and has since died.

The best and quickest work done with diamond-drills during the year was done by Engineer Pearson (assisted by Engineer Spargo), with No. 11 drill, at Holt-Sutherland Estate, and by Engineer Fryer, of No. 8 drill, at Red Head, Newcastle District.

Engineer Goodare, of No. A, and No. 7 drills, has been very unfortunate during the year, but I trust he will be able to show better results in future. The same may be said of Engineer Richards.

The

The total depth bored by diamond-drills during the year is 6,539 ft. 7½ in., or 4,785 ft. 8¼ in. less than during the year 1885. This is due to causes (as stated above) over which I had no control.

The average cost per foot of boring, exclusive of office salaries, store wages, and rent, also of Superintendent of Drills' travelling expenses, is 14s. 11½d., or 2s. 0½d. per foot less than during the year 1885.

Total working or field cost, exclusive of all office salaries, store wages, and rent, also Superintendent of Drills' travelling expenses, amounts to £4,899 12s. 5d., and the total earnings during the year amount to £6,264 12s. 5d.; but the total cost, inclusive of all expenditure in connection with the Diamond-drill Branch, amounts to £5,796 7s. 2d., or at the rate of 17s. 8½d. per foot for this year, which is 1s. 4½d. less per foot than for the year 1885.

In my last annual report I stated that the loss and wear of diamonds in the borehole, and the cost of diamonds at per foot bored, which had been very great at the commencement of the diamond-drill work, was likely to decrease, owing to the engineers in charge of diamond-drills gaining more knowledge in setting the diamonds in a working bit, to the knowledge gained in supervision as to which are the best diamonds adapted for the work, and to a thorough knowledge of the work generally, which experience alone can teach. My opinion formed last year has proved correct, as the following will show:—

Loss of diamonds and cost at per foot:—

	s.	d.
For 1883	3	8
„ 1884	2	0½
„ 1885	1	5¾
„ 1886	0	8½

Percentage of core saved, 80·07, which is 1·06 more than saved during last year.

Had it not been that the Government possesses the most powerful diamond-drill at present in New South Wales, capable to bore at least 2,500 ft. with a 3 in. diameter, the exact depth and thickness of the seams of coal within 16 miles of Sydney might not have been correctly ascertained for many years to come.

The boring for coal at Ballimore, about 23 miles from Dubbo, is also of great importance. At the depth of 540 ft. the drill passed through a seam of coal 5 ft. 2 in. in thickness, and while boring for a second seam of coal 10 ft. below the first seam artesian mineral water commenced to flow to the surface, and is now flowing at the rate of 1,000 gallons per hour, and will flow through tubing 30 ft. above the surface, and higher if required. The water when coming up out of the borehole contains a great deal of gas, and has a taste very similar to the German seltzer water. I believe this is the first artesian mineral water discovered at such a depth in New South Wales; it is therefore of great importance, and may become very valuable to the Colony. I brought two quart bottles full of water with me to Sydney for a rough analysis, but owing to the cork coming out the gas escaped, and the analysis is not as satisfactory as it would have been had I been able to obtain Winchester quart bottles on the place. Nevertheless the rough analysis obtained proves it to be a valuable mineral water, as the following certificate of analysis will show:—

Sir,

Department of Mines, Assay Branch, Sydney.

I have the honor to report as follows respecting the sample of water received from you, and numbered.

Total fixed residue, 226·66 grains per gallon, consisting of—

	Grains per gallon.
Carbonate of lime.....	14·00
Chloride of magnesium.....	12·05
Oxide of iron.....	1·02
Alumina.....	trace.
Silica.....	·21
Alkaline carbonates.....	199·38
	—————
	226·66

NOTE.—The quantity of water received was too small for a thorough analysis; if such a one is required it will be necessary to supply 2 gallons of the water in clear stoppered Winchester quart bottles, also two samples in sodawater bottles securely corked for the estimation of the free carbonic acid. The water has all the properties of a mineral water, and is highly charged with carbonic acid.

I have, &c.,

JOHN C. H. MINGAYE.

The above-stated facts prove beyond doubt that the use of the Government diamond-drills, although no burden on the revenue of the country, confer an immense benefit to the general public by materially assisting in the development of the mineral resources of New South Wales.

Water-augers.

In the beginning of the year there were eleven water-augers at work, nine in search of water and two prospecting for gold, viz., two on road Wilcannia to Silverton, three on road Bourke to Wanaaring, two on Moongulla Reserve, Collarindabri, one at Barringun, one at Hay, one prospecting for gold at Bingara, and one prospecting for gold at Forbes. The two augers on road Wilcannia to Silverton and the one at Barringun have been withdrawn and brought into store, as it was thought that any large or beneficial water supply would not likely be struck in the geological formation near the Wilcannia to Silverton road. At Barringun an artesian supply of water was not likely to be obtained at a lesser depth than from 1,000 to 1,200 ft., and the auger was not capable of boring to anything like that depth.

The water-augers at Moongulla Reserve have not been a success, and I intend to recommend their withdrawal at an early date. Total number of feet bored during the year was 2,185 ft. 3 in., or 1,661 ft. 4 in. less than during the year 1885, which is due to the withdrawal of three water-augers, as stated above. The total cost of boring per foot, exclusive of cost of carriage and office expenditure, was £1 7s. 8d., and inclusive of carriage is £1 12s. 8½d.; but inclusive of all office expenditure the total cost of boring per foot is £2 1s. 0½d.

When glancing over the mere figures the rate per foot of boring seems high, but when all circumstances are taken into consideration the rate of boring at per foot compares favourably with former years.

At Moongulla Reserve, near Collarindabri, the cost of boring appears very considerable. This is owing to great delays and other causes, viz., ministerial consideration whether the augers should be discontinued through great delay caused to articles forwarded from Sydney taking such length of time to reach bore site. Articles have often been on the road from four to six months. A shell auger which left Sydney four months ago has not yet arrived at the boring site. Swelling clays were also very troublesome, the borehole continually closing in.

The

The delays on the augers, Wilcannia to Silverton road, occurred through no funds being available for some time for the removal of augers and payment of men.

At Barrigun only 6 ft. were bored, after which the auger was removed, delays occurring through inability to obtain carriers and other causes.

The cost of the bore at Gunbar Road, 13 miles from Hay, also appears high, but as it includes the forcing down of tubing through 212 ft. and the sinking of two shafts 70 ft. and 78 ft. respectively, the latter shaft has been made use of as a permanent well, and has an ample water supply for domestic and stock purposes.

At Bingara the auger passed through nothing but hard boulders of felspar and other stones, which was the cause of slow boring; nevertheless it has proved the depth of the strata, and if gold-bearing. The boring was done in a large alluvial valley which miners had tried but could not bottom with their ordinary appliances.

In my last annual report I stated that I expected great results from the boring operations at the 75-mile, Bourke to Wanaaring road, also from the boring operations on the Gunbar Road, 13 miles from Hay. At the latter place the well has been completed for the use of the public on the site of the first bore, and a second bore has been started, which, by last report, was down 311 ft. Since the 14th August, when the services of the late foreman Ford were dispensed with, the work has been satisfactorily carried on by foreman William Morgan, but who has so far not had any fair opportunity to prove his real worth, but from whom I expect far greater results next year than have been obtained since the commencement of these boring operations.

The boring operations at the 75-mile, Bourke to Wanaaring road, closed with the depth of 844 ft. 2 in., but no water, although I was of opinion, as stated in my last report, that artesian water would be tapped at a depth between 700 to 800 ft. I am, however, pleased to state that although I was wrong as to the exact depth a large flow of artesian water was obtained at the 75-mile a few weeks after the closing of the year 1886, and the result being far beyond my most sanguine expectation. At the depth of 942 feet the water flowed to the surface at about 4,000 gallons per diem, and at the depth of 960 feet 33,000 gallons of water fit for domestic and stock purposes was flowing to the surface in twenty-four hours, and by latest report the supply was increasing. The water flowed through tubes fully 30 feet above the surface, and would flow or force up far higher if required.

This water supply has been tapped in the cretaceous formation in one of the most arid parts of New South Wales, and is therefore of immense value to the Colony at large. This tapping of large supplies of artesian water on the track from Bourke to Wanaaring to Mount Browne must by force of necessity and force of circumstances cause stock to travel during droughty seasons from Cooper's Creek, Thorgomindah Lake, and the Mount Browne and Poole districts towards the Bourke Railway Station and Sydney, instead of as formerly towards Adelaide. Great credit is due to foreman D. C. Carmichael for assisting me in every possible way to keep down the expenditure and bring the boring operations to a successful issue.

Foreman D. C. Carmichael had to undergo many hardships and privations, but his energy, perseverance, and practical knowledge overcame them all.

W. H. J. SLEE,
Superintendent of Drills.

APPENDIX A.

DIAMOND-DRILL work, showing average cost per foot, exclusive of office salaries, store wages, and rent, also Superintendent of Drills' travelling expenses, to the Department.

APPENDIX D.

REPORT of Water-auger Work for the year 1886, exclusive of office salaries, store wages, and rent, also for Superintendent of Drills' travelling expenses.

No of Machine	No of Bores put down	Locality	Days occupied							Depths			Rate bored per day	Cost of Carriage	Working Cost exclusive of Carriage	Working Cost inclusive of Carriage	Cost per foot		Remarks																	
			Moving	Erecting	Boring	Baling	Repairing	Delays	Holidays	Tank sinking	Total	Each bore					Total	ft		in	ft	in	ft	in	£	s	d	£	s	d	£	s	d	£	s	d
1, 2, & 3	1	Bourke	2	166		92	51	2			313	ft	in	ft	in	ft	in	£	s	d	£	s	d	£	s	d	£	s	d	(a) At Moongulla Reserve the loss of time was very considerable owing to several causes over which I had no control. First, Ministerial, considering whether the auger should be discontinued, second, swelling clay continually closing the bore, and articles forwarded to Moongulla often took from four to six months to reach there from Sydney. A shell auger has now been on the road for four months and not yet arrived. (b) Wilcanma to Silvertown, delays occurred through no funds being available for removal of augers and payment of wages. (c) At Barrington only 6 feet 7 inches were bored, the expenses were incurred through non payment of wages and inability to obtain carriers to remove auger. (d) The cost of the Hay bore at first sight appears very high, but as it includes the forcing of tubes through sand drift, and the sinking and timbering of two wells of a permanent nature 70 and 75 feet respectively, the cost would (were such taken as boring) be less than Bourke, viz, £1 7s 5s per foot. The forcing of tubes was begun by the late foreman, Ford, in the month of May last, who then reported that he would have the tubes down in a fortnight, but which was not completed on the 14th of August, when his services were dispensed with. Foreman Morgan, now in charge, succeeded him, and continued the work to the end of the year. He also sunk and timbered the aforementioned shafts. No 2 bore is now in progress, and Mr Morgan reports being already down 311 feet.

REMARKS

Fresh Artesian Water Tapped at 942 ft. rose over surface at a rate of 4000 Gal. per day

" " " 958 ft. rose 20 ft. over surface at a rate of 33000 Gal. per day.

The fresh Artesian Water Tapped at 942 feet continued to flow at an increasing rate until at 958 feet after cutting through a light layer into the water channel, the water burst up and rising 20 feet over surface continued to flow at the rate of 33000 Gallons per day. By test accounts the supply is increasing. Strata from 24. Water channel at 958 feet was driven up over the surface by the force of water.

Note - 115 ft. 10 in. of 2 1/2 in bore put down in 1887.

To accompany report by Geological Surveyor T.W.E. DAVID, B.A.F.C.S.

-  Recent auriferous alluvials.
-  Tertiary basalt capping tertiary gold gravel.
-  Tertiary auriferous alluvials consisting of quartz sand and quartz gravel with beds of white and grey pipeclay & black clay with fossil leaves.
-  Intrusive granite probably the matrix of the alluvial gold.

NOTE The total quantity of gold raised in this district from 1858 to 1885 has been about 120,025 ozs valued at £455,719. A payable branch lead has been worked between the 130 ft shaft at the base of Doherty's Hill and the No 5 "Sons of Temperance" shaft.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

ASSISTANT INSPECTOR OF COLLIERIES.

(APPOINTMENT OF MR. T. L. BATES—CORRESPONDENCE, &c.)

Ordered by the Legislative Assembly to be printed, 31 March, 1887.

[*Papers relative to Mr. Thomas L. Bates's application for and appointment to the position of Assistant Inspector of Collieries.*]

Mr. Thos. L. Bates to The Minister for Mines.

6, Brougham Terrace, Victoria-street, Darlinghurst,
Sydney, 4 November, 1886.

Sir,

I understand that an Assistant Inspector is about to be appointed under the Coal Mines Regulation Act, and I beg respectfully to make application for the same.

I am 31 years of age, and have had very considerable experience in the management of coal mines in the South Yorkshire District, in England.

In 1878 I obtained, by examination, a Government certificate of competency as mine manager.

I passed a Cambridge examination in geology, and passed in the first class with "special distinction," and am also a Fellow of the Geological Society of England.

Previous to leaving England I was on the Home Secretary's list as candidate for Inspector of Mines. I feel sure, sir, that should you see fit to appoint me that I could give you every satisfaction, and would be most diligent in the discharge of my duties.

I enclose copies of three testimonials, which I hope will be satisfactory. Trusting that you will favourably consider this application,—

I am, &c.,
THOS. L. BATES.

[*Enclosures.*]

Mr. James Ormiston to Mr. J. S. Keep, Birmingham.

Dear Sir,

Mount Vernon, Glasgow, 18 January, 1884.

I have received this morning from Mr. T. L. Bates a letter, in which he says he is applying through you for a situation as Mining Engineer to the Komo Colliery Company, New Zealand, and he asked me for a testimonial as to his qualifications.

I shall put all I have to say, and all that I think will be necessary, in this letter to yourself. For the two years—1876 and 1877—during which I held the post of Certificated Manager of the extensive Rothvale Collieries, Mr. T. L. Bates was my assistant in charge. During that time he was constantly employed, both above and below, helping me in every detail of the practical management of the collieries. In both the mining and the working of coal he had acquired at the time I left these collieries a wide and varied knowledge, as proved by his shortly afterwards passing successfully his examination, and obtaining a Government certificate of competency as a mine manager.

I need not go into any detail regarding the extent of his mining knowledge.

The searching nature of the examination he passed successfully through is the best voucher on this point. For the rest, I may say that I always found him faithful and diligent in the discharge of his duties, one who could be thoroughly trusted to abuse no confidence which might be placed in him, and one also who by firmness of character could command the respect of all with whom he came in contact.

I am, &c.,
JAMES ORMISTON.

Mr. F. J. Jones to The Komo Colliery, Auckland.

Gentlemen,

Rothervale Collieries, Limited, Rotherham, 19 January, 1884.

During the past three years Mr. T. L. Bates has acted as my assistant here. He has had during this time, and for years before, most exceptional opportunities of acquiring a thorough knowledge of every detail connected with the sinking, fitting-up, and working of collieries.

I have very great pleasure in recommending him for the vacancy of Mining Engineer you have, and believe the training he has received especially fits him for the appointment.

He is most trustworthy and faithful in the discharge of his duties, and will in no way abuse any confidence placed in him. His character is unimpeachable.

I am, &c.,
F. J. JONES.

Mr. T. Carrington to The Komo Colliery Company, Auckland.

Dear Sirs,

Kiveton Park Collieries, Sheffield, 22 January, 1884.

I have pleasure in stating that I have known Mr. T. L. Bates for several years, and that he is a gentleman of considerable experience and ability as a mining engineer. He has had charge as assistant manager at important collieries at Rothervale, in this neighbourhood, and I believe him to be well qualified for the post he seeks as the mining engineer of your collieries. Five years ago he passed with credit his examination for a certificate as Manager of Mines before the Yorkshire Board of Examiners.

I believe Mr. Bates to be a gentleman of the highest character.

Yours, &c.,

THOMAS CARRINGTON.

Mr. T. L. Bates to The Minister for Mines.

Dear Sir,

6, Brougham Terrace, Victoria-street, Darlinghurst,
Sydney, 19 November, 1886.

Since forwarding my application to you for an appointment as Assistant Inspector of Mines, I have received an additional testimonial, of which I beg to enclose a copy.

I trust that this and the ones previously sent will be satisfactory to you as regards my character and ability, and that you may see your way to grant me the appointment, as I feel sure I could discharge the duties to your entire satisfaction. I hope you will not think me importunate, but I am anxious to get to work and make myself useful.

Yours, &c.,

THOMAS L. BATES.

[Enclosure.]

Princes-street, Auckland, N.Z., November, 1886.

I HAVE great pleasure in stating that I have known Mr. T. L. Bates for more than a year, and can certify that I believe him to be of the strictest integrity, and in every way trustworthy. Mr. Bates came out from England with very high credentials, and his conduct fully endorsed the same. I believe Mr. Bates has a practical and theoretical knowledge of mining.

JOHN CHAMBERS.

Mr. T. L. Bates to The Minister for Mines.

Sir,

6, Brougham Terrace, Victoria-street, Darlinghurst, 31 December, 1886.

I have been advised by Mr. Fletcher to see you with regard to a matter under consideration at the time of his resignation.

I am a mining engineer, and was introduced to him by Mr. Goodchap. He informed me that it was contemplated to appoint an additional Inspector of Coal Mines, and advised me to apply to him for the same. I did so. He informed me that I had an excellent chance of the appointment, and advised me not to be away in the event of his requiring me. He sent me to Mr. Mackenzie, the Examiner of Coal-fields, who inspected my testimonials, and reported me fully qualified for the post. This was a day or two before Mr. Fletcher resigned, and consequently nothing has been done.

Having received such encouragement from Mr. Fletcher, I have stayed here about eight weeks, in the hope of obtaining the situation, for which I am in every way qualified, and my finances are getting very low, so that I am under the absolute necessity of doing something immediately.

May I ask you therefore to give my case your early consideration, and shall be glad to wait upon you whenever you may desire.

I sent in my application, together with copies of testimonials, as desired. I hold a Government certificate of competency as a mine manager, obtained by examination in 1878, and am a Fellow of the Geological Society of England.

I have had charge of collieries in England, and for a short time in New Zealand previous to coming here. My age is 31.

Trusting that you may be disposed to consider this application favourably,—

I am, &c.,

THOS. L. BATES.

Place with papers, Additional Inspector.—H.W., 3/1/87.

Re appointment of Inspector of Collieries.

REFERRING to your blank-cover communication of the 8th instant, asking me to examine the qualifications of the several applicants for the appointment of an Inspector of Collieries, and report the most suitable for the position, I have the honor to submit and recommend Mr. T. L. Bates, who is 31 years of age, possesses an English Government certificate of competency as a colliery manager, can make surface and underground surveys, and, as his testimonials show, has had considerable experience in the mining, working, and ventilation of coal-mines in Great Britain. Many of the other applicants are suitable in many respects, but, upon the whole, Mr. Bates appears to be the most competent.

J. M., 10/1/87.

The Under Secretary for Mines, B.C., 10/1/87. In view of this report, it would appear advisable to appoint Mr. T. L. Bates to the position of Assistant Inspector of Collieries.—H.W., 10/1/87. Submitted. Approved. Mr. T. L. Bates may be appointed.—C.K.M., 11/1/87. Ex. Co. Minutes, 9 Feb., 1887.

Minute

Minute for Executive Council.

Recommending the appointment of Mr. T. L. Bates as an Assistant Inspector of Collieries.

Department of Mines, Sydney, 17 January, 1887.

I RECOMMEND to His Excellency the Governor and the Executive Council that Mr. T. L. Bates be appointed Assistant Inspector of Collieries, with a salary of £250 per annum, such appointment to take effect from the 11th instant.

His Excellency the Governor and the Executive Council.

C. K. MACKELLAR.

Minute for Executive Council.

Recommending the appointment of Mr. T. L. Bates as an Assistant Inspector of Collieries.

Department of Mines, Sydney, 9 February, 1887.

I RECOMMEND to His Excellency the Governor and the Executive Council that Mr. T. L. Bates be appointed Assistant Inspector of Collieries, with a salary of £250 per annum, such appointment to take effect from the 11th instant.

His Excellency the Governor and Executive Council.

FRANCIS ABIGAIL.

The Executive Council advise that the appointment herein recommended be approved.—ALEX. C. BUDGE, Clerk of the Council, Min. 87/18, 7/3/87. Confirmed, 15/3/87. Approved.—CARRINGTON, 7/3/87.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

VENTILATION OF COAL MINES.

(CORRESPONDENCE AND REPORTS.)

Ordered by the Legislative Assembly to be printed, 1 April, 1887.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 5th February, 1886, that there be laid upon the Table of this House,—

- “(1.) A copy of all correspondence that has taken place between Mr. Curley, Miners’ General Secretary, and Mr. Mackenzie, Examiner of Coal-fields.
- “(2.) Copies of all reports from Mr. Mackenzie relative to the non-provision of ventilation as required by the Coal-fields Act.
- “(3.) A return showing the collieries in which such neglect existed; the time which elapsed from Mr. Mackenzie complaining to such colliery managers and the removal of cause of complaint; and the means taken to improve ventilation, and how carried out.”

(*Mr. Melville.*)

Newcastle-Wallsend Colliery.

SCHEDULE.

NO.	PAGE.
1. Mr. James Curley, Miners' General Secretary, to the Examiner of Coal-fields, calling attention to number of men working in one split in Newcastle-Wallsend Colliery. 8 January, 1883.	2
2. The Examiner of Coal-fields to Mr. James Curley, in reply to No. 1, with result of Mr. Dixon's inspection. 16 January, 1883.	2
3. Mr. James Curley to the Honorable the Secretary for Mines, enclosing Nos. 1 and 2, and pointing out defects in ventilation of Newcastle-Wallsend Colliery. 31 January, 1883.	2
4. Minute of the Under Secretary for Mines, with minutes. 2 February, 1883.	3
5. The Examiner of Coal-fields, in reply to No. 4, with minutes and enclosures. 16 February, 1883.	3
6. The Examiner of Coal-fields to Manager, Newcastle-Wallsend Colliery, notifying him that provisions of Coal Mines Regulation Act are not complied with. 8 March, 1883.	4
7. The Manager, Newcastle-Wallsend Colliery, to the Examiner of Coal-fields, in reply to No. 6. 15 March, 1883.	4
8. The Examiner of Coal-fields to Mr. J. Y. Neilson, acknowledging receipt of No. 7. 20 March, 1883.	4
9. Minute of the Honorable the Secretary for Mines, <i>re</i> ventilation of Newcastle-Wallsend Colliery, with minutes. 26 February, 1883.	4

No. 1.

Mr. James Curley, Miners' General Secretary, to The Examiner of Coal-fields.

Sir,

Hamilton, 8 January, 1883.

I have the honor, by direction of the representatives of the Miners' Association, to invite your attention to the number of men working in one split or current of fresh air in the Lambton headings, at the Wallsend mine. This question originated at a monthly meeting of the Wallsend miners some time ago, concerning which there was much discussion and dissatisfaction expressed. The dissatisfaction referred to was founded not only upon the check inspectors' report, but the practical daily experience of the workmen. The subject was therefore referred to the Delegate Board.

And while admitting that temporary advantages are occasionally secured by calling your attention to apparent defects and want of compliance with the Coal Mines Regulation Act, the miners regret, through their representatives, that there is not more permanent and satisfactory ventilation throughout the mines.

I am, &c.,

JAS. CURLEY,
Miners' General Secretary.

No. 2.

The Examiner of Coal-fields to The Miners' General Secretary.

Sir,

Coal-fields Office, Newcastle, 16 January, 1883.

I beg to acknowledge the receipt of your letter of the 8th inst., written by direction of the Representatives of the Miners' Association, and inviting my attention to the number of men working in one split or current of fresh air in the Lambton headings at the Wallsend mine, a question which you inform me originated at a monthly meeting of the Wallsend miners some time ago, concerning which there was some discussion and dissatisfaction expressed.

In reply, I beg to state that I forwarded your letter to Mr. Inspector Dixon for his report, which I received yesterday, and from which it appears to me that the 4th General Rule, section 12 of the Coal Mines Regulation Act, 1876, is complied with in the Lambton headings in the Wallsend mine.

2. Mr. Dixon's report is as follows:—"I entered the front heading from the main tunnel, Bossfield's side of the mine. Here I measured the air, and found it entering the heading at the rate of 7,680 cubic feet per minute. This current of air supplies 66 men, 5 boys, and 3 horses: total, 74—that is, when the men are all in together; but as some of the front shift men had gone home, I found only 50 men, 5 boys, and 3 horses; total, 58. I measured the current of air again at the far end of the front heading, and found it to be 7,000 cubic feet per minute. This current of air now leaves the front heading and passes through a stenton, where it is met in the middle heading by a current of fresh air, about 8,000 cubic feet per minute, coming along the middle heading from the main engine bank. The two currents—that is, the 7,000 cubic feet of air from the front heading, and the 8,000 cubic feet in the middle heading—now mingle together and form one current of about 15,000 cubic feet of air per minute. This current of air passes through another stenton into the back heading workings, where it serves about 45 men, boys, and horses, after which it passes to the furnace."

3. With respect to the concluding portion of your letter, in which you call my attention to apparent defects and want of compliance with the Coal Mines Regulation Act, and say that the miners regret, through their representatives, that there is not more permanent and satisfactory ventilation throughout the mines, I have to request that you will as early as possible be so good as to specifically mention the collieries in this district which you refer to.

I have, &c.,

JOHN MACKENZIE,
Examiner of Coal-fields.

No. 3.

Mr. James Curley, Miners' General Secretary, to The Secretary for Mines.

Sir,

Hamilton, 31 January, 1883.

I have the honor to respectfully submit the enclosed correspondence for your consideration. In conjunction with the Chairman and Treasurer of the Coal-miners' Association, I may state that this course is adopted owing to the expressed opinion of the Government Examiner of Coal-fields regarding alleged deficient ventilation at the Wallsend Colliery, and more men working in a district or split of air than

than what is provided for by the Coal Mines Regulation Act of 1876. In connection with the correspondence, it will be observed that Mr. Inspector Dixon's report is given, and in reference to which the Government Examiner of Coal-fields states:—"It appears to me that the 4th general rule, section 12, of the Coal Mines Regulation Act, 1876, is complied with in the Lambton heading in the Wallsend mine." It may be presumed that this opinion is based upon Mr. Inspector Dixon's report, and if so, we respectfully submit that such an opinion is contradictory to the report, and is also at variance with the 4th general rule, section 12, of the Coal Mines Regulation Act, 1876, to which reference is made. A brief quotation will at once make this apparent: "Every mine shall be divided into districts or splits of not more than seventy men, and each district shall be supplied with a separate current of fresh air." It will be observed that the Inspector's report makes reference to two separate currents of air, but unfortunately the "7,680 cubic feet" referred to, and that supplies 66 men, 5 boys, and 3 horses; total, 74. After it has done its work, instead of being carried by an overcast into the return, continues onward and "now mingles" with the second current, "8,000 cubic feet," and the two combined, "15,000 cubic feet," passes into another district and serves forty-five men, boys, and horses, after which it passes to the furnace. Here then it is quite evident that the 8,000 cubic feet of air, or second separate current, is allowed to be polluted with 7,000 cubic feet of air that serves another district, and which the Inspector in his report states "now mingles together"—that is, the 7,000 and 8,000—"and form one current of about 15,000 cubic feet of air per minute." This being so, very naturally, there is a bulky, polluted, and most unwholesome atmosphere for these forty-five men, boys, and horses to work in. The 8,000 cubic feet of itself, if a separate current at all, is of itself amply sufficient to supply forty-five men, boys, and horses. This cannot have escaped the notice of either the Inspector or the Examiner of Coal-fields. The cost of an overcast to the Company to carry off the 7,000 cubic feet appears to be the sequel. And why this was not directed to be done, instead of the apparent erroneous conclusion arrived at by the Examiner of Coal-fields, we leave the Honorable Minister to judge.

Mr. Inspector Dixon, in the former part of his report, alludes to the total in one instance as seventy-four, and then again as fifty-eight, through some of the front-shift men having gone home. This we contend may possibly give rise to complications, and should, if possible, be avoided. The Inspector might have said it was owing to the time his inspection was made that it is certainly better to confine himself to the number of men working in a district, without the qualification of either front or back shift. This can be obviated if the inspections are made when both shifts are in, for it must be well known to the Inspector that the most of the miners are in the mines during the major part of the day.

In conclusion, having brought these matters under the notice of the Honorable Minister, we are confident that he will deem them of sufficient importance as to require immediate attention, and by giving an early reply will greatly oblige,—

Yours, &c.,

JAMES CURLEY,
Miners' General Secretary.

No. 4.

Minute of the Under Secretary for Mines.

Complaint *re* Ventilation at the Wallsend Colliery.

THE complaint made by the Miners' General Secretary appears to be not that a sufficient quantity of fresh air is not brought into the mine, but that one of the currents, sufficient in itself both as to quantity and quality, is allowed to be polluted by mingling with contaminated air before it reaches the men for whom it is intended, and that consequently these men, contrary to the provisions of the Coal Mines Regulation Act, are not supplied with fresh air. The papers may be forwarded to the Examiner of Coal-fields for report; and the Miners' General Secretary may be informed that the complaint will receive due consideration.

H.W., 2/2/83.

Submitted. Approved.—J. P. ABBOTT, 3/2/83. The Examiner of Coal-fields.—H.W., B.C., 6/2/83.

No. 5.

The Examiner of Coal-fields on Minute dated 2 February, 1883.

To enable the Minister to more clearly understand this case, I forward a tracing* showing where the men were at work, and a statement of the number and names of the front and back shift men in the Lambton headings on the 10th ultimo, the day Mr. Dixon inspected it, from which it will be perceived that the number of men getting coal was fifty-seven in the front shift and fifty-seven in the back shift; and each set of fifty-seven men were supplied with two currents of air of 7,000 and 8,000 cubic feet per minute, both of which were fresh intake air currents when they entered the Lambton heading district; and that the 7,000 cubic feet of air per minute current was of itself more than was required by the provisions of the Act for the fifty-seven men.

* See Appendix
A.
See enclosure.

The hour at which the front and back shift men enter and leave the mine, and the time they are in together, is as follows:—About 2 a.m. sometimes a few of the front-shift men enter the mine; at about 4 a.m. more than half of the front-shift men are in their working places, and at about 6 a.m. the whole of them. At 8 to 9 a.m. the back-shift men go in to relieve the front shift, and they work together for about two and a half hours. The front-shift men are supposed to be all out by noon, and the back shift remain in until about 5 p.m. Thus we find that for about ten and a half hours out of thirteen (say from 4 a.m. to 5 p.m.), on the 10th ultimo, only fifty-seven men were in the Lambton heading district, and for two and a half hours out of thirteen there were 114 men. I do not consider, therefore, that the spirit of the Act has been infringed in this instance; but if its enforcement to the letter is thought necessary, the men appear to have a remedy in their own hands when changing shifts, by the "front-shift men" leaving off work when the "back-shift men" enter.

J.M., 16/2/83.

No. 6.

The Examiner of Coal-fields to Mr. J. Y. Neilson.

Sir,

Coal-fields Office, Newcastle, 8 March, 1883.

In pursuance of the provisions contained in the 31st section of the Coal Mines Regulation Act, 1876, I hereby give you notice that on the 13th January last, the 4th sub-section of the 12th section of the said Act was not carried out in the Lambton heading districts at the Newcastle-Wallsend Colliery.

I have, &c.,

JOHN MACKENZIE,
Examiner of Coal-fields.

No. 7.

Mr. J. Y. Neilson to The Examiner of Coal-fields.

Sir,

Newcastle-Wallsend Coal Co., Wallsend, 15 March, 1883.

Your favour of the 8th instant only came to hand yesterday. In reply to which I may state that although I entirely differ with you in your interpretation of the Coal-fields Regulation Act, I will at once proceed to make the necessary alterations to comply with your request.

I have, &c.,

J. Y. NEILSON.

No. 8.

The Examiner of Coal-fields to Mr. J. Y. Neilson.

Sir,

Coal-fields Office, Newcastle, 20 March, 1883.

I beg to acknowledge the receipt of your letter of the 13th instant, informing me that you will at once proceed to make the necessary alterations to comply with the request contained in my letter of the 8th idem.

I have, &c.,

JOHN MACKENZIE,
Examiner of Coal-fields.

No. 9.

Minute of the Honorable the Secretary for Mines.

Ventilation of Wallsend Colliery.

I HAVE read the correspondence in reference to the complaint of the Miners' General Secretary, and I am forced to the conclusion that the 4th sub-section of the 12th section of the Coal Mines Regulation Act of 1876 is not carried out in this mine.

The 3rd sub-section of this clause of the Act states that "an adequate amount of ventilation shall mean not less (as a minimum) than 100 cubic feet of pure air per minute for each man, boy, and horse, which shall sweep undiminished along the airway past each working place."

The 4th sub-section provides that "each district or split shall have not more than seventy men, and each district shall be supplied with a separate current of fresh air." I am satisfied that there being for two and a half hours 114 men in the mine, and during those two and a half hours there being an insufficient supply of fresh air in the terms of the Act, that there was not a compliance with the Act even in spirit. The remedy for this state of things is not in the hands of the men, but of the management, which is bound to supply the fresh air under the Act, as quoted. Where air which has served a district is then allowed to mingle with fresh air and serve another district, however great that supply may be, it is clearly not a compliance with the Act, which speaks of "pure air." This can only mean such air as is sent in fresh without having been used by the men. A copy of this minute may be sent to Mr. Curley, and the Examiner may be informed of it.

J. P. ABBOTT.

26/2/83.

Copy

Copy to Mr. Curley, 27 February, 1883. The Examiner of Coal-fields.—H.W., B.C., 27/2/83. I forward for the Minister's information a copy of notice I have served on Mr. Neilson, and shall be obliged by your informing me what further action he may desire I should take in the matter.—J.M., 8/3/83. The Under Secretary for Mines, B.C., 8/3/83. Submitted.—H.W., 13/3/83.

The Examiner of Coal-fields may be asked to report if any further breaches of the law in the same respect happen, and then steps must be taken to prevent them in the future.—J. P. ABBOTT, 17/3/83. Copy of letter received from Mr. Neilson (the Manager) and my reply thereto forwarded herewith for the Minister's information. Will instruct Mr. Inspector Dixon to visit and report on the Lambton heading district.—J.M., 20/3/83. The Under Secretary for Mines, B.C., 20/3/83. Submitted.—H.W., 28/3/83. Seen.—J. P. ABBOTT, 31/3/83.

Co-operative Colliery.

SCHEDULE.

NO.	PAGE.
1. Mr. John Dixon, Inspector of Collieries, to the Manager of the Co-operative Colliery, notifying defective state of ventilation in Co-operative Colliery. 5 November, 1885	5
2. The same to the Examiner of Coal-fields, reporting inspection of above colliery. 5 November, 1885.....	5
3. The Examiner of Coal-fields to Mr. James Fletcher, junr., Manager, Co-operative Colliery, notifying that he has failed to comply with Coal Mines Regulation Act. 24 November, 1885.....	6
4. The same to the Under Secretary for Mines, forwarding reports from Mr. Inspector Dixon, <i>re</i> deficiency of ventilation at above colliery, with minutes. 24 November, 1885	6
5. Check Inspectors' reports, <i>re</i> ventilation of Co-operative Colliery. 27 November, 1885	7
6. Mr. James Curley, Miners' General Secretary, to the Honorable the Secretary for Mines, drawing attention to interview with Executive of Miners' Association, and enclosing copies of Check Inspectors' reports. 25 January, 1886.	10
7. The Under Secretary for Mines to Examiner of Coal-fields, to report on complaint. 30 January, 1886.....	12
8. The Under Secretary for Mines to the Manager of the Co-operative Colliery, calling attention to Mr. James Curley's statement. 30 January, 1886.....	12
9. The Manager, Co-operative Colliery, to the Honorable the Secretary for Mines, in reply to No. 8. 1 February, 1886	12
10. The Examiner of Coal-fields to the Under Secretary for Mines, <i>re</i> complaint of defective ventilation at Co-operative Colliery. 3 February, 1886.....	13
11. Report of joint inspection of Co-operative Colliery by the Examiner of Coal-fields, Inspector of Collieries, and Miners' Inspectors, with minutes. 3 February, 1886.	14
12. The Under Secretary for Mines to Mr. James Curley, that complaint appears groundless. 25 February, 1886.....	15
13. The same to the Examiner of Coal-fields, that Mr. Curley has been informed that your reports have been considered satisfactory. 25 February, 1886.....	15

No. 1.

Mr. John Dixon, Inspector of Collieries, to Mr. James Fletcher, junr., Manager, Co-operative Colliery.

Sir,

Glebeland, 5 November, 1885.

I hereby notify you of the very defective state of the ventilation in certain districts in the Co-operative Colliery, as found by me on my inspection of said colliery yesterday (Wednesday), 4th instant, as follows:—

1. In the first split, brattice heading, the total current of air was only about 6,000 cubic feet per minute, for about 62 men, 3 boys, and 3 horses—total, 68.

2. In the third split, brattice heading, the total intake current of air was only 7,560 cubic feet per minute, for 76 men, 6 boys, and 6 horses—total, 88. There are too many men on this split, and the current of air is not well sustained, as in one working heading I only got a result of about 4,200 cubic feet per minute, and in the return from this split, 12,580 cubic feet per minute.

In No. 1 district the only available current of air for 53 men, 10 boys, and 7 horses was about 4,080 cubic feet per minute.

2. I have therefore to urge that you would give immediate attention to the above matters, with a view of having them remedied as soon as possible; and in my opinion the only way to effect a proper remedy would be to sink a shaft, and erect a furnace inside of the fault, which furnace would avail for many years to come.

I have, &c.,

JOHN DIXON,
Inspector of Collieries.

No. 2.

Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Co-operative Colliery Inspection.

Sir,

Glebeland, 5 November, 1885.

I have the honor to report inspection of the above colliery yesterday, Wednesday, 4th instant, as follows:—

In the 1st split, brattice heading, the current of air was only about 6,000 cubic feet of air per minute, for about 62 men, 3 boys, and 3 horses—total, 68.

In the 2nd split the intake current of air was about 7,980 cubic feet per minute, for about 52 men, 5 boys, and 4 horses—total, 61.

In the 3rd split the total intake current of air was only about 7,560 cubic feet per minute, for about 76 men, 6 boys, and 6 horses—total, 88. There are too many men on this split, and the overman (Mr. Davidson) informed me that this was caused by recent alterations made to relieve the 2nd split, where

where the ventilation had been defective. The current of air in this 3rd split was not well sustained in the working headings, for in one heading it was only about 4,200 cubic feet per minute, and in the return from this split the total current of air was about 12,580 cubic feet per minute.

In No. 4 split, at the top end of No. 3, the total current of intake air was about 7,800 cubic feet per minute for about 26 men, 2 boys, and 2 horses.

In the No. 1 district the total available current of intake air in the working headings was only about 4,080 cubic feet per minute, for about 56 men, 10 boys, and 7 horses, and at the same time the return current of air at the furnace for this district alone was about 20,000 cubic feet per minute.

The overman (Mr. R. Davidson) was with me the whole of the time, and I drew his attention to the above matters in every instance. In addition to this, I have notified the manager, Mr. J. Fletcher, junior, by registered notification, a copy of which I beg to forward along with this report.

Seeing the state of the ventilation in the brattice heading section of workings in the Co-operative Colliery on my inspection yesterday, I am more than ever convinced that the opinion I expressed in my report on 9th May last was a correct one, viz., that the brattice heading sections would never be properly ventilated, unless by having an up-cast shaft and furnace inside the fault; and on two occasions during this year I have urged on the manager the necessity of having this done before the summer months came, but as far as I know nothing has yet been done in the matter.

The main roads and wheeling roads were in good order, and a good supply of timber at the various stations ready for use.

I have, &c.,
JOHN DIXON,
Inspector of Collieries.

No. 3.

The Examiner of Coal-fields to Mr. James Fletcher, junior., Manager, Co-operative Colliery.

Sir,

Department of Mines, Sydney, 24 November, 1885.
In view of a recent report of Mr. Inspector Dixon on the ventilation of the Co-operative Colliery, and in pursuance of the provisions contained in the 31st section of the Coal Mines Regulation Act, 1876, I hereby give you notice that you have failed to comply with sub-sections 2 and 3, section 12 of the said Act.

I have, &c.,
JOHN MACKENZIE,
Examiner of Coal-fields.

No. 4.

The Examiner of Coal-fields to The Under Secretary for Mines.

Sir,

Mines Department, Sydney, 24 November, 1885.

I beg to forward reports, received from Mr. Inspector Dixon, respecting a deficiency of ventilation at the Co-operative Colliery, and copy of a notice I have served upon Mr. James Fletcher, junr., and shall feel obliged by your informing me what further action the Minister desires me to take in the matter.

I have, &c.,
JOHN MACKENZIE,
Examiner of Coal-fields.

The Examiner may take the necessary steps to enforce the penalty provided in this case, unless the owners comply with the law before such proceedings have been commenced.—H.W., 30/11/85.

Submitted. Approved.—G.T., 1/12/85. The Examiner of Coal-fields.—H.W., U.S., B.C., 2 Dec., 1885. Mr. Inspector Dixon for report as to whether the law is now complied with.—J.M., 22/12/85. Further report forwarded.—J.D., 23/12/85.

Mr. Inspector Dixon's report, forwarded herewith, from which it will be seen that the matters complained of have been remedied, and that there is only a slight deficiency of the required current of air in No. 6 split, which, in all probability, will be rectified in the course of a week, as the overman informed him it was the intention of the manager to have the furnace repaired during the week end, so as to get a better result throughout the split. Also that there are several shiftmen constantly employed in this colliery at present in connection with the ventilation, and tenders have been called for the sinking of another shaft for the fault section of workings.—J.M., 24/12/85.

Under Secretary for Mines.—B.C., 24/12/85. In view of this report further proceedings do not appear to be necessary.—H.W., 4/1/86. Submitted. Approved.—R.M.V., 9/1/86.

[Enclosure to No. 4.]

Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.
Co-operative Colliery Inspection.

Sir,

Glebeland, 23 December, 1885.

I have the honor to report inspection of the above colliery to-day, Wednesday, as follows:—

1st split.—In this split the current of air was about 10,000 cubic feet per minute, for about 62 men, 5 boys, and 3 horses; total 70. The current of air was well sustained throughout the split.

No. 2 split.—The current of air in this split was about 9,200 cubic feet per minute, for about 57 men, 8 boys, and 4 horses. The main current of air in this split was fairly well sustained, being about 8,610 cubic feet per minute at 36 bord, 6,000 cubic feet per minute at 44 bord, 6,975 cubic feet per minute at 63 bord, 8,400 cubic feet per minute at 68 bord.

No. 3 split.—In this split the current of air at the narrow bord was about 6,930 cubic feet per minute, for about 42 men, 4 boys, and 2 horses; total 48. The current of air at 50 bord was about 4,630 cubic feet per minute, at the stenton 5,850 cubic feet per minute, and at the last bord about 5,590 cubic feet per minute.

No. 4 split.—The current of air in this split was about 9,000 cubic feet per minute, for about 52 men, 6 boys, and 3 horses; total 61.

No. 5 split.—In the intake near shaft the current of air was about 5,040 cubic feet per minute, for about 38 men, 4 boys, and 2 horses; total about 44. The above current of air was well sustained past the first few working places, and I saw shiftmen at work building stoppings in order to conduct the current of air throughout the working headings.

No. 6

No. 6 split.—The intake current of air in this split was about 7,300 cubic feet per minute for about 64 men, 6 boys, and 4 horses; total 74. The above result shows a slight deficiency in the total current, but I beg to state that in all probability the current of air for this split will be very much increased in the course of a week, as the overman, Mr. Davidson, informed me that it was the intention of the management to have the furnace repaired during the week end, so as to get a better result throughout the split.

There are several shiftmen constantly employed in this colliery at present in connection with the ventilation, and tenders have been called for the sinking of another shaft for the fault section of workings.

I have, &c.,
JOHN DIXON,
Inspector of Collieries.

[Enclosure to No. 4.]

Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Sir,

Glebeland, 21 November, 1885.

For your information, I beg to state that on Thursday evening last, 19th instant, I received a telegram from Mr. H. Winchester, of the Coal-fields Office, informing me that Mr. A. Cook, secretary to the Co-operative miners, had wired concerning alleged deficient ventilation in that colliery, and that the miners had ceased work in consequence. I may here state that no particular part of the workings was specified as being defective in ventilation, and I did not see the Check Inspectors' last report, as I am not aware that it was entered in the book kept at the colliery office for that purpose when I was at said colliery yesterday.

However, acting on the message from Mr. Winchester, I went to the Co-operative Colliery yesterday (Friday), and judging that the splits complained of would be in the part of the workings known as "over the fault," I made an inspection of those splits, and beg to report as follows:—

No. 1 split: The total intake current of air for this split was about 6,620 cubic feet per minute. This current of air is coursed along the front heading, and at the far stenton between the two headings. I found it to be about 6,290 cubic feet per minute, and at No. 24 bord, in the back heading, the current of air was about the same as in the stenton. This split, when at work, contains about 67 men, 4 boys, and 2 horses; total, about 73,—thus showing a deficiency in the intake current of air for the above number of men, &c. (on the minimum quantity of air required by the Act), of about 700 cubic feet per minute. This is one of the splits complained of by me in my report of 5th instant, and of which I notified the manager, Mr. J. Fletcher, on the same day.

In No. 2 split the current of air was about 8,640 cubic feet per minute at the intake, and in the cut-through between Jarvie's bord and the Gannon bord it was about 6,600 cubic feet per minute. I saw men at work in this split erecting screen, &c., and when completed the ventilation will be sustained in the working headings throughout the split. When at work there are about 65 men, 7 boys, and 5 horses; total, 77 in this split.

No. 3 split: In this split the total intake current of air was about 8,100 cubic feet per minute, but at 53 bord the current of air was reduced to about 4,320 cubic feet per minute. About 42 men, 4 boys, and 4 horses—total, 50 men, &c.—belong to this split.

In No. 4 split the total intake current of air was about 8,250 cubic feet per minute, and at No. 86 bord it was about 8,000 cubic feet per minute, and well sustained throughout the split. There are about 52 men, 4 boys, and 3 horses—total, 59 men, &c.—in this split when the mine is working.

I here beg to state that the last-mentioned split has been formed since my inspection on 4th instant and notification of 5th instant, in order to relieve the third split, which was then overcrowded.

Concerning the quality of the air supplied in the above splits, I can only say that I have no instrument wherewith to test it, and may add that each of the above-mentioned splits is supplied with air direct from the surface—in two of them from air shafts, in one from a little tunnel, and in another from the main tunnel.

On my inspection yesterday I noticed several men at work in various places erecting stoppings, putting up screens, &c., and at one place a gang of men were at work making an overcast. All this work was being done to further benefit the above-mentioned splits.

In conclusion, I beg to state that I have notified the manager (Mr. J. Fletcher, junr.) concerning the deficiency in No. 1 split, and also of the loss of air in the third split.

I have, &c.,
JOHN DIXON,
Inspector of Collieries.

No. 5.

Check Inspectors' Reports.

Plattsburg, 27 November, 1885.

THE last three inspections on the state of the ventilation in the Co-operative Colliery are as follows:—

26 JUNE, 1885.

Thermometer on top 60°.

Intake in tunnel, 17,094 cubic feet. Thermometer 58°.

No. 1 (timber shaft) intake.—No record, shaft in disuse.

No. 1 Split.

Intake at shaft, 7,920 cubic feet. Thermometer 64°.

At No. 4 bord the current was 3,276 cubic feet. Thermometer 64°.

At No. 10 bord the current was 2,600 cubic feet. Thermometer 65°.

At No. 18 bord the current was 2,600 cubic feet. Thermometer 68°.

Return from No. 1 split, 8,015 cubic feet. Thermometer 70°.

Return from No. 2 split (in the cross-cut), 4,560 cubic feet. Thermometer 70°.

There are 49 men, 3 horses, and 5 boys working on this split of air.

No. 2 Split.

Back heading intake, 2,600 cubic feet. Thermometer 72°.

At Stenton, 2,050 cubic feet.

At No. 3 bord the current was 3,465 cubic feet. Thermometer 72°.

There are 50 men, 8 boys, and 10 horses working on this split of air.

No. 3 Split.

At No. 45 bord the current was 3,125 cubic feet. Thermometer 73°.

At Forester's narrow bord the current was 7,800 cubic feet. Thermometer 73°.

At No. 55 bord (in the back heading) the current was 4,242 cubic feet. Thermometer 73°.

At Stenton the current was 6,240 cubic feet. Thermometer 74°.

Intake from narrow bord, 3,042 cubic feet. Thermometer 72°.

There are 66 men, 9 boys, and 5 horses working on this split of air. The return at the furnace was 12,168 cubic feet.

No. 4 Split.

Intake from shaft, 10,000 cubic feet. Thermometer 69°.

Intake from No. 3 shaft, 8,244 cubic feet. Thermometer 70°.

At the return the current was 11,700 cubic feet. Thermometer 72°.

There are 34 men, 6 boys, and 4 horses working on this split.

No.

No. 5 Split.

At No. 92 bord the current was 5,720 cubic feet. Thermometer 72°.
 From No. 92 to No. 98 bord the anemometer would not work.
 At No. 101 bord the current was 4,500 cubic feet. Thermometer 75°.
 Stoppings badly required in this split.
 There are 30 men, 10 boys, and 8 horses working on this split.
 Return at the big furnace was 44,330 cubic feet. Thermometer 76°.
 Furnace in good working order.

27 JUNE, 1885 (Second Day).

Henderson's Tunnel.—Intake, 11,655 cubic feet. Thermometer 61°.

No. 6 Split.

Intake from fall in, 6,360 cubic feet. Thermometer 60°. Intake from shaft, 6,480 cubic feet.
 A door is badly required at the first cut-through.
 At No. 112 bord the current was 5,656 cubic feet.
 At the cut-through from narrow bord the current was 5,376 cubic feet.
 At No. 131 bord the current was 5,616 cubic feet.
 At No. 136 bord the current was 8,008 cubic feet.
 Return from little furnace 27,630 cubic feet.
 There are 58 men, 12 boys, and 8 horses working on this split.
 Furnace in good working order, and there seemed to be a good supply of timber on the various flats.

GEORGE COOPER, } Inspectors.
 JOHN HOUSTON, }

24 JULY, 1855.

Thermometer on top 58°.

The tunnel intake, 13,650 cubic feet. Thermometer 59°.

No. 1 Split.

At No. 4 bord the current was 2,840 cubic feet. Thermometer 62°.
 At No. 21 bord the current was 2,400 cubic feet. Thermometer 68°.
 There are 44 men, 5 boys, and 3 horses working on this split.
 Return from No. 1 split 8,000 cubic feet. Thermometer 69°.
 Cross-cut return, 9,750 cubic feet. Thermometer 72°.
 At No. 23 bord the current was 7,800 cubic feet. Thermometer 72°.
 At No. 29 bord the current was 3,200 cubic feet. Thermometer 73°.
 At Wonder's cross-cut the current was 7,280 cubic feet. Thermometer 73°.
 At No. 34 bord the current was 7,386 cubic feet. Thermometer 73°.
 At No. 42 bord the current was 3,930 cubic feet. Thermometer 73°.
 At No. 49 bord the current was 6,006 cubic feet. Thermometer 72°.
 At No. 56 bord the current was 2,808 cubic feet. Thermometer 72°.
 There are 84 men, 8 boys, and 10 horses working on this split.
 Intake, 6,760 cubic feet. Thermometer 70°.
 No. 3 split (over the fault) 4,788 cubic feet. Thermometer 72°.
 At No. 65 bord the current was 2,520 cubic feet. Thermometer 74°.
 Cruickshank's narrow bord intake 9,360 cubic feet. Thermometer 73°.
 At No. 74 bord the current was 3,900 cubic feet. Thermometer 74°.
 At No. 77 bord the current was 2,080 cubic feet. Thermometer 74°.
 At Stenton to back heading the current was 7,200 cubic feet. Thermometer 74°.
 The anemometer would not work in the cut-through at Thomas' bord. Very hot and smoky.
 At No. 89 bord the current was 3,120 cubic feet. Thermometer 74°.
 At No. 93 bord the current was 5,200 cubic feet. Thermometer 74°.
 There are 70 men, 7 boys, and 4 horses working on this split.
 Return for big furnace was 50,765 cubic feet. Thermometer 74°. The furnace was in good working order.

25 JULY (Second Day).

Intake from fall in, 3,824 cubic feet. Thermometer 58°.
 Intake from air shaft, 4,680 cubic feet. Thermometer 58°.
 At No. 136 bord the current was 5,440 cubic feet. Thermometer 68°.
 Over the fault, 2,940 cubic feet. Thermometer 71°.
 At No. 142 bord the current was 6,656 cubic feet. Thermometer 71°.
 At No. 148 bord the current was 5,766 cubic feet. Thermometer 71°.
 There are 44 men, 10 boys, and 7 horses working on this split.
 Little furnace, 25,875 cubic feet. Thermometer 70°.
 Intake at Henderson's tunnel, 9,688 cubic feet. Thermometer 64°.

Over the Fault.

At No. 96 bord the current was 4,075 cubic feet. Thermometer 65°.
 At No. 100 bord the current was 5,025 cubic feet. Thermometer 65°.
 At No. 113 bord the current was 3,960 cubic feet. Thermometer 69°.
 At No. 117 bord the current was 3,150 cubic feet. Thermometer 70°.
 There are 42 men, 7 boys, and 5 horses working on this split.
 Return for furnace, 8,970 cubic feet. Thermometer 72°.
 Return for No. 3 split, 11,700 cubic feet. Thermometer 72°.

No.

No. 5 Split.

At No. 118 bord the current was 3,936 cubic feet. Thermometer 72°.

At Nos. 122 and 123 and on to the door the anemometer would not work.

There are 26 men, 8 boys, and 6 horses working on this split.

GEORGE COOPER, } Inspectors.
JOHN HOUSTON, }

26 OCTOBER, 1885.

No. 1 Split.

This split is aired from No. 1 timber shaft and main tunnel.

At the time of our inspection there was not sufficient air coming down the main shaft or passing by the first thirteen (13) bords to work the anemometer, but the working places were cool, fresh, and clear. Thermometer ranging from 68° to 69°.

At No. 14 bord (over the fault) there was a current of 2,805 cubic feet. Thermometer 69°.

At the stenton (near the face of the heading) the current of air was 5,742 cubic feet. Thermometer 69°.

At No. 24 bord the current was 4,510 cubic feet. Thermometer 70°.

At the return for this split at No. 23 bord the current was 5,760 cubic feet. Thermometer 72°.

The air passing the last six or seven bords in this split was thick and sluggish.

There are 64 men, 4 boys, and 3 horses working on this split.

No. 2 Split.

This split is aired from the main tunnel. The intake current at No. 2. Jenny Flat was 7,260 cubic feet. Thermometer 70°.

The current at No. 68 bord was 4,000 cubic feet. Thermometer 72°.

At No. 57 bord the current was 5,900 cubic feet. Thermometer 73°.

At No. 53 bord (in the back heading) the current was 5,376 cubic feet. Thermometer 73°.

The current at No. 47 bord was 4,025 cubic feet. Thermometer 73°.

At No. 39 bord the current was 2,310 cubic feet; thermometer 74°. The air at this place was very irregular; we had to wait for some time before we could get the anemometer to work.

The current of air in the return for this split (in the back cross-cut) was 8,712 cubic feet. Thermometer 72°. The air from No. 47 bord back to the return needs improving very much. At the time of our inspection it was very hot and smoky; also from No. 63 to 68 bords the air needs improving. We were shown two doors that had just been fixed for the purpose of splitting the air at No. 47 bord. The fixing of these two doors should improve the air in this split.

There are 78 men, 9 boys, and 4 horses working on this split.

The return at the furnace for Nos. 1 and 2 splits was 33,900 cubic feet; thermometer 74°.

No. 3 Split.

This split is aired from the main tunnel and Morgan's narrow bord; the current of air at the intake was 7,486 cubic feet. Thermometer 73°.

From No. 80 to No. 88 bords the anemometer would not work, as the current was so slight.

At No. 88 bord the current was 6,860 cubic feet. Thermometer 74°.

At No. 93 bord, after waiting for a considerable time, we recorded a current of 4,255 cubic feet. Thermometer 74°.

At No. 96 bord there was a current of 5,550 cubic feet. Thermometer 74°.

At No. 101 bord the current was 5,445 cubic feet.

At No. 105 bord (next to the return for this split) there was a current of 8,897 cubic feet. Thermometer 74°.

The air all through this split was hot and smoky. The doors in this split require to be well attended. There are 54 men, 12 boys, and 6 horses working on this split.

No. 4 Split.

This split is aired from No. 2 timber shaft. Current of air at the intake was 5,280 cubic feet. Thermometer, 67°.

The current of air at No. 110 bord was 3,240 cubic feet. Thermometer 67°.

The air in the remaining portion of this split was not confined for us to measure it; but the working places were cool and clear, the thermometer ranging from 67° to 70°.

There are 40 men, 2 boys, and 2 horses working on this split.

The current of air at the return of the furnace was 7,920 cubic feet. Thermometer 71°. This furnace also draws the air from No. 3 split, the return from which near the furnace was 10,300 cubic feet.

No. 5 Split.

This split is aired from No. 3 timber shaft, Henderson's tunnel, and the fall-ins. The air not being confined we could not measure it near the working places till we came to—

No. 133 bord, where the current was 2,587 cubic feet. Thermometer 70°.

At No. 140 bord the current was 2,100 cubic feet. Thermometer 70°.

The current of air passing by the working places in the remaining part of this split was so slight that it could not turn the anemometer. Thermometer ranging from 70° to 72°.

The current of air at the furnace was 19,135 cubic feet. Thermometer 70°. There are 64 men, 6 boys, and 3 horses working on this split.

It is necessary that the air in this split should be confined and conducted by the working places as the men in the remaining portion of this split are badly off for air. There appeared to be a good supply of timber at the various flats. The travelling roads would be all the better for a cleaning, as there are some places nearly impassable for water and sludge.

The total currents of air at the three (3) furnaces were 71,255 cubic feet per minute.

JOSEPH MIDDLEBY, } Inspectors.
AMRAM LEWIS, }

No. 6.

The Miners' General Secretary to The Honorable the Secretary for Mines.

Sir,

Hamilton, 25 January, 1886.

I have the honor to respectfully refer you to the interview which took place on the 15th instant, by the Executive of the Miners' Association, and the subjects then brought officially under your notice by communication.

In furtherance of the object of the deputation, I am instructed by the Executive of the Mining Association to forward copies of check inspectors' reports made at several collieries for your perusal; and am requested to add that since the interview took place certain of the Co-operative miners have had to come out of the mine, not being able to work in consequence of alleged defective ventilation. This occurred on Tuesday, 19th instant.

Trusting that the subjects brought under notice on the 15th instant will receive immediate attention,—

I have, &c.,

JAMES CURLEY,
Miners' General Secretary.

[Enclosure to No. 6.]

Lambton Colliery, 28 and 29 July, 1885.

WE, the undersigned, having examined the workings and travelling roads of the above colliery, report as follows:—

New Tunnel—Farish Flat.

There are 62 men, 6 boys, 6 horses at this flat. Intake of air is 10,920 feet per minute; air passing the ends of 5 bords, from No. 1 to No. 5, is 6,840 feet per minute; air passing the ends of 7 bords, from No. 5 to No. 12, is 2,520 feet per minute, thermometer 68°; air passing the ends of 9 bords, from No. 12 to No. 21, is 3,240 feet per minute, thermometer 67°; air passing the ends of 5 bords, from No. 21 to No. 26, is 6,000 feet per minute, thermometer 67°; air passing the ends of 5 bords, from No. 26 to No. 31, is 4,290 feet per minute, thermometer 68°.

We also wish to call your attention to the cut-through that the men travel in, which is full of water, and requires something doing to it.

Far Flat No. 1.

There are 46 men, 6 boys, 5 horses at this flat. Intake of air, 7,560 feet per minute; air passing the ends of bords from No. 18 to No. 10 so slack that we were unable to test the quantity, thermometer 75°; air passing the ends of 7 and 8 bords, 2,840 feet per minute; there, 5 pillars with 20 men in them, we found the air to be very much heated, and were unable to test the quantity, thermometer 75°.

Far Flat No. 2.

There are 42 men, 4 boys, 4 horses at this flat. Intake of air is 5,280 feet per minute; air passing the ends of 10 places on right-hand side of bank so slack that we were unable to test the quantity, thermometer 70°; air passing the ends of 10 bords on left-hand side of flat, 2,640 feet per minute, thermometer 69°.

Straight-down Flat.

There are 60 men, 7 boys, 6 horses at this flat. Intake of air, 7,160 feet per minute; air passing the ends of 5 bords on right-hand side of flat is 2,400 feet per minute, thermometer 69°; air passing the ends of 4 bords on right-hand side of narrow bords is 2,400 feet per minute, thermometer 70°; air passing the ends of 5 bords on right-hand side of narrow bord cut-through higher up, 2,310 feet per minute, thermometer 71°; air passing the ends of 11 bords in Dent's heading, 3,465 feet per minute, thermometer 74°; air passing the ends of 5 bords on left-hand side of narrow bord, 2,800 feet per minute, thermometer 74°.

South Pit Flat.

There are 34 men, 3 boys, 3 horses at this flat; air passing the ends of Nos. 1 and 2 bords, 1,960 feet per minute; air passing the ends of 5 bords, from No. 2 to No. 7, so slack that we were unable to test the quantity; intake of air on right-hand side of bank, 2,640 feet per minute; air passing the ends of 10 bords here, 3,300 feet per minute, thermometer 70°.

Middle Pit Flat.

There are 54 men, 7 boys, 7 horses at this flat. No. 1 intake of air at New Chum, 8,320 feet per minute; air passing the ends of 4 bords, from No. 2 to No. 5, is 4,320 feet per minute, thermometer 65°; air passing the ends of 9 bords, from No. 6 to No. 14, is 4,512 feet per minute; air passing the ends of 4 bords, from No. 14 to No. 18, 2,871 feet per minute, thermometer 70°.

Intakes.	Returns at Furnace.
10,920	42,120
7,560	32,340
5,280	42,840
7,160	23,100
2,640	
8,320	
	Total..... 140,400

Total..... 41,880

Travelling roads and furnaces in good order, with the exception of No. 1 return at furnace, which is partly blocked up.

WALTER KERR, }
E. CHARLTON, } Check Inspectors.

[Enclosure to No. 6.]

Lambton Colliery, 24 and 25 August, 1885.

WE, the undersigned, having examined the workings and travelling roads of the above colliery, report as follows:—

New Tunnel—Farish Flat.

There are 62 men, 6 boys, 6 horses at this flat. Intake of air, 7,140 feet per minute.

Air passing the ends of 5 bords, from No. 1 to No. 5, is 3,300 feet per minute; thermometer 61°.

Air passing the ends of 10 bords, from No. 5 to No. 15 was so slack that we were unable to test the quantity; thermometer 64°.

Air passing the ends of 6 bords, from No. 16 to No. 21, is 1,470 feet per minute; thermometer 69°.

Air passing the ends of 10 bords, from No. 21 to No. 31, is 5,320 feet per minute; thermometer 70°.

Far Flat No. 1.

There are 46 men, 6 boys, 5 horses at this flat. Intake of air, 5,005 feet per minute.

Air passing the ends of 5 bords, from No. 18 to No. 14, so slack that we were unable to test the quantity; thermometer 71°.

Air passing the ends of 7 bords, from No. 14 to No. 7, is 4,800 feet per minute; thermometer 72°. We found the air to be more improved at the Pillars than last time.

Far

11.

Far Flat No. 2.

There are 44 men, 4 boys, 4 horses at this flat.

Air passing the ends of all the bords on right-hand side of flat was so slack that we were unable to test the quantity ; thermometer 70°. Intake of air on the bank, 3,960 feet per minute.

Air passing the ends of 10 bords on left-hand side of flat, 1,800 feet per minute ; thermometer 67°.

Straight-down Flat.

There are 60 men, 7 boys, 6 horses at this flat. Intake of air on the bank, 3,960 feet per minute.

Air passing the ends of 5 bords on right-hand side of bank was so slack that we were unable to test the quantity ; thermometer 72°.

Air passing the ends of 5 bords on right-hand side of narrow bord, 1,800 feet per minute ; thermometer 72°.

Air passing the ends of 5 bords in top cut-through, 2,210 feet per minute ; thermometer 72°.

Air passing the ends of 11 bords in Dent's heading, 4,050 feet per minute ; thermometer 74°.

Air passing the ends of 5 bords on left-hand side of narrow bord, 3,300 feet per minute ; thermometer 75°.

South Pit Flat.

There are 35 men, 4 boys, 4 horses at this flat. Intake of air on right hand side of flat, 3,630 feet per minute.

Air passing the ends of all the bords on right-hand side of flat, 3,630 feet per minute ; thermometer 69°.

Air passing the ends of all the bords on left-hand side of flat so slack that we were unable to test the quantity ; thermometer 74°.

We also wish to draw your attention to the want of timber at the South Pit, and also to the want of manholes in that portion of the bank from the old flat to the new one.

Middle Pit Flat.

There are 60 men, 6 boys, 6 horses at this flat. No. 1 intake of air, 6,490 feet per minute ; No. 2 intake of air, 5,720 feet per minute.

Air passing the ends of 7 bords, from No. 1 to No. 7, is 3,360 feet per minute ; thermometer 68°.

Air passing the ends of 12 bords, from No. 7 to No. 19, is 3,300 feet per minute ; thermometer 69°.

[Enclosure to No. 6.]

Lambton Colliery, 23 and 24 September, 1885.

WE, the undersigned, having examined the workings and travelling roads of the above colliery, report as follows :—

New Tunnel, Farish Flat.

There are 62 men, 6 boys, 6 horses at this flat. Intake of air for same, 5,460 feet per minute.

Air passing the ends of 5 bords, from No. 1 to No. 5, is 2,340 feet per minute.

Air passing the ends of 8 bords, from No. 6 to No. 13, is 2,730 feet per minute ; thermometer 69°.

Air passing the ends of 8 bords, from No. 13 to No. 21, is so slack that we were unable to test the quantity ; thermometer 70°.

Air passing the ends of 10 bords, from No. 21 to No. 31, is 2,400 feet per minute ; thermometer 69°.

Far Flat No. 1.

There are 50 men, 3 boys, 3 horses at this flat. Intake of air for same, 4,680 per minute. We inspected all the pillars and found the air to be workable ; thermometer 74°.

Far Flat No. 2.

There are 54 men, 6 boys, 6 horses at this flat. Intake of air for same, 4,800 feet per minute.

Air passing all the bords on right-hand side of flat so slack that we were unable to test the quantity ; thermometer 71°.

Air passing the ends of 10 bords on left-hand side of flat, 1,650 feet per minute ; thermometer 69°.

Air passing the ends of 5 bords on right-hand side of Straight-down Flat, which is attached to Far Flat, was so slack that we were unable to test the quantity ; thermometer 70°.

South Pit Flat.

There are 40 men, 6 boys, 6 horses at this flat. Intake of air for same, 4,650 feet per minute.

Air passing the ends of 5 bords, from No. 11 to No. 7, is 4,650 feet per minute ; thermometer 72°.

Air passing the ends of 6 bords, from No. 7 to No. 1, so slack that we were unable to test the quantity ; thermometer 72°.

Intake of air on left-hand side of bank, 2,790 feet per minute.

Air passing the ends of 8 bords, from No. 19 to No. 10, is 2,790 feet per minute ; thermometer 72°.

Middle Pit Flat.

There are 56 men, 6 boys, 6 horses at this flat. No. 1 intake of air, 4,680 feet per minute ; No. 2 intake of air, 5,985 feet per minute.

Air passing the ends of 7 bords, from No. 1 to No. 7, 2,695 feet per minute ; thermometer 67°.

Air passing the ends of 12 bords, from No. 7 to No. 19, 2,475 feet per minute ; thermometer 69°.

We once more wish to draw your attention to the want of manholes on the South Pit Bank from the old flat to the present flat. We further want to draw your attention to the different parts of the roof which want attending to, as we think they are not safe.

No. 7.

The Under Secretary for Mines to The Examiner of Coal-fields.

Sir, Department of Mines, Sydney, 30 January, 1886.
I am directed by the Secretary for Mines to inform you that a letter has been received from Mr. James Curley, Secretary of the Miners Association, to the effect that the miners at the Co-operative Colliery had to come out of the mine on the 19th instant, not being able to work in consequence of defective ventilation, and I am to request that you will report on the matter without delay.

I have, &c.,
HARRIE WOOD,
Under Secretary.

No. 8.

The Under Secretary for Mines to The Manager, Co-operative Colliery, Wallsend.

Sir, Department of Mines, Sydney, 30 January, 1886.
I am directed by the Secretary for Mines to call your attention to a statement made by James Curley, Secretary of the Miners' Association, in a letter to this Department of the 25th instant, to the effect that the miners at the Co-operative Colliery, Wallsend, had to come out of the mine on the 19th instant, not being able to work in consequence of defective ventilation.

I have, &c.,
HARRIE WOOD,
Under Secretary.

No. 9.

Mr. James Fletcher, jun., Manager, Co-operative Colliery, to The Honorable the Secretary for Mines.

Sir, Wallsend, 1 February, 1886.
Your letter of 30th ultimo, informing me that Mr. Curley, Miners' General Secretary, had written to you on the 25th ultimo, that the miners employed at the Co-operative Colliery, Wallsend, had to come out of the mine on the 19th instant, not being able to work in consequence of defective ventilation, is duly to hand, and contents noted.

I do not say that Mr. Curley wrote intentionally to mislead you, but I venture to affirm that the wording of his letter could have no other effect than to convey the idea that the whole of the miners employed at this colliery had to leave the pit in consequence of defective ventilation. I am so much accustomed to hear of late of misleading statements being made that they would have to be extravagant indeed to surprise me. Mr. Curley, in his official capacity, could not, of his own knowledge, know anything but what was communicated by some or other of the miners here employed, and it is but another proof that men holding important positions should act with the greatest of caution on *ex parte* statements before making such serious charges against this or any other colliery.

It is true that some fourteen or fifteen men left their work in consequence of the air being slack in that particular part of the pit where they were working. The cause of the deficiency of air was discovered by the underground manager by 7 o'clock a.m., the time the drawing of coal commences, and was remedied in less time than it takes to write this. Briefly stated the cause was the leaving of an air-door open which allowed the air to go direct to the furnace without passing over the men in this particular district, or any part of the pit, as the air passed through the doorway in question and went direct to the ventilation shaft. I may mention that this door was placed there as a convenience for the men, so that they might travel to and from their work in a shorter distance than by keeping the main road. It also served for the colliery officials to pass through when examining the airways.

Every practical coal-miner knows that air-doors are erected to check currents, and that the leaving of them open disarranges the whole of the ventilation in their locality; but notwithstanding this fact being universally understood, the miners in passing through this door, instead of closing it behind them, left it open, which I believe was done wilfully and designedly, with the view of creating a misunderstanding between us and the men.

When the defective state of the ventilation was detected by the underground manager and other colliery officials, they immediately examined the airways and ventilating furnace, and finding everything right with both they were at a loss to account for the slackness of air, never for one moment dreaming that the door in the travelling road for the men's convenience had been left open, and it was only by following up the return column of air that the cause was detected. This was at once explained to the men, who were about to go home, and they were assured that the air would shortly be all right, and within half-an-hour of their leaving, and the door being closed, the air was as good as it was before, and is since.

It was no secret amongst the men that the door being left open caused the defective ventilation, and I have no hesitation in saying that Mr. Curley's informant knew it as well as we did.

At every air-door on the main roads of our mine a boy is kept specially to open and shut it each time a person or horse passes through, but the door in question only being there for the convenience of the men, and not on a main road, no boy was kept to attend it. Whoever left it open committed a gross abuse of a privilege established for their convenience; and to prevent a like occurrence it has since been nailed up.

We have several miles of airway in our mine, and no matter how careful we are, falls from the roof and similar accidents may occur which temporarily interfere with the ventilation, and to provide for this the airways are examined every day, either by the regular officials, or persons told off for that particular duty. If, however, the miners themselves, who are equally interested with the management in keeping up a proper supply of air, will either negligently or designedly leave air-doors open it is a difficulty of far greater magnitude than keeping the airways in proper order, notwithstanding their great length.

We

We have 340 to 350 miners employed in this colliery, and as only fourteen or fifteen of that number left their work on the day referred to by Mr. Curley, it is, I think, substantial proof that the deficient ventilation was confined to the district I refer to, and not the whole of the mine, as must be inferred by Mr. Curley's letter.

Where the Coal-fields Regulation Act is not carried out faithfully, I do not, for one, complain at the miners seeking the Minister's assistance to insist on its being done, but I do complain of statements being made to the Minister calculated to mislead, when the miners themselves knew exactly the cause; and further, that the cause was not brought about by any act or neglect of the management, but by the negligence or design of members of their own body.

I trust the explanation here given will put the matter brought under your notice by Mr. Curley in its proper light; and to still further prove the statements here made, I shall feel extremely obliged if you will instruct Messrs. Mackenzie and Dixon to visit the colliery and ascertain for themselves by actual experiment whether leaving open the air-door referred to will not bring about the result of which Mr. Curley complains.

I am, &c.,

JAMES FLETCHER, JUNIOR,
Manager.

No. 10.

The Examiner of Coal-fields to The Under Secretary for Mines.

Examiner of Coal-fields' Report on a complaint made to the Honorable the Secretary for Mines by the Miners' General Secretary, respecting alleged defective ventilation at the Co-operative Colliery, on 19th January, 1886.

Sir,

Coal-fields Office, Newcastle, 3 February, 1886.

In compliance with the instructions of the Honorable the Secretary for Mines, conveyed to me in your letter of the 30th ultimo, with respect to a letter he has received from Mr. Curley, Secretary of the Miners' Association, to the effect that the miners at the Co-operative Colliery had to come out of the mine on the 19th ultimo, not being able to work in consequence of defective ventilation, and asking me to report on the matter without delay,—I have the honor to state that I went to the Colliery, accompanied by Mr. Inspector Dixon, yesterday, and report as follows:—

1. On arriving at the colliery, I went in the mine with Mr. Inspector Dixon, Robert Davidson (overman), and John Houston (deputy), where I was met by the "Miners' Inspectors," who happened to be there for the purpose of making their monthly inspection, and who came and asked if I had any objection to their accompanying me, or would I let them check their anemometer with the Government one.

I replied I was only there that day inquiring into and ascertaining the cause of a deficiency of ventilation on the 19th ultimo, which Mr. Curley had complained of at the request of the Executive of the Miners' Association. But after this was done, having before entering the mine seen the latest report made by them in the "book" kept at the colliery office for that purpose, I and Mr. Dixon accompanied by them would measure the quantity of air at the same places where they had measured it and reported a deficiency of ventilation.

Inquiry and Report.

1. John Houston (deputy), of the Co-operative Colliery, said as follows:—On the morning in question I was in No. 1 split at about 7 a.m., when some of the men then coming into that split said, "Houston, what is the matter in the cross-cuts; there are some of the men going away home on account of the air." I replied that is the first I have heard of anything the matter with the air this morning, but will make my way there immediately. On going, with a view to making my way to the furnace, thinking there might be a fall in the return, I entered into it from No. 1 split, and when coming up the return and arriving at the door that enters into the cross-cut return, I immediately saw what was the matter, as the door was standing about three-parts open with a stone against it, keeping it open. That the door must have been opened by some of the men coming in to work in No. 2 or 3 splits. Could not say whether the door had been propped open purposely, or a stone had fallen against it as some one had passed through it.

2. Robert Davidson (overman), of the Co-operative Colliery, stated:—When going to the mine from my breakfast, I met Daniel Rees, John Rees, Samuel Rees, Daniel Rees (junior), William Gilpin, Alfred Upton, Thomas Lewis, Henry Forrester, Ezekiel Williams, and Alfred Patterson at the tunnel mouth and asked them what was the matter. They replied "the air was bad." I told them I would go down immediately and see what was the matter, and that I could not understand how the air could be bad unless a door had been left open. They said they did not know. I then went to the bord where they had been at work and found the air as good as usual and nothing possible to complain of. Then I sent for the deputy (John Houston), who came and told me it was all right, and that he had found out where the fault was, "by a door being propped open by a stone," and that he believed it had been propped open on purpose. I then went to other miners who did not leave off working, and were still at work, in the same split, who said "their air was all right."

The "back shift" (second daily set of miners) never came to work that day, although the air was as good as ever in half an hour after the "front shift" had left the mine.

3. I got Houston to show me and Mr. Dixon how he found the door, and after taking the stone away which he put against the door to illustrate it I passed through it to see if it was possible that a stone could fall down and rest against the door in such a manner, whilst the door, which was a self-acting one, closed of its own accord. My opinion, and Mr. Dixon's, is that from the way the stone was placed, as shown us by Houston, it was most probably put there intentionally. (*Appendix B.*)

4. I annex a tracing showing the method adopted for the ventilation of the portion of the mine complained of, also the bords (lettered A) where the men left off work and those in which the men remained at work (lettered B) in the same split of air; and where the door (D in red) was found open in the

the stenton between the intake and return air-ways. The arrows shown in blue denote how the intake air enters the split outside of the said door and circulates through the northern side of the split crossing the heading almost opposite the door, near the top of which heading a temporary screen is fixed, from which it will be seen that when the door referred to (D) was open the current (→) would sweep through the screen down the heading and through the open door into the main return airway instead of circulating into the heading and bords where the men left off work, and that when the door is open the air would travel through it to the furnace, as it would be the shortest route.

5. In conclusion, I have only to state that the overman says the door was put where it is for the men's convenience in travelling in and out of this part of the mine, and that each person passing in and out was supposed to see it was closed, and that if it had been shut on the day in question the alleged defective ventilation would not have occurred. Also that the defect was rectified within half an hour of certain miners leaving the mine—they and others having been made acquainted with it immediately afterwards. Notwithstanding this, the complaint was made to the Minister after a lapse of five days, during which time the same miners had been at work in the places where they left off work. One of the miners who left off work with his three sons on the morning in question was Mr. Daniel Rees, of the Miners' Executive Committee, and District Chairman of the Hunter River Miners' Association.

I have, &c.,

JOHN MACKENZIE,
Examiner of Coal-fields.

From this report it appears there was no ground for the complaint of defective ventilation on the 19th January.—H.W., 8/1/86. Submitted. Approved.—R.N.V., 19/2/86. Mr. Curley informed 25 February, 1886.

No. 11.

Report of a joint Inspection of Nos. 2 and 3 splits in the Co-operative Colliery made by the Examiner of Coal-fields, Inspector of Collieries, and Mr. Middleby and Mr. Lewis (Miners' Inspectors), on Tuesday, 2nd February, 1886.

Sir,

Coal-fields Office, Newcastle, 3 February, 1886.

The following are the results of measurements taken at the request of the Miners' Inspectors for the purpose of ascertaining what quantity of air was circulating in the Nos. 2 and 3 splits in which they had reported, in the book kept at the colliery office for that purpose, a deficiency of ventilation on the 6th and 7th of January last.

The measurements were taken at the same time, and the anemometers placed side by side.

No. 2 SPLIT.

At No. 80 bord the result was about 7,716 cubic feet of air per minute, the reading of both instruments in this instance being nearly the same.

At No. 71 bord the result was about 5,082 cubic feet of air per minute, and by the Miners' Inspectors' instrument about 3,880.

At No. 41 bord the result was 7,049 cubic feet by the Government instrument, and 6,829 by the Miners'; and at 38 bord 6,600 by the Government anemometer, and 5,500 cubic feet per minute by the Miners'.

The largest current of air measured in this No. 2 split was about 7,716 cubic feet per minute for about 56 miners, 2 wheelers, 2 drivers, 3 tappers, and 2 horses—total 65, giving about 118 cubic feet of air per minute for each man, boy, and horse.

The Miners' Inspectors at Co-operative Colliery, however, have lately adopted the plan of measuring the current of air in several places in each split, then adding the measurements together and striking an average for the result, and even by this method the result would be a little over 101 cubic feet of air per minute for each man, boy, and horse in the split.

No. 3 SPLIT.

The greatest current of air was got at the No. 65 bord end, being about 6,840 cubic feet per minute. The two anemometers registered about the same on this occasion, and in the far stenton in this split the current of air was about 5,800 cubic feet per minute, the instruments again giving nearly the same reading. At 52 bord, however, the current of air was about 6,435 cubic feet per minute by the Government anemometer, and about 6,184 by the Miners'.

The largest current of air in this split was about 6,840 cubic feet per minute for about 48 men, 5 boys, and 3 horses—total 56 men, &c., giving about 122 cubic feet of air per minute for each man, boy, and horse in this No. 3 split, and by the Co-operative Miners' Inspectors' method of average would give about 113 cubic feet of air per minute for each man, boy, and horse in the split.

It will thus be seen that the provisions of the Coal Mines Regulation Act are here complied with.

I have, &c.,

JOHN MACKENZIE,
Examiner of Coal-fields.

The result of the investigation appears to be satisfactory, and may be communicated to the Miners' Secretary.—H.W., 8/2/86. Submitted. Approved.—R.M.V., 19/2/86.

No. 12.

The Under Secretary for Mines to The Miners' General Secretary, Hamilton.

Sir, Department of Mines, Sydney, 25 February, 1886.

Referring to the complaint made by you respecting alleged defective ventilation at the Co-operative Colliery on the 19th ultimo, I am directed by the Secretary for Mines to inform you that, from the report of the Examiner of Coal-fields, there appears no ground for complaint as to the ventilation of the colliery on the day named.

I have, &c.,
HARRIE WOOD,
Under Secretary.

No. 13.

The Under Secretary for Mines to The Examiner of Coal-fields.

Sir, Department of Mines, Sydney, 25 February, 1886.

Referring to the reports sent in by you—the one on a complaint by the Miners' General Secretary respecting alleged defective ventilation at the Co-operative Colliery, and the other as to the quantity of air circulating in Nos. 2 and 3 splits in the same colliery,—I have the honor to inform you that it has been intimated to Mr. Curley, the Miners' General Secretary, that both reports furnished by you as to the ventilation of the abovenamed colliery are considered satisfactory.

I have, &c.,
HARRIE WOOD,
Under Secretary.

Maryville Colliery.

NO.	SCHEDULE.	PAGE.
1.	Mr. John Wright to Mr. Inspector Dixon, calling attention to ventilation in Maryville Colliery. 9 November, 1885.	15
2.	Mr. Inspector Dixon to Mr. H. Harper, Manager, Maryville Colliery, notifying him of defective ventilation, &c., in Maryville Colliery. 25 January, 1886.	15
3.	The same to the Examiner of Coal-fields, with report of inspection of Maryville Colliery. 1 February, 1886.	16
4.	The Examiner of Coal-fields to The Under Secretary for Mines, re deficiency of ventilation at Maryville Colliery, with minutes and enclosures. 5 February, 1886.	16
5.	Mr. Inspector Dixon to the Examiner of Coal-fields, reporting a special inspection of Maryville Colliery to see if any improvement in ventilation since last inspection. 26 February, 1886.	18
6.	The same to the same, forwarding letter received from Manager, Maryville Colliery, and asking for further instructions, with minutes. 27 February, 1886.	18
7.	The Under Secretary for Mines to the Crown Solicitor, to prepare form of authority to enforce the provisions of Coal-mines Regulation Act. 6 March, 1886.	18
8.	Form of authority prepared by Crown Solicitor.	18
9.	Telegram—The Examiner of Coal-fields to Mr. Inspector Dixon, re working of top coal in Maryville Colliery. 6 March, 1886.	19
10.	Telegram—Mr. Inspector Dixon to the Examiner of Coal-fields, in reply to No. 9. 8 March, 1886.	19
11.	The Under Secretary for Mines to the Manager, Maryville Colliery, calling attention to notice served on him. 13 March, 1886.	19
12.	The Manager, Maryville Colliery, to the Honorable the Secretary for Mines, in reply to No. 11, with minutes. 19 March, 1886.	19
13.	Mr. Inspector Dixon to the Examiner of Coal-fields, reporting result of prosecution in connection with Maryville Colliery, with minutes. 16 April, 1886.	19

No. 1.

Mr. John Wright to Mr. J. Dixon, Inspector of Collieries.

Sir, Wickham, 9 November, 1885.

I am instructed by the Committee of our body to write to you calling your attention to the air in the Maryville Colliery, as there have been a great many complaints.

I have, &c.,
JOHN WRIGHT,
Secretary.

No. 2.

Mr. John Dixon, Inspector of Collieries, to Mr. H. Harper, Colliery Manager, Newcastle.

Sir, Glebeland, 25 January, 1886.

I hereby have to notify you of the very defective state of the ventilation in the Maryville Colliery, as found by me on my inspection of said colliery to-day (Monday), inasmuch as the total current of air in the main return airway near pit-bottom was only about 1,885 cubic feet per minute, being over 3,000 cubic feet of air per minute short of the quantity required by sub-section 3, section 12, of the Coal Mines Regulation Act, 1876, for the number of men, &c., at work in the Maryville Colliery at the time of my inspection.

2. On my inspection this morning I noticed that the top coal had been cut up and, to some extent, worked in three bords. Therefore, in pursuance of the provisions contained in the 25th section of the Coal Mines Regulation Act, 1876, I hereby notify you that, in my opinion, owing to the soft nature of the

the strata above the seam at the Maryville Colliery, it is a dangerous practice to work the top coal at the present time, more especially as there is only one shaft, and consequently only one way of escape for the persons employed below in the event of a sudden inrush of water, sand, and gravel, which, in my opinion, may be liable to take place at any time after the removal of the top coal.

3. I have, therefore, to urge that the above matter may have your serious attention at once, with a view to the well-being and safety of all persons employed in the Maryville Colliery.

I have, &c.,

JOHN DIXON,

Inspector of Collieries.

No. 3.

Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Maryville Colliery Inspection.

Sir,

Glebeland, 1 February, 1886.

I have the honor to report inspection of the above colliery on Monday (25th January ultimo), as follows:—

At the time of my inspection there were about 37 miners, 1 small coal filler, 1 deputy, 5 wheelers, 2 water-balers, 1 onsetter, and 2 horses; total, about 49 men, &c., employed below.

The total current of air for the above number of men, &c., was only about 1,885 cubic feet per minute. This result was got in the main return air-way near the shaft bottom immediately after descending the shaft on the day of inspection. After going through the workings (where I could not get a result with the anemometer), I came back to the bottom of the shaft again, and got exactly the same result as before. Although none of the workings are a very great distance from the pit bottom, yet, owing to the very limited quantity of air descending the shaft, the ventilation throughout the working headings was sadly defective, as the total quantity of air was over 3,000 cubic feet per minute below the requirements of the Coal Mines Regulation Act for the number of men, &c., employed below.

At the time of my inspection there was a good fire in the furnace at the surface, but it seemed to have little or no power over the up-cast column of air behind the brattice in the shaft. I here beg to remark that on the 12th December last the manager (Mr. Harper) promised me that he would raise the up-cast portion of the shaft above the level of the landing stage. This promise he (Mr. Harper) fulfilled by raising the furnace stack some 16 feet higher, but without any apparent beneficial results to the ventilation of the mine.

2. On my inspection of the Maryville Colliery on Monday last I also noticed that three bords had been cut up, and part of the top coal worked in each of the three. In the No. 2 heading there were two men cutting a bord up; they had reached the roof at about 5 feet, but had not got the bord cut all across when I saw it; this bord was about 6 yards wide. In No. 3 heading I saw two men working top coal in a bord about 7 yards wide; the tops in this bord were also about 5 feet in thickness, and had been worked for about 10 yards in length down the bord. In the adjoining bord, being No. 6 bord, No. 3 heading, I also saw two men at work in the tops; this bord was about 7½ yards wide, and the tops had been worked for a distance of about 11 yards. The roof in this bord was wet, as water was coming through in several places.

3. Seeing that as yet there is only one shaft in connection with the Maryville Colliery, and that the strata overlying the seam of coal is of an extremely soft nature throughout, I am of opinion that it is a highly dangerous practice to work the top portion of the seam in the Maryville Colliery until the dip-coal is worked, and a second shaft sunk to afford another means of escape for the persons employed below.

4. In conclusion, I beg to state that on Monday last, the day of inspection, I notified the manager (Mr. Harper), by registered notification, concerning the defective ventilation, and the top coal workings in the Maryville Colliery, a copy of which notification I herewith beg to forward.

I have, &c.,

JOHN DIXON,

Inspector of Collieries.

No. 4.

The Examiner of Coal-fields to The Under Secretary for Mines.

Deficiency of Ventilation, &c., at the Maryville Colliery.

Sir,

Coal-fields Office, Newcastle, 5 February, 1886.

I have the honor to forward for the information of the Honorable the Secretary for Mines a report I have received from Mr. Inspector Dixon, dated the 1st instant, with respect to a deficiency of ventilation at the Maryville Colliery, the ventilation of which had been previously complained of by the Inspector to the manager on 12th December last, when the latter promised to raise the up-cast portion of the shaft above the level of the landing-stage. This promise was fulfilled by raising the furnace stack 16 feet higher, but without any beneficial results to the ventilation of the mine, there being a deficiency on 25th ultimo of over 3,000 cubic feet of air per minute for the number of men, &c., employed underground.

2. Mr. Dixon also reports that three 6-yard bords had been cut up and part of the top coal worked in each of them. In No. 3 heading two men working top coal in a bord about 7 yards wide, and in another 7½-yard bord, the top coal had been worked for a length of about 11 yards where the roof was wet, and water was coming through it in several places; and that, seeing there is only one shaft in connection with the colliery, and that the strata overlying the coal seam is of an extremely soft nature throughout, he is of opinion that it is a highly dangerous practice to work the top portion of the seam in the Maryville Colliery until the dip coal is worked, and a second shaft sunk to afford another means of escape for the persons employed below, in which I fully agree, and forward for the Minister's information a letter I wrote to Mr. Dixon on the subject, on the 21st October last, and a copy of a letter to Mr. Dixon, dated 28th October, from the manager, saying he was putting down a borehole, in view of ascertaining the most suitable position for putting down a shaft. The bore was completed a short time afterwards

and

and nothing further has been done with a commencement of the second shaft, which Mr. Dixon and myself have told him we considered absolutely necessary, taking into consideration the extremely soft nature of the strata overlying the coal-seam, and the probability of a much larger influx of water flowing into the mine than has occurred on three previous occasions. I also enclose copy of notice Mr. Dixon has served on the manager.

3. I shall be obliged by your informing me, as early as practicable, what further steps the Minister desires me to take in the matter.

I have, &c.,

JOHN MACKENZIE,
Examiner of Coal-fields.

Unless the defects be at once remedied the Examiner may take proceedings to enforce the observance of the provisions of the Act.—H.W., 11/2/86. Submitted. Approved.—R.M.V., 12/2/86. The Examiner of Coal-fields.—G.E.H., B.C., 13/2/86.

In regard to the matter of the second opening referred to in the within report, the Examiner should instruct the Inspector to serve notice, in terms of section 25 of the Coal Mines Act, upon the owners of the Maryville Colliery.—H.W., 4/3/86.

Submitted. The Inspector served notice upon the manager on 25th January last.—J.M., 8/3/86. The Under Secretary for Mines, B.C., 8/3/86.

From the fact that the owner has not complied with the notice it may be inferred that he objects, in which case the matter will have to be referred to arbitration; but the Minister might perhaps desire that the owner's attention be called to the notice before taking further proceedings.—H.W., 8/3/86.

Submitted. Approved.—J.F., 10/3/86.

[Enclosures to No. 4.]

The Examiner of Coal-fields to Mr. John Dixon, Inspector of Collieries.

Sir,

Coal-fields Office, Newcastle, 21 October, 1885.

Since my inspection and examination with you of the heading and bord which caved in a short time since, where two men were at work at the Maryville Colliery, the caving in having taken place immediately after the heading and bord, being driven by the two men, reached a face of sand and gravel, when a tremendous rush of water and sand ran therefrom into the workings, which wash-out, consisting of sand and gravel, is now barred back by a barrier reaching to the roof of the coal-seam.

2. In consequence of the disturbed nature of the country at this Colliery and others in the neighbourhood, and the liability at any time of similar washes of sand and gravel, I have thought seriously as to the necessity of the owners of the Maryville, Wickham, and Bullock Island, and Stockton Coal Companies being compelled to keep boreholes at least 10 feet ahead in all exploring headings driven north, east, south, or west of their working shaft.

3. Do you not think it is a dangerous practice, knowing the disturbed nature of the country in which the Maryville and Stockton Collieries are, for them to be worked as they now are by one shaft, and consequently only one means of escape for the men, boys, &c., working therein, and that a second shaft should be commenced at once; if so, you had better serve the colliery managers with registered notices to that effect under section 25 of the Coal Mines Regulation Act 1876?

I have, &c.,

JOHN MACKENZIE,
Examiner of Coal-fields.

Mr. John Dixon, Inspector of Collieries, to Mr. H. Harper, Colliery Manager, Newcastle.

Sir,

Glebeland, 24 October, 1885.

Knowing the disturbed nature of the ground in connection with the Maryville Colliery, I have, in pursuance of the provisions contained in the 25th section of the Coal Mines Regulation Act 1876, to notify you that I consider the practice of only having one shaft (and consequently only one means of escape) to be dangerous; and therefore have to urge that a second shaft in connection with the Maryville Colliery be commenced at once, and carried on without delay, so that a second opening from the surface to the present workings may be completed as soon as possible.

2. Seeing that in the Maryville Colliery there exists a danger of tapping, at any time, loose ground liable to contain a heavy feeder of water, I am directed to draw your attention to the necessity of keeping a borehole at least 10 feet ahead of the working face in every exploring place or heading driven north, south, east, or west.

3. I have therefore to urge that you would give your serious attention to the above matters at once, with a view of having them carried out without delay.

I have, &c.,

JOHN DIXON,
Inspector of Collieries.

Mr. Henry Harper to Mr. John Dixon, Inspector of Collieries.

Sir,

Maryville Colliery, 28 October, 1885.

Your favour of the 24th instant came duly to hand, and your request I have carefully thought over. With regard to the second shaft, I have already put down one bore to the westward of our pit, with a view of ascertaining the most suitable position for putting down a shaft. I am also putting in a bore ahead of some of my headings, wherever I think there is the slightest necessity of doing so. As far as we can ascertain there are other collieries adjacent who are worse off in this respect than we are; but we will endeavour to comply with the various suggestions as far as practicable.

I have, &c.,

HENRY HARPER.

Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Sir,

Glebeland, 29 October, 1885.

I have the honor to acknowledge receipt of your communication of 21st instant, concerning the disturbed state of the country in connection with the Maryville, Stockton, and Bullock Island Collieries, and the necessity for the second shaft at Maryville and Stockton, &c.

In reply, I beg to state that I most fully endorse your views respecting the above-named collieries, and, according to your instructions, have notified the managers, under the 25th section of the Coal Mines Regulation Act, 1876, to commence at once the second shaft at Maryville and Stockton, and to keep a borehole at least 10 feet ahead of the face in every bord or heading driven north, east, south, or west, in the Maryville, Stockton, and Bullock Island Collieries, copies of which notifications I herewith beg to forward.

I have, &c.,

JOHN DIXON,
Inspector of Collieries.

No. 5.

Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.
Special inspection of the Maryville Colliery to see if the ventilation had been improved since my inspection of that colliery on 25th January last month.

Sir,

Glebeland, 26 February, 1885.

I have the honor to report inspection of the above-named colliery on Wednesday last, 24th instant, as follows:—

Since my inspection on 25th ultimo, the manager (Mr. Harper) had caused a "fire-lamp" to be erected in the return air-way at the shaft bottom, in order to improve the ventilation of the mine; and although a slight increase in the main current of air had been effected by the fire-lamp, yet I regret to say that on the 24th instant the ventilation in the Maryville Colliery was not by any means up to the requirements of the Coal Mines Regulation Act, 1876, as the following results will show. At the time of my inspection there were about fifty men and boys and two horses at work in the mine. The first measurement of the air current was taken in the main return air-way, near the shaft bottom, at about 9:20 a.m., the total result being about 2,940 cubic feet of air per minute. After going through a portion of the workings, I again returned to the shaft bottom and measured the current of air at the same place as before. This was about 10:30 a.m., and the result was an improvement on the first measurement, being about 3,360 cubic feet of air per minute. The first and second measurements, as given above, were taken when the pump was working and exhausting into the upcast behind the brattice in the shaft. The third measurement was taken about 11:30 a.m., when the pump was stopped, and the result was about 2,870 cubic feet of air per minute. For the fifty-two men, &c., employed in this colliery, on the day of inspection, the minimum quantity of air to comply with the Act ought to have been 5,200 cubic feet per minute. The first measurement, however, as taken by me shows a deficiency of about 2,260 cubic feet per minute; the second a deficiency of 1,840 cubic feet per minute; and the third a deficiency of about 2,330 cubic feet per minute.

In my previous report on this colliery I mentioned that top coal was being taken out in various places. I here beg to state that the same work is still being carried on; and since my inspection of 25th last month a top coal bord has given way, and the fall has extended to the surface. This is the bord I mentioned as having a wet roof.

On coming out of the mine on Wednesday last I saw Mr. Harper, and told him about the state of the ventilation in the Maryville Colliery, and he informed me that he was having a bore put down to test the ground with a view of commencing the second shaft as soon as possible.

I have, &c.,

JOHN DIXON,

Inspector of Collieries.

No. 6.

Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Sir,

Glebeland, 27 February, 1886.

For your information I beg to forward a letter which I received from Mr. Harper, manager, Maryville Colliery, this (Saturday) morning, by which is inferred that the ventilation at said colliery has been made considerably better since my inspection on Wednesday last.

I shall be obliged for instructions on this matter, as to whether I am to make another inspection of the Maryville Colliery prior to taking action in Court.

I have, &c.,

JOHN DIXON,

Inspector of Collieries.

Submitted for further instructions.—J.M., 4/3/86. The Under Secretary for Mines, B.C., 4/3/86.

A further inspection should be made, and if the ventilation is not in accordance with the provisions of the Act the Inspector should at once take the necessary proceedings. Authority to take proceedings, under the Coal Mines Regulation Act, may be issued to Mr. Inspector Dixon.—H.W., 4/3/86.

Submitted. Approved.—J.F., 4/3/86. The Examiner of Coal-fields.—H.W., 4/3/86. Mr. Dixon instructed.—J.M., 4/3/86. Under Secretary for Mines, B.C., 4/3/86. Proceedings taken on 6th April, 1886, and a verdict obtained.—J.D., 16/4/86. The Crown Solicitor may be asked to prepare a form of authority to enforce the provisions of the Coal Mines Regulation Act, and to recover any penalties under the said Act.—H.W., 4/3/86. Submitted. Approved.—J.F., 10/3/86.

No. 7.

The Under Secretary for Mines to The Crown Solicitor.

Sir,

Department of Mines, Sydney, 6 March, 1886.

I have the honor, by direction of the Secretary for Mines, to request that you will be so good as to prepare a form of authority to enforce the provisions of the Coal Mines Regulation Act, and to recover any penalties under the said Act.

I have, &c.,

HARRIE WOOD,

Under Secretary.

No. 8.

Authority to prosecute for the recovery of penalties under the Coal Mines Regulation Act, 1876.

To all to whom these Presents shall come,—

GREETING:

Whereas by the Coal Mines Regulation Act 1876 it is provided that all penalties imposed by the said Act may be recovered summarily before two or more Justices of the Peace at the suit of the Examiner Inspector or other officer authorized in that behalf by the Minister Now know ye that I the Honorable the Secretary for Mines for the Colony of New South Wales do by this

this writing under my hand in pursuance of the power and authority given to me in this behalf by the said Act authorize and empower _____ of _____ in the said Colony to sue for and recover all every and any penalties and penalty imposed by the said Act And for that purpose to make and exhibit before any two or more Justices of the Peace for the said Colony all and every such informations or information charging any person or persons with a breach or breaches of the provisions of the said Act in respect of which breach or breaches a penalty or penalties is or are imposed by the said Act as the said _____ may think fit And to proceed to judgment upon such information or informations or the same to withdraw and discontinue And for the purpose of suing for such penalties to employ any counsel solicitor or attorney And to take all proceedings necessary to recover and obtain payment of the said penalties And I declare that this authority shall continue in force until a revocation hereof in writing under the hand of the Minister for Mines for the said Colony for the time being shall be received by the said _____ And that same shall not be deemed or taken to be revoked by the appointment of another person or other persons to prosecute for the recovery of penalties under the said Act.

In witness whereof I have hereunto set my hand at Sydney in the said Colony this _____ day of _____ in the year of Our Lord one thousand eight hundred and eighty-

Sydney Club, Sydney, 6 March, 1886.

WHEN you were down Maryville Colliery yesterday were they working the top coal, or have they discontinued working it since you served notice on manager on 25th January?

JOHN MACKENZIE,
Examiner of Coal-fields.

No. 10.

Telegram from Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Hamilton, 8 March, 1886.

WERE working top coal in Maryville Colliery on my inspection in February. Pit not at work on Friday last; have forwarded last two reports on this colliery to Coal-fields Office, Newcastle.

JOHN DIXON,
Inspector of Collieries.

No. 11.

The Under Secretary for Mines to The Manager of the Maryville Colliery.

Sir,

Department of Mines, Sydney, 13 March, 1886.

I have the honor, by direction of the Secretary for Mines, to invite your attention to the notice which was served on you in terms of section 25 of the Coal Mines Act, in respect to the ventilation of the Maryville Colliery.

I have, &c.,
HARRIE WOOD,
Under Secretary.

No. 12.

The Manager, Maryville Colliery Company (Limited) to The Secretary for Mines.

Sir,

Newcastle, 19 March, 1886.

Referring to yours of the 13th instant, I am doing all that possibly can be done to carry out the provisions of the Coal-fields Act in the face of the most trying circumstances, to which, if it becomes necessary, I can refer you in detail.

So far I have had no complaint from the men under my charge.

I am glad to notice through the Press that you contemplate ordering a first-class anemometer from England, as such an instrument will enable the Inspectors to do justice to the masters as well as the men.

I have, &c.,
HENRY HARPER.

Submitted.—H.W., 20/3/86. The report of the officers must be acted upon.—J.F., 20/3/86.
The Examiner of Coal-fields, Newcastle.—G.E.H., *pro* U.S., B.C., 22/3/86.

No. 13.

Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Sir,

Glebeland, 16 April, 1886.

I do myself the honor to herewith return the papers in connection with the Maryville and Bullock Island Colliery cases, and at the same time to report that said cases came on for hearing at the Newcastle Court, before Mr. Mair, P.M., on Tuesday, 6th instant, and occupied the Bench nearly the whole of the day.

Messrs. Wallace and Sparke appeared for the prosecution, and Messrs. Thompson and Windeyer for the defence.

Much of the time during the day was taken up by Mr. Thompson's objections to the way in which the information had been laid; also to my authority to prosecute. On these points the arguments on both sides appeared most forcible, and, in my opinion, Mr. Wallace is deserving of great praise for the able manner

manner in which he conducted both cases. For of one thing I am pretty certain, namely, had not Mr. Wallace been well posted up in the many objections which he no doubt anticipated could be taken to certain clauses in the Coal Mines Regulation Act, 1876, both cases would have fallen through. In the Maryville case I gave evidence as to the state of the ventilation in that colliery on 24th February and 5th March last, and was cross-examined by Mr. Thompson at some length with a view of testing my knowledge of ventilation and the use of the anemometer, &c. The manager (Mr. Harper) was called for the defence, but failed to make a case, the consequence being that he (Mr. Harper) was fined the sum of £5 with costs of Court, and £2 2s., professional costs.

In the Wickham and Bullock Island case the information was laid against the owners, some of whom were present to answer the charge of neglecting to observe the provisions of sub-section 1, section 12, of the Coal Mines Regulation Act, 1876, which sub-section provides for the completion of at least two distinct openings to the day or surface intercommunicating with each other, by means of either of which openings all persons employed in the colliery might at all times pass in or out, &c.

On the reading of the information, Mr. Thompson raised a primary objection that action had not been taken within the eighteen months prescribed by the Act, and that the incorporation of the Company had not been proved. His Worship said he would reserve his decision on these points till after the hearing of the evidence. I was then called upon to give evidence as to the time when bords were first turned away in the Wickham workings, &c., after which the manager, Mr. Gardiner, was called for the defence. This defence was that there were the usual means of getting in and out of the colliery—an engine and wire ropes. In cross-examination, however, the manager admitted that the slides were being taken out of the pit, and that the steam was not kept up at the Wickham shaft, and that it would take three or four hours to get steam up, &c.

This evidence closed the case, and the Magistrate in summing up remarked that there were some difficult points to decide, but on the whole he felt justified in finding defendant guilty. He thought, however, that a moderate fine would meet the case, and returned a verdict against defendants for £10 Court costs, and £2 2s. professional costs.

I have, &c.,

JOHN DIXON,

Inspector of Collieries.

Forwarded for the information of the Honorable the Secretary for Mines.—J.M., 6/5/86. The Under Secretary for Mines.—B.C., 6/5/86. Submitted.—H.W., 10/5/86. Seen.—J.F., 14/5/86.

Wickham and Bullock Island Colliery.

SCHEDULE.

NO.	PAGE.
1. The Examiner of Coal-fields to the Under Secretary for Mines with reference to defective ventilation at the Wickham and Bullock Island Colliery, with minutes and enclosures. 9 March, 1886	20

No. 1.

The Examiner of Coal-fields to The Under Secretary for Mines.

Sir,

Mining Department, Sydney, 9 March, 1886.

I have the honor to forward a report received from Mr. Inspector Dixon with respect to sub-section 1, section 12, of the Coal Mines Regulation Act, 1876, not being complied with at the Wickham and Bullock Island Colliery; also copy of a notice served on the manager, and shall be obliged by your informing me what further action the Minister desires me to take.

I have, &c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

Has the working of bords, stalls, or longwall workings been commenced more than one year and six months since?—H.W., 9/3/86. Yes.—J.M., 9/3/86. Unless within one week steps are taken to remedy the defect, proceedings may be taken to enforce the fine.—H.W., 9/3/86. Submitted. Approved.—J.F., 9/3/86. The Examiner of Coal-fields.—H.W., B.C., 9/3/86. Mr. Inspector Dixon to take the necessary proceedings if matter complained of is not remedied within one week.—J.M., 10/3/86. Proceedings taken 6th April, 1886, and verdict obtained.—J.D., 16/4/86.

[Enclosure to No. 1.]

Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Wickham and Bullock Island Colliery Inspection.

Sir,

Glebeland, 6 March, 1886.

I have the honor to report inspection of the above-named colliery yesterday, 5th instant, as follows:—

The number of men, &c., employed below on the day shift is about eighty-two, being about sixty miners, eight wheelers, four horses, ten shiftsmen, and water-balers. The total quantity of intake air from the Wickham shaft at the time of inspection was about an average current of 8,500 cubic feet per minute. The majority of the working places were well ventilated, but in Dunn's heading, where there were six men at work, the air was very slack. I noticed, however, that cuts-through were being driven from bord to bord, and, when holed, the matter of complaint would be remedied.

A good road has now been made between the two shafts, and an incline plane is being formed, in order to run the coal down from the workings on the Wickham side of the colliery. I went to the bottom of the Wickham shaft and looked up, and from the appearance of the shaft I arrived at the conclusion that a considerable amount of work would have to be done in it before it could be rendered safe for men to pass in or out, according to the requirements of the Coal Mines Regulation Act, 1876.

Seeing that sub-section 1 section 12 of said Act was not complied with at the Wickham and Bullock Island Colliery, I notified the manager (Mr. Gardiner) to that effect yesterday, a copy of which notification I beg herewith to forward, and shall be obliged for further instructions on this matter.

Throughout the workings there seemed to be a good supply of timber on hand ready for use.

I have, &c.,

JOHN DIXON,

Inspector of Collieries.

[Enclosure

[Enclosure to No 1.]

Mr. John Dixon, Inspector of Collieries, to Mr. A. Gardiner, Colliery Manager, Wickham.

Sir,

Glebeland, 5 March, 1886.
During my inspection of the Wickham and Bullock Island Colliery this day (Friday) I noticed that although there were two separate and distinct openings to the day or surface from such mine, intercommunicating with each other, yet there was only one opening available for the persons employed in the colliery to pass in or out. I therefore hereby notify you that sub-section 1 section 12 of the Coal Mines Regulation Act, 1876, is not complied with at the Wickham and Bullock Island Colliery, inasmuch as said sub-section provides for two separate and distinct openings to the day or surface, "by means of either of which openings all persons employed in the colliery may at all times whatsoever pass in or out."

2. I have therefore to urge that you would attend to the above matter at once, with a view to having it remedied as soon as possible.

I have, &c.,

JOHN DIXON,
Inspector of Collieries.

Burwood Colliery.

SCHEDULE.

NO.	PAGE.
1. The Examiner of Coal-fields to the Under Secretary for Mines, enclosing reports from Mr. Inspector Dixon, respecting a deficiency of ventilation at the Burwood Colliery; also copy of notice served on the manager, with minutes. 14 January, 1886.....	21
2. Mr. Samuel Birrell, Manager, Burwood Colliery, to the Examiner of Coal-fields, that he had reduced the number of men in mine, with minutes. 19 January, 1886.....	22
3. The Under Secretary for Mines to the same, in reply to No. 1. 25 February, 1886.....	22

No. 1.

The Examiner of Coal-fields to The Under Secretary for Mines.

Sir,

Coal-fields Office, Newcastle, 14 January, 1886.

I have the honor to forward reports I have received from Mr. Inspector Dixon respecting a deficiency of ventilation at the Burwood Colliery, and copy of a notice I have served upon Mr. Samuel Birrell, and shall be obliged by your informing me what further action the Minister desires me to take in the matter.

2. Mr. Dixon informs me to-day that Mr. Birrell has made a commencement with building up the top of the furnace shaft.

I have, &c.,

JOHN MACKENZIE,
Examiner of Coal-fields.

Proceedings should be taken to enforce the provisions of the Act, unless the defects be remedied before such proceedings can be taken.—H.W., 21/1/86. Submitted. Approved.—R.M.V., 25/1/86. The Examiner of Coal-fields.—H.W., U.S., B.C., 30 January, 1886. Mr. Inspector Dixon for report as to whether the defects are remedied.—J.M., 1/2/86.

I inspected the Burwood new tunnel to-day, Monday. The stalk on the furnace shaft has not yet been made higher, the bricks and mortar are on the ground, but the manager, Mr. Birrell, informed me that he could not get a bricklayer, although offering a great price for the work. However, the current of air to-day was about 5,580 cubic feet per minute for forty-two men, six boys, and three horses; total, fifty-one men, &c. The current of air in the new pit was about 7,200 cubic feet per minute for a total of sixty-two men, &c.—J.D., 1/2/86.

The Act is now complied with.—J.M., 2/2/86. The Under Secretary for Mines, B.C., 2/2/86. Under the circumstances now reported no proceedings need be taken.—H.W., 17/2/86. Submitted. Approved.—R.M.V., 18/2/86. Inform Examiner.—H.W., U.S., 18/2/86.

[Enclosure to No. 1.]

Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Burwood New Pit Inspection.

Sir,

Glebeland, 10 December, 1885.

I have the honor to report inspection of the abovenamed pit workings to-day (Thursday) as follows:—

On the day shift in the New Pit workings there are about forty men, six wheelers, and two horses employed. About twenty of the miners are employed in ordinary 8-yard bords, and the others engaged in narrow work. When I inspected this place on the 28th of October last, there were only about fourteen men employed below, and the ventilation was good; but on my inspection to-day, I regret to say that I found the ventilation very defective throughout the workings, as the total current of air was only about 2,750 cubic feet per minute for a total of about forty-eight men, &c., being a deficiency of over 2,000 cubic feet of air per minute.

The shaft is bratticed from the surface to the bottom, and from the upcast side of the shaft at the surface there is a wooden box 16 inches by 10 inches, by which a portion of the return air is conducted to the boiler stalk.

In addition to the above there is a small exhaust fan employed at the surface, and connected to the upcast by a box 10 inches square.

The manager (Mr. Birrell) was with me throughout the whole of the workings. I drew his attention to the defective ventilation, and he (Mr. Birrell) stated that he intended putting the exhaust steam from the pump into the upcast part of the shaft, and if that did not produce the required quantity of air he would connect the whole of the upcast with a spare boiler and stalk, and promised me that he would do his very best to remedy the matter as soon as possible.

I regret to state that slight signs of inflammable gas have been found in one of the headings in this pit, and two men were slightly burned by it early on Monday morning last. The manager (Mr. Birrell) reported the matter to the Coal-fields Office, and after investigating it to-day I found that neither of the men had been laid off work by the accident, and that it was not at all serious. The underground overman (Mr. Horsfield) was one of the men, and from him I gathered the following particulars concerning the explosion:—It appears that a shift of men commenced work at about 12 p.m. on Sunday night last, and about half-an-hour after one of the men, named Townsend, came to bank and reported to the overman that his heading

heading had fallen in near the face and for some distance back. The overman went down the pit with the miner, and both went into the heading. The overman (Mr. Horsfield) gave orders for the removal of the fallen stuff, and was about to leave the heading when a slight explosion of gas took place, which burnt Horsfield a little on the forehead and Townsend very slightly on the hands.

I am informed that this is the first time that gas has been found in this pit workings; and I tried the same place to-day with a safety lamp, and could not detect the slightest trace of gas anywhere.

I cautioned the manager (Mr. Birrell) to strictly adhere to the 14th special rule, which provides for the deputy making an examination of the working places before the miners are allowed to start work. This he (Mr. Birrell) promised to have carried out in future, and gave orders in my presence to that effect. In my opinion a more vigorous ventilation is required to ensure safety.

I have, &c.,

JOHN DIXON,
Inspector of Collieries.

Make another inspection early next month, and report whether The matters complained of have been remedied.

J.M., 12/11/85.

Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Burwood Colliery Inspection.

Sir,

Glebeland, 9 January, 1886.

I have the honor to report inspection of the above colliery on Thursday last, 7th instant, as follows:—

In the New Tunnel the total current of air was about 5,600 cubic feet per minute for about sixty-six men, six boys, and three ponies; total, 75. The above result shows a deficiency of about 1,900 cubic feet of air per minute on the minimum quantity required by the Coal-fields Regulation Act, 1876. I drew the attention of the manager (Mr. Birrell) to this matter, and in reply he stated that he had been compelled to stop the "old tunnel" for a short time, and, not wishing to throw any of the men out of work, had to put six pairs, or twelve of the "old tunnel" miners into the new tunnel. He (Mr. Birrell) further stated that he was prepared to do anything to benefit the ventilation, and as I advised him to have the top of the furnace shaft built about 20 feet higher than at present he promised to have it done as soon as possible, which will be about three weeks or so.

New Pit.

In relation to this place, I am pleased to be able to state that since my inspection of 10th December (last month) I found a marked improvement in the ventilation. The total number of men, &c., employed in the New Pit is about 163. There are three shifts, and the greatest number employed on one shift is about sixty-four men, &c. This was about the number at work on the day of inspection, and the total current of air circulating in the mine was about 6,510 cubic feet per minute.

In both tunnel and pit I found the working places well timbered, and a good supply of timber on hand ready for use

I have, &c.

JOHN DIXON,
Inspector of Collieries.

The current of air in this new pit (lately sunk) has been increased from 2,750 cubic feet per minute, on 10th December, to 6,510 cubic feet on 9th January, 1886; *vide* Mr. Inspector Dixon's reports of 10th December, 1885, and 9th January, 1886.—J.M., 16/1/86.

The Under Secretary for Mines, B.C., 16/1/86.

The Examiner of Coal-fields to Mr. Samuel Birrell, Manager, Burwood Colliery.

Sir,

Coal-fields Office, Newcastle, 14 January, 1886.

In view of a recent report received from Mr. Inspector Dixon on the ventilation of the Burwood Coal Company's "New Tunnel" workings, and in pursuance of the provisions contained in the 31st section of the Coal Mines Regulation Act, 1876, I hereby give you notice that you have failed to comply with sub-sections 2 and 3, section 12, of the said Act.

I have, &c.,

JOHN MACKENZIE,
Examiner of Coal-fields.

No. 2.

Mr. Samuel Birrell, Manager, Burwood Colliery, to The Examiner of Coal-fields.

Sir,

Burwood Colliery, 19 January, 1886.

I have reduced the number of men so as to comply with the Coal Mines Act of Parliament.

I have, &c.,

SAMUEL BIRRELL,
Colliery Manager.

Mr. Dixon for report as to whether the provisions of the Act are now complied with.—J.M., 20/1/86. The provisions of the Act are now complied with.—J.D., 1/2/86.

No. 3.

The Under Secretary for Mines to The Examiner of Coal-fields.

Sir,

Department of Mines, Sydney, 25 February, 1886.

Referring to your communication of the 2nd instant, to the effect that the provisions of the Act were being complied with in respect of ventilation at the Burwood Colliery, I am therefore directed by the Secretary for Mines to inform you that, under the circumstances now reported, no proceedings need be taken.

I have, &c.,

HARRIE WOOD,
Under Secretary.

Newcastle

No. 1.

Check Inspectors' Report.

Newcastle Coal-mining Company's Colliery, 11 January, 1886.

WE, the undersigned, having examined the workings and part of the travelling roads, &c., of the above-named colliery, report as follows :—

No. 8 Intake.

Amount of air passing in is 6,192 cubic feet per minute ; thermometer 68°.

No. 8 Heading.

14 men, 2 boys, 1 horse. Air passing 7 bords is 4,896 cubic feet per minute, or 287 cubic feet per minute for each man, boy, and horse ; thermometer 75°.

No. 7 Heading.

24 men, 2 boys, 2 horses. Air passing 12 bords is 4,400 cubic feet per minute, or 157 cubic feet for each man, boy, and horse ; thermometer 74°.

Nos. 6 and 5 Headings.

57 men, 8 boys, 5 horses. Amount of air passing through these headings is 7,200 cubic feet per minute, or 102 cubic feet per minute for each man, boy, and horse ; thermometer 75°.

No. 1 Heading.

46 men, 6 boys, 3 horses. Air passing 23 bords is 4,320 cubic feet per minute, or 78 cubic feet per minute for each man, boy, and horse ; thermometer 75°.

No. 1 Return at Cut-through.

Amount of air passing through is 5,145 cubic feet per minute ; thermometer 75°.

No. 2 Heading.

28 men, 3 boys, 3 horses. Air passing 14 bords is 3,241 cubic feet per minute, or 95 cubic feet per minute for each man, boy, and horse ; thermometer 74°.

No. 1 Overcast.

Amount of air passing over from Nos. 5 and 6 headings is 9,635 cubic feet per minute ; thermometer 73°.

No. 10 Fault.

Amount of air passing in is 15,680 cubic feet per minute ; thermometer 70°.

No. 10 Front Heading.

18 men, 1 boy, 1 horse. Air passing 9 bords is 3,045 cubic feet per minute, or 152 cubic feet per minute for each man, boy, and horse ; thermometer 75°.

No. 10 Middle Heading.

26 men, 1 boy, 1 horse. Air passing 13 bords is 2,592 cubic feet per minute, or 92 cubic feet per minute for each man, boy, and horse ; thermometer 76°.

No. 10 Back and No. 11 Headings.

28 men, 2 boys, and 2 horses. Air passing 14 bords is 5,768 cubic feet per minute, or 180 cubic feet per minute for each man, boy, and horse ; thermometer 76°.

No. 12 Heading.

20 men, 2 boys, 2 horses. Air passing 10 bords is 5,400 cubic feet per minute, or 225 cubic feet per minute for each man, boy, and horse ; thermometer 73°.

At Furnace Shaft.

Total amount of air passing up the shaft is 63,080 cubic feet per minute ; thermometer 77°.

Remarks.

We found the air very slack in the first three or four bords in No. 8 front heading ; but the Deputy was busy putting up a canvas door on the mouth of the back heading which will drive a greater current of air to the men there. Complaints were being made to us in several flats with regard to the miners being unable to get timber brought into them when required. Also, complaints were made about the door being left open the greater part of the day by the wheelers and drivers, thereby causing the air to be slack with some of the men. We would especially draw the manager's attention to these matters, and also to many—but through being left open between the two narrow bords in No. 6 flat, also between Nos. 10 and 11 headings, as some of the canvas doors were torn to pieces ; found a good supply of timber on each flat.

Burwood, 12 January, 1886.

EDWARD BUXTON,
WILLIAM R. HARRISON, } Check Inspectors.

Mount.

Mount Kembla Colliery.

SCHEDULE.

No.	PAGE.

6. Mr. Inspector Rowan to the Examiner of Coal-fields, reporting result of legal proceedings against the manager of Mount Kembla Colliery, with minutes. 12 February, 1886.....	26

No. 1.

The Examiner of Coal-fields to The Under Secretary for Mines.

Sir,

Coal-fields Office, Newcastle, 19 January, 1886.

I have the honor to forward reports I have received from Mr. Inspector Rowan, showing a deficiency of ventilation in the Nos. 1, 2, and 4 divisions, and the Nos. 2 and 3 west headings at the Mount Kembla Colliery, near Wollongong.

2. It appears that Mr. Green, the colliery manager, is driving a heading to improve the ventilation, which he expected would be completed in ten days from the 8th instant; but the inspector says he is of opinion it will be of little or no benefit, and that upon his offering suggestions to the colliery manager he was told that he could only act through Dr. Robertson, the directing manager. Such should not be the case in a matter of this nature.

3. I have wired Mr. Rowan to make another inspection to-morrow (*vide* copy of telegram herewith), and shall be obliged by your informing me what further action the Minister desires me to take in the matter, besides causing the notice to be served on the manager (copy enclosed).

I have, &c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

Proceedings must be taken unless the owners remedy the defects before such proceedings can be commenced.—H.W., 21/1/86. Submitted. Approved.—R.M.V., 22/1/86. The Examiner of Coal-fields.—H.W., U.S., B.C., 23/1/86. Mr. Inspector Rowan to take proceedings at once, as he wires me on the 29th that defects are not remedied.—J.M., 30/1/86. Proceedings were taken on 11th February by Mr. Inspector Rowan, and the manager fined £5 and professional costs. Report herewith.—J.M., 15/2/86. Under Secretary for Mines, B.C., 15/2/86.

[Enclosures to No. 1.]

Mr. James Rowan, Inspector of Collieries, to The Examiner of Coal-fields.

Sir,

Wollongong, 11 January, 1886.

For your information, I have the honor to inform you that on the 8th instant I inspected Mount Kembla Colliery. About 124 men and horses are employed underground, and supplied with about 9,000 cubic feet of air per minute, in 4 separate currents. No. 1 east division of workings, 36 men and horses are employed, and supplied with 2,500 cubic feet of air per minute. No. 2 east division, 18 men and horses are employed, and supplied with 1,500 cubic feet of air per minute. No. 4 division, 40 men and horses are employed, and supplied with 3,000 cubic feet of air per minute. In the No. 1 east division of workings the air was very weak as it approached the working faces; also, in No. 4 the ventilating current was very weak. In the centre and extreme end of the workings a slight current was going, but insufficient to put the air meter in motion; the bords were also warm and uncomfortable. In the Nos. 2 and 3 west headings, 34 men are employed, and supplied with 2,000 cubic feet of air per minute, by means of two regulating doors from the main current, besides, a rush of air aids the ventilation, by the doors being opened to allow the full and empty sets to pass in and out.

I drew the manager's (Mr. Green's) attention to section 12, sub-section 3, of the Coal Mines Regulation Act. Mr. Green pointed out a heading, which he was driving with three shifts of men, to improve the ventilation of the colliery, and which he expected would be finished in about 10 days from the date of my inspection. This air-course referred to will come on the mountain side about 300 yards east of the tunnel.

I may state I am of opinion that little or no benefit will result from this new air-course, except a furnace be built in connection with it—that is to say, a furnace built at the mountain side where the heading will be driven through, and to bring all the ventilating current down the main tunnel.

This new furnace, with the present one, would have the combined power of ventilating the east and west sides of the colliery; or otherwise to sink an air-shaft in the interior of the workings, as it is quite evident either of these or some other motive power is required to assist the present system of ventilation. On putting these suggestions before Mr. Green he stated he could only act through Dr. Robertson, the directing manager.

I have, &c.,

JAMES ROWAN,

Inspector of Collieries.

Telegram from The Examiner of Coal-fields to Mr. James Rowan, Inspector of Collieries.

Newcastle, 13 January, 1886.

THINKING that little or no benefit will result from Kembla new air-course, why don't you serve Mr. Green with registered notice for non-compliance with Act, sending me copy of same?

JOHN MACKENZIE,

Examiner of Coal-fields.

Mr.

Mr. James Rowan, Inspector of Collieries, to Mr. W. B. Green, Manager, Mount Kembla Colliery.

Sir,

Wollongong, 13 January, 1886.

In reference to my inspection, made on the 8th instant, at Mount Kembla Colliery, I beg to inform you that I found the ventilation to be in a defective condition in No. 1 east and No. 4 division of workings. In the centre and extreme end of these workings I failed to get a register with the air-meter.

2. In accordance with the provisions contained in the 25th section of the Coal Mines Regulation Act, 1876, I hereby give you notice that you have failed to comply with section 12, sub-section 3, of the Coal Mines Regulation Act. I have therefore to request you to remedy this matter forthwith.

I have, &c.,

JAMES ROWAN,
Inspector of Collieries.

Telegram from The Examiner of Coal-fields to Mr. James Rowan, Inspector of Collieries.

Newcastle, 19 January, 1886.

Your Kembla report says Mr. Green expected heading being driven to improve ventilation would be finished in about ten days, which would be 18th instant. Make another inspection to-morrow, and wire me if it is finished, and if sub-sections 2 and 3 of Act are now complied with.

JOHN MACKENZIE,
Examiner of Coal-fields.

No. 2.

The Examiner of Coal-fields to The Under Secretary for Mines.

Re Kembla Colliery deficient ventilation.

Sir,

Coal-fields Office, Newcastle, 21 January, 1886.

I herewith beg to forward a telegram and letter received from Mr. Inspector Rowan this day, from which it will be seen that there was no improvement in the ventilation yesterday.

I have, &c.,

JOHN MACKENZIE,
Examiner of Coal-fields.

[Enclosures.]

Mr. W. B. Green, Manager, Mount Kembla Colliery, to Mr. James Rowan, Inspector of Collieries.

Sir,

Mount Kembla Colliery, 16 January, 1886.

I herewith beg to inform you that we have now got the drive holed outside on the north side of our "main tunnel," and that we have also shifted our return airway to escape the water that you spoke to me about when you last visited the colliery. And I may state that all will be done that can be done on my part to improve the ventilation of the colliery in those places you complain of in your letter to me, date the 13th January.

I have, &c.,

W. B. GREEN.

Telegram from Mr. James Rowan, Inspector of Collieries, to The Examiner of Coal-fields.

Wollongong, 20 January, 1886.

Re Kembla Colliery.—The new air-course driven through to the mountain side; no improvement in ventilation. Section 12, sub-section 3, of the Act not complied with in the No. 1 and two last, also No. 4 division of workings.

JAMES ROWAN.

No. 3.

Telegram from Mr. James Rowan, Inspector of Collieries, to The Examiner of Coal-fields.

Wollongong, 29 January, 1886.

MOUNT Kembla Colliery reinspected; defective ventilation not remedied. Shall legal proceedings be taken at once? Do you advise any solicitor in particular?

JAMES ROWAN,

Inspector of Collieries.

No. 4.

Telegram from The Examiner of Coal-fields to Mr. James Rowan, Inspector of Collieries.

Newcastle, 30 January, 1886.

INSTITUTE proceedings against Mr. Green for Kembla deficient ventilation at once, and employ whichever solicitor you think best. Great care is required in the way the information is drawn out.

JOHN MACKENZIE,

Examiner of Coal-fields.

No. 5.

Telegram from The Examiner of Coal-fields to The Under Secretary for Mines.

Newcastle, 30 January, 1886.

INSPECTOR Rowan wired yesterday that defective Kembla ventilation not yet remedied, shall he take proceedings at once, and what solicitor do I advise. Have replied that he must take proceedings at once, and the solicitor he thinks best.

J. MACKENZIE,

Examiner of Coal-fields.

The Examiner's action may be approved.—G.E.H. (for the U.S.), 30/1/86. Submitted.
Approved.—R.M.V., 1/2/86.

No.

No. 6.

Mr. James Rowan, Inspector of Collieries, to The Examiner of Coal-fields.

Sir,

Wollongong, 12 February, 1886.

In accordance with your instructions of the 30th ultimo, I have the honor to inform you that legal proceedings have been instituted against W. B. Green, Manager of the Mount Kembla Colliery, for neglecting to have an adequate amount of ventilation sent into the mine.

The case was tried at Wollongong Petty Sessions on the 11th instant, before A. A. Turner, P.M., and a Justice of the Peace; C. Russell, solicitor, for the defence, and F. Woodward for the prosecution. W. B. Green, Manager of the Mount Kembla Colliery, was charged, under section 31 of the Coal Mines Act, for a breach of section 12, sub-sections 2 and 3. W. B. Green in answer to the charge pleaded "guilty in part."

In leading the prosecution I produced a sketch of the Mount Kembla Colliery showing the various districts where the ventilation was defective, giving dates and the result of each day's inspection, viz., the 8th, 20th, and 29th ultimo; also showed the air-meter by which the air currents were tested. Also three miners gave evidence as to the defective state of the ventilation, and that no improvement had taken place up to the 10th instant.

Defendant's counsel urged much upon my assent to the bad ventilation being caused by the condition of weather outside, also the blasting had increased through the workings of late on account of extra hard coal, &c., &c.

These arguments being reviewed before His Worship for the prosecution, showed the more need of a strict adherence to sections 2 and 3 of the Act.

The defendant's counsel, in summing up for his client, pleaded guilty to the whole charge, and strongly begged for a mitigation of the penalty on account that the manager had made strenuous efforts to improve the ventilation by the new air-course, although it had failed to produce the desired effect. Also produced a letter from Dr. Robertson, the Directing Manager for the Company, that a furnace would be built at the mountain side of the new air-course, and a fan also erected if necessary; and W. B. Green pledged himself to have the colliery as well ventilated in a few weeks as any other colliery in the district.

After a patient hearing of the case His Worship imposed a fine of £5 with all professional costs.

I have, &c.,

JAMES ROWAN,

Inspector of Collieries.

Forwarded for the information of the Hon. the Secretary for Mines.—J.M., 15/2/86. The Under Secretary for Mines.—B.C., 15/2/86. Submitted for the information of the Minister.—H.W., 17/2/86. Seen.—R.M.V., 18/2/86.

No. 1.

Twenty-fourth Check Inspectors' Report of the A.A. Co.'s Collieries, at Newcastle, N.S.W.

COMMENCED this Inspection of the above collieries on Monday, 1st December, 1884, starting at the Hamilton pit.

Measured the air passing into Cope's heading, and found by the anemometer 7,980 cubic feet per minute passing. The most of this air returns on to the main column by way of the church heading.

Measured the air passing along the engine plane, with the result of 26,970 cubic feet per minute, which, added to the quantity passing into Cope's heading, makes a total of 34,950 cubic feet per minute passing into the workings of this pit.

We also measured the air passing into Bullerwell's heading at the bottom end of intake, and got for result 1,700 cubic feet per minute. There are 20 men, 2 wheelers, and 2 horses in this heading: 70 cubic feet per minute for each man, horse, and wheeler. Between the top end and bottom of this intake a deal of air escapes through the stoppings. Visited Gardiner's heading, and measured intake with result 5,544 cubic feet per minute. Cut-throughs want stopping in Collins's bord and also in No. 1 bord: 23 men, 1 boy, and 1 horse.

Stark's heading, 15 men, 1 boy, and 1 horse. The air coming into Gardiner's heading supplies it and also Stark's, thus giving to each man, horse, and boy, 132 cubic feet per minute.

Grant's heading, 4 men; Taylor's heading 12 men, 1 boy, and 1 horse; Donnison's heading, 22 men, 2 boys, and 2 horses; Sindle's heading, 6 men; Robinson's heading, on No. 1 bord the sheet is badly broken, and also the third bord wants a canvas hung: 12 men, 1 boy, 1 horse. In Tracey's heading there are 24 men, 2 boys, and 2 horses. The air in the five last-mentioned headings is very good. Men about the flats and pit bottom, 11.

Total quantity of air passing into this pit, 34,950. Total number of men, wheelers, and horses, 156, 11, and 11 respectively, thus giving to each 196 cubic feet per minute.

The

The several flats were well supplied with timber and travelling roads in good condition. Having completed our inspection of this pit we returned by way of the Old Galley horse-road to No. 2 pit bottom. Thermometer ranged from 79° to 71° Fahrenheit.

No. 2 Pit.

Measured the air at measuring place on engine plane, and found 37,170 cubic feet per minute passing. Air passing into No. 1 district from the above column, 24,500 cubic feet per minute. Visited the whole of the workings in this district. In the elbow there are 6 men, 1 boy, and 1 horse. In the second left-hand there are 40 men, 5 boys, and 5 horses. Sheet wanted on Wilson's bord; also on Riley's bord. Sheet wants repairing on Pascoe's bord. In the third left-hand there are 17 men, 2 boys, and 2 horses. There were complaints in this heading for want of timber. In fourth left-hand there are 28 men, 3 boys, and 3 horses. Sheet and stopping want attending to. In fifth left-hand, 12 men, 1 boy, and 1 horse. In sixth left-hand, 8 men; and in cross-cut and horse-road, 10 men, 1 boy, and 1 horse. In the sixth right-hand, 2 men. In fifth right-hand, 17 men, 1 boy, and 1 horse; and in fourth right-hand, 28 men, 2 boys, and 2 horses. The air in this heading is very dull. Sheet on Griffiths' bord wants attending to. We tried to measure the air in this heading in an area of 28 square feet, but got no result. In third right-hand there are 16 men, 2 boys, and 2 horses; in second right-hand, 9 men, 2 boys, and 2 horses; and in first right-hand, 2 men, 1 boy, and 1 horse.

The number of men, boys, and horses in this district is 195, 21, and 21 respectively.

Quantity of air, 104 cubic feet per minute.

We directed the overman's and other officials' attention to the several deficiencies, which they promised to rectify as speedily as possible.

No. 5 District.—Measured the air coming from Hamilton pit, by way of Griffith's narrow bord, with a result of 12,948 cubic feet per minute.

Quantity of air passing into No. 5 District, 18,972 cubic feet per minute.

In the first left-hand back horse-road there are 16 men, 3 boys, and 3 horses; second left-hand, 8 men, 1 boy, and 1 horse; first right-hand, 13 men, 2 boys, and 2 horses; back cross-cut, 6 men, 1 boy, and 1 horse; front cross-cut, 6 men. In the fourth right-hand, 14 men, 2 boys, and 2 horses; and in third right-hand, 21 men, 2 boys, and 2 horses. The air, at the time of our visit, was in a very bad state in the two last-mentioned headings, which we drew the attention of the deputy to. He promised to try and better it at once. In second right-hand there are 16 men, 2 boys, and 2 horses; in first right-hand, 20 men, 2 boys, and 2 horses. Canvas wants attending to. Men about the flats, 12.

Grand total in this district, 132 men, 15 boys, and 15 horses. Total quantity of air, 18,972, which gives to each 125 cubic feet per minute.

Visited No. 6 district. Measured the air passing, with result of 6,118 cubic feet per minute. There are 7 men, 1 boy, and 1 horse.

Visited fan shaft, the travelling road to which we found in very good condition.

Various flats throughout the pit we found well supplied with timber. Travelling roads in very good condition.

9th December, 1884.

GEO. JONES,
JAMES THOMPSON, } Check Inspectors.

No. 2.

Twenty-fifth Check Inspectors' Report of the A.A. Co.'s Collieries at Newcastle, New South Wales.

This inspection was commenced on 20th April, 1885.

Hamilton Pit.

Air passing into Cope's heading, 7,059 cubic feet per minute. Measured the air passing along engine plane with following result, viz., 34,944 cubic feet per minute, which, supplemented by the air passing into Cope's heading, makes a grand total of 42,000 cubic feet per minute passing into the workings of this pit.

Air passing into Bullerwell's heading, 11,000 cubic feet per minute; 22 men, 2 boys, and 2 horses in this heading. Canvas required on Christensen's bord, and also the canvas on Collins's bord wants repairing. We also visited Turnbull's heading, in which there are 14 men. In Gardiner's heading there are 30 men, 2 boys and 2 horses. Canvas and stopping want attending to in Firth's bord. In M'Auliffe's and Stark's headings there are 6 men, 1 boy, and 1 horse collectively.

Visited the workings on the right-hand side of the horse-road, and found in Donnison's heading 16 men, 1 boy, and 1 horse; in Harding's heading, 14 men, 1 boy, and 1 horse; and in Murphy's heading 6 men; in Robson's heading there are 23 men, 1 boy, and 1 horse; in Tracey's heading, 32 men, 2 boys, and 2 horses; and in Thomas's heading, 2 men.

The powder smoke in most of these headings hangs very bad, but at the time of our visit a number of men were employed making an overcast which when finished will divide these workings into two splits.

Total number of men, boys, and horses in this pit, 190, 12, and 12 respectively. Total quantity of air, 196 cubic feet each.

There were no complaints, for timber and travelling roads were in good condition.

No. 2 Pit.

Commenced an inspection of this pit on Tuesday, 21st April, 1885.

Measured the air passing below engine bank, and got for result 43,360 cubic feet per minute.

No. 1 District.—Air passing in, 31,920 cubic feet per minute. We tried to get a measurement at the intake to No. 3 flat, but the area being so large the instrument would not revolve. In this flat there are 44 men, 7 boys, and 7 horses. In the fourth left-hand heading there are 20 men, 2 boys, and 2 horses. At the top end of the heading the air was very slack. The canvas on Walker's and Dawes' bords wants repairing, as in their present state they allow a large quantity of air to escape that should go round the heading. In the split heading there are 12 men, 1 boy, and 1 horse; in the fifth left-hand there are 14 men, 1 boy, and 1 horse. The air returning from the two latter headings mixes with the air coming into

No.

No. 3 Flat, but the overman informed us that he intended having an overcast put in across the No. 3 road, so that the air returning from the fourth and fifth left-hands will pass into the main return without interfering with any other. In the sixth left-hand 11 men, 1 boy, and 1 horse; in cross-cut, 6 men; and in seventh right-hand, 6 men, 1 boy, and 1 horse. The air was very dull at the time of our visit in this latter heading. In the sixth right-hand, 10 men, 1 boy, and 1 horse; failed to get a measurement in the return from this heading. In the fifth right-hand, 16 men, 1 boy, and 1 horse; could get no result in this heading. In the fourth right-hand, 34 men, 2 boys, and 2 horses; this heading is supplied with air from its entrance, and also by the fifth right-hand. We tried to measure the air passing down this heading, but got no result.

Taking into consideration measurements taken in similar areas to those obtainable in this heading, and the number of men, we are of the opinion that there is a great deficiency of air. A narrow bord has been driven down from the third right-hand a distance of about 114 yards, for the purpose of easing the friction on the air, but the heading is not down far enough to meet it. We would respectfully urge on the management to push on this heading with all possible despatch, as the men complain bitterly of the bad air.

In the third right-hand there are 14 men, 2 boys, and 2 horses. In the second right-hand, 5 men; and first right-hand, 2 men. These three headings are aired from No. 5 district.

Total number of men, boys, and horses in this district is 193 men, 18 boys, and 18 horses. Total quantity of air, 31,920, equal to 140 cubic feet each.

No. 5 District.—Measured the air coming from Hamilton pit by way of Griffith's narrow bord, with the following result—13,552 cubic feet per minute. Measured the air passing into this district, and found 18,650 cubic feet per minute.

Back Horse-road.—First left-hand, 4 men; second left-hand, 8 men, 1 boy, and 1 horse; third left-hand, 4 men; third right-hand, 2 men, 1 boy, and 1 horse. In first right-hand, 16 men, 2 boys, and 2 horses; and in second right-hand, 2 men, 1 boy, and 1 horse. The air in most of these headings was very dull.

Back Cross-cut.—First left-hand, 6 men; and 10 men, 1 boy, and 1 horse in cross-cuts. In the fifth right-hand there are 14 men, 2 boys, and 2 horses; in fourth right-hand, 20 men, 2 boys, and 2 horses. This heading is one of the main intakes for the No. 5 district, but the current being so slow we failed to get a measurement. In the third right-hand there are 24 men, 2 boys, and 2 horses. This heading with the fourth are the only two splits in this district, but we failed to get a measurement in either of them. Failing to get a result at the intakes, we tried the return from the third right-hand in a 19-foot area, and got for a result 2,508 cubic feet per minute. In the second right-hand there are 16 men, 2 boys, and 2 horses; and in the first right-hand, 14 men, 1 boy, and 1 horse. These headings are aired from the third right-hand, consequently the air is very bad. There were no complaints for want of timber, and the travelling roads were in very good order. Number of men, boys, and horses aired from this district, 171, 19, and 19, respectively; quantity of air for each, 89 cubic feet per minute.

No. 6 District.—10 men, 1 boy, and 1 horse; quantity of air passing in, 6,000 cubic feet per minute; grand total quantity of air passing into workings of this pit, inclusive of air coming from Hamilton pit, 56,912 cubic feet per minute. Total men, boys, and horses, 448, 32, and 32, respectively; quantity of air for each, 127 cubic feet per minute.

We would most respectfully request men to refrain from committing nuisances in the airways, as it has a great tendency to render the air impure.

We, the undersigned, hereby certify that the foregoing is correct.

24th April, 1885. GEO. JONES, }
JAS. THOMSON, } Check Inspectors.

No. 3.

Twenty-sixth Report of the ventilation of the A.A. Co.'s Collieries at Newcastle, New South Wales.

WE commenced an inspection of Hamilton pit on 30th July, 1885.

Measured the air passing into Cope's heading with following result, 8,190 cubic feet per minute; most of this air returns again on to the main column by way of church heading. Measured the air passing along engine plane, at measuring place below engine bank, and found 29,148 cubic feet per minute passing.

Bullerwell's heading.—Quantity of air passing, 8,400 cubic feet per minute. There are 20 men, 1 boy, and 1 horse in this heading; in Turnbull's heading, 12 men; in Sneddon's heading, 4 men, 1 boy, 1 horse; visited Gardiner's heading; there are 30 men, 4 boys, and 4 horses; in Stark's and M'Auliffe's there are 4 men, 1 boy, and 1 horse, collectively; in Harding's heading, there are 6 men; in Donnison's, 12 men, 2 boys, and 2 horses; in Johnson's, 12 men, 1 boy, and 1 horse; in cross-cut, 14 men, 1 boy, and 1 horse; and in Murphy's heading, 10 men, 1 boy, and 1 horse; canvas wants replacing on Dixon's bord; the air at the time of our visit in the latter heading and the cross-cut was very bad; visited Robson's heading, where there were 20 men, 1 boy, and 1 horse; also Tracey's heading, where there were 36 men, 2 boys, and 2 horses; these two headings are aired from one intake; we measured the air passing along Tracey's heading and found 11,000 cubic feet per minute.

There are 15 men about the roads and flats; total quantity of air passing in this pit, 37,330 cubic feet per minute, which, divided amongst 190 men, 19 boys, and 19 horses, gives a result of 164 cubic feet per minute.

Travelling roads in very good order and no complaints for timber.

We saw very little to complain of in the ventilation of this pit, with the exception of those places mentioned.

No. 2 Pit.

Quantity of air passing at measuring place, 47,250 cubic feet per minute; air passing into No. 1 district, 25,000 cubic feet per minute; visited the various headings in No. 3 district; we tried to measure the air passing into this district, but could get no result; there are 59 men, 7 boys, and 7 horses in this split; although getting no result in this split, still we are of the opinion that there is a great deficiency, in

in fact less than one-half of the minimum quantity required; in the higher portions of this split the heat was intense, the thermometer ranging from 79° to 84° Fahrenheit; in the 4th left-hand there are 30 men, 3 boys, and 3 horses; canvas wants repairing on the 1st bord; in the 5th left-hand, 16 men, 2 boys, and 2 horses; canvas wants hanging on Oswald's bord; measured the air coming in this heading and found 2,312 cubic feet per minute, which, divided between these two headings, falls far short of the required quantity; in the sixth left-hand there are 16 men, 2 boys, and 2 horses; thermometer 81° Fahrenheit at face of the heading; in cross-cut, including horse-road, 10 men, 1 boy, and 1 horse. This side being concluded, we visited the several headings on the right-hand side, where, in the 7th heading, there were 6 men; in the 6th, 16 men, 1 boy, and 1 horse; canvas was required on Reid's bord; in the 5th right-hand there were 22 men, 1 boy, 1 horse; and in the 4th right-hand, 32 men, 2 boys, and 2 horses; canvas wants attending to on John Duke's bord; we found little improvement in this heading to that we reported on our last visit, and our opinion is that it will never be any better so long as skips are allowed to block up the entrance. Our reason for affirming this is from experiments made on the main road opposite. We tested the instrument at 5 feet from the floor, and the air passing there was not sufficient to work the fan, but on testing it at 1 foot from the floor the air passing there caused it to revolve very rapidly.

In the 1st, 2nd, and 3rd right-hand headings there are 18 men, 2 boys, and 2 horses, collectively; these headings are ventilated from No. 5 district; there are 221 men, 20 wheelers, and 20 horses, inclusive of those about the roads, flats, &c.; total quantity of air, 25,000 cubic feet per minute, which, divided amongst the above, gives 95 cubic feet each; travelling roads in very good order, and no complaints for timber.

No. 5 District.—Measured the air at intake, with following result:—20,100 cubic feet per minute, but upon again measuring it in the drift we only got 14,500 cubic feet per minute, so that the difference must be allowed to leak between the two places into the returns. We visited the first split in this district, which comprises the first, second, and third right-hand headings. The air is the first right-hand was very bad, but in the other headings mentioned it was very fair, especially in the third. We failed to get a result in this split, but that was owing to the area being so large. There are 58 men, 5 boys, and 5 horses in this split. In the fourth right-hand the canvasses on the first and second bords want replacing with stoppings. There are 20 men, 2 boys, and 2 horses in this heading. The air at the far end was very bad. In the fifth right-hand there are 18 men, 3 boys, and 3 horses; and in the sixth right-hand, 10 men, 1 boy, and 1 horse.

Front cross-cut, 4 men; third left-hand, 4 men, 1 boy, and 1 horse; second left-hand, 10 men, 1 boy, and 1 horse. Canvas required on Davis's bord.

Back Horse-road.—Third right-hand, 8 men, 1 boy, and 1 horse. Canvas wanted on the heading. Second left-hand, 10 men, 1 boy, and 1 horse. Second bord wants canvas hung. Second right-hand, 4 men; first left-hand, 6 men; and in first right-hand, 10 men, 1 boy, and 1 horse. Total number of men, inclusive of those about the roads and flats, 177; boys, 19; and horses, 19. Total quantity of air passing in being 20,100, gives to each 93 cubic feet per minute.

Visited No. 6 district, where there are 9 men, 1 boy, and 1 horse; quantity of air passing in, 4,000 cubic feet per minute. On the whole, we found a marked improvement, but we saw room for still greater improvement, especially in the first and fourth right-hand headings.

Total quantity of air passing into the workings of this pit, 58,000 cubic feet per minute, which, divided amongst 412 men, 40 boys, and 40 horses, gives to each 118 cubic feet per minute.

We found the travelling roads in good order, except one place in Griffiths' narrow bord, to which we would direct the overman's attention. The place in question was in the roof, a short distance from the entrance to No. 5.

We, the undersigned, hereby certify that the foregoing is a true report.

8th August, 1885.

GEO. JONES,
JAS. THOMSON, } Check Inspectors.

No. 4.

Twenty-seventh Check Inspectors' Report of the Australian Agricultural Collieries, at Newcastle, N.S.W.

We commenced this inspection on Monday, January 4th, 1886, starting at the Hamilton pit. Measured the air passing into Cope's heading, and got for result 10,760 cubic feet per minute. Measured the air passing along the engine plane, below engine bank, and got for result 31,500 cubic feet per minute.

Measured the air passing into Bullerwell's heading, with result of 10,475 cubic feet per minute. There are 4 men in this heading, 4 men Wilson's heading, and 2 men working in the cross-cut. There are 12 men, 1 boy, and 1 horse in Sneddon's heading, and 18 men, 1 boy, and 1 horse in Turnbull's heading. The air in this latter heading was very slack. In Gardiner's heading there are 22 men, 4 boys, and 4 horses. Visited Harding's heading, where there are 18 men, 2 boys, and 2 horses. In Bishop's heading, 4 men, and in the cross-cut, 18 men, 2 boys, and 2 horses. The canvas on the first bord was so badly torn that we found by the air-meter that about 1,000 cubic feet per minute was escaping that should travel around the face of the cross-cut. In Johnson's heading there are 6 men. The air in this heading was very bad at the time of our visit. With reference to the torn canvas in the cross-cut, we directed the deputy's attention to it, and he promised us he would attend to it as early as possible. In Murphy's heading there are 14 men, 1 boy, and 1 horse. Visited Robson's heading, in which there are 26 men, 2 boys, and 2 horses; and also Tracey's heading, where there are 30 men, 2 boys, and 2 horses—making a total of 56 men, 4 boys, and 4 horses. The air in this split was very good. We were pleased to notice in travelling along the engine plane in this pit that the greater part of the old stoppings had been replaced by brick stoppings.

The total number of men, boys, and horses in this pit is 192, 26, and 26 respectively. Total quantity of air, inclusive of air passing into Cope's heading, which returns on to the main column, is 42,260 cubic feet per minute.

There were no complaints for timber, and the travelling roads were in very good condition.

No. 2

No. 2 Pit.

Measured the air coming down this pit, and got for result 40,000 cubic-feet per minute. Quantity of air passing into No. 1 district from this column is 31,000 feet per minute. Visited various headings in No. 3 flat of this district. Measured the air coming in and found by the air-meter 7,500 cubic feet per minute. In this flat there are 82 men, 14 boys, and 14 horses. The quantity of air is only 68 cubic feet per minute each. In the fourth and fifth left-hand headings in this district there are 20 men, 2 boys, and 2 horses. Quantity of air, 2,200 cubic feet per minute. In the sixth left-hand, 10 men, 1 boy, and 1 horse. In the sixth right-hand there are 16 men, 1 boy, and 1 horse. The air in this heading was very slack. Quantity of air, 1,400 cubic feet, thus giving to each 78 cubic feet per minute. In the horse-road, eighth right-hand, and seventh there are 34 men, 3 boys, and 3 horses. Quantity of air, 4,300 cubic feet per minute, which gives to each man, horse, and boy 107 cubic feet per minute. In the fifth right-hand, 20 men, 1 boy, and 1 horse. The air was very dull in this heading. In the fourth right-hand 18 men, 3 boys, and 3 horses; and in the second right-hand, 2 men; about the roads, 10; making a total of 212 men, 25 boys, and 25 horses. Quantity of air, 31,000 cubic feet; giving to each of the above 118 cubic feet per minute.

No. 5 District.—Quantity of air passing into this district, 23,780 cubic feet per minute.

Back Horse-road.—First left-hand, 18 men, 1 boy, and 1 horse. There are 22 men, 1 boy, and 1 horse in the fourth right-hand heading of No. 1 district which are aired from this district. In the horse-roads there are 4 men, and 2 men lifting bottoms; and in the first right-hand there are 6 men, 1 boy, and 1 horse.

Back Cross-cut.—First left-hand, 10 men, 1 boy, and 1 horse. Second left-hand, 6 men; cut-through wants cleaning out. In third left-hand 4 men, and 6 men in the cross-cuts. In the seventh right-hand there are 6 men, 1 boy, and 1 horse. The air is very dull in this heading. In the sixth right-hand there are 14 men, 1 boy, and 1 horse. In the fifth right-hand there were two of the canvasses badly torn, which we called the attention of the deputy to. There are 22 men, 1 boy, and 1 horse in this heading. In the fourth right-hand there are 20 men, 1 boy, and 1 horse. These three headings comprise one split. Measured the air returning from these headings, over overcast, 8,250 cubic feet per minute. Several of the canvasses in these headings were allowing a considerable quantity of air to escape which should travel around the top end of the heading; but the system now being pursued by the management will prevent a recurrence of this, as they are substituting stoppings for the canvas, which is the only effectual remedy. In the first, second, and third right-hand headings there are 62 men, 6 boys, and 6 horses. The air in the upper parts of this split was very hot.

Total number of men, boys, and horses, inclusive of those about the roads and flats, is 215, 15, and 15 respectively. Total quantity of air, 23,780 cubic feet per minute, which gives to each 97 cubic feet per minute. In No. 6 district there are 12 men, 1 boy, and 1 horse.

We travelled the returns from No. 5, which we found in splendid condition, the management having of late expended a considerable sum in improving them. Total number of men, boys, and horses in the whole of this pit is 453, 41, and 41 respectively. Total quantity of air, inclusive of 14,700 cubic feet per minute coming from Hamilton pit by way of Griffiths' narrow bord, is 54,700 cubic feet per minute, giving to each man, horse, and boy 102 cubic feet per minute.

There were no complaints for timber, and the travelling roads were in very good condition.

Before concluding this report we wish to thank the officials for their courtesy, and also their readiness in supplying any information that we required during this inspection.

12th January, 1886.

GEO. JONES,
WM. AITCHESON, } Check Inspectors.

Ferndale Colliery.

SCHEDULE.

No.	PAGE.
1. Copies of Check Inspectors' Reports on Ventilation of Ferndale Colliery. 1 December, 1885.	30

No. 1.

Copies of the three last Check Inspectors' Reports.

Ferndale Lodge, 1 December, 1885.

No. 1 REPORT.

10 April, 1885.

We, the undersigned, having examined the several workings and airways, &c., of the Ferndale Colliery, report as follows:—

Intake of air on engine bank, 9,250 cubic feet per minute; thermometer, 68°. Intake from the old furnace shaft, 1,800 cubic feet per minute; thermometer, 68°. Air passing from old furnace shaft to No. 1 heading, 1,800 cubic feet. Air passing from engine bank to No. 1 heading 4,600 cubic feet. The top part of No. 1 heading the anemometer gave 2,550 cubic feet of air per minute for 19 men, 4 boys, and 2 horses, being 102 cubic feet per minute for each man, boy, and horse; thermometer, 71°. Middle part of No. 1 heading: Air passing from narrow bord at cut-through, 4,138 cubic feet per minute for 29 men, 4 boys, and 2 horses, being a fraction over 118 cubic feet per minute for each man, boy, and horse; thermometer, 71°. Lower part No. 1 heading, at cut-through from narrow bord, the anemometer gave 2,844 cubic feet of air per minute; thermometer registering 74°. After passing seven bords, anemometer gave 4,260 cubic feet of air per minute. There are 22 men, 5 boys, and 2 horses employed here. There is a vast improvement in this part since our last inspection. We never visited No. 3 heading, but at the cut-through from No. 8 narrow bord the area was so large that there was not sufficient air to move the anemometer. The cut-throughs have been cleared, and there were no complaints about the air; there were

were 8 men, 2 boys, and 1 horse working there; thermometer, 74°. No. 4 heading: 2 men, with a fair supply of air. No. 5 heading: Intake from engine brow, 575 cubic feet of air per minute. There were 6 men, 2 boys, and 1 horse employed here, giving each 64 cubic feet of air per minute; thermometer, 72°. Returns from No. 4 heading gave 3,032 cubic feet per minute. Returns from main flat, 5,402 cubic feet per minute, but all the returns cannot be taken here. Each was well supplied with timber.

JOSEPH BOWDITCH, }
WILLIAM LLOYD, } Check Inspectors.

No. 2 REPORT.

Ferndale Colliery, 2 July, 1885.

We, the undersigned, having examined the several workings, airways, &c., report as follows:—
Intake of air on the engine bank, 14,450 cubic feet per minute; thermometer, 61°. Intake from old furnace shaft, 1,800 cubic feet per minute; thermometer, 61°. Air passing from engine bank into No. 1 heading, 6,346 cubic feet per minute; thermometer, 68°. At the top part of No. 1 heading the anemometer registered 4,070 cubic feet per minute; thermometer, 72°. This gives 185 cubic feet of air per minute to each man, boy, and horse,—15 men, 5 boys, and 2 horses. At the cut-throughs from No. 27 narrow bord, the anemometer registered 5,730 cubic feet per minute; thermometer, 71°. At the two cut-throughs from No. 13 narrow bord, the current of air had increased to 6,320 cubic feet per minute. This current of air has to supply 59 men, 13 boys, and 6 horses, giving a fraction over 83 cubic feet per minute for each. There were 29 men, 8 boys, and 4 horses, from No. 27 to No. 13 bords inclusive, and 23 men, 5 boys, and 2 horses, from No. 12 to No. 1 bords, both inclusive, and 4 men in two bords in No. 3 and No. 4 headings, and 1 man pumping, making in all 57 men, 13 boys, and 6 horses supplied from the above current. In Nos. 1 and 2 bords the air was very slack; the thermometer registered 78°. The bord in No. 3 heading is in before the air nearly 60 yards without a cut-through; thermometer registered 76°. Our attention was called to the road in No. 19 bord being dangerous for the boys wheeling there, but a cut-through being nearly holed through will remedy that in a day or two. At No. 5 heading the air passing through cut-through showed 744 cubic feet per minute. We were told that the other cut-through was closed, but on passing next morning I found a large current of air passing through; 9 men, 1 boy, and 1 horse are employed here. Returns from No. 4 heading, 3,485 cubic feet per minute; returns from furnace shaft, 10,030 cubic feet per minute; total returns, 13,515 cubic feet per minute, but in consequence of the manner it splits up here we were unable to get all the returns correctly. There was a plentiful supply of timber in the headings.

JOSEPH BOWDITCH, }
CHARLES WILLIAMS, } Check Inspectors.

No. 3 REPORT.

Ferndale Colliery, 28 October, 1885.

WE, the undersigned, having examined the several workings, airways, &c., of the above colliery, report as follows:—

Intake at engine bank, 12,960 cubic feet per minute; thermometer, 68°. Intake from old furnace shaft, 2,812 cubic feet per minute. From engine bank to No. 1 heading, 5,964 cubic feet per minute. Top part of No. 1 heading, anemometer registered 4,890 cubic feet per minute for 27 men, 6 boys, and 4 horses, being a fraction over 132 cubic feet per minute for each man, boy, and horse; thermometer, 72°. At the cut-through at the top, Ganon bord, the anemometer registered 4,050 cubic feet per minute for 18 men, 4 boys, and 2 horses, being 168½ cubic feet for each man, boy, and horse; thermometer, 75°. At the cut-through in No. 17 bord the anemometer registered 2,450 cubic feet per minute for 15 men, 4 boys, and 2 horses, being 116½ cubic feet per minute for each man, boy, and horse; thermometer, 78°. At the cut-through at the lower Ganon bord the anemometer registered 3,870 cubic feet per minute for 22 men, 6 boys, and 3 horses, a fraction over 124½ cubic feet per minute for each man, boy, and horse; thermometer, 75°. There were 2 men working off the right-hand of No. 8 heading, but the area being so large there was not sufficient air to move the anemometer. No. 5 heading, intake from engine bank, 1,633 cubic feet per minute for 8 men, 2 boys, and 1 horse, giving a fraction over 148½ cubic feet per minute for each man, boy, and horse; thermometer, 72°. Return from No. 4 heading, 2,940 cubic feet per minute. At the main flat, 8,525 cubic feet per minute, but all the returns cannot be taken here. Each place was well supplied with timber.

WILLIAM LLOYD, }
DAVID HOPKINS, } Check Inspectors.

Lambton Colliery.

NO.	SCHEDULE.	PAGE.
1.	The Examiner of Coal-fields to the Under Secretary for Mines, enclosing Report from Mr. Inspector Dixon, and copy of notice served upon the Manager of Lambton Colliery, with minutes. 6 October, 1885	32
2.	Mr. T. Croudace, Manager, Lambton Colliery, to the Examiner of Coal-fields, admitting Mr. Inspector Dixon's complaint as justifiable, and promising improvements as to ventilation, with minutes. 7 October, 1885	32
3.	Mr. Inspector Dixon to the Examiner of Coal-fields, enclosing letter from Mr. Croudace, <i>re</i> ventilation in Lambton Colliery. 8 October, 1885	33
4.	The Examiner of Coal-fields to Mr. Croudace, in reply to No. 2. 8 October, 1885	33
5.	Mr. Melville, M.P., to the Honorable the Secretary for Mines, asking questions <i>re</i> Lambton Colliery, with Minister's replies thereto. 4 February, 1886	33

No. 1.

The Examiner of Coal-fields to The Under Secretary for Mines.

Sir,

Coal-fields Office, Newcastle, 6 October, 1885.

I have the honor to forward for the information of the Honorable the Secretary for Mines a report from Mr. Inspector Dixon and copy of a notice I have served upon Mr. Croudace, the Manager of the Lambton Colliery, for failing to comply with sub-sections 2, and 3, section 12, of the Coal Mines Regulation Act, 1876.

I have, &c.,

JOHN MACKENZIE,
Examiner of Coal-fields.

Unless

Unless within fourteen days from the date of the notice sent to the manager some effective steps are taken to remedy the matter complained of steps may be taken to recover the penalty.—H.W., 9/10/85. Submitted. Approved.—F.A.W., 12/10/85. The Examiner of Coal-fields.—G.E.H. (for the U.S.) B.C., 14/10/85. Mr. Dixon for a further report to be made, 24th October, as to whether the matters complained of are remedied.—J.M., 16/10/85. The Lambton miners being now on strike further inspection is useless until work is resumed.—J.D., 23/10/85. The men are still out on strike, therefore nothing further has been done in the matter.—J.M., 30/1/86. The Under Secretary for Mines, B.C., 30/1/86. The Examiner of Coal-fields.—G.E.H. (for the U.S.), B.C., 8/2/86.

[Enclosure to No. 1.]

Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Sir, Glebeland, 5 October, 1885.
I have the honor to draw your attention to the defective ventilation in that portion of the workings in the Lambton Colliery known as the right-hand side of the No. 2 far flat main tunnel. In this part of the mine there are eight working bords, two men in each, and two working headings with three men in each, making a total of twenty-two men, besides two wheelers and two horses.

When on the 15th August last I reported this same place there were about twenty men employed in it. At that time I found the ventilation defective, and drew Mr. Croudace's attention to the matter, and he (Mr. Croudace) at once promised to have it remedied. However, on the 28th ultimo (Monday last) I again made an inspection of the place complained of, and regret to report that I found matters in a similar position to that reported by me on 15th August. But as the ventilation in the whole of the far flat section was a little deranged on Monday last, owing to a very large fall of roof in the pillar workings in No. 1 far flat, I thought it best to go back again at the end of the week, when the No. 1 part of the workings would be properly settled. Consequently, on Saturday last, 3rd instant, I made another inspection, and found that the No. 1 far flat was in no way interfering with the intake at No. 2 far flat, but the same state of affairs prevailed in the split complained of, and I could not detect the slightest difference from what I found on the Monday. The only time when I could find trace of an intake current of air was when the empty train was running into the flat; then, on the loaded train going out, the current of air would rush back—then, to all appearances, come to a standstill. In every working place the powder smoke was hanging thick, owing to there being no current of air to carry it away. I may here remark that a new overcast was being built, which, when completed, would connect the part complained of with another return, and may possibly be of benefit. I notified the Manager (Mr. Croudace) by registered letter on Saturday last, a copy of which I herewith beg to forward, and desire to be instructed as to further proceedings in relation to the matter complained of.

I have, &c.,
JOHN DIXON,
Inspector of Collieries.

Mr. John Dixon, Inspector of Collieries, to Mr. Thomas Croudace, Colliery Manager, Lambton.

Sir, Glebeland, 3 October, 1885.
Referring to our several conversations concerning the deficient ventilation in the workings at the right-hand side of No. 2 far flat in the Lambton Colliery, and your repeated promises to have the matter remedied, and notwithstanding the fact that sufficient time has elapsed to have had the matter put right since you were first notified, I regret to state that on Monday last, 28th ultimo, and to day (Saturday), I found the abovenamed split in a deplorable state.

In this split there are eight working bords, besides the two headings, two wheelers and two horses, making a total of twenty-six men, &c. For this number (at the time of my inspection) there was no perceptible steady current of air, and as a consequence the powder smoke was hanging in dense clouds in every working place. The only time that there appeared to be any air entering the split was when the empty train was running into the flat; but the loaded train going out overcame this to such an extent that the current of air would return with the same velocity as it entered the split.

2. I have therefore to request that you would give attention to this matter at once, with a view of having it remedied as speedily as possible.

I have, &c.,
JOHN DIXON,
Inspector of Collieries.

The Examiner of Coal-fields to Mr. T. Croudace, Manager, Lambton Colliery.

Sir, Coal-fields Office, Newcastle, 6 October, 1885.
In view of a recent report of Inspector Dixon's on the ventilation of the Lambton Colliery (No. 2 far flat), and in pursuance of the provisions contained in the 31st section of the Coal Mines Regulation Act, 1876, I hereby give you notice that you have failed to comply with sub-sections 2 and 3, section 12, of the said Act.

I have, &c.,
JOHN MACKENZIE,
Examiner of Coal-fields.

No. 2.

Mr. T. Croudace, Manager, Lambton Colliery, to The Examiner of Coal-fields.

Sir, Lambton Colliery, Lambton, 7 October, 1885.
In reply to yours of yesterday, I can only say that Mr. Dixon's complaint is quite justifiable, and that he has complained two or three times about the same place.

I am making alterations to-day, which I will not be able to complete for a fortnight, but I hope even by Friday to have it materially improved.

I have, &c.,
THOMAS CROUDACE.

The above communication, *re* Lambton Colliery deficient ventilation, has been received by me to-day, and I enclose you copy of my reply for the information of the Honorable the Secretary for Mines.—J.M., 8/10/85. The Under Secretary for Mines, B.C., 8/10/85.

Under the circumstances proceedings may be stayed till the expiration of the fortnight.—H.W., 22/10/85. Submitted. Approved.—J. P. ABBOTT, 31/10/85. The Examiner of Coal-fields—H.W., B.C., 3/11/85. Seen, and noted.—J.M., 3/11/85.

33

No. 3.

Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Sir,

Glebeland, 8 October, 1885.

For your information, I beg to forward enclosed letter, received this morning from Mr. Croudace, *re* No. 2 far flat, &c.

I also beg to state that I have been notified to-day concerning the accident to John Hinds in Minmi on Monday last, also an accident to a boy in Brown's Colliery yesterday, and in consequence of such notification I intend going to Minmi to-morrow (Friday).

I have, &c.,
JOHN DIXON,
Inspector of Collieries.

[Enclosure to No. 3.]

Mr. Thomas Croudace, Manager, Lambton Colliery, to Mr. John Dixon, Inspector of Collieries.

Sir,

Lambton Colliery, Lambton, 7 October, 1885.

I have to acknowledge receipt of yours of 3rd, complaining of deficient ventilation at No. 2 far flat. In justice to you, and not wishing in the least to shield myself, I must admit that this is neither the first nor the second time that you have complained, and that I have promised to have it put right; but, as you know, there have been many other matters to attend to. I inspected the district complained of yesterday, and found it very bad—worse than I have ever seen it; but, upon closer inspection, I found two or three important in-by stoppings completely blown down by the recent heavy fall from the pillars, which occurred when you were there one day last week. I am now pushing ahead such alterations as I hope will improve it by Friday, and very materially improve it in about a fortnight, when we get a long wall holed over into back cross-cut.

I am so confident of having it improved by Friday that I would ask you to come up and inspect it.

I have to thank you for the tolerant manner in which you have dealt with this complaint, and trust you will not consider my neglect in any way intentional.

I have, &c.,
THOMAS CROUDACE.

No. 4.

The Examiner of Coal-fields to Mr. T. Croudace, Manager, Lambton Colliery.

Sir,

Coal-fields Office, Newcastle, 8 October, 1885.

I beg to acknowledge the receipt of yours of the 7th instant, informing me that Mr. Inspector ^{See No. 2.} Dixon's complaint is quite justifiable, &c., and that you are making alterations, which will not be completed for a fortnight, but hope by Friday next to have matters materially improved.

Trusting such will be the case,—

I have, &c.,
JOHN MACKENZIE,
Examiner of Coal-fields.

No. 5.

Mr. Melville, M.P., to The Secretary for Mines.

Department of Mines. Legislative Assembly.

Question for this day. Proof, No. 19. Thursday, 4 February, 1886.

QUESTION NO. 4:—

MR. MELVILLE *to ask* THE SECRETARY FOR MINES,—

- (1.) Has Mr. Mackenzie at any time made any complaints concerning the ventilation of the Lambton mine, of which Mr. Croudace is manager?
- (2.) Were such complaints, if any, made during Mr. Croudace's management?
- (3.) If such complaints were made, what steps were taken to remedy them, and what time elapsed between the making of complaints and the remedying of them?
- (4.) Has Mr. Mackenzie at any time called the Minister's attention to the extensive falling in of the surface of the Newcastle Pasturage Reserve, under which the Lambton Company, of which Mr. Croudace is manager, are mining for coal?
- (5.) When and on what dates did Mr. Mackenzie report that the main Northern Road, near Tighe's Hill, was being undermined?
- (6.) How long afterwards was such undermining stopped?
- (7.) Who was the owner of the coal so taken?
- (8.) Was any sum of money placed upon the Estimates for the repair of such coal by the Minister for Mines, and what amount?

ANSWERS:—

- (1.) Yes.
- (2.) Yes.
- (3.) Immediate steps.
- (4.) No.
- (5.) The information asked for was fully dealt with in Mr. Mackenzie's report to Mr. Secretary Abbott, dated 12th June, 1884.
- (6.) No coal was got after June, 1884.
- (7.) The Crown.
- (8.) No.

Wallsend Colliery.

SCHEDULE.

NO.	PAGE.
1. Mr. James Curley, Miners' General Secretary, to the Honorable the Secretary for Mines, inviting attention to copy of Check Inspectors' Report <i>re</i> defective ventilation at Wallsend Colliery, with minutes. 1 December, 1883	34
2. The Under Secretary for Mines to the Miners' General Secretary, in reply to No. 1. 11 December, 1883	34
3. Mr. James Curley to the Honorable the Secretary for Mines inviting attention to different subjects in connection with Wallsend Colliery, with minutes and enclosures. 22 November, 1883	34
4. The Examiner of Coal-fields to the Under Secretary for Mines, enclosing Mr. Inspector Dixon's report <i>re</i> Wallsend Colliery, with minutes. 15 January, 1884	35
5. The Under Secretary for Mines to Mr. James Curley, enclosing copy of Mr. Inspector Dixon's report on Wallsend Colliery. 23 January, 1884	36

No. 1.

Mr. James Curley, Miners' General Secretary, to The Secretary for Mines.

Sir,

Hamilton, 1 December, 1883.

I have the honor, by direction of the Executive Committee of the Miners' Association, to invite your attention to copy of Check Inspectors' report, made at Wallsend Colliery, on November 5th, 6th, and 7th respectively, and which was forwarded to you on the 27th November. This report, in connection with previous ones, goes to show that the provisions of the Act are not complied with in matters of detail. The proper conducting of the air and its necessary distribution will at once appear evident to the most casual observation; for instance, in some parts of the mine there is over double the quantity of air required by the Act, and in other districts no record can be obtained, as there is not sufficient air to work the anemometer, while in others 50 or 60 cubic feet per minute is all that is passing. This is most unsatisfactory, and it is to be regretted that a remedy is not urged by either the Inspector for Collieries or the Examiner for Coal-fields. And it is further to be regretted that more uniformity is not obtained in establishing a systematic method of ventilation in the several mines throughout the district. The health of miners is far too often impaired and seriously injured owing to such a cause, all because there is a manifest indifference regarding the carrying out of some simple detail, such as the erection of stoppings at old bord ends, the erection of a door, or it may be that an engine-rope works through a wood stopping, and it is splintered for want of a small pipe to confine the action of the rope, and thousands of feet of air lost to the miners, and otherwise by not erecting an air-crossing where required.

Having again brought this subject under the Honorable Minister's attention, the miners trust he will urge a more uniform compliance with the provisions of the Coal-mines Regulation Act, 1876, not only at the Wallsend Colliery, but the Newcastle Company's Colliery as well, where recent complaints have been made.

I have, &c.,

JAMES CURLEY,
Miners' General Secretary.

May be referred to the Examiner for report.—H.W., 6/12/83. Submitted. Approved. Acknowledge.—J. P. ABBOTT, 7/12/83. The Examiner of Coal-fields.—H.W., B.C., 11/12/83. Mr. Inspector Dixon for report.—J.M., 21/12/83. Returned. The Examiner of Coal-fields.—J.D., 27/12/83.

No. 2.

The Under Secretary for Mines to Mr. James Curley, Miners' General Secretary.

Sir,

Department of Mines, Sydney, 11 December, 1883.

See No. 1.

I am directed by the Secretary for Mines to acknowledge receipt of your letter of the 1st instant, on the matter of enforcing a more uniform compliance with the provisions of the Coal Mines Regulation Act, 1876, and to inform you that a report will be obtained upon the subject without delay.

I have, &c.,

HARRIE WOOD,
Under Secretary.

No. 3.

Mr. James Curley, Miners' General Secretary, to The Secretary for Mines.

Sir,

Hamilton, 22 November, 1883.

I have the honor, in conjunction with the Chairman and Treasurer of the Miners' Union, to invite your attention to the undermentioned subjects, which are deemed of sufficient importance for interview, and which has been asked for in a letter to Messrs. N. Melville and A. A. P. Tighe, Ms.P. :—

1st. Recent Check Inspectors' report at Wallsend Colliery, showing very defective ventilation.

2nd. Correspondence from Examiner of Coal-fields, dated October 18th, 1883.

3rd. A means of egress from mines other than the furnace shaft in case of accident to the main down-cast shaft.

I have, &c.,

JAMES CURLEY,
Miners' General Secretary.

This probably refers to the deputation recently received by the Minister.—Noted to await further communication.—H.W., 1/12/83.

[Enclosures

[Enclosures to No. 3.]

Special Inspection—Check Inspectors' Report.

Mr. T. Bonsfield's District.

Wallsend Colliery, 5 and 6 November, 1883.

Engine Bank, intake air-current	31,490	cubic feet per minute.
Swamp Oak	11,500	,, ,,
Chinaman's Shaft, Chinaman's Split intake air-current	5,520	,, ,,
,, Magpie and Donnolly's intake air-current	9,690	,, ,,
B Pit, intake air-current	9,500	,, ,,
					67,700	

B Pit, Chinaman's Flat, Nos. 111 to 116.—The air is very slack, and with 9,500 cubic feet registered at the intake we could only find 585 cubic feet per minute near the faces for the supply of 8 men, 1 boy, and 1 horse, giving each 53 cubic feet per minute; thermometer, 78°.

Chinaman's Flat, from No. 117 to 130.—Air-current, 5,520 cubic feet per minute for 22 men, 1 boy, 1 horse, giving each 230 cubic feet per minute; thermometer, 68°.

Magpie and Donnolly's Flats, from Nos. 130 to 176.—The air-current is 9,690 cubic feet per minute for 62 men, 5 boys, 4 horses at Magpie, and 24 men, 2 boys, 1 horse at Donnolly's, giving each a fraction over 98 cubic feet per minute, the last numbers at Donnolly's ranging from 70° to 76°.

Lambton back and part of front headings, from Nos. 177 to 215.—Air-current, 11,040 cubic feet per minute. This split includes Nos. 265 and 266, making 80 men, 10 boys, 5 horses, the air-current giving each a fraction over 116 cubic feet per minute; thermometer, 76°. The air from No. 178 to 189 would not register, as the anemometer would not work on the heading.

Lambton front heading, from No. 216 to 255.—Air-current, 6,000 cubic feet per minute for 78 men, 8 boys, 4 horses, giving each 66½ cubic feet per minute; thermometer, 72°.

Up-casts, Main Furnace	48,384	cubic feet per minute.
,, No. 1 Split	16,020	,, ,,
,, No. 2	19,080	,, ,,
Total Up-cast	83,484	,, ,,

Mr. W. Willis's District.

7 November, 1883.

No. 2 Tunnel, from No. 1 to 34.—The air-current is too unsteady to work the anemometer; thermometer, 72°. There were some complaints about short supply of timber.

Front heading intake.—Air-current, 15,750 cubic feet per minute for Nos. 59 to 85, making 54 men, 8 boys, 6 horses, giving each a fraction over 231 cubic feet. From 75 to 85 the air is very slack, but the management is busy sinking a shaft, which will give the required ventilation; thermometer, 74° to 76°.

Cemetery Flat, from No. 86 to 104.—The air-current is 2,975 cubic feet per minute for 38 men, 4 boys, 2 horses, giving each 67½ cubic feet per minute; thermometer, 73°. We suggest a stopping be put in the stenton opposite No. 104 bord end.

Old water pit, Nos. 105, 106, and 107.—There was no regular air-current, and old water pit Nos. 108, 109, and 110 there was no regular air-current.

Travelling road intake.—The air-current is 8,280 cubic feet per minute for Nos. 35 to 38, making 48 men, 4 boys, 2 horses, giving to each 153½ cubic feet per minute.

Upcast tunnel furnace, 33,620 cubic feet per minute. A good supply of timber on all stations excepting Little tunnel, previously referred to, and the travelling road is very dangerous between the door and the main horse-road in Mr. Willis's district.

J. SUMMERS, }
J. LEVER, } Check Inspectors.

The Examiner of Coal-fields to Mr. James Curley, Miners' General Secretary.

Sir,

Coal-fields Office, Newcastle, 18 October, 1883.

In reply to your telegram of this morning, asking if I consider Duckenfield Colliery ventilation is now in compliance with the Coal Mines Regulation Act, I beg to inform you, from a report I have received from Mr. Inspector Dixon, dated 16th instant, and a telegram from Mr. Croft, in reply to one from me, asking how many men, boys, and horses were at work in the mine to-day, that I am of opinion there must be more than an adequate amount of ventilation for the men, boys, and horses now at work there.

I have, &c.,
JOHN MACKENZIE,
Examiner of Coal-fields.

No. 4.

The Examiner of Coal-fields to The Under Secretary for Mines.

I FORWARD for the Minister's information a report I have received from Mr. Inspector Dixon, with reference to the Miners' Executive and Mr. Curley's complaint, that the provisions of the Coal Mines Regulation Act are not complied with *in matters of detail* at the Wallsend Colliery, Newcastle Co., and others, where recent complaints have been made, I beg to state that nothing more can be done than has been by myself and Mr. Dixon, and that it should not be expected that extensive mines like the Wallsend Colliery and others can *daily comply in detail* with the provisions of the Act, which require the erection of stoppings, doors, &c., to ensure an adequate amount of ventilation.

2. With regard to the charges made, of Mr. Inspector Dixon's neglect of duty in not urging remedies when he sees that the provisions of the Act are not complied with, I beg to say that I believe they cannot be substantiated, that the statement made is incorrect, and very great improvements have been made in the ventilation of the northern collieries since he received the appointment of Inspector of Collieries.

J.M., 15/1/84.

The Under Secretary for Mines.—B.C., 15/1/84.

[Enclosure to No. 4.]

Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Sir,

Glebeland, 24 December, 1883.

I beg to acknowledge receipt of correspondence forwarded by the Miners' General Secretary to the Honorable the Secretary for Mines, re the ventilation in the Wallsend and Newcastle Co.'s collieries, &c.

In reply thereto, in reference to Wallsend Colliery, I have the honor to state that I made an inspection of that colliery during last month, and, with the exception of a few matters of detail, I found the ventilation good. A few days after the inspection I saw Mr. Neilson, manager, and drew his attention to those matters. I also notified him (Mr. Neilson) by letter, and

and in reply he wrote me expressing surprise that I should deem such matters worthy of official complaint, and desires that at an early date an inspection of the whole of Wallsend Colliery be made by the Examiner, Inspector, Check Inspectors, and Manager, so that the exact state of the mine may be ascertained for the information of the Honorable the Secretary for Mines and the miners of Wallsend Colliery. I beg to state that I quite agree with the suggestion as being the only means to thoroughly sift the matter, and put an end to the complaints concerning the ventilation at that colliery. It is clear to anyone in the least degree acquainted with the working of a colliery, that in an extensive mine like Wallsend, with such an extraordinary output, and with such a length of airways, there will occasionally be a derangement of the ventilation, caused by circumstances over which there is no control; for instance, a heavy fall of roof, such as I saw in one part of the Wallsend workings on my last inspection; but as soon as I called the attention of the Manager to the matter, he caused a small shaft to be sunk, which at once effected a remedy. Seeing that such things do occur, it is highly necessary to inquire into the cause and extent of any defective ventilation before sweeping assertions are made concerning any colliery.

2. Newcastle Co.'s Colliery.—The place complained of in this colliery is, I suppose, the No. 6 district, where the ventilation was completely deranged by a heavy crush which took place a considerable time since. This No. 6 heading has had to be forewon in order to reach the No. 5 narrow bord. Lately there have been about 38 men, 2 boys, and 2 horses in this split.

It has been a most difficult place to ventilate, as a door had to be hung on the No. 1 main road, and one on the main road in No. 6, so that all possible pressure might be brought to bear on this split to ensure a sufficient quantity of air. On my several inspections of this district I have found a variation in the current, as the following results will show:—1st, 4,720 cubic feet per minute; 2nd, 4,130 cubic feet per minute; 3rd, 3,960 cubic feet per minute; and the last result obtained was during last month, 4,060 cubic feet per minute. But I observe by the report of the Check Inspectors for this month that they got a result of 5,670 cubic feet of air per minute, or 134 cubic feet per minute for every man, boy, and horse in the split.

It is expected that the No. 6 heading will be holed through into No. 5 narrow bord during this week; then the ventilation will be even better than it is at present.

Taking the Newcastle Co.'s mine throughout, I am of opinion that the ventilation is first-class.

Regret is expressed by the Executive Committee that a remedy is not urged by me in cases of non-compliance with the Act.

In reply, I fearlessly state that during the time I have had the honor to hold the position of Inspector of Collieries, whenever I have seen anything wrong in any mine I have drawn immediate attention to the matter with a view to having it remedied at once, and have never passed by anything, even down to the smallest detail, in a mine which I thought likely to militate against the health or safety of anyone employed in the mine.

Standing as I do, with employers on one hand and the employed on the other, my study hitherto has been to steer a steady course in my official capacity, knowing neither master nor man, but honestly and conscientiously giving a report of each mine as I have found it on my several inspections.

In conclusion, I desire to say that notwithstanding the enormous output of coal from the collieries in this district, and the continual changes which are taking place owing to the large output, in my opinion, the present state of said collieries will bear favourable comparison with any part of their past history, both regarding the quantity of air circulating and its distribution in the various parts of the workings.

I have, &c.,

JOHN DIXON,

Inspector of Collieries.

Submitted.—H.W., 18/1/84. If it is the practice to do so, a copy of this report may be sent to Mr. Curley.—J. P. ABBOTT, 19/1/84. In view of the precedent on 82-7,586, the copy may be supplied.—H.W., 22/1/84.

No. 5.

The Under Secretary for Mines to Mr. James Curley, Miners' General Secretary.

Sir,

Department of Mines, Sydney, 28 January, 1884.

See No. 4.

I have the honor, by direction of the Secretary for Mines, to forward a copy of the report furnished by Mr. John Dixon, one of the Inspectors of Collieries, upon the ventilation at the Wallsend and Newcastle Company's Collieries.

I have, &c.,

HARRIE WOOD,

Under Secretary.

Duckenfield Colliery.

NO.

SCHEDULE.

PAGE.

1. Copies of Check Inspectors' Report in connection with ventilation at Duckenfield Colliery. 20 October, 1885..... 36

Report of the Duckenfield Tunnel, taken on 20 October, 1885.

WE, the undersigned, have examined the airways and workings of the Duckenfield Colliery, and certify our report as follows:—

Intake of air taken in the engine brow below first flat, 12,210 cubic feet of air per minute; intake of air from Fault heading shaft, 6,565 cubic feet of air per minute; 7 men in the Fault heading. West heading, No. 7 cut-through, 3,520 cubic feet of air per minute; 6 men in this cut-through. No. 2 cut-through, 4,480 cubic feet of air per minute; 4 men in this cut-through. No. 3 cut-through, 4,620 cubic feet of air per minute; 3 men in this cut-through. There are 4 wheelers, 2 horses, and 20 men in the West heading cut-throughs and Fault heading. Average heat in the bords in West heading district—Thermometer registered 71°. Return air from Fault heading and West heading to Furnace shaft, 23,760 cubic feet of air per minute. Dip Workings.—Split of air from shaft at the foot of the engine brow to the B and D heading district: Result taken in B heading, 7,315 cubic feet of air per minute; 10 men in this heading. D heading, 5,940 cubic feet of air per minute; 10 men in this heading. D heading, No. 1 cut-through, 4,437 cubic feet of air per minute; 10 men in this cut-through. No. 2 cut-through, 3,812 cubic feet of air per minute; 7 men in this cut-through. No. 3 cut-through, 3,948 cubic feet of air per minute; 8 men in this cut-through. No. 4 cut-through, 4,770 cubic feet of air per minute; 4 men in this cut-through. No. 5 cut-through, 4,617 cubic feet of air per minute; 10 men in this cut-through. No. 6 cut-through, not sufficient air to take any result with anemometer (P.S.—The overseer informed

informed us that he would put a door on No. 5 cut-through to remedy the air in this cut-through); 10 men in this cut-through. There are 69 miners, 12 wheelers, and 6 horses in the B and D heading district. Return air from this district, 15,105 cubic feet of air per minute.

Intake of air from engine brow shaft to the E heading district, 4,235 cubic feet of air per minute. No. 7 cut-through, not sufficient air to take any result with anemometer (P.S.—The overseer said in a few days he would put a door on No. 6 cut-through to remedy the air); 15 men in this cut-through. No. 6 cut-through, 3,780 cubic feet of air per minute; 17 men in this cut-through. No. 5 cut-through, 4,307 cubic feet of air per minute; 8 men in this cut-through. No. 4 cut-through—2 men in this cut-through. Return air from E heading, 8,325 cubic feet of air per minute. There are 42 miners, 6 wheelers, and 3 horses in this heading.

M heading is supplied with the return air from E heading—2,827 cubic feet of air per minute; 12 miners, 1 wheeler, and 1 horse for this heading. Return air from dip workings to West heading furnace, 19,125 cubic feet of air per minute. Return from West heading district and dip workings at furnace, 53,560 cubic feet of air per minute.

We also find that there is a good supply of timber on the flats for the various sections.

JAMES SNEDDEN, } Check
GEORGE NIX, } Inspectors.

Report of the Back Creek Tunnel on 21 October, 1885.

WE, the undersigned, have examined the airways and workings of the Back Creek Colliery, as certify our report, as follows:—

Cross-cut pillars.—We find a sufficient supply of air travelling in this district. There are 10 miners, 2 wheelers, and 1 horse. Thermometer registered 68°. Intake of air in engine brow below turn for the No. 10 heading district, 21,890 cubic feet of air per minute.

First section in No. 10 heading.—Intake for No. 11 cut-through, 6,037 cubic feet of air per minute; 14 miners, 2 wheelers, and 1 horse in this cut-through. No. 8 cut-through, 5,759 cubic feet of air per minute; 20 miners, 2 wheelers, and 1 horse. No. 7 cut-through, 7,684 cubic feet of air per minute; 12 miners, 2 wheelers, and 1 horse. Return air from first section in No. 10 heading, 16,632 cubic feet of air per minute.

Second section in No. 10 heading.—No. 4 cut-through, 6,578 cubic feet of air per minute; 30 miners, 4 wheelers, and 2 horses in this cut-through. No. 3 cut-through, 12,358 cubic feet of air per minute; 20 miners, 2 wheelers, and 1 horse in this cut-through. Return air from No. 10 heading sections, result taken at furnace, 30,485 cubic feet of air per minute.

Intake.—First split of air from No. 12 shaft to A heading, 5,445 cubic feet of air per minute; 22 miners, 3 wheelers, and 1 horse in this district. Return air from A heading, 4,162 cubic feet of air per minute.

Engine brow, 3,465 cubic feet of air per minute; 3 miners, 1 wheeler, and 1 horse.

Second split of air from No. 12 shaft to No. 12 heading district.—Result taken in No. 4 cut-through, 4,312 cubic feet of air per minute; 32 miners, 5 wheelers, and 2 horses for this current of air. Return air from No. 12 heading district, 6,138 cubic feet of air per minute. Return air from engine brow, A heading, and No. 12 heading, result taken at No. 4 furnace, 19,720 cubic feet of air per minute.

We also find a good supply of timber on the flats for the various sections.

SCHEDULE.

NO.		PAGE.
1.	Minute of the Honorable the Secretary for Mines that Messrs. Melville and Tighe, Ms.P., should be informed of his decisions on matters considered at a Deputation of Miners at Newcastle. 26 February, 1883	37
2.	Minute of same that the Examiner of Coal-fields should institute an inquiry as to supply of timber at the A.A. Company's mine, with minutes. 26 February, 1883	38
3.	The Under Secretary for Mines to Messrs. Melville and Tighe, Ms.P., in conformity with No. 1. 1 March, 1883...	38
4.	The same to the same, that in reference to No. 2 the Examiner of Coal-fields reports an adequate supply of timber at the A.A. Company's mine. 12 March, 1883	38

No. 1.

Minute of The Secretary for Mines.

Re Deputation of Miners at Newcastle.

A DEPUTATION of miners introduced by Messrs. Melville and Tighe, Ms.P., waited on me at Newcastle on Saturday, the 24th February, 1883, in reference to the matters mentioned in the annexed letter, and I desire that Messrs. Tighe and Melville should be informed of my decision in the several matters therein mentioned.

- 1st. Send them copy of my minute on the Wallsend Colliery.
- 2nd. The number of men allowed in a district to my mind is very clearly defined as being not more than seventy men.
- 3rd. The Examiner of Coal-fields will at once be asked to report upon the charge of the air being bad in the Lambton Commonage Coal Tunnel.
- 4th. The same as to scarcity of timber at the A.A. Company's mine.
- 5th. The Examiner has also been asked to report as to two shafts at the Newcastle Coal-mining Company's mine.

J. P. ABBOTT,
26/2/83.

[Enclosure

[Enclosure to No. 1.]

Mr. J. Curley and others to The Secretary for Mines.

THE undersigned deputation desire respectfully, on behalf of the Coal Miners' Association, to bring under your notice for consideration the following subjects:—

- 1st. The apparent erroneous opinion of the Examiner of Coal-fields regarding the Act of 1876, and a recent inspection at the Wallsend Colliery.
- 2nd. The advisability of a definition as to the computed number of men in a district.
- 3rd. Report of Lambton miners' meeting which appeared in last Saturday's *Herald* and *Advocate*.
- 4th. Scarcity of timber at the A. A. Company's mine and timber of proper lengths.
- 5th. Last year's Annual Mining Report disclosing great indifference both on the part of colliery management and Inspector.
- 6th. The question of two shafts at the Newcastle Coal-mining Company's mine.

DAVID MITCHELL.
JOHN McFADYEN.
JAMES CURLEY.

No. 2.

Minute of The Secretary for Mines.

The Deputation of Coal-miners at Newcastle.

THE Examiner of Coal-fields will cause an inquiry to be made whether there is at all times a sufficient supply of timber kept at the A. A. Company's mine, and of proper lengths.—J. P. ABBOTT, 26/2/83.

The Examiner of Coal-fields.—G.E.H. (for the U.S.), B.C., 28/2/83. Mr. Inspector Dixon for report.—J.M., 1/3/83.

The deficiency of timber in the A. A. Company's mine was only in one district, viz.:—No. 1 in No. 2 pit, where very long props are required. Owing to the heavy rains up the river, this particular class of timber was rather scarce for about three weeks. However, there is now a good supply, for I was in No. 1 district on Tuesday last, and saw a good supply on the engine flat ready for the miners' use. I cannot hear of any complaint concerning the timber from any other part of the A. A. Company's mine.—J.D., 2/3/83.

Examiner of Coal-fields.—B.C., 2/3/83. The Under Secretary for Mines.—J.M., B.C., 3/3/83. Submitted—H.W., 5/3/83. Approved. Inform Messrs. Melville and Tighe, Ms.P.—J. P. ABBOTT, 10/3/83.

No. 3.

The Under Secretary for Mines to Messrs. N. Melville and A. A. P. Tighe, Ms.P.

Gentlemen,

Department of Mines, Sydney, 1 March, 1883.

Referring to the several matters brought forward by the deputation introduced by you to the Secretary for Mines, on the 24th ultimo, I am directed to forward a copy of Mr. Abbott's decision in the matter of the ventilation of the Wallsend Colliery.

2. I am directed to state that in Mr. Abbott's opinion the number of men allowed in a district is very clearly defined as being not more than seventy (70) men.

3. The Examiner has been asked to report upon the charge of the air being bad in the Lambton commonage tunnel; also,

4. As to the scarcity of timber at the Australasian Agricultural Company's Mine; and

5. As to two (2) shafts at the Newcastle Coal Company's Mine.

I have, &c.,

HARRIE WOOD,

Under Secretary.

No. 4.

The Under Secretary for Mines to Messrs. N. Melville and A. A. P. Tighe, Ms.P.

Gentlemen,

Department of Mines, Sydney, 12 March, 1883.

Referring to my letter of the 1st instant, I have the honor to inform you that it appears, from the report forwarded by the Examiner of Coal-fields, that the deficiency of timber in the Australian Agricultural Company's Mine occurred in No. 1 district, pit No. 2, where very long props are required, but that there is now a good supply, and there was no complaint as to the deficiency of timber from any other part of the mine when the Inspector visited it.

I have, &c.,

HARRIE WOOD.

Under Secretary.

Messrs.

Messrs. Browns' Colliery, Minmi.

SCHEDULE.

NO.	PAGE.
1. Mr. James Curley, Miners' General Secretary, to the Hon. the Secretary for Mines, complaining of defective ventilation in the Messrs. Browns' Colliery, Minmi, with minutes and enclosure. 19 October, 1881	39
2. The Examiner of Coal-fields to the Under Secretary for Mines, in reference to above complaint, with minutes and enclosure. 22 October, 1881	40
3. The Under Secretary for Mines to Mr. James Curley, in reply to No. 1. 28 October, 1881	41
4. Mr. James Curley to the Examiner of Coal-fields, complaining of the manner in which the inspection of the Minmi mine was made, with minutes and enclosure. 7 November, 1881	41
5. Mr. James Curley to the Hon. the Secretary for Mines, that a further communication has been sent to the Examiner of Coal-fields <i>re</i> defective working of the Coal Mines Regulation Act of 1876 in Minmi Colliery, with minute. 8 November, 1881.....	42
6. Mr. James Curley to the Examiner of Coal-fields, calling attention to the defective state of the ventilation in Raspberry Gully drive. 28 November, 1881	43
7. The Examiner of Coal-fields to Mr. James Curley, in reply to No. 6. 1 December, 1881.....	43
8. The Under Secretary for Mines to the Examiner of Coal-fields, asking what action had been taken <i>re</i> defective working of Coal Mines Regulation Act of 1876 in Minmi Colliery, with minute. 8 December, 1881	43
9. The Examiner of Coal-fields to the Under Secretary for Mines, with copy of reply to Mr. James Curley, minutes and enclosure. 14 December, 1881	43
10. Mr. H. Winchester to Mr. J. Y. Neilson, Manager, Wallsend Colliery, enclosing copy of Examiner of Coal-fields' report. 20 December, 1881	44
11. Messrs. J. & A. Brown to Mr. James Curley, with reference to his having drawn the attention of the Examiner of Coal-fields to an inundated mine in close proximity to theirs. 23 December, 1881	45
12. Telegram from Mr. James Curley to Mr. N. Melville, M.P., asking if Minister can receive deputation from Miners' Association, with minutes. 23 December, 1881	45
13. Minute of the Honorable the Secretary for Mines, <i>re</i> deputation from Miners' Association. 4 January, 1882 ...	45
14. The Examiner of Coal-fields to the Under Secretary for Mines, <i>re</i> having forwarded extract from Mr. James Curley's complaint to the Messrs. Brown, about defective working of Coal Mines Regulation Act, 1876, in their colliery, minutes and enclosure. 11 January, 1882.....	45

No. 1.

The Miners' General Secretary to The Secretary for Mines.

Sir,

Hamilton, 19 October, 1881.

I have the honor to bring under your notice the enclosed letter, which was delivered to the Government Examiner of Coal-fields on the 1st October, 1881, regarding the defective working of the Coal Mines Regulation Act of 1876, and referring to a number of accidents caused by explosions of gas at the Messrs. Browns' Colliery, Minmi. That there are just grounds for complaint will be admitted when I state that since the delivery of the letter herein mentioned another accident of a similar character has occurred at the same place, and in this instance has been officially reported, which, for some unexplained reason, has not been done in other cases equally serious.

There is, I may add, general complaint regarding defective ventilation at the principal mines in the district, not of the ventilation as a whole, but that in certain portions of the mines the ventilation is exceedingly bad, and believing it to be within the province of the Inspector for Collieries to effect some remedy in this direction, I would respectfully invite you to draw his attention to this very important subject, also the Examiner of Coal-fields.

Should you desire to have further information respecting this matter by deputation I shall be most happy to wait upon the Honorable Minister.

I have, &c.,

JAMES CURLEY,
Miners' General Secretary.

The Examiner of Coal-fields for explanation.—H. W., B.C., 22/10/81. The Under Secretary for Mines,—The correspondence with reference to this case was forwarded for the information of the Honorable the Secretary for Mines with my communication of the 22nd inst.—J.M., B.C., 24/10/81.

[Enclosure to No. 1.]

Messrs. J. Curley and others to The Examiner of Coal-fields.

Sir,

Hamilton, 30 September, 1881.

I beg respectfully to bring under your notice the defective working of the Coal Mines Regulation Act of 1876, and the apparent indifference of your Department in endeavouring to see that the provisions of the Bill are carried out. That the subject has assumed an important aspect you may infer when I state the miners of the district have placed myself and colleagues in a position to take all necessary steps towards a remedy. A series of questions have therefore been drafted to be placed in the hands of the Members for the county, upon which subject also the co-operation of the city Members will be invited, and an inquiry the most searching will thus be opened up, and will tend to show that on the part of the Inspector of Collieries there is a great indifference.

I have before me the Mines Report of 1880, wherein the admission is made that I have made previous complaints, with the assertion that they have been immediately remedied. What is the answer to this? Three miners have been burnt in the Minmi mine recently by explosions of gas. Two of these accidents were only three weeks or one month apart from each other, and at a time when no night furnacemen were employed. If atmospheric pressure has any influence (which you will admit) in generating gas and its accumulation in mines, surely, in a climate like ours of sudden atmospheric change, it is a first condition in ventilation that the apparatus be kept in motion. Minmi is not the only place where false economy requires your immediate attention, and, what is more, constant attention.

I will put the question thus with your permission:—"It is better that accidents should be prevented by inspection, than that it should be said accidents, in the cases cited, are the inspectors."

The report of Inspector for Collieries requires attention, and, to those unacquainted with the Act, is very misleading. For instance, it is said of such a mine there are "280 men and horses, &c., in the mine, for whom 55,000 cubic feet of air per minute is introduced, which is in excess of the minimum quantity required by the Act."

The inspector does not state whether the main current is divided into the requisite number of splits, and fresh air supplied to every section of seventy men, and it is certainly impossible to be so where the anemometer will not turn, which is recorded by the local inspectors in several recent examinations, some of which are in my possession.

In conclusion, we, the undersigned, request your immediate attention towards remedying the cause of complaint—defective ventilation—in some parts of the collieries in the district.

DAVID MITCHELL, Chairman.
J. MFADYEN, Treasurer.
JAMES CURLEY, Secretary.

No. 2.

No. 2.

The Examiner of Coal-fields to The Under Secretary for Mines.

Sir, Coal-fields Office, Newcastle, 22 October, 1881.

I beg to forward herewith, for the information of the Honorable the Secretary for Mines, a letter received from the Chairman, Treasurer, and Secretary of the Hunter River District Coal-miners' Association, bringing under notice an alleged defective working of the Coal Mines Regulation Act, 1876, and the apparent indifference of this Department in endeavouring to see that the provisions of the bill are carried out, with the Inspector's report thereon and a copy of my reply.

See Enclosures.

I have, &c.,

JOHN MACKENZIE,
Examiner of Coal-fields.

The Miners' General Secretary may be informed that the Examiner of Coal-fields having replied to the only specific charge made, and having asked for further information respecting the charges made in general terms, there does not appear to be any action for this Department to take until such information has been supplied.—H.W., 25/10/81. Submitted.—To be informed accordingly.—A.R., 26/10/81.

[Enclosures to No. 2.]

Messrs. Curley and others to The Examiner of Coal-fields.

Sir, Hamilton, 30 September, 1881.

I beg respectfully to bring under your notice the defective working of the Coal Mines Regulation Act of 1876, and the apparent indifference of your Department in endeavouring to see that the provisions of the Bill are carried out. That the subject has assumed an important aspect you may infer when I state the miners of the district have placed myself and colleagues in a position to take all necessary steps towards a remedy. A series of questions have therefore been drafted to be placed in the hands of the Members for the county, upon which subject also the co-operation of the city Members will be invited, and an inquiry the most searching will thus be opened up, and will tend to show that on the part of the Inspector for Collieries there is great indifference.

I have before me the Mines Report of 1880, wherein the admission is made that I have made previous "complaints," with the assertion that they have been immediately remedied. What is the answer to this? Three miners have been burnt in the Minmi Mine recently by explosions of gas. Two of these accidents were only three weeks or one month apart from each other, and at a time when no night furnaceman was employed. If atmospheric pressure has any influence (which you will admit) in generating gas and its accumulation in mines, surely in a climate like ours, of sudden atmospheric change, it is a first condition in ventilation that the apparatus be kept in motion. Minmi is not the only place where false economy requires your immediate attention, and, what is more, constant attention. I will put the question thus, with your permission:—"It is better that accidents should be prevented by inspection, than that it should be said accidents in the cases cited are the inspector." The report of the Inspector for Collieries requires attention, and to those unacquainted with the Act is very misleading. For instance, it is said of such a mine, there are "280 men and horses, &c., in the mine, for whom 35,000 cubic feet of air per minute is introduced, which is in excess of the minimum quantity required by the Act." The Inspector does not state whether the main current is divided into the requisite number of splits, and fresh air supplied to every section of seventy men; and it is certainly impossible to be so where the anemometer will not turn, which is recorded by the local Inspectors in several recent examinations, some of which are in my possession. In conclusion, we, the undersigned, request your immediate attention towards remedying the cause of complaint—defective ventilation—in some parts of the collieries in the district.

DAVID MITCHELL, Chairman.
JOHN M'FADYEN, Treasurer.
JAMES CURLEY, Secretary.

Urgent. The Inspector of Collieries for report. To be returned.—J.M., 4/10/81.

Being unable to understand the exact meaning of the statement in the letter, "The Inspector is indifferent, &c.," I can scarcely be expected to furnish a reply to it. As to the statement "That the Inspector's report does not state whether the main current is divided into the requisite number of splits, &c.," I reply that, although not so stated in the report, nevertheless such currents are divided into district currents; and the omission shall be made good in future.—T.L., 5/10/81.

The Examiner of Coal-fields to Mr. James Curley and others.

Gentlemen, Coal-fields Office, Newcastle, 22 October, 1881.

I have the honor to acknowledge the receipt of your letter of the 30th ultimo, bringing under notice an alleged defective working of the Coal Mines Regulation Act of 1876, and the apparent indifference of this Department in endeavouring to see that the provisions of the Bill are carried out.

2. In reply, I beg to inform you that as the only specific complaint brought forward in your letter had reference to the Minmi mine, I recently made it my business to make a thorough examination of Brown's colliery, by inspecting all the places where the men were at work, measuring the quantity of air circulating through the different districts or splits and the men's working places, as well as the quantity of intake and return air travelling through the mine, and found that the main current was divided into the required number of splits, and not only was there a far larger quantity of air passing through the mine than the Coal Mines Regulation Act requires, but it was properly circulated, and the mine well ventilated.

I asked each miner at work, amongst other questions, whether he considered the air he was working in was good or bad, and if he had been working in any badly ventilated places during the year, and they said they had no reason to complain of the air they were then or previously working in; that they had worked where the air was slack and deficient, when their bords, &c., had been driven past where a "cut-through" was about being "put through."

I also inspected the bords and headings where Hunter, Gilder, Hull, Davies, Bothwell, Duggan, and Andrews were burnt by explosive gas, and made inquiries as to their injuries. Hunter, Gilder, Davies, and Bothwell being only slightly burnt it was not considered necessary by the manager to report their accidents, and the men themselves did not consider they received "serious personal injury," or that it was necessary for the manager to have reported their injuries.

The manager informed the Inspector that Duggan and Andrews had been burnt by explosive gas, and that officer reports to me that upon visiting Duggan he found he was apparently only very slightly burnt, and did not consider he had received serious personal injury.

On the 6th instant I went to the Newcastle Hospital to see Duggan, and found that his back, arms, face, and one hand had been severely scorched; and although the Inspector, when visiting him, formed the impression that no serious personal injury had been received, the case has, in my opinion, proved to be one of that character.

Dr. Harris says, whilst the case has, in my opinion, proved to be one of that character, and Duggan says for over two weeks he was in such pain that he could not lie on his back to sleep; but, from his own account of the occurrence, I conclude that had he exercised ordinary caution the accident would not have happened.

4. In the No. 10 heading, where the seam of coal generates the most gas, and there were 42 men, boys, and horses at work (in the two shafts), I found there were 10,080 cubic feet of air per minute circulating through the working-places, and was informed that there was seldom a less quantity travelling through this part of the mine. I saw Davies, who was slightly scorched by an explosion of gas about eighteen months since, and he told me he did not consider his was a case which it was necessary to report; that he was working in a 6-foot heading at the time, and about 30 yards before the current of air. In No. 12 heading, where Andrews was burnt, there were 4,950 cubic feet of air per minute circulating through it, and only two men working in it. Mr. Brown has since my first visit appointed a fireman, whose special duty it will be to go round all the places known to contain explosive gas, before the men go to work. Previously

Previously it was John Morgan's (the deputy's) duty to go round the dip workings, wherever fire-damp was likely to exist. And as the quantity of gas generated by the seam of coal is at present small in quantity, and there is a good current of air circulating, it appears to be unnecessary for the Manager to do more than he has promised for the prevention of accident from such a source—a view supported by the miners themselves, of whom inquiry was made on the spot.

5. In conclusion, I may observe, that if you will be so good as to mention specifically the other collieries in this district to which you refer, as not carrying out the provisions of the Act, I shall take effective steps for ascertaining whether the law is complied with in each case, for the reports received from the Inspector of Collieries for some time have led me to suppose that there were no causes for complaint.

I have, &c.,

JOHN MACKENZIE,
Examiner of Coal-fields.

No. 3.

The Under Secretary for Mines to Mr. James Curley, Miners' General Secretary.

Sir,

Department of Mines, Sydney, 28 October, 1881.

Referring to your letter of the 19th instant, in which you bring under notice a communication made to the Examiner of Coal-fields, touching the alleged defective working of the Coal Mines Regulation Act 1876, and the accidents caused by explosions of gas at Messrs. Browns' Minmi Colliery, I have the honor, by direction of the Secretary for Mines, to inform you, that as the Examiner has replied to the only specific charge made and has asked for further information respecting such charges as have been made in general terms, there does not appear to be any action for this Department to take until such information has been supplied.

I have, &c.,

HARRIE WOOD,
Under Secretary.

No. 4.

Mr. James Curley, Miners' General Secretary, to The Examiner of Coal-fields.

Sir,

Hamilton, 7 November, 1881.

I have the honor to acknowledge the receipt of your communication dated 22nd October, and referring to the second clause therein, as to the answers given by the miners respecting the ventilation being of a generally satisfactory character; this was, as I am given to understand, when you were accompanied by Messrs. J. Brown, J. Croft, and G. Durie, all representing the management, while the miners were unrepresented by any of their number, exception being taken to Mr. J. Patrick, an experienced practical miner, now in the employ of the men as check-weigher, going down the mine in company with you, so that it is nothing unreasonable to conclude the inquiry and examination partook of a partial, one-sided, and unsatisfactory character, inasmuch that a sense of intimidation would under such circumstances be at once produced. This view of the case is supported by the fact that the delegate's two sons had been some days previous to this peremptorily discharged from their work in the fitting shops adjacent to and in connection with the colliery. Mr. W. M. Williams, the delegate, I know to be a man of exemplary character, while his sons had by their industry, won the respect and esteem of the overseers in their department.

This is most inconsistent with the courtesy uniformly observed by the gentleman representing the firm, whom I have met on several occasions at meetings between masters and men.

Admitting, however, the answers to have been given as stated, the evidence, judging from the number of accidents by explosions of gas and the time at which they occurred, it is quite evident that there has been grave indifference on the part of the management, and still more on the part of the Inspector for Collieries.

In clause 3 of your communication you state, "Hunter, Gilder, Hull, Davies, Bothwell, Duggan, and Andrews were burnt by explosive gas,"—"Hunter, Gilder, Davies, and Bothwell being only slightly burnt, it was not considered necessary by the manager to report their accidents, and the men themselves did not consider they received serious personal injury or that it was necessary for the manager to have reported their injuries." The opinion of both manager and men in reference to a report is perverse in the extreme, and probably was quite different on the dates when the accidents took place, and confirms what has been said regarding indifference. If the Inspector committed a mistake in the case of Duggan's accident, which you admit, neither the management nor men are more judicious (but the latter are not requested to report, and why you include them with the management I fail to understand). What is serious personal injury? When miners are knocked down and severely burnt by gas-explosions, and incapacitated from following their employment for two and three weeks together. It must be serious personal injury when these accidents are concurrent and take place at intervals of a few weeks together. It is not the slight trifling matter represented. And more especially when you consider the time at which the accidents took place, when the men had been some hours at work, the air would then be in motion, however defective, and forced about by the skips in motion, and yet gas collected in sufficient quantity to explode, which explains two important facts—

1. That there was very defective ventilation at the time of these gas explosions, or
2. That there was that amount of gas collecting in the mine requiring vigilant attention, and, in case of an accident, rendering a report imperatively necessary.

The Colliery Inspector in Duggan's case showed not only indifference and a want of judgement but is culpably negligent for not making an examination on the spot; and in reference to such examinations it would be more satisfactory if the miners were represented, and the press admitted. This would constitute something like an impartial Board of Inquiry. I cannot refrain from dissent regarding Duggan's want of caution as expressed by you. Did anyone warn him against going into his working-place on the morning of the explosion? No; and as he advanced into it the gas exploded about 15 yards from the working face. This was shortly after Hunter's accident. Duggan not only suffered serious personal injury, but, as you state, Doctor Harris considered his life was endangered; and yet the Colliery Inspector deemed this most serious case of such trifling importance that neither an enquiry was held nor an examination made. Is this in conformity with the Act? In attributing the accident to a want of ordinary caution there appears to be something strangely inconsistent, especially when you consider Hunter's, Gilder's, and other accidents in connection with it. Why not attribute it to careless management and indifferent inspection? The evidence in favour of this latter conclusion is overwhelming.

Both Duggan's and Andrew's accidents were occasioned by gas explosions as they were advancing to the working face in the morning, which goes to show that no fireman had been in these places on the morning of the accidents, or he would have noticed the gas, and warned the miners against entering them, and thus have prevented all approach to danger.

Whatever may have been the state of the ventilation when the examination was made, or the quantity of air passing in the mine,—at the time of the whole of these seven accidents by gas-explosions, the whole of which were more or less serious, there was not that quantity of air passing in the mine stipulated by the Act, wherein it is stated—(2) “An adequate amount of ventilation shall be constantly produced in every mine, to dilute and render harmless noxious gases to such an extent that the working places of the shafts, levels, stables, and workings of such mine and the travelling roads to and from such places shall be in a fit state for working and passing therein.”

I enclose you a copy of statement which I have taken from William Hunter, in the presence of Mr. Patrick, which confirms what I have stated relative to the whole question:—

1. Indifference on the part of the management regarding the ventilation of the mine.
2. Negligence in not using more precaution to prevent accidents by gas explosions, and when such accidents did occur, in not reporting the same to the Examiner for Coal-fields.
3. Indifference on the part of the Colliery Inspector, who must have seen from the local press, that miners were burnt by gas explosions at Messrs. Browns' Colliery, Minmi, and when informed of the same by report from the management to apparently treat the matter with contempt, as in Duggan's case.
4. The incorrectness of the Inspector's reports, in the face of the facts brought under notice.
5. That there is room for improvement regarding the way in which the inquiries and examinations are made.

With regard to clause 5 of your communication, before I refer to it, I would draw your attention to a mine abandoned, but inundated by water, in close proximity to the Messrs. Brown's Collieries now in work, and would ask you respectfully, whether the Inspector has reported this matter to you, and whether any steps are taken as a safeguard in the event of the old tunnel workings piercing the abandoned workings of the inundated mine, and if there are efficient appliances in case of escape on account of any unexpected accident arising from such a source of danger.

In conclusion, respecting clause 5, and the specific naming of the other collieries in this district, I would mention, Wallsend, Borehole, and Lambton, and for any reference to the state of ventilation being defective in these mines in any particular portions thereof, would refer you to the recent local Inspectors as entered in the book at the respective Colliery Offices named.

I am, &c.,
JAMES CURLEY,
Miners' General Secretary.

We the undersigned concur in the above statement.

DAVID MITCHELL, Chairman.
J. M'FADYEN, Treasurer.

[Enclosure to No. 4.]

William Hunter states as follows:—On the morning when I was burnt by an explosion of gas, I was working in No. 14 front heading. The heading was about 27 yards in past the cut-through; my mate was working in the back heading, which was about 6 yards past the cut-through; we had been working in these places about three weeks. Before commencing to work in them, we heard from report by the men there was fire-damp in these places; my mate, Alfred Conway, went to Mr. Thomas, the manager, and told him that we knew nothing about fire, and what the men had told us concerning these places. This was on the Monday morning before commencing to work them. Thomas, in reply, said there was no fire in the place, and if there was Durie would tell them. Durie at no time warned us about fire-damp. He said if we brushed the place with our shirts we would take no hurt. On the morning on which the accident occurred I brushed the place as usual, and had been working about two hours and a half—from half-past six to nine o'clock. I had been back from the face of the heading about 25 yards, for breakfast, only a few minutes, and on returning to the face I was brushing the place, and, when about 5 yards from the face, an explosion of gas took place. I was struck on the breast, and knocked down by the force of the explosion, and fell on my breast.

I thought it was a serious matter at the time, and was unable to follow my work for two weeks after.

I think the accident should either have been reported or steps taken to clear the gas from the places.

Mr. Durie came to see me and offered me a place to work elsewhere in the mine, and said I would go back there no more. Neither Mr. Lewis, the Colliery Inspector, nor Mr. Mackenzie visited me at the time I was off work. When I answered Mr. Mackenzie's questions Mr. J. Brown, J. Croft, and G. Durie were present, and I felt somewhat intimidated by their presence, and did not care to say anything reflecting on the management, for fear I should be dismissed.

I am a practical miner, having worked in mines for eight years. The day on which Mr. Mackenzie visited us in one of the No. 6 headings and said the air was good enough, there were very few men in that part of the mine, as the pit was filling slack and nearly all the men were cleared out.

WILLIAM HUNTER.
JOHN PATRICK.
JAMES CURLEY, Miner's General Secretary.

“Burley's Hotel,” Minmi, 31 October, 1881.

The Inspector of Collieries for explanation. Copy of my letter referred to in this communication forwarded herewith.—
J.M., B.C., 14/11/81.

In this statement I am blamed for indifference, but not knowing the meaning of the same as used herein, I am therefore unable to reply.

2. For the incorrectness of my report, to which I think that the result of the examination by the Examiner of Coal-fields is a sufficient answer.

3. For neglecting the accidents by explosions of fire-damp, to which I answer that I investigated each case brought under my notice.—T.L., 15/11/81.

No. 5.

The Miners' General Secretary to The Secretary for Mines.

Sir,

Hamilton, 8 November, 1881.

I have the honor to state that a further communication on the defective working of the Coal Mines Regulation Act, 1876, and recent accidents by explosions of gas at the Messrs. Browns' Colliery, Minmi, has been forwarded to the Examiner of Coal-fields.

A statement which I have taken from one of the miners burnt by explosive gas has also been forwarded, which confirms the allegations made respecting this important subject.

I have, &c.,
JAMES CURLEY,
Miners' General Secretary.

Ask the Examiner what has been done in this matter.—H.W., 2/12/81.

No. 6.

No. 6.

Mr. James Curley, Miners' General Secretary, to The Examiner of Coal-fields.

Sir,

Hamilton, 28 November, 1881.

I have the honor to respectfully call your attention to the defective state of ventilation in connection with the drive at Raspberry Gully, South Waratah. The drive is in 500 yards, more or less. Air is conveyed to the workmen by means of troughs laid on the floor of the drive, and when a change of shifts takes place water sometimes accumulates in certain places of the drive, so as to almost overflow the pipes and air current within. Gas is occasionally visible, so that the danger to the life of the workmen must be very great at times. At the time when the Inspector visited the drive recently, the workmen had been withdrawn a half shift the day previous.

I have, &c.,

JAMES CURLEY,

Miners' General Secretary.

No. 7.

The Examiner of Coal-fields to Mr. James Curley, Miners' General Secretary.

Sir,

Coal-fields Office, Newcastle, 1 December, 1881.

With reference to your letter of the 28th ultimo, calling my attention to the defective state of ventilation in connection with the drive at Raspberry Gully, South Waratah Colliery, I beg to inform you that, upon going to the Colliery on the 29th ultimo, I found that Mr. Green (the Colliery Manager) was connecting the trough with the Charles pit down-cast shaft, for the purpose of ascertaining whether the furnace would ventilate the drive better than the fan has lately done, and, as the men had not been at work the previous day, I arranged to go on the 30th idem, and see how the new method answered. Upon arriving there on the 30th ultimo, I found that the shaft which the men had to go down was full of smoke from the furnace. I then discussed with Mr. Green the advisability of remedying this, either by making Charles pit the up-cast or putting a landing at the 6-foot seam, in the present up-cast or furnace shaft, so that the men could go to their work down Charles pit and from thence to the bottom of the furnace shaft free of smoke, &c. This Mr. Green will do immediately, and, when completed, inform me of, and whether the ventilation is improved. See No. 6.

2. With respect to the gas, Mr. Green informs me that the overman is instructed, whenever the men leave the face of the drive, to examine the tunnel and see that it is free from gas, and safe to work in, before the men resume their work; and that whenever gas has been seen it has accumulated during the stopping of the "fan," from 2 o'clock on Saturday night to 6 o'clock on Sunday morning.

I have, &c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

No. 8.

The Under Secretary for Mines to The Examiner of Coal-fields.

Sir,

Department of Mines, Sydney, 8 December, 1881.

I have the honor to inform you that a letter has been received from Mr. James Curley, the Miners' General Secretary, to the effect that a further communication has been made to you respecting the alleged defective working of the Coal Mines Regulation Act of 1876, and the recent accidents by explosions of gas at the Messrs. Browns' Colliery, Minmi, and I accordingly request that you will be so good as to state what has been done in the matter.

I have, &c.,

HARRIE WOOD,

Under Secretary.

Copy of Mr. Curley's letter, &c., forwarded herewith. Have visited the collieries complained of, and shall reply to his letter early next week. I also forward copies of letters respecting the Raspberry Gully drive.—J.M., 10/12/81. The Under Secretary for Mines.—B.C., 10/12/81.

No. 9.

The Examiner of Coal-fields to The Under Secretary for Mines.

Sir,

Coal-fields Office, Newcastle, 14 December, 1881.

Adverting to your letter of the 8th instant, with reference to a letter received from Mr. James Curley, the Miners' General Secretary, and my blank cover communication of the 10th idem, I have the honor to forward you, for the information of the Honorable the Secretary for Mines, a copy of my reply to Mr. Curley and others' letter. See No. 8.

I have, &c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

It does not seem necessary for the department to take any further steps in this matter, unless further moved by the Miners' General Secretary, who is in possession of Mr. Mackenzie's report, copy of which is herewith.—H.W., U.S., 19/12/81. Await further communication.—A.R., 20/12/81.

[Enclosure to No. 9.]

The Examiner of Coal-fields to Mr. J. Curley and others.

Sir,

Coal-fields Office, Newcastle, 13 December, 1881.

In acknowledging the receipt of your letter of the 7th ultimo, referring to the second paragraph of my communication of the 22nd October last, with regard to the answers given to me by the miners at the Minmi Colliery, respecting the ventilation, and complaining that the enquiry and examination held on the occasion was of a partial, one-sided, and unsatisfactory character, owing to the men having been unrepresented, I beg to inform you that Mr. John Brown, the Colliery Manager, having objected to allow Mr. J. Patrick (who, I was informed, was the only person paid by the men at that colliery) to accompany

accompany me during my visit, I had no alternative but to make the examination without him, although I may state that the Colliery Manager was entitled, if he thought fit, to prevent Mr. Patrick from entering the mine. As stated in my letter of 22nd October last, the mine was, at the different days I examined it, well ventilated, whatever it may have been previously; and, as I also informed you, the reports from the Inspector of Collieries had for some time led me to suppose there were no causes of complaint.

2. With respect to your remarks about persons injured by explosive gas at the same colliery, I am of opinion that it would be better and more satisfactory if all such injuries, whether serious or not, were reported to the Examiner of Coal-fields by the owner or manager of the mine, although the Act does not make it imperative that such should be done.

I am also inclined to think that the presence of explosive gas, and the injuries received therefrom, were treated too lightly by the manager previous to my visiting the colliery on 4th October last, since which time a "fireman" has been appointed, whose special duty is to go around all the places known to contain explosive gas before the men go to work. Duggan told me he was about 30 yards in his bord, past the district air current, and about 5 yards from the face, not 15 yards, when the gas fired, and where I was shown his lamp was found was about the distance stated by him to me.

3. Upon making enquiries at the mine, and examining Messrs. Brown's colliery plans, I find that the nearest drives going towards the Minmi old abandoned workings inundated with water, are 35 chains, at least, distant from them, and consequently cannot be in close proximity thereto.

4. The proposal in the fourth paragraph of your letter, that the miners should be represented and the Press admitted at official examinations of collieries, is not provided for in the Act, and cannot, therefore, be complied with.

5. Adverting to the reference made in the concluding paragraph of your letter to the Wallsend, Borehole, and Lambton Collieries, I beg to inform you that I have recently made it my business to make a thorough examination of the Newcastle Wallsend Colliery, by inspecting nearly all the places where the men were at work, measuring the quantity of air circulating through the different districts (or splits) and the men's working places, as well as the quantity of intake and return air travelling through the mine.

6. On the first day, I was accompanied by William Willis (overseer), and John Naismith and David Beveridge (the men's Check Inspectors), whom the Colliery Manager permitted to accompany me through Mr. Willis' district.

In the engine bank road there were 21,600 cubic feet per minute of intake air travelling down it, and 13,860 cubic feet per minute of intake air circulating along the travelling road.

In the No. 1 district (or split) where the air enters it, near the travelling road heading, there were 5,910 cubic feet per minute of intake air for the supply of 70 men, boys, and horses at work; between Nos. 15 and 16 bords it measured 6,000, and between 18 and 19 bords 4,940 cubic feet per minute, thus showing the irregularity of the current of air circulating through this split, and that there is not the quantity of air circulating through it which the Coal Mines Regulation Act provides for, but Mr. Neilson expects that when the water shaft, now in course of being connected with the workings in this district is completed, the ventilation will be improved and exceed the requirements of the Act.

In the No. 2 district (split) there were only 11,040 cubic feet of intake air per minute coming down the "air shaft," for 133 men, boys, and horses at work there, and only 5,670 cubic feet per minute travelling along the air-way past the last working place in the split, which is far less than the Act requires. Mr. Neilson (the Manager) informed me that there was and had been for some time cause for complaint with respect to a deficiency of air in this split, but anticipated that when the new "water shaft" in course of sinking is in a few days completed, it will add to the quantity of air at present supplied to men in this part of the mine. On the second day I was accompanied by Mr. Neilson (the manager), Thos. Boasfield (overseer), and John Naismith and David Beveridge (the men's Check Inspectors), who Mr. Neilson again permitted to accompany me through Mr. Boasfield's district, where I found there was the requisite quantity of air circulating through the different "splits," and the provisions of the Act complied with. The Lambton heading (or No. 1 district) having 6,031, 1,377, and 9,800, equal to 17,208 cubic feet of air per minute (by three intakes) for 141 men, boys, and horses working therein, and with respect to a complaint the men's Check Inspectors drew my attention to, which I examined, where six miners were working in bords where the air was supposed to have passed over "stagnant water," I am of opinion that as the manager is daily drawing large quantities of water away from it, and it is continually receiving fresh supplies, that the 4th general rule in section 12 of the Act, does not apply to it, and I would further add that I could not perceive any bad smells coming from it or the air passing over it. The quantity of return air passing through the furnace shaft was—

No. 1 Split	30,564	cubic feet per minute.
No. 2 Split	12,960	" "
No. 3 Split	34,280	" "
Total]	77,804	

7. On my visit to the Borehole Colliery, where I met by appointment the colliery manager (Mr. Turnbull), and William Lee, and Samuel Selby (the men's check inspectors), and looked over their last reports. I found that the only places they had to complain of were in the south-east side of the south-east headings, and that since the Report dated 27th June last, W. H. Britton and Henry Turner had been appointed Check Inspectors in the place of Lee and Selby. The day previous to my visit Britton and Turner had come out of the mine and asked the Manager if he would go down the pit and see if something could not be done to improve the ventilation where men were working in the south-east side of the south-east headings, as the air was heavily charged with "black-damp," so much so that in many places the men could not keep their lights burning. Mr. Turnbull immediately accompanied Britton and Turner to the places complained of, and after discussing the matter, he made such alterations, as not only gave the men a larger quantity of air, but also that of a better quality. Owing to the large quantity of "black-damp" which is given off and accumulates in this part of the A.A. Company's workings, when a hot north or north-west wind is blowing it makes it very difficult for the Manager to always keep the ventilation in this district up to the requirements of the Act. When I examined this district with Mr. Turnbull and the Check Inspectors (Lee and Selby) the day after the alteration had been made, I found that the men were quite satisfied, and the places well ventilated.

8. I have been to the Lambton Colliery, and Mr. Croudace has marked for my guidance, &c., on the coal-fields record tracings, the different splits, doors, &c., and the way the air travels through and ventilates the mine, and also informed me that he was then busy making alterations and improvements in the ventilation. The Check Inspectors reports were lent me for my perusal, and to take copies of them if I wished to do so, and Mr. Croudace told me that he should have no objection to allow the Check Inspectors to accompany me in my examination.

Upon seeing Mr. Jackson, on Saturday last, I find that the Lambton Colliery is not likely to be working this week, and I must therefore leave my examinations of it until my return from the western and southern districts, and completion of my 1881 yearly report.

I have, &c.,
JOHN MACKENZIE,
Examiner of Coal-fields.

No. 10.

Mr. H. Winchester to Mr. J. Y. Neilson, Manager, Wallsend Collieries.

Sir,

Coal-fields Office, Newcastle, 20 December, 1881.

With reference to your communication of the 19th instant, I beg to inform you that the Examiner of Coal-fields, who is now absent from Newcastle, anticipating your request, instructed me to furnish you with a copy of his report, if applied for, and accordingly have the honor to enclose the same herewith.

I will forward your letter to Mr. Mackenzie without delay.

I have, &c.,
HERBERT WINCHESTER.

No. 11.

No. 11.

Messrs. J. and A. Brown to Mr. James Curley, Secretary, Miners' Association.

Sir,

Newcastle, 23 December, 1881.

We are much astonished to find that you have written to the Examiner of Coal-fields in the following terms:—"I would draw your attention to a mine abandoned but inundated by water in close proximity to the Messrs. Brown's Collieries now in work, and would ask you respectfully whether the inspector has reported this matter to you, and whether any steps are taken as a safeguard in the event of the old tunnel workings piercing the abandoned workings of the inundated mine, and if there are appliances in case of escape on account of any unexpected accident arising from such a source of danger."

As the above statement is both malicious and untrue we would ask you to immediately furnish us with an explanation with respect to the same, and a withdrawal of the statement to the Examiner of Coal-fields.

In the event of this not being done we shall deal with the matter in whatever summary manner we may be advised.

We have, &c.,

J. & A. BROWN.

No. 12.

Mr. James Curley, Miners' General Secretary, to N. Melville, Esq., M.P.

Hamilton, 28 December, 1881.

CAN Minister Mines meet deputation Miners' Association on Friday. Arrange same and meet in Mines Office; reply paid.

JAMES CURLEY.

PRESENTED by Mr. Melville, M.P. In the absence of the Secretary for Mines I informed Mr. Melville that the deputation would be received on Friday at 11:30 a.m.—G.E.H. (for the U.S.), 29/12/81.

Submitted.—G.E.H. (for the U.S.), 31/12/81.

No. 13.

Minute of the Hon. the Secretary for Mines.

Re Deputation from Miners' Association, Hamilton and Newcastle.

INFORM the Examiner of Coal-fields that it is reported that a letter having been forwarded to him by the Secretary of the Miners' Association, he forwarded an extract from the letter to the proprietors of the coal mine (Messrs. Brown), regarding which the complaint was made. Inform further that in consequence of this action on the part of the Examiner the proprietors have threatened to take summary action against the Secretary of the Miners Association.

The Minister requires a report from the Examiner on the subject.

[Enclosure to No. 14.]

Messrs. J. and A. Brown to The Examiner of Coal-fields.

Sir,

Newcastle, 29 November, 1881.

Referring to your semi official conversation with our Mr. Alexander Brown, relative to the near approach of our present workings at Brown's Colliery to some of the old Minmi pit workings, and the probable consequences which might arise owing to any careless working, and of which careless working you had been informed by some person in authority, we should be very glad to know the name of your informant, as Mr. Brown when at the mines, made it his special business to inquire into the truthfulness or otherwise of the assertion, and we are glad to say, found it as uncalled for as it was untrue.

We have, &c.,

J. & A. BROWN.

The Examiner of Coal-fields to Messrs J. and A. Brown.

Gentlemen,

Coal-fields Office, Newcastle, 7 December, 1881.

Referring to your letter of the 29th ultimo, asking me if I would tell you who it was informed me of the near approach of Brown's Colliery workings to some abandoned workings full of water in that neighbourhood, I beg to say that, in a communication received from Mr. Curley, the Miners' General Secretary, he states as follows:—"I would draw your attention to a mine abandoned but inundated by water in close proximity to the Messrs. Brown's Collieries now in work, and would ask you respectfully whether the Inspector has reported this matter to you, and whether any steps are taken as a safeguard in the event of the old tunnel workings piercing the abandoned workings of the inundated mine, and if there are efficient appliances in case of escape on account of any unexpected accidents arising from such a source of danger."

I have, &c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

Mr. J. Y. Neilson, Manager, Wallsend Collieries, to the Examiner of Coal-fields.

Sir,

Wallsend, 19 December, 1881.

I notice in to-day's issue of the *Newcastle Chronicle* a report of a Wallsend miners' meeting, wherein it is reported as follows:—

"Mr. Curley stated he had received a very lengthy report from Mr. Mackenzie, Examiner of Coal-fields, respecting the ventilation and stagnant water in the Wallsend workings, and on many things, &c.; and he, Mr. Curley, concludes by stating, if the meeting desired it, he would bring the report, and read it to the Committee." In

In reference to the above, I think you will have a perfect recollection of the Wallsend Check Inspectors asking to make a special report, you stating that it was a special report, and you could only report to your superior officer or head of your department; and they, the Check Inspectors, had only been allowed to accompany you round the works by the courtesy of the manager, who wished to give you (the Examiner) every information. You then asked me if I was going to make any special report. I at once replied, "Not until I see your official report."

Assuming the report in paper is correct, I do think that you have not acted in strict good faith, inasmuch as you have favoured the accuser with a report, and left the accused in ignorance of your conclusions; and to say the least, it is a most unfair and inequitable arrangement, and a position which you have taken without mature thought; and I shall be glad if you will give me the same copy of your report as you have given Mr. Curley, as I must now report this matter in full to my Directors on the 21st inst., when I have no doubt but that they will be as much surprised as I have been, to find that their Miners' Secretary has been furnished with information that has been withheld from the masters, the latter being equally interested and more responsible.

I am, &c.,
J. Y. NEILSON,
Colliery Manager.

The Examiner of Coal-fields to Mr. J. Y. Neilson, Manager Wallsend Collieries.

Sir,

I am very much surprised at your letter forwarded to me here, and in reply thereto, beg to state that I did exactly what I told you I should do, viz., reply to Mr. Curley's letter, and send you a copy of it (if you wrote for one), which I left instructions with Mr. Winchester to do in my absence; also, send a copy to the Honorable the Secretary for Mines.

I have, &c.,
JOHN MACKENZIE,
Examiner of Coal-fields.

Stockton Colliery.

SCHEDULE.

NO.		PAGE.
1.	The Examiner of Coal-fields to the Under Secretary for Mines, forwarding complaints by Mr. James Curley, and Mr. Inspector Dixon's report on the defective ventilation in Stockton Colliery; also copy of notice served on the Colliery Manager, and minutes. 11 September, 1885	46

The Examiner of Coal-fields to The Under Secretary for Mines.

Sir,

Coal-fields Office, Newcastle, 11 September, 1885.

I have the honor to forward for the information of the Honorable the Secretary for Mines, a letter received from the Miners' General Secretary, and a report from Mr. Inspector Dixon, with respect to defective ventilation in the workings of the Stockton Colliery, also copy of a notice I served upon the Colliery Manager, after having made an examination of the mine with Mr. Dixon, on the 9th instant.

2. I shall be obliged by you informing me what further action the Minister desires me to take in the matter. Whilst I was at the Colliery on the 9th instant, a man came to make a commencement at putting a brattice down side of shaft, for the purpose of improving the ventilation, and complying with the requirements of the Coal Mines Regulation Act, 1876.

I have, &c.,
JOHN MACKENZIE,
Examiner of Coal-fields.

Unless effective measures be adopted for improving the ventilation before he has time to initiate proceedings, he should proceed in terms of the Act to enforce compliance with its provisions.—H.W., 22/9/85. Submitted. Approved.—J. P. ABBOTT, 25/9/85. The Examiner of Coal-fields.—G.E.H. (for the U.S.), B.C., 28/9/85. The brattice down the side of shaft is now completed, and sub-section 3, section 12, of the Coal Mines Regulation Act, 1876, is now complied with.—J.M., 30/9/85. The Under Secretary for Mines.—B.C., 30/9/85. No further action appears to be necessary.—H.W., 3/10/85.

[Enclosures.]

Mr. James Curley, Miners' General Secretary, to The Examiner of Coal-fields.

Sir,

I am instructed by the miners working at the Stockton Colliery, to respectfully draw your attention to the state of the ventilation, with a view that some improvement be effected.

I may add that the miners refused to enter the mine to day, owing to alleged defective ventilation.

I have, &c.,
JAMES CURLEY,
Miners' General Secretary.

Mr. Inspector Dixon for report as early as possible.—J.M., 8/9/85. Seen and reported on.—J.D., 8/9/85.

Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Sir,

Glebeland, 8 September, 1885.

According to your instructions sent by telegram, and also your verbal instructions when I saw you this afternoon, I went to the Stockton Colliery and made an inspection of the workings, and beg to report as follows:—

2. I got down into the workings a little before 4 o'clock p.m., and just at the time the miners were knocking off. There had been several shots fired prior to the men leaving their working places, and as a consequence I found the various headings almost filled with powder, smoke, and seemingly no current of air to clear the workings of said powder smoke. I went through the various headings and bords and also into the return airway which has been holed into the shaft, but could nowhere find the current of air according to the Act, even for the twenty men employed below.

3. The cause of the above state of things is to be found in the fact that a tangye pump has been placed in the lower seam to force the water up the pit. It was found that owing to the steam having to be brought from the surface, the power was almost lost before reaching the pump, consequently the pump was not doing the work required, and the compressed air which had been used to ventilate the workings had to be used to work the pumps. When the Manager took the compressed air

air from the workings and connected it to the pump, he endeavoured to make a provision for a supply of fresh air into the workings by connecting the back return airway with an 8-inch column of pipes into the shaft, and also connecting the pipes at the surface with the boiler stack. This arrangement, however, does not seem to act, and in my opinion is due partly to the contracted area of the pipes and partly to a portion of the surface connection being formed of canvas.

4. I saw the Manager (Mr. Hardy), and urged on him the necessity of at once putting a quarter brattice in the shaft, which, in my opinion, would result in proper ventilation for the limited number of men employed. He (Mr. Hardy) informed me that it was his intention to put a brattice in, and that the timber for that purpose had been ordered several days since, but had not yet come to hand, and further added that to-morrow (Wednesday) morning, he would send a man on purpose and get the timber across if possible.

5. In conclusion, I beg to state, that it is about a week since the compressed air was put on the pump, but for the most part of last week the men were employed on the surface and there was very little work done below. The present arrangement to return the air was completed during yesterday (Monday) morning. I further beg to state that it is my intention to visit Stockton Colliery again to-morrow (Wednesday) morning, and I should very much like if you could make it convenient to accompany me and see the workings for yourself.

I have, &c.,
JOHN DIXON,
Inspector of Collieries.

The Examiner of Coal-fields to Mr. Joseph Hardy, Colliery Manager, Stockton Colliery.

Sir, Coal-fields Office, Newcastle, 10 September, 1885.
Referring to the inspection made by Mr. Inspector Dixon, on the 8th instant, and that made by Mr. Dixon and myself on the 9th instant, I hereby give you notice that you have neglected to comply with sub-section 3, section 12, of the Coal Mines Regulation Act, 1876.

I have, &c.,
JOHN MACKENZIE,
Examiner of Coal-fields.

Great Western Zigzag Colliery.

SCHEDULE.

NO.	PAGE.
1. The Examiner of Coal-fields to the Under Secretary for Mines, forwarding correspondence, and copy of notice served on the Manager of the Great Western Zigzag Colliery—Enclosures and Minutes. 8 April, 1884.....	47
2. The same to the same forwarding Mr. Inspector Rowan's report, and other enclosures on above Colliery. 7 May, 1884.	48

No. 1.

The Examiner of Coal-fields to The Under Secretary for Mines.

Sir, Coal-fields Office, Newcastle, 8 April, 1884.

I beg to forward for the information of the Honorable the Secretary for Mines, correspondence, &c., and copy of a notice I have served on Mr. Wilson, of the Great Western Zigzag Colliery, Esk Bank, for non-compliance with sub-sections 2 and 4, section 12, of the Coal Mines Regulation Act, 1876.

2. Mr. Wilson I have found to be an excellent promiser but a very bad performer in remedying any matters complained of when he was Manager at the Vale of Clwydd Colliery, and I shall be obliged by your informing me what further action the Minister desires me to take in the matter.

I have, &c.,
JOHN MACKENZIE,
Examiner of Coal-fields.

[Enclosures to No. 1.]

Mr. James Rowan, Inspector of Collieries to the Examiner of Coal-fields.

Sir, Esk Bank, 9 February, 1884.

I have the honor to report for your information that I have inspected the Zigzag Colliery, and regret to state I found the ventilation not in a satisfactory condition.

I tested the ventilation in several parts of the mine, but did not get a register with the anemometer; there were slight currents of air passing at intervals caused by the action of the ascending and descending cages, but no proper method of ensuring a constant current of air through the workings. I called the Manager's (Mr. Wilson's) attention to the upcast side of the shaft, where a small pumping engine and water tank are placed, not giving sufficient space for the ventilation to pass. I requested Mr. Wilson to remove the abovenamed tank and engine to the bottom of the shaft, or otherwise place them so as to allow a sufficient space for the ventilation to pass. This he promised to do.

I may state the above is a new colliery, commenced about two months ago, so the levels, and headings, &c., are not a great distance from the bottom of the shaft. Mr. Wilson desires a little time granted to enable him to make the necessary improvements in connection with the ventilation. He said in four weeks from date of inspection he would have the tank and engine removed from the upcast side of the shaft, and the ventilation made all right.

In conclusion, I beg to state, if the tank and engine referred to be removed, and a furnace or steam jet be placed at the bottom of the upcast, it will produce a plentiful supply of ventilation. About 30 men employed underground; distance from the bottom of the shaft to working faces, about 90 yards.

I received no complaints from workmen.

I have, &c.,
JAMES ROWAN,
Inspector of Collieries.

Seen, and Mr. Wilson written to, 14 February, 1884.—J.M., 14/2/84.

The Examiner of Coal-fields to Mr. W. Wilson.

Sir, Coal-fields Office, Newcastle, 14 February, 1884.

I beg to acknowledge the receipt of yours of the 12th instant, and forward you three copies of special rules.

2. In reply to paragraph 2, I have to request that you will have the matters complained of remedied in four weeks from the time of Mr. Inspector Rowan's inspection, in accordance with the promise you made him.

3. Have you removed the tank and engine to the bottom of the shaft or placed them so as to allow a sufficient space for ventilation to pass according to promise.

I have, &c.,
JOHN MACKENZIE,
Examiner of Coal-fields.
Mr.

Mr. W. Wilson to The Examiner of Coal-fields.

Sir, Zigzag Colliery, 12 February, 1884.
I expected you to send me according to promise the colliery rules; kindly forward as soon as possible, as I am now in fairly working order; got about thirty miners employed.

I have not got the air return quite up to the Act, as all the places are close to the shaft, but will have everything completed one month from date.

I have, &c.,
WM. WILSON.

Mr. James Rowan, Inspector of Collieries, to The Examiner of Coal-fields.

Sir, Esk Bank, 3 April, 1884.
According to instructions received I have inspected the Zigzag Colliery, and regret to state I found the ventilation not satisfactory.

The small engine and water tank referred to in my last report are removed a small distance back in the shaft where they were stationery, making a space about 9 square feet for the upcast ventilation to pass; also a small furnace has been built at the bottom of the shaft. I tested the air current in four different places in the main airway, but there was not a sufficient current going to work the anemometer; the only place I got a register was in the return airway immediately before the air current passed through the furnace, I got a register of 5,400 cubic feet of air per minute.

I showed Mr. Wilson (Manager), that nearly all the current was passing round the bottom of the shaft without going into the workings. On examining the working faces I found a large percentage of furnace smoke diffused through the workings caused by the midwall on the furnace side of the shaft being defective. I also examined the air stoppings, which consist of a mass of loose rubbish not sufficient to guide the ventilation into the working faces.

In conclusion, I beg to state, the midwall on the furnace side of the shaft is defective, and ought to be thoroughly repaired to prevent the furnace smoke from mixing with the downcast current of air, also that proper stoppings should be put in and the air current brought forward to the working faces. I am further of opinion that 9 square feet is not a sufficient space for the ventilation of the Colliery to pass through. Nevertheless if the midwall and stoppings are thoroughly repaired, this space may do in the meantime, seeing a new shaft has to be sunk to meet the requirements of section 12, sub-section 1, of the Coal Mines Regulation Act.

I have, &c.,
JAMES ROWAN,
Inspector of Collieries.

The Examiner of Coal-fields to Mr. W. Wilson, Great Western Zigzag Colliery, Esk Bank.

Sir, Coal-fields Office, Newcastle, 8 April, 1884.
In view of a recent report I have received from Mr. Inspector Rowan, on the Great Western Zigzag Colliery, and in accordance with the provisions contained in the 31st section of the Coal Mines Regulation Act, 1876, I hereby give you notice that you have failed to comply with sub-sections 2 and 4, section 12, of the said Act.

I have, &c.,
JOHN MACKENZIE,
Examiner of Coal-fields.

[Minutes on above.]

THE Examiner should give the Manager notice that he will, on a certain day to be fixed in the notice, visit the Colliery, and if he find that the rules have not been complied with, he will at once proceed to enforce the penalty.—H.W., 16/4/84.

Submitted. Approved.—J. P. ABBOTT, 17/4/84. The Examiner of Coal-fields.—T.C.B. (for U.S.), B.C., 18/4/84.

No. 2.

The Examiner of Coal-fields to The Under Secretary for Mines.

Sir, Coal-fields Office, Newcastle, 7 May, 1884.
In compliance with the instructions of the Honorable the Secretary for Mines on my letter of 8th ultimo, conveyed to me under your blank cover of the 18th idem, I beg to enclose copy of a letter I wrote Mr. Wilson on 27th April last, and to state, that Mr. Inspector Rowan having to visit the Colliery *re* hanging up of special rules, I instructed him to make a further report on the state of the ventilation.

2. I beg to forward Mr. Inspector Rowan's report, from which it appears that the provisions of the Coal Mines Regulation Act, 1876, are now complied with at that Colliery.

I have, &c.,
JOHN MACKENZIE,
Examiner of Coal-fields.

Seen.—H.W., 12/5/84.

[Enclosures to No. 2.]

The Examiner of Coal-fields to Mr. W. Wilson, Great Western Zigzag Colliery, Eskbank.

Sir, Coal-fields Office, Newcastle, 27 April, 1884.
I hereby give you notice, that on or about the 10th proximo, I shall visit the Zigzag Colliery, and if I find that the provisions of the Coal Mines Regulation Act, 1876, referred to in my letter of the 8th instant, are not then complied with at that Colliery, I shall at once proceed to enforce the penalty.

2. I have also instructed Mr. Inspector Rowan, who is now in the West, to make another early inspection, and report thereon.

I have, &c.,
JOHN MACKENZIE,
Examiner of Coal-fields.

P.S.—Have received no reply from you to my letter of 9th April, *re* hanging up of special rules.

Mr. W. Wilson to The Examiner of Coal-fields.

Sir, Zigzag Colliery, 30 April, 1884.
Yours of 28th to hand, and contents noted. I have had copy of special rules hung up at the Colliery, and the miners' attention drawn thereto. The rules have been hung up over three weeks.

Hope to see you next month.

I have, &c.,
W. WILSON.

Mr. James Rowan, Inspector of Collieries, to The Examiner of Coal-fields.

Sir, Eskbank, 2 May, 1884.
For your information, I have the honor to inform you that I have this day inspected the Zigzag Colliery, *re* defective ventilation.

2. Since my last inspection, on April 2nd, an improvement has been made in the ventilation, viz., several air stoppings are put in, the mid-wall overhauled, and the air current brought forward to the working faces.

3. I tested the air-current and got a register with the anemometer of 2,310 cubic feet of air per minute in one current. About eighteen men employed underground.

4. I may also state, a copy of the special rules are hung up in a conspicuous place at the mine, and the attention of the miners called thereto.

5. In conclusion, I beg to state, the spirit of the Coal-mines Regulation Act in the abovenamed colliery has been complied with.

I have, &c.,

JAMES ROWAN,

Inspector of Collieries.

Telegram from Mr. James Rowan, Inspector of Collieries, to The Examiner of Coal-fields.

Wollongong, 7 May, 1884.

ZIGZAG Colliery. The provisions of the Coal-mines Regulation Act complied with.

JAMES ROWAN.

Katoomba Colliery.

SCHEDULE.

NO.	PAGE.
1. Mr. G. Clark to the Honorable the Secretary for Mines, complaining of insufficient ventilation in Katoomba Mine, with minutes. 6 December, 1883	49
2. Telegram from the Examiner of Coal-fields to Mr. James Rowan, Inspector of Collieries, instructing him to inspect Katoomba Mine	49
3. The Examiner of Coal-fields to the Under Secretary for Mines, for copy of complaint <i>re</i> Katoomba Mine, with minute. 14 December, 1883.....	49
4. Mr. James Rowan, Inspector of Collieries, to the Examiner of Coal-fields—Report of inspection of Katoomba Mine. 15 December, 1883	49
5. The same to the same, reporting re-examination of Katoomba Mine. 1 February, 1884.....	50

Mr. G. Clark to The Secretary for Mines.

Sir,

Katoomba, 6 December, 1883.

Would you kindly inform the Chief Inspector of Mines to pay a visit to the mine of Katoomba, in regard to the air, as the place is in that sort of state that there is no air in it.

I have, &c.,

GEORGE CLARK.

P.S.—I hope you will not let it be known as to who was the informer.—G.C.

The Chief Inspector for the Western District. Mr. Inspector Rowan's report hereon forwarded for the Minister's information.—J.M., 11/1/84. The Under Secretary for Mines, B.C., 11/1/84.

From the Inspector's report it appears the proper quantity of air is sent into the mine, and that steps were being taken to perfect the distribution. The Examiner should see that the work is carried on with proper expedition.—H.W., 17/1/84.

Submitted. Approved.—J. P. ABBOTT, 18/1/84. The Examiner of Coal-fields, B.C., 19/1/84.—H.W.

The work has been completed, and the defective ventilation remedied. *Vide* Mr. Inspector Rowan's report herewith.—J.M., 4/2/84. The Under Secretary for Mines, B.C., 4/2/84. Seen.—H.W., 6/2/84.

No. 2.

Telegram from The Examiner of Coal-fields to Mr. J. Rowan, Inspector of Collieries.

HAVING got telegram at "Imperial," dated 7th instant, from Mines, saying that complaint has reached that office that supply of air in Katoomba Colliery is insufficient, come and see me "Hayles' Hotel," Blackheath, six train to-morrow morning. Bring anemometer and your last report, so that you may inspect it that day, and see me Saturday after inspection.

JOHN MACKENZIE.

No. 3.

Telegram from the Examiner of Coal-fields to The Under Secretary for Mines.

Blackheath, 14 December, 1883.

YOUR letters, dated 6th, *re* Usher's appointment, and telegram of 7th, *re* Katoomba ventilation, only received by me when happening to be at Mount Victoria yesterday. Please forward me copy of Katoomba complaint and Mr. Usher's address, so that I may write him and appoint some day next week.

J. MACKENZIE.

Forward information asked for.—H. W., 14/12/83.

No. 4.

Mr. J. Rowan, Inspector of Collieries, to The Examiner of Coal-fields.

Sir,

Esk Bank, Lithgow, 15 December, 1883.

By your instruction, I have carefully inspected Katoomba Colliery. I tested the air-current. Got a register of 3,000 cubic feet of air per minute in one current. This 3,000 cubic feet of air was well maintained through the workings, with the exception of two bords in the main cross-cut. Ventilation not very good.

Mr. Hepburn, Manager, showed me an air-passage he was driving and would be completed in about three days from date of inspection. This connection will bring the air-current up to the two bords above referred to. I went round every working face and inquired of every miner if he had any complaint to make about the ventilation. I received no complaint. About thirty men are employed in this colliery.

I have, &c.,

JAMES ROWAN,
Inspector of Collieries.

No. 5.

Mr. J. Rowan, Inspector of Collieries, to The Examiner of Coal-fields.

Sir,

Katoomba, 1 February, 1884.

By your instruction I have re-examined Katoomba Colliery.

I may state, the Manager has carried into effect the improvements promised on my last inspection, namely, the main cross-cut and heading are connected, and the air-current brought up to the two bords that were defective in ventilation.

I have, &c.,

JAMES ROWAN,
Inspector of Collieries.

Lambton Commonage Coal-mine.

SCHEDULE.

NO.	PAGE.
1. Minute of the Honorable the Secretary for Mines, that the Examiner of Coal-fields be asked whether there is a sufficiency of ventilation in Lambton Commonage Coal-mines, with minutes. 26 February, 1883.....	50
2. The Under Secretary, Department of Mines, to Messrs. Melville and Tighe, Ms.P., that the Examiner of Coal-fields has been asked to report on the charge of air being bad in the Lambton Commonage Coal-mine. 1 March, 1883....	50
3. The same to the same, reporting that, in order to purify the air in Lambton Commonage Coal-mine, an air-shaft had been commenced. 12 March, 1883.	51

No. 1.

Minute by The Secretary for Mines.

Re Deputation of Coal-miners at Newcastle.

26th February, 1883.

THE Examiner of Coal-fields should be asked to report whether the ventilation in the Lambton Commonage Coal-mine is sufficient, and whether men have to come out of the mine owing to the impure air.

J. P. ABBOTT.

The Examiner of Coal-fields, B.C., 28/2/83.—G.E.H. (for the U.S.) The Inspector of Collieries is requested to ascertain whether the ventilation in the Lambton Commonage Coal-mine is now sufficient, and say if men have had to come out of the mine owing to impure air. Also whether the defects complained of in his report to me of 24th January last, and which I wrote to the Manager about on the 20th ultimo, have been remedied.—J.M., 1/3/83. The Inspector of Collieries.—B.C., 1/3/83.

On the 21st ultimo fourteen miners came out of straight heading, Lambton Commonage Tunnel, on account of the air being impure in that heading. On the same day an air-shaft was started and is now down about 50 feet. Men have been employed at it day and night. The ground gone through has been hard—nearly the whole of it has had to be blasted. It is expected that the shaft will be through into the workings to-morrow (Saturday), when the defect will be remedied. The ventilation was much improved to-day, owing to a good breeze on the surface blowing directly into the mouth of main tunnel.—J.D., 2/3/83. The Examiner of Coal-fields, B.C., 2/3/83.

The Under-Secretary for Mines.—J.M., B.C., 3/3/83. Submitted.—H.W., 5/3/83. Approved.—J. P. ABBOTT, 10/3/83.

No. 2.

The Under Secretary for Mines to Messrs. N. Melville and A. A. P. Tighe, Ms.P.

Gentlemen,

Department of Mines, Sydney, 1 March, 1883.

Referring to the several matters brought forward by the deputation introduced by you to the Secretary for Mines on the 24th ultimo, I am directed to forward a copy of Mr. Abbott's decision in the matter of the ventilation of the Wallsend Colliery.

I am also directed to state that in Mr. Abbott's opinion the number of men allowed in a district is very clearly defined as being not more than seventy (70) men.

The Examiner has been asked to report upon the charge of the air being bad in the Lambton Commonage Tunnel.

I have, &c.,

HARRIE WOOD,
Under Secretary.

No. 3.

No. 3.

The Under Secretary for Mines to Messrs. N. Melville and A. A. P. Tighe, Ms.P.

Gentlemen,

Department of Mines, Sydney, 12 March, 1883.

Referring to my letter of the 1st instant, I have the honor to inform you that it appears, from the report forwarded by the Examiner of Coal-fields, that as regards the Lambton Commonage Tunnel some of the miners did, on the 21st ultimo, come out of the straight heading on account of the impure air in that heading.

That, on the same day, an air-shaft was commenced, which it was expected would reach the workings on Saturday last.

I have, &c.,

HARRIE WOOD,

Under Secretary.

Wallsend Colliery.

SCHEDULE.

NO.		PAGE.
1.	Mr. James Curley, Miners' General Secretary, to the Honorable the Secretary for Mines, calling attention to the defective state of ventilation at the Wallsend Colliery, with minutes and enclosures. 25 January, 1884	51
2.	The Under Secretary for Mines to Mr. James Curley, in reply to No. 1. 5 February, 1884	52
3.	Telegram from the Examiner of Coal-fields to the Under Secretary for Mines, for correspondence respecting complaint of ventilation at Wallsend Colliery, with minutes. 11 February, 1884	53
4.	Mr. James Curley to the Honorable the Secretary for Mines, <i>re</i> Mr. Inspector Dixon's report, with minutes. 13 February, 1884	53
5.	Mr. Inspector Dixon to the Examiner of Coal-fields, <i>re</i> Check Inspectors' reports, with minutes. 12 March, 1884	53
6.	The Under Secretary for Mines to Mr. James Curley, that all complaints should, in the first instance, be made to the Inspector. 20 March, 1884	54
7.	The Examiner of Coal-fields to the Under Secretary for Mines, enclosing copy of Mr. Inspector Dixon's report; also copy of notice served on Mr. J. Y. Neilson, Colliery Manager, with minutes. 18 April, 1884	54
8.	The same to the same, forwarding letter and telegram from Mr. J. Y. Neilson, in reply to notice served on him. 22 April, 1884	56
9.	The Under Secretary for Mines to the Examiner of Coal-fields, in reply to No. 7. 26 April, 1884	56
10.	The Examiner of Coal-fields to the Under Secretary for Mines, enclosing a further report from Mr. Inspector Dixon, also authority for inspection, with minutes. 8 May, 1884	56
11.	The Under Secretary for Mines to Mr. James Curley, that the Examiner of Coal-fields reports, defects complained of have been remedied. 15 May, 1884	57
12.	The same to the Examiner of Coal-fields, that the Honorable the Secretary for Mines approves of Mr. Inspector Dixon's report. 5 August, 1884	57

No. 1.

Mr. J. Curley, Miners' General Secretary, to The Secretary for Mines.

Sir,

Hamilton, 25 January, 1884.

I have the honor, by direction of the Executive Committee of the Miners' Association, and at the special request of the Wallsend miners, to again respectfully invite your attention to the defective state of the ventilation at Wallsend Colliery. This subject was brought under notice by deputation on November 27th of last year, and again by letter on December 1st. Upon the 11th December a report was promised on the subject, but up to the present date no further allusion has been made to the question, other than a reference to the Glebe Colliery.

The Honorable Minister's attention is again drawn to the enclosed Check Inspector's reports, numbered 1 and 2 respectively, and which are forwarded at the request of the miners concerned, who have expressed themselves with much surprise that no apparent action has been taken with a view to improve the ventilation of the mine. Trusting immediate attention will be given to the subject matter of complaint.

I have, &c.,

JAMES CURLEY,

Miners' General Secretary.

I wish to know what has been done.—J. P. ABBOTT, 28/1/84. Acknowledge and inform Mr. Curley.—J. P. ABBOTT, 31/1/84.

[Enclosure No. 1.]

Check Inspector's Reports.

Wallsend Colliery, 5 December, 1883,

Mr. T. Bamsfield's District.

Intake	Engine-bank	Cubic feet per min.
	26,790
„	Magpie and Donnolly's	8,360
„	B Pit Travelling Road	12,880
„	Swamp Oak	9,500
	Total	57,530

NOTE.—The figures following represent the velocity of air in cubic feet per minute, unless specified differently.

B Pit, Chinaman's Flat, Nos. 111 to 117.—With six men extra, the air-current registered 540 in the same place where we got 585 last month, but we found a current, two cut-throughs from this, registering 1,984, making a total of 2,524 for 14 men, 1 boy, 1 horse, giving each 157½. Thermometer, 76°.

Chinaman's Shaft, from Nos. 117 to 130.—The air-current is very unsteady, and the anemometer would not work on account of improvements at present going on at the bottom of the shaft, and a door is required to convey the air to first numbers on this split, and this will account for about 5,000 cubic feet per man, regularly registered, not appearing among the intakes. There are 24 men, 1 boy, and 1 horse on this split. Thermometer, 71°.

Magpie

Magpie and Donnolly's Flat, from Nos. 130 to 176.—The air-current is 8,360 for 70 men, 5 boys, 4 horses at Magpie, and 22 men, 1 boy, 1 horse at Donnolly's, giving each $81\frac{1}{3}$; but the men at Donnolly's receive only a small quantity of this air, as there are too many men on this split. Thermometer, 71° to 75° .

Lambton back and part of front headings, Nos. 179 to 215.—With 4 men extra, the air-current is 10,560 for 80 men, 7 boys, 4 horses, giving each $116\frac{2}{3}$. Thermometer, 76° .

NOTE.—There are too many men on this split, and we suggest a door be placed at the bottom of first heading, as the air is very bad from Nos. 180 to 190, and we think a general system of stoppering is necessary.

Lambton front heading, Nos. 216 to 256.—The air-current at main intake, off bank, is 6,240, which is supplemented with 520 at 246 cut-through, making 6,760 for 78 men, 7 boys, 4 horses, giving each $76\frac{2}{3}$. Thermometer, 74° to 78° .

NOTE.—There are too many men on this split.

	Cubic feet.
Upcast Main Furnace	34,560
" Left-hand split	14,400
" Right-hand split	19,080
Total	68,040

Mr. W. Willis's District.

Wallsend Colliery, 6 December, 1883.

Little Tunnel, Nos. 1 to 35.—The air is very unsteady, and the air-meter would not work. There are complaints about the air supplying Nos. 1 to 16. Other parts of this station there was a fairly good current. Thermometer, 74° to 76° .

No. 1 Tunnel, Nos. 59 to 76.—The intake registers 11,340 for 38 men, 3 boys, 3 horses, giving each $257\frac{2}{3}$. Thermometer, 74° .

Brookstown Shaft, intake Nos. 77 to 90.—The air-current registered 12,250 for 30 men, 4 boys, 2 horses, giving each a fraction over 340. Thermometer, 76° .

Cemetery Shaft, Nos. 91 to 104.—The air-current is very unsteady, and after various tests we found 2,040 for 29 men, 3 boys, 2 horses, giving each 60 cubic feet per minute. Thermometer, 75° .

Old water pit, Nos. 105 to 110.—Anemometer would not work. Thermometer, 76° .

Furnace upcast, 33,210 cubic feet per minute. Travelling road intake, 5,220 for Nos. 35 to 59, making 48 men, 4 boys, 3 horses, and giving each nearly 95 cubic feet per minute. This is supplemented with two small shafts, which will no doubt give the requisite quantity. Thermometer, 70° to 74° .

The travelling road is in fair order, and a stopping has been put in the stenton opposite No. 104 bord end, and there are no complaints about the timber supply.

JOHN SUMMERS, }
JAMES LEVER, } Check Inspectors.

Mr. W. Willis's District.

Wallsend Colliery, 9 January, 1884.

Little Tunnel, Nos. 1 to 24.—The air-current would not work the anemometer in any part of this branch of the works, and in the faces of Nos. 17 to 22 inclusive, the air is very light. Thermometer, 72° to 76° .

No. 1 Tunnel, Nos. 42 to 62.—The intake registered 10,880 cubic feet per minute for 40 men, 3 boys, 3 horses, giving each $236\frac{1}{3}$. Thermometer, 72° to 76° . And we would urge upon the miners to in no case interfere with the stoppings, as there is one between Nos. 48 and 49 broken through, simply to save a little travelling, at the expense of health; and we suggest any miner seeing another commit such acts to immediately report offender to Manager.

Brookstown Shaft, supplying Nos. 63 to 71.—The air-current is 9,500 cubic feet per minute for 22 men, 3 boys, 3 horses, giving each $351\frac{1}{2}$ cubic feet per minute. Thermometer, 73° .

Sneddon's Dog and Rat intake for Cemetery Flat, Nos. 72 to 90 inclusive.—The air-current is 3,740 cubic feet per minute for 36 men, 2 boys, 2 horses, giving each $93\frac{1}{3}$. Thermometer, 75° .

A trapper is needed at the far indoor, as the men in Nos. 83 to 90 inclusive, complain, with reason, about the air.

Old water pit, Nos. 91 and 92.—There is no air travelling near the men. Thermometer, 76° .

Travelling road intake for Nos. 25 to 42.—The air-current registered 9,000 cubic feet per minute for 32 men, 3 boys, 3 horses, giving each over 236 cubic feet per minute. Thermometer, 75° .

Furnace up-cast, 36,900 cubic feet per minute. Total intakes, 33,120 cubic feet per minute.

Mr. T. Bonsfield's District.

11 January, 1884.

Engine-bank intake.—25,380 cubic feet per minute.

Lambton front heading, Nos. 195 to 238 included.—The air-current is 6,120 cubic feet per minute, and at No. 227 bore end this is supplemented with 1,160 cubic feet per minute for 88 men, 7 boys, 5 horses, giving each 72 cubic feet per minute. Thermometer, 73° to 77° .

NOTE.—We again refer to too many men being on this split.

Lambton back and part of front headings, Nos. 157 to 194.—The air-current registered 10,560 cubic feet per minute, for 74 men, 6 boys, 4 horses, giving each a fraction over 125 cubic feet per minute. Thermometer, 76° to 77° .

Swamp Oak intake, 9,250 cubic feet per minute.

Furnace Upcasts—	Cubic feet per minute.
Main Furnace	38,880
Left-hand Furnace	18,000
Right-hand "	19,800
Total	76,680

Magpie and Donnolly's, Nos. 114 to 150 at Magpie, and Nos. 151 to 156 at Donnolly's.—The intake was 13,680 cubic feet per minute, giving each $138\frac{1}{3}$ cubic feet per minute for 84 men, 9 boys, 6 horses. Thermometer, 74° to 75° .

NOTE.—There are still too many men on this split.

Chinaman's Flat, Nos. 99 to 112.—The air registered 3,780 cubic feet per minute for 28 men, 2 boys, 1 horse, giving each 123 cubic feet per minute. Thermometer, 72° to 74° .

Chinaman's B Pit Flat, Nos. 95, 96, 97, and 98.—The air meter would not work, and after many attempts to find air supply, we could not get anemometer to work, and the air at present is very bad, and requires immediate improvement. Thermometer, 77° .

B Pit, travelling road intake.—7,840 cubic feet per minute.

JOHN SUMMERS, }
JAMES LEVER, } Check Inspectors.

No. 2.

The Under Secretary for Mines to Mr. J. Curley.

Sir,

Department of Mines, Sydney, 5 February, 1884.

I have the honor, by direction of the Secretary for Mines, to acknowledge receipt of your letter of the 25th ultimo, in which attention is again invited to the alleged defects in the ventilation of the Wallsend Colliery, and in reply thereto to invite your attention to my letter of the 28th ultimo, covering a report by Mr. Inspector Dixon on the matter.

I have, &c,
HARRIE WOOD,
Under Secretary.

No. 3.

See No. 1.

No. 3.

Telegram from The Examiner of Coal-fields to The Under Secretary for Mines.

Newcastle, 11 February, 1884.

PLEASE forward me to-night all the correspondence with respect to Miners' Secretary complaint, *re* Wallsend ventilation, with Inspector Dixon's report thereon.JOHN MACKENZIE,
Examiner of Coal-fields.

The Examiner of Coal-fields.—G.E.H. (for the U.S.), B.C., 11/2/84. Correspondence received to-day, and returned herewith.—J.M., 11/2/84. The Under Secretary for Mines, B.C., 12/2/84.

No. 4.

Mr. J. Curley, Miners' General Secretary, to The Secretary for Mines.

Sir,

Hamilton, 13 February, 1884.

I have the honor to acknowledge receipt of letter, dated 5th February, referring to ventilation See No. 2. of Wallsend Colliery, and drawing attention to a report from Mr. Inspector Dixon on the subject. The Executive Committee cannot regard the report of the Inspector as being anything like satisfactory. It is alleged that the ventilation was good in November, with the exception of a few matters of detail. The Inspector has not specified what he refers to as details; and if too many men and deficient quantity of air in various splits are to be considered as such, the Committee are of opinion the official interference of the Mines Department is required in a different manner to the present report.

The Inspector places great stress upon the large out-put, length of airways, falls, &c., but these are surely no reason why the management are justified in being behind the requirements of the Act. They are only so many proofs why uniformity should be maintained. If the Wallsend Colliery out-put is enormous, the Company have ample means at command. There are also natural facilities in connection with the mine that make it comparatively easy to remedy defects caused by falls. The shaft specially mentioned by the Inspector in his report would probably be sunk in three days by two men. The Committee drew attention to the Check Inspectors' report, and what it revealed concerning the ventilation of Wallsend Colliery. Subsequent to this report by the Inspector, other reports have been referred to by the Committee, all supporting, in the most substantial manner, the allegations made by them in the presence of the Minister. The Committee are not open to the charge of making "sweeping assertions" without inquiry, and as no reference is made by the Inspector in his report to the Wallsend Check Inspectors' report it must be evident it stands without any attempt having been made on his part to impugn it. The Check Inspector's reports do not deal with "occasional derangements of the ventilation," but the permanent standing violation of the Act. The Committee desire to state that it is their wish to see the suggestion of the Wallsend Manager, "with which Mr. Inspector Dixon quite agrees," carried into effect as early as possible, regarding a joint inspection of the Wallsend Colliery, to consist of the Examiner of Coal-fields, Inspector, Manager of Wallsend Colliery, and Check Inspectors of Wallsend, and of which they will expect notification.

It must, however, appear to the Minister that arranged inspections of this character are not likely to give satisfaction, and cannot take the place of ordinary inspections.

Wallsend miners, quite recently, have come out of the mine because there was not sufficient air for them to work in.

Reference is made to the Newcastle Company's Colliery, and the ventilation is described as being "first-class." A partial report of this mine was made by the Check Inspector on 30th January, 1884. This report has been forwarded to the Committee for consideration, and they observe that in No. 7 heading the anemometer would not register, although tried in three or four different places.

In a part of No. 6 district the air-meter would not work, owing to insufficiency of air. This district the Inspector speaks of as being difficult to ventilate, and if difficult to ventilate, and is not properly ventilated, yet it must also be very difficult for miners to follow their employment, and the sooner some permanent remedy is effected the better.

Mr. Inspector Dixon alludes to the past and present history of the mines in this district, and states "their present state will bear favourable comparison with any part of their past history, both regarding the quantity of air circulating and its distribution in the various parts of the workings." The Committee can only state that judging of the present state from reports which have been brought under their notice, they cannot do other than express their disappointment and dissatisfaction that the provisions of the Coal-mines Regulation Act, 1876, are not more faithfully enforced.

Trusting the Honorable Minister will deem this subject worthy of consideration,—

I have, &c.,

JAMES CURLEY,
Miners' General Secretary.

The Examiner of Coal-fields.—H.W., B.C., 3/3/84. Mr. Inspector Dixon for further report.—J.M., 8/3/84.

No. 5.

Mr. J. Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Sir,

Glebeland, 12 March, 1884.

I have the honor to acknowledge receipt of papers *re* the ventilation in the Wallsend and Newcastle Companies' Collieries.

In reply thereto, I beg to state that the matters complained of in the Wallsend Check Inspector's reports of November 5th and 6th, 1883, on Willis' side of the workings have since been remedied. In looking over the same report, on Bonsfield's side, I notice they (the Check Inspectors) give a result of 6,000 cubic feet of air per minute, for a total of 90 men, boys, and horses. On the 28th November, same month, I got a result of 9,240 cubic feet of air per minute for a total of 89 men, &c.

In

In the Check Inspection for 30th January, the result for the same split is given at 7,020 cubic feet per minute for a total of 102 men, &c., and in the second split in Lambton headings, 8,640 cubic feet per minute for 115 men, &c.

On the 1st February, I got a result of 9,600 cubic feet of air per minute in the first split for a total of 100 men, &c., or about 96 cubic feet of air per minute for each man, boy, and horse. On the same day, in the second split, Lambton headings, the result was about 11,550 cubic feet of air per minute for a total of about 115 men, &c.

On the 18th February, I again inspected the abovementioned splits, and in the first split the result was about 10,800 cubic feet of air per minute for a total of 77 men, &c., and in the second split about 10,850 cubic feet of air per minute for about 110 men, &c., being over 98 cubic feet per minute for each man, boy, and horse.

On the 4th December last, I wrote to Mr. Neilson about the extra men in the Lambton heading splits, and urging him to have another split made at once. This work was completed and another split made on the 20th of last month, and, also at my request, preparations are being made to form another split in the Magpie district, which, at the present time, has more men in one split than the Act allows; at the same time I beg to state that the last two results got by me in the Magpie and Donnolly's split showed the quantity of air to be more than the Act requires for every man, boy, and horse.

Regarding the statement made by Mr. Curley that "Wallsend miners quite recently have come out of the mine because there was not sufficient air for them to work in," I know nothing about this matter, as no complaint has been made to me officially or otherwise concerning it.

2. *Newcastle Company's Colliery*.—This colliery has again been referred to, and I again repeat my statement that according to the showing of the Check Inspectors in December last, the ventilation was first-class. I also made an inspection of the same colliery on the 22nd January last, and found the ventilation according to the Act in every working heading in the pit. I am therefore at a loss to account for the statements given by the Check Inspectors to Mr. Curley, as I believe the said inspection was made only about one week after mine.

3. In conclusion, I beg to state that in my opinion this method of doing business is not the correct one. What I mean is simply this, if the miners at any of the collieries have complaints to make concerning anything with which I have to do, I think it would be only common justice to me if they would communicate with me at once, either through the Lodge Secretary, General Secretary, or Executive Committee, which is composed of the three district officers. Then, if I failed to attend to the matter, the Honorable the Minister for Mines could be appealed to. I feel strongly on this point, and fail to see why I should not have the same fair play as an English Inspector, who, in every instance, is first appealed to in any matter concerning the health and safety of the miners, and, from my knowledge of the miners in this district, I believe they would endorse my views on this subject by a large majority.

I have, &c.,

JOHN DIXON,

Inspector of Collieries.

As I only lately returned from Wollongong to attend to matters requiring immediate attention including my annual report, I shall not be able to visit the Wallsend Mine at present. I therefore send the Inspectors' further report in reply to Mr. Curley's letter of the 13th ultimo, and I cannot help observing that if these complaints were made in the first instance to the Inspector, as suggested by Mr. Dixon, a great deal of time and trouble would be saved to all parties.—J.M., 13/3/84. The Under Secretary for Mines, B.C., 13/3/84.

The attention of the Miners' General Secretary may be invited to the suggestion that all complaints on the part of the miners be made in the first instance to the Inspector, and if not attended to by him they should then be forwarded to the Minister.—H.W., 17/3/84. Submitted. Approved.—J. P. ABBOTT, 18/3/84.

No. 6.

The Under Secretary for Mines to Mr. J. Curley, Miners' General Secretary.

Sir,

Department of Mines, Sydney, 20 March, 1884.

With reference to complaints as to alleged failure on the part of colliery owners in the Newcastle district to comply with any of the requirements of the Coal-mines Regulation Act, 1876, I have the honor to inform you that the Secretary for Mines is of opinion, that in all such cases any complaints on the part of miners should, in the first instance, be made to the Inspector of Collieries, and that if such complaints be not attended to by that officer they should then be forwarded direct to this office.

I have, &c.,

HARRIE WOOD,

Under Secretary.

No. 7.

The Examiner of Coal-fields to The Under-Secretary for Mines.

Sir,

Coal-fields Office, Newcastle, 18 April, 1884.

I beg to forward, for the information of the Honorable the Secretary for Mines, a recent report of Mr. Inspector Dixon's on the Newcastle Wallsend Colliery, and copy of a registered notice I have served on Mr. J. Y. Neilson, the Colliery Manager, for non-compliance with sub-sections 3 and 4, section 12, of the Coal Mines Regulation Act, 1876, and shall be obliged by your informing me what further action the Minister desires me to take in matter.

I have, &c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

At the end of fourteen days from date of his letter to the Manager, the Examiner should make another inspection, and if the defects have not been remedied he should take the necessary proceedings.—H.W., 22/4/84. Approved.—J. P. ABBOTT, 24/4/84.

[Enclosures

[Enclosures to No. 7.]

Mr. J. Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Sir,

Glebeland, 15 April, 1884.

I have the honor to report inspection of the Wallsend Colliery, as follows:—

1. *Willis's District, 9th instant.*

In the little tunnel I found the air good; there are about 32 men employed in this place. Front heading, from 19 to 24, there are 10 men, supplied with a current of air of about 3,500 cubic feet per minute from a small shaft.

From 24 bord to 32 the current of air was about 5,600 cubic feet per minute for 26 men, 2 boys, and 2 horses—total, 30. In the Brookstown shaft split there are about 28 men, 2 boys, and 2 horses—total, 32. For this number I got a result of about 3,150 cubic feet of air per minute, but at the same time found the current to be fluctuating, as there were times when the instrument would not work. There is, as a rule, a good result from this shaft, but at the time of my inspection the current of air seemed to be baffled. Please note.

Cemetery Split.

In this split there are about 62 men. At the far end of the split a new shaft has been sunk, which is known as the Foundry Shaft. At the time of my inspection the current of air from this shaft was almost nil. Hence the major portion of the split was being ventilated from Sneddon's tunnel, at the rate of about 7,800 cubic feet per minute. It will be seen by the above that the current entering this split is more than the minimum quantity for the 62 men, yet I am strongly of opinion that it has too much to do in this split after serving upwards of 20 men, &c., in Sneddon's workings, and certainly think it would be better to shut the air off from Sneddon's and get a current from the Foundry Shaft for the whole of the Cemetery Split. Please note.

Bonsfield's District, April 10th.—Lambton Front Heading, First Split.

In this split there are about 72 men, 4 boys, and 4 horses—total, 80, supplied with a current of air of about 10,000 cubic feet per minute.

Lambton Headings, Second Split.

In this split there are about 34 men, 2 boys, and 2 horses—total, 38; supplied with a current of about 4,000 cubic feet of air per minute. This air was not well conducted into the top heading, as a screen on one of the headings had been knocked down by a train of skips on the previous evening, and had only been put up temporarily, but the overman promised to have it put right at once.

Third Split, Lambton Headings.

The current of air in this split was about 10,710 cubic feet per minute for about 80 men, 4 boys, and 4 horses—total, 88. It will be seen that the current of air in this split is above the minimum quantity required by the Act, yet I would especially draw your attention to the fact that, although the men on this split were reduced to about 66 after the second or middle split was formed, yet I find that the manager has put more men in and brought the number up to 80. I certainly fail to understand this sort of work, in the face of all the vexation we have lately had in connection with the overcrowding of the splits in the Wallsend Colliery. Please note.

Maggie Split.

In this split there are about 42 men, but the current of air was only about 3,000 cubic feet per minute. Please note.

Donnolly's Split.

In this split there are about 70 men, supplied with a current of air of about 6,300 cubic feet per minute. Please note.

No. 1 Split, Chinaman's District.

In this district there are about 32 men, supplied with a current of air of about 16,800 cubic feet per minute. The three splits, as given above, are all ventilated from what is known as the Chinaman's Shaft, and, as a rule, there is a plentiful supply for every man, &c., employed in that part of the mine.

Yet it will be seen that there is not an equal distribution of the air got from said shaft, as I found both Maggie and Donnolly's short, while a current of about 16,800 cubic feet per minute was going into Chinaman's, for 32 men. The overman was with me when I got the above results, and I requested him (Mr. Maddison) to see Mr. Neilson that evening, if possible, and draw his attention to the state of things as I found them.

In the second split, Chinaman's or Cockroach, there are 8 men, 1 boy, and 1 horse. The current of air in this split is about 1,760 cubic feet per minute, which, in my opinion, is not an adequate amount to keep the working places sweet, as the current has a great distance to travel before it reaches the working places, and for part of the distance travels over water. Please note

The travelling roads are in good order, and a good supply of timber at the various stations ready for use.

In concluding this report, I desire to state that I did not see Mr. Neilson concerning the above matters, neither have I written to him, but leave the matter entirely with you to act on this report as you may think best. At the same time, I am of opinion that a letter from you to the Manager would cause matters to be rectified at once, for most of the things complained of by me in the above report can be remedied in a few days.

I have, &c.,

JOHN DIXON,
Inspector of Collieries.

The Examiner of Coal-fields to Mr. J. Y. Neilson.

Sir,

Coal-fields Office, Newcastle, 18 April, 1884.

In view of a recent report I have received from Mr. Inspector Dixon on the Newcastle Wallsend Colliery, and in accordance with the provisions contained in the 31st section of the Coal-mines Regulation Act, 1876, I hereby give you notice that you have failed to comply with sub-sections 3 and 4, section 12 of the said Act, in the third split, Lambton headings, and in Maggie and Donnolly's splits.

Mr. Dixon's report on them being as follows:—

"*Third split, Lambton headings.*—The current of air in this split was about 10,710 cubic feet per minute for about 80 men, 4 boys, and 4 horses—total, 88. It will be seen that the current of air in this split is above the minimum quantity required by the Act; yet I would especially draw your attention to the fact that, although the men on this split were reduced to about 66 after the second or middle split was formed, yet I find that the Manager has put more men in, and brought the number up to 80. I certainly fail to understand this sort of work, in the face of all the vexation we have lately had in connection with the overcrowding of the splits in the Wallsend Colliery.

Maggie split.—In this split there are about 42 men, but the current of air was only about 3,000 cubic feet per minute.
Donnolly's split.—In this split there are about 70 men, and supplied with a current of air of about 6,300 cubic feet per minute."

2. Mr. Dixon also informs me that he got unsatisfactory results in the ventilation in the Brookstown Shaft split, in which, as a rule, he had previously got good results.

3. That in the Cemetery split there are about 62 men. At the far end of the split a new shaft has been sunk, which is known as the Foundry Shaft, and that, at the time of his inspection, the current of air from the shaft was nil: hence the major portion of the split was being ventilated from Sneddon's tunnel, at the rate of about 7,800 cubic feet per minute. That it will be seen by the above that the current entering the split is more than the minimum quantity for the 62 men, but he was strongly of opinion that it has too much to do in this split, after serving upwards of 20 men, &c., in Sneddon's workings, and thinks it would be better to shut the air off from Sneddon's, and get a current from the Foundry shaft for the whole of the Cemetery split.

4. That on the second split (Chinaman's, or Cockroach) there are 8 men, 1 boy, and 1 horse. The current of air in the split being about 1,760 cubic feet per minute, which, in his opinion, is not an adequate amount to keep the workings sweet, as the current has a great distance to travel before it reaches the working places, and for part of the distance travels over water.

I have, &c.,

Sec No. 7.

Sir, Coal-fields Office, Newcastle, 22 April, 1884.
I beg to forward, for the information of the Honorable the Secretary for Mines, a letter and telegram I have this day received from J. Y. Neilson, Esq., with respect to the notice I served upon him on the 18th instant, referred to in my letter to you of the 18th idem, with respect to his non-compliance with sub-sections 3 and 4, section 12, of the Coal-mines Regulation Act, 1876, at the Newcastle-Wallsend Colliery, and asking to be informed what further action the Minister desired me to take in the matter.

I have, &c.,
JOHN MACKENZIE,
Examiner of Coal-fields.

[Enclosures to No. 8.]

Mr. J. Y. Neilson to The Examiner of Coal-fields.

Sir, Wallsend, 21 April, 1884.

Your favour of the 18th instant to hand, and contents duly noted.

In reference to your several queries, I shall reply at length in a few days, as your letter is so very strong, and your interpretation of the Act requires some consideration; and as I have a strong opinion of the justice of my position, and as the matter is likely to receive the serious consideration of other parties concerned, I will give you a detailed reply in a few days.

If you refer to the last Check Inspectors' Report on the mine you will find all things satisfactory, even to the miners.

I have, &c.,
J. Y. NEILSON.

Telegram from Mr. J. Y. Neilson to The Examiner of Coal-fields.

Wallsend, 22 April, 1884.

This morning I have made a thorough examination of Lambton headings, and find that my orders have been entirely disregarded in respect to No. 3 split. I promise you the matter will be all put right in seven days. I leave for Sydney to-night, and will be at the "Great Northern Hotel" at 10 p.m., and would like to see you.

J. Y. NEILSON.

Telegram from The Examiner of Coal-fields to Mr. J. Y. Neilson.

Newcastle, 22 April, 1884.

Your telegram received respecting No. 3 split, and promise to have it put right in seven days. Regret that I am unable to comply with your desire to see you at "Great Northern" 10 to-night.

J. MACKENZIE,
Examiner of Coal-fields.

No. 9.

The Under Secretary for Mines to The Examiner of Coal-fields.

Sir, Department of Mines, Sydney, 26 April, 1884.

Referring to your letter of the 18th instant, forwarding Mr. Inspector Dixon's report on the Wallsend Colliery, and copy of your letter to Mr. Neilson, the Manager of that Colliery, pointing out the defects in the 3rd split, Lambton headings, and in Magpie and Donnolly's splits, and I am directed to request you to be good enough, at the expiration of fourteen (14) days from the date of your letter to Mr. Neilson, to cause another inspection of the Colliery to be made, and if the defects referred to have not been remedied, you should take the necessary proceedings.

I have, &c.,
HARRIE WOOD,
Under Secretary.

No. 10.

The Examiner of Coal-fields to The Under Secretary for Mines.

Sec No. 9.

Sir, Coal-fields Office, Newcastle, 8 May, 1884.

Referring to your letter of the 26th ultimo, informing me that you were directed to request me, at the expiration of fourteen days from the date of my letter of the 18th ultimo, to cause another inspection to be made of the Newcastle Wallsend Collieries, I have now the honor to forward, for the Minister's information, a further report from Mr. Inspector Dixon, dated the 5th instant, from which it will be seen that Mr. Neilson has remedied the defects complained of, and that the provisions of the Coal-mines Regulation Act are now complied with.

I have, &c.,
JOHN MACKENZIE,
Examiner of Coal-fields.

[Enclosure to No. 10.]

Mr. J. Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Sir, Glebeland, 5 May, 1884.

According to instructions from you, I proceeded to Wallsend Colliery on Saturday last, 3rd instant, and made another inspection of the places complained of by me in my report dated 15th April last, and am pleased to be able to report that, for the most part, the matters complained of have been remedied, as the following will show:—

Willis's District.

1. In the Brookstown shaft split a steady current of air, of above the minimum quantity, is now supplied for the 32 men, &c., from a new shaft lately sunk to ventilate this split.

Cemetery Split.

2. The top end of this split is now ventilated from the Brookstown Shaft instead of from Sneddon's Tunnel. There are now only about 24 men on this split, part of which is ventilated from Sneddon's and part from the Foundry Shaft. I may here state that preparations are being made to shut the whole of Sneddon's air off and ventilate the whole of this split from the Foundry Shaft, as suggested by me, and I expect the arrangements to be completed this week. However, as it is, the matter complained of by me has been remedied, inasmuch as the air from Sneddon's tunnel is only supplying about 24 men in Cemetery split, instead of about 62, as before.

Bonsfield's

Bonsfield's District.

3. Lambton heading, 3rd split.—The number of men on this split have now been reduced to 68 instead of 80 men as reported by me on 15th April last.

4. Magpie back heading.—In this split the current of air was about 6,000 cubic feet per minute for about 42 men, being about 3,000 cubic feet more than I got on my previous inspection.

5. Magpie front heading and Donnolly's cross-cut.—As there has been some alteration made at the entrance to this split since my previous inspection, I could not get the whole of the intake air in one volume. But, judging from the result which I got on the front heading (about 5,000 cubic feet of air per minute), and from the amount of sealing through the framework of one of the bearing-up doors, I am of opinion that the total quantity of air going into this split was over 7,000 cubic feet per minute, for about 68 men. The air sealing through the door would go on to 12 men. I expect that the framework of this door will be plastered to-day, and the whole of the current sent down the front heading, then away through the whole of the split.

Cockroach District.

6. I found the current of air in this split to be about 1,920 cubic feet per minute for a total of 10 men, &c., being about 160 cubic feet per minute more than the quantity given in my previous report. Regarding this place, Mr. Neilson has decided to take the air from Chinaman's split to ventilate it, and shut the air off from the Ballarat Shaft which air has hitherto been supplying the Cockroach split.

This decision is heartily approved of by the men working in the above split, and Mr. Neilson gave me his promise that this should be done in a week, or less, if possible.

I have, &c.,

JOHN DIXON,
Inspector of Collieries.

The Under Secretary for Mines to The Examiner of Coal-fields.

Sir,

Department of Mines, Sydney, 26 April, 1884.

Referring to your letter of the 18th instant, forwarding Mr. Inspector Dixon's report on the Wallsend Colliery, and copy of your letter to Mr. Neilson, the Manager of that Colliery, pointing out the defects in the third split, Lambton headings, and in Magpie and Donnolly's splits, I am directed to request you to be good enough, at the expiration of fourteen days from the date of your letter to Mr. Neilson, to cause another inspection of the Colliery to be made, and if the defects referred to have not been remedied, you should take the necessary proceedings.

I have, &c.,

HARRIE WOOD,
Under Secretary.

Mr. Inspector Dixon to make another inspection on May 3rd, and report whether the defects complained of have been remedied.—J.M., 28/4/84. Seen.—J.D., 29/4/84.

Will make another inspection on May 3rd, and report whether the defects complained of have been remedied.—J.D., 29/4/84. The Examiner of Coal-fields, 29/4/84.

No. 11.

The Under Secretary for Mines to Mr. J. Curley, Miners' General Secretary.

Sir,

Department of Mines, Sydney, 15 May, 1884.

With reference to your letter of the 13th February last, respecting the defective ventilation in the Newcastle-Wallsend Colliery, I have the honor to inform you that the Examiner of Coal-fields has reported that the defects complained of have been remedied, and the provisions of the Coal Mines Regulation Act are now being complied with.

I have, &c.,

HARRIE WOOD,
Under Secretary.

No. 12.

The Under Secretary for Mines to The Examiner of Coal-fields.

Sir,

Department of Mines, Sydney, 5 August, 1884.

Referring to your letter of the 8th May last, covering a report from Mr. Dixon, an Inspector of Collieries, to the effect that the defects complained of in the case of the Newcastle-Wallsend Colliery have been remedied, I have the honor to inform you that the Secretary for Mines has approved of that report.

I have, &c.,

HARRIE WOOD,
Under Secretary.

BULLI COLLIERY ACCIDENT.

REPORT OF ROYAL COMMISSION.

To His Excellency the Right Honorable CHARLES ROBERT BARON CARRINGTON,
 Knight Grand Cross of the Most Distinguished Order of Saint Michael and
 Saint George, Governor and Commander-in-Chief of the Colony of New South
 Wales and its Dependencies.

MAY IT PLEASE YOUR EXCELLENCY,—

The Commission appointed to make a diligent and full inquiry into the cause of the explosion that recently occurred at Bulli Colliery, in the district of Illawarra, in this Colony, whereby many valuable lives were sacrificed, and also to investigate all the surrounding circumstances, in order to ascertain whether blame attaches to any person or persons, and if so, to report the person or persons to whom in our opinion the blame attaches; and, further, to make any recommendation affecting the general management, especially the ventilation of collieries, and to offer any suggestions which we may deem advisable for the amendment of the law relating to the working of coal-mines, especially with the view of preventing the accumulation of dangerous gases,—have concluded their inquiry into the cause of the said explosion, and, with the aid of voluminous evidence transcribed from the shorthand-writer's notes, have unanimously agreed upon the following description of the mine, the extent and nature of the explosion, particulars relative to the ventilation and conduct of the operations, the findings or conclusions, and the recommendations that they propose in order to ensure safety and proper discipline, also a *résumé* of the work accomplished and the evidence taken during the sittings. These, together with the documents and plans detailed on the margin hereof, the Commission have the honor to present to your Excellency.

A general meeting, at which all the then members of the Commission attended, was held in Sydney on the 5th day of May, when, considering the urgency of the inquiry, it was agreed to proceed to the scene of the explosion, and at once commence their investigations. Accordingly, they left for Wollongong by the evening steamer.

Early the following morning (the 6th) the Commission considered the question of the most suitable locale for holding their inquiries, when it was unanimously considered expedient to examine witnesses in Wollongong. Accordingly, having left one of their number to make suitable arrangements towards this end, the remaining members of the Commission at once proceeded to the scene of the explosion, and having by pre-arrangement met Mr. Inspector Rowan, they at once proceeded into the mine, and conducted by Messrs. Rowan, Ross, and White, narrowly inspected the mine and the damage to plant, with the object of arriving at an independent opinion as to the cause of the explosion, and the remedies to be applied.

For the purpose of ascertaining beyond all doubt the exact condition of the mine, and the position of the bodies as seen by the first search parties, the Commission considered it prudent to summon some of the volunteers who could best inform them on these subjects. Accompanied by Messrs. Jones, MacCabe, Evans, M'Kenna, and N. Hobbs, the Commission revisited the mine on the 7th, and again on the 9th, and minutely inspected the whole of the mine affected by the explosion, and were thereby enabled to form precise and independent opinions as to the cause of this unprecedented and deplorable accident.

Convenient premises having been secured, and most satisfactory arrangements made for taking evidence, the taking of evidence was commenced in public on the 10th, and was continued till the evening of Tuesday, the 17th May, when the Commission, having exhausted the evidence obtainable in the district, adjourned *sine die*.

Having by public advertisement inserted in the local papers, and by posters distributed throughout the district, invited the attendance of anyone desirous of giving evidence touching the inquiry, the Commission again assembled at Sydney, on the 6th day of June, and proceeded to Wollongong for the purpose of examining those who were prevented from giving evidence during the first sittings, and who desired to do so. In response to their invitation only five witnesses presented themselves.

On the 8th June the Commission, desirous of ascertaining by personal inspection whether any additional evidence was obtainable in support of an hypothesis put forward by the Examiner of Coal-fields as to the primary cause of the disaster, again visited the colliery, and having narrowly examined the main tunnel, and satisfied themselves upon this point, proceeded to Sydney and adjourned.

After the arduous and tedious work of transcribing the voluminous notes of the shorthand-writers had been completed, and having been requested to examine a man who emerged from or had left the mine a short time before the occurrence of the explosion, the Commission again assembled at Sydney, on Monday, the 27th day of June, and having examined Edward Kerrison, at once proceeded to consider the multifarious points referred to in the course of the inquiry, and during the inspection of the mine, and after serious and mature consideration of every point or circumstance of importance, they unanimously agreed upon the "findings" or conclusions given in the sequel.

In the work of inspecting the colliery, collecting and preparing information, taking evidence, and deliberating upon and considering this Report, the Commission sat during eighteen days, each sitting averaging five and a half hours, irrespective of the arduous and necessary work of preparing work in advance, and in this way expediting the work of the Commission. This occupied several hours daily, and could only be undertaken after the exhausting work of the day had been concluded.

The portion of the picturesque mountain range of Illawarra that surrounds a small bay about 8 miles north of the seaport town of Wollongong, and about 35 miles south of Sydney, and known as Bulli, has for the past quarter of a century been the designation of an important colliery and adjoining village.

The sandstone cliffs that are laved by the waters of the Pacific begin to recede at Coalcliff, and to the south of that exposed promontory the ocean beats against escarpments of the Lower Coal-measures, or on sand-covered beaches representing the ruins of solid strata, disintegrated by the operation of natural and ceaseless forces through untold time.

At

At Bulli a fringe of level land, about 1 mile in width, intervenes between the coast range and the beach, and this distance gradually increases towards the south. At Mount Keira, near Wollongong, the range has receded about 2 miles from the sea, and here it suddenly swerves to the west for a distance of 4 miles to Mount Kembla, when it again breaks to the west for 3 miles, from which point it curves to the south, and approaches the sea in the neighbourhood of Kiama and Jervis Bay.

In Illawarra the mountains rise to an average elevation of 1,000 feet, the prominent eminences of Keira and Kembla rising respectively to the height of 1,568 and 1,760 feet. The eastern declivities of this mountain range possess all the features of the Blue Mountains—sloping sides, covered with a luxuriant vegetation of semi-tropical flora, capped by perpendicular cliffs, fissured with numerous indentations, gullies, and ravines.

The cliffs that form a background, and give special character to the district, consist for the most part of the lower portion of a unique deposit, probably of Tertiary age, known as the “Hawkesbury Sandstones,” composed of inclined and horizontal beds of coarse, gritty, ferruginous sand and pebbles, of irregular and lenticular aluminous beds, enclosing boulders of transported rocks, the whole cemented by convoluted and segregated bands of hydrated iron ore, with embedded fragments of quartz. Some of these beds lie uncomformable on the older rocks.

These sandstones are intersected by regular joints or fissures, and they rest on peculiar reddish aluminous beds (that vary in thickness from 1 to 2 feet in the western to 10 to 15 feet in the southern or Illawarra Coal-field), that may be considered to mark the upper limits of the coal formation of New South Wales. Under this red aluminous bed is a considerable thickness of coarse sandstone, that towards the bottom becomes laminated and intermixed with bands of shale or bind, that overlie the upper coal-bed. This is succeeded by the other coal-beds of the series in regular sequence. These coal-seams, being separated by strata less resisting than the overlying sandstones, have yielded to the eroding action of climate and time, and crumbling, have formed the steep slopes that hide from view the outcrops of coal-seams and dividing strata.

The coast ranges under review are intersected by several lines or dykes of intrusive rocks. These seem to emanate from several centres of eruption. A cursory examination of the physical geology of the district is sufficient to convince the contemplative mind that in recent geological time it has been the theatre of one, if not two, eruptions of volcanic rocks. These, in a state of fusion, have been forced, in the lines of least resistance, through pre-existing rocks, as dykes; and over certain areas have (aided no doubt by conditions as yet obscure) been injected between the laminations of the strata, or into or below coal-seams. In other instances these igneous rocks have filled pre-existing crevices or rents, cutting through all the strata in the form of a wall or dyke. These intrusive rocks have apparently in some instances issued from crevices and flowed over wide belts of country, transmuting and crystallizing the older strata, or, from orifices, have poured in molten streams over certain areas. The rich alluvial bands of Illawarra have been formed by the decomposition of these eruptive rocks; and to this also may be referred the picturesque ravines and sombre crevices—even the very configuration of the scenery of the district is in large measure due.

The

The coal-seams of the Southern District are identical, although they have not been correlated, with the corresponding beds in the Western and Northern Districts. Taking Sydney as the centre of a vast mineral basin, the various beds gradually rise towards the north, and at Newcastle (65 miles north of Sydney) the lowest known workable coal-seam of the series approaches the horizon. In the Western District a coal-seam in the same stratigraphical position is extensively worked at Lithgow and Bowenfels. South from Sydney the beds also approach the horizon, and on the coast cliffs are seen to rise to the south-east. At Bulga, near Stanwell Park, about 26 miles south of Sydney, the strata are somewhat confused and disturbed by volcanic agencies; and at Clifton, about 35 miles from Sydney, the upper coal is seen on the cliffs, about 15 feet above the sea. Assisted by several faults south of Clifton, the coal-seams underlying the upper coal successively appear above the sea, and gradually recede into the coast ranges, still preserving their rise to the south-east. At Bulli the upper coal-seam is exposed on the cliffs, about 450 feet above the sea; at Mount Keira the altitude of the outcrop is about 550 feet; and at Kembla it is nearly 800 feet. A geological section showing the succession of the coal-beds in the Southern District is given in the Appendix, and marked No. 1.

Of the five workable seams in the Illawarra series only three have been operated upon. Of these the upper is by far the most valuable and important, and to it, practically, all the Southern Collieries have, since the first discovery of coal at Wollongong, ninety years ago, been confined. The coal-seam known as the 4ft. seam, and separated from the more important upper coal by about 30 feet of strata, has been worked to a limited extent at the Mount Pleasant and Bulli Collieries; while the bed of kerosene shale, representing the unique and valuable deposit of Hartley Vale and Joadja, in the Western Coal-field, has been found, and a small area worked about ten years ago, on the base of Mount Kembla.

The upper coal, to which operations have practically been confined, is one of the most important coal-seams yet discovered in the Colony, and has been extensively worked at the old-established collieries of Mount Keira, Mount Pleasant, and Bulli, and in later years at Clifton, North Illawarra, and Mount Kembla Collieries. In addition to these, operations have been resumed at Bellambi Colliery, while at Broker's Nose a new winning has been opened—in all eight collieries. The positions of these are marked on Plan No. 2, Appendix.

The upper coal-seam worked at the Southern Collieries, and known as the Illawarra or southern coal, is semi-bituminous, and is excellently adapted for steam purposes.

The following analysis of the coal as worked at Bulli Colliery will convey some idea of its value as a heat-producing agent:—

It has a somewhat singed appearance, is dull and non-lustrous, and, being friable, produces dust by attrition or handling.

The Illawarra Mountains may therefore be considered as a grand escarpment of carboniferous and other superimposed rocks, exposing in their mural sides the whole of the coal-beds and dividing strata of the series.

These coal-beds have a general dip or pitch to the north-west of about 1–25, and do not in the course of working give off much water. This, in part, may be due to the natural drainage affected by many miles of exposed beds, to the low rainfall, and to the comparative infrequency of faults, slides, or disturbances that penetrate the strata.

The upper coal-bed, as worked in the older collieries of the Middle Division (Mount Keira, Mount Pleasant, Bellambi, and Bulli), possesses some peculiar features deserving of notice.

In those collieries this bed measures from 8 feet to 10 feet in thickness of pure coal; while the roof is regular, the floor is subject to irregular waves, corrugations, or crumplings, known as “rolls,” or “houses.” Individually these “rolls” are localized; they begin, grow, and terminate within a short distance. Very rarely can the same “roll” be traced for any considerable length, but where one ends another may begin; nor do these maintain a uniform course—they are subject to infinite variations.

The following imaginary sketches represent a plan and section of two of these rolls:—

and may convey some idea of how these irregularities in the floor occur, and impede the working and winning of the seam.

These rolls are perplexingly irregular. As a rule the sides form steps, or “canohs,” as follows:—

As a rule the long diameter of these follows in a rough way the natural “reed” of the coal, but in actual working the bords or working-places are so directed that they shall run in the same course as the “rolls.” So frequently do these occur that in some parts a “roll” divides or separates every bord. (*Vide* plan and section, No. 2 headings.) These seriously interfere with the laying out and winning of a colliery.

colliery. Where nature has interposed so many obstacles it is next to impossible to conduct with regularity the operations for abstraction of the mineral. As a general rule the irregularities referred to do not cut off the whole thickness of the coal-seam; a few feet of coal are, as a rule, left above the apex of the ridge, and this facilitates the work of passing over and removing the irregularity.

Strange to say, these disturbances are solely confined to the horizon of the upper coal-seam. In the "4-foot" seam underlying the upper bed no such irregularities have been found, even under positions where the upper coal was particularly affected by these distracting occurrences. It is somewhat difficult to assign a cause for these curious irregularities of the floor. Suffice it to say that they manifestly point to violent eddies or currents that occurred prior to the deposition of the coal-seam. They are composed of aluminous schist and siliceous materials, evidently deposited by water.

The presence of so many rolls limit the scope by paralysing the scheme of the manager, and prevents a colliery being economically won by pursuing some of the regular and approved systems for recovery of the mineral that have found most favour in the principal colliery districts of the old world. Under such conditions no system can really be laid down and implicitly followed. Circumstances that cannot be anticipated must guide the manager from time to time in maintaining an output. The distance between bords, their width and direction, or the size of pillars, cannot possibly be predetermined. The "cut-throughs" that connect two bords—and which, according to the 4th sub-section of the 12th clause of the Coal Mines Regulation Act, 1876, must not exceed 35 yards from each other—cannot, on account of the uncertain occurrence of these rolls, be spaced with the mathematical precision possible in districts where the continuity of the coal-seams is unaffected, or as contemplated by the framers of the Act. It often occurs that to avoid driving these "cut-throughs" in stone at great cost the manager is obliged to place them at irregular intervals, and in positions where they can be driven in the greatest thickness of coal. The somewhat irregular and unique character of the workings in the Southern Collieries is principally due to the causes described.

Bulli Colliery was commenced about twenty-five years ago, by a Company incorporated and trading under the name of the Bulli Coal-mining Company (Limited). An adit was put into the coal-seam at the most suitable point of its outcrop, and driven towards the dip of the strata. The "bords" or "stalls" (working-faces) were broken off headings branching off the main tunnel at convenient intervals. The course of this tunnel is N. 75° W. The tunnel mouth is about 450 feet above the sea, and the coal, after being screened from the skips into larger waggons, is sent down a steep self-acting incline to the base of the mountain, whence it is conveyed in trains by a locomotive to a private jetty on the sea-coast, where it is shipped into the Company's steamers and conveyed to market. The colliery has for the long period of twenty-three years been under the management of Mr. Alexander Ross, who, from his earliest years (*vide* evidence), has followed the profession of mining in the large collieries in the north of England and in this Colony. Among his compeers he is considered a careful, cautious, even-tempered man, and a successful manager.

The colliery has maintained a large and steady output since its inauguration, and, from that period, the upper coal has been worked from under about 580 acres. (See plan, Appendix No. 4.) A very considerable proportion of this area is, however, represented by "rolls." The main tunnels have penetrated a distance of 93 chains = $1\frac{1}{6}$ miles from the adit mouth. The bords off the main tunnel to the north are
worked

worked up to a dyke of diabase that entirely cuts off the coal-seam, singed and charred for some distance to the south. This dyke appears to maintain a course almost parallel to the main tunnel, and about 100 yards to the north of that roadway.

The presence of this diabase has had a most disastrous effect upon this part of the coal-field owned by the Bulli Coal-mining Company.

To the north of No. 1 and the diabase dyke referred to, a new tunnel, No. 2, or B, has been driven from the outcrop (where for a few chains only the coal was of excellent quality) for a distance of about a mile under the mountain range, the coal-seam being charred in places to a natural coke; in other places partially burnt and useless. Behind the range a large outburst of igneous rock occurs, that supplies metal for the Government roads. The coal in this division of the field has evidently been burnt by the permeation of heated gases through the rough sandstone contiguous to the coal.

Two varieties of igneous or intrusive rock seem to intersect the southern coal-field—dolerite and diabase.* Of these the dolerite appears to be the oldest, and it is curious to observe the change that is effected on and by this intrusive rock when in contact with carboniferous strata. In presence of coal-measures it assumes a cream colour, and rapidly decomposes, the coal being burnt to a cinder in the neighbourhood of the point of contact, and the shales altered to hornstones. The diabase dykes, on the other hand, do not exhibit these phenomena; and in an adjoining colliery the older dolerite is pierced by a dyke of recent diabase. Both of these, when compared with the coal-measures, are of recent age.

The colliery of Woonona, to the south of Bulli, and that of Bellambi, 3 miles distant, both contain areas of burnt or cindered coal; so that the old Bulli Tunnel (No. 1 or A) has been working a wedge of good coal between areas of country under which the upper coal-seam has been more or less destroyed.

The intrusive dyke to the north of the old tunnel under review threw down protuberances or arms, some of which approached, and at least two of these crossed, the line of the tunnel. (*Vide Appendix 4.*) Through these the main road has been carried at great expense.

On account of the old western sections of the workings becoming exhausted it became necessary, about three years ago, to obtain additional land. In consequence a lease was obtained from the Government of coal in the Hill End District.

To work this coal the main tunnel was advanced through a wide branch of the diabase dyke that stretched down from the north; at the same time a branch bifurcating from the main tunnel, at a point about 1,300 yards from the entrance, was pushed on to open up the new coal-field at a point further south than the main tunnel.

The projections of intrusive rock encountered in the main tunnel terminated before reaching the Western Road, but the coal in advance of the position of this intrusive rock in the Western District is much reduced in thickness, and is somewhat cindered or singed. In this section no marsh or light carburetted hydrogen gas is or ever has been given off.

About two years ago the mine or roadway that was being carried through the diabase fault in the line of the main tunnel touched the coal. A considerable quantity of gas (probably "fire-damp," or light carburetted hydrogen or marsh gas)

issued

* Dolerite is a basaltic rock, composed of Labradorite spar and of augite, and is a typical trap-rock. Diabase is a recent rock, a basalt, and is composed of silica, alumina, sesquioxide of iron, and a little lime.

issued from the face, and forced the workmen to retire.* The gas was removed by means of bratticing† carried into the face of the mine; and this was continued until a separate return way had been obtained (*vide* Appendix No. 45) through the intrusive dyke.

The issue of gas from coal contiguous to or from a fault is no uncommon occurrence in mining; and special emphasis is laid on this circumstance because of the almost perfect immunity that Colonial collieries have hitherto enjoyed from the presence of marsh or light carburetted hydrogen gas. It is extremely difficult to discover how much gas really did issue from this roadway at this time. Considering that the ventilating current was at that period weak, the Commission are inclined to think that the quantity of gas was even then insignificant in amount.

As gas was still given off, safety-lamps (Davy) were issued to the whole of the workmen, and were used until the beginning of the current year, when, on account of a material improvement in the ventilation of the colliery, a change was made, to be hereafter referred to. In consequence of the presence of gas and the use of safety-lamps this part of the mine was known as the "gassy section."

So far as the Commission can discover, the provisions of the 7th sub-section of rule 12, Coal Mines Regulation Act, referring to safety-lamps, was adhered to up to the cessation of work, about August of last year, when, from a disagreement with the workmen, the mine was closed for some months.

The main tunnel was continued into the coal inside the intrusive dyke, and after a return was obtained a double road was pushed rapidly into what was virtually a new coal-field, to attack the coal leased from Government at a point 374 yards to the north of western heading.

With the object of keeping up the output, a pair of headings, Nos. 1 and 2 (*vide* Appendix 4), were broken off about 20 yards inside the dyke and driven in a north-westerly direction. These headings are straight, and are separated by a pillar of coal 7 yards thick, and have been driven 232 yards from the main tunnel. Both of these "headings" from the first gave off gas; both were broken off the main tunnel or intake; and to maintain a circulation of air a single trap-door was placed on the main tunnel between them. This door being closed intercepted the air current and directed it up No. 1 heading, thence it passed through the last cut-through or "stenton" to No. 2, and circulated or coursed down to the main tunnel.

These headings crossed over numerous "rolls" (*vide* plan, Appendix No. 5), their general trend being N.E., and by referring to the plan (Appendix No. 5) it will be seen that one of these almost intervenes between every bord. A horizontal section of No. 2 heading is shown by the following sketch:—

Ideal section of No. 2 Heading from Tunnel to Face.

The

* It may be pardonable for the Commission to state that "light carburetted hydrogen gas," or, as it is sometimes called, "olefiant gas," or ethylene—the "fire-damp" of miners—is composed of two atoms of carbon and four of hydrogen, and is represented by the chemical symbols C_2H_4 or CH_2 ; while methylic hydrogen—"marsh gas"—a much quicker and more sensitive gas, is represented by the symbols H_4C , being composed of four atoms of hydrogen and one of carbon.

Both of these natural gases require the admixture of air in proportion to their chemical composition before an explosion, by the application of a naked light, is possible. In the case of ordinary "fire-damp" it has been found that nine parts of air to one of gas forms the most explosive mixture.

† Bratticing is an artificial division of an airway or underground road. This may be effected by means of planking, canvas, or corrugated iron.

The stentons (openings for air) between the headings have, so far as possible, been driven in the spaces between the rolls, where coal existed; but in some instances the two headings have been connected on the top of rolls. These appear to "Stentons," have been closed by packed walls of stone, backed by rubbish, and were, so far as the Commission could discover, secure and tight.

Bords have been broken off both headings, and are shown on the plans Appendix Nos. 4 and 5. annexed.

Prior to the strike the workmen employed in the bords, as well as in the headings, used nothing but safety-lamps, and these appear to have been carefully locked, in accordance with the provisions of the 7th sub-section of clause 12, Coal Mines Regulation Act. The Commission believe that no considerable amount of marsh gas was given off from these bords. The testimony of Mr. Inspector Rowan was most decided upon this point (*vide* Questions Nos. 5,070–5,089); and his accurate observations have infinitely more weight with your Commissioners than the statements of witnesses of less experience and intelligence, some of whom, when under examination, did not create a favourable impression. Before extending the rope haulage into this district it became necessary to straighten, heighten, and widen the original road.

About 80 yards from the adit mouth the road to the old Western or "slacky" section branches off to the left. The main tunnel may be said to commence at this point. It has been driven through the old pillars and rolls, and across the bords which have been built up. Heavy sets of strong timber were placed at short intervals to secure this passage. About 4 feet of aluminous sandstone bands overlie the coal-seam, and intervene between it and a thick conglomerate post. These sandstone bands are liable to "make" or separate from the conglomerate on exposure to damp air, and had before the explosion, over a considerable distance of this roadway, so separated and sagged down upon the timber sets referred to. From the bifurcation of the Slacky Road the new main tunnel began to rise towards the W.N.W., and continued so to rise for a distance of 1,170 yards, at an average pitch of 1 in 20. This part of the road was worked by a self-acting incline.

The coal was brought from the Western, or from the Straight-in, or Hill End, or gassy section, by means of tail-ropes worked by an engine placed at the mouth of the adit, to the out-bye side of the Western Junction, where a long "flat" or siding was arranged. From this point the trains were sent down the incline to the foot, at the junction of the Slacky Road, where, being disconnected from the main rope, the skips ran by gravity to the screens; a horse, attended by a boy, being required to drag the empty skips to the Slacky Road, for attachment to the incline rope.

The amount of gas given off prior to the strike (September, 1886) seems to have been insignificant, and did not, on the occasions when a thorough examination was made by the Inspector, call for any special mention by that painstaking official. Thus, Mr. Rowan, on 2nd September, 1886 (Appendix 6), reports as follows:—"Hill End District.—Thirty-six men and horses are employed, and supplied with 3,600 feet of air per minute. The miners in this division are working with safety-lamps, as the coal gives off a small portion of fire-damp, &c." * * * "I carefully examined every bord with a safety-lamp, but in no case did the fire (meaning gas) explode in the lamp. I also asked the miners if every care was taken. They said they believed so, and that the deputy made several inspections during the day."

The last paragraph, repeated in Mr. Rowan's evidence, is in strange contrast to the statements of several of the witnesses (*vide* Questions ———), yet who admitted that they never did complain to the Inspector or to any official. On the 22nd December, Mr. Rowan, in his report, remarks, "this is the division that used to generate fire-damp, and where the men, when working, had locked safety-lamps."

For some time it had become apparent to the management that the motive column produced by a furnace at the surface was insufficient to ventilate extensive workings, and overcome the drag occasioned by the great length of rubbing surface over which the ventilating current was obliged to pass. In short, the ventilating power had reached its maximum—it could do no more—and this was insufficient for the requirements of new and distant sections of the colliery, from which gas was or had been given off. No more than 12,500 ft. of air could be circulated in all the districts up to the cessation of operations about September, 1886.

For these reasons an air-shaft had been commenced on a convenient part of the mountain slopes over a point of the Slacky Road workings (return way) about 43 chains from the adit mouth. (*Vide* plan, Appendix No. 4.) This shaft is over 300 ft. deep. A large and excellently constructed furnace—fired from the end and both sides—was built, and this work was reported by the Inspector (Mr. Rowan) as being finished in his report dated 22nd December, 1886. (See Appendix No. 6.) The effect of this new furnace upon the ventilation of the colliery was—by increasing the grate surface, and *caeteris paribus*, the motive column—to cause a circulation of 34,000 ft. in the districts where not more than 12,500 ft. could be passed before; and in the Hill End section from 12,000 to 13,000 ft. circulated, where, prior to the new furnace being started, only 3,600 ft. passed. (*Vide* Report, Appendix No. 6.)

This furnace is surrounded by a large area of high and wide bords, and at the date of the accident three main returns passed into it.

The returns coursed among the old bords, and considerable quantities of air scaled through and ventilated the abandoned workings.

The adequacy of these returns to circulate a large quantity of air is shown by the results of a minute record of the ventilation taken by Messrs. Rowan, Dixon, and Evans, at 9:30 a.m. on the morning after the accident, and which was as follows:—The Western return was passing 44,290 cubic ft.; the Hill End return was passing 37,410,—making a total of 81,700 cubic ft. And again, on the Monday following the accident (the 27th), the following quantities were found passing:—Western return, 59,740; Hillend, 23,635,—equal to a total of 83,375 cubic feet per minute.

The course of the ventilating current is shown by arrows on the plan, Appendix No. 4, and is as follows:—The current entering the adit mouth divides at the bifurcation of the Slacky Road; the main portion passes along the tunnel, and up the self-acting incline; the divided portion passes along the Slacky Road for 23 chains=506 yds., where a door (*vide* plan No. 4) was placed to prevent the current passing straight to the new furnace. This door directed the current to the right, and it passed up a cross-cut road known as the "Horse Road," and joined the main current passing up the incline, about 25 chains from the entrance. Stoppings (or walls) built of stone from the rolls, backed by small coal, confined the current of air to the main road. At the bank-head, or top of the incline, the road divides; the
left-hand

left-hand road is the main hauling road to the Western section, which is directed so as to avoid the edge of one of the basalt dykes already referred to ; while the straight road, or Main Tunnel, is the hauling road to the Hill End section. A single door, with a regulator, or sliding shutter (*vide* plan No. 4), was fixed on the Western Road, a few yards inside the Junction. This door is kept shut, but the regulating shutter permits the quantity of air required for the Western section to pass through it and along that road.

The remaining portion of the air-current passed along the main tunnel until it was arrested by a single door placed between Nos. 1 and 2 headings. (*Vide* plan, Appendix No. 4 and 5.) Another door was fixed in a diagonal road that connected Nos. 1 and 2 headings near to the bottom, as per sketch and plan, No. 5 Appendix.

The object of this door was to direct the whole of the air-current up No. 1 heading, scaling into the bords broken off that road, and arriving at the furthest up stenton, it passed through that opening to No. 2 heading.

These stentons, or openings between two parallel roads, are necessary to permit the ventilating current to circulate ; and, by the 4th sub-section of the 12th clause of the Coal Mines Regulation Act, these must be spaced not more than 35 yards apart. To prevent any leakage of air, and consequent diminution of the current, where it is required at the face, each stenton, as the succeeding one is finished, is stored up with rubbish and the face built with stone, and, if necessary, plastered, to make it impervious to the passage of air.

Having passed through the last stenton, the air descended No. 2 heading, a portion scaling into the working-bords that have been broken off that road, and passing through the cut-throughs or openings between the bords the two currents join and enter the main tunnel. Inside the door (marked on plan, Appendix No. 5); and, passing towards the face, the current was again arrested by a door (marked on plan) fixed between Nos. 3 and 4 headings. This door, in like manner, directs the current up to the face of No. 3, which has been driven about 60 yards from the tunnel, and passing through the stenton courses down No. 4 heading and into the main tunnel face. It then ventilated No. 5, or the face of the main tunnel, and passed down to No. 6—a new heading just broken off to the dip,—and from thence, having performed its circuit, it coursed along the return, marked with a black arrow. It then circulated through the headings marked (B) on plan No. 5, and passing through the intrusive dyke it followed the course indicated by arrows. This part of the return is capacious and in good travelling condition. Before coming to the Western Road a door was fixed. This door permits the passage of the wastemen or officials, but directs the effete or fouled air to the left, where it passed up an incline road, and over an “air-crossing,” or a bridge constructed of thick planks of timber, it was conducted above the pure intake air passing along the Western Road, and entering the old workings was drawn into the new furnace referred to.

It may be mentioned that from the air-crossing described, although there was ample space for the free passage of an abundant ventilating current, yet from the tender state of the bands of stone under the strong conglomerate roof, many falls had

had occurred in the abandoned bords, and it was travellable with difficulty. Scaling, as the return air did, through several old bords, ample space for the passage of almost any quantity of air was afforded, although the occurrence of falls would render the passage of men a work of some difficulty. This condition of the returns did not, it would appear, escape the notice of the Inspector, who, in his report dated 22nd December, 1886 (see Appendix 6), refers to his inability to pass through the return airway, when Mr. Ross, the manager, promised to put it in order when the strike was settled. On the 2nd of March, 1887, Mr. Rowan reports as follows:—"On examining the return airway I found that heavy falls of roof had taken place. The falls were so heavy I could not make a passage through. I drew the manager's attention to this matter. He stated that he had three shifts of men working making a new aircourse, and the same would be kept working until a proper recognized airway was made from the working-faces to the ventilating furnace. As I formerly reported, a number of these falls took place during the recent strike."

The Manager had not attempted to resile from this promise, and at the time of the accident the overman White, with one Cavill, was visiting this road in the hope of calling through to the men working from the western side. The position of White is shown on plan No. 4, and is marked by (c). The falls through which the overman was attempting to "call" or "knock" saved the life of him and his companions, while the men on the other or western side were lost. This return was at the date of our inquiry so far cleared as to permit men to travel (*vide* Ross's letter, 1887).

The doors (described) that were fixed in the main road were single, and, while trains of skips were not passing, directed the ventilating current. During the passing of trains these doors remained open, and at that time partially disorganized the air-current. To prevent delay in closing or damage to the doors, attendants (trappers) were provided. These doors are fixed on main roads. It is not uncommon to arrange double doors so that one is at all times closed, and in this way the regularity of the ventilating current is maintained. Where long trains of skips are hauled by machinery it is often very difficult to duplicate the doors. In the case of Bulli the length of trains would have necessitated their being placed 160 feet apart. This, under the circumstances, would have been impossible, and the practice is not pursued in any Australian colliery.

From calculations hurriedly made during the examination of some of the witnesses (*vide* Mr. MacCabe, Question 3871) it was apparent that the doors did not require to remain open more than about twelve minutes during each day, or more than half a minute on each occasion of the passing of a train. Some days before the accident the overman found the door between Nos. 1 and 2 headings propped open, and for certain reasons accused a witness (James Crawford), who was then a deputy, of having done so. With this exception, the Commission have no reason to think otherwise than that these doors were carefully attended to, and that the opening of them did not seriously interfere with the ventilation.

It will be seen from the foregoing description that the system of ventilation employed at Bulli was a "sweeping" one, consisting of one undivided current for each section. The enormous capacity of the bords, compared with that of portions of the tunnel, precluded the possibility of any marked current at the working-faces. The current entering No. 1 heading was permitted to scale into the bords, but was
not

not directed thither by any screens or other devices. The current was not directed into the face of the heading in advance of the air by means of fanners, air-pipes, or by brattice, *i.e.*, a temporary division in the roadway permitting the air-current to pass up one side and to return on the other.

It will be observed by referring to plan No. 5 (Appendix) that the first two bords off No. 1 heading had been worked back to the dyke, and that one of these bords had been built up or stowed full of rubbish. These are marked on the plan (a). None of the other bords had been worked more than 36 yards from the heading, and only Nos. 3, 4, 5, and 6 bords had been connected by a cut-through. In No. 2 heading the same remark applies. The bords had only been driven sufficiently to permit of the four lowest (nearest to the tunnel) being connected by cut-throughs. In Nos. 3 and 4 headings only two bords had been broken off.

The Hill End section was thus to all intents a perfectly new coal-field, separated from the older portion of the colliery by the dyke described and shown upon the plan. This natural barrier prevented the older workings from draining off the gas that is probably given off more or less by every colliery, especially those tapping untouched or virgin coal-fields. The numerous "rolls," likewise, had a tendency to imprison the natural gases, and to cause them to exude when these natural barriers were exposed. There was no extent of workings opened up. The men were working close to the heading. No room existed for the dissipation of force in event of an explosion; and to the limited area of ground opened up the Commission ascribe the great loss of life that occurred.

The Commission have some doubt as to whether any gas exuded from the coal in the working-bords off Nos. 1 and 2 headings. They are convinced that if any was given off it was in minute quantities, and soon after the section was opened up. They are, however, satisfied that Nos. 1 and 2 headings, going, as they did, in advance of the bords, crossing the rolls, and opening up new ground, always did give off more or less gas. Being the highest point of the whole underground workings they were the most likely spots for gas to accumulate, because of its low specific gravity when compared with that of air.

The evidence of the witnesses examined is most conflicting upon the quantity of gas given off in this section. Excepting Nos. 1 and 2 headings, the Commission are inclined to accept the testimony of the only trustworthy authority that submitted themselves for examination—Mr. Inspector Rowan—who, although his visits were frequent, yet found no amount of gas in this section, and the minute examination of the colliery by the Commission confirms this. No gas whatever was detected by them in any of the bords off Nos. 1 and 2 headings, and only in the face of these headings. The evidence of the Manager, Mr. Ross, who did not often inspect the workings, and of his overman, Richard White, points to the presence of small quantities of gas only. Several of the witnesses, some of whom have not worked in the mine since the strike, and who evinced a considerable amount of feeling, described the gas as issuing from "blowers" or "hummers" with a noise that could be heard a considerable distance off; that they were supplied with lamps that had no gauze. This startling statement emanated from men who had no extensive knowledge of mining, or any previous experience of fire-damp. The statement so confidently sworn to as to the condition of the safety-lamps by Wm. Becton and Noah Hobbs was indignantly denied by the old deputy, James Crawford (Question 3575.)

In

In other respects the statements of these witnesses were not borne out by those of calmer, more intelligent, and truthful men. The Commission have evidence of a small blower in No. 1 heading from whence gas issued for some weeks into which a pipe was fixed. It, however, appears to have issued with no great force.

The evidence referred to portrayed the alleged condition of affairs prior to the cessation of work in September, 1886.

Before the new furnace started the whole of the men employed in the Hill End section worked with safety-lamps. These were locked, the lock, as is the case with the majority of Davy's lamps, consisting of a screw. The overman alone kept a key wherewith, at an appointed station, he could open and relight a lamp that had been extinguished. This is a precaution that has no great value, seeing that such lamps can be unlocked by a nail, a strong pin, a knife, or other instrument that the most strict disciplinarian could not object to being introduced into a mine. Under such circumstances the security afforded by a "locked Davy lamp" is to some extent illusory.

This section of the workings was, in accordance with the provisions of the Special Rules, No. 4 (but this rule does not refer to the presence of "fire-damp"), inspected by a competent person before the men commenced their daily operations.

Before the new furnace was started, and while no more than 3,500 feet of air circulated, safety-lamps were used in every working-face in the section.

When the furnace was completed, and the quantity of air increased to 12,500 feet, and no gas was given off in the bords, the use of safety-lamps where gas was given off, at least in small quantities, was confined to the winning off or "fast" headings Nos. 1 and 2, 3 and 4, 5 and 6. In the ordinary working-faces open lights were used by the workmen.

It will thus be observed that the use of safety-lamps was, since February of this year, confined to the leading winning off or "fast" headings going in advance of the ordinary bords.

It would appear that the provisions of the Act with reference to the use of safety-lamps (7th sub-section, clause 12, Coal Mines Regulation Act, and No. 16 of the Special Rules) were not, since February 7, 1887, complied with, although this circumstance may have been unknown to the Manager. The provisions of the 4th Special Rule dealing with danger-boards were, however, complied with. We find that "danger-boards" were fixed at the last "stenton" in a conspicuous position. Beyond this no naked lights were permitted. It was clearly proved that wheelers (the lads whose duty it was to remove the loaded skips and return empties to the face), who worked with naked lights, were in the habit of leaving their lamps on the ground or hanging to the post supporting the danger-board; and after the explosion one of the search parties actually did find an ordinary lamp hanging on the prop supporting the danger-board in No. 1 heading, the solder being fused into beads or globules.

The result of ventilating by the system described was as follows:—The pure intake air sweeping up No. 1 heading, and diffusing through the bords, would of course take up and absorb any gas that existed in this part in quantities too minute to give any indication on a safety-lamp. At the face of No. 1 heading it would remove whatever gas existed within its sweep, or that had rolled down towards the
stenton

stenton. The quantity of gas so liberated and removed would be variable, and probably in comparison with the large current of air was insignificant. Partially fouled the current passed from No. 1 to No. 2, where the amount of gas given off probably exceeded the quantity given off from No. 1. Fouled by the gas from these headings, instead of being sent direct into the return, it was circulated, and supplied the bords off No. 2, which were really in the return way. The workmen in these bords, however, worked with naked lights. From this the same current supplied Nos. 3 and 4 and 5 and 6 headings.

The Commission are convinced that, although practically no gas was given off *in these bords*, the practice of working with naked lights after the intake air was more or less fouled by the gas exuding from Nos. 1 and 2 was, in the absence of bratticing, or some means of sweeping off the gas as it escaped from the coal, reprehensible. In the absence of bratticing, the space between the face of these headings and the last stenton in advance of the ventilation must have been a magazine, so to speak, for the stowage of gas. At all events, under the circumstances of this section, it would have been better practice to have passed the ventilating current over the main tunnel direct into the returns without requiring it to do duty in the ventilation of the other headings. Some such practice would have obviated the necessity for doors on the main roads, and reduced the risk of danger to a minimum. The Commission are aware that the absence of this latter precaution did not (in all probability) cause or contribute to this accident; but it betrayed an absence of forethought, or of erudition and skill in dealing with gas, that ought not to have been displayed by a manager or overman of the long experience of either Mr. Ross or Mr. White.

The arrangement for firing shots in this section was unusual and unsatisfactory. The Manager appears to have given orders which, if carried out, would have insured a measure of safety; but he appears to have so seldom visited this district with a critical eye to see whether his orders were in practice carried out that his very apathy may have induced carelessness and foolhardiness on the part of his officials and workmen. No better proof of this could be afforded than the manner in which shots were fired. The orders were for all shots to be fired by the deputy; and the Commission believe that, while safety-lamps were used by the ordinary miners in the bords, this custom was practically adhered to. It would also appear that Mr. Ross had given instructions to fire no shot in the actual presence of gas. So far this was as it ought to have been, but to remove the gas the ancient and perfunctory method of beating it out with a garment into the air-current was resorted to. While the management gave orders to remove the gas they provided no effectual means, such as bratticing, for doing so. No surprise need be excited if the operation was imperfectly performed or neglected. The headings were "special places," and driven by contract at an increased cost, by specially selected, and competent, and picked men. These headings were carried on night and day continuously. During the night-shift, when the specially selected men were alone at work, no deputy was provided, but the day deputy locked the lamps, or was supposed to do so, and the contract men fired their own shots. This is not unusual, and with competent men—as capable as any deputy perhaps—no special danger was incurred, but it would have been wise to have constituted one of these men a deputy to fire shots.

The mode of preparing shots was also unsatisfactory, and appears to have been as follows:—The men charged the shot and tamped it without any supervision or instruction. The tamping material was left to the choice of the
workmen.

workmen. While some careful men may have used pounded stone, damped with tea or water, the majority seemed to have used small coal or dust, and were not too particular as to the damping of it. As a rule, ordinary Beckford's fuse was employed to ignite the explosive (which was ordinary loose or compressed powder cartridges), and about 6 in. of this was left outside the hole. To ignite the fuse the safety-lamp was tilted on its side, and by so doing the flame impinged against and spread along the side of the gauze. As a rule, touch-paper (composed of ordinary brown paper soaked in saltpetre) was applied to the gauze; the flame in the inside was thus communicated to the touch-paper on the outside, and thus the fuse was ignited. So callous and careless had the men become that one man, Wood, working in the special heading No. 2, actually admitted that to avoid the trouble of lighting a shot by the means described he had lit the fuse by striking an ordinary lucifer match. With such men no orders probably would have ensured any safety to the other workmen. Illustrating the danger of the practice of tamping shot-holes pursued, the Commission were informed by ——— that about five days before the accident a shot so tamped (probably overcharged) had actually ignited the gas in No. 2 heading. No more reprehensible or dangerous practice could have been resorted to, and the Commission are surprised at the absence of strict orders dealing with the whole *modus operandi* of preparing and firing of shots that would have ensured safety. In the event of an overcharged shot the effect of tamping with small coal would probably be little better than tamping with powder; while inches of burning fuse in the presence of gas was to all intents courting an explosion.

Contrary to all discipline and common-sense, the workmen were permitted to take into this district matches and tobacco-pipes, and to smoke. In the case of the workmen in Nos. 1 and 2 headings, smoking was permitted anywhere under or outside the danger-board. Two days before the accident (*vide* Scott, Hope, and Morgan, Questions 358, 615, 2,943) the gas in No. 1 heading was lit by the wheeler's lamp hanging on the prop supporting the danger-board. While the Commission regret the absence of orders calculated to maintain constant and rigid discipline, and careful solicitude for the safety of the workmen, they cannot everlook the carelessness and the total disregard of the most ordinary precautions on the part of the men, many of whom, knowing the danger incurred, took no steps themselves to ensure the general safety.

This colliery has been from its commencement a peculiarly dry one. No water was given off in the mine. The coal was friable, and, falling on the roads, became pulverised into impalpable powder. Towards the conclusion of a busy day the air became loaded with clouds of dust, that rose in obedience to the slightest disturbance. To remedy this to some extent the Manager had for some time been in the habit of watering the main road, but this practice did not extend to the headings or working-faces. An atmosphere laden with impalpable dust has of late years been proved to be a source of no small danger on the application of an open light.

In collieries the part played by dust in the case of an explosion has long been suspected. In recent years special attention has been given to this recondite subject, and elaborate experiments have been made with the object of ascertaining the behaviour of dusts of various grades and qualities under the usual conditions existing in a coal-mine.

While some authorities are of opinion that coal-dust in a certain minute state of division or fineness may of itself explode and produce all the direful effects of an ordinary explosion, and that, in point of fact, some of the more recent explosions in
Britain

Britain have been attributable to dust alone, it has, without any doubt, been proved that the presence in the atmosphere of a mine of quantities of finely divided coal-dust, with gas, intensifies the effects that would otherwise follow from an explosion of gas alone. The presence of a dust-laden atmosphere increases the intensity and effects of an explosion. By its aid the length and intensity of flame is increased. The flame of an explosion that otherwise would be confined to a limited area may, by the presence of dust in the atmosphere, be prolonged, or projected, or carried to distant localities, and ignite accumulations of gas in those localities. The enormous surface presented by coal in a minute state of division (dust) to the action of flame induces instantaneous combustion, and the production of gases inimical to animal life. By distillation gas itself may be produced which, on the recoil of the first explosion, may be ignited, and so increase the effects originally produced. An explosion of gas in a dusty mine is generally productive of results more disastrous than an explosion of gas in a mine where no dust exists. The terrific effects of some explosions where a very small quantity of gas could have existed is thus explained.

We are of opinion that the explosion at Bulli Colliery is one of the most notable instances of this on record.

Accident.—At 2:30 p.m. on Wednesday, the 23rd day of March, a loud rushing noise was heard by the surface workers issuing from the main adit. The foreman, Alexander Lang, believed this noise indicated that a train of skips had broken away and were rushing down the incline. He was horrified to see a quantity of smoke, dust, and chips ejected from the tunnel with considerable force. In a few seconds another but slighter puff of smoke and dust was discharged, and all was quiet. He and his fellow-workers at once concluded that an explosion had occurred, and with admirable coolness and presence of mind a man was despatched to the village to telegraph the accident to Mr. Ross, who had gone to a flower-show in the neighbouring town of Wollongong. The engine-man blew the whistle to apprise the villagers that an accident had occurred, while Lang and ——— prepared safety-lamps.

Before they entered the mine, a boy, who attended the horse that drew the empty skips to the foot of the incline, came running out of the tunnel, holding his head, and in a state of fright, stating that he had been knocked down by the rush of air. In a short time the horse walked out of the adit. It does not appear that any particular notice was taken of this horse at the time, but in the course of a day or so attention was directed to very slight indications of singeing of the hair on certain parts of this animal, the inference being that the horse was singed by the flame from the explosion. In disposing of this matter, to which much importance has been attached, the Commission draw attention to the circumstance that this horse and its attendant were within 80 yards of the adit mouth when the effects of the explosion passed them. No flames appeared at the tunnel mouth; no indication of direct flame was seen by the boy, or can be detected on the level road for fully half a mile. The boy's hair or skin was uninjured by flame. He saw none. Only localized patches of the horse were slightly affected; strange to say, a small portion near the root of the tail, and the long hair under its lower jaw.

The Commission, in the absence of direct proof of flame having issued from the tunnel, attach no importance to this circumstance. If flame had passed the horse the whole hair on the animal would have been affected; the boy could not have escaped. The marks on the horse may have been caused by contiguity to the

open lamp attached to the cap of its attendant when he released the tail-chain (or draw-chain), or when standing near the animal's head. Trivial and localized singeing, such as that described, is irreconcilable with a flame-charged atmosphere.

On entering the tunnel Lang and his comrade observed that the air-crossing near the entrance—and that conveyed the return air to the old furnace—was deranged. The thick planking had been forced upwards. They proceeded to the foot of the incline. The atmosphere was charged with dust, and the ventilating current had become deranged. While in this position they were joined by Scott and Hope, who, at the moment of the accident, were proceeding to their work in the night-shift in No. 1 heading. A man was dispatched to the Company's jetty for canvas. Finding the tunnel fallen, the men proceeded along the Slacky Road in order to regain the tunnel at B by the cross-cut A referred to. (See plan No. 4.) While proceeding along this road they met the overman White and the man Cavill hurrying outwards. These men had been at the moment of the explosion at point © by pre-arrangement, endeavouring to communicate with the men who, from the western side, were making the new travelling-way, and had thus escaped. (*Vide* evidence of R. White.)

The news of the explosion having spread, managers and men from adjoining collieries, eager to render assistance, gradually assembled at the mine. When the first volunteers reached the tunnel by way of the cross-cut, within an hour after the accident, they found the ventilation in that road much deranged. The atmosphere was charged with smoke and dust and "after-damp." The temperature was somewhat high, but no steam was visible. The tunnel had fallen badly at this point. Passing over falls, they discovered two stoppings partially blown out or damaged. These were speedily repaired, when the ventilation steadily began to improve, and to take, though feebly, its natural course. On the arrival of Mr. Ross, he proceeded as far as the western junction (see plans), when, overcome by the after-damp, he was removed from the mine. Early in the evening, Lang, Richard White, the overman, and others, had, from the same causes, to be removed. A number of the men were also affected. No very concerted work appears to have been taken until 10 p.m., when a number of the managers of adjoining mines, seeing the desirability of concerted action, held a hurried consultation, arranged themselves as leaders of relays, and choosing search parties, the thorough work of penetrating the mine commenced.

Those who had first entered the mine came upon six (6) dead bodies lying on the flat close to the western junction. These they did not in any way touch; but discovering the western door blown away, and a very large fall completely blocking the tunnel, they tightened the stoppings, and closing the western door with canvas, commenced clearing off the top of the fall. This speedily improved the ventilation, and early on the following (Thursday) morning the search parties were enabled to cross this fall, and proceed along the tunnel to the Hill End section.

With the exception of a few falls, no serious damage was done to the tunnel beyond the falls near the Western Junction.

About 100 yards before arriving at the foot of Nos. 1 and 2 headings the bodies of two boys who had been engaged cleaning the road were found, and bore evidence of being blown about, and other marks of external violence.

The

The witnesses examined by the Commission, and who had seen the bodies of the six men at the Western Junction, had either not examined these at all, or had done so in a perfunctory manner. They were totally unskilled, and unable to diagnose burns. Some of these witnesses were evidently led astray by the shortness of the hair upon, and the caked dust adhering to, the bodies. The surgeon, Dr. Llewellyn, who had carefully examined these bodies on removal from the mine, and who had had some experience of explosions, had removed from the Colony, but his evidence as given before the Coroner is clear and emphatic, and is reproduced in No. 7 Appendix. After an explosion the steam and heated vapour licks up the impalpable dust, and deposits this in cakes upon anything with which it comes in contact. The fibres of a bunch of token strings, picked up from a prop within a few yards of where the six bodies were found on the flat, although coated with soot, are perfectly untouched by flame; pieces or fibres of bark—extremely sensitive to fire—exhibit no traces of flame; woollen garments, picked up in that spot by the Commission, also show no traces of fire. The statement by Dr. Llewellyn, that the shreds of cuticle on the hands of one of these bodies had preserved its elasticity, shows that the body had been forced along the rough floor, but that the skin had been untouched by flame. The same remarks apply to the two bodies found on the main road referred to.

The positions where the bodies were found are marked by crosses and dots upon plan No. 5.

So little damage was done to the stoppings and doors that these being temporarily repaired with canvas the ventilation was restored, and enabled the whole of the bodies, with the exception of two, to be recovered within thirty-six hours after the explosion.

Attention is directed to the circumstance that, with two exceptions in the Hill End District—one in No. 7 bord, off No. 1 heading, and one in No. 8 bord, off No. 2—the whole of the bodies were found on the main roads. The majority were found with their heads lying towards the exit, and conveyed the impression that, alarmed by the explosion, they had been attempting to effect a hurried retreat, when they were overtaken by the deadly “after-damp,” and fell as they ran, and died as they fell. The appearance of the body in No. 7 bord corroborated this view; when found one of his arms was inserted into the sleeve of his shirt, and the bulk of the garment over his head. The poor man had been choked by the after-damp while in the act of putting on his shirt, before following his neighbours. The awful suddenness of the death may be imagined from another body being found (at the opening to No. 2 bord, No. 1 heading) in the act of drinking out of a flask. No marks of burning were found on any of the bodies, with the exception probably of Westwood, who was found in the last stenton, between Nos. 1 and 2 headings, and probably one or two men in No. 2. The whole of the deaths were due, not to the direct effects of the flame of the explosion, but from the effects of after-damp (the result of the explosion), or the force or impact of the blast.

“After-damp” expresses the name given to the poisonous gases resulting from the explosion, *i.e.*, rapid decomposition of an (explosive) atmosphere consisting of certain proportions of air and fire-damp in some of its forms. It consists of varying proportions of carbonic acid gas (stytho-choke-damp), free nitrogen and watery vapour, in the form of steam, and, if coal-dust is distilled, probably a quantity of carbonic oxide gas (white-damp).

In

In the case of marsh gas, the "after-damp" will, in all probability, contain a quantity of carbonic oxide, as a direct result of the explosion, in addition to free nitrogen.

As nothing had been disturbed in the mine (save covering the dead horses with quick-lime) from the date of the explosion till after the Commission had finished their various inspections, the appearances presented by the workings during the inspections of the Commission were essentially similar to those that were observed by the first search parties. These were as follows:—

1st, Main Tunnel.—This had fallen at intervals for a length of about 350 yards, beginning 170 yards from foot of the incline. Over this portion the bands under the conglomerate had sagged, or separated from the main roof, and were resting upon the heavy sets of timber that protected the main road. The outward rush of air probably displaced one or more of the main sets; and in its or their fall others were displaced, and the heavy blocks of stone that had rested on the displaced sets fell upon the hauling ropes. These ropes resisted the weight, and tearing off some of the hanging pulleys, a heavy diagonal pressure was thus suddenly brought to bear upon the adjoining timber. Unable to resist this weight, they would collapse from the centre towards each side. A minute examination of this large fall shows that the major portion of it must have come down subsequent to the blast. Portions of dust carefully removed from the pulleys at the bend (1), and from props towards the bank-head, show that it was uninjured by flame.

The Commission on various occasions examined this fall, and could observe nothing singular in its appearance, or differing from any other similar occurrence that is every day noticed in colliery workings, and nothing to arouse or excite suspicion. A close scrutiny of the surroundings at once reveals the cause.

Bank-head.—A set or train of fifteen empty skips have been somewhat broken and pitched off the rails. On this flat the bodies of six men were found, all of whom exhibited proofs of being blown about and subjected to much violence, their bones being fractured and their clothes torn. Some of the witnesses affirm these bodies were sadly scorched, while the evidence of Dr. Llewellyn proves the contrary. The Commission, after a close examination, could discover no traces of flame upon the back of the props, or pieces of woollen garments evidently torn off the men, while the strings of tokens hanging on a prop have not been affected by flame.

The Western Door.—The western door had been torn from its strong iron hinges and broken into pieces, the fragments being blown inwards. The force that did this damage manifestly came from the outside, and travelled inwards towards the Western District.

Large Fall.—The large fall inside the Western Junction on the main tunnel occurred, in the opinion of the Commission, immediately after the explosion, and was probably caused by the swift rush of compressed air removing a defective set of timber under a weak and broken part of the roof.

On the date of our inspections, 7th and 8th May, 17,000 and 20,790 cubic feet of air were passing over this fall.

The Trap-door between Nos. 1 and 2 headings was demolished, and shows that the direction of the force came from *in-by* towards the mouth of the tunnel.

The

The Trap-door in the diagonal road between Nos. 1 and 2 has been forced from No. 1 towards No. 2, and in the opposite direction to the other.

The Trap-door between 3 and 4 has been destroyed and blown inwards by a force proceeding from the mouth of the tunnel.

The Main Flat between Nos. 2 and 3 headings contained a full and empty train of skips. These skips have been acted upon by a sudden though not a great force; they have been bodily blown in-by, and several have been lifted off the rails. Meeting with an obstacle at the end of this flat the empty skips became piled upon each other, and some old worn-out skips are smashed, and portions of the framework have been carried across the flat. Under the full skips the body of a boy was found entangled and very much mutilated, while close to No. 3 heading a man was found terribly smashed, with his clothes torn to shreds, probably from the force with which he was projected by the blast.

Almost opposite No. 2 heading a stopping with a door existed. This stopping was bodily blown in and levelled. Thirty yards down the return, and indicated upon the plan, a horse was found, and beyond it the bodies of four men. These had evidently been caught by the full force of the blast, and carried from the main tunnel through the stopping to the place indicated. The stoppings between the tunnel and the return were from this point inwards partially destroyed.

In the face of the Main Tunnel a skip which was being filled was slightly displaced, the front wheels only being carried over the rails.

Nos. 1 and 2 Headings.—At the moment of the accident a horse was evidently conveying a few skips through the door in this road. Overtaken by the blast, the horse was blown down to the tunnel, where it lay at our inspection, and the skips, slightly broken, were piled up partly in the diagonal road and partly in No. 2 heading. The stoppings opposite the two first bords off No. 1 are slightly displaced towards No. 1, the greatest force evidently coming from No. 2 heading. The three stoppings above this are partially displaced from No. 2 to No. 1.

Charring of Props.—The props in No. 3 bord and in No. 5 bord, No. 1 heading, are charred; portions of woollen clothing picked up in No. 5 were singed, and bore direct evidences of contact with flame. Quantities of coked dust were deposited as a cake on the props. Portions of this were fused into globules. The danger-board in No. 1 heading and its supports are partially charred. The horse that lay inside this signal was also singed, while a coil of fuse hanging a few yards from the face of No. 1 was unburnt, and a quantity of loose powder nearer to the face had not exploded. A safety-lamp, intact, but unlocked, was also found in this heading. An open lamp was found hanging on a support of the danger-board with the solder fused into globules; and beside Jer. Westwood a large copper lamp similar to that used by a deputy was found on the slack coal in the stenton. Evidently at the moment of the catastrophe no gas had existed contiguous to the face of this heading, hence no flame.

No. 2 Heading.—The danger-board was blown down at the stenton, and lies a few feet down the road. At the face a large *roll* was being crossed. About 3 feet of coal exists on the top of the roll. Gas issued from it. A few lumps of coal lay on the top, and a shot-hole could be felt in the face. The coal had evidently not been properly nicked or under-cut. A little gas was heard to issue from the vicinity,
if

if not from the shot-hole itself. The workmen engaged in fixing bratticing in this heading after operations were resumed found an open lamp on this roll, and sent it to the Commission on the —— of May. The oil on the outside of this lamp had not been touched by flame.

During the inspection by the Commission 13 yards of gas, tapering to 2 feet at the face, existed in No. 1 heading. In No. 2 heading 20 yards of gas existed. At the face this gas reached a depth of 3 feet 6 inches. The gas was remarkably sharp, instantly filling the lamp with flame even when the greatest care was observed. It reminded some of the Commission of silver gas (CH_4) met with in some fiery mines in Britain.

At the date of our inspection the ventilation was of course perfectly disorganised, and the following quantities of air circulated on the 8th of May:—

In the main tunnel, inside Western Junction, through last stenton, between Nos. 1 and 2 H, 2,160 cubic feet. Notwithstanding the deranged state of the ventilation, *no gas whatever* was detected in *any* of the bords off Nos. 1 and 2, *none* in the bords off 3 and 4, a trace only in No. 3 heading face, none in Nos. 5 and 6, and none in the western workings.

The bodies found in No. 2 heading were, so far as the Commission could discover, unscorched.

The props for three or four bords down this heading showed evidences of scorching contiguous to the roof. Between Nos. 5 and 4 bords no evidences of flame are visible in the main road, nor were some loose props disturbed. Cut-throughs connected Nos. 1 and 3 and 5 and 4 bords. Actual flame had travelled through these cut-throughs, charring the props. In No. 1 bord, opposite the cut-through connecting that bord with No. 2, a fierce fiery blast, probably due to accumulations of coal-dust, had kept charring the props, displacing some empty skips that were in the road, and depositing a thick layer of fused dust on the skips and props.

Western Section.

The return airways passed down the headings in (B) workings and across the dyke, and following the arrows passed over the Western Road.

The trap-door that separates this road from the return has been tilted up and jambed against the roof. *The planks of the air-crossing* have been broken down, destroying the crossings. A large fall of stone rests on the top of a train of skips contiguous to it.

The door-frame towards the face of the western tunnel is tilted inwards, while the door, smashed, lies —— yards on the out-bye side. No other damage was done to the workings in this section. The bodies of the victims were found on the main road, as if in the very act of effecting their escape.

Findings.

Your Commissioners, after repeated and minute examination of the district affected by the explosion, and having given due consideration to the evidence of witnesses of experience, skill, and erudition, have unanimously come to the following findings:—

Firstly.—That, in their opinion, the accident was caused by an explosion of marsh or of light carburetted hydrogen gas that had accumulated at the face (or between the face and the last stenton) of No. 2 heading in the Hill End district. The explosion was confined to this district, and there is no direct or indirect evidence of any other explosion having occurred elsewhere. *Secondly.*

Secondly.—That the immediate or exciting cause of the explosion was, in all probability, the flame from an overcharged shot that had apparently been fired by the man Westwood, or his mate, in the coal on the top of the “roll,” in the face of No. 2 heading.

Thirdly.—That the explosion was intensified and the force increased and transmitted to distant parts of the district by the presence in the atmosphere of the mine of coal-dust in a minute state of division.

Fourthly.—That the person or persons to whom blame is attachable for this disastrous accident is the man Westwood, or his mate (both deceased), who at the moment were working at the face of No. 2 heading, and who prepared and fired the shot, which, in the opinion of the Commission, *was the immediate or primary cause of the explosion.* The Commission are, however, of opinion that the deputy, Robert Millward (deceased), Richard White, overman, and to a less extent (except in the matter of providing bratticing, for which he was alone responsible), Alexander Ross, manager, were guilty of contributory negligence.

The Commission are firmly convinced that the carelessness, want of skill, and the loose and perfunctory manner in which the principal operations in this mine were performed by the majority of the men, and countenanced by at least the overman and deputies, were intimately connected with, and led up to, the occurrence of the final catastrophe, whereby by the direct negligence of probably one man eighty other men lost their lives.

The circumstance that a shot had apparently just been fired in the face of No. 2 heading, where gas was issuing, and that this shot had not done the full amount of its duty (the coal had not been blown down to the bottom of the hole—the bottom portion of the drill could be felt)—that Westwood, the man who at the time worked in that heading, was found dead in the stenton, where he must have taken refuge,—is pretty conclusive proof that the shot had partially blown out or been overcharged, and that Westwood fired it.

In connection with these findings the Commission desire to make the following observations:—

The examinations of the mine convinced the Commissioners that the opinion as to the seat and course of the explosion expressed by some of the mine managers and others, such as Mr. Inspector Rowan and Mr. Inspector Dixon, Messrs. Jones, MacCabe, Evans, Green, and Williams (*vide evidence*) was a correct one.

In the course of the evidence opinions were expressed by several of the witnesses (none of whom had any direct experience of previous explosions) that distinct and separate magazines of gas had exploded in the old bord at A and B on plan No. 5, and that these increased the effects of the original explosion in No. 2 heading. These witnesses had evidently been puzzled to account for the different effects produced in various parts of the mine—of damage in the main flat and in the western workings, and almost no appearance of a blast in parts of No. 1 and No. 2 headings or in the Hill End return,—and had, without special investigation or careful examination, endeavoured to discover a cause by enunciating the above hypothesis. The untenable nature of these opinions was at once apparent to those who had intelligently examined the condition of the mine and the effects of the explosion. In the first place, the abandoned bords at A are off No. 1 heading, in which a very strong current of pure uncontaminated air circulated—one of the bords was stowed up (*i.e.*, filled full
of

of rubbish); the other was patent, but contained no gas. (See evidence of R. White, Question —). None of the bords off No. 1 appear to have given off gas. Had this been the scene of a separate explosion from transmitted flame the stoppings opposite this bord (marked on plan) would have been demolished and blown into No. 2. On the contrary, they have been disturbed by a force in No. 2, which partially forced them into No. 1. There is no evidence of an explosion having taken place here—no charring of props—no deposition of charred dust or coke—while two delicate plumb-lines hanging from props in the main tunnel (adjacent) do not show the slightest sign of actual contact with flame. The same remarks apply to the bords at B. At no time did an explosive atmosphere pass these bords. They are ventilated by the return air, and being lower than the headings Nos. 1 and 2 they are unlikely places for gas to accumulate or lurk. These bords are partly stowed with rubbish. The stoppings in front of them are intact; there is nothing in the surroundings to lead to the suspicion of a separate explosion, or to warrant such an hypothesis. Considered in any aspect it is untenable, and the Commission are convinced that separate explosions, though possible under certain circumstances, did not occur here. On the other hand, however, the evidence that the explosion originated in the face of No. 2 heading is conclusive. Gas constantly issued from Nos. 1 and 2, and on two occasions immediately before the accident it was elicited in evidence that the quantity had increased. The Commission perceive a reason for this in the occurrence of the disturbances of the floor referred to (from which gas issued freely), and the distance that the face of the headings was before the current of air (28 yards) only five days before the catastrophe. Morgan, a wheeler, was requested by Scott, a miner of some experience, to raise his open lamp and hang it on the inside of the “danger-board” on No. 1 (this being a distinct violation of Mr. White’s orders), for the purpose of giving more light to fill a skip that he was then loading from a bord he had commenced. The result was that a sheet of gas lurking near the roof lit and flamed backwards, but was soon extinguished. It does not appear, however, that this circumstance was reported to Mr. White.

The Commissioners are convinced from the evidence that the greatest recklessness, amounting to culpable negligence, was the characteristic feature of the system of working practised in this mine. The use of open lamps in bords off No. 2 heading, which were supplied by air fouled by gas from 1 and 2 headings, was undoubtedly an error of judgment.

The *orders* of Mr. Ross in respect to shot-firing were to some extent in accordance with the practice pursued in fiery mines, viz., that such firing should be done by deputy only. The circumstance that no deputy was appointed during the night-shift clearly shows that Mr. Ross must have been aware that this rule could not have been closely observed, nor does it appear that in the absence of a night deputy he engaged, or instructed, or paid, the special men then engaged driving these headings how or when to do so. So far as the Commissioners could ascertain, the shots were fired at any time during the shift; but it would have been a salutary precaution if, before shots were fired, the men had been withdrawn from the mine, and that no iron or steel tools had been used for charging the shots.

In this the Commission consider the management, especially that of Mr. White, censurable. The method of preparing shots in this colliery deserves the strongest condemnation. This has been proved by the deplorable sequel to long-

continued

continued indifference. We feel that it would be wise for the common safety to impose severe penalties on all engaged in underground operations in respect to this part of their duties.

The Commission were somewhat surprised to find that only in some cases, and this by the more thoughtful and skilful miners, was the coal thoroughly undercut and "nicked" preparatory to using explosives. This they consider should be made obligatory. They feel convinced that no experienced miners would attempt to work coal in the unworkmanlike manner that some of the men seem to have pursued.

An unfortunate practice has almost become general among miners in the Colony, viz., of blasting coal out of the solid instead of pursuing the more skilful method of thoroughly undercutting, nicking the sides, and perhaps of wedging down the mineral. The practice is known by the name of "Cousin Jack," and with advantage could be eradicated. In the present condition of Colonial coal-mining it would perhaps be impossible for an individual manager to prohibit the practice, but where gas exists it is clearly the bounden duty of any manager to risk a strike rather than permit such a pernicious and unworkmanlike custom to be pursued. As a consequence of failing to undercut and nick, the coal is likely to bear the strain of the powder longer than the stemming or tamping, the result being a "blown-out" or a partially blown-out shot. In this event a tongue of flame is ejected from the hole, which would be prolonged by the ignition of the small coal tamping. In event of gas being present in air where dust in minute divisions floated, a very serious explosion might by this means be the result. Indeed, in some of the most disastrous of recent explosions in Great Britain it is doubtful whether the most active agent was not coal dust alone.

Most disastrous effects have been observed where gas was not discovered before or after an explosion, and evidently due to a dust-laden atmosphere in a favourable condition for ignition.

The exact part that coal dust plays in an explosion has not as yet been clearly defined, but the following points have been ascertained:—

- (a) The effects are in direct proportion to the state of division in which it occurs, and to its chemical composition.
- (b) The effects are proportioned to its condition, and the condition as to dryness and temperature of the mine.
- (c) In the presence of even an insignificant quantity of gas it very materially augments or increases the force and after-effects of an explosion. It increases the intensity and length of the flame, and may transmit flame and explode accumulations of gas in distant situations, although no gas existed between.

The scorching of organic substances and the production of coke and carbonic oxide and gases inimical to life after an explosion is very largely due to the presence of coal dust.

The Commission therefore feel that to the absence of proper precautions as to thoroughly nicking, undercutting, and preparing shots, and probably to an error in judgment in gauging the amount of the explosive, the loss of life at Bulli Colliery is to be attributed.

It

It is difficult to believe that the general practice pursued of tamping shots with small coal, and of using patent fuse for conducting the fire to the explosive, could be unknown to at least the overman, Richard White. The equally dangerous and reprehensible practice of lighting touch-paper by tilting the flame of the safety-lamp against the protecting gauze must have been observed and known by that official, who, from his long experience in looking after the safety of men under his charge, ought at once to have caused the discontinuance of these practices. In this Mr. White is to blame, while the conduct of the men, some of whom were well aware of the extreme danger incurred, is viewed by the Commission as being extremely reprehensible.

It must also have been known to at least a section of the men that on more than one occasion the fuse attached to shots was lit by the flame of a lucifer match. For neglecting to report this reckless and dangerous circumstance some of the workmen have displayed a callous indifference for consequences that would seem to demand severe censure.

The coal dust found in Bulli Mine existed in the condition favourable for an explosion. The mine was dry and warm, and the dust abundant. (For analysis of this dust, *vide* Appendix 10.)

The Commission can excuse the officials and those engaged in the mine of knowing little of the danger arising from coal dust in the atmosphere of the mine, seeing that the subject has only of late years engaged the attention of the scientific bodies in Great Britain and Europe—indeed they would desire to commend the manager in his endeavour to rectify the evils of dust by watering the main roads. Had this practice been extended to the face and thoroughly done the probabilities are that the Colony would not have had to mourn the occurrence of a disaster unparalleled in the history of Colonial mining. They cannot, however, excuse either officials or the men for the perfunctory and dangerous practices narrated.

The Commission must on another subject express their opinion in words of rebuke. These headings had given off gas for over eighteen months, but no attempt was made to sweep the gas from the face by special means, such as are generally adopted in mines where gas is generated. The management, even when the ventilation was weak, did not direct the current to the face, but relied solely upon the stereotyped number of cut-throughs provided for in the Act. The consequence was that the air in the headings in advance of these passages was stagnant, and served as a permanent reservoir for gas. This was manifestly wrong, and betrayed great indifference or callousness for the safety of the workmen and the mine. The Commission believe that Mr. Ross had a sincere regard for safety, but that both he and Mr. White were lulled by the strong and ample ventilating current obtainable since the new furnace was started, and depended solely—and perhaps too much for security—on the strength of that current. But this is no reason or excuse for neglecting to use bratticing from the last stenton, and so remove the gas as it issued. Had this been done, the difficulty of placing cut-throughs on the top of “Rolls” would have been obviated, and no gas would, in all probability, ever have been seen.

The Commission are further of opinion that Mr. Ross issued instructions to his overman and deputies to lock all lamps; but that for some cause, and unknown to Mr. Ross, this order had not been strictly carried out for some weeks preceding the explosion. At the same time the Commission are fully aware how very difficult

it

it is to get subordinates to carry out orders in their integrity. Some ill-feeling appears to have existed between a section of the men and the deputy, Millward, appointed after the resumption of work in February, 1887. The witnesses ——— explained that on their resuming work, the deputy, in obedience (no doubt) to orders, locked their lamps, and on being asked where they were to get them relit, in event of their going out during their shift, Millward is *alleged* to have replied that he would leave the key at a certain point, as apparently had been the custom prior to the strike, and with the old deputy; but struck, evidently, with the absurd insecurity of the practice, Millward, remarking that they might as well have unlocked lamps as the means of unlocking them so near at hand, is alleged to have at once unlocked them. This, it may be remarked, applied to the special men working in the headings. The Commission have some hesitation in accepting these allegations in their entirety. The deputy referred to was lost in the explosion, and they feel that he alone could explain or meet these charges, yet they can see nothing in the circumstances of the practice pursued subsequent to the strike that differ from that prior to that occurrence. It was manifestly easier for the men to retire outside a danger-board, a few yards off, and there relight a lamp, than to retire to the main road, as was the practice before the new furnace was lit. Reducing their labour and inconvenience was surely no cause for complaint.

With respect to the locks on these lamps. The safety-lamps used were the old fashioned "Davy." The bottom or lamp screws into a brass ring supporting the gauze, and the *lock* is merely a small pinching pin or screw on the side that jams into the thread of the screw attaching the gauze. This, however, affords no real security, as the end of a knife, a flattened nail, or almost any instrument is sufficient to undo the lock. Unless unscrewed (and no sane man would do so in the presence of gas) an unlocked is just as safe as a locked lamp, and if a man is determined to infringe the regulations the locking of this type of Davy lamp by officials offers no impediment. There is no evidence that immediately prior to the accident any safety-lamps had been unscrewed, and that this condition of the lamps in any way contributed to the accident. The unlocked condition of the lamps, however, constituted one of a long series of loose and unsatisfactory arrangements and conditions that, as has been remarked, led up to the loss of many valuable lives.

Two witnesses, Beckton and N. Hobbs, stated positively that a lamp issued to them wanted the top part of the gauze, that in short it was not a safety-lamp, and that they showed this to Deputy Crawford, who replied that he could not procure gauze. The Commission minutely investigated this serious charge. Deputy Crawford positively denied the statement, and neither Mr. Ross nor Mr. White ever heard of the circumstance. The witnesses (N. Hobbs and Wm. Beckton) did not favourably impress the Commission, who are inclined to place no importance on the statements of these men. This they believe *did not* occur. If, however, this had occurred, the men would have been guilty of infringing the 16th special rule by taking, or working with, such a lamp, and their having done so (endangering the lives of their fellow-workmen) should have been met with severe punishment.

The practice of permitting workmen to carry lucifer matches, and to use tobacco in a district where gas was given off and safety-lamps were used, is unusual, and is another link in an already long chain of lax discipline and loose and reprehensible practices. Such offences the Commission feel can only be put down by a
stringent

stringent provision sanctioned by Parliament. The lives of all in such a mine are dependent upon individual actions, and it is outrageous to suppose that all men are alike careful, unless compelled by stern discipline and the certainty of summary punishment.

The Commission are surprised that in a mine where so little regard was paid to safety, and where men were permitted and did smoke, in the immediate vicinity and aware of the danger, that a serious accident did not occur from causes other than an overcharged shot.

Mr. Inspector Rowan appears to have visited the mine with regularity, and to have performed his examination in a thorough manner. His statements as to the quantity of gas seen during these inspections is most explicit, while his truthfulness cannot be impugned. His evidence certainly differs materially from that of the majority of the witnesses, but it perfectly corresponds to the statements in his reports. (See Appendix 6.) It seems to have been Mr. Rowan's custom in going through the mines under his charge to ask the men whether they desired to make any complaint. This is perhaps not a usual custom, or one to be commended in Inspectors, but it is certainly one that ought to bring under the Inspector's notice any condition of the mine which, in the opinion of the men, ought to be remedied. He asked the men in Bulli Colliery *whether they had any complaints to make. They had none.* In his various inspections he only observed *traces* of gas in these headings. It may be that during these visits the face of the headings were clear of "rolls," or they were not far in advance of the stentons, and if so, naturally the minimum amount of gas would be given off. It was clear to the Commission that Mr. Rowan had thorough reliance on the large amount of ventilation that was available, and that he disregarded the insignificant quantity of gas in the headings. He did not consider the effect of dust in event of an explosion, and for this he may be excused and exonerated. Mr. Rowan hearing no complaints from men (naturally ready to complain) was seemingly unaware of the reckless manner in which their various duties were performed. He does not appear to have suggested the use of brattice, probably because he did not suspect danger. Had such a suspicion occurred to him, the Commission feel that he would not have hesitated to have brought the necessity of bratticing before the Manager.

The evidence of several of the men—McKenna, Nicholson, Hobbs, and Beckton—went to show that for some time they were aware of danger, but that they believed that rule No. 6 of the Company's terms of engagement precluded them from reporting anything to the Manager. The Miners' Secretary, J. B. Nicholson, who had not been re-employed since the resumption of work in February last, made a remarkable statement, viz., "That he was informed of extreme danger existing for a fortnight before the accident, but had taken no action."

This person aims at being a leader and adviser of the men. One of his duties is to bring complaints before the management, and the Commission believe that in this he seldom failed in performing it. Not being employed by the Company, he certainly was not bound by rule 6; he, at all events, was free to complain. He knew of the dangerous state of the mine, and he believed it would end in disaster, and he did not even warn his fellow-labourers whose avocations led them daily into the mine, but permitted them to carry on their labours in blissful ignorance of their
danger

danger. Rule 6 reads as follows :—“Any employee interfering in any way with the orders issued by the colliery manager or his overman for regulating the work of the mine shall be liable to dismissal without notice.”

The rule is in exact consonance and in perfect harmony with the 18th special rule. By these the men were bound to report—they did not do so, neither did they report to the Inspector. It seems incredible that men could work, or permit others to work, under obvious conditions of danger and not take advantage of their privilege to report that danger. Rule 6, in plain English, repeats the words of the special rules, and, when read in connection with No. 5 rule, was evidently only intended to maintain strict discipline and the authority of the management. The Company declare by this rule that they would not permit any of their employees to interfere with the orders of their Manager. Nicholson informed the Commission that the men objected to this rule to the Company's secretary. On being pressed he admitted that the objection referred to the whole of these engagement rules. The Commission can readily understand how the secretary of a Union that wielded so much influence over men would object to rules that were intended to emancipate the Manager from the control of outside organisations or influences. They are unable to comprehend how intelligent men could permit themselves to be persuaded to display so much pusillanimity, and to pervert or torture the words “That any interference with the orders of the Manager” into meaning that they must not report danger, especially as they admitted that no orders had been issued by the Manager to the effect that men were *not* to report danger, and that they did not ask the Manager whether rule 6 would bear the interpretation given it by Nicholson and others.

In view of the circumstances that the rule was in accordance with the special rules, and that no Company's regulation could or did attempt to override the provisions of these rules, that no complaints were made to Mr. Rowan when he requested the men to do so, the Commission are of opinion that the men or Mr. Nicholson did not misinterpret rule 6, or were under any dubity as to its real meaning. Mr. Nicholson's conduct (who did not come under the operation of the rule), if he really did know of danger and took no steps to communicate with the Inspector, the Minister for Mines, or his late fellow-workmen, betrays an obliquity of character that they sincerely trust is uncommon in the Colony, and will meet with censure that it so deservedly merits.

The course taken by the explosion has been as follows :—

The gas exploded in No 2 heading inside the stenton, expanded, and with lightning speed passed downwards. Had it been pure gas, the probability is that the major portion would have shot through the stenton into No. 1 against the air, but the explosion being in all probability due partly to gas and partly to coal dust it split at the stenton—one portion passed into No. 1, licking up what gas lurked there, and rushed down the heading, shooting into each bord where expansion was possible. At No. 3 bord a portion left the heading, and passing into that bord ran against the current of air coming through the “cut-throughs,” and again entered the heading. The portion that passed through the diagonal road wrecked the skips that at the moment were passing through, and destroyed the door. The portion that passed down No. 2 heading partly swept into No. 3 bord and through the cut-throughs to No. 1 bord, where its track is visible by the singed and charred props and deposits of coked dust on the skips and timber. Directed into No. 2, it joined the current from No. 1, and its intensity and vigour being increased thereby, it carried the horse
attached

attached to the skips at the diagonal road down into the main flat, where it lay at the date of our inspection, and with redoubled energy forced four men and a horse at the time standing on the flat through a stopping and 30 yards into the main returns. The slight impediment offered by this frail stopping was sufficient to divide the current. A portion passed inwards, did some damage to the skips on the main flat, and killed a man and a boy, and expended itself at the face. The other portion rebounding back the main tunnel, forced some of the stoppings and knocked out the weaker sets of timber, permitting the superincumbent weight of rock that rested on them to fall on the strong hauling ropes, thus bringing great pressure to bear diagonally on the adjoining sets, which yielded to the weight and were drawn down in quick succession. On passing under the old air-crossing the compressed air forced the planking upwards, and produced the blast seen at the mouth of the adit.

The first belch of soot and rubbish from the tunnel probably indicated the effects of the explosion; the second and less forcible blast was most likely caused by the outside half of the fall in the main tunnel, while the fall of the inner half would have the effect of restoring the course of the ventilating current, and to send a blast of air back into the workings.

The Examiner of Coal-fields visited this mine on the 16th of March, but, although in the vicinity, did not inspect the Hill End district. He was informed by Mr. Rowan that he would probably observe no gas there, and this is quite in accordance with Mr. Rowan's statements and his official reports. The object of the Examiner's visit was not to inspect but to report upon a section of coal in the Western District leased by the Company from the Government. It is somewhat unfortunate that he did not thoroughly perform his mission by visiting the face of the main tunnel and Nos. 3 and 4 headings, which in some of the plans are shown within Government lands.

Mr. Mackenzie, at the last hour of the inquest, after he had thoroughly inspected the mine, gave his evidence, and enunciated an hypothesis as to the cause of the explosion.

Before giving his evidence to the Commission, Mr. Mackenzie again inspected the mine. This visit confirmed the views expressed by him at the inquest, and he endorsed that to the Commission. His views are given in his reports to the Department, dated 30th April, 1887, and his supplementary remarks to the Commission, and will be found in Appendix No. 8.

Briefly, Mr. Mackenzie contends that there were two explosions: The first originated about the bend of the main tunnel, which blew down the roof and caused the long fall on that roadway; and the second, and in consequence of the first, occurred at the face of No. 2 heading.

The Examiner bases his hypothesis upon the circumstance that from the central point, indicated E on plan, the props are lying in two directions, one section being inclined to the outside, and the other to the inside, and that the western door is driven 30 yards in-by, and smashed from a force coming from the outside and that, in his opinion, the cause of that fall was an explosion of powder or dynamite.

The Commission, taking a comprehensive view of the accident, and the condition and state of the plant and the mine, fail to perceive the slightest grounds for this opinion of the Examiner.

Explosives,

Explosives, if successfully fired on a main road, might cause the destruction of one or two sets of timber, and so bring about the damage narrated, there being nothing to bind the sets of timber together; but the fracture or displacement of one or two sets by the passage of intensely compressed air would cause the same damage. The suggestion of explosives, infers malice of no ordinary kind; it also means that they were placed there and fired in a busy road during the busiest period of the day. No one came out of the mine for at least one and a half hours before the accident, so that the culprit who intended to entomb scores of his fellow-workmen must have perished by his own act. There is nothing remarkable in the conditions of this fall; it differs in no way from other falls that may be seen every day in mines. There is no proof that it occurred anterior to the explosion, *because* the planks of the air-crossing were tilted up by the compression of air, that a violent force from within could alone cause.

The damage to the *western door* may have been caused by the fall; it is much more likely, however, to have been occasioned by the instantaneous expansion of the blast when rushing past this junction, or by the *recoil* that occurred, and that always occurs after an explosion.

Mr. Mackenzie considers that it is necessary for his hypothesis that the large fall inside the Western Junction should have occurred prior to the fall in the tunnel, and that this increased the pressure on the western door. He, however, does not state what caused this fall. An examination of it shows that it occurred after the explosion and the passage of the soot.

How the accident to the tunnel could cause the explosion in No. 2 heading is somewhat obscure.

A force travelling inwards with rapidity would impinge against the door in the main tunnel between Nos. 1 and 2 headings and force it inwards. The contrary is the case. It would then pass into the tunnel face with undiminished force. This, however, it did not do.

The Commission fail to discover cogent reasons to support this remarkable proposition of Mr. Mackenzie, or any circumstance that can justify the enunciation of such views.

The damage done to the plant in the mine is insignificant; greater damage is frequently occasioned by one of the ordinary accidents incidental to mining. It certainly bears no comparison to the great destruction of life. This, considered in connection with the position in which the bodies were found, clearly indicates that the direct effects of the explosion killed very few (if any), and that warning was given to the men who, with a common impulse, ran to the main road, and were there met by the poisonous gas resulting from the explosion and the distillation of dust, which instantly suffocated them while in the act of effecting their escape. The total annihilation of life was entirely due to the small area opened up and the contiguity of the men to the course of the blast. No wastes existed wherein the force of the explosion could expend itself, it being confined to the narrow strip of working where the men were actually engaged.

RECOMMENDATIONS.

RECOMMENDATIONS.

1. The Commission consider that in all mines where gas exists the course of the air should be directed to sweep along the working-faces; in mines worked by Pillar and Stall, bratticing must be resorted to to carry the gas from the face as it issues, and so prevent any accumulation of explosive gases or of gases inimical to life. In cases where gas exists it would be better that no bords should be broken off the back or return heading or supplied with air fouled by dangerous gases. The panel system of working by confining and localising districts, or some modification thereof, might be pursued with advantage.

Of all known systems of mining, Longwall, by supplying a strong sweeping ventilation along the face of the workings, offers the best security to the miner. A modification of the Pillar and Stall (say the "wicket system") may, under certain circumstances and conditions, secure perfect ventilation of the face without the use of brattice (which is liable to injury), but it is very doubtful how far such modification could be permitted under the provisions of the present Coal Mines Regulation Act. This Act evidently only anticipated *one* system of mining.

2. Where safety-lamps are necessary—gas being present for (say) one month after being found in dangerous quantity—they should be securely locked by a man duly appointed, and tampering with them must be punishable by a simple and inexpensive process of law.

3. Where gas exists, and no provisions are made for its constant removal, no shots should be fired, and, where permitted in a gassy mine, shots should be fired only by a man specially appointed, and at such hours when the miners are not within the mine. All shots should be tamped by stone well damped, and only copper or wooden tools should be employed. As far as possible the use of explosives should be discouraged, and skilful mining encouraged. Danger-boards should be placed further from the faces from whence gas issues (say), where practicable, 50 yards.

4. Where safety-lamps are used, and the obligation is laid upon the men to cleanse the same, all examinations, tests, and repairs to these should be done by the owners.

5. Where safety-lamps are used the lock should be of such a character as to prevent any workman opening it. If the "Protector" type of lamp be employed the necessity for a lock is the less necessary, as the unscrewing of this type of lamp extinguishes the light.

6. The Commission would not insist upon a barometer being provided at each mine. Experience has proved that this is a tardy index to atmospheric conditions. Serious changes in the atmospheric pressure occur, and are felt before they are indicated by a barometer.

7. A measure of safety may be found in the use of high explosives combined with wet tamping, or, still better, water cartridges, instead of powder under any of its modifications. Encouragement ought also to be given to the use of patent multiple wedges and appliances of a like nature, for supplanting the use of explosives. Under all circumstances and conditions some provision should be adopted for compelling workmen to thoroughly undercut, shear, or nick, and generally to work the coal as directed by the Manager.

8. Where dust exists in quantity, and under conditions favourable for ignition, it should be periodically and sufficiently damped by water.

9. In gassy mines the Manager should be specially competent, and one possessing a thorough knowledge of the principles and practice of mining, the properties of gases, and systems of ventilation; and, above all, he must be prudent and cautious, yet resolute, possessing sound judgment. He must have absolute and supreme control over the whole operations, and of the men within the mine, to maintain rigid discipline, and be perfectly free and untrammelled by any outside influences. The competency of a manager should be certified by an examination before a specially-appointed Board. The Commission consider that better results may be obtained if such examinations be oral, and probably assume a more practical form than those hitherto conducted in Great Britain for the same object.

10. The Commission do not approve of removing any responsibility from the management by increasing the power or number of the Inspectors. The visits of these officials should, so far as possible, be visits of surprise.

11. The Commission feel that the 4th clause in the present Act, relating to the spacing of cut-throughs, should be amended—to admit of any convenient or safe system of mining being pursued. This is a matter of detail that would be better out of the Act. The Commission would advise that the word should not occur at all, and that, if bratticing be used, or the air by some other satisfactory device be conveyed to the face, scope would be given to Managers to introduce systems of mining adapted to the circumstances of each particular coal-seam, with advantage to all concerned.

12. Complete sets of daily-report books should be provided, and kept in the mine or office, to be overlooked by the Inspector during his periodical visits.

13. Infringement of the regulations by either party should be followed by a summary form of justice, instituted before two Magistrates.

In conclusion, the Commission are well aware that no matter how stringent the regulations, or perfect the discipline, in a mine, or however strictly the industry may be fenced in by Acts of Parliament, accidents will happen.

Where gas exists the safety of the whole workmen is dependent upon the care and attention with which every individual deports himself. The lives of all hang on the actions of an individual, and the momentary carelessness of one may imperil the lives of those observing the regulations. It is impossible to suppose that men will not attempt to deviate from rules obviously necessary for the safe conduct of a mine. In such cases accidents must and will happen, which no Act of Parliament, skilful management, or human foresight can avert; but it is none the less necessary to frame regulations for the preservation of human life, and to maintain the observance of these, while strict and close discipline will certainly decrease the risk or number of accidents; and for this reason they should be rigidly enforced. Harmony and a community of feeling on the part of and between employers and employed would materially contribute towards this end.

The investigation of the accident at Bulli Colliery, with the object of ascertaining the cause of the deplorable loss of life that occurred, has convinced the Commissioners that the accident was due to lax discipline and reckless indifference on the part of the men and colliery officials that they were not prepared to discover

in a mine so long known and so high in popular estimation. They have endeavoured to expose the salient features of the points that require remedy, and that undoubtedly led up to the accident. This duty they have performed with much regret, and have expressed it fairly and dispassionately, yet fearlessly. They hope that the deplorable accident that necessitated this Inquiry, and the unworkmanlike and unsatisfactory practices that it has been their painful duty to expose in this report, will show the necessity to all engaged in mining pursuits and prove an incentive to mine managers to introduce at once precise and workmanlike systems of mining and of thoughtful regulations calculated to protect life and property, and to maintain these by strict and inflexible discipline. The Commission feel assured that, by closely observing good discipline and by pursuing correct and precise systems of mining, especially if backed up and aided by the hearty co-operation of the more thoughtful employees, disasters similar to that just investigated will, under the favourable conditions existing in this Colony, be rare, if not altogether averted.

JOHN OWENS.
JOHN JONES.
GEORGE O'MALLEY CLARKE.

Witness—AUGUSTUS VIALOUX.

Sydney, 12th July, 1887.

BULLI COLLIERY COMMISSION.

MINUTES OF EVIDENCE.

TUESDAY, 10 MAY, 1887.

Present:—

DR. ROBERTSON, M.D., F.G.S., C.E., PRESIDENT.

MR. G. O'MALLEY CLARKE, S.M.,
MR. NEILSON,
MR. J. OWENS,MR. CROUDACE,
MR. J. JONES,
MR. J. HILTON.

Alexander Lang sworn and examined:—

1. *President.*] What is your occupation? I was weighman and screen overseer at the Bulli Colliery. Mr. A. Lang.
2. How long have you been employed at the Bulli Colliery? About seven or eight years I think. 10 May, 1887.
3. Have you been employed during that time in the same capacity? Yes, I think I have been since they commenced to earn the coal.
4. Are you conversant with the internal workings of the mine? No, I cannot say I am.
5. Your duties have not called you into the mine? No; that is, very seldom.
6. Where were you at the date of the accident? I was outside then.
7. Do you recollect the day on which it occurred, and the time? It was about half-past 2 o'clock on Wednesday, the 23rd of March.
8. Where were you at the time? I expect I would be about 7 or 8 yards from the tunnel mouth.
9. How were you apprised of the accident? By the quantity of stuff coming out of the tunnel—a rush of vapour, carrying dust and chips, as if there had been a fall which caused a sudden rush of air.
10. Did it come out with some force? Yes.
11. How far did it drive the chips and dust you speak of? About 7 or 8 yards I think.
12. Did that recur? Yes, there were two of them, the second coming with less force.
13. What interval was there between the two? It was a matter of seconds; I think, perhaps fifteen or sixteen seconds.
14. Then after the first burst or discharge of rubbish, did you remark any return of the air or recoil? No, sir.
15. There were simply two discharges? Yes.
16. Did it make any noise? Yes.
17. In what way? The way I would describe it would be that a set of skips had come away from Hill End. That was my impression at the time.
18. Then the report was loud and distinct? Yes.
19. What occurred to you when you observed that? Well, after I saw it I got out of the way for fear a set of skips should come out.
20. Did you apprehend any danger? Not unless the tubs ran out.
21. When you saw the chips and rubbish forced out of the tunnel mouth as by a blast, did it not occur to you that an accident of a serious nature had happened? No, not until I had found that no tubs were coming out after it.
22. What proceeding did you take then—what did you do? I went to the tunnel mouth with my mate and saw a lad coming out. It was Herbert Cope, and he was calling for his mother.
23. What were his duties in the mine? He was a driver from the bottom of the Hill End incline.
24. Then what did you do after that—did this lad apprise you of the accident? No, I do not know what he was saying; he was in a very excited state. When we got him away two or three men got ready to go inside the mine.
25. Did you observe whether he was injured in any way? I believe he was injured; he could hardly walk and was staggering about.
26. Was that from fright or personal injury? From personal injury I should say.
27. Did you question him on the subject? No; but when I took him into the office he seemed to get worse, and blood came from his mouth; I thought he would not live.
28. He had been knocked down apparently? Yes.
29. What men came to your assistance? M'Dowell came first and helped me to carry the lad in. Then Hope and Scott and other miners came; also Mr. John Chalmers, the engineer.
30. Then yourself, Mr. Chalmers, Hope, and Scott proceeded into the mine, I suppose? Yes; Hope and Scott went first, and, as soon as we got the lamps, we went in with them.
31. Was it you who apprised them of the accident? No; I do not know who it was. They were going to work at the time and found that there was something wrong.
32. Very well; give us your own story as to what you did after you entered the mine? After we entered the mine the first thing I came across was some slabs of the overcast near the mouth of the tunnel, and when we got within some distance from the bottom of the Hill End incline we could not get any further on account of the bad air.
33. Did you notice any falls? No, we did not come to any serious falls then.
34. How far did you go in? We went in over 300 yards at first, and found some stoppings blown out. We put those stoppings up and then got to a fall which prevented us from proceeding further. It appears now that the distance to the fall is 375 yards. Then we came back again and went up the slacky road.
- [Witness here describes the road on the plan. The slacky road is a road that diverges to the bottom of the incline towards the left.]
35. Then you made your way from this road up to the incline again? Yes.
36. And when you got to the incline, what did you observe? On the Hill End incline the road was all fallen; and having got a short distance, we had to return again, as the air was bad, and the stone was coming down freely.

- Mr. A. Lang. 37. What was the condition of the ventilation at that point? There was very little ventilation up there at that time.
- 10 May, 1887. 38. Then you came back to the slacky road? Yes; and we met two lads coming out with a horse.
39. Where were they coming from? They were coming from the grip section.
40. The grip section is a district to the left? Yes; up that road past the furnace.
41. Did you have any conversation with those lads? Very little. They wanted to know what had happened. We did not know, but told them to put out their lights and go out. We went a little further and met Mr. White, the overman, and a man named Cavill. That was before we came to the road that joins the slacky road to the tunnel.
42. Had White any conception of what had happened? Well, he knew that something had happened.
43. Did you tell him what had happened at Hill End? No. He was carrying a naked light at the time, and we thought it would be better to put the light out. We were carrying a Davy lamp. The air was taking its course along the slacky road. White said there was no danger there; but the men were not satisfied to go further with the naked light, and he went out. Hope, Scott, Mr. Chalmers, and myself went across to the Hill End road.
44. On reaching the main tunnel, or Hill End incline, had the ventilation improved? No. There was not much ventilation there; in fact there was very little after we got into the Hill End. It was owing to this that we made such slow progress. After going a short distance we could scarcely breathe at all. I had not gone much further when some other men came in; and as I did not feel well they advised me to go out, which I did.
45. When did you again enter the mine? Not until it was all over. I felt ill after I got out, and was not able to re-enter the pit.
46. Did you know of the existence of gas in the mine before the accident—I refer to what is known as fire-damp? Yes, I believed there was gas there.
47. How long had you been aware of the existence of gas in the mine? It was not till after the strike that I knew it of my own personal knowledge.
48. How did you become aware of it then? I saw it when I went in with Mr. White on one occasion.
49. In what part was this? In the gassy section—that is the Hill End.
50. The Hill End is known as the gassy section? Yes.
51. In what part of the Hill End did you see the gas? It was either in No. 1 or No. 2 heading, but I believe it was in No. 2.
52. I suppose you are aware that Davy lamps have been used for some time by a section of the men at Bulli? Yes.
53. Do you know how long they have been in use? I cannot say how long, but I know that they have been used in the gassy section since it was opened out.
54. That was some time before the strike? Yes.
55. Who used to clean and light the lamps? A man named Metcalf did before the strike.
56. To whom was that duty delegated after the strike? I do not know that there was anyone.
57. Was no one appointed to that duty after the strike? Not to my knowledge.
58. Then is that all you know about the accident? That is all.
59. Mr. Neilson.] Can you give us any idea as to the proportion of the second explosion as compared with the first? The second one you say was not so strong. Was it one-half the strength or one-fourth? I do not think it would be one-fourth as strong.
60. Then the first was much the stronger? Yes; a great deal.
61. Did you notice any smoke coming out of the tunnel? No; there was no appearance of smoke, only dust and chips.
62. Did you notice whether the air was hot at the tunnel mouth as you entered? It did not seem very hot there; but was very sharp after we got some distance from the tunnel mouth.
63. Did you not notice any peculiar smell after these discharges from the tunnel mouth? No.
64. Mr. Clarke.] Can you say what interval elapsed between these two falls or explosions? I should say fifteen or sixteen seconds.
65. When you went in after the strike with White, was it by his invitation? Yes. It was a few days after the commencement of the strike—a matter of seven or eight days after the men had gone out.
66. Mr. Neilson.] That was before the new furnace was going? Yes.
67. Mr. Clarke.] Mr. White looked for the gas, to test it? Yes.
68. Did you see much or little there? I could not say what quantity.
69. Mr. Owens.] Do I understand that you saw nothing but dust and chips when the explosion took place—no flames? No.
70. When you examined the mine with Mr. White was he aware of the presence of gas? Yes.
71. He tried for it himself? Yes.
72. Mr. Jones.] In what particular bords did you find gas? Only in No. 1 heading. I think it was a very slight quantity, and a little in No. 2 heading. But I would not be certain about the headings.
73. Mr. Owens.] But you found the gas only in the two headings? Yes; and very little in one of them.
74. Mr. Hilton.] Previous to this occasion when you went in with Mr. White, how long was it since you visited the mine? I cannot tell you.
75. Approximately? Well, it might be six or seven months. I was up there once with Mr. Ross, when he was surveying. I was employed outside the pit. I did not go inside unless some accident happened on the road.
76. Had Mr. White any particular desire for you to accompany him on that occasion? No; I do not remember how the matter came up. He asked me to go in with him. I do not think I would have gone in unless he spoke to me about it.
77. Did you see any brattice fixed in the headings to carry the ventilation to the working places? No.
78. Mr. Croudace.] You say that when you went into the mine immediately after the explosion you came across a fall? Yes.
79. And that you went round the slacky road to the other end of the platform? Yes.
80. Have you been into the mine since and seen the same fall? Yes.
81. So that what is now known as the large fall is the same as that which you saw upon first entering the mine? Yes.

82. Did you hear any rumour about a man having been blown some distance on a coal heap? Yes. Mr. A. Lang.
83. Did you believe that? No.
84. Is there any coal heap immediately opposite the tunnel that he could be thrown on? There is a dirt heap there, below the level of the tunnel. There was a man in front of the tunnel—about 7 or 8 yards away, when this stuff came out. It was on the 4-foot road. He was carrying sleepers to the tunnel to send them in to the men. He was facing the blast, and it got into his eyes, but did not hurt him. 10 May, 1887.
85. What is the man's name? Henry Bokey.
86. Is he employed at the mine now? No.
87. Can you tell us where he is? No.
88. Have you any idea of his whereabouts? No. I think he went back to Sydney.
89. You are positive as to the want of force? Yes.
90. Did you ask him to go inside the mine with you? No.
91. Why not? Well, his eyes were bad I thought, and I did not ask him. Besides, we had not lamps sufficient, as far as I could see.
92. Was that the only reason—what was the reason you did not ask him to go into the mine with you? I had no reason. Those that went in were volunteers.
93. Do you know why he did not go in? No, except that he was complaining of his eyes.
94. Have you any knowledge whatever of the conduct of a mine? I have some knowledge of getting coal. I have been fourteen or fifteen years at it.
95. Did a horse come out about the same time that the boy came out of the tunnel? No. The horse was brought out by the horse-keeper afterwards.
96. How long after? About two hours and a half.
97. Did you see the horse? Yes, I saw him that night.
98. Was there any sign of burning on him? Yes, there were signs of singeing on the tail and mane.
99. Was it on the hair of the mane and tail only, or on the rump? There seemed to be slight singeing on the tail and rump, and the mane was slightly singed.
100. *President.*] Can you account for the horse only being singed on those two isolated spots? No, I did not examine him very closely.
101. What occurred to you as to the cause when you saw the marks of singeing on the tail and mane? Well, I saw that there had been a considerable deal of heat there if nothing else.
102. Heat being present, did you consider as to whether you would have expected other parts of the horse to be singed? No, I did not think much about it.
103. Supposing that the horse was surrounded by heated atmosphere, would you consider it likely that the heat would be centralised in two spots, or be distributed over the whole body of the horse? I did not examine it particularly, nor did I think much about it at all.
104. Was the horse severely singed? Not very severely. The hair was curled, as it were.
105. Was it burned and charred over a large space? As I have already said, I did not examine the horse closely for any burning. I just noticed what I have told you.
106. Then the horse was not otherwise injured? No.
107. *Mr. Jones.*] Was not the horse standing on the road leading to the grip at the time of the explosion? I do not know.
108. Where ought the horse to stand? It should stand on the grip road.
109. Would not that partially account for the burning being confined to particular spots, with a full blast coming out of the main tunnel? Yes, it might.
110. Having a knowledge that gas existed in the mine, were you much surprised when you saw the first blast—did you readily perceive what had happened? Well, not at first. My second impression was that something had happened.
111. You say that in going round to get above the fall you met White, the overman? Yes.
112. And one of you advised him to put out his light? Yes, one of the four of us.
113. Did he put out his light? I do not think he did. He went directly out.
114. *Mr. Clarke.*] Who was in charge of the horse you refer to? The lad Herbert Cope.
115. Did he show any symptoms of burning? No, none.
116. How far in the tunnel was he when you came across him? Not in the tunnel at all, he was outside.
117. Do you know how long afterwards it was when the horse was brought out? I should say about an hour or so.
118. *President.*] You say you saw no flame issue from the tunnel? No.
119. *Mr. Jones.*] Are you quite sure that the singeing upon the horse was the result of flame? No; I am not.
120. What do you suppose caused it? I do not suppose anything about it. I am quite sure as to the singeing, but there was no burning of the flesh.
121. *Mr. Clarke.*] Was the singeing confined to the tail, or did it extend further? It was singed from the buttock up to the mane.
122. *Mr. Jones.*] On which side of the horse did you observe the singeing? I believe it was on the near side, but I did not see the horse till he was outside.
123. *Mr. Hilton.*] Can you say whether you went as far as the western junction when you went into the mine? I did not go as far. I think I went about half way up the incline. [*The witness withdrew.*]

John Chalmers sworn and examined:—

124. *President.*] What are you by profession, Mr. Chalmers? I am engineer for the Bulli Coal-mining Company. Mr.
J. Chalmers.
125. Would your duties lead you into the mine? Yes, occasionally.
126. Are you conversant with the workings of the colliery? Only so far as the main roads are concerned. I have been in the other places occasionally, but very seldom. 10 May, 1887.
127. What took you off the main roads to examine those places? Curiosity, I suppose.
128. Then it was not your duty? No.
129. When were you apprized of this accident at the colliery? Shortly after it happened.
130. About what time would that be? About twenty-five minutes to 3 o'clock. 131.

Mr.
J. Chalmers.
10 May, 1887.

131. Where were you at the time? I was on the road between the pit and the township. The first I knew of it was when the engine-driver blew the whistle, when I turned back and met some men coming down who told me that the pit had blown up.
132. Who was it told you? Thomas Bissell.
133. How was he employed about the mine? He was a spare engine-driver.
134. And he had been up in the mine at the time? Yes.
135. He told you that the mine had blown up, and you then returned. What did you do when you reached the mine? I went to the tunnel mouth, and several men there told me they supposed the mine had blown up.
136. Did they state to you what they had seen? Yes.
137. And what was the story they narrated to you? They told me that there had been a great rush of wind, and a boy had come out of the tunnel mouth.
138. Did you see the boy? Yes; I saw him through the window of the cabin to which he had been taken.
139. Did he appear to be injured? Yes.
140. Did you notice in what way? No.
141. Then what did you do, Mr. Chalmers? I told one of the men to get some safety-lamps and canvas, and I then went inside with Lang, and found that Hope and Scott, who had preceded us, had penetrated 50 yards or so into the mine. We found that the overcast was blown up, and a man was put on to fix that whilst we proceeded further in. We found a stopping blown out on the right-hand side further up going in. We fixed that up as far as we could with stone and rubbish, and a few yards further in we were stopped by a fall. That was about 300 yards up. We turned back, and having seen that the overcast was put right, we went up the slacky road, by which means we reached the main tunnel.
142. What was the condition of the main tunnel at the time? There was a lot of timber lying about, and the air was very bad.
143. Did you hear many falls? No, we did not hear many falls; but it was working in many places.
144. Then there was considerable damage done in several places? Yes.
145. What did you do next? We went up, following the air as far as we could, and found another stopping out, about 800 yards from the tunnel mouth.
146. Was Lang still with you? No; he had turned back not long before that. There were three of us, and some others were coming up.
147. What were their names? There were M'Kenna, Richards, and some others, whose names I do not know.
148. Having reached a point about 200 yards from the tunnel mouth you found a stopping blown out, did you put that stopping right? Yes. That was a stopping on the left-hand side. I went for some canvas for it, but in the meantime some other men came in and put up the stopping. We afterwards came in and put a stopping in the mouth of the western.
149. How long after the accident was that? About two hours and a half, I should say.
150. By the time you reached the western did you find the ventilation restored? Yes; it kept getting better all the time.
151. Was it very hot in the main tunnel? Not very hot.
152. Did you notice any steam? No; I cannot say that I did.
153. Was the air bad? Yes; it was very bad. We could hardly see anything at first.

[NOTE.—The witness here refers to the plan and indicates the road that the party took to reach the main tunnel; and also points to the stopping that was blown down on the left-hand side.]

154. Then you got to the western junction about two or three hours after the accident? Yes; I believe we did.
155. Before reaching that point did you see any bodies? Yes; I saw about three or four.
156. Where were they lying? They were lying between the western and the flat.
157. Did you particularly examine the bodies? No; I did not examine them at all.
158. What did you do, then? We went outside again.
159. And when did you return to the mine? On the Saturday.
160. Did you see, or observe, the horse that the boy Cope had? No; I did not see the horse at all.
161. After you came out did you see the horse? Yes; I saw it in the stable that night.
162. Why did you visit the stable—were you in the habit of doing so? No; I was given to understand that there was a horse in the stable singed.
163. Well, in what condition did you find the horse? Its tail appeared to be singed.
164. Was it singed to a great extent or only slightly? It was slightly singed, just on the top of the tail.
165. Was the singeing circumscribed or diffused—was it confined to a small area of the horse's body? It would cover about 6 or 8 inches. Only the hair was singed.
166. Was it completely or only partially charred? I did not examine it that closely.
167. Did you notice the horse's mane? No.
168. You saw it was not injured to any great extent? Yes; I did not think it was injured much.
169. Did you account to your own satisfaction for the singeing? I did not try to account for it.
170. You state that your duties led you frequently into the mine? Yes.
171. And that your duties terminated at the main road? Yes.
172. But, that out of curiosity, you had visited the workings on several occasions. Do you recollect any particular districts that you visited out of curiosity? Yes, I was in the first bord, off No. 3 heading, before the explosion.
173. Had you ever been up No. 1 or No. 2 headings? I do not think I had been up them; I have been up No. 1 heading, but not far.
174. Did the men work with safety-lamps? I understood that safety-lamps were used.
175. Were you aware of the existence of gas in that district? By report, yes.
176. Not from personal observation? No.
177. Do you know whether the lamps were regularly locked? I do not know anything about the lamps; I never used one of them.

178. *Mr. Neilson.*] Have you extended the engine plan latterly? Yes; we started the engine to run 300 yards per minute before the explosion.

[NOTE.—Witness describes on the plan the manner in which certain roads were diverted.]

179. The alterations made did not interfere with any doors or stoppings? No; we only put a tail rope through the door alongside the wall. That is all we did so far as the ventilation was concerned.

180. *Mr. Hilton.*] You know the door at the western junction? Yes; it is a door with two regulating slides to it.

181. Was that door subject to frequent openings? Only when anyone passed through, or when an engine set was running?

182. *Mr. Owens.*] You know that big fall on the right-hand side about 300 yards from the tunnel mouth? Yes.

183. Was that there when you first entered the tunnel mouth after the explosion? Yes.

184. You have been there since? Yes; there is some of it cleared away now.

185. *Mr. Jones.*] Did you carefully examine that horse? No.

186. You cannot say that there were no other burns upon it than those you have spoken of? No.

187. *Mr. Clarke.*] Did you come in contact with the men working in the gassy section at any time? I used to see the wheelers; at times I would come in contact with them.

188. Did you ever hear any rumours as to the presence of gas in dangerous quantities in that section? No; and if I had thought it was so, I would not have been there.

189. Did you ever hear any statement to that effect, or any complaint or expression of fear, with regard to gas in the mine? No.

190. Then you never heard any rumour of imminent danger? No. [*The witness withdrew.*]

Mr. J.
Chalmers.

10 May, 1887.

Herbert Cope sworn and examined:—

191. *President.*] What is your occupation? I am a wheeler engaged at the Bulli Colliery.

192. You were engaged driving a horse there? Yes. I used to drive a horse from the bottom of the incline to the tunnel mouth.

193. Were you on Wednesday—the day of the accident—at the Bulli Colliery? I was inside the mine.

194. At what point were you? I was just about half way in between the tunnel and the end of the flat.

195. The end of the flat terminates at the overcast, does it not? Yes. I was not so far in as that.

196. You would go from the tunnel to the overcast? Yes.

197. What were you doing at the time of the accident? I was following a full set of skips out.

198. Well, what did you experience—what did you feel? I did not feel anything, I heard the ropes shake first.

199. Yes, and what occurred after that? I do not remember anything else, except being knocked down.

200. Where were you knocked down? I was pushed up against a prop.

201. Were you considerably hurt? No, I was not very much hurt.

202. And you do not recollect what occurred after you were knocked down? No.

203. Did you see any flame? I saw what was similar to flame.

204. What was that? Well I cannot say whether it was flame or not.

205. Or whether it was the violence with which you were dashed against the prop? Yes. I cannot say.

206. Did you see any smoke? Yes, I saw it in front of me.

207. And a rush of dust and rubbish? Yes.

208. Then you picked yourself up and came out? Yes, and I passed the horse, which was standing in the grip road.

209. You were between the junction of the grip road and the overcast? Yes.

210. Did you notice whether the horse was injured when you passed him? I did not see the horse when I passed him. The horse was standing in the grip road in order to let the full trucks pass.

211. Then you simply picked yourself up and ran out to daylight? Yes.

212. Have you worked inside the mine? Yes.

213. In what part? In the western.

214. How long ago was that? A few months before the strike.

215. Did you wheel into the face of No. 1 or No. 2 headings, or No. 3 or No. 4 headings, or where? No; I used to be acting as trapper.

216. Were you ever in the workings of the Hill End district? No.

217. Were you aware of the presence of gas in that district? No; but I have heard of it.

218. Do you recollect the condition of the air in the tunnel when you were making your way out? No.

219. That is, further than what you have described as to the smoke and dust? Yes; that is all I noticed.

220. Do you recollect a rush of wind coming before you were knocked down? No.

221. Then you do not know what force knocked you down? No.

222. *Mr. Neilson.*] Did you notice whether the smoke felt hot? Yes, it did.

223. *Mr. Hilton.*] Did you hear any noises at all? No; I just heard the rope shake.

224. *Mr. Owens.*] Were you affected by any excessive heat? No.

225. And you would not be sure whether you saw any fire or blaze? No.

226. *Mr. Jones.*] Did you see the horse after you recovered? Yes.

227. To what extent was it burnt? Its head was a little singed round the mouth.

228. Was any other part burnt? The tail was a little singed also.

229. Was it on the side near the main tunnel? Yes.

230. And the horse was facing the mouth of the tunnel? Yes.

231. *President.*] Can you account for the horse only being singed on the head and tail? No.

232. Did you use an ordinary miner's lamp? I used a flaming lamp.

233. Are you sure the horse did not receive those singes from the flame of your lamp? Yes, I am.

234. Did you ever take off the tail chain of the horse? Yes.

235. Could not an accident in connection with that proceeding account for the singeing under the chin and the tail? No; I think not.

Mr. H. Cope.

10 May, 1887.

- Mr. H. Cope. 236. *Mr. Jones.*] You would be naturally confused at the time of the accident? Yes.
 237. And you saw no fire you say? No.
 10 May, 1887. 238. *Mr. Croudace.*] Did you notice whether the horse was burnt prior to the accident? No.
 239. And you could not say whether it was burnt before or not? No.
 240. You are quite sure the horse was standing with its head to the tunnel mouth? Yes; at least that is the way I left it.
 241. Was there any singeing upon the horse other than you have described? I noticed some on the tail and some on the mane. That was all. [*The witness withdrew.*]

Wm. Scott sworn and examined:—

- Mr. Wm. Scott. 242. *President.*] What is your occupation? I am a miner, engaged at Bulli.
 10 May, 1887. 243. How long have you been a miner? About 18 years.
 244. Where have you been principally engaged? In the north of England.
 245. In what part of the north of England? In the county of Durham, near Newcastle.
 246. Have you ever worked in mines where there was fire-damp? A little; not much.
 247. Did you ever work with Davy lamps in Durham? Yes.
 248. You are conversant with the rules and regulations applying to fiery collieries? I was not very much in fiery mines.
 249. How long were you engaged at the Bulli Colliery? I was engaged there five weeks before the strike.
 250. And since the strike how long? I worked there about a fortnight after the strike.
 251. Were you employed at the colliery at the time of the accident? Yes.
 252. Where were you employed—in what part of the colliery? In No. 1 heading.
 253. That was in the Hill End district? Yes.
 254. Were you on the day shift or the night shift? I was on the night shift.
 255. What time did you commence work on the night shift? Generally about 4 o'clock.
 256. We understand that you were proceeding to the mine when the accident occurred? I was just putting my clothes on at the time.
 257. Who told you of the accident? We heard the report of it.
 258. What was the nature of the noise you heard? I thought it was a tree falling at first. My mates said they thought it was that. We asked some men who were passing, and we then heard of the explosion.
 259. What did you do then? We got lamps and went into the tunnel mouth.
 260. What condition was the tunnel mouth in—was it full of dust and smoke? Well, it was taking the air when we got there—it was going back again, you know.
 261. Was Hope with you? Yes.
 262. You got safety-lamps before proceeding into the tunnel. How far did you go? Well, I cannot say exactly the distance. We went just over the siding points.
 263. These siding points do you mean, down to the grip? No, beyond that, on the main tunnel, at the foot of the incline.
 264. Before you come there, is there an overcast? Yes.
 265. Did you observe anything peculiar about that? No. We could see very little at that time when we went in with the Davy lamps.
 266. Was the air hot? Yes, rather hot.
 267. Was after-damp present—could you detect it? No; I could not say so.
 268. Did you think the peculiar atmosphere could be accounted for by the state of the ventilation at the time? It was very like after-damp.
 269. Could you smell it? Yes.
 270. Then, having got as far as the foot of the incline, what occurred then? Well, we stood looking round for a time. There was some timber knocked about there; and presently we saw two lights coming along. It was Chalmers and Lang. We then went up further till we came to a fall, which we could not get over. We filled up a stopping just there which had been blown out on the right-hand side as you go in.
 271. Was that fall of sufficient size to account for the interruption to the ventilation? It would doubtless stop the air a good deal.
 272. On reaching this fall and finding that you could not get over it, what did you do? I think I asked Chalmers if there was no other road up. He said there was, referring to the slacky road, and we returned and went up that road.
 273. That is the road leading down to what is known as the grip section? Yes.
 274. Then you proceeded along that heading, turned off to the right, and along the horse road? Yes; and got to the tunnel further in.
 275. Were there any falls there—at that point? Yes, there were falls there.
 276. Were they sufficient to bar your progress? No; we got over them.
 277. How far did you proceed? I should say about half-way between the top of the incline and where the skips meet.
 278. What did you observe at that point? I noticed a stopping blown out on the left-hand side.
 279. Did you repair the stopping? No; we returned for the purpose of getting the material to repair it.
 280. Did you pay any attention to the state of the ventilation at this time—was it getting better? Yes, it was getting better as we proceeded inwards as I have said; but after reaching this point we could not get any further.
 281. Then you returned to the outside? Yes.
 282. Did you again go into the workings? Yes.
 283. When did you enter the workings again? It was not long after we came out, I could not say exactly how long.
 284. Did you repair the stopping? No. The stopping was repaired in the interval by some others. We then entered the western.

Mr.
Wm. Scott.
10 May, 1887.

285. What condition was the ventilation in when you got there? There seemed to be more air going to the western than to the Hill End district.
286. The ventilation was restored along the tunnel? Yes.
287. And arriving at the western what did you do? Finding a door blown down at the mouth of that heading we put up a stopping to send the air down to Hill End.
288. Did you go any further than the western? No.
289. Was the atmosphere hot there? Well, it was rather hot; but cooling down greatly.
290. Before arriving at the western junction did you observe the condition of the props on the road? No.
291. Did you not notice whether they had changed in appearance? The sheaves and rollers were blown up.
292. Did you not observe whether the props were charred or coated with dust? No.
293. Did you observe any of the bodies of the miners? Yes, I saw one on the flat, and five others about the western road end.
294. Could you identify them? The only one I could recognise was Melville. I did not know any of the others.
295. Did any of your mates identify the others? A man named Wm. Joel, I believe, identified one of them. He was an engine man outside.
296. Did you closely observe the condition of those bodies? No, not particularly.
297. You did not look as to whether they were singed, or whether they died from after-damp; or as to their general condition, whether they had been tossed about in any way? No, I never examined any of them except Melville. He was a big man; and I knew him by his neck.
298. At the top of the incline did you notice anything peculiar about the skips there? No.
299. Did you notice whether they were knocked about? No, I did not take much notice, for I was not in very good fettle when I went in the second time.
300. Did you go in further than the western junction? No.
301. In what part of the tunnel or district were you employed? In No. 1 heading.
302. Do you mean in the heading itself? Yes, we were working a contract.
303. You were driving the heading? Yes.
304. As a rescuer did you enter No. 1 and No. 2 headings? On Thursday, the next morning, I did, in company with Mr. McCabe, Mr. Green, Noah Hobbs, J. Charlton, and John Wynne.
305. In going up the headings, did you examine the bords? I never was in one of the bords. Messrs. McCabe and Green were there.
306. Did you notice any of the bodies lying along the headings? Yes, I noticed sixteen or seventeen bodies.
307. Did any of your party identify the bodies? Two of them were identified—Millwood and John Westwood.
308. Where were they found—on the heading or in the bords? On the main heading.
309. In what positions were they found as near as you can recollect? Millwood was found sitting between the first and second bord by the rib side.
310. Against the coal? Yes.
311. And what positions did the other bodies occupy? Westwood was sitting by a pillar—the last that was standing between No. 1 and No. 2.
312. And between Millwood and Westwood several bodies were got? Yes.
313. Did you examine those bodies and satisfy yourself as to whether the men died from the immediate and direct effect of the blast of an explosion, or from after-damp? I did not examine them for that.
314. Millwood was in a sitting posture you say? Yes.
315. And Westwood, in what position was he? He was half sitting and half lying.
316. Where did Westwood work? In No. 2 heading.
317. And do I understand you to say that you did not carefully examine any of those bodies? Yes; I did not examine them.
318. In working in No. 1 heading did you use safety-lamps? Yes.
319. And did you strictly observe the rule of working with safety-lamps? Yes.
320. Were the lamps locked? No; only during the first two shifts, when we started to work.
321. Did you examine any of the props in the heading to see whether they were scorched or burnt in any way? Not in the heading.
322. You did not examine the condition of the heading or the prop? In the bord end we examined the props on one occasion, and found them charred a little.
323. What conclusion did you arrive at from the general appearance of the heading, and the bodies being found there? I scarcely understand you.
324. Did it occur to you that an explosion had taken place? Yes, certainly.
325. Well, that is what I wished to ascertain. As to the cause of the men's death, what conclusion did you arrive at? I thought it was through the explosion.
326. Before the accident did you observe gas in No. 1 heading? Yes.
327. Where did the gas issue from? I think it was on the Friday or Saturday before the accident, we had a roll there, and the gas issued from that.
328. In what way did it first make its appearance—did you hear it blowing? No. We saw it after trying when we got the stone.
329. Was there any quantity of gas in the heading after that? No, not in our heading.
330. Had you much gas in No. 2 heading? No; I was never in it but once. I was in the Monday night before the accident. We had a drilling machine, and a man came and asked us if we would bore a hole with it.
331. There was a roll also in the face of No. 2 heading? Yes.
332. Did you use safety-lamps while you were boring that hole? Yes.
333. Did you of your own knowledge know there was gas in the heading? No; that is, I never tried for it.
334. Did the deputy visit you occasionally while you were at work? Yes.
335. Did you have any conversation with him as to the presence of gas in No. 1 heading? No; except that after we did get it, he warned us one or two shifts after, to be careful with the lamps as there was a little gas in the face.

- Mr. Wm. Scott.
10 May, 1887.
336. Did you ever have any conversation with the deputy on his rounds as to the presence of gas in the mine? No, sir.
337. You did not report it to him? No.
338. Why did you not report it to him? Well, he knew it himself.
339. Was there a night deputy? No.
340. Can you give any reason why the lamps were not locked? No, I cannot.
341. Have you read that section of the Coal-mines Regulation Act applying to the use of safety-lamps? No, I do not think I have.
342. Are there not special rules applying to safety-lamps? Yes; I have read them since the explosion. But I never had a copy before that took place.
343. You knew you were entitled to a copy of the rules? Yes.
344. Did you not ask for one? No.
345. Why did you not ask for one when you knew that you were entitled to it? Well, I never had any rules since I began to work. There were none at the collieries I was at.
346. You see now, however, that in not reporting the circumstance of those unlocked safety-lamps, you were committing an infringement of the Act? Well, as I have said before, the deputy knew they were not locked.
347. How did he know that? He knew he did not lock them.
348. In not reporting to the inspector, did it occur to you that you were incurring an infringement of the Act? No.
349. How did you work the coal in No. 1 heading? We holed it and shot it; sometimes we cut both sides.
350. In blasting, what explosive did you use? We used compressed powder, and a fuse.
351. How did you light the fuse? With a touch, on which we canted the lamp.
352. Did you fire the shots yourselves? Yes. We sent for the deputy once, and he told us to fire the shots ourselves. He never fired any for us.
353. With what material did you tamp the shots? Sometimes small coal, and at others we used anything we could pick up.
354. Did you damp the coal? Yes, generally.
355. Did you consider that method of lighting the fuse a safe method? I thought it was safe at the time.
356. Did you ever really consider the safety or otherwise of it? Well, I cannot say that I did very much.
357. Did you ever observe the gas to fire at your heading? No.
358. Did you hear at any time of the gas having fired in your heading? Yes; I heard of it having lighted up the night before.
359. Who told you? It was my mate Hope, and the boy.
360. Who told Hope? He saw it, I think.
361. What did he tell you? Well, I was in the face, and he was away back, and he told us to keep down, as the gas had fired. When I got up it was out.
362. Where did it fire? At the wheeler's lamp.
363. Do you know at what point the wheeler fired the gas; was it inside the stenton? It was at the danger-board.
364. And with the heading so full of gas that it fired at that point, do you think it was a safe practice to light the fuse by tilting the lamp? Well, I think it would have been a bad job for us if it had fired that night.
365. You say the gas fired? Yes, but that was about 20 yards back from the face.
366. Did the wheeler on all occasions hang his lamp at the danger-board? I did not take that much notice.
367. Did you ever notice if he came in with a naked light? He never came in with a naked light.
368. How did the deputy come to the face of the heading? He often came up without a light.
369. Did you receive any extra price for working in the gassy section on account of using safety-lamps? Yes, we received 3d. per ton extra.
370. Did you receive the extra tonnage in order that you might display greater care and caution? Well, there is more difficulty in working with a safety-lamp than with a naked light.
371. Was it not a precaution against accident—so that you could take extra care and use caution? Yes, I suppose so.
372. And notwithstanding that, you adopted the plan of lighting the fuse by allowing the flame of your lamp to pass through the gauze? Yes.
373. When you were told that the gas had fired in your heading, did you make any report to the manager or overman? No.
374. Are you now aware that by refraining from reporting this circumstance to the manager or the overman you were infringing the general rules? Well, I never got a chance to report to anyone.
375. How was that? We did not see anyone. It was 12 o'clock before we got home from work that night.
376. Could you not have done so next day? We had not much time next day. We were looking after ourselves.
377. To put it in another light, did you not consider that by not reporting this circumstance you were endangering the lives of your fellow-workmen? Well, I do not know.

[Rule 15 read :—Should fire-damp be found in any place in the pit where naked lights are used, a danger signal must be set up across the entrance to such place, beyond which no person must go (except those authorized to examine and remove the evil) until the place is restored to its proper working order, and permission given. Should any unexpected discharge of gas occur, the overman must order all naked lights to be extinguished, withdraw the men and boys, and make the manager acquainted with the case, in order that the evil may be remedied, and the places restored to their proper working order. Hewers and others, when using naked lights, are strictly cautioned against the discharge of gas, where faults, rolls, and backs are met with, and on its appearance, they shall immediately leave the place and report to the overman, and shall on no account return to the place without proper authority.] 378.

Mr.
Wm. Scott.
10 May, 1887.

378. Do you not think that the occurrence of gas in such quantity that it lighted at the danger-board, implied that some danger existed? Well, if there had been much danger I think we should have reported it.
379. Do not you think that gas being present in such quantity as to fire at the nearest cut-through was a sufficient reason why you should have reported to the management? Well, we did not report it.
380. I suppose you are aware that these special rules are intended to ensure safety in the working and maintain discipline? Yes.
381. You say the wheelers or deputy never approached the face of No. 1 with a light? Not with an open light.
382. Before firing a shot did you take any precautions to get quit of any gas that might have accumulated in the heading? We would search for it, and if we found it present in any quantity we would not fire the shot.
383. What measures would you have taken to get rid of the gas if you had found it present in large quantities? There was, as a matter of fact, never much to get rid of.
384. Was there much dust in that part of the mine where you worked—was it a dry mine? Yes. There was not much dust in the heading that I worked in; I could not say what there would be in other parts—in the bords.
385. Did you apprehend any danger from the presence of dust in the mine? No, sir.
386. Were you aware that coal-dust in a mine is liable to explode under certain conditions? I have been told so, but was not aware of it before that.
387. Was that since or before the accident? Since the accident.
388. In that section of the colliery where the use of safety-lamps was enjoined, were the men in the habit of taking tobacco-pipes or matches in with them? Yes, as far as the danger-board.
389. Would they ever take them beyond that? No; we always put our clothes off at the danger-board.
390. Where did you smoke? Outside the danger-board.
391. Would that be immediately against the danger-board? No; not immediately against it—a yard or two away, perhaps.
392. Did it occur to you that there was something inconsistent in men who were obliged to work with safety-lamps taking tobacco to the face? No, sir.
393. Do you know what the practice with regard to smoking materials is in the larger and better regulated collieries in England? Yes; I know they will hardly allow pipes to go into a pit, let alone matches.
394. In the light of subsequent events do you think a similar rule ought to be enjoined in this district, where safety-lamps are used? Yes; I am of that opinion.
395. Then your opinion as to this accident was that it was the result of an explosion of fire-damp? Yes; I thought that was the cause of it.
396. *Mr. Neilson.*] What collieries did you work at in the old country? I worked at a place called Pit Hill for fourteen or fifteen years.
397. Was there any gas there? A little occasionally.
398. You say you were never supplied with any rules? No.
399. When you reached the fall in the main tunnel, did you detect any sign of powder smoke? No; I noticed the smell of after-damp.
400. Was it usual to find some gas when you struck these rolls that have been referred to? Well, I never had much practice in Bulli; I was about seven weeks in it altogether.
401. You were on contract in that district? Yes.
402. On the visits of the overman and deputy, I suppose, a general conversation would take place among you? When we met the deputy we generally asked him about the work, and he would reply. We had started on the night shift just before the explosion, and he told us what it was like.
403. Did your ever have any conversation with the overman and deputy? A little; the same as I would with the other men.
404. Did you ever brush the gas away from the face before you lit the fuse? No; I never saw that much in the face.
405. Did you ever hear of Millwood doing so? No.
406. You stated, in answer to the President, that you left the mine at 12 o'clock on the occasion when the gas fired at your heading. How far do you live from the residence of Mr. White, the overman? About 200 yards.
407. Would it have taken you long to go and report that circumstance to White if necessary? No; it would not have taken us long.
408. But you did not think it necessary? Well, I suppose we did not.
409. *Mr. Hilton.*] Can you say whether or not there was ever any gas in the place previous to your firing the shots? There was gas before we went in—before firing the shots.
410. At the time of firing the shots, did you try immediately previous to ascertain if there was gas in the face? Not until we cut the stone, I think.
411. You say that smoking was indulged in outside the danger-board—was the overman aware of that practice? I cannot say.
412. Do you know if Millwood ever saw anyone smoking there? I cannot say.
413. Did you ever receive a copy of the Bulli special rules? No; I had no knowledge of them before the explosion.
414. Did you apprehend any danger from gas previous to the explosion? No, not in our heading.
415. Did you ever see bratticing used in any of the working places of the mine—in your own, for instance, or any other? I never saw brattice used there.
416. How long did you work in Bulli altogether? I worked there seven weeks.
417. Did you send for the deputy to fire your shots? I sent for him the first morning.
418. Did he fire it himself? No, we fired it.
419. Did he show you how to fire the fuse by tilting the flame of your lamp against the gauze? No.
420. In what way did he tell you to fire the shots? He did not tell us at all.
421. Did he not tell you not to use naked lights? No; he told us to be careful when we got the gas.

Mr.
Wm. Scott.
10 May, 1887.

422. Who would lock your lamps? Millwood, the deputy. As a rule, no man has his lamp locked unless the deputy locks it for him.
423. Are you aware of any rule that would prevent you reporting danger to the deputy? Well, I think I would be interfering a little.
424. You are of opinion (referring to rule 13) that if you were out of your own place and seeking for the deputy, say, you would be coming within the meaning of that clause? Perhaps.
425. Do you think you would be interfering with the management in any way if you reported the existence of gas in the pit? I think I should be interfering a little.
426. Then on that account, if you saw danger, you would not report it—is that so? No; I do not say that.
427. Well, if you saw danger, would you report it? If there was great danger I would.
428. *Mr. Jones.*] On entering the mine for the first time after the explosion are you quite sure that it was the stopping on the right side that you saw blown in? I think it was on the right-hand side.
429. What side was the first stopping? The right-hand side.
430. Were you among the first of the explorers? Yes.
431. Are you sure that Millwood's body was found, as you say, between the first and second bord? I would not like to be sure; but I know that it was found in a sitting position somewhere near there.
432. You saw other bodies lying down. Did they look as if the men had been in the act of running out of the mine? Yes.
433. Was there not a bord being turned away close by there? Yes; a little way outside the stenton.
434. Had they worked with naked lights? Yes.
435. Do you think that was an evidence of good mining? No; I think it was a source of danger.
436. Yet they were allowed to work in that way? Yes.
437. And the only reason you had for not reporting the presence of gas to the deputy or the manager was that they were aware of it? Yes.
438. That is the only reason you did not go out of your way to report it? Well, as I have said, I had no call to report it, as they were themselves aware of it.
439. I think you have already stated—I am not sure—that it was the custom for the deputy to fire the shots in some portions of No. 2 heading? Not Millwood. I think Crawford used to before the strike.
440. Do you know how he did it? I never saw him fire one; but, I think, I have heard that he used a wire.
441. *Mr. Clarke.*] Are you personally aware that the management knew of the gas catching fire at night? No.
442. Do you not think that gas in such quantities catching fire was an element of danger? It might be. But I have seen bits of blowers at home when we have not reported them, if we thought there was no danger there.
443. Then it was not in consequence of this 6th rule of the colliery special rules that you did not report the occurrence you have described? No; if we had seen the deputy on that night we should probably have reported it.
444. But do you still think that reporting would be an interference with the management of the mine? Yes; I think it would have a little to do with it.
445. *Mr. Croudace.*] Where you worked in England did they lock your lamps? Yes.
446. Did the deputy examine your lamp here after you received it from the lamp man? No, sir.
447. With the knowledge you had at home of fiery mines, and the great caution used, do not you think that you received sufficient warning or teaching to show you that you should have done or said something yourself relative to these lamps being unlocked as they were given to you—I mean with the view to prevent a recurrence of such experience? Well, I do not think there was any necessity for me to tell him of a thing he knew about as well as I did.
448. You did not think it was necessary, after all the care and caution you had seen exercised at home, to caution anyone out here about it? The fact is, I have not been very much among the men here, and I do not see any more danger in the lamp being unlocked than locked, provided a man keeps the bottom on.
449. That is your opinion? Yes.
450. Now the question I am about to ask has been put before, but I think it necessary to ask you again. When you tilted your lamp to light your fuse, did not the flame come outside and strike the edge of your touch-paper? I do not think if we held the lamp over twenty times the flame would come through the gauze. It would make the gauze red-hot, but the flame would not come through.
451. Could you light the touch-paper before the gauze was red-hot? No.
452. Had you to hold it till the gauze was red-hot? Well, I don't know whether the gauze would be red-hot exactly, but I suppose it would be; I know the gauze has been burnt.
453. Was that in your opinion a right or proper thing to do? No, it was not.
454. Have you not lit your fuse by lifting the top of the lamp, as miners frequently do? No, I have not.
455. You have stated that the mine was rather dusty. Where did you get your damp stemming from? I never stemmed with anything else but coal. I am not accustomed to use dry tamping; it comes back too often.
456. You say that the boy's lamp lit up the gas at the caution-board? Yes.
457. Did I understand you to say that you or your mate were turning away a bord near there? The in-by side of the stenton, and between that and the danger-board.
458. Did not the gas come up to you in the face where you were working? No.
459. Has not No. 1 heading a slightly rising tendency all the way? I think it has; it is ballasted up now.
460. What appears strange to me is this—that knowing the air is travelling along No. 1 heading, and going through the stenton into No. 2 heading, and so on, that you should be on the in-by side of the rise heading and the gas should be on the out-by side. Was the stenton at a higher point than when you were in the face? I do not think it was higher at the stenton than it was in the face.
461. Was there much gas there when it lit up? No, I don't think there was.
462. As a man accustomed to fiery mines, did you think there was anything in the condition of No. 1 heading to cause you the slightest fear or anxiety? Well, if there had been any there that night—that is any large quantity—it would have been a bad thing for us. There was just a little. I tried before I lit the shot, and found a little.

Mr.
Wm. Scott.
10 May, 1887.

463. Was there much gas present during the time you worked in that heading? No; there was not much.
464. As much as you would see in fifty mines in England, I suppose? Yes.
465. Did you hear at any time of gas being found in any of the bords off No. 1 heading during the time you were working on the out-by side? No; I never spoke to any of the men who were working in the bords.
466. Have you any knowledge of how your heading was ventilated, or as to how the air reached you? We had a very good supply along the heading.
467. Had you a good current of air generally up to the face from stenton to stenton? We started within a yard or two on the in-by side of the stenton, and it brought a fair quantity of air all the way.
468. From the last stenton up to the face where you were working, did you see any necessity for the use of brattice on account of gas accumulating? I never saw any gas in our place till we got this stone, and that was on the Friday or the Saturday before the explosion.
469. Did you perceive any necessity for the use of brattice? Not in our heading.
470. The gas made its appearance when you reached the roll? Yes.
471. Are these rolls of frequent occurrence in the district? Well, I cannot give you an answer to that, as this I speak of was only the second one I came to.
472. Was there a door across the main engine brow to force the air into your No. 1 heading? Yes, sir.
473. Would the leaving open of that door affect the ventilation of your heading? Yes, it would.
474. Have you ever seen that door left open? There was a trapper kept at the door to open and shut it.
475. Going along the headings, and in the stentons between Nos. 1 and 2 headings, what sort of stoppings had you? They were stone and slack, I think.
476. Could you give me any idea of the thickness of them? No; I could not.
477. Could you give me any idea of the quantity of air you had at No. 1 stenton,—that next the face? No; I could not give you an idea of the quantity of air returned.
478. Have you never heard the manager or overman, or one of the inspectors, pass a remark such as "Well, you have a first-class current of air here—so many thousand feet,"—giving the quantity? No, I have never seen one of the inspectors there yet.
479. When you were on the night shift? Aye, or when I was on the day shift.
480. Did you not know the quantity of air going round them—10,000 or 12,000 cubic feet? I did not know the quantity of air passing.
481. *President.*] The amount of ventilation satisfied you? Oh, yes.
482. *Mr. Croudace.*] Referring to rule 6, I think I understood you to say that it would probably act as a deterrent against your reporting the presence of gas? Well, I think it would a little.
483. The rule says,—“Any employee interfering in any way with the orders issued by the colliery manager or his overman, for regulating the work of the mine, shall be liable to dismissal without notice.” Now, I want to see if you can in any possible shape or form construe this No. 6 rule in such a fashion as seems to have got into your mind—that you should not report gas or any other danger that might appear. For instance, I will ask you in the first place, has there ever been, to your knowledge, an order issued by the manager or his overman, or the deputy, against your reporting gas in the mine, or bad roof, misconduct or carelessness on the part of the men, or anything else that might lead to evil consequences to yourself or others? No, sir.
484. Then do you think that No. 6 rule could possibly, in any shape or form, prevent you from reporting that you had met with gas. After I have read it to you in the way I have done, and asked you the question whether you have received such orders against, do you think No. 6 rule could or should in any way prevent you from giving such information as would possibly lead to the prevention of a serious accident? Well, I would like to know what that rule has been put there for.
485. Well, it is scarcely for me to explain it to you, but if I were to, I should explain it something after this fashion:—Supposing the overman had ordered your heading No. 1 to be stopped, and that no one was to go into that heading, and some one came and said: “What has that to do with it?—you go in, Bill”; that would be a direct violation of No. 6 rule, because it would be a breach of a special order issued by a person in authority. Or to put it in another form—supposing an official in charge were to order the men to go on the western plane instead of the Hill End, and some one else were to order them to do the contrary, that would be a violation of all discipline, would it not? Yes.
486. But surely the reporting of an existing and imminent danger does not come within the rule. Supposing you came across a heavy blower in No. 1, would you not warn the men near you and the deputy? Yes, I think I would.
487. *President.*] Then it was just a question of the amount of danger that would restrain you from reporting, or the opposite? If there had been in my opinion a great amount of danger there, I think I would have reported it.
488. *Mr. Hilton.*] Was there ever an impression created in your mind that it was wrong to allow those who were using Davy lamps to go into the mine with their lamps unlocked? Well, I knew that it was wrong before we went in.
489. Was there at any time within your knowledge a person appointed to see that the lamps were locked? Millwood locked them twice after the strike, and Crawford locked them before the strike.
490. Then Millwood was appointed to see that the lamps were locked? Yes; I think so.
491. Can you say whether it was negligence or oversight that caused the practice to be discontinued? No, I cannot.
492. From the time that the lamps were locked until you were allowed to take them in unlocked, how long was it? I do not know.
493. What period elapsed between the time when Millwood locked your lamps and when he discontinued locking them? He locked them the first two days, and never locked them afterwards.
494. *Mr. Jones.*] Was the method of firing the shots adopted by you the customary method throughout the colliery? I cannot say as to that; it was just a method adopted by ourselves.
495. Was the management aware of your mode of firing the shots? They never inquired.
496. Then you never received any specific instructions on that subject? No.
497. *President.*] Did you ever see shots fired by means of a wire passed through the gauze? Yes.
498. Do you think that would be a safer way of firing shots? Yes; I think it would have been better than the other way.

- Mr. Wm. Scott.
10 May, 1887.
499. If, in tilting the lamp, the flame passed from the inside of the lamp to the outside, where the fuse was applied, what additional safety would there have been in locking the lamps, seeing that by your own act the flame passed through the gauze? I do not see how it would come through.
500. You know the flame was on the inside, and the fuse on the outside, and you had to connect the light with the fuse? Well, you can make the touch-paper take hold very quickly.
501. No doubt; but you are convinced that it would be safer to adopt the method of applying the wire? Yes, I think so, certainly.
502. You stated, in answer to a question by Mr. Jones, I think, that it was an evidence of bad mining to allow naked lights in a bord (No. 8) which is broken off about a yard or 1½ yard below the last stenton close to the caution-board? Yes.
503. In what way was it dangerous to permit naked lights in that heading, where there was no gas? I do not think there was much gas in that heading.
504. That is what I am coming to. If no gas existed in the bords, and as far as we have heard we know of no gas in the bords off No. 1 heading, what danger was there in working with naked lights in those bords. You see I want you to revert to the answer you gave to a question by Mr. Jones as to No. 8 bord. You stated that it was an evidence of bad mining, or something to that effect, to allow naked lights there? Well, if they were accustomed to get blowers in the heading, they might expect to get it in the bords as well.
505. You have no right to anticipate the blowers. Of course, if they had reason to fear such, they would require to take precautions. Did you hear of any gas being seen in the bords off No. 1 heading? Yes; I think I heard of it from one of the strange men that came there.
506. Do you know who it was that told you? I heard one of the men going home saying that he had seen gas in his bord that morning. I think it was the morning of the explosion.
507. Do you know the man? No, he was a stranger; I cannot tell his name. I just heard one man telling another.
508. Mr. Jones.] Will you inform the Commission if the name should occur to you? Yes.
509. President.] Try and recollect where you were, and under what circumstances you heard the remark made; that will probably assist you in recollecting, and, if so, will you indicate the name to us? Yes, I will try to find out by asking the man, whom I know by sight.
510. Who was it that turned away the last bord? It was my mate.
511. Is not the in-by side of the bord nearly opposite the caution-board? There are two bords just turned off—one at the out-by side of the danger-board, and the other at the in-by side; that is the one my mate turned off. Very little work had been done in it.
512. Were any naked lights allowed to go beyond the stenton? No.
513. Did you see the boy light up the gas near the caution-board across the stenton? I did not see it; I heard of it.
514. Is it not, in your opinion, dangerous to work with naked lights in such close proximity to the danger-board? I do not think naked lights should be there at all. I think safety-lamps should be used. [The witness withdrew.]

Charles Hope sworn and examined:—

- Mr. C. Hope.
10 May, 1887.
515. President.] You are a miner? Yes.
516. Working in the Bulli Colliery at the time of the accident? Yes.
517. How long have you been a miner? I think I have been working in different pits for about fifteen years altogether.
518. In this country or in the old country? In this country for about twelve months, and before that in the north of England.
519. Have you worked in fiery mines in the old country? Yes.
520. And you worked with safety-lamps? Yes.
521. You know then the object of safety-lamps? Yes.
522. In what district of the Bulli Colliery did you work? In the gassy section.
523. That is the Hill End section, is it not? Yes.
524. In what position was your working place? No 1 heading.
525. Your mate was William Scott? Yes.
526. Were you working on the day or night shift just before the accident? We had been working on the day shift, but we were working on the night shift the week of the accident.
527. And I suppose you were preparing to go to work when the accident occurred? Yes.
528. How were you apprised of the accident? My mate thought it was a tree that had fallen.
529. Were you in your own house at the time? Yes; I heard a noise and ran outside. The pick-sharper was the first man I saw. I asked him what was the matter, and he told me that the pit had fired. Immediately I got to the pit mouth and asked for a Davy lamp; I got one, and put on my own gauze, which I had with me, and went inside.
530. Who were with you? I was a little advance of some others. Scott came just behind me. We went up about 200 yards. There was a fall of stone there and we could not get any further.
531. Did you see the horse that was accustomed to draw coals about, there? No.
532. Did you see the boy who drove the horse? No.
533. What did you see or do about there? We were joined there by Lang and Chalmers.
534. Do I understand that the fall commenced at the overcast? It was beyond the overcast.
535. How far? About 150 yards.
536. Then you were stopped by the fall? Yes.
537. Were did you go when Lang and Chalmers came up? We then found a stopping blown out just near the fall.
538. On which side of the road was the stopping blown out? On the right-hand side going in.
539. What was it composed of? Stone and slack, I think.
540. Was it blown into the workings or on to the road? It was blown from the workings on to the road.

541. Did you repair that stopping? Yes; we made it up the best way we could, and we asked Chalmers if there was any other road by which we could get up. He told us that we might go through slacky, and we went along that way. Mr. C. Hope.
10 May, 1887.
542. And you struck the tunnel again? Yes.
543. Were there falls in the main heading? Not in the grip way.
544. Were there any falls beyond that? I did not observe any.
545. Having arrived at the tunnel, what did you do then? When we repaired the stopping near the fall we went up the gripway, and we found no falls until we got through into the tunnel again by means of the horse road. Up to this point the road was clear.
- 545½. You proceeded into the main tunnel through the horse-road? Yes.
546. And you found other falls in the main tunnel? Yes.
547. Did you proceed over those falls? Yes; I could not say the distance, but I think we went about 400 or 500 yards from the bank head. We came back for the purpose of sending in canvas to repair stoppings with. After we had been out twenty minutes we went back again, and this time we got as far as the western junction.
548. Did you pay any attention to the state of the atmosphere and ventilation? The atmosphere was very thick with what I call after-damp.
549. Have you had any experience with after-damp in England? Yes, when a little gas would light.
550. Was the ventilation partially restored at the time you got up to the tunnel the second time? Yes.
551. It was taking its usual course? Yes.
552. Was it hot? Yes, it was pretty warm.
553. Did you see any signs of steam? No.
554. Was the atmosphere laden with dust? I could not say. It was thick and disagreeable.
555. Did you find the western door blown inwards? Yes, and I helped to repair the door with the object of sending the air down the gassy section.
556. You had it closed up for the purpose of sending the air down the main tunnel into the gassy section? Yes.
557. When did you return again? The next morning at six o'clock.
558. With Messrs. Maccabe and Green? Yes.
559. Where did you go that morning? We went into Nos. 1 and 2 headings.
560. On the night before, when you penetrated to the junction of the western, did you pass any bodies on the flat? Yes; on the bank head.
561. Did you pay particular attention as to whether they were burnt? I paid no attention.
562. You simply passed on? Yes.
563. Did you pay any attention at the time when they were being taken out? Not at that time.
564. Did you observe how they were lying? They were lying on their faces.
565. Did you observe the way their heads were turned? Their heads were lying towards the mouth of the tunnel as if they were making their way out, or had been blown that way.
566. Do you know the effects of after-damp, or have you had any personal experience of an explosion? No.
567. You had never been a rescuer before? No.
568. Generally you know the effects of after-damp? Yes.
569. Was there anything inconsistent with the idea that these men had been overtaken by the after-damp and choked? I did not examine them particularly.
570. But their heads were turned towards the mouth of the tunnel? Yes.
571. You proceeded along the main tunnel on the following morning. Did you recover any bodies outside of No. 1—that is before you reach the heading? Yes; there were two boys lying down. That would be about 100 yards on this side of what we call Millwood's cabin.
572. I suppose they had been cleaning the roads? Perhaps so.
573. Did you pay particular attention to the position of the bodies? No, I did not.
574. In going up No. 1 heading did you see any bodies? Yes.
575. How many, and in what position? Well, I believe there would be about sixteen in that heading at different places.
576. You did not see any in the bords? No; I was not in the bords that day.
577. Did you observe the positions of the bodies in No. 1 heading? I believe the first three were lying between the first and second bord, and Millwood was sitting up against a rib of coal.
578. Do you refer to bords that were being worked, for there are two that had been stopped? Yes.
579. Millwood would be sitting near the fourth bord? Yes.
580. How was he sitting? He was just sitting up against the rib; I do not think he was burnt.
581. Did you observe his hair? No.
582. You did not take particular notice of the conditions of the bodies? No, I did not.
583. There were three found at this point, of which Millwood was one? No; there were three bodies besides Millwood.
584. Were they also in a sitting position? No; they were lying across the way. I thought when I saw them that they had been talking to Millwood.
585. Did you identify them? No; they were strangers to me.
586. You then proceeded onwards? Yes.
587. Proceeding onwards there was a group of five found immediately above these? Yes.
588. Did you pay attention to them? No, not particularly, because I did not know the men.
589. Where was the last body got? I believe the last body was that of John Smith, who was one of our mates working on day shift. He was found between the horse's heels, just above the stenton. I believe it was Smith that was found there.
590. Was anyone found at the mouth of the stenton? Yes; a man that worked in No. 2 heading. I believe it was Jerry Westwood; he was also sitting.
591. What do you suppose he was doing there? I could not tell.
592. Did you observe the condition of any of the props. Were they perfectly fresh, or were they charred? I did not take notice of them that day, but I was in on another night with Messrs. Gardiner, Evans, Crawford, and another gentleman, and we examined the main tunnel, No. 1 heading, and the bords off the heading. We did not find any signs of fire in the tunnel, and nowhere until we came to the headings.

- Mr. C. Hope. 593. Did you spend much time over the examination? Yes.
- 10 May, 1887. 594. You were satisfied that there were no traces of fire until you arrived in No. 1 heading? Yes, and in the bords off No. 1 heading.
595. And what evidence of fire did you see there? The props seemed to be burned there.
596. Were they burnt in one position or all round? Mostly the fronts of the props next to the heading were burnt.
597. You were perfectly satisfied in your own mind that these props were burnt by the blast? Yes.
598. You did not observe whether the hair of the bodies was singed? No, I did not.
599. Did I understand you to say that you were working with Scott in No. 1 heading on the night shift? Yes.
600. Did you ever at any time see gas in No. 1 heading? Yes, but not until Friday or Saturday, the week before the explosion, when we came across the stone in the heading.
601. Was it stone or a roll? A roll.
602. And you observed the gas after striking the roll? Yes.
603. Did it show itself in any quantity? No, there was not a great deal; it would take the lamp about 6 inches from the top.
604. There was a danger-board, I suppose, and beyond that board no naked light could be taken? There was a danger-board, and nobody was supposed to take a naked light beyond it.
605. Did you ever see a naked light beyond it? No.
606. Did you ever see a naked lamp hanging on the board? Yes, the wheeler's lamp.
607. Did you think that was safe? Well, if it was safe to go the stenton with a naked light, it was safe to go to the danger-board, because the board was fixed half-way across the stenton.
608. Then No. 1 was the intake of the air, and No. 2 the return? Yes.
609. Had you a sufficient quantity of air in No. 1 heading? Yes; but, of course, the heading was 20 yards in advance of the air.
610. But you did not observe any gas in No. 1 heading until three or four days before the accident? No.
611. Did you ever test the heading for gas? Yes.
612. And found none before this time? And found none.
613. You were careful in testing for gas? Yes, and I found none till Friday or Saturday; I forget what day it was.
614. Can you distinguish the different qualities of gas—did it fill your lamp very rapidly? It would fill the lamp, but not so quickly as I have seen it at home. I have seen it when it would not fail the lamp at all.
615. Did you ever hear of the gas in No. 1 heading being fired? Yes; it was fired by the wheeler's lamp on the night before the explosion.
616. Where was the lamp hanging? I would not be sure whether it was hanging on a prop or on the danger-board.
617. You refer to the prop on which the board was fixed? Yes.
618. The gas coming into contact with the naked light at the danger-board ignited? Yes.
619. The use of Davy lamps was enjoined in No. 1 heading? Yes.
620. Were they locked lamps? No.
621. Were they never locked? Yes; they were locked for one or two days.
622. Can you give any reason why the practice was discontinued? No, I can not.
623. Did you ever complain of the circumstance to the deputy? No.
624. Did you report the fact of the gas being fired to the deputy? No; we had no chance to report it, for the accident happened next day.
625. What time did you leave off work that night? At 12 o'clock, or half-past 12 o'clock.
626. Did you not think it worth while to report the circumstance on the Wednesday to some official of the colliery, the overman, or the deputy? Well, I did not give it a thought.
627. If you had given it a thought, should you consider it your duty to do so? Yes.
628. Did it not alarm you when you were informed that the gas was fired at the danger-board with the naked light? I did not feel alarmed.
629. Can you account for that? I was satisfied there was not much gas in the heading.
630. Although it fired at the danger-board? Yes.
631. You are positive that before Friday, four days before the accident, no gas existed in No. 1 heading? None.
632. Did gas exist in the bords off No. 1 heading? I do not know; I was not working there.
633. Did you ever hear your mate say there was gas there? No.
634. Were the places off No. 1 heading regularly examined before the men commenced work? I could not say for certain, but I believe they were examined.
635. And they would be examined before you commenced work? Yes; we have had to wait some mornings until Millwood came out.
636. Where did you wait? We waited where we got the safety-lamps.
637. When these places were examined by the deputy or overman, did he chalk the face as an indication that he had been there? No.
638. Do you know that it is the practice in England for the overman or deputy to chalk the day of the month in the faces each morning to show that he had been there? Yes; that is the practice at home.
639. Do you know if Millwood ever cautioned you to be careful? Yes, I believe so, on Saturday morning.
640. Did you take care? Yes, when I found the gas.
641. Having received that caution, do you think that you did your duty to Millwood by not reporting the presence of the gas which fired at the danger-board? The gas fired on the Tuesday night, and the accident occurred next day.
642. Yes, he enjoined you to be careful on the Saturday, and the gas fired on Tuesday night; but do you not think that it would only be right to intimate the circumstance to some official of the colliery? Well, you see, it was after 12 o'clock at night when I got home.
643. Did the deputy travel through your section with an open lamp, or with a safety-lamp? With an open lamp in the day-time.

Mr. C. Hope.

10 May, 1887.

643. How did the deputy travel at night? There was no night deputy.
644. The wheeler used an open lamp? Yes.
645. And would light it just outside the danger-board? Yes.
646. Was that, in your opinion, a safe proceeding? Well, it might be safe in the heading where we were working, but I do not think it was a safe proceeding in No. 2 heading, which had the return air.
647. For the reason that the return air would carry with it all the gas that issued from Nos. 1 and 2 headings? Yes.
648. Is this your opinion: That No. 1 heading being the intake, air was safe if no gas existed in the bords, but that it was not safe to use naked lights in the bords of No. 2 heading, because gas existed in a larger quantity in the heading? Yes; that is my opinion.
649. Tell us shortly how you worked the coal in No. 1 heading—did you work it with powder? Yes.
650. Before firing a shot was it the custom to hole the coal? Yes.
651. You never blasted in the solid? No.
652. Did you nick it or side-cut it? We never nicked it.
653. What explosive did you use? Patent blasting-powder.
654. Powder cartridges? Yes.
655. How did you fire the cartridges? With fuse.
656. With ordinary fuse? With ordinary fuse.
657. Beckfort's fuse? I don't know, it was double-take fuse.
658. How did you light the fuse? We used to fire our own shots; but the first day we started we sent out for Millwood to come and fire a shot; he came in, took one of our lamps, examined the face. He said, "She's all right, you can fire the shot," and we always fired them afterwards. We used to light the touch-paper at the gauze of the lamp and then apply it to the fuse.
659. Did you consider that that was a safe operation to allow the flame of the Davy lamp to be applied to the touch-paper outside? Yes.
660. Are you aware whether the lamp used in that way would be liable to destroy the gauze? Yes, in time.
661. Well, if the gauze were so destroyed would it impair the safety-lamp? Yes; of course if the wire broke the flame would have a better chance of getting through.
662. Yet you were in the habit of firing shots in that way? Yes.
663. Would you be allowed to fire them in that way in England? There are very few mines where men are allowed to fire shots at all in gas, but where they do fire them they generally use a wire.
664. Do you consider the use of a wire a safer means? Yes.
665. Do you mean by that it would be a quicker means? I do not think there is much difference.
666. Do you prefer the unsafe way to the safe? Well, we got the touch-paper given to us for the purpose of firing shots and we used it.
667. I suppose a pennyworth of wire would be sufficient to last you ten years? I don't suppose it would cost much.
668. I suppose you know what a safety-lamp is, and the objects for which it is used? Yes.
669. Did you ever know these lamps to be unscrewed and used as naked lights? Not inside of the caution-board.
670. In your opinion would an unlocked safety-lamp be less safe than a locked lamp? Both would be equally safe, provided they were not opened.
671. But could not an unlocked lamp be easily opened? Yes, of course.
672. Nevertheless you did not pass any remark to the deputy that he had omitted to lock them? No.
673. Have you ever seen in the mine any of the men unscrewing their lamps when they ought to have been locked? I have never seen them do it inside the caution-board.
674. Did the deputy or overman prohibit men taking in and using matches and tobacco? Not that I am aware of.
675. If you had struck a match at the face of the heading would anybody have objected to it? Yes; I believe any of the miners would have objected to it if they saw it done.
676. Do you think there was anything inconsistent in the men taking in matches and tobacco where safety-lamps were used? Well, naked lights were allowed to go up as far as the caution-board.
677. You were prohibited from using naked lights in your heading, and yet were allowed to take in matches? I never heard anything to the contrary.
678. Do you think you ought to have been allowed to take matches where safety-lamps were necessary? Not inside the caution-board.
679. Did you ever take them in? No.
680. Did your mates? Not that I am aware of.
681. Do I understand you to say that, had you observed a dangerous quantity of gas in your heading, you would have reported it to the authorities? I would have done so.
682. Then, looking at all the circumstances, what conclusion have you arrived at as to the cause of the accident? Well, I could not say.
683. Was it an explosion of fire-damp? Yes; I believe it was caused through fire-damp.
684. Fire-damp will not explode of itself? I should think not.
685. You made an examination of No. 2 heading after the accident? I was just in there once.
686. I mean since the accident? I was in there since the accident.
687. And you examined it? The day I was in there I could not examine it very well, because the ventilation had not been properly restored.
688. Was there gas there? Yes.
689. You also had an opportunity of inspecting the damage that was done? Yes.
690. And the course taken by the blast? Yes.
691. Would you like to make any statement of your opinion as to the cause of the accident? No, I would not.
692. *Mr. Neilson.*] Where were you at the time that the boy's lamp set fire to gas at the danger-board? I was turning a bord away; it was about 5 or 6 yards in the in bye side of the caution-board.
693. Did you see the lamp when it ignited the gas? I think I was repairing a skip at the time.
694. Did you ask the boy to hang his lamp on the inside of the danger-board? No, not on the inside. I asked him to put his lamp inside the prop so that I could see what I was doing. 695.

- Mr. C. Hope. 695. And by so doing you had a better light? Yes.
696. How long was it before the gas went off? Perhaps 5 or 10 minutes.
- 10 May, 1887. 697. What position was the lamp in? It would be close against the top of the prop.
698. That would throw a light down on the top of the skip? I was only 4 or 5 yards on the in-by side of the light, and I believe his lamp would be close to the roof.
699. You are sure it was on the prop and not on the board? Yes.
700. There was no other prop there? No.
701. Millwood and you were, I suppose, good friends? Yes, always pretty good friends.
702. You talked to each other? Yes.
703. Between Saturday morning, when you first saw gas in the heading, and Tuesday night, when the boy set fire to it, did you ever make any report to Millwood or White? I did not think there was any necessity to report it when the deputy told us himself on Saturday there was a little gas in the heading.
704. Did you always find Millwood in before you on the front shift? Yes.
705. You presumed that he had been examining the working places? Yes, we waited for him once or twice, and that led us to think that he had been examining them.
706. Did you ever see any lamp unscrewed in this heading? Yes.
707. Inside the danger board? Not inside.
708. Were you frequently in No. 2 heading? Only once since the strike, and that was the first week we started.
709. What took you there? Westwood, who worked there, asked me to come in and examine a blower which had been struck there. I went in and found no gas until I put my lamp against the rib where the blower was, and here the gas would fill the lamp.
710. Where was the blower? It was half-way up the seam of coal on the left-hand side.
711. And that was the only place where you detected gas? Yes.
712. Was there nothing in the roof? Nothing; the face was not far from the stenton, for it was just after we started work since the strike.
713. You saw nothing there before the explosion? None.
714. *Mr. Hilton.*] Did you ever notice any difference in the ventilation during the shift? I have noticed it sometimes slighter than at others.
715. Was there any one in charge of the district where you worked at night? Not that I am aware of.
716. Had there been any one in charge of the mine at the time the gas fired in your heading would it have been easier for you to report the matter? I would have reported it that night.
717. You stated that although it fired at the danger-board you did not report it on account of your going home at 12 o'clock at night? Yes, it would be nearly 1 o'clock before we got home.
718. I gather from that it would be somewhat inconvenient for you to go and report the matter to any colliery official? Yes, it would be inconvenient, and "bachelors" have not much time to run about at that time of night.
719. But you say you would have reported it if there had been anybody in charge of the mine? Yes.
720. Where did you get the touch-paper to fire the shots? Well, we generally got it from Millwood.
721. *Mr. Owens.*] You know the western door? Yes.
722. In the event of that door being opened, would it have any effect on the ventilation? Of course it would.
723. Did you ever notice it affected by that door being opened? No.
724. Have you seen the Government inspector in your heading? No.
725. You never saw him there? No.
726. How long have you worked in the mine? Five or six weeks before the strike, and after the strike, up to the time of the explosion.
727. And during all that time you never saw the inspector there? No.
728. How often did you see gas in the heading? We did not see it at all until we struck the roll.
729. *Mr. Jones.*] You stated that in exploring No. 1 heading you did not observe any burning on the bodies? I did not.
730. Did you carefully examine them? I believe Westwood was a little burnt; he belonged to No. 2 heading.
731. Did you carefully examine the other bodies? No, I did not know them; I only examined Jerry Westwood.
732. They may have been burnt as far as you know? Yes.
733. Have you any knowledge of the position of the driver who was found there? No, I did not see the boy.
734. And you were not there when he was found? Yes, he would be in the heading when I was there, but I did not notice him.
735. Did you notice whether the blower that you speak of arose from a crack in the coal? It was a long way back, and it was in the coal.
736. You stated you consider No. 1 heading perfectly safe to work in, provided no gas was found in the bords or anywhere else in the pit? Yes.
737. Are you aware that dust plays a part in an explosion? Yes; I have heard of it.
738. Do you know it of your own knowledge? No.
739. Do you consider the Bulli mine a dusty one? Well, it is dusty, but not nearly as dusty as I have seen mines at home.
740. You would not have considered it safe to work with a naked light under these circumstances? No; it was not safe.
741. Was it a safe thing to work near the caution-board with a naked light? Yes, if there was no gas there.
742. The danger board was put there to prohibit the driver from taking his light inside? Yes.
743. Was it not usual for the driver to hang his lamp on the prop? Yes.
744. He was allowed to put it there? He often did so.
745. He did not hang it there for the special purpose of showing you a better light? I believe it was hanging there before. I asked him to put it up a little higher.
746. Did you ever use a naked light in turning away a bord? No.

747. Would not bratticing up the heading from the stenton be a safe mode of preventing an explosion? Mr. C. Hope. Yes, it would.
748. In your opinion this should be done? Yes.
749. Would the bratticing of No. 2 heading have rendered the bords in the vicinity safer to work in? Well, I would think that if there was a quantity of gas in No. 2 heading naked lamps should not be allowed to be used in the bords off the headings.
750. I want to know if bratticing would be a safer mode of working? It would have rendered the bords off No. 2 heading safer to work in with naked lights.
751. *President.*] In what way? It would have kept the gas out of the heading and the bords. Sometimes when you go into a heading where there is gas, it clears away after you start to work, especially if there are only a few yards of gas there. That gas comes out, and it is liable to be taken into the bords which receive the return air; whereas if the heading was bratticed the gas would have been swept away as it was made.
752. *Mr. Clarke.*] Were you working in the gassy section before the strike? Yes.
753. Where? In the straight in heading.
754. How long did you work there? Five weeks.
755. Was there any gas there at the time? Yes, there was gas, but not until we touched the stone; then Hobbs and Beckton came to turn the stenton away, and that is where we got the most gas.
756. Any quantity? It would take the lamp 2 feet from the top.
757. Were you allowed to work on? Yes; up to the time of the strike.
758. Was gas found anywhere else? I believe there was gas found in the left-hand heading.
759. Have you ever been supplied with a copy of the rules? No.
760. Did you ever ask for them? No.
761. Did you ever make yourself acquainted with them? No.
762. Is this the first mine you worked in in this Colony? Yes.
763. Did it not strike you to inquire for a copy of the rules? We were strangers, and it did not strike us.
764. Did you know that there were any rules issued by the manager? I knew nothing of the rules of this colliery, but I knew the rules that existed at home.
765. And you do not know whether they are similar to rules in England? No; I did not know that it was the duty of the management to supply the rules.
766. With reference to the reporting of this firing of gas which took place on Tuesday night, were you deterred from reporting it by any other reason than that you did not consider it of sufficient importance? No; no other reason.
767. Do you know of the existence of these rules of employment? Yes.
768. You know the rule No. 6, having reference to interference by employees? Yes.
769. That did not deter you? It did not.
770. If you thought there was any immediate danger you would have gone straight away and reported it? I would. I do not think anybody would say anything if I had done so.
771. You do not think anything would have been said to you? I do not think so.
772. *Mr. Croudace.*] In answer to a question from the President, I think you said that an unlocked lamp was quite as safe as a locked one. Do you mean in your own hands? Yes.
773. Do you mean to say that in the hands of all the miners you would have felt it safe? No, I would not.
774. Would you think it better to lock them? Yes, if they were used throughout the mine.
775. You said you had worked five or six weeks before the strike, and a few weeks after the strike, and you had never seen the Government inspector in the mine? Not to my knowledge have I seen him.
776. Was it not possible for the inspector to be around a number of times and yet not to have come in your particular shift? I never saw him.
777. But was it possible for him to make four or five visits without seeing you? Yes, quite possible.
778. You have told us that a portion of air goes through the western door; was that a sliding door? I do not think it was a sliding door.
779. Was that door attended by a trapper? Yes; I believe there was a boy there.
780. When the air goes round there, is it conducted between Nos. 1 and 2 headings, and just after you turn into No. 1, is there not a door on the main road between Nos. 1 and 2 headings, and was that door attended by a trapper? Yes; there is a door there, and it is attended by a trapper.
781. How were the stoppings built? They were built of stone and slack.
782. Were they thick and closely packed? I do not know their thickness.
783. Do you know the measurement of the air at your heading? No.
784. This caution-board was half-way across the stenton in the heading? Yes, about half-way.
785. Do you know the turn leading from Nos. 1 and 2 headings? No; their coals came out of their own heading.
786. Would it not be safer if the caution-board had been on the out bye side of the stenton? Well, it would, especially if any one came through the stenton with a naked light.
787. Then that would be safer? Yes.
788. To the best of your belief, from your knowledge of gas at home, do you think there was such a quantity of gas in the heading to make you specially or extraordinarily careful? No, there was not.
789. Have you seen two or three times as much gas in a heading at home? Yes; there was very little gas in the heading, until we got the stone.
790. And it was your feeling that the deputy knew as much as you did about it, and that there was no necessity for you to report it? Yes.
791. Coming along No. 2 heading there is a diagonal cut through, from which the tubs have been taken as an easier way out to the main road;—was there a door there? I do not know; but I do not think there was.
792. If there was a door left open there, would it affect your ventilation? It would take it all off.
793. You have said there was deficient ventilation sometimes at night? Yes.
794. Was there a night furnace man? I could not say anything about the furnace at all.
795. Was it deficient in quantity? Sometimes there was not as much as usual.
796. You are clearly of opinion that No. 6 rule of this agreement between the management and employees did not in any way prevent you from reporting a blower of gas, or any extensive quantity of gas being found in your heading? No, it would not stop me from reporting it.

- Mr. C. Hope. 797. I will read the rule to you: "*Interference by Employees*—Any employee interfering in any way with the orders issued by the Colliery Manager or his over-man for regulating the work of the mine, shall be liable to dismissal without notice." Does that apply to reporting of gas? No, I do not believe it does.
- 10 May, 1887. 798. *Mr. Jones.*] You say that the stoppings were composed of slack and stone? Yes; they were built of stone, and stone with slack between the two walls.
799. Do you think that stoppings of that character are the best? I would prefer brick before slack and stone; but I believe stone is good enough if properly cemented together.
800. In the event of a blast similar to this, would the stoppings not be more effective if they were properly built up at the back? Of course it would take a larger force to knock the stoppings out if they were so constructed.
801. *Mr. Owens.*] Were you always employed on the night shift? No.

Allan Black sworn and examined:—

- Mr. A. Black. 802. *President.*] You are a miner? Yes.
- 10 May, 1887. 803. Employed in the Bulli mine? Yes.
804. How long have you been employed there? Twenty-three years or better.
805. Have you been employed in any other mine before coming to Bulli? It is twenty-three years since I came to Bulli, but twice, since that time, I have been employed in Newcastle.
806. Did you follow the occupation as miner at home? Never.
807. Your experience is confined to the Colony? Yes.
808. Where have you been employed in the Bulli Colliery? In the 4-foot seam for the last two years.
809. Were you working there on the day of the accident? Yes.
810. When were you apprised of this sad accident? About 3 o'clock on the day of the accident.
811. Who informed you? Someone came in and told us to come out, that an explosion had occurred in the big seam.
812. A messenger was then sent in to warn you? Yes.
813. What did you do? I came out, and went into the big seam with Spinks and with two men named Woods and Charlesworth.
814. Did they also work in the 4-foot seam? Yes.
815. Then you would follow Hope, Scott, Chalmers, and Lang? Yes; they went in before us, I think.
816. Where did you see them? When we first went in we went to the bottom of the incline, to where the overcast was blown down.
817. It was not drawing? It did not draw; it was in connection with the old furnace. We came back, as we could not get over the big fall, and afterwards, in the middle of the horse road I met Lang, who was overcome by the effects of stythe. A little further on we met Chalmers, who went out for some canvas. We afterwards put that canvas a little beyond the centre of the incline, on the left-hand of the heading.
818. Was the stopping where you put the canvas blown in or out from the road? It was blown into the main way.
819. When you first went into the mine you were stopped by the large fall? Yes.
820. Did you notice the stopping blown out almost at the foot of the fall? No, I believe it had been repaired. There was some canvas sent up to put on the western junction. When I got there Spinks took bad, and asked me to come out with him. I then left the canvas with Colton and came out with Spinks. Afterwards I returned and overtook the party.
821. Did you observe any bodies on top of the bank? Yes, the six bodies that were found there.
822. Did you closely inspect them? I closely inspected one, I think it was Bourne, but I could not positively say; I put my hand three times round his head, and found that the hair was short. I could not say whether it was cut short, or whether it was burnt short.
823. Did you see any marks of burning about his face? I did not notice any; his hair appeared to be shorter than usual, and I knew him well.
824. Did you notice any of the others? Well, the young man, Felix Bourne, looked as if he had no hair on his head.
825. How were they lying? When I went up the second time they had been laid out, and sheets put over them.
826. How were their heads when you saw them first? I believe Melville was lying with his head into the main road; Jackson was lying in an opposite way. There are two props just at the western junction, one man was on one side and another on the other, and the other bodies were on the western road.
827. Then you came out? Yes, and we did not proceed further that night, except to see the fall beyond the western.
828. That fall arrested your progress? Yes.
829. Was the atmosphere very thick? It was at first, but it cleared a bit afterwards; but when we first went in nearly all the ventilation was going through the stoppings. When we got the canvas up we could get further along.
830. When did you return to the mine again; or, rather, how long after the accident did you arrive at the western junction? About two hours.
831. What time did you return on Thursday morning? We went in about 6 or 7 o'clock.
832. Where did you go? Over the fall, inside the junction.
833. It is a high fall? I do not call it a fall, as it consists only of stuff that has been stowed on top of the timber sets.
834. Some men had been there during the night and partially restored the ventilation? Yes; there was a strong current going to the western junction.
835. You then went into No. 1 heading? Yes, to where they were bringing bodies on to the main road, and I was helping to carry them from the main road. There was another party ahead of us.
836. Do you know anything about the Hill End district? Not after the district had passed over the fault.
837. So all you know is from hearsay information? That is all.
838. You cannot speak positively of your own knowledge? No.
839. Have you completed your narrative? Yes.
840. Have you any other statement to make as to the condition of the workings? No. S59.

841. *Mr. Hilton.*] You know the door near to the furnace leading to the 4-foot seam? Yes. Mr. A. Black.
842. When that door is open does it make any difference to the ventilation going to the Hill End district? There are two doors there, and I forgot to state that one of these doors was blown out, at least one of the boards of the door was knocked out, and I went in with Mr. Ross to repair that door; that is the door placed at the division of the two mines. 10 May, 1887.
843. Were these doors partially damaged? One was blown open, and one of the boards was blown off the door, and the hinges were damaged.
844. Was there anything the matter with the other door? It was only very slightly damaged.
845. Was the ventilation escaping through these doors at the time? Some of the ventilation was going that way.
846. Would not these doors, if opened, cut off the ventilation from the Hill End district? No. It could not interfere with the Hill End district, but it would cut off the ventilation from the 4 foot seam.
847. *Mr. Owens.*] You never worked in fiery mines in the old country? I said I had never worked in the old country at all.
848. *Mr. Jones.*] You say you found the overcast blown out? Yes, that is the overcast of the old furnace. It has no connection with the new furnace. The witness then withdrew.

WEDNESDAY, 11 MAY, 1887.

Present:—

DR. ROBERTSON, PRESIDENT.

MR. O'MALLEY CLARKE,
MR. CROUDACE,
MR. JONES,

MR. NEILSON,
MR. OWENS,
MR. HILTON.

John Richards sworn and examined:—

849. *President.*] You are a miner? Yes.
850. How long have you been a miner? For twenty years.
851. Have you been engaged for that time in the Colonies, or in England? In England for the greater part of the time. I have been nine years here. Mr.
J. Richards.
11 May, 1887.
852. In what part of England were you engaged in coal-mining? In Lancashire.
853. As a miner in that country, are you acquainted with the presence of fire-damp in the mines? Yes, I have worked with safety-lamps, and know what gas is.
854. In what district in the Bulli Colliery were you prior to the accident? I was working in the gassy seam.
855. Were you working at Bulli before the strike? Yes.
856. That was under the old system of ventilation? Yes.
857. How long has the gassy district been working? It is two years since they first struck it.
858. On passing through a whin dyke you came to the gas? Yes.
859. Did you use safety-lamps before piercing the dyke? As I have said, we found the gas after winning the dyke.
860. Did it give off more gas than before? Yes.
861. So much so that it was deemed expedient to use safety lamps only? Yes.
862. Were you one of the explorers? Yes. I went in along with the first party—Scott, Hope, and others.
863. And you found a large fall in the main tunnel that prevented you from proceeding in that way, and you had to go round by the slacky road? Yes.
864. And there were other falls in the main tunnel beyond the point where the horse road strikes the main tunnel? Yes.
865. The explosion occurred on a Wednesday afternoon, about half-past 2 o'clock;—is that so? Yes.
866. Where did you reside? At Bulli, near the Oddfellows' Hall. I was working on the night shift, and was within 5 minutes' walk of the pit when the accident happened.
867. In what part of the mine were you working? I was working in No. 3 heading.
868. Did you continue the work of exploring the mine until all the bodies were recovered? Yes.
869. That is, you took your regular shift? Yes. I was not at home many hours, although I was bad after being in the first time. I went home till 3 o'clock the next morning, but stopped there all the time after that. We found Felix Bowen's body first, on the bank-head, at the top of the incline.
870. Did you specially examine his body? I just put my hand to him. He appeared to be badly burnt, as the skin was peeling off.
871. Who did you find next? We found the bodies of Luke Jackson, Tom Melville, and others.
872. You found several in a group there? Yes.
873. How many were there? I think there were three lying there altogether.
874. Did you observe the condition of the remaining men? Yes; they were burnt very badly. I got hold of Felix's trousers, and they pulled to pieces like a bit of paper.
875. Did you notice his hair? No, I did not notice much about his hair.
876. Would you not, as one accustomed to fiery mines, take notice of the hair first in a case of that kind? Well, I was very bad at the time.
877. And you returned on the following morning at 3 o'clock? Yes.
878. At that time was the large fall inside the junction cleared, so that you could get over it? Yes.
879. Had the ventilation been restored by that time? Yes.
880. On your first going into the main tunnel what was the condition of the atmosphere? It was very bad.
881. In what way? Well, when I first got in there was no air at all travelling up Hill End. The after-damp was making towards the grip, and we had to wait some time before we could proceed.
882. Could you smell the after-damp? Yes; it was very thick.

Mr.
J. Richards.
11 May, 1887.

883. Well, on the following (Thursday) morning what did you do? I went into No. 1 heading and No. 2 heading, and helped to carry out the bodies.
884. Before getting to No. 1 heading did you pass any bodies on the road? Yes; they were carrying them out.
885. A party had preceded you, and were carrying the bodies out? Yes; and there were the bodies of two boys found there.
886. Did you see any of the bodies lying in No. 1 heading where they had fallen? Yes. They were strange men, and I could not recognise them; but I saw Millwood back against the bord end.
887. Do you know the number of the bord? No.
888. Did you go up to the top of No. 1 that day? No, I did not go right into the face.
889. What were you engaged in doing? I helped to carry some of the bodies out of the road; and also to carry them outside from the main road.
890. Did you ever work in No. 1 or No. 2 headings? Yes, I worked in both of them before the strike.
891. Did they give off a considerable quantity of gas? Yes.
892. A dangerous quantity? Yes.
893. Did you work with safety lamps consistently? Yes.
894. You never used open lamps? No.
895. Did you ever see any open lamps used in that district before the strike? Well, they worked in a bord off No. 1 heading with a naked light.
896. Were you in those bords before the strike? Yes.
897. Did you see any gas in those bords? No, not accumulated.
898. Did you see any at all there? I have heard bits of blowers occasionally.
899. Did you ascertain what those blowers discharged? Yes, I have gone round the bord, and tried it with my lamp, and have seen it show in small quantity.
900. But the headings discharged a greater quantity, you say? Yes.
901. In driving these headings I believe you passed over a considerable number of rolls? Yes.
902. And on approaching the rolls the coal gave off a larger quantity of gas? Yes, because there were more facings in the coal on top of the store.
903. Have you worked in No. 2 heading? Yes, I did before the strike.
904. Did it give off more gas than No. 1 heading? No, I think it gave off about the same quantity; but if there was any difference I think No. 1 gave off the most.
905. What was the course of ventilation to No. 1 and No. 2 headings? It came on to the main road, and through the cross-cut.
906. It came from the main tunnel up to the heading? Yes, up No. 1 heading through the cross-cut, into No. 2 and out of No. 2 heading into No. 3; there was no air course through the bords.
907. When the bords got in a sufficient distance for cut-throughs, the air would go round the bords, would it not? No, I never saw any round the bords.
908. Then how were the men in the bords supplied with air? By the skips passing, and the like of that.
909. The object of cut-throughs is to take the air so much nearer the face? Yes, in the headings.
910. But I am talking about the bords? I do not know about cross-cuts in the bords.
911. But we are talking about the bords. What is the object and intention of cut-throughs or stentons? The object is to carry air from one heading to another.
912. Then the air was directed up No. 1 heading, passed through a cut-through into No. 2 heading, and from that it supplied the men working in bords off No. 2 heading;—is that not so? It would strike up to them no doubt.
913. Where did the men in No. 2 heading get the air from; was it not by means of the cut-through from No. 1 heading? Yes.
914. Then as the air passed into No. 2 heading by that channel, it supplied the men in the bord, and passed down to the tunnel again? It was supposed to have supplied them.
915. Were they supplied? I cannot say.
916. Then if they had no air how could they exist? I suppose they were supplied by the air driving up from the heading.
917. You said just now they were "supposed" to get it from there; where could they get it but from there? I do not know where else they could get it.
918. Then why not have said so at once. You have said that you worked in this heading before the strike; was the ventilation of sufficient strength there? If it was kept up to the face it was.
919. Well, was it kept up to the face? No.
920. How was it arranged? There were cross-cuts put through with perhaps a distance of 40 yards between.
921. Are you quite certain of that? Yes; the heading that I worked in last was fully that.
922. I am talking about No. 1 and No. 2 headings. Have you seen any cut-throughs in No. 1 and No. 2 with 40 yards of coal between? I never measured them.
923. Then why did you make that statement. I warn you to be very careful to give accurate replies to questions. If you make a statement to me that there were 40 yards of coal between the cut-throughs, I am bound to believe you; but if you say 40 yards, and mean 30 yards, you are speaking wide of the truth? I am telling you nothing but the truth.
924. Are you certain as to the distance between the cut-throughs? As I have said, I never measured them.
925. Then why did you state a particular distance? I am only speaking of what I was working in.
926. Well, what was the distance between the cut-throughs? I cannot say.
927. Was there any bratticing taken up to the face? No.
928. Would you think that a judicious course to pursue? Yes.
929. In that case the brattice would take the ventilation from the last bord, conducted up to the face, and sweep away the gases accumulated there? Yes.
930. It would prevent the accumulation of gas? Yes.
931. Did you work with safety-lamps in those bords before the strike? Yes.
932. Were they locked? Yes, before the strike they were.
933. Were they locked in all cases? There was a time, just at the start, when they were not locked; but afterwards Mr. Crawford locked every one.

Mr.
J. Richards.

11 May, 1887.

934. Did you work at night-time? Yes.
935. And did you work with your safety-lamps locked in the night shift? No.
936. Was there any greater danger in the day shift than in the night shift? No, not that I know of.
937. Then, as the danger was as great during the night as in the day, can you give any reason why the lamps were not locked at night? Well, there was no one there to lock them.
938. After you resumed work since the strike, did you notice any improvement in the ventilating current? Yes, I believe there was an improvement in the amount of air.
939. In your opinion, as an experienced miner, had brattice in any shape or form been taken up to the face after the strike;—could any great accumulation of gas have existed? Not in the headings, certainly.
940. The air thus carried down would have swept it away? Yes, it would.
941. After the strike did you go into the face of any of the bords? Yes, I did in one bord, in No. 4 heading.
942. You worked in Nos. 3 and 4 since you resumed work? Yes.
943. But you cannot speak as to the condition of the bords in Nos. 1 and 2? No.
944. Since you resumed work have you continued the use of safety-lamps? Yes.
945. Were those lamps locked? No, not since.
946. We have been told that the lamps were locked for a period after the resumption of work, but that the practice was discontinued. Do you know anything about that? On the first night that I started to work in the gassy section after the strike, I went to get my lamp at the cabin. Millwood gave me a lamp, and he locked it. I asked him how I should be able to get a light if the lamp went out. He said that we should have to go outside and get the key to unlock it; but afterwards he remarked that it would be no use locking the lamp if he gave me the key, and he asked me for the lamp back again, so that he could unlock it. I did as he directed me, and he never locked the lamp after that.
947. Was an unlocked lamp in your hands as safe as a locked lamp? Yes.
948. You know the danger of gas? Yes.
949. How did you work the coal in these headings? We used to hold and shoot it.
950. Did you nick it? Sometimes, not always.
951. Would nicking the coal have assisted the shots? Yes; but it was not always pursued.
952. Did you use compressed powder? Yes.
953. Was it a custom in the mine? Well, some used loose powder.
954. How did you fire the shots? We lighted ours with a match.
955. How did you stem the holes? With a little of the "bad" off the roof that was slightly damp.
956. If you were informed that some of the men tamped with small coal, would you consider that in the presence of gas as safe as the material you used? No, because I know there is a lot of spar in that coal.
957. How did you apply the light? I went back to my waistcoat, and struck the match.
958. Do you mean a lucifer match? Yes.
959. And you adopted that means of lighting the shots whilst working with Davy lamps? Yes.
960. Yet you are an experienced miner, and know what gas is? Yes; but we had no gas in our place at all.
961. Then are you referring to Nos. 3 and 4 now? Yes.
962. When you were working in Nos. 1 and 2 headings, how did you light the shots? With touch-paper.
963. And how did you apply the light to the paper? We tilted the lamp, and got the flame to beat against the gauze.
964. Did you think that a safe operation; would you have done that in England? Well there was always a man to light them where I was in England; they used a piece of wire.
965. Was that a safer method? It was as safe.
966. I suppose the large quantities of gas met with in the collieries of certain districts in England would teach people safe modes of firing shot? Yes, I suppose so.
967. There would be some reason for the adoption of that method in firing shots? Yes.
968. Probably on account of the increased safety. Do you know that firing shots by means of a wire is safer than the operation of tilting the lamp? I believe it would be safer; but we never fired a shot in the presence of gas all the time I was in.
969. Then in Nos. 3 and 4 headings, those that you worked in since the resumption of work, have you seen any gas in those places? Not accumulated anywhere in the headings.
970. Had you ever been in No. 3 and No. 4 headings before the strike? I never worked in them, but was in them many a time.
971. Did you ever see gas in Nos. 3 and 4 headings before the strike? I have heard of it, but never saw any.
972. But since the strike you can speak positively as to the condition of those headings? Yes.
973. Have you seen gas there? I have known traces of it, but never actually saw any in the headway.
974. You considered it safe enough to strike a match, and fire your shot? Yes; Millwood and all of them knew it.
975. Indeed; that is what you say, but is Millwood here to answer it? No.
976. Judging from the condition of the heading you worked in, had you any reason to fear an explosion? Well, no; I never thought there would be such an explosion as that.
977. You have gone carefully over the roads since the explosion? I have.
978. Have you noticed evidences of the explosion in the shape of charred props, and burnt bodies, and coal dust, and such like? I noticed a charred prop lying in a bord close to the side of No. 3 heading.
979. Was it only black, or was it charred? It was charred, I think, but I did not handle it to see.
980. There is a difference in a charred prop and one that is merely black; at all events you saw evidences of an explosion? Yes.
981. Have you satisfied yourself that an explosion did take place? I have.
982. Do you know how coal dust behaves in the presence of gas that is exploded; have you any personal knowledge? No, I never read anything about that; but I think it would require a large quantity of gas to pick it up and fire it.
983. Did you make any reports to the Deputy since resuming work as to the advantage or otherwise of having the safety-lamps unlocked? No.
984. You did not consider it mattered, so far as you were concerned, whether you had Davy lamps or not? I did not consider there was any danger of gas where I was working; in fact I knew there was no gas.

- Mr. J. Richards.
11 May, 1887.
985. Then there was no danger in your place from gas? No.
986. *Mr. Hilton.*] You say that the after damp was making towards the grip? Yes.
987. Can you give any reason for the after-damp going towards the grip? No, only this—that it was the explosion going out that reversed the air.
988. Did you ever work in the western district? Yes.
989. Was that before the strike? Yes, a good while before.
990. Are you acquainted with the return air-ways in the western district? No; I have not been through the return for a long time.
991. You know the door on the western road—at the western junction? Yes.
992. Did you ever know that door to be damaged by the set or any other cause? Not that I know of.
993. Have you ever in the old country worked in a dusty mine that gave off gas? I have worked in mines as dusty as this that gave off gas.
994. Did you ever work in mines that gave off gas, and which in your opinion were dustier than Bulli? No; but I have worked in dustier mines that did not give off gas; the mines I worked at in Lancashire were as dusty as Bulli.
995. You say you worked in the western district; supposing the road was blocked up, by what means would you get out? I do not know, unless we got through to the grip.
996. Do you know that you could get through that way? No; I do not know that we could get to it.
997. You know the overcast from the gassy section in the western district? Yes.
998. You are aware that that is the return road to the furnace? Yes.
999. Supposing the road was blocked up as I have described between the junction and the working face, I presume you would endeavour to get that way out? Yes.
1000. But you do not know whether you could get that way in the event of an occurrence of that kind? No.
1001. *Mr. Owens.*] Was the deputy aware of the method you employed to fire the shots? Yes.
1002. Did you at any time have gas in the western district? I never did; I did hear rumours of it, but I cannot speak of my own knowledge.
1003. *Mr. Jones.*] Were you ever supplied with a copy of the special and general rules for the guidance of the men while you were at the colliery? I do not recollect having one.
1004. You surely know whether you received one or not? Well, I believe I did get one.
1005. Can you point to the particular spot where Millwood, the deputy, was found? I did not take particular notice whereabouts he was found; I know I helped to carry him out.
1006. Was he found anywhere near to the last stenton? Yes.
1007. How far, in your opinion, from that stenton? I do not think he would be above 10 or 15 yards from the stenton.
1008. You have stated that the lamps were not locked during the night shift? Yes.
1009. Did you say that they were locked during the day? Yes, before the strike.
1010. You were employed at nights then? Yes; I worked nights and days—week about.
1011. Are you sure, of your own knowledge that the lamps were all locked during the day shifts? Every one was supposed to go to Crawford to get his lamp locked. I have seen him lock scores of lamps.
1012. You have stated that an unlocked lamp in your hands would be perfectly safe? Yes; it would be perfectly safe with me, because I should not take the top off where there was gas.
1013. Have or had you the same amount of confidence in the other workmen? No.
1014. Then you think it a wrong proceeding to allow all workmen indiscriminately to use unlocked lamps? I do.
1015. From whom did you receive instructions, if any, as to the mode of firing your shots? We did not receive any instructions; every one had to fire his own shots.
1016. Who supplied you with touch-paper? We supplied ourselves.
1017. Then you had no definite instructions as to how the shots were to be fired? No; Mr. Crawford found us some touch-paper before the strike, but since the strike we all had to find our own.
1018. *President.*] At least the deputy did not find it for you? No, sir.
1019. *Mr. Jones.*] When you first entered the mine you found it impossible to get beyond the big fall? Yes.
1020. Now I should like you to consider this question—which may be taken in connection with Mr. Hilton's questions—very carefully. Do you not think it necessary that there should be a second outlet, so that, and by means of which, the men would be enabled to get to the light of day in the event of a large fall taking place? I do.
1021. You say you have seen gas in small quantities in the working bords? Not accumulated there. I have seen little bits of blowers in the bords.
1022. Which satisfied you, I suppose, that gas was present? Yes.
1023. Did you work there with safety-lamps? Yes at that time, before the strike.
1024. *Mr. Clarke.*] Have you formed any opinion as to the particular spot where this explosion could have originated? No, I cannot tell.
1025. Could you localise the centre of the mischief in any way. Have you formed any opinion or theory on the subject? No, I cannot give any idea where it originated. It is supposed to have happened in No. 2 heading, I believe; but it is hard to say.
1026. You have no opinion of your own? No.
1027. How often did you see the overman, Mr. White, during the time you were working in No. 1 and No. 2 heading before the strike? Well we might see him every three or four days, or we might see him oftener.
1028. When he paid you these visits were you in the habit of drawing his attention to the presence of gas? Sometimes when he came in he would say, "Well, boys, is there any gas about?" and I have said many a time, "Yes, there is gas back here," and I have shown it him in the roof.
1029. He was very well aware of the presence of gas there? Yes. He would sometimes tell us to be careful till we came to the next cut-through.
1030. Going back to a former question, did you not say at the inquest that you thought the explosion had not originated in No. 2 heading? Yes I did, on account of the tubs being blown through on the flat.
1031. Then you did form a theory of your own? To that extent I have. I think if the explosion came in that direction it would not have blown the tubs about as they were found.

1032. Where, in your opinion, is the most likely spot for the explosion to have originated? I think it might have originated in the straight heading; there were men working there with safety-lamps, or somewhere in the western.

Mr.
J. Richards.

1033. Are you still of opinion that it did not originate in No. 2 heading—have you abandoned that theory? Well I cannot give any further idea of it.

11 May, 1887.

1034. Well would you rather not express any opinion? Yes, I would rather not express any opinion.

1035. *Mr. Croudace.*] I should just like, in the first place, to fall back on the question asked by Mr. Hilton. Supposing the return air-way from the western district to be blocked up, and this explosion to have occurred, do you know if there was any return air-way from the western district to the furnace? Not that I know of; but I should think there must have been a way for the air to go.

1036. You do not know? No, I have never been that way.

1037. Can you say whether the miners in the colliery made their monthly inspection of the mine? I do not think they did. I never heard of it.

1038. To come to the ventilation of this mine. In going direct from the tunnel do you know if there was a door placed at the entrance of the western district? Yes.

1039. Was it a slide or a scale door, or a fly door? I have heard there was a slide there.

1040. Have you been through it? Yes, scores of times.

1041. How did you open it? I pulled it.

1042. Is that a slide door? No, it pulled open in the ordinary way.

1043. Was that door closed when you went through, or partly open? It was closed—that is we had to open it to pass through.

1044. It was not propped open—there was no scaling? Not that I saw.

1045. Did you ever see a trapper boy there? No; I never saw one.

1046. If there was no boy there, who opened the door to allow the sets to go through? There was always somebody there when the sets came out.

1047. That is somebody who attended to the door? Yes.

1048. Then why not have said so at first. Leaving that door, and coming along to No. 1 heading, was there a door between No. 1 and No. 2 heading? Yes, there was a door between Nos. 1 and 2 headings.

1049. On the main engine brow? Yes.

1050. Did any one attend to that door? Yes, a boy.

1051. Was there a door at this diagonal cut-through? I believe there was.

1052. Can you say whether a boy attended it? I cannot speak with certainty.

1053. Then, coming to No. 3 and No. 4 headings, was there a door there? Yes.

1054. And was there a boy in attendance there? I do not think there was.

1055. Are you positive? Well I never saw one; there was not much traffic through it.

1056. Have you ever been in the return from the face in No. 5 up to the western district? Yes, but it is a good while ago.

1057. Now, just for one moment let me refer to the question of locked and unlocked lamps;—did you ever remonstrate or make any suggestion, either to the lampman, the overman, or the deputy that all the lamps ought to be locked? No, because when we knocked off on strike we were all working with safety-lamps, and when we started again they gave us naked lights.

1058. Did you not consider it unsafe for others to have their lamps unlocked? I did not think much about it.

1059. As a prudent man of some experience, do you not think it would have been a judicious and proper thing for you to have remonstrated about the unlocked lamps? I did not think it was any of my business to interfere with the deputy's duties.

1060. Would it not have been a prudent and fairly right thing for you, as a prudent man—when you found that other men whom you say you could not trust were using these unlocked lamps—to have remonstrated about it? Well I cannot say; the men who worked in these headings were supposed to be practical men.

1061. Yet you say you could not trust them? I meant to say that I would not put much trust in unlocked lamps if all the men in the pit were working with them. But there were only a few working with them at Bulli.

1062. You have said that you could trust yourself but not others. Would it not then have been in your own interests to have seen that all the lamps were locked; in fact would it not have been only reasonable for you to have suggested to some one, even your fellow-workmen, that all the lamps should be locked? I believe they ought to have been locked.

1063. Then why not have suggested it? It was not my business.

1064. It was certainly not your business to jeopardise your own life? I did not think it would interfere with us. That is, I thought there was not sufficient gas in the pit to trouble any but those who lighted it.

1065. I am quite satisfied with that. I do not want you to think I am putting you in a corner. My object is to show that we may learn a lesson from the past for our guidance in the future. You, for instance, will be imbued with the feeling that all lamps ought to be locked in gassy mines after this. Did anything else, beyond the belief that there was only a small quantity of gas in the mine, prevent you from making that suggestion to any one? Well if I had known that there was any danger where I worked I think I should have reported it.

1066. You would not have felt yourself prevented reporting by any rules of the colliery? There was a rule, No. 6, I think, that when the men signed it they thought they were signing their liberty away.

1067. Have you read it? Yes.

1068. Is there anything there to prevent you reporting anything that appears wrong to you, as you go out of the mine? It says nothing about reporting; but it says the men are not to interfere in the management of the mine in any way.

1069. The rule is very plain and simple; it says that the employees shall not interfere with the orders for regulating the working of the mine. Now can that possibly be construed or twisted into meaning that the men are forbidden to report upon a dangerous state of things, either as to the roof, an influx of water, the presence of gas, or anything else? Yes, it does, in my opinion, mean that.

1070. Explain how? Supposing I had lodged a complaint about the absence of bratticing, say, do you not think that would be considered interfering? I should have been interfering with the management of the work. Supposing I said to the manager, "There ought to be some bratticing up here," he would tell me to mind my own business.

1071.

Mr.
J. Richards.
11 May, 1887.

1071. Still, though that be your opinion, you would not call that a correct interpretation of the clause, as to "interference." You would not be interfering with orders for regulating the work, even then; you would be making a suggestion. But is there anything in these rules to prevent you leaving your place and telling the deputy that you apprehend danger from a quantity of gas? It does not say anything about that.

1072. Supposing a blower of gas existed in your working place, do you think you would be prevented by this rule from reporting to your fellow-workmen, or the deputy, or the overman that such had taken place? You see it does not meet with reporting gas.

1073. Answer the question, please. Do you believe in your heart that that simple rule, No. 6, which merely refers to the regulation of the working, could be held to prevent you going into your fellow-workmen and informing them, as also the deputy and overman, that a sudden blower of gas came into your heading? Well, sir, as to reporting gas, I do not know; but if I had gone and told the boys that there ought to have been some bratticing up, which we all knew there ought to have been, would it not have been considered that I was interfering with the overman's work?

1074. Certainly not? Well, that is my opinion.

1075. It would not have prevented you giving information. But the real fact is that you thought the gas would only affect the men that happened to fire it. Is not that so? Yes, I did think that, certainly; but I can see now that there must have been some gas besides what was in the heading to do so much execution.

1076. Did you see more gas there than you have told us of? No.

1077. Have you ever known more gas in that mine—any part of it—than you have stated on oath? No.

1078. Do you know of anyone in the Bulli mine who has ever seen a great quantity of gas in any part of it, and if so, will you give me his name and address? No, I do not; but I have found a body of gas there before now.

1079. I am speaking of a large accumulation of gas. Do you know of anyone who whether rightly or wrongly, has stated that he has found a large accumulation of gas there—either in a heading or place of any kind—because, if such is the case, I will endeavour to ferret it out. Do you know of any such, either by report or of your own knowledge? I have myself seen a lot of gas in that mine. That was about two years ago.

1080. Keep to within a month or two previous to the explosion? I have never seen any more since than in the heading I have mentioned.

1081. *President.*] Do you think the gas that existed in the mine was known to the men; that is, that no unknown magazine of gas existed there? I do not think any such existed; I think they all knew that gas was in the headings.

1082. *Mr. Jones.*] You have stated that there were no monthly inspections by the miners? I did not know of any.

1083. Do you not have any inspections whatever? No.

1084. You have stated that you did not think there was sufficient gas in No. 1 and No. 2 heading to produce any great effect, and you say you have no theoretical knowledge of the part that coal dust would play in an explosion? No.

1085. If you had been in possession of such knowledge, do you think that would have altered your opinion? I do not consider there is a great deal of dust in that pit. There is no dust lying about the roads.

1086. Can you say what quantity of dust would be required to form any part in an explosion? No. [*The witness withdrew.*]

Walter Settle sworn and examined:—

Mr.
W. Settle.
11 May, 1887.

1087. *President.*] You are a miner, residing at Bulli? Yes.

1088. How long have you been employed at Bulli? It is about nineteen or twenty months since I first started.

1089. Before that where were you engaged as a miner? At Mount Pleasant.

1090. Have you been engaged in mining anywhere else? Yes; in Lancashire, England.

1091. Did you work in gassy mines? Yes; we worked with lamps.

1092. Then you are acquainted with gas in mines? Well, not to a large extent.

1093. Were you employed at the Bulli colliery at the date of the explosion? Yes.

1094. In what part were you employed—in No. 4 heading? In the gassy section.

1095. That is further in than No. 1 and No. 2? Yes, beyond that.

1096. Were you on the day-shift or the night-shift? I was on the night-shift.

1097. Where did you reside? At Woonoona.

1098. How were you apprised of the accident? I was going up to work, and was told of it.

1099. Were you one of the exploring parties? No; they were inside when we got up there, and there were no more lamps.

1100. Then you did not go into the mine? Not on the day of the explosion; we went in on Thursday morning.

1101. Where did you go then? We went as far as No. 1 heading—into a bord.

1102. Were the bodies of the men in the main tunnel removed before you went in? Yes.

1103. Then tell us the story of what you did in your own way? When I went in on the Thursday morning it was with the idea of helping to carry the bodies out. I think I was in as far as the second bord in No. 1 heading, and I never got any further. I was engaged in carrying out the bodies.

1104. After the bodies were taken out were you inside the mine? No.

1105. Have you not been in the headings and seen the state they were in? No.

1106. Then you cannot give us any information as to what happened, the cause of it, I mean? No.

1107. Before the strike, in what district were you employed? In the grip district.

1108. And since the resumption of work where have you been employed? In No. 4 district.

1109. Can you give us any information as to the condition of the district known as the "gassy section" before the strike? I never worked in it; so I cannot speak of it of my own knowledge.

1110. Since resuming work did you work with Davy-lamps in No. 4 heading? Yes.

1111.

Mr.
W. Settle.
11 May, 1887.

1111. Have you ever tested for gas in No. 4 in your own place? I never found any there.
1112. Was the ventilating current sufficient to sweep away any gas that might exist? Close to the stenton it was; but not at the face.
1113. You did not discover any gas at the face? No.
1114. Or at any other part of the heading? No.
1115. Did you notice any blowers at any time? No.
1116. Did you hear of any gas having existed there before the strike? Yes; a man who used to come to my house told me about it.
1117. But you have seen none yourself? No.
1118. Was the safety-lamp you were supplied with locked? No.
1119. Then, so far as your heading was concerned, it was a matter of form using the safety-lamps. How did you fire the shots? With a needle and squib.
1120. Did you communicate the flame of the lamp to the squib? No; we used an ordinary lucifer match.
1121. Then it was quite a matter of form whether you used the Davy-lamp or not? Yes; there it was.
1122. Did you consider there was anything inconsistent in using Davy-lamps, and lighting your shots by means of lucifer matches at the same time? Well, of course, it is not usual to take naked lights into a place where you use Davy-lamps.
1123. Then you used it because you had satisfied yourself that no danger existed from gas? Yes.
1124. Had gas existed even in an infinitesimal degree would you have used matches there? No; not if there had been the slightest danger.
1125. Were you particular to examine for gas before firing a shot? Yes.
1126. Did you make any report to the overman or deputy as to the state of the lamps—you say they were unlocked? We made no report.
1127. Were the lamps unlocked in the situations you occupied in England? No; they were locked there.
1128. You did not make any remark as to the lamps being unlocked at Bulli? No; the first night I started there Mr. Millwood locked two lamps, and one of the men asked him what they should do if they got in the dark.
1129. Was that Richards? Yes; I think so. He (Millwood) considered a moment, and then said, "You must go outside, but I do not see what is the use of my locking the lamps if I leave you the key," and so he unlocked them.
1130. Did the danger-board exist then? Not at that time; he would mean us to go outside the stenton.
1131. Did that appear to be a safe course to you? If there was no gas it was safe enough, but if there was gas it was not safe.
1132. Were you special men, and were there special places? Yes.
1133. In your opinion when working in special places are unlocked lamps as safe as locked lamps? The lamps are safe so long as they are not interfered with; of course, if you unscrewed them, it would be quite unsafe.
1134. I suppose you know the principle of safety-lamps is a measure of precaution against danger? Yes.
1135. And knowing that you would not think of unscrewing a lamp where there was gas? No.
1136. Then was it as safe in your opinion in one way as the other? Yes.
1137. And so far as your place was concerned you say there was no need for safety-lamps at all, as proof of which you lit lucifer matches to fire your shots? Yes.
1138. Did you work on the day shift or the night shift on resuming work after the strike? I was working from the 7th of March to the 22nd, and I believe I was one half the time on the dayshift.
1139. Were the safety-lamps unlocked during the day? Yes.
1140. Did you not think there was any necessity for communicating with the deputy on the subject of the unlocked lamps? No.
1141. Had you any conversation with your mates as to the state of the lamps? No; except to state that it was an unusual thing to have the lamps unlocked.
1142. *Mr. Neilson.*] What was the state of the ventilation the month before the strike? I thought there was a very good current.
1143. After the strike did you find any change? Yes; I thought there was a much stronger current of air going.
1144. You knew that the new furnace was going? Yes.
1145. Who was this man who told you about the gas—the man who came to your house? Robert Calland.
1146. Did you ever receive any instructions from the overman or any other person about firing the shots? No actual instructions. One of our men asked the manager if we could use the needle, and he said, "Yes, we could use the needle and straw."
1147. Have you ever worked in any place in the mine where you have been able to detect gas in the safety lamps? No.
1148. *Mr. Hilton.*] Was the deputy or overman aware as to the manner in which you fired your shots? I believe he was. He has been close to where we fired the shots, but never said anything, and whether he took any notice or not I could not say.
1149. Take this copy of the rules in your hand. [*Copy handed to witness.*] Did you ever receive a copy of these rules? No.
1150. Are you sure? Yes; I am certain. I asked for them. I asked the deputy, Mr. Robbins, twice, and he said he would see I got them; but I did not.
1151. *President.*] When was that? When I was working in the grip.
1152. *Mr. Jones.*] I understood you to say you never saw gas in No. 4 heading. Did you get any extra pay for working in No. 4 heading—was there 3d. a ton allowed? Yes.
1153. Then it was considered a gassy heading? Yes.
1154. I think you have explained that notwithstanding that you worked with Davy-lamps, you fired your shots with open lights and matches? Yes.
1155. Was that proceeding somewhat inconsistent with your position in that heading? Well there was no gas, and we thought we were quite safe.

Mr.
W. Settle.
11 May, 1887.

1156. *Mr. Clarke.*] Did you see any rules posted up either inside or outside the mine? Not that I am aware of since the strike. I think I saw them before. They were on a prop about 30 yards from the entrance to the mine.
1157. Were they legible—could you read them? Some portions of them.
1158. Did you ever try to read them? I have read some of them, not all.
1159. *Mr. Jones.*] Did you think it a wise precaution to have a caution-board placed at the second stenton back from the heading—that is to say, would it be safer? Yes, certainly.
1160. Would you suggest that as a measure of safety? Yes, it would be better no doubt.
1161. *Mr. Crowdace.*] You have stated that you heard of gas in No. 4 district previous to the strike? No; I did not say No. 4 heading; I said it was in the gassy district.
1162. However you have told us distinctly that Millwood took the precaution to lock your lamps; but at the special request of the miners themselves he unlocked them? I do not think I said that.
1163. You have stated that he locked your lamps on the first night, but that on one of your mates asking what you would do if you got in the dark he unlocked them in your presence. Is that the case or not? Yes.
1164. Very well, that being so, is it not the fact that Millwood took precaution to lock the lamps, but at your request unlocked them? We did not request him to unlock them; mine never was locked.
1165. You say that at first Millwood locked the lamps, but that on the representation of a former witness (Richards) he unlocked them, and told you that should they want trimming again you could go outside for that purpose? Yes.
1166. Well that indicates that Millwood showed great caution in locking the lamps. Whether it was prudent to unlock them afterwards is another matter? I suppose it is usual to lock them.
1167. The man is dead and gone. I do not say that he was over wise in agreeing to your request; but it was on your request that he unlocked them? Had he locked them we should have gone to work with them so.
1168. But you induced him? I cannot see that at all.
1169. In answer to a question, you said you were paid 3d. per ton extra for working in the presence of gas. Is not that extra tonnage really for the use of the Davy-lamp? Is it not a matter of precaution on the part of the management in agreeing to pay 3d. extra for fear of gas? Yes.
1170. You think it a matter of precaution? Yes.
1171. Either previously to the strike, or between the strike and the explosion, did you of your own knowledge know of any large accumulation of gas in this mine? The only large accumulation of gas I know of was reported to me the night before the accident by a man that worked in No. 2 heading.
1172. Then you do not speak of your own knowledge? No.
1173. But you have heard of an accumulation of gas there? Yes; I heard the night before the explosion, from a man who was in No. 2 heading, that the gas was up to the danger-board. He told me as we were going home the night before the explosion. That was James Salisbury.
1174. He told you the night before the explosion that the gas extended from the face in No. 2 heading to the danger-board? Yes.
1175. Did he say what distance that was? No.
1176. Did he make any further remark about it to you? He said at the same time, I think, that the driver lit the gas in the next heading.
1177. Do you know of any other report on the subject? No; I do not. [*The witness withdrew.*]

Joseph Poppett sworn :—

Mr.
J. Poppett.
11 May, 1887

1178. *President.*] How long were you engaged at Bulli? Up to the strike; not since.
1179. When were you apprised of the accident, Mr. Poppett? In the afternoon; I was in Bulli at the time, and I went up to the mine immediately.
1180. And did you go in? Yes, as soon as I got a lamp I went in, along with another party.
1181. How far did you go? We went to the furnace first; then I came back, and went up the cross-cut to Hill End.
1182. How far did you proceed? I did not go to the bank-head then; it was too hot.
1183. The ventilation was deranged? Yes; I came back.
1184. When did you return again? I returned about 9 o'clock at night, and went into the mine again.
1185. Where did you go then? We went straight to the bank-head, and examined the bodies. Mr. Evans went with me.
1186. Did you particularly examine the bodies lying on the flatt? Yes; I had a brother there in the western.
1187. What position did the bodies occupy? How were their heads lying? Some of them had been shifted then, and wrapped in canvass.
1188. Some one had been there before you? Yes.
1189. Did you go to the fall beyond the junction? Yes, I went to the big fall; there were men working at it.
1190. When did the men get over it? The next day, in the morning.
1191. Did you go over the fall? Yes, carrying the bodies out.
1192. Did you identify the bodies, or had explorers been there before you? I could recognise some of them.
1193. But others had been there before you? Yes.
1194. Who was there before you? I cannot remember.
1195. Was Mr. Green there before you? No; I think I was in the pit before him.
1196. Did you see any of the bodies lying as they were found in the tunnel, or No. 1 heading, or in No. 2 heading? Yes, I saw some that had not been touched.
1197. Where was that? The far end headings; there were two new chums working there.
1198. Did you know No. 1 and No. 2 headings? No, I do not know much about them, as I was not much up there.

1199. Can you tell us anything as to the condition of the bodies as you found them? Some of them were lying face downwards, and had not been touched at all; some in the bords and some in the headings.
1200. Was that in No. 3 or No. 4 heading? I cannot be sure; I do not know these headings.
1201. Where were you working before the strike? In the western.
1202. Were you working in the gassy section? No.
1203. Was there any gas in the western section before the strike? I never saw or heard of any.
1204. Have you been round the whole of the workings since the bodies were found? I was round the gassy and the western, carrying the dead out.
1205. Have you been round with the managers with the view of ascertaining the cause of the explosion? No.
1206. Did you work with Davy-lamps in the western? No, with naked lamps.
1207. And you met with no gas? No; there was none there that ever I heard of.
1208. *Mr. Neilson.*] Did the body of your brother, after being washed, show any signs of being burnt? No, very little.
1209. What part of the mine was he in? In the western, as you come off the flatt, a good way up. [*The witness withdrew.*]

Mr.
J. Poppett.
11 May, 1887.

Wm. Beckton sworn and examined:—

1210. *President.*] What is your occupation? I am a miner residing at Bulli.
1211. Were you engaged at the Bulli colliery at the time of the accident? No, I was not.
1212. Were you engaged at the Bulli colliery before the strike? Yes.
1213. How did you first become aware of the accident? I heard it from a man as I was coming from my work at North Bulli.
1214. At what time was that? It was about 3 o'clock or half-past on the 23rd of last month.
1215. That was some time after the accident occurred? Yes.
1216. Did you go straight up to the mine? I went up after having tea.
1217. Were you one of those who went into the mine? Not at that time; I went in after.
1218. The accident occurred on the Wednesday—when did you go in? I went in on Monday with Mackenna, Hobbs, Mr. White, and the Government Inspectors, Mr. Rowan and Mr. Dixon.
1219. Where did you work in the Bulli mine before the strike? All over the gassy section pretty well.
1220. In what place did you work? We started in the straight heading; then we worked in an airway, following up the main back heading; then we worked in No. 1 left, or No. 6, I think it is, where the back air-way started off. [*Position indicated on Plan. Witness referred to No. 5 heading.*]
1221. Were you working in Nos. 1 and 2 headings? I drilled a hole in No. 1, but never worked in No. 2; I forgot this when giving my evidence before.
1222. Then practically you did not work in No. 1 heading? No, I just drilled a hole there.
1223. Was gas given off in considerable quantities in that district when you were working there? Yes, in the face and on the rib sides—that was on the main heading.
1224. Was there a larger quantity of gas given off in approaching these rolls you were troubled with? I believe there was.
1225. Did it issue from the cracks or joints in the coal? It came in the shape of blowers.
1226. It came out in some force, I suppose? Yes, some of the blowers were stronger than others.
1227. Did you use safety-lamps? Yes.
1228. Were they locked? Yes; that is sometimes before the strike, but not afterwards.
1229. During the day-shift were they locked? I have worked during the day-shift with unlocked lamps.
1230. Can you assign any reason for that? No; I would just go in and get my lamp, and if no one was there to lock it I would take it away with me.
1231. Have you never read the Act of Parliament dealing with regulation and working of coal-mines? No, sir.
1232. Have you not read the special rules dealing with the presence of fire-damp in mines? Well it is so long since I got them that I forget.
1233. Are the rules not posted up at the pit, where you could see them? I have tried to look at them, but they are so high up I could not see with the light there.
1234. Do you know the duties devolving upon you as a miner in working with safety-lamps? No, I can't say that I do.
1235. Rule 16 of the General and Special Rules Bulli Colliery says:—

“Should it be necessary to use safety-lamps in any portion of the pit, stations will be fixed upon and proper notice boards erected, beyond which no person under any pretence whatever shall take any naked lights, pipes, or matches. From these stations no person is allowed to take a safety-lamp to use in the pillar-workings, broken or waste, without it having been first examined and securely locked by the overman or other person appointed. None but the overman or other person authorized shall carry a safety-lamp key.” * * * * *

Do you not remember reading that portion of the rule No. 16? No; I do not remember reading that.

1236. Did you consider that you were incurring any special danger in working with unlocked lamps? No.
1237. You say occasionally they were locked? Yes.
1238. In the majority of cases were they locked? For a while they were; but before the price was settled and the miners came down in bodies to work we never used locked lamps.
1239. Then was the price increased on account of having to use safety-lamps? Yes; we were all working on shift-work at that time, and when the price was settled thirty more men came down there, and I suppose for safety they locked the lamps. I never saw a “safety” key before that.
1240. But after that you say the lamps were locked? Yes.
1241. And was the rule adhered to? They were never locked on the night shift.
1242. Did you receive any special instructions as to the use of safety-lamps in working on the night shift? Not to my knowledge.
1243. What did you in the event of your lamp going out? We had to go back.
- 1243½. Did you receive any instructions to that effect? No.

1244.

Mr.
W. Beckton.
11 May, 1887.

- Mr. W. Beckton.
11 May, 1887.
1244. How far did you go back? We went back past the danger-board into the main air-way, as a rule.
1245. Where was the danger-board fixed? At the last stenton, and it was moved forward as the stentons were advanced.
1246. Did you find a considerable quantity of gas in your face each day? I have found from 5 or 6 yards up to 40 yards of it.
1247. Was that every day? No, not every day. As the stentons were driven through, a certain quantity of gas would be carried away; but I do not think I worked a shift there without being in gas.
1248. Was the ventilation sufficient at that time? It was, up to the stenton; but beyond that it was not very good.
1249. Did it ever occur to you that brattice ought to have been used? Have you ever seen brattice used? There was a little brattice used there at first, but I never took any notice of it.
1250. Then has your experience been gained in this colony only? Yes; in the Bulli district.
1251. You know the object of bratticing? Yes; I do now.
1252. How did you fire shots in the presence of so much gas? I did not fire many; I did not care about it. Jim Crawford generally fired the shots.
1253. How did he do it? He generally fired the shots with a touch-paper from his Davy-lamp. He would hold the light on one side and put the touch paper against it.
1254. Had you ever worked with safety-lamps before you worked in the gassy section? No; never before then.
1255. What material did you use in tamping your shots? Sometimes we used slack coal, and sometimes stuff from the dyke. We would put it on and tamp it up dry.
1256. Did you consider that a safe method? I think it was as safe as anything else.
1257. Indeed. Did no one tell you it was unsafe? No.
- 1257½. *Mr. Neilson.*] Do you know anything about No. 1 or No. 2 heading? I know a little about No. 2 heading. I saw a drill hole bored there on one occasion and a gas-pipe put in it, with a tap attached. The deputy one day lit the gas coming through this pipe. It was very strong, and if he turned the tap full on it would not burn, the force was so great.
1258. How long did that blower in No. 2 heading continue? It was there, I think, when I left. I believe the pipe was put in there to convince Mr. White there was gas; at least so I heard.
1259. Who put it in? The deputy.
1260. To convince whom did you say? To convince the management.
1261. Was not the deputy part of the management? I suppose so. But perhaps they would not believe there was gas there.
1262. How long did this blower continue? Well, I only saw it once. As I say, it was so strong it would blow its own light out; but when the tap was turned on about a quarter power it would burn away fine.
1263. You have said you have known as much as from 5 to 40 yards of gas to be present in that heading. How did you manage to work there with that quantity of gas? I know the safety-lamp would be jingling on the bottom, and we complained about it, so they shifted us out of it. I suppose they saw that it was too bad.
1264. How long did you work with your lamps jingling, as you call it? That is the gas playing on the bottom.
1265. *President.*] Did you see the gas—did you have a blue blaze in the lamp? Yes.
1266. *Mr. Neilson.*] How long did it continue? Well, when we started to work the gas would go away to a certain extent; but if we went out for a time it would be just as bad when we came back, so we complained about it.
1267. If there was 40 yards of gas there the tail end of the gas would be close to the danger-board? Yes, so it was.
1268. This was a special place you are talking about—over a fault? No; it was in the main heading.
1269. But it is crossing a fault, as you pointed out on the plan? Yes.
1270. Did you pass over any rolls? We went over two in the 40 yards.
1271. Was the gas there at night time? Yes; more so at night.
1272. How did you manage to fire shots with such a quantity of gas present? Well they did it, that is all I know.
1273. You say you used dry tamping? Yes.
1274. Had you any blown-out shots? No; they always did their work well enough.
1275. Is it customary to use dry tamping? I never saw anything else used there; they used either dyke or slack.
1276. Did you never see any of the holes blown out? No; I never saw any.
1277. Were you at work on your own account all the time that the gas you describe was in this place? We were at that time. We had gas all through, but not always so bad.
1278. *Mr. Hilton.*] Did you ever report to the deputy or overman the presence of the gas? Well, it was a common occurrence. They would come and inquire about the gas, and we would tell them about it.
1279. Did you know it was a part of your duty to report the existence of gas to the overman in case he was not aware of it? No.
1280. Did you ever see a copy of these general and special rules (*produced*)? When I came here first I had a copy, but I have been away since and I have lost them, and I do not remember their contents. I was away about six or seven weeks.
1281. On resuming work again did you receive a copy of these rules? No.
1282. *Mr. Owens.*] Were you employed in No. 3 heading? Yes.
1283. And did you see a considerable amount of gas there? Yes.
1284. Have you ever worked in the western district? Very little; I drove the air-course from Hill End to the western.
1285. Did you ever see gas there? Well we were told on one occasion to clear out with our naked lights.
1286. That is the present return? Yes.
1287. Did you report that to the deputy? I did not see him. This was also abandoned ground.
1288. You found gas there? No; I will show you on the plan. (*Position indicated.*)

1289. Did you see the gas? No, I did not see it, but a man came down and told us to clear out.
1290. When was that? That was about two years ago, just about the time the gassy was struck.
1291. *Mr. Jones.*] When you went to work at night you took the lamps from the cabin, I suppose? Yes.
1292. Did the management ever remonstrate with you? No.
1293. *Mr. Clarke.*] Where was this large accumulation of gas, the presence of which it was necessary to demonstrate? In No. 2 heading.
1294. Did you ever see the overman or the manager there? No; my heading was a different one.
1295. Why did you say that this pipe with a tap was used for the purpose of convincing them? I said that this hole was bored to show the large quantity of gas there.
1296. Did you mean to imply that the management were unwilling to believe that there was that amount of gas there? I cannot say as to that; I know there was talk among the men to that effect.
1297. It meant that there was an unwillingness to believe in the presence of such a volume of gas, I suppose? Yes; that they thought there was only a small portion of gas there, and it was to convince them that there was a large quantity.
1298. Would not the fact of your carrying safety-lamps imply the presence of gas? Yes.
1299. Then there should have been no need of convincing? You would not think so.
1300. Then why use the word? All I know is that that was the word passed among the men.
1301. *Mr. Jones.*] I suppose what you want to convey to the Commission is this: that the pipe was put in simply to show the quantity? Yes; that is what I mean.
1302. You do not mean to say that the existence of gas was doubted? No; but they did not know it was in such large quantities.
1303. *Mr. Croudace.*] How long ago was it that this large flame of gas came from No. 2 heading? I think it was during the last quarter that we came out, but I am not certain.
1304. Say as nearly as you can? It was about three months before the strike. I know it was a good way from the face of the heading.
1305. Did it totally clear away before the strike commenced? I cannot say. I only saw it once, and I never heard anything more about it after.
1306. Did you consider Crawford a cautious and prudent deputy? Well, so far as that goes, he used to caution us pretty often.
1307. Do you think he thoroughly understood his work? Yes; so far as I know, but I have not much knowledge of gas.
1308. You know the use of the Davy-lamp—that in the presence of gas it will light at the flame and expand inside, but cannot come outside? Yes, I could detect it in the flame.
1309. You know of your own knowledge that the use of the safety-lamp is that the gas can be exhibited inside of it, but not come out by ordinary means? Yes.
1310. Then was it a prudent or a proper thing for Mr. Crawford to tilt his lamp up, so as to let his lamp come in contact with the touch-paper? I do not know enough about gas to answer that question.
1311. Knowing that the flame ought to be kept inside of that gauze, was it a prudent thing for Mr. Crawford to tilt his lamp and let the flame ignite his touch-paper outside? So far as my experience went, I saw nothing wrong in it. As I say, I do not know much about it.
1312. Have you been in the mine since the strike? Yes.
1313. Can you give me an idea as regards the state of ventilation with this amount of gas inside previous to the strike, compared to the amount of ventilation after the strike? I have no idea as to that. [*The witness withdrew.*]

John Hobbs sworn and examined:—

1314. *President.*] You are a miner? Yes.
1315. Employed at Bulli? Yes.
1316. Have you been employed in the Bulli Colliery since the strike? No.
1317. Where have you been working? North Bulli.
1318. How long have you been a miner? Twenty-nine years.
1319. In this country or in other parts of the world? Both in this country and in other parts of the world.
1320. Where? In England and in Wales.
1321. What part of England? In Lancashire, Yorkshire, Scotland, and in South Wales.
1322. Have you been accustomed to work in fiery mines? Yes, in some of the most fiery mines in England.
1323. You are well acquainted with the use of safety-lamps? Yes; we use nothing else in these mines.
1324. How long did you work in the Bulli Colliery? About three years.
1325. And where did you work? I started to work in the Hill End for the first quarter, that was before the fault was struck.
1326. There was no gas there at that time? No, the place was free from gas.
1327. There was no gas before the fault was met with? I never saw any.
1328. Where were you on the day of the accident? I was in the house.
1329. Were you with those who went into the mines? Yes.
1330. When did you reach the mine? At half-past 5 on Wednesday evening.
1331. Where did you go? I went up to the western door.
1332. What was the condition of the ventilation of the mine? Very foggy and thick with foul air.
1333. You found a good many falls, I suppose? Yes.
1334. Beyond the western? Yes; there was a heavy fall.
1335. Beyond which you did not deem it expedient to go? A hole over the top of it had just been made, and the manager, Mr. Ross, with three or four others, went through it and got on the other side.
1336. What hour was this? It was about 7 o'clock on Wednesday night.
1337. Did you go over the fall? Yes. I thought there was danger, and I went over to see if those who went before me were all right.
1338. Was the ventilation being restored? No; there was no alteration in the ventilation at that time.

*Mr.
W. Beckton.*
11 May, 1887.

*Mr.
J. Hobbs.*
11 May, 1887.

- Mr. J. Hobbs.
11 May, 1887.
1339. Had the canvas been put up at the western junction? Some canvas had been put up, but a great part of the ventilation was oozing through it.
1340. How far did you go? Close to where the dyke was.
1341. What prevented you from going further? Some of the men began to fall down from the effects of after-damp; we had to carry two of them out.
1342. What time was that? Between 8 and 9 o'clock at night.
1343. What time did you return again? I stopped in that night till 12 o'clock.
1344. But you did not get beyond the dyke? No.
1345. You worked to clear away the fall? Yes.
1346. Did that improve the ventilation? It could not improve it.
1347. Would it improve the road? Yes.
1348. Would it give a greater area for the air? Oh, yes.
1349. When did you return after 12 o'clock on Wednesday night? I returned about 9 o'clock next morning.
1350. Where did you go? I went right into the gassy section.
1351. Had any explorers been there before you? I believe so.
1352. Did you see any bodies on the road? Yes, they had not been removed.
1353. How many bodies did you find between the western junction and No. 1 heading? The bodies of two boys.
1354. You found them on Wednesday night? Yes.
1355. Was one entangled in the ropes and the other naked? One of them had no clothes on.
1356. None at all? None that I could see, and the other was entangled in some ropes.
1357. They had the appearance of being blown about? Yes.
1358. Who were with you? Mr. Ross, Fred. Robbins, and three or four more. I believe there were six of us altogether.
1359. Did you notice whether the boy who had no clothes on was burnt to any extent? I had no time to look for burning, the after-damp was too bad.
1360. Was it very hot? It was not very hot, but the after-damp was very bad.
1361. On the Thursday morning when you went into the mine, did you go with Mr. Green to No. 1 heading? No.
1362. Where did you go? I went into the gassy, but I think I went by myself.
1363. What do I understand by gassy, is that not the Hill End district? Yes; we call it gassy inside the dyke. I went through the dyke with Mr. Williams, the Manager of Coalcliff. I stopped there and placed forty-two bodies on stretchers, and other men carried them out.
1364. Did you identify any of them? Yes, some of them.
1365. Did you take any note of the positions of the bodies? Yes, I know the way all of them were lying.
1366. On reaching No. 1 heading, did you see any bodies there? Yes, I believe there was a man lying by the side of Millwood, and I believe Millwood was the second body. It was on the other side of the second crossing that was working.
1367. Were there any men lying in the main tunnel opposite No. 1 heading? No.
1368. Did you pass two bords? Yes, two bords that were not working.
1369. Was there a man lying at the second bord, near the main road? No; there was a man lying a little further out, but the two bodies were near each other.
1370. One of them was Millwood? Yes, I have no doubt about it.
1371. Was Millwood lying in a conspicuous position? Yes, and I took his watch off him.
1372. Where were the other bodies? Just past the next bord. There was one lying in the bord on the road, and another lying in the face of the same bord.
1373. Did you identify them? No, they were strangers to me.
1374. Going up the heading, what did you find? There was a man lying in some slack beside the cut-through, and inside the cut-through there was a horse; and there was a man lying between the front legs of the horse.
1375. You got five men a little above the fifth bord, then opposite or near the next bord you got one lying near the main road, and another man near the face, then you go up and were not two boys found near the next bord? No; I don't think there were.
1376. On the plan there are two other bords, namely, Nos. 6 and 7 working bords, and there are two men lying on the main road, near the entrances of each of these bords? I do not recollect seeing them.
1377. Was Mr. Green there with you? Mr. Williams and Fred. Robbins, and they were taking in men.
1378. Then you came to the cut-through, where the danger-board was placed between Nos. 1 and 2 headings;—was there a man found there? Yes.
1379. Near the entrance of the cut-through of No. 1 heading there was another man found? Yes, on the slack.
1380. Was he on his face? No, lying on his back.
1381. How were these men on the main road lying? Mostly with their face downwards, as if they were proceeding down the road.
1382. With the exception of Millwood? Millwood was sitting with his head on his left shoulder, and his big lamp was by his side.
1383. Then you come into No. 2 heading;—where did you find the men in No. 2 heading going downwards? There was a little bit of a rib in a bord which had just been turned off, and was in about 2 yards. There was one body there. It appeared that he had been sheltering himself, and he was lying down where he had fallen. We went back to where a fault had been blown up, and there were nine bodies in a heap in this fault, which was very narrow. I believe there were nine there altogether.
1384. Was there one in the next bord? No.
1385. Were there two on the main road near the next bord further down? The nine men I refer to were close together, no distance separated any of them, but there were two men in the double bord off No. 2 heading.
1386. Then you come down towards the flat? Yes.

Mr.
J. Hobbs.
11 May, 1887.

1387. And you reached the diagonal road? Yes, there was one man lying outside this lot; he had a tea-bottle in his hand, and this was lifted up just as if he had been in the act of drinking when the explosion occurred.
1388. You would conclude from that that his death had been very sudden? Yes, and it appeared as if all the old miners were trying to make their way out, but some of the miners had evidently dropped where they were standing.
1389. At this particular part they were all in the main road? Yes, all of them.
1390. Were their heads lying as if they were making their way down the road? All, except one, who was lying on his back.
1391. Were these men lying on top of each other? No, but they were lying very close to each other.
1392. Did you observe the diagonal road where the coal was brought from No. 1 heading into the main tunnel—what condition was that road in? Yes; there was a set of skips there, and the empty skips were all turned on their sides as if the blast had overtaken them as they were coming down the road.
1393. Was there a boy at the end of those skips? I suppose so, but I did not find him.
1394. Now, come to the main tunnel? There was a horse at the mouth of No. 2, and the boy who drove the horse.
1395. Did you observe the condition of the stoppings? Yes; they were blown towards the return as if blown inwards off the road.
1396. Did you go over the stoppings? No; we bratticed them up all the way down; the first one was a heading where a door is supposed to be, and next was an ordinary stopping; the third had been a horse-road for the return, and it had been shifted further in.
1397. Did you find any men in the main tunnel or the flat between Nos. 1 and 2? On the middle of the flat there were two boys—one was almost battered to pieces, and was lying under a full skip; the other was lying with an empty skip just turned over him as if the blast had come up and blown these skips to pieces. There was another man in No. 3, and every bone in his body was broken, and his inside was out; he was the worst mutilated of the lot, and had no clothes on; he was found in No. 3 turn.
1398. What about No. 2 heading? I finished there.
1399. Coming back to these boys that you got in the main tunnel before coming to No. 1 heading, one of whom was entangled in the ropes, had they any marks of burning on them? Their hair was burnt, but I did not take special notice of their skin.
1400. Coming to No. 1 heading, the first body that you found was opposite the second working bord off the main road? Yes; one of the bodies found there was badly burnt. Millwood, who was also found near there did not appear to be burnt at all; he appeared as natural as if alive.
1401. You conclude that he died from after-damp? Yes.
1402. Coming to where you got five or six other bodies, were they in the same condition? They were all lying with their faces downwards, and they did not appear to be burnt.
1403. Was there a man right in the face? Yes, with a pick by his side, and his light was hanging on his billycan.
1404. The position and condition of that body would lead you to conclude that death had come suddenly? Yes.
1405. Coming up to the cut-through there was a man lying on his back? Yes; he was burnt.
1406. Did you observe the condition of the horse found there? Yes, and I noticed that the body of the horse was awfully swollen.
1407. Some time had elapsed which might account for the swelling? Yes.
1408. Was the man lying near the horse burnt? Yes.
1409. What was his name? He was a stranger to me. Just beyond this horse I found a safety-lamp gauze; it was in No. 1 heading, a little further in than the horse. I picked up another lamp, and I tried it, and found it open.
1410. Was the gauze separated from the lamp? No.
1411. The lamp was intact? Yes, but open.
1412. Not unscrewed? No.
1413. Where was the lamp-gauze you found? Close to the horse.
1414. And where did you get the second lamp? Inside, nearer the face where there is a stone or the beginning of a roll.
1415. Did you find some loose powder? No; I found a coil of fuse burnt to ashes hanging on the prop.
1416. Have you heard that powder was found? Yes, I have heard some one say so.
1417. You have no doubt that the man found in the cut-through and the man that was under the horse were burnt? Yes, they were burnt.
1418. And the man you got further down the heading road had no visible marks of burning? No.
1419. Now come into No. 2 heading? The first one was found in a bord; he did not seem to be burnt to any noticeable extent. I was engaged in taking the bodies and placing them on stretchers, and I noticed that one was burnt very badly.
1420. Who was that? I think it was Jack O'Neill; his was the outside body but one in No. 2 heading.
1421. And he was found in the main road? Yes.
1422. Down in another bord you got two men? Yes; one on the bord and another further in; the one that was furthest out was burnt a little.
1423. Can you speak of those found in the main road? Yes; they were all lying with their faces down; some of them had their hands burnt and some their faces, but not severely. Jack O'Neill was the worst of the lot.
1424. Are you now referring to the group of men that were lying together? Yes; there were nine or ten altogether, but they were not badly burnt.
1425. Did you examine the condition of the bords off No. 2 heading? Yes.
1426. Did you see any marks of fire? Yes; a coil of fuse was found in No. 2 heading.
1427. What bords did you go in off No. 2 heading? I went into every one of them, and tried everywhere for gas, and I found a little in one of the bords; I believe it was Jack O'Neill's bord.
1428. It was a small quantity? Yes.
1429. Did you examine the last two or three bords nearest the main tunnel? Yes; in one there was a set of empty skips, but I saw no evidences of fire on them.
1430. The last bord down, did you go into that? I am not sure.

Mr.
J. Hobbs.
11 May, 1887.

1431. On what side of the skips did you go? I went in on one side and came out on the other, and I did not see much evidence of the blast; the skips were all on the road with the exception of one.
1432. Did you observe any evidence of fire on the props as if the blast had swept through the cut-through? Yes; I saw the props were crispy.
1433. Was that an evidence of fire? Yes; fire had been around them and made them crispy.
1434. You examined No. 1 heading? Yes.
1435. Did you see any evidence of fire? The props here seemed to be quite different; they seemed as if they had not been touched, and I saw no evidence of fire about them.
1436. You would not be surprised to learn that traces of fire have been found there? No; because I did not look particularly.
1437. Your examination was necessarily a hurried one? Yes.
1438. Coming down to the tunnel you did not go through the stopping that was blown out? No.
1439. Did you put up a canvas? Yes.
1440. You did not go up Nos. 3 and 4? No, not into No. 4, because we were short of canvas, and as it was getting late. On Friday morning we started out.
1441. Have you any other information to give us as to the examination at that time? Of course I worked in the gassy from the time gas was struck, when we passed over the dyke to where the workings are now, and I turned off No. 4 heading.
1442. In working that heading did you find gas? Well, you could find gas anywhere there; we were never without gas more or less. Sometimes there would be great quantities, and at others, when the cut-through was near the face, it would be much less.
1443. It depended on the ventilation? Yes.
1444. You are only speaking of the time before the erection of the new furnace? Yes.
1445. Was the ventilation sufficient at that time? I did not look much after that.
1446. Did you complain? Yes, both about the gas and the ventilation.
1447. I suppose it would probably be through the representations that the men made, as well as the evidence of gas itself, that caused the new shaft to be sunk? I believe the new shaft was started before much gas was got at all.
1448. How long ago? I think it was before the dyke was struck.
1449. Was it stopped for a time? It is only about a year and a half ago since the gassy started.
1450. But that is a long time to sink a shaft. Did you work with locked lamps? Yes; sometimes they were locked and sometimes they were unlocked.
1451. At night, were they unlocked? Both night and day.
1452. Why was the rule to lock them not continuous? I cannot say.
1453. Was there a rule for the locking of the safety-lamp? There is a rule all over the world.
1454. Did the deputy lock the lamps or not? I believe he locked them for three or four weeks at the latter end.
1455. Then he locked them for a time? Yes, perhaps for six or seven weeks.
1456. Did you complain to the deputy about it? I told him that the lamps ought to be locked.
1457. What did he say? Well, he said, "I will see that they are locked," and then they would be locked for a time. When the men started getting coal the deputy locked the lamps himself, and before that I was always at him about locking them, and about several other things that were not fit to be done.
1458. What were these things? Well, there was a safety-lamp used night and day with the top out, and the gas was coming out in the gassy and in the straight.
1459. Who used this lamp? Bill Beckton and Thomas Wales. My mate used it in the day-shift. I told him about it, and he said, "It is right enough; hang it back on the road."
1460. You know the special rules? Yes.
1461. You know the provision as to the duty of miners in dealing with safety-lamps, to take off the gauze and take it home for cleaning purposes, and if the gauze requires repairing to take it to the lamp-cabin;—did Beckton do so? Yes.
1462. How do you know? I told the deputy about it.
1463. But how do you know he took it to the cabin? Both of them did.
1464. But how did you know? I told the deputy about it myself.
1465. And what did he say? He said, "It is right enough; hang it back far enough on the rib."
1466. That was Crawford? Yes; he said, "I have been complaining to White about it." He also said, "I cannot get any gauze, and White won't take any notice of me."
1467. Who said that? Crawford.
1468. Are you sure of that? Yes.
1469. How did you work the coal in these places? Sometimes with a pick and sometimes we blasted it.
1470. What explosives did you use? Loose powder.
1471. How did you fire the powder? With a fuse and a bit of touch.
1472. How did you fire the touch? With the safety-lamp.
1473. You tilted the lamp? Yes.
1474. Was that safe? No.
1475. You say you have had a great deal of experience; and you said the gas was always present, and you made frequent complaints to the deputy, and yet you say that you perpetrated the awful absurdity in lighting the touch-paper by tilting the lamp? Remember, we did not do that in the presence of gas; if there was any in the face we always brushed it away before firing the shot.
1476. What effect would the flame have in impinging upon the gauze? No effect at all; the proper way to clean the gauze is with a covering of oil.
1477. Is there any other way of cleaning the gauze? You can clean it by steam.
1478. Can you clean it with soda? Yes; but if you boil the gauze it will loosen it.
1479. What was the practice in England? We had nothing to do with the lamps there.
1480. It was a rough-and-ready way you had? Yes.
1481. It does not redound to the common-sense of the people who do it. You cannot state the condition of that district of the mine since resuming work after the strike? No; not since the strike.
1482. Of course you examined the places during the time you were taking out the bodies, and you saw some gas? Yes; in No 2, and a little bit in a bord off No. 2.
1483. And the ventilation was then deranged? Yes.

Mr.
J. Hobbs.
11 May, 1887.

1484. On account of the destruction of the stoppings and doors? Yes.
1485. Was that a likely time to find gas? No; there is no gas where there is black-damp.
1486. What effect does that have? It drives it out or kills it.
1487. Are you sure of that? Yes.
1488. Suppose gas was existing in large quantities, how could you test for gas? In black-damp or after-damp we could not test, because the lamp would not burn.
1489. Did you find any gas anywhere else? No; only in one bord.
1490. The ventilation was then undoubtedly deranged? Yes.
1491. Very well, don't you think that with the ventilation so deranged it was a very likely time for the discovery of gas? No; the after-damp would stop it.
1492. How do you account for the gas in No. 2 heading? On account of the poor ventilation there.
1493. It was beyond a cut-through? Yes.
1494. Was the current of air appreciable that was going through the cut-through? Yes; I threw up a little bit of slack and found that the air was going through.
1495. Did you form any conclusion as to the cause of this accident? I cannot form any conclusion, but I have my opinion.
1496. That is what I want? I believe it was a fire-damp explosion, and that most of the damage was done between the Western and the gassy.
1497. Where, in your opinion? In the left-hand heading, off the middle flat.
1498. That is No. 2? Oh, no; it is between the Western and the dyke.
1499. How do you account for the position of the skips from the diagonal road, on that supposition, and if it fired in the left-hand heading who fired it? I don't say it fired there; I believe it fired in the bottom of the straight or No. 5 heading.
1500. How do you account for the position of the skips and the amount of destruction of property? Because everything was blown upwards from the bottom of the flat. The full skips were lifted up there.
1501. And supposing the blast came from No. 2? All these things would have been blown in a different way.
1502. What blew that stopping in towards the left? I cannot account for it; the stoppings were blown into the return, and everything else was blown from the bottom.
1503. And yet you follow the course that the blast has taken? No.
1504. You did not go into the mine with the object of discovering the course of the blast? No; only to help to carry the bodies out.
1505. Your conviction is that the explosion took place where you state? Yes; and that there was not enough gas in the gassy to do the damage that has been done. A large quantity of gas has lit there before a dozen times to my knowledge.
1506. Was that a safe state of matters? It was not.
1507. Did you complain? Yes.
1508. Did you not think it a prudent thing to retire altogether? It was as safe for me as for the others.
1509. Do you think that self-preservation is the first law of humanity? Yes; but men don't always think of that.
1510. I am afraid that men do think of that. Have you formed any opinion upon, or have you studied the behaviour of coal-dust in the presence of gas? I never studied anything of that kind; I only studied the easiest way of working coal.
1511. I think a man of your experience ought to look a little higher, and I am quite sure you do it.
1512. *Mr. Neilson.*] With reference to Millwood's lamp, who picked it up? I did not.
1513. Were you there when it was picked up? No; I was not.
1514. You were working in No. 3 heading? No; in No. 4.
1515. That is the heading going parallel with No. 3? Yes.
1516. What was the largest quantity of gas you have seen there? It was back to the cut-through in No. 3; it was back to the cut-through in No. 4; and it was back 8 or 9 yards in the straight; and it was full in No. 6.
1517. Outside the danger-board? Inside.
1518. Were you near up to the stentons? They were over the distance; 35 yards is the distance according to the rules.
1519. The gas tailed right out to the danger-board? No; I did not say that. The danger-board was outside at No. 3 turn, and there was a cut-through inside of that.
1520. The gas tailed back the full length where you were working? Yes.
1521. What gas had you in the face? The face was full of gas.
1522. Right on the bottom? Down to the stone. I was driving the cut-through in No. 3 up to No. 4.
1523. Your lamp would be full of fire? There was no fire at all in the lamp.
1524. Notwithstanding that it tailed back for 35 yards? I did not say that.
1525. I understood you to say that? It was to the cut-through.
1526. I noticed that you stated before that there were 40 yards of gas? That is not my evidence as you will see.
1527. Crawford fired your shots? Yes.
1528. Did he go back to light the touch? Yes.
1529. Even when he knew there was gas in the face? Yes; but it was brushed clean before it was fired.
1530. Was that the custom? Yes; but it was not the regular custom. There ought to have been bratticing.
1531. Was it the practice? Yes.
1532. A man would take his shirt to brush the gas out? That was our practice.
1533. The shot was lit inside the gas? When we brushed her out we could hardly see any gas.
1534. Did you brush from the face right back? Yes; to the cut-through. There was a cut-through beyond the danger-board, inside of it.
1536. Do you know that door leading into the Western? Yes.
1537. How is it made? It was an open door when I was there.

- Mr. J. Hobbs.
11 May, 1887.
1538. When did you see it last before the strike? The last thing before the strike I believe it was there.
1539. You never saw any slide? No; after the explosion there was no door there at all.
1540. Was there any trapper at that door? I think that the man who looked after the set also looked after that door.
1541. There was some one attending it? Yes.
1542. The next door was between Nos. 1 and 2 headings? Yes; a little lower down than the lamp-cabin.
1543. Was there a trapper there? Yes.
1544. There was another door further in? Yes.
1545. Was there a trapper there? Yes.
1546. You are quite sure you never saw a slide in this door? No; that road was not my road for travelling in and out, and I never made it my duty to look after another man's business.
1547. You never heard of a regulator being put on the western door since the erection of the new furnace? I never saw it; I heard them talking about it.
1548. Did you complain about the gas to any other person than the deputy? No; I thought it my duty to tell the deputy, as he was the person to look after that.
1549. *Mr. Hilton.*] You say that the Deputy Crawford complained of the bad state of the lamps? Yes.
1550. Did he say to whom he complained? Yes; he said he told White about them, and he took no notice.
1551. Did you hear him say whether he had complained to the manager? I never heard him say that.
1552. You are sure that Crawford stated to White about the bad state of the lamps? Yes.
1553. *Mr. Owens.*] In reference to that lamp with the top gauze off, I expect you have seen the Government Inspector in the mine? Yes.
1554. Did you see him when you were using that dangerous lamp without a cap? The cap was there, but the top gauze was falling to pieces.
1555. You never unscrewed it and showed it to him? When the inspector came it was all right; a new gauze was put in.
1556. Did you ever hear of a blower being struck in No. 2 heading, and of the gas being carried away with a gas-pipe? Yes; a drill-hole had been put in the side, and a bit of a gas-pipe had been put on a blower, and you could turn it off and on like ordinary gas.
1557. And you were in the habit of lighting this? No.
1558. Who was? Crawford.
1559. Did you see him light it? Yes; when we were a long way back all over the stone we used to strike blowers, and you could hear them buzzing like steam-cocks for a week or a fortnight.
1560. What course did you take? I took no notice of it; we kept our lamps back.
1561. Did you find any gas in any other part of the pit? I found a little gas once between the Western and the Hill End in the return in the heading off the middle flat; it was not so sharp as that which came off beyond the dyke. I saw Crawford as I was going in, and he told me he heard a fall, and he told me to go and see if it was clear; I went in to have a look, and found the gas.
1562. *Mr. Clarke.*] You say you saw Millwood's body with his lamp alongside of him? Yes.
1563. Or did you say you did not see his lamp? I was asked if I saw anybody take it. I saw his lamp and other lamps.
1564. He had a different kind of lamp? Yes; a brass lamp.
1565. Have you heard it was found elsewhere? I don't know about that.
1566. Have you heard it? No.
1567. You are sure it was found alongside of him? Yes; I saw it with my own eyes on Thursday morning.
1568. How far was his body from the main tunnel on the out-by side? I daresay it was about 40 or 50 yards.
1569. In firing shots you had to light the fuse with touch-paper? Yes; we used to go outside the gas to light the touch-paper.
1570. You used to brush out the gas first? Yes; one would be brushing while the other went to light the shot.
1571. Did you ascertain the heading was free from gas before lighting? Yes.
1572. You would light the gauze outside and bring it to the fuse? Yes; the man brushing away the gas would say she was clear, and the other would then come in and light the shot.
1573. Do you know whether fuse will fire gas? Yes; the spitting of the fuse would fire gas.
1574. *President.*] And yet you work with fuse? Yes.
1575. You used means that would fire the gas? Nearly everybody fired the gas but myself in the gassy. Some fired about 12 yards of gas to my knowledge, and men work with their lamp red hot in it.
1576. That speaks volumes for the men? I told them to go to the deputy.
1577. Yet you used to fire shots with fuse that would fire gas? Yes; others did it besides myself.
1578. *Mr. Jones.*] Crawford fired the shots for you before the strike by the same means? Yes; when the men came down to work by the tonnage he fired the shots.
1579. And he fired them in the same way? Yes; the very same. I have seen them fired with a wire; but one way is as safe as the other.
1580. *Mr. Croudace.*] There seems to be some doubt as to the spot where Millwood's body was found—is there any doubt in your mind? Not the slightest.
1581. Where was he found? On the road at the second crossing that was working—the fourth bord out, on the left-hand side.
1582. You are quite sure about that? Yes.
1583. I want just to question you in regard to this lamp which William Beckton and Thomas Wales used with the top of it knocked out? It was burnt out.
1584. Do you think it was a prudent, proper, or right thing, not only in your own interest, but in the interest of everybody working in the mine, for you three or four men to continue working for one minute with such a lamp as that? It was not a right thing.
1585. You must now realise that? But we were bound to do it, or else knock off work.
1586. How were you bound to do it? There was no other lamp available, and if we did not do it someone else would.

Mr.
J. Hobbs.

11 May, 1887.

1587. Do you mean to say that you could have induced another man to do so? I could not have stopped him, but I could have stopped at home myself.

1588. Would it not be better to do that than jeopardise the life of your fellow-men? Yes.

1589. There was the fact of a large quantity of gas, and yet you were tempted to work in it with this damaged lamp? Yes; and I tried to alter it as much as I could, but they would take no notice of me.

1590. You say you have seen in No. 3 heading the gas right back to the cut-through, also in No. 4, but you do not know the distance. You also have seen it from the face of No. 5. Further on you say that some of these places were 40 yards from the danger-board. Now, have you ever seen gas from the face back to the last holed stenton, a distance of 40 yards? I have seen it back beyond the danger-board for 30 yards.

1591. Where was the danger-board? By the lamp-cabin.

1592. How far from the face? There was no lamp-cabin there at this time; I mean to say where the lamp-cabin is now.

1593. Was the caution-board put up at the last holed stenton? Yes.

1594. Always? Yes; on the last stenton.

1595. From there to the face, what is the greatest distance that you have seen gas accumulated? I have seen it different distances; sometimes there would be from 10 to 15 yards of gas, and it ran out to a feather in thickness.

1596. Have you ever seen it when it was 40 yards from the cut-through—in other words, have you ever seen gas extending a distance of 40 yards right back to the cut-through? Yes.

1597. Have you worked in it? No.

1598. That is the point that puzzled me, as you could not brush out 40 yards of gas without your lamp becoming perfectly red hot? Quite so.

1599. You have never worked in 40 yards of gas? No; I have sometimes worked in 10 and 15 yards of it, but I have known of the presence of gas in the mine for a distance of 50 or 60 yards.

1600. I will ask you now, have you ever known of any accumulation of gas previous to the strike? Yes.

1601. What is the largest accumulation you have seen? Between 50 and 60 yards.

1602. Where was it? Just by the dyke.

1603. Not in Nos. 1 or 2? No. 1 was just turned away, a prop stood there, and the turn was put down, and the place was being worked for a flat 15 or 16 feet wide; there was a prop there with a danger-board on it?

1604. How long was that previous to the strike? It would be nine or twelve months before the strike.

1605. Have you known any other accumulation (say) within two or three months of the strike? Yes; these headings were all full about three weeks before the strike.

1606. Which headings? No. 3 was full back to the stenton; they reckoned it was 40 yards. The heading I was working in, No. 4, was full back to the stenton, and the straight was full, and there was gas in No. 6.

1607. Were any of these headings stopped? No. 3 was stopped, but I was working there to put an air-course through.

1608. How long was that before the strike? About three weeks.

1609. Do you know whether the gas was cleared out before the strike took place? We had the cut-through through before the strike, and Nos. 3 and 4 were completely clear.

1610. You say that Nos. 3 and 4 were completely clear of gas just previous to the strike. Yes.

1611. That gas having been cleared away, was there any actual accumulation in the mine? I don't know; there was none in these headings.

1612. You don't know whether there was any accumulation anywhere else? There was some in the straight heading, and there was an air-course driving there.

1613. What amount of gas was there there? That was full.

1614. How do you know? Because I had been in there.

1615. Who worked there? Nobody; the men had knocked off.

1616. How far was it from the face of No. 5, called the straight back, to the cut-through? It was 40 yards, or somewhere about that distance.

1617. Was that full of gas? Not all the road; the air-course was full.

1618. You say that the distance from the face back to the cut-through was 40 yards? Yes.

1619. Did the gas remain in that position up to the day of the strike? Yes; No. 6 was full. There was a big stone in No. 6, and the gas was full over that at the time of the strike.

1620. I will ask you to point out the places on the plan? (*Places pointed out.*) Are you perfectly sure that these accumulations were not cleared away before the strike? I am quite sure.

1621. You say that whoever were driving this cut-through did not finish it before the strike? It was not finished, as the men were taken out because there was too much gas there.

1622. Since resuming work after the strike, have you any knowledge as to whether the stentons have been holed through? No.

1623. Can you tell me how much air was going down here? I heard that the air had been measured, and that there were 3,500 cubic feet coming out of No. 2 and going down the road.

1624. What sort of current had you passing through the last stenton? A good current; but it did not work its way into the face of the heading, because there was no bratticing to carry it out.

1625. Did you ever go to see Beckton and his mate? Yes.

1626. You say there were 40 yards of gas there? I said there were 40 yards of gas from the return down to the face.

1627. You said that the face of No. 5 was full—do you mean from the roof to the bottom? Yes.

1628. Then you said that Beckton and his mate were working in this place, and that you saw them? Yes.

1629. Did you notice their lamps? No.

1630. Did you smell the fumes from their lamps? Yes, when they were in the gas; but after they had been working a while it would clear away to a large extent.

1631. Were these men working with their lamps on fire? No.

1632. You are now talking to a man who has seen more gas than ever appeared in the Bulli mine, and I know that you cannot take your lamp into No. 2 heading now without its becoming red-hot; and if your words are to be believed that the cut-through and the face of No. 5 heading were full of gas, you must know

Mr.
J. Hobbs.
11 May, 1887.

- know that the lamps were red-hot? Of course, by working in the heading, and by the current produced by the running of the skips, gas would clear away while the men were working in the heading.
1633. Well, the heading was not full then? Not while the men were working; but if they stopped for any time she would fill again; but the men were working in No. 6 heading with their lamps full—that is, their lamps jingled with the gas.
1634. You omitted to say that. I know exactly what you mean by the lamps jingling? Yes; that was in No. 6.
1635. You have no information as to whether that gas has been cleared away? I know nothing about it after the strike.
1636. Now, with respect to the habit of lighting the touch by tilting the lamp, and therefore destroying the gauze, and endangering many lives—was that a proper thing, not only for you, but for the deputy to do? No, it was not; but they do that all over the world.
1637. I undertake to say they do not? I have seen them do it in other parts of the world, and I have done it myself; and I have worked in mines where there was as much gas as in any part of the world.
1638. I undertake to say that if you had been caught doing that you would have been at once called upon to deliver up your lamp.
1639. *President.*] And I am afraid that you would have had your choice of gaols within a week.
1640. *Mr. Croudace.*] Have you ever known a shot to light the gas? Yes.
1641. And that would be perfectly possible here? Yes.
1642. With regard to the ventilation previous to the strike, did you make a close observation of the separate door going into the Western from the main tunnel, and can you describe what it was like? The door I saw opened just like a common door with hinges.
1643. Was there on any portion of it a sliding panel? I never saw it. I opened and shut it like any other door.
1644. Was there one door or two? Only one.
1645. Going through there, alongside the engine brow, you come to the heading through the dyke between Nos. 1 and 2 headings—was there a door there? Yes.
1646. Were there two doors? Only one.
1647. Was there a trapper there? Yes.
1648. In the diagonal road, made for the sets from No. 1 heading, was there a door there? I never saw one; but that crosscut has been made since I worked there.
1649. In any of these places—Nos. 1, 2, 3, 4, 5, and 6—was there any bratticing used by way of taking air into the faces? No.
1650. Would that be a better plan? Yes. This explosion would never have happened if that had been done—that is my opinion.
1651. You cannot at this time fairly suggest such a thing, for I know collieries where every heading was bratticed, and every door doubled, yet accidents happened? Well, nothing of this kind was done at Bulli.
1652. I suppose it is no use asking you anything about the new furnace? No.
1653. Did you hear that there was a great improvement in the ventilation? No; I heard them say it was just about the same.
1654. We have had it, as a matter of fact, that it was trebled by the erection of the new furnace. However, you do not know? I do not know anything about that.
1655. *Mr. Jones.*] In the early part of your evidence I understood you to say that the caution-board was not always placed opposite the last stenton? The caution-boards were kept back until the next stenton was holed through, and then when the heading got away the danger-boards were shifted forward.
1656. Always? Yes.
1657. *President.*] Do I understand you to say that you were the last man that worked in No. 5, or, as you call it, No. 6? Beckton was the last man working in the straight.
1658. Was it full of gas? The air-course in the bottom was full.
1659. What was the number of that heading? No. 5 in the straight.
1660. I also understood you to say Nos. 3 and 4 were full of gas, and that you had put over the cut-through, and that the gas then cleared away? Yes.
1661. The coal continued to give off gas, notwithstanding the cut-through? Yes.
1662. You say that the straight-in tunnel gave off gas, and that a considerable quantity lay in the face of the heading when you came out on strike? Yes.
1663. Also, that No. 5, which you call No. 6, gave off a considerable quantity of gas, and that you left that place with a quantity of gas in it? Yes.
1664. Before the strike, with the old system of ventilation and the old furnace, the quantity of air, you say, amounted to 3,500 cubic feet, and that this quantity circulated through the last stenton? Yes.
1665. Can you explain to me this circumstance, that after the explosion when it had caused a total derangement of the system of ventilation with practically no circulation of air at all, that in none of these places which you have mentioned, Nos. 3, 4, and the straight or No. 5, not a single vestige of gas was found? I can give no account of that.
1666. Do not you think it strange? Yes, it is strange.
1667. You left these places giving off gas in abundance? Yes.
1668. When there was a circulation of only 3,500 cubic feet per minute, yet the time comes when this current is entirely withdrawn, and these same places contained no gas—do not you think that is remarkably strange? I cannot give any account for that, excepting it is accounted for in the new furnace.
1669. But in all of these places, with the exception of Nos. 1 and 2 headings, where you detected a slight quantity, you found no gas in any of them? No.
1670. *Mr. Croudace.*] Have you any idea how it is that the gas which you left in these places does not exist now? I cannot say.
1671. Do not you know that gas will exhaust itself in the course of time? No; I have no idea of that kind.
1672. Have you never heard of a blower expending itself? Of course I have. We have struck very strong ones in the Bulli mine. [*The witness withdrew.*]

Noah Hobbs sworn and examined :—

Mr.
N. Hobbs.
11 May, 1887.

1673. *President.*] You are a miner? Yes.
 1674. Employed at Bulli? Yes.
 1675. Were you working on the day of the accident? No.
 1676. Where do you work? Nowhere.
 1677. But you reached Bulli after the accident? Yes.
 1678. How were you apprised of the accident? I heard a number of men shouting out about it.
 1679. And you went to the colliery? Yes.
 1680. Did you enter the mine along with your brother? No.
 1681. When did you go in? At about 7 o'clock at night.
 1682. Where did you go? I went to the other side of the big fall on the other side of the western that night.
 1683. Who were there with you? I can hardly tell who were there.
 1684. Who had you with you when you went in? I believe I was by myself.
 1685. Surely you must know? Yes; I went in by myself.
 1686. Were there any people on the other side of the western when you got in? There was nobody there then.
 1687. No one at all? Not on the other side of the western; the men were then coming back—they had been over.
 1688. What did you do? I stopped there.
 1689. What did you do? Some managers came up and told us to clear the fall.
 1690. Did you give them a hand? No.
 1691. What did you do? Nothing.
 1692. Well you could not do much less. Did you come out? At 10 o'clock at night I came out.
 1693. When did you go in again? I think I went in next day.
 1694. Did you work then? Yes, I worked a little then.
 1695. With whom? With Mr. MacCabe.
 1696. What time did you go in on Thursday morning? I do not know.
 1697. Think? I cannot think.
 1698. If a question is asked you you must answer it—do not trifle with me, please? I am not trifling; I think it was about 5 o'clock on Thursday morning.
 1699. How long did you take to get in? We got right in about 7 o'clock.
 1700. Well, why did you not say it at first—what did you do with Mr. MacCabe? We went down to the cabin and got some tools.
 1701. Did you clear the large fall on the other side of the Western? No; we were clearing on the other side of the flat to get right into the gassy. We went round to No. 1, and went into the furthest stenton in No. 1; I then came back and went out.
 1702. Did you remove any of the bodies? I never touched any of them.
 1703. You passed them? Yes.
 1704. Were your party the first that would pass them? Yes.
 1705. In going over the fall what bodies did you first come to? The bodies of two boys.
 1706. Where were they lying? In the middle of the road.
 1707. Had they been removed by a previous party? I think so.
 1708. Did you identify the bodies in going up to No. 1? I knew Millwood and Jerry Westwood.
 1709. Were those the only two you knew in No. 1 heading? That is all.
 1710. How many bodies did your party find there? Sixteen in No. 1.
 1711. Did you go into the face with Mr. MacCabe? No, not to the face, but I was in the heading and some of the bords.
 1712. Did you see any evidences of fire or of a fire-damp explosion? Yes; all the props were charred.
 1713. Westwood's body was lying at the last stenton? Yes.
 1714. Did you examine him? No; I only just looked at him with the lamp.
 1715. Did you see the horse there? Not at that time.
 1716. Did you examine the danger-board? No.
 1717. You did not go through the stenton? No.
 1718. When did you go through? On the Monday after that.
 1719. Along with whom? With John McKenna, Beckton, and Inspector Rowan, White, and I don't know the other one.
 1720. Did you inspect these workings with the view of ascertaining the cause of the accident? No.
 1721. What was it to do? To see how much one of the places was over the distance allowed.
 1722. To inspect the inspector? Yes.
 1723. You were not actuated by any desire to ascertain the cause of the disaster? No.
 1724. Did you go down No. 2 heading? Yes.
 1725. Did you pay any attention to the state of the workings going down? Yes; I noticed the things in the headings.
 1726. What did you see? I did not see much; I saw that everything was a total wreck.
 1727. Did you satisfy yourself that it resulted from an explosion? Yes.
 1728. What evidences did you see? Everything was upside down.
 1729. Were all the bodies burnt? Yes.
 1730. The bodies had been removed at this time? Yes, but the skips and props and other things were there.
 1731. Where did you work previous to the strike? I worked in the straight, or No. 5 heading.
 1732. Was it off the straight tunnel to the left? Yes.
 1733. We would call that No. 6; you call the straight-in tunnel No. 5? Yes.
 1734. Did you work there up to the last day before the strike? Yes.
 1735. How did you leave the face? What way do you mean?
 1736. Was there any gas there? Yes, full of gas; the return air-course was full up.
 1737. Was there any return at all? No, not there.
 1738. Where was it? Further back, coming off No. 6.

1739.

- Mr. N. Hobbs.
11 May, 1887.
1739. You were in advance of the last cut-through, and you say down to the cut-through it was full of gas? It was not full in the heading, and there was always more or less gas there, and the cut-through was full up.
1740. Was there any air passing through the cut-through? No; it was going out of No. 4, and it had no return, and there was no canvas.
1741. Where did it go after leaving No. 4? To No. 6.
1742. Where then? It would go into the —— return.
1743. You said that the return was full of gas? No, not that return; I mean the return off No. 5 heading.
1744. Let us understand that point. There was a door in the main tunnel, which sent the air up No. 3, and from No. 3 to No. 4, and from No. 4 back to the main tunnel? That did not make the air come down.
1745. Was there a door in the main tunnel? Yes.
1746. The object of that door was to intercept the air and to send it into No. 3? Yes.
1747. And it then returned down No. 4? Yes, and then into No. 6.
1748. And was the return full of gas? No.
1749. Well, what return was full of gas? The air-course down the straight.
1750. How much gas did it contain? There was a good bit of gas in the face, and the air-course was full up.
1751. *Mr. Crowdace.*] The last holed cut-through was on the in-by side of No. 4 heading? Yes.
1752. Then you had driven far enough for another cut-through on the inside of that, but which other cut-through was not at that time holed through? Yes, it was not holed through.
1753. And that was the cut-through that was full? Yes; the air was going through to the return.
1754. *President.*] Do you know the quantity of air that was going through the last holed cut-through? I know nothing about that.
1755. Did you work in No. 5 with safety-lamps? Yes; but I worked in the air-course in No. 5, which was not through.
1756. Did you work with a safety-lamp? Yes.
1757. And you are conversant with the use of a safety-lamp? Yes.
1758. You have worked with them before? Yes.
1759. Were the lamps locked? Yes.
1760. In what other parts of the mine have you worked? In No. 3 in the —— return, and in No. 7.
1761. That is down to the left of the tunnel? Yes.
1762. And you found gas in all of these places? Yes, in all of them.
1763. Was gas found up to the last day before the strike? There was none in the return at that time.
1764. Was there any gas in No. 5 heading? Oh, yes.
1765. Do you know whether there was any in Nos. 3 and 4? There was some in No. 3.
1766. Do you know that of your own knowledge? Yes.
1767. Were you in the heading? Yes; I was in No. 3.
1768. What doing? Fetching the tools out.
1769. How did you fire the shots in these places? The deputy fired them.
1770. You never fired them yourself? No.
1771. How did you tamp the holes? With slack.
1772. With slack coal? Yes.
1773. Was it dry? Dry or wet.
1774. If you could not get damp slack you would tamp with dry? Yes.
1775. Do you consider that manner of firing shots safe? Yes; that is the way I have seen them firing shots where I have been working.
1776. What way do you mean? The touch-paper.
1777. With fuse as well? Yes.
1778. Is there any danger attached to that do you think? Not much danger.
1779. No danger with touch-paper? No, not with touch-paper.
1780. Did you ever have any conversation with the deputy with respect to the condition of the mine and the quantity of gas? Yes; we were always making complaints to the overman and the deputy.
1781. With what object? To clear the gas away.
1782. Did you ask him to put up any bratticing? We never asked to brattice the heading, but to drive the air-courses.
1783. Don't you think that bratticing is the much better way? Yes; bratticing ought to be put in there.
1784. Did you ever suggest bratticing to the overman? No.
1785. You suggested the driving of the air-course? Yes.
1786. But you consider bratticing more effectual? Yes; everybody knows that no doubt it would be a good plan.
1787. On going through the mine on the Monday after the explosion, did you examine the places for gas or did Mr. Rowan or any of the others do so? I examined some of the places.
1788. Did you discover gas in any of the bords? Yes; I discovered gas in one bord and in No. 2 heading.
1789. Is that the second uppermost bord? I think it was the fourth bord; it is 42 yards long, without an air-course in it. I believe it is the fourth bord from the face.
1790. And you discovered some gas in it? Yes, but not much.
1791. Did you discover gas anywhere else? No, not in any of the bords, but we discovered it in the headings.
1792. Of course in Nos. 1 and 2 headings? Yes.
1793. You had not been working in any of these bords immediately before the strike? No.
1794. So you know nothing about these bords? No.
1795. Did you examine them on the Monday night after the accident, and the faces of Nos. 3 and 4 headings? Yes.
1796. Did you also go into the face of the tunnel No. 5? Yes.
1797. And into the face of No. 6? Yes.
1798. Did you discover any gas in any of them? No; all the faces were clear.

1799. Did you think it remarkable that they should be clear of gas after the explosion, when there was no circulating current, seeing that they contained a considerable quantity of gas before the strike? I can give no idea as to how they were clear of gas.
1800. You also went through that district with the men? Yes.
1801. You observed carefully and tested for gas in these bords? Yes.
1802. Did you observe any gas with the safety-lamp? I saw nobody look for it.
1803. You must have gone down with a pair of eyes with you? I had my eyes with me.
1804. When you went in on Monday after the explosion you discovered no gas in Nos. 3, 4, 5, and 6? No.
1805. Can you give any reason that no gas should exist in these bords and headings after the explosion with no circulation of air? No; I can give no reason.
1806. Don't you think it a little strange? Yes, it is strange.
1807. *Mr. Neilson.*] What is the greatest quantity of gas you have seen in No. 3? About 40 yards out I have seen it.
1808. Was that close out to the danger-board? Yes; from 10 to 15 yards from the danger-board.
1809. Was your lamp full of flame at the face? Yes.
1810. Was the lamp red-hot? I expect it was about red-hot. We used to fill our skip and then we would come back, because we could not stand it long.
1811. Did you fire the shots? No.
1812. Did you fire them in rolls and stone? Yes.
1813. Was there gas there then? Yes.
1814. And you were bound to fire shots in it? Yes; once when we were on these rolls White came in and the gas put his lamp out, and he went back 6 yards from the face and lit his lamp, he asked my mate if any of us had our lamps open, and my mate said "yes, my lamp is open," he then said "give us a bit of light."
1815. *Mr. Clarke.*] Who was your mate? Beckton.
1816. *Mr. Neilson.*] Are you quite sure the gas put his lamp out? Yes; I am sure.
1817. What sort of lamp was it? A Clanny lamp; we use Davy lamps.
1818. How did you fire the shot when gas was there? We used to fire them at night.
1819. Was the ventilation better at night? No; I don't think so.
1820. Would there be gas there at night? I suppose so.
1821. Did you ever brush the gas out? Yes; we used to brush it off when there was much there.
1822. Were you in the habit of brushing it out before firing? Yes; if there was any there.
1823. With all this gas were you not afraid of the fuse lighting it? We did not fire when all the gas was there.
1824. You said you used to fire in the stone? Yes.
1825. I suppose it was quite up to the face? Yes.
1826. And where the gas existed? There was enough to put White's lamp out.
1827. Where was it? In the right-hand cut, very near the roof.
1828. Your lamp was locked? Yes, mine was, and my mate's was open, and Mr. White told my mate to open his lamp and give him a light.
1829. *President.*] Where was this? In No. 3 heading.
1830. *Mr. Neilson.*] You worked in No. 5 last? Yes.
1831. Was there a large quantity there? Not much in the face, but plenty in the air-course that was turned away.
1832. *Mr. Hilton.*] Did you ever report the existence of gas? I sent out to fetch Mr. White in one day.
1833. How often did you report the existence of gas? Nearly every time he came down there. I reported it when there was 40 yards in No. 3 heading, and he told me to go on as I was strong enough to stand it.
1834. That was to Mr. White you reported it? Yes; and to Crawford the deputy.
1835. You never complained to any one else? No.
1836. *Mr. Owens.*] Did you ever complain about this to the inspector? Yes.
1837. What did he say? He told me to be careful and take care of it, that is all we got out of the inspector. I showed it in No. 3 and in the return. There was about 35 yards in the return, but I only showed it to him in the face of the heading.
1838. Do you know anything of the big blower? Yes, Crawford showed it to me; he asked me to come in and see it, and he turned on the cock and it put the lamp out, and the blower was coming out too strong to light; he then turned it on about half and it then lit.
1839. What was his object in doing that? I don't know; he only took me in and showed it to me.
1840. You are sure it was the deputy? Yes.
1841. *Mr. Jones.*] Am I to infer that your lamp was always locked? I was only working before the strike.
1842. During that time the lamps were always locked? Not always; if the deputy was there he would lock them, if he was not there he would leave the key in the cabin and you could do what you liked—if you lost your light while you were working and your lamp was locked, you could come out and go back as you liked with your lamp locked or unlocked.
1843. You never fired the shots yourself? No.
1844. How did the deputy fire them? With touch-paper.
1845. Was the bord that was 42 yards in advance of the air a violation of the law? Yes.
1846. And that was the only bord in which you discovered gas? That is the only one.
1847. *Mr. Clarke.*] Did Crawford tell you his object in fixing this pipe to the blower? I don't know.
1848. Did he ever say what his object was? No; he said nothing.
1849. Did Mr. White see it? I expect he did see it; I believe he would show it to the overman if he showed it to me.
1850. You don't know that he did? No.
1851. How long was the pipe there? I don't know.
1852. Did your mate see it? Nobody was with me when I was there.
1853. *Mr. Croudace.*] Have you ever worked in English mines? Yes; in South Wales.
1854. In fiery mines? Yes; where Davy lamps were used.

Mr.
N. Hobbs.
11 May, 1887.

- Mr. N. Hobbs.
11 May, 1887.
1855. Did you never fire any of your shots in this Bulli mine? No; never.
1856. Did you ever work by yourself? Yes.
1857. How did you do then? I used to go and fetch in the deputy.
1858. Was this when on day work? Yes.
1859. Have you ever seen him tilting his lamp to light the touch-paper? Yes; that is the way he used to light it.
1860. Is that a prudent or safe way of lighting shots in a fiery mine? That is the only way he did it.
1861. What do you think of it? I believe it is right enough.
1862. Quite right? Yes.
1863. Would it not be equally right to take the lamp top off? No; you need not turn your lamp right over for the touch-paper is supposed to catch fire through the gauze.
1864. In No. 3 heading you saw 40 yards of gas almost within 15 yards of the danger-board; is that correct? Yes.
1865. Was the danger board always at the last hole cut through? It was always supposed to be, but this one was back so as to act for four places.
1866. How far back from the last hole and cut-through was this danger-board? About 15 yards.
1867. And from the cut-through to the face was 40 yards? Yes.
1868. And that was standing full of gas? Yes.
1869. Was that the period when Mr. White took his lamp in and tried the gas? No.
1870. It was two different times? Yes; when White came in the heading was about 20 yards in at that time; he would never want a light again if he did that when there was 40 yards of gas in.
1871. When his lamp went out in the wick, you say he only went 6 yards back to light it? Yes, and I told him not to light it, as it was not safe there; but he was boss, and it was no good for me to tell him not to light it, or he would want to know who was boss, and a boss is no good in there if the workmen are going to rule him.
1872. And you have told us of the greatest accumulation of gas previous to the strike? Yes, that is the biggest quantity of gas I saw; it was in No. 3 heading.
1873. Was that quantity cleared away before the strike commenced? The most part of it was cleared away; the cut-through was put through, but it did not clear all the gas.
1874. How far was the stenton from the face? About 15 yards.
1875. Was any more work done in the face after the stenton was through? No.
1876. Why was the stenton not put right up to the face? Because the other heading was not up.
1877. I can quite understand that. Where was the greatest accumulation of gas, in Nos. 3, 5, or 6 headings just before the strike? In No. 3 there was about 8 or 10 yards, 5 feet wide and 4 feet high.
1878. Did you get more gas when you struck rolls? Yes.
1879. Were Nos. 5 and 6 standing full of gas when the strike took place? Yes.
1880. That gas has been cleared away since, and can you account for that by natural exhaustion? I can't give any account about that.
1881. Is it usual when you strike bodies of gas for these rolls to continue for a time giving off gas, or do they exhaust themselves? The gas dies away.
1882. So that during the strike the gas giving off from these blowers or rolls might exhaust itself, do you think that is possible? I don't know about that.
1883. Is it possible in your mind, seeing that you have got some gas on these rolls, to come suddenly upon a blower either in a drill hole or nick? You are very liable to come across blowers by drilling.
1884. And these blowers exhaust themselves in the course of time? Yes; they work themselves out.
1885. Do you think the exhaustion of gas in these headings may have been caused in this way? Yes; I suppose the gas would work itself all out.
1886. Have you heard of any inspection being made in this mine by the miners, as they have a right to do under the Act? No.
1887. Have you ever attempted to make any inspection? No.
1888. Are you not aware that the men have full power once a month to examine every mine in the colliery? I am aware that the men are supposed to go round at least once a month.
1889. Then why did not the miners in Bulli go round? I cannot tell you the reason.
1890. Was it idleness, indifference, or what was it? I never heard anything about it.
1891. Don't you care anything about it? Nobody asked me to go round.
1892. Do you know anything of your brother working with the top of a safety-lamp out? I know nothing about my brother; I was not working there at the time.
1893. What would you think of a man who went into a fiery mine where they had to use safety-lamps, and yet worked with a lamp that had a burnt-out top—bear in mind that the first gauze had gone, what would you think of such a man? They ought not to do it.
1894. Don't you think they were endangering the lives of every one in the colliery? Yes; but they were not very particular in this mine, not the boss's.
1895. Do you mean to tell me that the Bulli miners—intelligent men, as I suppose they were—did not value their own lives, your brother, for instance—do you mean to tell me that he does not value his life? I expect every man values his own life.
These things come to me as a perfect thunderbolt, for I never heard of them before. [*The witness withdrew.*]

John M'Kenna sworn and examined:—

- Mr. J. M'Kenna.
11 May, 1887.
1896. *President.*] You are a miner? Yes.
1897. Employed in Bulli Colliery? No, sir; but I have been employed there.
1898. You reside at Bulli? Yes.
1899. You went in to rescue the men in the colliery? I was one of the first party that went in the mine after the explosion.
1900. We have had so much evidence of the conditions of the workings soon after the accident, and the position of the bodies when first found, that I do not propose to examine you particularly with reference to these matters. Were you employed as a miner in the Bulli mine subsequent to the strike? Not since the strike; I was there previous to the strike.
1901.

1901. Were you engaged there up to the time of the strike? Yes.
1902. You cannot speak of your own knowledge of anything in the mine since the strike? No; not since the strike.
1903. But you were engaged there immediately before the strike. Where did you work? About the seventh or eighth bord towards the face in No. 1 heading.
1904. The seventh bord was the last bord? I could not exactly say how many bords there were. It was the second last at the time.
1905. Did you work in any other portion of the gassy section before that? Previous to that I worked here [*pointing out place on plan*].
1906. When was that? Three weeks before the strike.
1907. Where before that? [*Places pointed out on the plan.*]
1908. You drove the return through the dyke? Yes.
1909. And after that you were engaged in bords off Nos. 1 and 2 headings? Yes.
1910. In working these bords off No. 1 heading, did you use a safety-lamp? Yes; up to the time of the strike.
1911. Did you discover gas in these bords at any time? Yes; there was a large quantity of gas being given off in the bords in which I worked.
1912. You worked in the seventh or eighth bord? I cannot exactly remember the number of the bord, but I know it was the second last.
1913. And there was a large quantity of gas in that bord at the time? Yes.
1914. Was there in any of the other bords? I could not say, but there was a large quantity of gas in the heading face immediately below me, I could see that myself without going out of my way.
1915. Was the ventilation not sufficient to carry away the gas that was accumulated there? My place was off the heading, but the current was not sufficiently strong to carry all the gas away from my bord as it was brought round a number of other places.
1916. Have you been in the face of the heading where gas was given off? I have been in it.
1917. By working there, or through curiosity? I would occasionally go for the loan of tools.
1918. Where was the gas; was it contiguous to rolls? Sometimes it was, and at others it was not.
1919. Would a larger quantity of gas be found in approaching a roll? Very likely it would, for I did not take particular notice.
1920. Nothing but safety-lamps were used there while you worked? That is so.
1921. Were they locked? They were locked during the day-time.
1922. Were they locked at night? You could please yourself.
1923. Did you work at night? Yes.
1924. Did you fire any shots? Yes.
1925. Did you fire them at night? Yes.
1926. How would you proceed when firing a shot? We would light the touch at the side of the gauze and fire the fuse in the usual way.
1927. Did you go outside the danger-board? When in the headings the men went right outside the danger-board.
1928. Then you proceeded in with the touch-paper and lit the fuse? Yes.
1929. Did you consider there was no danger attached to firing that fuse in an atmosphere of gas? I was aware of the danger of lighting touch-paper on the gauze of a safety-lamp.
1930. How did you tamp the holes? With soft stone whenever I could get it.
1931. Suppose you could not get it? I would go back to the road and get some cake-dirt that had moistened itself.
1932. Are you aware, or have you been informed that some men tamped with small coal or slack in a dry state, and if so, would you consider that a safe proceeding? It is both unsafe and stupid.
1933. And I quite agree with you. Had you ever had any occasion to complain to the colliery officials as to the state of the bords, or the ventilation? No, sir; that was not my duty. I was supposed to use a pick and shovel only.
1934. Have you thought the people were too careless with the use of safety-lamps? The only occasion that I complained to Deputy Crawford was about eighteen months ago. I could not exactly say, but at that time I was working 80 yards in a bord in advance of the air.
1935. Where was it? [*Place pointed out.*] That was not in the gassy section? No.
1936. No connection with the gassy section? No.
1937. That must have been some two years ago? I think it might be about eighteen months ago. I don't think the gas was struck at the time, but the ventilation was so bad that I could not sit down without falling asleep, and after making several complaints to the deputy he removed me out, and put me to work in another place.
1938. Did you ever make any complaint to the Colliery Inspector about the gas? I never did, simply because I would be exceeding my duty by doing so.
1939. Do you really think so? The management take it as their duty, and I know they consider it as such.
1940. Do you mean to say that it would not be your duty to report anything that you found to be dangerous, or to complain of it? The question is, would I be permitted to make such a complaint, and if so would it be entertained?
1941. You think it was not your duty to complain? I say I had no real occasion to complain, and I say that if I did the complaint would not have been taken from me—in other words, it would not be entertained.
1942. You can know nothing about it then if you had no reason to complain? I had some idea of the management.
1943. *Mr. Hilton.*] Was there anything which caused you not to complain? Not in my time. The obstacle referred to has been brought into existence since the strike began.
1944. You have been several times in the mine since the explosion? Yes.
1945. Do you know the door on the western road? Yes.
1946. You know there used to be a door there? Yes.
1947. Suppose that door was damaged by an accident and knocked down, would it affect the ventilation in the Hill End district? Yes, and cause foul air at once.

- Mr. J. M'Keena.
11 May, 1887.
1948. Where would the air go in the event of that door becoming damaged? The air would go to the western.
1949. You have been in the western since the explosion? Yes.
1950. And in the Hill End district? I have been all over the two districts.
1951. Have you been all over the mine? I have been all over the three sections, the western, the gassy, and the grip, but not in the grip further than the furnace since the explosion.
1952. *Mr. Owens.*] You were one of the first party that went into the mine after the explosion? Yes.
1953. Did you find any of the bodies burnt? Yes; the first I discovered was burnt—Felix Bourne—he was badly burnt.
1954. Where was he? A few yards outside the brake on the bank heading.
1955. Did you examine the bodies found in Nos. 1 and 2 headings? Well, there were several bodies in No. 2 heading badly burnt.
1956. You proceeded from there to the western? From No. 2 I proceeded along the flat and got the bodies that were along there.
1957. Were they burnt? There were two boys; one of them was found beneath a skip, and one of them was badly burnt.
1958. Did you notice whether the bodies found in the western were affected by fire? No, I did not, though I believe they must have been burnt.
1959. Do you know these rules? Yes.
1960. Do you know No. 6, as to "Interference by employees"? Yes.
1961. Do you consider that reporting would be an interference according to that rule?
1962. *President.*] The witness did not work there when these rules were brought into operation.
1963. *Witness.*] I have been examined on that subject before.
1964. *President.*] It does not matter.
1965. *Mr. Owens.*] Were check inspectors appointed by the Bulli miners? No such officers were appointed in my time.
1966. *Mr. Jones.*] Who were the first party that went into No. 1 heading? Mr. McCabe had charge of a party, and they were a little in front of me.
1967. Did you arrive at the heading before the body of Millwood was removed? Yes; I was twice there before the body was removed.
1968. Could you point out the exact spot where the body of Millwood was found? [*Place pointed out on the plan.*]
1969. Would you be surprised to learn that it has been alleged that he was found on the out by-side of this spot?
1970. *President.*] I do not think it has been alleged at this court of enquiry.
1971. *Mr. Owens.*] In reference to the blower in No. 2 heading it has been alleged that Crawford fixed a pipe there. Do you know anything about that? I did not see it done, but I believe it was the practice.
1972. *Mr. Hilton.*] You heard of it? Yes.
1973. *Mr. Croudace.*] Have you known of any great accumulation of gas previous to the strike? Yes, in the left-hand heading, now called No. 6, I believe.
1974. Where is it? Going towards the dyke.
1975. How long is that ago? It was there at the time that we came out on strike. I saw the gas there the last night I worked, and I believe that was on the 10th of September.
1976. Are you speaking of No. 5? I am speaking of No. 6.
1977. Will you point out the heading? [*Heading pointed out on the plan.*]
1978. Was that gas there when the colliery stopped work? Yes; it was on the 10th September, and I think the strike commenced on the 11th—next day.
1979. Do you know of any other accumulation in the mine? On the same night there was a large accumulation of gas in No. 1 heading, immediately below where I was working.
1980. Was it there the following day? I was not working the following day. I took my tools out that night. The men working there prepared a shot, and requested Crawford the deputy to fire it. He refused, and that shot was left unfired.
1981. Who was the man who prepared the shot and asked the deputy to fire it? Bill Gard.
1982. Who was the deputy? Crawford. Gard's mate came in the same night, and Crawford would not allow him to work there, and took him away to work the last shift.
1983. You know that of your own knowledge? I saw it.
1984. That was the night previous to the strike? Yes.
1985. Would the bratticing of these places have prevented such an accumulation of gas? Yes. In my opinion, if they had been bratticed, the gas would not have been made there.
1986. *President.*] By bratticing, you mean to say that the gas would have been swept away as it was made? Yes, it would have been carried away.
1987. *Mr. Croudace.*] Have you known the gas to light by a shot? Yes; the week previous to that Bill Gard fired a shot in No. 1 heading, which lit the gas.
1988. *President.*] Was he lost? No; he is working in one of the neighbouring collieries.
1989. *Mr. Croudace.*] What did you say the result of his firing the shot was? To fire the gas.
1990. Where? No. 1 heading.
1991. *President.*] That was before the strike? Yes; a week previous to the strike.
1992. *Mr. Croudace.*] Did it do much damage? No.
1993. *President.*] Did you see it yourself? Yes.
1994. *Mr. Croudace.*] Then you are quite satisfied that a shot may light gas? Yes; I saw it.
1995. You have heard that it was the practice, and you have expressed your opinion about lighting shots by tilting the lamp to ignite the touch-paper? It is a bad practice.
1996. I quite agree with you. What do you think of the sworn testimony of two or three men having worked with the main gauze of the safety-lamp burnt out—what would you think of men who actually worked with that lamp in a large quantity of gas? I would think that it was a very unsafe thing, and that practically the man had no safety-lamp.
1997. *President.*] That they were reaching high for an explosion? Exactly.

1998. *Mr. Croudace.*] I should like to examine this witness with a view of getting his interpretation of No. 6 rule, having reference to interference by employees. I have an impression that the intelligence of this witness will lead him to see that it bears a different construction.

Mr.
J. M'Kenna.
11 May, 1887.

1999. *President.*] I don't think it should come out in this court, as the witness never worked under these rules.

2000. *Mr. Croudace.*] When you get really an intelligent witness, who might not have given much consideration over this rule, it is quite possible that he would give a fair interpretation of it when it is placed before him. This witness has given testimony with respect to this rule at the inquest; I would like to know now whether he is under a different impression.

2001. *President.*] Of the intelligence of this witness there can be no doubt.

2002. *Witness.*] I have been in the mine several times since the explosion; perhaps it is as well that I should state all I saw.

2003. *President.*] We do not think that another detail description of the tunnel and workings or the condition of the bodies would be of value; but if you communicate with me as to what further evidence you wish to give, we will consider it, and we can recall you if necessary.

2004. *Witness.*] I would like to give you my opinion as to cause of explosion.

2005. *President.*] Oh, we will have that.

2006. *Witness.*] I am of opinion that the explosion occurred in No. 2 heading, and that previous to the explosion a shot was fired there, and that the force of that shot drove the gas out to a naked light in No. 2 heading, and that that naked light was the cause of explosion. I have examined the course the explosion has taken, and find that it has gone straight out of No. 2 heading as if out of a cannon. The left-hand heading being immediately opposite, it carried a man, three boys, and horse a distance of about 50 yards. I am of opinion that during this strike the workings in that old left-hand heading became fouled with gas, and that the gas having lodged there, it was impossible for it to be taken out, unless put out wilfully; in other words, that the ventilating current of the mine did not reach it. I believe that the flame of the gas from No. 2 heading, which was ignited at the naked light, communicated itself with that other accumulation, and it exploded, also causing damage all along the road, in the first place death, and the second place destruction.

2007. *President.*] Have you any knowledge as to the behaviour of coal-dust in the presence of ignited gas? Perhaps you will allow me to finish. After the ventilation was restored, it was impossible for the gas that may have accumulated in the workings of this disused heading to be taken out, unless put out by some special means, and I am of opinion that that was not done.

2008. Can you say that it was not done? It was a disused part of the workings, and the air does not go around these workings.

2009. Have you been in these old workings? I have.

2010. Did you observe any gas there? I believed it was lodged there, and that it was beyond the reach of the ventilation; but when the explosion occurred it ignited there.

2011. Did you see any evidence of an explosion there? I have.

2012. Where? There is proof in the fact that the fire of the blast went to the western.

2013. We saw that, and I think we were together when we saw it? The blast, I believe, divided itself there, one portion reaching the main heading face, and travelling out to the tunnel mouth, and in its course upsetting the skips in such a way as to indicate that the force had come outside. The other portion of the blast went to the western, and that second portion was likely to reach the tunnel mouth a little later than the first, from the Hill End straight.

2014. You are of opinion that the explosion commenced in No. 2 heading? What I say is that the fire lighted some distance outside the cut-through. I picked up a man who was blown by the force of the explosion at that point; he was just on the main road. I am of opinion that the gas was lighted by that man's naked light.

2015. Did you see the evidences of an overcharged shot in No. 2 heading? I saw no appearance of an overcharged shot. In my opinion, the shot was a good one. There was not a great quantity of coal blown down by the shot, but that standing in the face is hollow behind; and if the shot had been overcharged, it would have knocked the coal into slack. [*The witness withdrew.*]

THURSDAY, 12 MAY, 1887.

Present:—

DR. ROBERTSON, PRESIDENT.

MR. O'MALLEY CLARKE,
MR. NEILSON,
MR. CROUDACE,

MR. JONES,
MR. OWENS,
MR. HILTON.

Wm. Bolan Green sworn and examined:—

2016. *President.*] You have been for many years a colliery manager, Mr. Green? Yes; about fifteen years. I have been thirty-eight years engaged in coal-mining altogether.

2017. In this Colony, or in England? In both.

2018. In what district were you in England? In the north of England—Northumberland.

2019. You are acquainted with gassy mines? Oh, yes.

2020. When did you hear of this disaster at Bulli? Well, I got out there at about 9 o'clock that evening, and I was not five minutes there before I went inside.

2021. Will you describe to us in your own way—here is a plan of the colliery—where you went and what you did? When I first went to the mine I volunteered my services to go in, and I did so, taking canvas with me, and the first thing I did was to go to the furnace, and finding that it was working all right I was quite satisfied there was no danger, so I came back and went up to the large fall—that is past the western,

Mr.
W. B. Green.
12 May, 1887.

- Mr. W. B. Green.
12 May, 1887.
- western, and is what they call the "big fall." I inquired if any men had gone over it, and was told that two men had gone over, a proceeding which I characterized as foolishly risky. It was, in my opinion, to commence clearing the fall in order to let the ventilation over, and I told the men who were on the top to call them back. When they came back I told them I was there to give instructions, and the best thing they could do was to clear away the top of the fall. They said they would commence to do that, and I then came outside, and saw Mr. Ross, who was complaining of being unwell. He asked me if I would go into the furnace with him? I said yes, and accordingly went back to the furnace with him and examined all round.
2022. Was there any change in the ventilation then? There was in the main road; the ventilation had improved. At my suggestion we went up to look at the fall again, and we then consulted as to what was best to be done to get the bodies out; we then proceeded out again, and met Mr. McCabe and Mr. Evans coming in; we consulted with them, pointing out that we thought it would be best to clear away the smallest of the falls to get the bodies over, and they were satisfied that such was the best thing to do under the circumstances.
2023. And did that finish that night's operations? Yes.
2024. In going in towards the western, Mr. Green, did you observe the bodies that were lying on the bank-head? I did.
2025. There were six bodies lying there? Yes.
2026. Did you observe the condition of those bodies? Yes; they were burnt.
2027. What evidences of burning did they show? The hair was singed on the face and head, and the skin seemed to be burnt in some cases.
2028. There is no doubt in your mind about the condition of these men—did you examine them narrowly? I have no doubt. There was one very big man lying on the crossing, his face being covered with a bag. I took the bag off and examined him. There was another one lying there with no clothing on him; he was burnt also.
2029. You are quite aware, of course, that the hair will show the first symptoms of burning? Yes.
2030. And you found unmistakable evidence of burning? Yes.
2031. Then I suppose you came out and saw that the shifts were properly arranged? Yes.
2032. And when did you return? About 2 or 3 o'clock we went to have a rest, and in the morning we went in again. The big fall was partly cleared, but not to our satisfaction. Mr. McCabe and I went over the fall, and found the bodies of two boys.
2033. You were the first to come on them? Yes; Mr. McCabe and I were the first. I never heard of the boys being seen by anyone else.
2034. Was one of them entangled in the ropes? No; they were on the opposite side.
2035. What was the condition of the bodies? They were burnt.
2036. In proceeding along the main road did you notice the condition of the props? I did not; my principal anxiety was to push forward.
2037. You say these two boys bore evidences of burning. Did you examine them particularly, and if so what evidences of burning did they bear? They seemed to be burnt about the hands. I noticed the hands more particularly than anything else.
2038. Might you not have been led astray by their hands being abraded? No; they appeared to be burnt.
2039. Suppose they had been drawn along the wires now. Did you see their hair? No; I noticed their hands mostly.
2040. Then you are not quite certain about it? Well, I will not be positive, as I did not examine their bodies so particularly.
2041. You arrived through the dyke at No. 1 heading? Yes.
2042. Did you see anything there? We put up two or three stoppings that had been blown out. We then proceeded to the main heading.
2043. Were you the first to come upon the bodies in No. 1 heading? Yes.
2044. Did you take a note of their positions? I did, though we had only a piece of brown paper in which nails were wrapped; but I made a copy on coming outside.
2045. Have you got that copy? No; I gave it to McCabe.
2046. Can you recollect the names of the men? No; I cannot.
2047. Give us the number then. In going up No. 1 heading how far did you go before you came to the first of the bodies? In the first bord we got to in No. 1 heading there was a group of four, three of them were lying in the middle of the road, and one was sitting by the side of the wall, as if he were asleep. This we supposed to be the deputy. I put my lamp to his face. The men who were with me, I think, said it was the deputy, and I thought so by the way he was dressed, differently from a miner.
2048. Did you notice the appearance of these four men? I noticed one of them who seemed to be burnt on one side.
2049. Was it black? No; of a reddish colour.
2050. What about the hair? The hair was singed of one man lying with his head between two props.
2051. Did Millwood, or the man supposed to be Millwood, show evidences of burning? No; I saw no signs of burning on him.
2052. Was this other man that you suppose to be burnt lying in such a position as would convey the impression that he had run some distance? Yes; I should say he had run some distance.
2053. Then you proceeded up the heading, and where did you come upon the next group of bodies? We came across three lying in the next bord.
2054. Were they burnt? I did not take particular notice.
2055. How were they lying—with their heads backwards? Yes; as if they had been suddenly overtaken.
2056. Did you notice whether they were burned? No.
2057. Then what did you do? After going into the third working bord, we came out into the main working heading, and found a body lying on the road at the fourth working bord. Proceeding into that bord we found another body lying at the face. We found two bodies at the fifth working bord, and two at the sixth.
2058. Did you see any evidence of burning upon these two at the sixth working bord? No; but I examined the timber there, and found it charred.
2059. Then you went up to the last stenton? Yes.

2060. What did you see there? We found the body of Westwood just at the corner. He was a worker in No. 2 heading. He was lying on the top of some rubbish or small coal.

2061. Did you see the danger-board here in No. 1 heading? Yes, I did; on the board was written "danger beyond this point." There was a horse and a boy just inside.

2062. Did you observe whether the horse and boy were burnt? No; I did not. We were very glad to get out, the air being bad.

2063. How many bodies did you find? We found sixteen or seventeen altogether.

2064. I think in going up the heading a group of five was found;—in the second group you came upon you mentioned only three? Yes; but there were two close to them.

2065. Did you go into the face of No. 1 heading? No.

2066. Did you go into the face of No. 2? No; I did not.

2067. Did anyone relieve you before you returned? No; by this time we found ourselves pretty well knocked up owing to the after-damp, and we went on to the main heading and sat down for a time.

2068. Were the workings hot at the time? Not very hot; just the ordinary warmth in the bords.

2069. Did you anticipate finding it as warm after what had occurred? Yes; I thought it would be worse than it was.

2070. Did you return to that part of the workings? I did not go down then any more that day. Mr. McCabe told me that I had better get the men to clear away the falls so as to convey the bodies out. On the Friday, Mr. McCabe and I went down to No. 3 and No. 4 headings along with Mr. Ross.

2071. Did you find anything in No. 3 and No. 4 headings? I found a safety-lamp in No. 3 heading.

2072. Who was with you at the time? Mr. McCabe and Mr. Ross.

2073. What was the condition of the safety-lamp? The lamp was broken. The gauze was smashed as if some one had stamped on it.

2074. Was it unlocked? Yes.

2075. Was it unscrewed? No; it was intact.

2076. In going into No. 3 and No. 4 districts on Friday in company with Mr. Ross and others, did you examine these places for gas? Yes.

2077. Did you discover any? Not the slightest.

2078. Did you see any evidences of burning along the main tunnel, or in Nos. 3 or 4 or No. 6? I did not notice. The only place I examined for fire was in No. 4, and I saw evidences of charring there.

2079. When did you first go into No. 2 heading? I have told you how I went in, and of course we went through the stenton; but I did not go to the face.

2080. Did you see any evidence of fire in No. 1 or No. 2 on that occasion? No.

2081. You did not specially test for it? No.

2082. When did you first make a circuit of the workings? I went up to the western on Friday, through the return, our object was to see if the overcast was broken down.

2083. Had any other person been in the western before you? No.

2084. Having gone into the western how did you proceed? We proceeded along the western air-course, and travelled up the overcast.

2085. Did you notice the door at the junction? Yes.

2086. What condition was it in? It was broken and tilted up.

2087. In what condition did you find the main western road? We found a large fall on the top of some skips, and we made a sketch of the position, and we then turned back on to the gassy.

2088. Then you did not go through the western on that day? We did, in the afternoon.

2089. Who accompanied you? Mr. McCabe and other men.

2090. What did you find in the western? We found in a place going down to the left-hand and on the outside end of the flat, two bodies—that was outside the overcast.

2091. There are two bodies marked on the plan as having been found in the air-crossing—is that so? I do not know of anyone having been found there. The first body we found was 40 yards or 50 yards in the flat, and near the water tub. It was just behind the tub. And next we found a boy, and going straight in for 4 or 5 yards we found another. Then Mr. McCabe and I had another conversation, he suggested that we should get the bodies out as quickly as possible, and asked me to get stretchers, &c., for that purpose. So I was not in the pit any more until Saturday morning.

2092. And on the Saturday morning you were accompanied by whom? By Mr. McKenzie, Examiner of Coal-fields; Mr. Dixon, the Inspector; Mr. Rowan, Inspector of Collieries, and Messrs. Neilson, Ross, the Manager, Evans, and Gardiner, I think.

2093. Then I suppose you made a minute examination of the workings with a view to arrive at a knowledge of the cause of the explosion? Yes, and the seat of it.

2094. Very well, did you go into every part of the workings? Yes.

2095. Who went up to the face of No. 2 heading? Mr. Evans and Mr. Dixon.

2096. Did they report the presence of gas? Yes.

2097. Did they report anything else? No; not to my knowledge.

2098. Did you hear of any loose powder being found in No. 1 heading? No; I did not.

2099. Were you aware on the Saturday of a shot having been fired in No. 1 heading? Yes; I was told there had been a shot fired.

2100. That is to say those sent up to examine the face of No. 2 heading reported that a shot had been fired? Yes.

2101. Going down No. 2, did you see any convincing evidence of an explosion having taken place? Yes; I was quite satisfied that an explosion had taken place. There was evidence of the course it had taken by the charring on the props, and the skips were knocked about.

2102. In coming down this diagonal road, between Nos. 1 and 2, did you observe anything special there? I noticed that the skips were tossed about?

2103. Did the positions of these skips convey to your mind the idea that they had been passing through the door at the moment of explosion? Yes.

2104. Did you notice anything peculiar about a stopping just inside the junction of No. 2 with the main tunnel? No; I did not.

2105. Did you notice that it had been blown in? No; I did not notice that.

2106. Did you again examine Nos. 3 and 4 headings? Yes.

Mr.
W. B. Green,
12 May, 1887.

Mr. W. B.
Green.
12 May, 1887.

2107. And what was your opinion as to the seat of the explosion? In my opinion a considerable accumulation of gas had been fired by a shot in the face of No. 2 heading; that the course of the explosion was down No. 2 heading, and in its road down had proceeded towards No. 1, and then came down on to workings marked on the colliery tracings with an A. I am of opinion that at this point the current must have been fed with an additional supply of gas; I do not think there was sufficient gas here [*pointing to plan*] to have caused the destruction that I noticed.
2108. Then how do you account for a man being burnt in No. 1? Well, when this stopping was blown out, the explosion would extend in that direction.
2109. Then, in your opinion, there were two currents—one going down No. 1 and one down No. 2, joining in the tunnel? Yes.
2110. And that the combined forces burst out the stopping? Yes; and projected the horse and man through the stopping.
2111. Then you have a fixed opinion as to the story of an explosion having occurred in the district below the tunnel marked A on the plan? Yes.
2112. Did you see separate evidence of an explosion in this place? Yes; I am quite satisfied in my own mind that there must have been an accumulation of gas in one of these old bords.
2113. Supposing it had taken place in any of the three bords marked as going back towards the dyke in district A, what course would it have taken? It would go against the air.
2114. Would it not have had a tendency to blow the stopping the opposite way, as well as the horse and man? No; I do not think so.
2115. In which case, where would it travel? It must have gone into the main road here [*pointing to the plan*] and down to Nos. 3 and 4.
2116. Did you see any evidence of charring there? No.
2117. Would it be possible for the same results as have taken place to have been occasioned by an explosion in No. 2 fouling the intake aircourse—in other words, would these men in Nos. 3, 4, 5, and 6 have been likely to have been killed by an explosion in Nos. 1 and 2 alone fouling the intake air? If there had been any gas coming from here [*position indicated*], the after-damp would have been safe to kill the men.
2118. As a matter of fact, however, you found upon examination on Friday no gas in Nos. 3, 4, 5, and 6? No.
2119. From your experience, would you anticipate that when the air current was deranged would be the most likely time to find gas? Yes; you would be most likely to find the gas when the current was not in its normal state.
2120. Do you incline to the belief that gas did exist in Nos. 3, 4, and 6? Yes; I have no doubt about it.
2121. But you say you found no gas in those places? On the Saturday morning—yes, that was so.
2122. But was not that a likely time to have found the gas? Yes, and more especially in No. 6, as it was going over a fault.
2123. Precisely, and from your knowledge of the district, would you anticipate finding gas contiguous to these rolls or faults? Certainly.
2124. Were you acquainted with this district—that is, with the Bulli Colliery—before the accident? No, I was not—yes, the first time I went over it was subsequent to the explosion.
2125. If you were told that in Nos. 3, 4, and 6 headings gas existed before the explosion, would you expect to find gas in the same positions after the explosions? Not for some time after.
2126. Why not? Well, the gas would be taken out by the explosion.
2127. Would the lapse of two days be sufficient? Yes, I should say so.
2128. Then, would the fact that you found no gas after the explosion convince you that the statement was correct if you were told that there was no gas in those places before the explosion? Yes; I cannot say anything contrary to that.
2129. Then I have only a general question to ask you, Mr. Green; you say you had no knowledge of this particular district of Bulli before the explosion, but you have great experience, I know, in working in fiery mines; have you heard of the practice of shot-firing pursued in the Bulli mine? I have since the explosion.
2130. Would you consider it a safe method to tamp with dry coal-dust? No; I do not think it is safe to fire a shot where gas exists.
2131. But do you consider there is any special danger in fuse, which is the means by which, we are told, the shots were fired at Bulli; would it alone fire the gas? Yes; if the shot were overloaded.
2132. Do you consider it a safe operation to fire shots by turning the flame of a safety-lamp against the gauze? No.
2133. Would that be equivalent, in your mind, to communicating the flame from the inside to the outside? Yes.
2134. Would tilting the flame against the gauze be liable to destroy the gauze? Yes.
2135. And the destruction of the gauze would be a source of danger? Yes; it would be a danger, certainly.
2136. Would it destroy the utility of the lamp? Yes.
2137. With your extensive knowledge of this district, would you be astonished if I were to inform you that men working in places known to contain gas would work there with the top of the gauze removed from a lamp? Well, I think if men were inclined to do that I should like to be outside.
2138. Did you see men that you think would have acted so? No; not to my knowledge.
2139. In a district where the lamps were on some occasions red-hot, do you think lamps could so exist without causing an explosion? They might, but I do not think it should be allowed to continue.
2140. Was that an indication that the flame should be pulled down, and the people removed from the mine? By all means.
2141. In that condition of affairs what would you think of people knowing the properties of gas and the use of the safety-lamp who would work with the top of the lamp removed? Well I should think if men understood gas and did such a thing as that they were trying to commit suicide.
2142. Now I ask you (for I do not know anyone who has a more thorough knowledge of the district than you have) did you ever meet men in this district so careless as to do such a thing? Well I have met careless men in connection with gas. We had a little gas at Mount Kembla, but I do not know whether it would be right for me to give that.

2143. Did you find gas in those bords off No. 1 and No. 2 on the Saturday of your inspection? No, none at all.

2144. In your opinion, had a large quantity of gas been fired in No. 2? I believe that the gas had been almost back to the stenton?

2145. Was that a large quantity of gas to produce such disastrous consequences to human life? I do not think there was sufficient gas there to have effected so much.

2146. Do you know anything of the part which coal-dust would play in an explosion? Yes, something.

2147. Do you think it would communicate flame from one part to another, and explode distant magazines of gas? Yes, that is my idea.

2148. Then if (say A) an explosion took place, it might, through the medium of coal-dust, reach a distant locality though no gas existed between? Yes.

2149. And in that way it might be a powerful factor in producing disastrous explosions? Yes.

2150. *Mr. Neilson.*] On the Saturday, when you were in, Mr. Green, did you observe anything in No. 1? I went into the stenton, and I left Mr. McCabe standing by a horse there.

2151. You are quite certain that the seat of the explosion was in No. 2? Yes.

2152. But that it was assisted by meeting with additional force on the way? Yes; it must have met with a reservoir of gas in these old workings.

[NOTE.—The reservoir in question consists of two bords, about 15 yards in length, between the two returns. Mr. Green explains, however, that he did not examine for the presence of gas in the situations he mentions; his remarks on this point being pure hypothesis.

Witness's attention being directed to the plan, he further explained himself by that means.]

2153. *Mr. Neilson.*] Do I understand you to say now, Mr. Green, that, notwithstanding the opinion you have expressed as to the cause of the accident, and where the explosion was conveyed by separate reservoirs of gas, that the most probable position in which to find gas after the explosion was in the face of Nos. 3, 4, and 6, and probably No. 5? Yes.

2154. *Mr. Hilton.*] From what you have seen, Mr. Green, do you think it necessary in such cases to erect brattice to carry the air to the working face, by way of precaution, for instance? Well, I believe it was necessary in No. 1, in view of gas being there. I believe precautions ought to have been taken from the last stenton to the face.

2155. You are aware that in a mine which gives off gas the quantity given off varies considerably—sometimes it is more than at others? Yes.

2156. That being so, you think it necessary to erect brattice in order to prevent accident occurring? Yes.

2157. I suppose you have a knowledge of the means by which this mine was ventilated? Yes.

2158. You are aware that there was a door placed on the western road at the western junction? Yes.

2159. That was for the purpose of ventilating the Hill End district? Yes.

2160. And that door would be liable to get destroyed providing the trapper boy neglected to open it, say? Yes.

2161. And suppose the door became injured and would not work, would not the effect be to diminish the ventilation to the Hill End district? Yes.

2162. Do you think the door could have been placed in a better position? It might have been placed inside the western flatt so as to avoid the engine train; and if that had been so all these stoppings (*pointing to plan*) would have been scaling the air—that would have been all the difference.

2163. Supposing the door had been placed in the western return so as to admit sufficient air for the men in the western district, and supposing the stoppings were all secure, it would have been better in that case, would it not? Yes.

2164. And by that means there would have been less liability to accident? It would have been less liable, I suppose.

2165. Owing to the position the door occupied at the time of the explosion, if anything occurred to it, as you said before, it would necessarily destroy the ventilation to the Hill End district? Oh, yes, certainly. If the door were placed inside the flatt, as I have suggested might be done, it would be opened so many more times than on the main road.

2166. *President.*] It depends upon the number of skips or trains that pass through? Yes.

2167. *Mr. Hilton.*] You did not understand me, Mr. Green. You know that the return airway is on the out-by side or towards the furnace side of the main workings. If the door was placed in the return airway it would not be interfered with by the transit of skips and so forth? I understood you to speak of having the door placed in the return inside the main road.

2168. Yes; but by placing it there, I say it would not be subject to frequent openings? No.

2169. *President.*] Could it be placed in the return, that is the point? Of course I could understand having the door placed in the return, but I would not approve of it myself.

2170. *Mr. Hilton.*] Would not approve of the door being in that position, and yet you have said you thought it would be better to be there? Oh, no, I did not; at least I did not mean that.

2171. You said that where it was it was liable to be damaged? Yes; there was that danger.

2172. There was also danger in the boy not being there to open it and a set of skips running against it? Yes; no doubt.

2173. It might also get disarranged on account of frequent use? Yes.

2174. And if it were placed in the western return it would be free from liability to such dangers? Yes, no doubt; but I do not think it would be well to place it there.

2175. *Mr. Clarke.*] Would it be as servicable? No; I do not think it would.

2176. *Mr. Owens.*] When you entered the mine first which way did you go—up the left-hand side, through the return? Yes.

2177. Not over the Big Fall? No.

2178. Were you there at all? No. I made enquiries of Mr. Ross why we did not go there, and he said there was a very large fall and we could not get there.

2179. Did you see it? No.

2180. You noticed a smell? Yes; when I went to the furnace.

2181. You have smelt fire-damp before, and powder and dynamite, I suppose? Yes.

2182. Did you detect any smell like that of powder and dynamite on first entering the mine? No.

2183. Would it be possible for hot air to be sent to the Hill End district to cause the singeing of those people in the western district without a good deal of fire? No.

2184.

- Mr. W. B. Green. 12 May, 1887.
2184. Taking into consideration the state of the mine and the bodies, do you consider sufficient gas could or did exist in No. 1 heading to produce such effects? No; there was not sufficient gas in No. 1 and No. 2 headings to cause the destruction that there has been.
2185. Do you think coal-dust would ignite of itself, or do you think it would require to be dissolved by the ignition of gas? Certainly, in my opinion, it would require gas to make it explode.
2186. Do you of your own knowledge know of such a thing as a powder magazine to be kept in the mine? No, I never did.
2187. *Mr. Jones.*] To come to No. 1 heading I suppose you observed the danger-board? Yes, placed at the last stenton.
2188. In your opinion as a practical man, would it not have been a greater precautionary measure to have had those boards placed at a greater distance from the working places? Yes.
2189. That is, so as not to admit naked lights? Yes, I should say it would.
2190. You have said that you think the system of firing shots with a fuse, and lighting touch-paper by tilting the lamp a bad system? Yes.
2191. Would you recommend that the practice pursued in England, that of having some person in authority to fire the shots, should be followed here? Yes, I think so.
2192. You observed, on going into the mine, some stoppings blown out? Yes.
2193. Did you notice of what material the stoppings were composed—were they built of stone and filled in with small coal? Yes, they were good strong stoppings?
2194. Do you think stoppings of that character of a sufficiently good kind for conducting the air in large collieries? I believe all main roads ought to have good brick stoppings with a reasonable amount of backing up.
2195. *President.*] That is in the absence of good building stone, I suppose? Well, they are often better filled in with stone.
2196. *Mr. Croudace.*] As a rule are safety-lamps used where the existence of gas is known, or the fear of gas exists? If gas has been seen safety-lamps are used.
2197. Do you consider all men equally careful in using safety-lamps? No.
2198. Do you consider it prudent or safe to allow lamps to be unlocked? —
2199. I asked you that particular question, Mr. Green, because I think you must have misunderstood a question in reply to which at the inquest you said that safety-lamps were as safe unlocked as locked? I say they are safe so long as they are not unscrewed.
2200. I ask you again, knowing that all men are not careful in gassy mines, do you consider it prudent or safe to allow the lamps to go in unlocked? No.
2201. That is a distinct contradiction to your statement at the inquest? I think my statement at the inquest was just the same, namely, that the unlocked lamp is safe, provided it is not unscrewed. But my opinion is that no man ought to go past the lamp cabin without his lamp being locked, and a man should be stationed there for the purpose in mines where safety-lamps are used.
2202. In answer to a question at the inquest you said, "A safety-lamp unlocked is just as safe as it is locked"; and now I understand you to say, as to a lamp in a gassy mine, that it is not as prudent to have it locked as unlocked? Not at all.
2203. Then do you consider it as prudent in a gassy mine to have the lamps unlocked as locked? No.
2204. You have expressed your opinion about tilting the lamp; now, do you consider it safe to use the ordinary needle and squib in firing a shot? I do not think it is safe in a case like this.
2205. Have you ever known a shot to light up gas? Yes.
2206. With what material would you recommend shot to be fired in a gassy mine—that is, damped or undamped? Damped, certainly.
2207. Would you use coal in the ordinary way, small coal or shale? Shale is always considered the best; but, in general, small coal is used.
2208. Now, to come to the question of the ventilation of this mine. You have been asked about the western door; would it not have been better to have two doors on the western? Yes.
2209. Did you notice whether there was a door between No. 1 and No. 2 on the main road? There had been?
2210. Would it have been better to have two doors there? Yes.
2211. In all cases it would be better? Yes.
2212. Now, I would just like to take you to your opinion about the explosion. You are of opinion that she fired in No. 2, dividing herself in going along the road into No. 1, pierced a stopping here on the main tunnel, a portion going on to the main tunnel, and that at length she fired a small accumulation of gas in two abandoned bords to the left. You observed that the stopping on the left-hand side was blown upward; did you observe which way these stoppings were blown into the face? No. A train of skips was standing there, and I was never down that side.
2213. Do you know or have you heard whether those bodies found at the point where you think she gathered the gas, were those of men who had been working there? They were mostly boys.
2214. Had the boys been working there, do you think? Yes; because the horses were there.
2215. As a matter of fact, did you observe a stopping on the left-hand side of this heading off the main road, and immediately beside No. 2 heading—right through there? I did.
- [NOTE.—Reference was here made to the plan, and Mr. examined the witness as to the probabilities of supporting his hypothesis of a separate explosion.]
2216. You have told us that the explosion came through a stopping on the left-hand side of the main tunnel? Yes.
2217. And you believe there was an accumulation of gas in these unworked bords? Yes.
2218. That being the case, would not that intensify the force and power of the explosion a very great deal? Yes.
2219. Then what would be the result of that intensification of the explosion—which way, for instance, might you then expect the increased force to expend itself? Out-bye—up the tunnel.
2220. Then how do you account for the five bodies being found here, where from every reasonable belief they should not have been, nor could have got, unless they came round by the face here? I think they were forced there by the explosion.

2221. Coming down No. 1, if gas existed in these two bords it would receive an accession of strength by the firing of the gas, and blow the five boys through the stopping as being in the direct course? Yes.
2222. *President.*] I think what Mr. Croudace wants you to consider is this: Supposing your hypothesis to be correct, and gas existed in the two unworked bords in the district marked A, and supposing that gas was fired, the explosion would gather new strength, and, as you say, the force of that would go necessarily down the tunnel? Yes.
2223. Mr. Croudace, in this view, wants you to account for the five bodies and the horse, which were projected through this stopping by the first explosion, remaining at this point, provided there was a second explosion in proximity to the spot where the bodies were found? I think the boys were standing in front of the stopping, and the gas having exploded, gathered more strength, and forced the bodies there. Then you must remember the bodies would be lying down, and if there was more gas to explode, it would not have the same effect upon the bodies in that position as it would if they were erect.
2224. Did you notice the condition of these bodies—were they burnt? Yes, they were burnt.
2225. *Mr. Croudace.*] Were they much burnt? One, lying further up than the rest against the corner of a bord on some small I specially noticed; his hair was singed; the horse was also singed.
2226. Did you notice the props, or any bark, or other material, showing any large extent of fire having been present? I did not.
2227. If there had been any large extent of fire from an explosion, do you not think that the bodies, props, and suchlike would have been charred? I do.
2228. Well, I may tell you that at this point, close to the body of the horse at the bord end, I picked up a piece of bark not even charred—are there indications in this direction, No. 1 and No. 2, of much charring? I was not in there.
2229. You believe that where charring exists there has been fire? Certainly.
2230. Do you think that where no charring exists there is much probability of there having been fire? No.
2231. Just look at these workings, please. [*Draws attention to particular workings affected, as shown on the plan.*] Is not that a very small area of workings altogether? Yes.
2232. And would not a comparatively small quantity of gas, therefore, do a considerable amount of damage in that district? Yes.
2233. Am I right, therefore, in saying that a comparatively small quantity would do the damage you have seen here? I am of opinion that the gas was probably assisted by the coal-dust.
2234. As a matter of fact, do you think there was much gas in any of these workings? I cannot say there was much gas where a naked lamp would be, and I found a naked lamp in this stenton here (*indicating a point on the plan*).
2235. Do you know whether the men working in the bords on the right-hand side of No. 1 used safety or open lamps? I believe they used open lamps.
2236. Did you travel through the return airway here to the west? Yes.
2237. Did you find any signs of much damage in that direction? No.
2238. *President.*] You stated, Mr. Green, that you picked up a lamp in stenton No. 1—what kind of a lamp was it? A copper lamp.
2239. Was it a large lamp? Yes.
2240. Where Millwood was found, did you see a lamp by his side? No.
2241. It was stated to us yesterday that his lamp was lying by his side? I did not see it, and this is the first I have heard of it.
2242. You and Mr. McCabe were there first to see his body? Yes.
2243. And you did not see his lamp? No; but I saw a lamp in the stenton, and I came to the conclusion that it was the deputy's lamp.
2244. You did not know the deputy? No.
2245. *Mr. Croudace.*] How did you know it was his lamp? I knew it was a deputy's lamp.
2246. *Mr. Jones.*] Did you consider the Bulli mine a dusty one? Yes, very dusty.
2247. You have already stated that there should be double doors in the air passages where required? Yes; I think it would be much safer.
2248. Is that the practice in England? Yes; in gassy mines it is.
2249. You, as a practical man, would suggest that it should be followed in all mines where gas exists? Yes.
2250. *President.*] Would you go further and say that on main roads no doors should exist? I think it would be much better if it could be arranged to have no doors on main roads. [*The witness withdrew.*]

Mr.
W. B. Green.
12 May, 1887.

David Howie sworn and examined:—

2251. *President.*] You are a miner, employed at Mount Kembla? Yes.
2252. Did you work in the Bulli mine before the accident? I never did work at the Bulli mine.
2253. You did not know anything about the workings before the accident? No.
2254. When did you first arrive at the mine? On the evening of the day after the accident.
2255. Did you go as a rescuer? Yes.
2256. Tell us where you went? We proceeded into the tunnel for about 400 yards, turned to the right, and went through the airway till we got on to the main tunnel again, and proceeded for a few hundred yards further, when Mr. Evans and Mr. Jones tested the air; we then proceeded on a bit further till we came to the large fall; we got over the fall, and again tested the air; we proceeded on till we came to a heading, of which I do not know the number, but a little further on we came to a heading where there were some skips lying all jammed together; I, at Mr. Evans' direction, jumped over, and I saw a boy's hand underneath a skip; we lifted the skips off, and got the boy out; by that time, another party came in.
2257. Did you observe the condition of the boy—was he burnt? I thought the hand was drawn together, I did not take particular notice of the face.
2258. Where did you go after taking out the boy? We proceeded to carry the boy out, and when we came back again, some more bodies were being carried out from the straight-in heading, and other working places the other side of that.

Mr.
D. Howie.
12 May, 1887.

- Mr. D. Howie.
12 May, 1887.
2259. That was Nos. 3, 4, 5, and 6; were you engaged carrying the bodies out? Yes, from the mouth of the tunnel.
2260. Were you in the face of any of these headings? No.
2261. Did you see any charred props on the road? No, I did not take any notice.
2262. You confined your attention to the carrying out of the bodies? Yes.
2263. Then you can state nothing about the condition of the workings? No, I never went in further than that.
2264. How often were you in the Bulli mine that night? Four times.
2265. *Mr. Clarke.*] Who accompanied you on those occasions? My brother, William Howie, Tom Hopkins, and William Wotherspone, and others.
2266. *Mr. Croudace.*] How was it you happened to go all the way from Mount Kembla to assist in this work? We were asked to go.
2267. Who asked you? Mr. Evans.
2268. Was there not plenty of assistance without you? It seems not.
2269. Were there no resident men with you—no Bulli hands? There was only one in our party; there were six of us besides Mr. Evans and Mr. Jones.
2270. Were there no men from Coalcliffe or North Illawarra with you? There were none in our party.
2271. *Mr. Jones.*] Then you simply accompanied Mr. Evans' party? Yes. [*The witness withdrew.*]

William Wotherspone sworn and examined:—

- Mr. W. Wotherspone.
12 May, 1887.
2272. *President.*] You are a miner, working at Mount Kembla Colliery? Yes.
2273. Did you accompany the last witness, David Howie, into the Bulli mine on the Thursday night after the accident? Yes.
2274. And you entered that mine along with Mr. Evans and party? Yes.
2275. Where did you proceed to? We proceeded up the Hill End, or gassy district.
2276. Had you been in that district before the accident? No.
2277. Having gone to the gassy district, what did you then do? The first thing David Hopkins and I did was to put up canvas bratticing in the straight heading; but before doing that we went up to where the horse was lying dead. We went in there to see if there were any bodies of the men.
2278. Did you see any gas there? No.
2279. Did you pass through the cut-through into No. 2? No, we took the same road, and went along the Flatt, into No. 3.
2280. Did you go to the face? Yes; that is where Newton was lying. The road was all fallen there.
2281. Were the bodies removed out of Nos. 3 and 4 at that time? No.
2282. How many bodies did you find? Two.
2283. Did you notice whether the men were burnt? Their hair seemed to be singed, but I could not say as to the bodies, because they were all black, being covered with dust.
2284. Then having gone to the face of No. 3 heading, did you go also to No. 4? Yes; that is where Bentley was lying; there were other four lying in that heading.
2285. Was a horse there? No; the horse was out on the main heading.
2286. Did you perceive the condition of the bodies in No. 4? Yes, as I have said, they were all black, as it were from dust.
2287. Then going down the main heading, did you and your party go into the face of No. 5? No; we did not go to the face, we came up through the canvas again.
2288. You would then go to the Flatt where the skips were lying? Yes.
2289. How were they lying? Most of them were lying about 6 inches off the rails, and tossed about.
2290. Did you notice any bodies lying under the skips? I saw a boy, and saw him taken out.
2291. Was he burnt? I cannot say; I did not examine him.
2292. Have you had any experience in gassy mines? Yes; I was in about as gassy a mine as any in the world.
2293. Where was that? Cadzow.
2294. *Mr. Neilson.*] Did you witness any explosions there? There was an explosion there, but no bodies burnt.
2295. Were you in No. 2 heading? Yes.
2296. Did you notice the effects of the explosion there? I cannot say much about the effects.
2297. Where men are injured in explosions, it is the hair that fires first, is it not? Yes.
2298. Were the bodies you saw at Bulli much burnt? Just singed only.
2299. Then they were not in that case burnt very much? No; they did not seem very much burnt, none of the skin had come off.
2300. If a man puts his head into fire, the hair on his face and head comes off first? Yes, I have seen that myself, where the hair and whiskers have come off and the man not much burnt in the face.
2301. Have you ever worked where there was fire-damp, and safety-lamps were used? Yes, in Cadzow.
2302. What was the system of firing shots there—who fired the shots? The deputy, or what we called the roads-man.
2303. What was the process? They used touch-paper generally.
2304. How did you light the touch-paper? Always with a match, because there was no danger of gas there, every place being bratticed up to the face.
2305. And you lit the touch-paper with a match? Yes.
2306. Was that in the main current? Yes, generally. There was always a good current if you went outside the bratticing.
2307. The men were never allowed to fire a shot, then? No, and a man always went around after we went out to see that all was right.
2308. What sort of tamping did you use? Damp tamping. Very small dry coal is not a safe thing to use.
