2309. *Mr. Hilton.*] From what you have seen do you think it required a large amount of gas to cause the

- the destruction? Yes, and I do not think it was the gas in the headings that caused the explosion. I think the new furnace had a great deal to do with it.
2310. In what way? Well, I think there has been a good deal of gas lying in Bulli for some time, and the new furnace has caused it to come out.
2311. *Mr. Owens.*] Did you test for gas when you were in the mine? Mr. Evans did in my presence in the headings.
2312. Did he find any? No.
2313. Do you know anything about the working of Bulli mine? No, nothing previous to the explosion.
2314. *Mr. Croudace.*] From your experience in gassy mines, would you think of tilting a lamp to light the touch? No, I think it is a very bad practice.
2315. Any man doing so, you think, would be doing a wrong both to himself and his fellow men, and to the community at large? Yes.
2316. That being your opinion, what would you think of a man, or two, or three men who worked in a mine with the top of a lamp burnt into a large hole, and continued so to work for two or three days? I should think it was a very foolish action.
2317. Then, Mr. Wotherspone, would you look at this plan [*pointing to a section of the workings*]; knowing that there is a small area of coal in this gassy district, would it take a large or a small amount of gas to do a considerable amount of damage? It would not take a great amount of gas to do a great deal of damage.
2318. In any gassy district comprising a limited area, you are of opinion that a comparatively small quantity of gas would do a considerable amount of damage? Yes.
2319. In going through the workings of Bulli mine, did you notice any stoppings composed of stone and loose earth blown out? Yes.
2320. Coming down into the main tunnel did you observe a stopping, the first on the left of No. 2 heading? Yes. That was the first put in with canvas.
2321. Did you notice any below that blown out? Yes.
2322. Did you consider that there was a great deal of damage done? Not a great deal of damage inside the workings.
2323. Coming to the Flatts where you saw the tubs displaced, you saw one or two broken tubs? Yes; we removed them to get the bodies away.
2324. Have you ever seen the effects of a really heavy explosion? Never; I have only been where they were slight.
2325. I asked you that question because I wanted you to compare this with a really heavy explosion.
2326. *Mr. Jones.*] You have stated that you believed that the new furnace had something to do with the explosion—what are your reasons? Well, I have worked in a pit where we had a lot of gas lying, “dampit,” and I believe it was in Bulli the same; and if it had been allowed to come out, it would have caused the pit to be blown out, but we kept it down so that it would not fire.
2327. Where would you expect to find light carburetted hydrogen? In the old workings.
2328. And is that where you would find black-damp? Yes.
2329. What effect would hydrogen have upon the furnace? It would burn on the furnace.
2330. Did you ever hear of any displacement having taken place at the furnace? No.
2331. Then what becomes of your belief that there was a large quantity of gas stored up in the return—would not the effect of the air be to diffuse it and render it harmless? Yes, if there was plenty of it.
2332. Yes, and plenty of black-damp would have a similar effect? Yes.
2333. Then these two elements would prevent a realization of your belief? Yes; but a slight current of air would cause the effect.
2334. But not having seen any manifestation of force at the furnace, there is no evidence to support your belief? I never knew of an explosion going to the furnace.
2335. *Mr. Neilson.*] Do you know how long the new furnace has been working? About six months, I see by the papers.
2336. With three times the quantity of air than there was before, would not six months be time long enough to draw out any quantity of gas that might be there? It would depend upon the working of the furnace.
2337. *Mr. Owens.*] You said in answer to Mr. Croudace that in a mine where gas exists the fact of a lamp with a top burning off would be highly dangerous? Yes.
2338. Supposing that you were supplied with such a lamp, say in the Hill End district, and could not get another, what would you do? I would go out. [*The witness withdrew.*]

MR. G. O'MALLEY CLARKE IN THE CHAIR.

David Hopkins sworn and examined:—

2339. *Chairman.*] You are a miner, working at Mount Kembla? Yes.
2340. Did you visit the Bulli mine after the accident? Yes; on Thursday, the 24th, at 10 o'clock at night.
2341. Did you visit the mine? Yes.
2342. In company with whom? Mr. Evans, David and William Howie, and William Wotherspone.
2343. In what direction did you proceed, and what did you do? We went into the gassy section, as far as No. 3 heading. I saw a man lying there; we turned the air into No. 3 and carried the man out.
2344. Did you go to Nos. 1 and 2? No.
2345. Did you notice much damage done? Yes.
2346. Did you go back the same road? Yes. I was only in once. I did not go into the western. All I did was to assist in putting the brattice up and carrying the bodies out.
2347. Did you form any opinion as to the cause of the accident—the origin of it? No.
2348. *Mr. Hilton.*] Have you had much experience as a miner? Yes; I have been at it since I was 12 years of age.

Mr.
D. Hopkins.
12 May, 1887.

2349.

- Mr. D. Hopkins. 2349. Have you worked in mines that gave off gas? Yes.
 2350. What sort of lights did you use? Davy-lamps.
 12 May, 1887. 2351. Were you ever in a mine that exploded? I was never inside during an explosion. I have been in after an explosion before this occurrence.
 2352. From your experience, do you think it would require a large amount of gas to cause the destruction you saw in Bulli mine? There must be a large amount of gas to do much damage.
 2353. Is there a great amount of damage done at Bulli? It depends upon the kind of roof. If the roof were bad, the same as it has been in some places where I have worked, there would be much more damage I should say.
 2354. *Mr. Owens.*] You never worked in Bulli Colliery? No. [*The witness withdrew.*]

Isaac Nixon sworn and examined :—

- Mr. I. Nixon. 2355. *Chairman.*] Are you a miner? Yes, working at Mount Kembla.
 12 May, 1887. 2356. Did you visit the Bulli mine after the accident? Yes, on Thursday, the 24th of April.
 2357. At what time? I think it would be about 10 o'clock at night.
 2358. Who did you go in with? I went in with John Chalmers.
 2359. Had you any knowledge of the mine? No; it was my first visit.
 2360. Where did you go? I went into No. 3 heading.
 2361. Was Hopkins with you? Yes; there were seven of us altogether.
 2362. What did you do? I helped to carry some of the dead bodies out.
 2363. Where from? No. 3 heading.
 2364. Did you examine the heading? No.
 2365. Did you only pay one visit to the mine? No; I helped to fetch three bodies out of No. 3 heading.
 2366. Did you leave the mine soon after? I left the mine about 5 o'clock on the Friday morning.
 2367. And all the time you were assisting to carry out the bodies from the main drive? Yes.
 2368. Did you take notice of any of the damage done? All the notice I took was that the skips were knocked about down in the bottom end of the main.
 2369. How many bodies did you find altogether there? I saw about four or five.
 2370. Was there any appearance of burning on them? Well, yes; there was a little appearance of burning on them.
 2371. You did not go into No. 2? No.
 2372. Or any other part of the mine? No; I only went to No. 3.
 2373. Can you give any opinion as to the cause of the accident; this wreckage, or anything of that sort? No.
 2374. *Mr. Neilson.*] Was the hair burnt on these bodies? The hair was slightly singed on the head—singed close to the skull.
 2375. Did you go into the western district of the Hill End district on the left-hand side? No.
 2376. Did you try for gas anywhere while you were in? No; I was simply engaged in getting the bodies out.
 2377. Did you see anyone else try for gas? No.
 2378. *Mr. Jones.*] Did you see any other bodies than the three you helped to carry out? Yes; I saw four or five of them.
 2379. Did you notice any signs of burning on them? No; I only noticed those I helped to carry out.
 2380. *Mr. Croudace.*] Did Mr. Evans ask you to go to the Bulli mine? Yes.
 2381. Did he state any reason? No; he wanted us to go to try and get the bodies out.
 2382. Have you had much experience in fiery mines? Yes.
 2383. But you did not see much in this mine? No; I did not pay any attention. [*The witness withdrew.*]

John Halloran sworn and examined :—

- Mr. J. Halloran. 2384. *Chairman.*] What is your occupation, Mr. Halloran? I am overman at Mount Kembla, in charge of the night shift.
 12 May, 1887. 2385. Had you any knowledge of the Bulli mine prior to the accident? I never worked at Bulli.
 2386. When did you visit the mine after the explosion? On the Thursday night, and entered the mine about 11 o'clock.
 2387. As a rescuer, I suppose? Yes.
 2388. Where did you go to? We went to the face of the main heading, no further.
 2389. What do you see? I saw two dead bodies.
 2390. Did you go into any adjoining heading and make any observation of things? I was in No. 2 and No. 3, I think; but I would not be sure as to the numbers.

[NOTE.—The headings were indicated on the plan, and witness recognises those he entered.]

2391. Did you observe any bodies? Yes; we took some bodies from that direction—one from these two headings, and on the return, not far from the face of the return, we got two bodies.
 2392. Did you go into these headings marked Nos. 1 and 2? No.
 2393. Did you go anywhere else? No.
 2394. Can you describe the condition of the mine—was there much damage done? There was not much damage done up there, there was some going in.
 2395. Are you in a position to give an opinion as to the cause of the disaster, or its effects? Well, no I do not know that I am. I went there more as a rescuer than anything else. [*The witness withdrew.*]

Archibald Gardiner sworn and examined :—

Mr.
A. Gardiner,
12 May, 1887.

2396. *President.*] You are a mining engineer? Yes; and a certificated colliery manager.
2397. Residing at Newcastle? Yes.
2398. You produced this plan of the Bulli Colliery? Yes.
2399. It is an accurate plan of the workings of the colliery which have been affected by the explosion? Yes.
2400. Where did you get the information which enabled you to mark the places representing where the different bodies were found, as well as to make other indications on the plan? This blue tracing here was handed to me by Mr. Ross.
2401. Were you present at the mine when any of the bodies were found? I was present when some men were brought out of the western.
2402. So you speak from your own knowledge of the positions of the men found in the western? Yes, of nearly all of them; but I did not see those found to the right-hand of western.
2403. When did you visit the Bulli Colliery first? The second day after the explosion.
2404. That was Thursday or Friday? That was Friday morning.
2405. When did you first go into the mine? On Friday morning at 10 o'clock.
2406. Who took you into the mine? I accompanied the Examiner of Coal-fields, Messrs. Ross, Evans, Neilson, and Inspector Rowan.
2407. With what object? To find out the causes of the explosion.
2408. Where did you go? We proceeded over the western district.
2409. How did you enter the mine? By the grip road.
2410. You did not proceed through the main tunnel? Not through the main tunnel at the beginning.
2411. When did you go through the main tunnel? On the Friday, the first time I went through the Hill End district.
2412. In going through the main tunnel, what conclusions did you form as to the cause of that large fall? The cause of it had been the blast of the explosion; the timber that has been torn away has been loaded with loose stuff, and it came down, and might appear at first sight as if it had been drawn from the roof, whereas it was only stuff used for loading the sets; the wire ropes running along the timber on pulley-wheels would greatly assist in pulling down the timber; but the primary cause of the destruction was the force of the explosion.
2413. Is it your opinion that the roof had previously started from the conglomerate, and was resting on the timber? Yes, and thereby loaded the sets; I have satisfied myself that that has been the case; and it is very easy to see proof of that.
2414. Did you take particular notice of the condition of the main road? Yes, in many places.
2415. Are you decided in the opinion that the large fall in the main tunnel is due to ordinary causes? Yes; I am satisfied it was due to the force of the explosion which knocked out some of the props, and the wire ropes and the stuff lying on the top of the timber have assisted in wrecking it for such a length.
2416. There was no evidence that it was caused by gunpowder or dynamite? No; so far as I could see there were no symptoms of anything of the kind.
2417. In passing along how did you make your examination—did you make particular inspection of the tunnel as you went along? About 10 o'clock on the night of the 30th March, in company with Messrs. Evans and Crawford, I went into the mine, and we minutely examined from the mouth of the tunnel to the commencement of the large fall; then we returned by the way of the grip and came down here for about a chain from the junction of the travelling road back towards the mouth of the tunnel, and then minutely examined the props, falls, and everything that could be seen from that point right to the face of No. 1 heading.
2418. Give us the results as you went along? About 120 yards in we got some coped dust, which was sticking to one of the props.
2419. It was attached to the props? Yes; we took samples of this dust; also some splinters off the props.
2420. Were they burnt? No, not the bark splinters; these things I produced at the Coroner's inquest; we also examined the overcast to the old furnace, to see if there were any effects of the explosion there, and to examine whatever had taken place; the explosion was not traceable there, and there was no disturbance in the old air-course; the top of the overcast was spiked down with 6-inch spikes; three of these were lifted up as if from below, but were not removed out of their places; the air-course was in itself intact, and did not seem to be under the influence of any explosion; the force where we saw indications of it appeared to come from down below; we then proceeded and examined further on. There was nothing particular at the junction of the travelling road with the main tunnel.
2421. Start at the junction of the travelling road and the main tunnel, and describe the result of your examination? We proceeded and examined all the timber at the road sides, and there was nothing remarkable up to the junction.
2422. What was the condition of the stoppings there? They were somewhat disturbed; but the force of the explosion had not affected them very much.
2423. Were they disturbed at all? I could not really say if they were disturbed; but if so, it was very little between these two points.
2424. Now coming to the top of the incline bank? At the junction there, where Melville and other five bodies were found, we took samples of bark and splinters from timber against which Melville's body was found lying, and as far as we could see no signs of fire were there at all; a fall had taken place, and I examined very minutely that place last night to ascertain whether I could see anything particular about that wreckage; that fall had evidently been caused by the concussion.
2425. How do you account for the bodies that were got at the top of the flat being burnt if you saw no signs of fire on the props, or did you examine any of the props with bark on them? Yes.
2426. Is bark sensitive to fire? Yes, very sensitive; particularly the bark I took from there; it was as fine as the hair of my head.
2427. If fire existed there, would you have seen it on the bark? Yes.
2428. And you saw no signs of flame? No.
2429. You are positive of that? Positive.
2430. How would you account for the bodies exhibiting signs of burning? The heated dust will account for it.
- 2431.

- Mr. A. Gardiner.
12 May, 1887.
2431. You took samples of dust from the props? Yes.
2432. Was it coke, or dust, or what? There was a good deal of coke amongst it; but it was not all charred, the dust was only partially consumed.
2433. It was adhering to the props? Yes; at one place it was a quarter of an inch thick on a tree standing in the centre of the junction facing the western and Hill End road; I took particular notice of it; found it to be a quarter of an inch thick.
2434. What side was it? The dust was in the in-bye side, as if it came outwards.
2435. After leaving the junction of the western, where did you go? Straight into the Hill End district.
2436. You passed over a large fall? Yes, and then went through several bords.
2437. Was that through the fault? I believe it was over some fault or other. There was a large fall there. From information given to me I was anxious to go into the western district to see the timber there, to ascertain if there were any signs of fire.
2438. Proceeding onward, where did your examination extend, and how was the ventilation at this time? We found the roads and places pretty clear until we got to No. 1 heading.
2439. Two bodies were found before you got there? Yes; 96 yards from the centre of No. 1 heading.
2440. You did not see them? No.
2441. Did you examine the props where the bodies were found? Just near there are no props at all.
2442. Did you examine the nearest? Yes; but there were no traces of fire along there.
2443. You found no traces of fire until you came where? Down in No. 1 heading, and in No. 1 bord off No. 1 heading, were the first traces of fire that I saw.
2444. In making this plan, you put down everything as it exists? Yes; I observed in travelling up No. 1 heading that the first bord off that heading was a disused bord. It is marked on the plan, "Bord stowed up." It was filled up with debris.
2445. And there was access? No, I tried, but could not get in.
2446. Could that act as a reservoir or magazine for gas? No.
2447. The next bord is also a disused bord, marked "Standing burnt coal"? Yes; the face of the coal is burnt.
2448. Did you get into the face? Yes; there was no gas there.
2449. Then you pass over the roll to the bords working coal between rolls? Yes.
2450. Were the spaces a little greater? Yes.
2451. You were not present when any bodies were found in Nos. 1 and 2 headings? No, not when they were found, but after they were taken out. I was there when the man, Olsen, the last man brought out of the pit, was taken out. He was found in the fifth working bord, and he was taken out on the Saturday, having been missed by one of the parties.
2452. That was the only body that you saw? Yes, in that district.
2453. Did you closely examine the body when you saw it? Yes.
2454. There were no marks of burning on it? Well, I could not really say. It was covered with coal dust, and I did not go out with it, and I would not like to pass an opinion unless I saw the body in daylight, after it had been washed.
2455. Passing upwards you come to the last stenton, where there is a danger-board standing almost level with the stenton? Yes; in the centre of the stenton, in No. 1 heading, the danger-board and props are still standing.
2456. And about there was a horse? Yes.
2457. Have you been in the face of that heading? Yes, several times.
2458. Did you find any fire-damp? Yes, every time; and I have seen from 4 to 14 yards of gas.
2459. How thick? It was 6 inches on the out-bye side, and I have seen as little as 4 yards in length.
2460. Was it very pure? Very quick.
2461. Was it remarkable for its quickness? It was.
2462. Was it silver gas, or do you know anything about that? That is what we had in the Forsyth district in Scotland.
2463. *Mr. Croudace.*] Do you know the component parts of silver gas? No, not minutely, but I believe there is something in it that gives it a quicker smell.
2464. *President.*] With reference to this bord, No. 1, was it 80 feet 6 inches in advance of the stenton? Yes.
2465. Can you vouch for the accuracy of the measurement? I can.
2466. At a spot within 6 or 7 yards from the face of No. 1 I see some compressed powder and a coil of fuse was got here unburnt—that is indicated on the plan? Yes.
2467. By whose authority? My own.
2468. Did you see it? Yes.
2469. Where was the powder found? On a canch or bench on the side of the coal, about 6 yards from the face of the heading, and about 3 or 4 feet from the floor, and the coil of fuse was found beside it. I brought out the fuse, and Mr. Dixon, the Government Inspector, brought out the powder.
2470. It was quite unburnt? Yes; and I believe it was produced by Mr. Dixon at the inquest.
2471. Passing through the stenton, you come to the face of No. 2, standing 85 feet in advance of the stenton, that is 28 yards 1 foot? Yes.
2472. That heading is on a roll? Yes. I have omitted to say that last night, when down in the heading, Mr. White had some men put on to put bratticing in the face of No. 2 heading, and while they were working there removing small coal from the front of a canch, and after they had removed the skip which was there, a naked lamp was found on the floor.
2473. Did you see it? Yes.
2474. What sort of lamp was it? An ordinary miner's naked lamp.
2475. Did you notice whether there was any oil or wick in it? Yes, I noticed that the wick was in it.
2476. Could you tell that it had been in recent use? Not very easily. It had been among the coal-dust, and it was not observed until they were putting the bratticing down to the bottom, where it was discovered.
2477. Had it been trampled on? No; it was close to the left-hand side of the heading, and I believe that search parties going in on occasions went to the right-hand side of the skips. We went on both sides of the skips on going in and out of that heading.
2478. You saw the lamp? I saw it.

Mr.
A. Gardiner.
12 May, 1887.

2479. Did it have every appearance of having been recently used? It might have been used, but I could not say; I suppose it was.
2480. Did you suppose that it was a suspicious circumstance? Very suspicious.
2481. Did you see any bodies removed from No. 2 heading? No.
2482. Did you see any removed from Nos. 3 and 4 headings? None.
2483. Can you describe to me the course of the ventilating current from Nos. 3 and 4 headings? Yes. The main intake of the Hill End district passes the main engine road to No. 1 heading; it then passes through the stenton to No. 2 heading, and then it passes down, supplying the bords down No. 2 heading, until it comes to the bord next to the engine road, subsequently it passes through out into the main engine road, again it then passes along to No. 3 heading, and is again separated there by a door; it passes up No. 3 to the in-bye stenton, through this stenton to No. 4, then down No. 4 on the main road, ventilating one bord here, also goes down to the straight and passes into its No. 5. It then enters the return air-course, which is parallel with the engine road, back to the entrance of No. 2 heading, passes up the heading road for about 2 chains, and passes by the return air-course through the dyke again.
2484. Did you get into these workings by the return air-course, near the dyke? I did.
2485. Right to the head of these workings? Yes.
2486. Did they contain any gas? None at all.
2487. In this circle of workings, marked on the plan A, did you see any evidence of a separate explosion? Nothing at all attracted my attention, although I examined the places all over it, and this stopping, marked on the plan "stopping good," I found not at all injured; the other stopping is marked partly out. Some debris was lying down for about 15 inches, and that is the reason I so marked it, although a part of the stopping is good the damage extends only 3 or 4 feet, but on the other side of that the stopping is just as good as if it had been recently built up, and all these bords in the section of the plan marked A show no evidence of fire or explosion.
2488. I see there are two bords going down the right of the working marked A, where you have marked "fall." Could you get over that fall? I went forward and looked over it, but I did not go over it.
2489. Did you see any evidence of gas on the top of this fall which stopped up these two bords? No.
2490. In your opinion were these two bords likely to contain a reservoir of gas? No.
2491. Did you see any evidence of a separate reservoir of gas having been fired there? Had there been a reservoir of gas fired there these stoppings must have been blown out.
2492. You pass through into the return? Yes.
2493. Is the return of adequate capacity? Yes.
2494. You then passed towards the western district? Yes.
2495. You get into it by a door? Yes.
2496. Which I see you have marked "slightly damaged but still hanging"? Yes.
2497. Before coming to that door there is a road which leads to the left? Yes; that is the return air-course.
2498. Reaching the western tunnel where did you go first on the Friday? On my first visit I came to the large fall towards the junction in an air-course.
2499. Did you observe the air-course broken down? Yes.
2500. In what way were the planks displaced, had the force come from below or above? The force came from above.
2501. Did I understand you to say that you saw these bodies lying on the western road? No, not these, they were lying under the overcast.
2502. You passed in towards the face of the western district, what was the condition of the face? There was not much wreckage at all in the whole of the western district.
2503. You passed through the door? The frame of the door was lying at an incline of 20 degrees inward, evidently showing that the force of the blast had gone in one direction, but that the recoil of it had taken the frame of the door in another, and the recoil had had the effect of bringing the door back to its position, although the frame was carried slightly inwards.
2504. After an explosion is there generally a recoil of the force? In all cases.
2505. You found a man as indicated here by a blue cross? Yes.
2506. And you found no gas in the face of these workings? None whatever.
2507. Was the ventilating current much deranged? It was. I observe the slacky road to the right of the western road, where six bodies have been 'got, the remark "in good order; canister with powder and fuse got here."
2508. Did you see that? Yes; I got it in searching for a man; it had been overlooked till the Monday morning, when I brought it out.
2509. Where is it? It is in the lamp room of the Bulli mine. There are 3 or 4 lb. powder in the canister, and it is in good order.
2510. Was the fuse burnt? No; I saw no symptoms of burning in all the western district, and no evidence of fire at all.
2511. In passing round this road and in the bords of the Hill End district at various times did you see any traces of fire in Nos. 1 and 2 headings? The traces of fire were in Nos. 1 and 2, and it was right up to the danger-board in No. 1 heading, opposite the in-bye stenton.
2512. The last stenton towards the face? Yes.
2513. Did you see any signs of fire in the bords? Yes; in the bords off the heading for a short distance there were signs of fire, but there were no signs in the faces of these bords.
2514. Did you see any trace of the existence of gas in the bords off the heading? None at all.
2515. Not in any of your examinations? I never found gas anywhere else; in all my visits it was confined to Nos. 1 and 2 headings.
2516. In your opinion do these headings give off gas? Yes.
2517. And that is where the gas of this explosion came from? Yes.
2518. Do you think that the rolls had any influence in the amount of gas given off? They always have.
2519. Do you think that the practice followed in this colliery of driving these headings was a judicious one in the face of the fact that gas was being given off in the leading headings: I mean in respect to ventilation, can you suggest anything that would have improved the ventilation and carry away the gas? I think they should have had canvas up in these headings.
2520. In view of gas being given off you would have recommended bratticing? Yes.
2521. The ventilating current is directed into Nos. 1 and 2 from Nos. 3 and 4 by a door being placed on

Mr.
A. Gardiner.
12 May, 1887.

the main heading. In the event of trains of skips passing through, the door would have to be open, would the ventilation be partially impaired for that time? Yes.

2522. In gassy districts of the mine would you consider it an evidence of good mining and management to have doors on a main road? No; it is advisable to dispense with doors as much as possible on main roads.

2523. Would it have been quite safe to have conducted the workings of this mine with the existing arrangements if bratticing had been used in the faces of the headings which gave off gas? Yes; quite.

2524. Of your own knowledge do you know the manner in which this mine was worked with safety-lamps? Of my own knowledge I do not.

2525. You made examinations with other gentlemen on a subsequent occasion for the purpose of ascertaining the circumstances and causes of the accident? I did.

2526. To what conclusion did you come? I came to the conclusion that the cause of the explosion was the firing of a shot in No. 2 heading.

2527. In the face? Yes; and I have every reason to believe that that shot was overcharged.

2528. In the event of shots being tamped with dry coal-dust, would that constitute a danger in itself? A very great danger.

2529. Would fire be shot out? Yes; a considerable distance.

2530. Do you know anything of the behaviour of fine coal-dust in the presence of gas, such as you saw in No. 2 heading? Yes; it would be highly explosive, and it would have the effect of greatly aggravating the little fire-damp that may have been there if the fine dust suspended in the air ignited.

2531. Have you any doubt at all as to the situation of this explosion or of the causes? Not the slightest hesitation.

2532. Would the finding of the naked lamp last night in No. 2 heading cause you to alter your opinion? No; it has not altered it in any way; it only shows the carelessness of the men inside a heading; the finding of the lamp does not alter my opinion, which is that the shot fired in the heading lit the gas.

2533. Can you describe to us the course of the explosion so far as you have been able to ascertain? The gas ignited in No. 2 heading, the blast passed out of the heading, a part of it going through the stenton and passed down No. 1, and the flame extended into the bords as it passed along; the strongest portion of the force expended itself in and about No. 2 heading.

2534. Did you trace the course down No. 2 heading? I did.

2535. How did it go? In my opinion the main force of the blast went right down No. 2; in going down No. 2 it passed into the third bord above the tunnel and through the cut-through into the second bord; then through another cut-through into the first bord, and from the bord into No. 2 and downwards to the tunnel; it passed through the stopping marked "stopping out" on to No. 1 heading.

2536. *Mr. Neilson.*] It passed through the second bord, did it? No; it passed into No. 3 bord off No. 2 heading.

2537. *President.*] A portion of the blast passed through this stopping; then where did it go? Into the main engine road.

2538. What was the damage done on the diagonal road? The greatest force of the explosion after coming from Nos. 1 and 2 headings is exhibited on that flat to the head of No. 1; from the first cut-through on the left-hand side a horse and four boys had evidently been blown; they were found blown into the return away to the section marked by the letter A.

2539. Then a portion of the force passed into the tunnel? These stoppings Nos. 2, 3, 4, and 5 to the left of the main flat are all blown outwards; the door between 3 and 4 was carried away by the force of the blast; the force must have recoiled into the faces of Nos. 3 and 4 headings; there was a small fall in No. 3 opposite the first stenton, and there were some skips turned upside down; the force passed through into No. 4, and there another skip was upset, and in a bord off No. 4 a horse was lying about half-way to the face from the heading road; it then simply passed into the return.

2540. Did you notice two trains of skips, one empty and another loaded, along the flat between Nos. 2 and 3? Yes; the empties were telescoped into each other, the first two or three of the full skips were off the rails, but all the others were on; the empties were very much huddled together, but the full ones were not much damaged.

2541. The blast having arrived at the main tunnel you say it passed out? Yes.

2542. Did any portion of the force separate itself and go into the western? Yes; it separated itself here [*showing place on plan*], and the remaining portion passed through into the western and afterwards into the return.

2543. Would the large fall that occurred in the main tunnel road have had anything to do with it? It would have intensified and increased the shot.

2544. Can you explain how it was possible for the bodies found on the incline bank to be burnt? They may have been burnt by heated-dust, not by actual flame.

2545. Had the actual flame existed, would you have seen evidences of it on the props? Yes, I would; at a point 15 yards on the in-bye side of No. 2 heading I picked up two lines, and I found them still intact.

2546. Were they plumb-bob strings? Yes.

2547. Was that evidence that the destruction which was done to the stoppings and trains of skips was due to the force of the explosion without flame? Yes; force without flame.

2548. Have you ever heard of an explosion of gas in one position transmitting flame so that it exploded another reservoir at a distance, no gas intervening? Well, that depends on the distance one from the other.

2549. Could it be done on the supposition that the intervening distance was laden with dust? Oh, yes.

2550. Is there any limit to the length of flame that might be transmitted in a dust-laden atmosphere by an explosion of gas? The flame might extend for hundreds of yards.

2551. Would you consider Bulli a dusty mine? It is not a particularly dusty mine, but it is dusty.

2552. Is it a particularly dry mine? I never saw any water.

2553. Has the force of this explosion been confined to a comparatively small area of workings? Yes; to a very small area.

2554. Would that have any significance, in your opinion, with the great destruction of life which has occurred; and, notwithstanding this great destruction of life, are you still of opinion that not much gas exploded? There was not an explosion of much gas.

2555.

Mr.
A. Gardiner.
12 May, 1887.

2555. Can you account for such a destruction of human life from the explosion of a comparatively small quantity of gas? It surprises me that such a small quantity of gas should cause the loss of so many lives.
2556. Is it explained by the fact that the area of workings is limited? It is largely explained by that fact, and the assistance the explosion derived from coal-dust.
2557. As a mining engineer and manager would you consider it an evidence of good mining to work bords and headings off the intake and off the return at the same time? Not in fiery mines.
2558. For what reason? In the mining of fast headings giving off gas it would be desirable to return the foul air directly to the return, and not into any working bords.
2559. *Mr. Neilson.*] If there had been a large extent of workings on each side of Nos. 1 and 2 when the explosion took place, would that have been the means of intensifying or reducing the extent of the explosion? It would be the means of reducing it.
2560. In what way? Simply because the force would be expended sooner.
2561. It would come out with great force and quickness when confined in the heading? Like a ball out of a cannon.
2562. When the force of the explosion struck against the side of the main tunnel it spread itself in the two directions as you have indicated? Yes; had the workings been more expansive the force would have been dissipated in the larger area, and less damage would have been done.
2563. Within the circle marked B, do you know the first two bords off No. 2 heading which are not working? I do.
2564. Do you think that there is any possibility of any gas having accumulated in there? No.
2565. A witness has given the opinion that there was an accumulation of gas in these two disused bords? Such could not be the case, for this reason: had gas been in there, and exploded from the flame of the original explosion, one of its effects would be to knock out the stoppings in a different direction; whereas these stoppings connecting Nos. 1 and 2 headings are both in good order at the present moment.
2566. *President.*] You say the force would have come out of No. 2 heading as if out of a cannon? Just so.
2567. *Mr. Nielson.*] You say that no gas could accumulate on account of the way the bords were stowed? Yes.
2568. And the stoppings near these disused bords would have been blown out? Yes.
2569. Instead of which they are in good order? Yes.
2570. Now, there are two boards in the A circle of workings marked "fall;" do you think there is any probability of gas accumulating in these two disused bords? No; the same reason I gave in reference to the portion marked B holds good with these; the stoppings almost opposite the bords referred to are in good order, and the other near it is only slightly damaged.
2571. What would have become of these stoppings if gas had existed in the bords? They would have been blown out completely.
2572. You have examined these surrounding bords; how far away from the heading were they charred? Not very far; in some cases not above 15 or 20 yards, and in others a little further; but none of the props of the bords off the headings were charred in the faces.
2573. The inference of that is the fire went directly out? Yes; licking into the mouths of the boards as it passed.
2574. Were the timbers outside mostly charred? Yes, those directly in the course of explosion; those in the in-bye side seem to have come in contact with the flame about a foot from the roof.
2575. The man, Olsen, was found in the face of the fifth bord off No. 1 heading; was his hair burnt? I really could not say.
2576. Assuming that in these old workings between the Hill End section and the western on the western side of the dyke there was an accumulation of gas standing; is it possible that the increased force of the furnace occasioned it? There is a theory now given that the furnace has drawn that gas out; is it possible, do you think, for the increased power of the furnace to have done that? There was not a great force shown there; no gas could have existed there, for the skips near the door of the western were not greatly disturbed; I believe there was only one found off the rails; if there had been a second explosion, the effect of it would have undoubtedly been shown in the air-course, and no indications existed, for there is a good passage through there.
2577. Have you formed any idea where the force of the explosion terminated in the western? I think very little of the force went down to the faces of the western workings, and that it died very quickly as it went down.
2578. What killed the men? After-damp, or gases generated by the explosion.
2579. Have you any idea as to what way the men have been requested to fire shots in these places? No.
2580. In reference to these heading faces being bratticed, what is the usual way of bringing air into these workings, and do you think there was any danger in working the bords off the headings with naked lights? There was plenty of air there to render it safe, provided there was no great quantity of gas being given off.
2581. Supposing these places were bratticed, and the gas diluted as it was given off, would there be any danger to work outside with naked lights? No.
2582. *Mr. Hilton.*] Have you measured the distance of these bords from the headings? Yes; from an actual survey.
2583. Would you give us the measurements? I have marked them all on the plan; if you will point out any one you refer to I will give you the distance.
2584. What is the distance of No. 3 heading face from the last stenton? 120 feet.
2585. What is the distance of No. 4 heading face from the last stenton? 70 feet.
2586. Will you point out to me the return airway from the western workings to the furnace? [*Airway pointed out on the colliery plan.*]
2587. Did you travel it? No.
2588. Why not? I had no instructions to do so.
2589. I suppose that you will be well aware that the return airway from the western workings to the furnace and from the Hill End district ought to constitute a part of the plan in connection with this disaster? It is not for me to say what should constitute the plan; I was instructed by the President of the Commission to prepare the plan.
2590. You have been asked your opinion on certain matters, and I wish to get your opinion on this; I now ask you again, do you think that the return airway from the western working to the furnace and from

- Mr. A. Gardiner.
12 May, 1887.
- from the Hill End district to the furnace should not constitute a portion of the plan in connection with the disaster? No.
2591. Why? Because there was no damage done there, and the blast was not fired at the furnace.
2592. Have you travelled the return airway from the western workings to the furnace? No; I have not.
2593. Have you travelled the return airway from the Hill End district to the furnace? No.
2594. Do you think you can travel it? Yes.
2595. Are you sure the airway is open? Yes.
2596. Are you positively sure? Yes.
2597. How long has it been open? All the time I have been visiting the colliery it has been open.
2598. Are you positively sure? Positively sure.
2599. How long ago is it since you first visited the mine? On the 25th of March, the second day after the explosion.
2600. And you say that the western return airway, right from the workings to the furnace, and the Hill End return airway to the furnace, have been in a state to be travelled since the second day after the explosion? I did not say that; I say that the airways are open.
2601. I asked whether it was open so that a person could travel through it, and I understood you to say that it was? I did not say that.
2602. Do you know whether the western return airway can be travelled? Of my own knowledge I cannot say that it can be travelled.
2603. You said to me a short time ago that it could be travelled? Yes; and I believe I could travel it.
2604. But that is simply a matter of opinion? No; I know it is open, because I measured 84,000 cubic feet of air per minute coming across it.
2605. Is it open so that you can travel it? I believe I could, but I never attempted it.
2606. Do you think it is a proper travelling way in the ordinary sense of the term? Not having travelled it I could not say.
2607. *Mr. Owens.*] Did I understand you to say that the men found on the incline top were singed, and that you could not account for the bodies being singed? I do not say that they were singed.
2608. Or did you say that the only way you could account for it was by the heated coal-dust; if it was hot enough to singe the hair would it not be hot enough to singe the bark on the props? I did not use the word "singe," but you might have heated air of sufficient temperature to cause singeing, for instance, you do not put flame into a baker's oven for the purpose of baking bread, nevertheless you can roast things in it.
2609. If the heated air was sufficient to singe the bodies, would it not show on the bark? I did not notice the bodies, and I cannot say they were burnt; they were taken out before I got there; there were no signs of burning on the props.
2610. Would not the heated air have a burning effect on this fine bark? It has not had any effect, for I have given proof of it by production of the bark.
2611. You are not sure whether the bodies found there were burnt or not? I did not see them; I do not know of my own knowledge that they were burnt.
2612. Where did you find the lamp? In No. 2 heading.
2613. Did you come to the conclusion that it was used in the heading? I think it is very suspicious, and that it was probably used in the heading.
2614. Don't you think that it could have been blown there? No.
2615. Why? There were no naked lamps used about there.
2616. You have heard of the practice of hanging lamps on the danger-board, don't you think it could have been carried in the heading by the recoil of the explosion? We got one of the lamps on the danger-board, and in No. 2 heading the danger-board prop had been blown down, and several lamps have been picked up there.
2617. Perhaps the wheeler had a spare lamp? Quite possible.
2618. And it might have been blown in, is that not possible? Possible, but not likely.
2619. *President.*] How many yards distant was the lamp from the danger-board? About 26 yards.
2620. *Mr. Jones.*] In making your survey what was the distance of the longest bord in No. 2 heading from the cut-through? 126 feet or 42 yards.
2621. Was that distance a violation of the Coal Mines Act? Yes.
2622. You said that in examining the timber in the bords off Nos. 1 and 2 headings you found little or no evidence of charring on the props? I said that the charring did not extend to the working faces.
2623. Was that owing to the distance of the cut-throughs? Well, I don't think it was.
2624. Did you not observe that the blast generally went as far as the cut-through from bord to bord? No; in the bords off No. 1 it did not go as far as the cut-throughs.
2625. Was there a cut-through in the first bord off No. 1 heading? There are three cut-throughs in the heading altogether.
2626. Did not the blast follow the cut-throughs from bord to bord? In No. 2 heading it did, but not in No. 1.
2627. You said you found the caution-board opposite the last stenton? Yes.
2628. Do you think that was a measure of safety to allow the danger-board so near whereby a naked light could approach so near the heading? I think it was the proper place for it.
2629. Would it not be better and safer to have had the caution-board further back? Well, seeing that there was a stenton here giving a large current of air, the caution-board was placed right in the air current.
2630. You have already said it would have been better if the headings had been bratticed? Yes.
2631. In the absence of that bratticing would it not be better if the caution-board was placed further back, and thereby not allow naked lights to approach so near? No doubt the further the board was back the safer it would be if gas was in the heading.
2632. Have you not found gas on every occasion you have been in these two headings? Yes; every time I have been down.
2633. *Mr. Clarke.*] Do you think it was prudent to fire shots in these headings in the absence of an air current or bratticing? No; not in the presence of gas.
2634. *Mr. Croudace.*] Can you tell me whether the main tunnel is rising or dipping here [*showing place on*

on the plan]? It is very flat along there, but there is a decline from this place to that [*places marked*]; but in the place you refer to it seems to be very flat.

2635. Are you sure that it is not falling? I could not say exactly.

2636. Are these headings Nos. 1, 2, 3, and 4 dipping? They seem to rise toward the place.

2637. Commencing at the tunnel mouth where the large fall exists, and where you noticed signs of carbonised coal-dust, did you notice whether the dust was thrown in-bye as well as out-bye against the props? At the point where I got the dust from 120 to 150 yards from the tunnel mouth it was on the in-bye side of the props.

2638. Which side of the main fall was that? On the out-bye side of the fall.

2639. On the out-bye side of the fall the signs were on the in-bye side of the props? Yes; the dust was lying against the wall as there were no props there. I did not examine any of the props particularly near there; but at a point which is marked on the plan, I believe the President took some dust from the in-byeside, and the props from which these samples were taken by the President from two different points are marked on the plan.

2640. Are they marked on the in-bye side or out-bye side? I believe they are marked both sides as the dust, I think, was taken from the in-bye side and out-bye side of the timber.

2641. This being a gassy mine, and safety-lamps being used in the Hill End section, do you consider it prudent or safe to allow the lamps to be unlocked? No; all the lamps ought to have been locked.

2642. Do you consider it a prudent or safe thing for any man under any circumstances to tilt his lamp with a view of lighting the touch to fire the shot? No, certainly not, I do not approve of it.

2643. Do you think by so doing the flame could possibly come outside the gauze and ignite the gas? Yes; if a man held the lamp horizontally or in a sliding position any length of time the flame would come through, and consequently light the gas outside the gauze of the lamp.

2644. And that would be wrong? Certainly.

2645. Supposing I told you that we had evidence that more than one man has worked with a safety-lamp, the principal gauze of which was burnt away, and that he continued to use that lamp in this fiery district, what would you think about that? He might just as well have had an open light.

2646. You would not credit such a thing? No; I never heard of such a thing.

2647. Would you consider it safe in gas to fire a shot with fuse? I do not consider it safe to fire shots at all in the presence of fire-damp.

2648. You would not consider it safe to use a needle and squib? Certainly not.

2649. Is it quite unsafe? Yes.

2650. As a matter of fact do you think that shots should not be fired at all where there is the slightest trace of gas? No; but where it is absolutely necessary. The shots should be fired at night by qualified men, as at home.

2651. These heading lines that you have referred to, and which I have seen, did you carefully examine them to see whether they were burnt? Yes; they were small lines, like fishing lines, and were not burnt by the flame.

2652. And that you take as proof that no flame or body of ignited gas had gone outwards? It had not been there, for if the flame had gone outwards it would have undoubtedly consumed these lines.

2653. There were four bodies and a horse discovered here [*marking the place*], and it was thought that the explosion had gathered fresh force from gas existing in the old workings, do you think there is the slightest cause to lead you to believe that was the case? There is not the slightest indication. I have no hesitation in saying that I marked the position of these skips, and I think it is one of a number of evidences that the flame was not carried a great distance outwards. The horse found there has been smashed against the corner of that pillar [*place marked*].

2654. Realising all the gas which you have seen here and the effects found in Nos. 1, 2, 3, and 4 headings and in the western, do you think these effects were caused by any large amount of gas? No; I do not think there was an explosion of a large amount of gas.

2655. Taking the extent or area of this Hill End district, independent of the old workings, which are completely severed by this dyke, does it not represent really a very small area of workings? Very limited area. I have measured this area in one straight line, and I think all these headings and bords would form a straight line area of (say) 62 chains.

2656. In that case, supposing gas to be exploded in the inmost end, where it was known to exist, did it not extend over a small area, and has not the destruction been somewhat limited? Yes; it came out just like out of a gun.

2657. Now, coming to the ventilation of this mine, did you notice the door placed at the western district? Yes, there was a regulating door there, but it is not there now; it was so regulated as to allow a certain quantity of air to go into the western, forming up to Nos. 1 and 2 headings.

2658. There is a door between them? Yes.

2659. And another door between Nos. 3 and 4 headings? Yes.

2660. And one at the diagonal road? Yes.

2661. Would these doors better serve their purposes if they were doubled? If they had been doubled on the main tunnel the distance would be too short to allow a set of skips to pass through; if the distance had been greater it would enable two doors to be put in and one could be opened while the other was shut.

2662. If a trapper boy had always been kept at the door would you consider that a sufficient safeguard? Yes.

2663. Was it the utmost care that could be taken at this particular place? Yes; and the trapper boy must see that the door was always closed immediately the set passed through.

2664. Have you measured the air? Yes; repeatedly.

2665. Can you give me any idea of the quantity of air going from the western district up to the furnace? Yes; I have measured it very frequently. On the 25th, when I first measured it, the return air coming from the western to the furnace was 44,290 cubic feet per minute at 11 a.m. the same morning. At the same time the return from the Hill End district was 37,410 cubic feet per minute.

2666. That is the return air; do you know the quantity that was going into each district? The western intake at the time we got in that day was 10,200 cubic feet per minute, and the Hill End intake was 14,000 cubic feet per minute.

2667. Can you tell me the number of men that were employed in those districts? I was told that there were

Mr.
A. Gardiner.
12 May, 1887.

Mr.
A. Gardiner.
12 May, 1887.

- were between forty and fifty men and boys in the Hill End district and about twenty in the western.
2668. The total number of men and boys killed in the mine was eighty-one? Yes.
2669. How many horses were killed? Five.
2670. So, eighty-six men, boys, and horses would represent the number in these two districts for which you have altogether over 24,000 cubic feet of air per minute going in? Yes.
2671. Equal to 300 cubic feet per man? Yes.
2672. And that is three times the amount required by the Coal Mine Regulation Act? Yes.
2673. Taking these figures of the quantity of air which existed after the accident, would it not likely be more previous to the accident? Certainly there would be, as the conditions of the stoppings and the falls which occurred were all damaging to the intake air.
2674. In taking these quantities we are taking an adverse state of matters? Yes; adverse to what would be the case previous to the explosion.
2675. And we have three times the quantity required by the Act? Yes.
2676. Supposing the western district return airway to be stopped up, do you think it could be so stopped up as to prevent you from getting a large quantity of air? No.
2677. It is open enough now to admit three times the required quantity of air? Yes.
2678. Whether you have travelled it or not? Yes. I have been down the return of the Hill End district and passed the western, and searching for the body of a man named Wilson. We went down some 300 yards to the south-western main road, and we got on the top of a large fall. Although we did not go over it, there was a good space left for the admission of air. One large fall was 3 or 4 feet high, and I understood from the overman, White, that on the day of the explosion he was up there, and that he had previously made an appointment with Wilson to come down on the other side of the fall and to give a shout. That was about the time the explosion occurred.
2679. Whether you have travelled the airway or not, are you perfectly satisfied that there is area enough to admit under adverse circumstances three times the quantity of air required by the Act? Yes.
2680. You stated that the bodies might have been affected by heated air? Yes.
2681. Which would be the most sensitive to the effect of heated air or dust, the delicate skin of a human body, or inorganic substance such as the bark of a tree? The human skin, I think.
2682. Well, might these bodies, or the hair on those bodies, have been affected by excessive heat, and leave the bark of the timber unaffected? Yes.
2683. *Mr. Owens.*] You think it very inadvisable to take a lamp into these headings with the top gauze burnt off. Well, what do you think of a deputy that would allow such a state of things to exist? He was not doing his duty.
2684. And he ought to have provided a new gauze if the man working with the lamp asked him to do so? Yes, or send the man home.
2685. And such a man should not be a deputy? No, or anything else. [*The witness withdrew.*]

FRIDAY, 13 MAY, 1887.

Present:

DR. ROBERTSON, PRESIDENT.

MR. O'MALLEY CLARKE,
MR. NEILSON,
MR. OWENS,

MR. CROUDACE,
MR. JONES,
MR. HILTON.

Thomas Bissell sworn and examined:—

Mr.
T. Bissell.
13 May, 1887.

2686. *President.*] What is your occupation? I am a miner and engine-driver.
2687. In what capacity were you employed in the Bulli mine on the day of the accident? I was working in the blacksmith's shop on that day.
2688. How far is the blacksmith's shop from the mouth of the tunnel? About 150 yards.
2689. How were you apprised of the accident? The noise caused by the explosion drew my attention that way. It was a loud rumbling sound, as if a runaway set was coming down the incline. I thought it was that at first; but on looking towards the tunnel I saw smoke rising up to a height of about 100 feet.
2690. It came out of the mouth of the tunnel? Yes; smoke and dust.
2691. Was that repeated? I cannot say that it was.
2692. You did not observe two ejections of smoke? No.
2693. What did you then do? I went to Bulli to tell the clerk of what had happened.
2694. What did you think had happened? My impression was that the gas had fired. On returning I entered the mine.
2695. Tell us what you did on entering the mine? I went to the main heading first, and after going up about 10 or 12 chains I found the road entirely blocked by a fall. The roof was down, and the timber was lying across. There were others there then. I went through a cross-cut and entered what is known as the horse road.
2696. Between the grip and the main tunnel? Yes; I went no further on that occasion. Later on in the day I went in again as far as the big fall, beyond the western heading.
2697. What o'clock was that? I think it was about 11 o'clock at night, and I worked there clearing away the fall till the morning.
2698. When you first went to the western was the ventilation in a defective state? Yes; it was burdensome to work there.
2699. Did you detect any after-damp? I cannot say that I did.
2700. As you cleared the fall the ventilation improved, I suppose? Yes.
2701. Were you one of those who went into the workings to recover the bodies? I went into the workings on Saturday evening, with about nine or ten others, into the western.
2702. With what object? It was supposed that a man named Wilson was still in the mine, and I went into his working-place.
- 2703.

Mr.
T. Bissell.
13 May, 1887.

2703. To search for him. Did you find him? No.
 2704. You did not go into the Hill End district? Not at that time. I did a few days afterwards.
 2705. With what object? We went through to have a look at the mine.
 2706. Who accompanied you? A man named James Charlton.
 2707. You went in out of curiosity? Well we had been in the mine several times, and knowing that it was supposed a man was still left in the mine we thought it would be no harm to go in with safety-lamps. We went up the Hill End beyond the last stenton, between Nos. 1 and 2, towards the face.
 2708. Did you see a skip there? Yes.
 2709. Did you examine the mine for the purpose of arriving at a conclusion as to the cause of the accident, or did you see anything that led you to form an opinion? I believe there was an explosion of carburetted hydrogen.
 2710. Why did you form that opinion? Because of the presence of gas and the wreckage.
 2711. Anything more? I saw the bodies.
 2712. What did you notice with regard to the bodies? Some of them had no hair on their heads.
 2713. Did you examine the state of the mine, or the props, for any evidences of actual fire? I cannot say that I examined the props.
 2714. You did not make a minute examination then? No.
 2715. Still, the conclusion you arrived at, for some reason or other, was that an explosion had taken place? Decidedly.
 2716. Do you wish to state anything further in regard to the accident? Well, I noticed that it was an exceedingly favourable day for an explosion. There was a sudden change in the weather, from a heavy to a light atmosphere, and knowing that atmospheric pressure has a great deal to do with the action of explosive gas, I came to that conclusion.
 2717. *Mr. Neilson.*] When were you last in the mine? I think that was the last occasion when I was in with Charlton? I do not remember going into the mine since then. I know I was in with Mr. Jones, manager of North Illawarra.
 2718. Had you permission to go in? Yes.
 2719. *Mr. Hilton.*] Were you at the furnace on the day of the disaster? No.
 2720. From what you saw of the state of the mine, do you think it would require a large amount of gas to cause the destruction you saw? Yes.
 2721. Have you ever had any experience of the effects of an explosion previous to the Bulli accident? No.
 2722. Then how do you form an opinion that it would require a large amount of gas to cause the destruction? I think it must have been a terrific explosion to reach so far from the place where it originated.
 2723. *Mr. Jones.*] Were you employed in the capacity of engine-driver at the time of the explosion? No.
 2724. Did you ever hear the workmen speak or refer to the probabilities of an explosion at Bulli mine? Casually I have heard the men talk about that kind of thing.
 2725. When you saw or heard that noise you speak of did it surprise you in any way? Yes.
 2726. Was it from conversations, or previous reports, that you apprehended it was an explosion? My impression was that it was an explosion.
 2727. You say the bodies you saw showed signs of burning? Yes.
 2728. Are you sure that they were burnt? That is my impression; one that I helped to carry out bore every evidence of being burnt.
 2729. You say the men had no hair on their heads—I suppose you mean it was burnt off. Is that the part, the hair, that you would expect to show principal traces of burning? Decidedly.
 2730. *Mr. Clarke.*] Were you employed in the mine during the strike? A little in the mine.
 2731. In what part of the mine? At the new furnace.
 2732. What was the ventilation like during the strike? I was only there while the new furnace was started. I cannot say about the ventilation there afterwards.
 2733. Is the new furnace an improvement on the old one? It is almost identical with the old one—the same pattern.
 2734. Would it increase the ventilation of the mine? That would depend upon circumstances.
 2735. You do not know? Well, it should improve the ventilation.
 2736. *Mr. Croudace.*] You say you noticed a great change in the weather between the morning and the afternoon? It was a very hot day, the 23rd of March.
 2737. You described the change taking place, I understood? I mean that the day the explosion took place was an excessively hot day as compared with days previous to that.
 2738. You had a knowledge of the old furnace? Yes.
 2739. Can you tell me which has the greatest motive column, or, in other words, which has the greatest power, the old or the new furnace? The new furnace is the most powerful.
 2740. Then the new furnace would be much better than the old? Yes.
 2741. *Mr. Jones.*] Did you hear any of the officials speaking as to the change of weather and its effects? No; I knew that from my own study.
 2742. Can you tell us what was the temperature on the day of the disaster? No, I cannot; but we were all remarking how very hot it was. It certainly was a very hot day. [*The witness withdrew.*]

Albert Smithers sworn and examined:—

2743. *President.*] What occupation do you follow? I am a miner, residing at Bulli.
 2744. Were you engaged at the Bulli mine on the date of the accident? Yes.
 2745. In what part of the mine were you engaged? In No. 3 heading—the gassy section.
 2746. How long were you engaged in that section? I worked about thirteen shifts since the strike.
 2747. And before that, how long? Ever since the gas was found.
 2748. That is ever since they pierced the dyke? Yes.
 2749. Were you one of those who went into the mine after the accident? Yes.
 2750. Immediately after? Yes; but I did not go very far in.
 2751. Were you one of those who were employed getting out the bodies? Yes.
 2752. Were you among the first to go up No. 1 heading after the accident? No.

Mr.
A. Smithers.
13 May, 1887.

2753.

- Mr. A. Smithers. 2753. Were the bodies out of that heading? No; I carried the first body out.
 2754. Did you go with others to examine the heading, that is, inspect the condition of the workings? No; not in that heading.
 13 May, 1887. 2755. Did you examine No. 2 heading? No.
 2756. Did you work in Nos. 1 and 2 headings before the strike? Yes.
 2757. Did you find any gas given off there? Yes.
 2758. Was it given off very abundantly as you approached the roll? Yes.
 2759. Was it confined to the roll or did it exude from the coal? There was gas more or less all the time in the headings.
 2760. Did the bords off the heading give off gas? Yes.
 2761. Have you been into these bords since the accident? No.
 2762. Have you worked in any other mine besides Bulli? I have worked at Mount Pleasant.
 2763. Have you worked in any other—in fiery mines? No.
 2764. Then you had no experience of gas or fire-damp before you went to Bulli? No.
 2765. And you never saw an explosion, or the effects produced by an explosion, previous to that at Bulli? No.
 2766. Before the strike, had you gas in Nos. 3 and 4 headings? I do not know.
 2767. Did not you work in these before the strike? No; I worked in Nos. 1 and 2 headings.
 2768. But since the strike, I understand you worked in No. 3 heading? Yes.
 2769. Did you observe any gas there? No.
 2770. You are quite certain of that? Yes.
 2771. Did you ever complain to the deputy or management as to the quantity of gas, or of your being made to conduct operations in the presence of gas before the strike? Yes.
 2772. To whom did you complain? To Mr. White and Mr. Crawford.
 2773. What was the nature of your complaint? We complained on account of there being so much gas, and on one occasion Jackson went out and fetched Mr. White in about 9 o'clock. He (Mr. White) came in with two safety-lamps.
 2774. Was that the first time you found the gas? Yes; and one of those lamps had a hole in the top.
 2775. How long ago was that? That was when we first struck gas—about eighteen months or two years ago.
 2776. Yes, but come to the time immediately before the strike? Well, on the Friday night before we came out on strike I was prevented, by White and Crawford both, from working in No. 1 owing to the accumulation of gas.
 2777. Well, was that wrong—did you complain of that? I made a complaint on that very day. I was on night-shift then.
 2778. But was that what you refer to as the subject of a complaint, that Crawford and White took you out of the heading on account of gas; I asked you first whether you had complained about the mode of conducting the workings and you said “yes,” and explained that at that time the Hill End section was opening up; I then asked you whether you had complained to Crawford since; that being so long ago, and you said that “on Friday before the strike you complained”; but on interrogation I found that you did not complain, but that, from motives of safety, they asked you not to work—is not that so? They did not ask me until I pointed out it was not safe to work there. There was a blower there you could hear hissing for a hundred yards.
 2779. But they were actuated by consideration for your safety in asking you not to work there? Yes; then they were, no doubt.
 2780. Then since the strike, have you had any occasion to complain, or have you made any complaint to the management? No; I do not know that I have, except that I pointed out to Millwood one day that we had gone beyond the distance from air required by the Act.
 2781. Since the strike—that is, since the new furnace was erected—was there a material improvement in the ventilation? There was in the main airway; but it was not improved much in the face.
 2782. What was the reason of that? Well, there was no brattice.
 2783. Was there any brattice before the strike? Yes; about 30 yards.
 2784. Where was that? From the dyke into the gassy section.
 2785. How long was that before the strike? When it was first struck.
 2786. That, you say, was two years ago; I am asking about the time immediately before the strike? There was none that I know of.
 2787. Then there was no brattice before the strike? No.
 2788. Had brattice been put up to the face after the strike, would the ventilating current have been much stronger? Yes; certainly.
 2789. Would that be on account of the greater force and power that the new furnace exercised for ventilation? Yes, but the furnace would not do it unless the air was carried to the face.
 2790. Well, would that have been due to the greater power exercised by the furnace? I do not understand you.
 2791. I am endeavouring to put it clearly to you—would the ventilating current have been stronger than before the strike if the brattice had been carried up to the face? Yes.
 2792. Then I ask, would that greater current be due to the new furnace? Yes.
 2793. Have you ever worked in any other mines than Bulli and Mount Pleasant? No.
 2794. Then your experience is entirely limited to Mount Pleasant and Bulli? Yes.
 2795. Did you ever fire any shots before the strike? Yes.
 2796. In Nos. 1 and 2 headings? Yes.
 2797. What method did you adopt? We fired the shots with touch-paper.
 2798. And how did you light the touch-paper? Through the gauze of the lamp.
 2799. Having no previous experience did it ever occur to you whether that was a safe practice or not? Well, I saw practical men do it, and I reckoned therefore it was quite safe.
 2800. That is, I suppose you knew nothing to the contrary? No.
 2801. How did you stam the shots as a rule? With clay.
 2802. Did you never stam with small coal? No.
 2803. Before firing the shots did you make any attempt to drive out the gas? Yes.
 2804. Did you always take that precaution? Yes.

2805. And if gas still existed, did you fire the shots? No; we brushed it out clean before we fired them.
2806. Did you use fuse? Yes, when we were working on our own account. We used the squib in the Company's employ.
2807. Do you know whether it was safe in the presence of gas to use fuse? I do not think there could be anything safer.
2808. That is to say you know nothing to the contrary? No.
2809. You have had no experience of any other mode of firing shots? No.
2810. *Mr. Neilson.*] In reporting this matter about the gas the night before the strike, did you think you were doing anything more than your duty;—do you know that when you find gas in the mine, or discover danger, it is your duty to report to the officials at once? Yes, if I considered it was not safe to work.
2811. In this case you did not consider it safe to work, and you reported it accordingly? Yes.
2812. That is, you did your duty—and what did they do? They brought us out.
2813. You say you swept out the gas? Not that night.
2814. In what heading was it? No. 1 and No. 2.
2815. In firing the shots, what length of fuse did you use as a rule? It would be according to the depth of the shot—about 3 feet.
2816. That would take about two and a half minutes to run before the shot went off? Yes.
2817. Was there any danger of the gas being swept back to the face before the shot went off? It might be so; but I was justified in firing a shot when I was given a piece of canvas for the purpose.
2818. Who gave you the canvas? Crawford, the deputy.
2819. *Mr. Hilton.*] You say you always drove out the gas in No. 1 and No. 2 heading? Yes.
2820. How long did it take for the gas to get back after you had driven it away? I cannot say.
2821. Did it ever return again after you had driven it away—I mean within a short time? Yes; it took fire on one occasion.
2822. Can you not give us some notion as to how long it would be after firing a shot when the gas would accumulate again? Well, after brushing the gas back I would light the shot, and I would not go in again directly the shot was fired.
2823. How long would you wait? Well, it might be 10 minutes.
2824. Would there be any gas in the place on your return? I cannot say.
2825. You never took any notice? No.
2826. *Mr. Owens.*] Did you work in any other part of the mine than the Hill End district? Yes; I worked in the grip, and a part they call Darlington.
2827. Did you work in the western district? No.
2828. Did you hear of any one finding gas there? No.
2829. You say that the deputy told you to fire the shots in this manner, that is, with touch-paper? Yes.
2830. And you considered that whatever the deputy told you to do was right? Certainly.
2831. Did you find gas in other parts than Nos. 1 and 2 headings—did you find any in No. 3, for example? No.
2832. Did you find any in Nos. 5 or 6? In No. 5 there was on the Tuesday before the explosion.
2833. How much gas was there? It extended about 2 yards from the face.
2834. Did you report that to the deputy? No; I was on the night-shift at the time.
2835. Did not your mates report it? No; because it was about 12 o'clock when we left that night, and we had not the chance.
2836. Is there any rule that would prevent you from doing it—you know No. 6 rule? Yes; that rule says I shall not interfere with the management in any way.
2837. Do you consider the correct interpretation of this rule prevents you from reporting any danger in the mine? Yes, I do.
2838. And therefore you did not report it? Yes; I had not a chance, any way.
2839. Supposing you had had a chance? I should not have reported it.
2840. Would that be on account of this rule? Yes, and another thing, I had no business to go in there.
2841. Were you not working there? No; I was working in No. 3 at the time; I went there for a dirt skip.
2842. And you found gas there? Yes.
2843. Do you know whether the deputy was aware of the existence of this gas? I think he was.
2844. During the time you were working in that place, did you see the Government Inspector in there? Not since the strike.
2845. Did you ever report the presence of gas to the inspector? No.
2846. Why did you not? I do not know.
2847. Was your lamp locked while you were working amongst this gas? Sometimes it was, and sometimes it was not.
2848. Who would lock them? Crawford, the deputy.
2849. That was before the strike? Yes.
2850. Crawford was not there after the strike? No.
2851. *Mr. Jones.*] Who was the deputy after the strike? Millwood.
2852. Did he lock the lamps? No.
2853. You are quite sure of that? Yes, quite sure.
2854. Did you ever receive a copy of these rules (referring to "General and Special Rules of the Colliery")? I do not recollect having received a copy.
2855. Would you try and recall to your mind whether you did at any time? No, I could not; it is over ten years since I first started in the mine, and I do not recollect ever having received a copy.
2856. Did you work with naked lights after the strike? Yes.
2857. Do you think that a wise proceeding—to allow naked lights in proximity to a large quantity of explosive gas? No.
2858. You say you have seen and heard of blowers in Nos. 1 and 2 headings? Yes.
2859. Did you report that? Yes.
2860. To whom did you report it? To Millwood and Crawford.
2861. What steps did they take to remedy it? None.
2862. Did you suggest the propriety of bratticing this place? No.
2863. Do you think it would have been wise to brattice this place? I do.

Mr.
A. Smithers.
13 May, 1887.

Mr.
A. Smithers.
13 May, 1887.

2864. You say that on one occasion you were some few yards before the air? Yes; that was since the strike.
2865. Was that in a bord or in a heading? It was in No. 3 heading.
2866. Did you complain? I spoke to Millwood about it.
2867. What did he say? Well, we were on a fault at the time, and he said that we would have to get over the fault first.
2868. Do you remember the particular day you spoke to White about this blower you have spoken of? One was at the very commencement of the gassy section; it was left standing there for a week blowing.
2869. *President.*] Have you complained since? No; there was no need to; he could see them as well as I could.
2870. *Mr. Jones.*] Was there any one in charge of the mine during the night-shift? No.
2871. Consequently you had no one to complain to without going out of your course? No.
2872. *Mr. Clarke.*] How many reports did you make to the overman or deputy that were not attended to during the time you worked in Nos. 1 and 2 headings? I cannot tell.
2873. You have said that you made general reports, and that no action was taken;—do you not know how many reports you made? Well, when the overman would come in we would show him the gas, and complain about it; it might be once a week. I would not swear how many times.
2874. Did he make any remark on these occasions? He told us to be careful. He told us on one occasion to work with our shirts on, to prevent getting hurt if anything happened.
2875. How long was this before the strike? A good while.
2876. Did you ever hear of a pipe being fixed to a blower? Yes, in No. 2 heading.
2877. Who put it there? Crawford, I believe.
2878. For what purpose? I do not know of any purpose. He put it there to show the manager, I thought.
2879. Did he say why he put it there? He never said so to me. I heard that he put it there to show the manager that there was gas there.
2880. Did the manager see it? Yes, I believe so, both the manager and the overman.
2881. How long was the pipe fixed to this blower? I think it was there till the commencement of the strike.
2882. It was there when you left the mine? Yes.
2883. Now, with reference to this No. 6 rule you take exception to—you say it debars you from making a report to the management. How do you make out it would be an interference by workmen to report the presence of gas? I will read the rule to you; it says:—
“Interference by employees.—Any employee interfering in any way with the orders issued by the colliery manager or his overman, for regulating the work of the mine, shall be liable to dismissal without notice.”
- That is plain enough—“interfering in any way with the orders issued by the manager.” How would you interfere with the orders issued if you were to report any existing evil or danger? Well, that is what the deputy is for.
2884. Oh, yes; but you said just now that you would not have reported any danger, because this rule prohibited you from doing so. How do you make that out? Because it says we are not to interfere with the orders of the management.
2885. Would the orders of the manager be to blow the mine up? No.
2886. Or to have gas in dangerous quantities—that would not be the order of the management? No; but there was a manager there to look after it.
2887. That is another thing altogether. You say you were prohibited from reporting danger because of the existence of this rule;—can you explain that in any way? Well, I considered that when I signed those rules I signed all my “say” away.
2888. Can you say you would be interfering with the orders of the management by reporting the existence of great danger to yourself and brother workmen, and the mine generally? I do not know that I would.
2889. Then why did not you say so before—why mislead people in any way? I did not intend to.
2890. *Mr. Croudace.*] In answer to a question by Mr. Jones, you said that Millwood never locked your lamps? Yes.
2891. Was that on the night or the day shift? The night-shift.
2892. Are you quite sure that is the case? Yes.
2893. Your name is Albert Smithers, and you gave sworn testimony at the inquest. Did you not swear this: “On Monday night, when we first started after the strike, we went to the cabin for our lamps, and Millwood handed us our lamps locked. Richards said to him, ‘What are we to do if we get in the dark,’ and Millwood said, ‘I will leave the key’; afterwards he said, ‘It is no use locking the lamps and leaving the key,’ so he unlocked the lamps, and never locked the lamps afterwards.” Is that practically your sworn evidence at the inquest? I believe it is.
2894. What are we to understand from this. In answer to one of the Commissioners you said Millwood never locked your lamps; and yet you have sworn that he did, and that at your request he unlocked them? Not at my request.
2895. Did he at the request of others? Yes; Richards. We never went to work with locked lamps.
2896. You have stated that you have no knowledge of gas? Yes.
2897. Have you any knowledge of the ventilation of a mine in any shape or form? Only from what I have heard them say.
2898. Then, of your own knowledge of gas, or the laws that regulate gassy mines, and the ventilation thereof? No.
2899. *President.*] You have said you thought you were signing away your liberty, and you would not report the presence of gas on account of a rule which you have since explained away. On that point I wish to put one question to you. Did you ever ask the management if it would be a breach of this rule if you were to report, in order to get a proper interpretation of this rule and its import? No.
2900. Did it never enter your head to put a question to Mr. Ross whether in the event of your reporting danger it would be considered a breach of the rules? No.

2901. *Mr. Jones.*] I understand that at the time of your resuming work the lamps were locked, but that deputy Millwood was quite willing to leave the key? Yes.
2902. Now, what was the difference between leaving an open lamp and a locked lamp with the key—were they not virtually the same? Yes.
2903. *Mr. Owens.*] Assuming you are working in a place with safety-lamps, do you think a prudent overman would allow you to go in with unlocked lamps, even at your own request? No; it was a breach of the rule.
2904. *Mr. Hilton.*] Did Millwood make the proposition to go in with the lamps unlocked? Well, he said it was no use locking the lamps and leaving the key.
2905. *Mr. Croudace.*] In the first part of your examination you said that a lamp was brought in to you with a hole in the top? Yes.
2906. Who brought that lamp in? I suppose it would be Mr. White.
2907. Did Mr. White himself fetch it in? I will not swear that.
2908. What part of the top was broken? The gauze.
2909. Did you see it when it was brought in? No.
2910. You did not notice it till some time afterwards? Not till he went away.
2911. Did you put it out of work? Yes; I gave it to the deputy next day.
2912. Can you tell me who was the lampman? Crawford.
2913. Did you consider it was a prudent act, Crawford giving you such a lamp? No, certainly, if he knew about it.
2914. Should he have known about it? Yes; I should think so.
2915. Should he have ascertained, as deputy of the mine, that the lamps were perfect in all respects? Yes.
2916. And knowing that, was he not, in your opinion, an imprudent man to give you a broken lamp? Certainly. [*The witness withdrew.*]

Mr.
A. Smithers.
13 May, 1887.

Thomas Morgan sworn and examined:—

2917. *President.*] What is your occupation? I am a wheeler, working at Bulli.
2918. Were you a wheeler prior to the date of the accident in the mine? Yes.
2919. In what district? The Hill End district.
2920. What roads did you attend? Nos. 1 and 2 headings.
2921. Were you engaged during the night or the day? During the night.
2922. Did you know that gas was given off in these headings—fire-damp? Yes; I have heard of it.
2923. You know what gas is? I have seen it in Bulli.
2924. Did you work with a safety-lamp? No.
2925. How long have you been aware that gas was given off in these headings? I knew it before the strike took place.
2926. How far did you go with the skips beyond the danger-board? I went in to fetch the full skip out from the face.
2927. You know the object of the danger-board? Yes, for stopping the people from passing with a naked light.
2928. Did you ever pass with a naked light? No.
2929. Where did you hang your lamp? Outside on the prop, sometimes I put it on the ground.
2930. Did you ever see the gas ignited in any of these headings? Yes; I saw it ignited off a shot there one night.
2931. Where were you when the shot went off? I was going into No. 1 heading, and it ignited in No. 2 heading.
2932. When was that? A week before the explosion.
2933. That is since the strike? Yes.
2934. Had they got the roll in the heading at that time? No; I do not think they had.
2935. Where did the flame extend to? It just blazed up the side.
2936. How did you happen to see that? I went in with an empty skip.
2937. What size was the flame? About 6 inches high, at the side of the face near the shot.
2938. Did the men assign any reason for the gas taking fire there? No.
2939. Did they say they had struck a blower? Yes; Westwood did.
2940. Did you ever see the gas fire in No. 1 heading? Yes.
2941. How did it occur? It took fire off a naked light.
2942. When was that? The night before the explosion took place.
2943. Was Hope in the heading that night? Yes. Hope was filling a skip of slack about half-way between the face and the heading. He told me to hang the lamp on a prop at the danger-board, so that he could see better, and it ignited off my lamp.
2944. Where did it go? Into the face of the heading, 4 or 5 yards.
2945. What did you do? I took my lamp off the prop, blew it out, and ran into the next heading and told them the gas had fired.
2946. Did you report that afterwards? Not that night; I never saw anyone to report it to.
2947. Was it not of sufficient importance to mention—did you converse about it with anyone? Not that night.
2948. Did you consider it dangerous? Yes, I did, and if I had seen anybody connected with the mine I would have told him.
2949. Then you did not consider it sufficiently important to seek the overman and report to him—where were you next day? I was down on the beach.
2950. Was it not more important to see the overman than to go on your own pleasure? I would have told him next evening.
2951. That was your intention, was it? Yes.
2952. Have you seen frequent blowers in this heading? Before the strike I did.
2953. They were not as frequent since the strike? No.

Mr.
T. Morgan.
13 May, 1887.

- Mr. T. Morgan.
13 May, 1887.
2954. Going along the roads, as you were in the habit of doing, did you notice any marked difference in the ventilation since the strike, comparing it with the ventilation before the strike? It was stronger after the strike.
2955. Was the quantity of air going through the last cut-through much stronger? Yes.
2956. That current of air would sweep past the danger-board? Yes, close past—outside the prop.
2957. *Mr. Neilson.*] When you saw the gas fire that night, were you frightened? Well, yes; I was frightened at the time.
2958. How far did you live from the mine? About $1\frac{1}{4}$ mile.
2959. Did you pass by Mr. White's house? No.
2960. How far is Mr. White's house from the tunnel mouth? About 200 yards.
2961. It would not have taken you long to go that far? Well, it was pretty late in the night, and I expect he would have gone to bed.
2962. Supposing this explosion had not occurred, would you have reported what you saw? Yes, I would.
2963. Did you tell your father? After the explosion I did.
2964. You saw your father, I suppose, and you did not even report it to him? No.
2965. Yet you say you had intended to report to Mr. White? Yes.
2966. How did the men fire their shots? In No. 1 heading they fired with touch-paper.
2967. And in No. 2 heading? Sometimes with touch-paper, and once or twice I saw them use a match; that is when there was no gas present.
2968. How many times did you see them fire shots with a match? Once or twice.
2969. Did you not think that strange? No; I supposed they fired with a match if there was no gas present.
2970. Were they working with safety-lamps when they fired with a match? Yes.
2971. *Mr. Hilton.*] Was there anyone in charge of the mine during the night-shift? No.
2972. If there had been anyone in charge of the mine when the gas went off, would you have reported it? Yes.
2973. You have no doubt about that? No.
2974. *Mr. Owens.*] You say you hung your lamp outside the post where the danger-board was? Yes; on the right side.
2975. And the gas caught fire from there? Yes.
2976. Then the gas must have been up to the danger-board? Yes.
2977. Did your work take you to all the bords in No. 1 heading? I was in the headings.
2978. Not in the bords as well? One bord.
2979. Did you ever detect gas there? I never went into the face to see.
2980. *Mr. Jones.*] I suppose you have no practical knowledge of shot-firing? No.
2981. Did you ever hear the men in the headings complain of a deficiency of air at night? No.
2982. Did you not hear them complain on the last night you worked? No.
2983. *Mr. Croudace.*] You know the door between the headings No. 1 and No. 2 on the main road? Yes.
2984. And do you know the door on the diagonal cut-through? Yes.
2985. Did you ever see that door propped open? One night when I went in there I found that door propped open.
2986. Have you any idea who propped it open? No.
2987. Did you ever prop it open? No; only to let the skips pass through.
2988. Did you prop it open regularly in allowing the horses and tubs to pass through? Yes, and I would shut it afterwards.
2989. Did you ever leave it open, or forget to close it? No.
2990. Did you ever hear of it being kept open at any other time than you have mentioned? No, not that one.
2991. Have you ever worked in the daytime as a driver? Yes, but not in the headings.
2992. Did you ever know of that door being left open during the daytime? I do not know that that door was there before the strike.
2993. But since the strike? I have never worked during the daytime since the strike.
2994. Have you heard amongst the lads of that door being left open during the daytime? No.
2995. *Mr. Jones.*] Was it when you first went into your work that you found the door propped open? Yes.
2996. Was there a boy employed as trapper at that door? Not in the daytime.
2997. But at night? No.
2998. About what time would you have to prop it open to take your skips through? I cannot say; it would be taken there at all times.
2999. Then it was frequently open. How long would it take for your skips to pass through a door? Well, we would go straight through. [*The witness withdrew.*]

Thos. Woods sworn and examined:—

- Mr. T. Woods.
13 May, 1887.
3000. *President.*] You are a miner, and had been working in the mine since the strike, at the time of the accident? Yes; I worked in No. 2 heading.
3001. When were you first in the mine after the accident? About 10 o'clock of the evening it happened.
3002. With what object did you go in? To try and get the bodies out.
3003. How long after the accident was it that you examined No. 1 and No. 2 headings and the bords off them? Well, I never was in them—not to the face.
3004. Have you been in the bords since? I was only in one bord, the sixth, off No. 1 heading.
3005. Was that to recover a body? Yes; it had been reported to me that there was a body there.
3006. Were you in No. 1 and No. 2 headings when the bodies were discovered on the Thursday or the Friday after the accident—did you see the bodies lying on the road? No.
3007. Did you work in No. 2 heading? Yes, on the night-shift.
3008. Where did you work before the strike? Principally down in the Hill End section.
3009. Did you work in No. 1 and No. 2 districts? I worked in both; I worked in the first bord off No. 2 before the strike, and I worked in No. 3 heading when it was turned away, and I also worked in No. 6 heading.
3010. Did you observe gas in any or all of these before the strike? In the bords, no; in the headings, yes.
3011. Did it exist in large quantities? No, not very large. 3012.

Mr.
T. Woods.
18 May, 1887.

3012. In No. 3, was there a large quantity? No; there was only a little on the main road when I worked in there.
3013. Did you take any notice of the places where the gas showed with the greatest freedom? It was on the top, lying pretty close to the roof.
3014. Was it between or near the faults? We would generally get most of it on the faults or rolls.
3015. Did you ever strike any blowers? Yes, many a one.
3016. In what heading? In No. 2.
3017. Were they more common in No. 2 than in No. 1? I cannot say—I never worked in No. 1 heading.
3018. Did you ever know of those blowers being fired from a shot? No.
3019. Did you ever hear of any—we have been informed that a blower was fired from a shot in No. 2 heading? No.
3020. Did you ever see gas fired in No. 2 heading? No, I did not.
3021. Did you ever hear of gas being fired in any heading? Yes, in No. 1.
3022. When was that? On the night before the explosion—on Tuesday night.
3023. It fired on the Tuesday night? Yes; I heard the young wheeler singing out that she had fired.
3024. Then you were working on the night-shift on Tuesday night? Yes.
3025. And the wheeler informed you? Yes; I was about to go in, but they sung out that the gas was out, and I turned back again.
3026. Since the new furnace was started, was there a larger quantity of air passing through the last stenton than before? Yes.
3027. Did you work with your lamps unlocked since the strike? Yes.
3028. And before the strike? Well, they were both locked and unlocked; for the last fortnight or three weeks they were locked.
3029. Were they locked on the night-shift? No; mine was never locked on the night-shift. Of course I cannot speak for everybody.
3030. Did you complain to the management of the state of the workings since the strike? No.
3031. You had never cause to complain? No.
3032. Were you satisfied with the amount of ventilation in these headings? Yes.
3033. Where was the danger-board erected? Beside the last stenton.
3034. The danger-board thus erected was level with the sweep of the ventilating current as it passed through the stenton? Yes, inside if anything.
3035. Beyond the danger-board no naked lights were supposed to be taken? No.
3036. Did you ever see naked lights taken beyond that danger-board? I have seen them beyond it, but not very far—about a yard perhaps.
3037. Whose were the lights you saw? I have seen the wheeler, but I have seen different men; they were not particular whether they were outside the danger-board or inside.
3038. In the event of the men desiring to smoke, where did you smoke? At the danger-board, outside.
3039. We have been informed that a naked light has been found in the heading near the face where you were employed;—can you account for that? No; I have not heard anything about it.
3040. Your mates, I presume, were lost? Yes.
3041. Were your mates, in your opinion, careful men? Yes; I think they were.
3042. So far as you can judge, do you think they would be likely to take an open lamp into No. 2 heading? I would not think so.
3043. You would give them credit for more caution? Yes.
3044. Did any force of gas exist in No. 2 heading during the last shift you worked? No.
3045. Was the gas greater in quantity during the last shift or less than on any previous occasion? It was greater.
3046. Where did it issue from? Out of the coal, I expect.
3047. What thickness of coal was there in the face on the top of the roll? About 4 feet of coal.
3048. Then in crossing this roll, when it was beginning to descend, going across the top, did you hole the coal? Yes, and afterwards nicked it.
3049. You did not go into the face? No.
3050. Do you consider that the gas, when you were working in No. 2 heading, existed in such quantities as to deter you from shooting? Yes, with the same amount of gas as was present on Tuesday night.
3051. Would there be, in your opinion, any danger in drilling a hole on cutting a joint or blower? There might be.
3052. Have you ever seen a blower struck in a drill-hole? Yes.
3053. In the last shift, did you take off the coal with a pick only? I was only fetching the stone up last shift.
3054. In which case you would use powder? Yes.
3055. In blasting the coal in No. 2 heading, how did you tamp your shots? With wet tamping.
3056. Would you consider wet or dry tamping the safer? Wet tamping I should say.
3057. Did you ever use shale or stone for tamping? No; always coal.
3058. Where did you get your water to damp it? From a billycan.
3059. Did you use fuse? Yes.
3060. How far would the fuse project beyond the hole? It would depend upon the man who has the shot.
3061. Do you consider it dangerous to use fuse in the presence of gas—that is, do you think the gas might be ignited from the fuse? I should not think so.
3062. If you were informed that gas has been lit from fuse, would you be surprised? I should; I do not think it would light from fuse itself.
3063. How did you light the fuse? With touch-paper.
3064. And how did you light the touch-paper? On the lamp.
3065. Did you retire beyond the danger-board? No; I lit it with the safety-lamp by tilting it.
3066. That is, you tilted the lamp so that the flame would beat upon the gauze, and you would put the touch-paper to the flame? Yes.
3067. And you retired no distance towards the danger-board when you lit the touch-paper? No; I lit it opposite the hole.
3068. Did you take any steps to remove the gas from the place? Yes; if gas was there I would brush it.
- 3068½. Did you make it a practice to test for gas? Yes, if it was in the coal; if it was in the stone I would not bother, because the shot would be away from the roof.

- Mr. T. Woods.
13 May, 1887.
3069. Supposing the stone came within 3 feet of the roof, would you test for gas? It all depends; I should know if there was a great quantity; I could smell and taste it.
3070. Had you much experience in coal-mining before working at Bulli? None in gassy sections.
3071. Then your whole experience of gas has been gained at Bulli? Yes.
3072. You state there was about 4 feet of coal in the face of No. 2 heading—that is on top of the roll. You also say that if you had a shot in the coal you would consider it your duty to test for gas before firing the shot; but that if it was in the stone you would not bother. Now, there was 4 feet of coal on top of this roll;—in blasting off the roll, would you consider it an expedient and a precautionary measure to test for gas? Yes.
3073. Then you want to amend your former answer to that question—that in the case of a roll, such as at present exists in No. 2 heading, you would consider it a precautionary and safe measure to test for gas before firing the shot? Yes, if the shot was up where you say.
3074. Did you notice whether the gas that issued from No. 2 readily took fire—was it a “quick” gas? Yes.
3075. This is probably not a right question to put to you, because you have had no experience in gassy mines other than Bulli. You have seen the gas firing in the lamp? Yes.
3076. In which case what did you do? I have drawn the lamp away.
3077. Did you reduce the length of the flame? I generally pulled down the blaze.
3078. With the lamp full, what would you do? Draw the lamp away.
3079. *Mr. Neilson.*] Did you report the extra quantity of gas that night? No.
3080. What quantity of gas was there in that shift? It was back from the face about 20 yards.
3081. What thickness would it be in the face? About 3 feet from the roof. It would take the lamp 3 feet from the roof in the face.
3082. Did you fire any shot that night? Yes.
3083. What, with that quantity of gas in the face? There was not the same quantity when I fired the shot.
3084. What time was it when you fired the shot? I suppose it would be getting on for 8 o'clock.
3085. And at what time did you find this large quantity of gas? When I went in, about half-past 4 o'clock.
3086. Did you attempt to brush the gas out before firing the shot? No.
3087. Yet you knew the gas was there? There was not much gas there.
3088. Where was your hole? Right on the bottom—straight in.
3089. Were your lamps ever oiled? Yes, at times; if the lamp happened to fall it would get oil on the gauze.
3090. Do you consider there would be danger in the flame of the lamp communicating with the oil on the gauze? There would not be that much of it to take fire.
3091. Have you not seen oil above the flame on the top of the gauze? No.
3092. Did you ever fire a shot with anything else but touch-paper in No. 2 heading? Yes; I have lit a match to fire it twice.
3093. How long ago was that? The first week I started; but she was back against the stenton then.
3094. Did you ever unscrew your lamps to clean them without going behind the danger-board? Yes, I have done that.
3095. Did you ever smoke inside the danger-board? Yes.
3096. How long ago is that? The last time we started.
3097. Were you ever cautioned, just before the explosion, not to take pipes and matches into the face? Yes; that was on Monday night.
3098. What inference did you draw from that? I thought she was beginning to make gas.
3099. You knew Millwood? Yes.
3100. What sort of feeling existed between the men in this heading and Millwood—was it a good feeling, and were you on friendly speaking terms? Yes.
3101. Did Millwood ever tell you to be cautious? No.
3102. Did no one ever tell you to be cautious? No, only Mr. White.
3103. *Mr. Hilton.*] Did you ever see Mr. Millwood take a naked light inside the danger-board? No; I cannot say I did.
3104. You say you sometimes brushed the gas out? Yes.
3105. Did you ever take notice how long it would be after brushing the gas away before more gas accumulated? Not a great while would elapse; but it would give you time enough to fire a shot before coming back.
3106. Would it come back in any quantity half-an-hour afterwards do you think? Well, not in the same quantity.
3107. *Mr. Owens.*] When you brushed the gas out, did you brush it beyond the stenton? No; we just brushed it away from the face.
3108. And was the overman aware of this practice? The deputy would know.
3109. When you were putting horizontal shots in, the flame would naturally fly to the roof? Yes.
3110. Did you ever notice gas fire from the shots? Yes.
3111. Was the deputy aware of it? No.
3112. Did you report it? No.
3113. What was the reason you did not report it? I did not know that there was any reason to do so.
3114. You did not consider it of sufficient importance? No.
3115. Did you find gas in any other part of the pit save in No. 1 and No. 2 headings? Yes; I have seen gas in No. 6, and I have seen gas in the straight, and in No. 3, though I never worked in it. That was before the strike.
3116. Did you see any in the western district? No.
3117. Did you notice whether the bodies you saw were burned? Yes, and some of them were burnt pretty severely too.
3118. Did you notice those you found on the straight tunnel—the incline? Yes; they were burnt.
3119. *Mr. Jones.*] Did you ever receive a copy of these special and general rules for the guidance of the men and boys employed in the Bulli Colliery? Yes.

3120. I understood you to say that previous to the strike safety-lamps were used in the bords in Nos. 1 and 2 headings? Yes.
3121. Do you think the ventilation afterwards had so far improved as to justify the abandonment of safety-lamps in these places? It would be very hard for me to answer that.
3122. I understood you to say you were quite satisfied with the mode of the ventilation up to the time of the explosion. Would bratticing in Nos. 1 and 2 headings have afforded a larger measure of safety in conducting into the waste the gas thrown off? Yes; the gas would not have remained there.
3123. Did you ever receive any instructions as to the method of firing shots? No.
3124. Never from the deputy? No.
3125. You stated that you had seen blowers in No. 2 heading? Yes.
3126. Roughly speaking, in your opinion, did they give off a large quantity of gas? Well, a good deal.
3127. Did you report to any one? No.
3128. Why did you not? I did not think it was worth while making any bother over. I did not think there was any danger in it.
3129. That might arise from your imperfect acquaintance with gas. Supposing you had had an extended knowledge of the subject? That might have made a difference.
3130. *Mr. Croudace.*] In these bords in No. 1 heading, where you say they worked with safety-lamps previous to the strike, were they giving off gas since the strike? No.
3131. Have you looked for any? No.
3132. Do you know, as a fact, that there is none? No; I never saw any.
3133. If there is none, would not that justify them in using naked lamps where they previously used safety-lamps? Yes; I suppose that was the reason.
3134. As to these blowers, did they not exhaust themselves in time? Yes; I have seen them blow for three days and then go off.
3135. Did you ever see the door between Nos. 1 and 2 propped open? No.
3136. Could you give us any opinion of your own as to how this explosion arose? No; I think not.
3137. Have you never talked it over with your fellow-workmen? You have given such straightforward evidence, honestly telling us you have done what is clearly wrong—going inside the danger-board with naked lights, and firing shots in the presence of gas—that it leads me to have confidence in you, and induces me to ask you if you have ever talked over the matter with your fellow-men in any way? No; I have not.
3138. On the night before the explosion, who were your mates? On the day-shift, Joe. Crofton and Jerry Westwood; and on the night-shift, Jim Salisbury. [*The witness withdrew.*]

Mr.
T. Woods.
13 May, 1887.

Frederick Robbins sworn and examined:—

3139. *President.*] You are a miner, residing at Bulli? Yes?
3140. How long have you worked in Bulli? Twenty-one years—ever since it commenced, until recently.
3141. In what capacity have you been employed? Ten years as a deputy.
3142. In what districts have you worked at Bulli? In No. 1 and the grip.
3143. Do I understand by No. 1 the Hill End section? No; further down in the old workings on the south-western side.
3144. Have you ever worked in other mines than Bulli? Yes; in England and Wales for many years.
3145. In districts where a considerable amount of fire-damp exists? Yes.
3146. And you know the composition and the danger of fire-damp? Yes.
3147. And the principle of the safety-lamp? I do.
3148. Where were you, Mr. Robbins, at the time of the accident? I was at Robbinsville, working at my own place.
3149. And being apprised of the accident, you proceeded to the mine? I did, and arrived at Bulli about half-past 4 o'clock in the afternoon.
3150. Did you proceed into the mine? I did.
3151. As you are conversant with the mine, would you give us your own story, as shortly as possible, as to what you did and where you went? On reporting myself to Mr. White, he asked me to take charge of a gang of men, which I did, and entered the mine. The first thing I noticed was the overcast forced up. We passed on, making everything right as we went, the carpenter, Jones, with others, repairing the overcast. We then proceeded up to the top of the Hill End bank, known as the western junction, and finding a door blown down, put up canvas. Before arriving at this point I found some stoppings had been temporarily repaired.
3152. What was the state of the atmosphere? It was considerably deranged.
3153. Was it hot? Yes.
3154. Did you see men lying on the bank-head? I did.
3155. Did you closely examine them? I did, and ordered them to be wrapped in canvas.
3156. Did you notice their appearance? I did.
3157. Have you had previous experience of explosions? Not as bad as this, but have been in light explosions.
3158. Did you believe these men's bodies were burnt? I did.
3159. Did you actually notice that they were scorched? Yes; Jackson and another. I considered them worse mangled than some of the others on the immediate scene of the action.
3160. Did you consider their appearance denoted actual contact with flame, or that it was due to heated dust? From an actual explosion, I should say.
3161. Why? Owing to the appearance of the hair, which was entirely singed.
3162. Were you of those who first went up No. 1 and No. 2 headings? I proceeded as far as the inner flat that evening. Ross overtook me at that spot. I had to be assisted out that night, as I was overcome by the after-damp. I returned about 10 o'clock next morning.
3163. The doors on the main tunnel between No. 1 and No. 2 headings and also that on the diagonal road were destroyed? Yes; both of them were blown out.

Mr.
F. Robbins.
13 May, 1887.

Mr.
F. Robbins.
13 May, 1887.

3164. You proceeded up No. 1 heading? Yes.
3165. And saw the different bodies lying there? Yes.
3166. Did you closely examine them? Yes.
3167. Did you identify the bodies? I identified two of them as being the Brodies—having worked in one bord together. They worked in the right-hand bord in No. 1 heading.
3168. Had they, in your opinion, been overtaken by the after-damp, or were they burnt? My opinion is that they were instantly killed by the explosion, and that they fell in the act of running.
3169. How could they have had any time to run from the face if they fell at the instant of the explosion? A sensation is felt on the drum of the ear in an explosion owing to the stagnation of the air, and a man who is in any way accustomed to such occurrences would immediately run.
3170. But you are quite aware, surely, that an explosion is as sudden as a flash of lightning, and a man would therefore not have time to run a step? I think a man could run a short distance, but of course at the immediate scene of the explosion he might not have time to move a step.
3171. Were these men burnt? Yes.
3172. Did you observe among these men one sitting on a piece of coal? Yes; that was the deputy Millwood; I think he was near the inside cut-through, sitting with his head leaning on his left arm.
3173. You knew him? Yes, well.
3174. Who was present with you at the time? Crawford, and some miners who recognized the bodies better than I did.
3175. So far as the evidence has gone up to the present, the majority of witnesses agree that Mr. Millwood was found amongst the first group above the tunnel? My opinion is that he was found below the inmost stenton, between the two last stentons; and the body of a man who was working in the face of No. 2 heading was found about 6 ft. outside of him on a heap of slack.
3176. Did Millwood bear traces of burning? No; I do not think he did; his body was less affected than any other in the mine that I saw.
3177. Did you afterwards examine that district of the mine for the purpose of arriving at some conclusion as to the cause of the accident? I did not examine the district with a view to giving evidence in any way whatever.
3178. It was simply with a humane object that you entered the mine? Yes, but I could see what was the matter.
3179. Did you examine the headings? Yes.
3180. Did you discover gas in any of the bords or headings? I did not discover gas to the extent that would fire in any lamp, but it might be present.
3181. You mean to say that the quantity, if any were present, would be too small to be indicated by a lamp? Yes.
3182. In what condition did you find No. 2 heading? In No. 2 heading the gas would explode in the lamp—it was as quick as ever I saw it.
3183. In No. 1 heading what was the condition? Much the same as in No. 2—it would show in the lamp.
3184. Did you form any opinion as to the cause of the accident? Yes. Even before I went into No. 2 I cautioned Crawford that we must be careful in going into No. 2, as having seen Westwood's body, I expected to find gas in there if anywhere, as I thought there might be a shot in there.
3185. Was Westwood's body burnt? Yes, it was burnt, but not so much as the other bodies further down.
3186. Did you observe the props charred in No. 1? Yes.
3187. Did you go down and examine the bords off No. 2? Yes, every bord and facing.
3188. Did you observe evidences of burning and flames? Yes.
3189. Then what opinion did you form as to the cause of the explosion? I thought that a shot had been fired in the face of No. 2 heading, and that perhaps there had been an overcharge of powder; and I thought to myself that the shot had done its work, and well.
3190. Had you ever been in that district before? Yes, on two occasions.
3191. Did you observe gas on those occasions? Yes.
3192. From your experience of Bulli, would you expect to find more gas in approaching those rolls so frequent in that colliery? I should.
3193. As a matter of fact, did you know where the gas did issue in greatest abundance from those rolls? Yes; but it does not follow that it all issues from the rolls, because I know to the contrary, from the fact that Bulli gave off carburetted hydrogen since passing the dyke, and it was giving off choke-damp before that.
3194. Did Crawford talk to you about the blowers at Bulli during your examination? Yes. When we were walking along where the air was passing the main tunnel we put a naked light to the side of the rib and it freely exploded.
3195. What was the length? Not a great length.
3196. It would be quite possible to tap one of those blowers in the act of drilling a hole? Yes.
3197. Would a freshly blown-out shot have a tendency to light the gas if it existed near the face? It might if there was an accumulation of gas previous to the drilling of the hole. An overcharge of powder, in my opinion, of course would explode gas—one part of the explosion does its work, and the other expends itself in space.
3198. Supposing a blower to be intersected by the hole, would a shot have any tendency to ignite the gas in the hole? I do not think it would be possible for much gas to exist in a hole that was well rammed up.
3199. Doubtless, it would be stemming up the gas as well? I do not think so much gas would exist as would escape while it was being tamped.
3200. Do you think there was a large accumulation of gas in this colliery? I do.
3201. Where would it be necessarily confined to? That I would not like to say without working there.
3202. You know that it is carried on the air, being the lighter substance. Supposing there was 12,000 ft. of air travelling through the last stenton, would you be likely to detect gas on the outside of the stenton? It might be.
3203. Would that quantity of air be sufficient to dilute it and render it harmless? It would if there was not too much gas.

Mr.
F. Robbins.

13 May, 1887.

3204. We have only the evidence of the men as to the amount. So far as we know blowers had been struck in two places in the mine only? Well, I should think you would not discover gas outside the stenton in that case.

3205. Do you consider Bulli a naturally dry and dusty mine? Yes.

3206. Do you know anything of the action of dust in the presence of an explosion through gas? Well, I know there is a theory on the subject, but I am not prepared to fall in with science as to that.

3207. Do you think coal-dust would intensify the action of gas? I do.

3208. And that it would probably prolong the effects of an explosion? Yes.

3209. In the case of No. 1 and No. 2 headings giving off gas, would you consider it a wise precautionary measure to carry bratticing within a reasonable distance of the face? Certainly; that is the known and best method.

3210. You have no doubt about that? No.

3211. You would have adopted that method in this case? If I found gas being given off, yes, I should adopt that method.

3212. Now, would you look at this plan for a minute. This is the main tunnel and the intake. A door is placed between Nos. 1 and 2, and also in the diagonal road between No. 1 and No. 2 for the purpose of taking the intake air up to No. 1, which is therefore the intake. Would you consider under the existing conditions here, of gas being given off at the face of Nos. 1 and 2 headings, that it would be safe to permit open lights to be used in these bords off No. 1? I should not.

3213. These bords were worked with open lights, the headings were worked with safety-lamps. Suppose these bords gave off no gas, and the heading was the intake, and a large volume of air such as 12,000 ft. per minute, was passing, would naked lights be safe? In my opinion naked lights are safe nowhere where light carburetted hydrogen is given off.

3214. Would you consider it safe for naked lights to be used in those bords without sweeping out the gas from No. 1 and No. 2? I should consider it very dangerous to work with naked lights in those bords, because the gas is carried with the air.

3215. In view of gas being given off in these headings, would you consider it safe to tamp a shot with small coal? No. I should not consider it safe to tamp shots in the presence of gas. From past experience in the world you cannot gauge the exact amount of danger. I think a man ought to be very careful.

3216. Well, shots being permitted, would you consider it a safe operation to tilt the flame of a safety-lamp on to the gauze in order to light the touch-paper? No, I certainly should not consider it safe.

3217. Can you suggest any other mode? Yes, I prefer a wire.

3218. Passing the wire through the interstices? Yes.

3219. Gas is known to be given off in the advanced districts—these headings, Nos. 1 and 2; would you consider it good mining to win all bords, both off the intake and the return? Perhaps it would be better to have a third heading.

3220. In what way would that render these bords more safe? It would be ventilated on the intake then; your return air would go back on the centre heading.

3221. In that way you would consider it quite safe? Yes, provided there was sufficient ventilation going through the bords. It is the accumulation of the gas that brings about the danger.

3222. Supposing a blower was suddenly struck, and the ventilating current was carried round these bords, would it be safe then? Yes, provided there was a sufficiency of air to render the gas non-explosive.

3223. Did you examine Nos. 3, 4, 5, and 6 headings? I did.

3224. Did you discover any gas? I discovered the appearance of gas in the lamp in all of these, the ventilating current at the time being arrested.

3225. You would more readily detect gas if it existed, under those conditions? Yes.

3226. You know the western district? I do.

3227. Have you ever discovered gas there? No.

3228. *Mr. Neilson.*] You say you do not believe there could be a sufficient quantity of gas in No. 2 heading, unassisted, to cause the damage you saw in the mine? I really do not think so.

3229. You think it was assisted? Yes, by accumulations of gas previously unobserved.

3230. Where was it likely that gas could accumulate—in the first bord off No. 1? If No. 1 was the intake it is scarcely likely that it would.

3231. *Mr. Hilton.*] Where would this gas you talk about accumulate? Anywhere in the old workings.

3232. Could you give any reason for such an accumulation? Only an insufficiency of ventilation.

3233. Are you aware that there was a door at the junction of the western? Yes.

3234. The object of that door was to cause a portion of the air to go up to the gassy section? Yes.

3235. Supposing anything happened to that door for an hour, say, or two hours, would not that interfere with the ventilation considerably? Yes.

3236. You say you have worked in the Bulli Colliery twenty years, and ten years as deputy?

3237. You would have some knowledge of the management then, the principal and his overman. Do you think these gentlemen careful and capable? I can speak of Mr. Ross as being an exceedingly careful manager. I said as much at the inquest, and I could not say different. Mr. White is not as able as he was perhaps.

3238. Why not as able? I think he received an injury some time ago that affected him mentally.

3239. How long after the explosion was it when you got to the mine? It was about two hours afterwards.

3240. Were you amongst the first party? No; there were three parties in before me.

3241. Did you notice any stoppings blown out in No. 1 heading? Yes.

3242. During your tenancy of office as deputy, were you using safety-lamps? I was in the grip district—in the south-western side of the western.

3243. Did you know Mr. Millwood? I did.

3244. Do you think he was a cautious man? He may have been sufficiently cautious.

3245. Do you think workmen should be allowed to fire their own shots indiscriminately? They would not if I were deputy.

3246. As an experienced man, do you think the return air-course should be travelling? I do.

3247. You have been connected with the Bulli mine, until recently, ever since it began? Yes.

3248. Have you a recollection of a man being killed there by the gas some years ago? Yes, I have; a man named Twaddle, I think.

3249.

- Mr. F. Robbins.
13 May, 1887.
3249. Then as a matter of fact you had gas in the Bulli mine before you got the dyke? Yes, that was many years ago.
3250. How many years ago? Sixteen years ago, more or less—I cannot say exactly.
3251. *Mr. Croudace.*] I understood you to tell us, Mr. Robbins, that the only time you had known gas in Bulli, was when you struck the dyke in the Hill End district? I do not think so; but if I did I must certainly contradict the statement, because I could not have intended to say that. The gas came as soon as this whin dyke was struck, but there was scarcely any given off so far as I know from twelve to fourteen years previous to that.
3252. Then you also stated that previous to striking the dyke carbonic acid gas, or choke-damp, was given off? I mean by that, in the interval between the time when the mine first opened.
3253. Will you briefly explain to us again what is the true state of the case, because you led me to believe that there was no fire-damp in the Bulli mine previously to striking the dyke, and that the gas that did exist before that time was carbonic acid, which is non-explosive. Now you state in answer to Mr. Hilton, that a man was killed some years ago in the Bulli mine by an explosion? I have freely told you the exact circumstances, but will repeat more fully. For five or six years, perhaps, from the first beginning of the mine, gas was seen in various parts, both in the bords and headings, in moderate quantities. Where Twaddle was killed was in the south-west straight heading, on top of a large fault in the face of the heading. I do not know that gas was ever found in any quantity at Bulli after that for the term I have stated.
3254. Was it after that you noticed the carbonic acid gas come off? Yes, and after getting through the dyke we found carburetted hydrogen.
3255. Have you seen the results of any other explosions than this at Bulli? No, not of any magnitude, as I have stated.
3256. Then you have no knowledge to go by in judging of the effects of an explosion? I have no practical knowledge to judge of the effects of a terrible explosion.
3257. Therefore in stating that you think there must have been an extra accumulation of gas than what existed in No. 2 heading, you have nothing to guide you in forming that opinion? I have my practical knowledge, and reading, and judgment. I really think there was not sufficient space inside of the stenton for men to work with gas present in sufficient quantity to cause that explosion.
3258. Your idea is that there was an accumulation of gas somewhere else? Yes, I think so.
3259. Can you explain to me where it would be? I think it would be somewhere between the western and the Hill End.*
3260. And if you were told that there were very little signs of damage there? I should think it very strange, seeing that a horse was blown from the main heading into that return. [*Plan examined.*]
3261. Is it not likely that those boys and the horse were blown through this place by the force of the explosion from No. 2? I think they were blown from No. 2 right through there—the force would be on those bords off No. 2.
3262. Have you seen any signs of fire there? Yes.
3263. Any timber blown out? No.
3264. Then you think the explosion coming from No. 2, and which blew the stoppings out, was the same explosion that blew the bodies through here? I do.
3265. Then it would seem that there was no other gathering of gas beyond that point? There must have been in that return.
3266. Is it possible for gas to exist in a current of air measuring 12,000 cubic feet per minute? I think it is quite possible, supposing a quantity of gas to be accumulated.
3267. *President.*] The question is as to separation? I do not say it would separate. I think it is possible that before mixing with the current, a portion of it might be deposited in some convenient place being the lighter substance. [*The witness withdrew.*]

James Crawford sworn and examined:—

- Mr. J. Crawford.
13 May, 1887.
3268. *President.*] What is your present occupation? I am a deputy at North Bulli Colliery.
3269. Were you for some time deputy at the Bulli Colliery? Yes, but not at the time of the explosion.
3270. You were there before the explosion? Yes.
3271. How long is it since you left? I left when the strike took place.
3272. Were you deputy of the Hill End section? Yes.
3273. Were you in that position before the dyke was pierced that gave off gas? Yes.
3274. Was there very much gas given off when you first touched the coal inside the dyke? At first, a small quantity came off; it was struck at night-time; two men, Richards and Gard, struck the coal, and they ran and reported to Mr. White that they had struck the coal on the other side of the dyke, and that the gas was coming out freely.
3275. Had you any experience in gas before you found it in Bulli? Yes.
3276. Where? Yorkshire and Scotland.
3277. Who arranged the workings, and laid off the headings and bords in the Hill End section? Mr. Ross and Mr. White laid out the headings.
3278. Were you consulted? No.
3279. Not at all? No.
3280. Up to the time of the strike, what was the amount of ventilating current that supplied that district? I could not possibly tell you.
3281. I mean just before the strike? Before the strike, there was 2,500 cubic feet of air going past the headings of the gassy section.
3282. Were you present when Mr. Rowan, the inspector, took his measurements? Yes, at one place.
3283. Was it you who arranged the doors between these headings and the main road? No, I had nothing to do with the doors.
3284. Were you instructed where to put them? No, White did that.

3285.

* NOTE.—Plan examined, and witness indicates possible positions.

Mr.
J. Crawford,
13 May, 1887

3285. From the time that Nos. 1 and 2 headings were broken off the main tunnel, had gas been given off up to the time you left? Yes.
3286. In a large quantity? Sometimes a large quantity, and sometimes a small, but they were never clear at any time.
3287. Where did it issue from? The centre of the coal.
3288. Was it more abundant in approaching rolls, or after the rolls had been crossed? I always found it largest in between the rolls.
3289. In approaching rolls, did you find any? Yes, all the way through.
3290. Did it come out in blowers? Yes, considerable quantities would come out from blowers, which you could hear 20 or 30 yards away.
3291. How long would they last? Sometimes from two to three weeks, and after the men had worked several yards past them, they would continue blowing out at the side.
3292. Was gas given off in the bords off No. 1 heading? Yes.
3293. Was it given off in the bords up to the time of the strike? Yes, up to the time of the strike; I know nothing afterwards.
3294. But you say it was given off in the bords? Yes, up to the time of the strike.
3295. In sufficient quantities to require the use of safety-lamps? Yes.
3296. They were used in the whole of that district? Yes, with the exception of two places.
3297. Where were these? In the first bords in No. 1 heading.
3298. Were these abandoned bords at the time of the accident? Yes.
3299. Were these safety-lamps locked? Yes, all the time I was there, with the exception of the time when we started using them; at that time, there were only four lamps for two shifts of four men each, and the day men had to give them up to those men working at night.
3300. Are you quite sure that these lamps were always locked afterwards? I am quite sure they were whilst I was there; I examined the lamps in the morning, and locked them, but of course I was not there at night.
3301. You locked them yourself? Yes.
3302. And you used all possible care for the safety of the men? Yes; all in my power.
3303. Did you ever hear of a safety-lamp being unlocked? Yes, at one time, owing to the scarcity of keys, two men were allowed to use their lamps unlocked; in giving them their lamps in the morning, I told them that the key was broken, but that I had given orders to White to get some more keys; I afterwards went into their working place, and caught them working with unscrewed lamps; I ordered them to screw on their lamps, and to go out of the pit, and report themselves to White.
3304. Did you ever receive complaints from the men on account of having unlocked lamps? I never had a complaint from any party.
3305. Did you ever have any complaints concerning unsafe lamps? Yes, on one occasion.
3306. When was that? A man gave me his lamp and said the top gauze was burnt out; I took his lamp to pieces, and found that one of the gauzes was gone, and I said I have not another to give you; the top gauze was perfectly sound; there are two gauzes, one takes off, and the other is a fixture.
3307. Did you consider that lamp safe? No.
3308. Did you allow that lamp to be used? No.
3309. And you thereby removed a source of danger? Yes.
3310. You considered that the man had done his duty, and that you had done yours? Yes.
3311. You are quite sure that you did not hand back the lamp to the man, and tell him that you had not another to give him? I am not aware of doing so; I know I told him that we had no wire to mend the lamp.
3312. Did you ask for wire? Yes, immediately afterwards.
3313. And they had to send to Sydney for it? Yes, there was none in the district.
3314. In your time, how were shots fired? During my shift, I fired all shots myself; I first examined the place to see if it were safe, and if I found it safe, I fired the shot.
3315. How did you light it? With touch-paper, which I would rub on my clothes, and light it by holding the lamp on one side. I find I have in my pocket a piece of touch-paper that I had when I left.
3316. Do you consider that a safe and proper way of lighting a shot? It is the only way we had; I kept a lamp for the purpose, and when I found the gauze of the lamp softening, I put a new one in; I have fired shots with a small wire, but I do not think it is as safe as the other.
3317. Do you know if any of the men fired shots? Not to my knowledge.
3318. Would this be as safe a means of firing as any other in the hands of any man? Yes, it would if a man properly understood what he was doing.
3319. But if he did not? Well he ought not to be there at all.
3320. How were the shots fired at night? I cannot say. I supplied the night men with touch-paper, and warned them to be very careful, and not to use a naked light whatever they did.
3321. You do not know how shots were fired at night? No.
3322. Were the lamps locked there at night? No; they were left to the men to do what they liked with them.
3323. There was no night deputy? No.
3324. Did you ever find any men unscrewing the lamps? I have already told you of two men doing so.
3325. That was some time ago? Yes; there were only a few men working in the gassy section at the time.
3326. You say that you exercised due care in cautioning the men? Yes. I would show them the gas oozing out of the coal, and gave them instructions to be careful.
3327. The ventilating current you say was 2,500 cubic feet per minute? That was the last report. The first report was between 3,000 and 4,000 cubic feet.
3328. If that current was trebled or quadrupled, would it render that part of the mine more safe? If it was carried into every working place I have no doubt it would.
3329. How did you ventilate the faces of Nos. 1 and 2 headings? There was a cut-through every 23 yards.
3330. Was any bratticing used? No; not to my knowledge.
3331. Did you think it necessary for the safe working of the bords off the headings? Yes, I did.
3332. Did you ever mention it to Mr. Ross? No; but I did to Mr. White.

3333.

- Mr. J. Crawford.
13 May, 1887.
3333. Did you not consider it your duty to mention it to Mr. Ross, seeing that nothing resulted from your mentioning it to Mr. White? I did not think it my duty to pass Mr. White in anything.
3334. But in a matter of life and death, for the safety of yourself and others depended upon the mode of ventilation, do you mean to say that you would not approach Mr. Ross—was he such an unapproachable man? I thought it was Mr. White's duty to report the matter to Mr. Ross at once.
3335. But having no result from your appeal to Mr. White, don't you think it was your duty to go to the court of last appeal? No; not to pass my superior, and Mr. White was my superior.
3336. Now, do you think you did your duty? Yes.
3337. Was the gas at all times given off in Nos. 1 and 2 headings? Yes, at all times. It never ceased.
3338. Did you ever hear of men firing shots by means of matches in No. 2 heading? I did not.
3339. Would you be surprised to learn that it has been done? I am not at all surprised at it.
3340. But you never saw or heard of it? Never.
3341. When you found any quantity of gas in these headings, were you in the habit of reporting it? Yes, regularly to Mr. White on all occasions.
3342. Had you any book at the mine for entering these reports? I never had a scrap of paper at the mine for any report whatever.
3343. If you found a dangerous condition of affairs could you not have procured some paper and entered your protest, for you were in a responsible position? I exercised my duty, I thought, when I reported to Mr. White everything that happened every day, and when I saw a place dangerous for men to work in I removed them.
3344. Had you opportunities of conversing with Mr. Ross? Not many.
3345. Not during the time you were deputy ever this fiery section? I had one occasion when he was in, and I then showed him the gas oozing out. A drill-hole had been bored in the wall side, in which I inserted a gaspipe, and I showed him the gas alight from this pipe to prove to him that it was not diminishing with 3,000 cubic feet of air passing.
3346. Had you any other object? I wanted to satisfy him that the gas was still strong.
3347. What did you follow that up with. Did you not say something to this effect—"Now, Mr. Ross, don't you think it is advisable to put bratticing in the headings"? I left that to him.
3348. No doubt, but is it the custom for deputies to do so? There is no doubt that it is.
3349. Had you no fear of any calamity happening from this gas which you showed to Mr. Ross? Yes, I had.
3350. Then why did you not warn Mr. Ross by suggesting some proper measures for the safe working of these headings. You say that in your opinion bratticing should have been used, and was not that the proper occasion to suggest its use to Mr. Ross. Had you not a good opportunity of doing so? I had, but I did not do so.
3351. Don't you think you failed in your duty? No; for Mr. White was present at the time.
3352. Why do you think it was not your place. You were the person who inserted the pipe into the blower for the purpose of showing the gas to him, and is it not a natural conclusion that you would say, "Now, Mr. Ross, don't you think this gas ought to be specially dealt with"? When I showed Mr. Ross this it was on the main road.
3353. But don't you think that you lost an opportunity of doing a great service to the colliery? If I had suggested such a thing I would have got a "snubby" answer.
3354. How do you know that you would when you did not tell him. You must see that that is not logical? I don't think that I violated my duty in any way, because I reported to White on all occasions.
3355. If you showed Mr. Ross that the gas was not diminishing in No. 2 heading, surely you had some intention in showing him that gas. What could be more natural, seeing that you believed that bratticing should be used, than for you to say, "Don't you think, Mr. Ross, that bratticing should be taken into these headings"? I was not paid for suggesting to Mr. Ross.
3356. Were you not paid for doing your duty? Yes; and I did it.
3357. You saw that valuable lives were imperilled, and you lost your opportunity? No; I lost no opportunity.
3358. You knew the mine better than Mr. Ross? Yes.
3359. You put yourself to some trouble to show him the gas, and if you thought he was wrong or sceptical about the quantity of gas, don't you think that you lamentably failed in your duty in not suggesting the remedy you believed in? No; I do not think I failed at all in my duty.
3360. You don't? No, I don't; I did my duty in showing the gas to Mr. Ross and Mr. White.
3361. Did you state to some man that you believed the colliery would blow up some day? I stated after the strike that if proper care was not taken the colliery would blow up, because I believed that Mr. Ross and White were not taking proper care.
3362. Was it on that account that you left? No; I left because my wages were reduced, and I was not paid sufficiently for my responsible charge.
3363. Did you state this danger to any of the officials higher than yourself? Yes; I told it to Mr. White the last time that we came out of the mine together. I said to him, "If this is a prolonged strike I will never enter this mine with a naked light." I said that because I thought that during the time the furnace would not be working regularly the gas would accumulate in the old workings. I have cautioned him many times about the existence of gas, and that he would insist upon men not working with naked lights.
3364. Where was that? In these places off No. 1 heading.
3365. You stated that they did not work with naked lights? Neither they did, with the exception of two bords.
3366. You expostulated with Mr. White upon the consequences? Yes.
3367. Yet you did not suggest any improvement in a mild way to Mr. Ross. He is an experienced man, is he not? Yes.
3368. Knowing what you do now, don't you think you failed in your duty? No; as I have said before, I do not think that I failed in my duty all.
3369. Were you in this district since the accident? Yes; I was.
3370. Were you one of those who went in for the purpose of recovering the bodies? Yes.
3371. Did you make an accurate examination of the seat of the explosion? Yes; I was in Nos. 1 and 2 headings.

Mr.
J. Crawford,
13 May, 1887.

3372. Did you go into the face of the bords off No. 1 heading? Yes; I went into two bords.
3373. Did you examine for gas? Yes; and I found none.
3374. Did you go to the faces of the bords off No. 2 heading? Yes; I went into four faces.
3375. Did you examine for gas in any of them? No; not carefully.
3376. Did you go into the faces of Nos. 1 and 2 headings? Yes.
3377. Did you examine for gas? Yes; and I found it there.
3378. Was the quantity as great as that when you were deputy there? Yes; the day before the strike took place I stopped a man named Gard from working in No. 1 heading. He had a shot waiting to be fired, everything was ready, and his coal cut; but when I went into the place and examined the gas I said, "I will not fire this shot for you as this place is full of gas for 12 yards back." I then put two boards across each other, some distance back in the heading, and wrote the word "Danger" over them, and left the shot unfired, and put him to work in another place. When I went into the same place after the explosion I found there gas 10 yards in length, and 3 feet in thickness.
3379. Almost as much as when you left? Yes.
3380. After the explosion the ventilating current would be totally deranged? Yes.
3381. You are not surprised at that? No.
3382. It was a natural consequence? Yes; but I was somewhat surprised to find the ventilation so good after such an explosion.
3383. Were you surprised to find no gas in the bords? No.
3384. You stated before that up to the time of the strike the bords gave off gas? So they did.
3385. And yet you are not surprised that without the ventilating current no gas was found in them? I did not make a minute examination of these bords.
3386. How would you account for no gas being found in them after the accident? I did not say there was none.
3387. I suppose that you were informed that there was absolutely no gas in these bords, or none visible in the safety-lamps after the explosion. I presume that you mean that before the strike the gas would show itself in these bords in a Davy lamp? Yes.
3388. The general expression "no gas" means that it is not visible in the safety-lamp, does it not? Yes.
3389. Would you conclude that gas had ceased to be given off seeing that there was none found there after the accident when the ventilating current was very low? No; I would conclude that if the coal was once cut again the gas would come off again.
3390. We are informed that immediately after the explosion no gas came off in these bords? I believe if they were minutely examined, gas would be found in any of them.
3391. That is your opinion? Yes; I would not like to go into them with a naked light.
3392. But you do not charge the people who saw these bords with being less able to detect gas than yourself? No.
3393. Did you consider the mode of working Nos. 1 and 2 headings, with bords off each heading, safe? Yes, it was safe.
3394. No safer could be followed? No. The distance between the headings was about 10 yards, and the cut-throughs were put in nearly every chain, or a little more.
3395. After this explosion, can you suggest anything better? Nothing better, excepting bratticing the headings.
3396. In your time did Nos. 3, 4, 5, and 6 give off gas? Yes.
3397. In your time did you ever discover gas in any of the abandoned bords off No. 1 heading? No.
3398. There are two bords driven back to the dyke? Yes; but I never saw gas in them.
3399. Would that be a likely situation for gas? Yes, provided the ventilation were stopped altogether. Gas might have settled in there, as they were not properly stowed up.
3400. Was it a likely place? Yes; if there was no air going, it might accumulate there; but if the current was kept up, it would drive it away.
3401. What conclusion do you come to as to the cause of the accident? I examined No. 2 heading, and I saw that a shot had been fired there recently, and I consider that due care had not been taken in firing that shot.
3402. In what way was care not taken? So far as my knowledge would lead me to believe, I saw that the coal had been smashed down a good deal, and no hole had been cut underneath. If this is not done, the shot will more likely cause a blast, and I would think from the position of the bodies of the men who worked in that heading that the shot had ignited the gas.
3403. Have you ever seen a shot ignite gas in that district? No.
3404. Have you heard about it? Yes; but I have no proof of it.
3405. Do you think that it is an improbable event? No; but I have not seen it.
3406. Do you think that the shot was overcharged? Yes.
3407. It is not a blown-out shot? No; there is a good quantity of coal driven down, but I am inclined to think that the shot was slightly overcharged.
3408. In examining the gas issuing from these headings, did you notice whether it was of a very quick description? Yes.
3409. It would rapidly fill the safety-lamp? Yes.
3410. In other words, it was very pure gas? Yes, no doubt about it.
3411. Did you form any conclusion as to the course of the explosion? I believe there has been an accumulation of gas on the opposite side of the main tunnel in the old workings. I maintain that there has been an accumulation of gas there, and that the fire in No. 2 heading has reached it.
3412. You do not say that the shot did not ignite the gas in the heading? No.
3413. You are of opinion that it did? Yes, I am of that opinion.
3414. And in proceeding down both headings it ignited other gas on its way out? Yes, that is my opinion.
3415. Gaining force as it proceeded along? Yes.
3416. Have you any knowledge of how an atmosphere of coal-dust behaves in the presence of ignited gas? Undoubtedly it increases the intensity of the explosion.
3417. Was the Bulli colliery of a dusty character? Yes, it was dusty.
3418. During the working hours the dust would be mingled with the air more or less? Yes.

- Mr. J. Crawford.
13 May, 1887.
3419. The gas having been exploded, the intensity would be increased? It would add a little to the fury of it; but I do not believe in the theory to any great extent.
3420. Would it intensify the action of the explosion? I have no reason to doubt that it would.
3421. *Mr. Neilson.*] You say that you always brushed the gas out before lighting a shot? I was always very particular in seeing that there was no gas in the face when I fired a shot.
3422. Where would the gas go? It would go out of the heading and into the air, but it might get into an old bord if it was in the way.
3423. Did you ever allow any oil to remain on the gauze of your lamp? I took good care that there was not any, and I took great care that no one used my lamp but myself.
3424. How long would you use the same gauze? Perhaps a week or more; but whenever I found it any way weak I renewed it, but I always took good care to keep a good one on for myself.
3425. You did not lock the lamps for the men at night? No, I was not there.
3426. These lamps were then unlocked? Yes; but I gave orders to the men to lock them themselves.
3427. Was the key left outside the cabin? Yes.
3428. Was it there in the daytime as well? Yes; but I was generally knocking about there during the day; it would be a pretty hard matter for a man to come there and unlock his lamp without my seeing him.
3429. It is now nearly eight weeks since the explosion, and would you be surprised to hear that there is no gas in the bords off No. 1 heading? I am not much surprised.
3430. Did you know Millwood? Yes.
3431. What sort of a man was he? A very good workman.
3432. How long did he work under you? I never considered he worked under me at any time.
3433. How long did you know him? Seven or eight years.
3434. Was he a steady man? Yes, a very steady man.
3435. And a good workman? Yes, good for what he had to do.
3436. And very intelligent? I cannot say that.
3437. Do you think he had a good knowledge of coal-mining? I do not.
3438. What reason have you for saying that? I thought the man was careless in detecting gas.
3439. In point of fact, have you ever seen him trying to detect gas, or have you shown him how to detect it? Yes, I have shown him on many occasions that gas was existing, when he would come in to the places to fix up a stopping or hang a door.
3440. He then had experience with you in the detection of gas? Yes; I kept it no secret from any man who wished to see it.
3441. You stated in your evidence that after the strike you prophesied that there would be a blow-up some day? I have stated before the strike that if due care was not taken with the gas, she would blow up some day, because Mr. White was not in my opinion going the right way about it.
3442. You considered that Mr. White was not competent to deal with it? Yes, I did.
3443. You knew of the danger that was existing, and you considered that Mr. White was incompetent, and yet you did not pass an incompetent man, and go to head quarters? I beg your pardon. Did I not say that I showed it to Mr. White and to Mr. Ross at the same time? Surely that was good enough?
3444. Was that doing your duty? I think so.
3445. How many times did you show it to Mr. Ross? Once.
3446. How often did Mr. White see it? Twice.
3447. Is that all? Yes, in my presence; but he has seen it hundreds of times by himself.
3448. And you saw it hundreds of times yourself? Yes.
3449. And you considered White incompetent? Yes; I have already said that.
3450. And you allowed an incompetent man to stand between you and the manager? I showed the gas to the manager in presence of his overman.
3451. I do not suppose there was a good feeling between you and the other officers at the pit after the strike? I never had any disagreement during the strike.
3452. Is it a fact that you have lately stated that you intended to make it hot for Mr. Ross and the Company, when you were called before the Commissioners? I have never said such a thing, and Mr. Ross and myself were always good friends.
3453. And yet you would not pass Mr. White to show him a danger? Yes; I passed him on the occasion that I showed it to the manager in the presence of White. The manager knew of it, and what is more, he knew White had been delegate for years.
3454. *Mr. Hilton.*] Did you consider it White's duty to report all matters to Mr. Ross? Undoubtedly.
3455. Have you read these general rules for the working of collieries? Yes.
3456. Do you find anything in these rules that requires you to go beyond the overman? No; I do not see anything.
- Mr. Hilton.*] Nor do I.
3457. *Mr. Owens.*] How long after the explosion did you enter the mine? The night afterwards.
3458. Did you notice that big fall on the engine plane? No, I did not go that way; I went the slacky way.
3459. Did you notice the stoppings blown out in No. 1 heading? Yes; but I did not go around them.
3460. Did you notice the first stopping? I did not pay particular notice; as I did not go in for the purpose of taking particular notice of everything.
3461. Did you know these stoppings [*Marking places on the plan*]? Yes; I think they were blown out, but I am not sure.
3462. What bords do you refer to when you speak of where an accumulation of gas might take place? In the old workings on the west side of the dyke. [*Places marked.*]
3463. You stated that your attention was once drawn to a safety-lamp with a burnt top? Yes.
3464. Are you sure that that lamp was not again used in the mine? I am positively sure that it was not.
3465. To whom did you give the lamp? I cannot positively recollect whether it was Beckton or his mate. We had only four lamps, and Mr. Ross had to send to Wallsend to get some more lamps. I believe we got half a dozen more afterwards, and when these lamps came I took out the old gauze on some of these lamps, and I recollect putting a new gauze in the top of this particular lamp.
3466. After danger had been reported you remedied it? Yes, as far as lay in my power.
3467. Did you ever notice any gas in the western district? Never.

3468. Did you ever notice it in any other part of the Hill End district? I have heard that it was seen ten or twelve years ago, but I was not there.
3469. Was it common for the gas to accumulate in any of these bords off Nos. 1 and 2 headings before the strike? I never saw any accumulated, but it came off at the working faces, and what I say is that if the furnace was slack at any time during the strike, the gas would get into the old workings because there was a great amount given off.
3470. Do you consider you did your duty in reporting to Mr. White? Yes; according to the colliery rules he was my superior.
3471. It was his duty to report to Mr. Ross? Yes.
3472. And if he did not do that? Well, I reckon I was clear.
3473. *Mr. Hilton.*] What reason had you for thinking that Mr. White was incompetent? On one occasion when I sent those two men out for having unscrewed their lamps he sent them back immediately and I had to find them other places. I found one of the men a place in No. 1 heading. There was no gas in there at that time. I asked Mr. White some days afterwards what Mr. Ross had said about the men, and he said he had never reported it to Mr. Ross.
3474. *President.*] That is some time ago? Yes.
3475. When you were opening out the district? Yes.
3476. *Mr. Jones.*] Do you know if Mr. White reprovved those men for neglect of duty? I do not know.
3477. He merely sent them back again? Yes.
3478. There has been a great deal of stress laid on the matter of reporting to officials. Does not this rule 3 prescribe your duty. Read it and see? Yes; I reported to the overman.
3479. And there your duty ended? Yes.
3480. Do you think it is an evidence of good management not to provide a system of reporting by which the report of each and every official would reach the head manager? If there was a book kept at the mine for entering these reports, the manager would see everything, but in the absence of that he would not.
3481. Do you think it is also a good system for each officer to send in his own report? Yes; either to do that or to enter it in the ordinary report book.
3482. Of course I am aware that in many of our large collieries and in some small ones as well, each official sends in a distinct report of his own. Don't you think that that would be a much better system? I do not see there is much difference if you had a report book in which these daily reports could be entered.
3483. But you believe a system of reporting in writing would be much better? Yes.
3484. Than the systemless system pursued at Bulli? Yes; and if it had been carried out there would have been no call for this inquiry.
3485. Was it any part of your duty to suggest the adoption of such a system? It was no part of my duty.
3486. You think you would be told to mind your own business? I have very little doubt about it.
3487. *President.*] I am sure you would not.
3488. *Mr. Owen.*] During your time were the roads from the Hill End to the western, and from the western to the grip in a travelling state? Yes; I was on the western road almost every day, so I can say positively that there was no accumulation of gas there then, for there was a good travelling road.
3489. You have already been asked as to your opinion of the competency of the late deputy—do you think it was a prudent matter on his part to allow men to work with open safety-lamps? No; I think it was a great neglect of duty and a violation of the rules.
3490. *Mr. Clarke.*] When you showed Mr. Ross this pipe fixed in a blower of gas, what was the conversation that took place—what did you say to him? I showed the gas to him in that way so that he could see that it was not diminishing, and his reply was to be careful.
3491. Is that all? That was all.
3492. Were no steps taken? None.
3493. *Mr. Croudace.*] During the time you were deputy did you examine the various working places previous to the men commencing work? Yes, every morning.
3494. Was that in compliance with any special instructions? It was in compliance with a rule.
3495. Rule 4:—"No workmen or boys shall enter any working place until it has been examined by the overman, or other person duly appointed, whose duty it is to make such examination before work is commenced." Is that the rule you refer to? Yes.
3496. And you complied with that rule? Yes, in all instances.
3497. Did you consider these places in your time properly ventilated? The places were very well ventilated, that is when the headings were not driven too far from the cut-throughs.
3498. Is there any difference between the system of ventilation which you have seen after the strike, than before? No alteration that I could see.
3499. None at all? None at all.
3500. Now I will read the rule a little way further on:—"If on examination any working place is found insecure from a defect in ventilation, or from insufficiency of props or timber, work shall not be commenced there until the insecurity is remedied. And if in the course of being worked any place prove insecure from any of the causes above mentioned, the overman, or other person appointed, shall, if he think necessary, stop the workmen there and remove the workmen. Immediately upon doing so he shall cause a danger signal or 'danger cross' to be erected across the entrance to the place, beyond which no person shall go on any pretext whatever, unless duly authorized so to do." Did you comply with that part of the rule? Yes.
3501. But would not the proper ventilation of these headings have consisted in carrying bratticing into the faces? Yes; no doubt that would have been the proper way.
3502. Knowing that, why did you not suggest to the overman, or to Mr. Ross, your way of improving the ventilation in the faces, or why did you not actually carry it out? When I went beyond their instructions I had to leave.
3503. You actually carried out a certain portion of No. 4 rule in examining every working place every morning, and there you seem to have stopped. Why not insist upon carrying out this better system of ventilation; you have full power, and you would not be amenable to any consequences that might arise? I cannot say that. When I gave my report to the overman it was his duty to attend to it.

Mr.
J. Crawford.
13 May, 1887.

Mr.
J. Crawford.
13 May, 1887.

3504. No. 4 rule also distinctly says:—"No workman or boy shall, unless duly authorized, go into any part of the mine, excepting that to which he is appointed by the overman or other officers." Did you carry that out? Yes, I carried that out also.

3505. And it also says:—"And until such examination shall be made and leave given, no workman or boy shall go beyond the flat, or other station appointed by the overman." Did you carry that out, too? Yes, I did, and I saw that all the places were properly ventilated then.

3506. Are all the places properly ventilated now? The headings are driven further past the cut-throughs than when I was there.

3507. But there is no difference in the system of ventilation? I did not notice any.

3508. You say that you told Mr. White that if he was not careful the pit would blow up some day? Yes; that was just about the time of the strike.

3509. But would not that state of affairs implicate you as well as any one else? I was leaving the service of the Company. I told him the last day before the strike took place.

3510. But supposing an accident happened before the strike, and it was found that the mine was not properly ventilated? It was properly ventilated.

3511. Have you not said that bratticing would have been a better system? Yes; but before I left, the places were safe.

3512. Are they less safe now? Yes; the bords and headings are driven further in advance of the air, that is the only difference.

3513. What was the distance between the stentons when you were there? They were about a chain apart.

3514. But did you not drive the last stenton that has been put between these headings? I could not say.

3515. How many stentons did you put through between these headings? I should say about seven.

3516. You admit you have put seven stentons between Nos. 1 and 2 headings? I am not sure.

3517. Shall I say six, will that please you? No, it will not, that might be one less.

3518. Now look at the plan and see what becomes of your statement that you drove the stentons more frequently than they have been driven since? I did not say that exactly; I said these places were driven further in advance of the air, and if you understood the rules of these headings you would find that Mr. Ross' instructions were to get the cross-cuts in coal as much as possible, and not over rolls.

3519. I want to know exactly what you said to White. You state that on one occasion when Mr. White was there, that you told him there would be a blow-up in this mine. I want to know what justification you had for such a statement. You say you left the places safe, and you see that you drove the last stenton? What I did was to drive the stentons as near as I could at every 22 yards.

3520. But does not the plan prove to you that the stentons in these headings, from beginning to end, are driven most irregularly? They were driven according to orders, and if you examine that plan you will see rolls coming down 18 inches from the roof, and extending perhaps 10 or 12 yards in length, these would interfere with the driving of the stentons.

3521. But you led me to believe that you drove the stentons every 22 yards until I show you that they are driven most irregularly, and that not one stenton has been driven since you left the colliery; what then becomes of your statement that you considered the system of ventilation was not so good after you left? My statement was this, that I warned Mr. White to be careful owing to the quantity of gas that was coming off.

3522. If the furnace was stopped for a few days during the strike, I would like to know where all this gas would go—could it go to the furnace, would it go outside, or would it stop there? I say it would get into the old workings. I also say that my idea was that these bords and headings were driven further in advance of the air than when I was there. I would like to know how long did men work in these bords during the strike.

3523. Was there any alteration or likely to be any alteration in the manner of working, which would cause you to believe that there would be some dreadful explosion after your time? I did not see any great alteration after the explosion.

3524. Are you aware that the ventilation was better after the explosion than when you left? If the stoppings were well built up there ought to be four times more.

3525. Have you any reason to think that the manner of building the stoppings has been altered? I do not know.

3526. Have you any reason to believe so? I have no reason to believe that they were altered in any way.

3527. Then with the new furnace giving a largely increased current, the probability is that the whole ventilating system was improved? Yes.

3528. In your time was there a door in the western junction? Yes.

3529. Was it a regulating door? Yes.

3530. Had it a slide? No.

3531. Was it a swing door? What do you call a door with hinges?

3532. *Mr. Croudace.*] I call that a swinging door. *Witness:* So do I.

3533. You stated that you told the overman that if he was not careful there would be a terrible explosion? I did say something of that kind, and I have never denied saying so.

3534. If you can prove to me that there has been any alteration in the stoppings, or any decrease in the quantity of air supplied to these headings, I will give you all credit; but if you cannot, it will be the reverse. You have admitted that there has been no alteration in the ventilating system as far as these headings themselves were concerned, and you have also said that there was a large increase in the quantity of air going in after the explosion. I will now ask you if there has been any alteration in the ventilating doors? I cannot tell you; I can only tell you what there was there, when I was there.

3535. Well, was there a door at the western? Yes; a swinging door.

3536. Was it kept open or shut? It was kept open as a rule, but the engine set of 20 skips had to come through there, and it had to be opened on many occasions every ten or twelve minutes to let the set through. There was no air allowed to pass when it was open, and when the door was shut there was a small hole in it to allow the wire rope to work, and on the right hand wall there was a hole 18 inches wide.

3537. Now, between Nos. 1 and 2 headings, was there a door there? Yes.

3538. Was it a closed door? Yes.

3539. Was a trapper kept there? Yes.

3540. Was it a double door? No; there was only one door.

3541.

Mr.
J. Crawford.
13 May, 1887.

3541. Proceeding from there to the diagonal cut-through, was there a door there? Yes.
3542. A closed door? Yes.
3543. Was it a double door? No; only one door.
3544. Between Nos. 3 and 4 headings, was there a door there? Yes.
3545. Was it a closed door? Yes; it was a swinging door.
3546. Was there a trapper kept there? No; this used to be the flat, but a day or two before the explosion they finished it and pulled the coal from here [*place pointed out on plan*].
3547. When you went down after the explosion did you look for this door? Yes.
3548. What did you find? I saw a sheet of canvas had been put up there.
3549. But did you not find the door? No.
3550. Where was it? I don't know; and I saw nothing there but a sheet of canvas.
3551. Did you see the No. 3 door? No.
3552. We have evidence that after the strike these doors were in existence as well as the western door, and that three of the doors were kept by trappers, and that the other was attended to by the man at the flat. Did the same state of things exist in your time? Yes.
3553. Then there is no alteration in the system of ventilation as far as the doors are concerned? No alteration.
3554. You stated that you believe that there could not have been sufficient gas in No. 2 heading to cause the effects of this explosion, and that there must have been some gathering of gas in these old workings west of the whin dyke? Yes.
3555. Do you think that she fired anywhere this side of the dyke? I could not tell you.
3556. Did you examine any of these old workings? No.
3557. Did you examine any of the workings in the western district? Yes; but not in the return.
3558. Did you see any sign of fire or of the force of the explosion? I saw a few slight indications of burning.
3559. Did you see the door at all? Yes.
3560. Were there any signs of burning on it? The door was not charred.
3561. Did you not think that if the explosion had gathered intensity by lighting gas in the old workings, you would have seen greater signs of fire in the western district? I did not go into the return; but if you go there you will see that the road is in a very ragged condition.
3562. But do you not think that if the explosion had gathered gas as it went along, that you would have seen greater signs of fire down here? I saw signs of fire, but of no great fire.
3563. I ask you still further—In getting into these old workings is there a continuous opening, or is the overcast carried right away through to the furnace? Yes.
3564. But are there many openings opposite the road? Yes.
3565. I ask you as a fair and good deputy, is there any chance of gas accumulating when the air is regularly sweeping to the furnace? Yes; in some of these places on the right and on the left, falls have taken place, and both roads are very ragged, and if this is the case is it not possible for the gas to leave the working faces and to pass into these old workings.
3566. Not with the current of air that is reported to have been passing. You know that Nos. 1, 2, 3, 4, 5, and 6 headings all produce gas; but did you ever hear of any gas lighting at the furnace? No.
3567. Did you ever hear any man say that he had seen gas in the western district at any time? No; but one morning there were some men working contiguous to the dyke, and when they fired a shot it lighted a small quantity of gas right in the dyke. That is the first gas I saw ignited in that locality.
3568. Do you know of your own knowledge that the new furnace has been working since the strike, and was the new air shaft sunk in your time? It was being sunk.
3569. But it is now complete? Yes.
3570. Have you heard of any large improvement in the ventilation from that new furnace? I saw the new furnace the last night I was in the pit. I went in with a friend, and I could see that it was a grand furnace, capable of ventilating over ten times the ordinary amount, if the other ventilating arrangements were properly constructed.
3571. Have you heard that there was a current of air passing amounting to 12,000 cubic feet per minute? Yes, that was a great improvement upon 2,500 feet, which I believe was Mr. Rowan's last report before the strike.
3572. You have stated that you handed a man a broken safety-lamp at one time? No, the man handed the lamp back to me.
3573. Was that man Albert Smithers? I could not positively swear.
3574. Did you ever give any person a broken safety-lamp? I never did to my knowledge.
3575. Will you swear that you did not on a certain day or night give a miner a broken safety-lamp? I swear now that I did not do so to my knowledge.
3576. *President.*] We are now speaking of a witness who swore that you gave him a broken lamp, and that you said it was the only one available? I gave no man a broken safety-lamp.
3577. Consider the circumstances. The man who made this statement explained it in this way: They were asked whether they had ever complained as to the condition of the gauze of the safety-lamp, and I think two witnesses said, "Certainly": one witness, I know, said that on one occasion he handed Mr. Crawford a safety-lamp, the top gauze of which was burnt through, and that you handed the lamp back and said you could not get any gauze? I never did such a thing as that.
3578. *Mr. Croudace.*] You have told us that very strict and proper care was taken by you in dealing with all safety-lamps, and that they were all locked during the day shifts, and that you locked them yourself. Did you know that the night lamps were not locked? I had no reason to believe that they were not.
3579. How was it that this carefulness became lax at night time? I don't know. I was only a servant and not an employer of labour. That was Mr. White's duty.
3580. I disagree with you there. Did you not consider that the lives of the men working on the night shift were as valuable to them and to their families as the lives of the men working in the day-time? Undoubtedly they were.
3581. Would it not have been a prudent thing for you to insist upon these lamps being locked at night as well as in the day-time? I insisted as far as lay in my power, and Mr. White was fully aware that the night men using safety-lamps were left to their own free will.

- Mr. J. Crawford.
13 May, 1887.
3582. To my mind you do not free yourself from all responsibility in trying to throw it on to Mr. White. You admit the performance of a portion of No. 3 rule, and then you failed in carrying out another portion of it? When 4 o'clock in the afternoon came my shift was done, and I had no further control over anybody.
3583. I am astonished that so competent an officer as you appear to be in many respects did not realise fully the extent of the duties which were yours? I did my duty, and I left my superior to carry out his.
3584. You stated that you believe you would have been snubbed if you had gone past Mr. White and reported these dangerous state of things to Mr. Ross? I have no hesitation in saying so, because I would then be going beyond Mr. White's authority.
3585. What sort of man do you consider Mr. Ross? A nice man, but a man of very few words.
3586. But are these words angry words or pleasant ones? Sometimes one, sometimes the other; it all depends.
3587. Did he ever on any occasion when you met him find fault with you, or censure you, or quarrel in any shape with you? I took good care not to do anything that would give him cause.
3588. Do you remember ever having any words with him which would give you the slightest reason for saying he would have snubbed you for reporting to him a dangerous state of things—anything to justify you in thinking so? Yes.
3589. Then tell it to me? Very often he would give me very short answers.
3590. Was there ever any occasion on which this nice man with very few words gave you any justification for thinking that he would have snubbed you if you had brought these important matters directly under his notice? I will not lay any charge against Mr. Ross.
3591. Is there anything that you can remember Mr. Ross doing that would justify or warrant you in making this statement? [*Question unanswered.*]
3592. *Mr. Jones.*] Was Mr. Ross aware that the men worked with unlocked safety-lamps at night? So far as I know he was; if he was not White should have reported this information to him.
3593. I suppose he knew that there was one in charge of the mine at night-time? He knew perfectly well. [*The witness withdrew.*]

John Barnes Nicholson sworn and examined:—

- Mr. J. B. Nicholson.
13 May, 1887.
3594. *Mr. Clarke.*] You are a miner? Yes.
3595. And you reside at Bulli? Yes.
3596. Have you worked in the Bulli mine? Yes.
3597. Was that before the strike? Yes.
3598. How long did you work there? Nearly four years.
3599. Where did you work? In the Hill End, in the western, and in the grip.
3600. Where, just before the strike? In the grip.
3601. How long before that was it that you worked in the Hill End district? A little over two years ago.
3602. And you did not work in the mine at all after the strike? No.
3603. You remember the explosion? I do.
3604. Did you enter the mine after the explosion? No, not the day after the explosion. I was up at the pit and offered my services, but they were not accepted.
3605. Were they refused? I asked the overman if I should go in, and he turned round and did not say anything.
3606. He gave you no encouragement? No.
3607. But you went in on the Monday following? Yes.
3608. What time was it? About half-past 2.
3609. Who were with you? Messrs. Ross (senior), Ross (junior), Gardiner, Evans, Inspector Owen, and two other miners, Doyle and Greenhalgh.
3610. For what purpose did you go into the mine? To make an inspection on behalf of the miners.
3611. You and the two other miners were appointed for that purpose? Yes, at a meeting of miners.
3612. And you made the inspection? Yes, a slight one.
3613. Where did you go? First into the furnace, and from there into the gassy section.
3614. Did you notice anything at the furnace that attracted your attention? Nothing; we simply tested the air and came back. We went to the bank head, and from there to the gassy section.
3615. What part of it did you examine? We first went into No. 1 heading, and from there into No. 2. We found a considerable body of gas in No. 2 heading.
3616. Did you make any examination of the bords off No. 1 heading? Yes; two at the mouth of the heading, and one old bord, and two bords that were working.
3617. Did you test for gas in them? No, I did not; I only went down to the face of one of the bords where the last body in the pit was found.
3618. Did you go to the face of No. 1 heading? Yes.
3619. Did you find any gas? Not at that time.
3620. Did you go into the face of No. 2 heading? Yes.
3621. Did you find any gas there? Yes. Mr. Evans said that the gas was back 22 yards from the face of the heading, and that it was not safe to go in with the lamp.
3622. Did you go in? I set my lamp down and went in without a lamp.
3623. What was the appearance of the face? I could not see.
3624. Did you notice the destruction in the mine at this time? We did not take particular notice of everything, but we noticed the extent of the destruction. In these headings the roof is very good, and there was not much timber to be knocked about.
3625. Did you make a particular inspection of the heading? As well as I could by feeling over the face. By feeling the coal in the face I thought a shot had been fired there. The gas was very strong; it was down from the roof to the top of the coal; I could feel it while I was in there, especially when right up to the face.

Mr. J. B.
Nicholson.

13 May, 1887.

3626. Did you examine the bords off No. 2? No, not particularly.
3627. Did you see any wreckage in No. 2? No; there is a good roof in there, and nothing to fall.
3628. Did you notice anything particular anywhere else? We went into No. 3 and found no gas there, and in one working place we found the stenton was 41 yards from the face.
3629. Did you find any gas? Not at that time.
3630. Did you examine any other heading about there? We went into No. 4 and into the straight which I believe they call No. 5, but we did not find any gas in either of them.
3631. Was there much wreckage or destruction? Hardly any.
3632. Did you make any other visit to the mine afterwards? Not until the inquiry was being held at Bulli. I then went in with the jury.
3633. From what you saw did you form any idea as to the origin of the explosion? That is very difficult to determine. I should almost fancy that it came from the straight, or in the old workings, from the position in which many of the bodies were described to me.
3634. From what you know of the mine since the strike, have you heard anyone remark that there was a large accumulation of gas there? I heard several men mention it; one in particular. It was Jerry Westwood.
3635. Where did he work? In No. 2 heading.
3636. What did he say? He told me that night, at Bulli—I think it was the Friday night week before the explosion—that they had struck a heavy blower that day in the heading, which was giving off gas all day.
3637. What did he say? He remarked it was a very heavy blower, and said they could hear it whistling 100 yards away.
3638. Did you make any remark? I asked him if there were any men working round about him with naked lights, and he said there were. I said, "God help you; one of these days you will get it."
3639. Were you secretary of the Miners' Union at that time? I was.
3640. Having heard of that enormous escape of gas did you take any action? I did not.
3641. Did you not bring it under the notice of the Association? I did not.
3642. Did you consider it your duty to do so? I did not.
3643. Why? I believe the management were thoroughly aware of it at the time.
3644. Did you believe what Westwood told you? Was he a truthful man—I had no reason to doubt his word.
3645. A blower giving out such an enormous quantity of gas would be a very dangerous element, would it not? Yes, undoubtedly it would be if there was not a sufficient quantity of ventilation to carry it away.
3646. Did you know that the men were working in its vicinity with naked lights? I was told that that was the case.
3647. That would be another element of danger, would it not? Yes; particularly those on the return side.
3648. And it was imperilling lives of all working there? It would depend on the quantity of gas coming off.
3649. A blower that could be heard a 100 yards away must have given off a considerable quantity of gas, was that not in itself a danger? It might be dangerous to the parties working there, but I do not believe it would be to the other portions of the pit.
3650. Holding the responsible position you do, and being the leader of others, did you not think it was your duty to take steps to avert such an evil as that? I did not think I had any right whatever.
3651. Not from a motive of humanity? It was purely a matter of business.
3652. I am asking you to take it from a human point of view. You knew that numbers of lives were being held as by a thread, did you not think it your duty, as a responsible officer, to bring that state of things under the attention of the management or Union? With regard to our own Union, I believe that every man in the Union knew it. I also knew that the manager knew it, and if I thought that any communication from me would have altered it, I should have been very glad to have made it, I can assure you; but I had every reason to believe that every man in the pit knew of it, for it was a matter of common conversation.
3653. But no steps were taken to avert it? Every man was afraid to do anything, for fear of losing his work.
3654. Why? Because of the rules that were signed after the strike.
3655. They were deterred by these rules from making reports? That is what I mean.
3656. I suppose you refer more particularly to rule 6 having reference to interference by employees? I refer to rules 3, 6, and 13.
3657. Rule 6—"Interference by employees—any employee interfering in any way with the colliery manager, or his overman, for regulating the work of the mine, shall be liable to dismissal without notice." That is the one? Yes.
3658. And the interpretation generally put upon this rule was, that if they reported any danger they would be dismissed? Yes.
3659. Was this matter ever discussed at the Union? All of the rules have been discussed and condemned *in toto*. A resolution was passed to the effect that none of us could work under them.
3660. What interpretation was put upon rule No. 6? That I have already given, that it would involve the loss of a man's work if he reported anything whatever.
3661. And that is your present interpretation? It is.
3662. How do you come to that conclusion? Because it is stated also from the fact, that I mentioned it to Mr. Hamilton and Mr. Ross, who told me that the rule could not be altered.
3663. Well, let us clearly examine the rule, and read it carefully. It says—"Any employee interfering in any way with the orders issued by the colliery manager, or his overman, for regulating the work of the mine, shall be liable to dismissal without notice." How can you interpret a complaint, or reporting the presence of a great danger, as an interference with the workings of the mine? Yes, easily; if I had been working and pointed out that a cross-cut should be put through to avert danger. That would be pointing out danger, but it would be an interference with the duties of the overman or manager, and he would tell me to go about my own business, as he has done.
3664. When was this—before the strike? Yes.

- Mr. J. B. Nicholson.
13 May, 1887.
3665. What did you do? I pointed out that it was unsafe for the boys to wheel the tubs from a particular part of the mine where I was working, and I was told to mind my own business, and that I had nothing whatever to do with it.
3666. Was that the only occasion? Yes.
3667. Does that rule convey that interpretation to your mind? Strictly speaking it does, for making complaints would be an interference with the duties of others.
3668. Would the reporting of a great danger be an interference with the orders of the management? Decidedly.
3669. Would a great danger be any part of the orders of the management? If I pointed out something that required a remedy, would not that be interfering with orders.
3670. No. Would you be interfering with the orders of the management in reporting the presence of gas? In a manner of speaking it would be. If Westwood had said that there was such a blower in existence, and that it would be necessary to put in some bratticing, that would be interference, and would be a contravention of these rules, and would have rendered him liable to dismissal.
3671. So you think that the management of the mine is of such a character, that a great danger being pointed out the man so reporting would be dismissed? I did not say that—what I said was, that a man would render himself liable to dismissal.
3672. Did you think that there was the slightest likelihood of a man being dismissed for reporting danger? I could not say.
3673. Did you ever hear of a man being dismissed for reporting a great danger? I have never really known a great danger existing there, so of course I cannot reply to that question. The only time I had occasion to point out danger I did so, and I have given you the reply I got.
3674. But you never took any steps to report this great blower of gas to the management? I did not.
3675. Did you hear whether the gas accumulated there in any great quantities up to the time of the explosion? No; I did not.
3676. Although it was well known to the members of the Union, they took no action? Not that I am aware of.
3677. Did it ever occur to you to appoint two miners, inspectors, under the 30th clause of the Act? It has occurred to me, but it was never done.
3678. For what reason? The best in the world.
3679. Did the miners themselves appoint two of their number to make periodical inspections, which they had a right to do, and which right could not be refused? The miners who did this work would want to be paid for it, and unless it was taken up by some organization of labour there would be no means of payment.
3680. The reason the Union would not undertake the responsibility was that the management would dismiss the inspectors—is that it? Not that exactly. Something like a year ago I notified to all the managements in the district that we requested a conference to arrange certain matters for the more satisfactory working of the different collieries. They refused to grant us a conference on every occasion, except one manager; that was Mr. McCabe, of Mount Keira Colliery; so we could not get arrangements made for the appointment of miners' inspectors.
3681. But it was not necessary for you to have a conference to do that? I think it was.
3682. Do you think the management would have prevented you? I did not say that.
3683. However, it was not done? No.
3684. When the mine was in a dangerous state you said to one of the men working there "God help you one of these days?" That was only a few days previous to the explosion, and it was the general idea that the new furnace had improved the ventilation.
3685. When you made this remark—that there would be an explosion, or something tantamount to it—was the new furnace going then? Yes, I suppose so; it was supposed to be going; I am not sure that it was.
3686. However, after making that remark, you took no steps to have a miners' inspection made? I brought the matter twice before meetings of miners, and nothing was done; as a matter of fact, men were so cowed down that they dared do nothing.
3687. Was that before the blower? Yes.
3688. The inspectors were never appointed? Never.
3689. Mr. Neilson.] You were appointed by the miners of Bulli to make a complete examination of the mine after the accident? Yes, with two others.
3690. To ascertain the cause of the explosion? Yes, for that purpose.
3691. What were your special instructions at the meeting? I do not think any resolutions were passed, but we were appointed to look through the mine and see if we could trace the cause of the explosion.
3692. I think you said you went down to make a special examination? Yes.
3693. How many places did you examine? Five headings, and two or three bords in the gassy section.
3694. How many bords are there in the gassy section? I could not tell you, never having worked there since they were opened out.
3695. You went down specially to make an examination to find out the seat and cause of the accident, and you only examined two or three bords in the Hill End section? I did not say that we only examined two or three bords, but there was nothing very special in the bords; I went more especially to find out how far the stentons were back from the headings.
3696. In point of fact then, you were sent to make a special examination of a trifling little matter, and not to see the cause of the accident? We knew the cause of the accident, and we could not get round as well as we wished, and there was no one to show us from the Hill End through to the western district. Mr. Ross could not find his way through, and I could not, never having been there before.
3697. Did you examine the props? Yes, several; one especially at the end of the stenton in No. 1 heading.
3698. Was that the inmost stenton? Yes, close to the end of No. 1 heading.
3699. Did you examine any props in No. 2 heading? I cannot say that we did examine any of them very specially, but in No. 1 we saw one charred $\frac{3}{8}$ of an inch deep.
3700. Do you call that a special examination? Yes, but we were chased round as if we were going on a walking-match.

3701. You considered it of more importance to go round and examine these places than making any attempt to find out the seat of the accident? The seat of the accident seemed to be generally understood. At any rate, a good number of men were under the impression that it occurred in No. 2 heading.

Mr. J. B.
Nicholson.

13 May, 1887.

3702. In point of fact, you had no business down the pit? Perhaps so, but the miners thought I had, or they would not have asked me to go.

3703. Did any of the miners report to the management when they heard of the dangers existing; you say it was a matter of general conversation, and you were so impressed with the danger that you exclaimed "God help you; one of these days you'll get it;" did any of this general conversation reach the ears of the management? I cannot say whether they reported it to Mr. Ross or not; I am not aware of it if they did.

3704. You are perfectly aware that you have full power to appoint two check-inspectors? I did not have full power myself; the miners have power, providing they had the means of paying for the work.

3705. But the management could not possibly stop you from doing that? I brought the subject under the notice of the men at several meetings, but the inspectors were never appointed. I do not know, but suppose it was because there was no means of paying them for the time they would be away from their work.

3706. What did you report to the miners when you made the special inspection of the mine? Several of the most important facts in connection with it. We reported that we found a number of props charred, and that we found a bord driven much beyond the distance required by the Act; that the bord was in No. 3 heading, and that it was 41 yards beyond the stenton, and that we could not get through the return from the "gassy" section into the western, and consequently that we had to come out by the main road. When we reached the junction of the western road, I asked if it would not be better to postpone the inspection until next day, but they said we had better finish it that day, as the horses were smelling very badly, and that it would be easier to finish it then than to come in again next day.

3707. Were the miners satisfied with the inspection? No, they were not.

3708. You only examined a few bords? We examined a number of bords when we got into the western.

3709. You only examined three in the Hill End district? I believe only three.

3710. *Mr. Hilton.*] You have just stated that you could not travel the return from the "gassy" to the western—was it from the "gassy" to the western, or from the western to the furnace? It was from the gassy to the western. We went a certain distance, but owing to a fall of rock, the road was partially blocked. However, Mr. Ross could not find his way through.

3711. *Mr. Owens.*] You were outside when the bodies were coming out? I was there the greater part of the time.

3712. And you viewed the bodies? Yes, a good many of them.

3713. Did you notice signs of burning on them or not? I did, and I saw that a good many of them were badly burnt.

3714. And were several of them not burnt at all? Yes, I believe so. There were several that I only examined about the head and face, and on a good many of them I saw no traces of burning on these parts; but a large number of them had traces of burning on their faces.

3715. When you went into the mine, the fifth day after the explosion, which way did you go? We went by the main incline first.

3716. Did you go over the big fall? As we came back we went over the big fall, and up to the Hill End district. We did not go over the big fall in the main tunnel.

3717. When you were near it did you smell any powder or dynamite smoke? Not the slightest.

3718. You say you only examined three bords in the Hill End district? I believe so.

3719. Did you try for gas in any of these places? We tried the faces of one of the bords, but found no gas. No gas was supposed to be in any of these bords; and while we were there I was told by Inspector Owen and Mr. Evans that there was no gas in any of them.

3720. Before the strike where did you work? In the grip, close to the return air-course.

3721. Have you worked in the Hill End district? Yes, but not since the gas was struck.

3722. Can you vouch for the statement that the miners never attempted to appoint check-inspectors? There was a resolution passed by the district to the effect that we were justified in making use of the Coal Mines Regulation Act wherever it would benefit us. Three times I communicated with the Bulli miners on this subject, but it was never acted upon.

3723. Did Mr. Ross ever object to it? Not to my knowledge.

3724. You have given us your interpretation of No. 6 rule; are you aware that the majority of the miners so interpreted it to mean that if they reported danger they would fall out with the management? Yes, that was the unanimous feeling.

3725. Was this interpretation put to any meeting of the men? These rules were all condemned by the men, and I pointed out the matter to Mr. Hamilton.

3726. I mean this 6th clause? The men thought it would mean dismissal if they reported.

3727. Are you thoroughly convinced in your own mind upon that point? Yes.

3728. *Mr. Jones.*] Did you communicate or indicate that interpretation to Mr. Hamilton? I did indicate it. I told him what the feelings of the men were in connection with these rules.

3729. You have stated that you did not consider it your duty to inform the manager of the blower of gas of which you had been informed? Yes.

3730. Does this explain what you mean: Rule 15 says:—"Should any unexpected discharge of gas occur, the overman must order all naked lights to be extinguished, withdraw the men and boys, and make the manager acquainted with the case, in order that the evil may be remedied and the places restored to their proper working order"; was that the simple reason why you did not write to the manager? I knew that these rules provided for it, and that a certain number of men were working where gas was known to exist with safety-lamps. More than that, the management for a long time had been paying those men who used safety-lamps 3d. per ton extra; therefore they must have been aware of the existence of gas.

3731. Do you know that the manager was aware of the large blower of gas? I could not say he knew of the existence of that.

3732. Was it possible for a blower of gas to exist that could be heard at 100 yards without the overman becoming acquainted with it? I should think not, but I do not know, as Westwood did not say whether he had reported it to the overman.

Mr. J. B.
Nicholson.
13 May, 1887.

3733. I have read you the law in reference to the duty of the overman—was that the reason that deterred you from taking any steps as Secretary of the Union? Yes, that was the reason.

3734. *Mr. Croudace.*] In answer to Mr. Jones, you said that that portion of rule 15 referring to the duty of the overman prevented you from reporting this blower to the management? I did not consider it necessary under that rule.

3735. But I will read another part of the rule; going on from where Mr. Jones left off, the rule says: "Hewers and others, when using naked lights, are strictly cautioned against the discharge of gas where faults, rolls, and backs are met with; and on its appearance they shall immediately leave the place and report to the overman, and shall on no account return to the place without proper authority"; were you aware of that part of the rule? The hewer in question was using a safety-lamp.

3736. The rule still applies, does it not? I do not think so.

3737. *Mr. Croudace.*] The spirit of it shows what you are to do.

Witness. I beg to differ from you.

3738. *Mr. Croudace.*] You may differ with me if you like.

Witness. I do. I think there is a very great doubt about it; for a safety-lamp is very different from a naked light.

3739. *Mr. Croudace.*] Well, we will come to No. 6 of the new rules of employment; I would just like to ask you a few questions on it, with a view of putting yourself right—an order is, I presume, a command, or some instruction given? Certainly.

3740. You are quite sure of that? Yes.

3741. No. 6 rule says:—"Any employee interfering in any way with the orders issued by the colliery manager or his overman for regulating the work of the mine, shall be liable to dismissal without notice"; you see it applies only to "orders"; can you apply it to anything else by any twist you like to give it? I do not think it requires any twist. I take this rule in conjunction with rule No. 3, and I say it prevents men from making any complaint whatever.

3742. By any twist can you, as an honest man, say that you misunderstand so simple a rule as that; it says, "Any employee interfering in any way with the orders;" you see you are confined to one thing—"orders" for regulating the work—it actually stipulates how the rule is confined? I will explain my meaning by stating, that if I objected to drive my place in the colliery further ahead from the cut-through, on the ground that it was too far in advance of the air, and the management said it should be driven ahead because I was going over a fault (which has been done), that would be interfering with the orders, strictly speaking.

3743. Am I to presume that, in the first place, you had received orders to go on with it? I have known such to be the case when men have been driving over stone.

3744. *President.*] Since these new rules came into operation? No; I have not been working in the Bulli Colliery since.

3745. *Mr. Croudace.*] I will put this rule to you again: "Any employee interfering in any way with the orders issued by the colliery manager or his overman for regulating the working of the mine shall be liable to dismissal without notice." Is not that very simple? It is very simple.

3746. An order, I take it, is this: Suppose the overman ordered a wheeler to wheel from Nos. 1, 2, and 3, and afterwards some miner ordered him to wheel from Nos. 5, 6, and 7, would not that be clearly a breach of the rule? Decidedly.

3747. Suppose, then, the overman ordered you and your mate to work in No. 1 heading, and Smith and son to work in No. 2 heading, and that afterwards you reversed the order, would not that be a breach of the order? It would.

3748. But would it be any breach of this rule or order if you suddenly struck a blower of gas or came across a bad piece of roof or a quantity of water (I do not care what it is), would it be a breach of any order if you went and reported the same at once. Do you really think that would be any infringement? Mr. White considered it an interference even previous to these rules being enforced.

3749. But would you think it a breach of No. 6 rule if you told the deputy and overman that you had met with a blower of gas unless they had previously said to you "If you strike a blower of gas you must not report it to anyone." Did you ever receive an order from the manager, or from the overman or deputy not to report to them a blower of gas or the presence of gas in any form? Never.

3750. Have you ever heard that any man had received any such order? I have never heard it personally, but I have heard the men say that they would be discharged for reporting.

3751. But you never heard any such order given? Never.

3752. Now, in reference to this rule 3, which says "*Absence from regular duties*" "Any miner or other employee found in any part of the mine or colliery other than that in which he should be working without the consent of the colliery manager, shall be liable to dismissal without notice." Is not that, in this particular mine, an absolutely necessary rule, particularly in this Hill End district? It would be if everything else was properly carried out.

3753. We are told that the men in the bords off No. 2 heading worked with naked lights. In the headings where a large quantity of gas existed, safety-lamps were used. Would it not be necessary to prevent the men working in the bords going into the headings with their naked lights? Exactly.

3754. Of course it would, and why allow the wheeler to go in the heading and hang his safety-lamp on the danger-board?

3755. *Mr. Croudace.*] The wheeler receives a positive order that he is not to take his lamp beyond the danger-board. If he did he would clearly break the rule. In this particular instance, there should be no misunderstanding, and I take this opportunity of having all these rules explained as best I can so that no one should turn and twist such a simple rule as this when, as far as I can discover, there is honestly and fairly no occasion.

Witness.] What other construction could the miners put upon the rule when they were told by Mr. Hamilton that the management would not allow any interference whatever.

3756. Did you mention anything of this blower to Mr. Hamilton? No; it was previous to the striking of the blower. I am not aware that any body was working in the pit at the time I speak of.

3757. Have you seen Mr. Hamilton since the blower was struck? Not to speak to him.

3758. What did Mr. Hamilton point out to you in reference to this particular rule? He said they could not alter the rules, and that they would have no interference with the management whatever.

3759. But did he specially mention rule 6? No.

3760.

3760. Did you not see the urgent necessity of having stringent rules, particularly in a colliery where gas exists? Yes; and I have always tried to observe them.
3761. Have you observed the system of ventilation that was pursued in this mine. Do you know the western door? I did know that a door was in existence before the strike.
3762. Did you know the door which separates No. 1 heading from No. 2? I was never in the gassy district while that turn was working.
3763. We are told that the turn and the bords off No. 2 heading were working with naked lights, and that gas was always being given off in No. 2 heading. Do you consider that a prudent principle? I do not, and I think it was done to save 3d. per ton charged when safety-lamps were used.
3764. It is a fact then that it was done, and that the 1st, 2nd, 3rd, 4th, 5th, 6th, and 7th bords were working with naked lights, and lights were also allowed in the cut-throughs? Yes.
3765. Is it a fact that the return air from No. 1 heading goes into No. 2 heading and returns by way of these bords? Yes.
3766. Would not the gas from this large blower have a tendency to go into these bords supplied by the return air? Yes; if there was not sufficient ventilation to carry it away. But of course, if it was sufficiently mixed with pure air the air the gas would become harmless.
3767. Did you ever hear the men working in these bords complain of any extra gas coming towards them, or of the danger of its doing so when this blower was coming off? No.
3768. Don't you think it likely that if there was such a large blower that they would have felt the effect of it? I had not an opportunity of knowing or of hearing their conversation.
3769. Is it natural to suppose so? It would be a natural supposition.
3770. When you were in the western district did you see any gas whatever there? We did not see a bit in the western.
3771. Independent of what masters may do, or masters' associations may do, the men can undoubtedly shelter themselves behind a much higher power for the purpose of making their own inspections of the mine at least once a month. Do you know that you can do that without interference? We have the right, but we were unable to carry into effect.
3772. Would you have me to believe that this was an impossibility at the Bulli Colliery where there were at least 160 men working. Was it impossible to get that number of men sufficiently interested in their own lives to pay 3d. per month each for the purpose of sending two men round the mine to inspect it? I believe they would very readily do it.
3773. Then why did they not do it, for there is no power to stop them? Had that conference been granted it would have been done.
3774. Would you have me to believe that the men so utterly disregarded their own safety that they would not pay 3d. per month to secure it? I do not know, but I believe that the men would not object to the expense, for I have always found them very willing to shell out where there is any cause for it.
3775. *Mr. Hilton.*] Have the miners got an anemometer for the purpose of testing the air when making inspections of the mine? I believe there are two or three in the district. [*The witness withdrew.*]

Mr. J. B.
Nicholson.
13 May, 1887.

SATURDAY, 14 MAY, 1887.

Present:—

The PRESIDENT (DR. ROBERTSON), IN THE CHAIR.

MR. O'MALLEY CLARKE,
MR. NEILSON,
MR. CROUDACE,

MR. JONES,
MR. OWENS,
MR. HILTON.

Henry Osborne McCabe sworn and examined:—

3776. *President.*] You are a mining engineer, and manager of the Mount Keira Colliery, Wollongong? Yes.
3777. I believe you have had extensive experience as a mining engineer in different parts of the world, Mr. McCabe? Yes, since 1881?
3778. And in some of the larger and better regulated collieries in the north of England? Yes.
3779. And consequently you have gained considerable knowledge of the properties of gas? Yes.
3780. When did you visit Bulli Colliery after the accident? At about half-past 10 o'clock on the night of the accident.
3781. Did you proceed into the mine on your arrival? Yes.
3782. Where did you go to first? I went into the straight, up Hill End, and got as far as that big fall.
3783. Did you go over the fall at that time? Not at that time. There was not sufficient room for the air to travel, and we arranged to make room.
3784. Did you afterwards proceed over the fall? Yes.
3785. With what object? To recover the bodies.
3786. Did you go over the fall in the straight-in heading? Yes.
3787. Did you come to any conclusion as to the cause of that fall in the straight-in heading? Yes; I considered it was the natural result of an explosion.
3788. Have you been long acquainted with the Bulli mine? Yes.
3789. I believe you were surveyor for the landowners, and as such you have travelled the tunnel several times? Yes.
3790. Did you observe whether any body of stone was resting on the top of the timber? Yes.
3791. And if that timber from any cause was knocked down it would have a tendency to cause a fall? Yes.
3792. We understand that the regulating door at the western was destroyed, and that the air that formerly went into the Hill End district was coursing down into the western? Yes, that was so.
3793. Did you repair that door temporarily? No; that stopping was put in some little time before I got to the mine.
3794. The following day did you search the No. 1 and No. 2 districts, in the Hill End section, with a party of men whom you conducted? Yes.
3795. Were you the first to arrive there? Yes.

Mr.
H. O. McCabe.
14 May, 1887.

3796.

- Mr. H. O. McCabe.
14 May, 1887.
3796. When you reached the top of the bank head, or the top of the incline, did you notice six bodies lying there? Yes, five or six.
3797. Did you examine those bodies to ascertain whether they had or had not been burnt? No, I did not examine the bodies there; but here are some tokens that we got on the top of the incline. [*The witness produces portions of bark from a prop, also several tokens picked up by him at the top of the incline.*]
3798. Does that bark appear to be burnt? No; it does not seem to be burned; it seems to be blackened with dust.
3799. Did you not examine the bodies? No, sir.
3800. Did any one of your party examine the bodies? Some of them did.
3801. But you have no personal knowledge as to whether they were burnt or not? No.
3802. Did you examine the props and other combustible material along the road to ascertain whether fire had travelled along that road? Here and there I did.
3803. Did you observe any at that point? No fire, or a trace of it.
3804. Before going to No. 1 and No. 2 headings did you discover the bodies of two boys? Yes.
3805. Were they burned? I did not look at them to discover that. I would sooner take evidence from the props, &c.
3806. Did you, or any of your party, take a note of the position of the bodies for the purpose of identification and otherwise? When we were down in No. 1 heading Mr. Green entered them on a piece of paper; I had no book.
3807. Mr. Green was along with you? Yes.
3808. How many bodies did you pass in No. 1 heading? Seventeen, according to Mr. Green's tally.
3809. Did you examine those bodies to ascertain whether they were burnt? No, I did not.
3810. In what way were they lying on the road? As if they were making out-bye. One man appeared to have been running, and knocked down in the act.
3811. Did you go into any of the bords? Yes, I went into several bords along No. 1 heading.
3812. Did you discover any gas in the bords? None in the bords.
3813. Your examination of the bords would be on Thursday—the day following the accident? Yes, on the Thursday morning.
3814. Had gas existed there, would you have discovered it on the Thursday at that time? Yes, I think so.
3815. The ventilating current was deranged on account of the accident? Yes.
3816. And the full quantity of air did not pass round the bords? No.
3817. Is that your reason for stating that, had gas existed in any of the bords, you would most likely have discovered it? Yes.
3818. In the face of No. 1 heading, did you examine it? Yes.
3819. Did you see bodies lying in the cut-through? There was one lying there.
3820. Was there a deputy's lamp beside it—a copper lamp? I did not see the lamp that day; I heard next day that one had been found.
3821. Did you examine that man to discover traces of burning? No.
3822. Did you find gas in the face of No. 1 heading? We found just a little there.
3823. Did you penetrate into the face of No. 2 heading? Not until later in the day; I got into No. 2 heading about 1 o'clock.
3824. Were you the first to get into No. 2 heading, as far as you know? Yes.
3825. Did you examine for gas in No. 2 heading? Yes, there was a little gas there.
3826. Did you roughly examine the quantity? It ran about 6 or 7 yards, I think.
3827. How deep was it? I just got the trace of it in the roof.
3828. Did you go to the face of heading, beyond the skip? Yes, I went in to look for a body.
3829. There was no body there? No.
3830. And what did you discover at the face of the heading? There appeared to have been a shot fired there.
3831. Then, where did your exploration extend to after passing through the cut-through from No. 1 heading, down to the bords of No. 2 heading on the main road—did you examine for gas in those bords? Well, I did not go down every bord. Robins was with me, and being slightly sick, I asked him to go, which he did, but saw no gas. I have no personal knowledge.
3832. Did you go into Nos. 3 and 4 afterwards? No, the next shift took those.
3833. When did you return to the mine, Mr. McCabe? On the Friday morning, at 6 o'clock.
3834. Where did you go to on Friday morning? The first thing we did was to look for four bodies said to be missing in Hill End.
3835. Did you find them? Yes; they were found through the stopping at the foot of Hill End.
3836. What other portion of the mine did you visit on Friday? We travelled down the Hill End return to the Western.
3837. In what condition did you find the return? It was in good condition—better than we found it last Saturday; that bit of a fall there took place since the explosion.
3838. Separating the return from the western main tunnel there is a door? Yes.
3839. Was that deranged? Yes, it was blown down, and the overcast too.
3840. How does the return from Hill End pass the western road? By the overcast.
3841. Did you examine that overcast? Yes, it was blown down.
3842. In what condition did you find the western, or did you explore it, after travelling the return? Not then. We went back into Hill End and made arrangements to get the bodies out. We were rather short of men, and we went out to send more men in before we opened up the western to get the bodies out.
3843. Had you also the exploring party that penetrated the western? Yes.
3844. How many bodies did you find in the western? Sixteen.
3845. Was much damage done to the roads there? No, with the exception of the fall on the flat.
3846. Proceeding from the overcast towards the face of the western tunnel, did you observe any damage done to the doors? Yes, there was a door blown down, that was driving the air up the right-hand heading.
3847. Where did you find the men in the western? They were all on the roads, as if they were coming down the roads.

3848. As if they had been apprised of danger? Yes; as if they had been apprised of danger and were making out. Mr. H. O. McCabe.
3849. Did you examine the timber in other parts of the western roadways to ascertain whether a good deal of fire had penetrated that part of the colliery? Yes. 14 May, 1887.
3850. Did you find any trace of fire? No.
3851. Did you examine the quantity of air on your visits to the Bulli mine since the accident? No; I had no anemometer with me, but Mr. Rowan had, and he told me.
3852. Do you recollect whether the quantity was materially diminished by the explosion? It was materially diminished, of course.
3853. Did you go to the furnace? Yes.
3854. How was the furnace working? It was burning very brightly and working well; there was any amount of air there.
3855. On what day was that? On the Friday.
3856. By that time the workings would naturally be cleared out and the ventilation partially restored? Yes.
3857. How long had you been acquainted with the gassy section, or Hill End district? I have known the colliery for the last five years.
3858. At the entrance to the western road from the main tunnel a regulating door was placed? Yes.
3859. Can you describe to the Commission the character of that door, as some little dubiety appears to exist on the point; was there a slide—a regulator upon it, or was it simply a hinge door? It was a door that opened and shut to allow the sets to pass. I think it had a hole in the middle to allow a certain quantity of air to pass through. That is what I understand.
3860. You have never measured the quantity of air on any occasion that you found passing down the western? No.
3861. Generally speaking, did you consider Bulli a well ventilated colliery? Since this new furnace was put up there has been plenty of air there.
3862. How long has this new furnace been in working order? Since the beginning of the year, I understand.
3863. Do you know of your own knowledge whether an attendant was placed at the western to open and shut the door on the passing of the sets? No; I presume there would be; I was never in the pit when she was going there.
3864. There is also a door between Nos. 1 and 2 headings on the main tunnel? Yes; it was to drive the wind up No. 1.
3865. And also a door on the diagonal between Nos. 1 and 2? Yes.
3866. Was that for the same purpose? Yes.
3867. Do you know of your own knowledge whether trappers were kept to attend these doors? No.
3868. Is the presence of suchlike doors on main roads an extraordinary circumstance in mining? No; it is done occasionally.
3869. Have you frequently seen doors that regulate the currents on main tunnels? I have them myself.
3870. Do you provide trappers to attend them? Yes.
3871. We are told that a train of skips in the Bulli mine consisted of twenty; how long do you think such a train would occupy passing through a door? Running at the rate of 3 miles an hour, it would take about half a minute to a minute.
3872. The duty of the attendant is to open the door as soon as a train comes forward, and shut it immediately the train passes? Yes.
3873. Would the opening of such a door materially alter the ventilating current in Nos. 1 and 2 district? Not if it was merely open long enough to allow a set to go through.
3874. If it had been propped open by a prop or stone, would that have a different effect on the current? Yes.
3875. Have you ever heard, Mr. McCabe, or do you know of your own knowledge, whether on any occasion they were found propped open? No.
3876. You never heard of it? No.
3877. No. 1 was the intake? Yes.
3878. And the bords of No. 1 would necessarily receive the fresh air before the ventilating current reached the face of No. 1 heading? Yes.
3879. No. 2 heading, and the bords off it, would be on the return from No. 1? Yes.
3880. Do you know how much air circulated through Nos. 1 and 2 since the new furnace was put in operation? I have heard that it was 12,000 feet.
3881. Who informed you? I think it was Mr. Rowan, the inspector.
3882. Would you think that an adequate amount of ventilation? Yes.
3883. Would you consider that with 12,000 feet of air passing over or through seven or eight working bords, the use of naked lights in those bords was a dangerous operation? No; not if there was no gas giving off.
3884. Have you ever seen any gas given off in these bords? No; I was only in them on this occasion.
3885. You say that on the occasion upon which you examined for gas, had it been present, it would very probably have shown itself? Yes.
3886. On account of the derangement of the ventilation? Yes.
3887. Would you apply the same remarks to the bords off No. 2, gas being found in the headings of Nos. 1 and 2? It would, doubtless, be better to use safety-lamps there.
3888. Although safe to use naked lamps in the bords off No. 1, you consider it would be better to use safety-lamps in the bords off No. 2, that being on the return? Yes.
3889. The air current being fouled more or less by the gas issuing from Nos. 1 and 2? Yes; that is my meaning.
3890. Did you find any brattice in Nos. 1 and 2? No.
3891. Do you consider that the presence of gas in No. 1 and No. 2 headings ought to have suggested brattice being applied or adopted? Yes.
3892. For what purpose? In order to keep the ventilation right up to the face, and sweep out the gas in small quantities as it issued.

- Mr. H. O. McCabe.
14 May, 1887.
3893. Do you, of your own knowledge, know anything of the condition of the returns from the western to the furnace? No, I have never travelled them; but there must have been a return, for there was 12,000 feet of air at Hill End, and 10,000 or 12,000 from the western. There must have been room for it to travel somewhere.
3894. Have you come to some definite opinion as to the cause of the disaster? I consider that the gas fired in No. 2 heading, proceeded down the heading, a portion of the flame, on passing through the last cut-through, shot towards No. 1, and probably picked up a little gas from No. 1, and proceeding down No. 1 the two currents joined. The blast proceeded down No. 2 into the third bord above the tunnel, through the cut-through, out of the third bord, into the tunnel.
3895. What evidence of destruction have you in the tunnel? These stoppings blown down here [*tracing the positions on the plan*]. The current going against the stoppings on the main tunnel, blew these upwards from the tunnel, and separating, one portion of the blast proceeded out to the tunnel, and another towards No. 3. and No. 4.
3896. Trace the position that goes in towards the face. The portion of the blast that passed inwards towards Nos. 5 and 6 expanded itself at the face. The portion that passed through the stoppings followed the return, and on reaching the door leading into the western, tilted it, and proceeding over the overcast to the left, blew the overcast down.
3897. Having blown the overcast down, where was it likely to go then? Finding an exit at the overcast, this portion was carried inwards towards the face of the western workings, and another portion backwards, the entrance to the western.
3898. In your opinion that is the course the blast took, and you are guided in your opinion by the evidences of the workings, charred props and coal-dust? Yes; and the position you see the skips in, the skips in the western workings having been blown towards the face.
3899. You have had considerable experience, Mr. McCabe, in large and well-regulated collieries, where strict discipline requires to be maintained, in the North of England? Yes.
3900. In the presence of gas what practice is followed as to the firing of shots in any of the collieries with which you are acquainted in England? The miners were not allowed to fire their own shots at all; they were always fired by the deputy.
3901. How did you fire them? With touch-paper, lighted by a heated wire passed through the interstices of the gauze.
3902. Do you consider that preferable to lighting the touch by tilting the flame of the lamp? Very much; I would not like to see that done.
3903. You think it would be unsafe? Yes; and it would damage the gauze.
3904. Would there be a liability of the flame passing through? Yes, there would be danger; but where you can detect the trace of gas, shots should not be fired.
3905. In England you refer to? Yes.
3906. The theory has been propounded here that it is possible an accession to the force and intensity of the blast might have been derived from a quantity of gas stored in the first or second disused bord off No. 1 heading. Do you consider that a feasible theory or hypothesis? No; I hardly think any gas would be stored there.
3907. Knowing the position of these bords with respect to the intake air, supposing this second bord to have contained a magazine of gas, and it had been fired from No. 1 heading, would you have expected to see second evidences of an explosion? Yes; I should have expected to see the stopping blown down.
3908. Would you have expected to have seen it blown out towards No. 2? Yes.
3909. Did you observe any other stoppings to be blown down between Nos. 1 and 2? No; the tops were blown off them.
3910. How many? I do not think more than four.
3911. From the time of the explosion the current of ventilation would be suspended? Yes.
3912. You carried the ventilation with you as you went along? Yes.
3913. Do you think that the quantity of gas in Nos. 1 and 2 headings, unassisted by other explosives, would have caused the damage done? I hardly think it would. I have an idea that coal-dust assisted the gas explosion.
3914. Picking up the coal-dust, it went along, and increased in this way in volume? Yes; the coal-dust provided fuel, as it were.
3915. If the area of the workings had been considerably larger, do you think the effect of the explosion would have been so remarkable? No; I think it would not have been much more than a puff if it had not been so confined.
3916. The whole of the force, in fact, was directed into these two places? Yes.
3917. *Mr. Hilton.*] I understood you to state to the President that you did not find any evidence of brattice being used in the gassy section? Correct.
3918. Do you consider it was necessary to use brattice in the gassy section? In those headings I would use brattice.
3919. *Mr. Owens.*] Which way did you proceed to the headings? Up the engine plain. I went up the slacky way first.
3920. Did you go over the big fall near the tunnel mouth? Not till last Saturday, because I could not get that way at first.
3921. You are of opinion that if a magazine of gas existed at the point which has been indicated, that the force of an explosion from that would have shown itself on the nearest stopping? I am of opinion that if a separate magazine of gas existed in the second bord above the tunnel, that the stopping opposite the mouth of that bord would have been blown clean away towards No. 2.
3922. *Mr. Jones.*] I think you have already stated that after arriving at the last stenton through No. 1 heading, you found little or no gas, and you have further stated that you found a similar amount in No. 2 heading. I suppose that would be at a time when the ventilation was virtually suspended? Yes.
3923. Now, with an air current of something like 12,000 feet passing, would you have expected to find any gas at all? That would depend. You see, there is a roll in the face of this heading, and the gas might make at one time and not at another, coming off that roll.
3924. You say that on the occasion of your visit you found little or none. I ask you, would you have expected to have found any with 12,000 feet of air passing? I do not say you would not see gas at all with a bigger ventilation.

Mr. H. O.
McCabe.

14 May, 1887.

3925. Do you think there could be a sufficient accumulation with that amount of air passing to cause the destruction you saw at Bulli? It would depend upon how much gas was making off that roll at the time the air was passing.
3926. The roll was there at the time? Yes; it is there now.
3927. And you say you found little or no gas there? Yes.
3928. Then I suppose you would say the probabilities are that the roll gave off less when you visited it than when the explosion took place? Yes.
3929. Do you think it possible that an amount of gas had accumulated sufficient to cause the destruction you have described? No.
3930. Do you consider the Bulli mine a dusty mine, such as you have seen in the North of England? No. It is not a very dusty mine; but it is dusty.
3931. Do you consider it dusty in Nos. 1 and 2 headings, travelling to the Flatt, where only the men and horses travel? It is dusty.
3932. Do you think there is sufficient dust to be likely to participate in an explosion? Yes. You see we do not know this gas yet. We have not experimented upon it. But we must take dust as a factor which would increase the force of an explosion.
3933. Can you point to any instance in your experience where an explosion has taken place, and dust has played an important part, in a mine such as this? I have only seen one explosion before this.
3934. But from your reading you may be able to speak? Well, I was reading the other day of an explosion in a mine that gave off no gas at all—the explosion being caused simply by dust.
3935. You have already referred to the door on the main engine bank opposite No. 1 and No. 2? Yes.
3936. Presuming that one of these doors had been left open, would that cause an accumulation of gas? Yes; you would expect an accumulation of gas there if that door was left open.
3937. Can you refer to any dusty mine in the old country that would compare at all with the circumstances of Bulli, where an explosion has taken place? I know of none.
3938. We have been told that previous to the new furnace being started it was a custom to work with safety-lamps in the bords off Nos. 1 and 2 headings? Yes.
3939. Now, in view of what has happened, and in view of your own knowledge and experience that little gas could have accumulated in these headings, do you think it would have been a greater measure of safety to work the whole of these places with safety-lamps? Yes. But where you take in safety-lamps you also bring in a new element of danger.
3940. Do you think it judicious of the management to consult with the men on the question of a danger, both for the protection of the lives of the men and the property? Well, the manager is supposed to be competent, and the men are supposed to report to the manager if they see any danger.
3941. But in view of these places having been worked with safety-lamps previous to the new furnace being erected, and the fact that they had been known to give off gas, would it not have been only a wise precaution to have used safety-lamps in these particular places—No. 1 and No. 2 headings? Do you mean in the headings?
3942. I am referring to the bords? Yes; I think it might have been better to have kept safety-lamps in them.
3943. *Mr. Clarke.*] In what way do you think the gas was fired? I think it was fired from a shot in No. 2 heading.
3944. In what different ways might the gas fire from a shot? Well, the shot might be very slightly tamped, and it might be blown out, in which case the flame would come from it.
3945. Would the nature of the material used in tamping have anything to do with it? Yes. Coal-dust would be a very dangerous element.
3946. Then you think the gas did fire from a shot? Yes.
3947. Would the finding of an ordinary miner's lamp near the face two days ago have an influence upon your opinion? Well, it might have fired at that lamp if it was alight.
3948. *Mr. Jones.*] Respecting the finding of the miner's lamp, is it not possible that the lamp might have been taken there for special use? Yes.
3949. That is travelling outside Nos. 1 and 2 headings to the mouth of the tunnel? Yes; it might have been that.
3950. *Mr. Croudace.*] We have been told, Mr. McCabe, that there was a certain door here between Nos. 1 and 2 headings? Yes.
3951. There is one on the diagonal course, and a single door at a point between Nos. 3 and 4? Yes.
3952. Now with the same course or system of ventilation previous to the strike—that is, on the intake tunnel—and the same number of doors existing, and the same course of ventilation, but with this addition that since the strike there was a trapper-boy placed on the door between Nos. 3 and 4, which would you consider showed the greater precaution? I should think greater precaution was shown since the strike by placing the trapper-boy to open and shut the door.
3953. We have also in evidence that, previous to the strike, there was only a quantity of from 2,000 to 4,000 feet of air going through the last holed stenton in No. 1 heading, and between Nos. 1 and 2, and ventilating the whole of this Hill End district. Since the furnace, we have the statement that a new furnace has been put in operation, and that there has been measured 12,000 feet of air going through the same stenton, and ventilating the same district. Would you consider that a great improvement was shown there? Yes; the increase in the ventilating current to 12,000 feet of air would be a great improvement.
3954. Single doors are placed at these different points; do you consider that these portions of the mine would have been rendered safer had there been two doors placed at a sufficient distance apart to allow travelling sets to pass through without both being opened at the same time? Yes, it would, no doubt, have been safer to have two doors.
3955. But having only one door do you consider that all knowledgable care was taken in placing one trapper at each of these doors? Yes; I do.
3956. Now, we have been told that it has been the custom to fire shots at Bulli by tilting the lamp to light the touch-paper. Do you consider that unsafe? Yes.
3957. What would you say, if I told you that it has been known for a man to work with the top of the gauze of his lamp actually burnt out? I think it would be highly dangerous, and I think the man who would do such a thing ought to be put in goal.

- Mr. H. O. McCabe.
14 May, 1887.
3958. In using safety-lamps, do you consider it prudent to have them locked? Yes. [*Plan examined.*]
3959. It has been advanced that the explosion in its course might have ignited gas from two or three bords started on the left-hand side of this return airway, and which are driven up to the dyke. Do you think that at all probable? No; I do not.
3960. Did you examine these stoppings between the two headings [*referring to the workings to the west of the main tunnel*]? No.
3961. Do you think a second explosion took place there? No; it would not have been possible, because the body immediately opposite to these bords would have been charred to a cinder.
3962. If I told you that the stoppings immediately opposite these bords were not disturbed at all? That would upset any theory about gas being there.
3963. What would have been the result of any body of gas being there? It would have blown those stoppings out.
3964. *President.*] Does that place bear any evidence of being the centre of a separate explosion? No; none at all.
3965. *Mr. Croudace.*] It has also been advanced that the explosion might have gathered force from the admission of gas in the old workings here [*pointing to old workings west of the dyke*]. Do you think that probable or possible? No; I cannot see any reason for gas being in those old workings at all. There was sufficient air going through the old workings to keep them clear.
3966. Have you heard of any gas being taken up to the furnace, or showing any signs of being near the furnace? No.
3967. Have you any idea of the extent of face open at Hill End—that is, in that particular part of the pit? I have not.
3968. Roughly, do you think it would be more than an acre? About that, I should say.
3969. Would an acre of opened-up coal be a very small limit in which to confine an explosion? Yes.
3970. In other words, would a comparatively trifling amount of gas in such a limited area cause the damage that we have seen? Yes; I have said before that it would only have been a bit of a puff if it had not been so confined.
3971. Coming to Nos. 3 and 4 headings, would it have been more prudent to have driven the main tunnel much further ahead—that is, to have had Nos. 3 and 4 much more in advance of Nos. 1 and 2, and separate the two pairs of headings by a greater distance, retaining Nos. 1 and 2 for a return airway? Working by panels altogether, yes.
3972. Would it have the effect of confining any explosion to each district? Yes; the effect of panels would be to confine an explosion.
3973. In other words, instead of breaking away the bords from both the headings to keep Nos. 1 and 2 wholly and solely in a return? Yes.
3974. Have you on any of your visits, either before or since the strike, seen any accumulation of gas in that mine anywhere that you know of? Never any accumulation at all. When I have been surveying the men I have had with me occasionally would say not to go in such and such a cut-through, as there was gas there. If I had met with any accumulation of gas I should have been blown out of the pit, as I used to go all over with a naked light.
3975. Have you heard of any such accumulation? No. The only gas I ever heard of was in the headings past the stenton, approaching the whin dyke.
3976. *Mr. Owens.*] Assuming that this door, between Nos. 1 and 2, was kept open for a considerable time, which shut off the air from No. 1 and No. 2, do you think that the effect would be to cause an accumulation of gas in No. 2? Yes; if it was kept open any length of time.
3977. And the bords here being worked with naked lights, would there be any danger of the gas being carried on to the lights? If the gas accumulated there, owing to the door being opened (and thus carrying the air past the headings), when it was shut again and the ventilation was restored the air would probably drive the gas on to the naked lights, and thus cause an explosion, if the gas was present in sufficient quantity.
3978. How long would the door have to be opened to do that? About half an hour, I should say.
3979. In your opinion where was the accumulation of gas that caused this explosion in Bulli mine? I consider that the gas and coal-dust have done it together. The explosion evidently started in No. 2 heading. The cut-through is scorched with fire from top to bottom.
3980. You do not consider that there was an accumulation of gas in any other part? No.
3981. *Mr. Jones.*] Do you know of your own knowledge whether any steps were taken to water the roads in Bulli mine? No.
3982. Do I understand you that as a general practice you would not permit ordinary workmen to fire their own shots in the presence of gas? Yes.
3983. *Mr. Hilton.*] Supposing anything occurred to the door at the junction of the western, would it cut off the ventilation to the Hill End district? Yes; it would diminish it considerably.
3984. Supposing those stoppings along the western road were in a good state of repair, and a regulating door was placed in the western return, would not that be a better arrangement than a door at the western junction? Yes; I am sure it would.
3985. And there would be less liability of accident? Yes. [*The witness withdrew.*]

John Evans sworn and examined:—

- Mr. J. Evans.
14 May, 1887.
3986. *President.*] You are the manager of the Mount Kembla Colliery, Mr. Evans? Yes.
3987. Are you a certificated colliery manager under the British Act of 1872? Yes.
3988. Have you had considerable practice as a mining engineer in the larger and better regulated collieries in Wales? Yes; I have been brought up from my boyhood in fiery mines.
3989. Where quantities of explosive gas existed? Yes; in very fiery mines.
3990. Did you know Bulli Colliery previous to the accident? I did not.
3991. Had you been through the workings of the colliery previous to the accident? No.
3992. And you know nothing about the conduct of the ventilation and the operations of the colliery before that? No; I knew nothing whatever about the colliery before the accident. 3993.

3993. When did you arrive at the colliery? I arrived there on the evening of the accident.
3994. Will you very shortly tell us what you did, and where you went? Having ascertained that an explosion had taken place, I went to the mine, and meeting Mr. Neilson and Mr. Ross, I offered my services to direct a search party, and they were accepted; the party was organized, and we proceeded into the mine to explore as far as we possibly could; I was satisfied that an explosion had occurred, and I set the members of the search party to clear the falls, put up stoppings, and penetrate into the mine as far as possible; we came across several bodies on the top of the incline.
3995. Did you carefully examine the bodies? I did.
3996. Did you find any marks or traces of burning upon them? No; I was satisfied they were not burnt.
3997. Did you examine the hair of any of the bodies? I did.
3998. Did you notice whether the hair was singed? Well, the hair was a little singed, as if it had been exposed to slight heat.
3999. And where could you expect the heat to come from—would you say it was from the flame caused by an explosion? I consider that the heated air after the explosion might probably singe the hair.
4000. Did you examine any of the props round the bodies to ascertain whether they bore any evidence of burning? Yes; I carefully examined them, and found no evidence of charring or burning or anything of the kind.
4001. Here is some string, Mr. Evans, evidently the string of some tokens picked up near the bodies; does that string present any evidence of burning [*string handed to witness*]? No; I do not consider it does.
4002. Would the hair of a man's head, or this string, be most sensitive to flame? Well, I should think the hair would be the most sensitive.
4003. You say the hair seemed to be singed? Yes.
4004. Were the clothes of these men burnt? No.
4005. Did the skin show signs of burning? The skin was affected as if by friction; they bore evidence of having been blown some distance, being very much lacerated and cut.
4006. Very well; what did you do then? After completing the shift up to 6 o'clock that morning I left, and was relieved by Mr. Green and Mr. McCabe.
4007. When did you return? I examined the mine again that day, in company with Mr. Rowan; measuring the ventilation we found 44,000 cubic feet passing.
4008. Of that amount how much was going into the Hill End district? Just at the entrance of the tunnel (No. 1) I found 10,000 cubic feet, but before reaching the place that quantity was reduced by leakage to 2,000 feet.
4009. Had the stoppings been blown down? Yes.
4010. Would that account for the leakage? Yes.
4011. Did you measure the quantity of air going into No. 1 heading? I do not think we did measure it on the heading; I have no recollection of measuring it there; but at the bottom we found on one occasion 10,000 cubic feet; there was a stopping or curtain put up to direct the current into No. 1, so that, with the exception of a little leakage there, this 10,000 feet was directed into No. 1; that was on the Thursday.
4012. On the Thursday morning you found 44,000 feet passing through the main tunnel, of which 10,000 feet was found passing through at the foot of No. 1? Yes.
4013. Did you examine the amount of air passing through the last stenton? Yes.
4014. How much was there? 2,000 odd feet; I remember that exactly.
4015. Were you present when the bodies were found in No. 1? I was not.
4016. Did you examine any of them afterwards? I only examined the body that was found in the 5th bord, I believe in No. 1.
4017. Was that Olsen's body? Yes; we found it had been accidentally left by the search party.
4018. Was it burnt? No.
4019. Do I understand you to say that you went through these workings on a tour of examination with Mr. Rowan? Yes.
4020. Did you examine for gas in all the bords off No. 1 heading? I did.
4021. Did you find any trace of gas on the Thursday? No; I did not find a trace of gas in any of the bords.
4022. Did you find any gas in No. 1 heading? I did.
4023. How much did you find? About 8 or 9 yards of it, a foot thick.
4024. Passing the cut-throughs did you find gas in No. 2 heading? Yes; there was 15 to 20 yards of gas there, about 18 inches thick.
4025. Was it a quick gas? Yes; it filled the lamp quickly.
4026. Did you observe a danger-board opposite the stenton at No. 1? Yes.
4027. It was standing? Yes.
4028. We are informed that an open lamp was found on a prop to which the danger-board was fixed. Did you see that board? Yes; it was a small wheeler's lamp.
4029. In what condition was the lamp? The solder on the lamp had been melted as if by great heat.
4030. Did you find any other lamps? Not in that heading.
4031. In No. 1 heading did you discover anything? No; I discovered nothing except that the danger-board had been blown down in the direction of the heading; but I discovered a coil of fuse in one of the bords off No. 2 heading, which was burnt or charred.
4032. Were you present on a subsequent occasion when some one discovered some loose powder in No. 2 heading? Yes; I believe that Mr. Dixon and Mr. Carpenter and some other gentlemen found a quantity of loose powder in the face of No. 1.
4033. Was there any fuse found there as well? I do not remember the finding of any fuse.
4034. Did you examine, with Mr. Rowan, the face of the bords off No. 2 heading? Yes.
4035. Did you discover any gas in any of these bords? No; none whatever.
4036. Would you infer from that, looking at the then deranged state of the ventilation, that no gas had been given off by these bords immediately previous to the accident? Yes.
4037. Did you examine the main tunnel, the stoppings at the foot of No. 2, and the Flatt on the main tunnel, and also Nos. 3, 4, 5, and 6? Yes.

Mr. J. Evans.
14 May, 1887.

- Mr. J. Evans. 4038. Did you examine those places for gas? I did.
4039. Did you discover any? None whatever.
- 14 May, 1887. 4040. Does the same remark apply to these places that you applied to the bords off No. 2 heading? Yes.
4041. That is, if gas was given off in these places at the moment of the accident, you would probably have discovered it the day after the accident? Yes.
4042. Did you hear any gas issuing from crevices or blowing in either No. 1 or No. 2 headings? Well, yes, I noticed a little humming in Nos. 1 and 2 headings.
4043. That was probably due to gass issuing from the coal? Probably, and perhaps to a slight quantity of water.
4044. Did you notice whether the doors at the foot of and between Nos. 1 and 2 headings were or had been destroyed? I noticed they were destroyed.
4045. In what direction had they been blown? I believe this door [*pointing to the plan*] was blown towards the face of the tunnel. I cannot be sure, but I believe I saw fragments blown towards the face of the tunnel.
4046. Which door do you apply your remarks to—the one on the tunnel or the one on the diagonal road? The one on the tunnel.
4047. In the presence of gas in Nos. 1 and 2 headings, do you consider that it was prudent to permit the workmen in the bords off No. 2 heading to work with naked lights? [*Question not answered.*]
4048. With gas known to exist in Nos. 1 and 2 headings, was it safe, in your opinion, to work with naked lights in the bords off No. 2 heading? Yes.
4049. You think so. Were the bords off No. 2 ventilated by the return current? Yes.
4050. Would that be likely to be fouled by gas from Nos. 1 and 2? Not to a dangerous extent.
4051. Would that depend upon the amount of gas issuing from Nos. 1 and 2? Yes.
4052. Supposing a dangerous quantity of gas to be issuing from Nos. 1 and 2, would you still say so? No; but I do not consider the amount of gas given off by No. 1, in view of the amount of air passing, sufficient to cause a vitiation of the air.
4053. How was the gas from No. 1 and No. 2 removed from these headings—that is, how were they ventilated? Simply by means of the cut-through.
4054. Was that sufficient to remove the gas from the face? Well, no; I would have put a small quantity of brattice up to carry the air into the face, and dilute the gas as it was made, and so sweep it away in small quantities.
4055. So far as you have observed, was that done? No; I do not think it was.
4056. What are your views as to the firing of shots in the presence of gas? I am of opinion that no shots should be fired in the presence of gas under any circumstances.
4057. You would not use explosives? No.
4058. If you were told that high explosives, such as dynamite, nitro-glycerine, and such like explosives were used with wet tamping would you alter your opinion? No.
4059. You do not think it prudent? No.
4060. If you were informed that the Commission, which for a number of years has been directing its attention to this subject, by a series of elaborate experiments, had arrived at conclusions which pointed to the safety of firing high explosives with wet tamping, would you be inclined to accept their views? Well, I would, because they would have made searching and diligent investigation into such matters.
4061. Have you ever made any such experiments? No; I have not.
4062. According to the evidence, the method of firing shots adopted in Bulli Colliery was this: The common way of lighting a shot was to strike a lucifer match and light it, or, as in the great majority of cases, to tilt the safety-lamp to one side, allow the flame to impinge upon the gauze, and apply the piece of touch-paper outside the gauze in order to light it by means of the flame inside, and then ignite the fuse. Was that in your opinion a safe or prudent step? No; in my opinion it was a most dangerous practice.
4063. Can you suggest any other mode whereby greater safety or less danger would be secured? Yes; the shot should be fired with a red-hot wire.
4064. Passed through the interstices? Yes. But in no case should a shot be fired in the presence of gas. I lay down that as a basis.
4065. How would you proceed in places where there were stone rolls, as in Bulli? I would cause a sufficient quantity of air to circulate, and thus dilute the gas.
4066. You qualify the rule you have laid down to the extent that you would sweep out the gas as it was made? Yes.
4067. In saying that "Shots should not be fired in the presence of gas," you mean when the gas will show in the safety-lamps? Yes.
4068. Did you closely examine the western district of Bulli? I did.
4069. Did you observe any evidences of an explosion, or the effects of an explosion there? Yes.
4070. What were those evidences? Well, falls had occurred; the skips were blown in different directions, and other damage was done. On my first inspection I did not see any trace of fire in the western district; but since then I have had an opportunity of re-examining the mine, and I noticed some small incrustations of coal-dust about.
4071. In what part? In the western; in the return, I believe, from the Hill End.
4072. In what position from the return? Facing the main tunnel, contiguous to the door.
4073. The air-crossing over the main tunnel was blown down—is that so? Yes.
4074. Did you examine for gas in the face of the western workings? Yes.
4075. Did you find any trace of gas in the safety-lamp? No; not the slightest trace of gas.
4076. In your second examination of these districts did you notice any place in Nos. 1 and 2 where a pipe had been inserted in a blower? No.
4077. Have you ever heard of such a thing? No; I have not.
4078. From your inspection of the districts have you come to any decided conclusion or opinion as to the cause of this accident? Yes.
4079. And what is your opinion? I believe that an explosion caused by the firing of a shot occurred in No. 2 heading, the shot having been fired in the presence of gas which might, or might not, have been detected by the aid of a safety-lamp.

Mr. J. Evans,

14 May, 1887.

4080. Have you satisfied yourself as to the course pursued by this blast? Yes.
4081. Will you shortly state the course? Yes. I am of opinion that the seat of the explosion was at the face of No. 2 heading. Proceeding down to the first stenton, a portion of the blast travelled through No. 1 heading, down to the main tunnel and outwards. The other portion went down through No. 2 heading near the entrance to the bords which had no cut-through, and travelled into the bords that had a cut-through down to the lowest bord, and coming out, blew straight through the stenton into No. 1 heading.
4082. Would that account for the stopping opposite No. 2 entrance being blown into the old workings? It would.
4083. Are you aware whether a horse and man were also blown through that stopping? Yes.
4084. About what distance from the tunnel were they lying? I should think the horse lay from 22 yards to 25 yards distant, and the men were lying in close proximity to the horse.
4085. Did you observe any skips on the diagonal road leading from Nos. 1 and 2, approaching the main tunnel? Yes.
4086. How do you account for the skips being in that position—where in all probability had this train of skips been at the moment of the explosion? I believe they must have been going down No. 1 heading.
4087. And do you think they were blown into the position they occupy now? Yes.
4088. Do you know if the positions of the skips have been altered in any way since the explosion? Yes; they have been slightly altered, because I found a body under one of them, and we had to tumble the skip in order to get the body out.
4089. Proceeding on to the Flatt, did you observe any evidence of the explosion? No evidence of fire, but I noticed evidences of force.
4090. Where did you notice evidences of force? Right along the main road, as if it had travelled towards the entrance of the main tunnel.
4091. There are two trains of skips on the Flatt between Nos. 2 and 3—were these damaged or tossed? Yes.
4092. As if considerable force had been expended upon them? Yes.
4093. How do you account for such a large loss of life from such a comparatively small accumulation of gas in No. 2 heading having been exploded? I have no doubt that the coal-dust on the Flatt played an important part in the explosion.
4094. In what way? By aggravating the force of the explosion, and creating a large percentage of carbonic oxide, which is very fatal to life.
4095. Would you be inclined to ascribe the terrible sacrifice of human life to the fact of such a small area of workings being involved in the workings? Yes.
4096. Had it been possible for the quantity of gas that you suppose to have exploded in No. 2 heading to have expended itself in a large area of the old workings, would you have anticipated the same disastrous results? No; I should not.
4097. Do you think, from your rapid inspection of these districts, that there have been separate centres of the explosion—in other words, that the flame from the face of No. 2 heading was transmitted to distant parts containing explosive gas? I do not think so.
4098. Have you ever considered the possibility of one or two disused bords towards the bottom of No. 1 heading holding gas at the point marked B on the plan? No; I do not think it is possible.
4099. Supposing for an instant that these two bords had contained a magazine of gas, and supposing also that the flame from No. 2, either by itself or through the medium of a dust-laden atmosphere, were transmitted to this distant centre marked B, what would be the results? Well, I consider if that bord there did contain a small accumulation of gas—and it could not be a large accumulation—it would not have added very much to the force of the explosion.
4100. Do you mean it would not have added to it? Oh, yes, it would have added to the force, but not very much.
4101. Did you examine the stoppings between Nos. 1 and 2? Yes.
4102. Did you find the first and second stoppings at all injured? Yes; the first and second were blown to No. 1.
4103. You mean to say that No. 2 stopping has been blown from No. 2 towards No. 1? Yes.
4104. Is that against the theory of a separate centre of explosion being in No. 2 abandoned bord, off No. 1? Yes.
4105. Had an explosion taken place in this second abandoned bord, in what way would you expect to see the force of such explosion expend itself? I should expect to see the stopping blown in the opposite direction.
4106. Did you examine the workings marked A, to the west of the main tunnel? Yes.
4107. A little below where the horse is at present lying, did you observe the entrance to some abandoned bords to the left, and going back towards the whin dyke? No; I did not observe that.
4108. Did you observe anything in these workings to lead you to believe that gas had existed and exploded in these two abandoned bords? No; I did not.
4109. Had a separate explosion taken place in the bords that I refer to, a little to the west of where the horse is lying, what effect would you expect, or where would the force have expended itself? It would have gone down the tunnel.
4110. And did the force not go down the tunnel? Yes; a certain amount went down the tunnel. But there would have been other evidences. This horse and man would have been blown through the stopping in a different direction—exactly opposite—and the props in that district would have shown some evidences of the explosion.
4111. Did you observe whether this horse showed evidence of burning? Yes; the hair was slightly singed.
4112. Not charred? No; not charred.
4113. Mr. Neilson.] You measured the air when you went in the second day? Yes.
4114. How much air did you find passing in the intake? I cannot give you the exact measurement from memory; but there was upwards of 44,000 feet going into the tunnel, and upwards of 80,000 going in the returns.
4115. Is there any probability of an explosion having taken place in the direction of the western return? No.

Mr. J. Evans. 4116. Supposing there had been an explosion there? Well, Mr. White would not have come out alive; neither would there be a furnace there to-day. All these stoppings would have been blown into the main tunnel. By the time the force reached the western district it had expended itself, and was unable to do any damage.

[NOTE.—In reply to further questions as to the course of the explosion the witness indicates the course on the special plan.]

4117. It would take a large amount of gas to vitiate 12,000 feet of air? Yes.

4118. When you entered the mine on the Thursday you examined these bords off Nos. 1 and 2 and found no gas? Yes.

4119. I suppose you had no difficulty in getting volunteers for exploring parties? Well, if I were to give my opinion I should probably offend. I do not consider I had the proper assistance I ought to have had on such an occasion at Bulli.

4120. Did you bring men with you from Mount Kembla? Yes.

4121. How many? I brought seven men with me.

4122. *Mr. Hilton.*] You have said you would fire shots with a red-hot wire, Mr. Evans? Yes, it is much preferable to tilting the lamp.

4123. I see that you said in your previous evidence that even the use of a red-hot wire might cause an explosion? Yes; that is true.

4124. To your knowledge, is a red-hot wire the best means yet discovered of firing shots? Well, it is a comparatively safe means; but it is not perfectly safe, of course.

4125. *Mr. Owens.*] If gas existed in any part of the mine, and yet not visible to the eye, would it explode in contact with a naked light? It would probably explode if the air was vitiated with coal-dust, or overheated with a shot.

4126. You think it improbable that gas could have accumulated in these abandoned bords that have been mentioned? Yes; I do not think it at all likely.

4127. You have stated that you had not the assistance that you would have expected on the occasion of the explosion. Were you refused assistance by any one? I consider that the spirit and energy that should have been displayed on such an occasion was wanting.

4128. Were you offered assistance? I was offered assistance, such as it was; but I may say that it was with great difficulty I could induce the men to explore the mine when I made up the first party. Taking into consideration the small amount of damage done in Bulli mine, the bodies ought to have been out much quicker than they were. We could travel as fast as we could put the stoppings up; but the indifference displayed by some of the men literally shocked me. Even the presence of death did not seem to nullify their bitter feelings, and I was horrified to hear one man, turning over a body, exclaim, "I wonder if this is a white-leg or a — black-leg." And that man's name is Poppett. He had a brother in the pit.

4129. *Mr. Jones.*] Was that expression used in your hearing? It was.

4130. I am sorry to hear it. But as to this apparent hesitancy in entering the mine—might not that be in consequence of the men being unacquainted with gas? Well, looking to the evidence given at the inquest, they seemed to be pretty well up in such matters.

4131. Is gas usually found in the Illawarra mines? It is found in that district, I believe.

4132. But that district is a very limited one, is it not? Yes.

4133. Then only a few men could have had experience of gas in that particular district; might not that be a reason for the feeling of apparent absence of feeling you speak of? Well, perhaps a small amount of it might have arisen from that; but I consider that with competent men to direct search parties they should have no fear; they should have had sufficient confidence in myself and Mr. McCabe to direct the search parties.

4134. I am not doubting your word, Mr. Evans, but would it surprise you to hear that one man offered his services and the overman turned away and refused to speak? No; I know there were a number of persons there whose services I would not accept if I were in the overman's position; that was not the time to go into the mine and find fault; I went there to save life if possible, and I could not get assistance.

4135. I do not doubt that; but we have it on the sworn evidence of individuals that they offered their services, and the management refused to recognise them? I can understand that; while there was a kind of assistance that would have been invaluable, on the other hand there were scores of offers from those who could be well spared; that is, they could do better without them than with them.

4136. That is quite possible; but why cast wholesale censure upon those individuals for not offering their services? I am not condemning the whole body of the men; some of them conducted themselves admirably, and stayed there from the time of the explosion till the whole of the men were got out; but I am sorry to say the majority of them displayed indifference.

4137. Do you speak of your own knowledge? Yes.

4138. That they were indifferent as to rescuing those in the mine—is that what you mean? Yes; that is my impression.

4139. You have stated that you believe the explosion would have been perfectly harmless if it had taken place in a wider area, where it would have had room to expand? I do not say it would have been perfectly harmless, but it would not have been so destructive in its effects.

4140. Considering that the workings in No. 1 or Hill End district were so limited, and knowing that everything depended upon a constant supply of fresh air to these workings, are you still of opinion, having in view the doors which regulate the ventilation in that part of the workings on the main tunnel, that it was perfectly safe to work with naked lights in the bords off No. 1 and No. 2 headings? Yes; I consider it was.

4141. What would be the effect of that door being propped open for a short time, that is, the door on the main tunnel, past No. 1 and No. 2 headings? The effect would be to cut off the air from Nos. 1 and 2.

4142. Then, as a measure of protection, would it not have been better to cause these men to work with safety-lamps in the bords referred to, in view of the whole of the circumstances? It would have been better, in my opinion, to put that division of the workings on an independent split by putting an air-crossing over the main tunnel, and doing away with that door altogether.

4143. Which would have contributed much more to the safety of the workings? It would have given a constant supply to No 1 and No. 2 headings, instead of an intermittent supply.

4144. That being your opinion, do you not think it would have been better to have no bords turned off at No.

- No. 2 heading, and so make it a clear return for the time being? Yes; it would have been better to work on the panel system; the bords should be on the intake.
4145. Are you of opinion that all return airways ought to be travellable? Yes, practically.
4146. Do you consider the Bulli mine a dusty mine? Yes, a very dusty mine.
4147. Do you consider the travelling road to the headings dusty to an extent likely to contribute to an explosion? Yes.
4148. Speaking from your own experience of dusty mines in Wales, does Bulli approach what you would call a dusty mine in Wales? Yes; it is as dusty a mine as any I have seen in Wales.
4149. If these roads were watered with a view of laying or damping the dust, would it reduce the extent to which dust would contribute to an explosion in Bulli Mine? It would lessen the part that dust would play, no doubt.
4150. *Mr. Croudace.*] You state that you consider the tilting of the lamp and the lighting of the fuse by touch-paper is dangerous. Would you consider the lighting of the fuse or squib (say) by an ordinary wax match much more dangerous? Yes; certainly.
4151. What would you think of any one in a mine working with a lamp the top of which he knew to be burnt—not merely the cap of the lamp, but actually the top of the gauze itself, by which the flame is confined? If that person worked for me, or in mines that I have had experience in, he would have been put in prison for six months, or six years, probably.
4152. Just so. And would not the officials have been censurable to have allowed it? Yes.
4153. As a matter of fact such a practice would be dangerous to the men at large? Yes.
4154. Now, you have been asked about the best method of firing shots. Would the method of using water tamping, and firing the shots by means of electricity, be the most perfect system we know of? Yes; I should say so. But I have just heard of a disaster that occurred in South Wales, where Sir Frederick Abel's water cartridge was used. So I disapprove of firing shots in the presence of gas, even by the best methods known.
4155. You were asked by Mr. Jones about the door being propped open between Nos. 1 and 2 headings. Is it likely that the door would be propped open when a trapper boy was stationed there? No; it would not be likely, because it is the trapper boy's duty to keep the door closed.
4156. Would you be inclined to think that the explosion was caused by any door being propped open? No; but if I may express my opinion, I should say that no doors should be on the main hauling plain.
4157. We have had it stated in evidence that a certain witness had had reason to believe that if care was not taken there would be an explosion in this mine. We have also had it stated by the same witness that when he was in charge of a portion of the mine known as the gassy section a door was erected on this western road just at the intake and off the main tunnel, at which there was a flat-keeper attending it; also, a door between headings Nos. 1 and 2, on the main road, where a trapper was kept; also a door on this diagonal cut-through between Nos. 1 and 2 which was attended by a trapper boy, and a door between Nos. 3 and 4 on the main engine brow, at which during his time no trapper was kept. Since then we have had it stated that the door at the western was attended to in a similar manner; also that the doors between Nos. 1 and 2 had trappers attached to them, and that there was a trapper boy attached to the door last referred to on the main engine brow. That was after the strike. Now, looking at these respective conditions, would you consider that there was any improvement in the matter of care and attention as to ventilation in the latter period as compared with the former? Yes; I consider that greater care was exhibited during the latter part, inasmuch as a trapper was stationed at the door between Nos. 3 and 4.
4158. Now, in the same district exactly, and under the same conditions, previously to the strike, there was a ventilating current of between 2,000 and 4,000 cubic feet of air passing through the last holed stenton; since the strike we have it that there was 12,000 feet of air going through. Do you consider that indicates any considerable improvement? Yes, a very great improvement.
4159. Now, to come back to the general system, for any improvement that you may be able to suggest. Do you consider that it would have been better to have double doors at the points I have referred to? No; I do not.
4160. Why not? Because double doors would lose their object on the Hill End plain, unless you could keep one door shut while the other was open.
4161. Would double doors, placed sufficiently far apart so that only one would be open at a time, be more efficient than single doors? Yes.
4162. Would it not have been better altogether, as a matter of proper and scientific ventilation, to have abolished all the doors on the engine plain? Yes; I have said so.
4163. Coming into this western district from the tunnel mouth, would it not be possible to abolish this door at the junction without seriously affecting the Hill End district? Yes.
4164. *Mr. Hilton.*] I understood you to say, in reply to the President, that brattice should have been used in those headings where gas existed? I did not say it should have been; but I say this, that where gas exists, and you cannot dilute it by putting cut-throughs every 35 yards, brattice should be used to carry the air to the face and sweep the gas away in small quantities.
4165. So far as we have been able to ascertain, gas was present in these headings previous to the explosion? If gas was present previous to the explosion I would have put up brattice to dilute it.
4166. These headings have been giving off gas for some time according to the information we have received. That being so, and from your own experience, would you say that brattice should have been used as a means of ventilation? I do not say that brattice should have been used necessarily, but I do say that the gas ought not to have been allowed to accumulate. If brattice was necessary to prevent this it should have been adopted.
4167. *Mr. Jones.*] Respecting the firing of shots, Mr. Evans, are we to understand that as a general rule you would not allow shot-firing, except by persons duly authorized to do it? No, not in fiery mines. [*The witness withdrew.*]

John Williams sworn and examined:—

4168. *President.*] You are manager of the Coalcliff Colliery, Mr. Williams? Yes.
4169. Did you arrive at the Bulli Colliery shortly after the accident? I did.
4170. About what time did you arrive? About 4:30 o'clock.

Mr
J. Williams.
14 May, 1887.

- Mr. J. Williams. 4171. Did you proceed into the mine? Not immediately.
4172. When did you proceed into the mine? About 11 o'clock, I think.
4173. Did you proceed to the fall that exists in the main tunnel? Yes.
- 14 May, 1887 4174. With what object? I was supposed to be in charge of an exploring party on the Thursday afternoon. I relieved Mr. McCabe, and my object in passing the big fall was to go into No. 2 workings in order to recover as many bodies as possible.
4175. Did you come to my conclusion in your own mind as to the cause of that fall—was there anything singular in its appearance differing from any other fall that you have seen? I did not stop to notice very particularly. My object in going there was chiefly to recover the bodies.
4176. Were you one of the first to reach Nos. 1 and 2 headings? No.
4177. Did you examine the bords off those headings to prove the existence or non-existence of gas? At the time I did not, but in company with two others I noticed that several props in No. 2 heading, and in the bords particularly, were charred.
4178. Did you examine the faces of these bords for gas? We visited all the bords and examined them, but could not discover any gas.
4179. The ventilation would be practically deranged? Certainly.
4180. Would that be a likely time to find gas had it existed? Yes, I should think so.
4181. Did you examine No. 2 heading? Yes.
4182. Did you observe any gas there? Yes, in the face.
4183. How many yards? I cannot say.
4184. Did it fill your lamp? Yes.
4185. Was it of a very quick nature? Yes.
4186. Did you examine the face of the heading? Yes.
4187. Did you satisfy yourself as to whether a shot had been fired there? There was an unusual quantity of loose coal there.
4188. Did you observe any hole as of a shot? No.
4189. Did you observe any traces of fire in No. 1 heading? No.
4190. In No. 2 heading you did see evidences of fire? Yes.
4191. Did you go round the workings of Nos. 3 and 4 headings, also the straight-in and No. 6? I will explain how far we went on the Thursday afternoon. After getting the bodies out of No. 1, and depositing them on the main road, we commenced exploring the main tunnel. Going towards No. 3 we had to put up temporary stoppings. We visited No. 2 first, and at 20 minutes past 10 o'clock we reached the top of No. 3.
4192. Did you observe any bodies? Yes; we saw a man and a boy at the top of No. 2 in the main tunnel, and a man in the face of No. 3.
4193. Were these bodies burnt? I cannot say, as I did not examine them.
4194. Did you pay any attention to the system of ventilation that had been in operation in this district? I saw that the ventilation was sent down No. 1 by a separation door between Nos. 1 and 2, which had been blown away, and canvas had been put up there.
4195. In view of gas being given off in these headings, do you consider that the system pursued was the best that could have been pursued, or does any other mode suggest itself to your mind? I think the system was a very good one.
4196. Do you think the system of breaking bords off No. 2, or the return, in the face of gas being given off in considerable quantities in Nos. 1 and 2 headings, a right and proper system? With sufficient ventilation it would not be considered a dangerous process.
4197. In view of gas being given off in Nos. 1 and 2 headings, is the system pursued for ventilating those headings the best—in the first place, ought gas to be removed as it issues from the coal? I should think so.
4198. What is the best and easiest way to remove gas from the face? By means of brattice.
4199. Had brattice been used in these headings, in your opinion? I cannot say.
4200. Did you see any evidences of it having been used? I did not. The probability is that, if brattice had been used there it would have been blown away.
4201. Do you think it would have been prudent to use brattice? Yes; it might have been as well.
4202. Did you satisfy yourself as to the cause of the explosion, or where it originated? I must explain that when I entered the mine I did so chiefly for the purpose of getting the bodies out. I had been three nights away from home, and had not the privilege on the Saturday of going in with the others. Therefore you must excuse me from giving clear and definite evidence on that point.
4203. In a general way, Mr. Williams, is it advisable to have regulating or directing doors upon a main intake or engine road. Would it be desirable to abolish all doors on main roads? Well, I suppose there should be a certain amount of check—for instance, this door would be necessary between Nos. 1 and 2.
4204. Under the present system, no doubt, but does any other system suggest itself to you, or have you given the matter any consideration? [*Question not answered.*]
4205. Mr. Hilton.] Had you opportunities of witnessing gas in the mine during your visit? I discovered some gas in No. 2.
4206. Did you discover gas in any of the bords? I did not; and I do not think there was any, although I would not be positive.
4207. Did you find much gas in No. 2 heading? No; there was only a small quantity when I went in.
4208. It is generally understood that since the strike the ventilating current to the gassy section measured 12,000 cubic feet of air per minute. Did you feel any way surprised that an explosion should take place with a current of air like that going to the Hill End workings, considering that you found such a small quantity of gas when the ventilation was deranged? Well, yes.
4209. Does not that lead you to believe that the ventilation must have been deranged previous to the explosion? It may have been. [*The witness withdrew.*]

MONDAY, 16 MAY, 1887.

Present:—

DR. ROBERTSON, PRESIDENT.

MR. O'MALLEY CLARKE,
MR. NEILSON,
MR. CROUDACE,

MR. JONES,
MR. OWENS,
MR. HILTON.

Jacob Carlos Jones sworn and examined:—

4210. *President.*] You are manager for the North Illawarra Company? Yes.
4211. Did you visit the Bulli Colliery shortly after the accident? Yes, about two hours after the accident. I suppose about 4 or 5 o'clock when I got there.
4212. Did you proceed into the tunnel? Yes; I went as far as the furnace.
4213. In what state did you find the furnace? It was in first-class order then—nothing damaged in the slightest.
4214. And was it taking a good current of air? Yes.
4215. Did you observe whether the ventilation in the tunnel was deranged? The ventilation in the tunnel as far as the furnace cross-cut was as good as ever it was I suppose—not the slightest trace of after-damp, sulphur, or fumes of any kind.
4216. Did you notice the state of the straight-in tunnel? I did not visit that part. I simply went in by the left-hand tunnel towards the furnace.
4217. When did you first enter the tunnel and examine it? The tunnel was not examined until the Commission arrived, I think; I went in with Mr. Croudace; that was the first time I examined the tunnel where the falls are. I travelled the other way up to the Hill End district immediately after the accident.
4218. You went down the slacky road and then by the horse road? Yes; and in coming from the furnace I met Mr. Ross and accompanied him.
4219. Was the ventilation in a defective state when you reached the main tunnel? Yes; it was rather hot, and you could feel the effects of the after damp; but it was improving.
4220. We have pretty well satisfied ourselves, Mr. Jones, as to the progress made by the different exploring parties along the tunnel. How often have you visited the workings since the accident? About six or seven times.
4221. Did you examine the working bords off Nos. 1 and 2 headings? Yes, fairly well.
4222. How often have you examined them? On several occasions.
4223. Have you found any appearance of light carburetted hydrogen in any of the bords? No, not in the bords. The only appearance of gas I have seen was in the two headings beyond the last stenton.
4224. Have you found gas beyond the cut-through in Nos. 1 and 2 headings? Yes.
4225. Did you find gas on every occasion on which you examined for it? No; on the first occasion after the accident I did not find any trace of gas.
4226. When was that? I think it was on the Thursday night—that is, the day following the accident.
4227. Did you carefully examine those headings at that time? I went in beyond the dead horse in No. 1 heading.
4228. Did you go into the face? Not actually into the face. I went in as far as the skip and the horse.
4229. Have you, from your repeated examinations, satisfied yourself as to the cause of the accident? Yes, I have quite satisfied myself. I believe that there was an accumulation of gas in the No. 1 or No. 2 heading, and became ignited by a shot, because there is ample evidence of a shot having been fired in No. 2. I think they must have struck rather an extraordinary quantity of gas at this point.
4230. A blower? Yes.
4231. Did you hear any sound as of a blower? No; I did not hear the slightest sound of blowers anywhere.
4232. Have you satisfied yourself as to the course of the blast? Yes; you cannot go wrong I think. The appearance of the charred props, and the dust, and so on, indicate pretty clearly the course it took. It left the back heading and came down through the bords where the cut-throughs are.
4233. One portion travelled through the cut-through into No. 1, and proceeded outwards? Yes.
4234. And the other portion went down Nos. 1 and 2, through the cut-through, and through the last three bords and out again? Yes, into the main heading.
4235. Do you think the force of the explosion was intensified by the presence of gas in the atmosphere? I would not like to say that the force was intensified. Of course the effect was greater in consequence of the dust, but there was not sufficient dust to explode of itself.
4236. Was there sufficient dust, in your opinion, to intensify the action of the gas? Yes; there was plenty of dust to intensify the action or the effects of the gas, but not the actual explosive force.
4237. Did you satisfy yourself as to the cause of the death of the majority of these men who were killed at Bulli? I am quite satisfied that most of them were suffocated either by after-damp or carbonic oxide. All the bodies showed indications of that. One or two, perhaps, were killed by the explosion.
4238. Where or by what means would the carbonic oxide be generated? By an imperfect explosion—by incomplete combustion of the gas. There might have been gas in the western that imperfectly exploded.
4239. Do you think there could have been much gas? No; I don't see how there possibly could have been.
4240. Where, in your opinion, was it confined to? Simply in the face of Nos. 1 and 2 headings.
4241. Then, in view of the 12,000 ft. of air travelling through Nos. 1 and 2 headings, how would you explain an imperfect explosion of gas? Well, either too much or too little gas might cause it.
4242. Would 12,000 ft. of air be too little to render explosive any gas that might be there along with the air in the headings? I think it possible that the gas near the face had not sufficient air.

Mr.
J. C. Jones,
16 May, 1887.

4243.

- Mr. J. C. Jones,
16 May, 1887.
4243. But that coming out after the explosion and mixing with such a quantity of air per minute—would that be sufficient to render that amount of gas explosive? Quite.
4244. In which case could there be an imperfect explosion? I can't thoroughly explain everything. This is only an opinion of mine.
4245. Would an imperfect combustion of coal on an ordinary fire produce carbonic oxide? I think so, but am not clear.
4246. Wherein does an imperfect combustion of coal-dust differ from that of an ordinary fire? It would not be a fire; it would simply be intense heat, with no flames.
4247. So is fire an intense heat. You are not prepared to demonstrate your idea on the subject? No; I cannot explain it.
4248. However, you are satisfied in your mind that these men met their death by suffocation, and not by the direct effects of an explosion or flame? Yes.
4249. Did you observe any evidences of charring on the bodies? No; I was astonished at the absence of charring on the bodies.
4250. You have seen the effects of an explosion in Wales, Mr. Jones? Yes, on several occasions.
4251. Have you compared the appearance of men you have seen affected by severe explosions there with the appearance presented by the victims to the Bulli disaster? Yes; in explosions I have seen in South Wales the bodies were charred; but the bodies at Bulli presented no appearance of that kind.
4252. They did not bear such evidences of intense heat? Certainly not.
4253. And from the positions they were found in, combined with the absence of charring, you formed the opinion that they met their death by suffocation? Yes.
4254. *Mr. Neilson.*] You have stated it as your opinion that the explosion originated in No. 2 headings? Yes.
4255. And that there was not a large accumulation of gas there? Yes; I do not see how it could be possible.
4256. And do you think it is possible for any accumulation of gas in any other part of the mine to have supplemented that which originated the explosion? No; not to any extent, at all events, with that amount of air constantly travelling through the workings.
4257. Then how do you account for such a small quantity of gas creating such havoc on the main road a mile away from the seat of the explosion? So far as the western, I would trace the damage to the effects of the blast; but lower down I cannot say so.
4258. In what part of the mine were the greatest effects of the explosion noticeable? In the Hill End district certainly.
4259. On the main engine plain? On the main straight, as they call it, between No. 1 and Nos. 4 or 5.
4260. The inference you draw from that is that the blast went straight from No. 1 and No. 2, and jammed straight up against the wall in the main road? Yes; a portion went outwards, and a portion went inwards. The damage was greater than it would have been owing to the confined space, there being no room, as it were, for the force to expand or lose itself.
4261. In your opinion, if the dyke had not been on one side, and the coal only just opening out on the other, or if there had been room for the explosion to play round, there would not have been nearly such striking effects? Certainly. I am of opinion that if the district had been worked for some years, and several acres of coal had been taken out, the explosion would have spent itself in the immediate district.
4262. *Mr. Hilton.*] Have you been over the fall between the tunnel mouth and the Hill End incline? Yes.
4263. What do you ascribe the fall to? From the appearance of the roof I should say the effect of the explosion on the ropes would do it. The falling of one or two props and the loose stone overhead would cause all the loose timber and debris to come down, and the concussion on the rope would be considerable.
4264. Are you sure in your own mind that powder or dynamite was not an agency in the fall? I do not think it was that, although, of course, it is not impossible. Dynamite would do anything of that kind if it were present.
4265. *Mr. Owens.*] You have been in Nos. 1 and 2 headings, Mr. Jones? Yes.
4266. Did you see any gas there? Yes.
4267. Do you think where gas is generated in headings of that kind it is a wise measure to put brattice there in order that the gas may be swept out? Yes, I do. It is better to do that than for the men to be working in the gas.
4268. You know the door at the junction of the western and the main tunnel? Yes. There was a door there.
4269. Assuming that door was open, what effect would it have upon the ventilation of the Hill End district? It would take some quantity of air away, but not much, because Hill End has a separate return, and that return, I think, was better than the western return.
4270. But there is no separate intake? No. But what I meant to say was that if the western door had been open a much greater quantity of air would not reach in there, because the Hill End is just as near a course for it.
4271. Then, in your opinion, that door not being at the western would make no difference? Certainly it would make a difference; but what I mean to say is, that the door being open would not prevent any air from going into the Hill End.
4272. Do you think that door being open would enable the gas to accumulate? Yes; it might affect the ventilation so far that it would not go right into the face of Nos. 1 and 2.
4273. *Mr. Jones.*] If I understand you aright, Mr. Jones, your answer is, that the opening of that door would scale the very large current of air going to the Hill End district? Yes. There are certain parts of the western that would not take the whole of it.
4274. I am quite satisfied, Mr. Jones. I suppose during your experience you have observed very dusty mines in the old country, and I think you have already stated that you do not consider Bulli a dusty mine? No; I do not.
4275. Then, looking at the very limited area of Nos. 1 and 2 workings (the headings), do you think it was possible for a small accumulation of gas in these headings to work the amount of destruction you noticed in the mine? Yes. I have satisfied myself as to that; the strain on the ropes and other things would have an indirect effect.

Mr.
J. C. Jones.
16 May, 1887.

4276. But do you think it could have arisen purely from a gas explosion unaided by dust? Yes, unaided by dust, certainly.
4277. If this door opposite Nos. 1 and 2 and that on the diagonal road were open, would that have a serious effect upon the ventilation of these workings? Yes. It would virtually shut off the ventilation so far as the face of Nos. 1 and 2 headings.
4278. Have you considered how far the fact of these doors being open would contribute to the explosion? It is possible that the doors being open the gas would have time to accumulate, and then if they were shut again, and the current being restored, it might carry the gas on to a light, but I do not think it is probable.
4279. Do you think it a wise mode of working to allow the bords to be so near the exploding headings, which are known to give off gas? I think in all cases the headings should be a good distance ahead of the bords.
4280. That is a principle approved of by mining experts generally? Yes.
4281. That they should be at least 100 yards in advance of the bords? Yes. But I do not say that length. In this case, at Bulli for instance, there may have been some delay owing to this dyke. I suppose they drove the headings as fast as possible.
4282. I think you have already stated that Nos. 1 and 2 headings should have been bratticed? What I mean is this, that if gas showed in the lamp, rather than have the men work in it I would put brattice there.
4283. That is the custom pursued in the old country? Yes.
4284. Do you think it right and proper to allow workmen to fire their own shots? Do you mean generally speaking, or only where gas exists?
4285. Where gas is known to exist? I do not think it is advisable to use shots at all while the men are in where gas is generating.
4286. In going up No. 1 heading, did you observe one or two abandoned bords to the right? Yes.
4287. Were these bords, to your knowledge, driven up to the dyke? I really do not know. I did not go up there.
4288. If you were told that these bords were driven up to the dyke, would you consider that a likely place to find gas—near the fault? I do not know. I could understand it being given off.
4289. Do you think these disused bords should be securely walled off? I do not think so, if they generated gas, unless you stowed them up completely.
4290. Does the Act provide for such a measure? I do not think so.
4291. It does so provide. Now, we have been told that the men working in Nos. 1 and 2 headings were permitted to do so with unlocked lamps. In your opinion, was that a wise proceeding? No; I cannot say it was; indeed, I think, it was most unwise for the men to take unlocked lamps into the mine.
4292. The law provides, I think, that some authorized person shall be put in charge of the lamps, and that no person shall be allowed to take a lamp into the mine unless it is locked? Quite so; and that is why I say the men should not have done it.
4293. Was it a violation of the rule to give the men unlocked lamps? Yes; I should say so.
4294. In your experience of mines that have generated gas, and where doors are required to be frequently opened for trains to pass through, is it not usual to duplicate or double the doors? Yes, if it is a very important place.
4295. Then, having in view the small area of the workings of Nos. 1 and 2, which you have already described as being very limited, do you think that double doors would have answered a good purpose as a precautionary measure opposite Nos. 1 and 2 headings? Yes, I do.
4296. *Mr. Croudace.*] Did you examine the workings from the Hill End district right round from the Western, Mr. Jones? I did.
4297. Supposing the first explosion to have taken place in No. 2 heading, did you in travelling round see any signs of a second explosion having taken place? No, I did not.
4298. Do think it possible that there was an accumulation of gas in any portion of the old workings? No, I do not think so, in that vicinity at any rate.
4299. You think there could not have been any accumulation of gas in any of the old workings west of the dyke? No; I think not.
4300. Supposing there had been any accumulation of gas there, what would have been the probable effect upon the main tunnel in the western district? It would probably have caused a complete wreck.
4301. Would it have affected the furnace there? Yes.
4302. Therefore you do not think there could possibly have been any accumulation of gas in any other part of the workings, so far as the effects can guide you in forming an opinion? No.
4303. Looking at Nos. 1 and 2 headings, and seeing that there are bords broken away in No. 2 heading, and that there has been an acknowledged accumulation of gas in the face of No. 2, do you think it was prudent to allow those bords to be worked with naked lights? No; I do not think it was.
4304. Looking at the positions of Nos. 1 and 2 headings, and Nos. 3 and 4, do you think it was advisable to have had these pairs of headings so near to each other? I do not think they are near—they are about 2 chains apart.
4305. Now, with regard to these doors, you have stated that it would be better to duplicate them. Supposing single doors to be in existence and a trapper to be kept at each of them, do you regard that as being as great a precaution as could possibly be taken to prevent these doors being left open? Certainly. The doors would not affect the ventilation if they were only opened while the trains were passing through.
4306. Assuming this accident to have occurred between 2 and 3 o'clock in the day, is there any probability of that door having been left open by the trapper boy, or by any one under any circumstances, a sufficient length of time to allow the gas to accumulate in Nos. 1 and 2, and therefore to cause the accident? No; I do not think so.
4307. Now, if you notice, there is a small pillar of coal between these headings, Nos. 1 and 2;—would it be possible to have two doors there, on that road, and at the same time allow five or six sets to pass through? No; you would lose the advantage of having two doors; unless one could be kept shut they would require to be 30 or 40 yards apart.

- Mr. J. C. Jones.
16 May, 1887.
4308. As a matter of ventilation, would it not have been better to have abolished all these doors in the main intake, and to have ventilated the district by scaling doors in the return? Certainly, that would have been a more precautionary measure in a case of the kind.
4309. Did you examine the big fall near the mouth of the main tunnel? Yes.
4310. Did you see any indication of fire there? I think I saw some charred timber there.
4311. Did you see any signs of explosives being used there (other than gas) that might have shattered the stone? No.
4312. You saw nothing but a heavy fall of the roof, caused, as you think, by the explosion? No.
4313. In the firing of shots would you consider it a desirable practice to tilt the safety lamp on one side in order to light the touch-paper by the flame up against the gauze? No; I think it unwise to do that.
4314. Going further than that, what would you consider the state of matters where a miner would work in the presence of gas with the top of his lamp burnt out? It would show great ignorance, and I think it would be folly on the part of any man to do such a thing.
4315. Supposing that the deputy or other person in charge, in compliance with a general rule laid down here, had locked a lamp and given it to one of the workmen, and the man specially asked him what he was to do in the event of the lamp going out, whereupon the deputy unlocked the lamp and allowed him to take it in unlocked—what would you infer from that? I should think the official allowed himself to do a wrong thing in order to oblige that man. [*The witness withdrew.*]

John M'Kenna recalled:—

- Mr. J. M'Kenna.
16 May, 1887.
4316. *President.*] We understand you wish to say something by way of supplementing your former evidence? Yes; I have it here.

[The witness had prepared a statement of the views he desired to offer by way of supplementing his former evidence as to the cause of the accident, and this statement he read, as follows:—“As to the singeing of horse at foot of incline, in dealing with this subject I must begin with the flame at the far end of the gassy flat, and describe its outward course. At the time of the explosion I believe there were nearly 2,000 cubic feet of gas in No. 2 heading (inside the caution-board), and that there were over 3,000 cubic feet in the disused workings in the old left-hand headings. My reason for supposing that there would be over 3,000 cubic feet of gas in these disused workings is on account of them being at a higher level than Nos. 1 and 2 headings; and during the strike the ventilation was reduced to a minimum. While the ventilation was in this low state the gas would naturally find its way into these disused workings; and after the ventilation was restored this 3,000 feet of gas would still remain there, for this simple reason, that the ventilation does not act upon the places in that heading.

When those two quantities of gas exploded the volume of flame would be equal to 40,000 ft., the temperature of which would be nearly 1,500 degrees Fahrenheit, and the destructive power would be equal to about 1,340 lb. of blasting powder. Allowing that half this volume, namely 20,000 ft., came direct from Hill End, and that the other half took the western course—such was the case, as I showed you a sample of coke half-an-inch thick, and nearly as large as my hand, which I took off a prop in the western, this being a proof that the fiery blast was in the western district—we would have, coming from Hill End, a volume of flame 20,000 ft., with a destructive power equal to about 670 lb. of powder, rushing headlong outwards and leaving its first victim on the turn of No. 3 heading. The second indication of its course was on the flat, where the skips were blown outwards, and one full skip was blown outwards on top of a little boy. About 160 yards further out were the lads Ralph and M'Kay, and on the bank-head were four or five men and two lads, all of whom were frightfully burned. The next forms of life in the course of the blast were the boy and horse who were within a few yards of the tunnel mouth. The fiery blast was almost exhausted when it got this length, and the tunnel being high and wide at this point the force of the blast knocked the boy down, and the almost exhausted flame passed over without injuring him; but the horse, whose height was near to the roof, got singed about the tail, mane, eyelashes, and other superficial parts. The horse is a living proof that the quantity of gas fired was so great that it did not exhaust itself until it became lost in space outside the tunnel.]

4317. *President.*] Can you speak positively of the state of the ventilation of the mine before the strike? Not of my own knowledge.

4318. Very well, you can make any statement you please to supplement your former evidence as to the state of matters before the strike? Very well; I say there were no doors or screens erected for regulating the air current in the workings of the gassy section. I was in there with Mr. White previous to the explosion.

[NOTE.—Witness was shown the position of the doors on the plan. But he was understood to explain that in his opinion these doors did not carry the ventilation where it was required, and pointed out that one of the places was 40 yards in advance of the air current.]

4319. You say you visited the mine after the strike and before the explosion? Yes, with Mr. White and others.

4320. For what purpose? For the purpose of looking at some headings that were to be tendered for.

4321. Then you observed that the ventilation was insufficient, and that these doors were not properly placed in your opinion;—did you make any complaint of that to anybody? No.

4322. You are a member of the Union, I suppose? Yes.

4323. Did you bring this matter under the notice of the Union? I did not.

4324. You believed that danger existed? Yes.

4325. And you also knew that miners have a perfect right to appoint check-inspectors from among their number? Yes. But the law is so evasive in itself that employers are allowed to drive this distance, as I have said, over that prescribed.

4326. I am not talking about that. You found a dangerous state of things there, you say. You know that the miners generally have the right to make inspections of the mine for the purpose of securing their own safety and for other reasons; and I ask, did you bring this state of things to their knowledge with the object of having a proper inspection made? No.

4327. Why have you bottled all this up till now;—why not have brought it out before, when you had an opportunity of averting a great danger according to your own opinion? The management would not have taken any notice of me, and whether the Union would have taken any steps I cannot say.

4328. You waited till an explosion took place, and then you bring these facts forward? Probably my name would have been "Walker" if I had interfered.

4329. Do you believe the gas which you say was in the old bords was ignited? I do.

4330. Would that create great destruction immediately it was ignited, as in the case of No. 2? Yes; if there was anything to destroy about the place.

4331. When I tell you that there was a stopping immediately opposite the place where you suppose the 3,000 feet of gas to have been stored, and that this stopping was not disturbed, do you not think it interferes with your theory to some extent? I assisted to close up four or five stoppings near the place I am speaking of.

[NOTE.—Witness being referred to the plans says he did not assist to close the particular stopping referred to.]

4332. *Mr. Jones.*] Are you quite sure that the horse you saw showed signs of burning? Yes. I also inspected the Big Fall, where the powder explosion was said to have taken place.

4333. *President.*] With what result? I saw nothing there but what bore the appearance of everything having been blown outwards. I did not see anything to justify the powder theory.

4334. *Mr. Croudace.*] In going down the main tunnel, did you observe any appearance of fire on the road? No, except on the bodies of the persons who were found.

4335. None on the timber? No; I did not observe any on the main incline going down.

4336. *Mr. Hilton.*] Do you know of any defects in the ventilation other than you have already described, of your own knowledge? The ventilation, in my opinion, was not in my way regulated round the working places where it ought to have been. There was good ventilation passing along the main roads.

4337. *Mr. Croudace.*] Then surely it must go into these other places? I contend that it passed along the main roads for a vain purpose. To do its work it ought to have been carried into the bords.

4338. How many bords or headings were driven beyond the prescribed distance? One heading, No. 3. It was over 40 yards.

4339. How many bords? There was one bord a little over 40 yards.

4340. Then are these the only violations of the law in that respect? Yes.

4341. *Mr. Owens.*] Did any of the men working in those places make any complaint to your personal knowledge? I cannot at present recollect that they made any complaint. [*The witness withdrew.*]

John Cavell sworn and examined:—

4342. *Mr. Clarke.*] Are you a miner, residing at Bulli? Yes.

4343. Do you remember the 23rd of March, the date of the explosion? Yes.

4344. Where were you at the time of the explosion? I was with the overman, in the old workings, between the grip and the western district. 16 May, 1887.

4345. What did you observe there first? I heard a loud report about half-past 2 o'clock, and felt a great rush of air from the western; it put out our naked lights.

4346. What did you do? We got a light, and went from the old bord we were in to an old heading where the air was running along, to see if there was any difference in the current of air. We found that it had not changed, and we came to the conclusion that there had been a heavy fall, so we turned back. After going about 60 yards the overman turned to me, and said, "Do you smell anything?" I said, "Yes; I smelt something like powder smoke." He then said, "Let us turn back; some disaster has happened."

4347. Which direction did you take then? We went out of the mine by the grip road, past the furnace.

4348. Did you observe anything unusual at the furnace? No. The furnace-man was there, and he wanted to know what was the matter, as the air was very much greater. He came out afterwards. We met Chalmers, Hope, Scott, and Lang at the bank-head.

4349. Did you go into the mine again? Yes; I was there helping to get the bodies out, on the Hill End Road, and I was in next morning again at the top of the flatt in the gassy.

4350. Do you wish to make any other observation, as to the state of the mine, for instance? I did not take much notice when I was in; I was simply assisting to get the bodies out.

4351. *Mr. Neilson.*] What was the object of your going in the old workings with Mr. White? We were exploring the road through where he was going to make a new return.

4352. Between the furnace and the western district? Yes.

4353. Were men working on the other side? I understood that from Mr. White.

4354. What sort of a road was there where you went? It was over old falls.

4355. Could you hear any men working on the other side? No. We were in the act of trying to get through to where these men were working when the explosion took place.

4356. *Mr. Hilton.*] You stated you were a miner—now, I want to distinguish between a miner and a coal-bewer. Were you a deputy, an assistant-deputy, a wasteman, or what? I was a miner, and signed the rules as a miner.

4357. Were you ever up in the old workings or return air-ways between the furnace and the western previous to that occasion? Not since the strike.

4358. Were you previous to the strike? Yes; I went through from the grip to the western.

4359. Was there a travelling way between the western and the furnace at the time you were in the old workings on the day of the explosion? I cannot say, because I never tried to get there. 4360.

Mr.
J. M'Keena.
16 May, 1887.

Mr. J. Cavell.
16 May, 1887.

- Mr. J. Cavell. 4360. How long before the strike was it when you travelled these return air-ways? About a month before the strike.
- 16 May, 1887. 4361. You say the object with which you and Mr. White went into the old workings on this last occasion was to mark out a new return air-way;—was there anything amiss with the old air-way that you were endeavouring to find a new one? I cannot say; I understood the old return to be practically closed with falls.
4362. When you travelled this return air-way, as you say, a month or so before the strike, what sort of a road was it? There was a good road then; in fact the return man used to go out that way—it was a near cut out.
4363. Were you met by any smoke or after-damp in the old workings on the day of the accident? I did not notice the smell of it until we got on to the grip road.
4364. Did you go into the mine again shortly after the explosion? I did not go any further than the cut-through that evening.
4365. *Mr. Croudace.*] At any time, either before or after the strike, have you ever noticed any sign of gas in the old returns? No, none whatever.
4366. Did you work with a safety or a naked lamp? With a naked lamp.
4367. And you never had any gas? Never on any occasion. [*The witness withdrew.*]

Richard White sworn and examined:—

- Mr. R. White. 4368. *Mr. Clarke.*] You are overman at the Bulli Colliery, Mr. White? Yes.
- 16 May, 1887. 4369. How long have you been connected with the Bulli Colliery? For twenty-two years.
4370. You remember the explosion that took place on the 23rd of March last? Yes.
4371. Where were you when the explosion took place? I was in the grip—what we call the grip heading.
4372. In company with the last witness, John Cavell? Yes.
4373. Well, what was the first indication you had of anything having occurred? I was in an old bord where I had some work done to meet a place coming in an opposite direction.
4374. A party of men were working towards you? Not at that time. I had come up to this old bord on this particular occasion to see if any falls had taken place.
4375. Well, what was the first indication you had of anything having taken place? I was holding a light to Cavell, when we heard a great rumbling noise and a rush of air, which put our light out.
4376. Then what did you do? We got a light as soon as we could, and went back on the return, and finding that the air was not affected I felt sure that nothing more than a fall had taken place. So we went back again, and worked our way up there; but when we had proceeded about 60 yards I smelt the after-damp a little, and on questioning Cavell I found that he had detected it too. So we made our way back the same way as we came, past the furnace. The furnace was all right, but the attendant was nearly done—exhausted.
4377. When did you go into the mine again? I went in on the Friday.
4378. Just tell us where you went and what you did, Mr. White? I followed Mr. M'Cabe in. I thought I would go up and see if I could be of any use. I proceeded to the Hill End district, and when opposite to No. 1 heading I met Mr. Robbins. I proceeded on, and went into No. 6 heading, to the left, towards the face of the main tunnel, and I discovered a horse and two boys and two men.
4379. Did you see any gas there? No.
4380. Where did you go to next? We went from the Hill End to the western, proceeding along the flat to the overcast, which was blown down, and as I was about creeping under the fall Mr. M'Cabe called me back.
4381. Did you see any other destruction or wreckage there? No. We returned then and made further inspections of all the headings—Nos. 1, 2, 3, 4, and 5.
4382. Do you remember what you observed in No. 1;—did you go into the bords there? Well, I went into work more than for inspection.
4383. Did you go into the face of No. 1? No.
4384. Did you find any gas in Nos. 1 and 2. No; I do not think I did.
4385. Subsequently, did you make any minute inspection of that district? Yes, I did.
4386. Within a week after, say? I think I was in before, but it was within a week after that M'Kenna and the miners went in.
4387. Did you go in at any time with the Government inspectors? Yes, I think I did. I went in almost every day.
4388. How did you find the ventilation? Very bad after the explosion.
4389. On the occasion of your special inspection, did you go into the bords? Yes.
4390. Did you search for gas in any of the bords? No.
4391. Did you go to the face of No. 1 heading? Yes.
4392. Did you find any gas there? Yes.
4393. Was it present in any quantity? No, only slight.
4394. Did you find any in No. 2? Yes; there was more there than in No. 1.
4395. Did you observe anything in the face there? I certainly found something strange on the Friday. I was in there superintending the erection of some brattice, and I saw a lot of loose coal there. I saw that it had been intended to put a shot in. A hole was drilled about 2 or 3 inches in, but the shot had not been fired. I pulled the loose coal away from the bottom, and found that the coal had been holed about 3 feet. This seemed to indicate that no shot had been fired there. A portion of the coal had fallen away at an acute angle from the face. After putting the brattice up I told the men to spread the slack along the bottom, and in spreading this out with my hand I suddenly found an open oil-lamp. Allan Black had put it there in a shovel of coal. I asked him where he got it, and he pointed to the place where he had taken the coal from.
4396. Did you see any indication of a shot having been fired immediately prior to the explosion? I can not say that, because they might have put a shot in on the right-hand side, and that coal might have been blown down by a shot.
- 4397.

Mr.
R. White.
16 May, 1887

4397. Have you got that lamp? Yes. [*Lamp produced.*]
4398. I think you said you searched for gas in the bords off No. 2, and that you found none? Yes.
4399. Did you see much wreckage in Nos. 1 and 2 headings? Very little.
4400. Further in—at Nos. 3, 4, and 5—did you notice much? No; I did not see much there.
4401. From your inspection and observation can you form any opinion as to the cause of the explosion? Well, at first I formed the opinion that it was by the action of a shot, but since finding this lamp I do not think so.
4402. And what is now your opinion? That the owner of that lamp was working with it there.
4403. You are of opinion that the gas was fired by some man working with a naked lamp which you now produce, and which you found near the face of No. 2 heading? Yes; and he must have been working close up against the roof, because the coal was not more than 4 feet thick.
4404. After the strike what official was employed in the Hill End district—the gassy section? Millwood.
4405. He was the deputy? Yes.
4406. There was no back deputy? No.
4407. Have you ever had any back deputies in the Bulli mine during your period of office there? No; I do not recollect any.
4408. Did you know Millwood well? Yes.
4409. Was he a capable and careful man? Yes; I considered him a very capable man.
4410. Do you know whether he was in the habit of examining the headings previous to the men going into work? I believe he was; but he had not been deputy very long.
4411. Did you give him instructions? Yes.
4412. And you had reason to believe he did so? Yes; I used to go down to the mine after 6 o'clock, and I only saw him on two occasions there.
4413. Were you aware of headings Nos. 1 and 2 giving off gas? I was aware that they were giving off a little.
4414. You were aware that gas existed there? Yes.
4415. Did you yourself make inspection of bords No. 1 and No. 2? Yes; we never found gas there.
4416. Was any report ever made to you of the presence of gas in these bords? Never.
4417. Did Millwood accompany you on your visits of inspection? Sometimes he did.
4418. Did he on any occasion ever draw your attention to any large extent of gas there? No, sir; every day when I saw him I would ask him how things were.
4419. Did you ever examine the faces of Nos. 1 and 2 prior to the explosion? Yes.
4420. What was the result of your inspections so far as gas was concerned? I never saw any till the Friday previous to the explosion.
4421. What happened then? Hope told me there was a little gas there. He was working in No. 1 heading.
4422. What did he say to you? He said there was a little gas there.
4423. With what object did he say that? To draw my attention to it.
4424. Did you search, and if so, what amount did you find? I had to hold the lamp a considerable time, half-a-minute or so, near the roof, and then it would flash.
4425. How near the face was it? Close to the face. Of course the men being at work there, you know, it would be very slight.
4426. Was bratticing used in any of the headings? No, sir.
4427. Why not? Well, we had never found it necessary.
4428. Did you think there was sufficient ventilation without it? Yes; we had never used brattice all the years I was there. Of course, if we had known what we do now we should have used it.
4429. Did it never occur to you to be necessary to use brattice where gas was given off? Not where the gas was so slight as when I saw it.
4430. Would it not be well to use it as a precautionary measure, even with that small amount of gas? I think not. If we had seen a large amount I would certainly have put brattice there, or recommended it.
4431. Do you know the system that was in vogue among the miners as to the firing of shots? I only know since the accident.
4432. You did not know the practice in vogue? No.
4433. Did you give instructions on the subject? Yes.
4434. To whom did you give instructions? To Millwood. I instructed Millwood to fire all the shots in the bords, and not to allow the men to do it.
4435. And in the headings? Yes.
4436. And you did not know whether he carried out your instructions, or how the shots were fired? No.
4437. Now with regard to the lamps—what instructions were given as to the use of the lamps in the gassy section? Open lights were used in the bords, and safety-lamps in the headings.
4438. Did you give instructions to that effect to Millwood when he became deputy? Yes.
4439. Did you instruct him to lock the safety-lamps? Yes; I gave him positive instructions on that point.
4440. Were you aware at any time that those instructions were not carried out? No; I was not.
4441. Did you see the men working with safety-lamps in those headings when you visited them. Yes.
4442. Did you ever examine the lamps with the object of seeing whether your instructions were carried out? No.
4443. Who would be responsible for the lamps on the back shift? The men themselves.
4444. Where would they get their lamps? At the lamp cabin.
4445. They could please themselves then as to whether the lamps were locked or unlocked; is that so? No; I put him (Millwood) on shift on purpose to lock their lamps for them.
4446. Was he present in both shifts? Yes.
4447. Then he was to lock the lamps on both shifts? Yes.
4448. After he would deliver the lamps to the men on the back shift, who would have charge of that portion of the mine then? There was no official there then.
4449. Then supposing anything went wrong with the lamps in that part, what would the men do? They would have to go back to the lamp house.
4450. Do you know where the key was kept? Yes, in a cupboard there.
4451. As a matter of fact, then, if the key was there the men could unlock their lamps and do what was necessary

- Mr. R. White.
16 May, 1887.
- necessary to them, and they could either lock them again or leave them unlocked, as they chose? It would be the case, yes.
4452. Have you ever had any large blowers in the gassy section either before or after the strike? Well, no; I have not seen any particularly large ones; but I have seen blowers.
4453. Who was the deputy before the strike? Crawford.
4454. Did he ever draw your attention to any issue of gas—a blower? Yes.
4455. *President.*] Do you remember the occasion, Mr. White? No, I really could not say to a week or two. I should say it was about a month or so back.
4456. What was the nature of his report, or what did he draw your attention to? The largest blower I ever saw there was the one he showed me. As we were going in one morning he said "Stop a moment and I will show you something." He then produced a pipe with a tap attached to it, and he placed this in a hole which he had made where the blower was. He then put a light to the pipe and lit the gas. In a conversation that ensued he asked me to let it burn, as it would be a convenience to the lads, and it would at the same time exhaust the gas. I told him not to let it burn, as although it would exhaust the gas it would eat up the air. I ordered him to put it out. Mr. Ross saw the pipe when he was in with me on one occasion.
4457. Was Mr. Ross shown the gas too? Yes.
4458. Did Mr. Ross give any instructions? I do not know whether Mr. Crawford made the same remark to him about letting it burn. He turned the gas on, and Mr. Ross told him not to make use of it in that way.
4459. Whereabouts was this blower—in what heading? In No. 2 heading.
4460. In what part of No. 2? It was about 100 yards in.
4461. How far would that be from the face, have you any idea—was it beyond the last stenton? Oh, no.
4462. What was the length of the hole? I cannot say exactly.
4463. Do you know what became of that blower? Did it become dissipated, or did you make any inquiries about it? I did not see it afterwards.
4464. Did you have any report made to you about it subsequently? No.
4465. Did you consider it a dangerous blower, or one calculated to have ill effects? No. Of course it would have been better for it not to have been there.
4466. Did any of the men complain of this to you? No, never.
4467. With the exception of the observation made by Hope, did you hear any complaint from the miners as to an accumulation of gas in any of the headings? No.
4468. Did Crawford say for what purpose he put this tap on? No; I believe he just put it on for curiosity.
4469. It has been stated here that he did it in order to convince the management of the presence of gas. You knew that gas existed there? Yes, I never denied it.
4470. Were you unwilling to believe that any large quantity of gas existed, or was any complaint made to you to that effect? No.
4471. Therefore you would say this pipe could not have been put there to convince you? No, sir.
4472. Whenever you saw Crawford, did he say to you what amount of gas existed in these headings? Yes, he did.
4473. What was the purport of his reports as a rule? I told him it was best to report everything he saw. I told him if he saw gas in any of the bords not to allow the men to find it out, and if he found any indication of gas, to put the men on with safety lamps immediately. On no occasion did he report any large quantity.
4474. Were attendants provided for each door on the main road? There were previous to the strike, but not at all times, because the lads were so irregular at their work.
4475. What steps did you take to prevent this irregularity? We allowed the wheelers on several occasions extra money for minding their own doors.
4476. What kind of doors were provided? Single doors.
4477. Do you think single doors sufficient? I do.
4478. Which do you think the best system? Double doors might be necessary in some places, but not at all necessary in others.
4479. If you were asked your opinion what would you suggest as a matter of precaution, double or single doors? I should suggest a single door, unless I saw a particular reason to adopt the other system; double doors should only be used in special places.
4480. As a rule, which would be the better plan to carry out, between Nos. 1 and 2 for instance? I should say a single door ought to answer all purposes if properly attended. It depends a great deal upon which way the heading is turned.
4481. Was the ventilation much improved after the strike? Yes.
4482. Was any alteration made in the system of regulating doors since the strike? No.
4483. The doors were left as they were? Well, there was some alteration made at the western junction.
4484. But not in the Hill End district? No, I think not.
4485. As to trapper boys, for instance? There were plenty of trapper boys after the strike. There was one for each door and plenty to spare.
4486. Then your observation as to the irregularity of attendance refers to a period previous to the strike? Yes.
4487. And since that, so far as you know, they attended to their duties? Yes, I requested Mr. Ross to put on more boys, and we had plenty of them—more than we wanted in fact—which accounts for the destruction of boys in the explosion.
4488. You never use bratticing in any portion of the Hill End district, since the strike? I never used it.
4489. Did you ever make any suggestion to Mr. Ross as to bratticing? Well it has just occurred to me that there was some bratticing used on one occasion in the Hill End district, when we were going through the dyke.
4490. That was about two years ago? Yes.
4491. Have you ever used any since in any of these headings off the main road? No.
4492. Did you ever suggest to Mr. Ross the propriety of using bratticing? No, sir, I did not.
4493. You did not think it necessary? No.
4494. Is there a travelling road between the western and the furnace? Yes.
4495. Is it a good travelling road? I cannot say it is a good one.
4496. But it could be travelled? Yes.

Mr.
R. White.
16 May, 1887.

4497. Have you been there since the explosion? Yes, on two occasions.
4498. You have travelled right through it? Yes.
4499. Did you examine any of the places while the men were on strike? Yes.
4500. Did you go alone? Sometimes I was accompanied by men, but generally I went alone.
4501. Did you travel the air-course? Yes, from the Hill End to the return, and from the western to the furnace, and I have travelled twice to a place midway between the western and the furnace, where we got through to the grip.*
4502. Did you ever see any gas in these old workings before or since the strike—any gas at all? No.
4503. Was the ventilation as good during the strike as it was before the strike? No, not by any means.
4504. Before the strike, what quantity of air was travelling round the Hill End district? I think the measurement Mr. Rowan took at the time, gave 2,500 feet; but I cannot say exactly as I did not take a note of it.
4505. After the strike what amount had you in the Hill End district? I think Mr. Rowan told me it was 12,000 feet on two occasions.
4506. Previous to the strike were you working with naked lights in the Hill End district? No.
4507. They all used safety-lamps? Yes, with the exception of the boys on the flat.
4508. Did you use safety-lamps in the headings after the strike? Yes.
4509. In the bords? No.
4510. What reason had you for discontinuing the use of safety-lamps in the bords? Because we had such a quantity of air that we thought it was unnecessary.
4511. Was there any other reason? Well, they are very troublesome to work with; for myself I would as soon be transported as work with a safety-lamp.
4512. You thought that the increase of air from 2,500 feet to 12,000 feet, did away with any possibility of danger from gas? Yes.
4513. When were you last in No. 2 heading before the explosion? On the Sunday morning, three days before the explosion.
4514. There would be no one working on the Sunday morning? No.
4515. Were you in by yourself? No; Millwood was with me.
4516. Then you did not see him any more? No.
4517. Did you find any gas there on the Sunday morning? Yes, a little in No. 1 and No. 2.
4518. Was the furnace man in that morning? Yes.
4519. Then the furnace would be going as hard on Sunday as on any other day? Yes.
4520. How often did you report general matters to Mr. Ross? As often as I saw him, we would talk about something or other in connection with the mine.
4521. Did you report to Mr. Ross about the small portion of gas that you saw on the Sunday morning? I cannot say that I did.
4522. You have stated in answer to Mr. Clarke that you gave Millwood instructions to fire all shots in the bords? Yes.
4523. Was that after the strike? Yes.
4524. And yet you worked with naked lights in the bords? Yes.
4525. What object was there in the deputy firing the shots where naked lights were used? Well, it was to keep the men out of danger as much as possible, there being a number of new hands there.
4526. You say that it is three months since this blower was shown to you by means of a pipe with a tap attached? Yes.
4527. The headings have been considerably advanced since then I suppose? Yes.
4528. When you first passed through the dyke did you get a large quantity of gas? We had gas; but I would not consider it a large quantity.
4529. Was it as much as you got in Nos. 1 and 2 headings? Yes, I believe there was even a larger quantity then.
4530. Is there any opening in the door at the western—is there any regulator attached to it? Yes, there are two openings.
4531. What size are the openings? I cannot say the exact size; but I should think not less than a foot and a half.
4532. Then there is another place where the rope runs through? Yes.
4533. If that door were propped open, would it do the Hill End district much harm? I do not think so.
4534. Is the return from the Hill End better than the return from the western? Yes, a good deal.
4535. Is there much difference in the respective distances that the air has to travel by these two routes—which is the longest? The western.
4536. The suction is to the Hill End, that being the best return? Yes.
4537. What good is the door then? To make the split for the required quantity per man.
4538. *Mr. Hilton.*] Have you a good knowledge of the special rules of the Bulli Colliery, and of the Coal-mines Regulation Act? Yes.
4539. Was there any one in charge of the door at the western junction? There were two boys and a man working there.
4540. Was there any one specially appointed to open and shut the door for the sets going through? No, not specially; but this man, who was working within a yard or two of the door, attended to it.
4541. *Mr. Croudace.*] Was that part of his duty? Yes.
4542. Then he was specially appointed? Yes.
4543. *Mr. Hilton.*] Were you in the habit of travelling the air-ways? Yes, occasionally.
4544. Was it not your special duty to travel the air-ways? No, I think not.
4545. Rule 8 of the Bulli Colliery rules says: "The overmen shall examine the main air-courses every morning and every evening, and report any defect they may notice to the master-wasteman, who shall remove any obstruction in the air-courses as soon as possible." According to this rule, you see, it is the duty of the overman to travel the returns? Do you mean to travel them right through every day?
4546. The rule says "travel the air-courses"? I examine them every morning by the light at the entrance, and if I found any defect or obstruction to the ventilation, I would set a man to clear it. I should have enough to do if I travelled right through every day from one district to another. 4547.

* NOTE.—Witness indicates position on the plan, and refers to the bord he was in at the time of the explosion, marked (C).

Mr.
R. White.
16 May, 1887.

4547. Have you ever travelled the return air-courses since the strike? Yes.
4548. How long before the explosion? I cannot give you the date; but the furnace-man knows that I did travel them, if you want any one as a witness.
4549. Have you used, or caused to be used, any brattice as a means of ventilation in the gassy section since resuming work after the strike? No.
4550. Do you know the distance from the face of No. 3 heading to the last stenton? Yes; I think it is about 41 yards.
4551. The Coal-mines Regulation Act says: "No place shall be driven more than 35 yards before the current of air without a cut-through, put through, or bratticed up, within 3 yards of the face of such working place." Were you aware when you drove this place 35 yards without putting brattice up that it was a contravention of the Coal-mines Regulation Act? I am aware of the fact; but I was not aware that the place was in so far when it was measured.
4552. Did Crawford ever send any men to you previous to the strike for having their lamps unscrewed? Yes; Woods and Wells.
4553. Did you report the circumstance to Mr. Ross? I think I did.
4554. Have you at any time had a book for the purpose of entering reports as to the working of the mine? No; not previous to the explosion.
4555. Rule 5, section 2, of the Mining Act says: "If at any time it is found by the person in charge of a mine, or any part thereof, that by reason of any cause whatever, the mine, or any part of it, is dangerous, every workman shall be withdrawn therefrom," and so on. Are you acquainted with that clause? Oh, yes. And I would just like to remark that these men you have referred to were never sent back into the same place again. I think all these facts should come out in evidence, because certain witnesses may state what they wish to say, and go no further, although they have probably not disclosed the whole truth.
4556. Did you ever unscrew your lamp to get a light in a place where there was gas? I do not think so. I should be a fool to do so, at any rate.
4557. It has been stated here, Mr. White, that you unscrewed your lamp to get a light a short distance from the working face in a place where there was gas at the time? It is not true; and the man who made such a statement is either a fool or a rogue.
4558. Was anyone specially employed to keep the air-ways in good order? Yes, previous to the strike two men were so employed, namely, Thomas Wilson and Sproule. They had nothing else to do.
4559. Was the system of ventilation employed previous to the explosion the best so far as you know? I could not answer that without comparing the system with some other systems. All I can say is, that it answered the purpose.
4560. Had Mr. Ross any fixed periods for going into the mine, either fortnightly or monthly? No; he frequently went in. Some days he would go in, and some days he would not.
4561. Did any lengthy period elapse at any time between the visits of Mr. Ross, for the purpose of examining the workings? I cannot say; sometimes he would be in two or three times a week.
4562. Were you in the habit of reporting matters connected with the mine to Mr. Ross? Yes.
4563. *Mr. Owens.*] Did the Hill End deputy report to you the presence of gas in these headings, Nos. 2, 3, 4, 5, and 6? Yes.
4564. Did you report that to the manager? Yes.
4565. I understand that you did not use brattice as a means of carrying the gas out of the headings? No.
4566. Were they working in those places with safety-lamps? Yes; no man has ever worked in the headings without safety-lamps since the strike.
4567. Have you ever carried a naked light up to the danger-board? We consider it safe to carry naked lights to the danger-board, but no further.
4568. Did the men use naked lights to go in and out of the mine—that is, take their lights in with them as far as the cabin, and substitute safety-lamps for them? Yes, they usually did; they would blow their lights out.
4569. Where did you find that lamp which you have produced? I found it 4 or 5 yards inside the stenton on a canch. The men were carrying slack coal back from the face of the heading, and I was regulating the slack being thrown down. Allan Black picked the lamp up in a shovel of slack in the face and brought it to me. I called his attention to it directly, and he said, "I took that shovelful of stuff from the top of the canch."
4570. Might not one of the men have taken that lamp there after blowing it out, and placed it on the canch till he was going out again? No; they would under ordinary circumstances leave the lamp with their food.
4571. Was it possible for the lamp to have been blown there by the force of the explosion? It was more impossible I should say.
4572. How is that? How could you fire a lamp in there when the force of the blast came out of the headings?
4573. We are told that the wheeler at No. 2 heading was in the habit of hanging his lamp on the prop that supported the danger-board—did you know that? No, I never saw it.
4574. You knew that the wheeler was in the habit of carrying a naked light? Yes, but he was always told to put his light on the ground and never to take it beyond the stenton.
4575. Were you in this district the night before the accident with a naked light? No. I would like to see the man who reported it.
4576. Did you give the same strict orders to Crawford as you did to Millwood with regard to safety-lamps? Yes, I did.
4577. Are you aware of a lamp being used in the gassy section of the mine with the top burnt out of it? No; but I have heard of it since.
4578. How? I became acquainted with it from the newspaper report of the evidence.
4579. Did Mr. Crawford never tell you of the circumstance? No, never.
4580. Did he never ask you for a new gauze to replace one that was destroyed, and you stated you had no gauze? No.
4581. You say you gave instructions to the deputy to fire shots in the bords in No. 1 heading? Yes.
4582. What instructions did you give as to firing shots in the headings? None.
4583. The men were allowed to fire their own shots? Yes. 4584.

Mr.
R. White.

16 May, 1887.

4584. You have stated that you knew that gas existed in these headings, and yet you allowed the men working there to fire their own shots? Well, I do not know.
4585. *President.*] You have said you knew it on the Friday before the accident? Yes, I did, so recently as that.
4586. *Mr. Owens.*] The men in the bords, who worked with naked lights were not allowed to fire their shots? No.
4587. And the men in the headings working with safety-lamps were allowed to fire their shots? Yes. But then these men in the headings were working by contract, and they were special miners—practical men.
4588. Were there no other practical miners in the pit? Yes, plenty. As I have said, I did this for precaution sake, because there were new hands, just to keep them out of danger.
4589. Were they all new hands? Some of them were miners, and some of them were new hands.
4590. Were you aware of the way in which they were firing their shots? No.
4591. Do you think the practice of tilting the lamp to ignite the touch-paper is a safe method of firing shots? I should not consider it a safe method; at the same time I do not consider it very dangerous—not in the absence of gas, or a large quantity of gas.
4592. But in the presence of gas? It all depends upon circumstances. A man appointed to look after a body of men does not necessarily confine himself to one line of conduct. A man must suit himself to circumstances.
4593. We have evidence here that on one occasion, in No. 1 or No. 2 heading, you lost your light; that you came into the heading and asked for a light; and that you went within 6 feet of the face and lit your lamp? It is a wilful lie—a fabrication. I am aware of my light going out. But as a matter of fact there has been nothing in such large proportions as has been represented. I will tell you the reason of this lamp going out. It was a Museler lamp, and these lamps require great care to handle, whether there is gas or not. Unless you are very careful, if you draw them down, they will go out instantly. On this occasion you refer to, a man named Hobbs wanted me to find him another place—to let him go on shift on his own account, because the men in that way were gaining more money. I said I would not shift him, and if he did not like it he could go; and when I was going back my lamp went out. I do not know who it was gave me a light.
4594. You were not within 6 feet of the face when you got a light? Certainly not. It was not I who went in that night. One day I was in with Millwood, and as we were going by the danger-board I saw a man going by me with a naked light. He was a man named Browning. I said to him, “Where are you going with your naked light?” He said, “I am going into the mine.” I said to him, “Do you not know that the rules prohibit you from going into this place with a naked light?” I was a very good mind to discharge him; but Millwood asked me to let him go that time, as he did not think he would do it again. These men may have seen that light; but there was no light beyond the danger-board.
4595. Who was supposed to lock the lamps of the night-shift men? Millwood.
4596. If I were working in the gassy section of the mine would you, in order to oblige me, unlock my lamp if I asked you? No, but another man might, and I believe he did.
4597. Do you know of your own personal knowledge? No.
4598. You say the reason that the men were allowed to fire their own shots in No. 2 heading was because they were trustworthy and skilful? Yes; I am sure Mr. Ross would not have put them in the headings otherwise.
4599. At the same time you think that they used naked lights in No. 2 heading, knowing that gas was given off in that particular heading? It is my opinion that someone had been in there with a naked light.
4600. Might not that lamp have been taken there for twenty reasons other than working. Is it not possible that it might have been rolled into the road and buried amongst the small coal? It is possible; but I do not think it is reasonable to suppose so, because a man would naturally expect to lose his lamp altogether with a shot going off there.
4601. You say that two men were sent out by Deputy Crawford for having an unscrewed lamp? Yes.
4602. And no record was made of that in a book kept for the purpose? No.
4603. Did you report that to the inspector? No; I have no recollection of it.
4604. Do you not think you ought to have reported it—why did you not put the law into operation? The only reason I can give for that is, that I was too lenient with them. Perhaps one man would have a large family, and perhaps in the case of another there might have been a little spite on the part of the deputy. You cannot punish men without consideration. As it was, I did punish them by not giving them the same place again.
4605. You are aware that such a violation of the Act might be calculated to bring about such a calamity as that of the late disaster? Not at all.
4606. Is it customary to use safety-lamps where there is no gas? Yes, if there is a suspicion of its existence. I have used them plenty of times in England on the mere suspicion.
4607. To close the matter, you did not think it of sufficient importance to report to the inspector? No, I did not.
4608. Did you report the circumstance of this blower, which was shown you by means of a pipe, to the inspector? No.
4609. You did not think it of sufficient importance? No.
4610. In the light now of what has happened, do you not think that bratticing should have been used in Nos. 1 and 2 headings? I can hardly answer the question, because if we had known that the gas was there we should most likely have used it for precaution.
4611. You were pretty well aware that gas was there; in the light of what has happened; therefore, would brattice, do you think, have given a larger measure of safety, putting the question in a general way? It would have been better, no doubt.
4612. Have you a night watchman at the Bulli mine? Yes.
4613. Previous to the explosion had you? Yes.
4614. Did anyone ever report to you that the furnace man, on the night previous to the explosion, went to his work in a state of intoxication? No, that was never reported.
4615. This is a matter I want to understand very clearly, and I want to understand whether any such report was ever made to you? No such report was made.
- 4616.

- Mr. R. White.
16 May, 1887.
4616. The watchman did not report to you that the furnace man went to you in a state of intoxication? No, he did not.
4617. You are quite sure of it? Yes, quite sure.
4618. *Mr. Crowdace.*] Who is it that lays out and designs the system of work generally at Bulli mine? Mr. Ross.
4619. In opening out this Hill End district from the dyke, did you receive instructions from Mr. Ross as to the points at which you were to start away these headings? Yes.
4620. Do you notice that the headings are turned away quite close to the dyke, within a few yards? Yes.
4621. Then you received instructions from Mr. Ross to turn away the pair of headings, Nos. 3 and 4? Yes.
4622. And the bords in No. 2 heading? Yes.
4623. Did you receive instructions from him to turn away the bords in No. 3 heading? Yes.
4624. Did you ever suggest to Mr. Ross the undesirableness of working away the bords in No. 2 heading for any reason? No.
4625. Not as a reason of economy, as it were, nor because it was a return air-way for the bords working in No. 1? No.
4626. Did you ever give the matter any consideration as one affecting the best interests of the colliery generally? Well, I have a reason myself for turning the bords away. We were so hampered up with rolls that we might get only 10 or 15 yards of coal between each (say), at this heading.
4627. Seeing that gas was known to be given off more or less in No. 2 heading at about the time of the strike, do you not think it would have been better and safer to have left No. 2 heading purely as a return? It would have been better.
4628. Would it not have been prudent, in your opinion, to have run a little bratticing into Nos. 1 and 2? Yes.
4629. Knowing, as you did, that you were meeting with gas in the Hill End district, would it not have been desirable to increase the distance between these headings, so that you could have had two doors between Nos. 1 and 2, instead of a single door? Well, I did not give it a thought.
4630. Do you think now that two doors would be better than one under the circumstances? Oh, yes.
4631. Do you not think it would be better to abolish the main road doors, and place regulating doors in the returns? I should not think it would be best to abolish the doors.
4632. Have you on any occasion, on measuring the air previous to this strike or disaster, found the ventilation affected by any one of these doors being left open? No.
4633. Do you recollect Mr. Rowan and yourself measuring the air and finding it deficient? I do. We stopped at that stenton between the 5th and 6th bords, I dare say, for twenty minutes, and he took the measure of the air three times, and we got the same register every time. I proceeded along the heading, and to my surprise, when I reached the left hand door leading into the return, I found it open. The deputy (Crawford) was standing not 15 yards from it, and I had some words with him.
4634. Well, what did you do? Well, I shut the door, and asked Mr. Rowan to go back and measure the air again. He did so in the same place, and got 1,500 feet more air in the same place.
4635. Therefore the leaving open of that door was the cause of your getting so much less air along there? Yes.
4636. *President.*] You mean to say that 1,500 feet of air escaped through the door on the main tunnel? Yes.
4637. *Mr. Crowdace.*] You think it was not the western door? No, sir, it was not.
4638. You say you had high words with Crawford? I told him I would report him.
4639. Had you any reason to believe that the door was left open wilfully? I had strong reasons to believe that the door was left open purposely, because the man had followed us down, and when we got down to this place (*pointing to the plan*) he left us; I went nearly to the stenton before I missed him, and when I came back the door was open.
4640. Was there any misunderstanding or ill feeling between you and Crawford previous to the strike? No; I have no ill feeling against any man.
4641. Did he caution you about being very careful in the Hill End district for fear there should be an explosion? Yes, he did, the last time he was in the mine.
4642. Was that to be taken as a friendly warning or as a vicious statement, in your opinion? In my opinion I do not think it was done in a friendly manner, although it would imply that. It was known there was gas there, and he wanted to make as much of it as possible.
4643. Previous to the strike had you the same system of ventilation in the Hill End district as you have now? Yes.
4644. The doors were in the same position? Yes.
4645. Previous to the strike had you men to attend these doors regularly? Well, no, they were more lax then.
4646. Since the strike have you been careful to have each of these doors carefully and systematically attended? Yes, I have.
4647. Did that arise from a fear you had in your own mind of this warning of Mr. Crawford's, or how was it you came to be more careful than you were before? No; as I have said it was because I had a good supply of boys, and before that there was a deficiency of boys.
4648. You believe that the explosion occurred in No. 2 heading? Yes.
4649. Do you believe there was an accumulation of gas in any of those bords off No. 1? No.
4650. Or in the bords off No. 2? No.
4651. Do you believe there was any accumulation of gas in these workings marked A? I do not think so.
4652. Have you seen any accumulation of gas in the old workings? No, sir.
4653. Have you seen any in the western district? No.
4654. Or any tailing at the furnace? No.
4655. Coming to this lamp you found, do you believe that lamp had any connection with the explosion? It seems to point to that conclusion.
4656. Do you believe that a man was working with it at the time of the explosion? I cannot say.
4657. Did you find or did you hear of a dead body being found at the face of No. 2? No.
4658. Supposing a man to have had that lamp while working, and to have thus lit the gas, do you not think

Mr.
R. White.
16 May, 1887.

- think there would be some signs of his having been there? I cannot say; he might have been in the act of filling a hole on the right hand side, and he might have been blown a long way from his lamp.
4659. Who were the men who worked in No. 2 heading at the time? Westwood and Crompton.
4660. Do you know where the bodies were found? No.
4661. Do you believe either of them could have had that lamp in the face of the heading when the explosion took place? They might have lit the fuse and ran away; dropping the lamp at the time.
4662. Did you see any fuse there? No.
4663. Does the lamp in any shape or form show signs of having been in a heated atmosphere or great flame, or subjected to a heavy fall of coal upon it? This lamp looked very different when I first picked it up.
4664. Did you have a special man to clean and trim the lamps? No; not a special man. Millwood did the whole of that.
4665. Would it not have been better under the circumstances to have had a man to properly attend to these lamps before passing them into the hands of the deputy? Well, we gave the deputy any assistance he wanted; and there would have been a special man if we had kept on a while longer, but a fresh start had been made at that time.
4666. Would it not have been better to have had a man to clean and feed the lamps previous to their being examined by the deputy, so that the deputy's examination would be a second safeguard as it were? Yes.
4667. Was this never thought of, or did you never suggest it to Mr. Ross? No.
4668. Did you report matters connected with the mine to Mr. Ross every time you saw him? Yes.
4669. If you did not see him, did you take any steps to report? No, not necessarily.
4670. Would it not have been better in the opening out of a gassy mine like this, and particularly since the workings were extended, to have had a regular system of daily reports as to the operations of the colliery, and with respect to gas particularly? Undoubtedly it would.
4671. *Mr. Jones.*] Are you quite sure that Millwood also examined the working places previous to the night-shift men starting work? Yes.
4672. Did you ever hear of fire-damp in the Bulli mine previous to striking the dyke in the Hill End district? Yes.
4673. Did you ever hear of a man being killed in the mine? Yes.
4674. In what district? In No. 2 tunnel, we used to call it.
4675. It was not in the Hill End district? No.
4676. *Mr. Neilson.*] Did you ever on any occasion hear a report as to a blower that could be heard hissing for a hundred yards?
4677. Did Smithers ever report such a thing?
4678. *President.*] Had it existed you would have been certain to have heard of it? Yes, I am sure I should.
4679. *Mr. Clarke.*] Did Millwood ever report to you about having found a door propped open? Yes.
4680. What time was that? It was about two nights before the accident occurred. He said it was the second time he had found that door open.
4681. What door was that? It was the straight-in door.
4682. Did he say how it was propped open? No.
4683. Was it Millwood's duty to see that all the doors were shut, all the lights put out, and everything attended to generally for the safety of the men before he left the mine? Yes.
4684. *Mr. Hilton.*] I think you stated, in reply to Mr. Owens, that the reason you did not give the men in the headings instructions as to firing shots was because they were practical miners and trustworthy men? Yes.
4685. Now, is the man Woods, that was working in No. 2 heading since the strike, and the Woods whom Crawford sent to you for unscrewing his lamp, one and the same person? Yes.
4686. Do you think it was a prudent thing to allow a man to fire his own shots, who had been sent to you by the deputy for such an act as he was guilty of? I see nothing in it. A man may forget himself once, and after a good caution might exercise as much caution as any other man. You cannot punish a man everlastingly for one fault.
4687. Would that explanation apply to No. 6 of the Bulli General Rules? I do not know much about those rules.
4688. Have you never read them? Oh, yes. [*The witness withdrew.*]

Alexander Ross sworn and examined:—

4689. *President.*] You are the mining manager of the Bulli Colliery? Yes.
4690. How long have you been manager? For twenty years.
4691. How long has the mine been working? For about twenty-five years; but I could not say exactly.
4692. What mining experience have you had? I have had mining experience as a deputy at home, and in this Colony I have been engaged here and at the Wallsend Colliery.
4693. In what districts were you engaged at home? In Northumberland, Newcastle-on-Tyne.
4694. For how many years in mines that gave off gas? For twenty years at home in mines that gave off gas.
4695. Has it been your practice to give copies of the special rules to workmen? Yes.
4696. Has this practice been rigidly adhered to? Occasionally a man might be missed by accident, but, as a general rule, it was done.
4697. Upon whom did that duty devolve? Mr. White.
4698. To the best of your knowledge did all your workmen receive copies of these rules? To the best of my knowledge they did.
4699. Were the general and special rules posted up in a conspicuous part of the mine? Yes.
4700. And in addition copies given to each man? Yes.
4701. Before opening out the Hill End district of your colliery, did any working place give off gas? No.
4702. At no time? A little was observed on one or two occasions, but it was only a small quantity.

Mr. A. Ross.
16 May, 1887.

4703.

- Mr. A. Ross. 4703. Have you ever had a fatal accident from an explosion of gas? Yes; one occurred some seventeen or eighteen years ago.
- 16 May, 1887. 4704. Since that time has gas been given off? Only on one or two occasions.
4705. In what district? In the old workings.
4706. In what position were they? Going to the south-west from the tunnel mouth.
4707. That is to the right? Yes.
4708. And these workings are now abandoned? Long ago.
4709. Did the gas that was given off in the Hill End section necessitate your improving the ventilation? Yes; but that was not the only cause for the improvement of the ventilation; it was for the improvement of the ventilation of the mine altogether that we made the alterations.
4710. Did the quantity of gas given off necessitate the use of safety-lamps? Yes.
4711. What amount of air circulated in this section under the old system of ventilation by the old furnace? Between 4,000 and 5,000 cubic feet per minute.
4712. Did that go into the Hill End section? Yes.
4713. When the new furnace was started what difference did it make? It increased to 12,000 and 13,000 cubic feet per minute.
4714. Nearly trebled? Yes.
4715. Was your colliery a dusty one? Yes; particularly the Hill End section.
4716. Have you worked in dusty mines in the old country? Yes.
4717. Compared with the mines at Newcastle-on-Tyne, would you consider it dusty? Yes; much more dusty than I have been accustomed to.
4718. Did you consider the dust in the Hill End section a source of danger? I did not previous to the accident consider it so.
4719. Did the mine produce any water? None in that district.
4720. Was it absolutely dry there? Yes, absolutely dry.
4721. Did the dusty nature of the roads in this district necessitate your watering them? We occasionally watered the horse-road.
4722. That only? Yes.
4723. Was this done to secure the comfort of the men and horses, or because of the feeling of danger? Only to secure the comfort of the men, boys, and horses by keeping down the dust.
4724. It was not for the purpose of purifying the air in the workings? Not especially for that.
4725. Had you no danger in view? I had no danger in view. The dust used to fly up upon the axles of the skip and interfere with the lubrication and velocity of the sets, and we used to water the roads to keep down.
4726. What directions did you issue with regard to the use of safety-lamps? That they were to be attended to by the overman, and given out to the men locked.
4727. Did you at any time see whether these directions were carried out? Not exactly. I did not see them actually locked, but I understood that they were.
4728. Did you ever hear anything to the contrary? Never, until the accident occurred.
4729. Previous to the accident, you heard nothing? Nothing.
4730. Did you give any directions as to the manner of firing shots? No special direction; only the shots were not to be fired in the presence of gas.
4731. To whom did you give these orders? To the overman and deputy.
4732. Had they the charge of these safety-lamps? The deputy had charge of them in the morning, and there was a man appointed to clean them during the day.
4733. Did you ever inspect the condition of these lamps yourself? I have.
4734. Were you generally satisfied with them? Yes.
4735. Has it been your practice to converse with the deputies about the districts under their charge? Yes.
4736. Do you know Crawford? Yes.
4737. Was he a careful and capable deputy? I considered him so.
4738. Who appointed the deceased Millwood deputy? I did.
4739. Did you consider him capable? Yes; a capable and careful man.
4740. Did you ever discourage deputies coming direct to you with their reports? I never discouraged them or anybody else.
4741. Did you ever speak sharply, or, to use his own phrase, snub Crawford when he spoke to you? No.
4742. Would you reprove a deputy for bringing the dangerous condition of the mine under your notice? Certainly I would not.
4743. Have you been careful to keep a supply of gauze in stock for the repairing of the safety-lamps used in the mine? Yes.
4744. Do you recollect Crawford informing you that a certain lamp wanted a new upper gauze cap? I do not remember his doing so; he might have informed me, and if so I must have given him gauze to repair the lamps.
4745. Whose duty was it to remedy the lamps when they were defective? It was my duty to see that they had good safety-lamps, and it was the deputy's duty to see that defective lamps did not go into the mine, and it was the duty of the men themselves that they did not use lamps in such a condition.
4746. You say you appointed a man to clean the lamps, would a lamp in that condition be likely to be observed by him? Assuredly it would.
4747. You do not recollect on any occasion Crawford, or any man, bringing under your notice a safety-lamp which had been used in the mine with the upper gauze removed or burnt off? I do not recollect anything of that.
4748. Do you recollect Crawford showing White and yourself a blower with a gas-pipe inserted in it? Yes.
4749. Was it a strong blower? No, it was not a very strong blower. He had put a pipe about the size of an ordinary gas-pipe in it.
4750. What object had Crawford in calling your attention to this blower, and what object had he in fixing the pipe into it? I don't know, except it was to show his ingenuity.
4751. Had you any doubt as to the existence of gas in any quantity in these headings? I knew the coal gave off a little gas in the headings.

4752. Did that convince you that it existed in a large quantity? No, it was not a very strong blower. Mr. A. Ross,
 4753. What did it convince you of then? Simply that there was a little gas there.
 4754. Can you tell us the conversation you had with Crawford on the subject? Well, when I came there 16 May, 1887.
 he showed it to me by igniting the gas at the end of the pipe, and I told him to do away with the pipe and not to practice that sort of thing.
 4755. What reason had you for saying that? Because I did not think it right to light gas wherever it was found, and Crawford said that if it was left burning it would lessen the gas and improve the air, and I replied that there was sufficient ventilation to carry away the gas without burning it.
 4756. How long was that before the strike? It might be about six months.
 4757. Where did you proceed on that occasion with White and Crawford after seeing the blower? To Nos. 4 and 5 headings.
 4758. Had you previously been up to Nos. 1 and 2 headings? Yes.
 4759. Did Crawford call your attention to the gas in these headings? I do not think so.
 4760. Did he suggest any special means of clearing the gas away from the headings? No.
 4861. Would the reporting of danger by any one of the workmen be considered an offence by you? Certainly not.
 4762. Would you encourage the reporting of dangers? Yes.
 4763. Would you consider it an ordinary workman's duty to report danger directly to you? Yes.
 4764. Did you provide report books for this purpose at the mine? No.
 4765. In the event of the deputy discovering a dangerous condition of things, what course would he pursue? He would report to the overman and the overman reports to me.
 4766. Before the new furnace started you say the safety-lamps were locked? Yes.
 4767. How long was the mine at work after the strike? We commenced again about the 10th January.
 4768. To work coal? Yes, with a few men.
 4769. Were safety-lamps employed in the faces since January? Yes; in the faces of the headings.
 4770. Were they used in the bords? No.
 4771. When was the use of safety-lamps discontinued? We discontinued the use of safety-lamps in the bords after the strike, when we started the new ventilating furnace.
 4772. Did you alter your orders relating to the locking of the lamps? No.
 4773. Did you relax your orders in any way? No.
 4774. Were you aware of the lamps being used unlocked? No, I was not.
 4775. Are you aware that your orders for the locking of lamps extended to those used by the night men? They ought to have extended to all lamps.
 4776. Who was appointed to look after the night lamps? The deputy, as they were going in.
 4777. Did you provide a night overman or deputy? No.
 4778. In the event of the lamps going out where would the men go to get them relit? No provision was made for that.
 4779. In the absence of any provision where could they have gone? Only outside the mine to get their lamps re-lighted.
 4780. Are you aware whether any man ever did come outside for that purpose? I do not think so.
 4781. After the new furnace was started you say that naked lights were used in the bords? Yes.
 4782. Was it done with your orders? Yes.
 4783. Can you explain to us the reason of that order? Because there was no gas in these bords even before the furnace was started.
 4784. Did no gas exist in these bords immediately before the strike commenced? No, not in the bords; but there was a little in the faces of Nos. 1 and 2 headings.
 4785. Were there any sign of gas in Nos. 3, 4, 5, and 6 headings? A little was drawn off the faces of these headings occasionally; but there was none in the bords.
 4786. So gas was coming off more or less in all the headings of the Hill End district? Occasionally.
 4787. Do you mean since the strike? It was only reported to me on one occasion since the strike, and that was a small quantity in No. 1 heading.
 4788. Before the new furnace was started the bords in this district were worked with safety-lamps, and you have since discontinued their use? Yes.
 4789. Did you depend entirely upon the increase which the new furnace gave to the ventilating current? Not entirely; one reason was the absence of gas, and the other the largely increased ventilation.
 4790. Do you think it is wise to place too much reliance upon increased ventilation when gas is being given off? Where it is being given off it is perhaps not wise.
 4791. Do you think that the gas coming out of Nos. 1 and 2 headings was sufficient to foul the nearest stenton between them? A large quantity of air was employed to dilute any gas that came off as far as I was aware of, and it would require a large quantity of gas to foul the air in that stenton.
 4792. The fresh ventilating current passed up No. 1 heading into No. 2, supplied the working bords of No. 2, and after entering the main tunnel, supplied the bords of Nos. 3 and 4, as well as the faces of those headings, then went into Nos. 5 and 6 headings, and afterwards passed into the return. Was that its course? Yes.
 4793. Was that a judicious system to pursue? Yes, under the circumstances.
 4794. In view of gas being given off in Nos. 1 and 2 headings, was it a judicious system? Yes, considering the small quantity of gas given off.
 4795. But, suppose a large quantity was given off? No, it would not be.
 4796. Would it not have been better, in view of gas being given off in these headings, to pass the return air directly into the return? Yes, if large quantities of dangerous gas were given off.
 4797. Do you consider, in view of the amount now being given off in Nos. 1 and 2 headings, and the occasional occurrence of blowers in No. 2, that it was a wise system to pursue, to carry the air that supplied No. 2 heading afterwards around to the bords off it, which were worked with naked lights? Yes, in consideration of the quantity of gas given off, and the experience we had in that district.
 4798. Did you adopt any special means to free the faces of these headings, Nos. 1 and 2, of gas? We adopted the means of driving stentons through it at short distances.
 4799. Did you adopt any other means? No.
 4800. Did it not occur to you that bratticing ought to be put in these headings to sweep away the gas as it was made? No, not with the quantity of gas we have experienced.

- Mr. A. Ross. 4801. In view of gas being given off in such faces as these, was it obligatory for you to use bratticings? Not under the circumstances, because I did not think the quantity of gas sufficient to require that. The quantities found in these headings was small.
- 16 May, 1887. 4802. Have you frequently examined these places? Yes.
4803. And have you had daily reports of their condition? Yes.
4804. And you came to the conclusion that the quantity was too small, considering the largely increased ventilating current that the new furnace gave, to induce you to put in bratticing? Yes; I did not think it necessary.
4805. Are you conversant with the manner adopted for the firing of shots in these places? No.
4806. Have you never inquired? No.
4807. If you were informed that in portions of this district where gas was given off that shots were occasionally tamped with dry coal or dust, and that fuse was inserted in it and fired by touch-paper lighted from the flame of a Davy lamp at the gauze, would you consider it a right and proper means of dealing with shots? No, the tamping ought to have been damped, and in firing a shot a wire should be put through the gauze of the lamp.
4808. Do you consider that a safe means? Yes, as safe as any other, and it is a less clumsy way of lighting shots.
4809. Respecting a system of ventilation, the air is directed by doors fixed in the main tunnel. Do you approve of doors in a main tunnel, or on engine roads? Not if it can be obviated, and the mine well ventilated in any other way.
4810. Could it have been obviated in this colliery? Not very well.
4811. Would special provision require to be made in the Hill End district? Considering the distance I expected to go, and the limited coal-field, I considered the doors the best plan to adopt.
4812. There is a door in the main tunnel? Yes.
4813. Is there anything to recommend a single door in the main tunnel—would double doors not be better? Certainly, double doors are better than single ones, but on account of the limited field of coal which we are likely to expect from former experience, and as it would occupy such a large space for double doors, I thought the present system was equally good under the present circumstances.
4814. How many skips apart would the doors require to be? To let a train through of twenty skips not less than 6 feet for each skip.
4815. How much would that be? That would be 120 feet.
4816. So you would have required a space of 120 feet to be of any practical value? Just so.
4817. For that reason, and owing to the limited and very troubled nature of the coal-field, you did not deem it expedient to adopt the double door system? No, I did not.
4818. Did you provide attendants at those doors? Yes; boys were kept at the doors.
4819. Did the opening or shutting of the doors tend to weaken the ventilation in Nos. 1 and 2 headings? Probably it would when they were open.
4820. How long would they be open when the sets were coming from Nos. 1 and 2 headings? About a half or three-quarters of a minute.
4821. There were twenty skips in a train, and how many trains would there be in a day? I could not say exactly, probably eight or ten.
4822. So the opening of the door to allow trains to pass would only occupy a few minutes during the day? Yes.
4823. In providing attendants for these doors are they peculiarly liable to be injured? No.
4824. As a matter of fact, do these doors get injured by the skips? Not that I am aware of.
4825. Are you aware whether any gas existed prior to the accident at any time in the abandoned bords off No. 1 heading? I am not aware of any gas having existed there.
4826. Do you know whether they were ever examined. The first two bords that were broken off No. 1 heading which had been worked back to the dyke have been abandoned. Do you know whether they ever contained gas? No, they did not.
4827. How do you know? Because I was in them just before they were stopped, and they had not contained gas for a long time previous to that.
4828. Did they ever give off gas? Yes, when they neared the dyke, but not since.
4829. How long is it since you were in them? I cannot say how long it is, but I know that they only gave off gas when they were near the dyke.
4830. Then the whole current passed the mouth of these bords? Yes.
4831. Was gas likely to accumulate in them considering their position? I do not think so.
4832. Have you examined all these bords to ascertain whether any gas which came from the headings did exist there, and to see if any of them formed a separate centre of explosion, and did you also notice the stoppings in this locality? I examined the stoppings that were blown away from Nos. 1 and 2.
4833. Had gas existed in these two abandoned bords, would you expect these stoppings to be blown through in that way? No; I would expect them to be blown in a contrary way.
4834. Did the western workings give off any gas? No, none at all.
4835. You have often inspected the mine subsequent to the accident? Yes.
4836. Have you come to any conclusion as to the cause of the lamentable occurrence? I have come to the conclusion that the explosion occurred in No. 2 heading.
4837. On what do you base that conclusion? From the probability of a shot which was fired there having ignited the gas.
4838. An overcharged or a blow-out shot? It might have been an overcharged shot, I do not know.
4839. But you have come to the conclusion that the gas was ignited then? Yes, but by what means I could not determine.
4840. And that the loss of life was caused by that explosion? Yes.
4841. Do you think it likely, considering the limited reservoir for the existence of gas in No. 2 heading, that coal-dust has played an important factor in the explosion? I think it must have done, and I do not think that the quantity of gas which exploded there could cause the destruction without some other cause to help it, such as coal-dust.
4842. Have you ever examined a colliery after an explosion? I never did.
4843. Did you expect to find the workings and plant more severely wrecked than they are? No; I did not expect to find them so badly wrecked.

4844. How do you account for the large fall in the main tunnel? I can only account for it by the force of the explosion blowing out the props. Mr. A. Ross.
4845. Did it ever occur to you that dynamite or powder had been used to bring this fall down? No, it did not occur to me. 16 May, 1887.
4846. Before the accident were you aware that the roof or a portion of the roof was resting upon the timber sets there? Yes, I believe it was.
4847. In which case if some of these sets had been displaced do you think that alone would be sufficient to cause the fall? Yes.
4848. Do you think that the wire ropes attached to the timbers had anything to do with the distribution of the fall? In some cases it might.
4849. Do you attribute this fall to any extraordinary cause? Well, there is something very extraordinary about it, from the fact that some of the timbers are blown in one way and some another.
4850. I ask whether the fact that the ropes being connected with the sets might not account for that? In some cases it might, but not in others.
4851. Suppose a fall took place in the centre of a large quantity of timber which carried the ropes down to the floor, would not that have any effect upon the manner in which the timbers were found? Yes; wire ropes were attached to the timbers, but there are props to which the ropes were not attached that are driven inwards.
4852. Are you aware whether a large fall causes any displacement of air? Yes; but that could not have done so.
4853. Have you ever heard of falls of roof causing great destruction to property and air-ways? Yes.
4854. Is that fall not sufficiently large to do so? No, it is not.
4855. Do you think or have you any reason to doubt that your overman, Mr. White, would conceal from you any complaint made by the men to him? I have no reason to doubt that he would or to think that he would.
4856. Has he ever reported to you any complaint made to him by the men as to the condition of the safety-lamps? No.
4857. If your orders to White with regard to the safety-lamps had not been carried out, would you consider that he has been guilty of negligence? Yes, if he knew it.
4858. So far as you are able to judge, do you consider that this accident has been brought about by the unlocked state of the lamps? No, it has not.
4859. Some evidence has been given to us as to the correct interpretation of rule 6 of your engagement rules. Do you know whether this rule ever prevented a man from making any report to you, I presume you know the rule, it is this: "*Interference by employees.* Any employee interfering in any way with the orders issued by the Colliery Manager or his overman for regulating the work of the mine, shall be liable to dismissal without notice." Did that rule prevent any man from complaining to Mr. White or yourself? It ought not to have done.
4860. Did you ever issue any orders for men not to report to you? Never.
4861. In which case would the rule read as the men have indicated? I do not see how that rule can be construed to mean the interpretation that the men put on it.
4862. Did any man ever ask you to explain whether it bore that interpretation? No; I do not remember any man asking me about that.
4863. Try and recollect? I do not remember if any man did so; I would certainly say it does not mean that in English.
4864. What does it mean? It means that the men would not be allowed to interfere with the management or discipline of the colliery.
4865. Is it necessary that strict discipline should be maintained? Certainly.
4866. Is it necessary that men should interfere with the discipline of the colliery apart from the management? I do not see that; it is only to assist in maintaining discipline.
4867. Would a report by any workman be construed by you to be an interference with the management? Certainly not?
4868. You cannot construe this rule to read as the men read it? No; there is nothing in it to imply that interpretation.
4869. Did you hear anything of this construction of this Rule 6 prior to the accident? No, I never did.
4870. Had you heard it would you have put the men right on it? Certainly.
4871. *Mr. Neilson.*] You stated, Mr. Ross, in the beginning of your evidence, that in the old workings you found gas—was that the time you worked through the dyke or afterwards? It was while we were driving the headings, the gas came off a roll in the heading.
4872. Was it permanent or temporary? It was temporary; it would last perhaps one day only.
4873. Did it have a chance of going off into the bords? No.
4874. Have you been through the old workings at all since that? Yes; many times I have been through these places with a naked light.
4875. Then there could not possibly have been any gas there? No.
4876. In reference to the locking of the lamps, in giving your officials instructions I presume that each was supplied with a copy of the rules? Yes.
4877. Would a manager consider it necessary to verbally detail the duties out to his officers? Not so far as the rules would relate to them; but if there was anything special it would be necessary.
4878. What quantity of air circulated in the Hill End district before the strike? About 4,000 cubic feet per minute.
4879. When were you last in the mine before the explosion? On the 15th or 16th of March last; on one of those days, I do not know exactly which, I was in the Hill End district.
4880. Since the explosion when were you in the mine? On Saturday last.
4881. What part of the mine? Through the return from the furnace to the western.
4882. Is that the part of the mine alluded to in your evidence at the inquest, where Mr. White was trying to get somebody to shout to him when the explosion happened? Yes, it was in that return.
4883. You have completed that road now? Yes; we got through on Saturday, and I believe White was through earlier.
4884. You are quite confident that you have examined the old workings, and that there could not have been any accumulation of gas there? Not the slightest.
- 4885.

- Mr. A. Ross. 4885. Did you enter the first or second bords? No.
 4886. Is the first bord in No. 1 heading stowed up? No.
 16 May, 1887. 4887. It was because of the increased quantity of air given out by the new furnace that you discontinued the use of safety-lamps in the bords? Yes, and the absence of gas as well.
 4888. You never found gas in them since the strike? No.
 4889. In reference to these doors, do you think if the west end door was left open that it would make much difference in the air? Not a great deal; it might make a little difference.
 4890. Were trappers kept by all these doors? Yes.
 4891. How many doors are there in the Hill End district? There are three doors in the Hill End district.
 4892. Is it a fact that in the old country in the most fiery mines the ventilation is intersected to a great extent by doors kept by trappers? Yes, by single or double doors as the case might be.
 4893. You expected that single doors would be a sufficient protection? Yes.
 4894. Did Millwood ever report to you that one of these doors had been propped open? It was reported that one had been propped open, but I never got to the foundation of it.
 4895. Did you hear of it before the explosion? No.
 4896. The fact of no gas being found in the face of the bords and some of the headings when the ventilation had been suspended, the natural inference is that even if the doors had been left open for half an hour, much gas could not accumulate? I do not think it could.
 4897. After 48 hours with very little ventilation there was only a little gas found? Yes.
 4898. You distinctly stated that you never received a report from anyone concerning the existence of gas? Only once since the strike, and that was a small quantity in Hope's heading No. 1.
 4899. Who reported it? White.
 4900. What time? On the Friday previous to the explosion; it was a very insignificant quantity as he told me that it just touched the lamp in the cut.
 4901. You say that in your opinion the explosion took place in No. 2 heading? Yes.
 4902. It then went to the wall side, to the stopping in front of No. 2? Yes; blowing away the door and the stopping behind it.
 4903. The explosion taking place in the face of No. 2, what space had it to expand when it reached that point? Only about 12 or 14 feet each way.
 4904. It had then no wide space to get down to the right or to the left? No.
 4905. Does that account for the confined state of the explosion? Yes.
 4906. Being confined to this narrow space? Yes.
 4907. If these places had been old, and had it not been for the dyke, it would have extended itself? Yes.
 4908. Mr. Hilton.] You stated to Mr. Nilson that you were in the mine on the 15th or 16th of March last? Yes.
 4909. Have you made it a special point of duty to travel the air-ways, to see that they were in proper order? Some of them, but not all of them.
 4910. Did you not think it was a portion of your duty to make yourself acquainted occasionally with the whole of the air-ways, to see that they were in proper order? The wasteman has charge of the air-ways.
 4911. Had you wastemen? Yes.
 4912. Who were they? Millwood, and he had a mate with him, who travelled with him through the air-ways and kept them in repair.
 4913. Millwood was wasteman and deputy? Not at this time—I was speaking before the strike.
 4914. Was the system of ventilation the best you could have adopted? Yes, under the circumstances.
 4915. Did Mr. White ever report to you the circumstance that two men, Woods and Wells, had been sent out of the mine for having their lamps unscrewed? Yes, I think he did so some days afterwards.
 4916. In view of these persons having their lamps unscrewed, and being sent out of the mine for it, do you think it was prudent to allow them to work on the night-shift without someone in charge of them? It would be better, probably, if there had been someone in charge of them; but there were practical miners working on the night-shift.
 4917. Did Mr. Nicholson ever state to you that No. 6 of these rules, which has reference to interference by employees, was regarded by the miners as a rule that would prevent them from making any remarks with reference to the condition of the mine, and that if they did so, some disability would be attached to them for so doing, under this rule? I don't remember that he did.
 4918. Mr. Owens.] You say that the night-shift men were supposed to have their lamps locked, and that in the event of their losing their lights, they would have to come outside? Yes, they would have to go somewhere for a light. If their lamps went out they would be very awkwardly situated.
 4919. Do you think that they could come out all that distance in the dark? No, but there were naked lights used outside the headings.
 4920. President.] In the air-ways? Yes; the drivers use naked lights in the headings outside the danger-board.
 4921. Mr. Owens.] Did ever anyone inform you that it was not safe for the wheeler to bring his naked lamp up to the danger-board in the heading? No.
 4922. Don't you recollect anything of the kind, and did you tell the man to mind his own business? Never. Mr. Nicholson never spoke to me about it, or anybody else.
 4923. Did the miners appoint check-inspectors at Bulli? No.
 4924. Would you allow that to be done? Yes, certainly.
 4925. Do you consider Mr. White a competent overman? Yes.
 4926. Is he a careful and efficient overman? I considered him a careful and efficient overman.
 4927. Mr. Jones.] I understood you to have said that you considered the Bulli mine more dusty than any you have seen? Yes.
 4928. Did you, before this disaster, know that dust played an important factor in a gas explosion? Well, I have seen it referred to, and have read about it; but I have only learnt about it not long ago. It is a new theory to me.
 4929. Then the watering of the horse roads was not done in view of danger? No.
 4930. If you had believed or known that dust does play an important part in explosions, would you not have thought it necessary to have watered the main roads where the trains travelled at a high speed in a strong ventilating current? Yes, it would have been more necessary. 4931.

4931. You say that your instructions were that all safety-lamps used in the mine were to be locked? Yes. *Mr. A. Ross.*
4932. Did you ever make any inquiry, to satisfy yourself that they were locked? I inquired of Crawford if they locked them, and he said, "Yes." *16 May, 1887.*
4933. Did you ever inquire of Millwood? No.
4934. Did it come to your knowledge that they were unlocked? No. In fact I was fully persuaded that they were locked.
4935. You gave instructions that no shots were to be fired in the presence of gas? Yes.
4936. Were you aware that shots were being fired in Nos. 1 and 2 headings? Not in the presence of gas.
4937. You knew there was gas there? I knew the coal gave off a little gas in the heading.
4938. Did you know that there was gas in Nos. 1 and 2 headings, when shots were being fired?
Witness: When?
Mr. Jones: At the time they were being worked after the strike? I was not aware of that.
4939. Why, then, did you instruct them to use safety-lamps? As a precaution, for fear gas might come off.
4940. Did White ever inform you that gas was coming off? Yes, once only after the strike.
4941. When was that? The Friday before the explosion, and that was in No. 1 heading, which I have referred to.
4942. You say you cannot believe that sufficient gas could accumulate to cause the disaster and the wreckage which has taken place in the mine? I did not say that exactly. I say that I don't believe that the amount of gas which accumulated there caused the destruction.
4943. Would it have required a very large amount of gas to cause the destruction, considering the limited area of the workings? It would have a larger effect coming through narrow headings than if there had been an expansive space for it.
4944. You have already stated that White reported to you that some men had been sent out for working with unlocked lamps? Yes; they had taken the top of their lamps off.
4945. Did you report that matter to the inspector? No.
4946. Did you not think it of sufficient importance? No.
4947. Did you consider it a breach of the Coal-fields Regulation Act?
Witness: What part of the Act?
Mr. Jones: That regarding the locking of lamps? Yes; working with an unscrewed lamp was a breach.
4948. Do you consider it a prudent measure to allow bords working with naked lights to be commenced in close proximity to new workings. That is, the exploring headings Nos. 1 and 2, under the circumstances, and the circumstances are these, that gas was known to exist in these headings? The presence of gas was not known when the naked lights were ordered to be used there; but safety-lamps were used in the headings, as there might be a probability of gas coming off.
4949. Were any safety-lamps used in the bords off No. 1? No.
4950. They were used in the heading on account of the presence of gas, we have been told? They were used on account of the probability that we might come across some gas.
4951. Is it not held by mining authorities that exploring headings giving off gas should be a reasonable distance from bords worked with naked lights? A reasonable distance, no doubt.
4952. Don't you think that a wider margin of safety would have been better? I thought that the margin was sufficient, from the former experience we had.
4953. Is it not a very narrow margin, considering that safety-lamps were used on one side of the prop of the danger-board and a naked light on the other? It depends upon the quantity of the air passing at the prop.
4954. We are told that the air was considerable; but in spite of that, an explosion has occurred which proves that there was not sufficient to prevent an explosion. Would it not, then, have been better for these headings to be further in advance of the naked lights? Perhaps it would have been better.
4955. Did you ever inquire from the deputy as to the mode of firing shots? No.
4956. You gave instructions that shots were not to be fired in the presence of gas. Would you be surprised to hear that your overman had appointed someone to fire shots in the bords off Nos. 1 and 2 headings?
Witness: In the presence of gas?
Mr. Jones: There was no gas at all.
Witness: I am aware that shots were fired in the bords and headings, but my instructions were that they were to fire no shots in any place in the presence of gas.
4957. You knew that shot-firing was carried on? Yes.
4958. Don't you think that some qualified person should be appointed to fire shots? There was a man to see that the places were clear before shots were fired.
4959. Did he do so? I have reason to believe so; of course I was not there.
4960. Do you believe that Crawford did so? Yes, I believe he did.
4961. We have it on oath that Millwood did not? I believe so.
4962. Did I understand you to say that the displacement of rock could have brought about the wreckage at the big fall? It could not displace the timbers, and put them in their present positions.
4963. But the haulage ropes pass at the back of some of these timbers? Yes.
4964. Would that not have a tendency to draw them out? Yes, if that rope was drawn down against them.
4965. Did Mr. White ever report to you that the men were working with unlocked safety-lamps? No.
4966. Ought he to have done so? Yes, if he knew it.
4967. Did you see the horse that was said to have been burnt at the mouth of the tunnel? Yes.
4968. Was it burnt? The hair seemed to be singed.
4969. How do you account for that? I cannot account for it.
4970. Can you offer any suggestion with regard to it? Probably it might have been caused by heated air.
4971. *Mr. Croudace.* Are you solely responsible for the laying out of these workings in the Hill End district? Yes.
4972. You laid out a plan or sketch? Yes.
- 4972½. Did you consult the overman? Sometimes I did. 4973.

- Mr. A. Ross. 4973. In opening out this Hill End district, that is, in going through the dyke, did you meet with gas there in the first instance? Yes.
- 16 May, 1887. 4974. And have you had gas in the Hill End district since that time? Yes, off and on, but not at all times.
4975. Was there any time when all portions of the mine were without gas? Yes, at times.
4976. The whole of it? Yes, the whole of it.
4977. Did you use safety-lamps before the strike, and from the time of first opening out the district? Yes.
4978. And ever since? Yes.
4979. In some instances they were used more as a matter of precaution? Yes, in the headings.
4980. In laying No. 1 heading out, you opened it quite close to the dyke; within some 20 yards? Yes.
4981. As a matter of economy, was that a prudent thing to do, knowing that your bords would only go 20 or 30 yards? Well, we could not study economy, as we had not sufficient places, and another reason was that I expected the dyke to run away back, as we got it on the other side of the workings, and I expected it to fall back the same way again.
4982. In opening up Nos. 1 and 2 headings, you took the fresh air from No. 1 to No. 2; and you stated that you believed the explosion occurred in No. 2 heading? Yes.
4983. Now, if there had been many bords broken away from No. 2 heading, do you think there would have been the amount of death? There would have been more if there had been men working in them; but the explosion would not have been so confined. Of course, if there had been no bords there, there would have been no men, except those in the headings.
4984. Under these circumstances, don't you think it would have been better not to have had bords in the return of the gassy section? I did not think there was sufficient gas to lead me to believe that.
4985. You say you had reported to you the presence of gas in Nos. 1, 2, 3, 4, and other headings? Yes, a little gas occasionally.
4986. But never reported since the strike? No, not in No. 2 heading or any other place, with the exception of a little in No. 1 heading.
4987. How then do you come to the conclusion that the explosion took place in No. 2? By the appearance of the heading, the charring of the props, and the destruction about there.
4988. Does that convince you that there was gas in No. 2? Yes.
4989. If White, Crawford, and other witnesses have sworn that gas has been there all along, how do you account for not knowing it since the strike? Well, I did not know of it, because it was never reported to me, and I had never seen it myself.
4990. Your system of reporting was simply verbal? Yes.
4991. As you saw the overman you got reports from him, and if you did not see him of course you did not get them? I always expected reports from him if there was anything important for him to report.
4992. As a matter of fact did you get reports daily? Yes, I saw the overman daily, and I visited the mine daily.
4993. And he never reported to you the existence of gas in No. 2 heading? No.
4994. Are you sure you saw him every day? Every day excepting Monday or Tuesday before the explosion.
4995. Would it not be better if you had written reports daily whether there was danger or no danger, gas or no gas, and that these reports came direct to you? Probably it would be.
4996. To me it is most unaccountable that gas existed, and yet you did not know it? The first time I heard of it was Monday or Tuesday before the explosion, and that it was very little.
4997. So it was practically the necessity of having coal that led you to start the heading near the dyke, and to break away the bords on each side? That was the principal reason, and I have already stated that I expected that the dyke would lay away from these headings, and I put these headings on on that account.
4998. Suppose there had been no pressure, would you have laid out these headings further away from each other? I think I would, but from former experience I did not expect a large coal-field there.
4999. Knowing that there was gas in No. 2 heading, do you not think it would have been better to have had bratticing running into it, and do you not think it best to run bratticing wherever gas exists? Probably it is if the gas is continuous.
5000. Coming to the doors, you say you did not think, on account of the nearness, that two doors would be better than one. As a matter of fact, if they were only 50 feet apart would it not be better to have only one door open at one time? Yes.
5001. Well, would not that be a better system? Of course two doors are always better than one in a main air-course where there is a pressure on.
5002. Have you seen the ordinary miner's lamp said to have been found in the face of No. 2 heading? Yes, one of that description. [*Lamp produced.*]
5003. Knowing that, and believing that the accident occurred in No. 2 heading, do you think that the explosion was owing to that lamp having been used by some one? I cannot say; I am not sure.
5004. Would it be possible for a man to be using that lamp in the heading when the explosion occurred without being blown away, and the lamp as well? Quite possible.
5005. Do you not think that the body of the man using the lamp would have been found in the heading? I should fancy he would.
5006. Do you attach any weight to the finding of that lamp as being the cause of the explosion? I hardly think so; of course I could not form any decided opinion.
5007. Have you ever had reported to you any accumulation of gas in any part of the mine, either in the old workings or in the bords in Nos. 1 or 2 headings, or in the return air-ways, or seen near the furnace, or in the western district, at any time previous to the strike? Oh, yes, gas was reported in the headings occasionally.
5008. Accumulated gas? Yes, in places which were stopped until the stentons were put through.
5009. Where? I think in No. 4 heading, but I am not certain.
5010. A long time ago? Yes, a long time before the strike.
5011. Between the commencement, after the strike, and the explosion, did you know of any accumulation? I had no idea of any accumulation that could take place since the new furnace was lit, and I never had it reported to me.

5012. *Mr. Neilson.*] In the event of there being a considerable quantity of gas which kept a safety-lamp full of fire, would you allow the miners to work in that? Certainly not. I would not allow a miner to work where gas would fire in the lamp at all. Mr. A. Ross.
16 May, 1887.
5013. With 12,000 cubic feet of air per minute did you think that quantity was sufficient to render any gas that might come off from these headings harmless? Yes, for it would take 1,000 feet of gas per minute to render that air explosive.
5014. Then 12,000 cubic feet of air per minute would render a large quantity of gas harmless? Yes.
5015. *Mr. Hilton.*] I understood you to say that you had never seen gas in the mine since the strike? No, I have not.
5016. And never reported to you? Not with the exception of that reported on Friday in No. 1 heading, and that was a very small quantity, which was just rising out of a small fissure.
5017. What day did the mine resume work when the strike terminated? The contracts for the headings were taken on the 7th March, but previous to that there had been four men in these headings, Nos. 1 and 2, for three weeks, and no gas was reported.
5018. According to your statement the strike was virtually over on the 7th or 8th of March? Yes.
5019. And the disaster occurred on the 23rd? Yes.
5020. That is fifteen or sixteen days? Yes.
5021. During this time were you in the gassy section? Yes.
5022. You never saw any gas? Never.
5023. Not in No. 1? No; but it was reported to me; I never saw any myself.
5024. How often were you in the mine since the termination of the strike and up to the day of the explosion? I do not know. I recollect being in on the 21st of February, on the 26th of February, and on the 15th or 16th of March.
5025. *Mr. Crowdace.*] Your overman was in daily? Yes, daily.
5026. *Mr. Jones.*] Are you aware that it has been reported to the Commission that some bords are as high as 41 and 42 yards in advance of the air? Yes. It has been an oversight on the part of the overman.
5027. You admit that it is a violation of the Act? Yes, certainly.
5028. Had you trappers employed at all times up to the time of the strike? Yes.
5029. Are you sure that you are not making a mistake? I do not think so. If there were not trappers there were some other persons appointed to look after the doors.
5030. We have it that such was not the case? If there were not boys there was somebody else appointed to look after them.
5031. *Mr. Clarke.*] Would the overman have authority to put in bratticing or order it to be done, or would he consult you? He would probably have consulted me first.
5032. *Mr. Crowdace.*] Have you been restricted in any way by any false idea of economy in the use of material for bratticing or doors? No, never.
5033. The Company are liberal enough in that way? Yes; I was never restricted by them.
5034. *Mr. Owens.*] Was the powder magazine in the mine? No, it was down near the jetty.
5035. Was no powder kept in the mine? Yes, some was kept there for supplying the men.
5036. How much? Sometimes 20 lb. or so.
5037. *President.*] Only a small quantity? Yes; the powder magazine, where the bulk of the powder is kept is down near the jetty, and it was brought up in small quantities, in bottles as we wanted it. [*The witness withdrew.*]

James Rowan sworn and examined:—

5038. *President.*] You are the Government Inspector of Coal-mines for the Southern and Western Districts? Yes. Mr
J. Rowan.
16 May, 1887.
5039. You hold a certificate of competency under the Coal-mines Regulation Act of 1872? Yes. I passed a Government examination and received a certificate of competency.
5040. What experience have you had in mining—How long have you been engaged in coal-mining? Since I was a boy 9 years of age.
5041. How many years? I am now 45; during that time I was ten years a colliery manager in two collieries in Scotland.
5042. Did these mines produce fire-damp? Yes, both gave off fire-damp more or less; and I may state that I, on one occasion, had charge of the safety-lamps in connection with an examiner of mines, when taking the ventilation of other collieries.
5043. In your present official capacity did you make periodical inspections in accordance with the terms of the Act in this colliery? Yes, every eight weeks, more or less.
5044. Were these examinations of a thorough character? I consider that they were careful examinations.
5045. Did your inspections include the examination of the return air-ways? They included the intakes, the returns, the main-ways, the bords, and the headings.
5046. Generally speaking, were you satisfied with the result of these inspections? As a rule I was; but I had occasion to complain to Mr. Ross on account of the condition of the return air-way from the western down to the grip. That is where the new furnace is.
5047. When was that? Previous to the strike I complained about it. After the strike of course the road was in a worse state owing to the heavy falls which had taken place during the time that operations were suspended, but before that it required a little repair.
5048. Have you ever had any complaint made to you regarding the condition of the workings of the Bulli Colliery? I never had a complaint good, bad, or indifferent.
5049. No complaint of the unsafe state of the roads? I never had a complaint of any kind whatever from the Bulli miners.
5050. Do you know Mr. Nicholson, miner at Bulli, and secretary of the Miners' Union? Since the strike he has been pointed out to me; I did not know him before that.
5051. Do you know whether he ever made a complaint to you of the unsafe state of the roads in this colliery? Never, to my positive knowledge.

- Mr. J. Rowan.
16 May, 1887.
5052. Are you quite certain? Yes; but if he did it has clearly gone away from my mind, for I have not the slightest recollection of anything of the kind.
5053. Were the management of this colliery always ready to comply with any request you made for the better condition of the mine? I never had reason to complain except the instance I have referred to.
5054. Were they disposed to meet you in order to better the condition of the colliery? Yes.
5055. Have you had occasion to doubt the competency of the manager at Bulli? I always looked upon him as a competent, careful, and anxious man.
5056. You think him a competent man? I considered him so.
5057. Were you satisfied with the qualifications of White, the overman? Well, he was somewhat peculiar in his habits.
5058. His habits or manner? Well, I should say that his manner was peculiar. I have had to enforce him to be careful, and he would generally want to know what was wrong now.
5059. Do you consider him a careful man? As far as I saw he appeared to be.
5060. Was he anxious? Yes, anxious.
5061. Did you consider him competent? I used to question him very often, and from the answers he gave I would consider he was qualified.
5062. Do you know Crawford, the former deputy? Yes.
5063. Did you consider him a careful and competent deputy? I have found nothing important against him except some little things. One day Mr. White had a dispute with him when he charged him with wilfully leaving a door open which considerably reduced the ventilation; that is the only thing I can remember.
5064. Did White impute that the door had been opened by Crawford purposely to reduce the ventilation? Yes; I was taking the register of No. 1 heading, and I found it was down below the requirements of the Act. I told White that it was so, and that I would have to serve the Company with notice. He seemed astonished, and I said I would go around the workings into the furnace, and would then take another register to see if there was any difference. After we had gone around a certain portion of the workings we came to the door that was open. Crawford was near it, and White charged him in high words with wilfully leaving the door open.
5065. You have no knowledge whether he was guilty or not? No.
5066. You knew Millwood, the last deputy? Yes, I have spoken to him.
5067. Were you satisfied of his qualifications? I had no personal knowledge of him. My only knowledge of him was from statements he made to me. He told me that he was thoroughly acquainted with the mine, and he examined it every morning with a safety-lamp; he also said that he had knowledge of fiery mines. I asked him if he had ever seen fire-damp in the mine. He said not very often; but he might at times see very little in some of the headings, but it was very slight.
5068. Did he not accompany you while you were last inspecting the mine? No; White was with me.
5069. When was your last inspection? My last official inspection was on the 15th February of this year.
5070. Did you carefully examine the bords for gas? I examined every bord in the Hill End district.
5071. Did you find any gas? I never found the slightest trace in any of the bords.
5072. Did you find any in the headings? I found a slight trace in one of the headings; a cut had been put in about 3 feet, and putting the safety-lamp right in the cut I saw a slight cap upon the lamp.
5073. Was the statement made by Millwood that he had seen very slight traces of gas confirmed by your own inspection? Yes.
5074. We are informed that the bords off Nos. 1 and 2 headings gave off gas before the strike? I never found the slightest trace of gas in any of the bords, and only on rare occasions in any of the narrow headings.
5075. Such a sweeping assertion as I have narrated is not in accordance with your examination? Not with the examinations I have made.
5076. We are also informed that no gas was given off in these bords since the strike. Is that in accordance with your examinations? Yes.
5077. Are you aware what would account for this circumstance, presuming that the bords gave off gas up to the time of the strike. Is the condition of the bords different now to what it was previous to the strike? I believe they are just the same.
5078. Then you would expect these bords to be giving off gas at present if they did so before the strike? Yes.
5079. Did anything occur during the strike that would cause gas to be given off in these bords? No; I examined the mine during the strike, and found no gas in the bords.
5080. So the strike would in no way account for it? No.
5081. Would the improved ventilation cause it? No, I should think not.
5082. You made particular examinations of all parts of the mine? Yes.
5083. You knew that the Hill End district gave off gas to some extent? Yes, a slight percentage of gas.
5084. Have you observed gas in any other district of the mine? Never.
5085. Did the knowledge of gas being given off in one district make you more careful in your inspections? I was always very careful in my examination of the Hill End district, and I made it a point to question and inquire of the miners in these places. I would say words to this effect: "Men, are you satisfied that this district is carefully examined before you come into your work." They would reply, "Yes." Then places were examined. I would also ask if the deputy ever came in during the day, and they would tell me that he came in several times. Before I left I would sometimes say, "Now is there anything that I have overlooked, and, if so, will you let me know what it is?" On many occasions I have said words like these to the men.
5086. You have not received any complaints from the miners as to the amount of gas, or any other dangerous condition of the mine? I never received a complaint before the explosion. I have heard a great deal since, but never before the explosion.
5087. You gave the miners every opportunity to complain if they wished to do so? Yes; I have often sat down with the miners, and was always friendly with them, and they with me.
5088. Gas was never found by you in dangerous quantities? Never in dangerous quantities.
5089. Was the quantity sufficient to render the use of safety-lamps expedient? Yes; because there was a limited amount of ventilation at that time. The average varied from 3,000 to 3,500 and 3,600 cubic feet

Mr. J. Rowan.
16 May, 1887.

feet per minute, and that intake being rather low I approved of the precaution of working the narrow headings, and the bords about them with safety-lamps.

5090. Your examination included the return airways. Were they sufficient? Yes; in one way I was satisfied, but not in another. There was a large enough area in the return airways to take 100,000 cubic feet per minute, but I wanted a travelling road through it, and I urged the manager to have a recognised travelling way.

5091. These airways did not impede the air? No; they are taking now 60,000 cubic feet of air per minute through the returns.

5092. You wanted a thorough travelling road and what was the result? The manager promised to comply with my request and said it would have been done earlier, but at the commencement of the strike, all the deputies left with the miners, and he could not get men, but stated that he would make it his first business after the strike to have the road completed.

5093. Do you know whether he complied with his promise? Yes; he had two shifts of men on the work.

5094. Could you have expected more? No; although I made myself disagreeable to him by urging him on, and he told me that he was doing all that he could. I considered it necessary to press the matter as I wanted a proper travelling way down to the furnace.

5095. Did you satisfy yourself of the amount of the ventilating currents? Yes.

5096. Could you give us the amount of these currents before the strike? The average amount of ventilation going in the main tunnel was 15,000 cubic feet per minute.

5097. Of which the Hill End section would get how much? From 3,000 to 4,000 cubic feet, and the balance would go to the western and grip districts—which were about equally balanced by the regulating door having from 5,000 to 6,000 cubic feet per minute each.

5098. Since the new furnace was put into operation what has been the difference in the ventilating current? We have got as high as 64,000 cubic feet per minute, of which amount 12,000 cubic feet was brought up to the Hill End district.

5099. And this large ventilation was due to the new furnace? Yes; it is in 43 chains from the entrance of the tunnel; and the air shaft is 320 feet deep.

5100. Were you satisfied with these results? Yes; I was satisfied so far as the ventilation was concerned, and I said to White "You are now in a position to send 20,000 cubic feet per minute into the Hill End district, and I hope next time to take a register of 20,000 cubic feet instead of 12,000."

5101. Knowing the quantity of air circulating in the Hill End district, was that sufficient to dilute and render harmless any quantity of gas which you supposed could have been given off in Nos. 1 and 2 headings? Oh, yes.

5102. In the course of your inspections of this gas, did it strike you that it was peculiarly quick? Yes; it seemed to come very quick upon the lamp. It acted very sharp upon the light.

5103. Had you ever to complain at the distance of the cut-throughs from one another? I never had any complaint; but of course in going round the mine to make an official examination, you have not time to measure everything.

5104. Does the Bulli Colliery contain many rolls? Yes; numbers of rolls.

5105. Do these offer any impediment to the cut-throughs? Yes; I have seen places where they had to drive 20 yards through stone, but in the bords they are inclined to work down and then back upon them.

5106. In view of these rules would you be disposed to extend any latitude to the manager in particular instances with respect to the distance which separated the cut-throughs? I have no power to do so by the Act.

5107. We are informed that safety-lamps were alone used prior to the strike in the Hill End district? Yes.

5108. And that open lights have been used in the bords of this district since the strike? Yes.

5109. Can you give any reason for this change? Owing to the increased ventilation and the new furnace having power to again increase it by another half and no fire-damp having been seen in any dangerous quantities in the Hill End district, I did not see that I could enforce the management to continue working with safety-lamps.

5110. Did you examine the condition of these lamps? I made no careful examination of them. I have gone into the bords and asked for a lamp from the miner to examine the condition of the working place, but not exactly to examine the condition of the lamp itself.

5111. You never said whether they were locked or unlocked? I never tried to twist them to see if they were locked. Of course I understood that the rule for locking these lamps was obeyed, and it was the province of the deputy overman and manager to see that it was carried out. The same rule applies to matches and pipes, and surely I cannot be called upon to search the men to find out if that rule is broken.

5112. It was beyond your power? Yes.

5113. Did any of the miners complain to you of the circumstance that the lamps were not locked? I never received any complaint at all about it.

5114. Was the change from safety-lamps to naked lights made with your approval? No.

5115. Were you consulted? I was not.

5116. Is your approval or consent required under the Act? No, not directly; but it would have been prudent for the management to have done so.

5117. Were you satisfied with the change that was made in the bords? I looked upon the change as safe, seeing that they were free from gas when the ventilation amounted to 3,000 cubic feet per minute, and when they received the ventilating current of 12,000 cubic feet per minute with power in the new furnace to increase that amount, I did not see how I could object to the management working with naked lights at a respectable distance from the headings.

5118. More or less gas always came off in these headings? Yes; I believe a small quantity of gas always came off in the narrow headings.

5119. In your opinion did not this require some special provision to sweep it out from these headings? No; with the quantity I have seen in any heading I did not think there was anything urgently necessary; I thought cut-throughs placed at the proper distance would meet the case.

5120. Have you seen any bratticing used in the Bulli Colliery? No; although had I been manager of the colliery I should have dealt with the ventilation in a somewhat different way.

5121. Did the use of bratticing in these headings ever suggest itself to you? Not particularly, because

Mr. J. Rowan. I did not see anything dangerous in the quantity of gas coming off, and even now with the crippled condition of the ventilation there is not a bord or heading in the Hill End district where the slightest trace of fire-damp can be found with the exception of Nos. 1 and 2 headings.

16 May, 1887.

5122. We have evidence all round of a quantity of gas coming off in these headings. Did the men ever complain to you of it as dangerous? I never had a solitary indication of any amount or accumulation of gas from any man.

5123. No complaint? No complaint whatever.

5124. Was any complaint made to you as to the state of the lamps? No complaint at all.

5125. Do you find the men generally backward in making complaints of these things? No; the men I find generally talk pretty freely.

5126. Are you perfectly positive that you never did receive a complaint as to the amount of gas in the mine or state of the lamps? I never received the slightest intimation concerning one or the other.

5127. Do you know the miner Hobbs? Since this inquiry commenced I have heard about him, but I never knew him before personally.

5128. Did he call your attention to the state of the lamps and gas? Never; my attention was never called to one or the other by Hobbs or any other man in the Bulli Colliery.

5129. Are you positive? I am as certain of it as death, sir.

5130. Were you in a general way satisfied that the colliery was carefully conducted? I had no complaint to make of it except what I have referred to in connection with the returns.

5131. Did you observe how shots were fired in this colliery? On my last inspection in February Mr. White told me that he had tried to insist upon doing away with shot-firing, but that the men said they could not make wages without it. He also said that since the new hands came in no shots were fired in the Hill End district, and that he intended to fire no shots in the district in future. That was his statement to me.

5132. Did you know whether shots were fired in the headings by the men working there on the day of your inspection? No shots were fired while I made my inspection in February.

5133. Did you ever enquire as to whether explosives had been used? White told me that all shots were done away with in the Hill End district.

5134. Would you be surprised to learn that inside the gas in No. 2 heading with the danger-board fixed at the end of the stenton, men have acknowledged here having lit shots in the face of that heading by striking a match? I have been awfully surprised to hear it.

5135. You were not aware that shots were fired at all? Not since the strike. I was informed that previous to that the deputy, Crawford, fired the shots in this district.

5136. These headings intersected numerous rolls? Yes.

5137. Is gas given off in greater abundance near these rolls? Yes; there is a likelihood of its being found in larger quantities in proximity to rolls and when fissures are cut. It is likely to come off in the shape of blowers, although I have seen rolls in other districts where there was no gas and have never heard of any blowers in connection with them.

5138. Was a blower never reported to you? Never; a blower, fissure, or any additional quantity of gas of any description.

5139. Is it customary for a tongue of flame to be projected some distance by a blown-out shot? Yes.

5140. If the shot is tamped with dry dust, would this flame be increased? Yes; greatly.

5141. If in addition to that the atmosphere is laden with fine dust, would that intensify an explosion? Yes; the proportion of 16 oz. of this coal-dust to 160 cubic feet of air is sufficient to cause an explosion?

5142. *Mr. Crowdee.*] Do you know that of your own knowledge? No; not from my own knowledge, but from experiments made by others.

5143. *President.*] Would this flame be intensified if, in addition to dust, there was a small percentage of marsh-gas present? Yes; it would increase it greatly.

5144. Have you examined the face of heading No. 2 since the accident? Yes.

5145. Do you think a shot had been fired before the explosion? It had all the appearance of a shot having been fired. The coal lying down in the face of the heading indicated that.

5146. Do you think that that shot was fired under the conditions I have narrated—a small quantity of marsh-gas, a dusty atmosphere, the probability of the shot being tamped with small coal, and of its being a blown-out or overcharged shot? I am of opinion that there has been a quantity of gas about the face of No. 2 heading, and that has been ignited by the shot, and that in the act of firing gas, or rather immediately after the explosion, it increased its force eight times, and came out of the heading in the shape of flame, which would instantly raise the coal-dust right throughout the Hill End district.

5147. So you believe that the explosion was due to the explosion of light carburetted hydrogen gas? Yes; I cannot define the quantity, but I believe there has been a mixture of coal-dust with it. I have been six or seven times in the mine since the accident, and from the indications of charred props, and indications where the force passed, I am positive in my own mind that it came from No. 2 heading, and that it was largely assisted by coal-dust.

5148. Can you give us the cause of the explosion as far as you could judge? It commenced in No. 2 heading and came straight out, separating itself in two parts at the stenton dividing the two headings. One portion went out of No. 1 heading, and the heavier body went straight out of No. 2 heading to the last bord of the main heading. It passed down then through the stenton, where we found the props literally charred, and in some places coke about 2 inches deep, where she has apparently lingered as she went down. Then I believe that the two divisions met in the main heading, and afterwards one division went down the main tunnel, and the other went into the western district. The latter part, in going down, then broke through the air-crossing, and again split itself into two. Subsequently, it went again into the main tunnel; but I believe a few seconds would elapse between these two currents reaching the tunnel-mouth. The other force went down to the western and exhausted itself, and that owing to the furnace it could only do a little damage.

5149. Then the combined force partly dissipated itself by blowing down the stopping at the foot of No. 2 heading? Yes.

5150. Do you believe that flame can be transmitted by means of fine dust to a distant locality and explode a magazine of gas in that locality, no gas intervening? I should think it would be hard to reconcile.

5151.

5151. You say that a dust-laden atmosphere will produce an explosion. Could a flame be carried by dust? **Mr. J. Rowan.** Yes; if the dust is in a fused state.
5152. If an explosion takes place in one spot, and there is a dust-laden atmosphere, could the flame be transmitted to a distant locality by means of the coal-dust? Yes; I believe it could. **16 May, 1887.**
5153. You have inspected this mine repeatedly since the accident? Yes.
5154. Do you believe that there were any separate reservoirs of gas ignited by the flame projected from the explosion at No. 2 heading? No; I do not think so.
5155. Do you believe that gas had accumulated in some of the abandoned bords off No. 1, I mean the first two bords that were driven off that heading? No; I do not think that any existed there, because I inspected all that locality, and I never found any gas in there.
5156. Are you of opinion that no gas existed in the abandoned bords off the return before the accident? I have travelled that way, and I never found any fire-damp, and I cannot see where it could exist there with 12,000 cubic feet of air per minute passing.
5157. If a reservoir of gas exploded here would these old bords have presented evidences of a separate explosion? Decidedly.
5158. Are there any indications shown on the stoppings? No; not in the stoppings. If gas had exploded in them, the stoppings would have been blown outwards.
5159. Then you don't hold to that opinion that gas existed in the bords in the locality that I have indicated? No.
5160. Is the damage in the mine very great? Not very great; there are two extensive falls, but these could have been done by a set breaking away at the top of the incline. The damage is not so great as one would expect after an explosion in which so many lives were lost.
5161. Considering the comparatively small area of workings, the destruction of life is unusually great? Yes; it is.
5162. Would the limited area of the workings account for the total annihilation of life? Yes; as the explosion was concentrated to this small area.
5163. If the force of the explosion had been dissipated in the old workings, do you think the same destruction of life would have occurred? No; because it was confined to certain limits in which all the men were working. It had a straight road to go out of the Hill End district, and a clear way down to the western. It had two tunnels to pass through; but if there had been a larger area that force would have been distributed, instead of which it was confined like the barrel of a gun.
5164. You made an examination of the condition of the bodies? Not the first day, as I was away at Mittagong, and it was some twenty hours after the accident when I got down.
5165. Have you formed any opinion as to the cause of the majority of deaths? I believe the majority died of suffocation from after-damp.
5166. What does after-damp consist of? In it there are seventy-one parts of free nitrogen, nineteen parts of steam, and nine of carbon; that is, the moment after explosion. Of course after a little while it undergoes some change, as soon as the steam is condensed.
5167. Free nitrogen is destructive to human life? Yes; there is no oxygen to carry on existence.
5168. Do you know of the destructive nature of carbonic oxide? Yes; 1 per cent. is fatal to animal life; but a light will burn in some cases in connection with it.
5169. How do you expect carbonic acid after an explosion? It is generated by imperfect combustion.
5170. Will the firing of fine dust account for its presence? Oh, yes.
5171. Composed as it is of nitrogen, it would be quite sufficient to destroy life? Quite sufficient.
5172. Are you satisfied with the system of ventilation by means of doors practised here? If I had been the colliery manager I would have tried to do away with the doors altogether in the mainways. Nevertheless, I have never found that the provisions of the Act require that.
5173. You are aware that many of the large collieries are ventilated by means of trap doors? Yes.
5174. Were these doors attended by trappers? Yes; placed there specially for the purpose.
5175. Would the opening of the door during the passage of trams through it be a source of danger in Nos. 1 and 2 headings? No, not for the passing of the sets; but if it had to be left open any length of time there would be a certain amount of risk in it, as the air would go another way.
5176. Would the door require to be open any considerable length of time during the passing of a set? No; I have been in the Hill End district when the traffic was going on for two hours, and I never saw any visible change in the ventilation by the traffic.
5177. It would only manifest itself if the door was allowed to remain long open? Yes.
5178. Do you approve of the position of the door fixed at the entrance of the western main road? Yes. It is what they term a regulating-door, allowing a certain portion of air to go one way, and another the other way. It had to be so regulated, because it would have taken the road into the furnace.
5179. Considering the circuitous routes which the air from the western district had to pass through, could not the regulator be placed on the return instead of where it is? Yes. I might be allowed to explain that this door on the western had a stationary man or boy specially to open or shut it. In the event of that door being open for any length of time it might seriously interfere with the ventilation, but no serious stoppage would ensue if only left open for a few moments, because the air would divide itself, and by its circuitous routes round the western and its straight way into the Hill End district, the straight route would get its proportion of the ventilating current.
5180. Do you consider that the opening of this door may have been the cause of this explosion? If the door was left open for any length of time, it would certainly deprive Nos. 1 and 2 headings of their proportion of air.
5181. Have you any reason to suppose it was left open in view of the fact of the attendant being found on the flat in the vicinity of the door? I could not say as to that; it is impossible to say.
5182. Do you consider that any interruption of the return airways from the Hill End district may have been the cause of the accident? No; because even now they are capable of discharging 100,000 cubic feet of air per minute.
5183. What quantity of air was passing through these returns on the day after the accident when you visited the colliery? There was a current of 30,000 cubic feet of air coming from the western, and 24,000 cubic feet coming from the Hill End district.
5184. Was that any evidence of any interruption in the returns? I should say not. I have tested them

Mr. J. Rowan. six or seven times since the accident, and I always got an average coming from the two returns of 60,000 cubic feet per minute.

16 May, 1887. 5185. With gas issuing from Nos. 1 and 2 headings, would you consider it an evidence of mining erudition to work the bords off No. 2 heading, or in the return air with naked lights? As I have previously stated, I thought that with this increased ventilation, and no fire-damp having been seen in the bords when the ventilation was much lower, I could not reasonably object to the bords being worked with naked lights, when the ventilating current was 12,000 cubic feet per minute, and when there was power in the new furnace to increase that in the same district up to 20,000 cubic feet.

5186. They had ample means of rendering harmless all the gas that you had ever known in these headings? Before that quantity of air could have been brought up to an explosive point it would require 1,300 cubic feet of gas per minute to be mixed with it; and such an enormous quantity of gas would be quickly felt as you approached it. [*The witness then withdrew.*]

TUESDAY, 17 MAY, 1887.

Present:—

DR. ROBERTSON, PRESIDENT.

MR. O'MALLEY CLARKE,
MR. NEILSON,
MR. CROUDACE,

MR. JONES,
MR. OWENS,
MR. HILTON.

James Rowan—examination continued.

Mr. J. Rowan. 5187. *Mr. Hilton.*] I notice, Mr. Rowan, that on the occasion of your last inspection of Bulli mine, previous to the explosion, you found 12,000 cubic feet of air passing into the workings? I may explain to the Commission that the inspection of the 17th March was not an official inspection, as it were. I was only down there with the Examiner of Coal Fields when he was taking the measure of the coal area for royalty. My last official inspection was on the 15th February.

17 May, 1887.

5188. On that occasion you found 12,000 feet of air going into the Hill End district. Now, considering the present defective state of the ventilation, and the small amount of gas found in the headings, would you be disposed to believe that the ventilation must have become deranged immediately before the explosion (say) for three or four hours before? Well, as to that, I can only fall back upon the state of matters as I have found them, comparing the results of inspection previous to the explosion, with the examinations made since, when there was a very low percentage of air passing, and not a trace of fire-damp could be found, except in Nos. 1 and 2 headings.

5189. Well, Mr. Rowan, would you reasonably expect that the same amount of air that you found on your last inspection was passing through the workings on the day of the explosion? I cannot say what took place, as it was an ordinary day, and everything was going on in the ordinary routine.

5190. *Mr. Croudace.*] Is there any part of the system of ventilation that could become deranged? I do not think so.

5191. Supposing it did become deranged, where do you think such derangement would take place, so as to diminish the amount of ventilation going to the Hill End division? You are well aware that there is a door on the western, at the junction with the main tunnel? Yes.

5192. Supposing that door was knocked down? You might as well ask me if all the doors were knocked down.

5193. Well, Mr. Rowan, supposing this door on the western had been open three or four hours before the explosion, would it considerably diminish the amount of ventilation going to the Hill End district? Yes; it might diminish it to the extent of 2,000 or 3,000 cubic feet per minute.

5194. Supposing this door (at the western) were knocked down by the sets passing, you say that the ventilating air would divide itself into two currents; on which road do you think the greater volume of air would go—on the western or to the Hill End division? Well, I can scarcely say; it would depend greatly on the friction of the respective airways.

5195. Supposing these stoppings on the tunnel were in good order and a regulating door was placed in the western return, do you not think it would be a better system of ventilation than having this door on the western road? Yes; I believe it would; and if I were the colliery manager I might adopt it.

5196. *Mr. Neilson.*] Can you assign any cause for the large fall on the main tunnel, Mr. Rowan? The only explanation I can give of that is that the blast as it came down dislodged a number of props, and caused the roof to fall.

5197. Can you assign any cause for the bodies on the top of the incline being burnt? No.

5198. Was the timber all charred in that part? I carefully examined all round there, and I saw no effects of flame passing that way.

5199. In view of gas giving off in Nos. 1 and 2 headings, do you think it would be advisable to dispense with these two doors on the main road? Well, it could be done; but it never occurred to me, because the requirements of the Act were complied with, and that is all I had to see to. If I were a colliery manager, and had to concentrate my attention on one colliery, I would use methods both as to trimming and ventilation to suit my purposes.

5200. It has been suggested that the doors on the main roads might be abolished. Where would you place your regulating doors? Well there is a door on the main road [*pointing to the plan*] you could dispense with, and put an air-crossing at the foot of No. 2 on the main road, and enter it on the return, taking the split at No. 1 heading. You could deal with Nos. 3 and 4 in the same way.

5201. But the gas is given off from Nos. 1 and 2. Do you think it would be advisable to carry the air round past the two points where gas is, and pass these bords here [*consulting plan*]? All the gas I ever saw there, with the exception of Nos. 1 and 2, was practically harmless.

5202. Could these doors be dispensed with altogether? Yes. You are aware that it is one thing to inspect a mine and see that the requirements of an Act are complied with, and quite another thing to manage a mine.

5203. Quite so. Fifty managers may have fifty different ways of doing things? Yes.

5204. *Mr. Croudace.*] We wish to see if any improvements could be made on the present system here? *Mr. J. Rowan.*
Yes. I have said these doors could be dispensed with altogether, and regulate the ventilation on the returns. 17 May, 1887.

5205. *Mr. Neilson.*] Have you any reason to believe that any of these doors were left open previous to the explosion? Well, I have no way of ascertaining that. There were boys stationed at the doors, and it was their duty to look after them. I only found a door neglected on one occasion. I generally found the boys attentive to their duty.

5206. You have no suspicion of any door being left open immediately before the accident? No.

5207. Is it usual to take any greater precautions as to the doors than you found at this colliery? No. In the best regulated collieries it is usual to have one in charge of each door, that is all.

5208. *Mr. Owens.*] I think you have stated that you consider the ventilation in Nos. 1 and 2 was sufficient to diffuse all the gas given off there? Yes.

5209. Then how do you account for the explosion? I account for it in this way: I think a shot had been fired in No. 2—an overcharged shot—and that a certain accumulation of gas was present in the roof or face. The shot ran out, and from the flame and coal-dust produced the explosion was caused.

5210. During your inspection at Bulli mine at any time did you see that the miners' lamps were locked and had been properly attended to. Well, I answered that yesterday.

5211. How often did you visit the mine? Periodically, about every eight weeks. I might be a week earlier or later, of course.

5212. You never found gas in any other part of the mine than these two headings, Nos. 1 and 2? I do not know that I ever saw fire-damp in Nos. 1 and 2 headings at all before the explosion. I did away down in the lower workings.

5213. Did you at any time receive a complaint from one, Hobbs, or any of the miners as to the condition of Bulli mine? Honestly I never did receive a complaint from any of the miners at any time. If I did, it has entirely vanished from my memory, and I have a pretty good one.

5214. How did you first become acquainted with the presence of gas in the Bulli mine? It was on one of my usual visits of inspection when they were working in the cinder coal. A certain quantity was being given off. They were then working with safety-lamps.

5215. Then the management did not inform you when gas was first discovered. Do you not think it was their duty to do so? Yes, I think so.

5216. According to your last report on Bulli mine, 12,000 cubic feet of air was passing the stenton between Nos. 1 and 2 headings, and you further stated that it would take 900 cubic feet of fire-damp to pollute that current of air or render it dangerous or explosive? Yes; it would take about 1,000 feet.

5217. You further stated that you thought it was quite improbable that Nos. 1 and 2 headings were giving off that amount of gas? Well, it has never been seen yet.

5218. But an explosion has taken place, and I now ask you how do you account for an explosion taking place under the circumstances in such a large volume of fresh air? I have already explained that I think it was caused by a shot in the first place, and the gas that might be in the roof or face assisted by the coal-dust converted into a gaseous state would account for it to my mind.

5219. Are you aware whether the roads were watered with the view of rendering the dust harmless? The engine plain was, I believe, not the headings.

5220. *President.*] Where did the engine plain end at the date of your last inspection? I cannot say precisely; it is shifted since, however.

5221. How far in? Several hundred yards. I cannot say from memory.

5222. *Mr. Jones.*] Presuming these parts of the mine were watered, would that in any way alter your opinion? Not very much. It would minimise it a little. This being a dry district, the dust would go all through the bords, and round everywhere; and then a shock or concussion would raise it even if the floor was a little damp.

5223. Considering the large quantity of air passing, does it in any way occur to you that one or more of these doors on the main heading, and that on the diagonal road leading to the flatt might have been open, and thereby contributed to the cause of the accident? No; I have no special reason to suppose so. You can go in the cross-cut now and you will have to go several yards off the cross-cut before you can catch it in the safety-lamp with only 1,000 feet of air passing.

5224. According to your own statement there was a very large quantity of air travelling before the accident, and scarcely a sufficient quantity of gas to show in the lamp, and yet we have had an explosion which has caused a considerable amount of destruction in the mine. How do you account for that? Simply because it was so confined. If a couple of sets had broken away it would have caused as much destruction almost as you see there.

5225. Did Mr. Ross ever report the existence in either of these headings of a blower of gas to you? No.

5226. To your own knowledge were boys always employed in attendance upon these doors? I cannot positively say that there was one at the western.

5227. Would you be surprised to learn that previous to the strike boys were not so employed? It is not to my knowledge. Since the strike I have spoken to the boy when I have been passing the western.

5228. Can you account for the singeing of the horse, Mr. Rowan? Well, I can say nothing but what I have previously stated. I am not so clear upon it as I would like to be.

5229. Was it ever suggested to you that a change in the weather had any material effect upon the ventilation? Well, that is an understood fact.

5230. Did it so operate? We have no barometers on the bank heads here, the same as we have in England, so I cannot say with certainty as to that.

5231. Do you think it necessary that each colliery should be supplied with a barometer? Yes; and there should be provision made for it in the new Act. There should be an instrument of that kind at every bank head, and the man who makes inspection of the mine should keep a register of it.

5232. I think you have already stated, Mr. Rowan, that you never made any inquiry as to the provision made for firing shots in this colliery? Yes; but I said that Mr. White gave me to understand in very clear terms that shots were to be done away with in the Hill End district.

5233. Do you think that the firing of shots in the presence of gas should be delegated to some authorised person? Yes.

5234. *Mr. Croudace.*] You said, Mr. Rowan, that you first came to the knowledge of the existence of gas in this mine when they struck the dyke in the Hill End district? Yes. 5235.

- Mr. J. Rowan. 5235. Are you aware that up to the present time that district has received the name of the "gassy section"? Yes; it is a very common thing in all places to give all kinds of names to particular parts of a mine; I have known curious names to be given, "the hospital," for instance.
- 17 May, 1887. 5236. Do you not think that the name, "gassy section," is a signification of gas being in the division of the mine so designated? I do not think so, necessarily; it may have taken its origin from the fact of safety-lamps being used there.
5237. Are safety-lamps used as a rule where there is no gas? They may be used where gas has not been actually seen, but where a mere trace of gas has been seen I consider it a wise precaution to use safety-lamps.
5238. Do you know, of your own knowledge, of a blower being exhibited by means of a gas-pipe in No. 2 heading previous to the strike? I never heard of such a thing until after the explosion.
5239. Am I to understand, as I did just now, that in your examinations you never saw gas in any part of the mine, except in Nos. 1 and 2 headings? As I have said, it was only on occasions when new cuttings were being put into the face.
5240. Would that be in No. 1 heading? I cannot refer to any headings in particular.
5241. You think you did see gas in some other heading? Yes.
5242. Coming to the question of these doors, Mr. Rowan, do you consider that under any circumstances, with or without gas, single doors are as good as double doors for purposes of ventilation? No.
5243. Then, where gas exists, would it not be infinitely better to have two doors instead of one? Yes; I think so.
5244. You have further stated the opinion that it might be well to abolish the doors on the main road, and have regulators on the return? Yes.
5245. In the diagonal road leading to No. 1 heading, and between Nos. 1 and 2, did you observe some tubs lying off that road after the explosion? Yes.
5246. May it not have been possible for these tubs to have been off the road previous to the explosion? I do not think so.
5247. Do you think it impossible? No; I do not think it impossible.
5248. Did you see any place in the Hill End district where any second explosion might have occurred? No.
5249. Whenever there is any fear of gas in any leading headings, would it not be advisable to put up brattice between stenton and stenton into the face? Yes; it might be advisable to do that.
5250. Then, where gas is actually known to exist, would it not be better to erect brattice as they proceed? Yes; I think it would under certain conditions.
5251. I will ask you, under any conditions would it not be better as a matter of precaution to use the most efficient means of bratticing where gas is known to exist either in large or small quantities? Yes.
5252. In dealing with gas in a mine, I understand you to say, or to be of opinion, that the question of cost or expense ought not to be considered? Yes.
5253. You are quite clear on that point that no expense ought to be spared? Yes.
5254. In your visits to the furnace recently, or while travelling the return airways, have you ever seen any indication of an accumulation of gas in the old workings? No; and I have made extensive examinations of the old workings in company with three witnesses; I have gone over large regions of the old workings with a naked light, and have never discovered any gas.
5255. *President.*] One word about barometers; are you aware, Mr. Rowan, whether much dependence is now placed on barometers as an index in fiery mines? I am aware that it is a good index, but at the same time fire-damp is sometimes 10 per cent. quicker than the barometer.
5256. Are you aware whether changes in the weather take place before the barometer gives indication of such changes? Decidedly.
5257. Is the instrument sensitive enough for rapid changes of atmospheric conditions, or are you aware that changes in the weather will take place without any indication being given by the barometer for some time afterwards? Yes; it may be under certain conditions.
5258. In that case, would you say that much dependance is to be placed upon the barometer in England, say, as an index to danger? Well, I have found it a great guide there.
5259. In the event of a rapid change? I do not say that, as I have already stated fire-damp may be developed a long time before it is indicated in the barometer outside; nevertheless it is a great guide.
5260. If it does no good it does no harm? No.
5261. *Mr. Neilson.*] How were the timbers lying at the big fall? Portions of the timber seemed to be lying towards the Hill End district, and others were lying outwards.
5262. Was there any appearance of charring on the timber? A portion of it appeared to be calcined.
5263. Was the timber shattered at all? No.
5264. What would be the effect of an explosion of powder or dynamite? If it was close to the timber, of course it would shatter it. The effect would very much depend upon where the explosive was placed.
5265. *Mr. Hilton.*] You have said, Mr. Rowan, that you examined a large region with a naked light, and found no gas? Yes.
5266. Supposing you had come across a large body of gas under those circumstances? I was in the hands of two guides—Cavell and an old man who was almost born in the mine. They had passed through many times themselves, and it was convenient to carry a light.
5267. *Mr. Croudace.*] Do you not think it possible that there may be an accumulation of gas in a place where it does not show itself? Yes.
5268. Then how were these guides to know? Well, it was a low level where we were going, and you do not expect to find gas in low regions.
5269. Do you think it prudent for an inspector of collieries to examine the workings of a mine with a naked light? Well, I was not examining the workings in that way on this occasion—I was examining for royalty.
5270. Do you make your examinations with a naked light or a safety-lamp usually? There are mines where no fire-damp exists, and you would not have me go in with a safety-lamp in such cases.
5271. We have a report from Great Britain that an explosion occurred in a mine where gas had not been seen for some months previously, yet the colliery was worked with safety-lamps. Let me ask you again, Mr. Rowan, do you think that the examination of a colliery should be conducted with or without safety-lamps? I would not like to lay down a fixed rule. The condition in the Coal Mines Regulation Act provide

provide that where fire-damp has been seen for so many months, an examination shall be made by some competent person with a safety-lamp. Mr. J. Rowan.

5272. Do you know whether there is a fairly good travelling way from the western district to the furnace? I have travelled it, but there is difficulty. 17 May, 1887.

5273. A portion of the road is a good traversable airway, and then it is interrupted by falls? Yes.

5274. *Mr. Owens.*] What velocity of air would be required to render a Davy-lamp unsafe, where the atmosphere contains gas? It would require a velocity of 600 ft. per minute.

5275. You are aware that the haulage ropes passed behind the timber? Yes.

5276. A small fall having taken place, would it tend to produce an increased force? Yes. It would be like a stone coming out of a bridge—it would make room for the rest, and there being great tension on the rope the timber would fall in the direction of the strain. [*The witness withdrew.*]

Alexander Ross recalled:—

5277. *President.*] We have recalled you, Mr. Ross, as some little doubt exists with regard to the watering of roads in Bulli mine. Some of the members believe that, in your evidence on this point, you meant that the main roads were watered, while others believe that you referred to Nos. 1, 2, 3, and 4 headings, and the Commission wish to have this point cleared up? I meant the main roads. Mr. A. Ross.
17 May, 1887.

5278. Were Nos. 1, 2, and 3 headings watered? No; they were not.

5279. Another point—where did the haulage system end about the time of the strike? Inside Nos. 1 and 2.

5280. Before you extended it to that point where did it end? It was outside Nos. 1 and 2.

5281. How far was it extended? There was about 300 yards difference between the two. [*The witness withdrew.*]

John Dixon, sworn and examined:—

5282. *Mr. Clarke.*] You are the Government Inspector of Coal-mines? Yes; for the Northern district Collieries. Mr. J. Dixon.
17 May, 1887.

5283. For what period does your mining experience extend? Since my boyhood days.

5284. How many years? Thirty odd years.

5285. How long in the home mines? Four years.

5286. In fiery mines? Yes; the mine in which I first started was a very fiery mine—the Haswell Colliery in the county Durham—that was a very fiery mine.

5287. And you have had experience in this Colony? Yes.

5288. Did you ever visit the Bulli mine previous to the explosion? Yes; it was over four years ago, that was before Mr. Rowan was appointed inspector for this district.

5289. That was before the gassy district was opened out? Yes.

5290. How many times have you been in the mine since the explosion? Five times through the Hill End district and three times through the western.

5291. You made a thorough examination of the mine? I did.

5292. Particularly the supposed seat of the explosion in the gassy district generally? Yes.

5293. Did you at any time find gas in any quantities in any portion of the Hill End district? Yes; on Monday evening after the explosion I found about 23 yards of gas in No. 2 heading; it took the lamp 18 inches from the roof, 23 yards from the face that night.

5294. Did you find any in the other heading? Yes; a small quantity in No. 1.

5295. Did you examine the bords in this district? Yes; every bord, and I tested for gas in all of them and never found the slightest trace of it or any indication of it in any of the bords.

5296. You observed the destruction that was caused by the explosion? Yes.

5297. Can you give any theory as to the immediate cause of it? It looked as if the seat of it was in No. 2 heading of the Hill End district.

5298. What had occurred? A shot had been just fired in No. 2 heading.

5299. In the face? Yes; in the face.

5300. Which ignited the gas? Yes.

5301. Would that be an overcharged shot? I believe it has been what we call a pretty tight shot; I thought that from the look of the face.

5302. Did you think that the gas which exploded there was assisted by any other means? Yes.

5303. By what other means? The explosion was aggravated and intensified by coal-dust.

5304. Can you trace the direction the explosion pursued from the face of that heading? Yes; a part of it came through the stenton of No. 1 heading striking the fore side of the wall and licking both props where the danger-board is placed. It went along the danger-board and into No. 1 heading and looked into the nearest bord in its road, but not into the face of any of the bords, as we could find no traces of fire right up to the faces. The main force went along No. 2 heading playing the same part in and out until it reached the last bord; it then went down through the cut-through back among the empty skips standing there, out again, and part of it split through one of the stoppings; one part united with that which went around No. 1 heading, and the greater force went through the cross-cut, up through the back heading, and a part of it went into Nos. 3, 4, 5, and 6 headings. I believe the greatest force was exhibited where a horse was blown through a stopping.

5305. Do you think there was a second or third explosion? I have studied the matter and thought it out in every conceivable way, and I cannot locate a second or third explosion.

5306. You think that the big fall in the main tunnel had no connection whatever with a second explosion? None.

5307. If a second had taken place it would have left appearances and traces? Yes.

5308. Unmistakably? No doubt of it.

5309. Do you approve of the system of ventilation pursued in the Bulli Colliery? Well, that is rather a delicate question, for we all know the saying that we can all be very wise after a thing happens.

5310. What is your present opinion? Well, I can give an opinion if it is of any importance, although people will be ready to say he knows all about it now, but I think I know how the system could be improved.

- Mr. J. Dixon. 5311. Will you suggest any improvement in the present system of ventilation? Well, I believe Nos. 1 and 2 headings could have been formed into a separate and distinct split very easily. That would have done away with the door in the main tunnel by the overcast, which I can point out on the plan. I would continue the second bord to the first bord off No. 2 heading and across the main tunnel. I held that opinion when I first came down. Here [pointing out place] where I would form the overcast over the main tunnel and put a door at No. 2, which would send all the air away clear of everything else. My opinion is that this air had no right to circulate in any of the bords off the heading, being already somewhat fouled after supplying the heading.
- 17 May, 1887.
5312. *President.*] It would serve the purpose of better ventilating Nos. 1 and 2? Yes; and it ought to have been done.
5313. *Mr. Clarke.*] Was it prudent to allow the use of naked lights in the bord on the return side? No; I do not think the air should have been carried to No. 2 after it had been in No. 1 heading.
5314. Do you approve of bratticing headings? Yes; by all means when driving such distances beyond the stenton.
5315. And in advance of the air-current? Yes.
5316. What is your opinion with regard to the firing of shots in the presence of gas or where gas is suspected or liable to show itself? I would certainly prohibit it altogether. I do not believe it is a correct thing to fire shots where gas is given off, for you don't know the moment that you might meet with a blower from a roll or other cause. I believe that blowers were occasionally met with and that sudden accumulation of gas occurred before the explosion.
5317. You have seen the large fall in the main tunnel? Yes; I have been all over it.
5318. Can you account for that fall? It is my opinion that for the most part it has been caused by the ropes jerking the props out. By the way in which the place was timbered you would only want to jerk one or two sets out and they would bring the rest down. Owing to the length of the timber between the cap pieces if one or two of the sets were displaced the probability is that it would bring the others down backward and forward. I believe that a great deal of the destruction in the main tunnel is due to the great tension placed on the ropes after the first fall had taken place.
5319. *Mr. Neilson.*] Would it be possible to place powder or dynamite on top of this 4 feet of shale above the sets? Yes; it would be possible.
5320. In sufficient quantities to do the damage? I could not say that it would be possible to place it on top and to displace sufficient timber to cause the fall.
5321. Do you think the fall is of sufficient area to stop the ventilation of the mine for any length of time? When I first examined that fall it was almost as close as that wall side [pointing to the wall]; it was a very close fall, so close that we could not see any distance beyond it.
5322. If there had been any heavy explosion of dynamite or powder would there be evident signs on the props? Yes; it would have shown itself downwards, especially if dynamite had been used.
5323. If dynamite had been used there would undoubtedly have been evidences of it? Yes; that is my experience. It would have powdered the hardest rock, for that is how it acts; if you fire a hole with dynamite it generally powders at the bottom; its peculiar feature is to strike downwards.
5324. You stated that your plan would be to bring the air down the inmost stenton? That overcast could have been placed opposite No. 2 heading for the purpose of getting the air out.
5325. You said that you did not think it was safe for any place to work with naked lights off these headings? If a place is giving off gas, my opinion is that the return air should be drawn immediately from it, and not allowed to go into the bords, as it is very impolitic to have naked lights between Davy-lights. I do not think that is a right thing, and I think the plan I suggested would have taken all the air away, as the remedy would keep each district separate and distinct. I can see a better plan than even that, which could be adopted there, that is, to put away a pair of cross-cuts and get your short headings off in other directions.
5326. Is not the course adopted the usual one all over the Colony? No. I know a colliery driving three main headings, and I believe in the three-heading system above any other. I believe it is better than any other system followed, and Mr. Neilson himself drives three headings at Wallsend, and a very good way it is too.
5327. Trappers being placed at these doors, is it possible that these doors could have been left open altogether, or if one was open, would not the others be likely to be shut? If the doors between Nos. 1 and 2 had been left open very little air would go up the heading. Perhaps the door on the main tunnel between Nos. 1 and 2 was open at the time of the explosion. That, I think, was indicated by the position of the horse. My experience of trapper boys is this, that they have to be kept in terror of a yard-stick to keep them at their doors. I have seen them 100 yards away, and they are particularly liable to leave their doors if there is a horse about to play with.
5328. *Mr. Hilton.*] Which is the best system of ventilation, having ventilating doors on the main road or in the return airways? It is a question which the greatest philosophers in England have not been able to decide yet, that is, according to my reading of the latest information. It was not a cablegram, but it is the latest news by mail. My own opinion is that there should not be a door on a main road, and if I do see one in my district I generally grumble about it till it is shifted.
5329. You would place regulating doors in the return airway as much as possible? Yes; the regulator should be placed in the return.
- 5330-4. *Mr. Owens.*] Assuming that there had been a big fall at the western junction and all the men were inside, which way would they get out? If the fall had occurred between the tunnel-mouth and the western door how could the men get out, seeing that there is no travelling way.
- President.*] We have not got that information; don't assume anything.
- Mr. Owens.*] We have information that it could not be travelled.
- President.*] We have also information that it has been travelled.
- Witness.*] Mr. White informed me that if we had liked to have gone on we could have got into the western. I have been up the road as far as where they were working at a pillar of coal. It is my opinion that if that road had been conveying a good current of air through and was clear of all falls the men would not have been got out in a fortnight, as the furnace would have been wrecked. It was owing to the distance which the air had to travel that so little wreckage was done in this part of the mine; and I am further of opinion that never in the history of the world have men been got out so quickly after such an explosion, where so many were killed.

Mr. J. Dixon.
17 May, 1887.

5335. *Mr. Jones.*] Do you approve of a report-book being kept at every colliery? My opinion is that there should be a report-book kept at every colliery, and that every deputy and overman should enter daily reports in it, and that the inspector should look at it to see that they were carrying out their duties. I also think that the engineer in charge of ropes, cages, &c., should make daily reports. I have established this system of reporting in several places, and I find it is a good thing.

5336. You are aware that traces of gas have been seen in this mine ever since the Hill End district passed the dyke? I have heard so.

5337. You are aware that Nos. 1 and 2 headings were turned away very near the dyke? Yes.

5338. Would that be an additional reason for not allowing the air-course in Nos. 1 and 2 headings to ventilate any other portions of the workings? Yes. I believe that the most mischief is done by dykes where there is inflammable gas.

5339. *Mr. Croudace.*] By the dyke or the inflammable gas? Now, don't you try to catch me. I said where there is inflammable gas.

5340. *Mr. Jones.*] Do you think the small area of the workings had anything to do with the wreckage in the mine? I certainly do. It is the smallest area of workings I know of for the length of the main road, and I think that the confined state of the force had a great deal to do with the loss of life.

5341. We have been told that it was the custom to work with unlocked safety-lamps; was that a safe thing to do? It depends upon whose hands they were in.

5342. In the hands of any person? I know people in whose hands they would be safe, but I know others that I would not allow to use safety-lamps at all.

5343. Does not the law provide that they should be locked? Yes; in the presence of gas.

5344. And it was a violation of the law to have them unlocked? Undoubtedly.

5345. *Mr. Croudace.*] Knowing that there was gas present in the workings, would you consider it safe to tilt a safety-lamp for the purpose of lighting touch-paper? No.

5346. And still more unsafe to light a shot by striking a match? Rather.

5347. What would you think of sworn testimony that men worked in a heading where gas was known to exist with a hole in the top gauze of a safety-lamp? Well, I think he ought to have been placed were you and I were the other day—in East Maitland.

5348. Suppose it was known to the officers that such a lamp was used? It was very wrong that such a lamp should be allowed to be used anywhere.

5349. Quite culpable on both sides? By all means.

5350. You believe in places being bratticed? Yes.

5351. Now, coming to the question of these doors, seeing the doors were used, would it not have been better to have had them doubled? In that particular place you could not get double doors to work very well.

5352. Would it not have been prudent for the manager to have foreseen the necessity? In answer to that, you know what a bearing up door is, that is a door where the current depends upon it, and where there are such doors they should be doubled.

5353. Did you notice the second door in the diagonal roadway, and did you notice some tubs near it? Yes.

5354. Is it not possible that some of these tubs may have been off the road just before the explosion? Quite possible.

5355. If so, would not that have kept the door open—the door at the diagonal road open, if these tubs which were off the road were in the way of it? Yes; if they were against the door.

5356. Is it probable that this door might have been open at the time of the explosion? Highly probable. I thought that from the first.

5357. Coming from the western to the Hill End district, don't you think that there ought to be a good travelling road used as a return? Yes; my opinion is that in every colliery there should be a well-defined road for any man to travel, and at the same time, I would not confine the return air current to that road. Immediately the air is pitched into the return I believe in ventilating everything.

5358. If that had been so the wreckage of this explosion would have been greater? Yes.

5359. But you think the return airway should have one good travelling road? Yes.

5360. You are quite clear upon the seat of the explosion? Yes.

5361. That it arose from the firing of a shot in No. 2 heading? Yes.

5362. With reference to this lamp which was found only a day or two ago in the face of No. 2 heading on a canch on the left-hand side, do you think that lamp could have been used at the moment of the explosion by either of the men working there? No. I think I told you that I thought it was used by a man working in the heading when he was travelling out of the mine, and that he would light it when he put away his "glow-worm," as the light of a safety-lamp is often called. I arrived at the conclusion that a shot had been fired in the heading, and that nothing had been done there afterwards. I believe that from the fact that the tools, drills, picks, and scraper were found back from the face, and one of the men working in the heading was found in the stenton, and no body was found in the face of the heading. Putting everything together, I am firmly of opinion that the firing of a shot was the last thing done in No. 2 heading, and I believe that one of the men had been in the habit of carrying the lamp which he used to travel in and out of the mine so as to have a better light into the heading. I don't say that he kept it alight in there.

5363. Might not anybody else have carried it there? Yes; but that is my idea.

5364. Could this lamp have been placed there subsequent to the accident? Certainly.

5365. You don't think that this lamp has had any effect upon the cause of this explosion? I do not.

5366. You have given us the effect of the explosion; did you notice close to Nos. 1 and 2 headings two very delicate strings? I did.

5367. Were they singed, charred, or burnt? Not in the slightest.

5367½. If there had been any body of fire, would it not have completely consumed the strings? Yes.

5368. *Mr. Neilson.*] If Westwood and his mate cautioned their mates on the night-shift the evening before the explosion, to be careful with their lamps, is it probable that under the circumstances they would have taken a naked light into the heading? No; I believe the man who used that light to travel with put it in there simply to prevent anyone running away with it.

5368½. *Mr. Croudace.*] In view of the way in which men used lamps, are you of opinion that very stringent measures ought to be enforced to compel every workman to report such a state of things, and otherwise to prevent their occurrence? Yes; and I would strip them of all tobacco and matches, because I believe tobacco is one of the greatest curses about a gassy pit. I like a smoke myself, but I know too well what men will do for the sake of a smoke. [*The witness withdrew.*]

John Mackenzie sworn and examined:—

Mr. J.
Mackenzie.
17 May, 1887.

5369. *President.*] You are Examiner of Coal-fields for the Colony, Mr. Mackenzie? Yes.

5370. After the accident on the 23rd of March you visited the Bulli Colliery? I did.

5371. And as a result of your visitation and inspection you sent in a full and particular report of your examination to the Department of Mines? Yes.

5372. To save the time of the Commission I propose that you read this report, on the understanding that you have liberty to supplement it by any additional statement you feel disposed to make. Will you be kind enough to read your report? [*Mr. Mackenzie reads his report, for which see Appendix.*]

5373. *President.*] This [*receiving the manuscript from witness*] is your report, Mr. Mackenzie. Do you desire to make any supplementary statement?

Witness.] Well, I have written a report as the result of an inspection I made yesterday, which I will read to the Commission. [*Mr. Mackenzie reads as follows*]:—

I made yesterday (Monday, 16th May) a close and minute examination of the Bulli mine, to see if it was possible to arrive at any other conclusion with regard to the cause of the disaster than that which I announced at the close of the late inquest. I was most anxious, if possible, to find ground for altering my conviction upon the subject, because I knew I stood almost alone in the view I took, and there was such an array of witnesses on the other side that it placed me in a position of apparent egotism to run entirely counter to their judgment. I therefore visited the mine, as I have said, with a desire to alter my views if I could find evidence which would justify their change. I regret to say that so far from finding anything to controvert my previously expressed opinion, I found evidences which more than ever confirms me in the opinion that the original seat of mischief was the heavy fall, however produced, at the bend of the Hill End incline plane, about 380 yards from the tunnel mouth. I found there unmistakable signs of a double and exceedingly fierce blast—one on the eastern side going to the tunnel mouth, and the other on the western side of the fall going to the interior of the mine in the direction of the Hill End and western districts. There is no mistaking the evidence offered by these mute witnesses of the catastrophe. The diverging currents are marked on either side of "the fall" by the torn ribbons of bark which stand at right angles from the props in the directions the blast took, also on the incline taken by the props as they were forced from their position, as well as by the angle at which cap-pieces lie that remain suspended by one prop only. These are themselves strong indications, but they are as nothing compared to the state of things revealed at the junction of the western road with the main tunnel. Here is to be found evidence which shows unmistakably that the destruction worked upon this portion of the mine came from the direction of the tunnel mouth, and therefore entirely contradicts the theory (and it is only theory) that the disturbing force came from a contrary direction, and as the result of a shot being fired in the No. 2 heading. The evidence to which I refer is that of the blowing away of the regulating door in the western heading, about 20 yards from its junction with the Hill End tunnel. Very little of this door or its framework and supports is to be found in its original position. It is blown to splinters and shreds; not out-by towards the tunnel mouth, as they must have been if the theory I have alluded to as erroneous were correct, but in the opposite direction. I saw pieces of the door 66 yards inwards from its original position. At a distance of 3 yards I found that a slab about 6 feet long, which belonged to the door-frame, had been driven endways, diagonally, through a cracked prop, and the upper end was jammed in the roof at an angle of about 35 degrees. One of the hinges of the door I discovered twisted and bent like a ribbon. Around a prop at the left-hand side of the road, 9 feet distant from the original position of the door, the bolts and nuts bent, from which the woodwork had been wrenched; and at 53 feet, lying between the centre of the rails, I saw the other hinge twisted and distorted, and alike divested of any woodwork. These hinges were heavy in construction, being of $\frac{3}{8}$ iron 2 inches wide and over 2 feet in length, evidently made at the works, and their great strength, coupled with their present condition, shows the violent force to which they were subjected. The blowing in of the door entirely upsets what appears to be the received theory, and I give it as my deliberate conviction that the trouble had its origin in the vicinity of the tunnel mouth. The terrible disturbance and concussion at this point sent a current with the force of a whirlwind in both directions. That which went outwards bore with it the first heavy shower of debris which witnesses have described, and the other rushed inwards up the incline plane, carrying with it upper coal-dust lodged along the ribs, and opening out at the meeting of the rails at the junction of the western road, split into two currents, one-half hurling itself against the western door and carrying it away, and the other continuing its course along the Hill End district to Nos. 1 and 2 heading. Here the current, heavily charged with coal-dust, came into contact with the gas escaping from these workings, and possibly ignited at the naked light hanging on the danger-board near the stenton in No. 1 heading, and from there proceeded with terrific force down No. 2 heading. This being the seat of the second explosion which wrought all the remaining mischief, adding its force to the recoil of the first explosion (that would take place at this point), and eventually producing at the tunnel mouth the second but weaker outthrow, as described by Lang.

5374. *President.*] Were you in the habit of inspecting the Bulli Colliery at intervals? No; not at regular intervals.

5375. When did you inspect the colliery, before the 15th of March? I cannot say when; it was some considerable time before then.

5376. How long was it? I cannot say without reference to my papers.

5377. Was it months or years? Well, I do not think I had been in the year before.

5378. At the examination you made before the 15th March, with a knowledge of gas existing in the Hill End district, you did not examine that district? No. I have said so in that report; I did not go into it.

5379. You state in your report as a result of the 15th March examination that the returns were defective and untravellable. Did you make that statement of your own knowledge? No.

5380.

Mr.
J. Mackenzie.
17 May, 1887.

5380. Did you attempt to travel them? No.
5381. Upon whose information did you depend? That of the inspector for the district, Mr. Rowan.
5382. You did not desire the inspector or the manager to take you to the impediment on the return? No.
5383. What district did you visit on the 15th March? The western.
5384. The western only? I visited the western and the furnace.
5385. What was the object of these visits? The company are working coal in coal land for which they pay a royalty, and I went on that account principally, and to see anything Mr. Rowan might think it necessary for me to see.
5386. In visiting a colliery known to produce gas, did it not occur to you that it would be well if you satisfied yourself of the presence of that gas by personal inspection? As I have stated in my report, if I had gone there, the mine being at work, I should not have been able to see anything probably.
5387. Would it not have been some satisfaction to you to test the accuracy of the reports as to the existence of gas? Well, Mr. Rowan reported that there was very little gas—nothing dangerous.
5388. The workings at that time were of a very limited character,—would it not have been consistent with your duty to have inspected the Hill End district as well as the western? I do not think so in view of my inspector's reports to me.
5389. A portion of the western district is within Government land;—was it not part of your duty to inspect all workings within Government land? No; I do not know that it is.
5390. In your report you speak of an infringement of the provisions of the Act in reference to unlocked lamps;—did you state that from the evidence given at the inquest only? Yes; from the evidence at the inquest.
5391. You also state that Millwood was lax in the performance of his duty;—was that taken from the evidence at the inquest? Yes.
5392. Millwood was one of those lost in the mine—the statement is therefore of an *ex parte* character? Yes.
5393. Did you also at the inquest hear the manager and the overman examined upon this point, as to the orders given to their subordinates? That is, Mr. Ross, yes.
5394. Were they of a positive character? Yes; I think so.
5395. And from your own knowledge you are not aware whether Mr. Millwood carried out those orders or not? No.
5396. With respect to the cause of the explosion, I understand from your report that you agree with some witnesses that have been examined as to the seat of the explosion in Nos. 1 and 2 headings? As to the seat of one explosion.
5397. You are inclined, from your own examinations, to believe that two explosions occurred? Yes.
5398. The first explosion being in the main tunnel? Yes.
5399. Have you any distinct evidence of an explosion in the main tunnel? There appears to be strong evidence of it at the fall.
5400. In your report you give the circumstances of these explosions. You are inclined to believe that an explosion in the main tunnel occurred prior to a subsidiary explosion in the Hill End district. Could not the effects be produced by a fall of the magnitude we see there? No; not in my opinion. There is a centre there where anything is blown one way and another.
5401. Would not the force of debris coming down by a fall be as great as by an explosion? No; I cannot see that any fall there could possibly have caused such a fierce blast to go in opposite directions.
5402. To what cause would you be inclined to ascribe the explosion—to the ignition of certain explosives or an accumulation of gas? There could be no gas there to my mind.
5403. Then you fall back upon the other explosives;—in what way do you consider it possible? I cannot say.
5404. Have you any evidence of explosives having been used? No.
5405. You have described with some minuteness the damage to the western door;—could not the damage sustained by that door have been caused by the recoil of air after the explosion in Hill End? Certainly not, because in that case the force came outwards.
5406. Would the blast going outwards be in a compressed state?—
5407. Then in going to the western door the space widens out considerably;—would that compressed air, or gas and air, be liable to expand suddenly on coming to a wider part of the road? I do not think so.
5408. Would it still go on in a compressed state? Yes.
5409. Could the damage to the door be caused by a fall of the magnitude you have described in the main tunnel? There are different falls. I believe this point [*referring to the plan of the tunnel*] to be the centre of the explosion, and the other parts fell afterwards.
5410. Would that have the effect of compressing the air out towards the tunnel mouth and in towards the workings? Yes.
5411. Would that account for the damage to the western door? Yes.
5412. With respect to the ventilation, you have accurately described the general scheme of this colliery. You had an opportunity of examining the plan before the accident? Yes.
6413. And knowing that gas existed in Nos. 1 and 2 headings, did it ever occur to you that a safer system of ventilation could have been pursued than the one they had? No; because my attention was never drawn to it.
5414. In the light of recent events, Mr. Mackenzie, are you of opinion that a safer system of distributing the air could be pursued in this colliery? Yes.
5415. In what way? In the western district I would have two doors instead of one, and there might be an overcast from the Hill End district into the return.
5416. And make the return direct into the main return? Yes.
5417. *Mr. Neilson.*] You say there are a number of falls in the main tunnel;—do you think they all fell simultaneously? I cannot say that. Of course we know the roof has been falling since. They would not all come down at once.
5418. *Mr. Hilton.*] How long ago is it since gas was first reported to you in the Bulli mine? It was in November, 1886. Mr. Rowan reported it in his report of December, 1886.

- Mr. J. Mackenzie. 5419. You know, according to your own statement, that gas was present in dangerous quantities? I did not say that. I said I knew gas was there.
- 17 May, 1887. 5420. To-day there may be a small quantity, to-morrow a large quantity? Yes; but I say it has only been reported to me as being present in small quantities. The inspector did not consider there was a dangerous quantity there.
5421. Is it not possible that the quantity given off there might become larger in the course of a day or two? Yes.
5422. Was it or was it not your duty, knowing that gas existed in the Bulli mine, to visit it for the purpose of seeing that the workings were in such a condition that the management would be able to cope with a larger quantity of gas, in the event of a larger quantity being given off? No; it is the duty of the inspector to do that, or report to me.
5423. Section 4 of the Act, as to "Duties of Examiners," says, "it shall be the duty of the Examiner or inspector to ascertain the state and condition of all mines," &c. Do you rely wholly and solely upon the inspector for reporting everything to you in connection with mining matters? No.
5424. That being the case, I ask again, as you knew that gas existed in the Bulli mine, did it never occur to you to visit the mine, and ascertain for yourself whether due precautions were being taken to meet with a possible increase of gas? No; I have a competent inspector to go round every eight weeks, and I read his reports when they are sent in to me. I ought not to have any occasion to go.
5425. Then what are the duties of the Examiner? The Act tells you what my duties are. I am the head of the coal-mining department. The inspectors go round the mines every eight weeks, and they report to me, and if anything requires my attention at any place I go there. It would be impossible for me to go through every mine in the Colony.
5426. *Mr. Owens.*] Would you explain to me how this second explosion, as you put it, was brought about? I have explained that everything from this centre in the main tunnel was blown outwards and inwards for a certain distance, and the coal-dust would be carried with the blast.
5427. Did it ignite? The coal-dust and gas together. There would be 2 to 3 per cent. of explosive gas in Nos. 1 and 2 headings, besides what was in at the far end.
5428. And do you mean to say that the coal-dust driven by the force of this fall into Nos. 1 and 2 headings is the explanation of the second explosion? Yes.
5429. Do you think there was any accumulation of gas in the old workings? No; there could not possibly be, because no gas was seen until they crossed the dyke. I wish to say further this: There appears to be an impression that the gas could separate itself after once being mixed with the air, and go into the old workings, whereas if no gas was made there it could not get there from the headings Nos. 1 and 2.
5430. *Mr. Jones.*] In your report you say on going up the tunnel the cap-pieces showed signs of being driven inwards? No; I said of them.
5431. Are there not a number of cap-pieces showing signs of being driven outward? Yes; that would be from the recoil that took place from the explosion in the Hill End district.
5432. Would not the haulage ropes, being attached to the timbers, and in some instances passing behind them, have a tendency to determine the position of the timbers, supposing a small fall to have taken place, and caused a tension on the ropes? Yes; it might do with some of the timber, but not the whole of it. It would not affect the pieces I have specially referred to.
5433. You have stated that you depended upon the evidence at the inquest for your remarks upon the lax discipline at this colliery? Yes.
5434. Have you any reason to doubt the truth of the evidence? No.
5435. You think there could not have been enough gas in Nos. 1 and 2 headings to cause the whole of the destruction you saw? Certainly not.
5436. If either of these doors—the one on the main road, or the one in the diagonal cross-cut leading to the Flatt—were left open for a short period, would not that allow of gas accumulating in Nos. 1 and 2 headings? Well, yes; but they were not open. This door at Nos. 1 and 2 was shut.
5437. What evidence have you of that? The position of the doors prove it. The frame-work of one is still hanging. If the doors had been open they would not have been damaged.
5438. On the diagonal road leading to the Flatt there is a train of empty skips? Yes.
5439. Presuming that they were passing at the particular time of the explosion, would not that allow of them being open? I tell you it was not open—you can see for yourself. [*Refers to plan.*] The set is clear of the door.
5440. Subsection 3 of the 24th clause of the Coal Mines Regulation Act says, as to the powers of Examiners, that they may "examine into and make inquiry respecting the state and condition of any mine or any part thereof, and the ventilation of the mine, and the sufficiency of the special rules for the time being in force in the mine, and all matters and things connected with or relating to the safety of the persons employed in or about the mine or any mine contiguous thereto." When you last visited the mine, I understand you knew that the Hill End district was giving off gas? Yes; a small quantity.
5441. You have further told us that you are the head of the department whose duty it is to see that the provisions of the Coal Mines Regulation Act are carried out for the safety of the men? Yes; with the aid of the inspectors I do that.
5442. Being in the mine, and knowing from the reports of Mr. Rowan that this portion of the mine was giving off gas, did you not consider it your duty to personally inspect that portion of the mine? No; not after what Mr. Rowan had told me. I put a question to him on the subject, and he told me that there was so little gas there that while the men were working I would very likely not see anything.
5443. *Mr. Croudace.*] Will you kindly tell me what is really your opinion as to the cause of this big fall? I cannot say; it appears to me to have been an explosion. I do not see how an incidental fall alone could do it.
5444. Could it have been brought about by an explosion of gas there? No; not by gas, as there could not have possibly been any there.
5445. By powder or dynamite? I could not possibly say.
5446. Have you any reason, from information received from the inspector, or from information received from any other person connected with this mine, to lead you to believe that it was not caused by the explosion of gas? It could not possibly be an explosion of gas, as there has never been any found until we got into the Hill End district.

Mr.
J. Mackenzie.
17 May, 1887.

5447. Supposing it was brought about by an explosion of gunpowder or dynamite, would there not be a report as that of a large cannon? There was a report, I am told, as if a large quantity of sticks had fallen, and one witness has said that he thought it was a large tree that had fallen.
5448. A rumbling noise? I don't know what it was myself, but it has been represented as like falling of trees.
5449. If a barrel of powder or a heavy charge of dynamite exploded, would not the report be like that of a cannon? I did not hear it, but I should think there would be a report.
5450. Have you ever heard an ordinary miner's shot? Yes.
5451. Does that not go off like a gun? Yes; but it would entirely depend on the quantity of powder put into it. My own opinion is that there must have been some explosive there to cause this wreckage, and that a fall itself would not so displace the timbers as I found them.
5452. If there was an explosive used there would be a very heavy report—such as that of a huge cannon;—you admit that? I could not say how it would be where that fall took place. It is a long way inside the tunnel, and it is hard to say whether a report like that of a cannon would be heard outside.
5453. Is the report of powder or dynamite not a sharp, quick sound, as if a gun went off? Yes; but I cannot tell how it would sound 380 yards in from the tunnel mouth, and with a bad roof above it.
5454. Have you ever heard of an explosion of powder bringing down that amount of stone? Not the whole of it; but if the props were displaced that would increase the amount.
5455. Have you ever seen a fall take place in pillar workings? Yes.
5456. Can you tell me the result of a sudden heavy fall upon the atmosphere? It will sometimes blow stoppings out, and in that and other ways will affect the ventilation of the mine.
5457. Have you ever seen an ordinary bord fall 30 or 40 yards long and 7 or 8 yards wide? Yes; and I have seen very large falls which have taken place in the Co-operative Colliery, in Newcastle.
5458. Is the effect there like this? No; nothing like it.
5459. You believe that when this fall or explosion took place there was immediately a tremendous blast of air going in? Yes.
5460. And that blast was sufficient to blow away the western door, doubling up the hinges of the door, and that another portion of the blast went down the main tunnel? Yes.
5461. And that it was of sufficient strength not only to blow away the door, but to double up the hinges, as you have described? Yes.
5462. Now, as a matter of fact, would not such a force immediately put out every light in the mine, naked or otherwise? I don't know what lights were there.
5463. Don't you think it would? I don't know where the lights were. We don't know, as far as the western headings are concerned, that there were any signs of burning there.
5464. I don't care twopence about the western, before or since the explosion. I merely ask you if you think the power which would blow away a door and double up its hinges would not be sufficient to put out all the lights? I presume it would in the western district.
5465. Would it not in the Hill End district? I don't know that it would, for there is another fall between the very heavy fall and the Hill End district.
5466. Would this fall not assist the large fall in doing so? The other fall might have closed before the blast smashed the western door.
5467. But let us get to the point. Don't you think that this volume of air, carrying this coal-dust, smashing the western door and skips to pieces, would not that power be sufficient to put out every light in the Hill End district? I don't know that it would, because of this fall between the western and Hill End might have closed before the force reached it.
5468. Did these other falls take place from the explosion of gas, or are they the result of the first fall? I believe it was simultaneous with the blast.
5469. Did the blast of the large fall get beyond the smaller falls before they occurred, or did the force go over the top of them? Some of the force would get through, perhaps, but not the whole of it.
5470. But suppose a moderate quantity went in, would not the effect be to blow out the lights? It might not, for if the lights were much beyond the fall the force would not likely blow them out.
5471. You think, then, that this great blast would not likely blow out an ordinary lamp? I say it would blow out all the lights in the western district.
5472. But not in the Hill End? I have told you the fall might have prevented it.
5473. But you do say that it would not blow out the lights in the Hill End district? I don't say that all of the lights would keep burning. It might blow out those this side of the stenton.
5474. How do you think the second explosion took place? A quantity of dust might have gone through there, and this might have been ignited at the naked light which I have referred to, and that an explosion of gas occurred in No. 2 heading on the other side of the stenton.
5475. You admit, then, that the cloud of dust then went over the fall, and that this dust ignited at the lamp. Don't you think that the power which blew the dust there would blow the light out? My opinion is that she did not blow the light out.
5476. You would lead us to believe that the power which carried the dust did not blow the light out? Yes.
5477. Is such a thing possible. Is it really creditable? I think so. There were a number of naked lights in the bords.
5478. I only ask you to reflect for one moment. What you are asking the Commission to believe is that the lights could not have been blown out? I say that the force of the blast would not go into the bords to the same extent, and that it might not have blown them all out.
5479. Between No. 1 heading and the dyke, are there any signs of flame? No.
5480. Is there any debris on the main tunnel inside the western? No.
5481. Are there any signs of charred coal-dust in there? I think not.
5482. Then how do you reconcile this blast leaving the return from the western to the dyke free from signs of fire? Because she went round the return to the western.
5483. Are there any signs of any fire at all in that route. You can see that she did not go down.
5484. Are there any indications of charring on the props between the dyke and the western district? I cannot say.
5485. In your evidence you charged Millwood, the deceased deputy, with being negligent. That, of course, means that White, the overman, had been also careless, as well as Mr. Ross, the manager, in really allowing Millwood to be careless? I am judging only from the evidence.

Mr.
J. Mackenzie.
17 May, 1887.

5486. We have sworn testimony that the western door was in existence up to the very hour of the explosion; that No. 1 door, that is the first between Nos. 1 and 2 headings, is in all respects the same; that the diagonal door in No. 1 heading was identically the same before and after the explosion; that No. 3 door in this district, between Nos. 3 and 4 headings, was also the same; that there were trappers kept at these doors, with the exception of the western door; and that, since the strike, these trappers have been systematically and regularly employed. Now, would that show less attention to these doors on the part of the overman or deputy after the strike? No; that is not the laxity I refer to.
5487. Since the strike we have evidence of a great improvement in ventilation, by the erection of a new furnace; so much was it improved that we find 12,000 cubic feet per minute, where previously there were only 3,000 or 4,000 cubic feet;—does that show any laxity? No.
5488. We also have it that the safety-lamps were locked previous to the strike by Crawford, but that they were not locked at night-time by him. Since the strike we have it that they were neither locked day or night. Is that the laxity you refer to? Yes.
5489. That is where the greater laxity comes in? Yes; in the men being allowed to take the lamps in unlocked.
5490. Has that anything to do with the bords off No. 2 heading, which were being worked with naked lights? Yes.
5491. You think that is not desirable? I do.
5492. Is there any other source of laxity that you can point out to us? Nothing in addition to what I have stated.
5493. Then, having been made acquainted that gas was coming off in this mine, did you attach so little importance to it as to render it unnecessary for you to visit the colliery specially to see it? Yes.
5494. Did you not think, knowing that our mines had been hitherto free from gas, and that being a new feature and a dangerous element in mining, did you not think it desirable to visit that gassy district, if only with a view of cautioning the management? I had no cause. Of course I had no idea that there was so much as there was, and you must bear in mind that gas has been found as far back as 1864 in the Bulli mine, and that some time later than that a man was killed there from the effects of a small gas explosion. So this was not by any means the first time that gas was found.
5495. Knowing that a man had been burnt in the Bulli mine many years ago, and that gas was again showing itself, did not that lead you to think that it was necessary for you to personally go down and warn the management of that mine? No.
5496. It did not? No. It was only reported in small quantities.
5497. *President.*] I am very anxious to have a clear understanding from you with reference to the large fall in the main tunnel, and I see that my colleagues have not touched one point in connection with it. You have clearly described the condition of the western door, and assigned as the cause that the blast or compressed air would travel from out-bye to in-bye—is that so? Yes.
5498. This current of air, rolling in the main tunnel, you stated would have a tendency to divide at the western? Yes.
5499. The door giving way before it would allow a portion of that blast to proceed down the western road, and the other portion would proceed down the main tunnel and into the bords of the Hill End district? There was a fall between there.
5500. Have you any evidence that this fall occurred before the blast reached it? At the time, I presume.
5501. Then the bulk of the blast must have entered the Hill End district before that fall occurred, if it was the result of the force supplied? Yes.
5502. You have accurately related the condition of the door on the main tunnel between Nos. 1 and 2 headings, and that at the present moment it stands on an incline, or opened partially towards out-bye? It is broken to pieces, and only some portions of the frame are left.
5503. In what direction would that door have been blown had it arrested the force of this blast from out-bye towards in-bye? If the explosion had occurred first in No. 2 heading, I should have expected to have seen that door blown away altogether, the same as in the western, but there has evidently been less force there than in the western.
5504. If that blast had been as far as you have narrated, where would you expect to find the remains of that door? She had spent herself before she had got there, for at that time the blast had gone 500 yards.
5505. What direction should that door be blown if the force came in-bye? The same as the western door. It would have had been blown in-bye if the force had been as great as at the western.
5506. Suppose it was not as great, in what direction would you expect that door to be blown by any force at all, out-bye to in-bye? I did not expect that there was a great force here.
5507. You say it was sufficient to go down and reach a naked light there, and, if so, would not that door have arrested the force? She would not have the same force there as elsewhere.
5508. But would not the door give some indications of the directions of the force? Yes.
5509. Was it so little as to leave the door intact? It is not intact.
5510. Do you think that this door would show that it was blown from the inside if the force came the other way? I do not think the force was sufficient.
5511. Would it take much force to displace a large door like that? I could not say how the door was fixed.
5512. Would it likely resist any considerable force? I think the force had spent itself before reaching there.
5513. Don't you think the position of the door was rather against your theory? I think it substantiates my theory that she came this way and recoiled.
5514. *Mr. Neilson.*] Can you define what you mean by an explosion at this place some 380 yards from the tunnel mouth? Some explosive material has been fired, that is my opinion about it.
5515. Is there any evidence of it on any of the props about there? There is coke to be seen on them on the out-bye side, and I ascertained that there is coke to be seen on the props on the other side of the fall.
5516. Are there any of the timbers about there much shattered? They are blown in different directions, some in-bye, some out-bye.
5517. As a man of experience, I suppose you know that if there had been a large explosion such as to cause all this damage which you have described, there would be some evidences of powder or dynamite in close proximity to it? I cannot tell; I can say nothing more concerning it; I have given you my opinion.

5518. Would you not naturally expect such to be the case if powder or dynamite had done this damage; would there not be direct evidences of it? I could not say; I have given my reasons for thinking so; I cannot say anything more.

Mr.
J. Mackenzie.
17 May, 1887.

5519. If this explosion in the tunnel occurred first, and it extended right into the western and Hill End districts, what caused the second explosion? It might have been caused by the coal-dust that was driven in there.

5520. You think that the first explosion would have the effect of compressing all the air? Yes.

5521. Would it be fresh air? It would take up the coal-dust with it.

5522. What would it do with the fresh air before it? The blast would collect the dust as it went along.

5523. But would there not be a certain proportion of fresh air before the dust? I do not think so.

5524. If the force could knock down skips, doors, and create big falls, would it not also put out the naked lights? How could the western door be blown in by an explosion coming out from the Hill End district. The western door is blown away, and I believe shreds of it have been found 66 yards away inside the place where the door stood.

5525. *Mr. Owens.*] Did you at any time see gas in the Bulli mine? No.

5526. You never saw it yourself? No.

5527. *Mr. Hilton.*] When was the last time you were in the Bulli Colliery? The 17th March.

5528. Are you certain? I am not certain; I think it was the 15th or 17th that I was there.

5529. February or March? Some time in March.

5530. How long previous to that were you there? Last year, perhaps; I do not know exactly.

5531. At any time has there been anything to specially cause you to visit the Bulli Colliery? No; I believe I was there (when I come to think of it) less than a year ago, but I cannot keep all these things in my mind. [*The witness withdrew.*]

Joseph Poppett miner.

5532. *President.*] Mr. Poppett, you desire, I understand, to correct the statement made by witness, Mr. Evans? Yes; and I will make the contradiction on oath if necessary.

5533. The proceeding is rather irregular in this way, and if we commence to allow one witness to come here to contradict statements made on oath by another there will be no end or finality to this inquiry. The statement made by Mr. Evans had no reference at all to the cause of the disaster. With me it is forgotten; it will have no weight with me whatever; and I believe it was wrung unwillingly from the witness; and I believe that if the Commissioners had known what Mr. Evans was going to say the statement would not have been made; however, you appear to give a contradiction to it? Yes; and I will swear there is no truth whatever in the statement.

Mr.
J. Poppett.
17 May, 1887.

5534. Very well, then; that will be taken down, and a remark made that you appeared and contradicted it. *Witness.*] I do contradict it.

This concluded the list of witnesses thus far summoned.

President said: It has been determined to adjourn this inquiry for a time, meanwhile, any communications from persons desirous to be examined on matters touching the accident at Bulli Colliery, addressed to the Secretary, at the Mines Office, Sydney, will receive due attention.

The Commission then rose.

TUESDAY, 7 JUNE, 1887.

Present:—

J. O'MALLEY CLARKE, Esq., ACTING PRESIDENT.

MR. NEILSON,	MR. JONES,
MR. CROUDACE,	MR. OWENS,
MR. HILTON.	

Alexander Ross sworn and examined:—

5535. *Chairman.*] The Commission wish to ask you a few questions upon your former evidence, Mr. Ross. Can you give us the exact orders that you issued to Mr. White and the deputy with respect to the locking of the lamps? I cannot exactly.

Mr. A. Ross
7 June, 1887.

5536. The orders you gave to Mr. White for instance, did you give him any positive instructions? I cannot say that I gave him positive instructions, unless it was to see that the lamps were locked.

5537. And as to Millwood? He had similar directions.

5538. Did these orders as to locking the lamps extend to the night-shift as well as the day-shift? Yes.

5539. The locking of the lamps for the night-shift was under the immediate supervision of the deputy—that is the deputy was to lock them? Yes. And here I may say that when I last gave my evidence I was a little confused about the question of the key being left in case any of the lights went out. I did not remember that when I gave my evidence before. It was only for the use of the night-shift men.

5540. Did you make any inquiries as to the carrying out of your orders? No; not specially.

5541. How often were you in the habit of inspecting the mine at stated periods, if you did inspect it periodically? I had no stated periods. Sometimes I would inspect it once or twice a week; sometimes once a fortnight—just as occurrences turned up, or something demanded my attention.

5542. From your knowledge of the gassy district, did it ever occur to you that it was necessary to use bratticing there? I did not think so.

5543. Did Mr. White ever express any desire to have bratticing in any of the headings? Not that I remember.

5544. If he had expressed a desire to use bratticing, would you have ordered it? I would have acted on his suggestion if I had thought it necessary.

5545.

- Mr. A. Ross. 5545. Did he ever make such a suggestion? Not that I remember.
- 7 June, 1887. 5546. Do you know the extent of the air current that passed into the western district before the strike? About 4,000 feet, more or less.
5547. And into the gassy district? About the same amount.
5548. Of your own knowledge, do you know whether any of the bords off No. 1 heading ever gave off gas? They gave off gas before the strike.
5549. And afterwards? It was never seen afterwards to my knowledge.
5550. *Mr. Neilson.*] Is it the custom when a general order is given in regard to the working, and the officers and men are supplied with the rules, to discuss these matters daily or weekly with your officers? It is not the practice, unless I suspect that the general orders are not carried out.
5551. You presume that having the rules and receiving general instructions they will carry out your instructions? Yes; I take it that is as it should be.
5552. How many men were on the night-shift? Eight men.
5553. What was the reason you had not back workmen on the night-shift? There were so few men I did not consider it necessary. These men I considered to be practical miners.
5554. Am I to understand you specially selected them as practical men? I tendered the headings for the purpose of getting practical men.
5555. Did you know any of these men? I knew them all.
5556. As practical men? Yes. These were all old hands.
5557. *Mr. Owens.*] Did Mr. White report to you the result of each day's work every day? I saw him every day, and he would report anything that it might be necessary to report.
5558. Did you examine the face of No. 2 heading after the explosion? Yes.
5559. Are you of opinion that a shot had been fired there? I am sure there had been, and that it was a partially blown-out shot, because there was 10 or 12 inches of coal left on, and the back of the hole is intact.
5560. How often did the overman travel the return airway? I cannot say, because before the strike we had a man to travel the western. He worked in the waste, and another man was appointed to go with him and make it right where necessary.
5561. *Mr. Jones.*] Did you engage the whole of the workmen employed in the mine? Yes.
5562. No other person had the power to employ them? No.
5563. Did you explain to the men on being engaged the risk or danger likely to accrue to them from the existence of gas in the mine? No.
5564. You never gave them instructions as to being careful or attentive for their own safety? Well, not particularly. I might on some occasions perhaps.
5565. You did not explain to them that gas existed, and that it was a source of danger? No.
5566. Did you ever use brattice in any part of the workings? We use brattice in going through the dyke.
5567. You thought it necessary then? Yes; until we got a return.
5568. But you did not consider it necessary in the case of Nos. 1 and 2 headings? No; not after the strike.
5569. Was not the practice of having a lamp-key for the men employed at night a violation of your own rules? Well, perhaps it might be to some extent.
5570. It was important, I suppose, in the interests of the colliery that these men should be employed at night? It was important in this way, that we required more places to be opened out.
5571. But in the light of what has happened, and the admission on your own part that a rule was violated, do you not now think it right and proper that the deputy, or some other authorised person, should be placed in charge of the mine during the night-shift? I can only say that I did not think it necessary on account of the small number of men employed, and the fact that they were all practical men.
5572. Did your business as manager of the colliery ever take you away from home? Yes; it did sometimes, for one or two days perhaps.
- 5572½. Then how were you to ascertain on each and every day what took place at the mine? If I were away from home of course I could not ascertain.
5573. *Mr. Croudace.*] Did Crawford ever suggest to you the advisability of using brattice in any part of the mine? Not that I remember.
5574. And you yourself did not consider it necessary? No.
5575. In view of what has recently occurred, Mr. Ross, would you consider it necessary to use brattice? Yes; I would use it now on account of what has happened.
5576. Have you been clearing away the big fall at the mouth of the tunnel, Mr. Ross? Yes; we are clearing it now.
5577. Have you observed any indications of a large body of gunpowder or dynamite or other explosive substance having been used? No; I have seen nothing to suggest anything of the kind. There have been a number of fresh falls from the roof there since the explosion.
5578. That would lead you to believe that the stone was of a tender or free nature? Yes; no doubt it is of a tender nature.
5579. And would be very liable to fall through concussion? Yes.
5580. *Mr. Hilton.*] Were the danger-boards fixed in Nos. 1 and 2 headings put there at your request? Yes; they were to be put at the last stenton to prevent any one going further with a naked light.
5581. *Mr. Neilson.*] Would not the rules of the colliery compel the overman to put these danger-boards up without your orders, if necessary? Yes; and he did so.
5582. *Mr. Jones.*] Was it the practice to place the danger-board from stenton to stenton? Well, this was the first time it was placed at the stenton, because previous to the strike we worked with Davy lights in all these places; we had it further out before; but on account of the large increase of ventilation we thought it was quite safe to work the bords with naked light. I may state that Mr. White and myself went through every hole and corner of the Hill End district yesterday, and we did not find a particle of gas in any place, except at this barehole, where the shot was fired in No. 2 heading.
5583. The ventilation, I suppose, is in a great measure restored now? No, not in there, because we have done nothing to the stoppings yet.
5584. *Mr. Croudace.*] You say you travelled all round this district and did not find any gas, except a trace in No. 2 heading, have you brattices up in the face of the headings now? In Nos. 1 and 2. 5585.

5585. Did you try the experiment of taking away the brattice to see whether gas would accumulate? No. *Mr. A. Ross.*
 5586. Do you think if you took away the brattice it would probably accumulate? Probably.
 5587. That would show the advantage of brattice? Yes. [*The witness withdrew.*]

7 June, 1887.

[NOTE.—Mr. Ross adds a remark with reference to the skips on the diagonal road, to the effect that the skips were apparently coming out of No. 2 heading, and not in the position where the “diagonal” door stood, so that the door would not be open through skips being there.]

Richard White sworn and examined:—

5588. *Chairman.*] You have been recalled, Mr. White, to clear up certain points upon which the Commission are in some doubt; can you tell us the exact orders you received from Mr. Ross with reference to the locking up of the lamps? I cannot, except that I believe that he has told me to be careful, and see that the lamps were locked on all occasions. *Mr. R. White.*
 5589. What orders with reference to that did you give to the deputy? I gave him the key, and told him to be sure and see that the lamps were locked before giving them to the men.
 5590. Did your orders extend to the night shift? Yes; I impressed upon him several times to always see that the lamps were locked.
 5591. Did you know where the key was kept? No.
 5592. Did you ever inquire as to whether your instructions were carried out with reference to the locking of the lamps? No; I did not; we had not very long started to work.
 5593. Then you did not know that the men were working with unlocked lamps, as a matter of fact? No, sir, I did not.
 5594. Did you ever consider the use of bratticing necessary? Well, I always considered it a useful thing, but I did not consider it necessary there.
 5595. You did not suggest its use to the manager? No.
 5596. Did you ever hear of any rumours that an accident was likely to occur from the mode of operations carried on in the mine before the disaster took place? Well, I did hear Crawford say when he was going away when the strike commenced, that the mine would likely blow up some day, but I did not think anybody believed it.
 5597. You did not attach any importance to it? No.
 5598. Was Crawford the only person who made use of such an expression? No, I believe a good many more of them did.
 5599. But to you did any one else make such a remark? No; nor did any of them make use of such an expression when they were happily at work. I believe it was only to intimidate the strangers from working there.
 5600. *Mr. Owens.*] You give that as your opinion? Yes; you may take it for what it is worth.
 5601. *Mr. Hilton.*] Were the danger-boards fixed in Nos. 1 and 2 headings by instructions from Mr. Ross, or upon your own authority;—did Mr. Ross give you instructions? Yes.
 5602. *Mr. Owens.*] Do you know what reason Crawford had for saying that the pit would blow up one of those days? Yes; I believe I do.
 5603. What was his reason, Mr. White? Well, I believe, he went away in a very bad frame of mind.
 5604. Was there any other reason? No; he might have a dozen reasons, for all I know.
 5605. Do you not think he might have been simply influenced by the knowledge that there was gas in the mine? No; I do not think so.
 5606. How often did you examine the return? Every day I examined parts of it, more or less.
 5607. You are the overman at Bulli Colliery? Yes.
 5608. The rules say you shall examine the return every morning and evening? Do you mean right through?
 5609. Yes? I never heard of such a thing.
 5610. You did not do it? No.
 5611. You had a man for the purpose of looking after the waste? We had two.
 5612. After the strike? Yes, and before the strike.
 5613. Was there a master wasteman? Yes.
 5614. *Mr. Jones.*] You have stated that you were not aware of the lamps being unlocked after the strike? Yes.
 5615. In your visits through the mine did you ever make any inquiries of the men on that subject? No.
 5616. Did you engage any of the men in the colliery? No.
 5617. It would be your duty, I suppose, to show the men to their working-places? Yes.
 5618. Did you ever explain to them the danger to be apprehended from the existence of gas in the mine? No; I have asked them if they had ever worked in gas, and so on. I cannot call to mind everything I may have said.
 5619. Before he left did Crawford ever suggest to you the use of brattice in these headings, Nos. 1 and 2? No.
 5620. It has been stated that Crawford, on leaving the employ, told you that unless great care was exercised the mine would blow up some day? Yes.
 5621. And you believed that in making that remark he was actuated simply by a spirit of vindictiveness? Yes.
 5622. And you still believe so? Yes.
 5623. In the light of what has happened do you believe that Crawford had no foreknowledge, or that he was not reasonably justified in making such a statement? No, not the slightest. As a matter of fact more care was taken in that place after he left than before.
 5624. Does not that prove, very forcibly, the truth of what he said? No; it might have happened at any time. Things like that cannot be accounted for.
 5625. Unfortunately the fear expressed by Crawford has been realised—does not that convince you that there was something more than vindictiveness in his statement? No.
 5626. *Mr. Owens.*] Have you examined the face of No. 2 heading since the explosion? Yes; a number of times.
 5627. You stated in your former evidence that you were of opinion no shot had been fired there? I do not

- Mr. R. White. not think I said that; I thought that a shot was fired on the right-hand side, but not on the left. A hole had been started there, and part of the coal was standing at an acute angle from the face. The facing went from left to right, and probably the shot only brought down a portion of the coal.
- 7 June, 1887. 5628. Did they keep a cut on one side and simply tear it down, or did they put shots on both sides? Sometimes they would fire at both sides, and sometimes not. This coal is jointed, and sometimes it is necessary to fire at one side and sometimes at another.
5629. Mr. Croudace.] I should like to be clear about Mr. Crawford's statement to you. I understand he told you if they were not careful he believed an explosion would take place? It was on the last day he worked there. He came outside and he told me then, when he was going away.
5630. It was after he had actually come out of the mine that he told you this? Yes; he told me that if the waste got fouled at any time the pit would be likely to blow up. But I could have told him that myself.
5631. That would be on the supposition that a naked light was taken into the place? Yes, I suppose so.
5632. Did he receive notice from the Company to leave before that? No, I think not.
5633. Had his wages been reduced? Yes.
5634. Was he dissatisfied? Yes, he had expressed great dissatisfaction.
5635. Did he offer to work on at the reduced wage? No.
5636. He joined the men that went out on strike? Yes.
5637. Did he on any day previous to that speak of the probability of the gas being ignited? No, he always made little of it.
5638. And as he never spoke to you in this warning manner before the very day of his leaving, you were led to believe that he was actuated merely by vindictiveness? Yes.
5639. If he had warned you before you would have thought much more of his statement? Yes, I should.
5640. You have been clearing away the big fall in the main tunnel, Mr. White? Yes.
5641. Have you seen any signs of explosive materials having been used in any quantity to cause the damage you saw there? No.
5642. Do you believe there was any explosion of dynamite or powder there? No, I do not.
5643. Since clearing away the fall have you had greater reason to believe that the stone there might be easily disturbed by a concussion of air taking away the timber supports? Yes, the incline at this place is in proximity to the old workings.
5644. Have you any faith or belief in the dynamite theory? No.
5645. In reference to the 8th of your colliery rules, as to examining the air-courses every morning and evening, what is your opinion about that, or how do you examine the returns? I examined them by going into the entrances of the return and examining them and measuring the air at certain places. It would be impossible for me to go through the whole mine.
5646. When Crawford told you the mine was likely to blow up, that was before the new furnace was started? Yes.
5647. He never saw the new furnace? No.
5648. Mr. Jones.] Were the returns travelled daily in Mr. Crawford's time? Yes, more or less.
5649. Mr. Crawford told you that there would be danger of the mine being blown up if the return got fouled? Yes.
5650. Was the return travelled every day during Mr. Crawford's time, or was it merely examined as it was subsequent to his time at the colliery? The returns were carefully examined.
5651. The inference seems to be that Mr. Crawford had some doubts as to the returns becoming fouled, therefore I ask were they examined daily or not? I cannot say.
5652. Up to the time of the explosion do you know, of your own knowledge, that two men were employed clearing away the falls on both sides in the western? Yes, I am quite sure of that.
5653. Mr. Owens.] Do you now consider it necessary to use bratticing where gas may exist? Yes.
5654. I think you have stated that since the strike you kept a master wasteman? Yes.
5655. Who was the master wastemen? Thomas Wilson.
5656. Did Mr. Ross know that? I do not know.
5657. You gave the master wasteman instructions, I suppose? Yes, I told him never to go away from the waste on any consideration.
5658. Do you recollect whether you told Mr. Ross that? I believe I did.
5659. What length of time elapsed between the termination of the strike and the explosion? Five or six weeks.
5660. Mr. Jones.] Up to the time of the strike the whole of the headings and bords in the gassy district were worked with safety-lamps? Yes.
5661. What lights did you use during Mr. Crawford's time in travelling the returns? Sometimes we used open lights and sometimes Davy lamps. [The witness withdrew.]

Senior-Constable Henry sworn and examined:—

- Senior-Constable Henry. 5662. Chairman.] You are the Senior-Constable stationed at Bulli? Yes.
- 7 June, 1887. 5663. And you are, I suppose, intimately acquainted with the people of the district and its surroundings? Yes.
5664. You were at Bulli during the strike and subsequently? Yes.
5665. Did anything ever come to your knowledge that would lead you to suppose that there was any foul play in connection with the explosion at Bulli? No; nothing whatever.
5666. Either in the shape of remarks or rumours, or anything of the kind? No. I made every inquiry and could find nothing to arouse suspicion.
5667. You made a thorough inquiry? Yes.
5668. Then any allegations of threats and foul play you found upon investigation to amount to nothing? Yes.
5669. And I suppose, from your intimate knowledge of the place and the inhabitants, and from your intercourse with the miners, if any feeling of that kind had existed it would have come to your knowledge in all probability? I am certain it would.

5670. Have you any suspicion yourself, as a police officer, in connection with that explosion? No.
5671. *Mr. Hilton.*] You are aware, I suppose, of a statement made by the Examiner of Coal-fields, Mr. Mackenzie, as to the probability of the accident having occurred through an explosion of dynamite or gunpowder? Yes, I heard of it.
5672. Did that prompt you to make a close and searching investigation into the matter? Yes.
5673. *Mr. Clarke.*] Certain statements were submitted to you for special examination? Yes.
5674. *Mr. Hilton.*] And you made inquiry to ascertain if there was any truth in them? Yes. Of course I made inquiries as to the remarks I heard before, and I found there was no truth in them. Then I made further inquiries as to the statement of the Examiner of Coal-fields.
5675. Were you led to believe that perhaps some foul play had occurred? No, I was not. I came to a contrary conclusion. [*The witness withdrew.*]

Senior-Con-
stable Henry.
7 June, 1887.

John Caldecott sworn and examined:—

Mr.
J. Caldecott.
7 June, 1887.

5676. *Chairman.*] What are you? A labourer.
5677. Have you been working at the Bulli Colliery at any time? Yes; since February last.
5678. That is since the strike? Before and after the strike.
5679. Did you commence work during the strike? Yes.
5680. How long before the strike terminated? Could not say.
5681. About how long? A month or six weeks before the end of the strike.
5682. Were any threats used towards you? Yes.
5683. Of what character were these threats? I was threatened one time whilst working outside the mine. Some of the miners on strike came up and threatened to throw me and my mate into a pond, but for some women who were looking on and who would see the act. They said but for that they would have thrown us into the pond.
5684. Who were your aggressors? They were supposed to be Union men.
5685. They did not carry their threat out? No.
5686. Were these the only threats made to you before the explosion? That was the only one used towards me.
5687. Did you ever hear any threats with reference to damaging the mine, or any statement as to what might take place in the mine? No; but I have heard of other men being threatened. I heard of men going to church and being threatened there.
5688. Did you hear the threats? No.
5689. I only want you to give your actual experience? I never heard anything beyond what I have stated.
5690. You heard no remarks before the explosion as to what might take place in the mine? No; nothing.
5691. Is there anything else you wish to say on this matter? No.
5692. Your name has been submitted as a person who could throw some light on the matter? That is all I know. I never worked inside the mine, and I was engaged outside at the time of the explosion.
5693. And you knew nothing of what was going on inside? No.
5694. *Mr. Hilton.*] Were you ever inside the mine? Yes.
5695. Have you any knowledge of underground mining? No, I have not.
5696. Were you ever employed inside the mine at any time? I have been since the explosion; not before.
5697. Can you throw any light whatever on the cause of the recent disaster? No; I cannot.
5698. *Mr. Owens.*] You stated you had been in the mine—how often? I never worked in the mine before the explosion.
5699. For what purpose did you go into the mine? I went in simply to put in a set where it came off the rails.
5700. Your usual employment was outside? Yes.
5701. And you merely went in to assist in putting the tubs on the road? Yes; that is all.
5702. *Mr. Oroudace.*] Why were these threats held out to you? Simply because I came to work before the strike had finished.
5703. I suppose it was to show the spirit of animosity towards you or anybody else that worked during the strike? Yes.
5704. Did it give you the idea that you were living in a free country? No.
5705. Had you done anything to cause it? Not that I know of, except it was because I went to earn an honest and respectable livelihood.
5706. And I think it highly creditable to you.
5707. *Mr. Owens.*] Have you worked in any other mine? No.
5708. You are not a miner by occupation? No.
5709. *Mr. Hilton.*] Did you not think that the threats were of sufficient importance for you to take legal proceedings to obtain redress? Had I known the men at the time I would have done so, but we were in such dread of going down to the village that I did not think it worth my while to run any risk. We seldom went down to Bulli to see a constable for fear of being molested by a crowd of miners.
5710. This threat you speak of was held out while you were at work? Yes.
5711. Could you not recognize them? Yes.
5712. I thought you said you would have taken proceedings if you could have recognized them? Yes; if I could have got away to do so, but in going down to Bulli I would have had to get half a dozen others to keep me company.
5713. *Mr. Owens.*] What prevented you from getting away? Because I knew that others had revolver shots fired after them.
5714. You are only speaking of what occurred to others? Yes.

Thomas Abel Jones sworn and examined:—

- Mr. T. A. Jones.
7 June, 1887.
5715. *Chairman.*] What is your occupation? I am a miner.
 5716. Where are you working at present? Nowhere.
 5717. You worked in the Bulli Colliery? Yes.
 5718. It has been suggested that you are able to give some evidence as to the cause of the explosion at Bulli;—how long did you work there? I worked there about six and a half years altogether.
 5719. When did you leave off working there? In August last year.
 5720. That was before the strike? Yes.
 5721. Do you know when the strike commenced? Late in August I believe.
 5722. What part of the mine were you employed in? I was working in the grip during the last quarter.
 5723. That is three months before you left? Yes.
 5724. Previous to that where did you work? Up in the "gassy."
 5725. What part of it? In Nos. 6 and 7 headings.
 5726. What was the state of these headings—did you ever observe any quantity of gas in them? There were slight traces in No. 6, and in No. 7 there was a quantity of gas.
 5727. What was the state of the ventilation at that time? Well it was good, but occasionally it was deficient.
 5728. From what cause? Well I should judge that it was on account of the doors.
 5729. Through their not being properly attended to? Yes; I think so.
 5730. Did this deficiency last for any time? No, for a few minutes only.
 5731. Would it occur frequently during the day? Yes; sometimes.
 5732. To what extent did the gas accumulate during these periods? Well, I could not say exactly.
 5733. What lamps did you work with? With Davy lamps.
 5734. Were any naked lamps used? Yes; they were used in about five bords.
 5735. But in none of the headings? No.
 5736. Did you ever make any complaint of an accumulation of gas or the deficiency of air? I had no reason to complain.
 5737. You did not think it of sufficient importance or the accumulation of gas sufficiently great to cause danger? In the place I was working there was no reason to complain, but in the other places there was reason for complaint.
 5738. Which headings do you refer to, and do you know this of your own knowledge? Yes, in Nos. 1, 2, 3, 4, and 7 headings.
 5739. Did you visit all these headings? Yes; every heading in the gassy section.
 5740. For what purpose did you visit them? Only to look in and see how the men were getting on.
 5741. Casual visits, not on business? Yes; sometimes on business.
 5742. For what purpose? Sometimes I would go in for powder and fuse or for anything else which I required.
 5743. But you were not working there? No; I was working in No. 6 heading.
 5744. And you visited others for the purpose of borrowing things? Yes.
 5745. And there you observed the gas? Yes.
 5746. To what extent—take No. 1 for instance? Well, I should say there would be about 4 yards in No. 1 heading from the face.
 5747. How much in No. 2 heading? There would be a little more in No. 2, but the worst heading was No. 4.
 5748. What was the largest accumulation that you have seen there? Well, I should think there would be 16 yards in that heading.
 5749. Were there men working in the face of that heading at the time? Yes.
 5750. With Davy lamps? Oh, yes.
 5751. Did you ever hear any complaints made of these large accumulations of gas? Yes; I remember Neah Hobbs one day went to Mr. White, the overman, to complain about it.
 5752. In your presence? No, I did not hear what he said, for he went outside.
 5753. For the purpose of calling on the overman? Yes.
 5754. Did he come in? No.
 5755. Do you know what transpired? No, I do not.
 5756. Do you know what steps were taken in consequence of the representations made by Hobbs? I did not hear what was done.
 5757. You know nothing of the mine since the explosion? I was in after the accident.
 5758. As a rescuer? Yes.
 5759. Have you formed any theory as to the cause of the accident? Yes.
 5760. Have you made sufficient observation to enable you to propound any theory as to its cause? The cause of it I think was the want of air in the back headings. That is what I think of it.
 5761. But can you tell us the immediate cause of the accident? There might have been two causes, but I believe it was caused either by the firing of a shot in No. 2 heading, or the gas was blown on to a naked light.
 5762. Where? In No. 2 heading.
 5763. Either one of these two causes? Yes. The gas was either fired by the shot, or blown on to a naked light.
 5764. How would it be blown to a naked light? By the shot.
 5765. Where, in your opinion, was the naked light? Hanging just outside the danger-board.
 5766. Then you think it might be accounted to the shot or this naked light? Yes.
 5767. That is your theory? Yes.
 5768. Do you think there was only one, or two separate explosions? I think it is possible that there were two.
 5769. Where would the second be? Between the western and the gassy sections.
 5770. Where? There is a heading off the straight that runs into the western, and I think there is a vacant place where the gas could have lodged, and that after the gas fired in No. 2 it might have reached the other accumulation, which helped to carry the blast into the western.
 5771. Have you seen any indications of a second explosion having taken place? I examined the positions of the skips and other things that were blown that way.

Mr.
T. A. Jones.
7 June, 1887.

5772. Is it impossible for these indications to have been caused by one explosion, or must there have been a second? They may have been caused by one, but I am inclined to believe that the blast was helped by the other. That is my opinion.
5773. You say it might have been caused by one explosion, but in your opinion it was assisted by a second? Yes.
5774. Did you know of any accumulation of gas in that particular spot before, or did you ever hear of it? Yes; I heard that when they were driving an air-course over the roll or fault that gas was found there.
5775. Was that at the dyke? Yes; on the left of the gassy section.
5776. How long was that ago? It is a year and a half or two years since that occurred.
5777. Do you know whether that accumulation was displaced afterwards by the air-courses? No, I do not know of it.
5778. It was soon after opening up the gassy section that it was found? Yes, at the beginning.
5779. The air-courses were not built at that time? It was in operation.
5780. Is there anything else that you would wish to say to the Commission with regard to the state of the mine before or after the accident—if so, we will be glad to hear it? I only wish to say that I am sure that the accident could not have happened if the air had been taken up to the back headings.
5781. Do you mean if bratticing had been used? Yes; I am confident that the explosion would not have occurred if it had.
5782. You believe, then, that in the presence of gas bratticing should be used in old headings? Yes, of course.
5783. Is there any other recommendation which you wish to submit for the proper working of the mine? I consider that every mine ought to be properly ventilated. The Bulli mine is not, and never has been, that I know of.
5784. Do you know whether the ventilation has been improved since the strike, or since you worked there. Yes, I believe it has been improved of late.
5785. Do you know to what extent? I think there have been a few hundred feet of extra air.
5786. It has been stated that the ventilation has been improved threefold? I have no doubt that it has been considerably improved.
5787. You have no reason to disbelieve that? No; but it is no use improving the ventilation if the air is not taken into the right places. I think if double doors had been used in these headings it would have kept up the ventilation continually; but it has been greatly hindered at times by the single doors.
5788. Is there any other recommendation? I may remark that I have mentioned to the deputies when I was going through the doors that they ought to have been doubled, and I recollect mentioning it to Crawford.
5789. What did he say? He did not say anything.
5790. Did you mention it to anybody else? Yes, to Harris and Robbins, two other deputies.
5791. Have you any idea whether they submitted your recommendation to any higher authority? I do not know.
5792. They were not followed by any result at any rate? No.
5793. Is there anything else that you would like to say? Yes; there is one thing. On the day of the election, when we elected Mr. Woodward, I had a conversation with Mr. White, the overman, and asked him whether he thought there would be any gas when he opened up the gassy section again. That was during the strike, and he said that he did not think there would be any gas at all in the Hill End section.
5794. Did he say why? We said it would all be drained away, and I said to him, "You will find yourself mistaken." I have been in several gassy coal pits in England, and I know the results of gas.
5795. Did you say anything more to him on that occasion? No.
5796. Did you not make any suggestion to him? No, because I was under the impression that he understood everything in connection with coal-mining, and I thought he knew as much as I did.
5797. *Mr. Neilson.*] Where is this No. 7 heading? It is the last heading in the section on the left.
5798. Going into the western? Oh, no.
5799. Is it on the left-hand of the straight run? Yes.
5800. *Mr. Hilton.*] Did you hear anything after the termination of the strike of the dangerous state of the mine on account of gas? Do you mean immediately after the strike?
5801. Yes. When the men resumed work after the strike, did you ever hear anything between that time and the explosion about the dangerous state of the mine? I did hear that there was still a quantity of gas in the headings. That is all I heard.
5802. *Mr. Owens.*] You stated, Mr. Jones, that you had seen gas in No. 6 and 7 headings? I said in No. 7 heading.
5803. I thought you said very slight traces in No. 6 and a quantity in No. 7? Yes, that is right.
5804. Did you report that to any of the officials at the mine? No, it was an understood thing.
5805. What was your reason for not reporting this gas? Because I knew that the officials knew of it, or I would have done so.
5806. How do you know? Because I have heard them warn men about it, and I have heard them tell the men to hang their lamps low on account of the gas.
5807. You stated that you were in the mine as a rescuer after the explosion? Yes.
5808. During that time were you in No. 2 heading? No, I was not in the heading; I only went up to the entrance of No. 1.
5809. Did you work in any of these bords off Nos. 1 and 2? I opened up the air-course off No. 7 heading.
5810. I mean in Nos. 1 and 2 headings or in any of the bords off them? No, I never worked in any of them.
5811. You say that you found gas in No. 7 heading, and that you did not report it to the officers? No, I did not report it.
5812. You stated further that you were perfectly sure that if bratticing had been used, the accident would not have occurred? Yes; in my opinion it would not.
5813. By that you mean to imply that you believe in bratticing? Yes.
5814. And that bratticing should have been used in these two headings? Yes.
- 5815.

Mr.
T. A. Jones.
7 June, 1887.

5815. *Mr. Jones.*] You stated that previous to the strike the doors were not attended to. Do you mean to imply that there were not trapper boys there? Yes, trappers were kept at the doors; but the hindrance would occur in this way: A set might get off the road, or an axle might break, and if this occurred at the door it would have to be kept open until the set was got away, and during all this time the air would be going in a wrong direction.
5816. For that reason you suggest that the doors should have been double? Yes.
5817. You further stated that in some portions of the gassy district bords were worked with naked lights? Yes.
5818. What bords were these? There were three bords off No. 1, I believe, and two in No. 7 heading.
5819. We have it in evidence that the whole of these places were working with safety-lamps previous to the strike? It is untrue.
5820. Do you make that statement of your own knowledge? Yes.
5821. What was the course of procedure with reference to the locking of lamps during Crawford's time, prior to the strike? I don't believe they were locked until Wales and Woods were sent out of No. 7 heading for working with the gauze of their lamps off.
5822. Can you say that the lamps were not locked at that time? You must understand that I can only speak from my own experience.
5823. If you were told that the whole of the lamps were locked previous to the strike would that be untrue? Yes.
5824. You stated that the air was sometimes deficient previous to the strike? Yes.
5825. Can you assign any special reason for that? Only the opening of the doors; that is the only reason I can give.
5826. Did you ever hear amongst the workmen or officials that the way in which the wind blew operated upon the furnace, and thereby brought about a depression in the air? I never heard of it, but it might be true.
5827. You stated that you believe a second explosion took place. Do you make that statement in the belief that gas was known to exist in a heading off the straight road? I do not understand.
- 5827½. You said that you worked in Nos. 6 and 7 off the straight, and that gas was known to exist there. Is that your reason for saying that a second explosion took place? I believe that gas got out into the place I referred to.
5828. But in the light of the ventilation having been improved threefold, do you still believe that gas existed there, and was ignited in the way you described? Yes, I believe so; for instance, if the furnace was idle, the gas would get up there.
5829. Have you any reason to suppose that the furnace was idle at the time of the explosion? I could not say whether it was idle or not.
5830. But, assuming that it was working as you say, and that you were told that something like 12,000 cubic feet of air was going over the Hill End district, that being the case do you still think that gas could have lodged in Nos. 6 and 7 headings, and that it operated as a second explosion? I believe a little of it would get out there, in consequence of the way in which the air-course was constructed. There was a big opening there; but if there had been a proper air-course gas could not have accumulated.
5831. Was not the return almost parallel with the intake, and were not the workings off Nos. 6 and 7 headings very limited? Yes.
5832. And there would be very little room for gas to lodge there? Yes, there would be very little.
5833. *Mr. Croudace.*] Had you a copy of the rules given you at any time during your employment at Bulli? I never had any rules.
5834. You never had? Never.
5835. Do you know whether there was any rule prohibiting men from going from one place to another in the pit? No, I did not.
5836. Do you know whether it is customary to allow men to travel about in fiery mines? I never heard anything to the contrary.
5837. Have you ever worked in fiery mines in England? Yes.
5838. Where? In Derbyshire and Staffordshire.
5839. Were you allowed to travel from one place to another in those mines? Yes; I never had any hindrance; we could go about them any way we chose.
5840. How long is it since you worked there? About eight years ago.
5841. Well there is a rule preventing it in the Bulli mine. No. 4 of the special rules says:—"No workman or boy shall, unless duly authorized to, go into any part of the mine excepting that to which he is appointed by the overman or other officers." You, by travelling about this fiery mine, have been breaking one of these rules? Well, if so, I was in ignorance of it.
5842. You stated that the Bulli mine, during your time, was not properly ventilated; in what way do you mean? Well all the air-courses were not properly built up in the headings; they were not properly constructed.
5843. Then you said that the system of ventilating by means of doors was imperfect? Yes. I have recommended that the doors should have been doubled.
5844. And with the exception of bratticing have you any other fault to find? The ventilation of the mine was not sufficient at the time I was working there.
5845. You say that this would have been remedied if bratticing had been used, and the doors had been doubled? Yes.
5846. Was there any other deficiency in the system of splitting the air and anything else? Yes. The ventilation could have been improved in different ways, and the Act specifies, I believe, that every seventy men shall have a separate split.
5847. Were there any more than seventy men in any part of the Bulli mine? Yes, I believe so.
5848. Are you perfectly sure; can you tell me in which districts there were more than seventy men? I am positive that there were more than that number.
5849. In which district? In the Hill End district and in the western.
5850. Were they supplied by one system of ventilation? Yes.
5851. No split in the ventilation? No, there was not.
5852. Are you quite sure of it? If there was I was ignorant of it.

Mr.
T. A. Jones.
7 June, 1887.

5853. Were there not a distinct travelling road, a distinct airway, and a distinct overcast over the western district? I cannot say that there were.

5854. Have you any knowledge of what you are saying; have you ever travelled that way? I have travelled from the "gassy" into the western, and from the western into the grip.

5855. Was that in one continuous airway, as far as the doors and the overcast were concerned? Yes, previous to the strike.

5856. And I am speaking previous to the strike; the air went round No. 1 return up the back heading, passed Nos. 6 and 7 heading, went away to the western, then to the grip, and thence to the furnace;—is that the route? I think there was some alteration some two or three years ago.

5857. I am referring to the time just previous to the strike; did the ventilation go round Nos. 1, 2, 3, 4, 5, 6, and 7 headings, thence to the western, then into the grip in one undivided course? Yes, I believe it did.

5858. Since the strike have you any knowledge as to its course? No, I have not.

5859. If I were to tell you that Nos. 1, 2, 3, 4, 5, and 6 in the Hill End district had, in fact, a distinct split, a distinct return air-course, and an overcast to the furnace, and that the western had a regulating door to give it a distinct split in the ventilation, would you consider that an improvement? Oh, yes, if that were so.

5860. Well that is sworn to be the case by several witnesses? If so it would be a great improvement on the system that existed when I was working there.

5861. Did I understand you to say that, after the explosion, you only went along the main road as far as the entrance to No. 1 heading? Yes.

5862. Then all your statement about a second explosion is not from observation or from the effects you witnessed after the explosion, but merely supposition; you did not examine the headings on the return air-course? No.

5863. Have you anything to substantiate your theory, or is it merely supposition? I had not an opportunity of making a complete examination.

5864. I am speaking of what you did; am I right in saying you only went to the entrance of No. 1 heading? Yes.

5865. And you think that a second explosion took place in the big heading going to the western? Yes.

5866. Were you in there at all? No.

5867. Then it is only supposition on your part; you have seen no effects on which to base your theory? No, I have not.

5868. You have already answered, but I want you to be very careful in answering it again; you said that, prior to the strike, you for some time worked with an unlocked lamp;—is that really the case? Yes.

5869. You make that statement without hesitation? I have none.

5870. It was only after two men were sent out of the mine for working with the gauze off their lamps that your lamp was locked? Yes.

5871. You are quite sure? Yes, I am quite sure.

5872. If Mr. Crawford, the former deputy, swore before the Commissioners that the lamps were all locked previous to the strike, and that, in fact, he locked them himself, is that true? So far as my lamp was concerned it was not.

5873. I am referring to your own knowledge? Well it was not so.

5874. And we cannot believe his testimony as far as you are concerned? No.

5875. You also made some remark that, providing the furnace was idle at any time, gas would accumulate in a certain part of the mine;—can you describe to me that position? I think it was No. 7 heading that you speak of. I will give you a rough sketch by which, I think, you will be able to point out where you mean. I think there is a probability of gas having accumulated in this heading (No. 7), which would be very liable to increase in quantity if the furnace was allowed to remain idle any length of time, and if there was a large accumulation there it might have been the cause of a second explosion.

5876. *Mr. Neilson.*] Can you tell me where the danger signals were fixed in the gassy district immediately you got through the dyke; you say there were several bords working with naked lights? The danger-board was fixed at the entrance of No. 1 heading.

5877. Was there not one fixed at the entrance of No. 2 heading? At that time there was only one danger-board, which acted for both headings.

5878. Was there any danger signal between the bords working with naked lights and those working with safety-lamps? Yes, there were bords off Nos. 1 and 7 headings working with naked lights.

5879. *Mr. Hilton.*] Did you work in the western district before the strike? Yes.

5880. Was there a door between the Hill End and the main western road fixed at the junction? Yes; there was a door in the junction.

5881. Was it an ordinary door? Yes, it was an ordinary door.

5882. When you entered the tunnel mouth you left the grip road on the left-hand side and went up the Hill End district, before getting there you came to the western road and found a door at the western junction. Did you notice whether there was any hole through that door, to admit air into the western district? No; I did not notice it.

5883. Then the air would have to go up the Hill End district, around by the return into the western, and from the western down into the grip, and then to the furnace? Yes; that was its course.

5884. And that leads you to make the statement that it was a continuous system of ventilation? Yes.

5885. Was the 4-foot seam working in your time? Yes, it was.

5886. *Mr. Owens.*] Do you know anything of the furnace? Yes.

5887. You say that you have been in since the explosion? Yes; but only as an explorer. I went up to the furnace the first thing.

5888. That was the first time that you saw the new furnace? Yes.

5889. It was not there before the strike? No.

5890. *Mr. Neilson.*] Do you understand the route of the air-course? Yes.

5891. If there was an air-crossing in the western, over the main road, would that air be utilized by the men in the Hill End district? There was no crossing there before the strike.

5892. *Mr. Hilton.*] Who was the deputy in the western district previous to the strike? Harris was the deputy.

5893.

Mr. T. A. Jones. 5893. Did Harris ever, within your knowledge, request that the western door should be opened to admit air to men working in the western district? I never heard anything of that kind, so I cannot say whether he did or not.
7 June, 1887.

The Commission then adjourned *sine die*.

MONDAY, 27 JUNE, 1887.

Present:—

DR. ROBERTSON, PRESIDENT.

MR. O'MALLEY CLARKE,		MR. OWENS,
MR. CROUDACE,		MR. JONES,
MR. HILTON.		

Eward Kerrison sworn and examined:—

Mr. E. Kerrison. 5894. *President.*] What is your occupation? I am a miner.
27 June, 1887.

5895. Where are you at present working? At Maryville colliery, Newcastle.

5896. Before that were you working at Bulli? Yes.

5897. Were you engaged there on the date of the explosion at that Colliery? Yes.

5898. When did you go from the mine—at what o'clock? I left the mine at 20 minutes past 1 o'clock on the day of the explosion.

5899. What was the reason of your leaving your work so soon? I met with an accident and got a cut on the head.

5900. Where were you working? We were for some time working in the western district.

5901. Were you working at the coal? Yes.

5902. What kind of an accident was it you met with? In pulling down a piece of coal I knocked out a prop, which struck me on the head.

5903. That was the cause of your leaving the mine? ———

5904. In going out of the mine what road did you strike? The Hill End incline.

5905. In coming down did you meet with anything unusual? No; I met Mr. Wade.

5906. Who is he? He was looking after the rails and that. It was near the tunnel mouth.

5907. How far in the tunnel was it? About 50 yards.

5908. Did you pay any particular attention to the state of the incline in going down? Not particularly. I did not feel very well after getting the knock.

5909. You met no one except Mr. Wade? No.

5910. And you saw nothing unusual in the appearance of the incline? No.

5911. Had you been working at Bulli for some length of time? For seventeen years.

5912. Were you working in the gassy section? No, sir; I did not work much in the gassy section, since the gas was found.

5913. Not for about two years? About two years and six months, or three years.

5914. Was Wade one of those who were lost in the mine? Yes.

5915. Do you know where he was found? From what I hear I think his body was found near the top of the incline.

5916. Had you any conversation with him when you met him, on the occasion you speak of? I told him about being cut on the head, and he said I ought to be careful, and things like that.

5917. And you saw nothing unusual in the state of the mine on your leaving? No; things were about the same as usual in the intake.

5918. You saw nothing unusual in the state of the incline? No.

5919. Do you know anything about the accident—did you enter the mine after the accident? Yes; I was on the Friday.

5920. Where did you go on the Friday? The first thing in the morning I went down to the gassy section to search. I went in on purpose to go to the western district, as I was of opinion that some men would be found alive there.

5921. Did you go into the western? I did in the evening.

5922. Had the men been taken out then? No; Mr. McCabe and others were going in.

5923. *Mr. Hilton.*] What part of the mine were you in on the day of the explosion? I was in the furthest in bord in the western. Previous to that I was working in the return air-course going into the furnace.

5924. Not having worked in the gassy section then you have nothing to say about it? No.

5925. Do you know any of the men that were working in the gassy section? I know one or two of them.

5926. Did you ever hear anything about gas existing there? Yes; Noah Hobbs told me there would be a blow-up. He was working there previous to the strike.

5927. Have you heard anything about the gas since the strike? No, I have not.

5928. You know nothing yourself? No, not from my own knowledge.

5929. *Mr. Croudace.*] When you heard Noah Hobbs say there would be a blow-up did you recommend him to tell the manager or the overseer of the mine? I did not reckon it to be my place, as he knew more about it than I did, because he had been working in it all his lifetime.

5930. You did nothing yourself towards informing the management of what Hobbs had said to you? No; it would not be my business, as I was not working in the gassy.

5931. You were working in the same mine? Yes; but a good distance away from there.

5932. Do you not think that, as a miner of old standing, it was your duty to make the officials acquainted with the circumstance? I thought they would know more about it than I did.

5933. Supposing you had no experience of gas at all, and you heard a man say there was gas, and that there would be blow-up, do you not think it would be your duty to tell about it? Under these circumstances it would perhaps.

5934. Those were the circumstances, and why did you not do it? Well, Mr. White and Mr. Ross knew it, and I did not see why they wanted telling.

5935. *Mr. Owens.*] When was it you heard Hobbs making this observation;—was it before or after the strike? Before the strike, when he was working there. 5936.

5936. *Mr. Jones.*] Who engaged you, Mr. Kerrison? Mr. Ross.
5937. Did he make any remarks to you or mention anything about the existence of gas in the mine? No. Mr
E. Kerrison.
27 June, 1887.
5938. Did he ever tell you to be careful or cautious? No; I did not work in the gassy section.
5939. Did you receive a copy of the rules? Yes.
5940. On coming out of the mine on the day of the explosion you came down the incline you say? Yes.
5941. Was there any other way out? No.
5942. You are quite sure? Yes; there was no other way. The only other road was to be the one we were driving through to the new furnace for air.
5943. On the day of the explosion did you notice any material difference in the air current? Not the slightest.
5944. You think the ventilation was as good as usual? It was about the same.
5945. You have said that Hobbs and others spoke of a probable explosion before the strike? Yes.
5946. Did you hear any similar remarks after the strike? Not to my knowledge. He often told me that the men were too careless.
5947. That was before the strike? Yes.
5948. Was there a considerable improvement in the air after the strike? No; I think it was the other way about. There was no proper return to the western, that was why we were driving there.
5949. Do you not think that since the new furnace came into operation there was an improvement in the ventilation? The air was a little better where I was working; but I reckon the reason was there were not so many men working there; there were only eight men working where there used to be forty.
5950. Do you mean to say there was no improvement after the new furnace started? I say the air was better; but I think the reason was that there were not so many men and horses to be supplied.
5951. Do you think the improvement in the air satisfied the men that there was less danger to be expected from an explosion? Where I worked we never had any thought of an explosion, and I cannot say anything about the other part.
5952. Did it never occur to you that an explosion in the Hill End district would affect the men in the western? No; that was the last thing to enter my head.
5953. *Mr. Owens.*] During your seventeen years' experience in the Bulli mine did you ever see any fire-damp or gas in any part of it? No.
5954. You never saw it yourself? No.
5955. You only heard of its existence? That is all.
5956. *Mr. Jones.*] So far as you are aware you never heard the men complain of the existence of gas after the strike being a source of danger—it was only before the strike? Yes, before the strike.
5957. You did not even hear about it afterwards? Not that I recollect; I never had much to say to any of them.
5958. Did you never hear of any unusual quantity being found, such as blowers, for instance? I heard of a blower in Westwood's heading.
5959. You did not take the trouble to go and see it? No.
5960. You did not think it was a source of danger? By our rules I did not think I should be right in going there.
5961. *Mr. Owens.*] Is or was there any rule that would prevent you reporting danger if you saw or heard of it? I can hardly think that.
5962. You did not regard the rules as preventing you reporting the existence of danger? I know that if I had seen any danger I would have reported it.
5963. *Mr. Hilton.*] You say you got a copy of the rules, was it a copy like this [*holding up a small book of rules*]? Yes; it is about seven years since I got those rules. [*The witness withdrew.*]
- This concluded the evidence.

APPENDIX No. 6.

Inspector Rowan's Reports in reference to the Bulli Colliery :—

Sir, Wollongong, 2 September, 1886.
For your information, I have the honor to inform you that I have inspected the Bulli Colliery on August 5th and 9th instant :—

Bulli old Tunnel.—About 130 men and horses are employed, and served with 12,500 cubic feet of air per minute in three different splits.

Hill End district.—Thirty-six men and horses employed, and supplied with 3,600 cubic feet of air per minute. The miners in this division are working with safety-lamps, as the coal gives off a small portion of fire-damp. Strict discipline is exercised by the management to ensure safety, viz., the bords are examined every morning by a competent person, and the same reported to be safe before the miners commence work. Four danger signals are placed at a respectable distance from the working faces, cautioning persons not to pass said boundaries with a naked light. I carefully examined every bord with a safety-lamp, but in no case did the fire explode in the lamp. I also asked the miners if they considered every care was taken; they said they believed so, and that the deputy made several inspections during the day.

Hill End, West.—About forty-six men and horses employed, and served with 5,500 cubic feet of air per minute.

Slacky heading.—About thirty men and horses employed, and served with about 3,400 cubic feet of air per minute. I went through a large portion of the waste workings, which from the return air-course, for the Hill End district, heavy falls of roof have taken place. I pointed out the defective condition of this return air-way. The manager showed me a new return air-way he was making through a portion of the waste workings and solid coal; which is expected to be finished in a few weeks, as he was driving it from each side, with two shifts of men. This air-course will come along all the working faces, and will be the future permanent air-course for the colliery.

I have, &c.,
JAMES ROWAN,
Inspector of Collieries.

The Examiner of Coal-fields.

Sir,

Wollongong, 25 October, 1886.
For your information, I herewith forward report of my inspection made at Bulli Colliery on the 20th instant.

On making my inspection of the workings I found that heavy falls of roof had taken place in the return air-ways, also in Harris's heading. In this heading, where about forty men were employed, the manager has lifted all the plant, as there was no possible way of keeping the roads in order.

This, Harris's heading has a very bad class of roof, and requires a constant staff of way-men to keep it in order. The manager informed me at the commencement all the day-men and deputies struck work with the miners, leaving him without a man; even the underground furnace man left, and it was with difficulty he could find another to fill his place. I mentioned in my last report that a new air-course was in course of construction, which by this time would have been finished, but that also was at a standstill for want of workmen.

The new furnace which is being built about 43 chains from the entrance of the tunnel is almost finished, which will be a great boon for the ventilation of the colliery.

I have, &c.,
JAMES ROWAN,
Inspector of Collieries.

The Examiner of Coal-fields.

Sir,

Wollongong, 22 December, 1886.
I beg to state that I have inspected Bulli Colliery on the 20th instant.

The miners are still on strike. Five men employed underground doing general repairs. I examined the Hill End division of workings. This is the division of workings that used to generate fire-damp, and where the men when working had locked safety-lamps. I examined this portion with a safety-lamp, and found the same clear from fire-damp or any other foul gases. I could not pass through the other two divisions of workings on account of heavy falls of roof, especially in the return air-ways. I drew Mr. Ross, the manager's attention to the condition of the return air-ways. He stated he could not get men to work to keep the air-ways in order, and they were constantly falling. (See October report on the Bulli Colliery.) But it would be his first business to put the air-ways in order, when the strike was settled. The new ventilating furnace is now finished, and in working order.

I have, &c.,
JAMES ROWAN,
Inspector of Collieries.

The Examiner of Coal-fields.

Sir,

Wollongong, 2 March, 1887.
For your information, I have the honor to inform you that I inspected Bulli Colliery on the 17th instant.

Hill End District :—Fifty men employed, four of them working in narrow headings with safety-lamps, owing to the coal giving off a small per cent. of fire-damp. I carefully examined this division of workings and found the ventilation good in every bord, 12,000 cubic feet of air being brought up to within 20 yards of the furthest in working face. On examining the return air-way I found that heavy falls of roof had taken place. The falls were so heavy I could not make a passage through. I drew the manager's attention to this matter. He stated that he had three shifts of men working, making a new air-course, and the same would be kept working until a proper recognized air-way was made from the working faces to the ventilating furnace. As I have formerly reported, a number of these falls took place during the recent strike.

Harris's heading, where forty men were employed previous to the strike, is so completely crushed, caused by the bottoms heaving, in this district. The boards will require to be cut out anew with a pair of headings.

I have, &c.,
JAMES ROWAN,
Inspector of Collieries.

The Examiner of Coal-fields.

APPENDIX No. 7.

Dr. Llewellyn's Evidence.

James Davis Llewellyn sworn :—

The Coroner.] What are you? I am a duly qualified medical practitioner, registered in this Colony, practising in this district, and residing at Wollongong.

Do you remember the 23rd inst.? Yes. On that day I went to the Bulli colliery, arriving there, from Wollongong, at about 10 o'clock on the night of the explosion. About 12 o'clock that night the body of a young man was brought out. I made an examination of the body, so as to discover the cause of death. The man was covered with coal-dust, and on the top of his head was a penetrating wound leading down to the skull cap. There were thin layers of skin well blackened with coal-dust, but not charred, detached from the palms of both hands. After his face was washed, both cheeks, both lips,—and upon feeling the skin further off—the palms of the hands were also florid. The elasticity of the detached portions of the skin from the palms of the hands was unimpaired. He had the appearance of a man who had died from carbonic oxide poisoning. The florid colour of the face and other parts was due to a chemical combination which carbonic oxide forms with the colouring matter of the blood. It possesses the chemical property of displacing oxygen from the blood. The hair on the head was short.

514—2 F

Were

Were there any signs of singeing? I could not say that. The hair was short and covered with coal-dust, but there was no evidence of the slightest burning on any part of the body; no vesication. I saw No. 2 body, said to be the father of the young man who was first brought out. He was very much injured. The left leg, at the junction of the lower forepart, was fractured, both bones being fractured also. The lower fragments of the limb were tilted outwards, so as to form about a right-angle with the long axis of the limb. Upon coming up the side of the body both bones of the corresponding forearm were fractured near the wrist. There was also a deep cut close to the wrist. The lower jaw on the left side was also fractured. There was hemorrhage within the interior chamber of the left eye, and on the head were several cuts, some down to the bone, and some going past and penetrating the soft tissues. The palms of the hands presented the same appearance as No. 1 body, with this exception that when peeling off the skin the pallid surface was exposed to view. This man must have died from the sudden shock before he had time to be poisoned. The hair on this man's head was also short, but there was distinct hair on the head. I saw several other bodies brought out, but I did not take particular notice of the cause of death, as with the first two. I took notice of the external marks of violence, and that the skin peeled off. I saw five or six bodies altogether. I thought at first that the appearances of the palms of the hands were due to burning, but I found that I had made a mistake. When the skin is burned it does not detach. It is due to friction or pressure. In burning, the skin always remains a fixture. The six degrees of burning, according to Charcot, the great French surgeon, are—

First.—Redness and tenderness of the surface; after a few hours these symptoms may subside, the cuticle possibly desquamating. *Second.*—Inflammation is the result. This action is manifested by the formation of blisters from the effusion of serum beneath the cuticle. *Third.*—The superficial layer of the true skin is destroyed, the surface appearing of a gray-yellowish or brown colour; not painful unless roughly handled. The vesicles that exist contain a blood-stained or brown fluid. The papilla of the skin with its nerves are first destroyed; but when in the course of a day or so the dead surface has been “shed,” and the nerves exposed, the pain is very severe, and the exposed surface has a reticulated appearance. *Fourth.*—The whole thickness of skin is destroyed, with more or less of the subcutaneous cellular tissue, the parts being converted into a hard, tough, dry, and insensible eschar, mottled with blood. Vesication does not exist in this degree, all the superficial tissues having been destroyed. The skin surrounding the eschar may be blistered, but when it comes in contact with the injured part it will be drawn into folds, from the contraction owing to the drying of the burnt integument. This puckering fairly indicates the important fact that the whole skin has been destroyed. The eschar does not begin to separate for four or five days, an inflammatory zone of redness, with pain of some severity, indicating the commencement of a process that will not be completed for two or three weeks. *Fifth.*—The skin with the deeper parts are involved, a black brittle charred mass taking the place of healthy tissues. *Sixth.*—The whole thickness of a limb is carbonised.

I never saw anything indicating the burning of the skin beyond the first degree of burning which is shown by redness alone. All I saw was the redness, and its cause I have already explained—namely, carbonic oxide poisoning. No. 2 body died instantaneously. He died before No. 1. I can give you the cause of the deaths of these two men, and from these causes I suppose the others died as well. I am satisfied of the causes of death only in two cases, but seeing that the men were all together it is reasonable to suppose that they all died in a similar manner.

Do you remember who identified the first body? No; there was someone in the room who recognized the body as that of Felix Bourne. An old woman named Mrs. Jones recognized both bodies.

Do I understand that Felix Bourne died from the effects of after-damp? After-damp usually contains carbonic acid, and in these two cases there were appearances of this cause of death.

In the case of death by asphyxia, from after-damp, how long does life continue? You must take two features into consideration. If you have pure carbonic acid a man falls down immediately. If there is a mixture of oxygen he might live 5 or 6 or 7 minutes until he becomes poisoned.

Mr. Bull.] Would you say what effect it would have upon the hair of the head? No effect at all. Of course everything depends upon the heat with it.

The oxide would have no effect upon the hair itself? Not knowing the appearance of the men of course I cannot tell.

But was not the hair of these men shorter than you would expect to see it? Well, if I were a miner myself I would have my hair cropped very short.

Had the hair the appearance of burning? I did not pay minute attention to it; I wanted to find out what the men died from. If there had been a flash of fire I think there would be bound to be obvious indications.

You said the hair was well coated with coal-dust? Yes; but the faces after being washed presented no appearances of burning.

But would not a coating of coal-dust protect the body? It would be a safeguard.

Mr. Gibson.] Have you had any experience in mining accidents? Yes; and I have seen men burned in the fourth degree, and I can tell the effects of strong burning immediately. I never saw anything of the kind on these bodies.

Is there any difficulty in persons who have seen bodies burned to tell whether these bodies were burned or not? If a man is burned after death the appearances are different; but I should not like to take the evidence of any man as to burning, unless he were a medical man.

Is it not a fact that numbers of bodies have been thought to be very seriously burned—from the general appearances—and yet have not been burned at all? I have not heard of it.

Mr. Bull.] I suppose a body that was burned would have a strong smell of fire? No; there would be no smell.

But you made a mistake at first? Yes, I did, about the hair.

Was it not the appearance of the hair itself which misled you? Yes.

What impression did you form when you first saw the hair? Well, the hair was very short, and it appeared as if it had been singed. I thought so until I pondered and thought well over the matter, when I came to the conclusion which I have given you.

Mr. Wallace.] If you had not thought the matter out and seen that the condition of these bodies negated the idea of burning, you might have remained under that impression? Quite so.

APPENDIX No. 8.

The Examiner of Coal Fields to The Under Secretary for Mines.

Reports on the explosion at Bulli Colliery by the Examiner of Coal Fields.

Sir,

Mining Department, 30 April, 1887.

About 2:30 p.m., on 23rd of March last an explosion occurred in the workings of the No. 1, or 7 feet, coal-seam at Bulli Colliery, which I regret to say has resulted in the death of eighty-one persons.

This is the greatest number of lives that has ever been lost in a colliery accident in New South Wales, the largest number in any previous accident having been five.

I have made several examinations of the workings, with a view of ascertaining the cause of this terrible disaster, and I have also heard the evidence given at the public inquiry in the Oddfellows' Hall, Bulli, and, having considered all the circumstances, I now submit the following report for the information of the Honorable the Secretary for Mines.

The Bulli Colliery is situated about 8 miles from Wollongong Harbour and $1\frac{1}{2}$ mile from the Bulli jetty. It belongs to the Bulli Coal Company (Limited), and is under the care and direction of Mr. George Hamilton, Manager, and Mr. Alexander Ross, Colliery Manager.

The mine was commenced to be opened out in 1863, and since then to the present time 1,794,685 tons of coal have been raised from the No. 1, or 7 feet, coal seam. The coal is won and wrought by two adits driven into the coal seam, facing the Pacific Ocean, on the Illawarra Ranges, at a height of about 400 feet above sea level, which adits intercommunicate with each other, and by means of either of which openings all persons employed in the colliery may at all times pass in or out.

Area of the coal workings.

The coal workings cover an area of about 588 statute acres, and the coal has been wrought by the pillar and stall system.

Ventilation of the Mine by the old furnace.

The mine was, previous to November, 1885, ventilated by a furnace capable of producing 17,000 cubic feet of air per minute, situated about 55 yards, in a direct line, from the entrance of No. 2 adit (*vide* C on plan) and about 1,960 yards from the far end of the Western and Hill End district workings, where on August 5th and 9th last Inspector Rowan reported that in the Hill End district the miners were working with safety-lamps, "as the coal gives a small portion of fire-damp;" that strict discipline was exercised by the management to ensure safety, the bords being examined by a competent person and reported to be safe before the miners commenced work; and that he (Rowan) examined every bord with a safety-lamp, but in no case did the fire explode in the lamp, and also asked the miners if they considered every care was taken; they replied that they believed so, and that the Deputy (Crawford) made several inspections during the day.

On 20th October last Inspector Rowan made another examination of the workings, and reported to me, "that heavy falls of roof had taken place in the 'return air-ways, also in Harris's heading'" (Grip). In this heading, where about forty men were employed, the manager had lifted all the plant, as there was no possible way of keeping the roads in order, in consequence of it having a very bad roof and requiring a constant staff of day men to keep it in repair; that the Manager informed him that at the commencement of the strike all the "day men and deputies" struck work along with the miners, thus leaving him without a man; the underground furnace-man also left, and it was with difficulty he found a person to fill his place; and that, as he stated in his previous report, the new air-course which was being constructed would have been completed if it had not also been at a standstill for want of workmen.

Ventilation of the Mine by the new furnace.

On 22nd December last Inspector Rowan reported that the new ventilating furnace was finished and in working order, and that on the 20th idem he examined the division of the Hill End workings which formerly generated fire-damp, and where the men when working had locked safety lamps; that he examined the district with a safety-lamp, and found the same clear of fire-damp or any foul gases; that he could not pass through the other two divisions of workings (western and grip) on account of heavy falls of roof, especially in the "return air-ways," and drew Mr. Ross's attention to their condition, when he promised to get men to keep them in order, as they were constantly falling; that Mr. Ross said he would put the air-ways in order when the strike was settled, and concluded by saying that the new furnace was finished and in working order.

On March 2nd Inspector Rowan reported that he had made an examination of the mine on the 17th ultimo, and found fifty men employed, four of them in narrow headings, working with safety-lamps, owing to "the coal giving off a small percentage of fire-damp"; that he carefully examined this division of the workings and found the ventilation good in every bord, 12,000 cubic feet of air per minute being brought up to within 20 yards of the furthest in-working place; that on examining the return air-way, he found heavy falls of coal had taken place, which falls he could not make a passage through, and that he drew the Manager's attention to the matter, who said he had three shifts of men at work making a new air-course, and that they would be kept at work until a proper recognized air-way was made from the working places to the ventilating furnace; that, as formerly reported by him, a number of the falls took place during the recent strike; also, that Harris's heading (grip district), where forty men were employed previous to the strike, was completely crushed, caused by the bottoms heaving, and that the bords would require to be cut out anew, with a pair of headings; no men have been working in Harris's heading since the strike.

On 15th March I went with Inspector Rowan for the purpose of examining the workings where the Company had been extracting coal from under Crown Lands in the western district, measuring the thickness of the coal so taken out, seeing the new furnace, measuring the currents of air, and to see anything that Inspector Rowan deemed it necessary for me to see. I asked him and Mr. Ross about the small

small quantity of explosive gas he had reported to me in the Hill End district, and they said that on account of the pit being at work I should not be able to detect any with a safety-lamp, and from what I have since seen in the Nos. 1 and 2 headings I have no reason to doubt it. We found 30,000 cubic feet of air per minute circulating through the western district workings, and 24,000 through the Hill End, or a total of 54,000 cubic feet of air per minute passing up the furnace shaft, the furnace not being full on at the time.

Since the strike, and at the time of the explosion, the air was distributed to the men, boys, and horses in the following manner:—At about 100 yards from No. 2 tunnel mouth the intake air is split, one portion of it goes into the mine by the main heading incline plane, and the other by the slackey heading (*vide A on plan*), which latter is connected with the former by a cross-cut lettered B at about 600 yards from the tunnel entrance. From this cross-cut the air travels up the incline plane heading in one current for a distance of about 760 yards, where it is again split, a portion of it passing through a regulating door into the western district, and the remainder along the incline plane and main heading, and through the Hill End headings and bords in the Hill End district.

At the time of Inspector Rowan's visits, previous to and since the strike, the requirements of the Coal-mines Regulation Act, so far as a sufficiency of ventilation is concerned, have been complied with.

When and where gas was first met with in the gassy or Hill End district.

Carburetted hydrogen gas (fire-damp) was first seen in the Hill End district about two years ago, when crossing a "dyke" in the main heading incline plane, at about 1,800 yards (*vide D on plan*) from the No. 2 tunnel mouth, and 220 yards from the far end of the Hill End district and the Nos. 1 and 2 headings. Since then gas has been reported to me in small quantities by Inspector Rowan.

Lights used in the Mine at the time of the explosion.

Naked lights were used in the whole of the workings with the exception of a few places past the dyke in the Hill End district, viz., 1, 2, 3, 4, 5, and 6 headings, where, according to Ross (manager), White (overman), and Inspector Rowan, small quantities of fire-damp had been found, and the men worked with Davy-lamps, all of which should have been, but appear not to have been, locked. Mr. Rowan, in his report of 2nd September, when the old furnace was at work, says he carefully examined every bord with a safety-lamp, and that in none of them did the fire explode in the lamp.

Disregard of General and Special Rules by the Management.

From the evidence of Deputy Crawford and others it appears that, previous to the strike, when Crawford was deputy, the provisions of sub-section 7, section 12, of the Coal-mines Regulation Act, referring to locked safety-lamps, and special rule 4, with respect to no person entering his working place until it had been examined, appear to have been strictly carried out by the management, and the men worked with Davy-lamps in the bords of Nos. 1 and 2 headings, as well as in the headings, which places were examined every morning by Crawford, and reported by him to the men to be safe before they commenced work. Danger signals were also placed at a proper distance from the working places where gas was found to exist.

Since the strike, and after Millwood was appointed deputy, great laxity of the regulations appear evidently to have prevailed, and from the evidence given at the Inquiry there is no doubt that the provisions of sub-section 7, section 12, of the Coal-mines Regulation Act, and special rules 3 and 4, have not been complied with by the management, inasmuch as there was no back overman for the night-shift, and the persons employed in the mine were allowed to go into their working places without an examination of them having been made by the overman or deputy previous to commencing their daily work.

Section 15 of the Coal-mines Regulation Act, which requires a printed copy of the general and special rules to be supplied to every person before he is employed in the mine, has also not been complied with by the management, and a bord and a heading had been driven 43 yards and 40 yards respectively, before the current of air, without a cut-through having been put through, or the places bratticed up within 3 yards of the face, as required by sub-section 4, section 12, of the Coal-mines Regulation Act. This took place after the date of Inspector Rowan's last report.

Disregard of General and Special Rules by persons employed in the Mine.

From the evidence of miners who were employed in the Nos. 1 and 2 headings it is very evident that there was great recklessness displayed by many persons working in the Hill End district, that they disregarded some of the special rules, &c., and committed breaches of:—

Special rule 15, in not reporting the discharges of gas they say they found, and immediately leaving their working-places when finding it, and reporting it to the overman.

Special rule 16, in taking Davy-lamps into the mine without their having been locked by the overman or deputy.

Special rule 17, in not informing the overman or other officer in charge of the danger anticipated by them.

And of general rule 4 of the Coal-mines Regulation Act, for driving a bord and a heading more than 35 yards before the current of air.

Mr. J. B. Nicholson, the Miners' Secretary, did not report to the Miners or others the danger anticipated by him.

J. B. Nicholson, in his evidence, said that he had a conversation with Westwood, a miner, ten days before the explosion, when Westwood told him he had struck a heavy blower in No. 2 heading, and that he could hear it humming 100 yards from the face.

That

That he asked Westwood if the men in the bords were working with naked lights, having heard they were, and upon his saying that they were, he replied, "God help you; one of these days you will get it." And that he inferred from what Westwood said that the lives of many in the pit were in danger, but did not report it to the manager or Government officials, and took no steps to make the matter known.

Appearance of the explosion at Tunnel mouth, and in the Mine.

According to Alexander Lang, screenman, &c., who was near the mouth of No. 2 heading at 2:30 p.m., the appearance of the explosion at the tunnel mouth was a blast of air accompanied by coal-dust, and a sound as if several skips had broken away, and immediately after the first blast came a second and third, accompanied by smoke. He also saw a boy named Cope staggering out of the tunnel, with his hands to his head, crying out for his mother. About a quarter of an hour afterwards a horse, which the lad was driving, from the bottom of the Hill End incline plane to the mouth of the tunnel, came out of the mine with his mane, ears, and the hair under his tail singed.

I arrived at the mine about 10 a.m. on the 24th of March, and after putting in an appearance at the inquiry then being held by Mr. Smith, the Coroner, I went to the Colliery office, and after seeing the working plan, and ascertaining how the air was being conducted to the Hill End and Western districts by the exploring parties, I went into the mine with Inspector Rowan, Mr. Ross (Bulli Colliery Company's manager), and Mr. Neilson (Newcastle Wallsend Colliery manager), and proceeded to the new furnace to see if there were any signs of gas having fired at the furnace, measured the return air coming from the Hill End, Western, and Grip districts, and then went to the entrance of the Western and into the Hill End district. In the No. 1 Hill End heading we found Mr. McCabe, manager of Mount Kiera Colliery, with a gang of men clearing out the foul air, and saw sixteen dead bodies of miners who had fallen down when running out of their bords, a distance of 20 to 30 yards. We then returned to the surface, it being impossible at that time to go any further until the ventilation was restored in the far end of the Hill End district.

On Saturday, the 26th of March, I made an examination of the mine with Inspectors Dixon, Rowan, and Bates, Mr. Ross, Mr. McCabe, Mr. Neilson, Mr. Ross, junior, and Mr. Gardiner, my object being to view the mine under the guidance of, and with the information provided by the colliery managers who had been engaged in directing the operations of the exploring parties, and, if possible, to arrive at the probable cause of this sad disaster and locate the seat thereof.

After measuring the intake and return air-ways, we proceeded to the No. 1 and 2 Hill End headings, where we saw two stoppings partly blown out, examined with safety-lamps the face of all the bords on the right-hand side of the No. 1 heading, and in the latter place we found a coil of fuse within 7 yards of the face, a plug of compressed powder, and a Davy-lamp. From the face of the No. 1 heading we also found 8 yards in length and about 1 foot in depth of explosive gas, and from the face of No. 2, 12 yards in length and about 18 inches in depth of explosive gas. The current of air travelling through the stenton, which is 20 yards from the face of the headings, was about 4,680 cubic feet per minute, and when Mr. Rowan inspected it on February 17th last, there was 12,000 cubic feet of air per minute passing up the No. 1 heading, through the stenton, and down the No. 2 heading; and if there had been the same current of air on the 26th of March there would not have been as much explosive gas to be seen, which was only a small quantity, diluted with fresh air, and could not, in my opinion, unless aided by "coal-dust," have caused such destruction in the Hill End headings, bords, and main headings, &c. From there we examined with a Davy-lamp the face of all the bords on the left-hand side of No. 2 heading, and with it saw no trace of explosive gas.

In the bords of No. 2 heading the props for a depth of 18 inches to 2 feet from the roof were charred and burnt, and coked coal-dust was on some of the props and in skips, of a set of skips, which had been much knocked about in the first bord of No. 2 heading. From here we went to the far end of the Hill End and Western districts.

My attention having been drawn to the blocking up of the Hill End main incline plane, between the "cross-cut" lettered B and mouth of the tunnel, which place we did not examine or go into on the 26th of March, I made an inspection of it on the morning of April 15th, and from that examination I am of opinion that there were two explosions, and that the first occurred at E on plan, about 374 yards from the No. 2 tunnel mouth, where there are heavy falls in the heading for a distance of 165 yards, and great wreckage of timber, pulley wheels. The bark on the props exhibits signs of a fierce blast in a north-western direction, towards Hill End, and on the opposite side of E there has been a similar wreckage in a contrary direction, viz., towards the tunnel mouth and in a south-easterly direction.

And I further believe that the second explosion occurred in the Nos. 2 and 1 headings of the Hill End district and was the result of the former. This, however, the Royal Commission, now appointed to inquire into the causes of the explosion, &c., may be enabled to throw further light upon. Powder unburnt
in No. 1.

Recommendations as to future mode of working, &c.

Keeping in view the present great calamity, I recommend that the former mode of working with naked lights in the Hill End district be discontinued, and that the headings be bratticed up to within 3 yards of the face, and that a more judicious system of ventilation be adopted by having double doors instead of one, doing away with the doors where possible, and constructing overcasts in their stead.

And in conclusion would add that I consider it was most injudicious to work with naked lights in the bords of Nos. 1 and 2 headings, especially in those of No. 2, when it was found necessary to use safety-lamps at the face of the headings, and that a system of locking should have been adopted similar to that in operation in all well-regulated collieries.

I have, &c.,
JOHN MACKENZIE, F.G.S.,
Examiner of Coal Fields.

APPENDIX No. 9.

The Under Secretary for Mines to The Secretary Bulli Inquiry Commission.

Analyses of coal-dust collected by members of the Commission.

Department of Mines, Geological Survey Branch,

2 July, 1887.

Sir,

I have the honor to inform you that the samples of coal, taken from the Bulli mine, submitted by you, have been analysed, with the following result:—

No.	Description.	Moisture.	Volatile Hydrocarbon.	Fixed Carbon.	Ash.	Sulphur.	Specific Gravity.	Coke. %
1	From wheel bend of main tunnel, about chains from entrance.	2·15	19·02	48·92	29·39	0·52	1·52	78·31
2	From top of a fallen prop chains from entrance.	2·40	16·30	50·43	30·24	0·63	80·67
3	From main road 40 yds. from No. 1 heading.	2·25	16·45	51·27	29·50	0·53	80·77
4	From No. 1 heading from shelf on coal near No. 4 bord.	1·40	19·00	55·37	23·70	0·53	79·07
5	From No. 2 bord, No. 2 heading.	1·46	19·14	51·94	26·91	0·55	78·85
6	From half-way down No. 2 heading.	1·40	20·25	50·90	25·81	0·64	1·480	77·71
7	From recess in coal near face of tunnel, Hill End.	1·98	16·87	57·32	23·25	0·58	80·57

REMARKS.—All these samples were received in fine powder, and contained much dirt; in one or two of the samples pieces of wood were visible. This will account for the high percentage of ash obtained. The colour of the ashes was from white to gray. Where the specific gravity of the sample is not given there was not a sufficient quantity of the sample left after analyses for that purpose. The samples were rather small for analysis.

I have, &c.,

GERARD E. HERRING,

(For Under Secretary).

APPENDIX No. 10.

Copies of General and Special Rules in force at the Bulli Colliery.

RULES FOR THE BULLI COLLIERY.

Department of Lands, Sydney, 20 February, 1866.

THE undermentioned Rules, to be observed in the Bulli Colliery, having been approved by His Excellency the Governor, with the advice of the Executive Council, are now published in conformity with the provisions of the Coal-fields Regulation Act of 1862.

J. BOWIE WILSON.

General rules to be observed in every Colliery in the Colony of New South Wales under the Coal-fields Regulation Act of 1862, being 26 Victoria No. 17.

1. Within one year and six months after commencing the workings of any bord, stalls, or longwall workings in any colliery, there shall be made and completed at least two separate and distinct openings to the day or surface of the colliery, intercommunicating with each other by means of either of which openings all persons employed in the colliery may at all times whatsoever pass in or out, provided that, if in any colliery, such bords, stalls, or longwall workings shall have been commenced before the passing of the Act; and without a second such opening as aforesaid, the same shall be completed at or before the termination of the year 1863; and the owner of every colliery, wherein such two openings shall not be completed as aforesaid, shall be liable to a penalty not exceeding one hundred pounds (£100) for every month during which the same shall remain incomplete.

2. Ventilation shall be constantly produced of adequate amount to dilute and render harmless all noxious gases, and to such an extent that all working places of the pits, levels, and workings of the colliery, and the travelling roads to and from such working places shall be so ventilated, except in the cases of such colliery being abandoned, as herein before referred to.

3. All entrances to any place not in actual working and extension, and suspected to contain or be liable to engender dangerous gas of any kind, shall be properly walled or fenced off so as to prevent access thereto.

4. Whenever any safety-lamp is required to be used, it shall be first examined and securely locked by some person duly authorized for that purpose, who shall keep the key thereof.

5. Every shaft or pit, which is not in use or used only as an air-pit, shall be securely fenced.

6. Every working or pumping pit or shaft shall be properly fenced when operations shall have ceased or been suspended.

7. Every working or pumping pit or shaft, where the natural strata are not safe, shall be securely cased or lined or otherwise made secure.

8. Every pit or shaft shall be provided with some proper means of communicating distinct and definite signals from the bottom of the shaft to the surface, and from the surface of the shaft to the bottom.

9. All underground self-acting and engine planes on which persons travel shall be provided with some proper means of signalling between the stopping place and the end of the planes, and with sufficient places of refuge at the sides of such planes at intervals of not more than 20 yards.

10. A sufficient cover over head shall be used when lowering or raising persons in every working, pit, or shaft.

11. No single-linked chain shall be used for lowering or raising persons in any working, pit, or shaft, and no material shall be lowered or raised in the cage with any person.

12. Flanges or horns, of sufficient length or diameter, shall be attached to the drum of every machine used for lowering or raising persons.

13. A proper indicator, to show the position of the load in the pit or shaft, and also an adequate break shall be attached to every machine worked by steam or water power, used for lowering or raising persons.

14. Every steam-boiler shall be provided with a proper steam-gauge, water-gauge, and safety valve.

15. The fly-wheel of every engine shall be securely fenced.

16. Sufficient boreholes shall be kept in advance, and on both sides, to prevent inundations in every working approaching a place likely to contain a dangerous accumulation of water.

17. Every examiner and inspector taking any copy or transcript of any plan of a colliery, as aforesaid, and of the workings thereof, accompanied or not by any observations and documents explanatory thereof, or applicable thereto, shall, from time to time hand over the same to the keeper of mining records, by whom they shall be kept as of record; provided that no such keeper of mining records shall furnish any copy or tracing of any such plan, or permit the same to be open to public inspection.

Department of Mines, Sydney, 27th June, 1877.

SPECIAL RULES FOR THE BULLI COLLIERY.

THE undermentioned Special Rules to be observed at the Bulli Colliery, in the District of Wollongong, are now published in conformity with the provisions of the Coal Mines Regulation Act, 1876, 39 Victoria No. 31.

GEO. A. LLOYD.

Special Rules for the conduct and guidance of persons acting in the management of the Bulli Colliery, in the District of Wollongong, and all persons engaged in or about the same.

1. One or more copies of these rules shall be fixed up in the principal office at the colliery, and all persons accepting employment in such colliery shall be engaged subject to the regulations contained in them. A printed copy of the rules shall be supplied to every person before he is engaged in or about such colliery.

Manager.

2. The Colliery Manager shall have full command over all other officers and persons employed in the colliery who shall receive their orders from him, and apply to him, or to such other person as may be appointed to act on his behalf, for instructions as often as may be necessary, and he shall, either by his deputy or some other person appointed for that purpose, take care that the following duties are duly performed.

Overman.

3. The responsible charge of the mine shall be with the overman and back overman, in their respective shifts, who are to see that the Rules in the different departments are closely and rigidly carried out, and suspend anyone infringing any rule. The back overman shall see all men and boys out of the mine safely, and all lights extinguished, and he and the deputies shall give a daily report of the proceedings to the overman, who shall report to the manager the result of each day's labour.

4. No workman or boy shall enter any working place until it has been examined by the overman or other person duly appointed, whose duty it is to make such examination before work is commenced, to ascertain that the place is properly ventilated and provided with sufficient props and timber, and until such examination shall be made and leave given, no workman or boy shall go beyond the flat or other station appointed by the overman. If, on examination, any working place is found insecure from a defect in ventilation or from insufficiency of props or timber, work shall not be commenced there until the insecurity is remedied. And if, in the course of being worked, any place prove insecure from any of the causes above mentioned, the overman or other person appointed shall, if he think necessary, stop the working there and remove the workmen. Immediately upon doing so, he shall cause a danger signal or "danger cross" to be erected across the entrance of the place, beyond which no person shall go on any pretext whatever, unless duly authorized so to do. No workman or boy shall, unless duly authorized to, go into any part of the mine excepting that to which he is appointed by the overman or other officers.

Waggonways and Tramways.

5. All waggonways and tramways shall be kept in a proper working state by the persons in charge of them, to whom it is a special instruction to secure them properly. No person except the driver or persons in charge of the setts, or those whom the manager may permit, shall ride in or out of the setts

Timbers and props.

6. The overman shall see that a sufficient quantity of timber and props are sent into the pit and into the several flats when needed. Any workman finding an insufficiency of props, and his place unsafe for the want of them, he shall stop work at once, leave the place, and report it to the overman, in order that props may be supplied. The workman must then first secure his place before again commencing work. Every working place shall be sufficiently timbered by the hewer in such place.

Waste.

7. The waste shall be examined from time to time by the master wasteman and other wastemen, who shall report its condition to the manager. The intake and return currents shall be carefully examined every morning by the overman or master wasteman, and if any deficiency of ventilation be experienced he shall ascertain the cause of such deficiency and take proper steps to have it remedied. He shall keep the air-courses in a proper state and of sufficient area; and if any part of the waste be foul, he shall inform the viewer of the same. The overman and other officials shall travel the air-courses with the master or other wastemen occasionally, in order to make themselves acquainted with the same.

Ventilation.

8. The overman shall examine the main air-courses every morning and every evening, and report any defect they may notice to the master wasteman, who shall remove any obstruction in the air-courses as soon as possible.

Machinery.

9. The pit ropes and chains, with the several bolts, shackles, springs, and cages, shall be examined by the banksman twice a day as they pass slowly for the purpose from the engine. If found faulty in any respect, he shall immediately report the same to the engineer; and if any defect be found in either rope or the apparatus connected therewith the banksman and onsetter shall reduce the number of men using that rope, or restrict them to the use of the better rope until the requisite repair or removal shall be made. The engine and machinery shall be examined by the engineer once a day. The brakesman, banksman, and onsetters shall make themselves thoroughly acquainted with the signals, and should any signal not be thoroughly understood the engine must remain at rest or be stopped until a properly understood signal shall be given. The brakesman shall not on any account leave the handles while the engine is in motion; and no other person shall be taught the duty of brakesman, or allowed to touch the handles of the engine without authority of the manager. The fireman shall be under the control of the brakesman, who shall not allow an apprentice to be left in charge of the engine nor to move it, except in his presence, until such apprentice shall have obtained a certificate of competency from the engineer. If any part of the engine or machinery be at any time found unsafe, the brakesman shall immediately give notice thereof to the engineer, with a view to the same being at once repaired. The brakesman shall exercise the greatest care while lowering or raising men out of the pit. The machinery upon the colliery, with its appendages above ground and below, is under the special charge of the engineer, who shall examine once a day the pits, ropes, guides, cages, and chains, and all other apparatus belonging thereto, the renewing and repairs of which at all times are under his direction.

Shafts.

Shafts.

10. No person shall be allowed to descend the pit without permission from the manager. It is the duty of the brakeman to see that this rule is attended to, and that no workman or other person goes down in a state of intoxication. No ale, spirits, or other intoxicating drinks shall be taken down or consumed in the pit without permission of the manager, who is only to give such permission in cases of necessity. The number of persons allowed to descend or ascend at one time will be prescribed by the manager. When men are to ride, the onsetter, or other person appointed, shall alone give the signal. No person shall ride on a full tub, or on the cage top. While men or boys are riding, a banksman shall remain next the signal-rope, lest an accident should happen. The onsetter shall work the signal himself, and not allow any other person to do so. The back overman, banksman, and onsetter shall remain in attendance where their respective duties require them after work in the pit has ceased, and until all the men and boys are out of the pit.

Stoppings.

11. It is the duty of the master wastemen to examine and keep in repair all the stoppings and air-crossings in the waste, and it is the duty of the overman to examine and keep in repair all the stoppings and air-crossings in the workings. The master wasteman is to examine all regulating stoppings, and to see that the same are kept locked, and no one else shall interfere with them.

Brattice.

12. Whenever brattice is necessary, it must be set up and kept in proper repair by the persons duly appointed, and they must examine the same daily.

Doors.

13. The main and other ventilating doors shall be examined daily by the overman; no door shall be propped open or fastened back whilst on its hinges; doors, giving access to waste, and separating the fresh from the return air-current, shall be kept securely locked by the master wasteman. The persons appointed to set doors necessary for the ventilation of the mine shall keep the same in proper repair, and see that all doors are so hung as not to stand open of themselves.

Furnace.

14. The ventilating furnace shall be kept clean by each furnace man in his shift, and supplied by him with a sufficient quantity of coal. The furnace man shall change at the furnace, so that some person be always in attendance, and no slackening of the fire be occasioned by absence. The master wasteman shall be responsible for the clearing out of the furnace drift when requisite, and he shall travel occasionally the air-ward at each side of the furnace. The furnace man shall frequently observe the velocity of the air-current, and should the indicator not show the requisite number of revolutions, he shall immediately fire the furnace so as to gain an increased amount of heat.

Fire-damp.

15. Should fire-damp be found in any place in the pit where naked lights are used, a danger signal must be set up across the entrance to such place, beyond which no person must go (except those authorized to examine and remove the evil) until the place is restored to its proper working order, and permission given. Should any unexpected discharge of gas occur, the overman must order all naked lights to be extinguished, withdraw the men and boys, and make the manager acquainted with the case, in order that the evil may be remedied, and the places restored to their proper working order. Hewers and others, when using naked lights, are strictly cautioned against the discharge of gas, where faults, rolls, and backs are met with, and on its appearance, they shall immediately leave the place and report to the overman, and shall on no account return to the place without proper authority.

Safety-lamps.

16. Should it be necessary to use safety-lamps in any portion of the pit, stations will be fixed upon, and proper notice-boards erected, beyond which no person, under any pretence whatever, shall take any naked lights, pipes, or matches. From these stations no person is allowed to take a safety-lamp to use in the pillar-workings, broken or waste, without it having been first examined and securely locked by the overman or other person appointed. None but the overman or other person authorized shall carry a safety-lamp key. Should any accident happen to the lamp by which the gauze is injured, or the oil spilt on the gauze, or the lamp is in any way rendered unsafe, the person using such lamp shall immediately pull the wick down carefully, and take the lamp out to the nearest station. Any person using a safety-lamp must clean the same every day after work-hours; but should it require repairs, it must be taken to the proper authority. No safety-lamp shall be used within 2 feet of the swing of the pick or other implement.

General Instructions.

17. Any person observing any door standing open, or any stoppings injured, or any other thing whereby the ventilation of the mine or its safety in other respects may be affected, shall immediately inform the overman or other officer in charge of the pit, so that there may be as little delay as possible in applying a remedy. No person acting in a place of trust shall depute anyone to do his work without the sanction of the manager. It is particularly enjoined upon the overman, engineer, and all other officers, to acquaint themselves with the foregoing rules and regulations, and to enforce and observe the same throughout the various departments. Workmen and boys are also required to inform themselves of the rules. Each workman shall be furnished with a printed copy of them, which shall be taken care of and produced when asked for; the loss thereof will be considered a delinquency. Officers and heads of departments who fail in the due and right observance of the rules, or in enforcing the same for the safety of the mine and the workmen, render themselves liable to degradation from their respective ranks. Workmen and boys who neglect the rules, or refuse obedience to the officers, shall be sent out of the mine, with a view to the investigation of the case and the punishment of the offender.

18. Every person who pulls down, injures, or defaces any notice hung up or affixed as required by this Act, shall for every such offence be liable to a penalty not exceeding forty shillings (£2).

A. ROSS,
Colliery Manager.

N.B.—By the 34th clause of the 39th Victoria, No. 31, it is enacted:—Every person who shall be guilty of any offence against this Act, or who shall wilfully violate or neglect to observe any provision of this Act, or any general or special rule established hereby or hereunder for the violation or neglect of which no penalty is hereby expressly imposed, shall for every such offence be liable to a penalty not exceeding ten pounds (£10), recoverable summarily before two or more Justices of the Peace. By the 33rd clause of the same Act it is enacted: Every person who pulls down, injures, or defaces any notice hung up or affixed as required by this Act, shall for every such offence be liable to a penalty not exceeding forty shillings (£2).

B.C.M. Co.'s Offices, Exchange, Sydney,
1st August, 1877.

GEO. HAMILTON,
Manager.

APPENDIX No. 11.

Copy of Engagement Rules.

BULLI COLLIERY.

RULES of employment, and rates for hewing coal, and yardage, &c., at the Bulli Colliery.

Engagement.

1. All persons accepting engagement in or about Bulli Colliery, shall do so subject to the following rules, rates, and conditions, and also to the general and special rules approved by the Executive Council, which a copy shall be supplied to each employee on attaching his signature hereto, and shall be bound hereby and thereby.

Time of labour.

2. Except in cases of sickness, or some cause which the colliery manager can accept as sufficient, miners, or other employees shall, if required, work regularly eleven (11) full days, of not over nine working hours each (unless specially and mutually arranged) in every fortnight or pay. Any employee absenting himself from work, without giving a sufficient reason, will be liable to dismissal without notice, and to prosecution for breach of agreement under the Masters and Servants Act.

Absence

Absence from regular duties.

3. Any miner or other employee found in any part of the mine or colliery other than that in which he should be working without the consent of the colliery manager, shall be liable to dismissal without notice.

Notice from and to employees.

4. Every miner or other employee shall give to the colliery manager fourteen (14) days' notice before leaving the Company's employment, or absenting himself from work for more than two (2) days (not necessarily consecutive) during any fortnight, unless leave has been granted; and on the other hand, except as otherwise provided, for infringement of rules, every employee shall receive fourteen (14) days' notice before his employment can be terminated by the colliery manager. Any employee leaving without giving due notice, shall forfeit any wages then standing in his name.

Control.

5. The colliery manager shall have full command over all employees in or about this colliery. They shall apply to, and take their orders and instructions from, him or such other person as may be appointed to act on his behalf.

Interference by employees.

6. Any employee interfering in any way with the orders issued by the colliery manager or his overman for regulating the work of the mine shall be liable to dismissal without notice.

Right to enter mine.

7. No person other than those immediately connected with the mine shall be allowed on any pretext whatever to enter same, unless by written consent of the colliery manager.

Pay day.

8. The pay day shall be on a Saturday in each fortnight as heretofore.

Hewing rates, yardage, &c.

9. The rates for hewing coal, compensation for yard-work, turning off bords, and small coal which cannot be thrown back shall be as follows:—

	"Bulli" seam.	s. d.
Hewing (screened) coal	2	4 per ton.
Extra where Davy-lamps are used	0	3 "
Driving headings 6 feet wide	3	8 per yard.
Turning off bords, from 2 yards to 8 yards	8	0 per bord.
Small coal	0	9 per skip.
	"4-feet" seam.	s. d.
Hewing (screened) coal	2	10 per ton.
Driving headings 6 feet wide	3	3 per yard.
Driving headings 9 feet wide	2	6 "
Driving headings 12 feet wide	1	6 "
Small coal	0	8 per skip.

Day or other wages.

10. Rates of day or other wages not specified in foregoing shall be as per arrangement made at time of engagement and set forth on this sheet, and initialled by colliery manager.

Wheeling and prop-cutting.

11. The hewer or hewers in each bord shall wheel his or their full or empty skips any distance not exceeding 50 yards from the working face free of any expense to the Bulli Company. The hewer or hewers shall set the necessary props, lay the rail after the turn is laid, and keep his place secure from the spot where he commences such place after balloting to the face of coal, and before leaving that place at following ballot.

Partners at work.

12. Unless otherwise arranged, each working place shall be occupied by two hewers, who will be considered to work as partners during the term of cavel. The signature of either partner, shall be a full and sufficient discharge for wages due by the Company to both parties. Any miner who for good and sufficient reason suspects the integrity of his partner, will so far as is possible be protected by the colliery manager, on the latter receiving in good time a written order to retain his half of the pay due to both.

The turn.

13. The colliery manager and overman alone shall have control of the turn, and any other person or persons interfering with the turn shall be liable for breach of agreement.

House or land rent.

14. The colliery manager shall deduct from the pay of each employee the rent of any house or land belonging to the Bulli Company, and occupied by such employee.

Doctor's fees.

15. The colliery manager shall have the right to deduct from each pay, employees' levies for their doctor or benefit societies, and his responsibility shall cease upon handing over the sum so deducted to the doctor, or to the secretary or treasurer of such benefit society as the case may be.

Fire coal.

16. The colliery manager shall have power to deduct from an employee's pay the amount due by such employee for fire coal supplied.

Breach of rules.

17. A copy of the foregoing rules, and also the general and special rules referred to therein, shall be fixed up in the office at this colliery, and any and every employee subscribing hereto shall be liable for each breach by action at law.
Bulli, N.S.W., 13th September, 1886. By order of the Board,

.....
Colliery Manager.

Bulli.....188 .

I, the undersigned, hereby agree to accept employment from the Bulli Coal-mining Company upon and subject to the rates, conditions, and rules above referred to.

Addenda to Rule 9.

N.B.—The above hewing rates, &c., have been fixed on an average selling price of 11s. 10d. per ton, and such shall be declared average price for January and July, 1887. Not later than 15th January and July in each succeeding year, the Associated Collieries shall determine what has been the average selling price for the previous half-year, which shall be declared, and the hewing and yardage rates shall be thereby fixed for the then current half-year.

An additional 1d. per ton on the hewing rates, and an additional 1d. per yard on the yardage will be paid to the miners, for every 4d. per ton advance in the price of coal above 11s. 10d., and 1d. per ton and 1d. per yard reduction shall be made in every 4d., the average price is reduced below 11s. 10d.

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

BULLI COLLIERY CATASTROPHE.

(CORRESPONDENCE RESPECTING.)

Ordered by the Legislative Assembly to be printed, 6 April, 1887.

The Principal Under Secretary to The Police Magistrate, Wollongong.

Sir,

Colonial Secretary's Office, Sydney, 28 March, 1887.

I am directed by the Colonial Secretary to request that you will be good enough to carefully collect and report to the Government, information under the following heads in respect to the late deplorable occurrence at Bulli:—

1. The number of men whose lives were lost in the colliery.
2. The number of women who have been left widows, giving the name and the number of children in each case.
3. The cases where women are near confinement, or are otherwise in weak health.
4. Particulars as to the interment of the bodies of the unfortunate men, and whether the graves are sufficiently secure to prevent exposure, or danger to the living.
5. The names of persons who have meritoriously exerted themselves in the exploration of the mine in searching for the dead, or otherwise in connection with the disaster.
6. Any other particulars which you may deem important.

I have, &c.,

CRITCHETT WALKER,
Principal Under Secretary.

The Police Magistrate, Wollongong, to The Principal Under Secretary.

Sir,

Court-house, Wollongong, 1 April, 1887.

I have the honor to acknowledge the receipt of your letter of the 28th ultimo, and in compliance therewith to forward a list of the men whose lives were lost by the late deplorable occurrence in the Bulli colliery.

I also furnish a list of the women who have been left widows, with the number of children in each case.

A list showing the names of the women who are near confinement, or are otherwise in weak health, is also enclosed.

The names of those persons who meritoriously exerted themselves in searching for the dead or otherwise in connection with the disaster are furnished in a separate list. This list is very large, and there may be some names yet to be added to it.

Nine bodies were interred in the Presbyterian Church-yard, at Woonoona. The graves in these cases, I am assured, are the regulation depth, and there is no danger to public health.

In the Roman Catholic burial-ground, at Cox Hill, eight bodies are buried, and in these cases the graves, I am also assured, are the regulation depth, and there is no danger to the health of the living.

All the other bodies are interred in the Church of England burial-ground at Bulli. In three or four cases the coffins were placed on the top of others, and in those cases the coffins are within 2 feet 6 inches or 3 feet of the surface. I have inspected all the graves and cannot discern anything offensive; but in those three or four cases to which I have alluded it would, I think, be desirable to build brick work round the graves to the height of 2 or 3 feet and to fill up with lime and earth to that height; I think this would be effective and allay any fears of danger to the living.

I have, &c.,

ALFRED A. TURNER, P.M.

[Enclosures.]

List of men whose lives were lost in the Bulli Colliery disaster.

Names.	Remarks.
James Adamson	
William Adamson	
John Barcroft	
Edwin Bean... ..	Boy, 14. Left father and mother.

ALFRED A. TURNER, P.M.

Wollongong, 1st April, 1887.

The Police Magistrate, Wollongong, to The Principal Under Secretary.

Sir,

Court-house, Wollongong, 2 April, 1887.

Referring to my letter of yesterday's date, relative to the Bulli Colliery disaster, and to the list of persons who acted as relief parties. I have the honor to inform you that that list was supplied from what I considered the most reliable sources. It is somewhat invidious, where so many rendered such ready and valuable assistance, to single out individual cases, but I think it would be an omission if I did not say that the gentlemen whose names come last in that list, viz.—Messrs. H. O. MacCabe, Evans, Jones, Williams, and Green—rendered assistance of especial value.

I have, &c.,

ALFRED A. TURNER, P.M.

Telegram from The Colonial Secretary to The Police Magistrate, Wollongong.

In the cases of the eleven women in list to your Report who will require medical aid and other assistance you will take care in every case, where help is necessary, to see that all proper steps are taken for their comfort and safety.

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

BULLI COLLIERY COMMISSION.

(INFORMATION RESPECTING.)

Ordered by the Legislative Assembly to be printed, 15 June, 1887.

RETURN (*in part*) to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 2nd June, 1887, That there be laid upon the Table of this House,—

“Copies of all letters, papers, and correspondence between the Minister for Mines, the Colonial Secretary, and the Members of the present Bulli Commission.”

(Mr. Melville.)

SCHEDULE.

No.	PAGE.
1. The Under Secretary for Mines to Dr. J. R. M. Robertson, as to whether he would be willing to serve upon the Commission, if appointed, and act as President. 21 April, 1887	2

No. 6.

T. Croudace, Esq., to The Secretary for Mines.

Sir,

Sydney, 22 April, 1887.

I received a telegram this morning from my son, stating he had received a letter asking if I would act on a Royal Commission to inquire into the cause of the recent accident at Bulli, &c.

I have pleasure in stating that I shall be glad to act in such capacity, and will honestly and fearlessly endeavour to reach the truth in such matter.

I have, &c.,

THOMAS CROUDACE.

P.S.—As I return to Lambton this evening please address any further communication there.—T.C.

No. 7.

T. Croudace, Esq., to The Colonial Secretary.

Sir,

Sydney, 22 April, 1887.

You mentioned the name of Mr. Neilson this afternoon as being one of the Royal Commission to inquire into the late Bulli catastrophe.

I would respectfully remind you that Mr. Neilson should be an important witness in this matter, he having been engaged at the very time of the accident making an examination and report upon the mine.

I have, &c.,

THOMAS CROUDACE.

Ask Mr. Neilson if the facts are as stated, and, if so, if he will permit the offer of a seat on the Commission to be withdrawn?—H.W., 26/4/87.

No. 8.

G. O'M. Clarke, Esq., S.M., to The Under Secretary for Mines.

Sir,

Central Police Office, 23 April, 1887.

In reply to your letter of the 21st instant, I have the honor to state that if appointed I shall be willing to serve on the proposed Commission to inquire into the late disaster at the Bulli Colliery.

I have, &c.,

G. O'M. CLARKE, S.M.

No. 9.

Dr. J. R. M. Robertson to The Under Secretary for Mines.

Sir,

97, Pitt-street, Sydney, 25 April, 1887.

I have the honor to acknowledge receipt of your favour of 21st, requesting me to state whether I would be willing to serve upon the Commission that the Government propose to appoint to inquire into the late disaster at Bulli, and to act as President.

I am deeply conscious of the responsibility of the position, and the honor proposed to be conferred upon me by Mr. Abigail, and will be willing to accede to the request of the Minister for Mines, and will do my very utmost to carry out the instructions of the Cabinet.

I have, &c.,

JAMES R. M. ROBERTSON.

No. 10.

The Under Secretary for Mines to J. Y. Neilson, Esq.

Sir,

Department of Mines, Sydney, 26 April, 1887.

I have the honor to inform you that it has been stated that you were engaged at the very time that the Bulli accident happened in making an examination and report upon the mine, and would probably be an important witness, and I am to request that you will be so good as to inform me if the facts are as stated, and if so that you will permit the offer of a seat on the Royal Commission to be withdrawn.

I have, &c.,

HARRIE WOOD,

Under Secretary.

No. 11.

Telegram from J. Y. Neilson, Esq., to The Under Secretary for Mines.

Wallsend, 27 April, 1887.

My business at Bulli was apart from and had nothing whatever with Pit A, which exploded. The colliery I was reporting on is miles from it.

J. Y. NEILSON.

Your telegram is perfectly satisfactory, denying as it does positively the correctness of statements made concerning your connection with the Bulli Mine.—F.A., 27/4/87.

HARRIE WOOD,
 Under Secretary,

No. 15.

Telegram from T. Croudace, Esq., to The Colonial Secretary.

YOUR telegram received; am writing by to-night's post.

Lambton, 27 April, 1887.

THOMAS CROUDACE.

No. 16.

T. Croudace, Esq., to The Under Secretary for Mines.

Sir,

Lambton, 27 April, 1887.
 I am really anxious to assist the Government if I possibly can in the Bulli inquiry, but I feel it a very difficult matter to accept the position of Dr. Robertson being Chairman. I am quite willing and ready to act with Mr. Clarke as Chairman, and I believe the latter appointment will give general satisfaction.

Before giving you my final answer will you kindly let me know what powers and privileges (if any) are attached to the position of Chairman, as over any ordinary member of the Commission.

I have, &c.,

THOMAS CROUDACE.

Acknowledge receipt and inform that Dr. Robertson's position was fixed, and the Commission had to be appointed without delay. The Minister deeply regrets that Mr. Croudace could not see his way to accept a seat on the Commission.—H.W., 28/4/87.

No. 17.

The Under Secretary for Mines to T. Croudace, Esq.

Sir,

Department of Mines, Sydney, 29 April, 1887.
 I have the honor, by direction of the Secretary for Mines, to acknowledge the receipt of your letter of the 27th instant, in respect to the matter of your forming one of the members of the Royal Commission on the Bulli disaster, and I am to inform you that the Commission had to be appointed without delay, and that Dr. Robertson's position was fixed. Mr. Abigail, nevertheless, deeply regrets that you could not see your way to accept a seat on the Commission.

I have, &c.,

HARRIE WOOD,
 Under Secretary.

No. 19.

T. Croudace, Esq., to The Under Secretary for Mines.

Sir,

Lambton, 30 April, 1887.

I have to acknowledge receipt of yours of yesterday.

Please tell Mr. Abigail I would have been but too glad to have in any way I could aided the Government, but for certain reasons I felt a strong prejudice against Dr. Robertson. I, however, for the first time since the issue of the Ferndale Report, saw Mr. R. yesterday, and we had a lengthy discussion upon various matters, when he removed from my mind certain ill impressions. He expressed himself as most anxious that I should sit on the Commission. I told him it was too late now, as it was formed, but I said I was willing, should any change take place, to act.

I would ask you specially to thank Mr. Abigail for his kindly consideration to myself in every way in this matter. From the first I understood that Mr. Clarke would be Chairman; it was probably my mistake.

I have been engaged the last four days at East Maitland, on behalf of the Government, in the case of Dibbs and Brown v. Commissioner of Railways.

Should there have been any neglect to telegrams or letters it will have arisen from this.

I have, &c.,

THOS. CROUDACE.

No. 27.

Dr. J. R. M. Robertson to The Secretary for Mines.

Sir,

109 Lankelly Terrace, Macleay-street, 5 May, 1887.

The members of the Commission met this forenoon, when a feeling prevailed in favor of holding the inquiry in Wollongong instead of Bulli, the reasons assigned being the general bitter feeling that exists in Bulli against the Company and the Commission.

Personally I ignore the wrath of an excited multitude and would prefer giving the Bulli people an opportunity of seeing for themselves how ignoble such ebullitions of impotent rage is, and how unjust and unseemly the position they have taken is. My colleagues are of a different way of thinking; but I have postponed a decision until to-morrow when we will inspect the mine. May I ask your views on this subject. A telegram addressed to me, on receipt to Bulli, would reach me in time to lay before the Commissioners before I finally fix.

I have called for plans, sections, daily or weekly report books, special rules or others from the Company.

In event of Mr. Croudace being appointed I have arranged for him to meet us at Bulli.

The whole of the Commissioners will reside at Wollongong—"Freemasons' Hotel."

I have, &c.,

JAMES R. M. ROBERTSON.

It rests with the Commission to sit where in its judgment the duties devolving upon it can be best discharged. Inform by telegram.—H.W., 6/5/87.

It rests with the Commission to sit where, in its judgment, the duties devolving upon it can be best discharged.

HARRIE WOOD,

Under Secretary.

No. 29.

Dr. J. R. M. Robertson to The Minister for Mines.

Sir,

Wollongong, 7 May, 1887.

On reading the Commission, under the Great Seal, to some of my colleagues to-day, I noticed that the letters "F.R.S.," instead of "F.G.S.," have been affixed after my name, probably through some clerical error.

It is right for me to say that I was not consulted as to this, else I would have requested either that no reference to titles should be inserted, or, if this was deemed advisable, the letters "M.D.C.E., F.G.S., F.R.G.S.," be added. I mention this lest misconception should arise.

The Commissioners have spent two long days thoroughly examining the underground workings. The surveyor is busy with the surveys and plans, and I will issue summonses or circulars to seven or eight witnesses for Tuesday morning.

Mr. Croudace and Mr. Hilton go through the mine on Monday.

I have, &c.,

JAMES R. M. ROBERTSON.

The same titles were used in the Commission on the Ferndale Colliery.—H.W., 9/5/87.

Will the Principal Under Secretary please say how the error herein referred to occurred, and whether it can now be corrected? A question on the subject is on the business paper of the Legislative Assembly.—H.W., B.C., 9/5/87.

A fresh instrument will be prepared with the affix of "F.G.S." to Dr. Robertson's name, instead of "F.R.S.," which was an error.—C.H.M., 10/5/87.

No. 30.

Dr. J. R. M. Robertson to The Under Secretary for Mines.

Bulli Inquiry Commission.

Sir,

Town Hall, Wollongong, 9 May, 1887.

I have the honor to acknowledge receipt of your letter of the 6th (see No. 28).

On arrival in Wollongong this letter was transmitted to Bulli, where I was engaged inspecting the mine, but unfortunately it crossed me, and was only received this morning.

On Saturday, on reading over the Commission to some of my colleagues, I observed that by some error, of which I can give you no information, the letters "F.R.S." were affixed to my name. Thinking that a clerical error had been committed, I advised the Honorable the Minister for Mines direct. No one communicated with me as to my professional titles, or asked me whether it was my desire that any should be affixed before issuing the Commission. Had my feeling been consulted I would have replied in the negative.

As

As it is, the letters "F.R.S." have, I presume, inadvertently been inserted instead of "F.G.S."

If the information is necessary, I may be permitted to state that I am a duly qualified Mining and Civil Engineer, and as such I am in extensive practice. I am likewise a Fellow and a Life Member of the Geological and Royal Geographical Society and several of the leading Mining Institutes.

I can offer you no explanation of the letters "F.R.S." being affixed to my name; this must be sought for elsewhere. I pay little attention to these, and that is my only reason for not sooner anticipating your inquiry.

I have, &c.,
JAMES R. M. ROBERTSON.

No. 31.

The Under Secretary for Mines to Dr. J. R. M. Robertson.

Sir,

Department of Mines, Sydney, 10 May, 1887.

I have the honor, by direction of the Secretary for Mines, to inform you that the matter concerning the place at which the Commission should hold its sittings has been brought before the Cabinet, and after very careful consideration it has been decided that the Government should not interfere, lest such interference be taken to relieve the Commission of some portion of its responsibility.

I have, &c.,
HARRIE WOOD,
Under Secretary.

No. 32.

Answer to Question.

LEGISLATIVE ASSEMBLY—THURSDAY, 10 MAY, 1887.

Question :—

Mr. WALKER to ask the SECRETARY FOR MINES,—

(1.) Is the person lately acting as President of the Royal Commission on Collieries, and recently gazetted as President of the Commission about to inquire into the cause of the Bulli catastrophe, &c., entitled to the affix of F.R.S.?

(2.) Is the said Mr. Robertson entitled to the affix of C.E.?

Answer :—

(1.) No; it appears the letters F.R.S. were affixed in error in place of F.G.S.

(2.) It is understood that he is qualified, and is practising as a Civil Engineer.

1887.
(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

MINERAL CONDITIONAL PURCHASES,
PARISH OF METZ.

(APPLICATIONS FOR.)

Ordered by the Legislative Assembly to be printed, 7 July, 1887.

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated 2 June, 1887, That there be laid upon the Table of this House,—

“Copies of all papers in connection with the applications for mineral conditional purchases of portions 109, 110, and 113, parish of Metz, county of Sandon; also copies of all papers in respect to applications to mine for gold on the above-mentioned portions.”

(*Mr. Copeland.*)

SCHEDULE.

NO.	PAGE.
1. Application for the conditional purchase, without competition, of unimproved Crown Lands, with minutes <i>re</i> mineral conditional purchase 81-266. 29 September, 1881	2
2. The same, with the same and enclosures <i>re</i> mineral conditional purchase 81-274. 13 October, 1881	2
3. Licensed Surveyor J. G. Martyn to the Surveyor-General, with minutes. 11 March, 1882	3

Application by J. Moore.

• C.

[Alienation Act, section 19.]

Application for the conditional purchase, without competition, of unimproved Crown Land.

District of Armidale.

No. 266 of 1881.

Application by John Moore for the conditional purchase, without competition, of 80 acres, unimproved Crown Land.

Received by me, with a deposit of £40, this 29th day of September, 1881, at 10 o'clock,—

J. BRAY,

Agent for the Sale of Crown Lands at Armidale.

Sir,

29 September, 1881.

I am desirous of purchasing, without competition, under the Crown Lands Alienation Act of 1861, the portion of unimproved Crown Lands hereunder described, containing 80 acres; and I herewith tender the sum of £40, being a deposit at the rate of 10s. per acre on the area for which I apply.

I am, &c.,

JOHN MOORE,

Armidale.

The Agent for the Sale of Crown Lands at Armidale.

Description.

County of Sandon, parish of Cooney, 80 acres, extending along the eastern boundary of mineral conditional purchase of 80 acres, made by James Powrie and James Glass, on the 3rd March, 1881, and adjoining said portion from south-east corner to north-east corner, and extending towards the river or creek.

Mr. L. S. Martyn,—For measurement in accordance with regulations, due regard being had to the river or creek mentioned in the application in view of circular 80/18 of 21st April, 1880.—J.H. (for Sur.-Gen.), B.C., 27th Oct., 1881. Replied to by my letter to the Surveyor-General, dated 11th March, No. 82-13.—JOHN G. MARTYN.

No. 2.

Application by J. Moore.

C.

[Alienation Act, Section 19.]

Application for the conditional purchase, without competition, of unimproved Crown Land.

District of Armidale.

No. 274, of 1881.

Application by John Moore for the conditional purchase, without competition, of 40 acres, unimproved Crown Land.

Received by me, with a deposit of £20, this 13th day of October, 1881, at ten minutes past 10 o'clock,—

J. BRAY,

Agent for the Sale of Crown Lands at Armidale.

Sir,

Armidale, 13 October, 1881.

I am desirous of purchasing, without competition, under the Crown Lands Alienation Act of 1861, the portion of unimproved Crown Land hereunder described, containing 40 acres; and I herewith tender the sum of £20, being a deposit at the rate of 10s. per acre on the area for which I apply.

I am, &c.,

JOHN MOORE,

Armidale.

To the Agent for the Sale of Crown Lands at Armidale.

Description.

County of Sandon, parish of Cooney, 40 acres, extending along the eastern boundary of mineral conditional purchase, No. 59, of 100 acres, and adjoining the said portion from south-east corner to north-east corner, and running towards the creek or river.

Lapsed 30th June, 1882, *vide* Register, 27/5/87.

[Enclosure 1 to No. 2.]

Mineral conditional purchase 81-274, Armidale.

Description.

Forty acres, county of Sandon, parish of Cooney, portion 113: Commencing on the right bank of Baker's Creek, at the eastern end of the northern boundary line of portion 110 of 80 acres, and bounded thence on the north-east and east by that creek upwards to a point in a direct line, about 14 chains; on the north by a line bearing west 29 chains 18 links to the south-eastern boundary of portion 59 of 100 acres, parish of Metz; on the north-west by part of that boundary south-westerly to the north-western corner of portion 109 of 80 acres; and on the south by the northern boundary of that portion and the northern boundary of portion 110 aforesaid,—in all bearing east 41 chains 15 links to the point of commencement.

Examined.—R.U., 8 May, 1885.

No. 3.

No. 3.

Mr. Licensed-Surveyor J. G. Martyn to The Surveyor-General.

Sir,

Armidale, 11 March, 1882.

I have the honor to transmit herewith the plan of one portion of land, containing forty acres, numbered 113, in the parish of Cooney, county of Sandon, applied for by John Moore under the 19th section of the Crown Lands Alienation Act of 1861, and surveyed in accordance with instructions dated the 17th November, No. 81-65. Improvements, nil. See Appendix A

This portion is situated in a deep gulf, the sides of which are excessively precipitous. Some idea of the precipitous nature of this land may be formed from the fact that the south-west corner of the portion is 1,400 feet higher than the south-east corner. The southern boundary, as far as practicable, has been marked, but the greater part of it is inaccessible.

I have, &c.,

J. G. MARTYN,

Licensed Surveyor.

C.P., No. 81,274. Forwarded 17th March, 1882. Two tracings received, one of which forwarded to the Land Agent.—J. S. CHARD, District Surveyor. Exd. and charted on Co. map.—G. H. DOUBLEDAY, 8 Oct., 1884. According to C.S. 84-5,754 Sur., the within M.C.P. 81-274, Armidale, with other M.C.Ps., specified therein, was on 12th July, 1884, demised by way of mortgage (for seven years) from Charles Henry Hodson (the presumed present transferee from applicant), in consideration of loan of the sum of £1,300 to Alfred Van Rompaey. Surveyor-General.—It is submitted whether survey may be accepted with Cliff as boundary (unmarked), or whether the portion should be bounded by marked right lines along edge of cliff.—D. H. CHISHOLM, 27 Aug., 1884. *Vide* my minute of this date on C.S. 82-1,807 Survey, accepted under above decision.—D.H.C.

This M.C.P. is not measured with an average depth of 60 acres to Baker Creek, as a deep gorge has been adopted as the back boundary. The M.C.P., as measured, is submitted for acceptance under 13th clause of C.L. Amend. Act of 1875.—ROBT. D. FITZGERALD (for Sur.-General), 27th November, 1884. Chief Commissioner Conditional Sales.

Appd.—J.S.F., 24th December, 1884. Dealt with in the Charting Branch. Tracing herewith for Inspector. Mr. Underwood for description.—ARTHUR J. BURNELL, 30th Jan., 1885. C.S. Branch. Description prepared, 8th May, 1885.—R.U. Cat. No. noted. Records, 21/5/85.

No. 4.

Mr. Licensed-Surveyor J. G. Martyn to The Surveyor-General.

Sir,

Armidale, 11 March, 1882.

I have the honor to transmit herewith the plan of one portion of land containing 80 acres, numbered 110, in the parish of Cooney, county of Sandon, applied for by John Moore, under the 19th section of the Crown Lands Alienation Act of 1861, and surveyed in accordance with instructions dated the 27th October, No. 81-57. Improvements nil.

This portion consists of excessively steep and barren spurs; the north-west corner is inaccessible and the northern boundary impracticable.

For explanation as to form of survey *vide* my letter dated 11th March, No. 82-20.

I have, &c.,

JOHN G. MARTYN,

Licensed-Surveyor.

No. 81-266 C.P. and plan herewith. Forwarded, 17th March, 1882, two tracings received, one of which forwarded to the Land Agent.—J. S. CHARD, District Surveyor. Survey approved (*vide* decision on copy 82-1,957, min. herewith).—D. H. C., 27th Aug., 1884. Exd. and chartered on Co. map.—G. H. DOUBLEDAY, 8th Oct., 1884.

According to C.S., 84-5,754 Cor. M.C.P. 81-266, Armidale, with other M.C.Ps. specified thereon was on 12th July, 1884, demised by way of mortgage (for seven years) from Charles Henry Hodson (the presumed present transferee from the applicant), in consideration of loan of the sum of £1,300 to Alfred van Rompaey.

M.C.P. 81-266 (Armidale), is not measured with a depth of 60 acres to Baker's Creek, but the Surveyor reports that the possession of this creek as a boundary cannot be considered an advantage, as it is quite inaccessible to stock on account of the precipitous nature of the falls. In view of the above it is submitted whether M.C.P. as measured may be accepted under 13th clause of Crown Lands Amend. Act of 1875.—ROBT. D. FITZGERALD (for Sur.-General), 27th November, 1884. Chief Commissioner Conditional Sales.—D.H.C., 23rd Oct., 1884. Tracing herewith for Inspector.—ARTHUR J. BURNELL, See Appendix B. 29th Jan., 1885. Cat. No. noted. Records, 11/2/85.

No. 5.

Mr. Licensed-Surveyor Martyn to The Surveyor-General.

Sir,

Armidale, 11th March, 1882.

With respect to the forms of measurement in the survey of portions 109, 110, and 111, in the parish of Metz, county of Sandon, viz., not being measured with frontage to "Baker's Creek," I have the honor to report that although portions 109 and 111 are situated within 60 chains of the creek, and portion 110 is bounded by it, still the possession of this creek as a boundary cannot be considered an advantage, as it is quite inaccessible to stock on account of the exceeding precipitous nature of the falls.

Until antimony was discovered in this neighbourhood the falls were looked upon as being utterly useless country, and consequently the edge of the tableland has been made the body of agricultural and pastoral lands, although many of these measurements are situated within the 60 chains limit. The falls are quite

quite devoid of pasturage, and are only available for mining purposes, and should the regulations regarding frontage portions be enforced it would seriously interfere with what is fast becoming an important industry of the district.

I would have submitted the cases for your consideration before survey, but owing to possibly conflict of leases it was very necessary that they should be measured with as little delay as possible, and as I trusted that an explanation would be sufficient, I therefore measured these lands as applied for, and I would respectfully request that my surveys may be accepted.

I have, &c.,
J. G. MARTYN.

A deviation from the usual practice of survey has been allowed under special conditions somewhat similar. (See C.S. 81-33,184, with Mr. Martyn's letter 82-16.) Mr. Martyn asked my advice on this point before survey. Taking into consideration the object of frontages, viz., to prevent a monopoly of the water I advised measurement as applied for and effected for the following reasons:—The edge of the falls has been adopted as the boundary between the available and unavailable land for grazing and agriculture, the sudden and precipitous falls into what may be considered a gulf or chasm nearly 2,000 feet deep, prevents any possibility of obtaining water from the creek and benefit derived therefrom. In a similar manner, were minerals found on Sydney cliffs, a portion would be unreasonably measured fronting the ocean and extending over the cliffs and back 60 chains. This gulf, though not so perpendicular, is seven times the depth, and walking access is only obtainable down it in parts, and then by climbing down it in a zig-zag manner. The regulations provide, in the case of land taken up for occupation, grazing, &c., that precipitous cliffs may form a boundary irrespective of the depth from the creek, thus dividing available from unavailable land. In this case the unavailable land has been found to contain minerals, and in view of the above and carrying out the spirit of the other regulations, I suggested measurement in the most suitable form, according to the special circumstances. (See paragraph 68 of Sur. Instructions.) These have been carried out by Mr. Martyn, and I would recommend acceptance of his surveys.—J. S. CHARD, D.S., 17 March, 1882.

It is submitted whether in view of the report by Licensed-Surveyor Martyn and report of the District Surveyor covering same (of which these are copies) the surveys of portions 109, 110, and 111, parish of Metz, county Sandon, may not, under the special circumstances herein mentioned, be accepted, notwithstanding that the form of measurement is apparently not strictly in accordance with the regulations.—ARTHUR J. BURNELL, 11th August, 1884. The Surveyor-General.

I may point out that the object of frontage is not a subject for consideration, inasmuch as in respect of land measured for alienation it is a point which is decided by the law. A cliff, which may be a natural boundary, may be adopted for a portion; it is advisable to exercise discrimination in such a matter, and it is requisite that such boundary be marked. Under the circumstances, and on the recommendation of the District Surveyor, the surveys of portions 109 and 110 may be accepted. I observe that portion 111 is partly within a gold-field; let inquiry be made whether the mineral selection is valid. I am inclined to the opinion that, viewing its position relatively to the water course, this area should be measured with frontage for further consideration as to portion 111.—E. TWYNAM (for Surveyor General). 21 Aug., 1884.

No. 6.

Declaration of Conditional Purchaser.

(C.P. 81-266.)

(F.)

[Alienation Act, 1861.]

Declaration of conditional purchaser for mining purposes.

I, JOHN MOORE, of Armidale, do solemnly and sincerely declare that I am the lawful owner, by conditional purchase, of the land hereunder described, and that an expenditure equal to £1 4s. per acre for the area of the land has been made on mining operations other than gold-mining on the land, and since the selection on 29th September, 1881. And I make this solemn declaration, conscientiously believing the same to be true, and by virtue of the provisions of an Act made and passed in the ninth year of the reign of Her present Majesty, intituled "An Act for the more effectual abolition of oaths and affirmations taken and made in various departments of the Government of New South Wales, and to substitute declarations in lieu thereof, and for the suppression of voluntary and extra-judicial oaths and affidavits."

Description.

County of Sandon, parish of Metz, 80 acres, on Hilgrove Run, being (part of) conditional mining purchase No. 266 of 1881, in the district of Armidale.

Taken and declared at Armidale, this 24th }
day of December, 1884, before me,— }

JOHN MOORE.

No. 7.

Final Declaration of Conditional Purchaser.

(Final C.P. 81-266.)

(F.)

[Alienation Act, 1861.]

Declaration of conditional purchaser for mining purposes.

I, JOHN MOORE, of Armidale, do solemnly and sincerely declare that John Moore, Peter Speare, and John M'Bean are the lawful owners, by conditional purchase, of the land hereunder described, and that an expenditure equal to £2 per acre for the area of the land has been made on mining operations other than gold-mining on the land, and since the selection on 29th September, 1881. And I make this solemn declaration, conscientiously believing the same to be true, and by virtue of the provisions of an Act made and

and passed in the ninth year of the reign of Her present Majesty, intituled "An Act for the more effectual abolition of oaths and affirmations taken and made in various departments of the Government of New South Wales, and to substitute declarations in lieu thereof, and for the suppression of voluntary and extra-judicial oaths and affidavits."

Description.

County of Sandon, parish of Metz, 80 acres, being (part of) conditional mining purchase No. 266 of 1881, in the district of Armidale.

Taken and declared at Armidale, this 30th }
day of December, 1886, before me,— }

Office Memorandum.

(C.P. 81-266.)

[Section 19 of the Alienation Act of 1861, 25 Vic. No. 1.]

District of Armidale; name of applicant, John Moore; area, 80 acres; date, 29th September, 1881.

DECLARATION upon the above described mineral conditional purchase requires verification. All available papers in connection with it were referred to the Chairman of the Local Land Board, Armidale, 10/3/85, with a view to the necessary instructions being issued to the Inspector of Conditional Purchases at an early date.

If the report when furnished by the Inspector shows that the improvements are not sufficient to satisfy the requirements of the law, or that they have not been effected *bona fide* for mining operations as contemplated by the 19th section of the Alienation Act of 1861, an investigation by the Local Land Board may be instituted, subject to the provisions of the 20th section of the Crown Lands Act of 1884. C.C., 29/1/87.

The above recommendation by the Minister for Lands (*vide* S7-3,158 D.)
The Chairman Local Land Board, Armidale.

Statutory Declaration.

[Crown Lands Act of 1884—Part II, section 14, sub-section 5.]

Statutory Declaration by a person desirous of prosecuting a complaint before the Local Land Board.

New South Wales, }
to Wit. }

I, JOSEPH FRANCIS M'KINLAY, of Armidale, in the Colony of New South Wales, miner, do hereby solemnly declare and affirm that I am desirous of prosecuting a complaint before the Local Land Board, and that the notice on the other side hereof correctly sets out the grounds of such complaint; and I make this solemn declaration as to the matters aforesaid according to the law in this behalf made, and subject to the punishment by law provided for any wilfully false statement in any such declaration.

Made and signed by the declarant at Armidale, this } JOSEPH F. M'KINLAY.
10th day of May, 1887, before me,— }

LAMBART S. GORDON, Commissioner for Affidavits.

[Crown Lands Act of 1884—Part II, section 14, sub-section 5.]

Notice of prosecution of complaint before Local Land Board.

I HEREBY notify to you, as Land Agent at Armidale, that I am desirous of prosecuting a complaint before the Local Land Board, for that the provisions of the law have not been fulfilled as regards conditional purchase of 80 acres, selected at Armidale by John Moore on the 29th day of September, 1881, in the county of Sandon, parish of Metz. The supposed present holders being John Moore, Peter Speare, and John M'Bean.

The grounds of complaint are that no conditions have been fulfilled, inasmuch as the land has not been improved, and I herewith deposit the sum of £10 as security for any costs which may be awarded against me by such Board.

Given under my hand, at Armidale, this 10th day of May, 1887,—

JOSEPH F. M'KINLAY.

To the Land Agent at Armidale.

Received the sum of £10 above mentioned.

Date, 10th May, 1887.

No. 12.

Memo. by Mr. Crown Land Agent Gordon to The Chairman, Land Board, Armidale.

Land Board District, Armidale, 12 May, 1887.

THE enclosed notice of prosecution of complaint before Local Land Board now forwarded to the Chairman.

LAMBART S. GORDON,

Crown Land Agent.

Mr. Makin, get the papers in this case, and let the matter come on before Board, June sittings.—
S. BLYTHE, Chairman, 16/5/87. C.P. 81-266, 80 acres, 29th September, 1881, Armidale.

No. 13.

Office Memo.

Department of Lands, 31 May, 1887.

M.C.P. 81,266, 19th September, 1881, 80 acres, portion 110:—John Moore, transferred to John Moore, Peter Speare, and John M'Bean, 3rd May, 1886. Both declarations made and now under reference for verification, having been forwarded to the Chairman at Armidale on the 22nd February last.

M.C.P. 81-54, 3rd March, 1881, 80 acres, James Powrie and James Glass, portion 109; to James Powrie, James Glass, and John Moore, 10th September, 1881; to John Moore, 9 December, 1884; to John Moore, Peter Speare, and John M'Bean, 3rd May, 1886. Declaration 84-14,789 Dep. at end of three years, under reference to Armidale Board for verification having been forwarded on the 23rd May, 1885. 87-1,976 Cor. and 87-2,259 Cor. application to prospect by other parties now under reference to Under Secretary for Mines. W.H.C.

Paper 82-1,809 Sur. regarding M.C.P. 81-274 of 40 acres, portion 113 by John Moore are enclosed. It will be seen that the C.P. was declared lapsed on the 30th June, 1885. No further action has been taken apparently.—W.H.C., 31/5/87. The Under Secretary.

With regard to portion 58, it is covered by an application by John M'Carthy, dated the 29th July, 1880, transferred to James Powrie and James Glass, 26th January, 1881; transferred to James Powrie, James Glass, and John Moore, 10th September, 1881, transferred to John Moore, 9th December, 1884; transferred to John Moore, Peter Speare, and John M'Bean, 3rd May, 1886. The C.P. was transferred from one under the 13th to one under the 19th section, and the papers are now under reference to the Local Chairman for verification of the declaration.—W.H.C., 1/6/87.

Inform Mr. Copeland, M.P., to the effect of this memo. in reply to personal inquiries.—C.O., 1/6/87. To-day. H. Copeland, M.P., informed., 1/6/87.—H.L.T.

No. 15.

J. Moore and Party to The Secretary for Lands:

Sir,

Armidale, N.S.W., 1 June, 1887.

We have the honor to report that we are the holders of the following M.C.Ps. situate county Sandon, parish of Cooney or Metz, district of New England, viz.: No. 80-357, 100 acres, taken up 29th July, 1880; No. 81-54, 80 acres, taken up 24th February, 1881; No. 81-266, 80 acres, taken up 29th October, 1881; and we desire to call your attention to the fact that these blocks are all adjoining; that we have spent the large sum of £2,500 upon improvements upon the first two mentioned areas, we have, however, made declarations of having spent £2 per acre upon the whole three blocks, and we have now the honor to request that you will allow the three blocks to be consolidated for the purposes of the improvement under the 26th section of the Crown Lands Act of 1875.

We have, &c.,

JOHN MOORE & PARTY,

(pro JOHN MOORE.)

The papers are with the Board. So far as can be stated in their absence, there is no objection to the request being complied with. Mr. Moore may be so informed, and this letter referred to the Board.—C.O., 3/6/87. Approved.—T.G., 3/6/87. Inform at once, and refer to Chairman.—C.O., 3/6/87. Informed, 4/6/87. The Chairman Local Land Board, Armidale.—S.F., B.C., 4/6/87.

No. 16.

The Under Secretary for Lands to J. Moore and party.

Gentlemen,

4 June, 1887.

Referring to your letter of the 1st instant, requesting that the mineral conditional purchases noted in the margin may be consolidated, I have the honor to inform you, by direction of the Minister for Lands, that the papers relating to the purchase referred to are under reference to the Local Land Board at Armidale, but so far as can be stated in their absence, there is no objection to your request being complied with.

I am to add that the letters under reply have been referred to the Local Land Board Armidale.

I have, &c.,

STEPHEN FREEMAN,

(For the Under Secretary.)

M.C.P. 80-357,
" 81-54,
" 81-266,
Moore and party.

No. 17.

Report by Mr. Inspector Harper.

Respecting the mineral conditional purchase of J. Moore, made at Armidale on 29th September, 1881.

Sir,

Armidale, 9th June, 1887.

I have the honor to report that I visited and inspected the above-described conditional purchase on the 6th day of June, 1887, and that I found the selector then not resident upon this selection.

The land, which consists of precipitous gulf and steep spurs, inaccessible in places, and comprises 80 acres, is held by applicant for mining purposes, and the selector, who follows the avocation of merchant, had at the time of my visit made the improvements hereunder particularly described, the value of which I estimate at the sums respectively stated, viz.:—Pot holes, 12 feet x 3 feet average, and 5 feet deep, £6. No other improvements on the block made by selector.

From the appearance of the land and the circumstances stated in the following remarks, I am of opinion that the selector has been continuously resident upon the selection.

REMARKS.

A gold bearing reef has been recently discovered on this land which promises to be very rich.

The dividing line between this portion and No. 109 has never been marked, I presume because of the precipitous nature of the country. At the south-west corner, however, an apple-tree is marked 109 over 110. A line due north from this tree to a position on top of high spur about 10 chains. A line north would cut perpendicular cliffs, inaccessible deep gulf intervening.

I have, &c.,

WM. HARPER,

Inspector of Conditional Purchases.

The Chairman of the Local Land Board at Armidale.

No. 19.

Caption to Deposition of Witness.

New South Wales, }
to Wit. }

[Crown Lands Act of 1884—Part II, section 14, sub-section 1.]

The examination of Joseph Francis M'Kinlay, of Armidale, in the Colony of New South Wales, publican,
William Weston, of Hillgrove, John Moore, of Armidale, and Mordaunt Alister Maclean, of
Armidale, in the said Colony, draftsman.WHEREAS it hath been alleged that the necessary expenditure required by law has not been made in
mining operations (other than gold-mining) on the mineral conditional purchase mentioned in the margin,
made at Armidale on the 29th September, 1881, 80 acres, county Sandon, parish Metz, and it hath been
found necessary to investigate the said matter on oath, the depositions of the several witnesses are
appended hereto.

[Enclosure to No. 19]

Examined by Mr. Kearney, solicitor: This witness being duly sworn, on oath, states: My name is *Joseph Francis M'Kinlay*; I am the person who lodged the complaint against the mineral conditional purchase, John Moore and others; I know the mineral conditional purchase portion 110, subject of inquiry; it adjoins mineral conditional purchase portion 109 on the eastern boundary; I have known this portion under inquiry about three months; I have been over the land; there is one place on it that there is a small hole about 5 or 6 feet deep x 2 feet wide; this comprised all the improvements on portion 110.*By Mr. Simpson, solicitor:* I know the boundaries of the lands as far as they are surveyed; I know the portion subject of inquiry, it adjoins portion 109; I know portion 58; they all adjoin each other; on portion 58 there is a good deal of improvements; as far as the tracing in my possession shows *me* there is little expenditure on 109; there is a good deal of mining expenditure on portion 109 in the tracing now shown me by you, and I will not say there is not £850 worth of improvements on this portion.Sworn at Armidale this 24th day of }
June, 1887, before us,— }SYDNEY BLYTHE, J.P., Chairman.
C. E. SMITH, P.M.

JOSEPH F. M'KINLAY.

This witness on oath states: My name is *William Weston*; I am a miner; I have been out in the neighbourhood of Hillgrove for this fourteen or fifteen years; I know a mineral conditional purchase of Mr. Moore, portion 110; it is only a short time ago that I knew it; the place I know now as 110 I have known for a number of years; I did not know it was a mineral conditional purchase until very lately; I do not consider there are any mining operations on this portion; there is a bit of a pot hole on it that a man could work for about £1; it is on the falls.Sworn at Armidale this 24th day of }
June, 1887, before us,— }SYDNEY BLYTHE, J.P., Chairman.
C. E. SMITH, P.M.

WM. WESTON.

This closed the evidence for the complaint.

This witness being duly sworn on oath states: My name is *John Moore*; I, Peter Speare, and M'Bean are the holders of three mineral conditional purchases, portions 58, 109, and 110, Nos. of conditional purchases, 80-357, 100 acres, 81-54, 80 acres, and 81-266, 80 acres; all these three selections belong to myself, Peter Speare, and M'Bean; I produce the receipt for payment of interest at the rate of 2s. per acre, dated 31st of March, 1887; on portions 58, 110, and 109 of 80 acres we have actually expended £2,566, the greater part of which has been spent on portion 109; I could produce vouchers for £1,743, money actually expended in men's wages; I have been in possession of this land uninterrupted since 1881; M'Bean resides on the land; it has been his home since it was taken up; these three blocks named above all adjoin each other; the letter which has been read by the Chairman, dated 1st June, 1887, is the one forwarded by me to the Minister for Lands, and I produce the reply to the same.*By Mr. Kearney, solicitor:* We made separate declarations on the three portions named; I could not state when I made declaration on portion 58; when I made this declaration I could not state if it stood in the name of Powrie, Glass, & Moore; I could not tell unless I saw the papers whether I made the declaration on mineral conditional purchase 80-357; I could not say from memory whether the expenditure was made by Powrie, Glass, & Moore; I do not think we applied for an extension of time; the property I think when I made declaration on 109 belonged to Powrie, Glass, & Moore; I made declaration on portion 110; this always belonged to me; I supposed the improvements on 109 would more than cover the 24s. improvements on 110; when I made the first declaration of 24s. per acre it was my own, not in the name of Powrie, Glass, & Moore; I subsequently transferred this to the firm, and made the declaration at the end of five years at £2 per acre in the name of firm, John Moore, Peter Speare, and John M'Bean.Sworn at Armidale this 24th day of }
June, 1887, before us,— }SYDNEY BLYTHE, J.P., Chairman.
C. E. SMITH, P.M.

JOHN MOORE.

This witness being duly sworn, on oath, states: My name is *Mordaunt Alister Maclean*; I am in the Survey Office; I represent the District-Surveyor; I produce the original plans showing portions 58, 109, and 110, parish Metz and Cooney; I look at plan of portion 109; portion 109 is surveyed for 80 acres, including portions applied for as gold leases; I have no doubt whatever; nor of portion 58, 100 acres, surveyed inclusive of any application for gold leases; there was a gold-field proclaimed Gwyr, 29th June, 1883; that embraces only portion 58 of these three portions; portions 109 and 110 have never been within any gold-field.*By Mr. Kearney, solicitor:* These plans are from the Surveyor-General's Office; they do not show any gold lease applications; the local map does show the boundaries of gold lease applications as being within portion 109; three of them are upon portion 109 and one on portion 58; the fact of their being shown on the local map would not necessarily show that these gold leases had been surveyed before the mineral conditional purchase; the mineral gold lease on portion 58 is the only one that is really included within the gold-field.Sworn at Armidale this 24th day of }
June, 1887, before us,— }SYDNEY BLYTHE, J.P., Chairman.
C. E. SMITH, J.P.

M. A. MACLEAN.

This closed the evidence.

No. 20.

Decision of Local Land Board.

[Crown Lands Act of 1884—Part II, section 14, sub-section 4.]

New South Wales, }
to wit. }

WHEREAS on the 24th day of June, 1887, it became a matter for investigation before us, whether the necessary expenditure required by law has been made in mining operations (other than gold-mining) on the mineral conditional purchase mentioned in the margin, made at Armidale on the 29th September, 1881, 80 acres, county Sandon, parish Metz; and having taken evidence and inquired into the said matter, we find that in this case a complaint is lodged by Joseph F. M'Kinlay that no conditions have been fulfilled, "inasmuch as the land has not been improved." Of course this legally is no complaint at all, as the Act (19 section) does not require improvements but expenditure for mining operations. No objection was however taken to the complaint. We find that John Moore and party are entitled to this mineral conditional purchase by virtue of the improvements (or rather expenditure) made on the adjoining mineral conditional purchase 81-54, portion 109, which was the sole property of John Moore when he made his declaration on this mineral conditional purchase, on 24th December, 1884, that he was then therefore entitled under 26th section 39 Victoria No. 13, to claim the mineral conditional purchase under inquiry, to be held as one holding and conditional purchase with the conditional purchase 81-54, 109, on which there had been an expenditure of £1,743 for men's wages alone for mining purposes. We, therefore, under the 20th section of the Act, dismiss the complaint and uphold this conditional purchase in the name of Moore and party, and further order that the sum of £2 2s., professional costs, and £1 1s. for Mr. Moore's costs be deducted from the £10 lodged.

M.C.P. 81-266
John Moore,

No. 21.

Notice of Appeal.

[Crown Lands Act of 1884—Part II, section 17.]

Notice of appeal to the Minister from decision of Local Land Board to be lodged with the Chairman.

New South Wales, }
to wit. }

WHEREAS on the 24th day of June, 1887, a certain matter wherein Joseph Francis M'Kinlay complained that Messrs. Moore, Speare, and M'Bean, the holders of a conditional purchase for mining purposes, 81-266, portion 110, parish of Cooney, county of Sandon, had not expended the sum of £2 per acre thereon in mining operations (other than gold-mining) as required by law, came before the Local Land Board at Armidale, in the Colony of New South Wales, for decision, I being a complainant, and the said Board, after having inquired into the premises, decided that though the original expenditure was not on portion 110 there was enough expenditure on portions 58 and 109, adjoining lands, to cover same, and dismissed the complaint and upheld the claim of John Moore and party to portion 110, and directed that the sum of £2 2s. for professional costs for defendant, and £1 1s. costs be allowed to John Moore, defendant, to be deducted from the £10 deposited with the complaint. And whereas I am dissatisfied with such decision, and intend to appeal therefrom to the Minister. These are, therefore, to give you notice of my intention to appeal as aforesaid, and I herewith tender the sum of £10 as security for the costs of such appeal. And the grounds of such appeal are annexed.

Dated the 25th day of June, A.D., 1887.

To the Chairman of the Local Land Board at Armidale.

JOSEPH FRANCIS M'KINLAY.

Received the sum of £10 referred to above.

SYDNEY BLYTHE, Chairman.

Armidale, 27th June, 1887.

GROUNDS OF APPEAL.

1. That John Moore, Peter Speare, and James M'Bean, present holders of mineral conditional purchases 80-357, portion 58, 100 acres, parish of Metz, county of Sandon; 81-54, portion 109, 80 acres, parish of Cooney, county of Sandon; and 81-266, portion 110, 80 acres, parish of Cooney, county of Sandon, are not entitled to amalgamate the said mineral conditional purchases, for the reasons that at the time required by law for expenditure of £2 per acre in respect to the said mineral conditional purchases respectively, portion 110 was held by John Moore solely, and the said portions, 58 and 109, were held jointly by James Glass, James Powrie, and John Moore, and that it appears by the evidence herein that there was not an expenditure of £2 per acre upon the said portion 110, nor in fact was there ever at any time an expenditure exceeding 2s. per acre upon the said portion 110.

2. That the present holders aforesaid claim to be entitled to amalgamate the said mineral conditional purchases by virtue of expenditure upon the said portions 58 and 109, and claim that there is sufficient excess of such expenditure to cover that required by law in respect to portion 110, which the appellant submits they are not legally entitled to do, inasmuch as all the declarations as to expenditure required by law in respect of the several portions referred to were made separately and independently of each other, and that it is apparent that the said portions were separately held, as the said John Moore made a declaration on his own behalf, on the 29th day of December, 1884, that the sum of 24s. per acre had been expended by him upon the said portion 110; and subsequently a further declaration was made on the 30th day of December, 1886, by the said John Moore, that the sum of £2 per acre had been expended on the said portion 110 by or on behalf of the said John Moore, Peter Speare, and James M'Bean, and that declarations were made previously to the said 24th day of December, 1884, by the said John Moore, that the expenditure required by law had been made upon the said portions 58 and 109 by the said James Glass, James Powrie, and John Moore, as the joint holders of the said portions.

3. That to entitle the said holders to amalgamate the said mineral conditional purchases by virtue of the Lands Act Amendment Act of 1875, section 26, it is necessary that the conditions and requirements of the Crown Lands Alienation Act of 1861, section 19, and the existing Crown Lands regulations relating to conditional purchases for mining purposes, should be complied with, under which, it is submitted by the appellant, that adjoining portions conditionally purchased for mining purposes may only be treated as one holding if held by the same owners or partners at the time when it is necessary to expend the sum of £2 per acre on mining operations, as required by law. And in this case, the one of the said owners—the said John Moore—was not a joint owner with the said John Glass and James Powrie in all the said mineral conditional purchases at the time when the said expenditure in mining operations was required by law to be made; the said holders as alienees of the said mineral conditional purchases from the said John Moore are not entitled to hold the said mineral conditional purchases as one holding.

No. 22.

Memo. from the Chairman of the Local Land Board, Armidale, to The Under Secretary for Lands.

Transmitting papers in connection with the mineral conditional purchases named in the margin.

Armidale,
80-357—100 ac.
81-54 — 80 ac.
81-266 — 80 ac.

THESE papers are transmitted together, as they relate to three mineral conditional purchases, formerly taken up in different names, but now all owned by John Moore, Peter Speare, and John M'Bean.

With regard to mineral conditional purchases, 80-357 and 81-54, there can be no question that the expenditure for mining operations is very far in excess of the requirements of the law, £2,566 being sworn to. This expenditure was made chiefly by John Moore, James Powrie, and James Glass. Mineral conditional purchase 81-266 was taken up by John Moore, in his own name; but, before it became necessary for him to make any declaration as to expenditure, the two former mineral conditional purchases were transferred to John Moore, viz., on 9th December, 1884, he then, afterwards, on 24th December, 1884, made a declaration as to expenditure to the amount of 24s. per acre on the mineral conditional purchase, considering that under the 26th section 39 Vic. 13, the expenditure on the former mineral conditional purchases would count as expenditure on this last, although there had been actually little or no expenditure on mineral conditional purchase 81-266 itself. A complaint that no conditions had been fulfilled on this mineral conditional purchase was lodged by Joseph F. M'Kinlay, and on the hearing of the case, the Board, on the foregoing facts, dismissed the complaint, and ordered the sum of £2 2s. professional costs, and £1 1s. costs, to John Moore, to be deducted from the £10 lodged. The case was sent to the Board under the 20th section of the Act of 1884, and against this decision of the Board, who upheld the claim of Moore and others to the mineral conditional purchase 81-266, M'Kinlay now appeals on the grounds as set forth in this notice.

SYDNEY BLYTHE, Chairman.

27th June, 1887.

Applications to mine for Gold, parish of Metz.

No. 1.

Application for Conditional Purchase.

C.

[Alienation Act, section 19.]

Application for the conditional purchase without competition of unimproved Crown Land.

District of Armidale.

No. 540 of 1881.

Application by James Powrie and James Glass for the conditional purchase, without competition, of 80 acres unimproved Crown Land.

Received by me, with a deposit of £40, this 3rd day of March, 1881, at 10 o'clock.

J. BRAY,

Agent for the Sale of Crown Lands at Armidale.

Sir,

Sir,

3 March, 1881.

We are desirous of purchasing, without competition, under the Crown Lands Alienation Act, 1861, the portion of unimproved Crown Land hereunder described, containing 80 acres, and we herewith tender the sum of £40, being a deposit at the rate of 10s. per acre on the area for which we apply.

We are, &c.,

JAMES POWRIE, 275, George-street.
JAMES GLASS, of Gara, Armidale.
ROBERT PHILLIPS, as Agent.

To the Agent for the Sale of Crown Lands at Armidale.

Description.

County of Sandon, parish of Cooney, 80 acres, extending along the eastern boundary of our mineral conditional purchase, portion No. 58, and adjoining the said portion No. 58 from its south-east corner to its north-east corner.

I certify that these applicants are over sixteen years old.—J. BRAY.

Mining Act in this locality it is not safe to deal with this case, which with others are with 81-15,376, conditional sales, I believe of M'Carthy's conditional purchases, with which this should be put, or perhaps it would be as well to refer to Mines as to whether my recollection is or is not correct.—F.H.W., 22nd April, 1881.

The Under Secretary for Mines.—W.B. (for Chief Commissioner), B.C., 8th June, 1881.

Enclosure (see Appendix C).

No. 2.

Notification of alienation of conditional purchase.

H.

[Alienation Act, sections 13, 14, 19, 21, and 22.]

Notification of alienation of conditional purchase under the Crown Lands Alienation Act of 1861.

Notification of alienation of conditional purchase by James Powrie and James Glass, in the district of Armidale.

I HEREBY notify to you, as the Agent for the Sale of Crown Lands for the district of Armidale, that we have (after a residence thereon of at least twelve months), in consideration of the sum of 10s., this day alienated to James Powrie, of Sydney, and James Glass and John Moore, both of Armidale, the 80 acres of land, situated in the county of Sandon, parish of Metz, which were selected at Armidale by James Powrie and James Glass, as a conditional purchase, under the 19th section of the Crown Lands Alienation Act of 1861, on the 3rd March, 1881.

Witness to the signature of }
JAMES POWRIE,— }
A. H. PRITCHARD.

JAMES POWRIE,
of Sydney.

Witness to the signature of }
JAMES GLASS,— }
THOMAS H. BROWNE, J.P.

JAMES GLASS,
of Armidale.

Dated at Singleton, this 10th September, 1881.

To the Agent for the Sale of Crown Lands at Armidale.

I have duly registered the above notification of alienation in the Records of this Office.

Fee paid :—7s. 6d. for registration fee and Stamp duty, £1, and fine, 4s.

JAMES BRAY, Agent for the Sale of Crown Lands.

District of Armidale, Land Office, Armidale,
3 December, 1881.

Received into the Office of the Registrar-General, at Sydney, this 4th day of February, A.D. 1882, at 10 o'clock in the forenoon, from Fred. Murray, of Sydney, a copy of the above transfer, verified by Edwd. G. Markham, of Armidale, and numbered 978, book 38.

JAS. BOSCAWEN DUFF,
Deputy Registrar-General.

No. 3.

Messrs. Farnell and Martin to The Chief Commissioner, Conditional Sales Branch.

Sir,

295, George-street, 21 September, 1881.

We have the honor to request, on behalf of Messrs. Powrie and Glass, that you will cause a survey to be made, as early as possible, of the additional mineral selection of 80 acres, applied for at Armidale on the 3rd March, 1881, situated in the county of Sandon, parish of Metz. The reason why we urge the survey of the land is that persons are illegally working upon it, and carrying away the antimony ore, and proceedings cannot be taken against the parties until the boundaries are defined.

We have, &c.,

FARNELL & MARTIN.

C.P. 81-54, Armidale. The case is now under reference to the Mines Department, application having been sent them on 8th June last. The U.S. Mines should be requested to return same.—A.B.C., 29/9/81. Inform.—J.W., 39/9/81. Mr. Blackman, a letter recently sent to Sur. Orr this case.—J.L., 1/10/81. Mr. Capper. U.S. Mines. Messrs. Farnell & Martin, and H. C. Mitchell.—21 Oct., 1881

No. 4.

No. 4.

Mr. H. C. Mitchell to The Secretary for Lands.

Sir,

40, Hunter-street, Sydney, 4 October, 1881.

I have the honor to request that you will give instructions to the Surveyor at Armidale to survey the 80 acres of land, county of Sandon, parish of Metz, taken up by Messrs. James Powrie and James Glass on the 3rd March, 1881.

Mr. John Moore, of Armidale, has requested me to ask you to give this matter immediate attention.

I have, &c.,

HENRY CHAS. MITCHELL.

C.P. 81-54, Armidale. Application to U.S. Mines, 8/6/81. This paper should be placed with the previous paper 81-42,441. It does not appear to relate to papers 81-44,110.—C.N., 6/10/81. Have not these papers been applied for and sent as within stated to the Mining Department so long ago as 8 June last.—A.O.M., 19/4/82.

No. 5.

Mr. H. C. Mitchell to The Secretary for Lands.

Sir,

40, Hunter-street, Sydney, 18 October, 1881.

Referring to my letter of 4th instant, wherein I had the honor to request you to give instructions for the survey of certain land taken up by James Powrie and James Glass on 3rd March, 1881, I have the honor to inform you that up to the present no instructions have reached the local Surveyor at Armidale, nor has any intimation reached me as to when it is likely that such instructions will be given.

I have, &c.,

HENRY CHAS. MITCHELL.

Urgent.—The Chief Commissioner of Conditional Purchases. Please let me know how this matter stands at present.—J.H., 18/10/81. The case is stated to be under reference to the Department of Mines.—A.O.M., 19/10/81. The writer should be informed to that effect as soon as possible, and the Department of Mines should be asked to expedite their report thereon.—J.H., 21/10/81.

No. 6.

The Chief Commissioner to The Under Secretary for Mines.

Sir,

Department of Lands, Conditional Sales Division,
Sydney, 21 October, 1881.

Referring to the application of Messrs. James Powrie and J. Glass, noted in the margin, which was referred to your Department on the 8th June last, I am directed to request that you will be pleased to cause its early return with the necessary report thereon.

I have, &c.,

W. BLACKMAN,
(For Chief Commissioner).

C.P. 81-54,
Armidale, 80
acres, 3rd
March, 1881,
19 section, J.
Powrie and J.
Glass.

No. 7.

The Chief Commissioner to Messrs. Farnell & Martin.

Gentlemen,

21 October, 1881.

Referring to your letter of the 21st ultimo, urging early survey of the selection noted in the margin, I am directed to inform you that the application was referred, on the 8th June last, to the Department of Mines for report, and that the Under Secretary for Mines has been requested to cause the necessary report to be furnished.

I have, &c.,

W. BLACKMAN,
(For the Chief Commissioner).

No. 9.

The Chief Commissioner to H. E. Mitchell, Esq.

Sir,

24 October, 1881.

Referring to your letter of the 18th instant, urging that instructions may be issued to the surveyor in connection with the selection of James Powrie and James Glass, I am directed to inform you that the case is at present under reference to the Department of Mines, but that as soon as the necessary report has been received, your request will be considered.

I have, &c.,

W. BLACKMAN,

(For the Chief Commissioner).

No. 10.

The Chief Commissioner to The Under Secretary for Mines.

Sir,

Department of Lands, Sydney, 24th October, 1881.

Referring to a letter received from H. C. Mitchell, urging that instructions may be issued to the surveyor in connection with the selections of James Powrie and James Glass, the papers relating to which are stated to have been referred to your Department, I am directed to request that you will be pleased to cause the papers, with the necessary reports thereon, to be furnished at your earliest convenience.

I have, &c.,

W. BLACKMAN,

(For the Chief Commissioner.)

Minutes on No. 9.

Can the report asked for be supplied in the absence of the papers relating to the applications to lease.—H.W., 31/10/81.

It appears that three applications made at Armidale for gold-mining purposes, as under, are entirely within the area intended to be embraced by Messrs. Powrie & Glass. Mineral conditional purchases 81-54, of 3rd March, 1881, viz. :—*Application 1,287, made 12/10/80, at Armidale; †1,288, made 15/11/80, at Armidale; †1,289, made 28/1/81, at Armidale.

These are all that I have any knowledge of.—H.C., 7/10/81. The Under Secretary for Mines. Where are these papers?—H.W., 16/11/81. Herewith.—W.K., 18/11/81.

Referred to Charting Branch. Opinion given in M'Carthy's case referred to on the application enclosed. Application for a mineral lease does not exempt land applied for from conditional purchase during the pendency of such lease application, and until the lease is granted by the Governor and Executive Council.—C.N., 30/11/81.

Mining Department.—How do applications 1,287, 1,288, and 1,289 stand, and has the lease been granted by the Governor and Executive Council.—C. H. DALE (for Surveyor-General), 16/12/81. The Under Secretary for Mines. Very urgent.—Applications 1,287, 1,288, and 1,289, Armidale, not yet approved.—J.W.C., 17/12/81. Gazetted refused, 10th October, 1882, *vide* 82-10,488 Mines. The plan of mineral conditional purchase 81-54 was transmitted to the Surveyor-General with my letter dated 11th March, No. 82-12, No. of portion being 109.—JOHN G. MARTYN, 31/8/82.

* Papers 80-10,031 Mines.

† Papers 81-5,281 Mines.

No. 11.

Mr. H. C. Mitchell to The Secretary for Lands.

Dear Sir,

40, Hunter-street, Sydney, 7 November, 1881.

Referring to your letters of the 21st and 24th ultimo, numbered respectively, C.S. 81-44,121, and C.S. 81-47, 289. I have the honor to inform you that I have just received the following telegram from Armidale:—"In consequence of the lines of land not being surveyed, six men are working our land," and to request you to be good enough to press the matter forward as much as possible, as my friends Messrs. John Moore, James Glass, and James Powrie are suffering loss from the delay on survey. The loss is the more aggravating in that they have done so much in developing the resources of the district.

I have, &c.,

HENRY CHAS. MITCHELL.

Urgent. The other papers in the case, 81-44,121, should be attached.—C.N., 16/11/81. Papers herewith, 18/11/81. Mr. Neale. Has a reply been received from the Mining Department, *vide* 81-47,289?—C.N., 21/11/81. Yes, *vide* 81-52,908.

No. 12.

Mr. Licensed-Surveyor Martyn to The Surveyor-General.

Sir,

Armidale, 11 March, 1882.

I have the honor to transmit herewith the plan of one portion of land containing 80 acres, numbered 109, in the parish of Cooney, county of Sandon, applied for by Jas. Powrie and Jas. Glass, under the 19th section of the Crown Lands Alienation Act of 1861, and surveyed in view of enclosed copy of C.P. No. 81-54, instructions for survey of which have not been received. Improvements consist of mining plant of a far greater value than the requisite £2 per acre.

The greater part of this portion is situated in a deep precipitous gulf.

For explanation as to form of survey *vide* my letter dated 11th March, No. 82-20.

I have, &c.,

J. G. MARTYN.

Forwarded

Forwarded 17th March, 1882. Two tracings received, one of which forwarded to the Land Agent.—J. S. CHARD, D.S. Survey approved so far as regards 60 chains depth not being given. *Vide* copy of 82-1,957 Min. with 82-1,808 Sur.—D.H.C., 27th Aug., 1884. Exd. and chtd. on county map.—G. H. DOUBLEDAY, 8th October, 1884. Surveyor-General. It is submitted whether the portion should not be bounded by marked right lines along the edge of cliff, and if so, should such lines be the common boundary of portions 59 and 109. Or may the edge of cliff be considered the boundary and not marked.—D. H. CHISHOLM, 27th August, 1884.

Inasmuch as the adjoining portions, 58 and 59, were measured, November, 1878, and survey approved, June, 1882, and are represented as having a natural boundary (not defined by right lines), there is no alternative to adoption of the same boundary in the latter survey of portions 109 and 113. Undoubtedly the portions 58 and 59 should have been defined by right lines marked along the edge of the cliff (*vide* par. 33 of Reg.), which would then have constituted the common boundary of portions 58, 59, 109, and 113. Send memo. stating the circumstances, directing the surveyor's attention to paragraph 33 of Regulations, and informing him that his survey has been accepted.—E. TWYNAM (for Surveyor-General), 3rd October, 1884.

According to C.S. 84-5,754, Cor., M.C.P. 81-54, Armidale, with other M.C.P.'s specified therein, was on 12th July, 1884, demised by way of mortgage (for seven years), from Charles Henry Hodson (the present transferee from applicant), in consideration of loan of the sum of £1,300 to Alfred Van Rompaey. Dealt with in Charting Branch.—D.H.C., 23rd October, 1884.

Tracing herewith for C.P. Inspectors. Underwood, for description.—ARTHUR J. BURNELL, 5th November, 1884.

No. 13.

Declaration of Conditional Purchaser.

(C.P. 81-54.)

F.

[Alienation Act, 1861.]

Declaration of conditional purchaser for mining purposes.

I, JOHN MOORE, of Armidale, do solemnly and sincerely declare that James Powrie, James Glass, and John Moore, the lawful owners, by conditional purchase, of the land hereunder described, and that an expenditure equal to £5 per acre for the area of the land has been made on mining operations other than gold-mining on the land, and since the selection on 3rd March, 1881, and I make this solemn declaration, conscientiously believing the same to be true, and by virtue of the provisions of an Act made and passed in the ninth year of the reign of Her present Majesty, intituled "An Act for the more effectual abolition of oaths and affirmations taken and made in various departments of the Government of New South Wales, and to substitute declarations in lieu thereof and for the suppression of voluntary and extra-judicial oaths and affidavits."

Description.

County of Sandon, parish of Metz, 80 acres, on Hillgrove Run, being (part of) conditional mining purchase, No. 54 of 1881, in the District of Armidale.

Taken and declared, at Armidale, this 31st }
day of May, 1884, before me, — }

JOHN MOORE.

LAMBERT S. GORDON, Commissioner for Affidavits.

Instalment £8, credited at Treasury, 4th June, 1884. Notice issued to parties to attend Court, Armidale, on 24th June, 1887. Poster, 3/6/87.—F.H.W., 3/6/87.

No. 14.

Office Memo.

MR. G. LEWIS.—Enclosed are plans and papers of portions 109, 110, and 113, parish of Metz, county Sandon.

Are these surveys within Gyra River gold-field or not? The chief draftsman considers that the parish boundary was intended to follow the edge of gorge. If so, those surveys are in parish of Cooney, and are outside Gyra River gold-field.

1st Sept., 1884.

D. H. CHISHOLM.

County maps and plans altered accordingly.—G. H. DOUBLEDAY, 8th Oct., 1884. Adopt the edge of the gorge.—J. W. ELLIS, 9/9/84. Mr. Chisholm. Description prepared, 8/1/85.—R.U.

No 15.

Office Memo.

CHARTING BRANCH.

(Papers No. 7 82-1,807 Sur.)

THE following is forwarded for the information of Mr. L. S. Martyn:—

In connection with plans of portions 109 and 113, parish Metz (now Cooney), county Sandon, transmitted by letters Nos. 82, 12, and 14 respectively, of 11th March, 1882, the following is a copy of Surveyor-General's minute thereon.

Inasmuch as the adjoining portions, 58 and 59, were measured November, 1878, and survey approved June, 1882, and are represented as having a natural boundary (not defined by right lines) there is no alternative to adoption of the same boundary in the later survey of portions 109 and 113.

Undoubtedly,

Undoubtedly, the portions 58 and 59 should have been defined by right lines marked along the edge of the cliff (*vide* par. 33 of regulations), which would then have constituted the common boundary of portions 58 and 59 and 109 and 113.

The surveys have, however, been accepted, but Mr. Martyn's attention is directed to the paragraph above referred to, which he is requested to observe more carefully in future.

ARTHUR J. BURNELL,

(For Surveyor-General.)

6 October, 1884.

In returning this memo., I beg to draw attention to the concluding paragraph thereof, which would appear to have been intended for the surveyor who measured portions 58 and 59, and not for me. Portions 58 and 59 having been measured with a natural boundary, I was consequently compelled, when joining on to them, to adopt the same boundary for my surveys, and I fail to see how any careful observance of paragraph 33 could have altered the circumstance of the case. I have measured several portions with frontage to the edge of the Falls, and I have always been careful to observe paragraph 33, but in this case I was prevented from doing so owing to the form of measurement of previous surveys.—J. G. MARTYN, 11th October, 1884.

Observed. As Mr. Twynam is away, I did not consider it necessary to keep the case back.—D.H.C., 23rd October, 1884.

No. 16.

Office Memo.

Mineral conditional purchase 81-54, Armidale.

Description.

EIGHTY acres, county of Sandon, parish of Cooney, portion 109: Commencing on the edge of the cliffs at the south-western corner of portion 113 of 40 acres, and bounded thence on the north by part of the southern boundary of that portion, bearing east 21 chains 96 links, and on the east by the western boundary of portion 110 of 80 acres, bearing south 35 chains 69 links; on the south by a line bearing west 16 chains 59 links to the edge of the cliffs aforesaid, and on all other sides by those cliffs northerly to the point of commencement.

Examined.—R.U., 8/1/85.

No. 17.

Report by Inspector William Harper.

Respecting the mineral conditional purchase of James Powrie and James Glass, made at Armidale, on 3rd March, 1881.

Sir,

Armidale, 9 June, 1887.

I have the honor to report that I visited and inspected the above-described conditional purchase on the 6th day of June, 1887, and that I found the selector then not resident upon this selection:

M.C.P. 81-54,
section 19th,
portion 109.

The land, which consists of precipitous walls of rock, inaccessible in places, and steep spurs, and comprises 80 acres, is now occupied by John Moore for mining purposes, and the selector, who follows the avocation of merchant, had at the time of my visit made the improvements hereunder particularly described, the value of which I estimate at the sums respectively stated, viz. :—

435 feet of shafts, tunnels, and cuttings, with wooden supports to walls, and tram partly made on floor of tunnel, top and sides of excavation varying from 3 and 2 feet x 6 and 7 feet by 4 feet, at £1 10s. per foot,—£652 10s.

From the appearance of the land, and the circumstances stated in the following remarks, I am of opinion that the selector has been continuously resident upon the selection.

REMARKS.

There are cross-drains in main tunnel, and a quantity of ground has been stopped, the value of which it would be impossible to determine now, as some of the timber has slipped away making it dangerous.

The works seem to have been suspended here for one year or more, and when in operation were used for raising antimony ore.

A person named M^r Bean resides on portion 58, an adjoining block, and has charge of the property on account of John Moore, present holder.

I have, &c.,

WM. HARPER,

The Chairman of the Local Land Board at Armidale.

Inspector of Conditional Purchases.

No. 18.

Caption to Deposition of Witnesses.

New South Wales, }
to wit. }

[Crown Lands Act of 1884—Part II., section 14, sub-section 1.]

THE examination of William Harper, of Armidale, in the Colony of New South Wales, Inspector of conditional purchases, and Charles James Ramsay, auctioneer, of Armidale, in the said Colony.

WHEREAS it hath been alleged that the necessary expenditure required by law has not been made in mining operations (other than gold-mining) on the mineral conditional purchase mentioned in the margin made at Armidale on the 3rd March, 1881, 80 acres, county Sandon, parish Metz, and it hath been found necessary to investigate the said matter on oath, the depositions of the several witnesses are appended hereto.

Mineral conditional purchase 81-54—James Powrie, James Glass, and John Moore, Armidale, 80 acres, parish Metz, county Sandon.

[Enclosure.]

[Enclosure.]

THIS witness, being duly sworn, on oath, states : My name is *William Harper*, Inspector of conditional purchases for this district ; on the 6th June last I visited the mineral conditional purchase subject of inquiry (mineral conditional purchase 81-54, section 19, portion 109, of 80 acres), which stands in the names of James Powrie and James Glass ; the land consisted of inaccessible wall of rock and steep spurs ; it is situated on the face of the falls now occupied by Mr. John Moore for mining purposes ; I might state before I go into the particulars of valuation I did not go down into these tunnels and shafts ; however, I employed a practical man, an auctioneer in the city, named Ramsay, who understands mining matters ; my son accompanied him, measuring the lengths and depths, and saw the tunnels, but did not go down myself, and it was principally from them I got my estimate ; the excavations vary from 3 to 3 x 6 and 7 x 4 ; there were 435 feet of shafts tunnelling and castings, which I valued at £652 10s. ; there are cross-drains in the main tunnel and a quantity of ground has been stopped, the value of which would be impossible to determine now, as some of timber has slipped away, making it dangerous ; these works appear to have been in operation for raising antimony from the mine ; a person named M'Bean resides on portion 58, of 100 acres (about which I have just given evidence), and appears to be in charge on account of John Moore, the present holder.

By Mr. Kearney, solicitor : This was the first inspection of this block, portion 109 ; I found the number on the tree, and the tracing (see Appendix D.) guided me, showing the expenditure stated had been made on portion 109 ; there were a number of other marks, G.L. and C.L., but I took no notice of them ; I was asked to look at these, but I did not consider it my duty to take any notice of them ; the expenditure I refer to was near the western boundary of portion 109, and near the edge of the falls ; they extended from the edge of the falls eastward, probably 10 chains down the falls ; I found the surveyor's number at the south-east and south-west corner of portion 109 ; the dividing line between portion 109 and 110 was not marked on the ground ; I determined its position by compass from the top of the spur across the gulf to the mountain the other side.

Sworn at Armidale this 24th day }
of June, 1887, before us,— }

SYDNEY BLYTHE, J.P., Chairman.
C. E. SMITH, P.M.

W. HARPER.

THIS witness, duly sworn, states :—My name is *Charles James Ramsay* : I am an auctioneer in Armidale ; I was employed by Mr. Harper recently.

By Mr. Harper : I identify the portion 109 by the tracing ; I remember on the 6th June, at your request, that I visited some mineral conditional purchases ; I measured the works, sinkings, and shafts on portion 109, shown on tracing ; your son accompanied me in the tunnel ; I measured the shaft by dropping a line from the surface to the bottom ; I found the shafts, tunnels, and cuttings to be 435 feet ; I valued this work at £2 per foot ; I saw some numbers on the trees which indicated this portion 109 ; I was satisfied that the expenditure of money of mining works was within the boundaries of portion 109, as shown in the plan of Mr. Harper ; I have been accustomed to see mining operations.

By Mr. Simpson : I have had some experience in surveying matters.

Sworn at Armidale, this 24th day }
of June, 1887, before us,— }

No. 19.

Decision of Local Land Board.

New South Wales, }
to wit. }

[Crown Lands Act of 1884—Part II, section 14, sub-section 4].

WHEREAS on the 24th day of June, 1887, it became a matter for investigation before us whether the necessary expenditure required by law has been made in mining operations (other than gold-mining) on the mineral conditional purchase mentioned in the margin, made at Armidale on the 3rd March, 1881, 80 acres, county Sandon, parish Metz, and having taken evidence and inquired into the said matter, we find that according to the evidence of Mr. Inspector Harper there has been an expenditure of at least £652 10s. in mining operations, other than gold-mining. We beg, therefore, to recommend that this conditional purchase be upheld, and certificate issue to the persons entitled thereto.

Given under our hands, at the office of the Local Land Board, at Armidale, in the Colony of New South Wales, this 24th day of June, 1887,—

SYDNEY BLYTHE, Chairman.
C. E. SMITH, P.M., Member.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

COAL MINING LEASE.

AND RENEWAL OF LEASE OF THE ANGLO-AUSTRALIAN MINING COMPANY: BETTER KNOWN AS THE LAMBTON COLLIERY COMPANY.)

Ordered by the Legislative Assembly to be printed, 24 March, 1887.

NO.	SCHEDULE.	PAGE.
1.	The Acting Surveyor-General to Messrs. Morehead & Young that applications for lease of land at Newcastle have been approved of, and enclosing description. 12 January, 1863.	1
2.	Messrs. Morehead & Young to the Acting Surveyor-General for amalgamation of leases Nos. 22 and 23, and re use of surface, with minutes. 29 January, 1863.	2
3.	The Acting Surveyor-General to Messrs. Morehead & Young in reply to No. 20 April, 1863.	2
4.	The Manager Scottish Australian Mining Company, Limited, to the Honorable the Secretary for Mines for renewal of mineral lease No. 22, with minutes. 14 December, 1875.	2
5.	The same to the same for renewal of mineral lease No. 23, with minutes. 31 December, 1875.	2
6.	The Under Secretary for Mines to Mr. R. A. A. Morehead in reply to No. 7 January, 1876.	2
7.	The same to the same in reply to Nos. 3 October, 1876.	3
8.	The Sub-Manager of the Scottish Australian Mining Company to the Under Secretary for Mines that fine for renewal of leases has been paid, with minute. 28 November, 1876.	3
9.	The Under Secretary for Finance and Trade to the Under Secretary for Mines asking for instructions, also stating that fine has been paid, with minute. 30 November, 1876.	3
10.	The Under Secretary for Mines to the Under Secretary for Finance and Trade stating fine fixed by the Secretary for Mines. 5 December, 1876.	3
11.	The Under Secretary for Mines to the Manager of the Scottish Australian Mining Company that renewal of leases will be granted to Messrs. Morehead & Young upon their making application. 15 December, 1876.	3

No. 1.

The Acting Surveyor-General to Messrs. Morehead & Young.

Gentlemen,

Sydney, 12 January, 1863.

In reference to your application dated 18th January last, to lease, under the Crown Lands Occupation Act of 1861, for mining purposes, four portions of land situated at Newcastle, each containing 320 acres, I have the honor to inform you that your applications for those portions have been approved of and the land measured.

With reference to your applications of same date for two other portions—320 acres, being M.L., No. 23, and 160 acres being M.L., No. 22, I have the honor to inform you that in both these cases the surface right is wholly reserved to the Government, the land being situated within the Newcastle Pasturage Reserve, and that the first mentioned portion, No. 23, has been reduced to 120 acres in consequence of Dr. Mitchell's prior application for part of the land in question.

You will be good enough to apply to the Treasury for a refund of the money due to you in consequence of such reduction. I enclose copies of the descriptions for your information.

I have, &c.,

W. R. DAVIDSON.

Consolidated Description.

280 acres, county of Northumberland Parish of Newcastle, Mineral Leases Nos. 22 and 23,—Commencing at the north-western corner of Mineral Lease No. 25, and bounded thence on the south by part of the northern boundary line of that lease bearing east 40 chains; on the east by the western boundary line of Mineral Lease No. 24, bearing north 70 chains; on the north by part of the southern boundary line of Mineral Lease No. 12, bearing west 40 chains; and on the west by the eastern boundary of Mineral Lease No. 14, and part of the eastern boundary of Mineral Lease No. 15; being in all a line bearing south 70 chains to the point of commencement. Examined—R.B.R.

No. 2.

Messrs. Morehead & Young to The Acting Surveyor-General.

Sir,

Sydney, 29 January, 1863.

We have had the honor to receive your letter of the 12th instant, transmitting descriptions of the portions of land in the neighbourhood of Newcastle, which have been leased to us by the Crown for mining purposes.

It is probable we shall make an early communication to the Government on the subject of mineral lease No. 23, the contents of which we perceive have been reduced to 120 acres. In the meantime, however, all we consider it necessary to submit to your Department, in connection with this portion of land, is the request that it may be joined in a lease with the portion comprised in No. 22 consisting of 160 acres, so as to constitute one portion of 280 acres.

I would beg to add that we take it for granted, as regards the land just adverted to, which forms part of the Newcastle Pasturage Reserve, that although the surface will not be leased to us, the use of such a portion thereof as is required for mining operations will be conceded.

I have, &c.,

R. A. A. MOREHEAD,

For self and M. Young.

There will be no objection to this arrangement, the area being under 320 acres.—W. T. D.

The only question which can be replied to, in this communication, is with regard to the amalgamation of Mineral Leases Nos. 22 and 23, to which there is no objection, and description may be accordingly prepared with regard to surface right on the Commonage Reserve; no doubt some small area will be allowed.—W. R. D., 18/2/63. Messrs. Morehead & Young informed, 20/4/63.

No. 3.

The Acting Surveyor-General to Messrs. Morehead & Young.

Gentlemen,

Sydney, 20 April, 1863.

In reference to your letter of the 29th January, on the subject of the land in the neighbourhood of Newcastle, leased to you for mining purposes, I beg to inform you that there will be no objection to portion No. 23 being joined to portion No. 22.

With regard to the surface right of the Commonage Reserve no doubt some small area will be allowed.

I have, &c.,

W. R. DAVIDSON.

No. 4.

The Manager of the Scottish Australian Mining Company (Limited), to the Minister for Mines.

Sir,

Sydney, 14th December, 1875.

On behalf of this Company, as holder of mineral lease No. 22 (or promise thereof), I have the honor to apply, under sub-clause 5 of section 22 of the Crown Lands Occupation Act of 1861, for a renewal of that lease.

In making this application, I assume that the fine, provided for under the clause above cited will be levied with reference to the area of coal, which will be ascertained to the satisfaction of the proper officer of your Department, to be unworked at the date of the expiration of the existing lease.

I have, &c.,

R. A. A. MOREHEAD.

Inform that the fine must be paid upon the area of the land demised by the lease of which he applies for renewal.—J. L., 3/1/76. Informed 7th January, 1875. The fine on renewal of mineral leases 22 and 23 shall be at the rate of £2 10s. per acre of land demised.—J. L., 27/9/76. Mr. Morehead informed 3rd October, 1876.

No. 5.

The Manager of the Scottish Australian Mining Company (Limited), to The Minister for Mines.

Sir,

Sydney, 31 December, 1875.

On behalf of this Company, as holder of Mineral Lease (or promise of lease No. 23), I have the honor to apply under sub-clause 5 of section 22 of the Crown Lands Occupation Act of 1861, for a renewal of that lease.

This application is made as supplementary to the application as to the Lease No. 22 made on the 14th, and with reference to an uncertainty as respects the boundary between the areas comprised in these two leases, or promises of lease.

I have, &c.,

R. A. A. MOREHEAD.

Application approved. Renewal lease shall be prepared with the least possible delay.—J.L., 3/1/76.

No. 6.

The Under Secretary for Mines to Mr. R. A. A. Morehead, Manager of Scottish Australian Mining Company, Limited.

Sir,

Department of Mines, Sydney, 7 January, 1876.

In reference to your letter of the 14th ultimo, applying on behalf of the Scottish Australian Mining Company, Limited, for a renewal of Mineral Lease No. 22, I am directed by the Secretary for Mines to inform you that the fine must be paid upon the area of the land demised by the lease of which you apply for a renewal.

I have, &c.,

HARRIE WOOD.

3

No. 7.

The Under Secretary for Mines to the Manager of the Scottish Australian Mining Company (Limited).

Sir,

Department of Mines, Sydney, 3 October, 1876.

Referring to my letter of the 7th January last, in which it was pointed out that the fine to be paid for removal of mineral lease No. 22, must be paid upon the area of land demised by the removal of such lease, I am now directed to inform you that the Secretary for Mines has decided that the fine upon renewal of mineral leases Nos. 22 and 23, shall be at the rate of £2 10s. per acre of the land demised, as provided by Regulation No. 37, relating to Mineral Leases under the Mining Act, 1874.

I have, &c.,
HARRIE WOOD.

No. 8.

The Sub-Manager of the Scottish Australian Mining Company Limited, to the Under Secretary for Mines.

Sir,

Sydney, 28 December, 1876.

With reference to your letter of 3rd October last, I have the honor to intimate to you that I have this day paid into the Colonial Treasury £700 sterling, being fine for renewal of leases for fourteen years from 31st December next of Nos. 22 and 23, portion of the Newcastle Town Pasturage Reserve, containing 280 acres, and I would request that deeds of lease should be issued in the name of this Company in due time.

I have, &c.,
H. SHANNON.

Prepare the leases so that they shall be ready for issue at any time after the 31st proximo. Inform the Treasury that the fine has been paid at £2 10s.—J.L., 30/11/76.

No. 9.

The Under Secretary for Finance and Trade to The Under Secretary for Mines.

Sir,

The Treasury, New South Wales, Sydney, 30 November, 1876.

I have the honor to state that a sum of £700 has been lodged in this office by the Scottish Australian Mining Company (Limited), in payment of fine of £2 10s. per acre on certain mineral leases at Newcastle, and I am to request the favor of instructions as to the disposal of the money.

I have, &c.,
G. EAGAR.

Inform the Manager that a renewal of the lease of portions 22 and 23 at Newcastle will be issued to Messrs. Morehead & Young, and that they can obtain the formal deed at any time after the 31st instant on application therefor.—J.L., 14/12/76. Informed 15 December, 1876.

No. 10.

The Under Secretary for Mines to The Under Secretary for Finance and Trade.

Sir,

Department of Mines, Sydney, 5 December, 1876.

I have the honor to inform you that Mr. A. Shannon, Sub-manager of the Scottish Australian Mining Company (Limited), has intimated to this Department that he, on the 28th ultimo, paid into the Treasury the sum of £700, as the fine for renewal of the leases of portions Nos. 22 and 23, comprising 280 acres, of the Newcastle Town Pasturage Reserve, for a period of fourteen years from the 31st of December instant, and I am to state that in this case the Secretary for Mines has fixed the fine at £2 10s. per acre.

I have, &c.,
HARRIE WOOD.

No. 11.

The Under Secretary for Mines to the Manager of the Scottish Australian Mining Company (Limited).

Sir,

Department of Mines, Sydney, 15 December, 1876.

With reference to your letter of the 28th ultimo respecting the issue of the deeds of lease of portions Nos. 22 and 23, being part of the Newcastle Town Pasturage Reserve, I have the honor, by direction of the Secretary for Mines, to inform you that a renewal of the lease of the aforesaid portions of land will be issued to Messrs. Morehead & Young, and that they can obtain the formal deed at any time after the 31st instant, on making application therefor.

I have, &c.,
HARRIE WOOD.

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

MINING ON PRIVATE PROPERTY.

(PETITION FROM MINERS AND OTHERS INTERESTED IN MINING.)

Received by the Legislative Assembly, 23 June, 1887.

The humble Petition of the miners of Mount M'Donald.

To the Speaker and the Legislative Assembly of New South Wales,—

We, the undersigned, being miners or interested in the mining developments of New South Wales, respectfully request that the Bill about to be introduced on our behalf by Mr. C. L. Garland, M.L.A., for the purpose of mining on private properties be favourably entertained by you.

There are without doubt, in this extensive territory of New South Wales, large areas of land known to be highly auriferous, and to contain vast deposits of mineral wealth, but which, under existing laws, cannot be touched, thus retarding all tendencies towards natural progress and advancement in the line referred to.

The Bill about to be brought forward by Mr. Garland is we believe a step in the right direction, and as such should be entitled to the hearty support of all classes.

It is undoubtedly a matter of the deepest importance, not only to the mining but also to all other industrial classes, that the mineral resources of the country should be fully developed, as by those means new centres of industry would be established, which, with consequent advantages to the country by opening up new avenues of commercial activity, would contribute largely to the prosperity and welfare of the whole Colony.

We therefore hope and pray that the said Bill will be treated in the manner in which we desire. And we your most humble Petitioners will ever pray.

[Here follow 119 signatures.]

Similar Petitions were received,—

On 24th June, 1887, from miners of Uralla and others—125 signatures.

On 27th June, 1887, from miners of Lucknow and others—49 signatures.

On 28th June, 1887, from miners of Bowling Alley Point and others—49 signatures.

1887.
(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

MINING ON PRIVATE PROPERTY.

(PETITION FROM MINERS OF HOME RULE AND OTHERS.)

Received by the Legislative Assembly, 29 June, 1887.

The humble Petition of the miners of Home Rule and others interested in the mining interests of the Colony.

To the Speaker and the Legislative Assembly of New South Wales,—

We, the undersigned, being miners or interested in the mining developments of New South Wales, respectfully request that the Bill about to be introduced on our behalf by Mr. C. L. Garland, M.L.A., for the purpose of mining on private properties be favourably entertained by you.

There are without doubt, in this extensive territory of New South Wales, large areas of land known to be highly auriferous, and to contain vast deposits of mineral wealth, but which, under existing laws, cannot be touched, thus retarding all tendencies towards natural progress and advancement in the line referred to.

The Bill about to be brought forward by Mr. Garland is, we believe, a step in the right direction, and as such should be entitled to the hearty support of all classes.

It is undoubtedly a matter of the deepest importance, not only to the mining but also to all other industrial classes, that the mineral resources of the country should be fully developed, as by those means new centres of industry would be established, which, with their consequent advantages to the country by opening up new avenues of commercial activity, would contribute largely to the prosperity and welfare of the whole Colony.

We therefore hope and pray that the said Bill will be treated in the manner in which we desire.

And we your most humble Petitioners will ever pray.

[*Here follow 71 signatures.*]

A similar Petition was received,—

On 30th June, 1887, from miners of Tarcutta and others—25 signatures.

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

MINING ON PRIVATE PROPERTY.

(PETITION FROM MINERS OF BULLI.)

Received by the Legislative Assembly, 12 July, 1887.

The humble Petition of the miners of Bulli and others interested in the mining interests of the Colony.

To the Speaker and the Legislative Assembly of New South Wales,—

We, the undersigned, being miners or interested in the mining developments of New South Wales, respectfully request that the Bill about to be introduced on our behalf by Mr. C. L. Garland, M.L.A., for the purpose of mining on private properties be favourably entertained by you.

There are without doubt, in this extensive territory of New South Wales, large areas of land known to be highly auriferous, and to contain vast deposits of mineral wealth, but which, under existing laws, cannot be touched, thus retarding all tendencies towards natural progress and advancement in the line referred to.

The Bill about to be brought forward by Mr. Garland is, we believe, a step in the right direction, and as such should be entitled to the hearty support of all classes.

CLAIM OF MATTHEW M'IVOR TO A TIN-MINE AT PHEASANT'S CREEK

REPORT.

THE SELECT COMMITTEE of the Legislative Assembly, appointed on the 22nd March, 1887,—“with power to send for persons and papers, to inquire into and report upon the claim of Matthew M'Ivor to a Tin-mine at Pheasant's Creek,” and to whom was referred on the same date *the Reports from the Select Committees of Sessions 1883-4 and 1885-6*, in reference to the said claim,—have agreed to the following Report:—

1. Your Committee having considered the Reports referred to them, find as follows:—

- (1.) That application for a mineral lease of block No. 9, of 20 acres, parish of Moogem, county of Clive, was made by Matthew M'Ivor on the 27th day of July, 1881, which application was duly received on the 5th day of August, 1881, by the Warden's Clerk at Glen Innes.
- (2.) That an application for a mineral conditional purchase of the very same land was made on 25th May, 1882, by one G. K. King.
- (3.) That a mineral lease of the said land was duly granted on the 9th day of May, 1882, and afterwards issued to the said Matthew M'Ivor, and a notification thereof appeared in the Government Gazette.
- (4.) That the said Matthew M'Ivor complied with all the regulations respecting said land to entitle him to a lease thereof.
- (5.) That in consequence of unnecessary and unaccountable delay in the Department of Mines, twelve months and five days elapsed between the time the application for lease was made and its being issued.
- (6.) That no less than forty-eight applications for mineral leases made by other applicants, subsequently to Matthew M'Ivor's application, were issued to them before the said lease was issued to the said Matthew M'Ivor.
- (7.) That the said lease was signed by His Excellency the Governor as if executed on the 9th day of May, 1882, whereas actually it was not executed until the 3rd day of June, 1882; and in consequence thereof the said Matthew M'Ivor lost the said land in an action brought by the said G. K. King against him.
- (8.) That the said Matthew M'Ivor had no knowledge of this illegal practice until the point was taken at the trial in the Supreme Court, and by it he lost, not only his land, but was put to very great expense, &c.
- (9.) That, on the faith of the validity of the lease other persons purchased large interests from the said Matthew M'Ivor, and that it is most probable that the mine would have been floated into a public Company, with a capital of £45,000.

2. Your Committee, in view of the foregoing facts, are of opinion :—

- (1.) That as the land applied for was a measured portion, and as in the application the said Matthew M'Ivor said "the previous survey is accepted, being measured portion block No. 9," the lease should have been issued shortly after the application was made.
- (2.) That inasmuch as the said land was in a proclaimed Gold-field it was not legally open to conditional purchase.
- (3.) That upon the evidence of professional and practical men of high standing (in this Colony and Victoria) the said land contains great mineral wealth.
- (4.) That the claim of Matthew M'Ivor is entitled to the most favourable consideration of the Government.

TRAVERS JONES,

No. 3 Committee Rooms,

Chairman.

Sydney, 21st April, 1887.

PROCEEDINGS OF THE COMMITTEE.

WEDNESDAY, 6 APRIL, 1887.

MEMBERS PRESENT:—

Mr. Jones,		Mr. Vaughn,
	Mr. Day.	

Mr. Jones called to the Chair.

Entry from Votes and Proceedings, appointing the Committee, and referring Reports from Select Committees of Sessions 1883-4 and 1885-6, read by the Clerk.

Printed copies of the Reports before the Committee.

Committee deliberated.

(Reassembling of the Committee to be arranged by the Chairman.)

THURSDAY, 21 APRIL, 1887.

MEMBERS PRESENT:—

Mr. Jones in the Chair.

Mr. Henry Clarke,		Mr. Vaughn,
Mr. Day,		Mr. Gibbes.

Committee deliberated.

Motion made (*Mr. Vaughn*) and Question,—“That the Report brought up by a former Committee on this subject, and dated 5 August, 1886, be the Report of this Committee,”—put and passed.

Chairman to report to the House.

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

PROSPECTING FOR GOLD AND OTHER MINERALS.

(REGULATIONS FOR DISTRIBUTION OF VOTE FOR.)

Ordered by the Legislative Assembly to be printed, 12 July, 1887.

REGULATIONS RELATING TO THE VOTE IN AID OF PROSPECTING.

1. From out the sum of £15,000 voted by Parliament for the encouragement of prospecting, such sums may be granted by the Minister for Mines to any miner or party of miners applying for the same, as shall be recommended by the Prospecting Board, as hereinafter provided.

2. Before recommending the grant of any money to any miner or party of miners for the purpose of prospecting any site selected by them, the Prospecting Board shall be satisfied by inquiry and examination that the tract of country proposed to be prospected, and the mode of prospecting proposed, are suitable and shall then estimate the cost of the proposed work, and of the materials and implements necessary therefor.

3. The Prospecting Board shall in no case recommend the granting of a sum exceeding 50 per cent. of the estimated cost of the proposed works and necessary materials and implements.

4. In the event of any money being granted to any miner or party of miners as aforesaid, such miner or miners may, from time to time, claim such instalment thereof as the Warden or other officer authorized thereto by the Minister shall certify as due under these Regulations. But before giving any such certificate, the Warden or other officer shall inspect the work, materials, and implements, in respect of which the instalment is claimed, and shall see that the work has been done within the site, and in the manner approved of by the Board, and that the sum claimed does not exceed 50 per cent. of the value (according to the estimate made by the Prospecting Board) of the work done, and of the cost of materials and implements necessary therefor.

5. The Prospecting Board may in any case in which it shall appear expedient so to do, recommend that, as a condition precedent to the granting of money, the miner or party of miners to whom it is proposed to make the grant, shall enter into a contract to perform the work in the place and manner recommended by such Board, and the miner or party of miners shall, if required, enter into a bond for the satisfactory completion of such work. And every such agreement shall set out in what manner, at what times, and subject to what conditions the money granted, or any instalment thereof, may be claimed.

6. Upon the recommendation of the Prospecting Board, any portion of territory selected as a site for prospecting may be reserved from sale, selection, or leasing, and from occupation under miner's rights or mineral licenses.

7. At any time after the discovery of gold or other minerals within any such reserve, so much of the area as in the opinion of the Minister for Mines shall not be necessary to recompense the miner or party of miners for having made such discovery, shall be thrown open to occupation under the Acts and Regulations relating to Mining.

8. No miner or party of miners to whom aid shall be granted under these Regulations, shall be entitled to claim any money reward which has been, or shall be offered by the Government for the discovery of new gold fields.

9. The Prospecting Board aforesaid shall consist of the Under Secretary for Mines, the Geological Surveyor, and the Inspector of Mines: Provided that the Minister for Mines may at any time appoint any other person a member of such Board, in addition to or in substitution for any of the officers aforesaid.

1887.

(SECOND SESSION.)

NEW SOUTH WALES.

REPORT,

MINUTES OF PROCEEDINGS, RESOLUTIONS, &c.,

OF THE

AUSTRALASIAN STOCK CONFERENCE,

HELD IN SYDNEY IN SEPTEMBER AND OCTOBER, 1886.

Presented to Parliament by Command.

SYDNEY: CHARLES POTTER, GOVERNMENT PRINTER.

[A name in parenthesis signifies that the Member named has moved a resolution.]

CONFERENCE of Chief Inspectors of Stock, Veterinary Surgeons,
and Stock-breeders of the Australasian Colonies, held
in Sydney in September and October, 1886.

REPORT OF AUSTRALASIAN STOCK CONFERENCE.

THE Conference commenced its sittings on the 27th of September, and concluded its labours on the 8th of October.

It was called together by the Hon. the Minister for Mines, with the view of assimilating the regulations in force in the Colonies for the prevention of diseases in stock.

The following were the representatives of the several Colonies :—

<i>New South Wales</i>	{	Mr. A. BRUCE, Chief Inspector of Stock. Mr. R. G. HIGGINS, Stock Breeder. Mr. E. STANLEY, F.R.C.V.S., Government Veterinarian.
<i>Victoria</i>		Mr. E. M. CURR, Chief Inspector of Stock.
<i>Queensland</i>	{	Mr. P. R. GORDON, Chief Inspector of Stock. Hon. H. C. WOOD, M.L.C., Stock Breeder.
<i>Tasmania</i>	{	Mr. T. A. TABART, Chief Inspector of Stock. Mr. A. PARK, M.R.C.V.S., Government Veterinarian. Mr. J. MEREDITH, Stock Breeder.
<i>New Zealand</i>	{	Hon. W. S. PETER, M.L.C., Stock Breeder. Mr. J. D. LANCE, M.H.R., Stock Breeder. Mr. J. M'KENZIE, M.H.R., Stock Breeder. Mr. G. S. COOPER, Under Secretary, Wellington.
<i>South Australia</i> ...	{	Mr. C. J. VALENTINE, Chief Inspector of Sheep. Mr. J. BAGOT, M.P., Stock Breeder.

The following is a copy of the circular letter, dated 30th July, by which the Conference was called together :—

“ Sir, Colonial Secretary's Office, Sydney, 30th July, 1886.

“ Referring to my letter of the 8th February last, in which attention was invited to the desirability of assimilating the regulations in force in all the Colonies relating to sea-borne sheep, I have now the honor, at the instance of my colleague the Secretary for Mines, to enclose, for the consideration of your Government, a copy of a minute by the Chief Inspector of Stock for this Colony, with reference to the holding of a Conference in Sydney for the purpose abovementioned, and to suggest that each Colony be represented at such Conference by its Chief Inspector of Stock and two gentlemen connected with stock-breeding.”

The Conference was opened by the Minister for Mines, who pointed out the vast interest with which the Conference were about to deal. He said that the value of horses, cattle, and sheep in the Colonies was estimated at £78,994,871, and the income therefrom £33,669,973. Taking the capital value of land with improvements and plant and the capital value of stock, the total was £359,000,000.

The Minister having declared the meeting opened, withdrew, and Mr. A. Bruce was appointed Chairman.

RESOLUTIONS PASSED BY THE CONFERENCE.

1. *Preliminary.*

1. That each Colony have three votes.
2. That the following be the subjects for discussion, and the order in which they are to be taken :—
 - (I.) The consideration of Regulations with respect to diseases in animals.
 - (II.) Regulations relating to the introduction of Australasian animals—
 - (1) by sea, (2) by land.
 - (III.) Regulations with respect to the introduction of Foreign animals.
 - (IV.) The collection and publication of information with respect to diseases in animals.
 - (V.) Regulations in regard to the travelling, movement, or conveyance of animals.
 - (VI.) The destruction of noxious animals.
 - (VII.) The destruction of weeds and noxious plants.
 - (VIII.) The branding and marking of animals.
 - (IX.) Any other subject which may be suggested and agreed to by the members of the Conference connected with the object for which it is convened.
3. That the term "Australasian Colonies" comprise the Colonies on the Continent of Australia, also Tasmania and New Zealand; and that the term "Foreign" shall be held to include all other parts of the world.

2. *Diseases in Animals.*

4. That Legislative power be taken to compel the destruction of all animals which have died of or are suffering from Anthrax, and that all other animals which have been in contact with the diseased animals be, where practicable, placed in proper quarantine until certified free from disease.
5. That the travelling, selling, or offering for sale, or slaughtering for food, of any animals affected with the disease known as Tuberculosis, or the using of cows affected with Tuberculosis for dairy purposes, be punishable by law.
6. That power be taken to destroy animals actually diseased with Pleuro-pneumonia; that penalties be enforced for leaving diseased animals or dead bodies undestroyed; and that stockowners be compelled to give notice in writing of every outbreak of the disease to the Chief Inspector of Stock and to the nearest Inspector of Stock.
7. That the Conference desires to express its belief in the efficacy of inoculation as a preventive of Pleuro-pneumonia.
8. That inoculation for Pleuro-pneumonia be not made compulsory.
9. That communication be opened with M. Pasteur with a view to ascertain whether the virus or contagium of Pleuro-pneumonia has been or can be cultivated apart from the living subject; and if so, to state the mode of cultivation, as also the best methods of preparing and preserving virus for inoculation.
10. That all sheep infected with Catarrh be destroyed; that the owners be recompensed to the extent of two-thirds the value of sound sheep at the date of destruction; and that the run or place on which the sheep were pasturing be strictly quarantined for six months.
11. That, as the conditions are so various in the different Colonies, each Colony should legislate for itself, where practicable, on the subjects of fluke, worms, and foot-rot in sheep.
12. That the Government of Western Australia be urged by the Governments of the Colonies represented at the Conference to take all possible steps for the speedy eradication of Scab.
13. That the Conference having heard from Mr. Lance, one of the New Zealand delegates, the steps taken by the Government of that Colony with regard to Scab are satisfied that the stringent measures being adopted will result in the speedy eradication of the disease.
14. That the several Governments obtain power, in the event of an outbreak of Scab, to destroy at their discretion the infected sheep, and those that have been in direct or indirect contact with them, and to take every other means for the absolute and immediate eradication of the disease.

15. That steps be taken by the several Australasian Colonies to thoroughly eradicate Ticks and Lice in sheep.

16. That any animals found to be infected with Glanders, Farcy, Foot-and-mouth disease, Rinderpest, Sheep Pox, Swine Fever, Rabies, Trichinosis, or any other infectious or contagious disease not existing within the Colonies be at once destroyed.

17. That it is desirable that an efficient and competent staff of Inspectors of Stock be maintained in each Colony, to prevent the introduction and to arrest the spread of Scab or any other contagious or infectious disease.

Interchange of Australian Animals.

18. That no sheep from any of the Australasian Colonies in which Scab exists be introduced into any of the other Australasian Colonies.

19. That no Colony shall be deemed to be a clean Colony in which Scab exists or has existed within the next preceding twelve months.

20. That no breeding sheep shall be imported except by vessels that have not traded to any but a clean Australasian Colony within the next preceding six months, nor by any vessel which shall within that period have had any sheep on board from any Colony or country other than a clean Australasian Colony.

21. That all breeding sheep be accompanied by a certificate of an Inspector of Sheep, or a declaration of health certified by an Inspector of the Colony from which they came that such sheep are clean, and that Scab has not existed there for the preceding twelve months.

22. That imported breeding sheep from any of the Australasian Colonies, before they are allowed to go at large in any other Australasian Colony, be placed in quarantine until they have been once dipped in a tobacco and sulphur or lime and sulphur dressing.

23. That the temperature of the dip be not less than 100, nor more than 110 degrees Fahrenheit.

24. That the sheep swim and be completely immersed while in the bath, and the bath to last from one to two minutes, according to its temperature, and as the case may require.

25. That no fodder, straw, litter, or excreta with or about imported sheep be landed; and that all fittings, cases, or cages brought with such sheep and landed be cleansed and disinfected, as the Chief Inspector shall direct, or be re-shipped.

26. That it be not necessary to dip fat sheep imported from any clean Australasian Colony to another Australasian Colony solely for the purpose of slaughter; provided that such sheep be slaughtered in accordance with the regulations of the Colony into which they are imported.

27. That stock, unless from Western Australia, which are allowed by law to travel in the Australasian Colony in which they have been bred, or into which they have been introduced, in accordance with the law there in force, be allowed to enter any neighbouring Colony by land at any lawful place of entrance without further obstacle, unless it be found, on examination by an Inspector of the Colony into which it is proposed to introduce such stock, that they are infected with some disease which is held to be contagious or infectious by the law of such Colony, or unless such Inspector has reason for suspecting the presence of contagious or infectious disease in such stock; and the fact that stock are held to be free from disease in any Colony, and so allowed to go at large, be *primâ facie* evidence of their freedom from contagious or infectious disease.

28. That where an outbreak of disease occurs in any Colony the neighbouring Colonies may, pending the expense and risk of the outbreak being definitely ascertained, at once issue a prohibition against the introduction of stock from such Colony; and that the duration of the prohibition depend upon the amount of risk arising from such outbreak.

29. That the Conference desires to express its strong opinion, in view of the prospect of the assimilation of the stock regulations of the different Colonies, and the great desirability for the freest interchange of stock, that it is undesirable that any duty be charged upon stock going from one Colony to another.

4. *Introduction of Foreign Animals.*

30. That the time has arrived when the prohibition on the importation of cattle and sheep from the United Kingdom may, under proper restrictions, be safely removed, and that the Governments of Australasia be requested to give effect to this resolution.

31. That the importation of Goats and Deer be prohibited, except for Zoological Gardens.

32. That the importation of Pigs be prohibited, as Swine Fever is prevalent in England.

33. That Foreign Dogs landed in any Australasian Colony be detained in quarantine at a special place set apart for the purpose by the Government of each Colony for a period of six months from date of arrival.

34. That Camels be inspected on arrival by an Inspector of Stock and a Veterinary Surgeon, and if they are not infected with disease they be permitted to land, and be quarantined for the same period as cattle, namely, 120 days; that if they are infected with Foot-and-mouth disease or Rinderpest they be destroyed; and that all Camels suffering from any skin disease be treated in such manner as the Chief Inspector shall direct, and under his control.

35. That the following be included among the regulations under which foreign stock are admitted into any Australasian Colony:—

- (a.) That foreign stock leaving for exportation to any of the Australasian Colonies be accompanied by a declaration from the owner or breeder that they are not infected.
- (b.) That all foreign cattle and sheep be taken direct from the place from which they start to the port of shipment; and if they do not travel on foot they be conveyed in a goods waggon, and not put into any conveyance, stable, or other place where animals liable to the same diseases have been within the next preceding 60 days.
- (c.) That all animals, except horses, exported to Australasia be shipped from the port of London.
- (d.) That the Agents-General for the several Colonies be asked to appoint one (*i.e.*, the same) registered Veterinary Surgeon to examine all stock intended to be exported to any of the Colonies; such Veterinary Surgeon to give a certificate of health to accompany the animals.
- (e.) That the skins of all animals which may have died or been slaughtered on board any foreign vessel during the voyage, and not destroyed or thrown overboard, be salted and securely packed in cases or casks, and not landed.
- (f.) That foreign animals be only admitted at such port or ports as shall be declared quarantine ports for such animals.
- (g.) That a declaration be obtained from the captain of the vessel as to the health of foreign stock on board on arrival in port.
- (h.) That the introduction by sea or land of any animal or thing infected or suspected of being infected be prohibited.
- (i.) That if foreign animals are infected they be destroyed or disposed of, as the Minister directs.
- (j.) That if any foreign animals are brought to a port or place in an Australasian Colony, but are not intended to be landed, they be examined by an Inspector or Veterinary Surgeon, and if found free from infectious or contagious disease removed to quarantine, and there kept until the sailing of the vessel, the expense of their detention in quarantine being defrayed by the owner. If their owner refuse to send the animals to quarantine they be forthwith destroyed on board.
- (k.) That foreign horses be admitted without quarantine if found, on inspection by a properly qualified Veterinary Surgeon and Inspector of Stock, to be free from disease.
- (l.) That foreign animals intended to be landed in the Colonies be examined by a Veterinary Surgeon and an Inspector of Stock, who shall report to the Chief Inspector of Stock whether or not such or any other animals on board such vessel are infected.

(m.)

- (m.) That if foreign animals other than horses are not prohibited, and are reported free from infection, and if the Chief Inspector be satisfied that they are not infected, they may, after being washed and disinfected, as he shall direct, be landed for quarantine on sufficient bond and guarantee.
- (n.) That all foreign animals be conveyed by water, at the owner's risk and expense, to quarantine, and remain for the terms respectively prescribed for the different kinds of animals, at their owner's risk and expense, and that they be washed, dipped, and disinfected, as the Chief Inspector of Stock shall direct.
- (o.) That the period of quarantine for cattle be 120 days.
- (p.) That all foreign sheep landed in any Australasian Colony remain in quarantine for a period of not less than 90 days.
- (q.) That all foreign sheep landed in the Colonies forthwith receive two or more dressings with tobacco and sulphur, or with lime and sulphur, at intervals of from ten to fifteen days between each dressing, with the medicaments of the strength, at the temperature, and for the duration prescribed in regard to imported Australasian sheep.
- (r.) That on the expiry of the term of quarantine prescribed for foreign animals they be examined by a duly qualified Veterinary Surgeon and an Inspector of Stock, and released on the order of the Chief Inspector.

5. *Publication of Information re Diseases.*

36. That the several Governments be invited to collect, publish, and exchange all original useful information with respect to diseases in animals, and their prevention and cure.

6. *Regulations re Travelling and Movement of Animals.*

37. That regulations in regard to the travelling, movement, or conveyance of animals be left to be dealt with by each Colony within its own boundaries.

7. *Destruction of Noxious Animals.*

38. That, as the skins of marsupials have become so valuable, the several Governments of the Colonies in which marsupials exist instruct the Vermin Boards, or others who have the administration of the law, not to levy assessment for the coming year, or for such further period as may be deemed advisable.

39. That the means at present available for the destruction of rabbits are most costly, and are not radical cures, and that until some discovery shall have been made more searching and fatal in its effects upon rabbits than anything at present known their absolute eradication cannot be accomplished. The Conference therefore recommends that a bonus be offered by the Australasian Colonies collectively for the purpose of bringing about such a desirable object; such bonus to be granted under such regulations as to success as the Colonies may consider desirable.

8. *Destruction of Noxious Plants.*

40. That the Governments of the several Colonies, where they have not already done so, take power to make the destruction of noxious plants compulsory, such as Prickly Pear, Californian Thistle, Bathurst Burr, Noogoora Burr, and other plants injurious to wool, stock, or pastures.

41. That collections be made of all plants suspected of being poisonous to stock, with the view to their true character being ascertained by analysis, feeding of stock, and otherwise, and to the necessary steps being taken to prevent, as far as possible, losses to stock by such plants as are found to be poisonous.

9. *The Branding and Marking of Animals.*

42. That only such ear-marks as are authorized by the Governor-in-Council and registered with the Inspector for the district be used for sheep; that the "tip" mark be prohibited; and that all ear-marks be made with pliers.

43. That any stockowner owning runs in different Colonies, with the sanction of the Registrars of Brands, be permitted to register in each Colony the brand in use by him and registered in his name in either Colony; and that it be a recommendation of the Conference that such Colonies as have legislation on the subject so amend their Brands Acts as to give effect to this resolution.

44. That the dew-lap mark be reserved in all Colonies having legislation upon the branding and marking of stock as a distinctive mark for spayed cows.

45. That the distinctive mark in use in Queensland—taking the tip off the off (*i.e.*, the right) ear—be used throughout the Colonies as the sign of inoculation.

10. *Additional.*

46. That all drafts of laws or regulations dealing with the diseases of animals be, as far as practicable, submitted by the Government framing them to the Governments of the other Colonies for remark before they become law.

47. That it is desirable that regulations be framed on the resolutions passed by the Conference so that the regulations and relative certificates in each Colony may, as far as practicable, be the same in all the Colonies.

48. That the Conference recommends to the Queensland, South Australian, and Western Australian Governments the desirability of exercising the greatest possible vigilance with respect to their northern ports to prevent the introduction of diseases from Eastern, Indian, or Chinese ports.

49. That the Conference, taking into consideration the importance of the subjects that have come before them for discussion and decision, are of opinion that an Australasian Stock Conference should be held triennially at the chief city of one of the Colonies, and they respectfully offer this recommendation to the several Governments.

ALEX. BRUCE,
Chairman.

MINUTES of Proceedings of the Australasian Stock Conference, held in Denham Chambers, Sydney, September and October, 1886.

Denham's Chambers, Sydney, Monday, the 27th September, 1886.

THE UNDERMENTIONED gentlemen were present:—The Honorable JAMES FLETCHER, Minister for Mines; Mr. HARRIE WOOD, Under Secretary for Mines; and the following representatives of the several Australasian Colonies.

<i>New South Wales</i>	{ Mr. A. BRUCE, Chief Inspector of Stock. Mr. E. STANLEY, F.R.C.V.S., Government Veterinarian.
<i>Victoria</i>	Mr. E. M. CURR, Chief Inspector of Stock.
<i>Queensland</i>	{ Mr. P. R. GORDON, Chief Inspector of Stock. The Hon. H. C. WOOD, M.L.C., Stock Breeder.
<i>South Australia</i> ..	{ Mr. C. J. VALENTINE, Chief Inspector of Stock. Mr. J. BAGOT, M.P., Stock Breeder.
<i>Tasmania</i>	{ Mr. T. A. TABART, Chief Inspector of Stock. Mr. A. PARK, M.R.C.V.S., Government Veterinarian. Mr. J. MEREDITH, Stock Breeder.
<i>New Zealand</i>	{ The Hon. W. S. PETER, M.L.C., Stock Breeder. Mr. J. D. LANCE, M.H.R., Stock Breeder. Mr. G. S. COOPER, Under Secretary, Wellington.

Western Australia was unable to send a delegate.

The Hon. James Fletcher took the chair for the purpose of formally opening the meeting.

Mr. FLETCHER said that so far back as February last some steps were taken to bring about a conference from the various Colonies of the Chief Stock Inspectors; but, for some reason or other—he supposed from no Government being allowed to keep office long—the matter was allowed to lie over until the present Government came into office. His attention was called to the matter by Mr. Bruce, Chief Inspector of Stock for this Colony, and he immediately took steps to give effect to the request then made. They were present in consequence of that request. The importance of the questions to come under their notice could not be over-estimated; and since he had been in office—a few months—he had found a great deal of difficulty, in consequence of the difference in the regulations of the various colonies, of dealing with these matters. It occurred to him that if the gentlemen connected with stock in the various colonies met and deliberated, it would be possible to more nearly assimilate the regulations so as to offer greater facilities for the interchange of stock, and yet guard against the importation of disease into any of the colonies. He had had a statement prepared which warranted him in taking the initiative in asking them to meet that day. He found from this carefully prepared statement that the value of horses, cattle, and sheep in the various colonies was estimated at £78,994,871 6s. It would be needless for him to give the estimated value of the stock in each colony. He simply contented himself with giving the gross amounts. The gross income, on the same basis, was estimated at £33,669,973. Taking the capital value of the land with improvements and plant and the capital value of stock, the figures furnished him represented a total of £359,000,000. With such an enormous capital it surely behoved everyone in authority to do everything possible to offer all possible facilities for the interchange of stock with, as he had said, proper precautions against the introduction of disease. He had very great hopes with the experience that they had gained that the result of their deliberations would be that the regulations would be more in harmony than they were at present, that proper precautions in their administration would be maintained, and that altogether the stock-breeding interest would be largely benefited by their assembling. It was his desire to give effect, as far as possible, to their recommendations, and to have them carried out. The colonies were not equally represented—some had two representatives, some three, and one had only one. He would therefore recommend that while they allowed all the representatives to take part in the debate, they should simply vote as colonies. For instance, it would be clearly unfair for New South Wales to have three votes while Victoria had only one or Queensland only two. In declaring the Conference open he could assure them that he hoped it would be for the good of all the colonies, that in future they would not have so much friction in carrying out the regulations as in the past, but that everything would be done to offer the greatest facilities to stock-breeders with a due regard for the protection of stock against disease. He hoped their deliberations would have that result, and that the time was not far distant when every stock-owner in the colonies would be thankful for this Conference sitting to-day.

The following is the Tabulated Statement referred to by the Minister for Mines :—

STATEMENT of the Number and Approximate Estimate of the value of the Horses, Cattle, and Sheep in New South Wales, Victoria, Queensland, South Australia, Western Australia, Tasmania, and New Zealand, 1885.

Capital Value of Stock 79,000,000

£359,000,000

The Minister and Mr. Harrie Wood then withdrew.

Mr. WOOD moved, and Mr. TABART seconded, that Mr. Alexander Bruce be the permanent Chairman of the Conference.

The motion was agreed to, and Mr. Bruce took the chair.

The following papers having reference to the appointment of the Conference were laid before the meeting, together with copies of the "Stock and Pastures Bill for New South Wales":—

Circular letter from Colonial Secretary, New South Wales, to Governments of other Colonies.

Sir, Colonial Secretary's Office, Sydney, 8 February, 1886.

I have the honor, at the instance of my colleague the Secretary of Mines, to transmit herewith, for the consideration of your Government, a copy of a recommendation of the Metropolitan Board of Sheep Directors, regarding the quarantining and dressing of sheep brought to New South Wales by sea from any of the other clean Australian Colonies, together with a statement showing how the regulations affecting such sheep differ, and to draw attention to the advisability of assimilating the regulations in force in all the Colonies relating to sea-borne sheep.

I have the honor to be,
Sir,

Your most obedient servant,

Sir, Board of Sheep Directors, Sydney, 7 January, 1886.

With reference to the correspondence submitted to this Board respecting the stringency of the regulations at present in force in regard to the introduction into this Colony of sea-borne sheep from other Australian Colonies, and as to the advisability of assimilating the laws in this respect in each of the Colonies, I have the honor to state that the subject was very fully considered at meetings of the Board held on the 10th and 19th November last, when the following resolution was unanimously adopted:—Proposed by Mr. E. Vickery, seconded by Mr. D. M'Master—"That this Board having carefully considered the correspondence, minutes, and petition submitted by the Minister for our consideration, resolved that this Board recommend that the regulations of 10th April, 1885, be modified so as to provide that the certificate of the Chief Inspector of Stock be deemed sufficient, that the quarantine be reduced from eighteen to twelve days, and that the term of two years, in clause 5, be reduced to twelve months."

"That in all other respects the regulations be adhered to."

I have, &c.,
R. G. HIGGINS,
Chairman.

The Under-Secretary for Mines.

STATEMENT

STATEMENT as to the Regulations under the Diseases in Sheep Acts as in force in each of the under-mentioned Colonies, with regard to the Quarantine and Dressing of Sheep introduced into each.

Colony.	Quarantine.			Dressings.			
	Length.	From what Colony.	Remarks.	No.	Remarks.	Ingredients.	
New South Wales.	*Eighteen days.	Clean Colonies..	Prior to dipping	1	Tobacco and sulphur.	Sheep from infected Colonies prohibited
Queensland.	Twenty-one days.	Any Colony.....	3	At ten days' interval.	As Chief Inspector directs	
Victoria ...	Twenty-four hours.	1	Or more, as Chief Inspector directs. (Practice is two dippings in twenty-four hours.)	Lime and sulphur.	
South Australia	Six days ...	Clean Colonies..	As Chief Inspector directs ...	1	Sulphur and lime, or sulphur and tobacco.	Sheep from New Zealand and Western Australia prohibited
	Not less than fourteen and likely thirty days	New Zealand, Western Australia.	Infected Colonies	3	According to circumstances	Sulphur and lime, or sulphur and tobacco.	
Tasmania ...	Nil	Allowed to travel inland when dipped.	1	According as Chief Inspector directs.	As Chief Inspector directs	
New Zealand.	Ten days ...	Any Colony.....	Allowed to land if accompanied by Inspector's certificate at port at which they were shipped, and that the vessel has not been in any outside port for the previous six months.	2	In ten days	
Western Australia.	On inspection.	Any Colony.....	Ninety days' quarantine if unaccompanied by Inspector's certificate at port where shipped from.	

* Now twelve days.

Sir,

Colonial Secretary's Office, Sydney, 30 July, 1886.

Referring to my letter of the 8th February last, in which attention was invited to the desirability of assimilating the Regulations in force in all the Colonies relating to sea-borne sheep, I have now the honor, at the instance of my colleague the Secretary for Mines, to enclose, for the consideration of your Government, a copy of a Minute by the Chief Inspector of Stock for this Colony, with reference to the holding of a Conference in Sydney for the purpose above mentioned, and to suggest that each Colony be represented at such Conference by its Chief Inspector of Stock and two gentlemen connected with stock-breeding.

I have, &c.,

Minute Paper.—Conference in Sydney of Chief Inspectors of Stock.

Department of Mines, Stock Branch, Sydney, 19 May, 1886.

It having been decided by the Hon. the Minister, on the suggestion of Mr. Chief Inspector Tabart, of Tasmania, to invite the Chief Inspectors of Stock and Government Veterinarians for the several Australian Colonies (including New Zealand) to meet in Sydney in the month of September next, with the view to the assimilation of the Regulations in force in these Colonies for the prevention of diseases in stock, the Colonial Secretary might perhaps be moved to transmit copies of this Minute to the Governments of these Colonies, and invite them to take part in the proposed Conference.

If this invitation be accepted, it would, I think, be well that the subjects to be discussed should, in the interval, as far as possible, be settled, so that the members on coming to the Conference may be fully prepared to take part in the discussions as they arise, and to vote under the direction of their respective Ministers.

With that view, therefore, and with the view also of furthering the proceedings, I would suggest a list of subjects for discussion, on the understanding that it is only tentative, which any member may amend; but any amendment should be communicated to the other members one month at least prior to the date when the Conference meets.

The following are the subjects which I would suggest for discussion, namely:—

1. Regulations with respect to the introduction of "Foreign" animals, *i.e.*, animals from places outside the Australian Colonies.
2. Regulations relating to the introduction of "Australian" animals.

(I.) By sea.

(II.) By land.

113—B

3.

Programme.

3. Regulations with respect to Diseases, such as—
- | | |
|---------------|---|
| (1.) Scab. | (6.) Anthrax. |
| (2.) Catarrh. | (7.) Pleuro Pneumonia. |
| (3.) Fluke. | (8.) Tuberculosis. |
| (4.) Worms. | (9.) Foreign Diseases, <i>i.e.</i> , diseases not known in the Australian Colonies. |
| (5.) Footrot. | |
4. Regulations in regard to the travelling, movement, or conveyance of animals.
 5. Regulations for the prevention of cruelty to animals.
 6. The collection and publication of information with respect to diseases in animals.
 7. The carrying out, reporting, and comparing experiments made, with the view of ascertaining the nature, cause, prevention, and cure of diseases in animals.
 8. The destruction of noxious animals.
 9. The destruction of weeds and noxious plants.
 10. The branding and marking of animals.
 11. Any other subject which may be suggested and agreed to by the members of the Conference, connected with the object for which it is convened.

ALEX. BRUCE,
Chief Inspector of Stock.

SUBJECTS TO BE DISCUSSED, AND ORDER OF DISCUSSION.

The CHAIRMAN said that the first thing that would have to be done by the Conference would be to settle the programme of business. He suggested that they should take as a basis the statement attached to his minute paper of 19th May, 1886, in which certain subjects were set forth.

This was agreed to.

The CHAIRMAN then suggested that they should now consider what diseases should be dealt with.

Mr. VALENTINE suggested that Nos. 3, 2, and 1 be taken as 1, 2, and 3.

Mr. WOOD agreed that the proposed order would be the best.

Mr. CURR pointed out that there were some matters besides diseases which ought to be taken notice of. For instance, there were ticks in sheep, which was not a disease, yet in Victoria the sheep-owners were very desirous of treating ticks as they did scab and getting rid of them altogether. In veterinary works ticks were not spoken of as a disease. They came more under the head of management. Other diseases, such as parasites, might be introduced here, and it might be desirous to deal with such matters. He had always thought that the Ministers of the different Colonies should have the power to deal with as diseases anything that appeared in that way. It was for the meeting to consider what they would do in reference to this matter. He thought that the various Colonies should take some action, either together or individually.

Mr. LANCE said they had suffered very much in New Zealand from lice; but they introduced legislation on the subject, and it proved effectual.

Mr. VALENTINE thought that ticks might be included under the head of No. 3—ticks and other parasites.

The CHAIRMAN said that ticks or other ailments might be included in the list to be considered.

Mr. LANCE did not think that the Conference should be asked to go into the subject of all diseases, for if that were done they might sit for ever.

Mr. COOPER asked what they intended by "regulations in respect to disease"; whether it meant regulations in the direction of prescribing a method of eradication and enforcing it, or whether it was for the prevention of the introduction of disease from one colony into another?

The CHAIRMAN said that it was intended to include the whole. He thought that they might take the different diseases mentioned in the circular letter, and any others they thought worthy of consideration.

Mr. CURR said it had long been his view on the subject that they should only deal with each other's regulations where there was a general interest at stake; where there was no such interest, he thought, they should not hamper other Colonies, or have too many regulations. If they could agree upon a dozen lines in the way of legislation they would do very well. The less legislation they had the better.

Mr. LANCE said if there was one subject on which unanimity might be expected it was the question of scab, yet it appeared that even on that there were differences of opinion. Therefore, if they debated every subject connected with stock their sittings would never terminate.

Mr. VALENTINE thought they had better leave the diseases affecting foreign animals until they had dealt with those affecting their own.

Mr. CURR thought that the foreign policy they would recommend to the several Governments would be by far the most important. When they had made up their minds on that they would have clear sailing with regard to their own animals, but they could not know what to do in intercolonial matters until they had considered the shipping business altogether.

Mr. VALENTINE thought they should first consider their own regulations apart from others entirely. The regulations connected with the outside would not be in any way connected with their own. In one case they were dealing with the health of their animals, and in the other with animals that might introduce disease.

Mr. VALENTINE suggested, and it was agreed, that Nos. 3, 2, and 1 of the statement attached to the minute of 19th May, 1886, stand as Nos. 1, 2, and 3.

Mr. STANLEY moved, that No. 6 stand as No. 4; Mr. BAGOT seconded the motion, which was agreed to.

Mr. STANLEY moved—"That No. 4 stand as No. 5; Mr. PARK seconded the motion, which was agreed to."

Mr. CURR moved—"That No. 7 be struck out; Mr. COOPER seconded the motion."

Mr. MEREDITH said he did not understand the idea of a motion to strike this out.

Mr. CURR: The number of people who might be of any use to make these experiments might be counted on the fingers. As far as he was aware this Conference was not sitting for the purpose of thrusting upon their Governments things that would be shelved. He considered that it would be 100
to

to 1 if they got a man to perform the necessary experiments, and if they did he would be some celebrated Programme man whose services they would not be able to obtain.

Mr. STANLEY said it did not need a celebrated man to collect poisonous plants and feed animals on them; such information might be easily obtained in any colony, and would be reliable for the others. That was the sort of experiments he thought this question referred to. It had recently been proposed by the South Australian Government that they should have permission to introduce a disease from Germany, and were they to be in a position to say anything on this matter? It was important to know what diseases they proposed to introduce and what experiments they would carry on. It was important that there should be a feeling of reciprocity in this matter.

Mr. BAGOT explained that the disease referred to was one which affected only rabbits and cats, and was absolutely fatal to rabbits. It was proposed, on the suggestion of Professor Watson, Professor of Anatomy at the Adelaide University, that it should be used for the purpose of destroying rabbits. Professor Watson went Home on his own business, on leave, but a sum of £100 was contributed towards his expenses. He went to Germany, where he was well known and had passed his student's days, to make investigations with regard to this disease and bring it out. He was a passenger in one of the Messageries boats, but there was such a fearful dislike to the animals which he was bringing out that he believed they were killed, at all events none reached South Australia alive. Professor Watson was so convinced that it was going to be an absolute means of eradicating the rabbits that he urged the use of it very strongly, and he (Mr. Bagot) thought he was qualified to speak on the subject when he said it could not be contracted by any other animal but the domestic cat. It would not affect stockholders injuriously, but, on the contrary, would be a benefit to them.

Mr. STANLEY: Might I ask the name of the disease?

Mr. BAGOT: *Sarcoptes Cuniculi*.

Mr. PARK: Sarcoptic scabies. He had been promised some rabbits infected with the disease by the Hon. W. A. B. Gellibrand, but the season having been dry none could be found. As a general rule every wet season the rabbits became infected, and, if they caught one, it could almost be snapped in two like a carrot from the effects of the disease. Notwithstanding this, they continued to breed.

Mr. COOPER thought they should make only practical suggestions such as their Governments would be likely to lay before the Legislatures. They should not overweight them by introducing matters which would make their suggestions too heavy. He begged to second Mr. Curr's amendment.

Mr. LANCE said that if he thought for one moment that in striking out the item they would prevent the introduction of poison into rabbits he would not do it, for he believed that was the only way of dealing with the pest; but No. 8 would do that. He would ask them to look at the vast nature of this subject. They could number diseases by the thousand.

Mr. GORDON: I shall support it formally.

The CHAIRMAN said they were beginning to do what was being done in other parts of the world; and although some experiments might be very difficult to carry out, there were simple experiments which they might make. There was no reason why they should not be carried out here as well as in the old country. No Government was obliged to take the matter up unless it chose to do so. If they thought anything was worth recommending, why should they not recommend it?

The motion was struck out.

Mr. STANLEY moved, and Mr. BAGOT seconded, That No. 4 stand as No. 5.

Mr. CURR moved an amendment, that No. 4 be struck out. He held that they should not interfere with the doings of other colonies more than they could help: what suited one colony might not suit another. In Victoria they would not submit to registration of brands and giving travelling notices, as was done in Queensland. For instance, a man near Warrnambool had 100 sheep, and wanted to sell them. He got notice on Friday from his agent in town that sheep would fetch a good price, say on Monday. He required to send off the sheep at once by train; but if he had to have them passed by the Inspector, he would lose his sale. The Victorian Legislature consequently would not pass such a regulation. We should only propose such regulations as would affect beneficially the whole of the colonies. Many which would suit Victoria would not suit Queensland, and *vice versa*. This Conference had to deal principally, if not entirely, with disease. The question before us has nothing to do with disease. The stock-owners of New South Wales are quite competent to make such regulations as they required.

Mr. PETER seconded the amendment.

Mr. MEREDITH said he was not present to interfere with the regulations of the other Colonies, but he had come to protect the interests of the Colony which he represented. This was an important matter as far as Tasmania was concerned. Subject 4 provided for the regulation of the travelling, movement, or conveyance of animals. There was no disease of any kind in the herds of Tasmania. The stock-breeders were desirous of improving their herds, and fully understood their business. They imported bulls from Victoria, and the animals were taken by train to the port of shipment. Unless there were certain regulations to prevent clean stock becoming diseased by travelling in trains in which infected stock might have been previously conveyed, what security had the breeders in Tasmania that pleuro or some other disease was not introduced into the herds and flocks of Tasmania. In Victoria there was no precaution with regard to the prevention of contagious diseases by disinfecting the trucks. Unless some such regulations were adopted, Victoria and the other Colonies would be shut out from Tasmania, and for that reason alone it would be necessary to frame some such resolutions. He would like to know whether there was any fear of stock or land being infected from the droppings, &c., from trucks while conveying sheep or cattle infected with Cumberland disease, or of sheep or cattle becoming infected if carried in the same truck afterwards. Was it possible to effectually disinfect trucks having had in them stock infected with Cumberland disease.

Mr. CURR pointed out that whatever the Conference might do there was nothing to prevent Tasmania from making such regulations for the safety of its stock as the Colony might think fit. They were present to recommend, as far as possible, the adoption of universal regulations. As the Minister had said, they had assembled to try and get over certain difficulties, and endeavour to adopt a general system as far as was practicable; but they had not met to discuss what the Tasmanian people would do with regard to their Colony. In Victoria every herd had had pleuro, and there was nothing to prevent Tasmania receiving bulls from there only under fixed conditions. Victoria might also say "we will not receive your rams except under certain conditions," but that was not a question for the Conference to deal with.

Programme. with. They were simply present to recommend certain general courses of action which could be adopted by the whole of the Colonies. About details it would be impossible to agree.

Mr. MEREDITH thought they had met to help in facilitating the interchange of stock among the Colonies, while preventing contagious disease. It appeared, however, from the last speaker that that was not the object of Victoria. All that was desired was that certain regulations should be enforced with regard to the conveyance of stock from any Colony to another. There should be universal regulations for the movement of stock by train, and there should be precautions taken to prevent stock going from one Colony to another becoming infected in the train, and taking that infection with it. Without some such regulations there was no security.

Mr. CURR: You think, as our cattle have pleuro, that our trains, which are thus constantly carrying diseased animals, should be disinfected after every mob of cattle that occupies them.

The CHAIRMAN understood Mr. Meredith to mean that cattle leaving one Colony for another should be accompanied by a certificate, which would be accepted, stating that they had not been carried in any conveyance in which they were likely to become infected. At present a declaration now accompanied stock from one Colony to another, and also a certificate of cleanness from an Inspector.

It was resolved that the motion be retained.

Mr. STANLEY moved, and Mr. BAGOT seconded, that No. 8 stand as No. 6.

Mr. CURR moved an amendment that No. 8 be struck out.

Mr. CURR said that it was an important subject, but it would have to be dealt with according to the requirements of each Colony. In one Colony a noxious animal might be got rid of by one means, and in a second by another.

Mr. LANCE thought they might discuss the question, and see whether it would be wise to recommend the Governments to go into the matter. Rabbits would never be eradicated unless some disease was introduced among them. Many people thought they should invoke the aid of science, and there was great hopes that something would be discovered which would destroy the rabbit without proving hurtful to the sheep.

Mr. GORDON was strongly of opinion that the subject ought to be considered. Two Governments, Queensland and New South Wales, had already taken it up. He had to destroy kangaroos and wallabies in Queensland, and why should not the other Colonies deal in a similar manner with other noxious animals.

The CHAIRMAN: We are paying over £100,000 a year for the destruction of marsupials.

Mr. GORDON: We have paid £70,000.

Mr. LANCE: Rabbits cost New Zealand half a million sterling a year.

The amendment was negatived.

Mr. STANLEY moved, and Mr. TABART seconded, that No. 9 stand as No. 7.

Mr. CURR moved, and Mr. PETER seconded, an amendment, that it be struck out.

Mr. TABART said that in Tasmania they had great difficulty in dealing with these noxious weeds. One weed which caused great trouble was the Californian thistle. By discussion some useful plan might be arrived at for dealing with these weeds.

Mr. LANCE: It has just been introduced into New Zealand.

Mr. TABART: In Southern Tasmania it has taken possession of our agricultural lands.

Mr. CURR: It is because I do not think that anything can be found to get rid of it that I moved that it be struck out.

Mr. TABART said that when the subject came on for discussion he would give some information with respect to it.

The amendment was negatived.

Mr. MEREDITH moved, and Mr. STANLEY seconded, that No. 10 stand as No. 8.

Mr. CURR moved, and Mr. PETER seconded, that the section be struck out.

Mr. BAGOT thought it would be a great pity if it were struck out. As the representative of stockholders in South Australia he could say so. Many stockholders had runs intersected by the boundary-lines of the Colonies, the partition being only an imaginary line. The brand of Queensland was two letters and a numeral, and that of South Australia one letter and two numerals, or a sign and two numerals. Run-holders in the position he had described were obliged to act with respect to brands as though they owned a run in each Colony. It would be a great advantage to run-holders so situated if the Governments of the various Colonies would consent to amend their Brands Acts to such an extent that they might work their single herd as one, instead of being compelled to work it as two, as they were whenever it was moved across the boundary-line from one Colony into another. Under such circumstances these run-holders should be allowed to use the brand of one Colony in another. The Conference might fairly make a recommendation in that direction.

Mr. CURR: That would be forcing a Brands Act on Victoria. We have none at present.

Mr. BAGOT: That is not forcing the Act upon Victoria.

Mr. CURR: What do you propose that Victoria should do?

Mr. BAGOT: Take the Mundi-Mundi Run, in the neighbourhood of Silverton, for instance. The owners have a block of land in South Australia which they work together with that in New South Wales. There is nothing but the boundary-line of the Colonies dividing the property. Those stock-holders were obliged to regulate their brands according to the Acts of each Colony. This was also the case with the Glengyle and Innamincka Runs. Any such regulation as he suggested should only apply to runs situated as he had stated. Under the circumstances the Chief Inspectors should be empowered to register in each Colony the brands used by a stock-holder in either.

Mr. GORDON stated that in Queensland the brand was *prima facie* evidence of ownership; and recently, when a mob of twenty-three infected cattle had been shot and left unburied they were clearly able to trace the owner and punish him for the offence.

The CHAIRMAN: We have a law, and I think a very good one, by which no man is allowed to crop the ear of a sheep. I do not suppose there is a cropped ear in the whole of the Colony. When sheep come here from another Colony with their ears cropped our endeavours to keep down sheep-stealing are frustrated, and we lose the effect of our work. I think it is a subject that ought to be discussed.

The amendment was negatived.

It was resolved that No. 11 stand as No. 9.

Mr.

Mr. VALENTINE moved, and Mr. CURR seconded, that No. 5 be struck out.
The motion was agreed to.

Programme.

The subjects as revised then stood in the following order:—

- I. Treatment of the different diseases in animals.
- II. Regulations relating to the introduction of Australasian animals (I.) by sea; (II.) by land.
- III. Regulations with respect to the introduction of "foreign" animals, *i.e.*, from places outside of the Australasian Colonies.
- IV. The collection and publication of information with respect to diseases in animals.
- V. Regulations in regard to the travelling, movement, or conveyance of animals.
- VI. The destruction of noxious animals.
- VII. The destruction of weeds and noxious plants.
- VIII. The branding and marking of animals.
- IX. Any other subject which may be suggested and agreed to by the members of the Conference connected with the object for which it is convened.

DISEASES TO BE DEALT WITH.

The CHAIRMAN said there was a list of diseases in Schedule VIII of the Draft Bill prepared in his department, and this list might be gone over by the Conference with the view to decide what diseases should be dealt with. The list was laid upon the Table.

SCHEDULE VIII.

Classification of diseases and periods of isolation.

Disease.	Classification.		Period of isolation and quarantine during which animals land and articles shall be deemed to be infected.	Disease.	Classification.		Period of isolation and quarantine during which animals land and articles shall be deemed to be infected.
	Curable.	Incurable.			Curable.	Incurable.	
<i>In Horses—</i>				<i>In Sheep—</i>			
Anthrax	Incurable	21 days.	Foot-rot	Curable...	21 days.
Farcy	do	20 "	Hydatids	Incurable	42 "
Glanders	do	90 "	Rabies	do	180 "

Entozoa	Curable...	42 "	Entozoa	Curable...	42 "
Foot and mouth disease	Incurable	42 "	Rinderpest	Incurable	90 "

It was agreed to take the list of diseases as a basis of discussion.

DISEASES IN HORSES.

Anthrax, farcy, and glanders.

Mr. STANLEY drew attention to the list of diseases submitted, and proposed that anthrax be dealt with.

The CHAIRMAN said that in New South Wales cattle infected with Cumberland disease (one of the forms of anthrax) could be driven along any road without being stopped.

Mr. CURR said they could be stopped in Victoria and slaughtered.

Mr. VALENTINE moved that the Conference deal with anthrax, farcy, and glanders; Mr. CURR seconded the motion.

The motion was agreed to.

Influenza.

Mr. LANCE moved that influenza be struck out; Mr. TABART seconded the motion.

The motion was agreed to.

Mange.

Mr. CURR moved that mange in horses be struck out; Mr. LANCE seconded the motion.

The motion was agreed to.

Rabies.

It was decided to postpone the subject of rabies until the question of diseases in dogs came on.

Strangles.

Mr. LANCE moved that strangles be struck out; Mr. WOOD seconded the motion.

The motion was agreed to.

DISEASES

Programme:

DISEASES IN CATTLE.

Cancer, scrofula, and tuberculosis.

Mr. STANLEY moved that cancer, scrofula, and tuberculosis be dealt with; Mr. VALENTINE seconded the motion.

The motion was agreed to.

Foot and mouth disease and rinderpest.

Mr. CURR moved that foot and mouth disease be dealt with; Mr. WOOD seconded the motion. The motion was agreed to.

Hoose in Cattle.

Mr. CURR moved, and Mr. VALENTINE seconded, that it be struck out.

Mr. COOPER moved, as an amendment, that it be considered.

Mr. MEREDITH seconded the amendment. He asked would it be wise to send cattle infected with such a complaint into a Colony such as Tasmania, where there was no disease whatever. He was present to represent the breeders of that Colony, and to see that every precaution was taken against disease of every nature being imported there. As far as Tasmania was concerned, those who were interested in stock were particularly cautious in guarding against the introduction of any disease.

Mr. CURR always saw that questions of this sort would come up. It had been said by himself already, and he thought by other gentlemen, that it was of no use to make laws which they could not enforce, hence they had struck out one or two of the regulations proposed for discussion, as they could not be enforced. The amount of stock in Tasmania was very limited, and there might not be lung-worm there. It was perfectly easy to control the introduction of stock into a Colony. They might make regulations to put an end to mange, and yet not be able to accomplish their purpose. They could not do it, but they could prevent mangy dogs being introduced here from New Zealand and Tasmania, or any other Colony, and the same with hoose and other things. It would have been better to have agreed with Mr. Bruce's proposal, but the Conference seems to think otherwise. We may in some cases have to agree as to the only reasonable course to take—that certain diseases that did not exist in some colonies, and could be excluded therefrom, should be excluded, and that power should be taken to exclude them, but that at the same time they should not attempt to deal with them in colonies where they could not be prevented. Mr. Meredith had spoken very reasonably if they were proposing steps which would result in lung disease going to Tasmania. The Conference should confine itself to general principles and not meddle with details.

The CHAIRMAN: It is only a question whether we will deal with it at all.

Mr. CURR withdrew his motion, and the amendment was carried.

Hydatids.

Mr. STANLEY said that hydatids meant cystic or bladder worms, the cystic form of tape-worm found in animals.

Mr. CURR was afraid that nothing could be done in this matter. How could they tell an animal had hydatids? He moved, and Mr. WOOD seconded, that hydatids be struck out of the list.

The motion was agreed to.

Mange in cattle.

Mr. LANCE moved, and Mr. COOPER seconded, that mange in cattle be struck out. The motion was agreed to.

Pleuro-pneumonia.

Mr. WOOD moved, and Mr. TABART seconded, that pleuro-pneumonia be retained. The motion was agreed to.

DISEASES IN SHEEP.

Catarrh.

Mr. CURR moved that catarrh be struck out.

Mr. GORDON was astonished at such a proposal. It had cost his Government £5,000 in two years to stamp it out. It was highly contagious, and he had met with a number of cases of it. It was called catarrhal fever.

Mr. GORDON moved an amendment, seconded by Mr. WOOD, that catarrh be retained.

The amendment was carried.

Entozoa.

Mr. STANLEY thought that lung-worm might be considered at the same time.

Mr. CURR: What other worms have we in Australia?

Mr. STANLEY: Tape-worm, stomach-worm, and fluke. They would have to pass regulations to prevent a man driving diseased stock about.

Mr. STANLEY moved, and Mr. CURR seconded, that entozoa, worms, and other parasites be considered.

The motion was agreed to.

Foot-rot.

Mr. VALENTINE did not think that anything was to be gained by discussing foot-rot.

Mr. LANCE said that, if he thought anything could be done, he would be prepared to sit there for a month.

Mr. VALENTINE moved, and Mr. TABART seconded, that foot-rot be struck out.

Mr. CURR had no doubt it was contagious. It existed to such different extents that if they began to propose legislation they must consider the matter of degree. Were they going to stop 20,000 sheep at the punt

punt because one of them was lame with foot-rot. If not, would they stop them if 100 were suffering; Programme. and, if not, what number would they stop them for? No Bench in Victoria would give a verdict against the owners, as they would get lots of men to say that the affected sheep were not in excess.

Mr. STANLEY: Cannot you make it an illegal offence to travel with diseased stock?

Mr. CURR: Yes, Parliament might enact such a law, and no Bench would convict.

Mr. GORDON moved, and Mr. WOOD seconded, an amendment, that foot-rot be retained.

Mr. VALENTINE withdrew the motion, and the amendment was agreed to.

Scab and ticks.

Mr. VALENTINE moved and Mr. STANLEY seconded,—“That scab, sheep-pox, and ticks be retained.” The motion was agreed to.

DISEASES IN DOGS.

Distemper.

Mr. STANLEY said that this was similar to influenza in horses, and was certainly not more controllable.

Mr. BAGOT moved,—“That entozoa and rabies be considered, and distemper and mange struck out. As far as the importation of dogs from foreign parts was concerned they had quarantine, and if any disease broke out they could be retained longer.

Mr. STANLEY said it was a disgrace to the Colony that mange existed here to the extent it did, and that no one tried to exterminate it. If the Stock Inspectors were to put their foot down they would go far to stamping out this disgrace to the Colony.

The CHAIRMAN said it did not exist to a great extent in the country, but it was a disgrace in the city.

Mr. STANLEY moved, and Mr. PARK seconded,—“That mange be retained.”

Mr. BAGOT thought it was a paltry matter for them to consider, and yet it was very difficult to get rid of. Under the circumstances, as Mr. Stanley thought it should be retained, he would withdraw that portion of his motion relating to mange.

The CHAIRMAN said that, with a view to the prevention of cruelty to animals, it should be retained. It was a disgrace to any man to leave animals covered with mange, as they saw hundreds of dogs in town, and subjected to the torture they suffered, when it could be easily put down by making this disease the subject of a regulation.

Mr. CURR had seen as much as 10 and 20 guineas spent in endeavouring to cure valuable greyhounds entered for stakes, but without success. They were proposing to enforce a regulation on all the colonies in a matter which each might deal with for itself.

The motion as amended by Mr. Bagot was agreed to.

DISEASES IN PIGS.

Hog cholera (better known as swine fever).

Mr. STANLEY moved, and Mr. CURR seconded, that hog cholera be considered.

The motion was agreed to.

Trichinosis.

Mr. STANLEY said that this disease was due to the presence of trichinice in the flesh; measles was another disease in the pig caused by a parasite in the flesh.

Mr. VALENTINE moved, and Mr. BAGOT seconded, that trichinosis and measles be considered.

The motion was agreed to.

Lice in sheep.

The CHAIRMAN asked if there were any other diseases, ailments, or parasites which might be added to this list for regulations. Someone had mentioned lice in sheep. He had seen it once or twice here.

Mr. VALENTINE said that lice were bad in New Zealand.

Mr. LANCE said that an Act had been passed to deal with this pest. It was amended last year, and was not of a vexatious nature. All the small farmers had fallen in with it.

Mr. VALENTINE thought that lice might be considered with ticks.

Mr. LANCE said that lice were 10,000 times more important than ticks.

Mr. VALENTINE moved, and Mr. CURR seconded, that lice in sheep be considered with ticks.

The motion was agreed to.

The subjects contained in Mr. Bruce's circular letter were then considered.

The Conference then adjourned until 10:30 a.m. on the following day.

TUESDAY, 28 SEPTEMBER.

SECOND MEETING.

Present :—Mr. ALEX. BRUCE, Chairman, and the full Conference.

The minutes of the previous meeting were read and confirmed.

VOTING AND REPORTING.

The CHAIRMAN thought that the suggestion of the Minister as to voting by Colonies should be carried out. He said it had been proposed originally that there should be two stockowners present from each Colony; but an objection to that number was taken by one of the Colonies (Victoria), and the number, by way of compromise, was altered by Mr. Fletcher to one breeder and the Chief Inspector. An intimation

Programme. intimation was made accordingly to the other Colonies, but in several instances too late to admit of effect being given to the alteration; and, as two were present from some Colonies, it would be a matter for the Conference to decide how the voting should proceed.

Discussion ensued.

Copies of the telegrams passing between the various Colonies with regard to the voting basis were read by the Chairman.

Mr. COOPER moved and Mr. LANCE seconded, that each Colony have one vote.

Mr. WOOD moved an amendment, seconded by Mr. CURR, that each Colony have two votes.

Mr. HIGGINS moved and Mr. MEREDITH seconded a further amendment, that each Colony have three votes.

Mr. HIGGINS' amendment was carried.

Mr. BAGOT moved, That the Chairman have a deliberative as well as a casting vote.

The motion was agreed to.

Mr. MEREDITH: There is another difficulty. The Colonies that have three members and Victoria with only one will agree very well among themselves, but what will be done by the Colonies that have two? I think it would be advisable to decide which of the two members should have the plural vote.

The CHAIRMAN: They will decide that among themselves.

Mr. COOPER: There are only two such Colonies.

Mr. CURR desired to point out to the meeting that a great part of the good they might hope to effect would be by educating the public mind as to the reasons for doing what they did, otherwise people would say "there is no reason for doing such things." If their meetings were reported so that the public could be informed from day to day of the various arguments put forward by each individual they stood a chance of educating the public mind. They should be prepared to educate the people to some extent by giving out the result of the long practice they had had in the matter of stock. If, however, it was simply reported that they had done so and so that would be of no use, as it would convey no information of the reasons for their action. The members of the Conference could give weighty reasons for whatever they did. Perhaps Mr. Bruce could arrange for due publicity being given to the doings of the Conference. What the public should know was what the Conference was doing from day to day and the reasons the members put forward for their votes. Otherwise the public might say that such and such a member did not move himself at all.

The CHAIRMAN: I do not think that anything further can be done than intimate to the Press that they may attend. Our proceedings will be published in detail when the business is all concluded.

Mr. BAGOT: The shorthand report of our proceedings will be embodied in a blue book, which may be obtained in all the Colonies.

Mr. CURR: If our proceedings are only published in blue-book form that is equivalent to their never reaching the public at all.

Mr. HIGGINS: Was it intimated to the Press that this Conference would sit? I am quite in sympathy with Mr. Curr in his remarks relating to our proceedings, and I think it will be a most important matter if the different Governments act upon our suggestions with regard to stock and its diseases.

I.—TREATMENT OF THE DIFFERENT DISEASES IN ANIMALS.

1. ANTHRAX.

Anthrax.

The CHAIRMAN: The next thing will be the consideration of the treatment of diseases. We have fixed upon a programme, and we should now deal with the diseases in that programme. The first on the list is anthrax.

MR. STANLEY then read the following paper on this disease:—

Cumberland disease is identical with the diseases known as splenic apoplexy, anthrax fever, and black-leg. This disease is known all over the world; but it is doubtful whether any country suffers greater losses from this one disease than Australia.

In New South Wales the annual mortality is certainly not less than 100,000 sheep, hence its great importance to everyone interested in stock.

Investigations into the nature and cause of this disease have been rigorously carried on during the last few years in France and Germany; England has been critically observing, now refuting, now confirming by experiments, their painstaking inquiries, which have concentrated themselves in observations on the history, development, and effects of very minute microscopic organisms termed bacilli, which are proved beyond doubt to cause the disease, and are absolutely necessary to its existence. The cause is the bacillus anthracis.

Symptoms.—These are not well marked, and are of little consequence for diagnosis, the disease being extremely fatal and very rapid. *Post mortem* examinations show extremely dark blood, which clots imperfectly, with congestions and blood extravasations in almost every organ; the spleen is usually enlarged, sometimes even to bursting; finally and most important, anthrax bacilli are found in the blood. To see them, the thinnest possible layer is spread on a clean glass slide, add a drop of violet aniline dye, after a minute draw off the dye with blotting-paper, add a little water, then examine under a powerful microscope, and the bacilli will be seen in great numbers as small rods.

Susceptibility varies even in animals of the same species, and it is to be noted that probably no herbivora are proof against this disease, and carnivora are only less susceptible (not exempt, as many people think). The human subject is fortunately the least susceptible; but many instances of disastrous effects from inoculation are on record.

Frogs and cold-blooded creatures, also birds possessing a *high* temperature, have proved refractory to inoculation. Bacilli anthracis are able to exist, and probably thrive, outside an animal's body in ordinary temperatures; in suitable nutritive materials they must feed or they cease to increase; they propagate by the formation of spores; these spores are practically indestructible, and retain their vitality and virulence for an indefinite period under almost every natural adverse condition. Infected animals contaminate the soil and herbage, and this is the source of infection so prolific in these colonies.

Treatment is not available, because the symptoms are ambiguous and the illness very short and fatal, hence protection has become imperative, and this is done by inoculation.

But so great is the virulence of even a drop of anthrax blood (which contains myriads of bacilli) that it has been found necessary to cultivate bacilli artificially in a medium or soil unfavourable to their growth

growth and so obtain a weakened growth of bacilli, which being used as the virus is found to produce a weak or mild form of disease from which an animal will recover, and that inoculated animal is found to resist a repetition of the inoculation of a virus at the same strength of culture, and to be able to endure inoculation with a second or stronger virus sufficiently potent to kill an animal not previously protected. After this second inoculation the subject is protected from the most virulent virus that can be obtained. In fact he is protected from infection. This protection gives immunity for a period of from nine to twelve months in the case of sheep. This would ensure comparative safety to a flock and carry them on infected land during the fatal season; and if persevered in year after year it is possible to exhaust the bacilli or starve them out of the land, a process which is greatly assisted by nature, the prolonged drought and hot sun deterring their development.

Cultivation of attenuated virus.—Agencies which have this influence are heat, light, oxygen, chemicals, and cultivation in the bodies of particular species of animals. Several methods are employed by individual scientists, all aiming at the production of a virus that may be reliable as a protective and the least fatal as a remedy. Pasteur leads the van, and his results prove the task no easy one. He prepares a virus which gives a high degree of immunity against spontaneous or inoculated anthrax; but there is no known method of attenuation which will give a virus of actual uniform strength.

It is not possible to obtain a virus equally applicable to different species of the domestic animals, or even to different breeds of the same species. Even in the most capable hands there is a liability to accidents entailing serious results in the preparation of the virus, or in its employment, the *quantity* of a known strength being used carelessly would be either ineffectual or fatal. Pasteur has succeeded in making it so nearly uniform as to be generally serviceable for use over the whole of France. Pasteur has inoculated 13,000 sheep and 3,500 cattle without an accident. Chauveau, by a simple and ingenious apparatus, cultivates the virus by heat, and sufficient to at once inoculate 4,000 sheep. With such a preventive remedy available it is our duty to take this subject up warmly; and with the view of gaining practical information a circular letter was sent on from the Hon. the Minister for Mines enclosing a list of questions (appended, marked A), I had prepared, to the Governments of Europe and America, and the replies which are now being received are of very great interest, and I believe I am not premature in saying that the outcome will be protective inoculation; for the prevention of anthrax is one of the successful discoveries of modern times, and means the saving of many thousands of lives, and consequently increase of the national wealth of these Colonies.

The cultivation of the virus will have to be carried out here, and it is for us to urge the authorities to commence this important manufactory.

Having thus briefly introduced the subject, the following points are suggested for discussion:—

1. Is there sufficient evidence to prove that Cumberland disease is anthrax?
2. What extent of country is known to be infected?
3. What is the estimated annual loss?
4. Is there sufficient evidence to support the value of protective inoculation?
5. Are we warranted in advocating the establishment of a laboratory for the cultivation of the virus for inoculation?
6. Is it advisable to have regulations to prevent the spread of this disease?

The following memorandum accompanied the paper, being a copy of the circular sent by the Government of this Colony to the various European Powers:—

A.

Department of Mines, Stock Branch, Sydney, 28 January, 1886.

SPLENIC APOPLEXY IN SHEEP.

Memo.—With the object of obtaining information from other countries, as suggested in your letter No. 9,353, 29/12/85, I have the honor of submitting a slight description of the leading features of the disease in sheep commonly known in this Colony as Cumberland disease, and the points on which information is sought are added in the form of questions.

The disease is characterized by the formation of viscid gelatinous infiltrations and effusions of a dark dull red even to a blackish colour, into parts of organs or tissues, the enlargement and softening of the spleen and lymphatic glands, patchy dark red stains or mucous and serous membranes, the tar-like consistency and hue of the blood, which rarely coagulates, and the microscope reveals myriads of bacilli in the blood.

Symptoms of illness are ambiguous—a short illness, and a rapidly fatal termination.

Information is sought on the following points:—

1. Has the cause of the form of anthrax known as splenic apoplexy been satisfactorily determined in _____?
2. Have any remedial measures, either medicinal, sanitary, or prophylactic been attended with success in its treatment or in arresting its prevalence?
3. Has Pasteur's method of inoculation with attenuated virus been tried, and if so—
4. With what practical results?
5. Has the cultivation of the virus been attempted in England, and with what results?
6. Is the virus of splenic apoplexy protective against all forms of anthracoid diseases?
7. Is the same virus suitable for sheep, cattle, and horses?
8. Is it possible there would be any danger of introducing to this Colony a European form of anthrax by importing the attenuated virus of Pasteur?
9. Are the practical results of the cultivation of the virus such as to encourage its manufacture in this Colony?
10. What is the system of culture carried on in England?
11. What methods of inoculation are practised?
12. For what period (after successful inoculation) is the animal protected from disease?

EDWARD STANLEY, F.R.C.V.S., Eng.,

Hon. Government Veterinarian,

Inspector of Stock.

Mr.

Anthrax.

Mr. BAGOT: Have any replies been received to the circular letter addressed by the Government of New South Wales to the Governments mentioned in Europe and America?

Mr. STANLEY: Yes; from America, England, and Belgium.

Mr. BAGOT: It would be extremely interesting if we could see the answers to these questions.

The CHAIRMAN: Mr. Stanley can say what the answers amount to.

Mr. STANLEY said that the answers would be placed on the table; the gist of the reply from England being that the disease was not prevalent to a large extent. As a matter of fact, it was more prevalent than was generally admitted. It was found in many places, but the British Veterinary Surgeons were engaged so much in other matters that they did not take up the subject so warmly as it had been in France. In consequence of this the few experiments that had been made were by specialists, notably by Klein, one of the leading pathologists of the present day. He had cultivated the virus and refuted Pasteur to some extent. Both Klein and Koch had been working the subject out. Professor Robertson, who was at the head of the Veterinary profession in England, was of opinion, from his own personal experience, that the study of the subject would lead to valuable results; but he had not gone into it far enough to arrive at any decisive opinion. The outcome of the matter had been that the Royal Agricultural Society of England had decided to send Professor Robertson to study under Pasteur, and give the result of his own observations. His (Mr. Stauley's) motive in submitting this paper was this—He had seen nothing in print explaining satisfactorily how Pasteur prepared his virus; and, without knowing what his difficulties were, it was impossible to proceed with the cultivation of the bacilli. From America the reply was to the effect that there was no large amount of anthrax in the country, and that so far they had not practically taken the subject up. Belgium gave the most particulars. Their reply was to the effect that they had been using the virus as prepared by Pasteur, and were satisfied as to its value. They were commencing the culture of it in their own country. It was the opinion of authorities that a virus would have to be cultivated in this country. There were a good many difficulties in the way of carrying on the necessary operations; although the virus might suit one animal in one country, it might not suit it in another; it might be too strong. There were also climatic influences which affected the virus, so that possibly if we did introduce Pasteur's virus here it might be inert, and it could only be used experimentally; therefore we shall have to study the cultivation of the virus. It was a matter that required serious consideration; but, at the same time, if they were satisfied that the disease existed here to the extent which he believed it did, then it was a very important matter, and one which ought to be taken up by all the Governments. As they were all probably aware, anthrax—*i.e.*, Cumberland disease—might exhibit itself in different forms. When present as splenic apoplexy animals in robust health and fat died suddenly, and the spleen was found to be engorged with blood. The animals fell and died suddenly. In other cases, as in those he saw at Dubbo, the disease was more local. It attacked different parts of the body, and was then called black-leg or anthrax fever. That form of the disease was found more in cattle than in sheep. Horses, again, often suffered from anthrax, the parts attacked being principally the head and neck. It was well known in India under the name of Loudianna fever. Loudianna fever, so named from the fatal outbreak amongst the Government horses which took place in that district some years ago. All the varieties of anthrax were not produced by the same germ. There were different anthrax bacilli, which produced the different forms of the disease. A collection of microscopic specimens of the various pathological bacilli was exhibited and explained to the members. The one which he suggested should be cultivated for treatment was the bacillus anthracis, which produced the disease called Cumberland, that was so fatal to sheep, and was known to exist in certain localities. France had far more anthrax than England, which might be due to its climate or soil, or some particular breed of sheep. The losses of stock had been so enormous in Europe that the stock-owners there had been induced to take the matter up, and now use extensively the cultivated virus for protective inoculation.

Mr. LANCE: Some sheep in New Zealand were supposed to have had black-leg, but there was no one there who could say positively whether it was black-leg or not. I tried to investigate it, but nothing satisfactory was ascertained. I was at Loudianna when the outbreak referred to by Mr. Stanley took place. It killed the cavalry horses in a wonderful way. There were 10,000 men there, and in three months we had not enough left to relieve pickets. The station was abandoned, and had been abandoned ever since. It was a curious incident that a malignant fever broke out among the men at the same time that the disease did among the horses.

Mr. HIGGINS: Have you any in South Australia?

Mr. VALENTINE: I heard of black-leg amongst some calves ten or twelve years ago, but I never saw anything of it; we have never had anthrax.

Mr. GORDON: It was very prevalent in 1868 in the Darling Downs, about Maranoa, and several men lost their lives through skinning the sheep that died of it. Since then it has not been so prevalent. We have black-leg every year among the cattle. It is always in the same class of soil—a rich, black soil.

Mr. TABART: We have lately had a disease with a similar effect; but it has not been officially reported upon as to whether it was Cumberland or not. When I return I will have a veterinary examination made to ascertain whether it is anthrax or not. It is among the sheep. The soil is a rich, red loam in the western districts. It was only a fortnight or three weeks before I left for here that I received intimation to make an examination as to the nature of the disease, so that I had not time to make a veterinary examination.

Mr. WOOD: Very little is known of the disease in cattle. I have seen a good deal of black-leg. It always broke out at the top of the season when the cattle were in their best condition. I have seen cattle alive and well in the morning and dead in the afternoon.

Mr. CURR: We have Cumberland occasionally in sheep and pigs, but it does not exist to any great extent. In occasional years we have had a few cases about Melbourne and the more populous districts, principally among pigs. I never saw or heard of it among horses. We have had a few cases among cattle.

Mr. HIGGINS said he had had some experience in Cumberland which might be interesting to relate. As I understand the term "Cumberland" is not the scientific name for the disease. It was so called, as he was informed, because it broke out many years ago in the county of Cumberland, and ever since had been known by that name throughout New South Wales. If any one were to speak of anthrax, even to some educated persons, as denoting Cumberland, they would not recognize it. They lost large numbers of sheep yearly through this disease. Its principal time for appearing was, in his experience, during the months of

December,

December, January, and February; or, as Mr. Wood had said, at the top of the season, during the period of the year when the heat was greatest and the feed best. Hitherto, until the past season, he had always considered that Cumberland would not show itself unless there was plenty of feed, but during the last drought it showed itself unmistakably in rich country, where, however, no feed had grown owing to the drought. It had previously shown itself in such districts when feed was abundant. The indications of it were something of this nature:—The sheep are going along to all appearance in perfect health, when suddenly one or two will drop behind. There will be a convulsive action through the animal, and it drops. You raise it, and it goes on for a little. Then it drops again, and in a very short time death takes place. There is a very great tension of the skin; the parts of it which you can see, where there is no wool, between the thigh and the flank, become black, and after a short time there is a small discharge of very black blood from the nostrils or anus, and sometimes both. If the animal is skinned (and of late years I and almost all stockowners have sternly prohibited our people from skinning any dead animals, owing to the danger ensuing to the men) it is found that the skin is very much discoloured, the blood beneath being black and clotted. Decomposition sets in very rapidly indeed, and the smallest portion of the virus from the animal getting on to a cut on the person skinning or handling the animal would, he was positive, cause death; and blood-poisoning, he believed, might be absorbed through the pores of the skin into the blood. He had never positively known such a case to occur, but he believed that blood-poisoning would ensue, and that the person affected would thereby lose a limb, or even his life, unless medical remedies were instantly resorted to. He had known blood-poisoning from Cumberland remain in the system of an individual for a long time. Perhaps the gentlemen from Tasmania might remember the case of Mr. Cox, a gentleman who came down from the Mudgee District, and was suffering from blood-poisoning. He simply handled the hide of a beast which had been taken off in order to salt it, and after a lapse of more than a year he died from blood-poisoning. In many parts of the Colony where the sheep were on rich pastures, the disease was of frequent occurrence. In the year 1855 or 1856 it swept the Castlereagh River from top to bottom, but since then it had not appeared in the district. It also appeared then in the Liverpool Plains on many stations, and destroyed many sheep, but of late years it had not shown itself in such a virulent form. In 1859–60 it appeared on one station, where they were losing at the rate of about 600 sheep a week, and the station had not above 20,000 sheep. For a long time the disease was known in the Liverpool Plains District, and various remedies were suggested. They used to give salt and all that kind of thing when it showed. During the shepherding days, when they used to put two flocks at the one station and divide them by yards, one flock would be dying from Cumberland and the other adjoining it would not. Of course they ran upon different pastures. His own idea was that it had been largely due to the rich pastures, the sheep eating some fungoid growth or something of the kind that would produce it. He tried to gain as much information as he could about the disease, as he had suffered a good deal from it. He asked several scientific men, some of whom accompanied H.M.S. "Challenger," if they could tell him what function the spleen performed, but they could not. People do not know what function the spleen performed in the animal; they might say this or that, but it would be pure speculation. He would like to know from experiments carefully carried out what functions the spleen performed, as it was really a disease of the spleen they had to deal with. If they made a *post mortem* of any animal dying from Cumberland they would find the spleen diseased. He thought Mr. Stanley's paper bore that out. The most effective remedy of all, and he had great pleasure in naming it, was to change the pastures of the sheep. If they were on good pastures move them if possible to the hills. He had known of twenty, thirty, forty, and even fifty sheep dying in a night out of 1,500 to 2,000, but by moving the flocks to the hills the deaths gradually ceased, and in the course of a fortnight perhaps ceased altogether. He had formerly been under the impression that Cumberland could only exist on rich pastures. On one occasion, however, he went to the poorer pastures in the west, at Mudgee, and bought some of their choice sheep from stock-holders there. All at once Cumberland disease showed itself. He made inquiries and found that the disease was in the sheep there. He decided to watch the progress of the disease, and travelled with the sheep for about six weeks. They had to go on one of his stations, and he remained with man in charge of them. He carefully noticed all the symptoms, and found that they were just the same in the poor countries as they were in the rich. The disease had been a great scourge to the country from time to time. During the drought he had letters from friends telling him that sheep were dying from Cumberland, notwithstanding the fact that there was hardly a blade of grass growing, and they were feeding the stock on cut boughs of trees. They were dying even so fed. In those parts they were accustomed to die, not in large numbers, but perhaps 10 or a dozen to 30 and 50 in a week, in a paddock containing 4,000, 5,000, or 6,000 sheep; 50 would be a large number to lose in a week. No one knew when it would break out again in a virulent form, and he thought it was a very important thing that they should be able to obtain some cure or some preventive agent. As he had stated, the only preventive he knew of was to change the pastures. Of course it could not be so readily adopted now as in the old days, when they had simply to order the shepherd off to the hills. Now, through the country being fenced in on all sides, people require to have special places set apart for such stock. That, of course, would not pay, and they were obliged to continue on, and take the risk of their stock dying. Fortunately, it had not shown itself in a virulent form for some time, and he was in hopes that it would not. His observations were to the effect that since the drought and the fresh crops of grass the disease had shown in a very mild form. Perhaps three or four sheep would die in a paddock in the course of two or three weeks, but nothing very alarming would occur. Such was the Cumberland disease, and that was how it had been cutting down the flocks. In the Murrumbidgee districts he understood that the disease had shown itself to a very considerable extent—so he had been informed. In the Upper Murrumbidgee district (he carefully avoided mentioning the names of any stations, as it would be improper for him to do so) the disease had shown itself in fair grazing country. It was not what they would call first-class fattening country, but, in one word, the disease had shown itself upon the very richest as well as on the poorest pasturages. If there was anything in those replies which Mr. Stanley had obtained from Europe to help them, it would be a very good thing; but the great difficulty he foresaw was in the practical part, in applying the cure or treatment in these Colonies. Our systems were so different. We dealt with large numbers, and they dealt with small numbers. Then again there was the question—would it pay? He alluded in connection with this particularly to sheep. Stock were so much more valuable at Home than here. We could save our stud flocks if inoculation established a perfect preventive, and it would be a great boon to have them saved.

Anthrax.

Anthrax.

saved. Of course to inoculate the millions of sheep all over the Colonies would be hardly practicable. It might be done, and might yet be considered worth doing; but so long as Cumberland existed only in a mild form and only broke out in odd spots, he doubted if such an immense work as general inoculation would involve would be followed up. At the same time it would be well to know that there was a preventive, and that it would be a safeguard for valuable stock. As regards horses, he had seen them dying of Cumberland. He had seen cattle dying of Cumberland, and Mr. Curr would tell them of pigs dying of that disease. Whether it be that Cumberland was produced from the causes which Mr. Stanley had spoken of or not was a matter he would like to be certain of. He was not prepared to say whether it was or was not. He had only stated his own experience, and had not gone into the matter scientifically. He understood that New Zealand, South Australia, and Tasmania were free from this disease.

Mr. GORDON: My observations go to show that the disease is rife in April and June.

Mr. HIGGINS believed that it showed more markedly in the months he had mentioned, but it showed in other months as well. He had had sheep die of it in April. If sheep were attacked with Cumberland the owners should avoid yarding them if possible, or disturbing them. He had known an instance in connection with his own sheep when they were infected. They yarded up the fat ewes, and all at once they began to drop dead. The overseer got so frightened that he let the sheep go out, and they travelled on to the pastures. They were not interfered with; the hurdles were thrown down, and after they got a little distance from the yard they ceased dying. In 1878—or the year of the drought—he met a lot of sheep travelling along almost perished for want of food. They came to a flat where there had been a thunderstorm, and a rapid growth of grass had sprung up. The sheep went into that to the number of 4,000, and in half an hour 100 of them were dead with all the symptoms of Cumberland. He told the man that his best plan was to get the sheep away instantly from the flat. He did so, and they ceased dying.

Mr. TABART: Suppose other sheep crossed over that pasture, would it cause infection?

Mr. HIGGINS: I never knew it have the slightest effect on other sheep passing over the same pasture.

Mr. STANLEY: I shall be very happy to answer any questions that may occur to any of you. Perhaps it will be better if I reply to Mr. Curr first; he says the disease is only seen in swine.

Mr. CURR: I said principally among swine.

Mr. STANLEY: I wish to explain that pigs are less susceptible to this disease than any other animal, so that it was doubtful whether the disease to which Mr. Higgins had referred was identical with that mentioned by Mr. Curr as affecting swine in Victoria.

Mr. CURR: The veterinarians pronounced it to be Cumberland.

Mr. STANLEY: Several scientific observers say it is impossible to give this disease to swine, and I know some persons actually feed pigs with the dead bodies of animals that have died of it. Flesh affected with anthrax has poisoned various animals, including pigs, and the men who skinned them.

Mr. HIGGINS: I have seen blacks eat the bodies of animals that died from Cumberland and the blacks did not die.

Mr. STANLEY said that when anthrax affected the spleen that organ was usually enlarged. Animals might however have Cumberland without the spleen showing any signs of the disease. That it was generally affected was shown by the use of the term splenic apoplexy being given to it by several writers. Although the functions of the spleen were not perhaps fully understood, yet it was known to elaborate the formation of blood cells. The spleen was also a reservoir for holding blood during the process of digestion. That might account for animals dying and their spleens being affected. The process by which the bacillus anthrax was cultivated is as follows:—Take a small drop of the infected blood on a glass rod or wire which had previously been heated red hot to kill any germs upon it. The drop of blood was dipped into nourishing fluid which had been sterilized by heating in an oven to a temperature double that of boiling water. These inoculated fluids were cooled and kept enclosed so as to prevent any contamination from outside germs. The cultivated bacillus developed in the fluids, and were watched as they grew from day to day, their vigor or attenuation being controlled by temperature, and this was the cultivation of the virus. Suppose that one fluid was inoculated. The germs were allowed to develop for say a week, and the virus is then ready for preventive inoculation of animals. From this cultivated virus the inoculation of fresh media could be carried on through any period of years by successive cultivation day after day, week after week, month after month. It is recorded that in four years time the scientists took a small portion of the artificially cultivated material and inoculated a sheep with a fatal quantity of it, then found that it died of anthrax, and that the germs in the dead body were just the same as those with which they commenced the original cultivation, so they might safely assume that they had been cultivating the bacilli anthracis outside the body all the time. There was no doubt that infected animals contaminated the soil, and it was known that the spores would lie on the ground for many months. If sound sheep were put on that ground so surely would they die of anthrax, having become the proper medium for the propagation of those germs.

Mr. HIGGINS: I quite bear out what you say by my own experience. If stock is taken from a locality where anthrax is rife, and afterwards put back on to it, then the disease will show itself.

The CHAIRMAN: It depends a great deal on the weather. Unless the weather was such as favoured the growth of vegetation and of bacilli stock would not run the risk of infection.

Mr. HIGGINS: Whenever there was a small shower of rain and the slightest shoot of grass sprang up Cumberland would show itself much quicker.

The Secretary then read the replies received from America, England, and Belgium, to the questions contained in the memorandum received from Mr. Stanley, dated 28th January, 1886. They are as follows:—

The Commissioner of Agriculture to The Hon. James D. Porter, Assistant Secretary of State.

America, Department of Agriculture, Bureau of Animal Industry,

Sir,

Washington, D.C., 29 April, 1886.

I am in receipt of your communication of the 28th inst., enclosing a despatch from the Consul at Sydney, and a letter from the Colonial Secretary of New South Wales in regard to splenic apoplexy of sheep. In reply to these inquiries I have the honor to state that splenic apoplexy of sheep does not appear to be a very common disease in the United States of America, and that when it does exist it is usually confined to a single flock or to a very small area of territory. It is very seldom

seldom that it occurs continuously or with any regularity as to seasons in any part of the country from which we have Anthrax information. For this reason no experiments with nor investigations of this disease have been undertaken by this Government, and very few have been made by veterinarians. Pasteur's method of inoculation is not practised, and has not been attempted, nor have any cultivations of the virus of this disease been made from animals affected with this disease in this country, so far as our information goes. Trusting that this information will be satisfactory,

I am, &c.,

NORMAN J. COLMAN,
Commissioner of Agriculture.

Sir,

Belgium, Brussels, State Veterinary College, 19 June, 1886.

I have the honor to return the papers which you have sent me with memorandum 54-441, and to reply to the various questions concerning the disease called "Cumberland disease." The symptoms of said disease are evidently of the nature of bacteridian anthrax. The existence of myriads of bacillae confirms this opinion.

My replies to the various questions are:—

1. The cause of the form of anthrax known as splenic apoplexy is evidently the "bacteridie," whether it acts directly or indirectly by means of its products, as many think. The preservation and multiplication of "bacteridie," and in consequence the circumstances favourable to such preservation or multiplication are conducive to the development of anthrax. Some kinds of soil seem to be favourable to the development of anthrax.
2. This disease is generally so rapid in its course that every measure, except preventive treatment, is inadequate. The latter consists of preventive inoculation by Pasteur's method, and production of causes detrimental to the preservation and multiplication of "bacteridie," and bacteridian germs irrigation of marshy country.
3. Inoculation by Pasteur's method has been tried against bacteridian anthrax, and has been found so satisfactory that our Government supplies the vaccine gratis, although it be expensive.
4. Good practical result.
5. In practice it is preferable with us to receive the vaccine direct from Paris, although this is rather expensive.
6. No; bacterian anthrax is too different from bacteridian anthrax, and both differ too much from rouget to allow of the supposition that the virus of splenic apoplexy is protective against all forms of anthralvid diseases.
7. Yes; as long as bacteridian anthrax is to be dealt with. It becomes only a question of dose or attenuation.
8. Impossible to say. Such question should be tested. But if, as it is probable, colonial anthrax is the same as ours, it would present but small differences in animals of the same species.
9. What is done in Paris for the artificial cultivation of virus could I think be applied elsewhere if proper dispositions are taken to that effect.
10. We have no special method because we are too near the place of production of the vaccine, which presents to us a quite reliable character. We are studying the mode of cultivation of vaccine.
11. We use Pravaz syringe and conform ourselves to the recommendations of Dr. Pasteur.
12. This question has not been solved mathematically.

I have, &c.,

O. WEHENKEL,
-The Director.

Mr. CURE said that they had been considering for several hours the experience of Pasteur and several gentlemen in this country of what was known as anthrax—Cumberland disease; but seeing that their mission was to recommend courses of a practical description, he failed to see that they were fulfilling their mission by going into minute scientific details of diseases of this sort. There was not the slightest probability that they would be able to profit by them even if everything connected with these diseases were known. There were several sorts of anthrax, and even Pasteur and others who had devoted a lifetime to the subject did not seem to know exactly how to deal with them. In Belgium every animal had a stable, and was worth £25 to £30, and even there they could not get rid of pleuro. He had watched the course of pleuro in the Low Countries and found that even yet they killed infected animals there, and those which had been in the same stable. Notwithstanding that they had not got rid of pleuro as late as last month. It seemed to him that little could come of the discussion, although he was sure they were all thankful to Mr. Stanley. No one could listen to the information they had received without being interested, yet it seemed to him that if they went on talking for a month they would not be prepared to make any great advance towards what they would have to recommend their Governments to do. The great aim of this Conference should be to bring about something practical. As for cultivating the virus of anthrax, the man who could accomplish satisfactory and practical results would be one in 100,000. It would be quite time for them to go into the subject when a remedy for anthrax had been discovered. Pasteur had told them that in this and every climate the mode of cultivation would differ. How then could they be in a position to recommend any fixed process, say to Queensland, where the climate differed so much from Tasmania and Victoria? As far as his experience went, the only practical step they could take was when an animal was suffering to destroy it; the balance of the flock or herd to be put into quarantine until deaths ceased. What would be the use of telling a man there was anthrax in his stock, and that it might take him four years to get the proper strength of virus? When they had an ordinary remedy, and the public were possessed of the facts, then it would be time for the Governments to legislate on the subject. At present the utmost that the Colonial Governments, especially Queensland and South Australia, could do under favourable circumstances was to insist upon the destruction of infected animals, the remainder to be quarantined in their own paddocks until deaths ceased among them. Such a proposal would, he believed, be given effect to. He begged to move that legislative power should be taken to compel the destruction of all animals which have died of or are suffering from anthrax, and all other animals which have been in contact with the diseased animals be, where practicable, placed in quarantine until certified clean.

Mr. HIGGINS said that they were all indebted to Mr. Stanley for the able paper they had just heard. Seeing that only two colonies were subject to anthrax, he thought that the matter might be dropped altogether. As to taking Mr. CURR's idea of killing the animal infected, he could only say that the animal saved them that trouble, as it died. What they wanted was prevention, not the cure. How were they to know when an animal had become infected?

Mr. PARK: The bacteria still live after the death of the animal.

Mr. HIGGINS: Although it lives, who can tell what animal has the disease in its system, and how are we to know which beast to kill? I have had as much experience of Cumberland as any one in the room, and I could not tell. I am altogether opposed to what Mr. CURR suggests, as it is impracticable.

Mr. CURR: You have only taken one side of the case.

Mr. HIGGINS: If you saw a flock of sheep travelling to market, could you or any one else say whether any particular sheep had become infected with Cumberland?

Mr. BAGOT: You could if you saw the sheep dropping. The whole lot should then be quarantined.

Mr. HIGGINS: We would interfere to too great an extent with trade.

Mr. PETER: Would you not burn the body?

Mr.

Anthrax.

Mr. HIGGINS: There is a law in this Colony by which a drover would become liable to a severe penalty for not burning the bodies of such sheep as had died.

Mr. COOPER: It does not affect us. Our Diseased Cattle Act has a schedule, and we can put into that schedule any disease and so deal with it. If Cumberland disease did appear we could put it in the schedule and make whatever regulations for dealing with it that we liked.

Mr. BAGOT seconded Mr. Curr's motion. He said he thought that the vivid picture which Mr. Higgins had drawn of the terrible nature of this disease, and its known effect in cattle and swine, was sufficient to justify the Conference in passing the resolution proposed by Mr. Curr. If their Governments chose to adopt preventive measures they would be for the benefit of stockowners throughout the Colonies. He remembered an outbreak occurring at Bacchus Marsh, in Victoria. It was approaching the eastern border of South Australia, where they had land exactly similar in character, and where stock would meet with exactly the same conditions of soil and climate. He thought that in all probability the Government would at once act upon a recommendation from the Board on this subject in the event of new regulations being framed. Unfortunately in South Australia they had not power to make the necessary regulations.

Mr. MEREDITH: This shows the importance of prohibiting the moving of stock suffering from this dreadful disease. It is quite right to locate disease. It appears to me that it does not affect an extensive area, and that only two Colonies suffer from it. Is it not better to confine it to those areas and stamp it out? If any laxity is shown there is no saying how soon it may go through the length and breadth of the land. I shall support the motion, and I think we should recommend to the different Legislatures the advisability of preventing stock travelling which has run the risk of infection until the Inspector has seen them.

Mr. HIGGINS said it was utterly impossible to apply any hard and fast rule. This disease was so mysterious, and its appearances so easily mistaken, that the most expert men in the Colony might take some other disease to be Cumberland. Whom had they here capable of determining it to a certainty? He ventured to say with regard to the Inspectors that perhaps not one in ten would be able to do so. Mr. Bruce would bear him out from what occurred before the examining Board as to how many could describe anthrax accurately. If they understood what anthrax was then they should deal with it, and if not they should let it alone.

Mr. VALENTINE: It is dealt with in European countries by inoculation. If anthrax broke out in South Australia the Government would have to take the matter into their own hands, and exceed their powers.

Mr. HIGGINS: What would you do?

Mr. VALENTINE: Destroy the stock, get the land clear, and compensate the owners.

Mr. LANCE: Putting the stock into quarantine is not practicable. The best means of getting rid of the disease is to move the sheep to fresh pastures. Here you propose to keep them on one pasture, and that means killing them.

Mr. CURR: If you do not do that you kill the stock of the neighbours.

Mr. PETER: Suppose that a thousand head of cattle are travelling and they are far from home—how are you going to put them into quarantine?

Mr. HIGGINS: I never knew of a flock getting disease by passing over country which had been travelled by a flock infected with Cumberland.

Mr. GORDON: I can correct that. In 1868 sheep travelling through infected runs in the Maranoa and Darling Downs became diseased. Since then the run has been burnt off for three seasons, and the disease has not shown again.

The CHAIRMAN: If the disease was first noticed in the county of Cumberland and is now found in other parts of the colony, it is surely reasonable to infer that it is infectious, especially as it is year by year found further and further from the starting-point. Some of our station-owners dare not at certain seasons of the year put stock on some parts of their runs, because if they did the stock would begin to die in ten days or a fortnight from Cumberland. If we can obtain any information regarding this disease we should certainly get it; and it was with that object we have been making these inquiries with regard to inoculation for anthrax. It is a most serious matter, and one affecting the whole of the Colonies.

Mr. MEREDITH: Is there any fear of stock or land being infected from the droppings, &c., from trucks while conveying sheep or cattle infected with Cumberland, or of sheep or cattle becoming infected if carried in the same trucks afterwards? Is it possible to effectually disinfect trucks having had in them stock infected with Cumberland disease?

Mr. STANLEY: There is no doubt that animals infected with Cumberland would also infect the ground over which they passed, and it is possible for the bacilli to be conveyed from one place to another by dust, and not necessarily on herbage. The disease known as wool-sorters disease is caused by the bacillus of anthrax being conveyed from one country to another in wool. Where it is possible to disinfect the trucks I believe that such a plan might be practised. The stock trains in England are constantly disinfected with steam and chemicals, but it cannot be done by the ordinary plan of sweeping and washing out.

Mr. PARK: From my own experience I am able to endorse Mr. Stanley's remarks.

Mr. HIGGINS moved and Mr. LANCE seconded the previous question.

Mr. CURR said that when a mob was infected, according to the judgment of a Veterinary Surgeon, the owners should be compelled to burn and bury the bodies, and not allow them to remove the others until the deaths had ceased.

Mr. HIGGINS: At what recompense?

Mr. CURR: No recompense.

Mr. HIGGINS: Would you condemn a man to tremendous loss because his stock were in beautiful pasture, and because some action—perhaps merely atmospheric—occurred, over which he had no control?

Mr. CURR: If a man is 500 miles from his station, and it is found that his herd is infected, is he to be allowed to send it back and infect all the stock on the way? The animals should be destroyed.

Mr. LANCE: After listening to these arguments, I fancy that this disease might be compared with foot-rot. I have been asked to bring in a bill to deal with foot-rot, and I have refused, for two reasons, as there is not sufficient information about it, and I think that it is also influenced by climatic surroundings. In the wet season I defy anyone to stop foot-rot. The same argument applies to Cumberland;

land; and if we recommend seriously to the Governments to legislate about this matter it might prove anthrax and tuberculosis exceedingly vexatious in those parts of the country where the disease exists. It would be better to allow such districts to arrange matters for themselves. If they find that it is a serious evil, if they find that their property is jeopardised by infected animals passing through it, they will use strong measures to put a stop to it.

Mr. HIGGINS: Stock-owners would have done so long ago if it had been feasible.

Mr. Higgins' motion was then put and negatived by twelve votes to five.

Mr. Curr's motion was declared to be carried.

2. CANCER, TUBERCULOSIS, AND SCROFULA.

Mr. STANLEY read the following paper on tuberculosis:—

As this disease is communicable from animals to mankind, and *vice versa*, its importance demands our attention.

Nature.—It is hereditary and contagious to an extent exceeding all other panzootic maladies; it is conveyed to human beings through contaminated flesh and milk.

Cause.—The germs of contagion are bacilli tuberculosis; they may enter the body with the food or in the air in immediate proximity of an affected animal, and establish themselves in various parts of the body. No organ is free from their attack; they increase at the expense of the surrounding tissues, which gradually undergo retrogressive changes, ending in disintegration and death. The disease is subtle and insidious, but nevertheless slow and sure, and it is incurable. The abattoirs revealed the disease in cattle slaughtered for food, although they may be well nourished, if the disease is in the early stages.

Symptoms.—Cattle are seen wasted by the disease—in fact, consumptive; they have been unhealthy bad thrivers for a long time—suffer from diarrhoea if the bowels are affected; panting, breathing, and cough if the lungs are the chosen seat of disease. In advanced cases the glandular system becomes diseased, as seen in lumpy throat, swollen jaw, and diseased mammary glands; if a constitutionally diseased animal receive an injury, in place of healing, tubercular growths spring up instead. That cattle live and get fat with tuberculosis is explained by their inactive life. We see the contrary illustrated in the external manifestation of the disease, so frequently seen in working bullocks, and again amongst dairy cattle; the drain on their systems accelerate the progress of disease, and from them it is communicated to their fellows by cohabitation, grazing and feeding on tainted pastures, and drinking from tanks and water-vessels contaminated by their expectorations and discharges from tubercular ulcerations or abscesses.

Treatment.—None is available.

The following points are suggested for discussion:—

1. What is the extent of its prevalence?
2. What preventive measures are advisable?
3. Is it advisable to compensate owners for the destruction of diseased animals?
4. Should the sale and traffic in tuberculous cattle be prohibited by law?

Mr. LANCE said that, so far as he was aware, they had no tuberculosis in cattle in New Zealand.

Mr. GORDON: In August, 1885, a lot of cattle came from New Zealand to our Exhibition. One of these animals was found to be diseased, and was not allowed to enter the yards. It has since died of tuberculosis.

Mr. TABART: In Tasmania we have tuberculosis to a small extent. It was only lately that three bullocks went into the abattoirs—whether to be sold for human consumption or not he was unable to say. They were condemned and destroyed, and there is no doubt they were suffering from tuberculosis. We have the disease in our stock only to a very small extent.

Mr. WOOD: I have known it in Queensland for twenty or twenty-five years, and we have not been able to do much with it. The best cure is to give the cattle plenty of salt. We have salt-sheds erected, and the salt, with unslacked lime mixed with it, has done a great deal of good. The best course is to destroy the infected animal, and thus prevent the infection spreading. With regard to the third question in Mr. Stanley's paper, "Is it advisable to compensate owners for the destruction of diseased animals," I think such a course would be impossible in Queensland. Years ago I was interested in a Shorthorn herd, and found that a great many Shorthorn cattle were infected. About fifteen years ago we changed the breed for Herefords, and, under the same conditions and treatment, they are not so subject to tubercule as Shorthorns.

Mr. STANLEY said they would all agree that this disease was hereditary and transmissible. The question was, would they use their influence to discontinue breeding from sires known to be effected with the disease, no matter how good they were. It was a well-known fact that the Shorthorn herds have been so in-and in bred, and their stamina so reduced, that they had become the special prey of tubercule. Where the disease existed diseased animals should, as far as practicable, be destroyed, and should not be bred from. As far as compensation was concerned, he had no doubt that that would be impossible. As progress was being made in science, and in tracing this disease, it was shown that it was being conveyed to invalids and children in the milk of cattle infected with tuberculosis. Hence the law would have to seize and condemn tuberculous animals at the expense of the owners. It would be an important matter to discuss, and to try and prevent the traffic in diseased meat and milk. Any hardship caused the affected animals to give external signs of the disease. If they received knocks or blows they showed it. When they had abscesses in the lungs and chronic cough the infection was spread about on the reserves over which they passed, owing to the expectorations, and thus healthy animals in turn were infected. It appeared to him that the Government should make regulations to prevent diseased animals occupying public reserves or travelling on public roads. That would go far towards arresting the spread of the disease. In inoculating animals for pleuro he was certain he stated the truth when he said that the inoculating matter, instead of being taken from a pleuro lung, had been taken in many cases from animals affected with tubercule, and the disease thus spread; hence it was important that tuberculosis should be fully recognized and put down with a strong hand.

Mr. LANCE was quite sure that this was a disease which should be recognized. He was not sure that it should be put down with a strong hand, as had been suggested, as it might prove to be one of the most

Tuberculosis. most valuable diseases ever brought into the Colonies. During the last Session of the Victorian Parliament a question was put by Mr. Buchanan, I believe, as to whether the disease which had broken out among the rabbits was tuberculosis. The reply of the Colonial Secretary was to the effect that he knew nothing about it. There was no doubt that the rabbits had a disease which appeared to be a bastard form of tuberculosis.

Mr. STANLEY: There are two forms, but the difference is only slight.

Mr. LANCE: At present they had only the mild form, and they desired to intensify it. This was one of the largest questions that the Conference would have to deal with. It was not like introducing a new disease. There were a great many people in this Colony who were strongly opposed to the introduction of any disease to inoculate rabbits, while others thought that it was the most efficacious means of getting rid of the pest. If this disease was found, after careful examination, to be a successful means of dealing with the pest, then the argument could not be maintained that they were introducing a new disease, as they had evidence on all hands to show that it had been running rampant through the lands among the cattle. At present he was strongly in favour of spreading tuberculosis among rabbits, in order to ensure their destruction.

Mr. STANLEY: If this disease is rampant through the country, how is it that the rabbits exist? There is no doubt that the rabbits are susceptible to this disease, but it acts so slowly in killing them that they have time to breed. The disease is not virulent enough to terminate the existence of the rabbits with sufficient rapidity, or to retard their breeding. Owing to that, tuberculosis will never be of any use it getting rid of the rabbits.

Mr. PARK said that two or three years ago Mr. Willows, Government Veterinarian, was sent to Tasmania to investigate the existence of tuberculosis in rabbits in Tasmania. He followed Mr. Willows to Ellenthorpe, near Campbelltown, and they found that about 75 per cent. of the rabbits they killed were affected with tuberculosis. He told Mr. Willows he was prepared to travel for 100 miles straight away, and to find tuberculosis wherever there were rabbits. He found tuberculosis to the extent of 80 per cent. where it was never supposed to exist. Mr. Mandeville, who manages the Denisbon Estate, was eager to have the disease communicated to the rabbits on this run. He told Mr. Mandeville to rest assured that he had it, and six weeks afterwards he found on his estate a larger percentage of affected rabbits than in any other place. He also found *strongylus contortus* in rabbits existing in large numbers. The form of scabies which Professor Watson had endeavoured to introduce to South Australia was also to be found amongst the rabbits in Tasmania. It had cleared them off one or two estates, viz.: Wellwood and Schawfield, but they had come back again.

Mr. HIGGINS said that in connection with tuberculosis in cattle they might direct attention to question No. 4 in Mr. Stanley's paper. After hearing what they had with regard to eating tuberculous meat there could be no doubt that it was a most dangerous thing to do.

Mr. PARK: The cooking renders the meat innocuous to a certain extent. The danger is in the milk.

Mr. HIGGINS thought that legislation should be effected in the direction of prohibiting the sale of cattle suffering from tuberculosis. Any person found taking tuberculous cattle to market, or any butcher killing diseased animals should be fined heavily. The selling or offering for sale or slaughtering affected cattle should be punished severely, and that would be one of the most efficient means for stopping the spread of tuberculosis. He believed that there was no cure for this disease (he spoke under correction), and therefore there was nothing left but to destroy the animal, which should be compulsory.

Mr. CURR said that a Royal Commission, consisting of several doctors and other professional men, sat for three months in Melbourne to inquire into this matter. They took evidence, had the appearances photographed, and produced a long report. The result was that they recommended the Government to act just as in case of pleuro—simply kill the animal where practicable. They found that an immense danger was run, especially by infants, and that tuberculous milk produced consumption. Any reasonable man would do as he had done years ago when he met with a disease he did not understand, namely, put a bullet into the beast which had it. The result was that for twenty years he had less disease in his sheep and cattle than any of his neighbours.

Mr. MEREDITH said he would support a proposal to prevent trading in cattle or other stock affected with tuberculosis. He would suggest to the mover that he went a little further and recommended to the various Governments to pass legislation to the effect that all milch cows found to be infected should be absolutely destroyed, because they had it on reliable authority that the consumption of such milk was liable to convey tuberculosis to consumers. There were thousands of persons in the colony who from ignorance of the danger and the disease would possibly, by using milk from diseased animals, bring about the most terrible results to themselves and their families. The Legislatures should interfere to prevent such diseases spreading.

Mr. HIGGINS: Do you think it would be beneficial to prevent infected animals being used in teams of working bullocks.

Mr. VALENTINE: Cancer is tuberculosis. If, for instance, an animal has a cancer in the jaw, that would not make the meat of the body unfit for consumption. People do not care about eating meat diseased with pleuro. If we confine the proposed destruction of carcasses to bad cases we can prevent the consumption of infected meat, but we should not destroy the meat in every case that occurs.

Mr. HIGGINS: Would it not be well to destroy infected animals in order to get rid of tuberculosis?

Mr. VALENTINE: A few years ago 20 per cent. of the animals coming to South Australia and on the border had cancer or tubercle in the jaw. I do not think that it did a great deal of harm.

Mr. WOOD: I have seen scores of them sent into the Brisbane market.

Mr. HIGGINS: If it be the case that it is dangerous to eat tuberculous meat it is necessary to prevent the sale of such animals in the interests of the public. The only way we do it is by adopting the recommendation of stringent measures. If we deal with it in a half-and-half manner offenders will escape the penalties imposed upon them. The only way to deal with it is as a whole and thoroughly. We all know what tuberculosis is. The animal affected with it is a useless beast. I know the theory of the disease, but I cannot say what its effects are on the human being. I propose to deal with it thoroughly.

Mr. STANLEY: Allow me to explain that, although cancer is often called tuberculosis, the two diseases are distinct. Cancer is often simply a local affection, although at times under certain circumstances it might be constitutional.

Mr. HIGGINS: I have also heard that these animals are slaughtered to give to pigs. That also ought

ought to be prohibited, for if an animal is dangerous to eat in one shape it is dangerous to eat in another. Tuberculosis. I beg to move, "That all stock affected with the disease known as tuberculosis be destroyed under a heavy penalty." Mr. PETER seconded the motion.

Mr. CURR moved as an amendment—"That all animals suffering from tuberculosis and not fit for human food be destroyed." He said there was not an instance on record of any one being affected by eating tuberculous meat. It was a well-known fact that in some parts savages eat the bodies of anyone dying amongst them. It was only after they had cut an animal's throat that they could tell if it was diseased, when the disease was in a mild form.

The motion and the amendment were withdrawn.

Mr. HIGGINS moved—"That the travelling, selling, or offering for sale, or slaughtering for food, of any animal affected with the disease known as tuberculosis, or the using of cows affected with tuberculosis for dairy purposes be punishable by law." Mr. WOOD seconded the motion.

Mr. CURR moved an amendment—"That when an animal is so affected with tuberculosis as to be too poor for human food such animal shall be destroyed."

The amendment was not seconded.

Mr. TABART: Are we not going out of our province in dealing with the traffic in dairy cows? I think we will be interfering with the Health Boards in meddling with such a matter.

Mr. WOOD: I have seen beasts sold that were not badly diseased in Queensland. It would be a good thing for a regulation to be passed to prevent such a practice.

Mr. STANLEY: We want to prevent traffic in the live animal. That is where our legislation is at fault.

Mr. CURR: We are not aware that animals with only a small degree of tuberculosis ever caused an injury to any person, but still we are to recommend that their throats be cut. There would be an enormous waste from this course which can only be carried out partially.

The motion was carried on the following voting:—For: Queensland, 3; New Zealand, 2; South Australia, 1; Tasmania, 3; New South Wales, 3. Total, 12. Against: Victoria, 3; New Zealand, 1; South Australia, 1.

Mr. COOPER moved, and Mr. HIGGINS seconded,—“That this Conference meet every week-day except Saturday; that it adjourn for luncheon from 12.45 p.m. to 2.15 p.m., and that it adjourn for the day at 4.30 p.m.; that there be no meeting on Saturday; that eight members form a quorum for the transaction of business; that all questions be decided by a majority of votes, and that the Chairman have a casting vote in consequence of equality in addition to his deliberative vote as a member of the Conference.”

The motion was agreed to.

The Conference then rose and adjourned until half-past 10 o'clock on the following day.”

WEDNESDAY, 29 SEPTEMBER.

THIRD MEETING.

Present:—Mr. Alexander Bruce, Chairman, and the full Conference.

The minutes of the previous meeting were read and confirmed.

Mr. MEREDITH: There are some subjects which members evidently take more notice of than others, and it is desirable that before the close of each sitting notice should be given of the subjects to be considered at the next meeting.

Mr. HIGGINS: The order of procedure has been laid down.

Mr. MEREDITH: It has not been followed. I see that Nos. 3, 2, and 1 have been taken as 1, 2, and 3.

Mr. HIGGINS: I believe they have been taken in the altered order I see that under No. 1 are most of the diseases sheep are principally affected with. I think we should adhere to the order of procedure as laid down, and if any gentleman wishes to bring forward a special motion he should be at liberty to give notice of it, or with the permission of the Conference, and then it could be dealt with on the following day. If a notice were given this afternoon it could be dealt with by the time of the adjournment for lunch on the following day. If we keep to the programme I think there will be no fault found.

The CHAIRMAN: I think it well to state the order in which we will take the different items. Glanders and farcy will come next, and I would suggest that we consider the other diseases not known in the colonies after glanders and farcy.

3. GLANDERS AND FARCY.

Mr. STANLEY then read his paper on glanders and farcy, but it was decided on the motion of Mr. CURR that the further consideration of these diseases should be postponed for discussion with foreign diseases. (*See under head of Treatment of Foreign Diseases.*)

Mr. BAGOT: No. 3 in the programme deals only with the introduction of foreign animals, and Mr. Stanley recommends that Inspectors should have power to confine animals which had disease to some particular locality. We should also have regulations for the internal management of the disease. So long as there is no objection to our discussing the mode of dealing with the disease, if it be in this country, when we are discussing foreign animals, then we can let it remain.

Mr. VALENTINE: All the diseases should be placed in a Schedule to the Act.

Mr. LANCE: We have one in our Act. The Governor has power from time to time, on the recommendation of the Minister, to add any disease to the Schedule.

4. HOOSE.

The CHAIRMAN: The next question is hoose. I suggest that it be held over until we deal with entozoa. This was agreed to.

5. PLEURO-PNEUMONIA.

The CHAIRMAN: The next question is the treatment of pleuro-pneumonia.

Mr. COOPER: It is not known in New Zealand.

Mr. TABART: It is not known in Tasmania.

The CHAIRMAN suggested that in order to facilitate the business of the Conference the resolutions passed at the Stock Conference held in November, 1874, should be taken as subjects for discussion at this, and in the order in which they were then passed. With that view he proposed, and Mr. GORDON seconded, that resolution No. 1 passed by the previous Conference in regard to pleuro-pneumonia be passed by this Conference. These resolutions were to the following effect:—

No. 2.—Pleuro-pneumonia. Legislation suggested.

1. That every mob of cattle which has become infected be inoculated when the virus can be obtained in the mob or in any cattle within a practicable distance.
2. That owners give notice of every outbreak of the disease to their neighbours, to Inspectors, and to the public.
3. That no inoculators but those authorized by the Government be allowed to inoculate for others.
4. That properly inoculated cattle depasturing on a run, on the expiry of six weeks from the last case of disease, be allowed to leave the run and to pass over infected ground without being deemed infected.
5. That all travelling cattle actually affected with or suffering from pleuro-pneumonia be killed immediately they are found to be so.
6. That if the travelling cattle in which any animal is thus found to be actually affected be fat stock, they be taken by day to their destination by the roads least likely in the opinion of an Inspector to spread the disease, and timely notice be given by their drovers to all owners of horned stock on or near the road that the mob is infected.
7. That where the travelling cattle in which any animal is thus found to be actually affected with pleuro-pneumonia are store stock, they be stopped and inoculated as soon as practicable, and afterwards taken to their destination, as provided for in the next preceding regulation; but such cattle be not required to travel more than 6 miles a day for the first thirty days after being inoculated.
8. That in Colonies in which pleuro-pneumonia exists, the owner of travelling cattle give notice of his intention to cross or pass along runs where stock of the same description are kept, if the road be not separated from the run by a sufficient fence.
9. That drovers do not abandon any travelling stock, nor leave the carcasses of any stock which may die, undestroyed.

Mr. MEREDITH considered that tuberculosis might be spread by means of inoculation.

Mr. HIGGINS pointed out that the third resolution says, that inoculation shall only be performed by persons authorized by the Government.

Mr. CURR thought it would be well to decide whether the policy laid down in this paragraph should be the policy of the Conference. He objected to it entirely. If the Conference were asked to adopt this in a general way subject to amendment, it might be accepted with such a condition. The course pursued in Victoria was a good common sense one. If an animal was found to be actually diseased it was destroyed and the others with which it had come into contact were watched; that was to ascertain whether it was an accidental case. If however four or five animals were found to be diseased the whole of those with which they had come into contact were put into quarantine. If the Conference desired to hear his objections to this plan of inoculation, he would be happy to state them.

Mr. LANCE: The plan might be suitable to small lots but not to large ones, or to a very large extent of country.

Mr. CURR: By quarantining, I mean keeping the stock on the station or in their paddocks.

The CHAIRMAN: I think it would be better to consider the resolutions one by one. The first questions we should discuss are:—Have we sufficient evidence to say that inoculation is effective and ought we to make it compulsory?

Mr. CURR moved as an amendment,—“That this Conference decide that the subject of pleuro be not discussed as under heading (No. 2.) in blue book containing report of the previous Conference.”

Mr. VALENTINE seconded the motion. He considered that the matter would be simplified if it were dealt with in a general way.

Mr. HIGGINS: The question is whether we should deal with pleuro in this form or not.

The CHAIRMAN: We have decided to deal with pleuro, and the form suggested is the simplest and best.

Mr. CURR's motion was then put to the vote and negatived by 10 votes to 8. The following was the voting: Against,—New South Wales, 3; Queensland, 3; New Zealand, 1; Tasmania, 3. For,—South Australia, 3; Victoria, 3; New Zealand, 2.

The CHAIRMAN moved the adoption of resolution No. 1, which had been altered to read as follows,—“That in every mob of cattle in which infection exists, those actually diseased be destroyed, and those infected but not showing symptoms of the disease be inoculated, when the virus can be obtained in the mob or in any cattle within a practicable distance.”

Mr. VALENTINE considered that if they adopted the list of regulations laid before them by the Chairman they would be making inoculation compulsory.

The CHAIRMAN: Yes.

Mr. BAGOT: The Legislature of South Australia would never for one moment entertain the idea of enforcing universal inoculation. The most the Conference should do should be to prevent drovers leaving the bodies of diseased animals unburied or travelling infected animals upon reserves. As far as our Colony is concerned the result of this Conference recommending compulsory inoculation would be null and void.

Mr. STANLEY said that the great object of inoculation was to prevent the spread of pleuro in the localities through which the stock was travelling. The matter must be dealt with from an intercolonial standpoint. If infected animals were inoculated the disease would be prevented from spreading. It seemed

seemed to him a very important matter not only to inoculate the mob in which disease appeared but also the adjoining mobs. If a stockowner knew that any diseased stock was approaching he should as a measure of precaution inoculate his own to prevent contagion. Mr. Curr had admitted that there was scarcely a mob of cattle in Victoria that was not infected with pleuro.

Mr. CURR: I spoke not only of Victoria but of all the Colonies. I beg to move, as an amendment, that inoculation for pleuro-pneumonia be not made compulsory.

Mr. WOOD seconded the amendment.

Mr. CURR said that, with all the advantages they possessed in the Low Countries, and the fact that animals were not allowed to mix with one another, they had failed to get rid of pleuro there. He would ask them to contrast the difference between animals in the Low Countries, where they were tied up and kept in stalls, and those in Queensland. Of course the advantages for the system of inoculation were infinitely in favour of the Low Countries. They could do it there, but we could not do it, especially in the larger Colonies. No Government would make it compulsory, even if the Conference did recommend it. Some years ago he had a discussion with Mr. Bruce in the papers, and he received a number of letters from squatters in New South Wales, agreeing with him entirely. They said that industries became emasculated from the constant interference of Government. Why not let everyone look to his own? Some of the letters he received went to show that since inoculation had been introduced a general weakening had taken place in the constitution of the herds, that the bulls never came to maturity thoroughly, and that if the country were polled from one end to the other there would be found to be a large majority of stockowners against the system recommended by Mr. Bruce. If by inoculation we could get rid of pleuro he would be ready to agree with him. He had heard of twenty undiseased animals being killed and paid for in Belgium on account of one outbreak. He apprehended that none of the Colonial Governments would take such a task upon themselves, or go to the expense of employing the necessary staff. He would ask, how could they muster half the cattle of Queensland? Many of the wild ones would be injured if they were pressed into yards. He had been told by men who had been connected with stock for twenty or thirty years, that it was only necessary to travel any herd in Australia 500 miles and they would begin to die of pleuro.

Mr. WOOD said it was a most tyrannical proposal to make inoculation compulsory, and it would never be adopted in Queensland. The loss by inoculation was considerable. He thought that the owners of cattle should be compelled to inoculate their stock before moving them from the stations, and the Government inoculators should see this carried out. It would be very hard on cattle owners to make them inoculate the whole of their stock whenever the disease broke out. There was pleuro in many of the herds without the owners being aware of it.

Mr. STANLEY said, that at a Congress of Veterinarians in Brussels, the subject of pleuro was gone into, and their proceedings published. The result of their investigations were to the effect that they advocated inoculation as a preventive of pleuro. The English authorities were formerly much against it. Now, the most recent information was that the majority of veterinarians of the highest standing in Europe were of opinion that inoculation was the best remedy to arrest the spread of pleuro in cattle where stamping out by slaughter could not be carried out. Sometimes mistakes were made by using the wrong virus, but if the virus were taken only from animals suffering from pleuro, inoculation would certainly be found to be a preventive, and certainly one of the most valuable introduced into cattle practice in this decade.

Mr. HIGGINS said, that one of the objects of this Conference, as he understood it, was to produce something which would assist the various Governments in dealing with the diseases to which the stock of the Colonies were liable, and also prevent the introduction of diseases into the country. Among the diseases which had been introduced into the country was pleuro. To his mind the best way to deal with it was to stamp it out just as they did with scab. If scab were to make its appearance it would be stamped out at once. Mr. Stanley had said that pleuro had not been dealt with successfully at home, and that therefore it could not be dealt with here. They could not get rid of scab at home and yet we had stamped it out here. The question was, would it be possible by any means to stamp out pleuro. He confessed that he saw one grave difficulty in the way, and that was with regard to compulsory inoculation. He considered that regulation No. 1 meant that diseased beasts must be destroyed.

The CHAIRMAN pointed out that the word "mob" and not herd was used in that regulation.

Mr. HIGGINS said when once pleuro shows on a run it extends throughout the herd, therefore you must not make exceptions, otherwise some trouble will certainly occur. We had better say whether inoculation should be compulsory or not.

The CHAIRMAN: If this were made law people would be careful to stamp out the disease for their own sakes. They would make a certainty of bringing in all the cattle likely to be exposed to the danger of infection. They might miss some the first time, but after that they would certainly muster all that were likely to be infected.

Mr. HIGGINS said they must deal with this question as a whole or not at all. He was ready to vote for compulsory inoculation as a general regulation, because he thought that when disease appeared efficacious steps should be taken to stamp it out. If that were done they would be going far towards stamping it out throughout the Colony. He believed that it was the only known remedy they had, and it was their duty to adopt such measures as would protect, not only one, but the whole of the Colonies.

Mr. GORDON said it was agreed that inoculation was a preventive, and it would be a foolish thing to offer any objection to it. He remembered how mobs were dealt with on the Hunter. The same cattle met in camp day after day, and a mob was called a camp. The camps were inoculated and the disease never spread. He would not propose to inoculate every mob of wild cattle, but if they saw that inoculation was a preventive of pleuro they would be very foolish to offer any objection to it.

Mr. VALENTINE believed that inoculation had done a great deal of good, and it was constantly resorted to in South Australia. Nearly all their cattle owners and farmers inoculated their cattle, but if the Conference went so far as to recommend that it be made compulsory he was afraid that it would be found a very difficult matter to carry out. The cattle owners would certainly put up their backs against any proposal to make inoculation compulsory.

The CHAIRMAN: Stock owners objected in the same way when we were engaged in stamping out scab.

Mr. VALENTINE: Scab is a very different thing. If you inoculate an animal the disease may remain latent in it, even with the inoculation, and then if the animal is moved, it will be the means of spreading disease.

Mr.

Pleuro-
pneumonia.

Mr. STANLEY: You cannot infect an animal which is inoculated.

Mr. VALENTINE: It is useless to recommend a law which will not be carried out.

Mr. CURR said there was no doubt that in Victoria and South Australia inoculation is carried out to a large extent. In Victoria, compulsory inoculation throughout the Colony could not be carried out without employing at least one hundred inspectors. At present there were only seven, and he did not think that the Government would care about increasing the number. He contended that they could not get rid of pleuro by any such measures as were now projected.

The CHAIRMAN said that he took the same view of the question as Mr. Gordon. What they had to decide was whether the treatment was a success. He thought that had been settled beyond all doubt. Were they then to do such a foolish thing as allow infected herds to travel through the length and breadth of New South Wales and Victoria, because there were some few immaterial objections to the proposal to make inoculation compulsory. He was astonished to hear the South Australian representatives object to the proposal; for as certainly as cattle started from Northern Queensland, so certainly did they, unless they were inoculated, get infected before they reached South Australia. There was no place where inoculation could be carried on so easily as upon the station, and owners should therefore be compelled to inoculate when the disease appeared. It would be somewhat inconvenient to do it on the road. But that, too, could be managed. A man might just as well put a fire-brand to a run as take a herd infected with pleuro upon it. For these reasons, he would recommend that regulation No. 1 stand as it appeared in the record of the previous Conference.

Mr. PARK said that his experience of travelling stock from Victoria to South Australia was, that every mob of cattle introduced pleuro. Had those cattle been inoculated many thousands of pounds worth of stock might have been saved. Had they been quarantined before being offered for sale, the infected ones could have been got rid of, and the infected mob inoculated and not allowed to mix with the farmers' herds. Therefore, if inoculation was a preventive against the disease spreading, then by all means they should adopt it.

Mr. WOOD said he had no objection to a regulation being passed providing for the inoculation of cattle before they started from the runs on any journey, but he was decidedly opposed to the compulsory inoculation of every mob at home.

The amendment was then put and carried by eleven votes to seven, the voting being as follows:—For,—Victoria, 3; Queensland, 2; South Australia, 3; New Zealand, 3. Against,—New South Wales, 3; Queensland, 1; Tasmania, 3.

The CHAIRMAN moved, and Mr. GORDON seconded, the second regulation,—“That owners give notice of every outbreak of the disease to their neighbours, to inspectors, and to the public.”

Mr. BAGOT: Nothing would suit me better, if I owned 50 miles square of land with stock on it, and desired to act dishonestly, than to put up a notice, “Pleuro on this run,” so as to keep everyone else off it.

The CHAIRMAN: The inspector would put the run into quarantine.

Mr. BAGOT: All these resolutions *re* pleuro might be decided by putting this resolution to the vote. I intend to move a resolution providing that diseased animals be destroyed, that penalties be provided for leaving the bodies of diseased animals undestroyed, and that notice be given to the inspectors of any outbreak of disease.

Mr. GORDON: What would be the use of that in the northern territory?

Mr. BAGOT said that the disease was not so virulent in the dry countries. There had been two outbreaks in his cattle, but he had managed to stamp them out. In one instance he lost heavily, but in the other only a few animals died. The inoculation of travelling cattle was practically impossible. There must be some place in which to perform the inoculation. They could not stop a diseased mob on another man's run.

Mr. GORDON said, that on the Warrego, at Wilcannia, and elsewhere, cattle were inoculated on the way, and the owners were very glad to do it.

Mr. HIGGINS: I was under the impression that, notwithstanding the loss of the first regulation, the others would be considered *seriatim*, and that, as they were being considered, any amendment that members of the Conference thought fit might be proposed.

Mr. BAGOT: The question of compulsory inoculation having been settled, there is nothing before the Conference now. Before we pass the regulation stating that stockowners shall give notice of an outbreak of disease, we must state what legislative power must be taken to stamp out the disease or how it shall be treated.

Mr. BAGOT moved,—“That this Conference recommends that power be given to destroy animals actually diseased with pleuro-pneumonia, and that penalties be enforced for leaving diseased animals or dead bodies undestroyed, and that stockowners be compelled to give notice in writing of every outbreak of the disease to the Chief Inspector of Stock and to the nearest Inspector of Stock.” Practically, he embodied in his motion the regulation which Mr. Bruce had brought forward.

The CHAIRMAN: I take the same view as Mr. Higgins, that the order should be according to this list. The motion decidedly was that these subjects should be considered in the order in which they stand. I rule Mr. Bagot's motion out of order.

The motion was then put and negatived by 12 votes to 6, the voting being as follows:—Against,—New Zealand, 3; Victoria, 3; Tasmania, 3; South Australia, 3. For,—Queensland, 3; New South Wales, 3.

Regulations Nos. 3 to 9 of previous Conference were then withdrawn.

Mr. BAGOT then moved his resolution again in the same shape. He said that pleuro had existed to a great extent throughout the herds of the Colony, but he believed they were now quite free from the disease. He thought that compulsory notification would be a disadvantage to conscientious men, as they would at once notify the presence of pleuro in their stock, whereas dishonest men would not do so until it was found out.

Mr. HIGGINS: What will be the benefit arising from carrying this motion?

Mr. BAGOT: You can destroy diseased cattle.

Mr. HIGGINS: But you cannot inflict a penalty for travelling diseased cattle.

Mr.

Mr. BAGOT: If you talk of inflicting a penalty for travelling diseased cattle, that would be the best trade protection South Australia could have, as very few cattle could then come in from Queensland, New South Wales, or Victoria. Hardly an individual mob of cattle reaches the northern railway stations in South Australia, coming from Queensland, without disease being present in it.

Mr. GORDON: It was by making scab public that it was banished from the Colony.

Mr. HIGGINS suggested that the words "in writing" be added after the word "notice."

The suggestion was agreed to, and the motion altered accordingly.

The motion was then put and carried unanimously.

Inoculation Mark.

Mr. BAGOT moved,—“That the distinctive mark in use in Queensland, viz., the tip off the ear, be used universally through the Colonies as the sign of inoculation.” Mr. HIGGINS seconded the motion, which was carried unanimously.

The motion appears in the report in the following revised form—“That the distinctive mark in use in Queensland, viz., the tip off the off (*i.e.* the right) ear, be used universally through the Colonies as the sign of inoculation.”

ADMISSION OF PUBLIC.

Mr. HIGGINS moved and Mr. WOOD seconded,—“That the public be admitted to the meetings of the Conference.”

The motion was negatived by 12 votes to 6, the voting being as follows:—Against,—New Zealand, 3; Tasmania, 3; South Australia, 3; Victoria, 3. For,—New South Wales, 3; Queensland, 3.

It was agreed that this exclusion should not affect the press.

Efficacy of Inoculation.

Mr. HIGGINS said it had been suggested to him by a member of the Conference that there ought to be a motion, contingent on the motion that compulsory inoculation is not desirable, to the effect that they recognized the efficacy of inoculation.

Mr. GORDON: There is nothing in the resolution to show that we believe in it at all. I beg to move that this Conference desires to express its belief in the efficacy of inoculation as a preventive for pleuro-pneumonia.

Mr. VALENTINE seconded the motion. It had been practised in South Australia with good results.

Mr. LANCE said it seemed to him that the first thing they should be careful about was not to stultify their previous action, but they could vote for this resolution without doing so. What they had done was to vote against compulsory inoculation. It would be quite right of them to recommend to their Governments such means as were fitted for stamping out disease, but surely it was not their duty to recommend any measures which would be either vexatious or impracticable. The remarks which he had heard from South Australia, Queensland, and Victoria, were to his mind conclusive arguments that if they insisted upon recommending compulsory inoculation it could not be carried out.

Mr. PETER: Travelling parties should be compelled to inoculate before they started on their journeys.

Mr. HIGGINS: There is nothing to prevent anyone bringing forward such a resolution.

The motion was then put and carried unanimously.

Reference to Pasteur.—Cultivation of Virus.

Mr. GORDON moved,—“That it is desirable to recommend to the Government of the Colonies represented at this Conference, that communication be opened with M. Pasteur, with a view to ascertain whether the virus or contagium of pleuro-pneumonia has been, or can be, cultivated apart from the living subject, and if so to state the mode of cultivation.” He said it had been satisfactorily proved that this disease owed its vitality to a specific micro germ, and there was no doubt that it could be cultivated. The present system of inoculation was satisfactory and the loss slight. The difficulty, however, was in preserving virus for use. If it could be cultivated in the way suggested, a quantity might be kept available for any emergency.

Mr. CURR: Although we know what the virus is, we shall be all the better for any information that Mons. Pasteur may favour us with.

The CHAIRMAN: Many people would use it, if they had it, as a safeguard for their stock.

The motion was carried.

The motion appears in the report in the following form:—“That communication be opened with M. Pasteur, with a view to ascertain whether the virus or contagium of pleuro-pneumonia has been, or can be, cultivated apart from the living subject, and if so to state the mode of cultivation; and also the best methods of preparing and preserving virus for inoculation.”

THE RABBIT NUISANCE.

This subject was then introduced.

Mr. HIGGINS: If it is not intended to deal with the rabbit nuisance, it is no use bringing it forward.

Mr. PETER: We do so under subject for discussion No. 6.

The Secretary then read a letter from Mr. Oscar Stub, which with the discussion upon it will be found in the proceedings, page 85, under the head of Rabbit Nuisance.

PROTEST BY QUEENSLAND BREEDERS AGAINST WITHDRAWAL OF PROHIBITION.

At this stage a protest was presented by Mr. R. B. Wilkinson (Messrs. Wilkinson and Lavender) by certain Queensland Breeders against the withdrawal of prohibition. It will be found under the head of “Introduction of Foreign Stock,” page 86.

Catarrh.
Entozoa.

CATARRH.

The CHAIRMAN said the next question to be discussed is the treatment of catarrh in Sheep.

Mr. HIGGINS moved,—“That this Conference recommend that all sheep infected with catarrh be destroyed, that the owners be recompensed to two-thirds the value of the sound sheep at the date of destruction, and that the run or place in which such sheep were depasturing shall be strictly quarantined for six months.”

Mr. GORDON seconded the resolution. He said that in the old days if a man wanted to get a piece of country he sent his catarrhed sheep on to it, and very soon he had it without opposition.

Mr. CURR said that in 1839 a friend of his had catarrh among his sheep and a neighbour was in the habit of allowing his sheep to encroach. His friend said, “your sheep will get this disease, and I strongly recommend you to order your shepherd to take them away.” He did not do so; the catarrh appeared amongst the lambs and they commenced to die. The neighbour went to his friend and said, “my sheep have got the catarrh; do you know anything that would be of any use to try as a cure?” His friend said “I have heard of a remedy and you might try it. It is to plough the land where they camp at night.” He did so, and averred that it cured his own stock and succeeded in two or three other cases.

Mr. PETER: I remember some years ago, whenever the sheep commenced to die in the yards, they were travelled away, and by that means they got rid of the disease.

Mr. HIGGINS: It is a most deadly and dangerous disease, and I hope we will be able to keep it down. The motion was carried unanimously.

ENTOZOA.

Mr. CURR said that if they drained swampy ground and gave plenty of salt to the sheep they would prevent fluke appearing, but they could do nothing with it after it had obtained a hold on stock.

Mr. PETER: Sheep fatten when they get fluke. In some countries they put sheep on marshy lands and then sell them as soon as they get fat.

Mr. HIGGINS: Some one said there is no cure for fluke.

Mr. CURR: I said so.

Mr. HIGGINS: We have had flukey sheep from the New England district, and put them into salt bush country, and very soon the fluke has disappeared. Limestone country does the same.

Mr. VALENTINE: I have known ironstone country cure it. That is, reduce it so much as to make it harmless.

Mr. HIGGINS: When the lower jaw towards the throat is “bottled,” as the shepherds call it, there is very little hope for the animal. The prevention consists in using plenty of Liverpool salt, given in troughs, and keeping the sheep from water. There should be salt-houses in the paddocks, so that the sheep can get to the salt whenever they want. By that means you will save your flocks to a very large extent.

Mr. VALENTINE: Salt and sulphate of iron has been found to be very successful in South Australia.

Mr. HIGGINS: The sulphate of iron may be mixed with salt to a slight extent, but in my experience when they eat the salt alone they were just as well off as if they had the sulphate of iron with it. They will not take the salt so readily when the sulphate is mixed with it. I have known Stockholm tar used on stations and mixed with salt, but it never had the effect of salt alone.

Mr. VALENTINE: We find that in our ironstone country flukey sheep recovered, which showed that iron was an agent in the cure. Liverpool salt is also used, under cover, in troughs. It is better than rock salt, and the use of it has been most beneficial. That is the only way in which the disease can be dealt with after it has appeared.

The CHAIRMAN: What we have to consider is whether fluke is infectious or contagious, and to look at it from a public point of view. If you take flukey sheep through country which does not grow salt bush, when it has plenty of moisture and a fair amount of grass, you will leave the seeds of fluke there.

Mr. MEREDITH said he could speak positively that it was so. In Tasmania for many years fluke was never known to exist where he was. Unhappily he purchased some flukey sheep with the idea of improving his flocks, having no suspicion that there was fluke in the Colony. Unfortunately it proved to be otherwise. The flukey sheep rested for one night on one of his stations, and ever since that the run had been flukey. They were removed from there to another portion of the run and that became flukey. When he found the fluke in his sheep he prevented them from going on to other parts of the run. Out of this flock of 1,800 ewes, with 90 per cent. lambs, in eighteen months he had not 50 left. He remembered one run which was esteemed to be the most valuable for lambing purposes, and they were all aware that when a run had that name it was considered to be very superior indeed. Until three years ago fluke was never known in the neighbourhood, but now it was so bad that sheep could not be put upon it. In another, fluke spread all over it in consequence of some flukey sheep being put upon it. He would recommend that flukey sheep should not be allowed to travel, nor should they be permitted to cross over country through which roads passed, unless the roads were fenced off. Generally in Tasmania there was more or less herbage along the sides of the roads, and flukey sheep nibbling it were apt to deposit fluke, and then clean sheep travelling after them were apt to pick up the fluke and become diseased. Persons had told him that there were some stations on which fluke was found only on patches of two or three acres, and any sheep going upon them became infected. One of these patches was only half an acre in size. It was a small swampy place, amongst steep ironstone gravelly hills, and it had to be fenced off. In cases of doubt, stockowners should prevent their sheep crossing such localities. That fluke would contaminate soil he had unfortunately had too much experience.

Mr. TABART said he could endorse every word that Mr. Higgins had stated with regard to fluke. About twenty years ago fluke first made its first appearance in Tasmania. On his own property he had never before had any flukey sheep. He bought a small flock of ewes which had fluke. They were placed on one portion of the run and then removed to another. The result was that he lost 4,500 sheep, and ever since that the property which had been occupied for thirty-five years and had never shown fluke had been infected with it. This season, fluke had been very fatal in Tasmania. On one run 4,000 sheep died, the summer having been very wet. It was the season in Tasmania that caused the fatal result in very many cases. Some of the runs in the midland districts were very dry this season, and the stock was removed to the

the

the Lake country, where they got the germs of disease, and so it was disseminated through the country ^{Entozoa.} by travelling. He thought that sheep suffering from fluke should be prevented from entering sale-yards or travelling along public roads.

Mr. MEREDITH said it had been a very dry season, and the gentleman who owned the sheep which he purchased was compelled to remove them to a marshy country. He was obliged to do so by the shortness of feed on his own run, and they contracted fluke. They brought it back, and as they looked so well he (Mr. Meredith) bought them, never thinking that they had fluke. He then took them across his summer run, and in consequence of their infecting that run he had been obliged to abandon it for sheep. He moved,—“That, except with the permission of the Inspector of Stock, sheep affected with fluke shall not be removed from the owner's land, and that they shall not be permitted to travel along any public or bye road, or to graze on any lands not properly fenced off from such roads.”

Mr. TABART seconded the motion.

Mr. PETER asked Mr. Meredith if there had never been fluke in his run before?

Mr. MEREDITH: No. It never existed there before.

Mr. HIGGINS: Our experience is that any marshy country will generate fluke.

Mr. MEREDITH: For twenty years we ran our sheep upon this land, and they never had fluke until these flukey sheep were brought on to the run.

Mr. PARK said that the life history of fluke was so well known that no one would dream of accepting the theory of spontaneous generation. Suppose that there were twenty fluke in one sheep. They did not grow or multiply. They remained the same while in the animal, but when the ova passed out of the body they performed the circle of life, so well known to Helminthologists.

Mr. HIGGINS: I will take sheep from salt bush country, put them in granite country, and then the sheep will have fluke.

Mr. MEREDITH said he had known thousands of sheep to die of fluke on a run in South Australia, the soil very dry and undulating; the only water obtainable in the summer was from native wells. Water would accumulate in the winter time, and there would be a pool perhaps as big as the room they were in, perhaps larger. The kangaroo grass grew so rank that if 1,000 sheep were to go amongst it not one of them could be seen. There were she-oaks and saplings growing over the country, with stringy bark and prickly hop, limestone ranges running through it. There was a plentiful rainfall and a heavy dew, and the grass was only dry for a few hours. On that ground the fluke was. There were no swamps there whatever. The sheep were flukey when he got them, and the fluke continued to infest that place.

Mr. HIGGINS said that the timber was generally a guide to the state of a locality. If there were stringy bark or black butt and a granite country, it was flukey, but where the white box grew the country was clean. If they took flukey stock into salt bush country it disappeared, and therefore they were not in the least afraid to receive sheep from the flukey district of New England so long as they had good frames. Given the frames, they did not care whether there was fluke to a small extent in the sheep.

Mr. LANCE said that this was a matter of degree. In New Zealand, the farmers sons when out shooting at the beginning of the season, would cut open the livers of the hares, and if fluke were present, it was an indication to them how to deal with their sheep. It certainly fattened stock very rapidly, and he was not aware that any harm had ensued to the consumers from its presence.

Mr. VALENTINE: Flukey sheep are destroyed in England by the Board of Health.

Mr. CURR said there was no cure for fluke as there was scab. He thought Mr. Meredith should inform the Conference more minutely what he desired to have done. With regard to the prevention of flukey sheep travelling, it would be necessary in many cases to kill the sheep to see if they were diseased. Out of the 9,000,000 of sheep in Victoria, 1,000,000 would be shut up by such a regulation as prevented their travelling. If it was not to touch mild outbreaks, but only virulent ones, where were they to draw the line. Who was to prove which were very bad and which were only affected in a mild form?

Mr. MEREDITH's motion was then put, and negatived by fourteen votes to four. The following was the voting,—Against,—New South Wales, 3; Victoria, 3; Queensland, 3; South Australia, 3; New Zealand, 2 (Mr. Lance and Mr. Cooper). For,—Tasmania, 3; New Zealand, 1 (Mr. Peter).

Mr. CURR moved, that as the conditions in each Colony are so different, this Conference recommends that on the subjects of fluke, worms, and foot-rot, each Colony should legislate for itself, where practicable.

Mr. LANCE seconded the resolution.

Mr. GORDON said, that at the last Conference, he read a paper on the worms which were decimating the flocks in Queensland. Since then they had had a Board to enquire into diseases in animals and noxious plants, and Sir Joshua Peter Bell gave them two sheep for experiments. Dr. Bancroft, who was on the Board, said that the disease was due to overstocking and starvation. They killed one sheep and found it full of stomach worms. They fed the other liberally, and killed it in three months time, and it was as fat as any sheep in Queensland. Another experiment was carried out, although not by the Board, with similar results.

Mr. VALENTINE: We have had some experience of these worms in sheep, on rich country, during the wet season, and on land which was hardly ever dry, even in summer.

Mr. GORDON; I should have mentioned that.

Mr. VALENTINE: The best treatment is feeding the young sheep well. In several instances this has been most successful. As weaners they were fed on good old feed, and in one case on hay. One lot when weaned were turned into turnips, and that reduced the worms. Fumigation was tried and was said to be successful, and it was also tried in the western districts of Victoria. Carbolic spray had also been tried, but he could not say with what success. He did not think that there was much necessity for legislation on the subject.

Mr. HIGGINS said that he had known sheep to die of worms when they were up to their belly in feed. In the wet season, on the table-land, if the summer has been much broken, there will be numbers of worms in the sour country. He had seen both sheep and lambs failing when there was plenty of feed. If they changed the stock from sour feed, which was in an unfit condition to enter the stomach of an animal, and thereby generated worms, to turnips and such feed, they took away the cause of the disease. That, however, could not be done on a very large scale. Where the grasses were sour, and there was plenty of moisture on the grass, they might as well try to prevent the grass growing as prevent worms and fluke from appearing amongst the sheep.

Mr. LANCE seconded Mr. Curr's motion, which was agreed to.

The

Entozoa.
Scab.

The following paper, by Mr. Chalwin, M.R.C.V.S., of South Australia, on worms in sheep, was tabled by Mr. Valentine, and ordered to be printed as part of the proceedings:—

Sir,

Adelaide, 9 May, 1884.

I have the honor to state, for the information of the Honorable Commissioner of Crown Lands, that I accompanied you on Tuesday, 22 April last, to the south-eastern district of the province, to jointly investigate the nature of an ailment which was affecting the flocks in that locality

Five (5) stations were visited, and at those where a *post-mortem* examination was made the results were almost identical, with this exception, that at two (2) stations there were present in the lungs of the animal destroyed a species of ascaris, known as *Filaria bronchialis*.

The appearance of the animals was emaciated in the extreme. On parting the wool, the skin had a peculiar white appearance, which extended externally to all parts of the body, and from the lower jaw appended a considerable enlargement, which, upon being opened, there issued therefrom a white viscid fluid of a glutinous character, tinged with blood. This swelling was only found at the lower jaws, and was termed a "bottle."

The blood which flowed from the animal, upon being killed in the usual manner, was preserved in a dish, and after standing a short time exposed to the air it partly coagulated, but a large quantity of serous fluid escaped from it. After being placed in a closely-fitting glass-stoppered bottle, and allowed to remain in a quiescent state for some hours, it assumed the look of water, which, upon being analysed, disclosed the results as furnished by A. Thomas, Esq., F.C.S. Upon opening the abdominal viscera, the same white appearance presented itself as was exhibited externally. All the intestines (peritoneal coat) were exceedingly pale in colour, and had an unusual feel to the fingers. The liver, gall-bladder, and kidneys were in a normal condition. On separating the small intestines from the rest of the viscera, and emptying them of their contents, a quantity of badly-digested food escaped, and upon pressure being given along the whole course of these intestines, tapeworms (*tenia*) were dislodged. The food which had been emptied from the small intestines and left exposed during an examination of the *tenia* was now looked over, and upon its surface were hundreds of worms (*strongylus refuscens*), some white and some red in colour, varying from $\frac{1}{2}$ inch to an inch in length. Upon opening the stomach (*abomaseum*), its contents were found insufficiently digested, and upon the mucous membrane there were thousands of the above small worms spreading all over its surface, and issuing from the undigested contents.

The thoracic viscera was next examined. The heart was found to be of a pale colour, and its walls were considerably weakened.

The lungs were of a light-pinkish colour (abnormal), and, with the exception of the presence of filaria, were in a healthy state.

Throughout our examination none but weaners were found affected; the older animals, seemingly, had power to combat the effects of the parasites.

There was not the slightest indication in any of the animals destroyed or otherwise examined of an infectious or contagious disease, the intestinal parasites alone being amply sufficient to account for the structural derangement of the body, both externally and internally.

Worms cannot be regarded as a disease; but are occasioned by morbid conditions, such as morbid secretions of mucus and debility of the digestive organs, which occasion constitutional disturbance, during which the parasites multiply to excess, when they appropriate to themselves the nutriment intended for the supply of the animal.

Death was caused by the absence in the blood of the mineral constituents which should be found in the food which the animals partook of, thus preventing the stomachs and intestines from receiving that nourishment which is conducive to animal life.

The treatment is a somewhat difficult matter to contend with, considering the number of sheep affected; and the grasses, owing to unusually wet seasons which have visited the south-eastern district, are so void of nutritious properties, that only by a free distribution of generous food (almost impracticable on so large a scale), combined with chloride of sodium (common salt) and iron (ferri sulph), can a good result be anticipated.

As a matter of course, in isolated cases there would be no difficulty in introducing this treatment with almost immediate beneficial effects, without having recourse to other medicinal agents; but it appears to my experience this morbid condition will not be eradicated until the soils yield a stronger and more nutritious herbage, and a favourable change of season will rapidly tend to bring about this most desirable improvement.

I have, &c.,

THOMAS CHALWIN, M.R.C.V.S., Eng., Govt. Veter. Surg., S.A.

C. J. Valentine, Esq., J.P., Chief Inspector of Sheep, South Australia.

SCAB IN SHEEP.

The CHAIRMAN: The next question is scab in sheep.

The CHAIRMAN laid before the meeting the various reasons—four in number—as set forth in the Report of the Conference of 1874, which induced that Conference to pass a resolution for the destruction of scabby sheep, as well as the flocks in which they were found running. They are as follows:—

- (1.) The existence of scab in any of the Colonies is a source of real danger to the flocks in the other Colonies.
- (2.) It entails very great expense on some of the Colonies, and a considerable amount on them all, in the protection of their sheep from infection.
- (3.) It puts a stoppage to free trade in sheep in Australia, and thus causes very heavy losses to all the other Colonies, not only through preventing the trade in store and breeding sheep, but also in the impediments it throws in the way of the introduction of improved stud sheep from one Colony to another.
- (4.) The immense losses that are sustained by all the other Colonies through the existence of scab in Victoria and Tasmania, in various ways, even when the disease is not allowed to spread beyond these Colonies.

The CHAIRMAN moved the adoption of Regulation No. 1.

It was elicited that no scab existed in New South Wales, Victoria, Queensland, South Australia, or Tasmania.

Scab

Scab in Sheep in New Zealand.

Mr. LANCE said that they were in hopes that scab would soon be stamped out of New Zealand; Scab. and when it was a clean country they intended to come here and request the New South Wales authorities to open their ports for New Zealand sheep. In the year 1878 there was a Consolidated Sheep Act passed. Previous to that, each province had its own Sheep Act. The provinces were abolished in 1876, but there was not then any general Act in force for the whole Colony. When the Act of 1878 was passed, there was strong pressure brought to bear on Parliament and the Government of the day, by a section of the House, to allow a certain portion of the South Island to be exempted from the operation of the Act, which was a very severe one. It was said that if the Act were brought into force at once it would mean almost absolute ruin to the flockmasters of the province of Marlborough. The concession was asked that it should not come into force in that province for two years, and the concession asked for was made. It was doubtful if the Act would have been passed only for that. Those who were opposed to the concession said that it ought not be granted, and that at the end of the two years the Marlborough flockmasters would not be in any better position than at the commencement. However, the two years passed, and exactly what was predicted came to pass. With only one exception but few steps had been taken to eradicate scab; but further pressure was brought to bear on Parliament, and another year's grace was granted. Thus for three years the Department had no power to put the Act into force, and it was in that province that the scab was so bad. Further time was again sought, but Parliament put down its foot, and the Department commenced to eradicate scab. What happened was this. The Inspectors summoned the sheep owners, and fines were inflicted in the resident magistrates' courts; but in more than one case the sheep-owner went to Wellington, button-holed the Minister, and got the fine remitted. The effect of this was to paralyse the energies of the Inspectors, and that state of things continued until 1884. Then a joint committee of the two Houses sat to investigate the whole matter. They took the most exhaustive evidence, and brought up what was considered to be a most severe report. The result was that it was decided to carry out the Act in its integrity under any circumstances, that no fines should be remitted, and that any Inspector who was not successful in cleaning his district in two years should be dispensed with. The effect was wonderful. In twelve months the area to which the scab had extended had been considerably reduced, brought down in fact to a minimum. They then thought that the best way of stamping it out would be to get the House to grant a sum of money to effect the destruction of all or the majority of the sheep infected and to pay the owners compensation. The House voted the grant and the Department at once set to work. The vote was passed in October. In a great many cases the owners received permission to muster their sheep up to the 1st of January, and any sheep they brought in they had to destroy, receiving half a crown a head compensation, and the skin. The Department then took possession of the run for 12 months, and engaged an efficient staff of men, who were armed with rifles. The country was mountainous and heavily timbered. A large staff of men, with efficient superintendents have been going over this country since January this year, and the result has been that at last they have not been able to find any sheep at all. Still they did not say that the country was clean, as they knew what a serious disease they had to contend with. The snow was off the top of the mountains by this time (end of September), and the inspectors in charge of the districts had ordered the owners of those runs to muster their sheep and they would assist in the work with a large number of men who had been employed up to that time in killing the sheep that had gone wild. It was presumed that there would be a fair muster. Directly they were mustered the Department intended to have every sheep dipped in the wool, whether they were infected or not, and that to his mind was the essence of the plan for cleaning them of scab. After that they would be turned back onto the ranges again, and would be mustered once more about the end of November. It was fair to presume if there were any wild sheep left out on the first occasion that they would come in on the second.

Mr. MEREDITH: And they will scab the clean sheep again.

Mr. LANCE: After being dipped in lime and sulphur there is no fear of the disease spreading. They will then undergo two dippings and be again turned out into the same country. That is the only way in which the mountainous country can be cleaned?

The CHAIRMAN: How many are infected at present.

Mr. LANCE: About 30,000. I do not suppose that there are more.

Mr. COOPER: Between 30,000 and 50,000.

Mr. LANCE: That shows that every step possible has been taken to clear the country. The infected sheep are now confined to a very small piece of country.

Mr. VALENTINE: Are these the only infected ones?

Mr. COOPER: Yes. The North Island is clean. The infection is confined to Marlborough, in the Middle Island.

Mr. LANCE: In the infected country there were two large tracts of forest; one was Rai Valley, which consisted of open bush. The sheep got into the dense scrub and became wild. They were known to be there, and it was fair to presume that there was scab among them. There were 2,000 sheep killed in those forests and yet not one was found to be scabby. That was the position of the infected flocks in New Zealand. What he wished to show the Conference was this, that the New Zealand Government had been perfectly frank in explaining the condition of their flocks. They had never concealed anything and never intended to do so, and when they assured the various Governments of Australia that there was no danger to be feared from scab, and that the country was absolutely clean, then the Australian ports might with perfect safety be opened to the New Zealand sheep.

Mr. HIGGINS: Would it not be a good thing if the 30,000 or 50,000 infected sheep were killed and the owners compensated, or the sheep put into paddocks instead of turning them back into the mountains.

Mr. LANCE said that in a great many cases the sheep were killed, but there were great difficulties in the way of mustering the sheep, and there was really not a sign of scab among them. Unless there were large mobs of sheep to drive over the mountains, and go into every nook and corner so as to fetch in the wild sheep, and those left behind, the mountains would never be cleared of the infection.

The CHAIRMAN: They were so recently dipped that they would not take the scab.

Mr. LANCE: Certainly not. They are only out six weeks before they are mustered a second time.

Mr. HIGGINS: They are used as coachers?

Mr. LANCE: Exactly so.

Scab.

Mr. TABART: If they are scabby why not destroy the skins.

Mr. LANCE: We take every precaution. There is a fellmongery close to where these sheep were killed. The skins go straight to the fellmongery, and we get a count from there.

Mr. TABART: I think it is a mistake to allow the owners to have contaminated skins.

Mr. CURR: We made a number of experiments in Victoria twenty-five years ago, and found that the scab acarus will not live more than thirty hours on a dead skin.

Mr. HIGGINS: We have had them alive for three months.

Mr. MEREDITH said he had known a scab insect live for three weeks off a piece of wool kept in a vial. When taken out the insect was as lively as when it had been put in. He had been shown the insect by Mr. Frank Pitt, of the Rakia River. He found a scabby sheep on the run, killed it, and had the skin dressed with cold tobacco water made extremely strong. The skin remained immersed for some hours, after which it was taken out and hung over a rail to dry. He could then see the acari running about upon it. He then took tobacco water at a heat of 110 degrees, and after that dressing never found an insect left alive.

Mr. TABART said he had been inspector for fifteen years under the Hon. J. White, and in an inspection which he made on the east coast he came across a scabby sheep which had been detained for his inspection. It was the only sheep he saw of that description. The scab insects were on the outside of the wool as if they had been dropped upon it all over, and that was the danger of dealing in the skins of scabby sheep or the sheep.

Mr. GORDON moved,—That the Conference having heard from Mr. Lance, one of the New Zealand delegates, the steps taken by the Government of that Colony to eradicate scab are satisfied that the stringent measures which are being adopted will result in the speedy eradication of the disease there. Mr. BAGOT seconded the motion, which was agreed to.

Scab in Western Australia.

The CHAIRMAN: There is scab in Western Australia. We do not know what communication there is between that Colony and South Australia in the matter of stock. We should certainly take into consideration the presence of scab in Western Australia, and try to induce the Government there to get rid of it as rapidly as possible.

Mr. VALENTINE: From the last reports I received there is only a very small number of sheep under license there, and they are taking all precautions to get rid of it. Western Australian sheep never come this way, and the disease lies in the north and north-west.

Mr. HIGGINS said that the Western Australian authorities might think them impertinent in recommending them to follow any particular line of action, but it certainly was the business of the other Colonies, and they would be perfectly justified in making a recommendation to Western Australia to clean or destroy their scabby sheep. Steamers trading from one port to another might convey the infection. He moved the adoption of the first reason given under the heading of "Scab in Australasia," page 8 of Report of Conference of 1874. It is as follows:—"The existence of scab in any of the Colonies is a source of real danger to the flocks in the other Colonies." They had heard from Mr. Lance what had been done in New Zealand, and he was sure that it would give the other Colonies confidence. He hoped the time was not far distant when New Zealand would be able to write to every Colony, and say that scab had been eradicated.

Mr. PETER seconded the motion, which was allowed to stand over to the following day.

Mr. HIGGINS moved,—“That the Government of Western Australia be urged by the Governments of the various Colonies represented at this Conference to take all possible steps for the speedy eradication of scab.”

Mr. PETER seconded the motion, which was agreed to.

The Conference then, at half-past 4 o'clock, adjourned until half-past 10 a.m. on the following day.

THURSDAY, 30 SEPTEMBER.

FOURTH MEETING.

Present:—Mr. Alexander Bruce, Chairman, and the full Conference.

SCAB.

The subject of scab was continued.

Mr. BAGOT: We should deal with scab as we have dealt with foreign diseases. I propose that we defer the item scab until we come to the intercolonial regulations.

Mr. HIGGINS said that this subject of scab would have a double bearing—what we would do if scab appeared among our own sheep, and what we would do if it appeared among imported sheep. With the latter phase they could not deal just now, as it would dovetail into the question of the importation of foreign stock.

Mr. LANCE moved—“That each Colony be allowed to make its own regulations for dealing with scab.” He said that surely they were the best judges of what they wanted.

The CHAIRMAN: We wish to see how far we can act together. With regard to scabby sheep, the best thing is to destroy them, if the law will allow that course to be taken, and the number comparatively few.

Mr. LANCE: If you pass a law to destroy sheep in mountainous country you destroy the best elements of getting rid of the infected sheep. Mr. CURR seconded the motion.

Mr. HIGGINS said that, without taking the matter formally, they might deal with the question of an outbreak other than from outside causes. The question of the importation of stock from the other Colonies would come on. The question of scab would be connected with it, and he did not wish to trench upon it. He was about to propose that infected sheep be destroyed, and the owners compensated. He did not, however, wish to force this upon the Conference, and he was sure they wished to act in unison.

Mr. MEREDITH said that he concurred with the opinions of those gentlemen who were in favour of each Colony making its own regulations. That was the only plan which could be adopted. If the Conference recommended anything it can only be that a sufficient staff of inspectors be maintained to prevent the introduction of disease from without. The Scab Acts in New South Wales, Victoria, Queensland, South Australia, and Tasmania had had the effect of eradicating scab, and it was rapidly diminishing in

New

New Zealand and Western Australia. The only fear was that in some of the Colonies, from a desire to economise, they might lessen the efficient staff of protection; and, therefore, it would be well for the Conference to express the opinion that an efficient staff of inspectors should be kept up in each Colony proclaimed clean, in order to prevent it being introduced from abroad, and to deal with it should any outbreak occur.

Mr. HIGGINS said that the people of New South Wales and Queensland were more deeply interested in this matter than those of Tasmania, and they received importations of Tasmanian stud flocks. Therefore it was very necessary that not the slightest possibility of the introduction of scab should exist. If they found that there was any fear they would make such regulations as probably might interfere seriously with the business of the Tasmanian stockholders, in order to protect these Colonies.

Mr. CURR said that with regard to making regulations, or laws designed to meet all circumstances, he thought it very undesirable. As an instance, he would cite the Scab Act of Victoria, still in force, which was passed when there were 5,000,000 of scabby sheep in that Colony. Under it, should a flock of sheep, little or large, be found scabby to-morrow it will be thought that their destruction might be ordered. This, however, could not legally be done, for it is specially provided in our Act that an owner may dip his sheep, nor can he be legally compelled to complete such dipping before the lapse of fourteen days after the discovery of scab. If the first dipping be found in time not to have effected a cure, a second may be given, so that in effect on the owner paying certain fees to dip, he may retain his scabby sheep for some months, after which an inspector may enter and dip, or if twelve months have elapsed, destroy the sheep. These provisions were suitable perhaps at the time at which they were made, but all will agree that an insignificant number of scabby sheep should not now be treated in this way, but be destroyed at once. On the other hand, he could not advocate a hard and fast rule making destruction compulsory in every case, for it might happen that a flock infected with scab was allowed to leave quarantine and to come into contact, direct or indirect, with (say) a million of sheep, a large portion of which might have contracted the disease whilst the rest might have escaped it. Who, in such a case, would recommend the destruction of the million sheep, or who would decide which flocks had escaped infection? And what Minister would enforce destruction in such a case? What seemed to him necessary and desirable was, that our laws on this subject of disease should be confined to determining general principles and leave us free to make and rescind regulations, as the needs of the hour may render desirable.

Mr. TABART: With regard to the remarks of Mr. Higgins that New South Wales is more interested than we are, I beg to differ from him. In 1885 Tasmania imported 65,339 sheep, 59,700 being from Victoria and 5,118 from New South Wales, so that we are deeply interested in the question.

Mr. HIGGINS: I said with regard to stud sheep.

Mr. TABART: What is the difference.

Mr. HIGGINS: The stud sheep are very valuable animals, whereas flock sheep are only from 5s. to 8s. a head.

Mr. TABART: Greater care would be taken of stud stock than of store stock.

Mr. HIGGINS hoped that the Tasmanian representatives would not be aggrieved at his remarks. They were simply made for the purpose of showing that in dealing with scab they should be unanimous, and the only unanimity could be a determination to eradicate scab so that there could be free intercourse in sheep between all the Colonies.

Mr. LANCE understood that Mr. Curr had said that according to the Victorian Act there were no means of insuring the efficient dipping. If that was so it was a very grave error. After very careful consideration of the different materials in which sheep should be dipped, it had resolved itself into this—that the sheep be dipped to the satisfaction of the inspector. The Tasmanian Act was similar to the Victorian, but in Tasmania they had sub-inspectors.

Mr. HIGGINS said he could sympathise with Mr. Curr in his desire to have the Act altered. From his description of the law, as it existed in Victoria, he saw the greater reason why they should deal with this question very determinedly and positively. He was sure it was not Mr. Curr's fault that there was the smallest loop-hole, but he did not make the law, he simply administered it. If they gave him their moral support it would help him a great deal towards gaining a victory. Anything that they did towards putting down scab would be a good work.

Mr. LANCE's motion was withdrawn.

Mr. HIGGINS moved—"That the Conference advise that the several Governments should obtain power, in the event of an outbreak of scab, to destroy the sheep infected and those that were in direct or indirect contact with them at their discretion, and to take every other means for the absolute and immediate eradication of scab."

The CHAIRMAN said that there was no scab in New South Wales, Victoria, Tasmania, or South Australia, and comparatively little in Western Australia. The opinion of stock owners, when it came to a test, was that the cheapest way to deal with an outbreak of scab was to destroy the infected sheep and not treat them for the disease. That course, however, was only applicable in case of a few sheep. He did not think that the motion went so far as to say that any Colony would be compelled to take the course proposed where a large number of sheep were infected.

Mr. LANCE said that that did not appear in the motion.

Mr. COOPER: In New Zealand the result would be that we would not take any notice of this if you passed it.

Mr. LANCE: We should resent it very much.

The CHAIRMAN: If there were an outbreak here would you not say "kill the infected sheep."

Mr. HIGGINS said that the motion for opening the outports would come on by and by, and then it would be for them to say, in case they decided upon opening the ports, whether, in conjunction with that, they would pass a resolution to the effect that if any diseased animal arrived from foreign or even inter-colonial ports it should be at once destroyed.

The CHAIRMAN: As our law stands at present we cannot kill infected imported sheep.

Mr. VALENTINE said that in South Australia they were not able to kill scabby sheep unless they took exceptional power, but they were able to fine the owners 5s. a head. Then, if the owner wished to keep them, he had to get a license for three or six months. There was not the slightest doubt that if scab broke out in any part of South Australia the Government would take steps to have the whole flock killed.

Mr. BAGOT: That is nearly equal to the absolute destruction of all infected sheep.

Mr.

Scab, &c.
Forage
Diseases.

Mr. CURR said that a bull suffering from foot and mouth disease was landed in Victoria. Four veterinary surgeons pronounced the complaint to be foot and mouth disease. He saw the animal, went back to town and met a large number of stock-owners next morning, and also saw the Minister on the subject. The Minister asked him what he required, and he said a credit in the Bank of £100 and power to destroy all the animals which had become infected or run the risk of infection. Next morning they were all shot, and he had had the carcasses buried. That was a power which should exist in all the Colonies.

The CHAIRMAN: There were some imported sheep destroyed here by the Government, and the owner brought an action for £20,000, because the Government had not taken power to destroy infected sheep.

Mr. HIGGINS: It has doubled the contributions upon us.

Mr. LANCE: In our Act they must be destroyed within twenty-four hours.

Mr. VALENTINE: We should suggest that the Government take power to destroy sheep when an outbreak of scab occurs.

Mr. HIGGINS moved,—“That power be obtained by the several Governments to destroy at their discretion scabby sheep whenever an outbreak occurred.”

Mr. GORDON seconded the motion, which was carried unanimously.

THE NECESSITY FOR A SUFFICIENT STAFF OF INSPECTORS.

Mr. MEREDITH said that the Government of Tasmania would pay very careful consideration to whatever was arrived at by the Conference with respect to scab. There were some political candidates who had been courting the popular vote and saying that the inspectors should be done away with and the work carried out by the police. He was glad, however, to find that the people had sufficient sense to set them aside.

Mr. TABART said that in Tasmania there were a chief and three inspectors who had to administer the Scab Act and supervise the destruction of rabbits. There were three other inspectors who simply had to look after the sheep landing. They were stationed at Hobart, Launceston, and Torquay.

Mr. MEREDITH moved,—“That it is desirable that an efficient and competent staff of inspectors of stock be maintained in each Colony to prevent the introduction of and to arrest the spread of scab or any other contagious disease.”

Mr. BAGOT seconded the motion, which was carried.

TICKS AND LICE.

Mr. CURR moved,—“That it is recommended that steps be taken by the several Australian Colonies, Tasmania and New Zealand, to eradicate thoroughly ticks and lice in sheep.”

Mr. PETER seconded the motion.

Mr. LANCE said there was a very stringent act in New Zealand dealing with lice, and according to that Act all sheep had to be dipped to get rid of the pest. An alteration was made in it last year in favour of butchers sheep, so that they need not be dipped if they were to be slaughtered within fourteen days after landing.

The motion was agreed to.

TREATMENT OF FOREIGN DISEASES.

Glanders and Farcy.

Mr. STANLEY read the following paper on these diseases:—

GLANDERS and Farcy is the most malignant disease of the equine species; it is known in almost every country, and it is extraordinary that it has not been imported into these Colonies. This disease is highly infectious and contagious, usually incurable and fatal. It has been frequently conveyed to mankind, cats, dogs, rabbits, sheep, and it has been remarked that cattle, goats and swine are refractory to inoculation.

The disease is characterised by the formation of miliary nodules of a soft grey or yellowish white in the lungs and mucous membranes of the air passages, and also on the skin. These nodules undergo degenerative changes, breaking into ulcers, from which a peculiar viscid discharge escapes. The lymphatic glands become swollen (hence the name glanders), and the lymphatic ducts connecting them are distended with fluid, giving the peculiar corded and nodular appearance on the skin of the thighs, leg, or neck, and which is termed farcy, being only a symptom of the true disease; this has been proved many times by inoculation.

Although this disease frequently runs a rapidly fatal course, it too often assumes a sub-acute or chronic form. The sufferer appears able to resist the progress of the malady, even for several months, but at the same time is a medium of conveying the dreadful infection to his fellows, and it is in this form liable to be conveyed into these Colonies.

This disease has been long thought to originate spontaneously in ill-kept, badly ventilated stables. Now, however, credence is being given to its micro-parasitic origin, and the discovery of its special bacilli leaves little room for doubt, and completely dispel the theory of spontaneous generation.

We know this disease prevails in America, India, Africa, China, as well as in Europe, and it would in all probability have been introduced from Egypt had the Contingent horses returned to this country.

Our ports being open, it is, I think, a subject well worth discussion at this Conference. For this purpose the following points are submitted:—

1. Are these Colonies protected from the introduction of glanders?
2. Is it advisable to frame regulations with that object?

Mr. STANLEY said there should be regulations in force to empower the inspectors of stock to isolate any locality where glanders and farcy were supposed to exist, until they were satisfied one way or another that it did exist. Then they should have the sanction of the Minister to destroy all animals infected with that dreadful disease. The Colonies had been protected hitherto from outside infection by the length of time that it took to bring horses here and by the fact that superior animals received most care and attention. Now, however, there was cheaper and more rapid transit, and people were inclined to bring horses here from India. The disease might be brought here in the chronic form and so it might be spread through the Colonies.

Swine

Mr. STANLEY then read the following paper on this disease :—

SWINE Fever is a highly contagious and infectious disease peculiar to pigs, and has become so firmly established in Great Britain as to threaten the extermination of the porcine species. It also prevails in the United States of America and Europe. It was for some time attributed to bad sanitation and impure diet, but now it is known to originate only from infection, the cause of the disease being due to the presence of a specific bacillus.

Symptoms.

These will depend on the seat of activity of the bacillus. The bowels, lungs, or brain being attacked leads to great variety in symptoms. Those generally observed are fever, prostration, patchy discolorations of the skin, drooping ears, flaccid tail with diarrhoea, in some cases vomiting, in others fits.

The disease varies in intensity,—in some outbreaks 50 per cent. recover, but usually it is so fatal that few survive.

Post-mortem examination shows extravasation of blood, with effusion of serous fluid and lymph, into intra-muscular tissue, and petechia on the spleen, liver and other organs, also coagulated lymph causing adhesions of serous surfaces.

Patchy congestions and consolidation of lobules in the lungs.

The large bowels have a blue discoloration interspersed with petechia, and the ulcerated mucous membrane is typical of this disease.

There is some danger of this disease being introduced to these Colonies. Although the incubative stage is limited to ten or twelve days, swine may have had the disease, and recovered, on board ship; other cases assume a chronic form which may last for weeks, and the virus will retain its vitality for many weeks in dirt, litter, and suitable media. Hence it is a very important matter to absolutely prohibit the importation, or landing for slaughter, any swine, or anything connected in any way with them, if the vessel had touched at a port in an infected country during the voyage.

Subject for Discussion.

Are the present regulations sufficient to prevent all possibility of the introduction of this plague?

A paper on the subject by Professor T. Walley, of Edinburgh, was also laid on the table by Mr. Valentine.

Synonyms.—Hog Cholera, Typhoid Fever and Enteric Fever of Pig, Blue Disease, Red Soldier, Measles, Pig Distemper, Contagious Pneumo-Enteritis (Klein).

As in the case of other diseases, so in this, many synonyms have been employed to designate it, some of them referring to some characteristic external symptom, as the colour of the skin or the character of the skin eruptions; and others to some fancied resemblance in its external lesions to those of well-known forms of disease. Unquestionably the present official synonym, "Swine Fever," or, better, "Swine Plague," is the most simple and the most useful for all practical purposes.

Definition.—A specific eruptive fever, peculiar to the pig.

Nature and Characteristics.—Many years ago, when I first became familiar with this malady, I looked upon it as a sporadic or enzootic affection, due to an altered condition of the blood, as the result of purely local causes *e.g.*, bad hygiene and improper or impure dieting; I was of opinion, in other words, that, like purpura hæmorrhagica, it was simply a blood lesion, and in my earliest lectures on the subject described it as such, and drew parallels between its lesions and those of purpura. Nor did I stand alone in this estimate of its character. In America it was also mainly attributed to bad hygiene and bad dieting; but, earlier in the United States than here, it was gradually recognized as a zymotic disease, and of a contagious character.

In the United States of America it was thought to be of the nature of cholera, and this is not to be wondered at when we consider its fatality, its rapid spread, the enteric conditions with which it is associated, and the state of collapse into which its victims are sometimes thrown.

Subsequently an idea prevailed that the disease was allied to the typhoid fever of man, and that, too, mainly from the fact that necrotic enteric changes were common; but as early as 1876 or 1877, Klein showed that a great mistake had been made, pointing out that the lesions of human typhoid, were confined mainly to the small intestines, and were localised in the lymph follicles thereof; and further, that the necrosed tissues on desiccation leave behind pit-like depressions, and not unfrequently result in perforation; whereas in swine plague the ulcerative lesions are confined mainly to the large intestines (often grouped around the ileo-caecal valve), seldom extend to the small intestines, and are still less often found in the stomach. (I have only seen two well-marked cases of ulceration of the stomach, one specimen of which, sent to me by Mr. Kettle, I exhibit.) The lesions are not localised in the lymph follicles, do not as a rule extend deeper than the superficial mucosa, and rarely produce perforation. About 1878 Klein suggested that the disease ought to be designated Contagious Pneumo-Enteritis, and he did this on the assumption that pneumonia was a constant lesion; in this, however, he was certainly mistaken, as I have seen numbers of in which lung lesions were conspicuous by their absence.

In 1887 Klein drew attention to the presence constantly, in the local lesions of the disorder, of colonies of micrococci, and to these he was evidently inclined to attribute specific properties.

At a much earlier period than this I had drawn the attention of the members of my class to the presence of micrococci in the blood and tissues of pigs which became the victims of the disease in the neighbourhood of Edinburgh.

In 1878 Klein drew attention to the fact that there existed in the peritoneal effusions and elsewhere a *bacterium* which, in its morphological characters, bears a close resemblance to the bacillus of hay infusion (*B. subtilis*), and in some respects to the *Bacillus anthracis*; the important differences being that the bacillus of swine fever is finer than either of the others, and although multiplying by spores, it is motile and somewhat rounder at its end. Recently Pasteur has described a dumb-bell shaped microbium. Klein looks upon these as foreign to swine fever.

Not only by Klein, but by Professor Laws and others, has the virus of swine fever been cultivated and attenuated, and with the modified virus animals have been inoculated, and, according to Laws, protected;

Swine Fever. protected; but Klein's experiments in this direction show that even after several inoculations the virus is still capable of producing specific symptoms, though the mortality is materially reduced. Not only has the pig been successfully experimented upon; rabbits and mice are shown to be susceptible to the action of the virus, while Pasteur has also stated (though this is contradicted by Klein), that pigeons are also affected by it.

Swine fever is no respecter of persons amongst the pig tribe. It attacks the young, the old, the fat, the lean, the well and the ill-bred, the male and the female alike; but in my experience pigs varying from six or eight weeks to several months old ("shots," as they are called in Scotland) are most susceptible, and in them the mortality is greatest, while large pigs, as sows, frequently escape it, or if attacked, recover. Young pigs in utero often die and are aborted, or if they survive through the normal period of parturition, are puny and short-lived; while sucklings not unfrequently pine away one by one, until the whole litter is exterminated, even before the mother gives any evidence of being herself affected with the disease. Frequently, too, the mother will pass through the nursing stage apparently in good health, but after the offspring have been weaned or have died out, she will gradually emaciate, and ultimately succumb to enteric, hæmal, or pulmonary disease. There are those who attribute the death of the fœtus in utero to the fact of its being supplied with impure blood, or to histological changes in the placenta, and not to the direct action of the virus of the disease. Such a statement has been made in reference to anthrax, and even some of our best authorities declare that anthrax lesions are never found in the fœtus (or its blood) in utero, the placenta acting as a filter, and effectually preventing the passage of the bacilli. To this statement I give a flat denial. I have found extravasations and effusions into the tissues of the unborn lamb, and I have found bacilli in these products and in the blood when I have failed to find them in the blood or tissues of the mother. In swine fever, as in other zymotic affections, abortion is often the salvation of the pregnant female.

Swine fever may assume either an enzootic or an epizootic character. Probably never within the memory of the present generation of veterinary surgeons, in this or in any other country, has it spread so rapidly or so widely as in the prevailing epizootic. What the determining cause of this wide-spread outbreak may be, it would be difficult to say; but I am satisfied of one thing (and do not hesitate to make the assertion here), and that is, that the disease has in the past been practically left to wander as it listed; that it has existed in certain districts (and that not always owing to the fault of the authorities) for weeks or months before it has been detected or recognised; while during the whole of that time animals from the infected areas have been sent into the surrounding districts, and have thus scattered the disease far and wide. Moreover, a remarkable amount of ignorance as to its diagnosis has been exhibited, even by veterinary surgeons, and it was on this account mainly that I suggested to the Provisional Committee of the British National Veterinary Medical Association that the subject of swine fever would be an appropriate one for discussion at the Birmingham meeting.

Swine fever, perhaps more than any other similar malady, presents itself under a variety of aspects; in other words, its visible manifestations and the localisation of its lesions in different outbreaks assume very different characters. In its clinical character it is hydra-headed, and this fact alone is sufficient to explain the apparent anomaly that scientific men have not always been able to recognise it when the malady has been for the first time brought under their immediate notice. Not only so, but even in one and the same outbreak it often passes through different phases ere it runs its course; thus, the few first animals attacked may show no external manifestations of the disease; they may pine and waste gradually away, perhaps coughing or purging to some extent, but showing no symptom sufficiently pronounced to raise even a suspicion in the mind of the owner or the attendant as to the nature of the malady which is gradually but surely emptying the pig-styes of their occupants. At another time a number of animals are attacked with symptoms of narcotic poisoning—staggering about their styes, boring their heads against the wall, passing into a state of convulsions, foaming at the mouth, and champing the jaws or gnashing the teeth, as the pig is wont to do when under the influence of a cerebro-spinal excitant. Again, the animals appear to be suffering from rheumatic cramp, and when called upon to move, not unfrequently do so with their forelegs spasmodically flexed, the motive power being supplied entirely by the hind legs. But after a time, in each of these cases, characteristic enteric, cutaneous, or pulmonary lesions are developed, and the matter is set at rest. In other outbreaks the lungs are most largely the seat of organic changes, while the existence of bowel lesions is the exception that only proves the rule; and lastly, there are cases in which the skin and enteric lesions are so pathognomonic as to leave no doubt in the mind of the veterinary surgeon as to the nature of the malady with which he has to deal, and there are others in which no sign (external or internal) exists to show what the disease actually is.

Swine fever is in every sense both infectious and contagious. It is disseminated (to limited distances) through the medium of the air; by means of such fomites in water, food, litter, urine, fæces, and dung; by other animals, and above all by ducks, poultry, and rats; by contaminated conveyances, such as railway trucks, floats, carts, and vessels; by the dirty boots and clothes of attendants; by the actual cohabitation of healthy with diseased animals, and by direct inoculation. I was at one time inclined to think that in those outbreaks in which lung lesions were most pronounced the disease had been contracted by inhalation, while in those where bowel lesions were most prominent it had been contracted by ingestion, just as I believe is often the case in anthrax; but on considering the matter more closely in the light of our present knowledge of the fact that, as a rule, in most of these maladies the virus must gain access to the blood before it can produce its characteristic effects, I have been led to modify my opinion in this respect certainly. The manner in which the lesions of some of the granulomata—*e.g.*, tuberculosis, actino-mycosis, and gregarinosis (?)—are locally developed according to the manner by which the fungus is introduced into the system, seem to support the view mentioned, but we must of course remember that the starting point of at least two of the maladies referred to is at some exposed part, as the nostril or the mouth.

In a recent number of the *Journal of Veterinary Science* in India, the details of a very instructive experiment carried out by Mr. Fred. Smith, with the view of determining the method by which the virus of anthrax is introduced into the system are given; and in this case the striking fact is demonstrated that while the anthrax virus was carefully administered to a horse in the form of ball, the resulting lesions were manifested mainly in the lungs, and but very slightly in the bowels.

Swine fever does not necessarily attack all animals exposed to the influence of the virus—a very large percentage escape—nor is it in every outbreak equally fatal. In years gone by I used to treat this malady with great success, and certainly saved 50 per cent. of the animals treated; and even now I feel quite

quite satisfied that numbers of pigs pass through the disease without manifesting any recognisable external symptoms, no matter how carefully they may be watched, and recover. Swine Fever.

Does one attack of the disease protect against future attacks?—According to the evidence afforded by Dr. Klein's experiment on the protective value of swine fever virus, the question should be answered in the negative; but in the past few months I have had the opportunity of watching several animals that during a previous epizootic were attacked by the malady and recovered, and which during the present outbreak have successfully resisted its influence.

Swine fever, so far as I know, has never been transmitted to any other of our domestic animals, nor, except experimentally, to any other creature; and while mice may be successfully inoculated with the cultivated or natural virus, the rats seem to enjoy perfect immunity from its effects—at least so I conclude from the fact that these animals cohabit with pigs (in all stages of the disease), and live with them on the most intimate terms, without showing any signs that they are in the least degree affected by the virus of the disease. Swine fever is as pre-eminently a pig disease as in cattle plague a bovine disease.

The extent of vitality possessed by the virus of swine fever has as yet to be determined; but of one thing I am quite assured from experience and observation, and that is, that it may retain its vitality for several weeks, if not for months, in dirt or other suitable pabula.

Its incubative stage has been shown experimentally to be confined to about four or five days, but naturally it is about ten or twelve days.

Its duration is somewhat indefinite. As in the case of pleuro-pneumonia, so here; an animal may be labouring under the influence of the virus for many days without attracting the attention of those persons who have charge of it. On the contrary, it may be well, and dead in the course of several hours, or two or three days: while in not a few instances it runs a sub-acute or chronic course, which may extend over several weeks, or a month or two.

Symptoms and Course.

The invasion of swine fever is sometimes very pronounced; at others its actual existence is evidence by indeterminate symptoms, its special characteristics being slowly and insidiously developed.

Constitutional Symptoms.

In the earlier stages there is always more or less fever, the temperature being elevated two or three degrees, the pulse increased in rapidity, the bowels constipated or relaxed, occasionally there is vomiting, and sometimes a husky bronchitic cough. The animals show a marked tendency to isolate themselves, and in cold weather seek warmth by burying under litter or huddling close to their companions; they frequently refuse to rise when recumbent, and at all times rise unwillingly and stiffly, and when made to move, do so with a stiff gait, and soon show signs of exhaustion if submitted to exertion. The ears are frequently lopped, and not unfrequently present a congested appearance. The conjunctiva is injected, and there is sometimes lachrymation or discharge of a small quantity of agglutinous mucus from the inner canthus of the eyelids.

In the most advanced stages the above symptoms become aggravated and more pronounced, but their character will depend largely on the seat of the lesions. The temperature rises to 105–6–7° F, the pulse becomes more rapid, the breathing hurried and occasionally jerky, the urine scanty and highly coloured at times, normal in character at others, but frequently evolving a peculiar characteristic odour. Wasting of the muscles proceeds apace, weakness increases, the movements become more unsteady, and often the hind legs are plaited one over the other. Food is refused, or only taken in small quantities, but there is frequently great thirst. The irregularity of the bowels is more marked, and the fæces become of a dark colour, pasty, and of a very unpleasant but characteristic odour. In the case of pregnant sows, abortion sometimes takes place as the disease advances, many of the young pigs being dead, some decomposed. Occasionally a little blood is discharged from the conjunctivæ or the nostrils.

If the bowels are inflamed or ulcerated, diarrhoea replaces constipation, the discharges being of a dirty chocolate colour or of a yellow-ochry hue, and in any case they have an abominable odour, and are sometimes passed with a jerk, and, as the end approaches, involuntarily. At other times the ægesta is retained, accumulates in the large intestines, undergoes decomposition, liberates sulphuretted hydrogen, producing tympany, which gives the animal a rotund appearance, and thus deceives the careless observer—it being taken for granted by such that the patient is eating well, and consequently that there cannot be much the matter.

If the lungs are markedly affected, the breathing becomes laboured as well as hurried, the cough (especially if animal excited) distressing; there may be catarrhal discharge from the nose and eyes, that from the latter causing dirt to adhere to the eyelids, thus giving the animal a very peculiar appearance. There is often a short, painful, hollow grunt, and on physical examination of the chest signs of consolidation are readily detected. The skin of the ears and abdomen is often cyanotic, and the extremities cold, and not infrequently foam (sometimes bloody) oozes from the nostrils, and when this takes place the breathing becomes gasping and oral.

If the brain or the cerebral meninges is involved, the animal presents a stupid appearance, wanders aimlessly and mopeishly about, staggers like a drunken man, and often falls helplessly over, or, if excited, is thrown into a state of convulsions, on the passing off of which it is left lying helplessly on its side. At other times the head is bored against a wall, or thrust into a corner, or the nose is buried in the litter, producing nasal stertor; the pupils of the eye may be contracted or dilated, and the retina may be markedly injected.

If the spinal cord or its meninges is affected there is marked muscular twitching, clonic spasm, and partial, followed by total, paralysis.

The Local External Lesions are to be found in the skin. They consist of (a.) Discolorations; (b.) Vessication; (c.) Pustulation; (d.) Papulation; (e.) Sloughs; (f.) Desquamation.

(a.) The discolorations vary from a pale blue or light red to a dark livid blue, purple, or black. At times a scarcely perceptible erythematous black is to be discerned on the skin of the abdomen, the vulva, the docks, the ears, the throat, or the inside of the thighs; or it may be a little cyanosis (blueness) of the ears. In some cases this discoloration is diffuse, at others in discrete patches; when faint and undecided the animal should be excited a little, and the entrance of air to the lungs excluded for a short time; the discoloration

Swine Fever. discoloration of the ears is rendered more distinct by taking the pig up by the hind legs. In many instances the undecided erythema during life becomes very pronounced, and, chameleon-like, passes rapidly through various hues after the animal is stunned by a blow on the head.

In the course of a few days—hours in some cases—the discolorations become more pronounced and more permanent. At first, being due only to capillary congestion, they may pass off, but as venous congestion sets in, followed as it usually is by extravasation, the colour becomes deepened, and the cutaneous structures positively stained, and if the pig recovers it subsequently passes through the changes seen in ecchymoses from other causes, desquamation of the cuticle taking place as it passes off; on the contrary, the interference with the circulation is so great as to lead to necrosis, usually arterial, and consequently dry and sloughing. The latter condition is well seen in Figs. 1 and 2 (not shown in this report), and the further fact that the lesions are usually localised at the outset in parts which have been previously injured is also shown. The skin from which the sketch was taken was removed from the carcase of a young sow, and the injuries had been caused by the worrying of a boar to whom she had been put about a fortnight previously. The dark central parts are those injured by the boar.

In very many cases no pathognomonic discoloration exists, but even here it will be observed that the dorsum over the lateral and inferior aspects of the body contracts a peculiar yellowish brown hue.

Cyanosis is often the result of imperfect oxidation from the existence of extensive lung lesions.

(b.) Vessication is rarely a primary lesion, and still more rarely is it a solitary lesion, being usually seen during the course of the disease, the vesicles forming in the patches of healthy skin, and being usually followed by desiccation and desquamation. The bullæ, associated with sphacelus, may be mistaken for vesicles.

(c.) Pustulation, like vessication, is rarely primary or solitary, nor is it seen except in the most virulent cases. In some instances there is a distinct collection of pus under the epidermis, in other instances the apparent pustulation partakes more of the character of a circumscribed pemphigus, being marked by circular patches of a very dark red colour, followed by the effusion of sanguineous serum and a little pus, the fluids drying and the superficial parts of the skin becoming necrosed, giving to the patches an appearance similar to that produced by the action of a powerful escharotic, such as nitrate of silver, or in some instances like the lesions seen in a virulent septicæmia.

(d.) Papulation may be primary or secondary, it may be solitary or associated with other lesions. Very frequently, especially in old sows, the formation of papulæ is the first cutaneous lesion observed, and more, it is often the only skin lesion seen throughout the course of the disease. The papulæ vary in size from a hemp seed to a pea; they are not usually of a very high colour, are hard and unyielding, formed about the abdomen and thighs at first, and may appear in successive crops; as a rule, they fade away without going on to vessication or pustulation.

(e.) Sloughs, as already indicated, are the result either of absolute capillary or of hæmorrhagic lesions. Sloughing is most largely seen in the ears, occasionally in the haunches and in the back; the tail is often lost by sphacelus, especially in very young pigs.

(f.) Desquamation of the Cuticle is not peculiar to the disease, it is a common result of all forms of fever. Icterus (jaundice) is not so frequently seen as it is in many other specific diseases. This may probably be due to the fact that jaundice is not often seen in the pig under any circumstances.

Diagnosis.

The importance of a correct diagnosis in such diseases as the one under consideration cannot be too strongly insisted upon. If a false diagnosis is made, much injustice is done to the owner of the animals, much anxiety and often loss is caused, and the practitioner oft-times brings down upon his head severe rebuke.

The conditions most likely to be confounded with those characteristics of Swine Fever are—(a.) Pneumonia with Cyanosis; (b.) Purpura Hæmorrhagica; (c.) Urticaria; (d.) Measles; (e.) Variola; (f.) Anthrax.

(a.) Pneumonia is most likely to be taken for Swine Fever when it attacks a number of animals simultaneously; when, as a result of bad hygienic surroundings or improper feeding, it is accompanied by diarrhœa; and when, from the involvement of a large lung surface, cyanosis is marked.

(b.) In Purpura Hæmorrhagica.—The discolorations of the skin, the congestions and extravasations, with the fatal character of the affection, are very likely to mislead. Purpura, however, is not accompanied by such a high degree of fever, is traceable to some local cause, as the ingestion of putrid or diseased flesh, bad drainage, or dirty styes, and is not contagious.

(c.) Urticaria (Nettle Rash).—In urticaria there is a tolerably high degree of fever, derangement of the bowels, refusal to feed, isolation, tendency to seek warmth; there is frequently patchy erythema, and even discrete ecchymoses, with occasionally superficial pustulation, and sometimes a little hæmorrhage from the conjunctiva and the nose, with conjunctival petechiæ, and in the sow vaginal petechiæ.

The affection is sporadic and non-contagious; is traceable to ingestion of large quantities of cabbage, or to some other form of improper feeding; is not fatal, and passes off in a period varying from forty-eight to sixty hours, though occasionally, owing to a renewal or prolongation of the existence of the determining cause, relapses occur.

(d.) The term measles in the pig is usually associated with hydatid (*Cysticerci cellulosæ*) disease. I do not refer to this. I am of opinion that the pig suffers from an eruptive affection in some respects similar to measles of the human subject. It is not fatal; the attack is local, and there are some of the pathognomonic lesions of swine fever found in *post mortem* examinations. Measles often, however, attack a number of young pigs; is accompanied by a moderately high degree of fever; by some is believed to be contagious, and if the animals affected by it are neglected or exposed to inclement weather or damp and cold they are very apt to suffer from broncho-pneumonic disease.

(e.) Variola Suillus is not often seen in this country, and so far as I know, never occurs as an epizootic. It always runs a definite course, and the skin lesions are evolved in regular order. The characteristic intestinal lesions of swine fever are not developed, though there may be patches of congestion, or even of muco-enteritis, discovered after death, with systemic effusion and extravasation. As in swine fever, and as in foot and mouth disease, the young frequently die while sucking their dams, without the latter giving any external evidence of the existence of such a disease in their system.

(f.)

(f) Anthrax.—As before remarked, there seems to be an impression in the minds of some pathologists that, because the pig resists experimentally the action of the anthrax virus, he is not susceptible to anthrax. This is a great mistake, and is not in accordance with clinical experience. Pigs frequently die from anthrax after the ingestion of the offal, the blood, or the flesh of cattle which have succumbed to the disease. The fatality of anthrax, the rapidity of its course, its contagious nature (unsuspectedly by ingestion), the marked blood lesions seen in *post mortem*, and the hæmorrhagic condition of the lymphatic glands, all combine to lead the unwary practitioner astray. Anthrax is probably never seen on a farm as a primary affection of the pig, this animal almost invariably suffering secondarily by cattle; and the very fact that the disease has made its appearance in cattle first, or that the affected animals have been fed on offal or refuse from a slaughter-house, or have gained access to manure contaminated with the refuse from an abattoir, is sufficient to enable an ordinarily intelligent practitioner to determine the nature of the malady without much difficulty. In any case where doubt exists, inoculation with a little of the blood of the dead animal—of some small animal—or microscopic examination of a drop of the blood for the characteristic bacillus, will soon set the matter at rest.

Finally, it may be said that whenever a large number of pigs are found to be dying simultaneously (and especially if the fatality extends over a large area, with symptoms of bowel or pulmonary derangement, and in some cases skin eruptions), it may safely be assumed that the disease from which they are suffering is swine fever. Practically, pigs in this country are not subject to any other fatal malady of an epizootic type.

Pathological Anatomy.

In dealing with this part of the subject, I shall direct attention (firstly) to the general conditions of the tissues of the body and the blood; (secondly) to the pulmonary lesions; (thirdly) to the gastrointestinal lesions; (fourthly) to the lymphatic lesions.

At the outset I may remark that many of the lesions of swine fever are not peculiar to the disease; they are only concomitants of it, and are common to other affections in which the blood has undergone important physical and vital changes.

The first thing to be thought of in making a *post mortem* examination is to carefully look over the skin, not only in undressed, but in dressed carcasses also, and it must be borne in mind that the cutaneous lesions will be materially modified by three circumstances:—(a) The fact as to whether the animal has died a natural death; (b) As to whether blood has or has not been abstracted at the time of or prior to death; (c) As to whether the carcass has or has not been properly dressed and the skin scalded and scraped. It must be patent to all ordinary observers that if an animal has been allowed to die a natural death, with all the blood in its veins, or if it has been killed without the abstraction of blood, the skin lesions must be more pronounced than where opposite conditions exist. It must be equally plain that the removal of the bristles and epidermis, and with this the dirt from the skin, brings the skin lesions more prominently to view than is the case when the carcass is allowed to lie in the usual filthy surroundings of the porcine species. I do not, however, wish any person to accept these statements hypothetically. I assert that, after making hundreds of *post mortem* examinations under every variety of conditions, and after having investigated the matter experimentally, the propositions laid down are substantially and essentially correct. Frequently, indeed, skin lesions are rendered prominent by dressing that could never have been detected during life.

In the general condition of the carcass much aid is not afforded to the inquirer. If the pig has been fairly well fed, if the disease has not been too long in existence, and if the carcass has been properly dressed and hung in a cool dry atmosphere after dressing, even the experienced inspector can gain nothing by its physical examination. The fat may be as well set and as white, and the muscular tissue as dry and as firm, and of as good colour and consistence, as the carcass of a healthy pig, and even after hanging for several days these conditions may be preserved; if, however, the animal has been labouring for some time under the disease, if emaciation has set in, and if bowel or lung lesions are at all extensive, then the carcass will be pale, flabby, and moist, and suspicion will be aroused at once.

The blood in the early stages, and even in the advanced stages sometimes, does not present any important physical alterations. It may clot with tolerable rapidity and firmness, and may be of its normal colour; on the contrary, and in spite of the assertions of one or two of our best pathologists, it may present some very important physical changes. It may be dark in colour and thick in consistence, or it may have a tarry appearance, or, and more important than either, it may resemble a mechanical mixture of red brick-dust with some colloid solution. The last mentioned condition I look upon as very pathognomonic in its character, and I have frequently found such blood in the heart when I have failed to find sufficiently convincing evidence of the existence of the disease in any other organ or tissue of the body. *Ante mortem* cardiac clots are sometimes found.

The systemic lesions are extravasations of blood and effusion of serum and of lymph. The skin extravasations may be superficial or deep; they may extend into the sub-cutaneous tissue or even into the subjacent muscles; they may be very dark or red in colour, and usually become of a brighter hue after exposure to the atmosphere. They may be confounded with the lesions produced by bruising, and the strokes of whips or sticks; the latter are superficial, and the extravasation is confined to the immediate seat of the injury. Along the back of the neck and on the back they may be confounded with the redness produced by the animal rubbing itself shortly before death against a rail or spar; in this case the redness is diffuse; in swine fever it presents the defined characters of an eruption.

In the muscular tissue itself, the extravasations are rarely pronounced, but in the intermuscular connective tissue they are common, and very frequently, when doubts exist as to the nature of the malady, the detection of intramuscular extravasation, especially in the sub-scapular region, dispels the doubt.

Serous or sub-serous extravasation is common into or under the peritoneum, into the pericardium, into or under the endocardium, particularly of the left ventricle, under or within the renal capsule, or the serous tunic of the liver or spleen, into or within the cerebral meninges. In form the petechia may be punctiform, ramiform, or diffuse; in colour, bright red or modena.

The mesentery and omentum are more often the seat of congestion than of extravasation.

Parenchymatous extravasation is sometimes very extensive, at other times absent, though visceral congestion, especially in the case of the liver, the kidneys, and the spleen, can generally be distinguished if carefully sought after.

Swine Fever.

I have seen the kidneys presenting an appearance such as could scarcely be credited without ocular demonstration; the malpighian bodies as distinct as if they had been painted, the intratubular tissue mapped out to a nicety with effused blood, and the organ rendered more like a kidney into which blood had been injected with superhuman force than anything else to which I can compare it. Usually the lesions are punctiform.

Effusion of serum is found in the deep inter-muscular connective tissue and into cavities, as the peritoneal, pleural, pericardial, and arachnoid; while layers of coagulated lymph are frequently found deposited in the serous surfaces of organs, causing adhesion of visceral to parietal reflections.

Pulmonary lesions are by no means constant or necessary. They may, however, be primary, and may exist independently of intestinal or of any other lesions—frequently I have discovered (and confirmed my diagnosis thereby) pulmonary when the systemic and enteric lesions have been entirely absent. In the early stages the lesions, like those of pleuro-pneumonia, are of an effusive or exudative type. On careful examination, patches of lung will be found in which the lobules have a more solid appearance and feel than have the surrounding lung tissue, and in which the interlobular tissue is distinctly infiltrated with colourless serum, or more usually serum having a slightly sanguineous hue; and if a transverse section of the involved lung-structure is made, and pressure applied, serum oozes out in large quantities, and as it passes from the small bronchi it is seen to be mixed largely with air bubbles (frothy), showing that the effusion has been in existence during the life of the animal. In other cases small patches at the borders of the lungs are found presenting the characteristic appearance of small patches of consolidation from collapse.

As time goes on, the involved part of the lung assumes a condition very similar to that with which we are familiar in pleuro-pneumonia in the ox. The inflammation is circumscribed by effused lymph, the surface of the involved area is raised distinctly above the surrounding level, the pleuræ becomes opaque and thickened, and masses of lymph are found deposited on its external surface, not infrequently producing adhesion of the pulmonary to the costal pleura, while in very asthenic cases I have seen suppuration.

On section the affected lung is found to be solid and friable, charged with serum, red, black, or grey in colour (red, black, or grey hepatisation), increased in density and in specific gravity, decreased in resilience, and, as in pleuro-pneumonia, separated from the surrounding lung structure by a distinct segregating band.

The bronchial tubes, and often the trachea, are filled with serum or occluded with coagulated lymph.

Gastro-Intestinal Lesions.

In making a *post mortem* examination of a pig supposed to have died of swine fever, the best plan to adopt is to carefully remove the whole of the intestines and stomach, and lay them aside until the carcass itself has been examined.

In most cases, lesions in the small intestines are readily detected by visual examination; the coats being semi-transparent, any thickening or discoloration is readily seen from without as they are run over the fingers.

Adhesions of the bowels to each other, or to the mesentery or omentum, should also be noted, as such adhesions, when circumscribed, invariably mark the site of grave structural lesions in the walls of the bowels. Discoloration, ecchymoses, roughening and opacity of the peritoneum, are useful guides, as they are also in the localization of lesions. In the large bowels a peculiar blue discoloration, interspersed with petechiæ, usually capilliform, is often seen.

The large bowels are best examined by making an incision immediately over the junction of the ileum with the cæcum and colon, and continuing the incision along these bowels, noticing first the character of the egesta they contain, and subsequently washing them, when any lesions which may be in existence are at once rendered prominent.

Gastro-intestinal lesions, for convenience of description, may be arranged in two groups:—(1st.) Those in which there are no marked necrotic changes. (2nd.) Those in which such changes predominate.

In the first group the prominent lesion is diffuse mucositis, extending frequently from the cardiac orifice of the stomach to the ileo-cæcal junction, and in some cases along the colon and cæcum.

The inflammatory action may be very slight, and extend no deeper than the superficial mucosa; on the contrary, it may be very pronounced, and involve the deeper structures of the membrane, which may become very thick, soft in consistence, and oftentimes of a gelatinous character. The epithelium in the worst cases is dry and roughened, and there may be superficial erosions. Extravasations into the structure of the bowels are often seen, and not unfrequently the contents are of a sanguineous hue. As a rule the fæces are either semi-solid or of a very liquid consistence, and give off a very unpleasant but characteristic odour, which lingers on the skin of the hands for a considerable time.

In the second group very definite structural changes are observed; these are superficial necrosis in patches having an appearance similar to that which is produced by the application of a cautery, and characteristic ulceration.

Before describing the typical ulcers of Swine Fever, I wish to direct attention to an anatomical glandular peculiarity which exists around the base of the ileo-cæcal valve of the pig. If the surface of the mucous membrane is closely scanned a number of pit-like depressions or *cul-de-sacs* will be seen; these are probably the mouths of glands closely assimilated in character to the solitary glands. In the vast majority of cases the typical lesions of the disease are to be found associated with these pouches, *i.e.*, if there are any intestinal lesions in existence. The mouths of the sacs seem to be enlarged, and extruding therefrom there are masses of a yellowish brown-looking material, not unlike dried yellow putty; on the application of a little pressure these plugs may be enucleated intact, leaving behind a distinct alveolus with jagged surfaces and edges, and often of a yellow ochre hue. In the more advanced stages distinct molecular death has gone on, the ulcers have increased their boundaries by peripheral extension, and very frequently they have become confluent, and form large irregular patches round the base of the valve. Personally, I attach much importance to these changes, and even where there seems to be an absence of bowel lesions I never fail to examine the part indicated.

The typical ulcers of swine fever can scarcely be confounded with the lesions of any other malady. They are preceded by small nodular formations in the mucosa, these producing rounded elevations on its surface, and, on passing the fingers over the part, they can be distinctly felt. They resemble in size and general character the miliary nodes of glanders, and are probably the result either of plugging of the small capillaries (embolism) by bacteria, or of circumscribed inflammatory changes, leading to the throwing out of an exudate.

In

In any case they are of greyish colour, and at first are discrete and tolerably resistant to the touch. *Swine Fever.* After a time, central softening is observed to have taken place, followed by irruption and the formation of distinct small circular ulcers with jagged edges, and of a greyish-yellow or black colour. Many of these ulcers remain discrete throughout the course of the subsequent changes, others run together, and may produce extensive necrotic patches of a very irregular shape. Long ridges of necrotic tissue are sometimes arranged in parallel rows, giving the part the appearance of a crow's foot, as exemplified by preserved specimens in my possession. Whenever these extensive necrotic changes go on, the coats of the bowel in the involved parts become very thick and hard and dark (either black or dark red) in colour, and the patch stands prominently out from the surrounding bowel. In very severe cases there is a tendency to perforation—a result, however, rarely seen, as it is prevented by adhesion of the investing peritoneum to that of an adjacent bowel, or to the mesentery or omentum. This condition is also well shown in specimens in my possession.

The small ulcers already noticed tend to increase their bounds by peripheral extension, layer after layer of epithelium proliferating and degenerating, until ultimately ulcers as large as a sixpenny piece or a shilling are formed, which, on close inspection, are seen to be made up of circumferential layers of necrosed tissue and cells, as seen in preserved specimens. In the course of time the necrosed tissues are cast off; but, in the process of exfoliation, the mass is sometimes seen to separate circumferentially after the manner of a variolous lesion, the central parts clinging to the subjacent structures with great tenacity.

The necrosed structure is of various hues, but there is no doubt that the dark colour so often seen is due to the dyeing effects of coal and coal-dust, a material ingested in large quantities, whenever opportunity offers, by the pig. The discoloration here and over the surface of the bowel is undoubtedly due in some cases, as in cattle plague, to the fact that the iron in the extravasated or stagnated blood has become converted into sulphide by the action of the hydrosulphuric acid so largely found in the intestines by the decomposition of the *egesta*.

As already indicated, gastric ulceration is rare, and the ulcers do not partake of the specific characters seen in those of the intestines.

The contents of the large bowels present remarkable characteristics. Sometimes they are simply fluid or semi-fluid, dark in colour, and of a sickly but peculiar odour; but more largely they will be found (*a*) in the form of small concrete masses, which adhere tenaciously to the mucous membrane, and when detached therefrom leave behind a roughened and sometimes an inflamed surface, (*b*) in the form of large masses of a very dark colour, of firm consistence, very cohesive, and coated with a layer of mucus, or mucus mixed with blood.

A very marked condition often associated with intestinal lesions is enormous engorgement of the mesenteric capillaries, and sometimes pronounced mesenteric extravasations.

Glandular Lesions—Lymphatic and Mesenteric.

There are perhaps no organs in the whole body which become so soon altered in their character as the lymphatic glands. Even when other evidence of the existence of Swine Fever is not forthcoming, it can be obtained in these bodies. The mesenteric, bronchial, and hepatic groups are certainly the most frequently found to present the characteristic lesions; but even when all the viscera have been removed there are still left for inspection the prepectoral, the sublumbar, the inguinal, and the laryngo-pharyngeal groups; and, unless an animal has been slaughtered in the very earliest stages, they usually furnish us with indubitable evidence of the prior existence of the disease.

The glands on section will be found enlarged and charged with serum, the cut surface being moist and glistening; the small vessels in the reticulæ of the lymph channels are found at the outset distinctly injected; but if the disease has been at all advanced, the injection gives place to extravasation, which, like the former condition, is confined at first to the lymph spaces; the parenchyma remaining intact, and of its normal colour (white), gives to the cut surface a mottled appearance—not at all unlike a section of the "Queen" strawberry. After a time all structural characteristics are lost in the gland, it becomes universally infiltrated with blood, very large, very dark in colour, and very friable. The conditions above described are characteristic of Swine Fever; they are not, however, exclusively so; they are found in anthrax and in septicæmia, but, notwithstanding this fact, they afford us a very reliable piece of confirmatory evidence in all cases.

The changes in the mesenteric glands are, on the whole, allied to those described in the lymphatics.

Treatment.

In view of the fact that treatment is not, except for experimental purposes, permitted by the Privy Council, it is unnecessary to make any extended observations in reference thereto.

I may, however, remark that many years ago (over twenty) I used to treat cases of Swine Fever wherever and whenever they came under my observation; and notwithstanding the fact that therapeutics were not so far advanced then as now, I had a very gratifying amount of success in my treatment of the malady.

The plan adopted was to clear out the alimentary canal by a purgative, following this up by the administration of sulphur and by potash salts; with ammon. carb. whenever there was great depression, or lung symptoms were urgent. Good, easily digested food, with plenty of milk, was allowed.

At the present day I should administer sodium sulphite and potassium chlorate; and if the *feces* were very *fœtid*, sulpho-carbolate of soda—alternating these agents with hydrargyrum *cretæ*, and preceding their use by the administration of a purgative.

Prevention and Suppression.

I suppose the various legislative measures which have been put in force by the Privy Council are familiar to all those who are interested in the matter, and local authorities have large powers placed in their hands to enable them to cope with this porcine plague.

Of the Privy Council measures the "Circles Order" is perhaps one of the best; and next in importance to this are the Orders connected with the holding of fairs and markets. But, unfortunately, these measures are not, in most instances, put into force until the disease has made extensive ravages—until, in fact, the legend *Ichabod* may be appropriately written against them. This fault, however, does not always lie at the door of the powers that be. In reference to compensation and slaughter, it may be said that the measures now in force are only half measures. There is too much of the voluntary element about

Swine Fever. about them to render them of any great practical value; and, as in the case of pleuro-pneumonia, there is no uniformity of action observed amongst different and adjoining districts.

Foot and mouth.

Whenever slaughtering is not decided upon, the first care of the Inspector is to persuade the owner of the pigs to slaughter all animals of whose carcasses anything can be made, and which are not of great value for breeding purposes. If proper precautions are observed, and perfect isolation and disinfection insisted upon, there is no necessity to slaughter the brood animals. The necessity for the immediate slaughter of affected or even of suspicious animals need not be insisted upon.

In addition to these measures, the piggeries (every part of them) should be thoroughly cleansed and disinfected, and painted over with fresh hot lime-wash mixed with a large percentage of phenol. I prefer myself gas-tar to white-wash, especially when dealing with wooden erections. The flows of the styes should be put into thorough repair and rendered impervious to moisture. The feeding-troughs, if of wood, should be burnt; if of iron, cleansed, disinfected, and painted, and so arranged as to preclude the possibility of contamination by the feet of the pigs. Rats should be destroyed as speedily as possible, and if very numerous, liquefied gas-tar should be forced into their holes and burrows, and a watch kept at the various outlets for the half-stupefied rats as they make their escape therefrom.

Aërial disinfection by means of sulphurous acid gas and chlorine should also be had recourse to; and medicinal disinfectants—hyposulphite of soda and potassium chlorate—administered to the healthy animals in their food.

By the energetic adoption of the methods above recommended the mortality may be considerably reduced, and the disease effectually suppressed; but while this is so, I do not hesitate to say that such measures are only temporising measures, and that the most effectual method of suppression is the slaughter of all diseased animals, and of those which have been exposed to the infection, with imperial and full compensation.

Mr. GORDON thought that this subject should be dealt with to prevent the introduction of disease in ships' stores.

Mr. PARK: Mr. CURR has said that swine suffered from anthrax. Might it not be swine fever. Has any official inquiry been made into the nature of the disease there as to whether it was really anthrax or swine fever.

Mr. CURR: I said it had been reported upon by the veterinary surgeon as being anthrax. I think it has occurred two or three times.

Mr. STANLEY: Can you give any of the *post-mortem* appearances. They would be interesting, as swine are believed to be refractory to the inoculation of anthrax. I have known swine suffer from diphtheria.

Mr. CURR: The veterinarians were of opinion that it was anthrax.

The CHAIRMAN: They were not imported pigs?

Mr. CURR: No. They were at a place 4 or 5 miles from the port of Williamstown.

Mr. PARK suggested that steps might be taken by Mr. CURR to ascertain beyond doubt what was the nature of the disease.

Mr. CURR: If the Conference wishes for further information I shall be glad to look it up. At the same time it seems to me that I have given a plain straightforward statement, and I do not know what further information is wanted. However, I am in the hands of the Conference, and will do whatever they wish.

Mr. PARK moved,—“That Mr. CURR be requested to ascertain definitely if the disease which appeared in swine in Victoria some years ago was anthrax.”

Mr. CURR: The principal facts, I find on reference to my Correspondence Book, were as follows:—On 29/1/78 a cow on a farm at Kororoit, near Williamstown, was reported to have died of Cumberland. Mr. C. Marson, V.S., made a *post-mortem* of the animal and reported it to be a case of splenic apoplexy, and cautioned the owner not to allow the flesh to be eaten by his pigs. Whilst making the *post-mortem* Mr. Marson cut his hand, which accident laid him up and nearly cost him his life. However, the flesh was eaten by the pigs and numbers of them died, and the cause of their deaths was pronounced to be anthrax by Mr. M'Guire, V.S. I made a further inspection of the pigs with the late Mr. Vincent, V.S., who found them to have died of anthrax, on which I quarantined the two farms.

Foot and Mouth Disease.

Mr. PARK read the following paper on foot and mouth disease:—

Eczema epizootica or foot and mouth disease is one of the most infectious and contagious diseases that has affected the herds and flocks of Europe, Asia, America, and Great Britain for centuries past—the latter country for nearly half a century since the introduction of the disease by importation, which is now and has been declared stamped out of Great Britain for nearly one year. On several occasions reports have been made that foot and mouth has again broken out, but on an investigation have proved this to be groundless.

Nature.—Contagious and infectious, attacking all cattle, sheep, pigs, goats, horses, and men—the human subject—the latter through the medium of milk, and mostly affecting young children.

Cause.—Are due to a specific virus producing the disease only; the period of incubation varying from twenty-four hours to ten or twelve days.

The symptoms are characterised by a vesicular eruption on the tongue and lips, extending occasionally to the mammary gland. The feet participate in this vesicular eruption, producing lameness, sloughing of the hoofs, giving the animal the most intense pain in aggravated cases.

Importation.—All animals should be inspected by a duly qualified Inspector of Stock or Veterinary Surgeon on board ship before being allowed to land. A period of quarantine of ninety days with periodical inspection during that period, together with disinfections if necessary.

The risk of introducing any contagious or infectious disease is almost impossible if proper precautions are taken. England only prohibits importation from infected countries.

Treatment is preventive and curative; the former is already dealt with. Curative treatment is very rarely required; it consists of hygienic measures being adopted—good nourishing food; simple dressing to affected parts.

Mortality.—The mortality is very slight; thousands may be affected without sustaining a single death. The greatest loss occurs amongst sucking young animals.

ARCHIBALD PARK, M.R.C.V.S.

Mr.

Mr. HIGGINS: Have you seen a case of foot and mouth disease in horses?

Mr. PARK: Yes, I have; there is also a disease—a species of catarrh—which resembles it, except with regard to the characteristic vesicles. Rinderpest might also be mistaken for it. For the last twelve months England has been free from it. One case was investigated, but it proved not to be foot and mouth disease. Foreign Diseases. Australasian Regulations.

Mr. STANLEY: The disease is so rare among horses that it is supposed that they cannot be inoculated with it.

Mr. COOPER: We get from the Agent-General a weekly return of diseases compiled by the British Agricultural Department, and for the last two or three months foot and mouth disease has disappeared.

Mr. WOOD: How long has it been in England?

Mr. PARK: Since 1839. It might have been stamped out long ago if it had been well known and unanimous action taken.

Mr. STANLEY: British agriculturalists attach very little importance to it. They will buy in a fair where it is present. The practice is to put the cattle they buy at a fair in quarantine for ten days. If they go fourteen days they are satisfied, and will turn those animals among their own breeding herds. With a quarantine of ninety days there is very little fear of it getting amongst our stock here.

Mr. PARK: Pigs have been known to leave Ireland quite healthy and to be diseased by the time they get to Glasgow, within twenty-four hours from time of shipment.

DESTRUCTION OF ANIMALS INFECTED WITH FOREIGN DISEASES.

Mr. HIGGINS moved—"That this Conference recommends that any animals found to be infected with Glanders, Farcy, Foot-and-mouth Disease, Rinderpest, Sheep-pox, Swine-fever, Rabies, Trichinosis, or any other infectious or contagious disease not existing within the Colonies, be at once destroyed.

Mr. GORDON seconded the motion, which was agreed to.

II.—REGULATIONS RELATING TO THE INTRODUCTION OF AUSTRALASIAN ANIMALS BY SEA.

Mr. COOPER moved that, "The term Australasian Colonies be used instead of Australian Colonies and that it comprise the colonies on the continent of Australia, Tasmania, and New Zealand."

Mr. HIGGINS seconded the motion.

The motion was agreed to.

Mr. TABART read a paper on the regulations relating to the introduction of Australasian animals by sea. The paper is as follows:—

"At the present time the regulations in force throughout the Colonies are so at variance it is with difficulty that exporters and importers can ascertain the particulars as to how they should forward stock. I recommend that a regulation be framed, to be submitted for the approval of the several Governments, dealing with the interchange of Australasian animals; but in doing so I anticipate considerable difficulty will be experienced in arriving at such a code of laws as will be acceptable to all the colonies, there being such a peculiar difference in the circumstances of each country, inasmuch as South Australia, Victoria, New South Wales, and Queensland form part of the mainland, while New Zealand and Tasmania are islands. It would necessitate arrangements being entered into as to the difference to be observed in the case of clean and unclean colonies, and the risk of re-infection that would likely be caused by the introduction of stock from unclean colonies. *Cattle*: The position of Tasmania in reference to this description of stock is singular, as at the present time there is absolute immunity from cattle disease, which is not so in the adjoining colonies. I consider we are subject to greater risk of cattle disease being introduced into the herds of Tasmania by the importation of stud animals from Victoria, New South Wales, South Australia, and Queensland than is the case from direct importation of foreign animals—that is, stock from England, &c.—this on account of the frequent outbreaks of pleuro-pneumonia, also Cumberland disease, which latter plague is reported as being most alarming in New South Wales. This fact is significant, as shown by Mr. Stanley, Veterinary Surgeon for the New South Wales Government, who reported in August last upon the fatality of this disease when it attacked Mr. Leithbridge's cattle, near Dubbo, when 161 head died. The short distance that stock have to be conveyed, with the few hours' length of sea trip from the abovenamed colonies, is most dangerous to the future of Tasmania, and the risk is far more alarming when compared with the length of sea voyage that foreign stock are obliged to undergo, with the greater chance of the development of disease before being landed. It behoves this colony to act with great caution to prevent a repetition of the dire calamity that resulted to this great interest in Australia in 1858 by the importation from England of a cow belonging to Mr. Boadle that was infected with pleuro-pneumonia, hence this disease has established itself throughout the length and breadth of the continent. I feel strongly upon this subject, and assert that measures should be devised to protect our colony from these diseases, particularly when the Australian Colonies, as also Tasmania and New Zealand, absolutely prohibit the introduction of cattle from places and countries outside the colonies. The regulations now in force in Tasmania require a Veterinary Surgeon's certificate, and also a certificate from an Inspector, to be produced before stock can be landed into quarantine, which extends to six months. I should propose in all cases of shipment of cattle that the Inspector's certificate be abolished, and a breeder's substituted, certifying that the herd from which the animal was drafted never had suffered from any contagious or infectious disease, nor had any diseased cattle depastured upon the estate from which the animal came within the next preceding 24 months, and that the vendor should be held responsible for the safe delivery of the animal, free from all contagious or infectious diseases on shipboard. Upon arrival in Tasmania, the stock should be inspected by the Government veterinary surgeon, and if passed as free from disease be sent to quarantine, and there remain for a period of six months at least. In interchange between Victoria, New South Wales, South Australia, Queensland, and New Zealand there is no quarantine upon cattle, but an inspection is required,

Intercolonial
importations.

required, and if diseased are forthwith destroyed. *Sheep*: To this description of stock I wish to draw the particular attention of members of the Conference, on account of the great difference in the regulations in each of the Colonies, and the unnecessary inconvenience to which breeders and shippers are subjected. It is an authenticated fact that the admixture of fresh blood is beneficial and absolutely necessary, as also profitable, into any stud flock or herd, if it can be effected without introducing any disease. I feel satisfied that the decision likely to be arrived at by this meeting is, that sheep from clean colonies should be admitted into any other clean colony under less restrictive and arbitrary regulations than those at present in force. I trust that a law will be made allowing sheep to be interchanged, as named above, with one dipping and no quarantine. I intend to review the regulations in force in each of the colonies, so that the inequalities may become apparent to any member of the Conference. Victoria allows sheep from either clean or unclean colonies to be introduced under the same regulations, provided they are furnished with a statutory declaration made by the owner or person in charge that the stock are free from disease. The Chief Inspector shall then detain the sheep until they have been dipped once or oftener as he may direct, and until he shall by writing, under his hand, authorize their removal. This I consider inconsistent, particularly when by admitting sheep from an unclean colony the contact with an attendant's clothes might cause scab to be introduced, when from a clean colony such a risk is impossible. I respectfully beg to intimate to the members of the Conference that when the two last seasons' shipments of stud sheep from Tasmania were forwarded to the annual stud sales held in Melbourne two dippings were enforced, when in previous years only one dipping was considered quite sufficient to ensure safety from the introduction of scab. Upon making inquiry I was informed that this change was consequent from the outbreak of scab in New South Wales, which unfortunate circumstance was the result of an importation of Vermont stud sheep from America, an unclean country. South Australia wisely distinguishes the difference between clean and unclean countries, as signified by their regulations, viz.:—All sheep entering South Australia must produce a certificate from an Inspector of Stock or a qualified Veterinary Surgeon that the sheep were free from disease. If from the clean colonies of Victoria, New South Wales, Queensland, or Tasmania they undergo a quarantine of six days and are dipped, as directed, by an Inspector of Stock; but sheep entering from the unproclaimed clean colonies of New Zealand and Western Australia are necessitated to undergo a quarantine of fourteen days, and dipped as directed by the Inspector of Stock. This Act seems to me to be administered upon more equitable grounds than the law now in force in Victoria. Queensland: All sea-borne sheep from any of the Australian Colonies must undergo a quarantine of twenty-one days, and absolutely three dressings. This law almost amounts to prohibition. Breeders do not care to risk losing a high-priced stud ram from the frequent dippings, which are considered excessive. This law has the effect of excluding the best stud sheep being introduced for the improvement of the Queensland flock. New Zealand requires all sheep landing at their ports to be accompanied with a certificate from an Inspector of the Colony from which the stock are exported, also a Veterinary Surgeon's certificate as to their being free from disease. Upon arrival the sheep are dipped once, and allowed to travel. Under this law I do not consider any hardship is caused to the exporters of sheep, and no practical sheep-farmer could object to this precautionary one dipping being enforced. New South Wales: This colony requires that sheep landed from other colonies shall be inspected one by one by the Chief Inspector of the place from whence they are shipped. The vessel carrying the stock has to be thoroughly disinfected and cleansed before the sheep are taken on board. These portions of the regulations being complied with, upon arrival in New South Wales the sheep have to undergo the examination of two Inspectors, who handle every animal along the back and sides to ascertain if the acari is then upon the sheep. If it is not discovered (which is not likely if there is no outward and visible signs) the sheep are allowed to be taken to a proclaimed quarantine, and there remain for twelve days before being once dipped; but if the sheep are not accompanied by the certificate above-mentioned they have to be dipped three times. Sheep landing in Victoria and travelled overland, in addition to holding the certificate from the Chief Inspector of Tasmania, must also have a certificate from the Chief Inspector of Victoria, certifying that the sheep intended to be travelled have undergone the two dippings enforced by Victoria upon sea-borne sheep. They then enter New South Wales without further dippings or quarantine. The cages or crates which are used for carrying the sheep to the stud sales in Sydney are not allowed to be landed without being disinfected, notwithstanding that the sheep which are enclosed in the crates or cages are landed. The attendants also land without being subject to a disinfecting process. It is the last-mentioned fact that proves the inconsistency of this law. Breeders from all the Colonies attend these sales, and as a matter of fact examine all the sheep exposed for public auction, leave the proclaimed quarantine station, and afterwards travel the length and breadth of the land without any precautionary disinfecting. This colony prohibited the introduction of sheep from New Zealand and Western Australia on account of being unclean. Tasmania admits sheep from all proclaimed clean colonies with one dipping enforced before sheep travel outside the town boundary, and a certificate is required from an inspector that they have always been free from contagious or infectious diseases, and were bred in one of the following colonies:—Victoria, New South Wales, Queensland, and South Australia, or had undergone in the colony from whence they were imported the necessary dippings and quarantine in accordance with the regulations in force in such colony, and that the pens wherein the sheep are confined on shipboard were such as could not possibly have at any time contained diseased sheep. Sheep from New Zealand and Western Australia are prohibited from landing. All returned Tasmanian stud rams are dipped upon arrival in the island before being allowed to travel. *Dogs*.—New South Wales must have a declaration made by the owner before a Magistrate, and certified to by the inspector, that the animal is the produce of the Australian Colonies. Upon the production of this there is no quarantine enforced. New Zealand: A certificate is required from an Inspector setting forth from whence the animal came, and that it is free from disease, and is the produce of the colonies, or that the animal had performed a quarantine of six months, thereby causing the same to be classed as an Australian-bred animal; with this certificate no quarantine is necessary. Victoria: The inspector has to give his authority in writing for a dog to be landed; if Australian-bred, no quarantine. Tasmania and South Australia: Free interchange when colonial-bred. The law for this particular class of stock could without difficulty be assimilated, and required when moving from one colony to another to carry a declaration by the owner, made before a Magistrate, and certified to by an Inspector, that the animal mentioned is Australian-bred, or had performed the necessary quarantine, thereby making the animal equal to and allowed all the privileges of a colonial-bred dog. *Horses*.—This stock upon production of certificate can land in any of the colonies without a quarantine being performed. I consider before horses are exported from any of the

the colonies an examination should be made by a duly qualified Veterinary Surgeon, who shall grant a certificate of health, the production of which at any port of the Colony to be proof of the non-existence of disease. I have only, in conclusion, to say that certain alterations of the existing laws in the interchange of stock would be a mutual benefit throughout the colonies. The high figure given by breeders for good constitution, sound, and suitable animals shows conclusively the great desire there is in the colonies to improve the herds and flocks, thereby adding materially to the wealth of the colonies.

HARBOUR EXCURSION.

The Chairman read the following letter from the Under Secretary for Mines :—

Gentlemen,

I am desired by the Minister for Mines to inform you that he will have very great pleasure in placing one of the Government launches at your disposal with a view to enable you to visit some points of interest in and around the Harbour on Saturday next. If you do him the honor to accept, the Minister will be glad to know at what hour you wish to start.

30 September, 1886.

I am gentlemen, yours faithfully,

HARRIE WOOD.

The Chairman and Members of the Stock Conference, Sydney.

Mr. PETER moved,—That the proposal be accepted, and that a vote of thanks be accorded to the Minister.

Mr. MEREDITH seconded the motion, which was agreed to.

Mr. MEREDITH moved,—That the members meet on Saturday at 10 30 a.m., at Princes Stairs.

The motion was agreed to.

Mr. TABART—with respect to Intercolonial Regulations—said he wished to mention that Tasmania had been free from scab for seven years, and had been proclaimed clean for five and a half years. To ensure safety and prevent its introduction they took every possible precaution. They absolutely prohibited the landing of sheep from New Zealand and Western Australia. It lately came to his knowledge that an endeavour was to be made to introduce carcasses of mutton from New Zealand into Hobart. The sheep were to be put alive on to a vessel at New Zealand, and slaughter them a day before they reached Hobart. They had no regulations in Tasmania to meet such a case, so he at once wrote to the Chief Secretary, and a regulation was framed, which was now in force, prohibiting the introduction of sheepskins, or any part of the skins, from New Zealand into Tasmania. Further, to provide against the possibility of the introduction of scab, all the Tasmanian stud sheep returned unsold from the sales in the other Colonies or purchased by Tasmanian breeders, were dipped before they travelled inland.

Mr. VALENTINE: Are they dipped in Melbourne before they leave.

Mr. TABART replied that they were not, nor in New South Wales. All imported sheep from Victoria or New South Wales were dipped before they went outside the town boundary, and if any of the imported Tasmanian sheep mixed with other sheep during the time they were within the town boundary they had to be dipped before they were taken out. The members of the Conference would see from this that every effort was made to prevent the re-introduction of scab. There were only three landing ports—Launceston, Hobart, and Torquay—and there was an Inspector at each port to supervise the landing of sheep, and to see that they were dipped if they were landed on the north coast at Torquay; they were dipped before being travelled inland. If they were landed at Launceston and trucked to Hobart they were dipped at Launceston.

Mr. HIGGINS: Are your Inspectors practically acquainted with scab.

Mr. TABART replied that they were. He did not think they could find more practical men in the Colonies. To show how important a matter this was to Tasmania, and to the whole of the Australian Colonies, he would state, in 1885, Tasmania exported to Victoria 1,484 stud sheep of the value of £24,310; to New South Wales during the same year they exported 1,244 stud sheep, valued at £29,200; to New Zealand 277, with a value of £1,238; to Queensland 145, with a value of £2,581; and to South Australia 46, with a value of £776. The total number of stud sheep thus exported in that year, 1885, was 3,249, with a value of £58,105. This was sufficient to show the importance of the question. In asking for a relaxation of the present regulations, he might also say that in the same year Tasmania imported 59,744 sheep, with a value of £49,205, from Victoria; 5,118, with a value of £3,837, from New South Wales; 477 carcasses of mutton, with a value of £400, from New Zealand. The grand total of imported stock in 1885 was 65,139, with a value of £53,450.

The CHAIRMAN laid on the table the New South Wales regulations relating to sea-bound Australian sheep. They are as follows :—

AUSTRALIAN STUD SHEEP.

Sheep to be only landed at Sydney.

1. No stud sheep from any other Australian Colony shall be landed at any port or place in this Colony except at the port of Sydney.

What is to be deemed a clean Colony.

2. No Colony shall be deemed to be a clean Colony in which scab or catarrh or any other infectious or contagious disease exists, or is suspected to exist, nor any Colony in which scab shall have existed within the next preceding one year, and no sheep shall be imported except from a clean Australian Colony.

What is to be deemed a clean vessel.

3. No stud sheep shall be imported except by vessels that have not traded to any but a clean Australian Colony within the next preceding twelve months, nor by any vessel which shall within the period hereinbefore mentioned have had any sheep on board from any Colony other than a clean Australian Colony.

Vessel to carry sheep must be cleansed and disinfected.

4. Every vessel on which it is intended to carry any such stud sheep shall be thoroughly cleansed and disinfected before the sheep have been shipped.

Sheep

Intercolonial
importations.

Sheep must be accompanied by certificate from Chief Inspector of exporting Colony.

5. All such stud sheep shall be accompanied by a certificate and declaration to the effect of Form 1 hereto, that they have been examined one by one by the Chief Inspector for the Colony from which they are exported certifying that they have been so examined, and that they are free from any infectious or contagious disease, and that scab has not existed in such Colony for the next preceding two years.

Sheep on arrival to be examined by an Inspector and Veterinary Surgeon.

6. No sheep from any clean Australian Colony shall be landed in this Colony until they shall have been examined and a certificate to the effect of Form 2 hereto, granted by an Inspector of Stock and a duly qualified Veterinary Surgeon, that all the requirements of the abovenamed Acts and of these Regulations with respect to such sheep have been duly complied with, and that they are not infected.

Infected sheep to be destroyed or disposed of by Minister's order.

7. If any such stud sheep brought by sea into a port or place in this Colony be found to be infected they may be forthwith destroyed or otherwise disposed of, as the Minister may direct.

Quarantine and Dressing of Australian Imported Sheep.

8. Stud sheep from any clean Australian Colony may, if found on inspection to be not infected, be landed and taken by a conveyance to the quarantine for such sheep, where they shall be quarantined and dipped under the supervision and direction of the Inspector, and the length of such quarantine, the medicaments to be used in dipping, the temperature and duration of the bath, the number of dippings, and the fees to be charged for the keeping and dipping of the sheep, shall be as follows, viz. :—

Quarantine.

- (1.) The quarantine shall extend to at least twelve days prior to dipping

Medicaments.

- (2.) The medicaments to be used in dipping shall be good sound tobacco, or tobacco leaves and flowers of sulphur, at the rate of 1lb. of each to every 5 gallons of water, the tobacco to be put into boiling water and infused for five hours at least, and the sulphur to be added to the infusion in the dip.

Temperature.

- (3.) The temperature shall not be less than 100 nor more than 110 degrees Fahrenheit.

Bath and Duration.

- (4.) The sheep shall swim and be completely immersed while in the bath, and the bath shall last from one to two minutes, according to its temperature, and as the case may require.

Number of dippings.

- (5.) The sheep shall receive one dipping.

Charges.

- (6.) The rates to be charged for the keeping and dressing of sheep in quarantine shall be as follows, viz. :—

	s.	d.
Sustenance and attendance per day or part of a day per sheep	0	6
Dipping each sheep	1	0

Declaration by persons dipping, dressing, or disinfecting.

9. Every Inspector or other person who shall have superintended any dipping, dressing, or disinfecting, shall make and transmit with due dispatch to the Chief Inspector a declaration to the effect of Form 3 hereto.

How sheep are to be released from quarantine.

10. No sheep shall be released from quarantine until they shall have been examined by the Chief Inspector and a duly qualified Veterinary Surgeon in consultation and a certificate granted by them to the effect of Form 4 that such sheep have been duly quarantined and dressed, as prescribed by these Regulations, and are free from infection.

How imported Australian sheep are to be admitted overland from other Colonies.

11. Sheep imported from any clean Australian Colony into any other clean Colony, and intended to be introduced overland into this Colony, may be admitted if their owner produce the certificates prescribed by Regulations 5, 6, and 10 of 1st July last (1886) under the abovenamed Acts for such sheep, and if they are found on examination by the Inspector for this Colony at the border to be not infected; or such sheep may be admitted at the border on inspection as aforesaid if their owner produce to such Inspector a certificate under the hand of the Chief Inspector for the Colony from which they are intended to be introduced that when such sheep were introduced into that Colony they were accompanied

accompanied by a certificate as prescribed by number 5 of the abovementioned Regulations, and that such sheep have been twice dipped with proper preparations of tobacco and sulphur, or of sulphur and lime, in a bath given at the temperature and of the duration and in the manner prescribed by number 8 of the abovementioned Regulations. But all such sheep, unless they shall have been imported, inspected, quarantined, and dressed as prescribed in this and the abovementioned Regulations, shall, on crossing the border, be placed in quarantine, and kept and dipped in the same manner in every respect as prescribed with regard to Australian imported sheep landed at Sydney.

Intercolonial
Traffic, &c.

How Australian imported sheep which have not complied with all the Regulations are to be admitted.

12. Should any Australian sheep be imported into this Colony by a vessel which shall not have been cleansed and disinfected, as provided by these Regulations, or should any such sheep not have been examined in the Colony from which they were exported, as prescribed by these Regulations, then such sheep may, with the sanction of the Minister, be admitted to and shall remain in quarantine for twenty-one days, and shall in every such case receive three dippings at intervals of not less than ten nor more than fifteen days.

Stud sheep from inland or overland from other Colonies to be treated as "imported" if in or near Sydney at same time.

13. Stud and show sheep brought from any of the inland districts of this Colony or introduced overland from any adjoining clean Colony which shall be in Sydney or in any of the suburbs during the time that any imported sheep shall remain in Sydney or the suburbs, shall, prior to their leaving the coast district, be dipped the same as if they were imported Australian sheep.

Owners of special quarantines to pay for attendant.

14. In any case where a special quarantine has been granted for Australian imported sheep an attendant may, where necessary, be placed by the Chief Inspector of Stock in charge of the sheep in such quarantine; and the person to whom such quarantine has been granted shall pay the expense of such attendant.

No fodder to be landed, and no cages without disinfecting.

15. No fodder-straw or litter which shall have been used for, with, or about imported sheep, nor any fittings on board any vessel for such sheep shall be landed; and all cases or cages brought with such sheep shall be cleansed and disinfected as the Chief Inspector shall direct.

Mr. MEREDITH said it was most important that they should have any proposed motions in hand before they came on for discussion. They should be laid on the table each night and printed, so that they might be able to see at a glance what matters were to be brought forward. That would save a great amount of time. The members could then take the resolutions home and talk them over together so that many differences of opinion might be got over. That was why he proposed on a former occasion that notice should be given at each sitting of the motions for the following day. Take for instance the subject which Mr. CURR had referred to. It ought to be in the hands of members beforehand.

Mr. PETER: It is a subject we are so well up in that it would be a waste of time to deal with it as Mr. Meredith proposes.

Mr. CURR laid on the table the following resolutions:—

1. No sheep brought from any Australasian Colonies in which scab exists shall be introduced into any of the Australasian Colonies.
2. All sheep bred in the Australasian Colonies which have been on board of any ship, steamer, or other vessel, before they are allowed to go at large in any of such colonies, be placed in quarantine until they have been twice dipped for scab in lime and sulphur dressing at intervals of not less than forty-eight hours nor more than seven days.
3. Stock which is allowed by law to travel in the Australasian colony in which it has been bred or into which it has been introduced in accordance with the law there in force, shall be allowed to enter any neighbouring colony by land at any gazetted place of entrance without further obstacle, unless it shall be found on examination by an inspector of the colony into which it is proposed to introduce such stock to be suffering from some disease which is treated as infectious by the law of such colony, or unless such inspector has reason for suspecting the presence of contagious disease in such stock; and the fact that any stock is held to be free from disease in any colony and so allowed to go at large shall be *prima facie* evidence of its freedom from contagious disease.
4. That the lime and sulphur dip shall be adopted as the only dip for scab in the Australasian Colonies, by which last term is meant the several Australasian Colonies, Tasmania and New Zealand.
5. That it is desirable that all drafts of laws or regulations dealing with the diseases of animals, &c., should be submitted by the Government which institutes them to the other Governments of the Australasian Colonies for remark before they become law.

Mr. CURR moved—"That they be discussed."

Mr. LANCE: They all deal with subjects with which we are conversant. We are as well acquainted with them now as we would be if they were held over for six months. On the first there will be little or no difference of opinion. With the 2nd I do not at all agree as to the proposed quarantine restrictions.

Mr. CURR: In Victoria quarantine means that the sheep are taken to a store and the owner was asked whether he would have them dipped on that day or the following. He was then told that he could have the second dipping carried out after the lapse of forty-eight hours, so that as a matter of fact the sheep could be released forty-eight hours after they were landed.

Mr. LANCE: It is practically useless to have the second dipping within such a short period as forty-eight hours.

Intercolonial
Traffic, &c

Mr. CURR: It is not useless. One thorough dipping in lime and sulphur is a cure for scab. You cannot dispute the fact.

Mr. LANCE: I do dispute it.

Mr. CURR said that although the cure for scab was practically effected with one dipping, yet the stuff might not be at the proper heat, or the animal might not be kept in it the proper time. Hence it seemed to him that where they were dealing with seventy millions of sheep it was well to take all possible precautions. It might be said that the period between the dips was too short, but he was of opinion that as soon as the sheep were dry there was nothing further necessary for the destruction of the scab.

Mr. LANCE asked how the two dippings within forty-eight hours would work when the eggs of the scab insect were laid under the skin. The New Zealand Act was based on the theory laid down by Professor Wallz. That theory had been restated recently. He did not think that anyone in England had had the experience of Mr. Bruce or Mr. Gordon with regard to scab. They had dealt with it for the last twenty years. If the theory was true that the scab insect laid its eggs under the skin of the sheep, and the eggs were not germinated for nine or ten days, it would be impossible to destroy the acari of the scab with one dip, notwithstanding that Mr. Curr said he had cured scab in one dipping hundreds of times.

Mr. TABART: I have done it hundreds of times with the scabbiest sheep I have ever seen.

Mr. MEREDITH: I have cured thousands with one dip. I remember one sheep which was scabby from the end of its nose to its feet. He dipped the sheep in sulphur and lime and immersed it the proper time. The sheep did not require another dipping.

Mr. HIGGINS: What was the length of time of the dip?

Mr. MEREDITH: Two minutes.

Mr. HIGGINS: What was the temperature?

Mr. MEREDITH: 110 degrees.

Mr. LANCE: If one dip is enough why should we have two?

Mr. VALENTINE: We have not proposed two.

Mr. MEREDITH said that Dr. Rowe gave him the recipe for the lime and sulphur dressing. At that time scab existed to a considerable extent in Tasmania. He selected for a test ten of the worst sheep that could be found. The insects could be seen upon them with the naked eye. He dipped the sheep according to Dr. Rowe's instructions, immersing the sheep for two minutes. They were then put into a small paddock by themselves, and allowed to remain there for ten days. They were examined daily for a month, and not a single insect appeared on them afterwards. The principle adopted in Tasmania was that they never thought of taking the sheep back to the same run for six weeks or two months. They were always put on clean runs, and every sheep was removed from the infected run.

Mr. CURR said he was glad to be able to add the testimony of his own experience to that of Mr. Meredith. There had been hundreds of thousands of sheep cleaned in Victoria under his guidance, when they had been diseased to the last degree, with bales of wool lying against the hurdles. The sheep were dipped twice for scab in those yards, and no scab ever appeared on them again. The reason of this appeared to him was, that the materials used for dressing, lime and sulphur or tobacco, was so obnoxious to the scab insects that they would not go on the sheep, and if they did they would not live. It was usual to give a second dipping, but it was generally the case that the sheep, even with the bales of wool lying about the hurdles and the branches of the trees covered with the acari of the scab, remained free from disease, as the insects would not go upon them, and they would not live if they did.

Mr. COOPER: If you are sure the Colony is clean, why do you dip for scab?

Mr. CURR said that the only sheep dipped were those which arrived in the Colony by sea, of the condition of which it was impossible to be sure. That much as he objected to interference with traffic in this case it was necessary. That occasionally a scabby sheep was found on board an English vessel in Hobson's Bay. That such a sheep might be transhipped on board a Colonial craft, by which means scab might be introduced. He was not aware of any method, except dipping, by which a catastrophe of the sort could be prevented. He was aware that this did not give the Tasmanian's as good a chance with their stud sheep as he could desire, but he maintained that the 70,000,000 of sheep in these Colonies should not be put to the most infinitesimal danger of getting scab among them. If such a thing occurred it would ruin a great number of people. These Victorian regulations were a little more stringent than those he had in force at a certain time when a deputation waited on the Chief Secretary. The members of the deputation did not know the Victorian regulations. They thought there was some laxity by which scabby sheep might get into the Colony. They insisted upon a few additional precautions to guard against such a possibility. The ones adopted were that the sheep should be kept in stores at the west end of the town. There they were locked up at night and the keys were taken away, so that they could not be removed at night, except by burglary. The dipping only costs a penny a head. In all cases where the sheep were quarantined the Government take upon themselves all the expenses of looking after them. He considered that the ideas of the Tasmanian representatives were somewhat sentimental. As a matter of fact, sheep which were quarantined in Victoria could be taken away forty-eight hours after they landed.

Mr. HIGGINS said he did not see the importance of these resolutions so forcibly when Mr. Meredith raised his objections as he did now. These resolutions were almost as important as any business they had on the paper. They dealt with the question of introducing sheep into one Colony from another. At present each Colony had its own regulations, and now Mr. Curr was bringing forward a set of resolutions introducing regulations which would differ from ours to a considerable extent. He confessed that he was not at present able to grasp where the difference lay. If the different resolutions were to be brought forward they should be before them in order that they might see to what extent they could be dovetailed into one another. There was so much in Nos. 2 and 4 that he would like to study and compare them before any attempt was made to discuss them.

Mr. MEREDITH moved as an amendment,—“That the resolutions be printed and laid on the table.”

Mr. HIGGINS seconded the amendment, which was carried by sixteen votes to two.

The following was the voting on the amendment:—For,—New South Wales, Victoria, Queensland, South Australia, and Tasmania, all; New Zealand, 1. Against,—New Zealand, 2.

(The further discussion of intercolonial regulations was deferred until the notices of motion should be printed.)

IV.—COLLECTION AND PUBLICATION OF INFORMATION WITH RESPECT TO
DISEASES IN ANIMALS.

Noxious
Animals.

Mr. GORDON moved,—“That it be a recommendation of the Conference that the various Governments be invited to collect and publish all original useful information with respect to diseases in animals and their prevention and cure, and that they interchange them with the various Colonies.” Mr. WOOD seconded the motion.

Mr. MEREDITH supported the motion, which was agreed to.

V.—TRAVELLING MOVEMENT AND CONVEYANCE OF ANIMALS.

Mr. CURR moved,—“That the subject now numbered 5 in their programme—the travelling movement and conveyance of animals—be left to be dealt with by each Colony within its own boundary.” Mr. COOPER seconded the motion.

Mr. MEREDITH said he objected to it when it was under discussion a day or two ago. Mr. CURR, the Victorian representative, had said that there were no precautions taken to prevent stock travelling in infected districts. He (Mr. Meredith) asked, in the case of Tasmania importing stud animals from Victoria if there was any possibility of the animals being infected where they were shipped, and Mr. CURR had replied that there was none. The question of keeping both their sheep and cattle clear of infection was not a small one to the breeders of Tasmania. In 1886 their cattle numbered 138,642, which was quite sufficient to create a desire to guard against infection. They also wished to improve their stock as much as possible, and they wished to have ample security in case they dealt with New South Wales, Victoria, South Australia, New Zealand, or other Colonies. They wished to see such regulations in those Colonies as would prevent their stock being infected during the time they were travelling between the run and the port of shipment. The representatives of Victoria, Queensland, and New South Wales had informed them that Cumberland and pleuro existed in those Colonies to a large extent, and therefore the stock-owners of Tasmania should be cautious, and ask their neighbours to take such precautions as would prevent infection spreading to the Tasmanian animals. From the explanation given by the gentleman representing Victoria, it would appear that clean stock leaving the breeding station might return infected if they travelled by rail or even by road.

Mr. CURR assured Mr. Meredith that he was by no means careless as to whether Tasmanian stock became diseased or not. If they wanted to make sure that the cattle which came from Victoria to Tasmania were free from disease they would have to undertake an enormous business. All that had been suggested to meet the difficulty was not worth six-pence. If they decided in Victoria to disinfect stock-trucks—which they could do, but which no Ministry in Victoria would undertake to do—what would it be worth? To carry out effectually a plan in detail to know exactly the movements of all suspected animals, it would be necessary to cut the Colony up into small divisions, and the inspectors in each would require to be intimately acquainted with the movements of stock. No Colonial Government would dream of initiating such a scheme. It had been tried in England, and the representatives of the agricultural department had said that it was not satisfactory. Just take the case of Queensland. How could anyone say with certainty where a beast had been the day before. No inspector could actually certify to that. If he held the position in Tasmania which he did in Victoria, he should endeavour to persuade his countrymen not to admit a beast from the Australian Continent any more than from England. The most eminent Veterinarian Surgeon in England—Mr. Flemming—said that a country could not continue to import animals without importing their diseases. That authority had said that it was only a matter of time to bring into Australia, diseases incidental to the stock imported. However, he believed that on such points, if they consulted a dozen of the most successful Veterinarians in the world, they would probably have fifteen different opinions.

The motion was agreed to.

VI.—DESTRUCTION OF NOXIOUS ANIMALS.

(1.) *In Queensland.*

Mr. GORDON said he was not in favour of native dogs being included in the list, because they were not grass eating animals. The Queensland Government had spent £70,000 on the destruction of marsupials up to the end of 1884. Up to the end of last year no less than 6,000,000 of kangaroos and wallabies had been destroyed according to the number of scalps brought in.

(2.) *In Tasmania.*

Mr. TABART laid on the table his report on the working of “The Rabbits Destruction Act of 1882,” for the year ending 30 June, 1886, which, as it deals exclusively with rabbits, will be found under the sub-head of Rabbit Nuisance, page 77.

(3.) *In New South Wales.*

The CHAIRMAN read the following extract from his last Annual Report, with respect to noxious animals, other than rabbits, in New South Wales:—

1. *The Districts in which the Pastures and Stock Protection Act is in force.*

The Act has been brought into operation in all the districts, fifty-nine in number.

2. *Receipts and Expenditure under the Act.*

The amount of assessment paid by stock-owners during the year 1884 was £49,212 13s. 1d., and the amount expended, £67,485 10s. 4d. The amount of assessment raised by stock-owners in 1885 was £61,754 15s. 4d., and the amount expended was £67,432 1s. 8d., the difference being accounted for by the subsidy granted by the Government to the Boards which raised full rates. Three districts are reported to be in debt to the amount of £414 5s. 4d.

In forty-one districts full rates were levied, in two districts half rates, and in eleven districts various rates, while in four districts no rates whatever were levied.

During the year the bonuses paid by the Boards for scalps ranged as follows:—For kangaroos, from 3d. to 1s. 6d.; wallaby, from 1d. to 1s.; wallaroo, 6d.; paddymellon, from 3d. to 1s.; wombats, from 2s. 6d. to 5s.; hares, from 6d. to 2s. 6d.; eagle hawks, 10s.; native dogs, from 10s. to 60s.; pups, 2s. 6d. to 10s.; and wild pigs, 2s.

**Noxious
Animals.****3. Estimated Number of Noxious Animals.**

The aggregate of the returns by Inspectors of the estimated numbers of noxious animals in their districts, shows that there are supposed to be 2,500,000 kangaroos, 2,300,000 wallabies, and 20,000 native dogs in the Colony.

4. Increase and Decrease.

The decrease of noxious animals during the past year has in twenty districts been reported as considerable; in thirty-five districts it is slight to fair; in four districts they are reported as increasing.

5. Number destroyed.

The number of kangaroos destroyed during the past year was 855,676; of wallabies, 506,372; of wild pigs, 922; of hares, 5,878; of native dogs, 8,474; and of eagle hawks, 55.

6. Steps taken for their Destruction.

In the majority of the districts, hunting with dogs, drives, shooting, and trapping, have been adopted with satisfactory results. In several of the districts poison has been used with fair to best results, and only from two districts has it been reported as unsuccessful.

7. Amendments suggested in the Act.

It is suggested that the Government should administer the Act, that uniform rates be levied, that all assessments be paid to a general fund at the Treasury, that the rates of bonuses be the same throughout the Colony, that all owners make returns of their stock on a particular day, and that all owners should contribute irrespective of the number of stock.

8. Losses from Tame and Native Dogs.

The losses in stock for the past year from the ravages of native dogs are estimated at 63,117 sheep, valued at £25,068, and from tame dogs, 69,745 sheep, valued at £29,658, making the loss from tame and native dogs together, £54,726.

Special Inspections.

The Forbes Board, at the suggestion of its Chairman, had a special inspection made during the year of the runs in the district as regards the prevalence of noxious animals, and where required has called the attention of the owners to the necessity for more effective work. This course might be followed with advantage by other Boards.

(4.) In South Australia.

Mr. BAGOT said there was no doubt that an enormous amount of money had been spent in the destruction of marsupials and rabbits. In South Australia the cost was defrayed by an assessment levied on the landholders and stock-holders in each particular district. The management was in the hands of the ratepayers in those districts. The rates varied considerably, but the maximum rates had been levied by most of the boards and cheerfully paid. The result was that marsupials were becoming extremely scarce. He had seen the large blue skins sold as high as 80s. to 84s. per dozen, as they were very valuable for tanning purposes. Although the system of paying scalp-money had ceased, men were still employed on their own account killing kangaroos for their skins, and making good wages. With regard to rabbits, the Government had cut away the scalp-money system, and the work of extermination was now performed by the land and stock-holders, who were compelled to destroy the vermin. If the inspector went on to any land and found that rabbits existed there he served a notice on the holder to commence the destruction of rabbits within 14 days. If by the end of that period, or on his next visit, he was not satisfied that the landholder was doing his best he placed a Government party on the land. An ordinary party consisted of five men, with dogs, bi-sulphide of carbon, &c., and the cost of this party was charged to the landholder. In the event of non-payment, the cost could be recovered by summary proceeding. The Government were at present considering a Local Government Bill, and the whole question of the extermination of vermin was somewhat undecided in the meantime. It was believed that the present system of dealing with vermin did not work satisfactorily. It would not, however, be amended until the question of local government was settled, as it was anticipated in that scheme to throw all the burdens of local government, including that of rabbit destruction, on to the shires. The central government would then have nothing to do with it. In the meantime, however, they had no reason to be afraid of the marsupial.

Mr. HIGGINS thought that as the skins were so valuable the stock-owners should cease paying an assessment. The persons who were engaged in the destruction of the animals were paid well, not only by the sale of the skins, but by the enforced payments on the part of the pastoral occupants. He begged to move,—“That as the skins of kangaroos and wallabies have become so valuable, this Conference recommends to the Governments of the Australasian Colonies in which the kangaroos and wallabies exist, that they instruct the various boards or others who have the administration of the Acts not to levy any assessment for the coming year, or for such future period as may be deemed desirable.”

Mr. WOOD seconded the motion.

The motion was agreed to.

It being half-past four o'clock, the Conference then adjourned until 10.30 a.m. on the following day.

FRIDAY, 1 OCTOBER.**FIFTH MEETING.**

Present:—Mr. ALEX. BRUCE, Chairman, and the full Conference.

The CHAIRMAN: The business to-day will be a continuation of the discussion of the Intercolonial Regulations under subject No. 2 on the programme—Introduction of Australasian Animals I. by Sea.

PAPERS.

Mr. COOPER laid on the table a copy of the Annual Report of the Superintending Inspector of Sheep and Rabbits in New Zealand; copies of the proceedings of the joint committee of the two Houses on the Rabbit and Sheep Acts, which sat in 1884 and 1886; also copies of Sheep Act 1878; Act to amend Sheep Act of 1878; Rabbit Nuisance Act 1882; Brands and Branding Act 1880; Diseased Cattle

Cattle Act 1884; Act to amend Dog Registration Act of 1880; Annual Sheep Returns for the year ending May, 1885. Intercolonial
Traffic

II.—REGULATIONS *RE* INTRODUCTION OF AUSTRALASIAN ANIMALS BY SEA—*contd.*

Mr. CURR's motions, of which he had given notice on the previous day, and which were now printed, were then considered.

Mr. HIGGINS said that, referring to these motions, he was not aware until that morning that one of the chief causes which had promoted them was the fact that exception was taken by some of the Colonies to our regulations. He would put it to them whether it would not be desirable to go through our regulations before coming to any formal decision on Mr. Curr's motions. By coming to a formal decision on these motions, they might bind themselves to something contrary to the spirit of the regulations, which he was sure no representative present wished to do. Unfortunately, New Zealand was in an awkward position in this matter.

Mr. CURR: If you go through the New South Wales regulations you will have to go through those of all the Colonies. Our desire is to put the least possible inconvenience in the way of the stock-owners.

The CHAIRMAN: There are several matters which will have to be discussed which are not touched upon in these resolutions.

Mr. CURR: They take a general view of the whole business.

Mr. HIGGINS said that the New South Wales regulations were more in detail. They were thoroughly in detail. If, however, they could dovetail the two things—the regulations and the motions—no one would be more pleased than himself. He would like, if it were possible, to see one code adopted for the whole of the Colonies, but that was not practicable just now. He would give an instance of how Mr. Curr's motion and the New South Wales regulations would clash. Mr. Curr, according to his fourth resolution, stipulated that the dressing should be composed of sulphur and lime alone. In New South Wales they used tobacco and sulphur from which they got good results, whereas according to this resolution they would be compelled to adopt a dressing which they were not in the habit of using. He was not saying anything against the efficacy of the lime and sulphur dip, but they were at issue as whether it should be compulsory to use only one dip.

Mr. VALETINE: We can easily meet that difficulty as we are not compelled to use any particular dipping.

Mr. HIGGINS: I am only using this as an illustration. If we pass Mr. Curr's resolutions we will be stultifying ourselves.

Mr. MEREDITH said that if the gentleman who had just spoken would move that the New South Wales regulations be considered as a basis for discussion he would second the motion. He thought that Mr. Curr's resolutions should have every consideration. If they contained any improvement on the New South Wales regulations the improvement should certainly be adopted. If the resolutions were not applicable to the Colony the majority of the Conference would decide accordingly. He repeated that Mr. Curr's resolutions should have full consideration, and if they adopted the New South Wales regulations as a basis, they should at the same time give Mr. Curr's resolutions every consideration they were entitled to.

Mr. CURR: If you come to the conclusion that you cannot accept my resolutions strike them out and let us begin to make detailed regulations. These regulations are only proposed as a general policy.

The CHAIRMAN: The greatest complaint is with respect to a matter which is not touched upon by Mr. Curr's motions, namely, the certificate to be granted by the Chief Inspector of Stock in the neighbouring Colonies. We are pretty well agreed in general, but there are small things which cause friction.

Mr. CURR: I shall go on with these resolutions, first, because they tend to settle our general policy and hardly go into detail, and secondly, because they originate discussion.

The CHAIRMAN: There are some other resolutions on the paper preceding Mr. Curr's.

Mr. CURR: That is very unfair.

Mr. BAGOT submitted, in connection with the Chairman's ruling, that Mr. Curr's were motions of which notice had been given. They were distinct motions, and printed to be considered first thing that morning. He thought that Mr. Curr would be hardly used if any precedence was given to a motion of which notice had not been given.

The CHAIRMAN: This matter of assimilating the regulations was first proposed here, and you will find a statement before you showing the regulations in the different Colonies. A beginning was made by complaints being made by the other Colonies with respect to our regulations. These are the regulations which contain the ground of complaint, and I thought that the only way was to start at the beginning. At my instance Mr. Higgins brought the matter up to-day. But so far as I am concerned, I will not press my view for one moment.

Mr. COOPER: We should not discuss the regulations of any Colony, unless the Minister officially transmits them to us to show where they are faulty. If we begin with the New South Wales regulations, we will have to go all round the Colonies.

Mr. CURR then moved the adoption of the first resolution standing in his name. Mr. GORDON seconded the motion.

The motion was agreed to.

Mr. CURR moved the adoption of the second resolution. He said he did not know that he was called upon to say much about this resolution. There was a certain risk from sheep on board a vessel, unless they were dipped after landing. What he meant by quarantining, was, that the sheep should be taken from a vessel in trucks, or vehicles, and dipped, before they had any communication with any other animals. In Victoria, the owner could have his sheep dipped for the last time within forty-eight hours after landing, and then set at liberty.

Mr. COOPER: Sheep intended for butchers use should not be allowed to go at large in the Colonies after being landed, unless they are dipped.

Mr. LANCE: It would be most vexatious to insist upon fat sheep being dipped.

The CHAIRMAN: We might confine ourselves to stud sheep for the present.

Mr. LANCE: Do you mean to apply this regulation to all sheep.

Mr.

Intercolonial
Traffic.

MR. CURR: If you simply want to put sheep in the yard and slaughter them, I have no objection to such a plan being allowed.

THE CHAIRMAN: I suggest that, in the first place, we consider the regulations as only applying to stud sheep, and afterwards as applying to fat sheep.

MR. VALENTINE: A proviso might be drawn up, making an exception in the case of sheep intended for slaughter.

MR. COOPER moved that the following words be added to the resolution, "Provided that this suggestion shall apply to fat sheep imported solely for purposes of slaughter, on the condition that such sheep are slaughtered within five days of their arrival in the Colony. Mr. BAGOT seconded the motion for the addition, which was accepted by Mr. CURR, and incorporated in his resolution.

MR. TABART: Would it not be better to confine ourselves first to stud sheep, and then deal with fat sheep. We would require special regulations, as we are large importers.

MR. HIGGINS: I intend to move that the word "breeding" be inserted in Mr. CURR's resolution, at the commencement, in place of the word "all," that the dipping may be either with sulphur and lime or tobacco and sulphur, that the quarantine be of greater length, and that there be only one dipping.

MR. LANCE: "Twice" should be struck out and "once" substituted, and all the words after dressing should be struck out. The only possibility of a vessel becoming infected between clean ports, was that mentioned by Mr. CURR, where a sheep might be sent off to a vessel as a present to the captain from a friend, and proving to be infected. Some sheep were taken away from a harbour in New Zealand, and a vessel was infected in that way. The vessel was the City of Brisbane which was trading here from Fiji and Brisbane. It turned out, that while lying in dock, a store sheep from New Zealand was put into the vessel. The disease was detected, and the sheep destroyed at Brisbane.

THE CHAIRMAN: It will expedite business to deal with stud sheep first and fat sheep afterwards.

MR. HIGGINS moved that the word "breeding" be substituted for "all" at the commencement of the resolution.

MR. GORDON seconded the motion, which was agreed to.

MR. CURR said that a decided success had been achieved in Australia with the lime and sulphur dressing. Mr. TABART would say the same.

MR. COOPER: And with us too.

MR. CURR said that the adoption of the lime and sulphur dressing was especially valuable as there was no difficulty in using it, and it did not do more harm than other dressings.

MR. MEREDITH: Not so much.

MR. CURR said there was once an officer sent down to see the Tasmanian sheep which were going across to New South Wales by land from Victoria. He offered no objection to what that officer proposed, and said to him "take the matter into your hands; there is the dip; I shall be here in the morning with the local Inspector to see how things are going." He returned in the morning, took some of the tobacco water, looked at it, and said, "if you will put a little milk and sugar in that I will drink a pint of it." The officer said he had been up since 4 o'clock in the morning, and had been boiling it ever since. He said to the officer, "of course, and now all the essential oil has been evaporated from the mixture and it is useless." He added that the use of that dressing could not count as a dressing. That could not occur with lime and sulphur dressing. All that was required was to weigh the ingredients, and boil them for a certain time. That would turn out to be a cure for anything in the shape of scab in twenty minutes. If the sheep were kept in it the prescribed time, and at the proper temperature one dressing would be a cure. He had used only one dressing, but the Minister, seeing that one had failed in New South Wales, thought that it was not right to expose the stock of this continent to such a danger. He once knew a careful sheep-owner who wished to get rid of scab in his sheep. He went to see him, and asked to see the dip, which he was shown. He found a magnificent dip, worthy of being sent to the exhibition, heated with steam, with circular yards, and everything in first-class order. It was a dip in which 10,000 sheep could be dipped daily. The fences were perfect, and the logs away from the fences. He was somewhat puzzled to account for the presence of the disease, and how it was that the sheep could not be cleaned. The stock-owner then showed him the tobacco which he used, and he said to the stock-owner "That is not tobacco; it was once, but it has been badly cured, and has perished altogether. It would be better to use gum leaves, for they have been effectual." At that time the lime and sulphur treatment was not known. His friend asked him to order him some good tobacco, and he did so, and the sheep were soon cleaned. Of course, the people who held stocks of tobacco knew all about its quality, and they would not say that any they had for sale had perished. Therefore he would say why not have a dressing which had been proved to be perfectly effectual, and with regard to the ingredients of which there would be no temptation to effect any cheapening. The recipe for the lime and sulphur dressing was published in one of the medical journals of Belgium, which Dr. Rowe subscribed to, and he suggested that it might be used for sheep itch. The result of his suggestion they were all acquainted with. Those were his reasons for suggesting, as they desired to assimilate the regulations, that the whole of the Colonies should use this one dip.

MR. MEREDITH endorsed what Mr. CURR had said. It was proposed to substitute lime and sulphur for tobacco and sulphur. Sulphur could not be dissolved without lime. Lime was the solvent and sulphur the curer. The application of tobacco and sulphur was not to be relied on. If they wished to make the sulphur a curative it must be associated with lime and properly dissolved, and then it was an effectual cure, but the sulphur was not a certain cure when associated with tobacco. He had effected cures with tobacco alone with one hand dressing, and he had failed afterwards with tobacco in three cases. In one of these cases the tobacco was strong, but in the others it was spurious stuff and of no use. The use of sulphur with tobacco, without the sulphur being dissolved in lime, was not to be relied on. If sheep were dipped in sulphur and lime he would guarantee one dipping to be effectual; he strongly objected to stud sheep being subjected to two dippings. It was not only suggested that there should be two dippings, but that they should take place in not less than 48 hours. Imagine the effect of two dippings in 48 hours on stud sheep, in heavy wool, having undergone a voyage and possibly been knocked about by bad weather. Quarantine in all cases was absolutely necessary, and for that reason alone it should be optional with any person importing valuable stock to say whether he would allow them to be dipped on arrival, or, if he apprehended serious consequences to defer it until such time as he thought fit. When the sheep had been dipped they should be no longer subjected to any quarantine.

Mr.

Mr. HIGGINS: I go with you in that.

Mr. MEREDITH said it was absolutely necessary to have quarantine. There were instances of stud sheep being brought into the Colonies for sale. It would be most destructive, as far as prices were concerned, to have these sheep dipped before they were offered for sale. Hence they required a quarantine ground, where these sheep might be kept until they had been sold; but after the dipping quarantine should cease.

Mr. CURR: I suggest that we deal with the resolution as far as tobacco and sulphur is concerned.

Mr. HIGGINS: We had an outbreak of scab, which was cured with tobacco and sulphur, long before the Victorian sheep were cured. I say take your choice. We are satisfied with your dipping with lime and sulphur. We do not doubt its efficacy.

Mr. CURR: We cured four and three quarter millions of sheep with tobacco and sulphur, but after many failures; with lime and sulphur there were none, and the cost was enormously less.

Mr. HIGGINS said they had found tobacco and sulphur so efficacious that they intended to adhere to it. He agreed with what Mr. Meredith had said as to the treatment of sheep. It had grieved him to see those poor creatures treated as the law compelled them to be treated. But for the surrounding circumstances he would be willing to allow them to be brought in without dipping, or with only a slight quarantine. The object in making the quarantine twelve days was this:—The best authorities on scab had laid it down, that from the time of first contact or attack by the insect until it again appeared on the surface of the skin was about sixteen days. That being so, they calculated that sheep would take four days to arrive here from Tasmania, and the twelve days quarantine would make sixteen days, the time allowed for the appearance of the insect. The period of quarantine had been shortened from twenty-one days. With regard to the use of lime in dressings, he desired to point out that if it were exposed to a storm it would be destroyed, and would not be efficacious then.

Mr. MEREDITH: Do you know that, in order to dissolve the sulphur, you must have unslaked lime?

Mr. HIGGINS: There are some inspectors who are mere machines, and they would simply mix the ingredients without noticing their condition.

Mr. MEREDITH: In Tasmania we have all practical men, who know how to mix the dressings, and are able to see that it is done properly before being used.

The CHAIRMAN: As far as the dippings are concerned they would require to be under proper supervision. We would see that the tobacco and the lime were in good condition. Mistakes might happen as easily with one as with another.

Mr. LANCE moved,—That 'twice' be struck out, and 'once' inserted in its place, in the resolution." Mr. VALENTINE seconded the motion, which was carried by 15 votes to 3, the Victorian representative dissenting.

Mr. HIGGINS moved,—“That the dressings be optional, either of tobacco and sulphur or lime and sulphur.” The motion was carried by fifteen votes to three, the Victorian representative dissenting.

Mr. HIGGINS moved,—“That all the words after 'dressings' be struck out.” The motion was agreed to.

Period of Quarantine.

Mr. HIGGINS moved,—“That the period of detention in quarantine be not less than ten days.” Mr. STANLEY seconded the motion.

The CHAIRMAN: If we dispense with the second dressing we should stipulate that the sheep should be under our care for a certain time; and they should be examined daily, in case there might be anything wrong. I do not think we would inflict much, if any, hardship on the Tasmanian and South Australian owners by fixing the quarantine at the time proposed, as it would take nearly the whole of that time for the buyers to examine the sheep before the sales.

Mr. CURR said that heretofore they had kept apparently clean sheep in quarantine. They were put into quarantine for ten days, and if they were not found to be scabby, they were dipped and allowed to go at large. If the sheep were not scabby they did not require dipping. He thought that, instead of keeping sheep in quarantine and dipping them, as was suggested, at the end, the dipping might as well take place on the first day.

Mr. LANCE: The stud rams which come to New Zealand from Tasmania are not dipped until they are sold. If they were dipped beforehand their value would be seriously lessened.

Mr. CURR did not object to sheep being kept until after a sale without being dipped. In the plan which he suggested there was no detention whatever, except that which was asked for by the owner himself. He had no desire to see Tasmanian sheep kept for an unnecessary time in quarantine. If sheep ran any risk at all it was utterly impossible to say as a matter of certainty that they were free from scab. It must be discovered by examining the wool, which was impossible when the sheep had been on board a vessel, and perhaps trodden on, and the wool pulled out. In such cases the disease would not be discovered unless the scab insects were very thick and very noticeable.

Mr. HIGGINS said that the whole object of quarantine was to prevent infection being brought into the flocks of this Colony. He had explained why they had twelve days' quarantine—because the authorities had laid down that the insects did not appear on the wool until sixteen days had elapsed, and the time of the voyage from Tasmania, and the twelve days' quarantine, made up that period. During the twelve days that the sheep were here in quarantine, probably seven or eight days were consumed by buyers looking at the sheep. If we insisted upon the sheep being dipped as soon as they arrived here, what benefit would that be to Tasmania?

Mr. MEREDITH: We propose that the time when the dipping takes place should be optional with the owners. This is a matter of compromise, and it has been put forward by Mr. Higgins and Mr. Curr in that spirit. The position we are in is this:—There are six Colonies represented here, and of these three are in favour of no quarantine whatever. There are two Colonies in favour of twelve days, and I do not know what is the feeling of the Queensland representatives with regard to the period during which sheep should be maintained.

Mr. GORDON: We will accept ten days as the period.

Mr. MEREDITH: There are two Colonies in favour of twelve days, one of ten days, and three of none at all. Suppose we halve it and take six days.

Mr.

Intercolonial
Traffic.

Mr. CURR: Do you want your sheep detained six days for that is what you propose.

Mr. MEREDITH: I say they should not be kept six days.

Mr. CURR: I do not want to keep them a minute.

Mr. TABART moved as an amendment on Mr. Higgins' motion,—“That there be no quarantine beyond the time required for inspection and dipping.”

Mr. VALENTINE seconded the amendment.

The amendment was carried by twelve votes to six, the New South Wales and Queensland representatives voting against it.

Mr. COOPER moved as an addition to Mr. Curr's second resolution,—“Provided that this suggestion shall not apply to fat sheep imported solely for purposes of slaughter, on the condition that such sheep are slaughtered within five days of their arrival in this Colony.”

Mr. LANCE seconded the amendment, which was however withdrawn temporarily, until the discussion with respect to Australasian Breeding Sheep was concluded.

What is to be deemed a clean Colony.

Regulation No. 2 appearing in the *Government Gazette* of New South Wales, 1 July, 1886, was considered. It is as follows:—

“No Colony shall be deemed to be a clean Colony in which scab or catarrh or any other infectious or contagious disease exists or is suspected to exist, nor any Colony in which scab shall have existed within the next preceding two years; and no sheep shall be imported except from a clean Australian Colony.”

Mr. HIGGINS moved,—“That no Colony shall be deemed to be a clean Colony in which scab exists or has existed within the next preceding twelve months.” He said they had already decided that sheep should only be admitted from clean Colonies. If the sheep of a Colony were affected with catarrh, the Colony could not be said to be clean. Therefore the importation of sheep from New South Wales to South Australia would have to cease. Directly such a disease as catarrh appeared in a Colony it was no longer clean. Mr. STANLEY seconded the motion.

Mr. TABART: There is a telegram in this morning's paper stating that sheep are dying of anthrax at Dubbo.

Mr. MEREDITH thought that the period stated in the motion should be fixed at two years. In New Zealand there were many mountainous places to which sheep had excess. If it were fixed at a shorter period it might be the means of doing an immense amount of injury. For two or three years, owing to the applications of interested persons, a portion of New Zealand, which was affected with scab, was not put under the directions or control of the inspectors. He presumed that these difficulties still existed; and, with all the efforts made, it might still be possible for a few sheep to remain out for six or eight months after the country had been pronounced to be clean. He moved, as an amendment,—“That twelve months be struck out and two years inserted.”

Mr. TABART seconded the amendment. He said that it was not likely that sheep would be imported into New South Wales from New Zealand; but Tasmania would be receivers of New Zealand sheep; and if infected sheep were introduced, the interests of the Tasmanian stock-owners would be destroyed.

Mr. LANCE: At the earliest, there will be an interval of eighteen months from the end of the last license.

The amendment was put, and negatived by 15 votes to 3. The following was the voting:—For,—Tasmania, 3. Against,—Queensland, 3; South Australia, 3; New Zealand, 3; New South Wales, 3; and Victoria, 3. The motion was then put and carried.

What is to be deemed a clean vessel.

Regulation No. 3 of the same Gazette. It is as follows:—

“No stud sheep shall be imported, except by vessels that have not traded to any but a clean Australian Colony within the next preceding twelve months, nor by any vessel which shall have within the period hereinbefore mentioned have had any sheep on board from any Colony other than a clean Australian Colony.”

Mr. HIGGINS moved,—“That no breeding sheep shall be imported, except by vessels that have not traded to any but a clean Australasian Colony within the next preceding six months, nor by any vessel which shall within the period hereinbefore mentioned have had any sheep on board from any Colony other than a clean Australasian Colony.” Mr. STANLEY seconded the resolution.

Mr. CURR moved as an amendment,—“That the period be reduced to one month.” Mr. LANCE seconded the amendment.

Mr. HIGGINS said that a scab insect might live on board any vessel notwithstanding the fact of being washed and disinfected. In that way sheep coming to a clean colony might be infected and bring the infection with it. Therefore they should be very guarded and very careful not to make any mistake.

Mr. MEREDITH said he had found in a very able prize essay, written by Mr. Curr in 1870, the author stated that under the most favourable circumstances the insect would live for forty days, that is on moist wool and with warm weather. Now Mr. Curr said that it would die almost immediately after the animal died on which it had been living.

Mr. BAGOT: What I understood Mr. Curr to say was that it would not live on the dry skin beyond a certain short period.

Mr. CURR said that certain experiments were tried in Victoria with the scab acari. He wrote an essay on the subject, and some old Victorian stock-owners in Mexico and Monte Video asked him to republish it for the benefit of the Spanish people, so that experienced people thought that it was a fairly good essay. It had been ascertained, as set out in that essay, that if the insect were placed in a corked bottle amongst greasy wool it would live for several days. If, however, it were placed on cold skins his opinion was that it would only live for a few hours. It was the opinion of many people that one night's frost would completely cleanse ground from scab. With regard to the possibility of scab being caught

in a vessel after the lapse of a month, it was not worth troubling stock-owners about, when they remembered that the sheep would be dipped as soon as they landed. What vessel would wait for six months for a consignment of sheep. Intercolonial traffic.

The CHAIRMAN: Sheep are put on board ships and steamers which go all over the world, and the pens are not so clean as to be any guarantee against infection.

Mr. TABART: How do the people of New Zealand remove their sheep from one coast port to another? Are they removed from one port to another in an infected district?

Mr. LANCE: Never. The only ships I know trading on the coast go from Gisborne to Auckland. Auckland is supplied from both coasts. The sheep are put on board from a punt, and the Inspector sees them and lands them.

The amendment was then put, and the voting on it being 9 to 9, the Chairman gave his casting vote against it.

The following was the voting:—Against,—New South Wales, 3; Queensland, 3; Tasmania, 3. For,—Victoria, 3; South Australia, 3; New Zealand, 3.

Vessel to carry sheep must be cleansed and disinfected.

Mr. HIGGINS moved,—“Every vessel, on which it is intended to carry any such stud sheep, be thoroughly cleansed and disinfected before the sheep have been dipped.” Mr. STANLEY seconded the motion.

The motion was withdrawn.

Clean certificate.

Mr. VALENTINE moved,—“That all such breeding sheep shall be accompanied by a certificate of an Inspector of Sheep or a declaration of health by the owner, certified by an Inspector of the Colony, that such sheep are clean and scab has not existed for the preceding twelve months in the Colony from which they come.”

The motion was agreed to.

Temperature of Dip.

Mr. HIGGINS moved,—“That the temperature shall not be less than 100 nor more than 110 degrees.” Mr. STANLEY seconded the motion.

Mr. GORDON thought the temperature should be 110 degrees. He had known insects survive when the temperature was 80 degrees. He had frequently dipped sheep in 120 degrees Fah.

Mr. CURR moved, as an amendment,—“That the temperature be not less than 105 nor more than 110 degrees.” Mr. LANCE seconded the amendment.

The amendment was negatived and the motion was agreed to.

Bath and Duration.

Mr. HIGGINS moved,—“That the sheep shall swim and be completely immersed while in the bath, and the bath shall last from one to two minutes according to its temperature, and as the case may require.” Mr. GORDON seconded the motion.

The motion was agreed to.

Stud sheep from inland or overland from other colonies to be treated as “imported” if near imported sheep.

Mr. HIGGINS moved,—“That stud and show sheep brought from inland, or introduced overland from any adjoining clean colony, which shall be near or in contact with any imported sheep shall, prior to their leaving the coast district, be dipped the same as if they were Australian imported sheep.” Mr. STANLEY seconded the motion.

Mr. CURR: Sheep are dipped as soon as they come into the colony. There is no more danger of infection from a sheep on the coast than from one in the interior.

The CHAIRMAN: A person examines sheep which come by sea and then stands over the sheep from inland. The result might be to spread infection to clean sheep. If it is necessary to dip the sea-borne sheep so it is to dip those from inland.

Mr. LANCE moved as an amendment,—“That the resolution be struck out.” Mr. CURR seconded the amendment.

Mr. MEREDITH: All this dipping is perfectly unnecessary. If it is necessary to dip sheep because they are infected, how does it happen that people were allowed to examine infected sheep and then go away to examine others.

The amendment was then put and carried by 12 votes to 6.

The following was the voting on the amendment:—For—Victoria, 3; Queensland, 3; South Australia, 3; New Zealand, 3. Against—New South Wales, 3; Tasmania, 3.

No fodder to be landed and no cages without disinfection.

Mr. HIGGINS moved,—“That no straw, litter, or excreta with or about imported sheep shall be landed, and all fittings, cases, or cages brought with such sheep and landed shall before being landed be cleansed and disinfected as the chief inspector shall direct, or be re-shipped.” Mr. STANLEY seconded the motion.

Mr. TABART said with reference to the cages and crates that it was not possible that they could be infected when the sheep enclosed in them were clean. No objection was taken to the attendants landing, and yet the crates for the sheep were tabooed. This caused a loss to the sheepowners and inconvenienced them to a great extent; vessels were detained at the wharf for two and a half days, and the stud sheep were dragged out of the cages one by one to be inspected, and the result was that their appearance was destroyed.

Mr. TABART suggested that the words “before being landed” in the latter portion of the motion be taken out.

The suggestion was accepted.

Fat imported
sheep, &c.

Mr. MEREDITH said that large numbers of breeders had drawn his attention particularly to this point, that they had to send fodder on before their stud sheep in anticipation of their coming, as they were not allowed to land any fodder they had on board.

The motion was then put and agreed to.

NEXT SESSION.

The question was considered as to whether the Conference should sit on Monday (October 4th), Eight Hours Anniversary Day.

Mr. CURR moved,—“That the Conference sit on Monday.” Mr. BAGOT seconded the motion.

The motion was agreed to.

FAT SHEEP EXEMPT FROM DIPPING.

Mr. COOPER moved,—“That it be not necessary to dip fat sheep imported from any clean Australasian colony to another Australasian colony solely for the purpose of slaughter, provided that such sheep are slaughtered within five days of arrival.”

Mr. HIGGINS suggested the following amendment:—“That the words ‘are slaughtered within five days of arrival’ be struck out, and the words ‘be slaughtered in accordance with the regulations of any such Colony for the slaughtering of such sheep.’” The alteration was accepted.

The motion, as amended, reads,—“That it be not necessary to dip fat sheep imported from any clean Australasian Colony to another Australasian Colony solely for the purpose of slaughter; provided that such sheep be slaughtered in accordance with the regulations of any such Colony for the slaughtering of such sheep.”

The motion was put and carried.

III.—REGULATIONS *RE* AUSTRALASIAN STOCK ADMITTED OVERLAND.

Mr. CURR moved,—“That stock (unless it come from Western Australia) which is allowed by law to travel in the Australasian Colony in which it has been bred, or into which it has been introduced in accordance with the law there in force, shall be allowed to enter any neighbouring Colony by land at any lawful place of entrance without further obstacle, unless it shall be found on examination by an Inspector of the Colony into which it is proposed to introduce such stock to be suffering from some disease which is treated as infectious by the law of such Colony, or unless such Inspector has reason for suspecting the presence of contagious disease in such stock; and the fact that any stock is held to be free from disease in any Colony and so allowed to go at large, shall be *prima facie* evidence of its freedom from contagious disease.

The CHAIRMAN read Regulation 1,—Sheep introduced overland, under the “Diseases in Sheep Act of 1886” and “Diseases in Sheep Acts Amendment Act of 1878 and 1882,”—“The owner of sheep other than imported sheep which it is proposed to bring overland into this colony shall give the Inspector for the crossing-place at which they are intended to be introduced not less than forty-eight nor more than ninety-six hours’ notice in writing, stating the day and hour when it is intended to cross such sheep, to the effect of Form A hereto, and shall produce to such Inspector a certificate from the Inspector for the district in which the sheep were depasturing at the time they commenced to travel to the crossing-place, that such sheep are not infected with any infectious or contagious disease, and that they have not within the next preceding six months been in direct or indirect contact with sheep so infected.” He also read the following regulation under the “Imported Stock Act of 1871” and the “Imported Stock Act Amendment Act of 1884,” to stand in lieu of Regulation 2 of 1st July, 1886, cancelled.

How Imported Australian Sheep are to be admitted overland from other Colonies.

Sheep imported from any clean Australian Colony into any other clean colony, and intended to be introduced overland into this Colony, may be admitted if their owner produce the certificates prescribed by Regulations 5, 6, and 10, of 1st July last (1886), under the above-named Acts for such sheep, and if they are found on examination by the Inspector for this colony at the border to be not infected; or such sheep may be admitted at the border on inspection as aforesaid if their owner produce to such Inspector a certificate under the hand of the Chief Inspector for the colony from which they are intended to be introduced that when such sheep were introduced into that colony they were accompanied by a certificate as prescribed by number 5 of the above-mentioned Regulations, and that such sheep have been twice dipped with proper preparations of tobacco and sulphur, or of sulphur and lime, in a bath given at the temperature and of the duration and in the manner prescribed by number 8 of the above-mentioned Regulations. But all such sheep, unless they shall have been imported, inspected, quarantined, and dressed as prescribed in this and the above-mentioned Regulations, shall, on crossing the border, be placed in quarantine, and kept and dipped in the same manner in every respect as prescribed with regard to Australian imported sheep landed at Sydney.

The CHAIRMAN said that the certificate was unnecessary except as regards sheep.

Mr. CURR: I object to certificates; they are unnecessary and perfectly useless.

Mr. CURR’s motion was then put and carried.

Mr. CURR moved,—“That it is desirable that all drafts of laws or regulations dealing with the diseases of animals, &c., should be as far as practicable submitted by the Government which institutes them to the other Governments of the Australasian colonies before they become law.” Mr. LANCE seconded the motion, which was carried unanimously.

It being half-past 4 o’clock the Conference then adjourned until half-past 10 o’clock on Monday morning, 4th October.

MONDAY,

MONDAY, 4 OCTOBER.

SIXTH MEETING.

Present :—Mr. Alexander Bruce, Chairman, and the full Conference.

New Member.

The CHAIRMAN stated that another breeder, Mr. M'Kenzie, M.H.R., had arrived from New Zealand, with a letter from the Colonial Secretary there, asking our Premier to allow Mr. M'Kenzie to take part in the proceedings, in addition to the delegates already present from that colony. He read the letter, which is as follows :—

New Zealand, Colonial Secretary's Office,
Wellington, 16 September, 1886.

Sir,

In continuation of the correspondence which has taken place upon the subject of the approaching Conference on matters relating to stock, I have the honor to inform you that as there are in this colony two classes of persons interested in stock—the large runholders and the agricultural farmers—the Government have come to the conclusion that both should be represented at the Conference, and as Messrs. Peter and Lance represent the former class, Mr. John M'Kenzie, a Member of the House of Representatives, has been asked, and has consented, to attend the Conference as representing the agricultural interest. May I venture to ask that Mr. M'Kenzie may be allowed to take part in the Conference along with the gentlemen originally selected to represent New Zealand.

I have, &c.,
P. A. BUCKLEY.

The Honorable the Premier, Sydney.

Mr. PETER: I represent all classes.

Mr. LANCE: We might let Mr. M'Kenzie take part in the proceedings without voting. If you consent to that it will satisfy us, and it will really make very little difference. I beg to move,—“That Mr. M'Kenzie be allowed to take part in the discussions, but not to vote.”

Mr. PETER: I think that will be satisfactory.

Mr. HIGGINS thought that as Mr. M'Kenzie had come so far, and the New Zealand Government was anxious to have an extra representative on the Conference, they might allow Mr. M'Kenzie to take his seat. Mr. Peter had properly corrected one remark appearing in the letter which had just been read, and had said that he was present as a representative of New Zealand, not of any particular class. They might all say the same—that they represented the whole of the Colonies; but as Mr. M'Kenzie had come so far it would be only a proper and courteous act to admit him. The Conference had decided that each Colony should have not more than three votes. If that resolution was rescinded the Conference could agree to give each Colony four votes; but as the New Zealand representatives seemed satisfied that Mr. M'Kenzie should be present and not take part in the discussion, he did not think it would be necessary to rescind the resolution. It would of course be only courteous to New Zealand to allow Mr. M'Kenzie to take part in the discussion, but if that gentleman did take part in the discussion he ought to be allowed to vote.

Mr. WOOD: My colleague and myself agree that there can be no harm in Mr. M'Kenzie taking part in the discussion, but we do not think that he should vote. We decidedly object to his doing so.

Mr. MEREDITH: I agree with the remarks which have fallen from Mr. Woods. I think it would be very awkward if any other person were entitled to vote at the Conference. It would clash with the votes already given.

Mr. BAGOT: It would be very irregular to admit any fresh votes.

Mr. HIGGINS seconded Mr. Lance's motion.

The motion was agreed to.

Mr. LANCE then introduced Mr. M'Kenzie.

The CHAIRMAN informed him of the result arrived at by the Conference, namely, that he be allowed to take part in the discussions, but not to vote.

Mr. M'KENZIE thanked the Conference for the consideration shown him. He was sure that the arrangement come to by the Conference would be satisfactory.

The CHAIRMAN said he wished to mention that the Minister thought they were doing altogether wrong to work on a holiday, and that they should take advantage of the day to enjoy themselves. Unless they were very anxious to proceed he would move that the Conference adjourn until the following day. They might then to-day visit the sheep quarantine at Randwick.

Mr. BAGOT said that the South Australian Parliament was now in session. He represented an exacting constituency, interested in the Consolidating Land Bill—consolidating thirteen Land Acts. The Estimates were under discussion, and many of the items affected his constituents. On that account he was anxious to get back as soon as possible, and he deplored anything that would delay their deliberations for an hour. It had been considered desirable that the Colony of South Australia should be represented by a Member of Parliament notwithstanding that Parliament was in session. The object of the Commissioner of Crown Lands in making that arrangement, and urging him to come here, in spite of his protest that his constituents might be neglected, was that when any subsequent legislation the outcome of this Conference came before the House there would be some one besides himself who would be familiar with the details, and in all probability know a great deal more about them than the Commissioner. He would point out that on Friday they carried a resolution unanimously, with no dissentient, in favour of deliberating that day (Monday), and, unless there was some special reason to alter their decision, he for one must say that he preferred to go on with their work.

Mr. LANCE: I am strongly of opinion that we ought to go on with the work. We are not artisans, and do not represent artisans, so the best thing we can do is to get on with the work.

Mr. BAGOT moved,—“That the sittings be continued.”

The motion was agreed to.

ADMISSION OF FOREIGN CATTLE.

Mr. MEREDITH's paper on the admission of foreign cattle was laid on the table printed. It will be found under the same head at page 92.

III.—

III.—REGULATIONS *RE* AUSTRALASIAN STOCK OVERLAND—*continued.*

Intercolonial
trade.
Inspection
fees.

Mr. HIGGINS moved the following regulation, No. 12, relating to the conduct of the intercolonial stock trade, appearing on page 7 of Report of Stock Conference of 1874:—"That where an outbreak of disease occurs in any Colony the neighbouring Colonies may, pending the extent and risk of the outbreak being definitely ascertained, at once issue a prohibition against the introduction of stock from such Colony, and the duration of such prohibition shall depend upon the amount of risk arising from such outbreak." He thought that some such resolution should be passed if they intended to have an intercolonial stock trade.

Mr. BAGOT: He thought they had this power. It is contained in the Importation of Diseased Cattle Act of 1861, "To enable the Governor to prevent the importation of cattle into South Australia under certain circumstances and for other purposes." The preamble says:—"Whereas certain fatal and contagious diseases sometimes prevail amongst cattle, and it is desirable to prevent the spread of such diseases amongst the cattle in the Province of South Australia, and for that purpose to prevent the importation of cattle into the said province from any place where any such contagious or fatal diseases prevail, and to make the provisions hereinafter contained."

Mr. HIGGINS: We have that power now.

The CHAIRMAN: If Mr. Curr's motion relating to the introduction of stock from one colony to another were taken by itself it would be going too far. A colony which is clean should have the power when an outbreak takes place in another colony to stop the introduction of stock until the extent of the outbreak had been ascertained.

The CHAIRMAN here laid on the table, at the request of Mr. Curr, a copy of the Report of the Secretary of Agriculture, Victoria, 1884, containing a report by Mr. Curr, on the dangers attending the importation of foreign stock.

It was resolved that it be printed. It will be found at page 87.

Mr. HIGGINS' motion was seconded by Mr. CURR, and agreed to.

INSPECTION FEES ON STOCK.

Mr. HIGGINS moved,—“That it is undesirable that any inspection fee be charged by one colony on the stock introduced from another colony, inasmuch as such a charge would tend to prevent the initiation of uniform legislation and combined action by the different colonies for the eradication of disease.”

Mr. GORDON seconded the motion.

Mr. CURR said he was not present to discuss any such proposal, nor did his Minister anticipate that anything of the sort would be dealt with by the Conference. He did not think if it were passed that it would have the least effect as far as his colony was concerned. It was a matter for Parliament to decide, and the Conference would do no good to meddle with it.

Mr. VALENTINE said he must endorse what Mr. Curr said. In South Australia a stock fee was charged under the Customs Act, and he did not think he had been sent here to say what the Government should do in regard to fiscal matters. He would not think it right to vote on such a question. The stock fee in his colony was charged by a large majority in the last session.

Mr. COOPER: We have no fee in our colony except a small fee to cover the absolute cost of inspection. That, however, was not imposed in the shape of duty.

Mr. HIGGINS: This is not a duty fee; it is only an inspection fee.

Mr. TABART: We have an inspection fee of one halfpenny a head on sheep.

Mr. BAGOT said that by a very large majority protective duties had been imposed in South Australia during the present parliamentary session. He was sorry to say that unfortunately protective duties were the order of the day in South Australia. A fee of 2s. 6d. had been imposed on cattle, and 1d. a head on sheep imported into South Australia, not as the result of a desire to establish an inspection fee, but a protective duty. It was opposed by himself and other squatters, but they stood almost alone. He believed that any resolution on the subject, even if carried by the Conference unanimously, would not have any weight.

Mr. HIGGINS said there was a slight misunderstanding with regard to this motion. It did not in any way touch the question of a stock tax; it was simply an inspection fee charged on stock entering the Colony where such a fee was in existence, but it had nothing to do with any fiscal matter. It was a great hardship to some colonies that it should be imposed; New South Wales felt it keenly.

Mr. BAGOT: Where is it imposed?

Mr. HIGGINS: In Victoria. It has nothing to do with regard to the Customs duty, but simply a matter that came within the Stock Department and is dealt with entirely by that Department in Victoria and the other colonies where it is so charged.

Mr. CURR said that this was a vote of Parliament. In Victoria they had a fee on stock which was probably about one-tenth of what was now charged as the Customs duty; that fee on stock was collected by the inspector, and had been done away with. Sir Graham (then Mr.) Berry introduced the stock tax on stock coming into Victoria from the various colonies. There were no fees; if anyone called the tax a fee, he miscalled it. Almost every officer he had on the border was a Customs officer, and they might perhaps have called the tax a fee, but improperly so.

Mr. TABART said there was a fee of $\frac{1}{2}$ d. a head on all imported sheep entering Tasmania. The Government had, however, to provide an inspector at each of the three ports of entry, and to provide an inspector to visit each ship to see that they carried the necessary certificates and were perfectly clean. The fee was charged to cover the costs in connection with these inspections.

Mr. HIGGINS said he had been under the impression that this fee existed in every colony. He now found that it was only charged in two colonies, Tasmania and New Zealand. Supposing that it were not charged in the other four colonies, he thought it was highly desirable that they recommended Tasmania and New Zealand not to insist upon the charge of this fee. It was simply a departmental matter which could be dealt with by the Government, and therefore he thought it was a very proper thing to bring forward and ask the Conference for an expression of opinion upon.

Mr. STANLEY: Our horses going from Sydney to New Zealand require a veterinary certificate. Is that certificate charged in New Zealand as well as here?

Mr. COOPER: No. Only when the Veterinary Surgeon is called upon to visit any horses does he charge a fee.

Mr.

Mr. STANLEY: Then if an exporter to New Zealand from this colony gets a certificate here he need not get one in New Zealand.

Mr. COOPER: No.

Mr. STANLEY: And he gets it gratuitously from us and makes us do the work you would charge him for.

Mr. COOPER: The Veterinary Surgeon's fee in New Zealand is not charged unless he is called in by the Inspector, which hardly ever occurs.

Mr. MEREDITH: The question we have to consider is this: The members of the Conference representing Tasmania are in a difficulty, as they cannot take upon themselves the responsibility of touching anything affecting the finances of the colony. None of the representatives from Tasmania were Members of Parliament, and they have no authority to pledge their Government to any particular line of action which might affect the revenue of the colony. It is a matter I do not think it is competent for me to vote upon.

Mr. HIGGINS: In speaking on the question of removing this fee, what are we doing? We are dealing with the Acts of Parliament through the whole course of our conference.

Mr. MEREDITH: We are not dealing with financial questions. It has been urged at this conference and the previous one that there is more risk of introducing disease in stock by sea than in stock travelling overland. Hence it is that we disregard the certificate of New South Wales and Victoria. It is all sufficient if there is no fear of any intermediate infection.

Mr. HIGGINS: My motion is simply as to whether an inspection fee should be charged.

Mr. MEREDITH considered that it was a distinction without a difference, as the mere dipping and providing a regulation was of no use unless they had an inspector to see the whole thing carried out. With regard to the fee in Tasmania it was only charged on the imported sheep at those particular places provided for the convenience of stock-owners in the other colonies. Only for that the inspection—and consequently the fee—would not be required. It was provided simply to facilitate trade, and to see that trade was carried on in accordance with the regulations. The $\frac{1}{4}$ d. per head was levied on the sheep, subject to an inspection and dipping, towards defraying the cost. As a matter of fact it did not defray the cost. There was another aspect of the case to be considered. If, for instance, Tasmania had any scabby sheep, and South Australia were free from it, she would be very cautious about allowing our sheep to come in.

The CHAIRMAN: In New Zealand the certificates bear a stamp which must mean that an inspection fee is charged on stock going out as well as coming in.

Mr. COOPER: There is no fee in New Zealand on stock going out.

The motion was then put and negatived by 12 votes to 6.

The following was the voting: Against—Victoria, 3; South Australia, 3; Tasmania, 3; New Zealand, 3. For—New South Wales, 3; Queensland, 3.

STOCK DUTY.

Mr. MEREDITH moved—"That it is undesirable that any duty be charged on stock introduced from any Australasian colony."

Mr. LANCE seconded the motion.

Mr. BAGOT: The question of free trade and protection is too big for us to enter upon here. If it is brought forward we shall not discuss it.

Mr. HIGGINS: Where any disability exists in the proper intercourse for stock between the colonies we should suggest all we possibly can to the different colonies for the removal of these disabilities.

Mr. CURR: The letter of the Minister calling us together says we are to meet with the view of "assimilating the regulations for the prevention of disease." Therefore we are not here to review the question of fees or taxes.

Mr. VALENTINE: I shall decline to vote on the motion.

Mr. COOPER, Mr. BAGOT, and Mr. CURR expressed themselves to the same effect.

Mr. LANCE: I am not quite sure that we are doing right in suggesting to our Governments what we should do in respect to fiscal matters, but we have already done so much in this direction that I do not think we shall be doing harm if we deal with the present motion.

The motion was withdrawn in favour of the following:—

Mr. HIGGINS moved,—“That this Conference desires to express its strong opinion in view of the prospect of the assimilation of the stock regulations of the different colonies, and the great desirability for the freest interchange of stock that it is undesirable that any duty be charged upon stock going from one colony to another.” He said that the Conference had met with the object of assimilating, as far as possible, all the different regulations for the interchange of stock that existed throughout the Australasian Colonies. If their suggestions were accepted and embodied in regulations, then it was, undoubtedly, a most important question what those regulations should be. If it was intended that there should be the freest interchange of stock between the colonies, then it would be an anomaly in the highest degree that any one colony or other should labour under any disability in respect to that interchange. If it were not intended that the colonies should have that free interchange then keep it on. As regarded the fiscal question, they were not dealing with it, but were simply placing before the different Governments the result of their deliberations and the desirability of adopting them. He took it that as far as New South Wales was concerned it was a very great disability that the stockholders laboured under at present. He felt that if he did not assist in bringing this forward he would not be doing his duty as a representative of New South Wales, and he desired it to go forth that he, as one of their representatives, had endeavoured to assist Mr. Meredith in bringing forward this resolution. Even the Victorian people themselves saw the desirability of it. If the different Governments did not see where the difficulty was there was an end to the matter.

Mr. MEREDITH said he would be sorry to act against the opinion of the majority of the Conference, but it was desirable that they did not exceed their functions.

The motion was carried by 6 votes to nil. The following was the voting:—For—New South Wales, Mr. Higgins; Queensland, 3; New Zealand, Mr. Peter and Mr. Lance. The following members abstained from voting:—New Zealand, Mr. Cooper; South Australia, 3; Victoria, 3; Tasmania, 3; New South Wales, Mr. Bruce and Mr. Stanley.

DISPOSAL

DISPOSAL OF WOOL FROM SHEEP LIABLE TO INSPECTION.

Noxious
plants.

Mr. TABART asked if sheep sent from one colony to another were shorn, how would the wool be disposed of? In Tasmania, whenever sheep were shorn after being returned to the colony from another the wool was not allowed to be sent inland without being dipped.

Mr. LANCE said that in New Zealand the sheep were brought into a large store in Christchurch, and were there examined and sold. Then the sheep were shorn, and the sheep itself went to be dipped. The wool went straight off to England, and a great deal was sent to the intercolonial exhibitions.

Mr. TABART: The wool is not dipped in any way?

Mr. LANCE: No; not in any way.

Mr. CURR: The same thing happens in Victoria.

Mr. VALENTINE: Until this year I have always had the wool dipped.

Mr. CURR: Perhaps when the sheep are shorn the wool is sold by the wool-brokers not 500 yards away.

Mr. VALENTINE: Not necessarily. The wool may be sent inland.

The CHAIRMAN: The rule in New South Wales is to treat the wool as if from infected sheep, and see that it is securely packed in bags or bales. See Diseases in Sheep Act 1866, section 65.

VII.—DESTRUCTION OF NOXIOUS PLANTS AND WEEDS.

I. PLANTS AND WEEDS INJURIOUS TO PASTURES AND CROPS.

Mr. HIGGINS moved that this Conference is of opinion that the Governments of the several colonies should, where they have not already done so, take power to make the destruction of noxious plants, such as prickly-pear, Californian thistle, Bathurst burr, Noogoora burr, and other plants injurious to wool, stock, or pastures compulsory. He said that the existence of Bathurst burr in the wool caused a great loss. It was not compulsory in this Colony to destroy Bathurst burr.

Mr. BAGOT: We have an Act to deal with it.

Mr. HIGGINS said that one station might become infested from another, or the burr might be brought from a station higher up a stream. Again, with regard to reserves. We had not the power to clear them of the burr because there was no money to do the work. He should like to see the destruction of burr made compulsory, not only on the pastoralists, but on the Government. With regard to travelling stock reserves, until it was compulsory on both, the colony would never be clear of burr. He was not speaking of clover burr, as the clover was one of the best fattening herbs in the Colony. Therefore they need not legislate on that. There was another burr, the Noogoora burr, which was not very well known.

Mr. GORDON here exhibited a specimen of the burr.

Mr. HIGGINS said there was an Act here for the destruction of prickly-pear which had been recently passed into law. In some parts of the colony (in the valley of the Hunter especially) it had shown itself to a very serious extent, and would cost in some instances £10 an acre to clear. To prevent our lands being destroyed our Legislature had passed a law for the destruction of the prickly-pear.

Mr. TABART said that the Californian thistle was the most objectionable weed they had, although at present time the Colony was likely to suffer by the introduction of sheep from the mainland, and the consequent introduction of Bathurst burr. It had appeared on the north-west coast, and also on the line of road along which the sheep imported from Victoria were driven. It had also been found on the south Esk River, where the skins of imported sheep were fellmongered, the seeds having been washed down the river. The Bathurst burr is also to be found at the abattoirs which clearly indicated that it had been introduced from the other colonies. In inspecting a milk farm at Newtown the other day he found that 16 acres of the property were overrun with Bathurst burr. He had recommended the Colonial Secretary to introduce an Act to deal with noxious weeds such as Californian thistle, Cape weed, and burrs. The Californian thistle had taken possession of some of the best lands in the Clarence district and New Norfolk. There were now in Tasmania 1,800 acres of land covered with Californian thistles. It was similar to the Scotch thistle. The centre root went down to a depth of 8 or 10 feet, and laterals were thrown out. Then in ploughing, if a small particle of this thistle was moved by the plough another plant sprang up. They considered that it depreciated the value of land 75 per cent. It could, however, be got rid of, and the plan for this was constant cultivation. Thus, if anyone had an acre of Californian thistle he should upon its first appearance in the early spring start hoeing at one corner on a Monday morning; and finish at the other on Saturday night. So by preventing the leaf from appearing above ground (which is the lung of the plant) it will be soon destroyed. He would recommend Mr. Lance to take the most energetic measures to destroy this most abominable pest. This thistle was introduced in seed oats from America, and there were now 300 acres of Californian thistles on the property where those oats were sown. There was now a law in Tasmania compelling all owners or occupiers of land to prevent it from blossoming. Failing that, the owners were liable to be prosecuted, there being a penalty attached to the extent of £20. Unfortunately the Inspectors had not been assisted as they should have been by the different Benches of Magistrates throughout the colonies, and the result was that thistles were extending and were being allowed to blossom. On many properties it would cost £20, £30, or £40 to prevent the thistles blossoming, whereas the owners were fined 5s. and the costs remitted. The result was that they found it better to pay one, two, or three fines than go to the cost of cutting the thistles, and consequently the thistles were extending through Tasmania. Until last year the Thistle Act was worked under the police, but not in a satisfactory manner, as prosecutions did not take place as they should have done. Now the Act had fallen upon himself to administer. He was afraid that he did not occupy a very enviable position among agriculturists, as he had tried to prevent the owners allowing the thistles to blossom in growing crops, if then cut down for hay, the seed would be carried into various districts. From hay of this description thistles could be traced along the track of the wood-carter to where he fed his horses. There was no way of eradicating thistles except by constant cutting.

Mr. LANCE said he was extremely obliged to Mr. Tabart for what had fallen from him with regard to this weed. He never heard of it until the last session of the New Zealand Parliament. Then it was brought forward by a leading member of the House, who did so at the request of Mr. John Greig, who wrote to him (Mr. Lance) saying that it had appeared on his land. It was brought forward towards the end

end of the Session, but the Government was busy in winding up business. Not a member had heard of this weed, and, like other matters, it was shelved and dropped. Next Session he would bring the matter before the Government seriously, as he considered that it was a very important matter. In the Provincial Council years ago they had an Act for the destruction of thistles. The Act, however, proved to be unworkable, and was dropped, as the farmers found that the thistles did not do them any harm. With regard to Bathurst burr, Mr. Higgins had told them that it occupied vast tracts of country. The question was, could they suggest anything that was practicable.

Mr. HIGGINS said he could. The burr was an annual. Prickly-pear existed largely in the Hunter district, and they had legislation to deal with it. If it was thought advisable similar legislation might be recommended for the thistle. There was no doubt that the Bathurst burr could be dealt with, but it was being allowed to spread through neglect of proprietors. It did not matter to the cattle-holders, but to the wool-growers it had been and would be a great nuisance and a cause of loss, because, as they knew, it got into the wool and depreciated the wool in some instances 3d. per lb., and in some cases more. The burr got on to a fleece which was sometimes double its true weight in badly burred country. It was necessary that steps should be taken to compel our neighbours to carry out their part as well as we did our own. There were many stock-owners who kept their runs clear, which was very creditable to them.

Mr. TABART handed in his report on the working of the Californian Thistle Act, dated 1st July, 1886. It is as follows:—

CALIFORNIAN THISTLE ACT.—*Report by Chief Inspector.*

Sir,

Office of Inspector of Sheep, Hobart, 1 July, 1886.

I have the honor to submit the following report upon the working of "The Californian Thistle Act" during the past year.

From the representations made in my last report upon the prevalence of this weed in Southern Tasmania, and its alarmingly rapid extension over our most valuable agricultural lands, I considered it desirable to apply for further inspecting power, which was granted, to perform duties under the Act, and to see that its provisions were properly enforced.

One of the most serious difficulties this Department has to contend against is the action taken by one of the municipalities with reference to fees. I have communicated with the authorities in that district, pointing out the inconvenience to the inspector by being compelled to pay fees out of his private purse for costs of informations laid under the Act, and have intimated that great facilities would result to the working of the Act if the fees were allowed to stand over until the cases are heard. I further stated that this Department would be responsible for any liability so incurred. The authorities did not accede to the request. In view of these facts, I have to suggest that an amendment be made in "The Californian Thistle Act, 1883," 47 Vic. No. 17, with a clause inserted equivalent to section 41st of "The Education Act, 1885," 49 Vic. No. 15, so that the difficulty may be overcome.

I would suggest that a minimum penalty of £2 be fixed by law when a second offence under this Act is committed and verdict given for the plaintiff, and £3 for the third offence. I feel satisfied from past experience that no permanent good will result as the Act at present stands; occupiers of land having Californian thistles upon their properties maintaining that it is far more to their pecuniary advantage to pay one, two, or even three such fines as are at present inflicted at the different Police Courts than to cut their thistles to prevent them blossoming.

Property owners must be, and are, blind to their own interests in demanding such exorbitant rents for infested agricultural land. It is unreasonable and impossible to expect that a property so leased will have justice done to it. Patches of Californian thistles are ploughed through yearly, allowed to bloom, seed, and eventually to take complete possession of the cultivated portion of the estate, as is the case in the Clarence District; little or no care is taken by the tenant, who must pay rent, and cannot afford, nor does he attempt, to eradicate the thistles so long as he keeps out of the Police Court and within the reading of the Act. I should recommend owners of agricultural properties to assist the tenant by giving him a bonus in the shape of reduced rent for all patches of thistles destroyed, and thus encourage him to improve and enhance the value of the estate.

It only required a repetition of the energy and perseverance displayed by Mr. Joseph Barwick, of the Tea Tree, who has eradicated upwards of 9 acres, and Mr. Charles Mathews, who has destroyed thirty-four patches of thistles in five years. Mr. Earle has also exterminated about 5 acres of Californian thistles. He informs me that he purchased the ground he now occupies, containing about 7 acres, four years since, which at that time was literally one mass of thistles, and has now the satisfaction of knowing he has exterminated this weed by constantly keeping the ground moving. He made the work reproductive, for during the operation the land produced vegetables and strawberries in abundance during the season. The ground is now planted out as an orchard. This work has been accomplished in three years. Mr. Earle tells me the work of extermination cost him £7 per acre, but now, with his increased experience, he thinks he could undertake to destroy these thistles from any land for half that sum. By advertisement he offered to place the knowledge he has gained by long experience and his services at the disposal of those holders of Californian thistle land who are desirous of being rid of this weed, and undertakes the work of extermination at a price per acre to be agreed upon—the terms being, "No cure, no pay."

Mr. Tasman Morrisby entered into an arrangement with Mr. Earle to destroy 62 rods of thistles, with the pleasing result that after two seasons' work the few thistles that remained were small, but, with one more season's work, these few stragglers totally disappeared. Last season the ground was cropped; not one thistle made its appearance. After this practical and satisfactory test, Mr. Morrisby laid himself out to eradicate a large area he had in a paddock of 6 acres, and by constant attention, and working the land thoroughly and systematically, he had the satisfaction of seeing the land cleared in two seasons. One paddock of Mr. Morrisby's that has been laid down in grass for thirteen years still has these thistles growing, but they are spindly, showing that grassing the land weakens the thistle, but will not eradicate it. A few other practical gentlemen have eradicated large areas. These gentlemen assert, without fear of contradiction, that what they have done others can do by persistently hoeing the infested land once a week, thus destroying the lungs of the plant. This method will, in most cases, destroy the weed in one, and certainly in two, seasons.

I

**Californian
thistle.**

I am also of opinion that in the districts of Green Ponds, Spring Bay, Oatlands, Glamorgan, Hamilton, Bothwell, and in all districts in the north of the island where the Californian thistle has not obtained complete possession, the Government should insist on the extirpation of this objectionable plant, by compelling owners upon whose property it exists to start with systematically hoeing the thistle patches once a week during the season, commencing when the thistle first appears in the spring. The owner should be allowed two seasons to destroy the pest on all land in the above-mentioned districts; and if after that period these thistles are still found to exist the owner shall be liable to proceedings being instituted against him, and failing to prove to the satisfaction of the Justices that he has taken proper means to eradicate the thistle, a penalty, to be mentioned in the Act, shall be inflicted. A license shall then be issued, upon application and payment of a certain fee, to extend the time for eradication for another season.

Another very important matter is the selection of grain for seed, and careful inspection of hay before purchasing. The carelessness with which seed grain was formerly purchased from thistle-infested land has been the primary cause of the rapid extension of the pest. It is also a known fact that grain is cut for hay during the time thistles are in bloom and in seed, and has in the past been sold without restriction in the Hobart market. The destructive effect of this is now evident in the Huon district by following the timber-splitter's track to the stump where his horse and cattle have been fed—you will see the Californian thistle now growing most luxuriantly. If agriculturists and consumers were more particular in purchasing their grain for seed and hay for horse feed, and not invest in produce grown upon farms whereon Californian thistles are known to exist, it would have the effect, in a great measure, of decreasing the pest, and compel farmers in districts such as Glenorchy, Clarence, and Brighton to cut all thistles out of growing crops.

In consequence of the large area of thistles now known in the Huon District, I must ask for another inspector to be appointed. Up to the present this locality was considered fairly free from the pest, but, from the isolated position of this district, an inspector is required solely to enforce the carrying out of the law in that portion of the island.

The remuneration now provided is not adequate to the work performed. It is impossible for an inspector to travel and do the work required unless he is paid in proportion. I therefore recommend that the rate of salary be increased by 3s. per diem. The rate now sanctioned, viz., 12s. per diem working days, is not sufficient to meet the inspector's outlay. The duties frequently compel their absence from home at nights; they also have to provide their own horses, shoeing, and forage.

I have to express my entire satisfaction at the able way the present gentlemen have carried out their extremely unpleasant and difficult duties connected with this Act. There has been considerable agitation as to the way in which the inspectors appointed to carry out the law have performed their duties, and complaints have been made. These I have required to be reduced to writing, with the view of enabling the inspector to furnish their remarks to the charge preferred against them. The explanations made in all cases satisfactorily explain their actions, and prove they have not exceeded their duties, as has been fully borne out by the verdicts recorded at the various Police Courts.

I have the honor to draw your attention to the convictions and fines under "The Californian Thistle Act" for the years 1884 and 1885. The particulars I have curtailed, only furnishing the number of convictions with the total amount of fines inflicted, but giving a full summary for 1885-6:—

Convictions.		1883-4.		Fines inflicted.	
				£ s. d.	
46	24	0 0
36	16	0 0
		1885-6.			
		s. d.			
2	convictions carrying fines at	1	0	0	2 0
1	"	2	6	0	2 6
31	"	5	0	7	15 0
24	"	10	0	12	0 0
23	"	20	0	23	0 0
1	"	25	0	1	5 0
6	"	40	0	12	0 0
5	"	60	0	15	0 0
Total	93	£71	4 6

I herewith beg to furnish as accurate a list as is possible of the number of properties infested with thistles, with the number of known patches, and the extent of area in each district:—

District.	Properties.	Patches.	Area.	District.	Properties.	Patches.	Area.
Oatlands	8	14	10 acres.	Green Ponds	16	48	22 acres.
Glamorgan	2	3	A few rods.	Bothwell	5	10	5 "
Spring Bay	3	6	1 acre.	Hamilton	2
Sorell	31	91	12 acres.	Deloraine	1	...	10 rods.
New Norfolk	34	116	115 "	Port Sorell	2	11	5 acres.
Brighton	94	689	341 "	Huon	43	75	65 "
Clarence	57	296	835 "	Selby	1	2	20 rods.
Glenorchy	56	167	350 "	Kingborough	8	13	2 acres.
New Town and Queenborough.	64	121	6 "	Total	482	1,842	1,809 acres 30 rods
Richmond	55	180	45 "				

It is certain that other properties are infested, but unknown to Inspectors, the gentlemen now acting having only been in office since November last. Besides the thistles known to exist on private land, there are thistles on the Crown estate, Main Road, and upon the railway lines. I

I desire to draw your attention to the serious injury that is likely to accrue to Tasmania by the extension of the Cape weed (*Cryptus temma-calendulaceum*), Bathurst burr (*Zanthium spinosum*), gorse, and briar. These noxious weeds are spreading slowly but surely, and in a few years' time will be as great a curse to the Colony as the Californian thistle. Noxious plants.

No doubt the Cape weed has been introduced from Victoria in the fodder provided for the circus horses and imported cattle, also in ships' ballast.

The Bathurst burr is chiefly confined to the North Coast and along the roads travelled by imported Victorian sheep. This plant is also to be found upon the milk farm at New Town. The introduction of the weed in this instance is clearly to be traced to the removal of manure from the slaughter-house, where the seed must have been deposited by imported stock. The briar is increasing to an alarming extent in Tasmania, and will shortly be beyond control. To successfully cope with this growing pest, I am of opinion that a Noxious Weeds Act should be made law to prevent these objectionable plants spreading throughout the length and breadth of Tasmania.

In New South Wales the Chief Inspector's Report for 1884 shows the necessity of keeping in check, as also the cost that will have to be incurred, to destroy noxious weeds in that Colony, viz.—the Bathurst burr, trefoil burr, variegated thistle, and black thistle. The following report of expenditure clearly shows that action should be taken before the imported weeds referred to by me establish themselves throughout the Colony. The cost of clearing the commons of noxious weeds is estimated at £18,085; the temporary commons, £8,720; the police paddocks, £5,697; the travelling stock reserves, £43,355; and the droving roads throughout the Colony, at £32,205; making a lump sum for clearing the whole, of £108,012.

An Act is now in course of preparation in New South Wales to provide against the spreading of the prickly pear, which is becoming such a pest, and so increasing that legislation is now absolutely necessary to control its extension.

I have, &c.,

THOMAS A. TABART,
Chief Inspector.

Mr. WOOD seconded Mr. Higgins' motion.

Mr. BAGOT said that in South Australia they had an Act, known as the Thistle Act. It had been introduced for the eradication of the variegated thistle which spread over the country and grew to a height of 10 feet in rich gullies. It took possession of the country, and the Act was passed for its destruction. There was a very valuable clause in the Act which he would recommend to the consideration of the Conference. The clause in question gave the Governor in Council power to include, by proclamation, in the provisions of the Act any other noxious weed which might be introduced. Under this Act they had dealt with Bathurst burr, Star thistle, and Darling pea. A well grown Bathurst burr plant would produce 2,000 or 3,000 seeds, and they were not destroyed by fire under ordinary circumstances; unless the plant was first hoed out, it seemed impossible to destroy it. Generally the Act was fairly administered. They were not troubled with the Californian thistle. He thought the Cape weed which infected South Australia was different from that met with in Tasmania. The plant they had in South Australia was the true *Calendula*—and is a very valuable fodder plant. It came up with the first drop of moisture that fell. It formed a very valuable pasturage for lambing. If left alone it grew up and covered the whole face of the country. When it flowered, the plains of Adelaide for miles around were one blaze of yellow. The dairy people said that it gave a great quantity of milk, and they looked upon it as a valuable plant. It had a little seed surrounded by purple fluff. He had collected the seeds, put them into a mortar, and they crushed into oilcake. He had seen the cattle apparently licking up the dust of the roads, and on examining it found that it was thickly covered with the seed, so that the cattle were really eating nutritious food. There was prickly pear in South Australia, but the seed did not ripen. The crows and other birds eat the fruit and thus spread the seeds, but he had never seen any part of South Australia where it had been a nuisance. He hoped power would be taken to include in all existing Acts in the different Colonies any noxious weeds, for the destruction of which no provision had yet been made.

Mr. WOOD said that in Queensland noxious weeds were dealt with by the divisional boards. If the chairman heard of the appearance of noxious weeds he had power to make an order for their destruction. He thought it was a matter in which the chairman and the Government should work altogether. So far as the district in which he lived was concerned the plan worked very well. He thought that the nuisance was being greatly reduced on the Darling Downs.

Mr. HIGGINS said that in New South Wales the plan adopted was to allow the Bathurst Burr to grow to a certain stage. It must be allowed to grow until the seed was just beginning to show, then it must be attacked at once. Of course if it were cut down after the seed had ripened they would simply do more injury than good. The seed of the burr had wonderful vitality; it had been known to germinate after being in the ground for three or four years. Last season he saw the burr growing on the hills and among the rocks where it would not be thought of during the drought, it was really the only vegetation to be seen. While it was young they could force stock to eat it, and when it existed in broad patches and was tender, he had destroyed it by keeping wethers upon it.

The CHAIRMAN said with reference to the difficulty alluded to by Mr. Tabart of enforcing the law relating to the destruction of noxious plants and weeds, and the inadequacy of the penalties inflicted by magistrates, he thought it would be an improvement to put the owner of infested land under license until the land was cleared. Thus the owner, on his land being declared infested, would receive a license for such a reasonable term as the Board considered would be sufficient to enable him to eradicate the weeds, without any charge; but if on the expiry of the term the weed still existed the owner should be obliged to renew the license for say three months, and to pay such a fee per acre as should be fixed by regulation for the renewal, and so on at the end of every three months until the land was cleared. This got over the difficulty arising from taking cases before the local benches and fighting for a conviction. If an owner did not clear his infested land he was obliged to renew his license, and to pay; and he would soon get tired of that and complete the eradication.

Mr. TABART said that licenses with reference to the Californian thistles should be issued during the season in which they blossomed, as in the winter months they were not to be seen. The first frost cut down the thistle. It was possible to go on to land and not see a thistle, and then during the spring and summer months it would appear. The tenants who rented the land would be continually hampered

Noxious and hampered by being obliged to cut them down. He thought that when the Californian thistle appeared on land it should be placed under license, and the owner compelled to take steps for its clearance. Unfortunately in Tasmania the tenant had to do everything to destroy the thistles, and to pay all the fines. The owner if he were not also the tenant, did nothing. He coincided with what had been said as to the advisability of issuing licenses for land infested with noxious weeds.

Mr. MEREDITH said that in Tasmania various public meetings were held throughout the Colony to deal with nuisances affecting stock and pastures. The meetings were to consider what steps should be taken for the destruction of rabbits. With that question was associated that of the eradication of noxious weeds. From these public meetings delegates were appointed to attend a meeting to be held in Hobart for the purpose of representing the views of the Colony in general. He attended that meeting and a committee was formed to draft the necessary legislative measures. He was appointed chairman of the committee, and they drew up certain resolutions, proposing to deal with existing Acts and amend them. One recommendation they made was, that the question of the noxious weeds should be separated entirely from those of the destruction of rabbits, and the inspection of stock. They came to the conviction that the first should be under separate management, which he believed to be a sound and proper recommendation. He agreed with the remarks of those delegates who spoke in favour of the issue of licenses for land infested with noxious weeds. A similar recommendation should be made with regard to the destruction of this abominable weed—the Californian thistle—as had been arrived at already in the Colonies with regard to the destruction of rabbits. Where the owners did not take proper precautions to prevent the plant blooming and seeding, the Government should have the power to enter upon the land and do the necessary work at the owner's expense, otherwise, it would be useless to do anything. The same thing would be done over and over again. He knew of one instance in which several magistrates of a municipality were defendants, and the Bench which tried the case was formed of several members of the council which was summoned. Each member was fined in turn, and then went on to the Bench to deal with the others, and so it went round.

Mr. BAGOT: Were their names allowed to remain on the list of Justices of the Peace?

Mr. MEREDITH went on to say that they would never deal with the Californian thistle nuisance successfully until they had such regulations for the destruction of the plant as would permit the Governments to enter upon infested lands and destroy the thistles at the owner's expense.

Mr. CURR said there were many noxious weeds in the Colonies. He believed that the plant which was doing most injury in New South Wales and Victoria was the pine scrub, which was increasing enormously, and already occupied a large area of the Murray country. If the Conference intended to deal with the question of noxious plants they should recommend the introduction of a bill for the eradication of these plants. They could do nothing by recommending the destruction of any particular plant, whether Californian thistle, Bathurst burr, or anything else; they must leave those details to the Government or municipality interested. He understood that an attempt would be made to destroy the scrub by drawing rollers provided with knives through it.

Mr. MEREDITH presumed that Mr. Curr was referring to the pine scrub which grew about the Murray. It was known in Tasmania as the Oyster Bay pine. It grew as thick as in New South Wales or Victoria on many sheep runs. He could always destroy the plants in three years. The land should be unstocked, the grass allowed to grow, and fire put to it. That plan never failed.

Mr. CURR: No grass grows amongst these plants, and they seem to kill everything. There are localities where formerly 25,000 sheep were kept, and now there are only 2,000; that is owing to the spread of the pine.

Mr. M'KENZIE said there was no Act in New Zealand to compel the destruction of noxious weeds. There had been an Act against the common thistle, but it proved to be inoperative, as the farmers and other stock-owners found that it benefited the country. In three years time the thistles died out. The first season they grew up so thickly that a man could hardly ride through them. Now the same country was perfectly smooth without any attempt being made to eradicate the thistles. He presumed, if he was right, from what had been said by the Chairman with regard to the licensing system, that the occupiers of infested lands must take out a license to hold them, and that the owners of private land, or land leased from the Crown, would be responsible for cutting the weeds. If he were the owner of the property he was responsible, and if he did not do so the inspector would not renew his license unless he were able to show good cause why he had not cut the thistles. That should prove to be a very good system.

Mr. HIGGINS said that with regard to pine scrub the New South Wales Land Act of 1884 provided that holders of certain pastoral lands might obtain licenses to hold lands conditionally on the destruction of pines, and that if they carried out this work they were to get a twenty-one years' lease.

The motion was then agreed to.

Mr. BAGOT said that the thistles had been used successfully in silos in conjunction with grass and barley. If they were passed over a fire and the prickles thereby made limp by the action of the flame they might be at once fed to stock.

2. PLANTS AND WEEDS POISONOUS OR SUSPECTED POISONOUS TO STOCK.

Poisonous Plants of Queensland.

Mr. GORDON read the following paper on the "Suspected Poison Plants in Queensland":—

"For over ten years I have laid myself out for the collection of plants poisonous, or suspected of being poisonous, to stock. I lay no claim to a knowledge of botany. As the suspected plants are sent to me by stock-owners or drovers, I submit them to our Colonial Botanist, Mr. F. M. Bailey, F.L.S., who supplies the names, and they are then placed in a book prepared for the purpose, and kept in my office, open for inspection by visitors, and in this way they are readily recognized by stock-owners. The number of poison or suspected poison plants sent to me or to the Colonial botanist, from all districts of the Colony, is forty-two. Thirty-four of those are common to Queensland and New South Wales, many of them also to Victoria. So far as I know, eight of them are peculiar to Queensland only and to the Northern Territory of South Australia. It should, however, be stated that several of the plants submitted to me as being poisonous to stock have been forwarded at various times to the botanist as good fodder plants. A pamphlet on the subject, illustrated by lithographed drawings, is now in preparation for the Press, under the

the joint authorship of the Colonial Botanist and myself. In this short paper I shall only touch upon **Poison plants**. those plants known to be poisonous and those which have been found by analysis or experiment to possess some poisonous qualities. In this list the *Gastrolobium grandiflorum*, the 'Wallflower,' 'Australian' or 'Desert-poison bush,' is first deserving of notice. About the poisonous nature of this plant there is no differences of opinion. There are belts of this plant through which it is impossible to travel bullocks and sheep without constantly watching them and yarding them at night. Before the line of railway was constructed through the belt on the Great Northern Line from Townsville to Hughenden, parties travelling in charge of valuable stud sheep had to muzzle the sheep during the day and carry hay for the purpose of feeding them in bush yards during the night. Strange to say, Mr. Staiger, the analytical chemist, failed to find any irritant poison in an analysis of dried specimens of this plant, but he is of opinion that a volatile irritant poison will be found on analysing fresh specimens. The plant, fortunately, is not widely distributed; and it is worthy of notice, that stock bred on the areas on which it grows are seldom affected by it. The next in order is the *Swainsonia galigifolia*, the dark red flowered indigo bush, with its variations *Coronillefolia* (the rosy flower) and the *Albiflora* (the white flower). This plant is generally recognized under the name of 'Indigo' and the 'Darling Pea.' It is not an irritant poison, but when sheep once eat it it is difficult to break them of the habit. They become what the shepherds term 'cranky,' separate themselves from the flock, and are for all practical purposes useless to their owner. Mr. Staiger, then Government Analyst for Queensland, experimented with an extract from the plant, and found it to be a powerful diaphoretic when applied to frogs, rats and mice under confinement; the animals literally sweat to death. A sheep-owner on Darling Downs selected a lamb that had taken to eating the plant, placed it in a small paddock near the homestead, and notwithstanding that grass was plentiful, the lamb (although not a pet one) followed its owner all round the paddock, eating from a bundle of *swainsonia* which he carried in his hand. When grass is plentiful the percentage of 'indigo-eaters' in a flock is not large. Of the *Euphorbias*, the *E. drummondii* and the *E. eremophila* are the only two that have been brought under my notice as poisonous. Of the latter I cannot speak from experience. Of the former (called by the stock-owners the caustic creeper) I have had considerable experience. Its effects on sheep are curious. The head swells to such an enormous extent that the sheep has frequently to drag it along the ground, and there is frequently suppuration of the ears. Like the *gastrolobium*, analysts would seem to have a difficulty in detecting poison except in green specimens, and drovers state that it is only poisonous when eaten before being dried by the sun. The *Solanum nigrum* (small black nightshade) was some years ago reported as having poisoned large numbers of stock in the metropolitan districts of Victoria. The fruit is decidedly poisonous to children, but I have had no experience as to its effect on stock in Queensland. The *Datura stramonium* (thorn or mad-apple) and the *D. leichhardtii* (native thorn apple) are both poisonous to cattle, but are rarely eaten except by quiet milkers, or during seasons of drought, when feed is very scarce. The *Nicotiana suaveolens* (native tobacco) and the *Bulbine bulbosa* (the native leek or onion) both grow in abundance in the western or saltbush districts, and cause numerous deaths amongst travelling sheep, but they appear to have little or no effect on the sheep bred on the runs on which the plants grow. The only other plant on which experiments have been made is the *Xanthium strumarium* (Noogoora burr), a plant introduced into Queensland with cotton seed, from the Southern States of America. When young and succulent this plant is readily eaten by cattle, and many deaths have been the result. From experiments made by Dr. Bancroft, of Brisbane, this plant is decidedly poisonous. His results are embodied in the transactions of the Queensland Philosophical Society. It may not be generally known to members of the Conference that a plant of the same family, the *Xanthium spinosum* (the Bathurst burr) is also of a poisonous nature, but fortunately it is rarely eaten by stock. With most of the abovenamed plants, however, losses in stock are as a rule confined to travelling sheep and cattle. Rarely do sheep bred on the runs on which they are prevalent, eat them, or if they do, fatal results rarely occur."

Mr. GORDON moved, that the Conference recommends that collections be made of all plants suspected of being poisonous to stock, with the view to their true character being ascertained by analysis, feeding of stock and otherwise, and to necessary steps being taken to prevent so far as possible losses to stock when the plant is poisonous.

Mr. HIGGINS seconded the motion.

Mr. LANCE said that in New Zealand there was a plant called the *Tutu*, which was excellent food for stock accustomed to it, and eat it on a full stomach in the ordinary way. If however, freshly landed stock, or stock with empty stomachs, eat it, they were seized with vertigo, and died.

Mr. M'KENZIE: A berry comes on it, which is very dangerous.

Mr. VALENTINE said that in South Australia they had had a good many losses from sheep eating the *Lotus Australis* the year before last in the south-eastern districts. The *Swainsonia Procumbens* was also to be found over an area of country covering about 60 or 70 miles, and horses and cattle had died in great numbers from eating it. Stock that eat it became affected with the staggers, and generally became useless. They had also the *Euphorbia Drummondii*, which came down the river; and two or three seasons ago a number of sheep died from eating it. One settler put some sheep in to feed on that plant and nothing else, and they got fat upon it.

Mr. PARK: I have not heard of poisonous plants doing any damage.

Mr. STANLEY said that when he was in the Riverina district he had a number of sheep penned up. He collected a quantity of *Euphorbia Drummondii*, and fed the sheep upon it, but they did not die. Having done that, he sent through Mr. Duff to Baron von Müller, and asked him for his authority for stating that *E. Drummondii* was a poison plant. The reply from Baron von Müller was as follows:—

John Duff, Esq., Inspector of Forests, New South Wales.

Melbourne, 22/9/86.

Dear Sir,

In reply to your letter of the 20th instant, I beg to observe that all species of the large genus *Euphorbia* are characterized by being pervaded by an acrid milky sap, the induration of which from some North African species yielding the highly irritant and blistering gum *Euphorbii*. Many other species are recorded from various parts of the globe as possessed of burning acidity, and not one instance is known of any congener having proved really harmless, even the *Euphorbia pilulifera* can be used only cautiously, and in small doses against asthma; indeed, so corroding is the sap of many species, as to be occasionally applied as a caustic. Though therefore not likely any of the *Euphorbias* are inert, it may be that some contain only a slight quantity of milky sap, and that of less burning property, so this may account for the deleterious qualities of *Euphorbia Drummondii* not being readily apparent, should the latter plant be consumed only in small quantity, and at particular seasons when least of the sap is developed.

Branding and marking.

I have the plant nowhere accessible near Melbourne, and have neither the means of subjecting it to chemical analysis, though toxic experiments could easily be carried out wherever the plant is copiously available. I cannot think that the numerous correspondents who through many years successively sent me specimens of *Euphorbia Drummondii* as poisonous to their pastoral stock could all have been in error when attributing the mischief to this plant. Indeed the *Euphorbia Chamaesyce* of the countries around the Mediterranean Sea, a plant from which hardly our *Euphorbia Drummondii* can be distinguished, has been used there since antiquity, for removing by its milky sap, obscuring patches from the cornea, and for corroding away any warts. A good test for the acidity of our plant would be to apply a few drops of the sap to the eye of a lamb, dog, small calf, rabbit, or some other animal for seeing whether such an application will produce inflammation or not. I presume that against any possibility of using some other habitually similar plants for the experiments instituted in New South Wales, has been effectually guarded.

I am, &c.,

FERD. VON MÜELLER.

Mr. STANLEY said that the Government Analyst had stated that the plant contained a slight bitter, but nothing of a poisonous character.

Mr. GORDON remarked that the *Solanum Nigrum* was poisonous to children, when growing in deep rich soil, yet people used it in pies without injurious effect.

Mr. STANLEY drew attention to the injurious effects resulting from the presence of mould and fungus on ensilage. Horses and valuable sheep had been destroyed by eating it. The fodder had been flooded, and put away wet, the result being that fungoid growths were encouraged on the ensilage, with fatal effects to the stock.

The motion was then agreed to.

VIII.—THE BRANDING AND MARKING OF ANIMALS.

Sheep—Ear-marks.

The chairman said it was very desirable to prevent the use of such ear-marks as the "crop," which would cut off or out other ear-marks. He moved the following resolutions:—

"That only such ear-marks as are authorized by the Governor-in-Council, and registered with the Inspector for the district, shall be used for sheep."

"That the crop or tip-mark be prohibited."

"That all ear-marks be made with pliers."

Mr. BAGOT said that these marks would interfere with the inoculation marks.

Mr. CURR said that in civilized countries people had done away with these ear-marks. In Spanish South America the system was used for some time. That was one of the strictest laws in force in the country. In the case of branding, a horse could be pretty well identified. After they finished branding the animal on one side, they could turn him round and begin branding on the other. He had learnt from a gentleman who had lately come from South America that the whole system was falling into disuse. In Victoria they did very little branding, and that was of the most ridiculous description. He had registered, he supposed, fifty owners who used A for a brand, and the only thing they could do was to prevent any neighbour using that brand so as to enable him to steal sheep.

The resolutions as moved by the chairman were agreed to. They appear in the following form in the report:—

"That only such ear-marks as are authorized by the Governor-in-Council, and registered with the Inspector for the district, be used for sheep."

"That the tip-mark be prohibited."

"And that all ear-marks be made with pliers."

CATTLE—EAR AND OTHER MARKS.

Mr. MEREDITH believed that considerable difficulty would arise if the Conference retained the resolutions which had been passed relating to ear-marking. He remembered a case where a man was charged with perjury for swearing that a cow was marked on the near ear; and he justified himself by stating that the near ear of a bullock was opposite to that of a milking cow—that the near ear of a bullock was the left, and of a cow the right, because it was nearest in milking. The man was acquitted.

Mark for Inoculation.

Mr. STANLEY moved,—“That the mark for inoculation be on the off ear for cattle.”

Mr. BAGOT seconded the motion.

The motion was agreed to.

The motion appears in the following form in the report:—“That the distinctive mark in use in Queensland—taking the tip off the off (*i.e.*, the right) ear—be used throughout the Colonies as the sign of inoculation.”

Mark for Spayed Cows.

Mr. BAGOT moved,—“That, in the opinion of this Conference, the dewlap mark be reserved in all Colonies having legislation upon the branding of stock, as a distinctive mark for spayed cows.”

Mr. WOOD seconded the motion, which was carried.

RUNS ON INTERCOLONIAL BOUNDARY LINES.

Mr. BAGOT moved,—“That any stock-holder owning runs in different Colonies which are only separated by the boundary line between such Colonies should be permitted to register in each Colony the brand in use by him, and registered in his name in either Colony, and that it be a recommendation of this Conference that such Colonies as have legislation on the subject should be requested to amend their Brands Acts, so as to give effect to this resolution.” He said that there were runs which were only separated by intercolonial boundary lines. They were absolutely identical, and were worked as one run. In Queensland it was compulsory on stock-owners to register one numeral and two letters, and in South Australia one letter and two numerals. On one side of the line the stock-owner had to use one brand, and

and on the other side the other. It only required a recommendation to the different Governments to Rabbits, N.Z. have the substance of his motion carried into effect. He had looked at the matter from all points, and he was of opinion that no injury could come of it to any Colony.

Mr. GORDON seconded the motion.

The motion was agreed to.

The motion appears in the Report in the following form :—“That any stock-owner owning runs in different Colonies, with the sanction of the Registrars of Brands, be permitted to register in each Colony the brand in use by him, and registered in his name, in either Colony; and that it be a recommendation of the Conference that such Colonies as have legislation on the subject so amend their Brands Acts as to give effect to this resolution.”

ORDER OF BUSINESS FOR THE FOLLOWING DAY.

The following business was then decided upon for the following day :—

1. The rabbit question.
 2. The introduction of stock from places outside the Australasian Colonies.
- The Conference then, on rising, adjourned until 10.30 a.m. on the following day.

TUESDAY, 5 OCTOBER.

SEVENTH MEETING.

Present :—Mr. A. BRUCE, Chairman, and the full Conference.

Suppression of Scab in New Zealand.

Mr. LANCE read the following telegram, which had been received by Mr. COOPER from Mr. Buckley, Colonial Secretary of New Zealand :—“Wellington. First muster Clarence Run shows no disease.—P. A. BUCKLEY.” He said that that was the country which had been infested for the last twenty-two years.

VI.—DESTRUCTION OF NOXIOUS ANIMALS—*continued.*

1. THE RABBIT PEST.

The Chairman, with the view to elicit information on the subject, handed the following list of questions to each of the delegates :—

- (1.) Does the rabbit pest exist in your Colony?
- (2.) If so, to what extent have the rabbits spread?
- (3.) At what do you estimate the annual loss through rabbits to your Colony, and the total loss to date?
- (4.) Have you legislation for the pest? If so, state its features.
- (5.) How is the destruction of the rabbits carried out?

(1.) *Rabbits in New Zealand.*

The CHAIRMAN : The question to be dealt with now is the rabbit pest.

Mr. LANCE said, that with regard to this question he had come to the conclusion since his arrival in Sydney that no further information could be obtained. He was aware that they had had two exhaustive Conferences, of which he was not aware until he arrived here. He had read the result, and found that so late as last June they had fifty-four delegates present from all parts of the Colony, and the question was debated carefully. They came to certain conclusions, and drew up a report. At the same moment we were doing the same thing in the Parliament of New Zealand. There was a joint committee of both Houses, which sat for certainly over two months, and examined an enormous number of witnesses. The Report was now lying on the table. In noticing what took place in New Zealand and what took place here, he saw that they came to practically the same results, and in New Zealand legislation immediately followed. A Bill was passed in the few last days of the Session. They did not say it was perfect, but it was a step in the right direction. They might have gone further and arrive at the conclusion agreed to by the Sydney Conference—that certain localities should be under the local administration of Rabbit Boards. The Sydney Conference came to the conclusion that those local districts should elect among themselves a Central Board, the business of which would be to advise the Government as to the action to be taken in connection with the rabbit pest. This was a mode which the New Zealand Government would probably adopt in future legislation. Both came to this conclusion—that fencing was one of the great elements of success, but in New Zealand fencing was an exceedingly difficult matter. There was a mountainous backbone all through the infested island, and parts of it were so precipitous and rocky that they could not get a pack-horse into hundreds of thousands of acres, so that poisoned grain could not be carried there. Therefore they could see that on these mountainous regions it was not possible to carry out fencing to any extent. There were spots, however, where it could be done. In the south and north they had rabbits, and a large tract of valuable country was not infested. To the north it was possible to construct a fence which would be a very efficient one, and that was what they proposed to do. To the south the fencing would be more difficult, but they hoped to be able to find fairly good country over which to carry it. If they did so they would save that country from being overrun with rabbits. The Queensland people bore in mind the fact that the New South Wales people were doing the proper thing, that they were going to fight the enemy on another man's ground, and that was what they wanted to do in New Zealand with the centre of the Middle Island. They thought that if they erected a fence, and allowed the great wave of rabbits to come against it without any opposition, that it would never keep them back. Therefore they proposed to build huts at certain intervals along that fence,

Rabbits, N.Z. fence, at distances varying according to the nature of the country. Sometimes there were an enormous number of water-courses within a short distance, extending over 10 or 12 miles. They proposed to have two men in each hut, and those men were to breed ferrets as largely as they could and turn them out. The men would not be allowed to possess dogs; and the Government did not intend to allow the destruction of the natural enemies of the rabbit, or fumigation, or anything of that kind. The men would be provided with guns, but the main thing would be keeping the men at the fence turning out ferrets to meet the army of rabbits coming towards it, driven on by the ferrets in the rear. The rabbits would thus be between two lines of ferrets, and the Government believed that on the infested side a large area would be kept practically free from rabbits. That was how they proposed to work in New Zealand. The Sydney Conference recommended the preservation and propagation of the natural enemies of the rabbit—so they did in New Zealand. It should be borne in mind that blood-sucking animals required an enormous amount of water. Ferrets would not live without a plentiful supply. They had had a sad experience of that in New Zealand. There was a long-dry season, and in one part of the country where ferrets were turned out it happened to be rolling country, but without permanent watercourses. The ferrets were absolutely exterminated in a very few months. Therefore it would be for the Australian representatives to judge whether ferrets would answer here. Almost every witness they examined, he thought, without a single exception, both *viva voce* and by writing, were in favour of the introduction of stoats and weasels. The joint committee was, of course, bound to frame its report on the evidence; and it therefore recommended the Government to import those animals largely. On looking over the matter calmly and quietly afterwards, he came to this conclusion—that stoats were dangerous animals, and he was not in favour of weasels. When he came to analyse the evidence he found that the whole of the witnesses, or most of them, were sheep farmers, or connected with the pastoral industry. There were no agricultural farmers amongst them, as they did not understand the question. He found that the agricultural farmers were almost to a man against the introduction of stoats and weasels, as they thought those animals would be destructive to their poultry. It was of no use to tell them that they might protect their chickens with a little wire-fencing. For himself, he would be very chary about advising any Government to introduce stoats and weasels. Cats were most useful in keeping down the rabbits; and with ferrets, fencing, and poisoning, there should be sufficient power brought to bear to keep down the rabbits. Poisoning was not even mentioned at the Sydney Conference. He did not know why, as it had been found by us to be most valuable in keeping the rabbits in check. With regard to poisoning, they had only one means which was efficacious, and that was the use of phosphorised oats. They could, however, only be used in winter, as the heat of summer evaporated the phosphorus so rapidly. In winter it would stand snow and rain for three weeks, and then be perfectly good. There was, however, the danger of the phosphorus setting fire to the grass during the summer months. There had not been a stone left unturned to find out better means for the destruction of rabbits. They had an excellent Agricultural College in Canterbury—The Lincoln Agricultural College,—and the Government had put the machinery of it in motion to try if a poison could be discovered, which the rabbits would prefer to grass, in summer. He did not know why the subject of poisoning was omitted from the discussions of the Sydney Conference. With regard to rabbiters, he might give them some information. Mr. Bullen, a resident of the Marlborough district, determined to clear his lands of the rabbits, and he began to use phosphorised oats and also to breed ferrets very largely. He had been breeding them for a year or two, and one morning, while walking near his house on the borders of a lake, he heard on the other side a tremendous noise, the sound being carried a considerable distance across the water. He concealed himself until the noise was over, and the parties had time to go away. He then went around to where the noise had occurred, and found a fine dog ferret which had just been killed by his rabbiters. He walked quietly home, and after thinking what course he should adopt, he resolved on a plan and acted upon it. He sent for every one of his rabbiters, gave them their cheques, and sent them about their business. Mr. Bullen assured the committee before whom he gave evidence that in three months after that there was an evident decline in the number of rabbits. That occurred eighteen years ago, and he never employed a rabbitier since. They had come to the conclusion in New Zealand that the rabbitiers encouraged rabbits in every way, and the joint committee recommended the Government to prohibit men from being employed in that way. There was another question brought up, and about which Mr. Gordon had asked him. That was as to the bonus system for eradicating rabbits. The joint committee went exhaustively into that matter, and came to the conclusion that it was not advisable to recommend the system. They thought it would encourage rabbit farming, and the bonus system was also an expensive one. The bonus proposed was 1d. per skin, but it was found that each skin cost 2d. or 3d. As he had said, the proposed bonus was 1d. per skin, but what would the Conference think that came to. If they took eight and a-half million skins as the average number of skins exported, at 1d. per skin that came to £37,000 per annum. What did that expenditure do? Practically nothing. Therefore they came to the conclusion not to recommend the system of bonuses in any way, and he strongly advised them to follow the same course. With regard to the cost, the Conference could easily understand when the Government was about to introduce the Bill into Parliament, how valuable it would be, and how it would strengthen the Bill, if they could have approached anything like an idea of what the rabbits had cost New Zealand. He did his utmost to ascertain it, and he found that the public expense was nothing compared with that incurred by private individuals in striving to get rid of the pest. He found that it was impossible to arrive at the actual cost, but he averaged it in this way. He succeeded in getting what the rabbits actually cost in annual expenditure on three stations, and he knew that that was perfectly reliable information. Then he took the area of these stations, compared them with the area of the infested country, and thus got a rough idea of the total cost. By that means he calculated that a quarter of a million sterling had been annually expended in the destruction of rabbits, without reckoning the loss of grass, and the falling off in the condition of the sheep, and the amount of wool. Many of the runs which used to carry 20,000 sheep now only carried 2,000. Allow for the losses in sheep and wool, he thought that another quarter of a million sterling might be added, which would make the total annual cost half a million sterling, despite which fact the rabbits were increasing. There was one point that should not be overlooked, and that was that whatever means were taken to attack the rabbits, whether by poisoning or by means of natural enemies, or by rabbitiers, all had the effect of spreading the rabbits. Although their actual numbers were not, perhaps, greater now than formerly, yet they were being found over a larger area, and therefore it was believed that

that nothing but fencing would check them. That was why they advocated fencing so strongly in New Rabbits, N.Z. Zealand.

Mr. HIGGINS: Do ferrets kill the lambs?

Mr. LANCE said that the very gentleman to whom he had referred (Mr. Bullen) was asked before the joint committee, how many ferrets there were on his land, and he replied that he would not be surprised to find that there were ten thousand, as he had been breeding and turning them out for the last eighteen years. He grazed forty thousand sheep on his land, and he was asked whether the ferrets were dangerous to lambs. He replied that he never knew a case of a lamb being killed by a ferret. More than that, he had done his utmost to find if such a thing had ever occurred, and when his ewes were lambing, his shepherds had orders to examine as many camping places as possible, as they knew if the lambs were found killed anywhere, it would be there, but they had been unable to find one. It had been also said that ferrets were dangerous to human life. They had been making the Government road through the district in which Mr. Bullen lived, and they had camps of men there for eighteen months. Every night the ferrets came into the men's tents, crawled over them, and yet there was not a single case recorded, of a man being bitten by a ferret. For those reasons, the committee came to the conclusion that ferrets were not dangerous, either to human or animal life.

Mr. STANLEY: Do they keep the rabbits down?

Mr. LANCE: They do in a wonderful manner, but they cause them to spread.

Mr. TABART: Have the rabbits been killed or driven off?

Mr. LANCE: They have been killed by hundreds of thousands, by millions. That country used at one time to be black with rabbits.

Mr. TABART: Does Mr. Bullen use phosphorised grain?

Mr. LANCE: Yes, every year. The best plan is to poison the country first, to bring the number down to a reasonable extent with phosphorised grain, and then turn out the ferrets.

Mr. MEREDITH: What method do you use for phosphorising your oats? What guarantee have you that they are properly prepared before being spread on the ground in the infested districts?

Mr. LANCE: The people who use them have machines for preparing the oats. They consist of large iron drums.

Mr. MEREDITH: You said there was some danger to the grass. If the oats are properly prepared the phosphorus will not ignite the grass.

Mr. WOOD: Do the stoats kill lambs?

Mr. LANCE: We have not had any experience on that point. The stoat is a large animal, and it was thought it would increase in size here, and become a larger and more vigorous animal. There was a case known, where a stoat had killed lambs, and he thought they should be chary in introducing any animal into these Colonies which might hereafter prove to be a great curse. With all these means—poisoning, the use of ferrets, and other natural enemies, and fencing—they consider that they would never be sufficient to eradicate the pests. Therefore they thought that science ought to be invited to discover some means that would actually exterminate the rabbit. Until that was done, the Colonies would never have any rest.

Mr. HIGGINS: With regard to the administration of your Act. How is it carried out?

Mr. LANCE said that the Act had been altered this Session. There had been very great difficulty in administering it, especially in the northern parts, which were infected with scab. The Sheep Inspectors and Inspectors under the Rabbit Act, found great difficulties in dealing with the rabbits. They found it was practically impossible to deal with scab and rabbits on any one run at the same time. The inspectors contented themselves with making those people who had rabbits, breed ferrets and turn some out every year. The eradication of the rabbits had not been conducted so efficiently as it would have been if scab had not been present. Now, however, the Act was being carried out thoroughly, and vigorous steps taken to get rid of the rabbits.

Mr. MEREDITH: At whose expense?

Mr. LANCE: At the expense of the owners of the lands infested. Wherever there were Government reserves they were cleared by contract, the charge being set against the Consolidated Revenue. It had been decided in New Zealand to strike an optional local rate with a maximum of 1d. per sheep. The rate would be a differential one, according to the proximity of the rabbits. All sums so raised the Government would subsidise at the rate of £ for £ for erecting fences, and so forth. That Act was passed last Session. The Government had to bear all the departmental expenses for working the Act, and in this way, with the subsidy, the rabbits cost the Government about £40,000 a year. He moved—"That the Conference recognises that the means at present available for the destruction of rabbits are most costly, and are not radical cures, and that, until some discovery shall have been made, more searching and fatal in its effects upon rabbits than anything at present known, their absolute eradication cannot be accomplished. The Conference therefore recommends that a bonus be offered by the Australasian Colonies collectively, for the purpose of bringing about such a desirable object, such bonus to be granted under such regulations as to success, as the Colonies may consider desirable."

Mr. PETERS seconded the motion.

Mr. M'KENZIE said that his experience of the rabbit question was different from that of his colleagues for the reason that he came in personal contact with them himself. Mr. Lance had just told them that during the last Session of Parliament in New Zealand there was a Joint Committee of both Houses sitting, and it went into the subject exhaustively. The conclusions of that committee, of the New Zealand Parliament, and of the Conference which sat in Sydney, brought out the same facts. They had come to the conclusion that the rabbit nuisance was more serious than many people gave credit for. If they expected to occupy the country successfully they must use every effort to destroy the rabbits. In Otago, fifteen years ago, the rabbits were only found on an area of 20,000 acres in the extreme south of the Island. He resided about 200 miles north from that place in North Otago, and they scouted the idea of rabbits reaching so far. They could have easily fenced off the rabbits then, and driven them into the sea. Unfortunately they did not really know what the evil was, and the rabbits gradually spread. About ten years ago the first of the rabbits made their appearance in the district in which he resided. A few people took immediate action to keep them down, but their efforts were useless, as there was no law for their eradication, and the Government reserves were left lying without anything being done to them. Some owners gave as much as 6d. per head for the destruction of the rabbits. For

Rabbits, N.Z. four or five years they did not do much harm, but they were noticed to be increasing. About five years ago they came upon the district in millions, taking almost every person by surprise, causing very serious losses indeed. The result so far, whether on pastoral country owned by the Government and leased to the runholders, or on private property, was this:—The carrying capacity of the land had been reduced by one-third, and the weight of the fleeces had decreased on an average from 1 lb. to 1½ lb. per fleece. The lambing percentage had decreased 30 or 40 per cent., and the death-rate had increased from 3, 4, 5, and 6 per cent. to 10, 11, 12, and 13 per cent. He then referred to the following evidence given before the Joint Committee on the Rabbit and Sheep Acts:—

Mr. Brydone examined:—

Chairman.] Have you had much experience in the matter of rabbits? Yes.

In what part of the Colony? In the Waitaki district.

Not all in one block? No; we have got runs and freeholds extending over most of Otago.

What quantity of freehold and what quantity of leasehold? I superintend something like 200,000 acres of leasehold, and about 150,000 acres of freehold.

And you have rabbits over all? No; on some of the freeholds there are no rabbits.

Would you speak more particularly about the properties on which you have rabbits? We have a freehold property in Southland, which now extends to about 50,000 acres, on which we have had the rabbits for the last eight or ten years.

And have you rabbits on the whole of the leaseholds? Yes.

Are the rabbits very bad in any part of it? There are three places where they are very bad—one, in the Queenstown district, of about a 100,000 acres.

Is that along the bank of the lake? It is opposite to Cromwell. We have another one between Shag Valley and the Taieri River of about 44,000 acres, on which there are rabbits; and one on the Waitaki of about 40,000 acres.

Is that high up? No. It is a place called Kowrow, just at the extremity of the railway.

The rabbits are a great nuisance on all these places? Yes. On the Queenstown run during the last two years we have spent about £7,000; and we collected skins there the year before last to the number of 244,000, and this year to 283,000.

Then the rabbits have increased? I would not like to say they have increased; but we got some new country there very rabbitly, and we did not get them thoroughly killed the first year. I think it was because we were more successful last year than the previous one; and we have been killing all last summer, which has been adding to the number. The rabbits trapped and shot are all got, whereas of those poisoned in the winter probably not more than a half or a third are got. That has increased the number of skins. It does not exactly indicate that the rabbits have increased.

What system of killing do you adopt? Poisoning with phosphorized oats in winter, and last summer we practised trapping and shooting. We have some fifty or sixty men on that run, and we think we have got the rabbits very much under hand just now; but it has cost us a great deal of money to do so. The skins we get in the summer are perfectly valueless.

What proportion of the expense do you think the skins would return, taking the year all round? Now I do not expect we get half of what the skins cost us, particularly with so many summer skins coming in.

Less than 50 per cent? Yes, at present prices. The price has come down very much.

Do you poison at all in summer? No; it has been tried, but found to be no use.

Do you turn out any natural enemies? We have turned out ferrets on nearly all our places.

In what quantities? We have turned out probably a 150 on that particular run at Queenstown.

Have you seen any results? Yes; we believe they are increasing and doing some good. Of course they require to be in larger numbers on a big tract of country to see very decided results.

Have your sheep diminished on account of the pest? Slightly, but not to any great extent. Of course our increase has diminished very considerably. From an average increase of about 70 per cent. on the Kawarau run we now average about 45.

And in regard to wool? We clip about 1½ lb. less wool per sheep than we did formerly, and it is not of as good quality.

Mr. Fulton.] And how about deaths? The death-rate formerly averaged 3½, and since the rabbits came it has become 10½. There is another run we have—Deepdell—where the death-rate formerly was 6 per cent., and for the last few years it has averaged 13½; while the increase was formerly 67, and is now 45.

We considered that Mr. Brydone's evidence was a fair sample of the experience of Otago runholders.

Mr. M'KENZIE also referred to the following evidence given by Mr. J. Roberts, Station Agent of Dunedin:—

Chairman.] Have you had large experience in connection with rabbits? I have had experience to this extent; that one season we killed 50,000 skins off 35,000 acres.

What method of killing have you adopted? We have adopted the usual methods. With regard to fumigation, I only tried bisulphide of carbon four or five years ago, when the remedy was first started; but we found it was difficult to apply, and the results were not equal to the expenditure.

I suppose it could only be carried out in certain parts of the country? Where there are burrows.

Have you tried ferrets? I have turned out a great many ferrets; and in one place of 5,000 acres in Southland we found that in trapping we caught almost as many ferrets as rabbits, so we gave it up.

Have rabbits diminished in your neighbourhood? My own experience is that they have diminished. In the year ending June, 1884, we killed about 50,000 on 35,000 acres, the net result being a profit on the value of the skins of £191 9s. 5d.

During the shearing previous to that (in November, 1883) I found that the clip fell 1 lb. per fleece as compared with that of the previous year; but since the rabbits have been kept down the wool has recovered its weight, and the country is carrying now quite as many sheep as it ever did. During the year ending June, 1885, the net charge for rabbits was £402, crediting the value of the skins.

That was a loss? Yes; and I expect the loss this year will be about £500.

And that is the result of your exertions to kill rabbits? Yes.

In the other parts of the district have they succeeded as well as yourself? No; on the adjoining run I think their wool has fallen off a good deal, and their stock too.

Is that through neglect, or other cause? I think it is through neglect.

And you think rabbits can be kept down? I am quite satisfied if proper care is taken they can be kept down to such an extent that they will not affect the wool nor carrying-capacity, though they may affect the lambing. The shorter and finer grasses are taken by the rabbits, and the ewes do not get the same amount of milk in the early spring that they otherwise would.

Mr. M'KENZIE said that Mr. Roberts' evidence went to show that the weight of the wool was decreased to the extent of 1 lb. per fleece, and that notwithstanding the fact that he had been spending a very large sum of money in keeping the rabbits down, they had been increasing.

Mr. M'KENZIE also referred to the following evidence given by Mr. H. S. Valentine, of Waimea South:—

Chairman.] What experience have you had in matters connected with the rabbit pest? I have had great experience. We cover a large tract of country, about 300,000 acres, of which perhaps about 100,000 is leasehold country, and that is the worst rabbit-country.

You suffer very much from it? Very much.

In what way do they affect you? They eat the grass, and reduce the carrying-capacity of the country.

I suppose you have taken means to kill the rabbits? If we had not done so, and that very extensively, we should soon have no country. We have taken every possible means of destroying them—poisoning and shooting them, and so on. For the last five years, after allowing for the value of the rabbit-skins, we must have spent nearly £20,000 in this way.

And have you succeeded in reducing the number? To a very great extent. The country is better now than it has been since they became a nuisance. We are carrying more sheep now by 10,000 than we were three years ago.

Which means have you found the most effectual? The poisoning was the most effectual.

Have you tried natural enemies? Ferrets—not many.

What

What do you suggest that the Government should give during the summer months as a bonus for the skins? A bonus would certainly have the effect of stimulating the small settlers—and particularly the small men—to kill rabbits coming down on their farms. Rabbits, N.Z.

It would also act as an inducement, I imagine, to the owners of the land to proceed with killing, as they do at other times of the year? Yes; anything in that way will undoubtedly stimulate them to carry on the work they are doing. Of course, large owners must carry on the work for their own protection. Although they get their leasehold lands at a nominal rent, the rent becomes a serious matter when they have to add to it the cost of keeping down the rabbits. Although the land may be got for 3d. an acre, the cost of the destruction of the rabbits brings it up to 9d.

Mr. HIGGINS: How is the decrease with regard to the wool and lambs brought about.

Mr. M'KENZIE said that the carrying capacity of the land was reduced, and the feed eaten down by the rabbits. From one of Mr. Brydone's runs he took 244,000 skins in 1884. In 1885, after the expenditure of £7,000, he took 283,000 skins off it, making an increase of 40,000 skins in one year, after an expenditure of £7,000. Through there being no grass in the spring, the ewes had no milk and the lambs died. From the want of feed the fleeces were lightened and were therefore less valuable. That result might be considered rather singular when they remembered the last sheep report of New Zealand. It would be seen on looking through it that there had been an increase in the number of sheep last year by half a million. The colonists had however been largely improving the country, ploughing and sowing turnips, feeding them off and laying the ground down in grass. By that means the carrying capacity of the ground was improved by one or two sheep to the acre. That however did not affect the facts, although the returns of the whole Colony showed an increase in the numbers of stock. During the last two years in New Zealand, the prices of grain had been so low that a large number of agriculturists had given up grain cultivation and taken to sheep farming, which would largely increase the number of sheep in the returns. If, however, there were no rabbits in the Colony, the increase in the number of sheep would have been three or four millions, instead of half a million. The small farmers suffered very largely from the rabbits, and where the settlers had extended their holdings on to the Crown Lands, they were very much troubled with rabbits. In some cases they eat one-third or one-fourth of the crop, and he knew one case last year—a man had 100 acres of very good wheat, the part of which was not touched by the rabbits, yielding 40 bushels to the acre; out of that 100 acres, 10 acres were completely cut by the rabbits, and 30 or 40 acres more were quite destroyed. That would give an idea of the enormous losses which the farmers were suffering. He could vouch for that, as he saw the land being measured. He might say that that was the experience of all the settlers who were now going on to Crown Lands in the different settlements. Then they had to consider the enormous yearly cost of keeping the rabbits down. They had had various estimates of the cost of keeping the rabbits down. They had had the evidence of Mr. Brydone, Mr. Valentine, Manager of the New Zealand Agricultural Company, and Mr. Roberts, and it had been ascertained that the cost varied according to the nature of the country. They had it in evidence that in some cases where the land was rented at 3d. per acre, it cost 6d. per acre to keep the rabbits down, thus trebling the original rent. Then there was a large area of abandoned country in Otago, owing to the rabbits having taken hold of it. He could speak of that from his own knowledge. Many applications were also made to the Land Boards by tenants to be allowed to surrender their lands. They had tried in all sorts of ways, but without success, to get this land taken up. The Land Act had been amended so as to allow an extended time for the leases; and the policy of the department in grouping a number of small runs into one had prevented the abandonment of the back country altogether. Instead of ten years tenure the Government were giving twenty-one years tenure. The small runs which had been grouped had been offered at low prices, and in some cases they had been taken up, and in some they had not. An area of 120,000 acres had been offered for a period of twenty-one years at a nominal rental of £5, and no one would take it. At one time that land yielded a large revenue to the country; so they could understand the loss that ensued to the State. In his opinion Mr. Lance's estimate was under the real cost. Of course it was impossible for anyone to say what it actually was. He thought that Mr. Lance was within the amount when he said half a million. While he agreed with the efforts now being made to keep down the rabbits he quite agreed that every effort should be made in the way of fencing to prevent them spreading, and also to assist in their destruction and use every possible means known at the present time. He did not think that anything had yet been discovered that was a radical cure. His own opinion was that they should not give up, but should endeavour in every possible way to get some further assistance from scientific men. Until scientists said they were defeated he could not believe but that a more effectual remedy would yet be discovered. If they had to fight this pest year by year it would interfere with the progress of the Colonies seriously. People had been ruined by the rabbits already, and he was afraid they had not seen the last of it. He therefore heartily supported the motion as moved by Mr. Lance, and he was sure that the Government of New Zealand would co-operate in the matter, and would be only too glad to act with the other Colonies. He would like to correct a statement of Mr. Lance, who had stated that farmers objected to the introduction of the natural enemies of the rabbit. That was quite true so far as the localities were concerned where there were no rabbits; but where there were rabbits they would be very ready to bring in any mortal enemy of the rabbit. Mr. Meredith had asked some questions about phosphorised grain. All the remedies tried proved to be ineffectual until they got phosphorised oats. Until then they could make no headway. The phosphorised oats had been the greatest friends of the New Zealand stock owners. The plan used was to take 100 lb. of oats or wheat and put it into a boiler. They had an excellent boiler, which had been patented by a blacksmith in Otago, and which was a great saving in many ways. Before that description of boiler was brought into use they had to put the grain into a common boiler, heat the water and melt the phosphorus. It was difficult to dissolve the phosphorus. The plan adopted was to put the water into the boiler, boil the water, then put in the phosphorus, and when dissolved well, the oats, and the moment the oats were put in the fire was drawn away. There was a handle attached to the boiler which turned a number of scrapers so that the phosphorus was distributed through the oats. 50 lb. of grain prepared in this way were equal to 70 lb. or 80 lb. prepared in the old way. If it was properly prepared every grain of it would kill. Mr. Meredith had said something about the danger of laying down phosphorised grain in grass. This was where people made a mistake. It was a mistake to lay the grain in grass, as then they could not prevent stock from eating it. The first time that he poisoned his land, he had the misfortune to have 300 ewes poisoned in one week. He engaged a man who said he had great experience in the business, with the result he had stated. What they did now was this: In every little place where there was no grass growing,

Rabbits, N.Z. growing, they laid a little of the poisoned grain. First it was laid with a teaspoon, but the sheep eat the little heaps, and now they spread it as if they were sowing. One grain was strong enough to kill a rabbit. One difficulty they had to contend with was this,—there was no law to enable the inspector of rabbits to force every person to commence poisoning at the same time. The result was that in large properties it might take the gang of men a month or two to reach from one end to the other, so that when one end was cleared a fresh inroad took place from the neighbouring runs. Now, if the inspector had power to order all to commence poisoning on the same day it would be more satisfactory. Poisoning was generally done now by an overseer. They had tried various methods. At one time they used to let contracts, and a man received so much money to do so much work. That was found to be a very bad system, and the grain was sometimes merely buried. That system had been done away with, and those who were most successful in dealing with the nuisance had the management of eradicating it themselves. The Government did it by contract under the supervision of an inspector or agents. There were an inspector and agents, the agents being under the inspector. There might be four or five agents under one inspector to see that the work was done.

Mr. TABART: What distance would that cultivated field of which you spoke be from the nearest warren?

Mr. M'KENZIE: Perhaps nine or ten chains.

Mr. TABART: How far will rabbits travel for their food backward and forward in a night?

Mr. M'KENZIE: Three or four miles. With regard to ferrets, he said that he bred them himself, and he found out that where he turned out a few ferrets he did not want rabbiters. The ferrets were easily bred, but required the attention of a person who knew their habits. They should be fed once a day on porridge and milk, and once on rabbit. They required to be kept clean, and should be bathed once a week.

Mr. BAGOT: They suffer from distemper. They are very delicate in some ways, and cannot stand a bruise. If the young are touched before they are four or five weeks old, the doe immediately kills them.

Mr. HIGGINS: How do you feed them?

Mr. M'KENZIE replied that there were two compartments in the cage, one for sleeping and one for eating. They never took their food into the sleeping compartment. The reason why so many died was that they were not kept clean. One gentleman he knew lost 200 ferrets last year from distemper. He believed that his own success was due to keeping them clean, and he bathed them once a week in soda, soap and water. After the bath they were put into a big box filled with straw, and they dried themselves in the straw. While they were being bathed their houses were cleaned out. They were trained to kill rabbits, and were then turned out anywhere. His own method was to carry them out in a little box, and give them milk and porridge for the first four or five days. They at first came back at night, but in three or four weeks they disappeared altogether.

Mr. TABART: What effect have ferrets had on the acclimatised game?

Mr. M'KENZIE: They killed it clean out.

Mr. TABART: In fact they will attack feathers before fur.

Mr. M'KENZIE said that before he turned out ferrets he lost all his game by poisoned grain, so that the thing was as broad as it was long. There were also a large number of wild pigs which were killed by eating the poisoned rabbits. Now there was hardly a pig to be seen.

Mr. HIGGINS: I suppose that is a great relief.

Mr. M'KENZIE: Oh, yes.

2. Rabbits in Tasmania.

Mr. TABART said that this question was one of the most important that there was to be dealt with in the Australian Colonies. He said so from the little experience they had had in Tasmania of that abominable pest. For the last six years their sheep had decreased in number by 250,000, and the weight of wool they were exporting by 323,000 lb. From this it would be seen that Tasmania also was suffering from the same plague which affected New Zealand and New South Wales. In Tasmania the rabbits had spread over the midland and south-western districts. These were the great breeding places for lambs, but now instead of getting 70, 75, or 80 per cent. they only got 50 or 60 per cent. consequent upon the rabbits taking all the milk producing portion of the feed.

Mr. LANCE: To what do you attribute the fact that the rabbits are not all over the island?

Mr. TABART: They have not extended sufficiently.

The CHAIRMAN: Have they extended over one-half?

Mr. TABART: Oh, yes, fully one-half. Up to the present time the Tasmanian Rabbit Act had been most imperfect, and the Government were now trying to pass a new Bill through Parliament giving additional powers and making the use of poisoned grain compulsory and simultaneous. It also provided that great power should be given to the inspectors in this way,—that where the owner did not carry out the destruction of rabbits, a Government party could be placed on the land to destroy them. A provision was made that if, after the Government party had been on the land fourteen days, he evinced a desire to use energetic measures, the Government party might be withdrawn upon the owners paying the expenses of the party for the fourteen days. The use of phosphorised grain throughout Tasmania had been most successful. One run in particular now carried 900 sheep whereas formerly in only carried 300, and during the time it only carried the smaller number the owner had two trappers employed on 1,200 acres of land. They were making a profit to the injury of the owner of the land. Since he had taken to using phosphorised grain the rabbits had greatly decreased. With reference to trapping, he thought it was most objectionable to have men employed in this work. They did not care what became of the owner as long as they made a large profit in the winter time. They could go away in the spring and summer and allow the rabbits to breed again so as to be a source of profit for the next winter. He thought that employing lads as rabbiters had a most demoralising effect on the rising generation. After lads of 10, 14, and 15 years of age had been trapping for two seasons they would do no other work. Their earnings were spent in the public-house, and the result was in all probability that they found their way to prison. Fencing in the runs had been found to be very successful, but the rabbit proof fencing was not made of wire netting, as had been proposed for use in New South Wales, but consisted of palings. It was an expensive process, and would not suit New South Wales on that account and the large expense attendant on getting the timber. They had boundary riders who had to attend to the fence and fill up the holes made by the rabbits. After they had been filled up for fourteen days or three weeks the rabbits did not attempt to burrow, but simply ran up and down the fence. That was their experience in Tasmania. He thought that the mode of destruction

tion would have to be regulated according to the means and requirements of the different Colonies. The same plan could not be used in all Colonies. In the fenced in lands numbers of owners in sandy lands were digging out the burrows, which had been found to be successful. He maintained that to narrow the rabbits in, and so limit the area over which they had spread, that fencing must be resorted to. Whatever was done to destroy the rabbits would simply cause them to be driven on to new lands, and thus spread them. Therefore, to effectually deal with the pest they would have to fence and also to use poison. With regard to ferrets, he had no experience.

Mr. LANCE: There is an absolute necessity for legislation with regard to people having live rabbits in their possession. We have found that scoundrelly rabbiters would actually trap a dozen rabbits and take them away to a new place.

Mr. TABART: By our new law we have a penalty on persons keeping rabbits or letting them loose.

Mr. TABART said that with reference to ferrets his experience was very limited. He had been an inspector since 1870. About four years ago he was riding on one of his rounds and heard a great commotion at the hut of a rabbitier. Thinking, perhaps, that the hut was on fire he galloped up, and on going to the door found an animal attacking a child. He killed it, and found it to be a large dog ferret, which would have killed the child had it been by itself.

Mr. LANCE: Rats have been known to do the same.

Mr. TABART said that with reference to legislation on the rabbit question, every country would have to adopt itself to its own circumstances. In Tasmania the Government were now asking for an increase upon the tax on sheep to be increased by one-fourth the amount so raised for the destruction of rabbits on Crown Lands. It was useless for private people to do anything while the Crown took no steps to clear its own land. On two of their properties in Tasmania some years ago, one in the south and one in the western portion of the island, the rabbits died off in a mysterious manner, and for some years not a rabbit appeared on the properties; but now they were as badly infested as ever.

Mr. TABART's Report for the year ending 30th June, 1886, on the working of the Rabbit Act in Tasmania (which had been laid on the Table on Thursday, the 30th ultimo), is to the following effect:—

THE RABBITS DESTRUCTION ACT.—*Report by Chief Inspector.*

Sir,

Office of Inspector of Sheep, Hobart, 1 July, 1886.

I have the honor herewith to furnish you with a report of "The Rabbit Destruction Act of 1882," for the year ending 30th June, 1886.

The outlook upon the serious question of rabbits' destruction is not encouraging to the Australian Colonies; it requires considerable and prompt attention, and the passing by Parliament of such stringent measures as shall compel the destruction and eradication of the pest.

I may remark that when the eradication of scab from Tasmania was enunciated by the late Hon. James White, he was looked upon as a theorist, but the successful issue proved beyond a doubt that he understood the task he proposed to accomplish, though it was deemed by many sceptical persons to be an impossibility; and so it might have been, had not the Scab Act of 1870 been repeatedly amended, with more stringent clauses inserted and enforced. These remarks, I maintain, are applicable to the present working of "The Rabbits Destruction Act;" the time has arrived for the enactment of more stringent measures with an increased staff of inspectors.

With the meagre staff at present employed in Tasmania no possible good will or can be effected, particularly when we see the want of co-operation on the part of large property holders with the Department, and when they, instead of assisting the Inspectors, place impediments and obstructions in the way of rabbits' destruction. This, in a measure, may be accounted for by the diversity of opinion expressed by holders of infested land, who are divided as to the best and most destructive methods that should be adopted. The general opinion of those who have had considerable experience, and who have watched closely the operation of the Act, in connection with the obstructive action taken by some owners of rabbit-infested land, and the want of combined action, is that the pest increases daily; this I admit.

The information to hand, taken from "The Report by occupiers" furnished up to date, clearly indicates that to effect any permanent and satisfactory results, compulsory and simultaneous poisoning, with the use of bisulphide of carbon and digging out burrows, must be the recognized modes of destruction. Many argue that with the use of phosphorised grain they cannot find the carcasses of rabbits poisoned, and at once condemn the method, asserting that if the rabbits were killed they would be found. The test is, are the traces disappearing?—if so, the number of rabbits must be reduced. Much capital is made out of the injurious and destructive effect poisoned grain has upon our native magpie, and is taken up as an argument against the use of poison, by those who do not care for this system of destruction to rabbits, and cannot be sincere in their belief, asserting that the bird is the farmer's friend, and destroys worms, grubs, and other insects,—and there is no disputing this point; but yet these gentlemen maintain the magpie is a grain-eater, consequently a destructive bird to the farmer, unless his discrimination is so great that he would rather commit suicide than eat the grain the farmer sows for seed.

Upon referring to "The Handbook of the Birds of Australia," by John Gould, Esq., F.R.S., whose authority cannot be denied upon this subject, he says:—"The magpie's food consists of grasshoppers and other insects, to which berries and fruit are added when procurable."

The use of bisulphide of carbon as a destroying agent for rabbits has been fully tested by a few practical men last season, who are much gratified with its destructive powers. In one instance twenty-five rabbits and rats were taken dead out of the burrow; snakes have also been destroyed by the deadly fumes of the carbon. Those who have used carbon are much impressed with the desirability of using it in the breeding season. The labourers employed for this method should be careful and reliable men.

Trapping, as a means of extermination is, I contend, most objectionable; the more I see and hear of this practice the more convinced I am that the system is bad. At the present time trappers will not work at the rate now offered, from 1s. to 1s. 3d. per dozen for skins, but will allow rabbits to increase unless owners or occupiers engage them to trap at so much per week. In my Report of 1885 I asserted trapping was taken as an occupation by those who wished to be under no control, and only trap so long as the work is reproductive, as has been proved this season; who will liberate young rabbits as unprofitable on account of the lesser money value on their skins; who do not care for the interests of the owner

of

Rabbits,
Tasmania.

of the estate upon which they are working (being rovers for this employment); who will only reduce rabbits to a certain limit, taking care to leave numbers to propagate, making these estates a source of profit for the following season. Another most objectionable feature is that trapping drives rabbits into country not previously occupied, also into the unoccupied Crown Lands; hence the Government are blamed for having lands, warrens, and feeders for the surrounding private holdings,—which I assert is not the case. Trapping has a most seriously demoralizing influence upon the rising youth of Tasmania, who naturally embrace an employment that enables him to go or come at will or, in other words, to be his own master.

The natural enemy of the rabbits I look upon as a thing of the past, but trust the Government in Tasmania will pause before they adopt the course of action New Zealand has, I think, injudiciously followed for rabbits' destruction, viz., the introduction of ferrets, weasels, stotes, and polecats. Granted they will destroy numbers of rabbits, it yet has to be proved whether these animals will not turn their attention to sheep and lambs; we know their appreciation for hen-roosts and all feathers, which I maintain they will attack before fur.

I am very strong in my belief that eventually, to cope with this increasing pest, rabbit-proof fencing will have to be erected. In the case of small holdings it might be constructed by a combination of owners in groups, so as to embrace areas of from 6 to 15 square miles; fencing of this description has been erected by some of the midland proprietors with good effect. When constructed the property so embraced is safe from the inroad of rabbits, and the operation of extermination can be carried on with greater chance of success within the limited extent so protected. Care must then be taken to prevent rabbits from burrowing into these enclosures. In the case of large estates each owner could completely isolate his property. This process would entirely do away with the ill-feeling that now exists as to who are the rabbit breeders.

In consequence of the rabbit pest being such a serious evil and loss to the Colony, I trust that the Government will see fit to admit wire netting for rabbit-proof fencing, phosphorus, phosphorising machines, and bisulphide of carbon into Tasmania free of duty. I believe many holders of land would avail themselves of the concession, and erect netting fence as a block against rabbits.

I must again suggest that section 6 of "The Rabbits Destruction Act, 1882" be repealed, and an Amended Act passed with a clause making the use of poisoned grain and bisulphide of carbon compulsory and simultaneous (from a date to be named), to be continued with other means such as the Department recommends to be followed.

More power must be conferred upon inspectors under the Act; provision must be made compelling negligent owners or occupiers to destroy rabbits. When an inspector finds that an owner or occupier is not using sufficient means to cope with the pest, he shall at once serve a notice insisting that more active means be taken to destroy rabbits; if the occupier or owner fails within seven days to carry this into effect, an inspector shall have power to employ men and destroy rabbits on the property mentioned in the notice, at the cost and risk of the owner or occupier.

The insertion of a clause equivalent to the 14th section of "The Education Act, 1885," (49 Vict. No. 15), to provide against objectionable action being taken when inspectors are laying informations, as has been the case within certain municipalities, is absolutely necessary to facilitate the working of the Department.

Under these circumstances I consider I am justified in asking that compulsory and simultaneous poisoning, with the use of bisulphide of carbon and digging out burrows, shall become law for rabbits' destruction throughout Tasmania. This method, with an increased staff of inspectors, is absolutely necessary to secure that the work is well and truly done.

The additional inspectors required, with the rate of salaries, I will embody in my Report under the "Scab Act," as inspectors under the "Rabbit Destruction Act" are inspectors under the "Scab Act," which I propose to have renamed the "Sheep and Stock Act."

I have, &c.,

THOMAS A. TABART,
Chief Inspector.

The Hon. J. W. Agnew, Chief Inspector.

NUMBER of Occupiers adopting the various modes of destruction specified, during the six months ending 31st December, 1885.

	Total number of Occupiers.	Hunting, shooting, trapping.	Digging out.	Poison.	Fumigating.	Bisulphide of Carbon.	Men working.	Rabbits destroyed as shown by Returns.
Northern District.....	532	783	403	227	3	...	807	380,379
Southern District.....	140	195	63	47	43	...	286	107,263
Midland District.....	203	558	17	93	4	...	672	370,973
	875	1,536	483	367	50	...	1,765	858,615

NUMBER of Occupiers adopting the various modes of destruction specified, during the six months ending 30th June, 1885.

Total number of Occupiers.	Hunting, shooting, trapping.	Digging out.	Poison.	Fumigating.	Bisulphide of Carbon.	Men employed.	Rabbits destroyed as shown by Returns.
678	392	120	309	7	22	1,725	2,841,911

No reliable data is given to show how much time of the men employed was given to rabbits' destruction.
The

The Custom House Report shows the number and value of rabbit skins exported as under:—

	Rabbit skins exported.	Value.
1883...	1,735,857	£20,367
1884...	1,730,626	14,537
1885...	2,872,896	22,572

Rabbits,
Tasmania.

I herewith beg to furnish a Report of the number of prosecutions that have been instituted under the "Rabbits Destruction Act" during the past twelve months, from 30th June, 1885, up to 30th June, 1886, showing the fines inflicted in each district, with the amount:—

MIDLAND DISTRICT.

Cases tried.	Fines inflicted in each case.	Total amount.
	£ s. d.	£ s. d.
3	0 1 0	0 3 0
9	0 5 0	2 5 0
1	1 0 0	1 0 0
1	3 0 0	3 0 0
1	5 0 0	5 0 0
4 cases dismissed.
19	11 8 0

One case was heard in this district for using insulting language to the Inspector, under "The Police Act." Delinquent fined £1 and costs.

SOUTHERN DISTRICT.

Cases tried.	Fines inflicted in each case.	Total amount.

1	2 0 0	2 0 0
1	20 0 0	20 0 0
11	24 13 0

The following Table contains information furnished by Messrs. A. G. Webster & Son and Mr. C. E. Pitt, of Campbelltown:—

	Year.	Phosphorised Grain.	Bisulphide of Carbon.	Phosphorus.	Phosphorising Machines.
Messrs. A. G. Webster & Son.....	1884-5	bushels. 260	lb.	lb. 800	8
Do do	1885-6	58½	170	740
Do do	1886-7	80	165	960	5
Mr. C. F. Pitt	1884	81½	196
	1885	72½	672	62
	1886	98½	464	140½

It will be seen from the above Table the large increase in the quantity of phosphorus used, which method will, I feel certain, shortly become the recognised mode of rabbits' destruction.

Mr. MEREDITH said it was very necessary that phosphorised grain should be properly prepared, otherwise it would not be effective to the extent it ought to be in the destruction of rabbits, and would be dangerous in many places. He was the first person to use phosphorised grain in Tasmania. He was led to do so by the experiments of a gentleman in New Zealand. He followed out that gentleman's plan, which was to make up the phosphorus in an open pot. With all the pains he took to dissolve the phosphorus he found that it was impossible to do it. A large quantity of the phosphorus would always fall to the bottom and precipitate in a cake. Some portions of it would ignite. He obtained his phosphoriser from Victoria. It was perfectly air and water tight. He always prepared the phosphorised oats himself. He found from experience that the proportions given by Raymond were not the best, the proportions

Rabbits,
Tasmania.

proportions advised by him being 6 gallons of water and 100 lb. of grain. That was half a gallon of water too much. The correct proportions were $5\frac{1}{2}$ gallons of water, 100 lb. of grain and 12 oz. avoirdupois of phosphorus. He also mixed in about 4 lb. of brown sugar with beneficial results. The water should be boiled and the phosphorus introduced, revolving the phosphoriser for ten minutes. Mr. Raymond advised two or three minutes. The sugar was then introduced, and the mixture revolved for a minute. The oats were then introduced as quickly as possible, and a little fire was kept under the boiler after the introduction of the oats. The phosphoriser should then be slowly revolved for three quarters of an hour. Then in a couple of hours the mass should be given a few more revolutions. Last of all it should receive a few revolutions two or three times during next day. The mass should be allowed to remain for forty-eight hours, and it was then ready for use. Two or three grains would then destroy a rabbit, and it was utterly impossible to ignite the driest grass with it on the hottest day. He had found that unless the phosphorus was properly mixed it was dangerous to put it near a fence or anything inflammable. If the oats were properly prepared and kept without being exposed to the air it was just as efficacious after a lapse of four months as after a lapse of a week. It might be exposed for three or four weeks and if a person put a grain in his mouth he might fancy that there was no phosphorus in it, but if he were to take the husk off he would at once notice the taste of the phosphorus which had penetrated the grain. With reference to rabbits not taking it when there was abundance of green feed, his experience was different. He had used it when there was abundance of green feed and found that it was taken largely. He had also strewn it in a growing crop of rape, and poisoned numbers of rabbits in that way. There were, he believed, no rabbits in Queensland. A discussion took place at a meeting of gentlemen in Tasmania on the best means of dealing with the pest, and some were of opinion that if rabbits were taken to a district where their natural enemies existed they could not spread. Mr. Robert Jones, a large breeder of stock, had told him of an instance of a station belonging to himself or a friend on the banks of the Ouse. The rabbits were on one side of the river and not on the other. The station was broken up and the shepherd and his wife coming to that place brought a pair of rabbits with them which were a present to the children. They did not like to kill the pets when going away and let them go to take their chance. Within fifteen years after that the rabbits were there in immense numbers. There were the Tasmanian "devil," the tiger cat, the native cat, and the tiger in that part of the country. From that small commencement the evil had extended and had become a perfect curse there. He had made a note of what happened in the Rabbit Conference, Sydney, and he saw it had been suggested that they should form an opinion as to the advisability of the Colonies using wire netting for fencing as one remedy against the pest. He thought it advisable that they should consider what was the best rabbit-proof wire netting as regards height, size of mesh, and gauge of wire. At the time that he was using phosphorus he always put it on their feeding grounds; also near to, but not on the mounds they make and frequent—about a teaspoonful—scattered thinly. When he found the feeding ground, which any man could detect, he sowed it like grain, but never put it in dabs. He might say that he had used it more sparingly than any person who had the same extent of land, and had poisoned the same number of rabbits. It struck him that he could invent a fumigator cheaper than any he had seen. Accordingly he got a large pistol, and by firing it into the burrows destroyed everything in them. In some of the burrows they found snakes, iguanas, the native cat, and the domestic cat. He must, however, caution them that if they resorted to fumigation they destroyed not only the rabbits but the natural enemies of the rabbits in the burrows. Whenever his dogs ran a rabbit into a burrow he gathered a handful of fern, grass, or twigs. He then put about two charges of powder into the pistol, rammed it down with paper, thrust his arm as far as he could up the burrow and discharged the pistol, after which he crammed the fern into the mouth of the burrow, and closed it firmly with the earth or sand which had been scratched out. He would then go on and do others in the same way, and never were those burrows opened from inside or out. Sometimes there were double or treble burrows, and where they existed he did the same at each opening, and never did a single animal come out or go in again. In Tasmania they objected to fumigation because it destroyed not only the rabbits but their natural enemies as well. He was advised to try trapping. He got four or five dozen traps, got the necessary information from old trappers, and attended to them every day. He caught more domestic cats gone wild than he did rabbits, so he abandoned trapping and fumigating. He adhered to poisoning, the result being that he cleared the place so thoroughly that, whereas once a person could get a bag of rabbits in a couple of hours within a quarter of a mile of his cultivation paddock recently, some friends went out for the whole of the afternoon with six good dogs over favourable ground. They turned up two rabbits and got one of them. Trapping and fumigating were both injurious systems to pursue, but phosphorised grain was efficacious and adapted for every place. He would suggest to those interested that in a warm climate greater precaution was required in preparing phosphorised grain. He had known phosphorised grain to be prepared in the same kind of machine as he used. It was sent for by a neighbour of his. The grain was put in a garden which had just been formed where the fowls had scratched up all his seeds. The fowls eat the grain and got fat on it, and that grain was advertised for sale as having been prepared on the Raymond system, and it was sold for the purpose of exterminating rabbits.

Mr. HIGGINS: Have you found the domestic cat destructive to the young rabbit.

Mr. MEREDITH replied that the tame cat was destructive to old and young rabbits alike. He had seen a cat hunting a rabbit like a dog. The cat chased it for fully 150 yards until it took to cover again. Generally, however, the cats laid in wait and sprang upon the rabbits. Cats would bring home a rabbit or two now and again, and it was a common thing for a cat to bring home a rabbit bigger than itself; so convinced was he of the great advantage resulting from using domestic cats that he would give another instance in point. His house was situated on the banks of a river. On the opposite side he had a neighbour, and there was a considerable amount of river growth, scrub, and other matter between their two houses where it was impossible to lay grain, from the fact that the domestic pigs and the poultry sometimes running about. It was a favourite sport of his to practice across the river, with a rifle, on the rabbits in his neighbour's garden. The rabbits used to come up to the house, and when he commenced poisoning around for a distance of a quarter of a mile he found that there were rabbits about. There was not the slightest doubt that cats had destroyed them, as now there was not one to be seen where they formally existed in hundreds. Where they existed in the cover and could not be poisoned the cats were constantly to be seen carrying rabbits about in their mouths. He had turned out a number, and they were often to be seen sunning themselves in front of the burrows. The destruction of the native enemies of rabbits was a mistake, and trapping and fumigating were unnecessary. Mr.

Mr. PARK said that tuberculosis would not kill the rabbits off quick enough. In Tasmania over 80 per cent. of the rabbits were affected with tuberculosis, and, strange to say, full-grown rabbits were sometimes found which had suffered from tuberculosis and had recovered. The marks could be seen where the tubercles had existed and had healed, the liver having become perfectly healthy. Certain parasites were supposed to have destroyed them at Shawfield and at Lewis' Neck, Cambridge, and Wellwood. The Hon. W. A. B. Gellibrand promised to get him some of the rabbits so affected, but he had been unable to do so. Mr. Cecil Parsons, a squatter in New South Wales, had told him that the rabbits in his district had exhibited signs of a skin disease, beginning at the nose and extending over the body. The rabbits actually became so brittle with the disease that they would almost snap in two like a carrot. The disease destroyed the rabbits in that district. Mr. Gellibrand had told him that it occurred mostly in the wet season. He wanted to ascertain whether the parasite was *strongylus contortus*, which was sometimes to be found in the stomach of sheep and rabbits. At Lewis' Neck there had been 1,800 sheep last year, and now they were reduced to 1,200, the remainder having died from worms in the stomach. He had the sheep drenched with turps, and no more deaths occurred. He never saw the rabbits so much infected with parasites as at Dennison, near Bothwell. Something might be done with the aid of science to exterminate the rabbits, but he had very much doubt if tuberculosis would do anything more than affect the young.

Rabbits—
Tasmania,
Victoria,
and South
Australia.

3. Rabbits in Victoria.

Mr. CURR: I have no special knowledge of what has been done with regard to rabbits in Victoria. It is not in my department.

Mr. GORDON: What is the total loss in New Zealand from rabbits?

Mr. LANCE: It costs us now half a million a year.

Mr. M'KENZIE: It has cost New Zealand 5 millions up to the present time. Teschmacker, estimated it at 10 millions.

Mr. LANCE: It may be safely set down at 5 millions.

4. Rabbits in South Australia.

Mr. BAGOT said he would take the Chairman's questions as they were put. He might say, to commence, that personally he had never come into direct contact with the rabbit plague. Still, many of his friends, run owners and stockholders, were fully impressed with the terrible nature of the pest, and had felt its baneful effect on their purses. The rabbit pest formerly existed almost entirely on the best and richest lands of the Colony, but they had been eradicated almost without exception from the lands worth anything. This was effected chiefly by digging out burrows and by the destruction of the rabbits in the ways already mentioned. At the same time, he agreed with what was said by Mr. Lance and others, that the means adopted for the eradication of the rabbit had been the cause of their spreading all over the country. He believed that if South Australia had gone in for a definite system when the Colony first commenced to realise the magnitude of the evil, and the Parliament and the country had worked as industriously as individuals the evil might have been stamped out. Resolute landholders in getting the rabbits off their lands, hunted, trapped, and shot them until they spread into the worst country—into the scrub and hills—where the land was of little value. The first question was, "Are there any rabbits?" and to that he had given his answer. The second was, "To what extent have they spread?" The reply to that was, that they occupied the greater portion of the south-eastern districts, but they had been driven out of the richer portion. They had spread over the Mallee country, much of which was similar to the Wimmera district, and had spread along the Murray through the pastoral districts to the north-east to about 31 or 30 south latitude, spreading across the whole country. Probably 30,000 square miles of South Australia was infested with this rabbit pest. The third question was, "What do you estimate the annual loss to your Colony from rabbits, and the total loss?" He could not hazard a guess. He had not prepared any such information, nor did he think it would be possible for any one in South Australia to give it. The Government had not given the question any serious consideration until within the last few years. The fourth question was, "Have you legislation for the pest, and if so state its features." There had been two or three Acts passed, but they had been passed either wholly or in part as new experience came, and the main principle of the present legislation was the wholesale destruction of rabbits by landholders and stock-owners. The Government undertook to clear all lands within their control, and the other occupiers of land, whether as leaseholders or freeholders, had to destroy all the rabbits on their land. There was a department known as the Vermin Destruction Department. There was a chief inspector, and Sub-inspectors, who were pretty numerous. They were spread about the country in the different districts and it was their duty to see that the Act was rigidly carried out. They served notices on the owners in case of continued neglect. Within a certain time the owners were required to institute measures for the destruction of the rabbits, and if they continued to neglect the notice, there was a system of compulsion brought into action by which Government rabbit parties were placed on their lands, and not taken off until the rabbits were destroyed. The whole expense was charged to the landholder and was recoverable in Court in the most simple and summary way. The Government tried the system of paying scalp money, and had a fearful experience of it. Numerous instances were recorded of rabbits having been trapped, carried by persons to various distances and turned adrift in places where they could not be noticed until they had increased to such an extent as to become a positive evil. The aborigines had made pets of them and carried them about in their blankets, and it was reported when the question was under discussion, that they carried them about from camp to camp and turned them adrift. In this respect the Act was insufficient, as it only provided a penalty of £100 for turning a rabbit adrift; but such regulations always broke down, as it appeared that the act of turning the animal adrift must be proved to be wilful. In the New Zealand Act it was a penalty to possess a live rabbit, except for scientific purposes. If it were made absolutely penal to be in possession of a live rabbit except under the condition he had named, it would go far towards putting a stop to the rascally practice of turning rabbits adrift in order that they might propagate and increase in new places. The fourth question was, "How is the work of destruction done?" Every known means had been tried. The country over which the rabbits had now spread—the saltbush country—was so large that it was difficult to enforce such stringent regulations.

However,

Rabbits, S.A. However, people are beginning to realise the fact that fencing must precede all attempts to effect the actual eradication of the pest. Fencing was being largely resorted to by individuals, but there was no compulsion in the matter. The Government had done what they could in that direction by abolishing the duty on wire netting and allowing it to be carried on Government railways at a cost below that of ordinary merchandise. That was a matter which should be fairly considered by the other Governments if they had not done so already. In South Australia there had been a duty of 30s. a ton on wire netting, which was abolished. Bisulphide of carbon was largely used, and they had a factory for preparing phosphorised oats. Arsenised water was also used. The only safe way to use it was to remove the sheep from the paddocks in which it was placed, or to fence off a corner and have men and dogs near where the sheep were collected. Hunting with dogs and shooting had been discouraged, on the ground that the use of such means spread the rabbits over a larger area. Under the same Act which dealt with rabbits eagle-hawks were once destroyed, a fee of half-a-crown a head being paid by the Government, while the vermin boards in some cases increased the fee very much. The funds of the vermin destruction boards were raised by rates levied on the sheep and cattle, the maximum on sheep being £2 per thousand. That had made a large fund available in each district, and a great deal of it had been absorbed in the destruction of rabbits. They had also a good deal to do with dingoes and marsupials of all kinds, and the marsupials had been very much thinned down. The eagle-hawk was at one time destroyed under the Act. The ban had recently been removed from the eagle-hawk, it being found that though it might take an occasional lamb it destroyed an immense number of rabbits. He had seen their nests in tall trees, the ground around which was covered with rabbit bones. Wire netting was largely resorted to, as he had said. Some gentleman had asked for information as to the size of the mesh, the gauge of the wire, and the height of the netting. Formerly the first persons who used wire netting were satisfied with a height of 3 feet, 6 inches being buried in the ground. It was found that the rabbit invariably got under the wire when it was put straight down in the ground, and the consequence was that the wire was now turned out at an angle of 45 degrees on the infested side, according to the appended cut :—

Their experience was that the rabbit started to burrow a few inches back from the wire and stopped on reaching the netting. It had been found that galvanized wire netting did not stand in the earth, and in consequence they had to import wire netting in strips 6 inches in width. These strips were put down in separate pieces, and could then be replaced as it rotted away. The netting used was $1\frac{1}{2}$ -inch mesh, but the strength or gauge of the wire depended entirely on the fancy of the person who bought it. 2-inch mesh had been used, but it was found that small rabbits got through it. Two and a half feet out of the ground had been found to be insufficient. A friend of his who was interested in the matter tried an experiment to ascertain whether such netting was high enough. He had a number of rabbits put into a barn and a piece of two and a half feet netting placed across the centre with staples to secure it, so that there was no possible way of the rabbits getting from one side to the other except by climbing over. Among the rabbits were a number of yellow and black ones which were on one side and greys on the other. He put abundance of feed on one side of the netting to ascertain whether the temptation would bring them over, and he found that the yellow and black rabbits were sometimes on one side of the netting and sometimes on the other. The consequence was that all the wire netting which was now being bought was 3 feet high, and in addition to that the stockholders who had made a study of the subject put a rail on the outside of the post so as to give the wire netting an outward trend on the top. One landowner had completely surrounded his property with 3 feet 6 inch wire netting, 6 inches of it

it being in the ground, turned out a little at the top by being fixed to a rail. He was satisfied that it was absolutely effectual. The wire netting cost about £30 a mile, and the erection of it cost very little extra on a fence already constructed. The seventh question, as to how in his opinion the work of destruction ought to be carried on, he had no further suggestion to make. He would be very happy if he could, for every encouragement ought to be given to get persons of ingenious minds to invent an effectual process. The primary object should be to discover a means of destroying the rabbits when the grass was growing and was plentiful; it was easy to use poison when the feed was scarce, but the difficulty was to induce them to take the poison when they could get green feed. He thought that the value of wire netting had been proved by what had been done in South Australia, and every reasonable facility should be given to encourage people on Crown Lands to protect their holdings by the use of netting, by the Government contributing part of the cost. The last question was—"Have you any general suggestions to offer?" He could only express a hope that inventive geniuses should be stimulated by the offer of a large bonus for the discovery of some disease or something which would destroy the rabbits in its own course. He thought also that experiments, such as they had proposed in South Australia, should be encouraged as much as possible—of course under all proper precautions. He meant that they should try to introduce some infectious disease fatal to the rabbit, and not to stock or domestic animals. In Melbourne, questions were asked in the House whether steps had been taken to introduce any such disease. It was proposed to do it in South Australia under the supervision of scientific men of high attainments. It was proposed that the experiments should be carried out on an island which was situated close to Adelaide, and separated by an arm of the sea from the main land. The experiments never took place, and he thought it was a pity that circumstances interfered with the carrying out of them. The opposition of public opinion which was raised to it in New South Wales and Victoria was sufficient to deter the Ministry of South Australia from taking any further action in the matter. When the Government was urged to go on with the subject they said, "You see what a storm it has raised in Victoria and New South Wales." It was very hard to get squatters into Parliament, and only slightly interested persons had the handling of the subject. The attempted eradication of rabbits had been carried on under harsh laws, which were not effectual, and which, he was satisfied, had spread the plague. For instance, in the case of his own Colony, they could see how the newspaper correspondents kicked up a row about the introduction of this disease, and yet here was the opinion of all the delegates of the Colonies saying that the only effectual way to deal with this plague was to introduce some such disease. He thought that the Colonies should join in offering a large bonus to scientific men to produce something which would destroy this pest. The engineers, while making the Victorian border railway-line, found the rabbits a great nuisance. The rabbits burrowed into the earthworks, and interfered seriously with the work. The result was that the contractors and others interested in that part of the country urged the Government to make one side of the fence rabbit-proof, which they should have done. Then there would be one fence, from the river Murray to the neighbourhood of Border Town, from which stockholders could run their fences. They were now, in conjunction with Victoria, fencing the boundary between the two Colonies. There was no fence to the north.

The CHAIRMAN: What did the owners do after they had enclosed their runs and found rabbits inside?

Mr. BAGOT: They cleared their lands of rabbits.

The CHAIRMAN: What means did they adopt?

Mr. BAGOT: They used every means. The first thing was to root out the burrows and kill the rabbits.

5. Rabbits in New South Wales.

Mr. HIGGINS said he might state, on rising, that he was one of those who had no practical acquaintance with the rabbit. That is to say, the rabbit had not reached his part of the country, and they were very desirous of preventing it coming there. As they were aware a Conference sat in Sydney some time ago. He was present at the first Conference as a member, and was also present at the second Conference. The first idea mooted was to prevent the spread of the pest, and they desired to do everything possible in that direction. The next step suggested was to destroy it. They were of course aware that there was a Rabbit Act in this Colony. The members who attended the last Conference were unanimous with regard to the utter uselessness of that Act. If he remembered rightly, the term used towards it was "unmitigated failure," and they all cordially and thoroughly indorsed that expression. Some gentlemen were of opinion that there should be a clause in the Act making it penal for anyone to have a rabbit in his possession. He might point to the 36th section of the Act, in which it was made penal for anyone to have a rabbit in his possession in the Colony. He only stated that, as it appeared that some gentlemen present were not aware that such a clause was in our Act. Our Victorian friends (he did not know whether they were aware that that clause existed), sent dead rabbits over here, and they were hawked about Sydney as late as June, although there were bonuses on the skins, in some places as high as 5s. and 10s. It was an easy way of making money to send the rabbits over here and the skins to the interior. A newspaper found fault with him for bringing the matter under the attention of the Conference, although this clause was in force. He wrote a letter to the editor pointing out that if he knew anything of the subject he would not have written the paragraph. The outcome of it was that the Minister here some little time afterwards published an advertisement in the Gazette, but he did not know whether anything appeared in it offering rewards, or pointing out the penal clause in our Act. Since then he did not know if they brought rabbits over from Victoria. At all events, it was done through laxity in the administration of our Act. If Victoria had known the great damage that would have been done to the continent of Australia, her authorities would have taken care long ago to have the rabbits destroyed. The Conference assembled, and the leading feature was the question how to deal with this pest. They could only arrive at this conclusion after hearing the various evidence given of how the rabbit had been dealt with by the different colonies, and how the Act was administered, that our Act was administered in a very loose way. For the first year the amount of money spent in the extermination of the pest was estimated at from £70,000 to £80,000, inclusive of the taxation levied on the stockholders towards the fund for the extermination of the rabbit. Our Government subsidised the fund to a large extent. He thought that the assessment for the Rabbit Act on the pastoral people

Rabbits,
N.S.W.

was something like £40,000. The second year the expenditure was something like £104,000. The third year the expenditure was about £120,000, and it was increasing from year to year. That of course was irrespective of the private expenditure of various owners of land and lessees of runs. Therefore they would see what a terrible pest the Colony still had to cope with. The rabbit was not diminishing—rather the contrary, it was increasing; and without some miraculous thing being discovered it was not likely that its numbers would diminish. At both Conferences that had been held the members were very desirous of obtaining every possible information from outside sources. One of his own suggestions was, that the Minister should write to the Government of New Zealand, where they had larger experience than in the other colonies, and ascertain their opinion as to what should be done. The Minister, however, did not see fit to do so, and thus this Colony lost some very valuable information. If they had the valuable information given to that Conference that had been given that day this Conference would be in a different position. He took this opportunity personally, and on behalf of the pastoralists of New South Wales, of offering his best thanks to the various gentlemen from the different colonies who had given such very valuable information with regard to dealing with the pest. Mr. Holmes, son of Mr. Matthew Holmes, volunteered to give them some information, and it was placed on record in their proceedings. It was valuable, but not in any way comparable with what had been given to the present Conference. The second Conference was called together without anything being done by the Government other than the proposition to carry out one of the leading recommendations of the first Conference, namely, fencing. In the interval the matter of fencing was not gone on with. Our politics interfered with our progress to a large extent. The former Minister was a strong advocate of fencing, and did all in his power to get rid of the pest. The present Minister coincided with him on these points, and was heart and soul in favour of the destruction of rabbits. A letter was read at the previous Conference from Mr. M'Lellan, who bred ferrets largely, and that gentleman strongly recommended the introduction of them, but the only suggestion which had come to anything was the fencing. An able paper was read by Mr. Hebden, a pastoralist, residing on the Murrumbidgee, who gave it as his experience that the natural enemies of the rabbit, such as the iguana, the native cat, the tame cat turned wild, were great destroyers of rabbits, especially of the young. He had listened with great interest to the information given by Mr. Lance and Mr. M'Kenzie with regard to ferrets, and he must say that they were very lucid in their descriptions, and he thought that from what they had stated our people now possessed information which they did not possess before, and which would be very valuable. He was sorry to hear that ferrets would not live in waterless countries. Unfortunately our country was waterless in the interior, and that was where the difficulty would ensue with regard to turning out ferrets. When the second Conference met tenders were about to be decided for the rabbit-proof fencing between Bourke and Narramine. Several gentlemen thought it would be better to bring the fencing towards the Forbes district, away from the proposed original line, to between Nyngan and Narramine, and a resolution was carried to that effect. He considered that no time should be lost, and he proposed a resolution, which was carried, for a deputation to wait on the Minister to urge him to do this. Next day, however, on the Conference thinking the matter over, they came to the conclusion that it would be better not to push the matter, but to see what the wisdom of the Conference would be with regard to the subject, and he therefore withdrew the motion. Now the line of fencing was actually going where it was originally intended, and in his opinion very properly so too, as he believed that the rabbits would be outside the proposed line. Now, however, they would be within it, and he hoped that the Government would see their way to call for tenders not only for the fence from Narramine to Dubbo, but to extend it down to the Murray.

The CHAIRMAN: The Minister intends to call for tenders for this part of the line of fence, but at present he was not empowered to do so. He cannot make use of the existing fences without fresh legislation. About one-half of the Colony is now infested with rabbits, and what makes matters worse, is that they are getting into the great pine scrubs between the Lachlan and the Darling.

Mr. HIGGINS said that they occupied an area as large as the whole of New Zealand. The second Conference also recommended local boards. Several members of the Conference felt that under a squatter administration local boards would be a perpetration of the evils of the present Act. The Conference thought it would be best to have a central board to become the directing head of the local boards under the Minister, as it was felt that if the local boards had not some central control that they would act entirely for themselves. The Conference decided that the Colony should be divided into eastern and western divisions—that was the infested and non-infested districts—and run a fence between the two. They decided to continue the taxation upon themselves and out of the money so raised to pay £5,000 a year to the men in the western division to help them and get rid of the rabbits, they being subsidised by the Government and levying taxes upon themselves. The landholders would also help to maintain the barrier fence between the two divisions. That, after a good deal of discussion, was accepted, and that was how the matter stood as regards the barrier fence. One of the things proposed at the Conference was, that there should be fences within the infested district—that two or three runs should join and have a cordon of fences. He made a proposition which was not carried, that they should go further. The view he took was this: that the people who owned private lands within the infested districts should at their own cost destroy the rabbits on their lands, and that the State being a large landholder should, if they did not accept the onus altogether of destroying the rabbits, at least do so to a large extent, and also help those men in their holdings, either by the loan of money at a small interest, or else make them a great concession with regard to their leases. It was found best not to press anything of that kind. The groups of runs were decided upon. If they looked at the result of the Conference they would find that that matter was decided upon, but, with the exception, as he had said before, of this barrier fence, nothing had been done that was recommended by the last Conference. Our position was this—the rabbits were still increasing and were more numerous than ever. He was in hopes that some gentleman would have been present from the Rabbit Department who would have given valuable information of what had been done. The difficulty they saw with regard to the leases was that they would have to go back on the Land Act if they desired to do anything, and alter portion of a measure which had taken twelve or thirteen months to pass. How the Government intended to deal with the evil he did not know, but there it was, and it was increasing. Reference was made to the matter of fencing by some of the gentlemen now present in connection with the size of the wire netting. The mesh should be 1½ inch in diameter, and the wire sixteen or seventeen gauge, as the

case

case might be. The conference of delegates carried a resolution that our fences should be from 3 feet 6 inches to 4 feet high, and of this 6 inches at least should be in the ground; that was provided for the barrier fence between Dubbo and Narromine. They desired to ascertain if the rabbits climbed up the wire netting, and Mr. Walter Lamb gave them information on that point. He said he had seen the rabbits climb up the wire. If hares were hard pushed by dogs they would go right over the fence. It was desirable that the Australian Governments should offer a reward for some means, rapid in its operation, for the destruction of the pest. The reward should not be given until the thing was proved to be a success beyond all doubt.

Mr. CURR did not agree with the proposal to have the Act administered by boards. He said so, having had a good deal to do with boards. They were intelligent men, but you could not get outside men who knew as much as those who had studied a subject. With regard to scab in Victoria, until the boards got sick of it and gave it up very little progress was made towards its eradication.

Mr. MEREDITH: When we had rabbit boards in Tasmania the pest increased, because the board relied on dealing with it by bounties on the scalps and skins.

Mr. CURR: Owing to the prosecutions which took place complaints were made, "Oh! here is the inspector pursuing this man."

Mr. HIGGINS: We find that Acts are better carried where there are boards than where there are not. Nothing can be better worked than the stock and pastures boards, and the result was that large numbers of kangaroos were destroyed, and the animals were becoming scarce. It is impossible for those people who administer Acts to do impossibilities.

Mr. M'KENZIE: The people in New Zealand think they can manage themselves and their own affairs better by means of boards than from Wellington.

Mr. GORDON said that all they had done in the way of coping with the rabbit pest in Queensland was to put a fence on the border. At first it was proposed that there should be parallel fences. Now they had a single line of fencing. At the public crossings there were paddocks a mile square for the purpose of catching those rabbits which might pass the barrier. The netting was sunk 6 inches into the ground perpendicular. With regard to the destruction of marsupials, he believed that it was he who made a feature of the bonus system, and now he was disgusted with it. While the marsupials were plentiful it worked well, but not so when their numbers were thin. The only thing to do was to repeal the Act allowing persons to keep rabbits.

The CHAIRMAN said ours is almost a copy of the New Zealand Act, and the leading provision of that Act is that the owner of the land shall be compelled to clear it of rabbits. He went on to say that while the New South Wales Government paid from the Consolidated Revenue a considerable portion of the money expended in the destruction of rabbits, the principle first acted on was this, that the landholders should be treated liberally, but that if they were not at first inclined to kill the rabbits off with reasonable dispatch the continued expense to which they were put would be sufficient to compel them in the long run to do good work. It was, however, found that, without fencing, when they cleared their lands fresh supplies of rabbits came from other lands, and that principle was abandoned for the bonus system. Under that system, although not a good one, they had killed a great many rabbits, and through the liberality of the Government in giving bonuses there were comparatively few in the infested country, but they had now spread over a large area. With fencing and other effective work, however, they hoped to overcome the pest, especially as the delegates from the Eastern Division at the recent Rabbit Conference had made such a liberal offer of assistance. They offered that, if the Government put up a barrier line between the infested and the uninfested country, they would double it by enclosing the runs along the barrier line with rabbit-proof fences, and they guaranteed that no rabbits would be allowed to exist on the eastern side. They had, therefore, fair hopes, if effect was given to the resolutions of the Rabbit Conference, of arresting the spread of the pest, and ultimately getting rid of it in New South Wales.

The CHAIRMAN laid on the table a copy of a Bill, framed by the Minister for Mines, to induce the discovery of new methods for the destruction of rabbits, and to protect all patent rights in connection with the same. The Bill is as follows:—

"WHEREAS it is expedient to induce the discoverers of new methods for the destruction or extermination of rabbits and other noxious animals to make such methods known and to provide for the protection of such methods for the benefit of the discoverers Be it therefore enacted by the Queen's Most Excellent Majesty by and with the advice and consent of the Legislative Council and Legislative Assembly of New South Wales in Parliament assembled and by the authority of the same as follows:—

"1. Notwithstanding anything to the contrary contained in any Act relating to patents or patent rights any person who has discovered any new method or process for the destruction or extermination of rabbits or other noxious animals may deposit in the Department of Mines Sydney a written description or specification with or without illustrative models plans or drawings and such description or specification shall forthwith be registered in the said department in the order of receipt and thereupon the method or process referred to in such description or specification shall be deemed the exclusive property of the person or persons depositing the same hereinafter termed the owner and any person who shall infringe pirate or use such method or process without the sanction and consent of the owner shall be liable to a penalty not exceeding _____ pounds for infringing or pirating such method or process and not exceeding _____ pounds for using such method or process without the sanction and consent of the owner.

"2. The owner of any method or process registered as aforesaid shall be at liberty to sell or transfer his property in such method or process and to have the name of the transferrer registered in the Department of Mines."

Mr. LANCE's motion was agreed to.

Gas for the Destruction of Rabbits.

The SECRETARY read the following letter from Mr. Oscar Stub, 22, Grey-street, East Melbourne, under date 27th September:—

SIR,—Enclosed I forward to you a report on my partner's invention for destroying the rabbit pest, and the *phylloxera vastatrix*, which appeared in the *Argus* of the 23rd inst. We can likewise produce a liquid which will destroy noxious plants in a wonderfully short time at a very small outlay. Any further information will be gladly given by your obedient servant,

OSCAR STUB,
The Secretary of the Stock Conference, Sydney.
The

Rabbits, &c.

The following paragraph from the *Argus* was appended to the letter:—

A new invention for the destruction of rabbits was tested yesterday afternoon in an enclosure off Grey-street, East Melbourne. The destroying agent in this system is a species of gas, the constituents of which are kept secret, but which are said to be so inexpensive that a shilling's worth of gas will kill 150 rabbits. The meter, in which this gas is self-generated, is equally economical, its construction costing only 4s. The meter, with the materials for the formation of the gas within it, is placed at the mouth of a rabbit burrow, and when the gas is generated a small pipe of India-rubber, about 2 feet in length, conveys it into the burrow. The gas gradually fills all parts of the burrow, with the result that every rabbit breathing it is asphyxiated. At yesterday's experiment several live rabbits were placed in boxes connected by a pipe with a meter, the tops of the boxes being covered in with glass to enable the spectators to observe the effect of the gas. In about six minutes the gas forced its way into the nearest box. The rabbits on first inhaling it became exceedingly vivacious, but in a few seconds they ceased jumping, and died almost simultaneously. A few minutes later the gas arrived at the second box of rabbits, and produced precisely similar results. To demonstrate that the gas was innocuous in the open air, the inventor, M. Le Blanc, removed the glass covering from one of the boxes, and held a live rabbit over the escaping gas for some time, with no perceptible effects on the animal; but as soon as he placed the rabbit inside the box and covered it in with the piece of glass the animal expired. The invention is claimed to be applicable also to the destruction of the *phylloxera* in vineyards. Its promoters are now in correspondence with the Government of New South Wales on the subject of utilising the invention for the destruction of the rabbits in that colony.

MR. LANCE: Anything of that kind will not do for New Zealand. We use ferrets, and what kills rabbits kills ferrets; so we prohibit the use of any noxious gas.

MR. TABART: I think that this mode would be ineffective in this country.

MR. TABART moved, and Mr. PETER seconded,—“That the letter be acknowledged with thanks.” The motion was agreed to.

3.—INTRODUCTION OF FOREIGN ANIMALS.

MR. MEREDITH moved,—“That the consideration of the introduction of foreign animals take precedence on the meeting of the Conference to-morrow.” Mr. BAGOT seconded the motion. The motion was agreed to.

MR. TABART laid on the table a paper containing his answers to the questions prepared by the Chairman *re* the rabbit pest.

It being half-past 4 o'clock, the Conference adjourned until 10:30 a.m. on the following day.

WEDNESDAY, 6 OCTOBER.

EIGHTH MEETING.

IX. INTRODUCTION OF FOREIGN STOCK.

1. PROTEST BY QUEENSLAND OWNERS AGAINST WITHDRAWAL OF PROHIBITION.

The following is the letter from Mr. Wilkinson, to the Chairman, on Wednesday, the 29th ultimo, forwarding protest by certain breeders in Queensland against the withdrawal of the prohibition:—

Mr. Robert Wilkinson to A. Bruce, Esq., Chairman, Australasian Stock Conference, Sydney.

Sir,

12, Spring-street, Sydney, 29 September, 1886.

I have the honor to inform you that I am in receipt of a telegram from Brisbane, instructing me, on behalf of Hon. S. Smythe, M.L.C., Hon. W. Forrest, M.L.C., Messrs. J. M'Whannell, M.L.A., J. Nelson, M.L.A., J. Stevenson, M.L.A., F. Murphy, M.L.A., Lumley Hill, M.L.A., D. Wallace, M.L.A., J. Lalor, M.L.A., E. Wemholt, and James Tyson, for themselves and other Queensland stock-owners, to signify to your Conference, and place on record their most emphatic protest against the removal, under any conditions, of the prohibition against imported stock, as they consider the benefit problematical and risk undoubted, seeing that foot and mouth disease was introduced into Victoria some time ago, and scab into New South Wales more recently. I have, therefore, the honor to request that you will be good enough to read this letter to the Conference.

I have, &c.,

ROBERT WILKINSON.

MR. VALENTINE moved, and Mr. BAGOT seconded,—“That the letter be received and the receipt of it acknowledged.”

MR. CURR moved,—“That the introduction into Australasia of all bovine, ovine, equine, porcine, caprid, feline, and canine animals from places outside of Australasia shall be prohibited, except for the purpose of introduction into Zoological Gardens,” and in doing so said that anything they had yet considered was of secondary importance to the question of the importation of foreign stock. Anything they had done with regard to diseases, rabbits, &c., were all matters to be met with in the colonies, but now they came to dealing with diseases which had not yet reached the colonies. After recalling his many years of practical experience, and the many researches he had made into the best authors of modern times, he could come to no other conclusion as to the matter of breeding. The subject was dwelt on by Darwin and other writers who were only known to the few, and many might think that his own conclusions were far fetched—that is, if they had not gone into the matter in a theoretical as well as a practical manner. One thing that seemed to be traditional in the minds of men was that England possessed all excellence in stock. There was no doubt that England did possess a great deal of excellence in stock, but how did England come to be possessed of it? In the time of the fathers of gentlemen then sitting around the table the excellence of England began in pigs, pigeons, sheep, draft horses, and all other stock except race-horses. How was it that she became so celebrated in stock that her race-horses beat the Arabs and other famous importations? How was it that this excellence with regard to horses was obtained? It could not be by importation, because the imported horses could not do a mile or a mile and a quarter in the time it was done now in England? It arose simply in this way: The breeders of horses, urged by desire of gain and aided by experience, found that the old system of selection was the best—that is to breed from horses which were winners. They found by experience that they must work on that system, and by degrees they acquired the amount of experience which they now possess. Admiral Rous, the famous racing authority, had pointed out that there was no horse in the world which could vie with the English horses in the matter of speed. Who made the short-horn cattle? That was of course only a name for them. They had gradually acquired certain qualities and the square shape by which they became recognised. Then the head and feet were small, as those were the parts which afforded least meat and naturally were wanted small. The breeders of sheep took these things into consideration, and

in

in one life-time brought the Leicester cross-bred and Southdown sheep to their present perfection. Since then there had been no improvement to any great extent. He had noticed the result of the theory in many places—on the Murrumbidgee for instance in the old days. He had seen a mob of 20 or 30 horses which had developed great carrying powers, and he had asked the owner how this came about. The reply he got was that they had never been crossed with any imported horses. In the matter of work a donkey would kill a thoroughbred. The argument he was using might well be taken up with any other animal. He took horses because he understood them better than he did some other animals. The merino sheep originally came from Spain. Towards the end of the last Century they were introduced into Germany, England, America, Australia, and France. The most remarkable thing about these sheep from the point they were looking at was that they were now all different from the Spanish merino. The latter, from the climate and other causes, developed certain fine qualities of wool. No one would now introduce the Spanish merino sheep here to improve his sheep. Anyone who was well up in sheep could put his hand on a merino and say what country it came from. They now came to the point, "What is the Australian sheep?" It had developed a type of its own. No other country produced the same wool we produced, and if we began to import German, or French, or Spanish merinos and give them fair play, in five generations they would be exactly the type of sheep we have here. If that be so, what was the use of importing sheep which were different from our own, the progeny of which would become the same as ours. It might be said that stockowners would derive a temporary advantage from these importations. Suppose they did for the moment. They might gain a certain profit, but there was a certain risk. There had been an outcry now and then to open the ports, but when they were opened what occurred. When they were opened they were opened for a couple of years. Mr. M'Culloch, of Melbourne, introduced a little herd, but no second man did so. Of the principal breeders of cattle in Victoria three introduced two bulls apiece. They were of very secondary quality, nothing like what they had in their own herds. They were simply introduced by the owners so that they might say, "Oh! we have imported bulls as well as Mr. M'Culloch." In the old days of Kirk's bazaar an imported bull would fetch twice as much as a colonial bull which was a better animal.

Importation
of Foreign
Stock.

The SECRETARY, at the request of Mr. CURR, read the report by that gentleman on the dangers attending the importation of foreign stock, incorporated in a report of the Secretary of the Department of Agriculture of Victoria, 1884.

The Report is as follows:—

In dealing with this question I will begin by referring briefly to the evils we have already suffered from the importation of foreign stock into the Colonies and the risks which are inseparable from the practice.

For many years after the first introduction of the domestic animals into New South Wales they enjoyed immunity from all the contagious diseases, except sheep scab and fluke, which were brought by very early comers. How much these diseases have cost Australia cannot, of course, be ascertained. That the sum has been an enormous one there can be no doubt, and experienced persons who have thought the matter out have questioned whether, if we had back the money lost in this way, it would not pay for all the railroads we have heretofore constructed in this continent.

Subsequently, Cumberland (anthrax) gained a footing in New South Wales, committed considerable ravages, and continues to this day yearly to exact its victims in one part or other of this continent. Somewhat over twenty years ago pleuro-pneumonia was added by importation to the list of our diseases, and it is probable that the losses which the Colonies have suffered from it cannot, from first to last, be set down at less than two per cent. per annum of our horned cattle. Nor is this the only, or perhaps the greatest, evil we have experienced from that malady, for it is complained that either the disease itself, or inoculation (the remedy used) has injured the constitution and reduced the stamina of the whole of our horned stock generally.

Finally, at a later date, it is thought, tuberculosis made its appearance, and besides the gradual wastings and deaths which flow from this disease, it is a moot point amongst veterinarians whether both the flesh and milk of animals suffering from it do, or do not, give birth to consumption in the human subject. That the milk of tuberculous cows has this effect some authorities do not hesitate to assert. It is also to be remembered that there is no reason to hope that either anthrax, pleuro, or tuberculosis will be got rid of to the end of time, so that we have already reaped the consequences of importation by establishing throughout Australia three lasting and malignant preventible diseases.

Whether indeed tuberculosis is yet found in the other Colonies, I am not aware; but that it will be eventually there can be no doubt, for experience has shown that any infectious disease admitted into one Colony *cannot be prevented from spreading to the rest.*

It must further be remembered that the live stock of Europe and America has, since steam communication rendered the conveyance of animals by sea easy, suffered enormous losses from diseases which as yet do not exist in this continent. Russia alone is reported to have lost one million head of cattle during the last four years from foot-and-mouth disease, without speaking of other maladies. Other facts of the same sort might be adduced, so that it seems probable that many countries in Europe, in spite of restrictive measures and lavish expenditure by their respective Governments, must annually reckon their losses from infectious diseases by millions sterling. What would be the losses in Australia were foot-and-mouth disease, for instance, or variola in sheep to acquire a footing amongst us it is impossible to estimate.

Heretofore, to obviate the risk consequent on the introduction from time to time of a few stud animals from countries which we know are never free from diseases which have not yet obtained a footing in Australia, inspection, veterinary examination, and quarantine have been had recourse to, and in Mr. Bruce's memorandum it is proposed to continue this system (the details of which in New South Wales emanated, I believe, from himself) under regulations of additional stringency. Hence we have the fact that measures which that officer formerly held to be sufficient he now believes to be insufficient, and consequently that for the years they were in force the door was open to disease.

In Mr. Bruce's new regulations, however, I find myself bound to acknowledge that I place no more trust than in the old ones, neither do I agree with their policy, on the grounds—

- 1st. That, even if admitted to be perfect, their administration cannot be depended upon.
- 2nd. That the importation of the primest sheep or cattle from Great Britain, Germany, or other countries *in which the conditions of nature differ widely from those of Australia* is injurious instead of beneficial to our stock, and *per se* an evil.

In

In support of the first of these objections it need hardly be said that what is required is positive security against the introduction of any infectious disease, and that neither inspection nor veterinary examination, before or after quarantine, can give this security, an assertion which requires no other support than the acknowledged fact that all who deal with diseases constantly differ fundamentally in their diagnoses. This unreliability of opinions, even when several experts concur in a conclusion, is well exemplified in the late outbreak of scab in Sydney, on which occasion the sheep were examined by the Chief Inspector and the Government Veterinarian in consultation, on their arrival in harbour, and frequently afterwards by one or both of these officers, during the currency of a five months' quarantine, and were on each occasion pronounced free from scab, and finally dismissed as clean, whereas we now know that they were suffering from that disease during the whole period. Further, we learn from the report of the Royal Commission which investigated the case that it recommended in future that the appointments of Chief Inspector of Stock and Government Veterinarian should be held by persons "possessed of a practical knowledge of scab; and that these officers should also inspect the sheep in consultation previous to releasing them from quarantine; and that the release of the sheep only be allowed on a certificate signed by both."

To this recommendation the Minister replied in his minute as follows:—"I quite agree with the Commissioners in the recommendation that all sheep, previous to their being admitted to quarantine, shall be examined by the Chief Inspector of sheep and a Government Veterinarian; and for the future this course will be adopted, and the Chief Inspector must be relieved of some of the duties now devolving upon him, in order that he may efficiently perform this service. I regret that I cannot agree with the recommendation that both of these officers should be men possessed of a practical knowledge of scab. Of course, such a qualification if possible would be most desirable, and would add to the efficiency of the officers in question; but as, with the exception of the late outbreak, there has been no scab in any of the colonies for many years, and it is to be hoped that we may be kept free from this infliction, it is evident that the selection of officers would be restricted to persons advanced in years, or who had visited Europe or America; unless, indeed, a depôt were formed for the maintenance of scab, in order that our youths might obtain a practical knowledge of the insect scourge; which would be very like introducing small-pox in order that medical men might, by study of symptoms, become more assured and unanimous in their opinion. These officers must also in future inspect sheep in quarantine in consultation previous to releasing them, and the clean certificate must be signed by both. A regulation to this effect should be prepared at once."

Now, what does this amount to? That sheep in New South Wales are still to be inspected, or liable to be inspected, by an officer who does not know scab, but under a new regulation; nor assuming that importation is to be persevered in, could a Minister, except from a want of knowledge, make any other reply. But I would ask, are the qualifications of these officers really to begin and end with scab? Is not the same practical knowledge of other diseases necessary? If the Minister has found it impossible, as he remarks, to find persons possessed of the requisite knowledge of scab, is he likely to be more successful when the requirements are infinitely enlarged?

Another point which strikes me as very deserving of notice in the Sydney outbreak is that very sufficient regulations for dealing with scab existed at the time. These required, amongst other things, that imported sheep should be properly and efficiently dipped, and a certificate of their freedom from scab be given. But the evidence shows that neither one nor the other of these regulations was thoroughly enforced; that the catastrophe occurred not for want of regulations, but of their enforcement. These are but a few of the facts which have convinced me that no reliance can be placed on regulations. Hence it is clear that the quarantine system is not only one of risks, and has absolutely broken down, but is one which, in the nature of things, cannot ensure freedom from risk. Now, my contention is that no preventable risks should be allowed in connection with our live stock—the great source of Australian wealth. In other words, that prohibition should take the place of importation under restrictions.

My second objection to importation is that, under our circumstances, *it is a proceeding at variance with the laws of breeding*. In this you will notice that I entirely disagree with Mr. Bruce, who sets out in his memo. that the quality of our animals has been, and must continue to be, kept up by means of imported sires. In my remarks on this point, I shall (the fundamental laws of breeding extending to all animals, and the conditions of nature in Australia being favourable alike to sheep, cattle, and horses) illustrate what I have to say by reference to the merino sheep, on the ground that we may, through the wool of this animal, test the results of Australian breeding *by reference to the London market*, which annually marks by its sales the success or failure of the steps taken by breeders with an authority which the person most inclined to dispute facts will hardly venture to call in question. I will begin by referring you to the first lines of Mr. Bruce's memorandum, in which he argues that, though there is no theoretical obstacle in the way, practically the improvements needed in our stock cannot be made in these Colonies; that our breeders of stock have not developed the capacity for establishing new and improved families of stock, and that, therefore, their success in breeding is attributable to the frequent introduction of foreign blood; that the experience of the old countries has shown that the talent in question is an exceedingly rare one.

As regards these statements, their incorrectness may be shown by calling attention to the fact that several flocks, with new and excellent characteristics, have already grown up in Australia. I will instance the Canowie flock, and Mr. Pitt's sheep on the Levels. These flocks show that breeders in Australia have both the means and knowledge necessary to produce new types when required, for none such exist elsewhere. The creation of Mr. Currie's *Lustre flock* is another instance of the same thing—of a new type of sheep of great value, brought into being without the aid of importations from abroad.

Passing to another and more important of Mr. Bruce's statements, that the quality of our stock, and hence of our wool, has been solely kept up by means of importation, it will only be necessary in disproof to call attention to the facts that the flocks of Australia at large are not the progeny of imported sires, and that yet we find by the *fiat* of London sales that the average Australian fleece has not only kept up its qualities, but has constantly been rising in the wool market of the world, in which it now holds, perhaps, the premier position. It hardly needs arguing that the mass of Australian wool-growers are, and have been for perhaps half a century, beyond the reach of importation, and that if all the foreign breeders of our national sheep, the merino, were, putting cost out of the question, yearly to ship the whole of their prime rams to our shores, they would fail to supply a tithe of our wants, and that this impossibility is daily becoming greater. Exactly the same may be said in connection with bulls. It will be argued, however, that no vast importation

importation of the sort was ever contemplated, but that what is needed is the periodical introduction from abroad of a few first-class animals into the flocks of our stud-breeders, as through their descendants their excellencies and good qualities will become disseminated through our flocks at large. My answer to this argument is a short, and I think conclusive one. It is this: If imported sheep do not transmit their excellencies through many generations, they are useless to stock-owners at large; if they do transmit their qualities, they are not wanted, as we possess already, as the result of former importations, large numbers of merinos of the purest blood and best quality. Hence it seems that the importation of merinos means the risk of disease, an enormous evil, without any adequate object.

There are other facts connected with the past of the Australian sheep, and the innate fitness of this continent for sheep-breeding and wool-growing, which should not be lost sight of.

Thus, prior to 1840, very large numbers of merino sheep of high quality, chiefly Germans, were imported into the colonies, the Circular Head Company of Tasmania alone expending £30,000 in this undertaking; but after that date, importations, then unobstructed by law, dwindled away to a number quite inappreciable, when the numbers of sheep then in Australasia are taken into consideration. But it is also since that date that the wools of our stud-flocks, and the common wools of the continent, have steadily gone on rising in the London market. Since the introduction of foreign blood into our flocks ceased, our wools have improved in quality. Nor do I look on these facts as unconnected, but in the relation of cause and effect, as the following goes to show:—

In the interval between the years 1763 and 1801 the merino, which was the product of Spain heretofore and existed in that country, alone, was introduced into Germany, England, Australia, and America. It reached Germany just thirty years before it found its way to Australia. Very shortly after this dissemination of the hitherto jealously guarded Spanish sheep, differences of type began to manifest themselves amongst its descendants, so that there quickly came to be a German merino, a French merino, and an Australian merino; their wools being held by the manufacturers as distinct articles. Some years, however, before the merino reached Australia, a number of sheep were introduced into New South Wales from Bengal. As a part of what Youatt, a leading authority on stock, says concerning them is exceedingly important in connexion with the subject of which I write, I shall take the liberty of quoting it. It is as follows:—"They had," says he, "large heads, Roman noses, and slouch ears; they were extremely narrow in the chest; they had plain and narrow shoulders, very high curved backs, a coarse hairy fleece, and tremendous long legs. This was an accumulation of bad qualities—yet such were the primitive New Holland sheep, more, according to Mr. Atkinson, resembling goats than sheep, and from such emanated all the improved flocks now in the Colony. *The climate worked wonders upon them; New South Wales seemed to be an exception to the fundamental principle of the paramount influence of blood, and the more subsidiary one of soil and climate. In the first two or three years these sheep were in a manner changed; the hair was comparatively gone, and a fleece of wool, although of no great fineness, succeeded.*"

Reading this, we are not surprised to find that our merino soon came to differ from others, nor that the merits of his descendants, pure and crossbred, should go on improving, and be spoken of by the same writer in the following terms:—"Those who are best capable of judging, and could have no temptation to deceive—the woolstaplers and manufacturers, shall here speak for themselves." Then succeed a number of extracts from evidence taken before the House of Lords, of which I quote the following:—"The qualities of the wool were originally very bad, but they all possess an extraordinary softness, which the manufacturers here so much admire, and they are sought for more than any other description of wools." Again—"There is no other wool which spins so well as the Australian; the finer description of stuff which is now manufactured is made of this wool. Whether from the climate or herbage, or both, the wool has improved in softness, and in staple too; and I have no doubt we shall shortly derive the whole of our supplies of foreign wool from that part of the globe." Again—"The Australian wools have much improved; they are decidedly preferable to the apparently slender description of German wools. They have comparatively very peculiar qualities. They have a softness and silkiness about them which, when worked into cloth, shows itself more distinctly than in the raw material of the same description." These quotations have reference to the descendants of our early Bengal sheep, crossed by the merino, the wools of which we find already *challenging those of Spain and Germany in the London market*. What Youatt extracts from the evidence before the House of Lords concerning the wool of our early merinos is as follows:—"The wool of Mr. M'Arthur has made some of the finest cloth that has ever been seen in the country." Youatt adds, of his own knowledge, "One bag of Mr. M'Arthur's wool, weighing 1 cwt., and properly sorted, sold at the unprecedented price of 10s. per lb." He had already remarked that the improvements in our wools of all sorts were the effects of climate.

Of the advantages which Australian-bred sires have over imported ones, I will give a single instance, one in which we see imported blood struggling for mastery with climate, and climate gaining the day. In Mr. George A. Brown's excellent work entitled *Sheep-breeding in Australia*, we read (p. 137) that in the celebrated Waganella stud flock, French, German, and American rams were used. That writer says, "The French, German, and American rams were used for six years, after which rams bred in the flock were used; and found to answer better. Messrs. Peppin found that their prize-takers were invariably drawn from those sheep which had the largest amount of acclimatised blood in them." And let me ask what is the explanation of this? I take it to be that when natural conditions, climate, &c., favour the production of any class of animals, the introduction of blood the product of dissimilar conditions disturbs the homogeneity which nature is striving to bring about. That such an introduction of blood is, in spite of a common pedigree a *mild cross*. The disadvantages of such crosses may be realized by remembering the fact that flocks, herd, studs, &c., which enjoy a lasting celebrity, are to a great extent inbred. Hence I look upon the importation to Australasia of European or American sheep and cattle as a backward step, as well as a dangerous practice. As regards coarse woolled sheep and animals with peculiarities which may require specialities of climate to keep up perfection, there exists as far as we can judge within the bounds of Australasia, from the perpetual snow line of New Zealand to the burning plains of central Australia, all those natural conditions which are necessary to preserve original qualities.

Before closing my report, it seems to me essential to add to what I have already advanced, a few remarks on the statement made by Mr. Bruce, to the effect that men fitted to carry on breeding in its highest form have been exceedingly rare in Europe, and quite wanting in Australia. Whilst acknowledging the merit, due to original thinking and investigation in the case of Bakewell of Dishley, and others of the same stamp,

it

Importation
of Foreign
Stock.

it seems to me that what was a rare knowledge in their day would be comparatively a common one now, having at present to guide us many excellent writers on breeding, Darwin amongst others, whom they had not. That since Bakewell's time knowledge of the laws of breeding has advanced as much as knowledge in other sciences. Hence I not only do not share Mr. Bruce's low estimate of our breeders, but I fail to understand how any one acquainted with the sheep shows of Melbourne can endorse his opinion. Neither does it seem to me probable when I see rams bought and sold at £50, £100, £1,000, up to £3,500 per head, that both buyers and sellers are not well acquainted with the science of breeding, so far at all events as concerns sheep. Again, I would ask is there any foreign rams which would compete in price with our own if submitted to auction in Melbourne? Has Germany any rams which would hold their own in our market with those of the Messrs. Gibson, of Tasmania?

Still it must not be overlooked that the pastoral wealth of a country cannot mainly rest on the efforts of a few eminent breeders, however useful and indeed necessary they may be, but must always principally depend on the use made by the ordinary breeder of the advantages at hand. In other words, natural conditions being allowed for, national success in stock rearing must always depend at last on the average knowledge which prevails on the laws of breeding. If, in conclusion, I may be permitted to offer a suggestion as to how this matter should be dealt with, I would recommend, as I have already recommended on many occasions, that as foreign importation is at present an obstacle instead of a help to good breeding in Australasia, that steps should be taken *whilst there is yet time* to avert the dangers of introducing fresh diseases by prohibiting the entrance into our harbours of vessels with foreign stock on board. In my opinion, no step short of this will confer absolute security.

So ends my original memorandum on this subject, which I have altered a good deal textually, as already said. At the time it was written it might have been thought open to argument whether quarantine was an effectual safeguard against the introduction of disease or not, but it is not so now, for it has been tried in *New South Wales, and failed, and no argument can avail against a fact.* That quarantine failed whilst carried out by an officer who may be said to have championed the system, under regulations framed by himself, and in connection with scab (a disease more easily provided against than any other) does not fundamentally alter the case, though it renders the rude refutation his argument has met with more conspicuous.

Mr. CURR went on to say that where animals were allowed into a colony in quarantine under certain restrictions every one must rely on the restrictions. Persons might say that it was easy to form such regulations as would prevent the introduction of disease. Some of these diseases took two years to incubate. There was the matter of carrying out the regulations, and to say that the officers should go through an examination, the Board, as far as his experience went, considered any advice an impertinence. When he looked back upon the past history of his own Department he saw that perhaps fifty individuals had been in the Stock Department during the last twenty years. Of these two had been sent to prison; one hanged himself; and three or four (one of whom had been a Minister of the Crown) died of drinking. These men were selected just as the Minister liked, and they had the power of saying whether stock was or was not fit to be imported into the Colony. What man would give such a power in that haphazard manner where his own interests were concerned? He did not see how the difficulty relating to importation could be got over. He had drawn up a good many regulations, and the Minister accepted them, but they all dribbled away in spite of anything he could do. A difficulty ensued about the regulations regarding the importation of dogs. The owners were informed—"There is the quarantine; you can pay £15 and have the dog quarantined for six months; any unexpended balance to be returned to you." However, one or two persons managed to evade the law, and they were summoned. In the first four cases, what did the magistrates do? The cases were heard at Port Melbourne, and the defendants were fined 1s. apiece. The fifth was, if he remembered rightly, fined £1. So that, instead of a person having to expend from £2 to £6, he paid 1s. and took his dog home. Another regulation with regard to stock was that all sheep, pigs, or cattle in a vessel which came alongside the wharves should be killed within twenty-four hours. The captains did not like this, especially with regard to their milch cows. What was the use of trying to keep disease out if cattle were to be kept so near the land? It was found also that they smuggled boars ashore. A deputation of captains waited on the Minister, and it was pointed out to him what an objection they had to their stock being killed. He informed the Minister that the stockowners of the Colony should run no risk; but the Minister decided that the beasts should be allowed to live, so the risk continued. There was an old axiom—that you cannot import stock and keep out its diseases. The Conference now had the opportunity of bringing itself before the world by announcing that the Colonies intended to protect themselves against the importation of disease. If they did take the step of keeping out foreign stock people in high stations would say that they had taken a very wise step, and that they could not breed stock to perfection if they crossed their own productions with those of other countries. Where is the perfection of English stock? They could not breed a decent beast in England unless it was housed, whereas here a beast had only to be turned out and given proper pasture and it would flourish. The Colonies did not want free trade in disease, and that must follow in the importation of stock from abroad.

Mr. BAGOT seconded the motion. He considered that the arguments put forward by Mr. CURR were practically unanswerable.

3. Mr. Wood's Amendment.

Mr. WOOD moved as an amendment—"That this Conference is of opinion that the time has arrived when the prohibition on the importation of cattle and sheep from the United Kingdom under proper restrictions may be safely removed. 2. That the Governments of Australasia be requested to give effect to the foregoing resolution."

He then read the following paper on the subject of Prohibition:—

THE subject of the Prohibition of the Importation from the United Kingdom has lately become a prominent question amongst the stock-owners in the Colony which I have the honor to represent at this Conference, and I take it to be part of my duty to present to the Conference my views on this momentous question—views which, I may observe in passing, are identical with those held by a large number of stock-breeders in Queensland.

As

As this is no ordinary and every-day question that we have to attempt to decide upon I have thought it more respectful to the members of this Conference and to the public generally to put forth my ideas in the form of a paper. Importation
of Foreign
Stock.

And let me say first that no one is more sensible than myself of the diversity of opinion existing about this Prohibition, not only in my own Colony, but probably in all the Colonies represented at this table, and no one can be more prepared than I am to give great weight to any opinion contrary to the conclusions that myself and many others have arrived at.

I desire to express an earnest hope that out of the conflict of opinion a correct and safe decision may happily be arrived at. I think it may be taken for granted that all of us are pretty well acquainted with the history of the past twelve years as regards the closing of the Australian ports. Shortly stated, they may be said (New Zealand excepted) to have been closed for ten years and open for two years.

In 1874, the subject was carefully considered at the Stock Conference held in this city, and the outcome was a recommendation to all the Governments to the effect that importation should be altogether discontinued, and that recommendation was unanimously adopted. The recommendation was made because at that time disease was rampant amongst the herds of Great Britain, and, beyond all doubt, the imposition of the Prohibition in 1874 was a wise precautionary measure. In 1878 a better state of things having come about in Great Britain the ports (Tasmania excepted) removed the Prohibition, and importations went on until 1880. In that year, an outbreak of foot and mouth disease happening in Great Britain, Prohibition was again resorted to, and has continued in force ever since.

I have said that New Zealand did not associate herself in the Prohibition of 1874, and it is only within the last three years that New Zealand (under the threat of an embargo being placed upon her stock by the other Colonies) came into the general Prohibition then and now existing. In the years intervening between 1874 and 1883 New Zealand made considerable importations of Shorthorn, Hereford, and dairy cattle, and it is to be hoped she earned a rich harvest through her enterprise. Now, the point to be noted here is, that we have never heard of any ill consequences or outbreak of imported disease consequent upon the New Zealand importations which extended over a number of years. If that be so, why should we hesitate, now that Great Britain is entirely free from foot and mouth disease, to open our ports and allow breeders of cattle in all the Colonies an opportunity of refreshing their strains of blood and improving their herds where improvement is required.

And not only to improve and to strengthen existing herds but also to permit the introduction of valuable breeds of cattle which have never yet reached their shores.

In speaking of the question of importations from the United Kingdom it is impossible not to refer to the position taken up by American breeders. In America we are confronted with the pregnant fact that the introduction of all breeds of cattle into that country from England and Scotland has been carried on for six years past on a scale of extraordinary magnitude.

It is no exaggeration to say that cattle have been sent to America from England in thousands, and I am not aware that any untoward result has happened.

It is reasonable to suppose that considering the enormous interests involved and wrapped up in the cattle industry of the United States—interests to which our interests in Australia, so far as cattle are concerned, may be called insignificant—that the Americans would take special and peculiar precautions against the introduction and dissemination of disease by importation of stock. But it is quite clear that beyond the ordinary and usual quarantine the United States Government has not found it necessary to resort to any vexatious and prohibitory measures. The result has been a marked improvement of their immense cattle property, now amounting to about twenty-two millions of cattle, and a stimulation of their export trade in beef, which makes them the most formidable competitor that the Australasian Colonies have to contend with. And it is not America only that has been making good use of her opportunity; Canada, Mexico, and the South American States have all been making selections from the best herds of Great Britain, while Australasia has been unable to do anything. In answer to all this it may be said, and indeed it is very frequently advanced, that the cattle of Australasia are equal to any in the world. I should be the last person to say a word of depreciation of Australasian cattle. I am fully sensible of their merits, nay, in many cases of their super-excellence; but I hold that first-class herds are few in number, and that mediocrity is the general rule. I think it is the first and paramount duty of breeders of thoroughbred and grade bulls to take every conceivable care that no sire shall be sold for the purposes of commercial cattle without being quite sure that the animal he sells goes forth to do good and not harm, to beget sound and robust stock endowed with quality and early maturity, and fitted to cope with the many vicissitudes inseparably connected with the pursuit of grazing in Australia. But without the privilege of changing his blood, and introducing fresh strains when necessary, the breeder has set before him a difficult and well nigh impossible task.

As with beef stock so it is and in a greater degree with dairy stock. If there is one industry more than another in Queensland which needs development, and which, combined with agriculture round the centres of population would become extremely profitable, it is that of dairying in an intelligent way. In Queensland the dairy stock as a rule are not good; the product is extravagantly dear, and at times hardly procurable. Importations of dairy stock from England, Scotland, the Channel Islands, and the Continent of Europe will greatly stimulate and encourage this important pursuit. I am not one of those who hold too lightly the possible risks and dangers of foreign importation, and I recognize and accept the responsibility attaching to the advocacy of this cause. That there is a certain amount of risk attending every human undertaking I think we all must agree to, but to my mind the accruing benefits of doing away with this restraint are so numerous and so valuable to Australia as a pastoral country, that it is worth the risk. And I am strongly of opinion that the risk may, by proper precautionary measures, be brought into a very small compass, if not extinguished altogether.

Mr. WOOD went on to say that the Queensland breeders objected to prohibition for two reasons: the first was that they desired to import stock, and the second was that they considered that the present disability had no business to exist at all. To show their faith in the introduction of fresh strains into their herds stock-owners had gone to the herds of Victoria, South Australia, and to New Zealand, where stock had been most recently imported from England. Stock that came from New Zealand was eagerly sought for at sales, and at once sold at a high price. He took it that New Zealand went on with its importation from England because the stock-owners of that colony desired to get imported blood to as large an extent as possible. In the interests of a herd of 120 pure-bred pedigree cows he was eager to

Importation
of Foreign
Stock.

get fresh imported stock, and he went to New Zealand, and got the offspring of the celebrated "Lord Wilton." By that means he obtained for the Colony a strain of the best Hereford blood in the world. He would have preferred to have secured the celebrated bull "Chippendale," but was unable to do so. He desired as shortly as he could to review what importation had done for the colonies in the past. In Victoria it has built up the valuable and splendid herds of Messrs. Moreton, C. B. Fisher, M'Culloch, Neil Black, M'Dougall, and Horwood. It has created in New South Wales the famous herds of Dr. Jenkins, the Messrs. Dangar, Woodhouse, White Bros., Nowlan, Loder, Reynolds, and Wyndham; while in Queensland it had been the nucleus of the herds of Messrs. Archer, the M'Connells, Marshall and Slade, and Macaush. He could see no reason, if this prohibition were removed, why fresh and valuable herds should not spring into existence. With regard to the remarks that fell from Mr. Curr, concerning the importation of sheep and the formation of a distinct type in Australia, he agreed with a great deal of what was said, but a proper stock was required to begin with. It would be a very tedious proceeding to build up from the present stock. There were one or two valuable breeds of cattle in England to which he would specially refer. Take, for instance, the Norfolk polls. He did not think there were any in Australia, yet they were one of the best beef producing class in England. Then there were the Angus polls. There were very few of them here, and there was only one herd in the whole of Australia. With regard to Herefords, he might say that they had made a great impression on breeders as being good beef producers, but, unfortunately, it was difficult to obtain any fresh Hereford blood. The Messrs. Robertson in Victoria had a herd, but it was sold, and the animals dispersed. There were two or three herds in New South Wales, and to show how eager the stock-owners of this Colony were to refresh their strains of blood, they took advantage of the lapse of the prohibition here by effluxion of time, to introduce two or three imported bulls from England. They made arrangements so that the bulls came in before the renewal of the prohibition. He was aware that a number of people denied the efficacy of fresh importation. Some said that the cattle of Queensland were equal to any in England, and some said they were better. He dissented altogether from those opinions. There were others who said that the risk of disease was so great that importation should not be thought of. The question could be put into a very small compass, whether sheep, cattle, and swine could be imported from the United Kingdom with little or no risk of disease being imported also. If so, then by all means let them come. Should they continue to oppress the great pastoral industries of the Colonies by continuing this vexatious prohibition, or do away with it, and thus advance the industries, the welfare of which had been in some measure committed to their care.

MR. MEREDITH seconded the amendment, and in doing so, read the following paper:—

"The question of permitting Foreign cattle to be introduced is entirely a question that should be determined by the breeders of the Australasian Colonies.

The carefully prepared paper laid before this Conference by the Honorable the Minister of Mines, shows that the value of horses, cattle, and sheep in the various Colonies, is estimated at £78,994,871.

That the gross income on the same basis is estimated at £33,669,973, and the capital value of land with improvements and plant, and the capital value of stock represent £359,000,000.

All this 'enormous capital' belongs to the breeders and others dealing in stock, and it cannot, for one moment, be doubted that they are anxious to further increase the value of the same, neither can it be disputed that fresh blood is necessary to improve our herds and flocks, both in quality and constitution. Momentous as this question is at the present time, it is rapidly becoming more so; every year the area occupied for pastoral purposes increases, as also do the numbers of breeders and owners.

It is not only for the improvement of *merino* sheep and *short horn* or *Durham* cattle that the introduction of Foreign animals is required; but also to fully develop the new and important industries, if I may so call them, of exporting frozen meat, and the manufacture of butter and cheese, to which no doubt will soon be added that of preserved milk.

The great varieties of climate, pasture, soil, &c., should not be lost sight of in considering this question, because as the climate, pasture, &c., varies, so it stands to reason that different breeds or grades of animals will be required so as to stock parts of the Colonies with that particular class of animal best adapted for the purposes required and surrounding circumstances. I will allude to one instance in confirmation of this. A cargo of frozen mutton sent to England from either Victoria or New Zealand, composed partly of long-wooled and partly of merino sheep, upon being sold, it was found that the merinos realized much less per pound than the long-wools. Have we in the Colonies the best kind of long-wooled sheep for exporting in a frozen state?—I mean that will prove the most profitable? I am advised not. Then again we must be prepared in the future for a keen competition in the butter and cheese exportation trade. America is rapidly developing a variety of breeds of dairy cattle, as most suitable to the different States. For developing an extensive dairying business in these Colonies it will be necessary to build up herds of various kinds or grades, and we have not the material to begin with.

The objections that have hitherto been raised against the introduction of foreign animals (from England, at all events), viz., the fear of introducing foot and mouth disease, &c., ought no longer to be persisted in, because foot and mouth disease no longer exist there. It has been stamped out, and it has been, I submit, most conclusively proved that, with regulations and quarantine for six months, there will not be any risk in importing animals from England. Have not cattle and sheep for over twenty years been introduced from England successfully, with the exception of one cow, which introduced Pleuropneumonia, and a bull, "Achmet," by which Foot and mouth was introduced; and if there had been proper quarantine regulations at the time, these diseases would have been detected in quarantine, and the animals destroyed.

I know the stock breeders of Tasmania were unanimous at a meeting held by them when this subject was considered, and it must be borne in mind that there is no disease amongst the herds or flocks in Tasmania, except fluke. The very great care that has hitherto been taken by allowing only fat cattle to be landed in Hobart slaughter-yards, where they are killed, and stud animals under stringent quarantine regulations on an island in the Tamar, has been effectual in keeping out pleuro and Cumberland disease from the Australian Continent, which is only a few hours steaming distance from Tasmania, and from which we have within the last few years imported thousands of cattle and sheep during the existence of these diseases amongst the herds and flocks therein.

In the face of the evidence which has come before the Conference, with respect to the controlment of infectious disease by proper quarantine regulations, and having regard to the fact that the importation of stock

stock from this Continent to Tasmania has been going on for years without any bad results following, in spite of the existence of Pleuro-pneumonia and Cumberland diseases in Australia, I think we may be justified in assuming that the great length of the voyage, and the jealous care with which stud animals are guarded in England, ought to be a sufficient guarantee that the introduction of foreign diseases from England need not cause any very serious apprehension."

JOHN MEREDITH.

Importation
of Foreign
Stock.

Mr. PARK said that Foot and mouth disease had been stamped out of England since the beginning of the year. Its period of incubation was from one to eight days, and the period of quarantine thirty days. Rinder-pest incubated in from two to eight days, and it had not existed in England for fourteen or fifteen years. Rabies incubated from three to fourteen days according to Pasteur; but you all gave it, up to thirty years. Swine fever incubated in from seven to eight days; sheep scab fourteen to sixteen days. These infectious diseases could not be introduced, now that we know how to deal with them.

Mr. CURR: How about the outbreak of scab here.

Mr. PARK: Was it scab.

The CHAIRMAN: Yes, the acarus was found.

Mr. STANLEY said that when a disease broke out in England the area was quarantined. The period of quarantine for foot and mouth disease was thirty days. The retention of the prohibition must seem an extraordinary thing to the English people. He had known a bull to be seized with foot and mouth disease in a yard surrounded by dairy animals. The animal went through all the stages of the diseases surrounded by the stock, and none of the other animals took it. The bull was simply isolated in a pen. This showed that foot and mouth disease could be very easily controlled by proper regulations.

Mr. VALENTINE said he looked at this from an official point. From what had been already said by the Conference, it was evident that they should not allow the importation of stock from any country where disease had existed during the previous twelve months. They had already passed a resolution that no sheep from New Zealand should be admitted, until it had been clean of scab, for a period of twelve months. Yet, now it was proposed to admit sheep from England, where scab was rife, and where they had not been free from foot and mouth disease for twelve months. It was utterly inconsistent with their treatment of the different Colonies to open their ports at once to importation from Great Britain. If the stock of Great Britain had had no diseases for twelve months, then there could be no objection to opening our ports, as we would only run a moderate risk, and the stock would also be quarantined on arrival here. With regard to swine fever, he might state that it caused an immense loss to the farmers of England. It was a very dangerous disease, and it would be a most improper thing to admit swine from the old country. So far as foot and mouth disease was concerned, he did not look upon it as a difficult disease to cope with, but it would spread very easily if it once obtained a hold here, and we should have great difficulty in stamping it out, and that would not be done without serious loss. They should pause before they admitted stock from Great Britain, until that country had been free from disease for a certain time. So far as merino sheep was concerned, he did not think that the Colonies required their admittance from England. He had seen some of the primest sheep in France, and he certainly would not admit them to our stud flocks, as he did not consider that the French sheep were worthy of a place amongst ours. Whatever action might be taken, the Conference certainly should not recommend the admission of stock from Great Britain until the whole country had been clean for a period of twelve months if it were necessary to prohibit them from New Zealand for that period.

Mr. TABART said he took this question to be purely a stock-owners question, and if it was determined that the prohibition now existing upon foreign stock should be removed, it was then a matter for the chief inspectors of stock of the Australasian Colonies to frame such stringent quarantine regulations as would absolutely prevent the possibility of other diseases than those we now had, from being introduced, and he had come to vote on behalf of Tasmania without being hampered in any way, and he intended to record his vote in the direction which was most calculated to benefit his own Colony, and accorded with the expressed views of the stock-owners. He would vote that the existing prohibition now imposed upon the introduction of foreign stock be removed. One reason for recording his vote in the way he indicated, was, the knowledge that the introduction of new blood had been beneficial to the Colony, and he could instance the introduction of the Vermont ram into Mr. M'Farland's flock, which resulted in producing the first prize ram at the late Melbourne Agricultural Exhibition; also by the introduction into Tasmania of a Vermont ram by Messrs. W. Gibson and Son, the progeny of one of which was sold at the last annual stud sale held in Melbourne, for £500. Tasmanian blood had been introduced into New Zealand, New South Wales, Victoria and Queensland, with astounding results. The result being the production of first prize animals at the principal shows held in those Colonies, thus clearly indicating the advisability of adopting the amendment proposed by Mr. Wood, which he certainly intended to vote for.

Mr. M'KENZIE said he could not agree with the conclusions at which Mr. Curr had arrived. It was true that breeding could be improved by natural selection, but to improve the herds in that way might take a century, and even then a man might not be able to bring his flocks or herds to perfection. He did not see why they should wait for such a time when they could get the article ready-made in a short time. He thought they would be very foolish not to take advantage of the experience gained, and the perfection arrived at by their forefathers. It was impossible for any climatic influences or the nature of feed to introduce new blood into stock. New Zealand, as they had been told, had kept their ports open to the importations from the old country for a longer time than the other Australian Colonies, and they had consequently been able to improve their herds to a greater extent than the other Colonies. New Zealand could never have done so if she had not been able to fall back on the mother country for fresh stud stock. The advantages the Colony had thereby received were well known. The stock-owners could send their stock here, and sell their animals at high prices. With regard to disease New Zealand had first to import stock from Australian Colonies, and in doing so Pleuro was carried into Otago. It existed for two or three years, but by careful regulations and inoculation, they had been able to stamp it out. There was not a case of that disease now in New Zealand. The introduction of disease resulted from the introduction of stock for slaughtering. In introducing stock from Great Britain they had never introduced one case of disease. Owners of stud stock kept their animals very free from disease, and therefore there was not nearly so much risk of disease from those animals as from stock for slaughtering.

Mr. GORDON said that with regard to the question of the necessity for fresh importation, he had nothing to say, but in his official position he came into contact with all the stock-owners of his Colony, and if Great Britain were free from disease, there would not be a dozen Queensland stock-owners found

to

Importation
of Foreign
Stock.

to be in favour of prohibition. In connection with the question of disease he was prepared to accept the responsibility of dealing with it.

Mr. COOPER: If Mr. Curr's motion is carried it will exclude horses, goats, dogs, and cats.

Mr. MEREDITH: When I seconded Mr. Wood's motion I failed to hear some of the words which it contained. I was not aware that swine were included in it.

If Mr. Wood would consent to confine his resolution to cattle and sheep it would leave members more free to act.

Mr. WOOD withdrew the word "swine" from his amendment.

Mr. HIGGINS said he desired to express his regret that his friend Mr. Curr had included in his paper that which was to a certain extent personal to Mr. Bruce. He was sorry to say, having the knowledge he had of the matter, as at the time of that unfortunate calamity he (Mr. Higgins) was Chairman of the Sydney Board. Mr. Bruce had an officer who had been appointed with the thorough conviction in the minds of those who appointed him that he was a first-class man with a certificate as Veterinary Surgeon from the Royal College of Veterinary Surgeons, and that he understood animal diseases, inclusive of scab. It therefore followed that those who had the appointment, made it with the feeling that they had selected a competent man who would be able to deal with any emergency that might arise. That was the position of the late Mr. Willows. With him was associated as assistant inspector a gentleman who had had the misfortune to get all his sheep scabbed, and had to go through the difficulty of getting them cleaned. That being so, Mr. Bruce being hampered with the administration of matters relating to water-supply and the Rabbit Act, it was impossible for him to give that attention to the matter he otherwise would have given. It must also be pointed out that Mr. Bruce placed the utmost confidence in the ability of his officer to detect scab, and thus it had happened that Mr. Bruce got into the position of being brought to book for scab having been introduced into the Colony, he being chief inspector. He was sure that it was without the slightest intention of jarring upon Mr. Bruce that this matter had been introduced, but it might have been well left out.

Mr. VALENTINE: I do not consider it as personal.

Mr. CURR denied any intention of being personal. He asked how could it be said that his remarks were personal when it had been reported in the papers, referred to in Parliament, and a Commission appointed to inquire into it. If the reference he had made came into conflict with anything which his duty called upon him to say with respect to public matters, he must be held to be exonerated from any wish to say anything disagreeable to Mr. Bruce.

Mr. HIGGINS: I think it is simply an unfortunate reference and might have been done without.

Mr. CURR went on to say that they could never get over the fact that quarantine had been found to be insufficient. He had said that Mr. Bruce was a most competent officer. If it had not been necessary for his argument to refer to the matter he would not have done so, but he wished to show that even with such an officer they had been unable with quarantine to guard against the introduction of disease. Those who knew himself were aware that he was not a rancorous man, but even if it were his own brother he would have pointed out, that notwithstanding all his zeal and competency, scab had been allowed to come into the Colony.

Mr. BAGOT: That is the only view I take of it.

Mr. CURR: I say you will not get a more competent or zealous man than Mr. Bruce, and if I had been in his place, and had been actuated with an urgent desire to keep out disease, I should have utterly failed.

Mr. HIGGINS: Mr. Curr says in his paper (and I think he will admit that I am not in any way questioning his ability), that new flocks have grown up in Australia. He uses that as an argument against the introduction of stock from foreign countries. By what means did the owners produce these types? Was it not from the introduction of imported stock?

Mr. CURR: No; it was not.

Mr. HIGGINS maintained that it was. None of our flocks obtained any excellence they now possessed except by the importation of stock from home. He would now refer to the Mudgee sheep. At all events the New South Wales breeders would admit they were an excellent type. One of the things that had raised them to their present standard was the introduction of Silesian rams about 1862. The Mudgee breeders would tell them that that was the case, and Mr. George Henry Cox had said that the flocks had been stamped by that introduction. He contended that without the importation of stock we could not stamp our flocks as they ought to be. He would now refer to that part of Mr. Curr's paper in which he said that the sheep from Bengal of an inferior type improved here, and produced wool instead of hair. If our climate worked wonders on stock, would they not admit, when remembering the improvement in such a class of animals as the Bengal sheep, that they could work wonders with the excellent stock of Great Britain. Then, again, Mr. Curr, in referring to Tasmanian stock, had asked whether Germany had any rams which would hold their own in our market with those of Messrs. Gibson of Tasmania. What was it that gave such excellence to those flocks but the importation of the Steiger rams? Young Mr. Gibson had told him that that was so. Given the conditions which Mr. Curr laid down—a good, suitable climate and lovely pastures—and we could not do better than procure the best animals possible and bring them here. Mr. Curr had stated that quarantine failed while administered by capable officers, and he had given his reasons for the great danger which there was of quarantine failing. There was no doubt that it did fail, and would fail again, under certain conditions; but could not the conditions be made such that there could be no possibility of failure. Could they not have the inspectors, veterinary surgeons, and a board of breeders acting together, who would examine stock, so that it should not be let out of quarantine until it was clean. He was quite ready to admit that there were diseases existing at home which, if they threw open their ports, might be brought here with stock. Whilst he did not go with either resolution in its entirety, he did desire to see something done. About the early part of this year, when the question of opening the ports was brought forward, the Sydney Boards desired that a deputation should wait on the Minister, with the intention of suggesting that something should be done towards the removal of the prohibition. It was thought at the meeting of the Sydney Stock Board that it would be better to send out circulars to all the boards, asking for opinions with regard to the removal of the prohibition. The circular was drawn up, signed by himself, and sent out. The Sydney Board conceived that by doing that, they would be taking the best possible means of obtaining the opinions of the stock-holders of New South Wales. There were altogether fifty-nine Stock and

and Pastures Boards in the Colony. The substance of the circular was—"Shall the prohibition be removed or not?" Out of these, fifty-two boards replied direct; one board sent in a reply which was not an answer to the question, and six boards did not reply at all. Of those which replied, twenty-eight were against the removal of the prohibition, and twenty-four were in favour of it. The numbers were, therefore, as it might be seen, very close; but he admitted that the majority were of opinion that the prohibition should not be taken off. They could not ignore that, and he, as Chairman of the Sydney Board, would not ignore it. The opinions of the Boards would influence his vote, and he intended to vote according to the opinions of the majority of the Boards. At the same time, he had also the greatest respect for the opinions of the minority.

Mr. WOOD: Were the opinions expressed by the Board, in connection with cattle or with sheep?

The CHAIRMAN: The two were submitted and answered together.

Mr. HIGGINS said that if he voted in accordance with his personal wishes and personal interests he would vote for the opening of the ports, because he believed he could do much better with his stock if he could import fresh blood from home. Although he had some excellent stock he desired to import some more, but when he looked at the result of the circular to the various boards and saw the result of their careful opinions, he felt he must bow to the majority and vote accordingly. He said this in order to justify his vote. He also took into account the fact that the twenty-four boards had men on them who must be considered, and they had spoken in favour of an intermediate course, which might be followed if some such resolution as the following were agreed to, which he moved as a further amendment:—

4. Mr. Higgins's Amendment.

This Conference is of opinion that if in eighteen months from the present time it be satisfactorily ascertained that neither foot and mouth disease nor scab has existed in England for twelve months previously, then the prohibition against the importation of cattle and sheep from that country can be removed, but with the strictest regulation.

The CHAIRMAN said that Mr. Curr had stated that he (Mr. Bruce) said there was no breeder in the Colony who had established a distinct type of sheep. Mr. Curr had misquoted him in that. He had allowed that there were breeders, such as Mr. N. Bayly, Mr. King Cox, and others in New South Wales, Mr. Currie, Messrs. Learmonth, Mr. Canning, and others in Victoria, and the Messrs. Gibson, Mr. Taylor, and others in Tasmania, who had been successful breeders, and to some extent formed distinct types. He had not made such a sweeping assertion as Mr. Curr inferred he did. All that he had done was to point out that such cases were extremely rare, and only partially successful. With respect to the improvement of Mr. M'Arthur's sheep, if Mr. M'Arthur had followed the principles laid down by Mr. Curr, and confined his endeavours to improving the long-eared Indian sheep without introducing fresh strains, the Colonies could never have been in the position they are to-day with regard to sheep and wool. It would have taken a good few centuries more to make our sheep what they are (if ever they could have been so improved in that way) had no importations of fresh blood been introduced; in fact it is absurd to suppose they could have been improved in any other way. Mr. Curr, in quoting Mr. M'Arthur's action, had therefore cut the ground from under his own feet. With respect to his motion that all animals, except for zoological purposes, should be prohibited, the exception also upset his arguments, as the animals imported for zoological purposes might introduce the infection; and we know it could easily be communicated to other animals, over a fence, as it had been on several occasions at home. With respect to tuberculosis and anthrax he believed they were brought here with the stock in early days, and so far as his reading went no part of the world was free from them. If, again, Mr. Curr's theory was sound, why do breeders go, as they constantly do, to their neighbours for fresh blood. Victorian breeders are continually buying Tasmanian rams. On the question of the withdrawal of the prohibition and the introduction of foreign animals, he said that he was, like his friend Mr. Higgins, bound by the opinions of the majority of the Boards.

Mr. CURR: Then vote for my resolution.

The CHAIRMAN: I will; but it is not because I think it is right. Because we once made a mistake here, it does not follow that we will make it again. I believe we can frame such regulations as will absolutely prevent it occurring again. I am not my own master with regard to the question at present. As the circular letter emanated from my own office, and as the opinions of the majority are to guide me, I cannot now vote against them.

Mr. MEREDITH strongly maintained that the question as to whether foreign animals should be introduced should be decided solely by the breeders. The breeders were shown in the paper laid before them by the Minister, to represent property worth £359,099,000. Did that belong to the Inspectors of Stock or to the veterinarians? The majority of the stockowners still further desired to improve their property, the value of which was rapidly increasing. In 1874 there were in the Colonies of New South Wales, Victoria, Queensland, South Australia, and Tasmania, irrespective of New Zealand and Western Australia, 723,877 horses. In 1885 there were, 1,106,444. The number of cattle in 1874 was, 5,203,352, and in 1885, 6,367,967. The number of sheep in 1874 was, 45,086,718, and in 1885, 67,529,901. This marvellous increase had taken place in eleven years, and if that were so, what might they not hope for in the future? In the seven Colonies there are 1,302,542 horses, 8,137,054 cattle, and 83,857,167 sheep. The question under discussion was therefore a most momentous one, affecting not only the present generation, but all who were to follow hereafter. The question was—"are we to plod along with this vast number of stock such as they were, or are we to open our ports to improve them, as we did in the past?" New Zealand had had a considerable advantage over the other Colonies, as it kept its ports open longer than the other Colonies. New Zealand now possessed stud stock that would take years before the other Colonies could compete with. He maintained that the breeders of all the Colonies were not represented. Victoria was only represented by her chief inspector, and the opinion of the breeders in that Colony was in favour of the removal of the prohibition. Mr. Youatt, who had been quoted by Mr. Curr, was an antiquated authority. With regard to Zoological Gardens, Mr. Curr would allow animals to come in and infect the whole Colonies, but would not allow those to enter which would be for the general benefit of the Colony. On the 12th of August, 1886, there was a meeting of stock-owners of Victoria held at the "Victoria Hotel," Bourke-street, to consider the question of the admission of foreign stock and other matters. Mr.

A.

Importation
of Foreign
Stock.

A. Patterson, of Cranbourne, was voted to the chair. Mr. Graham Mitchell, who had called the meeting, explained the present stock regulations, and pointed out that the recommendations of the Select Committee, which sat a few years ago, and the recommendations of the Tuberculosis Board had received no notice from the Legislature. The existing prohibition regulations were no real protection against the introduction of disease, such as an effective quarantine system would supply. England was now free from the foot and mouth disease, and there was no longer necessity to prohibit breeders from importing cattle from the home country. Mr. H. Beattie contended that cattle and sheep could be imported to great advantage. Importation by breeders direct should be permitted under effective quarantine regulations. He moved "That this meeting considers the continuance of the prohibition of the importation of live stock from England unnecessary, as that country is now declared free from foot and mouth disease, and that a proper system of quarantine and inspection should be adopted by all the Australian Colonies." Mr. J. BELL seconded the motion, and it was carried unanimously.

Mr. MEREDITH then referred to the existence in the Colony of pleuro-pneumonia, and suggested that an effort should be made to secure Parliamentary action in the direction of compensation being given for animals slaughtered, or of rendering enoculation compulsory. He considered that the present arrangements tended to prevent the disease being imported. No action was taken in the matter by the meeting. This was the only report of a meeting of stock-breeders that he had seen, and they were in favour of the admission of stock. It seemed extraordinary, that a Colony which could send representatives here with such convenience, was not represented except by an inspector, who was dealing with things outside his province. It had been stated also by Mr. Curr that there could be no advantage from bringing in stock from abroad. How did that agree with the fact that Mr. Fisher gave Mr. Gardiner £4,000 for a bull a few years ago? He had referred already to the fact that only two diseases were known to have been imported into Victoria in the past—pleuro-pneumonia and foot and mouth disease,—and during that time he was under the impression that there were no proper quarantine regulations. At present did we not import people suffering from all sorts of diseases, and go so far as to pass a Contagious Diseases Bill, yet none of the arrivals were examined. It was a most extraordinary thing to put the beast before the human being. It was a great pity that publicity was not given long ago to this question of importation, throughout the length and breadth of the Colonies, and the breeders allowed the opportunity of meeting independently to consider it.

Mr. HIGGINS: We did that.

Mr. MEREDITH did not think they had done so. The board might be like Parliaments, and yet not be representative. Mr. Curr had also spoken of the impossibility of improving animals by fresh importations. What had America done? She had availed herself of the opportunity of importing stock, and now possessed stock superior to anything known here. Why should not that be done here? Take Queensland. That Colony always required fresh supplies of rams. They wanted a characteristic animal—one with plenty of grease in the wool, as the wool rapidly deteriorated in quality in that climate. That showed that it was absolutely necessary to build up and establish different herds and flocks for different climates and pastures. In Tasmania, at the present moment, they were most desirous of introducing polled Angus stock and other breeds to improve their dairy cattle. A member of the Conference (Mr. Valentine) said some twelve months ago—"The most important question which arises in connection with the special inquiries into the diseases of stock is the probability of the introduction of diseases by the removal of the prohibition. The question has now become a national one, and can only be dealt with by the Colonies as a whole, since the introduction of disease into any one Colony is of vital importance to all. I have carefully considered the state of disease in Great Britain, and the probabilities of foot and mouth disease being introduced by importation. As regards stud herds themselves, but little, if any danger exists. Owners of stud herds in Great Britain do not expose their valuable animals to danger any more than do our own breeders. The danger lies in the movement of such animals from the owner's property to the ship, and this is difficult to estimate. At the present time it is not great, on account of the disease being restricted to a very few centres. Precautions could be taken and the chances of infection reduced to a minimum. With no other stock on board the vessel, and the fodder being carefully selected, after undergoing the voyage, and a quarantine of ninety days on their arrival here, I believe there would be little or no risk of introducing disease.

Mr. VALENTINE: I did not advocate the removal of the prohibition. I simply said there was little or no danger after the voyage and quarantine.

Mr. VALENTINE said that in his remarks, as quoted by Mr. Meredith, he was only expressing his personal opinion. That there was a risk must always be admitted, and the question arose—was it of sufficient importance to our owners that they should seek fresh blood out of the Colonies. During his visit he had seen very valuable and beautiful animals, some of which, in his opinion, would improve our herds; but at the same time he believed there were as good animals and equal in point of breeding in Australia. Was it then desirable, with even then the slight risk of introducing such a calamitous disease, to allow the importation of stock? He considered that this important question should be decided by stock-owners themselves. If they were desirous of removing the prohibition, and did not fear the introduction of foot and mouth disease, it might be withdrawn.

Mr. HIGGINS said he wished to point out again and again that we could only take this as the expression of the stock-holders opinion. They believed that they fairly represented the opinions of the majority of the stock-holders, but it was his idea that to settle this matter a circular should be sent throughout the Colonies, to the stock-holders, containing the question, "do you vote for free importation, or do you not?" That, however, was not done. He felt that if he proposed such a course here it would put the matter aside, and defer the settlement of it. He proposed an intermediate course to meet both parties, and in this way a settlement might be effected.

Mr. COOPER: I intend to move a further amendment, that equine, bovine, ovine, feline, canine be omitted from the resolution, so that only pigs and goats be left. I am entirely unfettered by any instructions.

Mr. CURR in reply, said Mr. Higgins had stated that the stock-owners were in favour of the ports being open, but he had put forward nothing but assertion in support of that claim. He (Mr. Curr) claimed to represent the stock-holders, who had really affirmed the principle of his resolution. The meeting of stock-holders in Melbourne, which had been alluded to by Meredith, was a hole and corner affair, at which only ten or a dozen persons were present. With regard to stock in England, it had arrived at its perfection by natural selection, except in the case of horses.

Mr.

Mr. WOOD remarked that Herefords came from the Ukraine.

Mr. CURR said if that were the case, he would say "in the majority of cases" With regard to what Mr. Park had said as to there being little or no danger of foot or mouth disease being introduced by stud stock, he would ask how it was that the bull Achmet showed the disease after being imported out here. Importation
of Foreign
Stock.

Mr. WOOD's amendment was then put and carried by 10 votes to 8,—the voting being :—For,—New South Wales, Mr. Stanley; Queensland, all; Tasmania, all; New Zealand, all. Against:—New South Wales, Mr. Bruce and Mr. Higgins; Victoria, all; South Australia, all.

Mr. HIGGINS' further amendment was put and negatived by 12 votes to 6,—the voting being :—Against,—Victoria, Queensland, Tasmania, and New Zealand, all. For,—New South Wales and South Australia.

4. *Importation of Dogs.*

Mr. HIGGINS moved,—“That the importation of dogs be prohibited”; Mr. BAGOT seconded the motion. The motion was lost by 10 votes to 7, the voting being :—Against,—Queensland, Victoria, New Zealand, all; South Australia, 1. For,—Queensland, all; South Australia, 1; Tasmania, all; New Zealand, all.

5. *Importation of Pigs.*

Mr. HIGGINS moved,—“That the importation of pigs be prohibited.”

The motion was carried by 15 votes to 3, the voting being :—For,—New South Wales, Victoria, Queensland, South Australia, Tasmania, all. Against,—New Zealand, all.

6. *Importation of Goats and Deer.*

Mr. STANLEY moved,—“That the importation of goats and deer be prohibited, except for Zoological Gardens.” Mr. HIGGINS seconded the motion.

The motion was carried by 12 votes to 6, the voting being :—For,—New South Wales, Victoria, Queensland, Tasmania, all. Against,—South Australia, New Zealand, all.

PREPARATION OF REPORT.

Mr. LANCE moved,—“That Messrs. Cooper, Curr, Tabart, Gordon, Valentine, and Bruce, be a sub-committee to prepare the Report of this Conference, in accordance with the minutes of the proceedings.”

The motion was agreed to. The Conference then rose, on the understanding that the Committee would meet at 10 a.m. on the following day, for the preparation of the Report, and the full Conference at 2 p.m., for the transaction of other business.

THURSDAY, 7 OCTOBER.

NINTH MEETING.

Present :—Mr. A. Bruce and the full Conference.

FAT SHEEP.

Mr. COOPER's motion,—“That it shall not be necessary to dip fat sheep imported from any clean Australasian Colony to another Australasian Colony solely for the purpose of slaughter, provided that such sheep be slaughtered in accordance with the regulations of any such Colony for the slaughtering of such description of sheep,” was altered, by consent, by the words “the slaughtering of” being struck out.

Mr. COOPER, Chairman of the sub-committee, informed the Conference that the sub-committee desired to insert in Mr. Curr's third resolution the words “infectious and contagious,” so that both expressions shall be used when speaking of disease.

The recommendation was accepted.

Mr. COOPER also reported that the sub-committee desired that a resolution arrived at by them defining the term foreign, as indicating every place outside Australasia.

This recommendation was accepted.

REGULATION FOR IMPORTATION OF FOREIGN ANIMALS.

The regulations for the importation of foreign animals was then considered.

Mr. STANLEY moved,—“That all animals, except horses, to be shipped to Australasia shall be shipped from the port of London. Mr. MEREDITH seconded the motion.

Examination of Stock.

Mr. STANLEY moved,—“That the Agents-General for the several Colonies be asked to appoint one, *i.e.*, the same registered veterinary surgeon, to examine all stock intended to be exported to any of these Colonies, the veterinary surgeon to give a certificate of health to accompany the animals.” Mr. WOOD seconded the motion.

The motion was agreed to.

Ports of Admission.

Mr. WOOD moved,—“That foreign animals be only admitted at such port or ports as shall be declared quarantine ports for such animals. Mr. PETER seconded the motion.

The motion was agreed to.

Prohibition

Prohibition of infected Animals.

Importation
of Foreign
Stock.

Mr. WOOD moved,—“That the introduction by sea or land of any animals or thing infected or suspected of being infected shall be prohibited until further decision.” Mr. PETER seconded the motion. The motion was agreed to.

Admission of Horses.

Mr. WOOD moved,—“That foreign horses shall be admitted without detention, if found on inspection by a properly qualified veterinary surgeon and inspector of stock, to be free from disease.” Mr. PETER seconded the motion.

Foreign Dogs.

Mr. WOOD moved,—“That foreign dogs landed in any Australasian Colony shall be detained in quarantine, at a special place set apart for the purpose by the Government of each Colony, for a period of six months from date of arrival.” Mr. CURR seconded the motion.

Mr. PETER moved an amendment,—“That the period be three months from the date of arrival.” Mr. COOPER seconded the amendment.

The amendment was negatived by 15 votes to 3, the voting being :—Against,—New South Wales, Victoria, Queensland, South Australia, and Tasmania, all. For,—New Zealand, all. The motion was declared to be carried.

Freedom from Disease.

Mr. WOOD moved,—“That all foreign cattle and sheep intended to be introduced into any Colony shall be accompanied by the breeders' or owners' declaration as to their freedom from disease, and of their not having been in contact with infection. Mr. GORDON seconded the motion, and agreed to.

Mr. CURR moved,—“That if any foreign animals are brought to a port or place in any Australasian Colony, but are not intended to be landed, they shall be examined on arrival by an inspector and veterinary surgeon, and if found free from infectious or contagious diseases, they shall be removed to quarantine and there kept until the sailing of the vessel, or be destroyed forthwith on board; and the expense of their detention in quarantine shall be defrayed before removal from such vessel by the owner.”

Motion agreed to.

Skins of Animals.

Mr. WOODS moved,—“That the skins of all animals which may have died or been slaughtered on board any foreign vessel during the voyage and not destroyed or thrown overboard, shall be salted and securely packed in cases or casks, and shall not be landed in the Colony.” Mr. GORDON seconded the motion.

The motion was agreed to.

Declaration of Captain.

Mr. WOOD moved,—“That a declaration be obtained from the captain of the vessel as to the health of stock on board on arrival in port.” Mr. GORDON seconded the motion.

The motion was agreed to.

Destruction of Infected Animals.

Mr. WOOD moved,—“That if foreign animals are infected they shall be disposed of as the Minister directs.”

Mr. COOPER moved an amendment,—“That they be forthwith destroyed by the Chief Inspector without compensation to the owner.”

The amendment was lost by 15 votes to 3, the voting being :—Against,—New South Wales, Victoria, Queensland, South Australia, Tasmania, all. For,—New Zealand, all.

The following resolutions with respect to Foreign Stock were also agreed to :—

Foreign Cattle and Sheep, intended to be introduced into any of the Australasian Colonies, shall be taken direct from the place from which they start to the port of shipment, and if they do not travel on foot they shall be conveyed in a goods waggon and not put into any conveyance, stable, or other place where animals liable to the same diseases have been within the next preceding sixty days.

If foreign animals are intended to be landed in any of the Colonies, they shall be examined by a duly qualified Veterinary Surgeon, and by an Inspector of Stock, who shall report whether or not such or any animals on board the vessel are infected.

If foreign animals other than horses are not prohibited, and are reported to be free from infection, and if the Chief Inspector is satisfied that they are not infected, they may, after being washed and disinfected as he may direct, be landed for quarantine, on sufficient bond and guarantee.

All foreign animals found on inspection to be free from infection, shall be conveyed by water at the owner's risk and expense, and remain in quarantine for the terms respectively prescribed for the different kinds of such animals, during which they shall be kept at their owner's risk and expense, and shall be washed, dipped, and disinfected, as the Chief Inspector of Stock shall direct.

On the expiry of the term of quarantine hereinafter prescribed for such animals, they shall be examined by a duly qualified veterinary surgeon and an Inspector of Stock, on the order of the Chief Inspector.

Period of Quarantine.

Mr. WOOD moved,—“That all foreign cattle and sheep landed in any Australasian Colony shall remain in quarantine for a period of not less than ninety days.”

Mr. GORDON seconded the motion.

Mr. MEREDITH moved an amendment,—“That the period for cattle be 120 days.” Mr.

Mr. TABART seconded the amendment.

Mr. PETER moved,—“That the period be six months.”

Mr. CURR seconded the amendment.

Mr. PETER's amendment was lost by 11 votes to 7, the following being the voting:—Against,—New South Wales, Queensland, Tasmania, all; South Australia, 1; New Zealand, 1. For,—Victoria, all; South Australia, 2; New Zealand, 2.

Mr. MEREDITH's amendment was carried by 9 votes to 6, the voting being:—For,—New South Wales; Queensland, Tasmania, all. Against,—South Australia, New Zealand, all.

The motion as relating to sheep was then agreed to.

Dressings and Bath for Foreign Sheep.

Mr. WOOD moved,—“That all foreign sheep landed in the Colony shall forthwith receive three dressings with tobacco and sulphur, or with lime and sulphur, at intervals of from ten to fifteen days between each dressing; and the medicaments shall be of the strength and the bath at the temperature and for the duration prescribed in regard to imported Australian sheep.

Mr. VALENTINE moved as an amendment,—“That the number of dressings be two or more if necessary.”

The amendment was accepted by Mr. Wood, and the resolution carried, with the amendment embodied in it.

IMPORTATION OF CAMELS.

Mr. VALENTINE stated that camels were largely imported into South Australia, and they were subject to foot and mouth disease and to scab and lice, which frequently cause their death. Camels should only be landed under inspection, and those infected with foot and mouth disease should be destroyed. He moved,—“That all camels arriving by any vessel shall be inspected by an Inspector of Stock or duly appointed veterinary surgeon, and if free from disease shall be permitted to land. All camels suffering from foot and mouth disease shall be destroyed, and all camels suffering from any skin disease shall be treated in such manner as the Chief Inspector shall direct, and under his control.

Mr. BAGOT seconded the motion.

INFECTION FROM EASTERN, INDIAN, OR CHINESE PORTS.

Mr. TABART moved,—“That this Conference recommends to the Queensland, South Australian, and Western Australian Governments the desirability of exercising the greatest possible vigilance with respect to their Northern ports, to prevent the introduction of disease from Eastern, Indian, or Chinese ports.”

Mr. STANLEY seconded the motion.

The motion was agreed to.

The Conference then adjourned to the following day, the sub-committee to meet at 10 a.m., and the full Conference at noon.

FRIDAY, 8 OCTOBER.

TENTH MEETING.

Present:—Mr. ALEX. BRUCE, Chairman, and the full Conference.

Introduction of Camels.

The CHAIRMAN stated that the camels which were imported into these Colonies came from countries where disease was prevalent, and it was possible that unless precautions were taken that they would be the means of introducing disease here.

QUARANTINE FOR CAMELS.

Mr. HIGGINS moved,—“That the quarantine for camels be the same as for cattle—120 days.”

Mr. BAGOT moved an amendment,—“That the period of quarantine be thirty days.” He said that if the proposal to quarantine them for 120 days were carried it would be the means of stopping their introduction. In South Australia there were from 1,000 to 1,500 camels. Every bush police station was provided with two, and nearly all the outlying squatters had a team of from fourteen upwards. The occupants of the territory in Western Queensland used them, and in dry season the Birdsville traffic was carried on by means of those animals.

Mr. LANCE seconded the amendment.

Mr. CURR seconded the motion. He said the question was not whether camels were necessary for South Australia, but whether they were likely to import disease. As far as he knew, the period of incubation of diseases common to the ox tribe, or to camels, was the same. They had fixed the period of detention at 120 days for cattle. They were either making it too long for cattle, or too short for the camel.

Mr. HIGGINS: I would like to know whether the foot and mouth disease to which camels are said to be liable is the same foot and mouth disease as that which affects cattle. If it be so, I do not think we can safely make any difference.

Mr. STANLEY: The camel is liable to all the diseases of ruminants.

Mr. MEREDITH said that they had agreed to a certain period of quarantine, not on account of the animals, but on account of the diseases in respect to certain animals. The camels were animals which were employed in distant places, and if disease did break out through them it might be very widely spread before steps could be taken to deal with it.

The motion was carried by 11 votes to 7, the following being the voting:—For,—New South Wales, Victoria, Queensland, all; Tasmania, 2. Against,—South Australia, all; Tasmania, 1; New Zealand, all.

PERIOD OF QUARANTINE FOR CATTLE.

Mr. LANCE moved,—“That the resolution fixing the period of quarantine for cattle at 120 days be rescinded.

Mr. BAGOT seconded the motion.

The motion was negatived by 11 votes to 7, the following being the voting:—Against,—New South Wales, 2; Victoria, Queensland, Tasmania, all. For,—New South Wales, 1; South Australia, New Zealand, all.

INTRODUCTION OF FOREIGN STOCK.

The sub-committee recommended that Mr. Stanley's motion, *re* the introduction of foreign stock,—“That all animals to be shipped to Australasia shall be shipped from the port of London, be amended by the insertion of the words ‘except horses,’ after the word ‘stock.’”

The recommendation was accepted.

The motion appears in the report in the following form:—“That all animals, except horses, exported to Australasia, be shipped from the port of London.”

RUNS ON BOUNDARY LINES.

Mr. BAGOT's resolution, having reference to runs situated on the boundary lines of Colonies was altered by consent, to read as follows:—“That any stock-holder owning runs in different Colonies may, with the sanction of the Registrar of Brands, be permitted to register in each Colony the brand in use by him and registered in his name in either Colony, and that it be a recommendation of this Conference that such Colonies as have legislation on the subject should so amend the Brands Act as to give effect to this resolution.”

ASSIMILATION OF REGULATIONS.

Mr. MEREDITH moved,—“That it is desirable that regulations should be framed from the resolutions passed by this Conference, so that the regulations in each Colony may be assimilated as far as practicable, and that the necessary certificates in the interchange of Australasian stock shall be the same.”

The motion was agreed to.

DRAFT REPORT.

Mr. COOPER laid on the table the draft report of the sub-committee, and moved that it be adopted and signed by the Chairman.

The motion was agreed to.

ACKNOWLEDGMENT OF SERVICES OF CHAIRMAN AND SECRETARY.

Mr. CURR moved,—“That the Conference desires to express to the Hon. Mr. Fletcher, Minister for Mines, its appreciation of the services of the Chairman, Mr. A. Bruce, and the ability and urbanity with which the Secretary, Mr. R. Brannon, has recorded the proceedings.” Mr. Cooper seconded the motion.

The motion was agreed to.

REVISION OF REPORT.

Mr. CURR moved,—“That the Chairman and Secretary be jointly authorized to revise the report of the proceedings of the Conference, in order to correct any verbal errors in the same.” Mr. VALENTINE seconded the motion.

The motion was agreed to.

VOTES OF THANKS TO THE MINISTER FOR MINES AND MINISTER FOR WORKS.

Mr. MEREDITH moved,—“That a vote of thanks be accorded to the Minister for Mines and the Minister for Works for the kind way in which the members of the Conference coming from the various Colonies have been received.” Mr. COOPER seconded the motion.

The motion was agreed to.

Mr. MEREDITH moved,—“That a vote of thanks be accorded the Press for giving publicity to the matters coming before the Conference.” Mr. LANCE seconded the motion.

The motion was agreed to.

TRIENNIAL CONFERENCE.

Mr. WOOD moved,—“That this Conference, taking into consideration the importance of the subjects that have come before them for discussion and decision, are of opinion that an Australasian Stock Conference should be held triennially at the chief city of one of the Colonies, and they respectfully offer this recommendation to the Governments of Australasia.” Mr. LANCE seconded the motion.

The motion was agreed to.

VOTE OF THANKS TO THE VETERINARY SURGEONS.

Mr. WOOD moved,—“That this Conference accords a cordial vote of thanks to the Veterinary Surgeons who have favoured this Conference with so much varied and valuable information.”

The motion was agreed to.

Mr. COOPER moved,—“That a vote of thanks be accorded to the Chairman.” Mr. BAGOT seconded the motion.

The motion was agreed to.

The CHAIRMAN and SECRETARY having expressed thanks for the recognition of their services, the Conference terminated.

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

SCAB INSPECTORS.

(INFORMATION RESPECTING.)

Ordered by the Legislative Assembly to be printed, 9 June, 1887.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 1st June, 1887, That there be laid upon the Table of this House,—

“A Return showing the number of Scab Inspectors in the Government Service, together with their names, the amount received by each, and the date of their appointments; also, the names of such officers (if any) who have shown by examination that they are capable of distinguishing a scabby sheep when they see one.”

(Mr. Wall.)

SCAB INSPECTORS.

			Rate of Salary per annum.	Date of appointment.

Sydney, 2nd November, 1886.

PASTURES AND STOCK PROTECTION ACT, 1880,
AND PASTURES AND STOCK PROTECTION ACT
AMENDMENT ACT, 1881.

His Excellency the Governor, with the advice of the Executive Council, has been pleased to approve of the cancellation of Regulation No. 40, of 13th January, 1882, under the "Pastures and Stock Protection Acts," together with Schedule 12 thereunder, and to substitute the following Regulation and Schedule in lieu thereof.

JAMES FLETCHER.

REGULATION 40.

Every owner of horses, cattle, or sheep, whatever the number may be, shall, between the first and thirty-first days of December in each year, make and deliver personally, or transmit by registered letter through the Post to the Inspector of Stock for the district, a return in the form of Schedule 12 hereto of the horses, cattle, or sheep owned or kept by him at the date of making such return.

SCHEDULE 12.

PASTURES AND STOCK PROTECTION ACT, 1880.

Return by owner of number of stock to Inspector.

RETURN of all Horses, Cattle, and Sheep owned or kept by in the Sheep District of and Colony of New South Wales, made this day of 188 , to the Inspector of Stock for the said District.

Name of Run.	Name and Address of Owner and of Superintendent or person in charge	Description of Stock.	Number of each description.	Brands or Marks.	*Acreage.
		Horses ...			
		Cattle ...			
		Sheep....			
		Hogs			

NOTE.—It is particularly requested that the correct Address (including Post Town) of the person making this Return may be given.
* The acreage of the entire holding, including "Freehold," "Leasehold," and "Crown Lands," must be stated.

I, , do hereby solemnly declare that the several matters and things contained in the above Return are true, to the best of my knowledge and belief.

Declared at , this day of , 188 .
Owner (or Superintendent).

N.B.—All owners are cautioned that they will render themselves liable to a penalty of £20 if they do not make their returns between the 1st and 31st days of December in each year, and that the Inspectors have been instructed to recover this penalty in every case in which it is incurred.

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

PROTECTION OF STOCK AND PASTURES.

(PETITION FROM CERTAIN GRAZIERS.)

Received by the Legislative Assembly, 7 June, 1887.

To the Honorable the Speaker and the other Members of the Legislative Assembly of the Colony of New South Wales, in Parliament assembled.

The humble Petition of the undersigned graziers of the Colony of New South Wales,—

SHOWETH :—

That this Conference, representing the stock-owners of this Colony, owning ten head of cattle and one hundred sheep and upwards, has unanimously agreed on certain principles which they think should be embodied in an Act of Parliament, the principles agreed on being,—

That rates necessary for the protection of stock and pastures of the Colony should be raised by bodies locally elected by the people who are to pay assessment, and that the expenditure of the rates so raised should be made by the same locally elected bodies or boards.

That the administration of all laws relating to stock and pastures should also be by the same locally elected bodies or boards.

That the only attempt at local administration in reference to stock and pastures which has yet been made (the Stock and Pastures Protection Act now in force) has been eminently successful in every part of the Colony.

That the principle of centralization adopted in many other Acts relating to stock and pastures has been one of the chief causes of their failure.

For these reasons your Petitioners urge as strongly as possible that your Honorable House should take into consideration, and pass into law with as little delay as may be, a Bill embodying the above-named principles, and consolidating and amending the many Acts and many principles now in force relating to stock and pastures and other matters in which stock-owners are materially interested, which consolidating and amending Bill has been drawn up by this Conference, and will in due course be presented to the Minister under whose charge the stock and pastures of the Colony of New South Wales are now placed.

Your Petitioners therefore pray that your Honorable House will be pleased to take into consideration the above premises.

And your Petitioners, as in duty bound, will ever pray.

[Here follow 43 signatures.]

(SECOND SESSION.)

NEW SOUTH WALES.

IMPORTED STOCK ACT 1871, AND IMPORTED STOCK
ACT AMENDMENT ACT 1884.
(REGULATION UNDER.)

Presented to Parliament, pursuant to Acts.

Department of Mines, Stock Branch,
Sydney, 17th June, 1887.

IMPORTED STOCK ACT OF 1871, AND THE IMPORTED STOCK ACT AMENDMENT ACT OF 1884.

His Excellency the Governor, with the advice of the Executive Council, has been pleased to cancel so much of No. 8 of the Regulation of 1st July, 1886, issued under the abovenamed Act, as refers to the quarantine of Stud Sheep imported from any clean Australian Colony, and to substitute the following Regulation in lieu thereof:—

QUARANTINE OF AUSTRALIAN IMPORTED SHEEP.

The quarantine for such sheep shall only extend to such time as will admit of their being once dipped.

FRANCIS ABIGAIL.

1887.

(SECOND SESSION.)

NEW SOUTH WALES.

PUBLIC WATERING PLACES ACT OF 1884.
(AMENDED REGULATIONS.)

Presented to Parliament, pursuant to Act 14 Vic. No. 16, sec. 14.

Department of Mines, Public Watering Places, Sydney, 6 May, 1887.

PUBLIC WATERING PLACES ACT, 1884.

His Excellency the Governor, with the advice of the Executive Council, has been pleased to cancel Nos. 3, 9, and 49 of the Regulations of the 1st December, 1885, issued under the above-named Act, and to substitute the following in lieu thereof:—

3. All stock upon prepayment of the following watering charges shall be supplied with water, all persons in charge of travelling stock being required to show their travelling statements or permits. Tenants may water and depasture within their lease not more than 35 head of large stock or 200 sheep where both sheep and large stock are kept; five head of the former shall be reckoned as the equivalent of one head of the latter.

9. The charges for water which the tenant or caretaker shall collect are as follows:—

	s.	d.
Horses, per head	0	2
Cattle, per head	0	1
Sheep, per hundred or portion of hundred	1	0
Goats and pigs, per head	0	0 $\frac{1}{4}$

When water is required for domestic purposes or in bulk, the same shall be supplied at the rate of one shilling per 100 gallons.

Any other animals according to agreement between tenant or caretaker and the owner or drover.

Water Trusts.

49. Any public watering place may be placed under Trustees, subject to these Regulations and the following conditions:—

1. The number of Trustees may be three or five, as the Minister shall decide.
2. The Trustees must engage, and may discharge, a caretaker, who will be under their immediate control and direction, but his remuneration will be fixed and paid by the Government.
3. The Trustees shall see that the works, appliances, and appurtenances are kept in a thoroughly efficient state, and will, as the necessity arises, make requisition to the Minister for repairs.
4. The following charges will be made for water supplied:—

	s.	d.
Horses, per head	0	0 $\frac{1}{2}$
Cattle, goats, and pigs, per head	0	0 $\frac{1}{4}$
Sheep, per hundred and portion of hundred	0	6
Water for domestic purposes or in bulk per 100 gallons	1	0
Any other animals according to agreement with Trustees.		

5. All travellers, teamsters, and drovers entitled to obtain water at a Public Watering Place shall, on prepayment of the charges prescribed by Regulation No. 9, be equally entitled at Public Watering Places under Trustees.
6. All watering charges collected at Public Watering Places under the control of Trustees shall be paid into the Consolidated Revenue Fund.

FRANCIS ABIGAIL.

(SECOND SESSION.)

NEW SOUTH WALES.

PRICKLY PEAR DESTRUCTION ACT OF 1886.

(ADDITIONAL REGULATION UNDER.)

Presented to Parliament pursuant to Act, 50 Vict. No. 2, sec. 23.

Department of Mines, Forest Branch, Sydney, 22 February, 1887.

WHEREAS by the Prickly Pear Destruction Act of 1886, power was given to the Governor to make Regulations for declaring how and in what manner Prickly-pear may or shall be destroyed otherwise than as provided for in the said Act, and it is expedient that such Regulations should be made: Therefore, His Excellency the Governor, with the advice of the Executive Council, has been pleased to make the following Regulation.

FRANCIS ABIGAIL.

DESTRUCTION OF PRICKLY-PEAR.

4. As an alternative to burning or burying the prickly-pear, it may be stacked in large heaps upon ground out of reach of flood or storm water, such heaps not to exceed 25 feet in width, and to be enclosed with a close paling or closely-laid log fence at least 1 foot higher than the heaped prickly-pear, but not exceeding 6 feet in height, each post to be supported with a stay outside the enclosure, the heap of prickly-pear to be closely covered with bark, palings, slabs, branches, or stones, upon which a covering of not less than 1 foot of earth is to be placed and firmly stamped down, the fence and covering on top to be made close so as to exclude light and air, openings in the sides or top through shrinkage to be made good, and any growth of prickly-pear through the sides or top of such heap to be destroyed. The covering may be opened and prickly-pear added to the heap from time to time, provided the conditions herein specified are observed. If the stack is erected upon sloping ground, a channel to be cut around the upper sides sufficiently large to carry off storm water. The whole to be kept in good order to the satisfaction of the Minister until the mass of prickly-pear is thoroughly destroyed, or until the remains of any such heap is burned or buried as provided for by the "Prickly-pear Destruction Act of 1886."

1887.

(SECOND SESSION.)

NEW SOUTH WALES.

PRICKLY-PEAR DESTRUCTION ACT OF 1886.

(REGULATION IN LIEU OF REGULATION No. 4.)

Presented to Parliament, pursuant to Act 50 Vic. No. 2.

Department of Mines, Forest Branch,
Sydney, 1st July, 1887.

WHEREAS by the Prickly-pear Destruction Act of 1886, power was given to the Governor to make Regulations for declaring how and in what manner prickly-pear may or shall be destroyed, otherwise than as provided for in the said Act; and such Regulation No. 4 was made on the 22nd February, 1887, and it is expedient that a new Regulation should be substituted: Therefore, His Excellency the Governor, with the advice of the Executive Council, has been pleased to cancel Regulation No. 4 of 22nd February, 1887, and to make the following Regulation in lieu thereof.

FRANCIS ABIGAIL.

DESTRUCTION OF PRICKLY-PEAR.

No. 4. As an alternative to burning or burying prickly-pear, it may be stacked in large heaps, not to exceed 24 feet in width, built so that all portions of the plant bearing fruit are turned inwards and covered, to prevent birds or animals from obtaining access to and disseminating the seed, and so as not to be liable to be washed away by flood or storm water. Two such heaps or stacks shall not be built within 300 feet of each other on land belonging to the same owner or occupier without permission of the Minister. Heaps or stacks may remain on the ground and be added to from time to time, as the work of clearing progresses, until the land is cleared of prickly-pear, after which they shall be burned: Provided that the Minister may at any time direct that a heap or stack shall be burned within two months from date of notice, and until every part of the prickly-pear in any such heap or stack is completely burned, the owner or occupier of the land shall be liable at common law for any damage caused to other owners if any of the prickly-pear fruit or seed is carried away by flood or storm water. And if any prickly-pear on the top or sides of the said heaps or stacks is allowed to bear fruit, the owner or occupier shall be deemed guilty of a breach of the Act 50 Vic. No. 2.

[F. 87-5,718]

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RABBIT PROOF FENCING.

(NARRAMINE TO BOURKE—TENDERS.)

Ordered by the Legislative Assembly to be printed, 22 March, 1887.

Memo. from Mr. Henry C. Taylor to The Minister for Mines.

In considering the contracts for the supply of wire netting, it will be seen that the tender of the Victoria Galvanized Iron and Wire Company is the lowest, the sum stated being £9,652 15s., and if from this is deducted the *ad valorem* duty the cost to the State would be reduced by about £1,100; but in response to enquiries the Company state that they cannot comply with the conditions unless the time occupied in dealing with the tenders is allowed for, and they hint that in the event of accidents at sea they would also expect consideration.

Next comes the tender of T. Dunn & Co., amounting to £9,743 11s. This firm state that they are prepared to deliver within the time specified, and they neither ask nor do they require an extension of time.

The last tender to be considered is that of John Lysaght, Limited, the amount being £9,881 17s. 6d., the wire to be supplied in the time named, and in all respects in accordance with the conditions. An offer is made to reduce the price by about £500 if the time is extended by three months.

In view of these facts it is submitted that the Minister be asked to decide which tender is to be accepted.

HENRY C. TAYLOR, 16/6/86.

Submitted.—H.W., 16/6/86.

I hereby accept the tender of John Lysaght, Limited, for the supply of wire netting, according to specification, for the sum of £9,881 17s. 6d., and the tenders of Job Coles for erection of the fence according to specification from Narramine to Nyngan for £1,767 1s. 1d.; from Nyngan to Byrock, £1,860 7s.; and from Byrock to Bourke for £1,064 17s. 6d.—JAMES FLETCHER, 11/8/86.

Messrs. Lysaght and Coles so informed, 11/8/86.

The specification and general conditions, together with the tenders which have been accepted, may now be forwarded to the Crown Solicitor, with a request that he will prepare the necessary bonds.—H.T., 12/8/86. Forwarded as directed, 12/8/86.

Minute Paper.

Subject:—Tenders for rabbit proof fencing, Narramine to Bourke.

Department of Mines, Rabbit Branch, Sydney, 2 June, 1886.

From an inspection of these tenders it will be seen that one firm (T. Dunn & Co.) have offered to supply the whole of the netting, and erect the same in terms of the specification for the sum of £15,138 8s.; but although it would be an advantage to have but one firm to deal with in carrying out the work, it can be done cheaper by accepting other contracts.

Under the head of contract B will be seen particulars of the various tenders for the supply of the whole of the wire netting, the colonial manufacturers being able, owing to the *ad valorem* duty and other causes, to supply in accordance with the specification at a much lower rate than the representatives of the British manufacturers, who also in the majority of cases are unable to supply the article within the time specified.

The following are amongst the lowest offers:—

The Victoria Galvanized Iron and Wire Company	£9,652	15	0
Thomas Dunn & Co.	9,743	11	0
J, Lysaght, Limited	9,881	17	6

The last firm offer to reduce the price by £2 10s. per mile if the time for delivery is extended by three months.

In

In contract C, for the erection of the whole of the netting, fencing, &c., the following are the most reasonable offers:—

William Sharp	£5,353	11	0
T. Dunn & Co.	5,394	17	0
J. Fox & Co.	5,615	10	0

but by accepting the tenders of Job Coles (See Contracts E, 1, 2, and 3), who has offered to carry out the work of erection in three sections, as follow:—

Narramine to Nyngan	£1,767	1	1
Nyngan to Byrock...	1,860	7	0½
Byrock to Bourke	1,064	17	6

The work can be done for £4,692 5 7½

and this tender we desire to recommend for acceptance.

In the Schedule of Contracts E it will be seen that D. C. J. Donnelly's tender is less than that of Cole's for the same section, but to effect a saving of £5 13s. 6d. it would not be judicious to divide the work.

GERARD E. HERRING,
HARRY A. GILLIATT,
HENRY C. TAYLOR.

CONTRACT A.

For the supply of the whole of the Netting, Fencing, and all necessary material, and the erection of such Netting, Fencing, &c., from Narramine to Bourke.

Name of Tenderer.	Amount.
	£ s. d.
Thomas Dunn & Co.	15,138 8 0
Ryan, Hammond & Donkin	20,461 10 0

CONTRACT B.

For the supply of the whole of the Netting, as per Specification.

Name of Tenderer.	Amount.	Remarks.
	£ s. d.	
The Victoria Galvanized Iron and Wire Co.	9,652 15 0	
Thomas Dunn & Co.	9,743 11 0	
J. Lysaght & Co. (Limited)	9,881 17 6	Offer to reduce the price by £2 10s. per mile if time extended for three months.
John Macdonald	9,197 10 6	Cannot supply within the time specified; the price is calculated exclusive of duty, which at the present tariff would increase it to about £10,298 10s. 6d.
R. L. Scrutton & Co.	10,198 0 0	Cannot complete until 30 November.
Schmedes, Erbsloh & Co.	10,289 15 0	Cannot supply in time.
Andrew Rowan & Co.	10,778 7 6	Cannot supply in time.
Dalgetty & Co.	11,413 0 0	Cannot complete under twelve months; tender late, and without deposit.
Gibbs, Bright & Co.	11,572 14 11	Cannot complete until January.
M'Lean Brothers, Rigg & Co.	11,816 0 0	Could complete order on 1 December for £9,983.

CONTRACT C.

For the erection of the Netting and Fencing, and the supply of all materials (other than netting) and labour required, as per Specification.

Name of Tenderer.	Amount.
	£ s. d.
William Sharp	5,353 11 0
Thomas Dunn & Co.	5,394 17 0
James Fox & Co.	5,615 10 0
D. C. J. Donnelly	6,239 19 10
M. Kinshela & T. Bellwood	6,496 16 0
P. J. D'Arcy	9,542 5 0

CONTRACT D.

For the supply of Netting for any of the Sections, as per Specification.

Name of Tenderer.										Amount.

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

THE RABBIT PEST.

(PETITION FROM REPRESENTATIVES OF THE STOCK AND PASTURES BOARDS OF THE COLONY.)

Received by the Legislative Assembly, 3 June, 1887.

To the Honorable the Speaker and the other Members of the Legislative Assembly of the Colony of New South Wales, in Parliament assembled.

The humble Petition of the undersigned representatives of the Stock and Pastures Boards of the various Sheep Districts of the Colony of New South Wales met in Conference,—

SHOWETH :—

That whilst an ever increasing area of the Western pastoral country is already so seriously affected by the rabbit pest that extensive assistance in some form has become an absolute necessity, the pastoral and agricultural interests extending over the whole area of the Colony are threatened with an indefinite loss from the same cause.

This grave national evil has been considered by past Rabbit Conferences, and following their careful deliberations they proposed and suggested a fair foundation for legislation, which has once more been adopted by this Conference, and by it urged with strong reasons for its adoption, and in the hope that your Honorable House may see your way to grant to your Petitioners such a measure of relief as may be just to them and conducive to the general interest.

Your Petitioners therefore pray that your Honorable House will be pleased to take into consideration the above premises.

And your Petitioners, as in duty bound, will ever pray.

[*Here follow 35 signatures.*]

1887.
(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

SIR JOHN FOWLER.

(EMPLOYMENT OF, AS CONSULTING ENGINEER TO THE GOVERNMENT, IN ENGLAND.)

Ordered by the Legislative Assembly to be printed, 15 June, 1887.

RETURN to an *Order* of the Legislative Assembly, dated 21st April, 1887, That there be laid upon the Table of this House,—

“ A Return showing the various amounts paid to Sir John Fowler every year since his appointment; also, copies of all letters, minutes, and other documents having reference to the appointment of the above-named gentleman, showing who recommended his appointment, and any correspondence from any persons offering to carry out the duties performed by him on different terms from those at present in force.”

(*Mr. Cameron.*)

Memo. by The Chief Clerk.

THE records of the Department have been diligently searched, but no paper anterior to 22nd September, 1863, can be found bearing upon Sir John Fowler's connection with the inspecting business of the Department, although it is clear from the search made in the books of the Accountant's office that payments to him on this account were made as far back as 1862.

The following letter from the Commissioner for Railways to the Representative Agent in England, dated 22nd September, 1863, refers to an arrangement with Sir John Fowler, which was then in existence. In that letter reference is made to instructions issued to the previous Inspecting Engineer, Captain Galton, R.E., but no copy of such instructions can be found in the records.

D.C.M'L., 13/6/87.

No. 1.

Extract from letter to E. Hamilton, Esq., Representative Agent, dated 22 Sept., 1863.

Inspection of Railway Materials.

THE arrangements made with Mr. Fowler appear to me satisfactory; but to prevent any misunderstanding on this head, I enclose a copy of the instructions to Captain Galton, R.E., and the late agents, which, as far as possible, should still be adhered to. I may add it is particularly desirable that all tenders accepted should be previously approved by you, using such discretion, however, under the advice of Mr. Fowler, as the circumstances may seem to you to render necessary, where you are unable to rely upon your own judgment. As a rule, however, you should, I think, act independently; but I offer this merely as a suggestion; and not in any way to fetter you in the mode of carrying out your very onerous and difficult duties.

JOHN RAE,
Commissioner for Railways.

No. 2.

335—A

[842 copies—Approximate Cost of Printing (labour and material), £19 16s. 4d.]

No. 2.

The Secretary for Public Works to E. Hamilton, Esq., London.

Sir,

Department of Public Works, Sydney, 22 October, 1864.

In consequence of recent investigations of the invoices for railway iron shipped from England on account of this Colony from the beginning of 1859 to this time, it appears to the Government that the charges for rails and chairs have been greatly and improperly in excess of prices current at the times of purchase and shipment. Under these circumstances they are of opinion that a most rigid inquiry should be instituted in England, and as a preliminary step I have to request that Mr. John Fowler's services as Inspector of railway iron, plant, and rolling stock may be dispensed with at once.

As to any orders for railway materials which may be transmitted by this mail, I have to request that they may be executed under the superintendence and inspection of a leading London broker in the iron trade.

As to orders for railway materials which have already been transmitted to you, I have to request that so far as practicable the execution of contracts for such materials should be stopped until further orders.

In respect of orders already transmitted, the execution of which cannot be fully stopped or suspended till next advices from this, I have to request that you will do nothing without consultation with a leading London broker as abovementioned.

If the advice and opinion of an Engineer should be required in reference to orders still outstanding, you will be pleased to employ an experienced gentleman in lieu of Mr. Fowler.

The Government are about to institute inquiries into the supposed overcharges above referred to, and I purpose forwarding by next mail full information and instructions for your guidance, or the guidance of your successor, should the Government be in a position to appoint such successor in the meantime.

I have, &c.,

ARTHUR T. HOLROYD.

No. 3.

The Under Secretary for Public Works to The Agent for New South Wales.

Sir,

Department of Public Works, Sydney, 21 November, 1864.

Referring to the notification in the *Government Gazette* of the 10th instant, of your appointment as Agent for the Colony of New South Wales, resident in London, I am directed by the Secretary for Public Works to request that, as there is reason to believe that for a considerable period this Government has been defrauded of large sums of money in the prices paid for railway iron, you will on your arrival in England investigate into, and report upon, all the circumstances connected with these purchases and the actual value of the rails and chairs so purchased.

2nd. I am to inclose herein a return of invoices of rails and chairs purchased by the Government Agents in England; and for the purpose of further accrediting you in this matter, I am instructed specially to authorize you to take all proper and necessary steps for the elucidation of all the circumstances connected with the alleged overcharges.

I have, &c.,

JOHN RAE.

No. 4.

The Representative Agent of New South Wales to The Secretary for Public Works.

196, Gresham House, Old Broad-street, London,

24 January, 1865.

Sir,

In reference to an instruction contained in your letter of 22nd October, 1864, that a leading London broker be engaged to inspect any railway materials now under contract, I beg to call your attention to the terms of the contract, a copy of which has been furnished to you, that the money is to be paid one month after the production of the bills of lading, accompanied by Mr. Fowler's certificate. Any delay in payment through a second inspection may be resisted as being at variance with the terms of the contract, and will probably create trouble. I therefore suggest that Captain Mayne be authorised to carry out all existing contracts without alteration in the conditions, and that the new regulations, whatever they may be, be limited to future engagements.

I have, &c.,

EDWD. HAMILTON,

Representative Agent of New South Wales.

No. 5.

The Representative Agent for New South Wales to The Secretary for Public Works.

196, Gresham House, Old Broad-street, London, E.C.,

26 January, 1865.

Sir,

I have the honor to acknowledge the receipt, on the 19th instant, of your letter dated 22nd October, 1864, conveying certain instructions for my guidance, based apparently on an assumption "that the charges for rails and chairs supplied during the last few years to the Colonial Government have been greatly and improperly in excess of prices current at the times of purchase and shipment."

I have handed over this letter to my successor, Captain Mayne, who will enter upon the duties of the agency on the 1st proximo, and he will, I make no doubt, inform you of the course he intends to adopt in reference thereto. The only point which calls for remark from me is the order to suspend, *so far as practicable*, all existing contracts for railway material, and I beg to say that they must proceed to completion, and that any attempt to interfere with them would expose the Colonial Government to consequences which the words *underscored* lead me to believe that you did not contemplate or desire.

The only contracts for railway material in hand are:—

(1.) For locomotive engines, of which there are fifteen not yet ready for delivery, and 2nd for miscellaneous stores ordered in your letters dated respectively the 22nd September and 22nd October, 1864, of which part has already been shipped; and it will be obvious to you that it is not practicable to break, suspend, or alter the engagements entered into.

The foregoing is, perhaps, the only answer which, on the eve of my retirement from the agency, it is my duty to give to your letter now under reply, but as it is in my power to afford information which will help to remove the unfounded suspicions which exists in some quarters as to the management of contracts for permanent-way material, I do not feel justified in withholding it, and I offer it as entitled to credit, inasmuch as no contract of the kind has been executed by me, or on my responsibility, since I have filled the office of Representative Agent to the Colony.

The only order for rails, fish-plates, &c., received in London since the 1st of January, 1863, when my duties commenced, is that dated 20th March, 1863, and, in conformity with my instructions, it was placed in Captain Galton's hands, and was executed by him and Mr. Fowler. I was on one occasion present for the consideration of tenders which had been sent in to, and opened by Captain Galton, but the responsibility of decision rested with him and not with me. I mention this only as a fact, and not with a view of suggesting that the interests of the Colony were not on that and on all previous occasions fully and entirely protected. There was, however, one small order for rails not executed on Captain Galton's responsibility, that, namely, for the replacement of rails lost in the "Everton," but in that case I was expressly instructed to employ Messrs. Beale and Co., who had furnished the original lot. I am particular in stating these facts in order that it may be clearly understood that I am not affected in any way by the imputations that are distinctly referred to in your letter, and in the hope that the information I offer may be received as that of an impartial person. I will further add that I am not responsible for the appointment of Mr. Fowler as inspecting engineer, or for the rate at which his commission was fixed.

When the supervision of railway contracts passed into my hands (in compliance with the Commissioner's letter, dated 22nd September, 1863), I took over the business, subject to all existing arrangements and appointments, and having obtained a copy of the authority by which Mr. Fowler's commission was fixed, I allowed matters to remain as I found them.

The way in which the business was conducted by Captain Galton was, I believe, thus:—On receipt of an order for rails (and I confine my remarks to the subject matter of the imputations, viz., permanent-way materials), Mr. Fowler was instructed to advise upon the quality which, in his judgment, was most suitable for colonial traffic, keeping in view the heavy addition to prime cost on account of freight, insurance, &c.; and after general approval by Captain Galton, to draw up specifications, setting out in detail the conditions to be complied with by the manufacturers. As soon as the specifications were settled and in print, Captain Galton (probably after consultation with Mr. Fowler) determined what parties should be invited to tender (*vide* Mr. Fowler's letter herewith on the question of inviting tenders by public advertisement), the specifications were sent to the parties so selected, and the tenders were addressed to Captain Galton, opened and abstracted by him, and the selection was made by him in the presence of Mr. Fowler and the Commercial Agent. After this, the superintendence of the execution of the order virtually devolved upon the inspecting engineer; it was his duty to see, at the proper stage of the work, that each specification was complied with, and to follow the goods till, in compliance with the contract, they were delivered into the Agent's charge for shipment; and I will hazard this assertion, that if disposed to prove the fidelity with which his inspection was performed, Mr. Fowler could, by reference to the diaries of his Inspectors, state the day on which every order has been inspected at the different stages of its progress.

As to the number of tenders invited in each case and the names of the parties, I beg to refer you to the list furnished to me by Mr. Fowler, and forwarded to the Commissioner for Railways by last mail.

It is not within my knowledge whether abstracts of tenders were sent to the Colony while the contracts were in Captain Galton's charge, but they have been forwarded in every instance since I became agent, whether the order was executed on my responsibility or not.

If they were not forwarded by Captain Galton, the reason, probably, is that they were not asked for.

Such were the arrangements, for the superintendence of the railway contracts, while it was intrusted to Captain Galton, and I am confident that no better could be devised for the protection of the public interests.

Under these arrangements all the permanent railway material sent out since 1859 has been inspected by a civil engineer of the highest eminence, most punctual in attention to his business, and shrinking from no trouble or expense incident to the discharge of his duties; and that engineer has been controlled by an officer whose impartiality, integrity, and knowledge of every branch of railway business are universally recognized.

It is, therefore, to me a matter of surprise as well as regret, that a suspicion should be entertained that the Colony has not received full value for the money expended, and before concluding this letter I beg to address myself to the specific allegation which has been made, viz.: "That the charges for rails and chairs shipped from England to the Colony from the beginning of 1859 have been greatly and improperly in excess of prices current at the times of purchase and shipment." The ground on which this charge is made appears to be that the contract prices are higher than those quoted in the lists published by the *Economist*. The fact is so; the quoted prices are materially lower; but the discrepancy admits of easy explanation, and the information I have obtained will, I trust, have the effect of allaying the feeling of dissatisfaction which has so unfortunately arisen.

As soon as my attention was called to the subject in an unofficial way by the Commissioner for Railways, I wrote to Mr. Fowler about it, and received in reply the explanation contained in his letter herewith forwarded.

I also sought an interview with the Secretary of the London and North Western Railway Company, with whom I had no previous acquaintance, and requested him to be good enough to furnish me with the price paid by that Company for rails of good quality, in June, 1863, 75 lb. to the yard, 50 per cent. 24 feet long, and the remainder carrying from 20 to 15 feet.

I enclose his written reply, which, though marked private, contains nothing which he would care to withhold from publication. In the course of conversation he observed that the information would be of no use to me unless I could tell him whether the rails were made of Welsh, Staffordshire, or Yorkshire iron, and what were the specifications with which the manufacturers had to comply. My reason for applying to the Secretary of this Company was that Mr. Fowler has no connection with it, and the requirements of their extensive line bring them continually into the market.

I have also seen a statement prepared by the Lancashire and Yorkshire Railway Company to show the durability of rails of various prices ranging from £8 as high as £16 per ton, the result of their experience being that a rail of low quality is the most expensive that can be laid down. It must be known to you that the experience of all the large Railway Companies in this country points in the same direction. In fact the evidence on this question is so conclusive, that the London and North Western Company are beginning to lay down solid steel rails (Bessemer) at all points of heavy traffic, and it is understood that the substitution of them for iron rails throughout their system is only a question of time. The engineer of the Great Western Railway Company mentioned in my presence, only two days ago, that in order to test the durability of Bessemer steel rails, the London and North Western Company had laid down, in the throat of their London terminus where the traffic is greatest, a Bessemer rail on one side and an iron rail of first quality on the other, and that the iron rail had been replaced over and over again, while the Bessemer showed no signs of wear or deterioration, and he said that if Bessemer could be laid down at a cost not exceeding £15 a ton, iron rails would cease to be used.

Again I forward for your information the specification of rails for one of the Grimsby lines, prepared by Mr. Fowler. The contract was taken about the same time as the last colonial contract of 1863, and as there is no material difference of quality, though there is some slight variation of detail in the specification, the comparison goes to establish two points.

- 1st. That the price paid for the colonial rail was not excessive if the Grimsby price was not so; and
- 2nd. That Mr. Fowler does not fail to consider the special conditions in each case that he has to deal with.

The foregoing explanation amounts to this: that the prices named in the printed lists refer to rails just merchantable but not made under specification and subject to no test; that such rails are rarely if ever used in this country; that the price of rails varies in proportion to quality, the range being from £5 as high as £16 per ton; that it was Mr. Fowler's special duty to decide on the quality of rail which was best suited to colonial traffic, and most consistent with an economical application of the funds appropriated to the construction of colonial railways, and that there is absolutely no evidence whatever that the quality of the rails supplied is not up to the price paid for them.

In conclusion I beg to hand in copy of a statement sent to me by Mr. Fowler, giving the names of makers of rails of best quality on his list, selected, because the execution of previous orders had given satisfaction, but subject to be struck out if the character of their manufacture was not maintained. As Captain Mayne wishes to see the original tenders referred to in Mr. Fowler's letter of the 25th inst., I shall not forward them to the Colony.

I have, &c.,

EDWARD HAMILTON,
Rep. Agent of New South Wales.

No. 6.

J. Fowler, Esq., to E. Hamilton, Esq.

Dear Sir,

2 Queen's-square Place, Westminster, 24 December, 1864.

In reply to your letter of the 22nd I enclose you a list of the rails which have been sent out to New South Wales under indent since I have acted on behalf of the Government as Inspecting Engineer.

I also enclose a list of all indents during the same period.

As regards the difference in price between the published price current of rails and the price in the accepted tenders, it is very easily explained.

The price in the price current is what is called "Merchantable iron," manufactured in the cheapest possible manner without specification or supervision, or test or guarantee.

Such rails are never used in England, India, Russia, or other great markets for English manufacture. At one time they were largely used in America, and are sometimes used in foreign countries—when, from omission, a Government or Company have neglected to require the supply of rails to be furnished under a proper specification and supervision.

An instance occurred lately in the Riga and Dimsburg Railway, constructed under my friend Mr. Hawkshaw, when tenders were sent in for £6 5s. per ton without specification, but when they were required to be of proper quality under a specification the price was increased to £8 5s. on a quantity of 32,000 tons, and the rails were supplied at that price.

The rails supplied to New South Wales under my specification and superintendence were quite as cheap at the price, in the accepted tenders, as the price in the price current for the rails then referred to; and it would have been a most serious mistake of judgment to have adopted rails of inferior quality when carriage is so important an element.

The

The quantity of iron of superior quality in the rails sent to New South Wales under my specification at the top and bottom, where the wear takes place, is exactly four times the quantity usually put into the rails referred to, in the price current, besides other precautions in the manufacture which greatly affect the quality of the rails.

As regards the best principle of tendering, I believe you get the best competition by selecting a sufficient number of makers or contractors of character and give the contract to the lowest tenderer, and this is the principle almost universally adopted in England at the present time.

If you throw tenders open to everybody you are obliged to say you will not be bound to accept the lowest tender, and then conditions frequently prevent the most eligible parties tendering.

I shall be most happy at all times to furnish the fullest information and explanation to you with respect to every contract entered into on behalf of the Government of New South Wales.

I can say with confidence that from the prompt payments and attention with which the financial business of New South Wales has always been conducted in this country, I have been able to obtain the most favourable possible terms from makers of all kinds, in the tenders they send in.

Yours, &c.,
JOHN FOWLER.

Minute by Minister for Public Works.

Acknowledge with thanks for the valuable information conveyed herein, with the expression of my regret at the early termination of Mr. Hamilton's services.—W.M.A., 22/3/65.

No. 7.

The Agent for New South Wales to The Secretary for Public Works.

Sir,

New South Wales Agency, 36, Cannon-street, London, 13 February, 1865.

Having reference to the letter of the 22nd October last, from the Honorable the Secretary for Public Works to my predecessor, intrusting him at once to dispense with Mr. John Fowler's services as Inspector for Railway Stock; to have any orders for railway materials transmitted by the same mail executed under the superintendence and inspection of a leading London broker in the iron trade; as regarded orders for railway materials previously transmitted to stop, so far as practicable, the execution of contracts for such until further orders; in case of such as could not be stopped doing nothing without consultation with a leading London broker as before mentioned; and if the advice and opinion of an engineer should be required in reference to orders still outstanding to employ an experienced gentleman in lieu of Mr. Fowler, I have the honor to state for your information that it is not, in the case of any of the orders for railway materials, practicable to stop the execution of the contracts, and that the terms of these, involving as they do, payment under Mr. Fowler's certificate, preclude till the completion of those contracts dispensing with Mr. Fowler's services.

2. Regarding the instruction touching superintendence and inspection by a leading London broker in the iron trade, I have to state that the services indicated are, I am informed, entirely beside those of a broker, and that all the inquiries I have made lead me to the conclusion that to employ the services of a broker in the carrying out of contracts for permanent-way material and rolling stock, would merely include the additional charge of a brokerage commission without any one safeguard or advantage whatever.

3. As regards the instruction for the employment of another engineer in lieu of Mr. Fowler, in cases in which the advice and opinion of one should be required in reference to orders still outstanding, I have—referring you to what I have stated in paragraph 1, as to the impossibility of setting aside Mr. Fowler, so far as existing contracts are concerned—to point out that compliance with that instruction would involve expense to an amount which cannot, I am confident, have been foreseen, and this without any commensurate advantage; as I have already explained, the existing contracts render imperative payment under Mr. Fowler's certificate, and such payment the contractors would demand and enforce, whatever might be the report made by any other engineer after inspection and trial of the material or stock.

Such inspection and trial could, it is obvious, be made only after delivery by the contractors; that delivery in terms of the contracts is to be "alongside" the ship—now observe what this in case of the engines (twelve in number) now in course of construction and delivery, would after delivery "alongside" involve,—

- 1st. The removal from the wharf (not without risk) of cases of such weight and dimensions, as are those containing locomotives packed for a voyage to Australia.
- 2nd. The several processes of unpacking, taking to pieces (indispensable for inspection of any value) putting together again, after this actual testing on rails (only to be effected on a railway line, or in a contractor's workshop or yard) then repacking and final removal back to the wharf.

The expense of all this, added to the charge by the engineer employed, for his time and professional services, in making detailed inspection, would be so very serious that having regard to all that fulfilment of the instruction would and might involve. I feel it to be my duty, in the exercise of the discretion with which, at such a distance, an agent must be invested, to suspend acting on the instruction in question, until I receive further orders on the subject

I have, &c.,
W. C. MAYNE,
Agent for the Colony of New South Wales.

No. 8.

The Agent for New South Wales to The Under Secretary for Public Works.

Sir, New South Wales Agency, 36, Cannon-street, London, 22 February, 1865.
 Having reference to your letter of the 21st November last, conveying to me the instructions of the Hon. the Secretary for Public Works, on my arrival in England to investigate and report upon the purchases of permanent-way material for the Government of New South Wales, I have the honor to inform you that, though I have used every exertion to carry out those instructions, the steps I have taken to that end have not yet placed me in a position to arrive at a definite conclusion, and to make my report on the subject for the information of the Secretary.

2nd. It must be borne in mind that those to whom I have to address my inquiries, and from whom I have to seek information on the subject are for the most part gentlemen weighted with their own pressing and important business, to whose leisure and convenience I am obliged entirely to defer.

3rd. I have already had to make one journey into Staffordshire to obtain a personal interview with one of those gentlemen, and I expect to have to report it to procure further information from him.

4th. By the March mail, however, I have every hope that I shall be able to report the result of my investigation for the information of the Honorable the Secretary for Public Works.

5th. Before closing an inquiry intrusted to me, I have always guarded myself from forming a conclusive judgment, or committing myself to positive expression of opinion, and I do so now; but in the special circumstances of this case, I consider it open to me, and right to state that the result of all my inquiries hitherto tends towards establishing the *bona fides* with which the purchases of the permanent-way material for the Government have been made.

6th. In these circumstances referring you to Mr. Hamilton's recent communications respecting Mr. Fowler, and to my letter of the 13th instant, I would submit for the consideration of the Hon. the Secretary for Public Works the expediency of so far modifying the instructions conveyed to my predecessor in Mr. Secretary Holroyd's letter of the 22nd October last, as to make the dispensing with Mr. Fowler's services as Inspector of Railway Iron Plant and Rolling Stock dependent on the result of the inquiry, in which I am now engaged, and on the final decision of the Executive.

On this point it is very desirable that I shall be favoured with a reply by the mail to be despatched from Sydney on the 22nd of April.

I have, &c.,

W. C. MAYNE,

Agent for the Colony of New South Wales.

As the mail had left Sydney before this letter was received, the only means of complying with Captain Mayne's request was by means of the telegraph. The Minister for Works accordingly requested the Chief Secretary to forward the accompanying telegram to the Chief Secretary at Melbourne for transmission to Captain Mayne, and a telegram has been received that the letter has been sent to Captain Mayne.—J.R., 24/4/65.

No. 9.

Telegram from The Colonial Secretary, Sydney, to The Chief Secretary, Melbourne.

24 April, 1865.

Will you have the kindness to send the following communication in a letter by your outgoing mail:—

Sir,

Department of Public Works, Sydney, 24 April, 1865.

Your letter of the 22nd February, 1865, is just received. I concur in the proposal contained in your sixth paragraph, and you may consider the instructions there referred to as modified accordingly.

W. M. ARNOLD.

To Captain W. C. Mayne, Esq.,
 36, Cannon-street, E.C., London.

No. 10.

The Agent for New South Wales to The Under Secretary for Public Works.

Sir, 36, Cannon-street, London, E.C., 22 March, 1865.

Referring to my letter of the 22nd ult. I have the honor to state for the information of the Hon. the Secretary for Public Works that it is with very great regret I find myself compelled to forego the hope which I had confidently entertained that by this mail I should have been in a position to dispatch my report on the purchases of the permanent-way material for the Government of New South Wales.

2. Until this day I had every reason to believe that I should in sufficient time have been placed in possession of information which alone is wanting to enable me to conclude my investigation; but I now learn from the Civil Engineer, through whom I have sought it, that occupation of time during the last few months with Parliamentary business before the committees has rendered it impossible to make the necessary references back, and go into the details requisite to afford that information. I am, therefore, obliged to keep the inquiry open till I have received it.

3. By the April mail I shall, I have no doubt, be able to forward my report; and I may state that, while I still hold final judgment in abeyance, and guard myself from positive expression of opinion, nothing whatever has arisen since my letter of the 22nd ultimo was written to cause me to withdraw or modify what I conveyed in paragraph 5 of that letter.

I have, &c.,

W. C. MAYNE,

Agent for the Colony of New South Wales.

No. 11.

No. 11.

Précis.

PRESENT arrangements for procuring Railway Material from England.

1. The present arrangement for procuring supplies of railway materials from England is contained in Mr. Holroyd's letter to Mr. Hamilton of date 22 October, 1864, herewith. In that letter the Minister requests that Mr. John Fowler's services as Inspector of Railway Iron Plant and Rolling Stock be dispensed with at once; that any orders that may be transmitted by the October mail may be executed under the superintendence and inspection of a leading London broker in the iron trade; that as far as practicable the execution of contracts for materials already ordered should be stopped till further orders; that in respect of those that cannot be stopped or suspended till next advices from Sydney, Mr. Hamilton should do nothing without consultation with a leading London broker; and that if the advice of an engineer should be required in reference to orders still outstanding, he will employ an experienced gentleman in lieu of Mr. Fowler.

2. On 21st November, 1864, the Under Secretary, by order of Mr. Secretary Wilson, acting Minister for Works, requests Captain Mayne, successor to Mr. Hamilton, to investigate into and report upon all the circumstances connected with the purchase of railway iron, and the actual value of the rails and chairs so purchased, and forward for his guidance a return of invoices of rails and chairs purchased by the Government Agent in England, showing the prices per ton in London and the prices current as quoted in the *Economist*.

3. In his letter to the Minister for Works, dated 24th January, 1865, Mr. Hamilton with reference to the instructions of 22nd October, 1864, as to the employment of a leading London broker to inspect materials now under contract, calls attention to the terms of the contract, any deviation from which might be resisted, and would probably create trouble; and suggests that Captain Mayne be authorised to carry out all existing contracts without alteration in the conditions, and that the new regulations may be limited to future engagements.

4th. On the 24th of the same month Mr. Hamilton informs the Minister for Works that he has handed over the instructions of 22nd October, 1864 to Captain Mayne, who would enter upon the duties of the agency on the 1st February, 1865; but with reference to the order to suspend as far as practicable all existing contracts, he says that they must proceed to completion, and that any attempt to interfere with them would expose the Colonial Government to consequences which the words underscored led him to believe that the Minister did not contemplate or desire. Mr. Hamilton adds that it must be obvious that it is not practicable to break or suspend the arrangements entered into for the contracts now on hand.

5th. It will be seen that the instructions to the English agent have reference merely to an investigation of past contracts, and the execution of contracts now on hand, but make no allusion to orders for materials hereafter required from England. And as Mr. Secretary Wilson on 24th January last approved of the accompanying indent for permanent-way materials, for which no tenders could be obtained in the colony, being sent to England for execution, I submit that instructions should be sent for the guidance of the English Agent.

6th. On the appointment of Captain Galton, the instructions,* of which a copy is appended were forwarded for his guidance. A copy of the same instructions was subsequently sent to Mr. Hamilton. They have hitherto been acted upon by the English Agent; and, no doubt, Captain Mayne will adopt them for the future, unless they are now modified or amended.

*A copy of the instructions cannot be found among the papers in this office.

7th. The present indent is the largest that has ever been sent to England. It consists of the following quantity of rails with the corresponding amount of chairs, fish-plates and bolts, &c. :—

Southern Line	Tons.
Western Line	7,906
Northern Line	4,130
										2,124
										14,160

And the appointment of a new Agent for the Colony seems a proper occasion for modifying the arrangements hitherto in existence for procuring railway materials from England, if the Government consider that any alteration is necessary.

8th. In connection with the subject of the English agency, I would venture to suggest that it would be a graceful act on the part of the colonial Government to acknowledge by some substantial mark their recognition of the valuable gratuitous services rendered to the colony by Captain Galton during the period of his connection with this Department.—J.R., 30/3/65.

No. 12.

The Agent for New South Wales to The Under Secretary for Public Works.

Sir,

36, Cannon-street, London, 24 April, 1865.

Having reference to your letter of the 21st November 1864, I have the honor to enclose for the information of the honorable the Secretary for Public Works, my report on the purchases of railway iron for the Government of New South Wales.

I have, &c.,

W. C. MAYNE,

Agent for the Colony of New South Wales.

[Enclosure.]

[Enclosure.]

Agent-General's Report.

IN pursuance of the instructions of the Honorable the Secretary for Public Works, under date the 21st of November last, "on my arrival in England to investigate into and report upon all the circumstances connected with the purchases of railway iron, and the actual value of the rails and chairs so purchased" I lost no time after reaching London, in addressing myself to the inquiry directed.

2nd. Mr. Hamilton having in his letter of the 26th of January last placed the Government in possession of full and detailed information respecting the mode of obtaining and dealing with tenders for railway iron, has rendered it unnecessary for me, as regards that, to do more than, referring the Secretary for Public Works to that communication, to state, in addition, that I have examined the specifications, the tenders, and Captain Galton's abstract of these, with the accepted tenders noted; and that, following the acceptance, I have seen and examined the reports made from time to time by Mr. Fowler's assistants, detailing their supervision and inspection of the work in progress at the factories, the tests they applied and the results, all these leaving no room to doubt that watchful supervision was exercised, and stringent means adopted to secure the material being in each case in strict accordance with the specification.

Mr. Hamilton has also, in his letter of the 26th January last, so fully disposed of the question of the difference between the prices quoted in the *Economist* and those charged in New South Wales, that it is unnecessary for me to encumber this report by repeating, as substantially I could but do what he has written on the subject. I have only to say that all my information entirely bears out what he has stated on the general question of difference between quoted prices and those for material under stringent conditions.

3rd. Proceeding to the question of prices paid for and actual value of the railway iron supplied, I sought and obtained introductions to gentlemen largely connected with railways here, competent to afford me the information I desired, and thoroughly reliable from positive experience and absolute disinterestedness, as regarded the matters and persons involved.

The first of those to whom I applied for information (having been introduced to him by a relative of mine) was Mr. Henry Woodhouse, resident engineer of the southern division of the London and North Western Railway Company.

Mr. Woodhouse has charge of some six hundred miles of rail over which passes a traffic certainly greater than that over any other six hundred miles in the world. His practical experience of all that is connected with permanent way material is consequently wide and ample. His intelligence and capacity are vouched by his having for years, and to the entire satisfaction of the great Company he serves, held the important office he fills.

Proceeding to Staffordshire for the purpose, I had an interview with Mr. Woodhouse; and having placed in his hands the specifications, several of the tenders, the quantities of and prices paid for permanent-way material supplied to the Government of New South Wales during the years 1859, 1860, 1861, 1862, and 1863; having also handed to him the official report as to the quality of the materials (read to the Assembly by Mr. Secretary Holroyd), together with his (Mr. Holroyd's) reported testimony as to the state of the rails after five or six years' wear, with a request that he would, after having gone through and considered the whole matter, favour me with his opinion as to the prices charged and paid; and having in subsequent interviews with Mr. Woodhouse, after he had read and carefully considered the papers, discussed the matter in detail and at considerable length, he gave it to me as his distinct opinion, having regard to the specifications requiring an exceptional make of rail, to the tests being very severe, to the quality of the material as proved by those tests, and by actual wear, and to all the circumstances, that, with the exception of one lot of 94 tons, the prices charged and paid were not in excess of the current rates of the periods for material of the quality supplied, or more than sufficient to give that reasonable and fair profit which the iron and every other trade properly and prudently conducted has a right to claim and to secure.

4th. The following were, I have satisfied myself, the circumstances in which the 94 tons referred to in the preceding paragraph were obtained:—

Captain Galton mentioned in a communication to Mr. Fowler, that Lord Dudley's works were making very good iron, and finding that no tender had been sent in from those works, resorted to subject in a second communication to Mr. Fowler.

Lord Dudley's manager then tendered "as a sample to supply 100 tons at £9 per ton, and the tender was accepted for 94 tons, by Captain Galton, doubtless for the purpose of testing the quality that had been mentioned to him as very good. The result of the experiment I have no means of tracing, but I conclude the Railway Department can furnish it.

5th. Considering it desirable to have a second entirely impartial, independent, and reliable opinion drawn from comparison of prices paid by railway companies in England with those paid by the Government of New South Wales, I obtained an introduction to Mr. Forbes, the General Manager of the London, Chatham, and Dover Railway, a gentleman standing high in estimation for ability, experience, and intimate practical acquaintance with all connected with railway management, and placed in his hands the whole of the documents which I had submitted to Mr. Woodhouse, with a request that he would have a comparison of the prices made, and would favour me with his opinion on the whole question.

Mr. Forbes very kindly consented to do so, and placed the matter for comparison in the hands of an assistant whom he knew to be perfectly competent to the task.

Having carefully analysed the comparison made between the prices paid at periods the most nearly approaching each other by some of the great railway companies of England, and by the Government of New South Wales, and having considered the documents I had put before him, Mr. Forbes gave it to me as his distinct opinion, that in the cases where the prices charged to New South Wales were higher than those charged to the English companies, the difference was fully and satisfactorily accounted for by the different conditions and circumstances; and, having regard to the generally stringent nature of the specifications, but especially to one particular condition in them, not usual, but decidedly favourable to the Government (a condition to which contractors are extremely averse, as involving possible loss to a considerable amount, and for which they would certainly charge an increased rate), to the severity of the tests, which from Mr. Fowler's known character as to supervision and inspection contractors would regard as certain to be applied to the quality of the material furnished proved by actual wear, to the difference to be taken into calculation on account of delivery at the docks instead of at the railway station (involving certain additional cost, and possible delay and loss to the contractors), and to all the circumstances, that the prices paid by the Government of New South Wales for the materials supplied were not in excess of the current rates of the periods for material of equal quality, and that the Colony had been uprightly and fairly dealt with in the matter.

6th. The special condition in the specifications referred to as unusual and disliked by contractors is to be found where, after stringent provision for supervision and testing at the contractor's works, the specifications go on to say, "but notwithstanding such tests and inspection any rails may be rejected on delivery, which in his (Mr. Fowler's) judgment are defective in any respect; and if labour should be required for turning over and examining the rails at the post of delivery, the manufacturer is to supply it."

This, it will be seen, continues the liability of the contractors to have the rails (under the terms of the specifications without appeal) thrown back upon their hands after having incurred the cost of carriage to the post, and to have either to sell them, thus depreciated by rejection, at any price obtainable, or to incur the further cost of carriage back.

The insertion of such a condition shows, I consider, that Mr. Fowler has sought very carefully to guard the interests of the Colony in the matter, and has not sought to court or conciliate the contractors.

The importance and value of stringent and well considered measures to secure permanent-way material of the kind best suited to the particular traffic, and in a special degree of lasting quality, in a case where freight and labour so materially enhance prime cost are so obvious that they cannot fail to be recognised.

7th. Mr. Fowler, it is right to mention, has the character of carrying out very rigid supervision and inspection, and of applying severe tests, and this is a matter which, I have had conclusive proof afforded me, materially weighs with contractors in making their tenders.

As direct evidence of this, I may mention that I have seen the letter to a railway company from a manufacturer who had agreed to furnish material at a certain price, and who, on finding that it was to be subject to the supervision and tests of a particular engineer (not Mr. Fowler, but one having a like character for strictness) drew back from his agreement; but, and this as a concession in the circumstances, offered to furnish the material subject to the required supervision and tests, at a rate, however, fifteen shillings per ton over the price named before he was aware of who the inspecting engineer was to be,

8th. Every person with whom I have been in communication respecting the matters involved in my inquiry, has, on being told that the tenders had been invited and dealt with by Captain Galton, on the instant said that, such being the case, the colony had the very highest guarantee that universally recognized professional ability, exalted character, and unblemished honor could afford.

9th. Mr. Fowler's high professional standing, his very large and profitable employment, dependent upon upright discharge of duty, his character for strict and watchful supervision, all afford guarantees for a faithful discharge of professional duty; and the stringent nature of his specifications, and the facts, prove that such discharge of it has not been wanting.

10th. Guided then by the concurring opinions I have given, emanating from able, experienced, and practical men after investigation and consideration of the matter submitted to them, and having regard also to all the facts and circumstances, I have to report that I consider it beyond doubt, that, in the purchase of permanent-way material during the periods in question, the Colony was zealously, faithfully, and efficiently served; and was not charged for the material supplied prices in excess of the fair current rates of the periods for material of the quality obtained under the particular specifications in force.

24 April, 1865.

W. C. MAYNE,

Agent for the Colony of New South Wales.

No. 13.

The Colonial Secretary to The Agent-General.

Sir,

Colonial Secretary's Office, Sydney, 6 September, 1871.

I have the honor to inform you that this Government have had under consideration the position and duties of Mr. Fowler, the Inspector in England of Permanent-way Material and Rolling Stock for the Railway Department of the Colony, and that it has been determined to make some other arrangement for the duties now discharged by Mr. Fowler, not less on the ground of economy than because it seems to the Government that that gentleman's numerous other avocations must preclude him from giving such attention as is desirable to the duties required of him on behalf of the Colony.

2. Under these circumstances, I have the honor to request that you will take steps to ascertain on what terms the duties in question can be performed, so as to meet the views of this Government as already stated, and that you will also make any suggestion that may occur to you, not only as to the selection of a gentleman to perform these duties, but as to the nature of such arrangements as are likely to bring about the best results.

3. In conclusion, I have the honor to request that you will deal with the matter under consideration so far as it is entrusted to you by the terms of this letter without delay.

I have, &c.,

JOHN ROBERTSON.

No. 14.

The Agent-General for New South Wales to The Colonial Secretary.

Sir,

London, 3, Westminster Chambers, 3 November, 1871.

I had the honor to receive your letter of the 6th September last, requesting me to ascertain on what terms the duties of inspecting in England the permanent-way material and rolling stock for the Railway Department of the colony can be performed, so as to meet the views of the Government; and requesting me to make any suggestion that may occur to me, not only as to the selection of a gentleman to perform the duties, but as to the matter of such arrangements as are likely to bring about the best results.

The subject is one of such grave importance, that I shall not be able to deal with it in the short period which will elapse before the outgoing mail is closed, but it shall have my immediate and earnest attention.

Mr. Fowler has never spoken to me on the business intrusted to him, nor has he ever been in my office. In fact, I have never seen him except accidentally in the open air. Yesterday I received the first letter bearing his own signature, and I am informed that my predecessor never had one, nor have the clerks ever seen him in the office. His representative, I am in justice bound to say, is an attentive and apparently a well qualified gentleman; but I imagine that our business is of comparatively insignificant consideration to Mr. Fowler.

I have, &c.,

CHARLES COWPER.

Resubmit when report is received from Agent-General.—J.R.

No. 15.

The Agent-General to The Colonial Secretary.

Sir,

London, 3, Westminster Chambers, 30 October, 1873.

I have the honor to refer you to the despatch from Mr. Robertson dated the 6th September, 1871, upon the subject of Mr. Fowler's position as Consulting Engineer for the New South Wales business, in which my attention is called to the question of his remuneration, and to the multiplicity of his extensive engagements; and I was instructed to take such steps as I might consider advisable for the future conduct of the duties of Consulting Engineer. My replies to that communication were dated the 3rd November, 1871, and 10th January, 1872, and to those letters I would also request your reference.

Since those letters were written I have employed Mr. Shields, who was connected with the Sydney railway in its earliest stages. This gentleman has for many years resided in London, and has maintained a reputation for strict integrity and close attention to the business of his profession. I find that Mr. Lowe, the Chancellor of Exchequer, employed him in some of the Government works here, and still employs him occasionally. Since I have consulted him he has been most attentive, and always available when required. He has, in fact, given me entire satisfaction.

The

The enclosed letter states minutely the rate at which he has been paid for the several works he has inspected. When I first employed him, I stipulated that should he be employed in heavier works the remuneration must be considerably reduced; and when the order for the Railway Extension to Wagga Wagga reached me, I agreed with him that he should only be paid half per cent for inspecting the rails.

I found upon inquiry that the Victorian and Queensland Governments pay two or two and a half per cent. upon all their work, including everything, however extensive.

Mr. Shields is to give the most rigid inspection of the work, in strict conformity with Mr. Whitton's specification, throughout the manufacture of the rails.

I have, &c.,

CHARLES COWPER.

No. 16.

The Agent-General for New South Wales to F. W. Shields, Esq.

Sir,

3, Westminster Chambers, 17 September, 1873.

I shall be glad to be informed at your earliest convenience upon what terms you are prepared to act as Inspector for the Indent of Rails for the Railway works projected in New South Wales, as described in the accompanying specification. When I requested you in the early part of last year to undertake to act as inspector of the small indents which I might from time to time place in your hands, I explained that if I should at any future time employ you upon large indents, such as that for which I now have to contract, I should feel it my duty to make them the subject of a special agreement. My impression then was at the time advised that a minute inspection, and indeed any inspection at all, might be dispensed with, the contractor being held responsible for the delivery in New South Wales of rails to the satisfaction of the Engineer-in-Chief there. That view does not appear to have been adopted by the Government, as I judge by the very minute details of the specification which I have now received. On the contrary, by my instructions it appears that while a strict supervision of the rails during the course of manufacture is rigidly insisted on, the charge that was made by the gentleman who was formerly employed as Inspector of Permanent-way Material is objected to as being excessive. That charge was 1 per cent.

When you have carefully read the enclosed specification, I will thank you to state the terms upon which you are willing to undertake the duty which will devolve upon you in the faithful inspection of the rails as required by the New South Wales Government under it.

I have, &c.,

CHARLES COWPER.

No. 17.

F. W. Shields, Esq., to The Agent-General.

New South Wales Railways, &c.

Dear Sir,

3, Delahay-street, Westminster, S.W., 17 September, 1873.

With reference to our conversation yesterday, respecting the remuneration for my services as Inspector in the Contracts for Railway and other Materials exclusive of Rails, upon which you requested me to report fully to you without delay, I beg accordingly to report as follows:—

My duties in these matters consist in advising you personally, and in writing, on the carrying out of the various contracts for railway and other materials for which indents are sent from Sydney, and also in inspecting at the contractor's works wherever situated throughout England and Scotland such materials when completed, in order to ensure their being of proper quality and workmanship.

For the contracts I have inspected hitherto, which were exclusive of rails, I have been paid at the rate of 2 per cent., and the following list shows the nature and amount of each contract, the place where the inspection was made, and the payments I have received in each case.

List referred to.

Material of Contract.	Amount of Contract	Where inspected.	Amount paid to me.
	£ s. d.		£ s. d.
Axles, &c.	417 3 2	Leeds	8 7 0
Telegraphic apparatus ..	3,554 3 4	Birmingham, Darlaston, Dudley, Manchester ..	71 1 8
Carriage materials ..	130 13 0	London	2 12 3
" ..	29 12 8	" ..	0 12 0
" ..	36 11 6	" ..	0 14 6
Machine tools ...	552 0 0	Manchester ..	11 0 10
Cranked axles ...	200 12 0	Leeds ..	4 0 2
Springs ..	87 10 0	Newcastle-on-Tyne ..	1 15 0
" ..	77 4 9	Sheffield ..	1 11 0
Iron plates ..	171 0 7	Tipton ..	3 8 5
Carriage materials ..	44 15 0	London ..	0 18 0
Copper plates ..	204 2 6	Swansea (Wales) ..	4 0 5
" ..	86 9 0	Birmingham ..	1 14 6
Machine tools ..	166 0 0	Manchester ..	3 6 5
Woodcutting machines ..	172 6 0	Glasgow ..	3 8 10
Machine tools ..	524 0 0	Leeds ..	10 10 0
Iron plates ..	3,627 17 10	Newcastle-on-Tyne ..	72 14 3
Crank axles ..	110 0 0	Manchester ..	2 4 0
Telegraph wire ..	1,363 0 0	" ..	27 5 3

When it is considered that even in the smaller contracts more than one inspection is frequently required, and that the larger contracts require repeated and lengthened supervision, extending in cases over several weeks, it will be very evident that my remuneration is not excessive.

I remain, &c.,

F. W. SHIELDS.

No. 18.

No. 18.

F. W. Shields, Esq., to The Agent-General.

3 Delahay-street, Westminster, S.W., 23 September, 1873.

Sir,

New South Wales Rails.

In reply to your letter of 17th instant, requesting me to inform you upon what terms I am prepared to act as inspector for the indent of rails for the railway works projected in New South Wales, as described in the specification accompanying your letter, I beg to say that my terms for inspection thereof, as described in your letter, would be one-half per cent. on their contract price, my inspection including not only the usual superintendence of the rolling and testing of the rails but the retaining of an experienced inspector at the contractor's works during the entire period of manufacture, the inspector himself also being under my regular supervision.

I am, &c.,
F. W. SHIELDS.

No. 19.

Précis.

Employment of Mr. Shields as Inspecting Engineer of Railway Materials imported by the Government.

In a minute signed by the Hon. John Robertson, then Colonial Secretary, and Mr. James Byrnes, Secretary for Works, dated September, 1871, it is stated, "That at the last Cabinet Council, on consideration of the position and duties of Mr. Fowler, the Inspector in England of permanent-way materials and rolling-stock for the Colony, it was determined to communicate with the Agent-General for the Colony by the mail about to be closed for England, and request Mr. Cowper to make some other arrangement for the duty, on the ground that it seems to the Government that Mr. Fowler's numerous other avocations must preclude his giving such attention to the duties required of him for the Colony as is desirable."

Mr. Robertson proceeds to say that, "On consultation with my honorable colleague, the Minister for Works, difficulties appeared to us of a kind not discussed at the Cabinet," viz., as to the propriety of final arrangements being made for the appointment of some one in Mr. Fowler's place without the sanction of the Executive; and also, whether it would be proper for the Agent-General to make the selection of a gentleman for the office and to appoint him without first making reference to the Government here. "Under these circumstances," the Minister goes on to say, "we think the least objectionable course will be to limit the action of the Government at present to writing Mr. Cowper, and informing him of its determination with reference to Mr. Fowler and the duties with which he has been connected—requesting Mr. Cowper to take steps to ascertain under what terms they can be performed so as to meet nearer the views of this Government already stated, and generally for him to make any suggestion that may occur to him, not only as to the selection of a gentleman to perform the duties, but as to the nature of such arrangements as are likely to bring about the best results."

A letter to the above effect was written to Sir Charles Cowper on the 6th September, 1871. He acknowledged the receipt of it on the 3rd November following, stating that the subject was one of such grave importance that he would not be able to deal with it in the short period which would elapse before the outgoing mail was closed, but promising that it should have his immediate and earnest attention. Mr. Cowper added—"Mr. Fowler has never spoken to me on the business entrusted to him, nor has he ever been in my office. In fact I have never seen him, except accidentally in the open air. Yesterday I received the first letter bearing his own signature, and I am informed that my predecessor never had one, nor have the clerks ever seen him in the office. His representative, I am in justice bound to say, is an attentive and apparently a well qualified gentleman; but I imagine our business is of comparatively insignificant consideration to Mr. Fowler."

On the 10th January, 1872, the Agent-General wrote to say that he had been making inquiry as to the course pursued by other Governments in regard to inspection in England. "He finds," he says, "the practice differs, and the opinions of engineers vary; in some cases inspection in England is insisted upon, but not in all," &c. Mr. Cowper adds,—"I wrote on the 8th instant to Mr. Fowler, requesting him to meet me here to-day that I might have some conversation respecting the existing arrangement with him, but Mr. Baldry, his deputy, wrote to me that he was absent in Egypt, where I understand he is likely to be for some months. Mr. Baldry, however, came, and I briefly informed him that a change would probably be made"; and then he says,—"The present seems a favourable time for making a change, as there is not much required by the Colony. Whatever may be found necessary with respect to machinery, I see clearly that inspection of rails here is not thought by engineers to be of any value, though very large sums have been paid by us in past years on that account."

On this letter is a minute by Sir James Martin,—“The Cabinet approve the suggestion of the Agent-General,” 19th March, 1872. On the same date Mr. Robertson directed a letter to be prepared, informing Sir Charles Cowper, which was sent on the 25th March, and on the papers being forwarded to the Works Department, Mr. Byrnes expressed his approval thereon on the 8th April following.

On the 20th March, 1872, Sir Charles Cowper wrote to say that since the date of his letter of 10th January, he had, when he required professional advice, consulted Mr. Shields, C.E., who was many years ago connected with the Sydney Railway Company. "Of his integrity and intelligence"—the Agent-General says—"I entertain a high opinion. Since he left New South Wales he has been in practice in London, thereby having ample opportunity of becoming acquainted with contractors for railway machinery; and his offices being in the immediate neighbourhood of my chambers, every facility for personal conference is afforded. I have not, of course, made any permanent arrangement with Mr. Shields, but the cost of inspection, &c., will be considerably less than 2½ per cent."

The only minute on this paper is one by the Hon. John Robertson,—“May be communicated to the Minister for Works, 8th May, 1872”; and the Commissioner for Railways has marked upon it,—“Seen by Minister, 16/5/72.”

No further steps appear to have been taken, and it was not till Sir Charles Cowper wrote his letter of 31st October, 1873, that the question was again before the Government. Sir Charles, after calling attention to previous correspondence, says:—“Since those letters were written I have employed Mr. Shields, who was connected with the Sydney Railway in its earliest stages. This gentleman has for many years

years resided in London, and has maintained a reputation for strict integrity and close attention to the business of his profession. I found that Mr. Lowe, the Chancellor of Exchequer, employed him in some of the Government works here, and still employs him occasionally. Since I have consulted him he has been most attentive, and always available when required; he has, in fact, given me entire satisfaction. The enclosed letter states minutely the rates which he has been paid for the several works he has inspected. When I first employed him I stipulated that, should he be employed in heavier works, the remuneration must be considerably reduced, and when the order for the Railway extension to Wagga Wagga reached me I agreed with him that he should only be paid half per cent. for inspecting the rails. I found upon inquiry that the Victorian and Queensland Governments pay 2 or 2½ per cent. upon all their work, including everything, however extensive.

From Mr. Shields, 17th Sept., 1875. This letter shows that Mr. Shields had been paid £232, being 2 per cent. upon orders to the value of £11,555.

Mr. Shields is to give the most rigid inspection of the work, in strict conformity with Mr. Whitton's specification, throughout the manufacture of the rails."

Mr. Fowler's charges were:—2½ per cent. on orders for machinery, and 1 per cent. for rails and fastenings, &c. These charges included everything, cost of plans, consultations, &c., &c.

Mr. Shields' charges are:—2 per cent. on orders for machinery and fastenings, &c., and ½ per cent. for rails; extra charges being made for plans, drawings, &c., consultations, attendances at Board for opening tenders, &c., &c.

CH. A. G.
19/11/74.

No. 20.

Minute by The Accountant to The Commissioner for Railways.

I BEG to bring under notice that Mr. Shields is charging 2 per cent. for inspection of steel rails for renewals. The charge for other rails being only ½ (one half per cent.)

The form in which Mr. Shield's accounts for commission are rendered makes it very difficult to check them off. For instance, a number of shipments are added together and the percentage charged on the gross, without mentioning the ships' names, leaving it to us to find them out as best we can, which is rendered impossible when any mistake is made in the figures. Perhaps instructions may be given for the names of the ships to be mentioned in the accounts.—H.A.W., 12/1/75.

The Agent-General should be communicated with, and asked to inquire and report.—CH. A. G., 13/1/75. Approved.—J.S., 14/1/75.

No. 21.

The Secretary for Public Works to The Agent-General.

Sir, Department of Public Works, Railway Branch, Sydney, 13 January, 1875.

I have the honor to bring under your notice that Mr. Shields is charging 2 per cent. for inspecting the steel rails required for renewals, whereas the charge for inspection of other rails is only ½ per cent. I may also state that the mode in which Mr. Shield's accounts are rendered makes it a matter of some difficulty to check them off. As an instance, I may mention a number of shipments are added together and the percentage charged on the gross, without mentioning the names of the ships, thus leaving it to this Department to find them out as best they can, which is rendered almost impossible when any mistake is made in the figures.

In order to remove this difficulty, and at the same time facilitate the checking of these accounts, I have to request that you will be good enough to give instructions to have the names of the ships mentioned in the accounts for the future.

I have, &c.,
JOHN SUTHERLAND,
Secretary for Public Works.

No. 22.

Capt. A. A. Jopp to The Secretary for Public Works.

Sir, London, 3, Westminster Chambers, 6 April, 1875.

In reply to your letter No. 75-49 of the 13th January last, I have the honor to explain, with reference to Mr. Shield's charge for the inspection of the rails in question, that Mr. Shield's fees for inspection generally have been at the rate of 2 per cent., but that when the large extension contracts were entered into a special arrangement was made by which he was to charge only ½ per cent. for rails under those contracts. The quantity of Landore Siemens steel rails, in the instance to which you refer, was only 150 tons, and as special arrangements had to be made for this, as for any other inspection for which 2 per cent. is charged, I think that you will not consider that Mr. Shields could have been limited to ½ per cent., which has hitherto been paid for the large rail contracts only.

I may mention that in the case of the 1,025 tons (800, 200, and 25) of Landore rails, ordered under cover of your letters of the 3rd September last, I pointed out to Mr. Shields that the inspection of so large a quantity appeared to come under the general conditions of the extension contracts, and accordingly only ½ per cent. was paid.

Your instructions as to keeping each shipment distinct, and inserting in each case the name of the ship, in Mr. Shields' accounts, will be carefully attended to.

I have, &c.,
A. A. JOPP, Capt. R.E.
(For Agent General.)

Seen.—J.R., 10/6/75. Mr. Whitton, B.C., 10/6/75. See memo. 75 herewith.—W.H.Q., 11/6/75.

No. 23.

No. 23.

Minute by The Engineer-in-Chief to The Commissioner for Railways.

Engineer-in-Chief's Office, Sydney, 11 June, 1875.

Rate of Commission paid to the Inspecting Engineer in England.

I HAVE up to the present time refrained from making any remarks on the arrangements made with Mr. Shields for the inspection of railway materials supplied from England, nor should I now have considered myself justified in doing so had not the Commissioner asked my opinion with reference to the letter of the Agent-General, dated 6th April, 1875.

The reasons given by the Agent-General for the appointment of Mr. Shields as Inspecting Engineer in preference to Mr. Fowler were, that the work would be done at much less cost, and that Mr. Shields would personally inspect every article, which, it was stated, Mr. Fowler did not.

From the Agent-General's letters, I understood that Mr. Shields was to be paid $\frac{1}{2}$ per cent. for rails and 2 per cent. for fastenings, bridges, and rolling stock.

Mr. Fowler was paid 1 per cent. for rails and fastenings, and $2\frac{1}{2}$ per cent. for bridges and rolling stock; but it must be remembered that for these amounts Mr. Fowler prepared all specifications and drawings of every description and for all kinds of work, and made no extra charge whatever.

I desire to draw the Commissioner's attention to an account which has been supplied by Mr. Shields and which has been paid. It is dated April 9th, 1874, the amount £327 10s. 4d.

Mr. Fowler's charge for similar inspection, including the cost of printing and writing specifications (which, in the case of Mr. Shields, was done in Sydney) would have been £302 1s.; and, therefore, although Mr. Shields was to do this work for less money I find he has been paid in excess of Mr. Fowler's charges £25 9s. 4d.

This may be an exceptional account, but as it is the only one in my possession I have made use of it.

An amount of £75 12s. is charged by Mr. Shields for advising and reporting upon contracts, but no such charge was ever made by Mr. Fowler for similar services.

Probably I may here be permitted to say that, in my opinion, it is utter folly to employ anyone to inspect rails at $\frac{1}{2}$ per cent., as no man can possibly afford to do so, if he be expected to discharge the duties satisfactorily.

I now come to the Agent-General's proposition to pay Mr. Shields 2 per cent. for small orders for rails instead of $\frac{1}{2}$ per cent. previously paid. Without offering any opinion on the above proposal, I may state that the commission paid to Mr. Fowler was 1 per cent. for rails and fastenings on all orders whether large or small.

JOHN WHITTON.

No. 24.

The Under Secretary for Public Works to The Principal Under Secretary.

Sir,

Department of Public Works, Sydney, 4 June, 1875.

I am directed by the Secretary for Public Works to enclose herewith a letter respecting the dispensing with the services of Mr. Shields as Inspecting Engineer for this Government in London, which I am to request you will have the goodness to forward to the Agent-General in London by the outgoing mail.

I have, &c.,

JOHN RAE.

Letter forwarded per mail, 4/6/75.

No. 25.

The Secretary for Public Works to The Agent-General.

Sir,

Department of Public Works, Railway Branch, Sydney, 4 June, 1875.

Referring to my telegram of the 28th ultimo, directing you to dispense with the services of Mr. Shields as Inspecting Engineer, I have now the honor to inform you of the causes which have led to this decision. You are already aware by my predecessor's telegram of the 27th August last, followed by his letter of the same date, that the inspection of the rails imported for the railway extensions was considered to be unsatisfactory, and in your letter of reply, dated the 22nd September last, you furnished a report from Mr. Shields on the subject.

When the first shipment of these rails arrived in the Colony it was apparent from their rough and unfinished appearance that in this respect they were not equal to specification; they were then tested by being laid down in the Newcastle and Sydney yards where the traffic was the heaviest, and it was found that they were out under this test in a few weeks, confirming the Engineer-in-Chief's opinion that they were next to worthless. Upon this result being ascertained, it was decided that a Board, composed of competent men, unconnected with the Department, should be appointed to inspect, test, and report upon the rails with a view—if their report confirmed the opinion of the Engineer-in-Chief—to the Crown Law Officers being asked to advise if any steps could be taken to obtain redress.

The report of the Board was obtained on the 4th ultimo, and as the conclusion they arrived at after a most exhaustive enquiry fully confirmed the verdict of the Engineer-in-Chief, the advice of the Crown Law Officers was at once asked for. A copy of the opinion given by the Honorable the Attorney-General is enclosed. In accordance with his advice the Crown Solicitor has been instructed to communicate at once with the legal agents of the Government in London, instructing them to obtain without delay a copy of all contracts with the Park Gate Iron Company, and other papers from you, and to submit a case to Counsel as to whether an action will lie against the Company for breach of contract.

The Board in their report state that had the specification been strictly adhered to there could have been no possibility of any cause of complaint; it was Mr. Shield's duty to see that the specification was adhered to, and as it was clear that he had failed in this duty, I had no alternative but to direct that his services be dispensed with.

With

With printed copies of the report of the Board on the rails, I forward by book post printed copies of their report on the fastenings, spikes, screws, fish-plates and bolts, and nuts supplied by the Patent Nut and Bolt Company, the Ebbir Vale Iron Company, and the Darlington Iron Company. It will be seen that the Board report that these materials have not been manufactured in strict accordance with the specification for the supply of same, and as they were passed by Mr. Shields it is evident that in this respect also he has failed in his duty.

I have to request that you will have the goodness to furnish the Law Advisers of the Government in London with all papers and information they may require to enable them to take the required action, and that you will employ some person other than Mr. Shields to make the Government inspection of the material to be supplied in satisfaction of the indents now in your hands. I shall be glad to be informed at as early a date as possible of the name of the gentleman so employed temporarily, and the rate of remuneration agreed upon for his services.

I have, &c.,
JOHN LACKEY,
Secretary for Public Works.

No. 26.

Telegram from W. Forster, Esq., to The Colonial Secretary.

16 January, 1876.

LETTER 7th July, from four engineers about dismissal Shields, signed by Woods, then our engineer; this presents confidence in him; shall we return to Fowler?

Received 17th January, 1876. Telegram to Forster to try the suggestion of the Martin Government.

No. 27.

C. H. Gregory, Esq., and others, to F. W. Shields, Esq.

Sir,

Great George-st., Westminster, London, 7 July, 1876.

In accordance with your request we have given our best consideration to the subject of the recent withdrawal of your appointment of Inspecting Engineer for New South Wales Government, as mentioned in the letter of the Agent-General, Sir Charles Cowper, to you of the 3rd ultimo, and in consequence of statements made in the Colony respecting certain rails supplied by the Parkgate Iron Company.

After careful consideration of the documents placed before us, which documents comprise, as you inform us, the whole of the correspondence which has passed between the Agent-General and yourself on this subject; we have arrived at the following conclusions, viz:—

1st. It appears to us from those documents that you have carried out the inspection (which was the only duty intrusted to you) in a careful manner; the returns showing that you had submitted sample rails day by day for testing during the progress of their manufacture, and had applied to them the tests prescribed by the specification sent for your guidance. According to these returns, the rails have borne the tests satisfactorily, with the exception of that test named in clause 16 of the specification, which requires rails of the dimensions specified to support a weight of 30 tons on bearings of $3\frac{1}{2}$ feet—a condition which, according to our experience, is entirely impracticable.

2nd. We have noted the two telegrams communicated to you in the letter of the Agent-General, of 3rd September, and 29th May last, viz.: “Rails tested very inferior, worn out in a month, better inspection required”, and “Regret that rails supplied by Parkgate Iron Company, six thousand five hundred tons condemned utterly useless; make immediate inquiry as to inspection by Shields.”

In the absence of definite information we cannot understand how it can have happened that so large a quantity as 6,500 tons (the entire lot) should have been proved to be utterly useless within so short a period. Such a result, as also that of any rails being worn out by any ordinary traffic in a month, being unprecedented in our experience.

3rd. We are of opinion that the application contained in your letter of the 31st May last, to the Agent-General, viz., that some of the rails in question should be sent back to be tested in England, is a reasonable and proper request, which should in fairness be acceded to by the New South Wales Government.

4th. We have carefully considered the instruction sent to the Agent-General to withdraw your appointment without notice, and without any explanation of the reasons for which you were considered to have failed in your duty, other than an assertion that the rails were condemned as utterly useless.

We find that no opportunity has been afforded you as yet of knowing or refuting the specific charges against you on which it is to be presumed the order to withdraw your appointment has been based.

5th. Under all these circumstances, we think that the instruction given by the Government of New South Wales to the Agent-General to summarily withdraw your appointment must have been sent under some misapprehension of the facts; as it is difficult to conceive that the Government should commit the injustice of withdrawing your appointment without affording you the opportunity and means which you have asked for, of knowing and refuting the specific charges which are presumed to have been made against you.

We are, &c.,
CHARLES HUTTON GREGORY,
W. H. BARLOW,
EDWARD WOODS,
CHARLES MANBY.

TELEGRAPH to Forster:—"Unwilling to revert to old system, even with Fowler. We think it best to arrange, if possible, to have railway material approved here by our Engineer-in-Chief; all other ironwork to be approved here by Engineer-in-Charge, as exhibited in specifications.

"Payments to be made on shipment to 66 per cent. of amount, remainder on approval here. None but first-class houses should be invited to tender.

"Understand Deniliquin Railway has arrangement of the kind.

"JOHN ROBERTSON."

Telegram, 31/1/76.

No. 29.

The Agent-General to The Colonial Secretary.

Sir,

London, 3, Westminster Chambers, 18 February, 1876.

With reference to your following telegram dated 1st instant,—“Unwilling to revert to old system, even with Fowler. We think it best to arrange, if possible, to have railway material approved here (by our Engineer-in-Chief; all other ironwork to be approved here by Engineer-in-Charge, as exhibited in specification. Payment to be made on shipment, &c., 66 per cent. of amount, remainder on approval here. None but first-class houses should be invited to tender. Understand Deniliquin Railway has arrangement of the kind,”—I have the honor to enclose for your consideration a minute which I have prepared on the subject of the system of inspection and payment of railway and other materials, together with a report from Captain Jopp on the same subject.

I also enclose a minute on the subject of the appointment held by Mr. Woods, C.E., and a copy of a letter dated 20th ultimo, conveying to him my intention not to refer the inspection of railway materials to him in future. A copy of Mr. Wood's reply is also enclosed.

I have, &c.,
WILLIAM FORSTER.

No. 30.

Minute by The Agent-General to The Secretary for Public Works.

I RECOMMEND for the consideration of the Government the within suggestions of the Secretary, which have been furnished by him at my request. The telegram attached is not imperative, and goes no further than to indicate the desirability of either a discontinuance or considerable modification of the existing system of inspection and approval of railway materials by a skilled and qualified person, upon whom the chief responsibility of obtaining good and suitable articles accordingly rests, and, as has been exemplified in the case of the bad iron supplied by the Parkgate Company, whose approval goes far towards binding, if it does not entirely bind the Government, and conclude them against any expression of disapproval thereafter. The telegram, however, still leaves the question open for further consideration.

The case of the Parkgate Company above alluded to shows, I think, the necessity for some, and perhaps even considerable modification of the system. There appears to be an obvious objection to the nominal employment of an inspector who never personally inspects but appoints some other person, of course inferior in position and capability, to inspect for him, without giving the Government a voice in this second nomination.

I am given to understand that in a great many cases these sub-inspectors are of a class not quite removed from the suspicion of bribery to which they become inevitably exposed, during a process of inspection, which extends over, and involves residence on the spot, for a long time. And it is clear that the very assumption or supposition of an authorized person being always present during the manufacture of materials, renders it the more difficult for the Government afterwards to object to the quality of the materials, and consequently places the Government very much at the mercy of the sub-inspector. This constant inspection moreover seems almost to obviate the necessity of, and to impart a superfluous character to, the application of tests after the material has been completed. And were I to choose between the two methods, I should unquestionably prefer the tests to the inspection.

I cannot hesitate, therefore, strongly to recommend the application of tests at such times as the Government may themselves choose for their application, whether it be before shipment from England or on arrival in New South Wales; and to this, I imagine, no reasonable manufacturer could possibly object. But I am greatly inclined to concur with the Secretary in doubting, as he seems to doubt, the practicability of entirely abolishing inspection in England, and relying altogether in its stead upon subsequent examination and approval in the Colony. If practicable, there can be no doubt that to make the final settlement of the account for payment, postponed to the extent of 40 per cent. until the materials should be finally approved in the Colony, would involve an increase of expense so great as almost to amount to an inseparable difficulty. But suppose this difficulty overcome, or the cost determined to be not in commensurate with the benefit, which no doubt would be considerable, then occurs the possibility suggested by the Secretary, which does not seem to me so extreme as he considers it, namely, that the materials supplied might tend to be of the quality which would be worth, and could be supplied or purchased for the amount payable in England, that is to say 66 or 60 per cent. in round numbers, the manufacturers or sellers of the article being content to take the chance of being paid the remainder, if by any chance the inferiority of the article should fail to be detected.

The change of system proposed or anticipated in the telegram of abolishing inspection in England must, in short, involve practically the purchase of the materials in question from merchants or agents, and not from manufacturers. There may be, and no doubt are, certain advantages to be gained by this, as it were extending the competition and entering a more open market; but in such case we must be prepared to incur additional expense, in order to compensate the sellers for additional risks, arising out of the inevitable competition with firms of doubtful integrity or reputation. We must be prepared also to suffer from the possibility of even worse frauds than have occurred in the case of the Parkgate Company. I trust, therefore, the Government will see the desirability of caution in making this change, some change

change being, in my opinion, inevitable and absolutely necessary. What I am inclined to recommend is that in all cases a guarantee should be obtained from the parties supplying the goods, and that inspection in England should be discontinued as far as to render unnecessary the appointment or employment of a permanent inspector, but that the Agent-General should be empowered in all cases, and should be required in particular cases, to employ a skilled person to test the quality of important or valuable materials, at such times and places as he might consider expedient, or the Government might determine. The inspection in this case would amount to no more than approval or acceptance subject to further trial, and in a number of cases would be obviously unnecessary.

In these views, I gather from a late conversation with Sir Daniel Cooper, that he substantially concurs. W.F., 15/2/76.

No. 31.

Minute by Capt. A. A. Jopp.

MINUTE for the Treasurer, with reference to the Chief Secretary's telegram, dated 1/2/76, received 2/2/76, relative to inspection and payment of railway material.

In compliance with your instructions (on receipt of the above telegram, "Unwilling to revert, &c.") that I should give you my views upon the matter of local inspection of railway materials and similar articles, I beg to submit as follows:—

The telegram, as I understand it, indicates that it would be best to arrange, if possible, that railway materials and other ironwork should be inspected and approved on arrival in the Colony, instead of in England as heretofore; and that the Agent-General should pay only 66 per cent. of the invoice value on shipment here, withholding the remainder (34 per cent.) until the goods had been passed in the Colony. (The proportions of payment intended are probably $66\frac{2}{3}$ and $33\frac{1}{3}$ per cent., or $\frac{2}{3}$ and $\frac{1}{3}$.)

2. It is not quite clear whether it is suggested that we should dispense with the services of an engineer in England altogether, or whether it is only the system of inspection by him which would be discontinued.

3. In considering this question it may be well to detail the duties hitherto performed by our engineer here. They have been as follows:—

A.—On receipt of an indent from Sydney to consider it and recommend the firms from whom tenders should be obtained. This frequently involves the preparation of specifications and drawings, and occasional correspondence with the makers, in order to guard against defects and to stipulate for attention to points of detail in manufacture which suggest themselves to an engineer who is experienced in the actual supervision of the various processes which have to be gone through.

B.—To recommend the acceptance of the most desirable tender.

C.—To supervise and inspect the article during its manufacture.

D.—To inspect the article finally on completion.

4. The charges for these services, A, B, C, and D, have been,—

Mr. Fowler—Rails, 1 per cent.; other articles $2\frac{1}{2}$ per cent.

Mr. Shields:—Rails, $\frac{1}{3}$ per cent.; other articles 2 per cent.

Mr. Woods:—2 per cent. all round, but with the intention that a reduced charge for rails be suggested, in the want of a large order being received.

5. The charge of $2\frac{1}{2}$ per cent. is the one usually made by all our first-class engineers; and the more we cut it down the greater risk we incur of having an inferior class of inspectors.

6. If we had no engineer in England A and B would be done by the Agent-General on his own sole responsibility. C would not be done at all, and D would be done in the Colony.

7. How would this work? With regard to A and B, or making the contract, I think it could be done, and it would become my duty to a greater extent than heretofore to make such inquiries and suggestions as might be of use to the Agent-General, though it is not to be supposed that this professional assistance would be as acceptable to the Government as that of an experienced civil engineer.

8. C, or supervision during manufacture, could not be done satisfactorily, as the limits of time and distance would preclude its being attempted to any great extent, in combination with their other duties, by the Agent-General or the Secretary. The result would be that we should depend entirely on tests at the final inspection (D, in the Colony), which cannot always be relied upon to detect bad material.

To devise tests which shall expose a bad wearing material is most difficult. Wear and tear is the real test, and an article which will wear well is best insured by careful examination of the generality of the materials used, and by strict attention to all the processes of manufacture. I think that it was actual wear, rather than the repetition of the tests in the Colony, which most fully exposed the bad quality of the iron used in the Parkgate rails, and careful inspection during manufacture would have detected this fault with greater certainty than could be expected from the application of tests on completion.

If, therefore, we dispense with inspection during manufacture, we at least lessen the probability of our obtaining good material.

9. The next question which arises is whether a first-class firm, willing to submit to the most rigid inspection here, but accustomed to payment on delivery, would be disposed to tender at all under the conditions proposed; and supposing that it would, then what increased charge would it make, in view of the delay and risk to which the proposed mode of payment would expose it?

10. Putting ourselves in the place of the contractor, let us consider this delay and risk and their consequent effect on his price.

11. In the first place, as he will have to wait probably for about six months for one-third of his money, he will arrange his price to meet this delay. It must be remembered that when the contractor delivers the article, he has laid out, in plant, labour, and materials, its full value, less his own profits, and as he is deprived for six months of one third of the purchase money, which he requires to meet his expenses, he must in the first instance find it in some other way, which will involve him in outlay in some form, and this he will charge to the purchaser, by adding it to his price. It is true that Government will be in receipt of interest on the money it withholds; but this will not be equivalent to the value which it would represent to the contractor were he to receive it, or to the expense to which he might be put for want of it.

12. But this is a small item when compared with the additional price which the contractor would charge to cover the consequences to him of the rejection of the whole, or a portion of his goods, after delivery in the Colony; and this brings before us the most serious aspect of the difficulty.

13. A contractor is willing to submit to the most rigorous inspection at his works, and to correct defects which may be found during manufacture, or on completion, and a good contractor courts such inspection, because it checks faults at their earliest stage; and it is moreover an additional check on his workmen, whose regard for the eventual consequences to their masters will not prevent their slipping in bad material, or slurring over some important process, if they know that they are free from the risk of detection by a vigilant inspector. But if the goods are to be inspected after they have been delivered, at so distant a spot as Sydney, where the contractor cannot be present to protect his own interests, the consequences of rejection assume, in his eyes, a most serious magnitude. Every article rejected is thrown on his hands, and must be replaced. As there will probably be no market for it in the Colony, he must reship it to England (or to the best market he can find), get rid of it at a depreciated value, and ship goods to replace it at his own expense.

The measure of this risk partly depends on the ratio of the weight to the value. Thus, if a batch of rails, say at £8 per ton, were rejected, it would cost him at least 40s. per ton for freight and charges home and out again, or 25 per cent. on the value of the rails; to which must be added their depreciation in value, which would depend on his success in finding a market for them. The contractor will therefore determine in his mind what proportion of rejection it will be provident for him to provide for; he will then make some such calculations as are indicated above, and he will add the result to the price which he would charge if the goods were accepted and paid for on leaving his works. In making these calculations he will naturally feel his disadvantage in not being present at the inspection, and he will dread possible rejections for small faults. It is true that the Government would probably hesitate to condemn an article for some very slight defect, when the result of such condemnation would be so serious to the contractor. This, however, is an argument against the proposed system, for we should certainly not hesitate to make the very smallest blemish a ground for rejection if detected at the works.

14. Moreover, as the consequences of rejection would be so serious, the inclination of the contractor to attempt to secure approval by the offer of percentages, or by other unfair means, would be increased. This would correct itself in time, where its failure had proved the uselessness of the attempt; but it might, in the first instance, be made an element in the calculations of an unscrupulous contractor, ignorant of the position and character of those with whom he would have to deal.

15. Then what is to prevent a very inferior article being shipped, for which the contractor would charge such a sum as that 66 per cent. thereof would satisfy him, taking his chance of getting the remainder? If payment of the balance were refused, and he were called upon to replace the rejected goods, he would simply decline to do so, contenting himself with the 66 per cent. already in his pocket. We should then endeavour to proceed against him for breach of contract, but under the most favourable circumstances, such a course will be attended with difficulty, with the party to be sued against in England, and his goods and our witnesses in the Colony. This is of course an extreme case, and by selecting first-class firms we should render its occurrence very improbable; but the nature of the indent frequently limits very much our choice of firms, and it is occasionally necessary to order goods from a house that we know will require careful supervision, in order to insure its carrying out the order satisfactorily.

16. I am led, by a consideration of the difficulties which I have endeavoured to point out, to the conclusion, that very few first-class firms would be disposed to tender at all under the conditions proposed, and that such firms as might do so would, in view of the delays and risks above indicated, increase their ordinary price, by an amount which cannot be accurately estimated, but which would probably vary from 15 to 33 per cent.

17. I therefore earnestly hope, natural though it be, that the recent instance of grave failure in the existing system should make the Government doubt its efficacy, that the arrangement indicated in the telegram will not be adopted at least before its probable working has been more fully considered. I still venture to think that the employment of a first-class civil engineer, on whom we may depend for a thoroughly careful and efficient system of inspection, and full payment on his certificate, will be found to be the most certain and the most economical method of securing the best materials and the best workmanship. At the same time, I think that it may be arranged (without necessarily informing the contractor of our intention) that the contract may be so framed as to guard against the inspecting engineer's certificate being claimed by the contractor as a final approval from which there can be no appeal under any circumstances. This point was considered by Sir Daniel Cooper, when the replacing of the rails lost in the "Cambridgeshire" was under consideration, and Mr. Mackrell was of opinion that it could be provided for. I therefore wrote to Mr. Woods on the 15th November last a letter, of which a copy is attached. I also attach a copy of Mr. Woods' reply, dated 16th November last, in which he suggests a form of guarantee. You will observe that Mr. Woods is of opinion that even under the restrictions which he suggests, the makers may not consent to undertake the liability, though he supposes that they would do so by putting on a little extra price to cover any possible risk. The clause in its modified form as not as yet been referred to Mr. Mackrell, as Sir Daniel Cooper decided to do nothing further in the matter until you arrive in England, and you have determined to make no changes in the specification in the particular instance in question. For future orders, however, Mr. Mackrell might be asked to draw up a protecting clause framed on the principle above indicated.

18. I may add that the system which we have hitherto followed is the one which has, I believe, been in practice for all our distant colonies, although the system indicated in the telegram has been occasionally suggested, but has on full inquiry been thought to be impracticable.

19. To the supervision exercised by our engineer, we should probably be able in future to add a greater degree of supervision from this office than was possible during Sir Charles Cowper's illness. As far as could be effected by correspondence, every order, whether in the hands of our engineer or not has been throughout under the full control of the Agent-General; but the actual inspection of the railway orders has been intrusted to our engineer, and it has been to the miscellaneous orders that I have given more immediate personal attention. In arranging this, it has latterly been thought desirable only to refer to our engineer, as a rule, the indents from the Public Works Department and the other orders have been inspected

inspected by me when necessary. But in future I think that some of the orders, even when in the hands of our engineer, might if thought desirable, be occasionally inspected, either during manufacture or on completion, by the Agent-General or the Secretary. Such inspection would not profess to be of such value as that of our engineer, and could not efficiently take its place, but it would at least be an additional check.

A. A. JOPP, CAPT., R.E.,
Secretary.

5/2/76.

No. 32.

Capt. Jopp to E. Woods, Esq., C.E.

Dear Sir, 3, Westminster Chambers, Victoria-street, S.W., 15 November. 1875.

With reference to the proposed modifications in the specification for rails, I am desired by Sir Daniel Cooper to inform you that it has been suggested by our solicitors that it might be desirable so to alter paragraph 16 of the specification as to provide, not only that the rails actually tested should stand the tests prescribed, but that all the rails should be guaranteed to stand the tests. By this means, you could as before, test such rails as you might chose to select, and we should have the additional security of being able to maintain that any rails which would not stand the tests, if afterwards applied in the Colony, did not comply with the conditions of the contract.

If you do not see any objection to this, please say in what way you think it would be best to introduce the condition into the specification.

Yours, &c.,
A. A. JOPP, CAPT., R.E.,
Secretary.

No. 33.

E. Woods, Esq., C.E., to The Agent-General.

3, Great George-street, Westminster, London, S.W., 16 December, 1875.

Dear Sir, Rail Specification.

In reply to Captain Jopp's letter of yesterday's date, I see no objection whatever, but rather the contrary, to the introduction of a clause which has been suggested by your solicitors. The only question is whether the makers will consent to undertake the liability. I suppose, however, they would do so, putting on a little extra price to cover any possible risk.

I would suggest that the first line in clause 16 should be struck out, and that in lieu thereof the following words should be inserted:—"All the rails included in this contract shall be guaranteed to stand the following tests, which will be applied from time to time to such individual rails the inspector shall select for testing."

And I would further suggest that the words which I have marked through in pencil in clause 17, should be struck out; and this clause as thus altered would then read as follows:—"If the result of the tests do not show compliance with this arrangement the whole of the batch of rails from which the rails have been taken for testing should be subject to rejection."

I beg to return the specification.

Yours, &c.,
EDWARD WOODS.

No. 34.

Minute by Mr. William Forster.

My attention has been directed to a letter addressed to F. W. Shields, Esq., 6, Delahay-street, Westminster, dated Great George-street, Westminster, London, July 7, 1875, and signed by certain persons who I understand are reputed engineers, and among their names I find that of Mr. Edward Woods, inspecting engineer in London to the Government of New South Wales. I have been in London since December 7th, and as no further communication or explanation has been received from Mr. Woods, I think it my duty to place on record some observations upon the extraordinary position in which Mr. Woods appears to me to have placed himself by signing such a letter.

This letter ostensibly has reference to what the writers term "the recent withdrawal of his, Mr. Shield's, "appointment of Inspecting Engineer for the New South Wales Government." It purports directly, "after careful consideration of the documents placed before the writers by Mr. Shields himself, but also as afterwards admitted," in the absence of definite information "upon certain material points to inquire into and condemn the course taken by the Government of New South Wales by such withdrawal, and to express approval of the manner in which Mr. Shields performed his duty in inspecting certain rails supplied by the Parkgate Company to the Government of New South Wales in pursuance of contract made with that Government.

These rails have been since, by careful inspection, and by actual use, proved to the satisfaction of the said Government, and of other parties not interested in the matter, to be not only quite incapable of standing the tests to which it was agreed by the contractors that the rails should be submitted but utterly worthless for the purposes for which they were intended and for which the contractors knew and must have known they were intended. From this unquestionable fraud, by whomsoever committed, it is clear that Mr. Shields' inspection failed to protect the Government by whom he was employed. The letter, therefore, obviously, though indirectly, prejudges the case which may possibly be, and very probably will be, matter of litigation between the Parkgate Company and the Government of New South Wales, and pronounces an *ex parte* opinion in defence or in extenuation of the fraud charged by the Government of New South Wales against the Parkgate Company, and so far in prejudice of any claim arising out of the transaction, which may be made by the Government of New South Wales upon the Parkgate Company. So far as the other writers of this letter are concerned, doubtless the Government of New South Wales may easily afford to treat their interposition as an impertinence.

The time has not yet come when three or four engineers can be regarded as infallible exponents of the value of evidence, or can undertake to rule public opinion or courts of law, in matters for judicial inquiry, and of possible legal litigation.

The

The gross folly, presumption, and injustice of venturing to pronounce an *ex parte* opinion in such a matter by means which, whether or not intended, yet evidently tend to favour one particular side at the expense of the other is too obvious for comment, and cannot be excused or counteracted by any weight of professional authority. With Mr. Woods, however, the case assumes a different complexion. This letter seems to me to have very much the aspect of a concerted attempt of certain persons, friends of another person deeply interested, virtually to gloss over a fraud, and in the interest of their friend to protect from its legal consequences, not only him as the paid servant of the defrauded parties who have suffered by his failure rightly to perform his duty, but even to shelter the actual parties by whom the fraud was committed, and surely it cannot be regarded as otherwise than an extraordinary fact that another inspecting engineer of the Government of New South Wales should be a party to such a transaction, and should in effect offer himself as evidence for the defence in case of an action by the Government of New South Wales against the defrauding Company.

It appears to me, therefore, that by holding such opinions upon this matter much more by their publication in the form now under consideration, Mr. Woods has rendered it difficult for the Government of New South Wales to have any confidence in him, either as inspecting engineer or as an individual. Of course I have no wish to assume that Mr. Woods has acted otherwise than honestly in the matter, or to impute to him any breach of faith or confidence. But even upon this supposition, what opinion can be formed of Mr. Woods' judgment and general capacity after having allowed himself to be drawn into taking such a step?

Mr. Woods may be an excellent engineer, but upon the most favourable view of his conduct in this matter he must be convicted of an unpardonable error of judgment, as well of deplorable ignorance of the necessities of his position, and the sort of relations which ought to subsist between possible or actual employers and employed.

Communicate to Mr. Woods, and forward a copy to the Government.

W.F., 15/1/76.

In communicating with Mr. Woods, it may be sufficient to inform him of the withdrawal of confidence in him, stating only such reasons as are applicable to himself.—W.F., 17/1/76.

No. 35.

Captain Jopp to E. Woods, Esq., C.E.

Sir,

3, Westminster Chambers, Victoria-street, 20 January, 1876.

The attention of Mr. Forster, Colonial Treasurer, of New South Wales (who is now in England for the purpose of inquiring into the question of the supply of railway iron to the Colony) has been directed to the letter of the 7th July last, addressed to Mr. Shields, and signed by you after your appointment as Mr. Shields' successor, in which you comment on the withdrawal by the Government of Mr. Shields' appointment as inspecting engineer.

Mr. Forster has desired me to inform you that in view of the circumstances under which this letter was written, and of the opinions which you have therein expressed, he finds a difficulty in bestowing upon you that confidence which ought to subsist between the Government and their engineer; and he has, therefore, desired me to intimate that the inspection of railway materials will not be referred to you in future by the Government of New South Wales.

Yours, &c.,

A. A. JOPP, CAPT., R.E.,
(For Agent-General).

No. 36.

E. Wood, Esq., C.E., to Capt. Jopp, R.E.

Sir,

3 Great George-street, Westminster, 27 January, 1876.
New South Wales Government.

I beg to acknowledge the receipt of your letter of the 20th instant, in which you inform me that, in view of the letter of the 7th July last addressed to Mr. Shields, and signed jointly by myself and by some members of our profession, commenting upon the withdrawal of Mr. Shield's appointment as Inspecting Engineer for the New South Wales Government, you had been directed by Mr. Foster, the Colonial Treasurer of New South Wales (who had arrived in England for the purpose of making inquiries into the matter of the contract for the railway iron), to intimate to me that the inspection of railway materials will not be referred to me in future by the Government of New South Wales.

Yours, &c.,

EDWARD WOODS.

No. 37.

Minute by the Superintendent of Railway Stores.

Inspection of Railway Material.

I NOTICE that Mr. Fowler is being paid $2\frac{1}{2}$ per cent. commission instead of 2 per cent., the rate paid to his predecessors Mr. Shields and Mr. Woods—also 1 per cent. for rails instead of $\frac{1}{2}$ per cent.

I presume this is correct.

A.R.

The Secretary, 28/5/77.

The rates now paid to Mr. Fowler are those which were originally fixed. There are no papers in this office showing how Mr. Fowler came to be reappointed, nor the terms on which his services have been obtained. As the rates have been passed by Agent-General, it is presumed they are correct; but it is desirable that the Department most concerned (Public Works) should have some record of the matter.—CH. A. G., 4/6/77.

Principal Under Secretary,—Are there any papers on the subject?—J.R., B.C., 5/6/77. Certain papers forwarded herewith for perusal, B.C., 8/6/77. Commissioner. These papers show only what we already know, viz., that there was some proposition to revert to Mr. Fowler; but that the Government did

did not desire to do so. They do not show how Mr. Fowler was reappointed, nor the rates of remuneration for his services.—CH.A.G., 15/6/77. Principal Under Secretary. If there be no other papers on the subject in the Colonial Secretary's Office, probably the Agent-General might be able to furnish.—J.R., 15/6/77.

No. 38.

The Under Secretary for Public Works to The Principal Under Secretary.

Sir,

Department of Public Works, Sydney, 26 June, 1877.

In returning to you herewith the documents forwarded to this Department by your B.C. of the 8th instant, I am directed by the Secretary for Public Works to state that these papers do not contain evidence of the reappointment of Mr. Fowler as Consulting Engineer on behalf of this colony in England, nor the remuneration allowed; and as there do not appear to be any papers in existence giving the information required, I would suggest that the Agent-General be requested to furnish the particulars of Mr. Fowler's reappointment, and the remuneration received by that gentleman for his services, in order that the same be made a record of this Department.

Letter to Agent-General for approval, 3/7/77. Agent-General, 6th July, 1877.

I have, &c.,
JOHN RAE.

No. 39.

The Principal Under Secretary to The Agent-General for New South Wales.

Sir,

Colonial Secretary's Office, 6 July, 1877.

With reference to the reappointment of Mr. Fowler as Consulting Engineer for this colony in England, I have the honor, by the desire of the Secretary for Public Works, as expressed in the enclosed letter, to request that you will furnish me with the particulars of information required by that Minister as to Mr. Fowler's reappointment, and the remuneration that he receives for his services.

I have, &c.,
HENRY HALLORAN,
(For the Colonial Secretary).

No. 40.

The Principal Under Secretary to The Under Secretary for Public Works.

Sir,

Colonial Secretary's Office, Sydney, 13 December, 1877.

With reference to your letter of the 26th of June last, asking that information might be obtained from the Agent-General in London regarding the position and remuneration of Mr. Fowler as Consulting Engineer for this Government in England, I am directed by the Colonial Secretary to transmit to you, for the information of the Secretary for Public Works, a copy of a report which has now been received from Mr. Forster on that subject.

I have, &c.,
HENRY HALLORAN.

No. 41.

The Agent-General to The Colonial Secretary.

Sir,

London, 3, Westminster Chambers, Victoria-street, S.W., 18 October, 1877.

In reply to your despatch No. 77/5478 of the 6th July last, requesting, at the desire of the Secretary for Public Works, as expressed in his enclosed letter of the 26th June last, that I would furnish you with particulars of information required by that Minister as to the reappointment of Mr. Fowler as Consulting Engineer for the colony in England, and the remuneration that he receives for his services, in order that the same be made a record of the Department of Public Works, I have the honor to remind you that in January, 1876, shortly after my arrival in England, I thought it desirable, for the reasons set forth in my minute of the 15th January, 1876, forwarded to you under cover of my despatch No. 77/5478, of the 18th February, 1876, to discontinue the inspection of railway materials by Mr. Woods, C.E. I telegraphed to you to this effect on the 13th January, 1876, and proposed our returning to Mr. Fowler. Your telegram in reply, dated 1st February, 1876, suggested an alternative system, which was most carefully considered by me; and on the 18th February, 1876, also under cover of my above-quoted despatch No. 77/5478, I enclosed for your consideration a report by Captain Jopp, dated 5th February, 1876, and a minute by myself dated 15th February, 1876, on this subject.

Subsequently, in April 1876, on my receipt of Public Works indents of 9th February, 1876, I referred them to Mr. Fowler, as I had no definite instructions to discontinue inspections; and I considered, acting on the responsibility which necessarily devolved on me with respect to ordering and despatching the articles required, that I could not do so satisfactorily without reference to a first-class Civil Engineer.

Your despatch now under reply is the first communication I have received on the subject since the transmission to you of my above quoted despatch and reports of February, 1876; but during the interval, the occasional mention of Mr. Fowler's name in the instructions accompanying various indents, as well as the absence of any reply objecting to the views taken in the above reports, have led me to infer that the system which I have adopted had met with the approval of the Government.

At the same time, I would suggest that it is not, in my opinion, desirable to recognise or assume that any "appointment" has been conferred, either on Mr. Fowler or any other gentleman of whose services I may avail myself in connection with any matters entrusted to me, for whose proper execution, as far as such can be ensured by all reasonable precautions, I am responsible. At the same time, bear in mind that all such references are subject to your confirmation and approval, both in respect of the references themselves, and of the persons to whom they are made.

In

A copy may be forwarded to the Under Secretary for Public Works in reference to 77/5478. 6/12/77. Agent-General, 18th Feb., 1876. Minute on the subject of inspection and payment of railway and other materials, Park Gate Works 26 April, 1876. Under Secretary for Public Works, 13 Dec., 1877.

In the matter of railway materials, I desire to record my opinion, derived from the information and experience which I have acquired during my tenure of my present office, that the existing system—under which railway materials are ordered under the advice of a first-class Civil Engineer, inspected by him at all necessary stages, and paid for in full on shipment after his approval, subject to the guarantee provided in our existing form of tender, is the most reliable, efficient, and economical system which we can adopt; nor can I view any departure from it as free from the risk of impaired efficiency, as well as of increased cost, eventually if not at first.

Mr. Fowler's remuneration is that of most first-class engineers in this country, and is as charged in the quarterly accounts regularly rendered to the Treasury and to the Department of Public Works, being 1 per cent. on the invoice value of rails, and $2\frac{1}{2}$ per cent. on that of all other articles, for the services detailed in the preamble of his accounts, which runs as follows:—

To professional charges for duties performed on behalf of the Government of New South Wales as follows:—

Receiving instructions from the Agent-General, examining drawings, designs, specifications and engraving, and lithographing same.

Investigating tenders and advising thereon as requested—inspection by self and assistants of materials and work during the progress of manufacture.

Certifying accounts and generally acting professionally in the interests of the Government.

These terms were agreed to when I first referred the railway indents to Mr. Fowler, the arrangement being advisedly left otherwise indefinite, in order that no actual appointment might be assumed. They are now, however, placed on record, by my letter of 11th September 1877 and Mr. Fowler's reply of 22nd September 1877, copies of which are enclosed.

I have, &c.,
WILLIAM FORSTER.

No. 42.

The Agent-General to J. Fowler, Esq., C.E.

Sir, Westminster Chambers, Victoria-street, 11 September, 1877.

Having been directed by my Government to furnish them with particulars as to the remuneration received by you for your services as Consulting Engineer, I shall be obliged by your informing me whether you propose that the services set forth in the preamble of your quarterly accounts should continue to be charged at the percentage rates herein detailed (1 per cent. on the invoice value of rails, and $2\frac{1}{2}$ per cent. on that of all other articles), or whether there are any modifications of these rates which you would be prepared to adopt in any specific cases or otherwise.

WILLIAM FORSTER.

No. 43.

J. Fowler, Esq., C.E., to The Agent-General.

Sir, 2, Queen's Square Place, Westminster, 22 September, 1877.

I beg to acknowledge your letter dated September 11, 1877.

The percentage rates charged in the accounts to which you refer are the same as those which have always been charged by me for similar services, and I do not propose to make any departure from them.

Provided that real and thorough inspections are made by trustworthy and competent persons, that detailed specifications and all other necessary communications and correspondence are included, and provided the same percentage rates apply to periods when prices for materials are very low, as well as otherwise, to small as well as large indents, I consider the rates charged are reasonable and could not be reduced without a corresponding reduction in the efficiency of the services performed.

I need hardly say that it would not be desirable to adopt the latter alternative.

In cases of consultations, or in preparing plans and specifications for which no contracts are made, or where no inspections are required, I should make a charge in proportion to the work done in such cases.

Yours, &c.,
JOHN FOWLER.

No. 44.

The Agent-General to J. Fowler, Esq., C.E.

Sir, 3, Westminster Chambers, Victoria-street, 28 September, 1877.

I beg to acknowledge the receipt of your letter of the 22nd inst., intimating the terms which you propose in connection with the professional services rendered by you to the Government of New South Wales.

Yours, &c.,
WILLIAM FORSTER.

No. 45.

Position and Remuneration of Mr. Fowler as Consulting Engineer.

THIS is a matter that concerns exclusively the Department of Public Works. Without some knowledge of the affairs and practices of that Department the papers are only partially intelligible.

The Agent-General herein replies to an inquiry of the Secretary for Public Works, put to him in July last, regarding the reappointment of Mr. Fowler as Consulting Engineer for this Colony in England, and his remuneration, on which points it seemed no information had ever been given. Mr. Forster now explains why such information was not given—namely, because it was not thought expedient that any formal transaction in the nature of an appointment should take place.

In January, 1876, shortly after Mr. Forster's arrival in England, he thought it desirable, for reasons stated at the time, to dispense with the services of Mr. Edward Woods in the inspection of railway

railway materials. The Government, however, objected to any returning to the old system, (which was proposed by Mr. Forster), and no appointment of Consulting Engineer was made. Mr. Forster, however, found it necessary to avail himself of the services of Mr. Fowler without any formal appointment; and in the absence of any reply to his reports or objection to the course taken, inferred that his system was approved.

Mr. Forster thinks it is not desirable to recognize or assume that any "appointment" has been conferred on Mr. Fowler or any other gentleman, of whose services he may avail himself. He believes the existing system to be the most "reliable," efficient, and economical.

Mr. Fowler's remuneration is that of most first-class engineers in England—1 per cent. on the invoice value of rails, and $2\frac{1}{2}$ per cent. on that of other goods. These terms were settled when the railway indents were first referred to Mr. Fowler, "the arrangement being advisedly left otherwise indefinite, in order that no actual appointment might be assumed." Now, however, since the inquiry of the Secretary for Public Works was made, these terms are placed on record in correspondence between Mr. Forster and Mr. Fowler.

7th December, 1877.

No. 46.

Telegram from The Agent-General to The Secretary for Public Works.

London, 19 June, 1881.

ARRANGED with Fowler for considerable reduction his charges, from two and half to two per cent. in machinery, from one per cent. on rails to fixed charge of tenpence per ton, estimate saving on this and shipping business nearly two thousand pounds annually on basis of past and present operations.

Railways, B.C.—J.R., 25/7/1881.

No. 47.

The Agent-General to The Colonial Secretary.

Sir,

5, Westminster Chambers, London, 29 June, 1881.

I have the honor to report that I have given very careful consideration to the system adopted in this Department in making contracts for the supply of railway and other materials, and to the engineer's inspection thereof, with a view of ascertaining whether improvements could be effected and other arrangements made to secure greater economy and faithful examination of our large indents.

I do not see that any preferable system of inspection and of making contracts could be introduced; and, so far as the inspection is concerned, I arrived at the conclusion that it would be in the interest of the Government to continue the existing system and the services of Mr. John Fowler, if they could be secured upon terms advantageous to Government. With this in view, and having regard to the large orders present and prospective, I have on several occasions discussed the matter with Mr. Fowler, and our conversations have led to an arrangement between us, the result of which I hope may be considered satisfactory by the Government.

The nature of the arrangement will be gathered from Mr. J. Fowler's letter to me, of date the 14th instant, a copy of which I send herewith and of my reply.

On the 19th instant I informed you, by telegram, of the arrangement between Mr. Fowler and myself, and although it is impossible accurately to estimate what the annual savings will be, the amount on the whole will be considerable, especially when the reduced cost of shipping is taken into consideration.

By the old arrangement of 1 per cent. for the inspection of rails, and 6d. per ton for shipment, the cost per ton was about 1s. 9d.; this is now reduced to 1s. 1d., viz., 10d. per ton inspection, and 3d. per ton shipping agent's commission, a saving upon outstanding orders which I estimate at nearly £2,000.

I have, &c.,
SAUL SAMUEL.

No. 48.

The Agent-General to J. Fowler, Esq., C.E.

Dear Sir,

5, Westminster Chambers, London, 20 July, 1881.

I am in receipt of your letter of the 14th instant, in which you state the modified terms on which you will advise the New South Wales Government on the railway orders and inspecting engines, rails, &c.

I am willing to assent to the terms you mention respecting orders which may be referred to you; but it must be understood that the Government, or the Agent-General acting for them, shall be at liberty at any time to terminate this agreement should they so desire, and that this arrangement is not for any fixed period.

I am, &c.,
SAUL SAMUEL.

No. 49.

J. Fowler, Esq., C.E., to The Agent-General.

Dear Sir,

2 Queen's Square Place, Westminster, 14 July, 1881.

I have the honor to acknowledge your letter informing me that large orders for railway and other materials are now outstanding, and requesting me to consider whether under such circumstances I am prepared to make any reductions in my charges as Consulting and Inspecting Engineer.

Having had personal interviews with yourself on the subject, I have carefully examined the cost out of pocket to myself for inspections during the last five years, under indents for large and small quantities, and I find that when quantities are small the cost of inspection almost entirely absorbs the remuneration

remuneration received, whereas, when the quantities become large, the remuneration gradually increases. The result during the last five years has been that the net balance left to me annually is a very moderate average amount.

So far as I can judge, however, the quantities for some future years will exceed the average of the past, and I am willing, as agreed between us, to make the following modifications in my remuneration so long as the present large quantities continue:—

Locomotives (in one order) to 2½ per cent. on 4 engines, and 2 per cent. on all above.

Inspection of rails and fish-plates to be paid for at 10d. per ton.

Miscellaneous articles, that is everything except locomotives, and rails, and fish-plates to continue as at present.

It is understood that when the quantity of rails becomes considerably smaller than at present, the arrangement to be subject to reconsideration, so as to be equitably adapted to the altered circumstances.

This new scale of remuneration to commence on the 1st July, 1881.

I am, &c.,
JOHN FOWLER.

Forward to Engineer-in-Chief. Accountant to note first.—CH. A. G., B.C., 24/9/81.

No. 50.

Minute by The Secretary for Public Works.

Inspection of materials, &c.

REPRESENTATIONS have been made to me that it would prove of much advantage to the Department if the inspection of all materials and supplies obtained in England, now carried out in England, was carried out in this Colony on the arrival of the supplies.

I shall be glad to know if there are any insuperable objections to this course.

W.J.L., 21/11/85.

Circular to heads of branches.—J.R. Resubmit with replies.

Copies sent to Commissioner for Railways, Engineer-in-Chief for Railways, Engineer-in-Chief for Harbours and Rivers, Commissioner for Roads, and Acting Colonial Architect.—24/11/85.

No. 51.

The Engineer-in-Chief for Railways to The Secretary for Public Works.

Engineer-in-Chief's Office, Sydney, 16 March, 1886.

Subject:—Imported materials, &c., from England. Proposal to inspect same after arrival in the Colony, instead of before leaving England.

WITH reference to the Minister's minute of the 6th instant, on the subject of materials and supplies for the use of this Department being inspected in the Colony instead of in England, I have to state that I do not consider such an arrangement to be practicable.

I am under the impression that first-class manufacturers would not send goods from England, or elsewhere, if the final payment is to be made after they have been inspected and approved in the Colony.

Should any of the articles be rejected, the manufacturer would have no market for them, and they would consequently be thrown on his hands as worthless, and there would be no chance of obtaining the balance of his account for their supply.

Besides, there would be the risk to the manufacturers of damage during transit, which I do not consider would be a fair risk for which they should be held responsible.

I also think that such an arrangement would greatly increase the cost of all manufactured articles, as the contractors would take care that the advance made in England would be the full value of the articles being rejected in the Colony.

In the case of permanent-way materials, tires, axles, &c.; these should be inspected during manufacture, as there could be no proper inspection afterwards, and few contractors would allow the Government to retain any portion of the contract sum until the articles had been a sufficient time in use to test their wearing qualities.

JOHN WHITTON.

No. 52.

The Engineer-in-Chief of Harbours and Rivers to The Under Secretary for Public Works.

Harbours and Rivers Branch, Sydney, 23 March, 1886.

Re substituting Colonial for English inspection of imported material.

I THINK the effect of substituting inspection in the Colony for English inspection, in all cases, would be undesirable, and would have the effect of limiting the range of selection for Government contracts to Colonial tenderers entirely. No English contractor would tender for work or supplies which might be subject to the risk of being condemned and thrown on his hands in the Colony.

But while I say I do not think it should be done in all cases, I am of opinion that wherever practicable it is desirable to do so, and I have insisted on it in regard to the pipes for the Sydney and suburban water supply.

As regards the pumping machinery, although it is subject to my approval, and will not be taken off the contractor's hands till after satisfactory trials, it is of the utmost advantage to have the work carried out under careful inspection in England. Many things may be just on the border-land between good and bad, not so good as to be quite satisfactory, yet not so bad as to be condemned, which if executed under rigid and careful inspection in England would be quite satisfactory. I think, therefore, on the whole, that the present arrangements as to inspection should be allowed to stand.

E. O. MORIARTY.

No. 53.

No. 53.

The Commissioner for Roads to The Secretary for Public Works.

Re inspection of materials, &c.

THE material for iron bridges means the ironwork of the bridges complete. The inspection is obliged to be in England. I do not think it likely that any manufacturer would send out a bridge complete, without some advance, which necessitates inspection. Provision is made for a reserve of 5 or 10 per cent to cover defects,—*e. g.*, the correspondence now going on about Cochrane's bridges as to paint.

The iron ropes are passed in England, but I do not think they can be got here; we called for tenders over and over again, and could not get them satisfactorily here.

Pellett's process materials, is a simple article of stationery—and is not inspected in England or here, but returned if not good.

Troughing for tanks is inspected in England. Mr. Musson got contracts for inspection here, and failed to carry it out.

W.C.B., 26/11/85.

No. 54.

The Commissioner for Railways to The Secretary for Public Works.

Re inspection of materials, &c.

I AM of opinion that inspection in England should be considered indispensable.

The correspondence with these papers elucidates the question thoroughly; the project of dispensing with inspection and holding a portion of the purchase money till inspection could be made in the Colony was introduced some ten years since, and the reasons given for continuance of inspection in England were considered to be conclusive.

No. 55.

Mr. Strickland to The Secretary for Public Works.

Sir,

Sydney, 13 March, 1885.

I have the honor to point out to you that Mr. W. Mason, lately Engineer for Existing Lines, and for some 26 years in the service of the New South Wales Government as one of the Engineers of the Railway Department, is now in England and would be inclined to act as your representative for inspection of bridge-work, rails, and other materials, which inspection requires a practical knowledge of the wants of the department, such as Mr. Mason from his long experience, possesses.

Mr. Mason would undertake the duties (and indeed hardly say would inspect to your satisfaction) either on a stated salary or on a much smaller commission than you have been paying.

Will you please give this matter your consideration.

I have, &c.,

THOS. STRICKLAND.

Memo. by Chief Clerk.—Found in Minister's room when clearing up last week.—D.C.M.L., 12/10/85.

RAILWAY DEPARTMENT.

(CASES OF EMBEZZLEMENT FOR THREE YEARS ENDED AUGUST, 1886.)

Ordered by the Legislative Assembly to be printed, 18 March, 1887.

[*Laid upon the Table of the House in accordance with promise made by the Honorable the Secretary for Public Works, in answer to Question No. 1 on Votes and Proceedings of 28th September, 1886.*]

1. How many cases of embezzlement in the Railway Department, for three years ending August 1886, have been discovered, the amounts misappropriated, and the names of persons prosecuted, with the result of such prosecution?
 2. Did any, or all of the said defaulters provide a fidelity bond, if so, for what amount?
 3. What amounts, in whose case, and by whom, have been made good to the Commissioner for Railways?
 4. Names of those whose defalcations have not been made good, who is the responsible officer, in each case, and does he intend calling upon such responsible officers to pay up the said deficiency?
-

[34.]

RETURN showing the number of CASES of EMBEZZLEMENT which have been discovered in the Railway Department during the three years ending August, 1866.

QUESTION No 1				QUESTION No 2		QUESTION No 3		QUESTION No 4		Remarks
The number of cases of embezzlement discovered during three years ending August, 1866	The amounts misappropriated	The names of those prosecuted	Result of such prosecutions	Defaulters who provided Fidelity Bonds	The amounts of such Bonds	The amounts which have been made good	By whom made good, &c	Names of those persons whose defalcations have not been made good	Responsible Officer in each case	
Daly, T. G	£ s. d. 57 19 5				£ s. d. 57 19 5	£ s. d. 57 19 5	The Defaulter's Father.		Station-master, Dubbo.	
O'Donnell, B.	20 9 6				O'Donnell, B.	Station-master, Newtown.	The Station-master who was at Newtown at the time of the discovery of the defalcations, is now deceased.
Gamble, E	75 11 8	Gamble, E.	Two years imprisonment	Bond was in course of preparation when Gamble absconded	100 0 0			Gamble, E.	.	Gamble was as usual sent to the Bank with the day's remittance, and brought back to the Station-master a forged receipt. This was not discovered until the document was returned by the Bank to the Cashier marked "unpaid." Gamble in the meantime absconded.
Hicks, E. T.	21 13 4	Hicks, E. T	Six months imprisonment.	Hicks, E T	100 0 0	21 13 4	Mercantile Mutual Insurance Co.			Hicks was in charge of Douglas Park Station. He suddenly disappeared, and an examination of the Books disclosed the deficit named.
Kelly, J.	19 18 10	Kelly, J.	Six months imprisonment.	.				Kelly, J.	Station-master, Mittagong.	The defalcations could not be attributed to laxity on the part of the Station-master, and he was not called upon to make the amount good.
Russell, H.	9 2 1	Russell, H.	Three years imprisonment.			9 2 1	Station-master, Orange.	.	Station-master, Orange.	
Berner, G.	2,012 5 7	Berner, G	Ten years imprisonment	These Officers were not authorized to receive cash on behalf of the Department, and consequently were not called upon to provide a Fidelity Bond.				Berner, G	.	No one can be held responsible, because he took money which he was not authorised to do.
Logan, E.	20 0 0	Logan, E	Two years imprisonment.					Logan, E.	District Engineer, Bathurst.	The officer named was Logan's immediate superior, but the fraud practised was such that he cannot be held accountable for the amounts misappropriated.

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAY DEPARTMENT.

(EMPLOYÉS DISMISSED SINCE 24 JANUARY, 1887.)

*Ordered by the Legislative Assembly to be printed, 30 March, 1887.**[Laid upon the Table of the House in accordance with promise made by the Honorable the Secretary for Public Works, in answer to Question No. 5, on Votes and Proceedings of 29th March, 1887.]*

RETURN showing:—

- (1.) The number of employés dismissed from the Railway Department since 24th January, 1887.
- (2.) The character of the occupation pursued by such employés while in the service of the Department.
- (3.) Is it the intention of the Department to further increase the dismissals.

(Mr. Toohey.)

RETURN showing the number of employés dismissed from the Railway Department since 24th January, 1887, and the occupations which they pursued, &c.

Number dismissed.	Occupation in which employed.	Remarks.
10	Labourers ...	One was dismissed for losing time, four through slackness of work, two through completion of special work on which they were engaged, and three through misconduct.
1	Rivet Boy ...	Dismissed for losing time.
1	Apprentice ...	Do do
1	Officer-in-charge ...	Do irregularities.
1	Clerk ...	Do do
12	Porters ...	Ten of these were temporary hands whose services were no longer required, while the other two were dismissed for irregularities.
1	Boilermaker ...	Dismissed for incompetency.
17	Carpenters ...	Discharged through slackness of work.
1	Tinsmith ...	Do do
1	Bricklayer ...	Do do
2	Boys ...	One discharged in consequence of slackness of work, and one on completion of special work on which he was engaged.
3	Carters ...	Two through slackness of work, and one in consequence of special work on which he was engaged being completed.
51		

3. It will be the duty of the Department to dispense with the services of men when it is found that they are not required, they will, however, be taken on again as trade revives and their services are wanted.

The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that every entry should be supported by a valid receipt or invoice. This ensures transparency and allows for easy verification of the data.

In the second section, the author outlines the various methods used to collect and analyze the data. This includes both primary and secondary sources, as well as the specific techniques employed for data processing and statistical analysis.

The third section provides a detailed overview of the results obtained from the study. It includes a series of tables and graphs that illustrate the key findings and trends observed in the data.

Finally, the document concludes with a summary of the main points and offers some recommendations for future research. It suggests that further exploration of the underlying factors could provide more insights into the observed patterns.

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAY PROBATIONERS.

(EMPLOYED ON LINE BETWEEN NEWCASTLE AND MURRURUNDI.)

Ordered by the Legislative Assembly to be printed, 4 July, 1887.

[Laid upon the Table of the House, in accordance with promise made by the Honorable the Secretary for Public Works, in answer to Question No. 2 in Votes and Proceedings, No. 47, of the 16th June, 1887.]

(1.) *Question—*

How many Probationers are employed in the Railway Service between Newcastle and Murrurundi?

Answer—

Ten.

(2.) *Question—*

What salaries do they receive?

Answer—

Two shillings and sixpence per week.

(3.) *Question—*

How long have they been so employed?

Answer—

One since July, 1884; three since August, 1884; one since November, 1884; two since January, 1885; one since February, 1885; one since April, 1885; and one since January, 1887.

RAILWAYS.

No. 1.

Mr. S. Butterly to The Commissioner for Railways.

Dear Sir, 2 Grigg-street, Glebe, Sydney.
 As I have been out of employment for the last few weeks, my last employer was Mr. Railton, of Bay-street, Glebe (grocer), with whom I stayed for two years and nine months. I have been most of my time in the country up till the last six years, which I have passed in Sydney; wishing to know if you would oblige me by doing anything for me by putting me on the railway such as porter or anything where you may have a vacancy. Hoping you will oblige,

Yours, &c.,
 STEPHEN BUTTERLY.

I can confidently recommend this application to the favourable consideration of the Commissioner; he is a very active, intelligent, steady, young man, who would, I am sure, give every satisfaction.—JOHN ROSEBY.

Traffic Manager, B.C., 10/7/82.—G.B. No vacancy.—W. V. READ, D.K., Commissioner, 11/7/82. Mr. S. Butterly informed no vacancy, 24/7/84.

No. 2.

Sir G. W. Allen to The Commissioner for Railways.

Toxteth Park, 1 August, 1882.
 I BEG to recommend Stephen Butterly for employment in the Railway Department.
 He is the son of well conducted parents, who have lived on the Glebe for a great many years, and I have reason to believe he will do credit to any position for which the head of the Department may consider him qualified.
 Address, No. 2 Grigg-street, Glebe. G. WIGRAM ALLEN.

This young man is twenty years of age, and small of frame. I do not think he would be suitable for a porter but as Sir Wigram Allen strongly recommends him for employment I shall be glad if something can be done for him.—CH. A. G., 2/8/82. Traffic Manager. Write Butterly to call.—W.V.R., 23/8/82.

Sir, The Traffic Manager to Mr. S. Butterly.
Traffic Manager's Office, Redfern Station, Sydney, 24 August, 1882.
 In reference to your application for employment in this Department, you will please call on me at this office at your convenience.
I have, &c.,
 W. V. READ,
 Traffic Manager,
 (per W. H. COLQHOUN.)

Butterly would do for platform man at Blayney; pay 30s. per week.—W.V.R., 25/8/82. Inspector Hornidge. P.S.—He leaves for Blayney, on Monday, 28th. Let me know when he commences duty.—W. V. READ, per D.K., 26/8/82. Please see that Butterly is provided with a rule book, and properly instructed in his duties as platform porter, wages 30s. a week, let me know when he commences.—M. HORNIDGE, 29/8/82. Station-master, Blayney. Butterly commenced duty on 29th August, 1882.—J. GEO. CRENNY. Inspector Hornidge, Bathurst. Traffic Manager.—P.J. (pro HORNIDGE), 8/9/82.

No. 3.

Sir G. W. Allen to The Commissioner for Railways.

My dear Mr. Goodchap, Toxteth Park, 14 October, 1882.
 Some time ago you gave employment on the Railway works, on my recommendation, to a young man named Stephen Butterly. He is carriage or lamp cleaner at Blayney. His mother called on me this morning to beg that he may be removed to Sydney as his father is a very old man, and is very ill, and just able to leave his house.
 I suppose that frequent changes are made, and perhaps at these times you could keep him in similar employment in or near Sydney. His father and mother are mainly dependent upon what this son is able to give them.
Yours truly,
 G. WIGRAM ALLEN.

Traffic Manager, B.C., 18/10/82.—G.B. Can Inspector Richardson arrange for some one to exchange with Butterly.—W. V. READ (per W.H.D.), 27/10/82. Inspector Richardson. A man named Holborow, at Darling Harbour, will exchange, as he wishes to be removed to a country station.—H. RICHARDSON, 27/10/82. Traffic Manager. What sort of a man is Holborow? What is his age, and how long has he been employed? If he is suitable for the Service he must pass the Medical Board.—W. V. READ (per T.L.), 11/11/82. Mr. Paull. From the little I know of the man he appears to be very respectable, and is a very good working man. Medical certificate attached.—CHAS. PAULL, 14/11/82. Traffic Manager. The medical certificate is not satisfactory; can another man be found to exchange with Butterly?—W. V. READ (per W.H.C.), 17/11/82. Mr. Paull, urgent. Porter Frank Goodman will exchange with Butterly, and will be ready to go to Blayney to-morrow (Tuesday) if necessary.—CHAS. PAULL, 20/11/82. Traffic Manager.

No. 4.

Memo. from The Traffic Manager to The Commissioner for Railways.

I REGRET to have to inform the Commissioner that while the No. 33 down goods train was shunting at Blayney yesterday morning, platform porter Stephen Butterly in going between the trucks to couple up, was caught between the buffers, and died immediately. A doctor attended at once.

An inquest will be held on the body.

21/11/82.

W.V.R., Traffic Manager.

Seen.—D.V.

No. 5.

Minute by The Locomotive Engineer.

Fatal accident at Blayney, on 20/11/82.

I REGRET to inform you that an accident happened at Blayney, on the 20th instant, which resulted in the death of porter Stephen Butterly.

It appears that after the arrival of No. 33 down goods (driver, John Fullerton) at Blayney, engine was detached from the train which was left on the main line opposite the station platform.

Fullerton was told by the shunter to go into the goods-shed road, and whilst doing so, he saw some person being carried on to the east end of the platform.

On going to see who it was he found porter Stephen Butterly had been crushed between the buffers of the break-van and the last truck on the train.

It appears the break-van had been detached by the traffic men, and a horse-box shunted into the dock, also by them. They then pushed the brake-van down the line towards the train, which was moving at about one mile an hour up the line, Stephen Butterly getting in between for the purpose of coupling the brake-van on, lost his presence of mind and stepped out with right foot outside the down side rail, and stood facing the brake-van by which he was crushed, as before stated.

An inquest was held and the jury returned the following verdict:—"That the deceased Stephen Butterly, died on the 20th November, 1882, at Blayney, from injuries caused through his being accidentally crushed between the buffers of two railway trucks. The jury add as follows:—"We consider that no blame can be attached to any person connected with the Railway Department."

23/11/82.

(per Locomotive Engineer.)

No. 6.

The Under Secretary of Justice to The Under Secretary for Public Works.

Copy of verdict and rider—Inquest on Stephen Butterly.

Sir,

Department of Justice, Sydney, 27 November, 1882.

I am directed by the Minister of Justice to forward for the information of the Secretary for Public Works, the accompanying copy of verdict, and riders of jury, on inquest on Stephen Butterly, held before James Oliver Dodd, Esq., coroner, Carcoar, on the 20th instant, with reference to opinion that no blame can be attached to any person connected with the Railway Department.

I have, &c.,

W. G. PLUNKETT,
Under Secretary.

[Enclosure.]

New South Wales, }
to wit. }

INQUISITION held at the dwelling house of Michael Watson, known as the sign of the "Cosmopolitan Hotel," at Blayney, in the District of Carcoar, in the Colony of New South Wales, this 20th day of November, one thousand eight hundred and eighty-two, before me, James Oliver Dodd, one of the Coroners of our Sovereign Lady the Queen, for the Colony aforesaid, on view of the body of Stephen Butterly, then and there lying dead, upon the oaths of—Henry Oliver, George L. Wardell, William Fitzgibbon, Samuel Dean, George Black, John Marsden, George Marsh, William Whittaker, Frederick Franke, Peter Viper, Louis Viper, good and lawful men of the district aforesaid, who, having been sworn and charged to inquire (on the part of our said Lady the Queen) when, where, how, and by what means the said Samuel Butterly came to his death, do, upon their oaths, say that the deceased Stephen Butterly died on the 20th November, 1882, at Blayney, from injuries caused through his being accidentally crushed between the buffers of two railway trucks.

The jury also add:—"We consider that no blame can be attached to any person connected with the Railway Department."

In witness whereof, as well the said coroner as the jurors aforesaid, have to this inquisition set their hands and seals, this day and year aforesaid.

No. 7.

Sir G. W. Allen to The Secretary for Public Works.

My dear Mr. Lackey,

Toxteth Park, 23 December, 1882.

Some time ago a respectable young man, named Stephen Butterly, was appointed to some position on the railway in the country.

He met with a fatal accident while attending to his duties, by being crushed between the buffers of some carriages.

He

He has left a mother, a widow, who was in the main dependent on him for her living.
Can you do anything for her, by placing a sum of money on the Estimates as compensation for her loss? I strongly recommend her to your very favourable consideration.

Yours, &c.,

G. WIGRAM ALLEN.

If you cannot do anything yourself, will you leave a recommendation for your successor?

As the deceased was the support of his mother, the usual sum in such cases will be given.—J.L., 28/12/82. Inform that the Minister has approved of some amount of compensation being placed on the Estimates.—D.V.

The Commissioner for Railways to Sir G. W. Allen.

Sir,

Department of Railways, Sydney, 3 January, 1883.

Referring to your letter of the 23rd ultimo, addressed to the Honorable the Minister for Public Works, in which you recommend that an amount be placed on the Estimates as compensation to Mrs. Butterly, whose son was recently killed by a railway accident at Blayney, I have the honor to inform you that Mr. Secretary Lackey has been pleased to approve of an amount being placed on the Estimates for the purpose named.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

No. 8.

Minute by The Secretary for Railways.

Re Stephen Butterly, killed at Blayney, 20 November, 1882.

STEPHEN BUTTERLY was employed as porter at Blayney, and while engaged in the performance of his duty was crushed between the buffers of two trucks and killed.

Butterly was a single man, aged 17 years and 10 months at the time of his death. Gratuities are paid in the case of single men killed in the performance of their duty, when it is shown that relatives were supported by them at the time of their death. Butterly left an aged father and mother and two sisters; the father subsequently died. Previous to joining the railway service, Butterly was employed by Mr. Railton, grocer, of the Glebe. Mr. Railton has called to say that Butterly's earnings went to the support of his family, as he used to pay their bills, &c.

D.V.

Shall £100 or £200 be placed on Estimates?—D.V., 9/1/83. Commissioner.

I would recommend that £100 be placed on the Estimates as a gratuity to the mother of whom the deceased was the chief support.—CH.A.G., 9/1/83. I see that the late Minister approved of this on 28/12/83. Make provision accordingly.—CH.A.G., Accountant, B.C., 15/1/83.—G.B. Amount placed on Estimates.—D.V., 19/1/83.

No. 9.

Minute by The Secretary for Railways.

Mrs. BUTTERLY, the mother of the late porter, Stephen Butterly, who lost his life in the performance of his duty at Blayney recently, has called to ask if some assistance can be afforded her, as she is in very straitened circumstances. Mrs. Butterly is a widow, and has a daughter lying at the point of death: she has sickened since it happened. The case appears to be one of great necessity, and deserving of consideration. The only method by which assistance can be rendered her is by obtaining Ministerial sanction for making an advance, in anticipation of the approval of Parliament, to the amount of £100, submitted, as a gratuity to Mrs. Butterly, on the Estimates for 1883.

D.V., 2/2/83.

Re-submit on Wednesday.—CH.A.G., 5/2/83. Pay Mrs. Butterly £35 on account, pending approval of amount to be voted by Parliament.—CH.A.G., 7/2/83. Mrs. Butterly written to, and voucher herewith.—7/2/83.

The Secretary for Railways to Mrs. C. Butterly.

Madam,

Department of Railways, Sydney, 7 February, 1883.

Referring to your personal interview, when you asked that some assistance might be afforded you in consideration of your son having lost his life while in the performance of his duty in the railway, I have the honor to inform you that the Government have recognized yours as a case in which compensation should be allowed, and have placed the sum of £100 on the Estimates for this year, to be paid to you as a gratuity.

This sum cannot, however, be paid until the amount is passed by Parliament, but in view of the necessities of your case, the Commissioner has been pleased to approve of an advance of £35 being made to you pending the passing of the Appropriation Act.

If, therefore, you will call on the cashier at this office the amount named will be paid to you.

I have, &c.,

D. VERNON,

Secretary of Railways.

The accountant.—D.V., 7/2/83. Urgent. £35 paid from advance.—J.W.B., 8/2/83. Accountant.

No. 10.

Mrs. C. Butterly to The Secretary for Public Works.

Dear Sir,

59, Hugo-street, 13 March, 1883.

I called to see you to-day, but the person whom I saw told me I was to write to you. I wanted to see you about my son Stephen's death, he was killed on the Government Railway at Blayney, on the 20th of November; he was the only support I had; he was caught between the buffers of the carriages and died instantly. I wish to put in for £2,000, it is a poor recompense for the loss of my child. I wish you to bring it before the House as soon as possible, for I am at present in great want and heavily in debt through his father's illness, who has left me too, they both got buried the one week—there was only three days difference.

C. BUTTERLY,

59, Hugo-street, Redfern, Sydney.

Will the Commissioner inform me as to the circumstances of this application.—H.C., 14/3/83. £100 voted; £35 advanced (C. 83-6,070)—see verdict of jury. The Department is in no way answerable for this unfortunate event.—D.V., 17/3/83. Commissioner.

Accidentally crushed between the buffers of two railway trucks. Verdict of jury,—Accidental death, with rider that no blame can be attached to any person connected with the Railway Department.—CH.A.G., 29/3/83.

No. 11.

Mrs. C. Butterly to The Commissioner for Railways.

Dear Sir,

Sydney, 28 March, 1883.

I now take the liberty of writing to you again to inform you that I accuse Porter Bourke for Stephen's death, he being the cause of it. On Sunday night he had taken a drop too much, and on Monday he asked Stephen to shunt as he was going down the line with lamp in his hand. Porter Bourke asked him to give the carriages a shove, so he left down his lamp to obey him; the moment he put his hands to the buffer he was struck by the buffers of the other carriages and as he bumped back Bourke took him in his arms before he fell; he got no warning of the other carriage coming. Bourke was always inclined to put Stephen shunting; when he went first shunting he wrote and asked me to go to Mr. Vernon in Sydney, and when he wrote his next letter he begged of me to go to Mr. Vernon again and beg of him to have him removed to Sydney as soon as possible, for Bourke was like a jealous child; he thought that the people made too much of him. Bourke said at the inquest he could save himself, that he seen the carriage coming and let his arms drop waiting for it; the moment Stephen put his hands to the buffer he was struck by the other, so his hands dropped when he was killed; he was not lazy nor sleepy, but he always had a dread of Bourke, and he did everything he could to oblige him. He said in his letter the only enemy he had in Blayney was Bourke; they all liked him only Bourke; there is not a night but in my dream are Stephen and Bourke walking down the platform together to a certain spot, Stephen's head drops and Bourke looks stupid, when they come to the certain spot they disappear and then I can rest no more.

I remain, &c.,

C. BUTTERLY.

Put by till balance of money voted is available.—CH.A.G., 9/4/83. £100 has been voted on Estimates for 1883.—G.B., 7/5/83. Commissioner. To be paid, make out voucher.—A.S., 21/5/83. Voucher herewith.—D.C.M.L., 23/5/83. Commissioner. Pay.—CH.A.G., 25/5/83. Examiner, B.C. Voucher forwarded.—J.B.F., 25/5/83. Secretary.

No. 12.

Petition.

To the Honorable the Minister for Works.

The humble petition of Catherine Butterly, of Cleveland-street, Darlington, near Sydney, in the Colony of New South Wales, widow,—

HUMBLY SHOWETH:—

1. That, on the twentieth day of November, one thousand eight hundred and eighty-two, her son, Stephen Butterly, was employed by the Government at the Blayney Railway Station as platform porter.

2. That, on the said day, upon the arrival of the 10:40 a.m. train from Bathurst, several of the railway officials were required to detach some waggons from the train, and though it was not the duty of the said Stephen Butterly to assist in shunting, he was ordered to uncouple and shunt some of the trucks attached to the train.

3. That while thus employed in pushing a truck before him an empty truck was sent along the line after him, and in trying to avoid it he was caught between the buffers of the said truck and the one he was pushing, and was crushed to death.

4. That the deceased was the only support of your petitioner, and that he obtained employment on the Government Railways solely that he might be enabled to support her more respectably.

5. That your petitioner has been thus deprived of her only support and is now in great distress.

6. That your petitioner has been allowed the sum of one hundred pounds by the Government, but that this sum is altogether insufficient to enable her to avoid the most distressful poverty.

Your petitioner therefore humbly prayeth that you may be pleased to take into consideration all the circumstances of the case, and to grant her such relief as may be just and reasonable, and your petitioner, as in duty bound, will ever pray.

Dated at Sydney, this twentieth day of February, in the year one thousand eight hundred and eighty-four,—

her
CATHERINE × BUTTERLY.
mark.

SIGNED by the said Catherine Butterly by affixing her mark in the presence of me, and I certify that the above petition was first read over and explained to her, and she appeared to me to understand the nature and effect thereof.—J. GILLESPIE.

No. 13.

Mrs. C. Butterly to The Secretary for Public Works.

Dear Sir,

503, Cleveland-street, 25 March, 1884.

I am Mrs. Butterly, the mother of Stephen Butterly, who was killed—or rather murdered—between the buffers of a Government railway carriage on the 20th day of November, in the year 1882. He was my only support. I am but a widow since the day after he was buried.

I sent in a letter for £2,000 damages—that was a poor recompense for the loss of my son. I am 63 years of age, and am very much troubled with rheumatic pains. I have no means of support. If my son was let live I would never have been any trouble to any one: he always told me that he would keep me respectable while I lived. I trust to your Honor to grant me compensation to do so.

I am, &c.,

CATHERINE BUTTERLY.

I wish your Honor to grant me a reply.

Commissioner for report.—F.A.W., 20/2/84. Traffic Manager for any remarks he may wish to make.—D.V., 5/3/84.

I have really nothing to say. Butterly was only a temporary hand, having been barely three months in the service. The inquest showed that he met with his death accidentally, and that there was no blame attributable to the Department.—N.V.R., 15/3/84. Commissioner.

Can a gate be found for Mrs. Butterly? Where does this woman live;—ascertain what her circumstances are, and what she does for her living.—CH. A. G., 25/3/84. Traffic Manager, B.C.

Mrs. Butterly is 63 years old, and looks about 10 years older. She is too old and infirm for a gate. I have ascertained that she keeps a small fruit and lolly shop, and also takes in sewing, but I do not suppose she makes much of a livelihood. No doubt her loss was a hard one, but I see the Department has already paid her £100, although her son was only a temporary hand, and had not been three months in the service.—W. V. READ (*per* D.K.), 21/4/84. Commissioner.

I cannot recommend anything further.—CH. A. G., 26/4/84. I concur; inform.—F.A.W., 28/4/84. Mrs. Butterly informed, 30/4/84.

The Commissioner for Railways to Mrs. C. Butterly.

Madam,

Department of Railways, Sydney, 30 April, 1884.

I have the honor to acknowledge your letter of the 25th ultimo, addressed to the Secretary for Public Works, claiming to be compensated for the loss of your son, who was accidentally killed on the railway at Blayney, on the 20th November, 1882.

In reply, I am directed by Mr. Secretary Wright to express his regret that he is unable to sanction the payment of any further amount than the gratuity you have already received.

CHAS. A. GOODCHAP,
Commissioner for Railways.

No. 14.

Mrs. C. Butterly to The Commissioner for Railways.

Sir,

Sydney, 3 May, 1884.

Re your letter of the 30th April, Reg. Nos. 84/8,642 and 84/2,328,—

I beg to state that my son entered the Government employ for the sole purpose of supporting me respectably while I lived, and the compensation I received, after funeral and other expenses were paid; I had very little left. As regards the accident, I can assert that if he got warning, which he did not get, as I was told by the policeman and many others at Blayney, and as the fault was on the Government side, I demand full compensation to support me while I live. I consider that he was murdered by the Government, and I insist on getting what I demand.

If he was let live, I would not trouble about it, as he was my sole and only support.

I remain, &c.,

CATHERINE BUTTERLY.

Petition.

To the Honorable Frederick Augustus Wright, M.L.A., Minister for Public Works, &c., Sydney.

The humble Petition of Catherine Butterly, of Sydney, in the Colony of New South Wales, widow,—
HUMBLY SHEWETH:—

1. That your Petitioner's late son, Stephen Butterly, deceased, was an employee in the New South Wales Government Railways in the year 1882, and was employed at Blayney, on the Great Western Line, in the capacity of Railway Platform Porter.

2. That your Petitioner's said deceased son, by his earnings as such employee, was the only support of your Petitioner and her daughter.

3. That in the exercise of his duties as such employee the said deceased had occasionally to assist at shunting and other Railway work.

4. That on the morning of Monday, the 20th November, 1882, upon the arrival at Blayney, aforesaid, of the daily morning train from Bathurst, the deceased, with several other men at the Blayney Station, were required to detach some waggons or trucks from the said train.

5. That during shunting, and whilst being engaged in coupling one of the waggons, the said deceased, in trying to get out of the way of some approaching trucks, got jammed between the buffers of the waggons he had been endeavouring to couple, and was so seriously injured, that he died almost immediately.

6. That your Petitioner's said deceased son was a young man of steady habits and quiet disposition, and respected by all his fellow employees, zealous in his work, and anxious to acquire the knowledge requisite to enable him to rise in his vocation, the better to enable him to support his mother, your Petitioner. And that the lamentable accident which caused his untimely death and left your Petitioner in almost destitute circumstances, could not in the remotest way be attributable to any want of care, diligence, or forethought on his part.

Your Petitioner therefore humbly prays that the Honorable the Minister for Works will kindly take the foregoing statement into favourable consideration, and be pleased to place a reasonable sum of money at the disposal of your Petitioner, to recompense in some measure the irreparable loss sustained by her through the death of her only son, whilst in the execution of his duty, who was her only support.

And your Petitioner, as in duty bound, will ever pray.

CATHERINE BUTTERLY.

WE beg to recommend the prayer of the foregoing Petition to the favourable consideration of the Honorable the Minister for Public Works.

HUGH TAYLOR, M.P., A. G. TAYLOR,
T. M. SLATTERY, NINIAN MELVILLE,
JOHN SUTHERLAND, GEO. MERRIMAN,
E. O'BRIEN, W. T. POOLE,

And twenty-four others.

No. 15.

Précis.

Case of Stephen Butterly.

In August, 1882, Stephen Butterly was appointed porter at the Blayney Station, at 6s. per diem. In the November following, just as he was about to be removed to Sydney (on the recommendation of Sir G. Wigram Allen, in order that he might be near his parents, whose chief support he was, he met with an accident which resulted in his almost immediate death. He was crushed between the buffers of two waggons which he was coupling up. An inquest was held, and the verdict was one of accidental death, and that no blame attached to any one connected with the Department.

On the recommendation of Sir G. W. Allen, Mr. Secretary Lackey minuted that the sum usual in such cases should be given to the mother, Butterly having died unmarried, and Commissioner gave orders for £100 to be placed on the estimates for the purpose.

On the 8th February, 1883, Mrs. Butterly received £35 on account, and the balance was subsequently paid to her.

In February, 1884, Mrs. Butterly petitioned the Minister for further relief, and Commissioner inquired if a gate could be found for her, and what her circumstances were. Traffic Manager reported that she was 63 years of age and too old and infirm for a gate, and that she kept a fruit and sweet shop, which probably afforded her but a poor livelihood. Commissioner minuted that he could not recommend anything more, and Minister concurred. Mrs. Butterly was so informed and she (or some one for her) wrote a rather intemperate reply.

Subsequently she addressed another petition (without date) to the Minister, and got it endorsed by a number of M.L.A.'s and others, and she also wrote an appeal to Mr. Slattery, M.L.A., who forwarded it to Commissioner.

On the 26th June, Mrs. Butterly addressed a letter to the Colonial Secretary drawing attention to her petition, representing herself to be in great distress, and praying for relief.

On the 15th instant Mr. G. Eagar returned the papers to Acting Secretary, remarking that he would be glad if something more could be done for Mrs. Butterly.

Commissioner.

C.A.B., 20/8/84.

Seen. I can see no reason why more should be paid.—CH.A.G., 21/8/84. Minute of Acting Secretary for Works approved.—G.R.D., 22/8/84. Inform Mrs. Butterly.—G.B.

The Commissioner for Railways to Mrs. C. Butterly.

Department of Public Works, Railway Branch,

Madam,

Sydney, 25 August, 1884.

Referring to your memorial, dated 27th June last, respecting your claim to further compensation on account of the death of your son, Stephen Butterly, who was accidentally killed while in the service of this Department, I have the honor, by the direction of Mr. Secretary Dibbs, to inform you that the matter has been fully considered, but he is unable to approve of any further amount being paid.

I have, &c.,

CH. A. GOODCHAP,
Commissioner for Railways.

(per G.B.)

No. 16.

Mrs. C. Butterly to The Commissioner for Railways.

Sir,

28 August, 1884.

With reference to your letter of the 25th instant respecting my claim for compensation on account of the death of my son, Stephen Butterly, I do myself the honor to make application for appointment as a gate-keeper on the railway line. If you should be good enough to grant this request, my daughter, who is 21 years of age, will accompany me and reside with me at whatever place you may be pleased to send me.

I have, &c.,

CATHERINE BUTTERLY.

Traffic

Traffic Manager.—R.J.S., B.C., 3/9/84. Mrs. Butterly is altogether too old to be employed as gate-keeper; and in any case, there is no vacancy.—W. V. READ (*per D.K.*), 5/9/84. Commissioner. Inform.—G.B., 9/9/84.

The Acting Secretary for Railways to Mrs. C. Butterly.

Madam,

Department of Railways, Sydney, 15 September, 1884.

In reply to your letter of the 28th August, applying for an appointment as gate-keeper on the Government Railways, I have the honor to inform you that inquiries have been made, but there is no vacancy.

I have, &c.,

GEO. BERNER,

Acting Secretary for Railways.

No. 17.

Mrs. C. Butterly to The Secretary for Public Works.

Sir,

Sydney, 11 June, 1886.

I most humbly beg that you will do something for me now, for my last means are gone. I have nothing to depend on, for what little I had I had to spend going backward and forward trying to get my petition signed. I am in sad distress, so I most humbly beg your honor will do something for me as soon as possible.

Yours, &c.,

CATHERINE BUTTERLY.

Thirty-four honorable members have signed my petition.—Mrs. C. BUTTERLY, 503, Cleveland-street, Darlington.

What does this refer to? Please let me have particulars.—W.J.L., 14/6/86. Commissioner. *Précis* of case herewith.—CH.A.G., 17/6/86. Minute of Secretary for Works. Scen.—W.J.L., 19/6/86. Inform.—D.C.M'L., 22/6/86.

The Commissioner for Railways to Mrs. C. Butterly.

Madam,

Department of Railways, Sydney, 23 June, 1886.

With reference to your letter of the 11th instant, addressed to Mr. Secretary Lyne, again appealing for further compensation on account of the death of your son, Stephen Butterly, who was accidentally killed while in the service of this Department, I am directed to inform you that the matter has had the fullest consideration, but the Minister is unable to approve of any further gratuity being paid.

I have, &c.,

CHAS. A. GOODCHAP,

Commissioner for Railways.

No. 18.

T. Williamson, Esq., M.P., to The Commissioner for Railways.

Dear Sir,

Sydney, 16 November, 1886.

During the last Session of Parliament I presented a petition for a Mrs. Butterly, asking for further assistance from the Government in consequence of her son being killed at Blayney.

I may state that Mrs. Butterly is over 60 years of age and has not a friend in the Colony. It appears her husband died a few days after the son was killed. I have made inquiries and find that the old lady is in extreme poverty and is not destined to live very long. Hoping that you will fairly consider her case.

I remain, &c.,

THOS. WILLIAMSON.

I think this is a case for private benevolence. Mrs. Butterly received more than she would have received; had her son been a contributor to the Superannuation Fund, and had been killed (as he was) in the execution of his duty, she could not have received more than six months pay, and she received nearly twelve months.—CH.A.G., 20/11/86.

Butterly was only three months in the Department, but would have received six months gratuity as the minimum. Mr. Williamson called again to see the Commissioner about Mrs. Butterly this morning, and will take an early opportunity of seeing him further.—A.R., 23/11/86. Commissioner.

Inform Mr. Williamson in reply to his letter.—CH.A.G., 25/11/86.

The Commissioner for Railways to T. Williamson, Esq., M.P.

Sir,

Department of Railways, Sydney, 26 November, 1886.

In reply to your letter of the 16th instant, in which you ask that the case of Mrs. Butterly, whose son was killed on the railway while in the discharge of his duty, may be reconsidered with a view to affording her some further pecuniary assistance, I have the honor to inform you that Mrs. Butterly received more than she would have been paid had her son been a contributor to the Superannuation Fund and had been killed (as he was) in the execution of his duty. In the latter case she would not have received more than six months' pay, while she actually received nearly twelve months'. In my opinion this is a case for the exercise of private benevolence.

I have, &c.,

CHAS. A. GOODCHAP,

Commissioner for Railways,
(*per A.R.*)

No. 19.

T. Williamson, Esq., M.P., to The Secretary for Public Works.

Dear Sir,

Sydney, 1 December, 1886.

I wrote a short time back to the Commissioner for Railways in reference to the case of a Mrs. Butterly, and after considering the representations made by me he informs her that the allowance paid cannot be increased.

I may state that the poor creature has no friend, in fact is quite penniless. The money that she previously received was expended in burying her son and her husband, the latter a few days after the son. If a small amount was given to her it would be a valuable assistance.

Hoping you will kindly consider her case.

I remain, &c.,

THOMAS M. WILLIAMSON.
(per G.N.)

Where are the papers?—W.J.L., 6/12/86. Papers herewith.—A.R., 9/12/86. Commissioner's 87/7,278,—For Minister's information. There is really no claim, and to grant an allowance would form an inconvenient precedent. It is a case for private benevolence.—C.H.A.G., 9/12/86. Inform.—W.J.L., 18/12/86.

No. 20.

Memo. from W. Stephen, Esq., M.P., to The Secretary for Public Works.

On the 20th November, 1882, a young man named Stephen Butterly was killed between the buffers at the Railway Station, Blayney.

The deceased's mother (Catherine Butterly, widow) presented a petition to Parliament praying for consideration in her bereaved condition; she states that she is in indigent circumstances.

Has the Government given any relief to the said Catherine Butterly; if so, does the Government intend to grant her any further relief?

Will the Government have any objection to the appointment of a Committee to make further enquiry into the circumstances of the death of the said Stephen Butterly.

Let me know how this matter stands.—J.S., 31/3/87. The matter was brought forward in December, and the Commissioner then submitted that Mrs. Butterly had no claim, and that he considered it a matter for private benevolence. The then Minister concurred, and Mr. Williamson was so informed.—A.R., 7/4/87. Inform Mr. Stephen.—J.S., 14/4/87.

The Commissioner for Railways to W. Stephen, Esq., M.P.

Sir,

Department of Railways, Sydney, 15 April, 1887.

Referring to your memo., urging that further assistance might be given to Mrs. Butterly, whose son was fatally injured at Blayney, I have the honor to inform you that the matter has had further consideration, but Mr. Secretary Sutherland regrets he is unable to make any direction in this matter.

Mrs. Butterly was granted the allowance usually made in such cases, and to depart from the regular practice would establish an inconvenient precedent.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(ACTIONS AGAINST COMMISSIONER FOR LOSS BY FIRES.)

Ordered by the Legislative Assembly to be printed, 18 March, 1887.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 11th May, 1886, That there be laid upon the Table of this House a Return showing,—

- “(1.) The number of cases for loss by fires, occurring through negligence, which have been brought or threatened against the Commissioner for Railways during the past ten years.
 “(2.) The number of cases which have gone to trial in which the Commissioner has been successful.
 “(3.) The number of cases in which he has been unsuccessful.
 “(4.) The number of cases which have been settled.
 “(5.) The amount paid in damages, and the amount in costs.
 “(6.) The amount in costs which has been recovered by the Commissioner.
 “(7.) The amount paid for settled cases.
 “(8.) The number of cases in which settlements have been offered to the Commissioner and refused, and what were the offers, showing which cases the Commissioner has lost, after an offer of settlement has been refused.”

(Mr. Thompson.)

RETURN relative to claims and actions against the Commissioner for Railways for loss sustained by fire

Mary Jane Cunningham claimed £50 as compensation for destruction by fire of grass, fences, &c., alleged to have been caused by the negligence of the fencers when burning off the grass along the line. The Department repudiated liability. Subsequently an action was brought against the Department for the recovery of the amount named, when a verdict for £12 for plaintiff was recorded.

On behalf of trustees of Anglican Church, Singleton.

Claimed originally £1,000. The Department disclaimed liability. Subsequently a writ was issued, and the claim increased to £2,000. The action was tried at Maitland, and the Jury brought in a verdict for £1,000 damages against Department.

The original claims in connection with these cases were respectively £220 and £150. Subsequently writs were issued for £500 in each case, and Mr. Gould, M.P., who was acting for the claimants, intimated that he had been instructed to accept without prejudice the sums of £400 and £300 respectively. The offers were declined, and the claimants brought actions against the Commissioner for Railways to recover £500 in each case, with the results shown.

Carroll, John.....	Carroll, J.	62 3 0	167 13 4	Carroll, John ...	Mr. Carroll claimed the sum of £131 13s. as compensation in respect of damage done to his grass paddock at Uralla, by fire, alleged to have been caused by carelessness of fettlers when burning off grass within the railway fences. Enquiry was made, and it was reported that the amount of damage done was over-estimated, and that £30 would adequately compensate Mr. Carroll for his loss. This amount Mr. Carroll was offered without prejudice, but he refused to accept it; he, however, intimated that he would accept £100, but the offer was not entertained. Subsequently Mr. Carroll increased his claim to £300 and issued a writ to recover that amount. While the case was pending the Commissioner offered to pay £60, but the offer was not entertained. The action was tried at Armidale, and verdict for £62 3s. for plaintiff was entered.

Chambers, W. R.....	Claim not entertained
Aarons, Joseph.....	Aarons, J.	190 6 1*	441 16 4	Mr. Joseph Aarons claimed £500 as compensation for damage sustained in consequence of the destruction by fire of a quantity of lucerne, wheat, prairie and other grasses, alleged to have been caused by sparks emitted from a passing engine. The damage was estimated at £10 15s., but as every precaution, calculated to ensure immunity from fires, was adopted, it was decided to resist the claim. Mr. Aarons was so informed on 31/12/84, and on 12/1/85 a writ was issued against Commissioner to recover amount of damage sustained. The action was tried at Dubbo, on 16/10/85, and the jury brought in a verdict for plaintiff, damages £189
Bowman, A. and E	Bowman, A. and E.	539 19 8*	412 5 11	Messrs. A. and E. Bowman claimed compensation for destruction by fire of 800 acres of grass and a quantity of fencing. Claimants were informed that Department was not liable, as the best known appliances for arresting the emission of sparks were fitted to the engine in question. A writ was issued to recover £1,000 damages. The action was tried at Maitland, when the jury returned a verdict for plaintiffs, damages £530.
Bowman, William	Bowman, William	533 17 6*	208 4 1	Mr. William Bowman claimed £1,000 for damages sustained by the same fire as referred to in the preceding case. The action was tried at Maitland, and resulted in the jury returning a verdict for plaintiff, damages £524.
Mackay, D. F.	Mackay, D. F.	1,112 7 4*	722 14 5	Mr. Mackay claimed £8,000 as compensation for destruction by fires of about 8,500 acres of grass and a large quantity of fencing, alleged to have been caused by sparks emitted from passing engines. On the 8/3/84, and before the Department had time to enquire into and ascertain the particulars of the damage sustained by Mr. Mackay upon which to base a reply to the claim advanced, a writ was received claiming the amount stated. The action was tried at Maitland, and the jury brought in a verdict for plaintiff, damages £1,084 11s. 6d.
Quinn, Celia M.	Quinn, C. M.	Mrs. Quinn claimed compensation for a quantity of grass and fencing destroyed by fire, alleged to have been caused by sparks emitted from a passing engine. The Department declined to admit liability, and an action was then commenced to recover £300. The case was tried at Goulburn, in October, 1884, when the jury, in opposition to the opinion of the judge, brought in a verdict for £50 for plaintiff. A new trial was applied for and granted, the costs of the case to abide the result of the second trial, which took place at Goulburn, on 19/4/86, and resulted in a verdict for the Commissioner. The costs in this case have been taxed, but no amount has been recovered from Mrs. Quinn.
Mackinnon, C.	Mr. Mackinnon claimed £100 as compensation for destruction by fire of a large quantity of grass and fencing, alleged to have been caused by sparks emitted from an engine which failed to haul a load up a steep gradient. The Department disclaimed liability, and an action was commenced against the Commissioner to recover £200 for the damages in question. The case was tried at Wagga, on 9th October, 1884, and the jury brought in a verdict for plaintiff, damages £120. A rule nisi for a new trial was applied for and granted on 6/11/84, and on 10/8/85 the original verdict was set aside by the full Court. The costs to abide the event of the second trial, which is pending.

COMMISSIONER FOR RAILWAYS v. MURPHY.

No. 1.

Memo. from Station-master Collins to Assistant Guard Murphy.

Sydney Station, 17 February, 1887.

You are suspended from duty, and your explanation required why you left your train at Newtown this morning without coming to your destination. J. COLLINS.

Assistant Guard Murphy's reply to above:—

Sir,

I beg to state I plead guilty to the above. My wife being unwell, was anxious to get home, and am very sorry to think have incurred your displeasure, and it shall not happen again. Guard Pratt not to blame. I am, &c.,
E. MURPHY.

No. 2.

Memo. from Station-master Collins to Guard Pratt.

Sydney Station, 18 February, 1887.

You will report at once why you allowed Assistant Guard Murphy to leave his train at Newtown this morning, contrary to orders issued that no one leave their train until arriving at your destination. J. COLLINS.

Guard Pratt's reply:—

Sir,

The reason why I allowed Murphy to leave his train at Newtown this morning. He told me that his wife was very bad when he left home the night before, and as there was no one with her he asked me would I let him get off, and as I did not think Mr. Collins would object in a case like this I let him off. Yours, &c.,
ANTHONY PRATT.

No. 3.

Minute from Station-master Collins to The Traffic Manager.

TRAFFIC MANAGER to see. Certainly I should object; how was he to know what was to take place with his train; also, there are strict orders against leaving trains before going to destination. Please send to Superintendent Richardson. J. COLLINS, 19/2/87.

No. 4.

Report from Porter W. Stuart to Goods Superintendent Harper.

Sir,

According to your instructions I proceeded to Picton by the mail on the 16th instant, and saw the Station-master on following morning, with whom I arranged that I should start work in the shed, where I assisted to load and watch produce and poultry up to the hour of train, viz., No. 10 south, left for Sydney. There were very little lots in all, which consisted six coops of poultry, one pigs, and one magpies.

Everything went on well till we arrived at Burwood, where the train stopped for about 10 minutes. From 3 to 5 minutes before the train left Burwood Assistant Guard Murphy got into cattle waggon 40, in which I was planted, and broke open the coop containing three and a half pairs of magpies. I heard a magpie sing out. I got on to my knees and could see nothing in Murphy's hands. He then knocked the board back in its place with the heel of his boot. Like a flash it came to my mind it would not be well for me to collar this fellow, for if he overpowered me he would think nothing of strangling me and throw me out on to the line, and, knowing something of the man's principles, I watched and allowed him to depart, and the train started off and I saw Murphy get into brake-van. I then found that three magpies were missing from the case. To make sure I was not mistaken in Murphy I called at Redfern and asked the officer-in-charge who it was went out on the 6:40 p.m. train last night, and he told me Guard Pratt and Assistant Guard Murphy; then I was positive it was Murphy who stole the magpies. I am certain, too, that there is not another man in the service who I would have treated so easily as I did Guard Murphy, simply for the reasons I have already stated. I shall, with your leave, set about recovering the magpies missing. I have, &c.,
W. STUART.

P.S.—As Guard Murphy was returning by brake-van the magpies could be heard as he walked along, wherever he may have had them hid about his person.—W.S.

STATEMENT made by Guard Pratt.

ANTHONY PRATT was guard of No. 10 up south train this morning. Left Picton at 12:20 a.m., arrived at Burwood at about 3 a.m. Drew up to platform, and, with assistance of Assistant Guard Murphy and Porter Callaghan, put out ten cases of fruit from a cattle waggon, No. 55, I think, from Camden. Murphy travelled in van with me from Picton to Burwood. I left it first at Burwood and he followed me to the cattle waggon. After putting out the cases the train drew up to the advance signal and we, *i.e.*, Murphy and myself, got into the van as it drew past us. We were nearly opposite to ticket office window. Murphy did not leave me during the time we were at Burwood, and he did not get out of my sight. I have not seen Murphy since he left the train at Newtown this morning. I have been away from home since 11 a.m. this day, having been to the cricket match. My train stood about 10 minutes at the advance signal, and during that time Murphy did not leave the van. Anyone might have interfered with the train during this time without my seeing him. ANTHONY PRATT, 18/2/87.

No. 5.

No. 5.

Memo. from Station-master, Darling Harbour, to The Station-master, Picton.

Darling Harbour Station, 18 February, 1887.

RECEIVED from yours in cattle waggon 40, one case magpies, J. Clark to Inglis and Son; the ticket on the case shows three and a half pairs magpies; please note we only received two pairs of birds, three alive and one dead. Please advise at once.

H.R.,
(pro S.M.)

Station-master's (Picton) reply:—Birds were not counted by Department.—D. SHEPPARD, 21/2/87.

The Station-master, Darling Harbour, to The Goods Superintendent.

Goods Superintendent's information. This is in connection with Guard Murphy's case going into Court on 24th instant. CHAS. PAULL, 22/2/87.

No. 6.

Minute from The Goods Superintendent to The Traffic Manager.

I FORWARD the attached report for your information. As you are aware, complaints are being almost daily made to either the Commissioner or your office, of poultry and other goods being tampered with in transit.

This has really become a serious matter and the subject of gross reflection on the Department, and in order to detect the offenders, Stuart, a smart, active officer, who has been employed for the past twelve or eighteen months in this direction and has convicted several offenders, was detailed. On Thursday last he proceeded to Picton, from which district the complaints have been specially numerous. After watching the loading all day he was secreted in a cattle waggon by the station-master, and proceeded in it by No. 10 goods to Darling Harbour. He reports that on arrival of the train at Burwood, Assistant Guard Murphy entered the truck, examined the contents, and finally selecting a box containing magpies, removed a batten and abstracted three birds. He says he had no difficulty in recognizing Murphy by the light of the hand lamp he carried. He further reports that Murphy returned to his brake-van, but was not in it on arrival at Darling Harbour. Subsequent inquiry proves that Murphy left the train at Newtown.

When Stuart reported the matter to me at 9 a.m., and after consultation with you, the case was placed in the hands of the Detective Department, and an officer was despatched with a search warrant to Murphy's residence at Newtown, where Stuart identified him as the thief.

Although a thorough search was made of the premises no trace of the magpies could be found; the detective officer, however, says Murphy's manner exhibited strong symptoms of guilt.

It appears from Stuart's statement that Pratt saw him at Darling Harbour, and it is of course possible that he may have suspected his mission and warned Murphy before the search was made, as the detective informs me that Murphy passed a remark showing he knew of Stuart's presence at the Harbour when the train arrived.

Pratt, on being questioned by Superintendent Richardson and myself, emphatically denied that Murphy was out of his sight during the time the train stopped at Burwood.

The matter is now in the hands of Detective Clough, who is engaged in obtaining evidence to corroborate Stuart. JNO. HARPER, 19/2/87.

[Enclosure.]

Statement of Porter Wm. M. Stuart:—

New South Wales Railways, Goods Department, Sydney, 18 February, 1887.

WILLIAM MONTGOMERY STUART states:—I am employed by the Railway Department of the New South Wales Government on special duty; on the 16th of February, 1887, I proceeded to Picton on duty; on the 17th (Thursday), I assisted to load a cattle waggon, No. 40, with various goods invoiced to Darling Harbour, Sydney, amongst the consignments being one addressed, "From James Clark, Razor Back, Picton, to William Inglis, three and a half pairs of magpies;" the truck was loaded in the shed at Picton; it was about 5 p.m., when the truck was finished loading; I remained near it until 7:30 p.m., when I left for refreshments; I returned at 8 p.m., and got into the truck and secreted myself underneath the sheet; I took particular notice of all the consignments that were placed in this truck, and they all appeared in good order; I examined the contents of the truck, viz., one coop of pigs, six coops of poultry, and one case of magpies, and rearranging the things, I placed the coop of magpies on the top of one of the coops of fowls; the train left Picton at 12:20 a.m., the 18th inst., and arrived at Burwood Station at 3:15 a.m., and remained for about 5 minutes, the train then started and again pulled; having gone from 80 to 100 yards, and stopped about 5 minutes; during this time Murphy, the assistant guard wearing the uniform of the New South Wales Railway Department, and carrying a lamp in his hand, got into the truck over the door; I saw him force the case containing magpies open; I saw him take some out; afterwards he proceeded to secure the case by striking the battens down with his foot; he then left the truck by the same way as he entered it; as he was passing me I heard a bird cry as of a magpie, the sound coming from the direction Murphy was going; when the train arrived at Darling Harbour I drew the attention of the watchman, Charles Douglas, to the case of magpies; we examined it together and found that there were four magpies in it.

W. M. STUART,
Porter.

No. 7.

Minute from The Goods Superintendent to The Traffic Manager.

ACTING in accordance with your instructions, I arranged for a summons to be issued against Edward Murphy for stealing three magpies, the property of the Commissioner.

As you are aware, this step was taken in order that the various conflicting statements might be made and verified on oath before a Magistrate, and in view of the fact that certain allegations were made as to Stuart's character. The case and evidence was placed in the hands of Mr. Wallace, solicitor, who, with the detective who had it in hand, expressed a conviction that it was strong enough to secure a committal. It came on for hearing yesterday 24th inst., before Mr. Abbott, S.M.

The fact that seven magpies were in the case when delivered at Picton was proved, and Douglas, the watchman at Darling Harbour, deposed that directly the train reached that station, Stuart called his attention to the box, and on counting the contents only four birds were found. Stuart,

Stuart, when called upon, clearly and positively swore to the matters contained in his written statement, and cross-examination by defendant's solicitor (Mr. Thompson) failed to shake his evidence as to the occurrence. He was then examined as to his character whilst in the Police Force, and admitted that he had been charged with smoking whilst on duty, with taking a drink in a public-house whilst in uniform, and further that he had been charged, to use his own words, "with perjury by a number of prostitutes and larrikins, but the case was dismissed, and he was advised by the Bench to take proceedings against his accusers."

He was asked to explain the circumstances of his leaving the Police, and stated that he had been charged by two fellow-officers with receiving £22 as a bribe from a prostitute, and having reported to the Inspector-General that two of his superior officers were parties to a conspiracy against him in this matter, he was offered the opportunity of resigning, which he refused to avail himself of. He was then discharged. He was questioned as to whether, since he has been in the Railway Service, he had not falsely charged a carter named Pugsley with stealing a case of grapes which had never been received. This he positively denied, and I may say that prior to the information being laid I saw and questioned Mr. Paull on this subject, having indirectly heard that it would be made a feature in the case. Mr. Paull denied that such an incident had ever occurred, the whole matter being contained in the paper attached, from which it appears Stuart made a mis-count, and reported thirty-two cases as received instead of thirty-one cases.

For the purpose of proving that an animus existed on Stuart's part against Murphy, he was asked if he had not been called "a damned black mailer" by Murphy.

This he positively denied, swearing most emphatically that he had never spoken to Murphy, or Murphy to him.

The defence was then gone into, Mr. Thompson raising a preliminary objection that "magpies could not form the subject of a charge of larceny," and that there was consequently no case. After this point had been somewhat strongly insisted upon, it was overruled by the Bench and evidence given by Superintendent Richardson and Mr. Collins to the effect that Murphy's character, whilst under their supervision, was very good. The guard of the train, Pratt, was next examined, and swore positively that Murphy was with him in the brake-van during the time Stuart swore he was stealing the magpies. At this stage Mr. Abbott dismissed the case without assigning any reason for so doing. As a certain doubt may have existed as to the weight the technical objection may have had in his decision, I saw him subsequently, and pointed out to him that our object in sending the case for trial was to have the evidence weighed and considered impartially by a Magistrate accustomed to deal with such matters, and that we wished to know on what grounds had he dismissed the information. He was good enough to tell me that it was purely on the evidence, and that Pratt's testimony had decided him. When I pointed out the position the Department was in, as either Stuart was a perjurer, or Murphy a thief, he assured me that he would not say that the former had perjured himself, but that he did not think Murphy was the thief.

These are the facts of the trial, but as there are always certain points which the law of evidence will not permit of being brought under notice, and which do not appear in the foregoing, it will be as well to place them on record.

Pratt, whose evidence decided the case, was not subjected to cross-examination to prove the possibility of collusion, and I think you will remember that the misstatements made by him had much weight with you in deciding to go on with the case. Then, again, we were assured by the detective that although Murphy left the train at Newtown and could not have then known that Stuart was on it, yet when he reached Murphy's house Murphy knew that Stuart had been at Darling Harbour at 4 o'clock a.m. that morning. I do not mean to say that had these facts been known to the Magistrate, his decision would have been a different one, but it must be admitted that to us they had a certain amount of meaning.

JNO. HARPER.

26/2/87.

No. 8.

Statement of Porter W. M. Stuart to The Goods Superintendent.

Sir,

Re the case tried yesterday at the Central Police Office, I wish to state that although the case went against me, that there are three who know which side was in the right, viz., Murphy and myself and the Supreme Being of the world (our Maker), and sooner or later it will come home to the guilty.

I wish also to state, if it should be your desire to again employ me upon any such duty in the future, that I will have the power to arrest, and a second person with me to corroborate whatever may occur in the performance of such duty.

I am satisfied in my own mind that I performed my duty fearlessly and truthfully, and trust I shall ever retain the confidence of yourself and all my other officers under whom I serve. When leaving the Central yesterday I was hooted by fifteen or twenty Railway men. A sad sight indeed, and a hard lot for one to bear who has always strove to do his duty, as I have, fearlessly and impartially, and I am now a marked man amongst a portion of the Railway men.

I have, &c.,

W. M. STUART,
Porter.

No. 9.

Minute from The Assistant Traffic Manager to The Coaching Superintendent.

THIS is an extraordinary and I must say a very unsatisfactory case.

In consequence of repeated complaints of petty pilferages, Porter Stuart, of Darling Harbour, was selected to act as a detective on repeated occasions, but it was not until the morning of the 18th instant that he had occasion to make a report implicating anyone.

In consequence of numerous petty pilferages between Picton and Sydney, he was directed to go to Picton, see a truck loaded there, and accompany it to Sydney. He accordingly went there on the 16th instant, and on the following day assisted to load cattle waggon, No. 40, for Darling Harbour. In this truck

truck was a box containing seven magpies consigned from James Black to William Inglis. This box was put into the truck, according to Stuart, about 5 p.m., and he knows it contained seven magpies, for he counted them. He says he did not leave the vicinity of the truck until 7:30 p.m., when he went to tea. He returned at 8 p.m., got into the truck, arranged the articles in the truck, and placed the box of magpies on the top of a coop of fowls, and then secreted himself under a sheet that was in the truck, where his presence was entirely unknown to anyone on the train. The train left at 12:20 a.m., and nothing of any importance occurred until Burwood was reached.

There, Stuart says (and in that respect his statement is fully borne out), the train stopped at the platform for about 5 minutes, and then drew forward to the starting signal and stood for about 5 minutes there. It was while standing there that Stuart alleges he saw Murphy, the assistant guard, enter the truck with his hand-lamp in his hand (Murphy's action is fully explained in Stuart's written statement to Detective Clough), open the box containing the magpies, remove one or more of the birds, and then nail up the box, after which he left the truck as he entered it; and as he walked away, Stuart says he heard the cry of a bird resembling a magpie from the direction in which he was walking.

Stuart alleges that the moment the train arrived at Darling Harbour he drew the attention of Watchman Charles Douglas to the case, which then only contained four magpies.

The question then arose, what had become of the three missing birds? It was difficult to conceive what Murphy could do with them, and yet they had gone. If he had gone to Darling Harbour with the train it would have been seen at once whether he had them or not, but he jumped off the train at Newtown and went home; so that Burwood was the last stopping-place of the train.

Stuart made such a clear and positive statement (which was not shaken in the slightest degree, although he was closely questioned) that it was deemed advisable to put the matter in the hands of the detectives.

Detective Clough, who inquired into it, was convinced of the accuracy of Stuart's statement; and on the forenoon of the day the magpies disappeared he visited Murphy's house, but failed to discover anything.

In addition to Stuart's statement, it was ascertained that seven magpies had been put into the box by the sender and Stuart. Watchman Douglas, of Darling Harbour, and the consignee were able to swear that it only contained four when it arrived at that station.

It was therefore thought advisable to take out a summons against Murphy, and let the case come before a Magistrate, who would take the statements of the men on oath, as Murphy had stoutly denied having gone near the truck.

The case accordingly came before Mr. Abbott, at the Central Police Court, on the 24th instant, and Mr. Wallace, the solicitor, and Detective Clough seemed to think there was sufficient evidence to secure a committal.

Mr. Thompson, M.P., and Mr. Hillyer defended Murphy, and it seems the former raised and persisted in the technical objection that, as magpies are wild animals within the meaning of the Act of Parliament, they could not form the subject of a charge of larceny. It is but fair to Murphy to say that he informed me that Mr. Thompson attended the Court on behalf of the Railway Association, and that he (Murphy) was entirely unaware that such an objection was going to be raised. It would certainly have left a better impression on my mind if it had not been raised. If Murphy was innocent it would have been better if all such technical objections had been avoided.

However, after Mr. Richardson had been examined, and had given Murphy a good character, and after Pratt, the guard, had sworn that Murphy never left the van after the train drew forward to the starting signal at Burwood, Mr. Abbott dismissed the case without calling upon Mr. Wallace to cross-examine Pratt, or even giving him an opportunity of doing so. Possibly Pratt's cross-examination would not have elicited much, perhaps nothing at all, to Murphy's discredit; still, it could have been shown that in a written statement he made he had not adhered to the truth, for he said that he had allowed Murphy to leave the train at Newtown that morning because his wife was ill, whereas she (an invalid, as I am told) was not worse than usual, and it had been of frequent, if not of daily, occurrence for Murphy to get off at Newtown, notwithstanding repeated written instructions to the contrary.

Pratt, doubtless, made the statement in question to screen himself and Murphy, but the statement, nevertheless, amounts to an untruth, and the impression is made, that if he could knowingly tell an untruth about one thing, he may have consciously or unconsciously told an untruth in stating that Murphy never left his sight after the train left the platform at Burwood. If Murphy did take the birds, and if by any chance he has taken articles on previous occasions, it is hardly likely that he did so entirely on his own account.

Altogether, as I have said, the case is not a satisfactory one. Still, as the Magistrate dismissed the case, principally on Pratt's evidence, and has since expressed himself to the effect that he believed the birds to have been stolen, but that he considered Stuart was wrong in identifying Murphy as the delinquent, I am not prepared to press the case further against Murphy, and, having now been reinstated, his pay during suspension should not be withheld.

D.K., 28/2/87.

No. 10.

Minute from Station-master Collins to The Coaching Superintendent.

Sydney Station, 26 February, 1887.

In reference to Assistant Guard Murphy—as it seems by the evidence he was accused innocent—is he not to be paid for time lost. Reply what is to be done.

J. COLLINS.

To the Traffic Manager,—Although Murphy has been honorably acquitted by the Court in the robbery case, he is guilty of breach of my orders in leaving his train at Newtown, and I recommend he be punished for it.—H. RICHARDSON, 28/2/87.

No. 11.

No. 11.

Minute from The Assistant Traffic Manager.

I THINK a caution both to Murphy and Pratt will meet the case. Having been acquitted by the Magistrate of the graver charge, and reinstated, I would not like to inflict a heavier punishment for the lighter offence. It would look like a determination that Murphy should be punished somehow.

D.K., 7/3/87.

No. 12.

Mr. G. Wallace, Solicitor, to The Commissioner for Railways.

Sir,

Sydney, 129, King-street, 12 March, 1887.

Herewith I send a memo. of fees in the case of Murphy. I cannot understand how the Magistrate dismissed it in the summary manner he did, as it appeared to me that there was a strong *prima-facie* case made out, and he should have committed for trial; but we have no remedy unless you thought the matter of sufficient importance to lay before the Hon. the Attorney-General.

Yours obediently,
GEORGE WALLACE.

Legislative Assembly—Friday, 6th August.

5. *Railway Employé named Stuart*:—Mr. Burke asked the Secretary for Public Works,—

1. Is there a person in the employ of the Railway Department at Darling Harbour by the name of Stuart?
2. Was he an officer of Police in this Colony?
3. Was he discharged from the Police Force, and for what offence?

Answers.

1. Yes; he first joined the Department in August, 1884, as night watchman at West Maitland, but subsequently made an exchange with a porter at Darling Harbour.

2. Yes.

3. The Inspector-General of Police has reported as follows:—"The above-named man was discharged from the Police Force on the 24th June, 1884. His conduct was not satisfactory, but he was a determined, active constable, who had on more than one occasion behaved very well in the discharge of his duty, and strong recommendations were made to me to procure him other employment."

No. 13.

Minute by The Commissioner to Mr. Higgs.

History of Porter Stuart.

W. M. STUART, 30 years of age, is recommended by Mr. Burdekin, M.P., for a position on the Northern extension.

Mr. Higgs has several vacancies, and has submitted names of applicants of long standing to fill them. Stuart, however, is recommended as a peculiarly good man, and Mr. Higgs should make room for him. Stuart's address is 61, Burton-street; Mr. Higgs should send for him when required.

CH.A.G., 12/8/84.

Please send this man for employment. I do not know whether he is in Sydney or elsewhere.—
JOHN HIGGS, 13/8/84. Acting-Secretary.

No. 14.

The Acting-Secretary for Railways to Mr. W. M. Stuart.

Sir,

Department of Railways, 19 August, 1884.

Referring to the application made by Mr. Burdekin, M.P., for employment for you, I have to request that you will be good enough to at once proceed to Newcastle and report yourself to the Traffic Manager there.

I have, &c.,

GEORGE BERNER,
Acting-Secretary of Railways.

No. 15.

Memo. by Mr. Higgs.

STUART starts as night watchman at West Maitland, *vice* Drake, promoted, this day. Pay, 42s. per week.

JOHN HIGGS,

Commissioner.

22/8/84.

No. 16.

S. Burdekin, Esq., M.P., to The Commissioner for Railways.

My dear Sir,

Macquarie-street, Sydney, 13 November, 1884.

I understand that a man named James Stapleton has been suspended from his position as porter at the goods-shed at Elgin-street, West Maitland, for drunkenness.

Mr. Ferris has, I believe, a very high opinion of a man named W. M. Stuart, whom you kindly appointed some little time ago on my personal recommendation.

Stuart

Stuart has been employed as night watchman since his appointment, and has, I understand, earned golden opinions. He is an excellent shunter and has learned the telegraphing to make himself more useful.

Could you give him Stapleton's position if it became vacant? I understand that the Station-master is anxious to have him, and that you have no more promising Railway servant.

Yours faithfully,
S. BURDEKIN.

For report.—CH. A. G., 13/11/84. Mr. Higgs.

Stuart will, I think, make a very good man; at present he has had no experience of shunting, and but little of telegraphing. Should Stapleton be dismissed (and I trust he will be) I will arrange for Stuart to take Stapleton's place.—J. HIGGS, 15/11/84. Commissioner.

No. 17.

Memo. by Mr. Higgs.

At his request Stuart has been exchanged with William Ponsfrett from South and West lines, and leaves West Maitland to-night for Sydney.

JOHN HIGGS, 26/2/85.

Secretary.

Traffic Manager.—D.C.M'L., 2/3/85. Stuart commenced duty at Darling Harbour on 2/3/85, at 7/- a day.—W. V. READ, 10/3/85. Commissioner. Inform Mr. Burdekin.—CH. A. G., 11/3/85.

No. 18.

The Commissioner for Railways to S. Burdekin, Esq., M.P.

Sir,

Department of Railways, 12 March, 1885.
Adverting to your letter of 13th November last, recommending W. M. Stuart, an *employé* under this Department, for promotion, I have the honor to inform you that the matter has received attention, and I have approved of Stuart being transferred from Maitland station to Darling Harbour. His pay will be 7s. per day.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.

No. 19.

Minute by The Commissioner for Railways.

WHAT work is Stuart supposed to do at Darling Harbour? I hear that he does little or nothing, but seems to be the associate of Mr. Paull. Traffic Manager will please inquire into this at once. I hope no idlers or gossipers only are employed.
CH. A. G., 9/8/86.

I HAVE made inquiries into this matter, and am satisfied that there are no grounds whatever for the assertions that seem to have been made respecting Stuart, who is an ordinary goods porter, a hard-working fellow, and a man who does not, like many others, content himself with doing no more than he is required to do, but takes a general interest in everything relating to the Department. Mr. Paull tells me that he (Stuart) has completely rid Darling Harbour of the larrikins that used to infest it.

I have been shown a number of written testimonials obtained by Stuart when his connection with the Police Force was severed, and they all speak of him in high terms. The attached letter, extracted from the *Evening News* of the 19th instant, has just been handed to me.

Stuart's duties are those of an ordinary goods porter ordinarily, but being a man of greater intelligence than the majority of goods porters, he is not unfrequently selected to perform duties for which other men would not be well fitted.

Traffic Manager.

D.K., 24/8/86.

[Enclosure.]

EXTRACT from letter in *Evening News* of 19th August, 1886.

CONSTABLE STUART, who struck dismay into the hearts of the larrikin element, and did more to stamp out ruffianism than any man now in the Force, and who openly stated that he would, single-handed, purge Sydney of the crowds of lads, youths, and hobbledoys who had been encouraged to prey upon the citizens, I say when this man was doing his duty bravely, and people who had long suffered, began to enjoy a peaceful regime, certain of the authorities became alarmed at finding their occupation slipping away from them, and Constable Stuart was removed from the force and placed on the Railway, but not as a constable. Since then the larrikins have had the free run of Sydney, and then comes the cry of "more Magistrates wanted."
IN MEDIAS RES.

Minute to The Commissioner by The Traffic Manager.

I AM sure that the Commissioner has been misinformed concerning Stuart. From inquiries I have made I am convinced he is a very good man. Mr. Paull assures me that he performs his duties in a most satisfactory manner, as also does Mr. Kirkcaldie, who has seen him while he has been at Darling Harbour investigating the wool cases.
W.V.R., 29/9/86.

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAY BRIDGE OVER THE HAWKESBURY RIVER.
(TENDERS, REPORTS, PLANS, &c)

Ordered by the Legislative Assembly to be printed, 27 April, 1887.

RETURN to an *Address* of the Honorable the Legislative Assembly of New South Wales, dated 15th April, 1886, That there be laid upon the Table of this House,—

“Copies of all minutes, letters, reports, tenders, contracts, plans, and
“documents, relating to the Railway Bridge over the Hawkesbury River.”

(*Mr. Abbott.*)

SCHEDULE.

NO	PAGE
1. Letter from Mr Augustus Morris to Secretary for Public Works <i>re</i> a promise made by Mr Lackey when Minister, that the Company he represented would, with the rest of the world, be afforded an opportunity of tendering for construction and erection of proposed Railway Bridge over the Hawkesbury, &c, and minute by Minister thereon 30 May, 1883	3
2. Letter from Mr J S Robertson to Secretary for Public Works <i>re</i> Ironwork for Hawkesbury Bridge, with reply and minutes 23 June, 1883	4
3. Letter from Mr Thomas Wearne to Minister <i>re</i> report current that the manufacture of superstructure for Railway Workshops at Eveleigh, and Bridges over Parramatta and Hawkesbury Rivers was to be confined to England, and argument in opposition thereto, with reply 12 November, 1883	4
4. Minute to Minister by Engineer in Chief, forwarding Specification and Plans for Hawkesbury Bridge, and minutes thereon 16 May, 1884	4
5. Further letter from Mr Augustus Morris <i>re</i> his Company being permitted to tender on their own designs for Hawkesbury Bridge, &c 18 July, 1884	5
6. <i>Precis</i> 23 July, 1884	6
7. Minute by Minister for consideration of Cabinet <i>re</i> proposal to erect bridge over the Hawkesbury, &c, with approval of Cabinet and minutes 10 September, 1884	7
8. Letter from Colonial Secretary to Agent General, transmitting copies of conditions and plans for proposed Hawkesbury Bridge, and requesting him to call or cause tenders to be invited for performance of the work. 24 December, 1884	8
9. Letter from Agent General to Colonial Secretary, acknowledging receipt of letter of 24th December, 1884	9
10. Telegram from Agent General to Secretary for Public Works <i>re</i> hesitation of manufacturers in preparing designs under uncertainty of their tender being accepted, &c, with minutes thereon	9
11. Telegram from Agent General to Secretary for Public Works <i>re</i> action of engineers Evans and Hawkshaw, with minutes 14 May, 1885	9
12. Letter to Under Secretary for Public Works, by Messrs Eldred & Co, in explanation of Mr Evans' refusal to act on Board appointed to examine and report upon designs submitted for Hawkesbury Bridge 19 May, 1885	9
13. Letter from Mr W H Eldred to Minister <i>re</i> previous communications, with Minister's reply. 2 June, 1885	10
14. Telegrams from Agent General to Colonial Secretary <i>re</i> number of designs and tenders received, &c, and minutes thereon	10
15. Letter from Agent General to Colonial Secretary, enclosing summary of tenders for Hawkesbury Bridge, received and opened by him 5 June, 1885	10
16. Telegrams from Agent General to Colonial Secretary stating tenders and designs handed to Bridge Committee, also if report of Board should be submitted to Mr Fowler for separate report, &c, with minutes and Minister's reply	11
17. Letter from Messrs Eldred & Co to Minister <i>re</i> their action in inducing the Phoenix Bridge Co to reduce their original tender by 2½ per cent, with minutes 29 June, 1885	12

54—A

[1,105 copies—Approximate Cost of Printing (labour and material), £48 5- 51]

RAILWAY BRIDGE OVER THE HAWKESBURY RIVER.

No. 1.

Augustus Morris, Esq., to The Secretary for Public Works.

Sir,

24, Bridge-street, Sydney, 30 May, 1883.

Permit me, on behalf of the Edgemoor Iron Company of the U.S.A., whose agent I am, to draw your attention to the promise made by Mr. Lackey, when Secretary for Public Works, that with the rest of the world it should be afforded an opportunity of tendering for the construction and erection of the proposed railway bridge over the River Hawkesbury, and that its own designs for the superstructure would be accepted.

In 1878, Mr. Sutherland, who was at that time Minister for Public Works, gave the Edgemoor Iron Company permission to tender on its own designs for the superstructure of two iron bridges, to be erected respectively over the Shoalhaven and Bundarra Rivers, but although the company was the lowest tenderer in both cases, it only received the contract for the Shoalhaven Bridge. It was, however, expressly stated that if the work was fully approved of the American contractors should have an opportunity of tendering on their own designs for all future great bridges. The Shoalhaven Bridge was completed to the entire satisfaction of the Commissioner for Roads and Bridges, and the Government Engineer appointed to inspect and take over the work reported that it had been submitted to a load six times greater than would in practice pass over it, and that the deflection was a minimum.

Mr. Lackey opened the bridge, and was so much pleased with the beauty and strength of the structure that he publicly stated the Edgemoor Iron Company should have an equal chance with other contractors of tendering for any other bridge. Mr. Lackey further promised me, as representing the company, that it should be allowed to tender for the railway bridge to be erected over the Hawkesbury, and on its own designs.

At one time Mr. Whitton, the Engineer-in-Chief for Railways, was favourable to calling for tenders in England, Belgium, and America, but latterly he receded from that position unless the tenders were in accordance with a design of the bridge to be prepared beforehand. Such a provision will wholly shut out American builders, and doubtless all those of other countries except England. I brought the matter, in a personal interview, before Mr. Lackey, when he admitted his promise and stated that he believed his policy to be the right one, but he left office without further action. I afterwards drew the attention of the late Minister, Mr. Copeland, to the promise made by his predecessor, and he agreed that the subject deserved every consideration, and he has since told me that had he remained in office he would have directed that designs and tenders should be called for in England, Belgium, and the United States.

By carrying out this policy it is certain that the bridge over the Hawkesbury will be constructed for £100,000 to £150,000 less than if tenders are called for on official designs.

The best bridges in America are connected by pins instead of by rivets. Some engineers have objected to connections by pins, fearing that they may slip; but of late years pins have been made so that they cannot move, and so strong that every part of a bridge must go to destruction without their breaking. The best standard books on bridge engineering admit that while the riveting as done in the shops cannot be improved, that done in the field is very often most defective, and that on that account immovable pins are superior. Of course all designs, as well as the tenders, must be submitted to the approval of engineers in the confidence of the Government. The designs should be beautiful, and the strength of the structure should be in accordance with the requirements of the Board of Trade.

May I be allowed to suggest that tenders might be called for the bridge as a whole, or in these parts as follows:—

1. The superstructure and erection thereof.
2. The cylinders for the piers.
3. The sinking and erection of the cylinders.

It has been determined to erect the bridge on iron piers, and it is probable that the local foundries can tender low enough for the cylinders, and it is certain that local contractors can erect the piers cheaper than any out of the Colony.

I am by no means sanguine, on account of the shortness of the spans, that my friends can, if permitted to tender, obtain the contract for the bridge, but I am certain that their competition will save the Colony not less than £100,000.

On this last ground, and because the promise made by Mr. Lackey ought not to be disregarded, I trust that my request may be acceded to.

I have, &c,

AUGUSTUS MORRIS,

Agent for the Edgemoor Iron Co.

I regret that Mr. Lackey should have made the promise Mr. Morris says he did, because I think the promise was a mistake. While I am anxious to give American firms an opportunity of tendering for this and for any other large work of this kind, I cannot approve of their tendering upon their own designs. The Colony possesses an Engineer-in-Chief for Railways, of admitted ability, who has a large staff of engineers and draftsmen under him, and in my opinion all bridges should be designed in his office. Tenders for the Hawkesbury Bridge should, I think, be called for in the Colony, England, and America. As follows:—
1. The cylinders; 2. The sinking and filling of the cylinders; 3. The superstructure and erection thereof.—
F.A.W., 2/7/83.

Forward for information of Mr. Whitton, and send copy of Mr. Wright's minute to Mr. Morris.—
J.R., 3/7/83. A. Morris, Esq.—4/7/83. Railways.—J.R., B.C., 4/7/83. To be returned.

No. 2.

No. 2.

J. S. Robertson, Esq., to The Secretary for Public Works.

Dear Sir,

Sydney, 23 June, 1883.

The writer desires to see you regarding the ironwork for the Hawkesbury Bridge, and would be much obliged if you could give him a few minutes conversation on the subject. Kindly say what time would be most convenient.

Yours, &c.,

J. S. ROBERTSON.

Reply any time to-morrow from 11 to 1 a.m.—F.A.W., 25/6/83. Inform at once.—J.R., 25/6/83.
J. S. Robertson, Esquire.—25/6/83.

LIST of iron bridges (with cast-iron cylinders) to be constructed on the railway from Homebush to Waratah, for which the ironwork has not yet been ordered:—

1	Hawkesbury River Bridge.

W.H.Q., for E.-in-C.

WILL Engineer-in-Chief for Railways inform me when plans for bridges on line Homebush to Waratah will be completed, so that tenders may be invited for the works.

F.A.W., 23/8/83.

Mr. Whitton.—J.R., B.C., 24/8/83. J. W. Drewett.—W.H.Q., 23/8/83.

The drawings for the cylinders for the 66-foot plate girder bridges on contracts Nos. 3 and 4 can be ready for calling tenders on the 16th September next, and the detail drawings for the plate girders and remainder of superstructure can be ready for tendering by the 16th October next.—J.W.D., 24/8/83.
Engineer-in-Chief.

E.-in-C., 25/8/83. Advertisement inviting tenders cast-iron cylinders (1,568 tons) herewith.—
W.H.Q., 6/9/83. For the Engineer-in-Chief. Under Secty.—B.C.

No. 3.

Thomas Wearne, Esq., to The Secretary for Public Works.

Sir,

220, Pitt-street, Sydney, 12 November, 1883.

I have the honor to inform you that, it is reported, the plans for the iron-work in roofs and cranes for the Eveleigh workshops and the bridges over the Parramatta and Hawkesbury Rivers, for the Northern Railway extension, are being sent to England for the whole of the works to be carried out there, this appearing to be in direct opposition to your expressed wish to encourage the industries of the Colony as far as possible, I, as one of the many manufacturers and contractors, take the liberty of bringing this matter under your notice. As you are aware there are a number of firms in this Colony who have proved beyond doubt that they are quite capable of carrying out and completing these works equal to anything that can be imported, and as you have kindly caused tenders to be invited here for the cylinders and rails, I am led to hope that you will extend the favour and give us an opportunity of tendering for the above, in the event of which I am confident you will find there are quite enough in the trade to create a healthy competition, and that we have the ability, skilled labour, and appliances to enable us to compete successfully with foreign producers. Trusting you will kindly give these matters your favourable consideration, and pardon the liberty taken.

I have, &c.,

THOMAS WEARNE.

Inform Mr. Wearne that tenders for superstruction of iron bridges for Northern Railway are now being invited.—F.A.W., 14/11/83. Thomas Wearne, Esq.—16/11/83. Railways.—J.R., B.C., 16/11/83

No. 4.

The Engineer-in-Chief to The Secretary for Public Works.

Southern and Northern Junction Railway (Homebush to Waratah).—Hawkesbury River Bridge.

Department of Public Works, Railway Branch, Engineer-in-Chief's Office,

Sydney, 16 May, 1884.

I FORWARD for the consideration of the Minister the detail plans, sections, and specification for the bridge over the Hawkesbury River from Long Island to Mullet Point.

As there will be about 6,400 tons of cast-iron and nearly 6,000 tons of steel in this bridge, I advise that tenders be invited as early as possible in England for the work complete, as stated in the specification, including all cast-ironwork in cylinders, &c., sinking of cylinders, filling with concrete, the whole of the steel superstructure, and all the work described in the specification.

I am satisfied that no portion of the ironwork could be manufactured in the Colonies in a reasonable time, and any attempt to divide the work into separate contracts would not only cause great delay, but would largely increase the cost of the bridge.

The total estimated cost of the iron and steel work in England will be about £142,500.

JOHN WHITTON.

Submitted.—J.R., 17/5/84. Cabinet.—G.R.D., 26/6/84. Returned to-day by the Hon. the Col. Treasurer, with whom it has been since.—17/5/84. J.R., 14/4/85.

Great Northern Railway.—Extension from Homebush.

Department of Public Works, Sydney, 10 July, 1884.

I SHOULD like to be informed :—

1. Whether tenders have been called for the bridge across the Hawkesbury.
2. If punt or bridge has been decided upon.
- 3a. If the rest of the connections, viz., between Homebush and the Hawkesbury, and between Waratah and the Hawkesbury will be completed, at a date prior to the cross water connection being completed.
- b. Generally, what steps have been taken with regard to this bridge, and what has been decided.

G.R.D., 10/7/84.

Mr. Whitton.—J.R., B.C. Urgent, 11/7/84. 1. Tenders have not yet been invited. 2. The Engineer-in-Chief has recommended the building of a bridge. 3a. In the absence of the Engineer-in-Chief I cannot answer this question. b. The plans and specification for the bridge were forwarded for the consideration of the Minister on the 16th May last, and no instructions have yet been received by the Engineer-in-Chief.—W.H.Q., 11th July, 1884. Mr. Whitton will be in the office on Monday next—J.R. Mr. Whitton for report—J.R., B.C., 31/7/84.

1. Tenders have not been invited for the above bridge.
2. Bridge was decided upon and the Minister (Mr. Wright), gave instructions to have the drawings prepared.
3. I believe the whole of the works, Homebush to Waratah, will be completed before the bridge can be erected, and tenders should therefore be immediately invited.

No steps, so far as I know, have been taken, beyond preparing the drawings and specification for this work, and which were forwarded to the Minister on the 16th May last, with a suggestion from me that tenders should be immediately invited in England.

If it be considered advisable to invite tenders in the Colony, the drawings should first be sent to England, and when ascertained on what conditions the English manufacturers would tender, similar conditions could be sent out here, and tenders invited here and at home at the same time, and to be sent in on the same date.

J.W., 2nd August, 1884.

Seen.—F.A.W., 10/8/84.

No. 5.

Augustus Morris, Esq., to The Under Secretary for Public Works.

Sir,

24, Bridge-street, Sydney, 18 July, 1884.

I have the honor to request that you will be good enough again to lay before the Minister for Public Works my application on behalf of the Edgemoor Iron Company, of Delaware, in the United States, to be permitted to tender on their own designs for the railway bridge proposed to be erected over the River Hawkesbury. When the Edgemoor Iron Company tendered on their own designs for the superstructures of the bridge over the Shoalhaven and Bundarra Rivers, they only obtained the contract for the former, although their price for the latter was much the lowest. It was thought by the Department of Roads and Bridges as the American system of pin connections was a novelty in this Colony, that it would be in the public interest to make one trial first. The Minister, the Honorable John Sutherland, who took a great interest in the experiment, promised that if the Nowra Bridge turned out the success he hoped it would be, the Edgemoor Iron Company should have opportunities of tendering upon their own designs for all future important iron bridges. Subsequently when the Honorable John Lackey, when he opened the Nowra Bridge, not only publicly expressed his great satisfaction with its construction, but said that American contractors should be welcome competitors for the Government requirements for the future. Mr. Lackey also assured the writer that his friends should have the opportunity of tendering for the construction and erection of the Hawkesbury Bridge. The Commissioner for Roads and Bridges has expressed his unqualified satisfaction with the bridge at Nowra over the Shoalhaven, and his opinion has been endorsed by every engineer who has visited the structure. Excellent as that bridge is there have been since its erection some most important improvements made by which every other part must be destroyed before the pins can be moved, or in any way effected. So convinced are the most eminent engineers of Europe, of the superiority of pin connections for long spans that the Government of Austria, in calling for competitive designs and tenders for the great bridge, with its spans of 450 feet, to be erected over the Danube, required that the American system should be adhered to. I have already placed in your possession diagrams of the three best designs for that bridge with all particulars. I also gave you a diagram of the long span bridge designed by an American engineer for the Canadian railroad, and manufactured in England.

I may also remark that the Cantalever Bridge, lately thrown across the Niagra Rapids is a pin construction, as will be the bridge over the River Forth with its two spans of 1,700 feet each.

The

The consulting engineer of the Edgemoor Iron Company is the celebrated C. Shaler Smith, who, during the last year designed and erected no less than 131 iron bridges in Canada and the United States, besides carrying out other great aquatic works.

I have I trust stated sufficient to induce the Minister to give a favourable consideration to my request. I desire to be furnished with a diagram of the proposed site of the Hawkesbury Bridge, and so much of its specifications as will enable an independent engineer to produce a design in accordance with the requirements of the railway. If the Minister will grant this, in fulfilment of the promises made by his predecessors, I engage the necessary designs transmitted to him from Mr. Shaler Smith without an hour of unnecessary delay, and the design shall be so complete in its details that exact conclusions can be arrived at in the Colony as to its strength and suitability for the purpose intended. My friends will, on approval of the design or in company with it, furnish a tender. They will, as may be desired, tender for the whole structure including the cylinders and the piers, or they will give a separate price for the manufacture and erection of the superstructure. It will be understood that Mr. Shaler Smith will not be bound by any specified length of spans, but shall be at liberty so to vary the lengths that the lowest price may be offered. The requirements of the Board of Trade as to the strength of the structure, or such as you may prescribe, will be complied with, and full allowance will be made for wind pressure. The spans shall be tested with four or five times the weight which can in use be placed upon them, and these shall not be more than the required deflection with trains so loaded, running at the rate of 45 miles an hour. There is no law or regulation in the United States which limits the minimum of safety of the spans of a bridge, but it is one of the articles of the Edgemoor Iron Company that no railway bridge shall be turned out of their shop unless equal in strength to the requirements of the English Board of Trade, and consequently they never compete for cheap work.

It is well known that the superstructure of a pin bridge can be put up in one-fourth the time required to erect a riveted one, and that the work done in the field is as good as that done in the shop. If the Minister accedes to my proposition he may be sure that many thousands of pounds will be saved to the country.

The Edgemoor Iron Company may not obtain the contract, but their competitors must cut down their prices lower than they would. By such competition, too, the time contemplated for the erection of the bridge can be reduced four or six months.

I may point out that the question I have raised is one of policy, not engineering, and no one is so competent to decide it as the Minister himself.

I have, &c.,

AUGUSTUS MORRIS,

Agent for the Edgemoor Iron Company.

No. 6.

Précis.

Railway Bridge over the Hawkesbury.

On the 6th June, 1883, a deputation of Members of the Protection and Political Reform League and others waited on the Colonial Secretary and the Minister for Public Works to urge the desirableness of calling for tenders in the Colony for some portions of the ironwork required for the railway bridge over the Hawkesbury, and Mr. Wright stated that he would call for tenders both in England and the Colonies, and if the latter were 10 per cent. the dearer he would give them the preference, but if colonial tenders were, say, 25 per cent. in excess he would have to act with the advice of his colleagues.

Per letter of 30th May, 1883, Mr. Augustus Morris, Agent of the Edgemoor Iron Company of Delaware, U.S.A., addressed the Minister of Public Works, stating that Mr. Lackey, when Minister, had promised that his company should have an opportunity of tendering for the Hawkesbury Bridge, and that the company's own designs for the superstructure would be accepted; that Mr. Sutherland, when Minister, gave the company an opportunity of tendering for the Shoalhaven and Bundarra Bridges, and although their tender was the lowest in both cases they received the contract for the Shoalhaven Bridge only, but with the express understanding that if this work were fully approved, the company would be allowed to tender, on their own designs, for all future large bridges; that the bridge gave complete satisfaction, and that Mr. Lackey, who opened it, was so pleased with the strength and beauty of the structure that he gave Mr. Morris the promise before referred to; that he (Mr. Morris) brought the matter, at a personal interview before Mr. Lackey, who admitted his promise and justified his policy, but left office without taking action; that he drew the attention of Mr. Copeland, when Minister, to the promise made by his predecessor; that Mr. Copeland said the matter deserved every consideration, and had since told him that had he remained in office he would have called for designs and tenders in England, Belgium, and America. Mr. Morris goes on to say that if this policy be carried out the Hawkesbury Bridge will cost from £100,000 to £150,000 less than if the tenders were to official designs. He then enters into technical details as to the relative merits of rivets and pins as fastenings for the parts of a bridge, pronouncing in favour of "immovable pins." Mr. Morris suggested that tenders for the bridge should be invited either as a whole or in parts as follows:—

1. Superstructure and erection thereof;
2. Cylinders for the piers;
3. Sinking and erection of cylinders.

Thought local firms could tender low enough for the cylinders, and that local contractors could erect the piers cheaper than any out of the Colony. Tenders and designs should be approved by Government engineers, and the strength of the structure should be in accordance with Board of Trade requirements. Wound up by re-affirming that the competition of the Edgemoor Company would save the Colony at least £100,000. Mr. Secretary Wright minuted that he regretted that Mr. Lackey had made such a promise, that it was a mistake, that he (Minister) was anxious that American firms should have an opportunity of tendering for large works, but could not approve of their doing so to their own designs; that the Colony had an Engineer-in-Chief of admitted ability, with a staff of engineers and draftsmen, and in his office all bridges should be designed. Tenders should be called in Colony, England, and America, for—1. Cylinders; 2. Sinking and filling cylinders; 3. Superstructure and erection.

Under date of the 18th instant Mr. Morris addressed the Commissioner on the same subject, repeating a good deal of the matter contained in his former letter, and stating further that in the designs for the great bridge over the Danube the Austrian Government has insisted upon the adoption of the American system ; that the cantalever bridge over the Niagara rapids and the Forth Bridge, with its spans of 1,700 feet, are both on that principle ; that the consulting engineer of his company, C. Shaler Smith, designed and erected last year no less than 131 bridges in Canada and the United States. Hoped he had stated enough to induce Minister to give favourable consideration to his request in fulfilment of promises made by his predecessors. Desired to be furnished with a diagram of proposed site of bridge, with so much of the specification as would enable an engineer to prepare a plan in accordance with requirements. If this were done Mr. Shaler Smith would forward designs without an hour's delay, and so complete in details that exact conclusions might be arrived at as to strength and durability. The company would tender for the bridge as a whole, or for superstructure and erection only ; but would not be bound by the number of spans provided if contract limited to superstructure ; and stated that it was one of the articles of the Edgemoor Company that no railway bridge should leave their shops, in point of strength equal to the requirements of the Board of Trade, and that a pin bridge could be put up in one-fourth of the time taken to erect a riveted one, and that in that system the work done in the field was as good as that done in the shops, and if his proposals were acceded to Ministers might rest assured many thousands of pounds would be saved to the country, for although his company might not get the contract their competition would compel other tenderers to cut their prices down.

C.A.B., 23/7/84.

No. 7.

Minute by Secretary for Public Works.

Bridge across the Hawkesbury River in connection with the Railway Extension, Homebush to Waratah. I FIND before me a minute from Mr. Whitton, Engineer-in-Chief for Railways, submitting a set of plans for the proposed bridge across the Hawkesbury River, which it is estimated will cost £150,000. In view of this large outlay, and as interest, viz., £30,000 per annum at 4 per cent. upon 3,000 feet of this railway, it is a question for the Cabinet to decide whether the bridge should be constructed as proposed, or whether, as is the practice in some instances in America, a floating steam punt should be provided in lieu thereof. Another important question to be considered is whether tenders should be at once called for the structure upon the plan submitted by Mr. Whitton, or whether it would be advisable to call for tenders throughout the world for a bridge to be designed by the various tenderers. I doubt if the plan hitherto followed in designing and calling for tenders for our railway bridges is the wisest one that could be adopted. I understand that bridge manufacturers all over the world have their own plans and designs for bridges, and machinery for making their specialty. I am unable to say whether the bridge proposed by Mr. Whitton is the cheapest and best form of structure, doubtless it is strong enough for the services required, but there can be little competition on the part of manufacturers if we decide upon the one form, without allowing manufacturers the option of preparing their own plans and sections, subject of course to the standards of strength laid down by the Board of Trade in England.

Taking into consideration the fact that borings for some of the piers of the proposed bridge have reached a depth of 250 feet before a suitable bottom has been found, I think we should endeavour to procure a design of a bridge providing for fewer piers than the plan submitted by Mr. Whitton. There is no difficulty, I imagine, in obtaining a bridge with much wider spans, and this would considerably decrease the cost of construction, as the great depth to which the piers have to be taken must necessarily add very largely to the expenditure.

While asking the Cabinet to decide whether communication across the Hawkesbury shall be by bridge or punt, I would recommend if it be decided to adopt the former, that tenders be invited throughout the world upon plans to be prepared by each tenderer ; tenders to include the cost of putting down piers and the final completion of the work ; the bridge to be subject to the Board of Trade tests ; and the plans and tenders when received in London to be submitted to a Board of three skilful engineers for their report. After obtaining which, the whole of the plans and specifications might be forwarded for the opinion of Mr. Fowler, the consulting Engineer in England, who should be asked to attach his recommendation for the guidance of the Government. I do not think it advisable, in view of Mr. Fowler acting as agent for the Government in the selection and passing of materials, that he should be called upon to form one of the proposed Board. The report of the Board, and the recommendation of the consulting Engineer, to be forwarded to the Colony, to guide the Government in the selection and approval of the most appropriate design of bridge.

F. A. WRIGHT,

10/9/84.

Minute

Minute of Premier.

Approved with reservation of right to reconsider the whole subject of the bridge, or the substitution of a steam punt or floating bridge in the event of the bridge estimates proving too expensive.—A.S., 15/9/84. The Engineer-in-Chief will please make the necessary arrangements to carry out the views of this minute.—F.A.W., 16/9/84. Mr. Whitton.—J.R., B.C., 24/9/84.

I may be permitted to remark that my estimate for this bridge is £600,000 and not £750,000, as stated in this memo.—J.W., 2/12/84. Under Secretary.—B.C.

Proposed Bridge over the River Hawkesbury.

Department of Public Works, Railway Branch, Engineer-in-Chief's Office,
Sydney, 27 November, 1884.

I FORWARD, for the information of the Minister, the conditions upon which tenders and designs are to be invited for the bridge over the River Hawkesbury, on the Southern and Northern Junction Railway, and also explanatory plans and sections, showing the crossing of the river, and borings for depth of foundations.

I suggest, for the consideration of the Minister, that one pound (£1) be charged to each applicant for plans and conditions, so as to prevent persons asking for the information who never intend to make use of it for the purpose for which it has been prepared.

JOHN WHITTON.

In submitting to my honorable colleagues the plans and general conditions for the Railway Bridge over the Hawkesbury, so that tenders for the work may be invited throughout the world, I beg to recommend that fifty copies of attached plans and general conditions be sent to the Agent-General, and that he be instructed to invite tenders for the work in terms of the general conditions and of my minute accompanying these papers. That such tenders be submitted to a Board of Engineers, to consist of the following gentlemen:—Sir John Hawkshaw, C.E.; Colonel Galton, R.E.; and W. W. Evans, Consulting Engineer, New York. Should Mr. Evans decline to act, Mr. T. Harrison, C.E. (North Eastern Railway), to be asked to form one of the Board.

After the members of the Board have considered the tenders, &c., they shall make report upon the same, and recommend the acceptance of one tender. Such report and recommendation to be addressed to the Minister for Public Works in this Colony under cover of the Agent-General.

The tenders then to be submitted to Mr. Fowler for a separate report, which shall also be forwarded with the Board's recommendations, tenders, and all designs to the Minister for Public Works, N.S.W. I would further recommend that in the event of any or all of the gentlemen I have named refusing to act on the Board, that the Agent-General be instructed to submit by cablegram, for the approval of the Government, the name or names of gentlemen of eminence in the profession, who would be willing to act.

F.A.W., 12/12/84.

Cabinet approved.—W.B.D.

Hawkesbury Bridge, *re* Plans and Sections.

Department of Public Works, Sydney, 1st December, 1884. Information with reference to the Hawkesbury Bridge. Is this ready, or when will it be so?—J.R.

Mr. Whitton.—The plans and sections were all printed last week, but were found to be wrong, and had to be relithographed, but I expect the correct ones will be ready by to-morrow. I have had nothing but trouble with this matter, and shall be very glad to be rid of it.—J.W., 1/12/84.

How are the copies to be disposed of when completed?—J.R., 2/12/84.

Minute of Minister.

Mr. Whitton knows how to act and what to do in this matter.—F.A.W., 2/12/84. One pound per set is to be charged for them.—F.A.W. Mr. Whitton.—B.C., 3/12/84.

I forwarded fifty copies of these plans, sections, and conditions to the Minister a few days ago, for the purpose of being sent to the Agent-General in London. If these should not be considered sufficient I have another fifty copies ready. I think it might be advisable to send 100 copies to the Agent-General.—J.W., 4/12/84.

No. 8.

The Colonial Secretary to The Agent-General, London.

Sir,

Colonial Secretary's Office, Sydney, 24 December, 1884.

I have the honor, at the instance of the Secretary for Public Works, to transmit herewith fifty copies of the plans and general conditions for the proposed railway bridge over the River Hawkesbury, and to request that you will be good enough to cause tenders to be invited throughout the world, for the performance of the work, in terms of the general conditions, and that you will cause the tenders received to be submitted to a Board of Engineers consisting of the following gentlemen, viz.:—Sir John Hawkshaw, C.E., Colonel Galton, C.E., and W. H. Evans, Consulting Engineer, New York. Should Mr. Evans decline to act, Mr. T. Harrison, C.E., North-Eastern Railway, to be asked to be a member of the Board.

After

After the members of the Board have considered the tenders received, they are to make a report upon the same, and recommend the acceptance of the one tender; the report and recommendation to be addressed to the Secretary for Public Works, under cover to yourself. The tenders are then to be submitted to Mr. Fowler for a separate report, which is also to be forwarded with the Board's recommendation, tenders, and designs to the Minister for Public Works.

I beg to add that in the event of any or all of the gentlemen named refusing to act on the Board, you will be good enough to submit by cablegram, for the approval of the Government, the name or names of gentlemen of eminence in the profession who will be willing to act.

I have, &c.,
ALEX. STUART,
Colonial Secretary.

The Agent-General, London, to The Colonial Secretary.

F 1,244—Hawkesbury Bridge.

Sir, 5, Westminster Chambers, Westminster, S.W., 6 February, 1885.

I have the honor to acknowledge the receipt of your letter of the 24th December last, on the subject of the proposed bridge over the River Hawkesbury, and to state that the matter has been put in hand and will receive my immediate attention.

I have, &c.,
SAUL SAMUEL

No. 10.

Telegram from The Agent-General, London, to The Secretary for Public Works.

Received 13 March, 1885.

MANUFACTURERS hesitate about preparing designs Hawkesbury Bridge, because uncertainty acceptance any tender. I suggest that substantial premium given three best designs; also, that Government accept alternative tenders for materials only, and make contract for foundations and erecting in Colony, otherwise competition very little.

SAMUEL.

The Under Secretary for Public Works.—B.C., 13/3/85. C. W., Railways.—J.R., B.C., 17/3/85.

Minute by Commissioner.

The only instance I know of in which premium for designs were offered was in the case of the proposed new Houses of Parliament. The premiums were for the first design, prize £1,000, and for the second, £500. The Government will not, probably, dispense with the condition that each design should be accompanied by a tender for the erection of bridges.—CH.A.G., 13/3/85.

Minute of Secretary for Public Works.

No alteration will be made in this matter, our object being to get designs and tenders together.—F.A.W., 24/3/85. Send cablegram.

“Conditions for tendering designs, Hawkesbury Bridge, will be adhered to; no premiums.”—CH.A.G., 25/3/85. Cablegram sent to Public Works for transmission to Agent-General.—28/3/85.

No. 11.

Telegram from The Agent-General, London, to The Secretary for Public Works.

London, 14 May, 1885.

HAWKESBURY Bridge.—Evans and Hawkshaw decline to act. I suggest W. A. Barlow and T. E. Harrison, both past President's Institution.

SAMUEL.

The Under Secretary for Public Works.—C.W., B.C., 15/5/85. Inform Capt. Eldred, by Minister's instructions, that a cablegram received from Agent-General, it appears that Mr. Evans declines to act on Board with reference to Hawkesbury Bridge.—J.R., 16/5/85. Capt. Eldred informed.—18/5/85.

No. 12.

Messrs. Eldred & Co. to The Under Secretary for Public Works.

Sir, Sydney, 19 May, 1885.

I am requested by my partner, Capt. Eldred, to thank you for your courtesy in informing him in your official letter of yesterday's date of the refusal of Mr. W. W. Evans, of New York, to act on the proposed Board with reference to the competition in designs for the railway bridge over the Hawkesbury.

I beg to request that you will inform the Honorable the Minister for Works, that both Capt. Eldred and myself feel assured that our friend Mr. Evans will have been the first to appreciate the high honor it was proposed to confer on him. but, if we may judge from our latest advices from him, we are equally assured his refusal is based on the fact that, in conjunction with the Phenix Bridge Company, who intend to tender, he has interested himself in the designs, &c., to be furnished by them, and would, in consequence to a certain extent, have to sit in judgment on his own work; otherwise, we have no doubt he would too gladly

gladly have given the Agent-General and this Colony the benefit of his long and valuable experience in bridge building or other matters relating to his profession.

I have, &c.,
ALEX. GRAY,
(Eldred & Co.)

Minute by Commissioner :—I presume Minister's approval is to the appointment of A. Barlow, Esq., and T. E. Harrison, Esq., in the place of Messrs. Evans and Hawkshaw, as recommended by the Agent-General ; if so, cablegram will be sent, as time is now short.—C.A.G., 23/5/85.

Minute of Secretary for Works :—Approved.—F.A.W., 27/5/85. Cablegram to Agent-General.—3/6/85.

No. 13.

W. H. Eldred, Esq., to The Secretary for Public Works.

Sir,

Sydney, 2 June, 1885.

Referring to the various communications which have passed between my firm and your Department with regard to the tender for the bridge over the Hawkesbury, for which I am led to understand our friends the Phoenix Bridge Company have prepared designs, plans, and estimates, I make free to express a hope that, as Mr. W. W. Evans, C.E., of New York, has declined to act on the Committee for, apparently, the reason contained in my partner's letter to the Under Secretary of 19th ultimo, you may have felt it advisable to instruct the Agent-General to enlist the services of some other competent American bridge engineer in lieu of Mr. Evans ; so that the Colony may not be without the experience of a class of bridge builders who, however much their principles may differ from those of English engineers, have achieved a large degree of success in many parts of the world.

Trusting I may be pardoned the liberty I am taking.

I am, &c.,
W. H. ELDRED.

Inform that the Board has been appointed.—F.A.W., 4/6/85. W. H. Eldred, Esq.—Informed 5/6/85.

Sir,

5, Westminster Chambers, Westminster, S.W., 5 June, 1885.

In continuation of correspondence on the subject of tenders for the Hawkesbury Bridge, I have now the honor to report that tenders were received here, and opened by me on the 1st instant, and I now enclose, for your information, a summary of them.

My

My telegrams of the 2nd and 4th instant, of which I hereto attach copies, will have acquainted you of the number of tenders received.

I am now waiting your reply to the inquiry in my telegram of the 4th instant, before handing the tenders and designs to the Committee of Engineers for examination and report.

I have, &c.,
SAUL SAMUEL.

HAWKESBURY RIVER.

ABSTRACT of tenders opened by Sir Saul Samuel, Tuesday, 2nd June, 1885 :—

- Munro (Melbourne)—£702,384. Complete according to requirements in three years.
 Fives-Lille (Paris)—£685,000. Complete according to requirements in three years.
 R. Parkinson (London)—£584,898. Complete according to requirements in three years.
 Arrol Brothers (Glasgow)—£586,395 (design No. 1). £439,847 (design No. 2). Complete in four years.
 Tender also for steel superstructure—£18 10s. per ton, F.O.B., Glasgow; £12 10s. per ton, W.I. Cylinders, F.O.B., Glasgow.
 John Dixon (London)—£486,100. Complete according to requirements in two years from commencement of operations.
 Oscar Reichenbach, G. B. Godfrey, and G. A. Innes (London)—(Hawkes, Cranshay make it)—£466,032. Complete according to plans. Time not mentioned.
 Handyside & Co. (Derby)—£456,000, £435,000 (two designs). Complete according to requirements in three years.
 Royce & Co. (Sydney) with Butterley Co., Alfreton, near Derby—£403,367. The whole complete in three years. £158,211. Materials at Sydney.
 Fford & Young (London)—£317,500. Cylinders not carried down. £377,500. Cylinders full depth.
 Westwood, Baillie, & Co., make it (London)—£71,907. Steel superstructure. £30,107. W.I. cylinders, F.O.B. only. In three years.
 Union Bridge Co. (U.S.A.)—£327,000; plan, No. 1. £277,000; plan, No. 2. £306,000; plan, No. 2. No. 1, complete in thirty months. No. 2, shallower depth of piers. No. 2, full depth of No. 1 complete in thirty-six months.
 Edgemoor Iron Co. (U.S.A.) sellers—£105,500, No. 1, superstructure only erected. £265,650, No. 2, whole completed. £296,350, No. 3, whole completed. £119,938, No. 4, superstructure only erected. Superstructure completed in three months. The whole complete in two years.
 Phoenix Bridge Co. (U.S.A.)—£250,800, Phoenix construction, thirteen spans. £256,400, plate and angle construction, thirteen spans. £252,950, Phoenix, eleven spans. £258,940, plate and angle, eleven spans. Each of the above increased £30,000, by telegram. Tender is for wrought-iron superstructure. All materials ready for shipment in four months. Erection, five months from arrival of iron at site.
 Dominion Bridge Co. (Canada)—£85,482*a*. £91,586*b*. £98,857*c*. Tender for superstructure, F.O.B., in Liverpool.
 McLellan (Glasgow)—£92,535. Tender for superstructure only. No cylinders, F.O.B., Glasgow.
 T. R. Bell—Schedule and tender incomplete, quantities not priced, and no total given.

Tender received, 3rd June, from Melbourne.

- Messrs. Millar (Melbourne)—£441,230. No. 1 design, by G. H. Edwards. £344,740. No. 2 design, by Frazer & Chase. Complete in three years from date of contract.

No. 18.

The Agent-General, London, to The Colonial Secretary.

Sir,

5, Westminster Chambers, Westminster, S.W., 7 August, 1885.

I have the honor to forward herein for your information the Report of the Committee of Engineers appointed to examine the tenders received for the Hawkesbury Bridge, together with the covering letter accompanying the same from the Committee.

I do not clearly understand from the instructions already conveyed to me in regard to these tenders, whether I am to show this document to Mr. John Fowler, the Inspecting Engineer, or not; and further, whether he is to make a distinct and separate report upon the tenders received. My telegram of the 27th ultimo will have apprised you of this, and I am now waiting a reply thereto, but I send you the Report of the Committee at once.

You will notice from the letter (25/7/85) of the Committee addressed to me that their fees for examining and reporting upon the tenders are 200 guineas each, and the out-of-pocket expenses incurred amount to £50 8s.

I have to-day telegraphed to you, asking whether I should cable to you the recommendation of the Committee of Engineers.

I have, &c.,

SAUL SAMUEL.

P.S.—Since closing the foregoing letter, I have received your coded telegram of this date; I interpret as follows:—"Fowler to send Report without seeing Report of Board; not necessary to telegraph recommendation." I will, therefore, act accordingly.—S.S.

Messrs. Barlow, Berkley, and Galton to The Agent-General, London.

Sir,

2, Old Palace Yard, Westminster, S.W., 25 July, 1885.

In accordance with the instructions which you conveyed to us on behalf of the Government of New South Wales, to consider and report upon the tenders received for the construction and erection of a Bridge over the River Hawkesbury, on the Southern and Northern Junction Railway in New South Wales, we have the honor to forward to you herewith our Report addressed to the Honorable the Secretary for Works.

The necessary calculations, and other expenses out of pocket incurred by us, amount to £50 8s., and we have the honor to inform you that our own fees in the matter are 200 guineas (£210) each.

We have, &c.,

W. H. BARLOW.
GEORGE BERKLEY.
DOUGLAS GALTON.

Hawkesbury

Hawkesbury River Bridge, New South Wales.

Sir,

In compliance with instructions received from the Agent-General for New South Wales we, the undersigned, have considered the tenders for the construction and erection of this bridge, and we have thoroughly examined the designs accompanying the tenders with a view to recommend the acceptance of one tender, and we have the honor to report as follows :—

Twenty-two tenders have been received, consisting of :—

Two designs and tenders from the Phoenix Bridge Company, 40, Walnut-street, Philadelphia, Pa., U.S.A.

Two designs and tenders from the Edgemoor Iron Company, C. Shaler Smith, Consulting Engineer, Wilmington, Delaware, U.S.A.

One design and tender from the Union Bridge Company, 18, Broadway, New York, U.S.A.

Two designs and tenders from Messrs. James Fforde, M.I.C.E., and Edward William Young, M.I.C.E., 8, Victoria Chambers, Westminster, London, S.W.

One design and tender from the Butterley Iron Company, near Alfreton, Derbyshire, and Messrs. Royce & Company, Sydney, Australia, and of 62, Holborn Viaduct, London, E.C.

Two designs and tenders from Messrs. Andrew Handyside & Company, Derby, and 32, Walbrook, London, E.C.

Two designs and tenders from Messrs. Arrol Brothers, Germiston Iron Works, Glasgow.

One design by Oscar Reichenbach, 6, Victoria-street, Westminster, London, S.W., and tender from Messrs. Geo. B. Godfrey & Company, 6, Queen Anne's Gate, Westminster, London, S.W., and George A. Jones, M.I.C.E., Hatherley Court, near Gloucester.

One design and tender from Mr. John Dixon, 1, Laurence Pountney Hill, London, E.C.

One design and tender from Mr. Richard M. Parkinson, Eastern and Midland Railways, Melton Constable, East Dereham.

Two designs and three tenders from the Compagnie de Fives-Lille, 64, Rue Caumartin, Paris, France, Agent, Mr. Sauvée, 22, Parliament-street, Westminster, London, E.C.

One design and tender from David Munroe & Company, 154, Queen-street, Melbourne.

One design from P. and W. M'Lellan, Clutha Iron Works, Glasgow.

Three designs from the Dominion Bridge Company, Montreal, Canada ; Agents—Reynolds, Carter, and Reynolds, 3, Clements-lane, Lombard-street, London, E.C.

These twenty-two designs and twenty-three tenders are shown and described on a statement appended to this report, which statement gives in relation to each design and tender :—

- 1st. An illustration of the general character of the design.
- 2nd. A description of the piers.
- 3rd. Description of the superstructure.
- 4th. The amount of the tender.
- 5th. The time named in the tender for completion.
- 6th. Remarks.

Among these twenty-two designs six do not comply with important conditions.

The Phoenix Bridge Company in its two designs has tendered for a construction made entirely of iron instead of steel.

Messrs. M'Lellan, in the one design which they submit, and the Dominion Bridge Company in its three designs, have tendered only for the delivery of materials for the superstructure of the bridge and not as required by the conditions for its completion.

A divergence from the condition respecting the headway under the bridge is made in the design of Mr. Reichenbach, inasmuch as the specified headway is reduced for a length of 70 feet on each side of the centre line of the piers ; and in the design of the Compagnie de Fives-Lille the rails are laid 2 feet 3 inches above the specified level.

Although these two latter examples of non-compliance with the specified conditions are named, we do not regard them as of sufficient importance to condemn the design, were either of them the most advantageous.

The Edgemoor Company's design No. 2, and Messrs. Fforde and Young's design No. 1, show the piers carried down below the bed of the river by groups of timber piles of about 70 feet long ; this mode of construction is not in our opinion satisfactory, and these two designs are therefore excluded from further consideration.

The designs of the Compagnie de Fives-Lille, and No. 1 design of Messrs. Arrol Brothers, represent exceedingly fine works, and are presented for our consideration in a manner which reflects credit upon these two firms, but unfortunately the structures represented by these designs are necessarily very costly. We regret that their large cost prevents us from recommending either of them for acceptance.

For the reasons above mentioned we have thus set aside eight of the designs.

In the case of all the other designs which have been submitted, we have calculated the strains, and otherwise so examined the details as to enable us to form an opinion respecting the strength, stability, durability, and facility of execution of each of the designs.

We do not propose to trouble you by stating in this report the whole of these elaborate calculations, as it appears to us sufficient, and a compliance with the instructions given to us if we give the effect of these calculations for such of the designs as comply with the conditions, and which it appears probable will secure a thoroughly substantial and suitable structure at a reasonable amount of cost.

With this view, we have directed particular attention to the design No. 1 of the Edgemoor Company, which it will be seen by the appended statement is the lowest tender for any design which has not been excluded from consideration for reasons hereinbefore stated.

This design consists of masonry abutments, and generally complies with the printed conditions. The piers below a point 10 feet above the level of high water to the bottom of the foundations, consist of steel cylinders $\frac{1}{2}$ an inch thick, 20 feet diameter at the bottom, and 15 feet diameter at the top, completely filled with concrete to a height of 10 feet above the bottom, and beyond this height by a ring of concrete 5 feet

thick

thick. At the top of this ring we judge, from the drawings submitted (which in this respect are not very clear), that there will be a thickness of masonry on which a steel trestle will stand and carry the ends of the spans of the superstructure.

The diameter—20 feet at the bottom—is only applicable to the deepest of the piers, and will be reduced in proportion as the piers are shorter.

The superstructure consists of two spans of 134 feet, from the centre of the end pier to the faces of the stone abutments, and nine spans of 292 feet from centre to centre of piers.

The flooring is proposed to be of timber.

The estimated cost of the piers is £190,850, and of the superstructure £105,500, giving a total of £296,350 for the whole of the proposed work completed, including twelve months' maintenance.

The short time of two years is named for the execution and completion of this work. We are of opinion that too much reliance should not be placed on the statement of so short a time as two years, as circumstances almost always arise which cause such an estimate of the time required to be extended.

The proportion between the breadth and the unstayed length of the vertical struts is, in our opinion, too great to bear the strain that will come upon them. The breadth of these struts should, we think, be increased 50 per cent.

We are also of opinion that before this design could be accepted it would be desirable to connect at the top, by deep girders, the steel casing of the two columns which form one pier, which girders should again be connected together by diagonal bracing, or be made of a form which would produce great lateral stiffness; and we also think that the cylinders should be very much strengthened both by thickening some of the plates and by T and L bars rivetted to the plates at the joints, both vertically and horizontally; and that the concrete should be solid for the whole depth and surrounded by 18 inches of good brickwork or cut masonry in cement, well bonded into the concrete immediately within the outer plate of the cylinders, and that the base of the steel trestle resting upon these columns requires horizontal diagonal bracing, which is not shown on the designs accompanying the tender.

The cost of these additions would probably amount to £37,000, which, added to £296,350, will make this tender £333,350, or £115 per foot run of viaduct.

The next lowest tender is that of the Union Bridge Company. The design accompanying the tender complies generally with the conditions stated by the Engineer.

The piers consist, between the level of low water and the foundations, of caissons made of steel plates each 48 feet long by 20 feet wide, with semi-circular ends, which caissons have an outer skin $\frac{3}{8}$ inch thick and have three cylinders 8 feet in diameter, one placed in the centre of the length of the caisson, and the other two in the centre of the semi-circles forming the ends, to which cylinders consisting of $\frac{1}{4}$ inch plate) the outer skin is connected by diagonal bracing.

The bottom lengths of the cylinders (10 feet long) are made of a form which brings the outer skin and the skin of the shaft into communication at the bottom of the caisson, where it forms a cutting edge. In this length these two skins, which are increased in thickness to $\frac{5}{8}$ inch and $\frac{3}{8}$ inch respectively, are strongly braced together.

It is proposed to fill this caisson with "beton made of broken stone, sand, and best Portland cement of such proportions and mixture as will sustain 30 tons per square foot, measured on cubes of 12 inches."

An alternative was suggested, which, were this design adopted, appears to us worthy of consideration, viz., "that the outer skin of the caisson for a length at upper end sufficient to go below the bed of the river may be made of grey cast-iron plates $1\frac{1}{2}$ in. thick, with interior flanges 4 inches wide, and united by $\frac{3}{4}$ inch round bolts 9 inches apart.

The proposed superstructure consists of seven spans of 415 feet. The floor consists of timber. The amount of the tender for the piers is £159,000, and for the superstructure £168,000, making a total of £327,000.

The time named for completing the work is two and a half years.

We consider that the horizontal stiffener extending from the inclined strut at the end of the girder should be extended so as to stiffen two more of the vertical struts at each end, which appear to us to require support.

In the third bay from the end of each span the strain upon the boom or bottom member somewhat exceeds the tensile strain named in the conditions; the area of this part should be therefore increased.

We also consider that the outer skin of the caisson, where it is flat and unsupported for a length of 14 feet between the centres of the cylinders, sunk within it, would require staying to the cylinders, and to an inner plate extending from the centre lines of the cylinders at a distance of about 6 feet from the outer skin.

The thickness of some of the plates forming the caisson should be increased and stiffened by vertical and horizontal T and L bars at the joints.

The beton should be surrounded by an 18-inch ring of good brickwork or cut masonry in cement, well bonded with the beton, immediately within the outer steel skin.

The cost of these additions to the work, as shown in the design submitted, would probably be £30,000, which, added to the amount of this tender, £327,000, will make it £357,000 or £124 per foot run of viaduct.

The design No. 2 of Messrs. Fford and Young complies generally with the conditions.

The piers consist of two cylinders, 10 feet 6 in. diameter, from 4 feet above high water to the bottom of foundations, diminished to 6 feet diameter under the bed-plates. These cylinders are made of wrought-iron plates 9-16ths in. thick, filled with concrete.

The superstructure consists of two end spans, 116 feet 6 in. between the face of abutment and centre of pier, four spans of 221 feet, and five spans of 357 feet, from centre to centre of piers.

The total amount of the tender is £377,500, and the time for completion three years.

The design of the Butterley Company, and Messrs. Royce and Company complies generally with the conditions.

The piers consist of two circular columns, 16 feet in diameter, made of wrought-iron plates $\frac{1}{2}$ inch thick, and filled with concrete.

The superstructure consists of two spans of 167 feet 8 inches, one span of 175 feet 8 inches, and ten spans of 238 feet 6 inches.

The

The amount of the tender is £403,367, and the time named for completion three and a half to four years.

The design No. 1, of Messrs. Handyside and Company, complies generally with the conditions of the Engineer.

The piers consist of two cylinders, 15 feet diameter, from the foundation up to about the bed of the river; this part is made with two skins of iron plates $\frac{3}{8}$ inch thick, connected together by vertical plates. From this level to 4 feet above high water the diameter is reduced to 12 feet, and a single skin of $\frac{3}{8}$ inch thick is used. The whole of the cylinders are filled with concrete. Between the top of the cylinders and the underside of the girders there are steel octagonal pillars 10 feet across at the bottom, and 8 feet at the top.

The superstructure consists of two spans of 138 feet, and ten spans of 262 feet. A buckled plate floor is provided.

The tender for this design is £456,000, and an alternative tender of £435,000, is also submitted for a design with a superstructure of a somewhat different form.

The time named for completion is three years.

An extra payment is required for the removal of boulders or other obstructions to the sinking of the cylinders.

In our opinion the strength and stability of the piers in these three designs are not equal to the strength and stability of the piers proposed in design No. 1 of the Edgemoor Iron Company, or that of the Union Bridge Company. The tenders for these two bridges are from 25 to 50 per cent. less in cost, and after the additions have been made to the designs which we have referred to when reporting on the Edgemoor Iron Company's and the Union Bridge Company's plans, the cost would still be considerably less.

The design No. 2 of Messrs. Arrol Brothers complies generally with the conditions of the Engineer.

The abutments are of masonry. The two end piers are elliptical in form, 55 feet long by 25 feet wide, made of wrought-iron plates, except at the bottom, where steel plates of increased thickness are used. These caissons are filled with concrete.

There are six other piers, consisting of four cylindrical columns 18 feet diameter at the bottom and 13 feet at the top, placed in a rectangular form 40 feet by 28 feet, between centres up to 5 feet above high water, with a steel trestle resting thereon to support the superstructure.

The bottom length of each of the cylinders is made of steel; from the top of these steel lengths to about 8 feet below the bed of the river wrought-iron plates are used in the form of a double cylinder, with diagonal stays between the two cylinders, and from the top of this wrought-iron work to the underside of the trestles cast-iron cylinders are used.

The cylinders from the top to the bottom are filled with concrete.

The superstructure consists of two spans of 153 feet 6 inches, two of 369 feet 6 inches, and five spans of 370 feet.

The amount of the tenders for the piers is £249,462 10s., and for the superstructure £190,385; giving a total tender of £439,847 10s.

Extra payment is claimed if serious obstructions are met with in the execution of the work.

Messrs. Arrol's design No. 2 would be satisfactory, but the cost would amount to £152 per foot run of the viaduct, whilst the design No. 1 of the Edgemoor Company, including the additions which we have suggested as being necessary to its stability and strength, would not cost more than £115 per foot run; and the design of the Union Bridge Company, with the additions necessary to render it satisfactory, would cost about £124 per foot run.

We consider that the foundations proposed by the Union Bridge Company will be superior to those proposed by the Edgemoor Company, provided the caissons be strengthened, and provided the beton with which they are to be filled be surrounded with a ring of brickwork or cut masonry in cement as hereinbefore described; and that, with such additions, the superiority of the foundations of the Union Bridge Company over those in the design No. 1 of the Edgemoor Company, would justify the payment of the higher price for the work.

We consider that £124 per foot run should (unless some extraordinary difficulties present themselves to which our attention has not been directed) be sufficient for the construction, including a year's maintenance, of this viaduct, we therefore feel it to be our duty to recommend that arrangements should be made to strengthen the design of the United Bridge Company, in the manner hereinbefore stated, to the satisfaction of the Engineers, who will have charge of the construction of the work, and that if this can be done without increasing the amount of the tender beyond about £124 per foot run, the contract should be let to that company.

We have not thought it our duty to continue a detailed description of designs which are more costly than No. 2 design of Arrol Brothers.

Although the designs submitted to us have generally been prepared with care, none of them afford the same amount of detailed information as would be given by the working drawings which will have to be made and submitted to the Engineer prior to the execution of the work.

The final settlement of the exact form of joints, the bearing surface, the shearing and transverse strength of pins, the thickness and best form of the plates at the bottom of the caissons, and such like matters of detail must be left for the decision of the engineer in charge of the work.

We have, &c.,

No. 19.

The Agent-General, London, to The Colonial Secretary.

Sir, 5, Westminster Chambers, Westminster, S.W., London, 4 September, 1885.

Referring to my communication of last month, in which I forwarded to you the Report of the Committee of Engineers appointed to examine the tenders received for the Hawkesbury Bridge, I have now the honor to forward herein a duplicate of that document.

I hope by the next mail to transmit to you the separate report of Sir John Fowler.

I have, &c.,
SAUL SAMUEL.

No. 20.

The Agent-General, London, to The Colonial Secretary.

Hawkesbury Bridge.

Sir, 5, Westminster Chambers, 11 September, 1885.

In continuation of former correspondence on the subject of the tenders for the Hawkesbury Bridge, I have now the honor to forward for your information three copies of the separate Report of Sir John Fowler upon the tenders received.

By the next mail I shall transmit to you the whole of the tenders and drawings in connection with this matter.

I have, &c.,
SAUL SAMUEL.

Get all papers together, as ordered by the Minister. Railways.—B.C., 26/10/85. All papers herewith. See letter of Aldred and Co.—J.R. Repeated inquiries have been made for the plans. No action can be taken till they are received. The Principal Under Secretary is making further inquiry.—C.A.G., 19/11/85. The plans are on board of the "Iberia." She will be in on Monday.—C.A.G., 21/11/85.

Minute of Secretary for Public Works.

For Mr. Whitton's Report upon the whole question.—W.J.L., 21/11/85. Mr. Whitton.—J.R., B.C., 23/11/85.

No. 21.

Sir John Fowler to The Secretary for Public Works.

PROPOSED RAILWAY BRIDGE OVER THE RIVER HAWKESBURY.—REPORT OF SIR JOHN FOWLER.

Sir,

In accordance with instructions, I have carefully examined the designs, calculations, and tenders for the proposed railway bridge over the River Hawkesbury, and have the honor to report as follows:—

Tenders for the construction and erection of the bridge were submitted by twelve firms, at the amounts tabulated below.—

	£
Edgemoor Iron Company, No. 1	265,650
Do do No. 2	296,350
Union Bridge Company, No. 1	277,000
Do do No. 2	306,000
Do do No. 3	327,000
Phoenix Bridge Company, No. 1	280,800
Do do No. 2	282,950
Do do No. 3	286,400
Do do No. 4	288,940
Fforde & Young, No. 1	317,500
Do do No. 2	377,500
Royce & Co. ...	403,367
Handyside & Co., No. 1	435,000
Do do No. 2	456,000
Arrol & Co., No. 1	439,847
Do No. 2	580,000
Reichenbach & Godfrey	466,032
John Dickson	486,100
R. Parkinson	584,898
Fives-Lille, Nos. 1 and 2	685,000
Do Amended tender	515,000
D. Munroe	702,384

The above list is remarkable for the absence of many well known English firms of bridge builders as tenderers for the complete work, and also for the great difference in amount between the lowest and highest tenders.

It is probable that the great depth of the foundations of the piers, the absence of exact information as to local prices, and the impossibility of making a personal inspection of the site, led certain contractors either to refrain from tendering, or to add excessively large amounts for unknown contingencies. Indeed, one firm, upon receipt of further particulars from their agents in the Colony, sent in an amended tender lower by £170,000 than the original one.

Under these circumstances it is impossible to attach much value to the figures in the list as indicative of the correct relative costs of the different designs.

In

In illustration of another of the causes of the great discrepancy in the amount of the tenders, namely, the absence as regards the foundations of the specific directions which were issued in respect of the steel superstructure, I may mention that whilst one American firm is satisfied with piers consisting of a few wrought-iron columns only 2 feet in diameter, a French firm proposes massive masonry piers, nearly 60 feet in diameter. And further, one English firm estimates for piers 70 feet long by 33 feet wide at the base, whilst an American firm estimates for piers 52 feet by 24 feet. As the cost of such piers is practically proportional to the area, it is clear that if the smaller pier is of adequate stability, the size of the larger one and the amount of the tender for its construction might be correspondingly reduced.

Notwithstanding the great differences in the amount of the tenders sent in, there are amongst them tenders of reasonable amount, from parties of reputation, for designs of satisfactory character, so that the Government of New South Wales may safely entertain the acceptance of one of them.

I am disposed to think that the difficulties of the foundations of the Hawkesbury Bridge have been exaggerated by many of the parties tendering. In India, practically, similar work has been frequently and successfully accomplished by native labour under proper engineering supervision; and I see no reason why local contractors might not attain equal success with the piers of the proposed bridge, provided the Government of New South Wales desires to separate the contract for foundations from the superstructure.

In my work of investigation of the drawings, tenders, and calculations which preceded the preparation of this Report, I was much impressed with the amount of labour and expense which the parties tendering for the Hawkesbury Bridge must have incurred, and I would suggest that the New South Wales Government might perhaps be disposed, in communicating their final decision to the contractors, to recognize this fact of careful and laborious work in the preparation of the designs, by the terms of their communication to the parties whose tenders are not accepted.

If this suggestion be thought worthy of consideration, the mode of giving effect to it will be better determined at Sydney than by anything I can propose for the guidance of the Government.

I have had diagrams of the different designs prepared and attached to this Report for more convenient reference.

I will now proceed to consider in detail the different tenders submitted, but I may at once exclude the following four tenders for the reasons set forth in each case:—

Edgemoor Iron Co. (tender No. 1), because the piers are not carried down to solid ground.

Phoenix Bridge Co. (tenders Nos. 1 to 4), because, amongst other reasons, the superstructure is of iron, instead of steel as specified.

Union Bridge Co. (tender No. 1), because the piers are not carried down to the solid ground; and (tender No. 2), because no drawings are submitted.

Fforde & Young (tender No. 1), because the piers are not carried down to solid ground.

In considering the remaining tenders, it will be convenient to commence with the highest and finish with the lowest in amount.

D. MUNROE, Melbourne.

Amount of tender, £702,384. This tender does not include providing or laying permanent way or floor.

Piers.—There are ten piers, each consisting of two cast-iron columns 48 feet apart, centre to centre at the base, and 14 feet diameter from bottom to high-water level, above which they are reduced in size to 11' x 3' 6". Concrete, broken stone, and sand are used as filling.

Superstructure.—There are two spans of 144 ft. 8 in. and seven of 289 ft. 6 in., with girders 2 feet deep at the ends, and 21 feet and 42 feet deep at the centres respectively. (See diagram.) The floor, including rail-bearers, is of timber, and the stresses resulting from compression in the cross girders and main girders exceed those specified. Owing to the great height and small diameter of the cylinders the pressure on the foundation is excessive. The estimated time for completion is three years.

FIVES-LILLE, Paris.

Design No. 1.—Amount of tender, £685,000, subsequently reduced to £515,000, which does not include the supply or laying of the permanent way.

Piers.—There are six massive cylindrical piers 57 ft. 5 in. diameter at the bottom, and 42 ft. 8 in. at high-water level, above which four columns 8 ft. 6 in. diameter are adopted. Concrete and masonry are used as filling.

Superstructure.—There are two spans of 73 feet and five of 550 feet, with girders 6 ft. 5 in. deep at the ends, and 6 ft. 5 in. and 91 ft. 4½ in. deep at the centres respectively. The floor is of timber, and some of the stresses slightly exceed those specified.

The estimated time for completion is four years.

Design No. 2.—The amount of tenders, the details of the superstructure, and of the piers also up to about high-water are the same as in the design already described; but above high-water the piers are carried up as single masonry columns, ranging from 42 ft. 8 in. to 39 ft. 4½ in. in diameter.

R. PARKINSON, East Dereham.

Amount of tender, £584,898, which does not include the supply or laying of the permanent way.

Piers.—There are eight cylindrical, concrete piers 40 feet in diameter. The bottom, 40 feet, is solid, and the remainder of the pier is hollow, with sides 7 feet thick.

Superstructure.—There are two spans of 269 ft. 6 in. and five 338 feet, with continuous girders of a uniform depth of 36 feet. Adjustable hydraulic bearings are proposed to be used, but no details are given. The floor is of timber, and the stresses are excessive in all the principal parts of the structure. The estimated time for completion is four years.

JOHN

JOHN DIXON, London.

Amount of tender, £486,100, which includes the cost of supplying and laying the permanent way.

Piers.—There are nine piers, each consisting of a group of four cast-iron cylinders from 12 feet to 10 feet in diameter, and filled with concrete. The cylinders are arranged in a rectangle 45 × 25 ft.

Superstructure.—There are ten spans of 251. feet between the piers, and nine spans of 43 feet at the piers, with girders varying in depth from 10 ft 8 in. to 33 feet. The stresses in the structure are within the specified limits.

A floor of steel buckle plates is provided.

The estimated time for the completion is two years from the commencement of operations.

REICHENBACH, GODFREY, & JONES, London.

Amount of tender, £466,032, which does not include the supply or laying of the permanent way.

Piers.—There are eight rectangular piers 54 feet long by 22 feet wide at the base. It is proposed to execute the work partly by means of pneumatic caissons, and partly by freezing the ground in advance of the excavations, and so, it is assumed, arresting the flow of water.

Superstructure.—The spans are—one of 89 feet, one of 306 feet, three of 311 feet, and four of 392 feet, with continuous girders 87 feet deep over the piers, and from 45 to 27 feet deep at intermediate points. The lower number of the girder at the piers is but 15 feet above high-water, and the condition requiring “a clear headway of 40 feet under the girders” is thus infringed.

The cross girders are of a peculiar form, and, if taken as independent girders, are deficient in strength.

The floor is of buckled plates. No time is stated for the completion of the bridge.

ARROL & Co., Glasgow.

Design No. 2.—Amount of tender, £580,000, including the laying but not the supply of the permanent way.

Piers.—There are seven elliptical piers, two of which are 50 feet long by 25 feet wide at the bottom, and the five others are 72 ft. × 33 ft. Up to near the level of low-water the piers consist of concrete brickwork or masonry, in a double-skinned iron caisson. Above low-water brickwork and masonry alone are used. The skins of the caisson are well braced together, and the form of structure is preserved by adequate strengthening.

Superstructure.—There are two spans of 153 ft. 6 in., two of 430 ft. 6 in., and four of 432 feet, with girders ranging from 25 feet to 55 feet in depth.

The stresses in all parts are well within the specified limits. A steel buckle-plate floor is provided. The estimated time for completion is four years.

Design No. 1.—Amount of tender, £439,847 10s., including the laying, but not the supply, of the permanent way.

Piers.—There are eight piers, two of which are similar to the small piers described in design No. 2. The six main piers consist of four columns 18 feet diameter at the base, disposed in a rectangle 40 feet and 28 feet between the centres, and braced together. Upon each group of four columns is erected a steel trestle about 33 feet high and 40 ft. × 28 ft. at the base.

Superstructure.—There are two spans of 153 ft. 6 in., similar to those described in design No. 2, two spans of 369 ft. 6 in., and five spans of 370 feet. The girders covering these six spans are of similar construction to the large girders in design No. 2, but of smaller dimensions. With the exception of the rail-bearers and cross-girder, the stresses in all parts are well within the specified limits.

In both tenders there is a provision that if boulders, driftwood, or other obstructions impede or render it impossible to complete a pier, the Government is to bear the cost.

HANDYSIDE & Co., Derby.

Design No. 2.—Amount of tender, £456,000, which does not include the supply or laying of the permanent way, or removal of boulders or other obstructions to the pier-sinking.

Piers.—There are eleven piers, each consisting of two columns 15 feet in diameter at the base. The columns have a shell of $\frac{3}{8}$ inch steel plates, double to the top of the taper piece and single above, filled in with concrete. From the level of 4 feet above high water to the top of the girders the columns are octagonal in form. The foundation of the first pier on the south side is but 15 feet below the bed of the river; and if no support be given by the soil in which it is sunk, an excessive pressure might be brought upon the foundation.

Superstructure.—There are two spans of 138 feet and ten of 262 feet, with girders of 19 ft. 6 in. and 34 ft. 6 in. in depth. The stresses in all parts of the structure are within the specified limits. A steel buckled-plate floor is provided. The estimated time for completion is three years.

Design No. 1.—Amount of tender, £435,000, which does not include the supply and laying of permanent way or removal of boulders, &c.

Piers.—These are of the same character and materials as those described in design No. 2.

Superstructure.—The number and size of the spans are the same as those already described in design No. 2; but the girders, instead of being of uniform depth, are of bowstring form, varying in depth from 19 ft. 6 in. in the centre to 2 feet at the ends, and from 34 ft. 6 in. in the centre to 2 feet at the ends respectively.

ROYCE & Co. and BUTTERLEY & Co., Sydney and Alfreton, Derbyshire.

Amount of tender, £403,367, which includes the sleepers but not rails.

Piers.—There are twelve piers, each consisting of two steel plate columns 16 feet in diameter, spaced 28 feet apart centre to centre, and filled solid with concrete. The

The end piers, when exposed to 56lbs. wind pressure and heavy floods, would have hardly a sufficient margin of stability to resist overturning, if the columns forming them be considered to act independently; and the pressure on the foundations of the longer columns is rather excessive.

Superstructure.—There are two spans of 167 ft. 8 in., one of 175 ft. 8 in., and ten of 238 ft. 6 in., with girders ranging from 18 feet to 24 ft. 6 in. in depth. The stresses in the main girders are within the specified limits, but the upper windbracing and compression members of the cross girders are weak. A timber floor is provided. The estimated date of completion is three years from the first delivery of materials in Sydney.

FFORDE & YOUNG, London.

Design No. 2.—Amount of tender, £377,500, which does not include the supply or laying of permanent way.

Piers.—There are ten piers, each consisting of two wrought-iron columns, 10 feet diameter at the bottom, reduced to 6 feet at the top, and filled with concrete.

The pressure on the ground in this design is excessive, amounting to 18.6 tons per square foot area of cylinders.

Superstructure.—There are two spans of 116 ft. 6 in., four of 221 feet, and five of 357 feet, with girders varying in depth from 52 feet over the piers to 35 and 18 feet elsewhere.

No complete floor is provided, but plates 10 in. by $\frac{1}{4}$ in. are laid longitudinally in the space between the lines of rails.

The time for completion is estimated at three years.

UNION BRIDGE COMPANY, New York.

No. 3.—Amount of tender, £327,000, which includes the supply and laying of the permanent way.

Piers.—There are six piers 52 feet long by 24 feet wide at the base, and 48 feet by 20 feet at low water level, formed by caissons of wrought-iron filled with concrete. Above low water, up to the girder bed-plates, masonry piers will be built, consisting of two cylindrical columns, 14 feet diameter, and 28 feet apart centre to centre, joined by a wall 6 feet thick.

Superstructure.—There are seven spans of 415 feet, with girders of the ordinary American type, 53 feet in depth. There is no complete floor, the rails being carried upon sleepers 8 in. by 9 in., extending across the bridge between the girders, and spaced 8 inches apart. Alternative designs for the horizontal wind-bracing are submitted; one with round rods, as in most American bridges; and the other with lattice girder, struts, and ties. I prefer the latter, on account of its superior rigidity and freedom from vibration under passing trains.

The stresses, with trifling exceptions, are within the specified limits. The estimated time for completion is two years and a half.

EDGEMOOR IRON COMPANY, Delaware.

No. 2.—Amount of tender, £296,350, which includes sleepers, but not the rails.

Piers.—There are ten piers, each consisting of two steel plate columns 20 feet to 15 feet in diameter, partially filled with concrete. Upon these are placed trestles, which carry the superstructure.

Superstructure.—There are two spans of 134 feet, and nine spans of 292 feet, with girders similar in form to those in the last design, and 32 feet deep. The stresses, as a rule, are within the specified limits; but in the case of certain vertical struts the stress is rather excessive. The floor is composed of sleepers 9 in. by 7 in., spaced about 6 inches apart.

The estimated time for completion is two years.

In addition to the above tenders for the construction and erection of the bridge, Messrs. McLellan, of Glasgow, and the Dominion Bridge Company of Montreal have tendered for the supply of the materials only.

RECOMMENDATION.

Several of the preceding designs have high engineering merit, notable that of the Fives-Lille Company, whose bridge would be looked upon as a monumental work in any country, and that of Messrs. Arrol. But owing to the large sums included in the estimates for contingencies, the majority of the tenders are excluded from present consideration.

Indeed, it appears to me that only two of the tenders need be entertained, namely, the Edgemoor Iron Company's No. 2 Tender for £296,350, and the Union Bridge Company's No. 3 Tender for £327,000. These are both for good bridges of the ordinary American type, and the amounts of the tenders represent the fair commercial value of the respective works without any excessive addition for contingencies.

The Union Bridge Company propose six piers, and the Edgemoor Company ten; but as the latter propose two cylinders for each pier, and the former only one, there will be practically twenty separate piers to sink in one case as compared with six in the other. From my own experience, in sinking cylinders and caissons through mud, I am of opinion that the reduced number and larger size of the Union Bridge Company's caissons is a distinct advantage, minimising the risk of accidents and delay when executing the pier work. And further, that the larger spans of the superstructure of the Union Bridge Company have a substantial superiority over the smaller spans of the Edgemoor Company's design.

Certain minor modifications, which it is unnecessary to particularise, might be usefully made in both the preceding designs; but these would not affect the relative cost of the two structures.

My instructions, I understand, are to "recommend the acceptance of one tender," and I beg, therefore—presuming the work to be let as a whole—to recommend the acceptance of the tender of the Union Bridge Company for the sum of 327,000, subject to a proper specification and contract being first arranged, together with a schedule for additions and deductions at prices based upon the lump sum, for any modifications which the engineers of the New South Wales Government may hereafter direct.

I have, &c.,

JOHN FOWLER.

2 Queen Square Place, Westminster, S.W.,
3 September, 1885.

PROPOSED

PROPOSED RAILWAY BRIDGE OVER THE RIVER HAWKESBURY.

Report of the Engineer-in-Chief for Railways to the Honorable the Minister for Public Works.

Department of Public Works, Railway Branch, Engineer-in-Chief's Office,
Sydney, 25 January, 1886.*Minute Paper.*

Hawkesbury River Bridge, Report on Designs, &c.

THE competitive designs and tenders for the construction of a Bridge for a double line of railway over the River Hawkesbury having been forwarded for my consideration, I have the honor to submit the following report :—

DESCRIPTION OF DESIGNS.

EDGEMOOR IRON COMPANY, Delaware.

The Edgemoor Iron Company of Delaware send in four tenders as under, viz. :—

- No. 1. For superstructure only, with spans of 292 feet, £105,500.
 No. 2. For the same superstructure, combined with piers of design A, £265,650.
 No. 3. For the same superstructure, combined with piers of design B, £296,350.
 No. 4. For superstructure only, with spans of 328 feet, £119,338.

The designs Nos. 1 and 4 being for superstructure only, will not be considered. The other designs, Nos. 2 and 3, are for a bridge with nine spans, 222 feet each, and an abutment span at each end of 134 feet.

Piers—Design A.

The upper portion is a framework of steel columns and bracing. The lower portion of piers Nos. 1, 2, and 10, consists of a pair of steel cylinders, 20 feet in diameter, with $\frac{1}{2}$ -inch thickness of metal, and filled with concrete. Piers 3 to 9 consist of two groups of about forty piles, supporting similar cylinders. The piles are cut off 5 feet above the lower edge of the steel shell, the space between being excavated and filled with concrete. It is assumed that, after sinking the steel cylinders to a certain depth, the ground will be of a sufficiently impervious character to allow of the water being pumped out and the piles driven. This design does not conform to the conditions upon which tenders were invited.

Piers—Design B.

The upper portion is a framework of steel columns and bracing. The lower portion consists of a pair of hollow cylinders of concrete, incased in steel $\frac{1}{2}$ -inch thick. They are 15 feet in diameter at the upper end, and increase downwards at the rate of 1 inch in 33, each ring fitting inside the ring below it. The diameter of the base of the deepest pier will thus be 20 feet 6 inches.

The bulk of the concrete to be used is one of cement to three of sand, and five of broken stone, that at the top of the cylinders having a large proportion of cement.

The masonry of the abutments is of the quality specified in American railway specifications as "first-class bridge masonry laid in cement."

Superstructure.

The main girders are of the American type, with pin fastenings. One end of each girder rests on expansion rollers. The depth of the girders is 32 feet.

The upper boom and end post are of trough section, made up of riveted plates and angle irons; the vertical struts are angle bars with lattice bracing, while the bottom boom and diagonal ties consist chiefly of eye bars.

The cross girders have plate webs, and are attached to the lower ends of the vertical struts, and are thus about 24 feet apart. There are six lines of longitudinal plate bearers, across which sleepers at 16-inch centres are placed to form the platform of the bridge, and to carry the rails.

The main girders are braced laterally at the end posts and each vertical strut. Resistance to wind is effected by diagonal bracing at top and bottom between the girders.

Two years are required to complete the whole bridge according to tenders 2 and 3.

UNION BRIDGE COMPANY, New York.

The Union Bridge Company of New York submit three tenders as under, viz.—

No. 1. For a bridge with spans of 415 feet each and piers to depths shown on drawings, and in accordance with the printed conditions :—

Masonry and foundations	£159,000
Superstructure	168,000
Total	£327,000

No. 2. For a bridge with spans of about 250 feet each, with piers carried down to depths averaging 21 feet less than No. 1 :—

Masonry and foundations	£160,000
Superstructure	117,000
Total	£277,000

No. 3. For a bridge with spans of about 250 feet each, with piers carried down to the full depth :—

Masonry and foundations	£189,000
Superstructure	117,000
Total	£306,000

No

No drawings are furnished with tenders 2 and 3, which cannot, therefore, be considered. The following is a description of the design furnished :—

The piers from low water mark downward consist of a mild steel or plate iron casing, with three internal tubes 8 feet in diameter braced to the casing. The size of the piers thus formed is 48 feet by 20 feet, with semicircular ends, but towards the bottom the dimensions are increased to 52 feet and 24 feet. Concrete is to be filled in between the outer shell and the tubes during sinking, and on the completion of the pier the tubes also will be filled in with concrete.

Above low-water the piers will be carried up in masonry according to the specifications of the Government Railways, and as stone, obtained locally, will admit; the same kind of masonry will be used for the abutments.

It is proposed to sink the foundations by open dredging, but the caissons will be so arranged for the application of air-locks if required.

Superstructure.

The main girders are 410 feet 1 inch between end pins, and 51 ft. 3 in. in depth. They are of the American type, with pin fastenings. The upper boom and end post consist of riveted plate and angle iron. The vertical struts are of plate and angle iron with lattice bracing, while the segments of the lower boom and diagonal ties are eye bars.

The cross girders have plate webs, and are secured at each joint of the lower booms to the vertical struts, and there are four lines of longitudinal plate-bearers fixed nearly under the rails. Sleepers are placed about 16 inches apart from centre to centre across the bridge, and guard rails as well as permanent way rails, 70lbs. per yard, are supplied and fixed for each road.

For the wind bracing two designs are furnished, one with pin fastenings, the other with riveted fastenings.

The time required for the completion of the contract is two years and six months.

THE PHOENIX BRIDGE COMPANY, Philadelphia.

The Phoenix Bridge Company of Philadelphia submit four tenders, viz. :—

No. 1. For a bridge of Phoenix construction, with thirteen spans	\$1,404,000
No. 2. For a bridge of plate and angle construction, with thirteen spans	\$1,432,000
No. 3. For a bridge of Phoenix construction, with eleven spans...	\$1,414,750
No. 4. For a bridge of plate and angle construction, with eleven spans...	\$1,444,700

The superstructure in all cases is of wrought-iron, and does not therefore comply with the published conditions.

The Phoenix construction consists of the use of columns of circular section, with four, six, or eight segments, according to size. These are used, singly or in combination, in piers, and all members of the superstructure subject to a compressive strain.

Tension members are flat bars or rods with pin fastenings.

The design, with thirteen spans, provides main girders 219 feet in length between end pins.

The cross girders have plate webs, and are suspended from each joint of the main girders. Between these run six lines of longitudinal bearers, upon which the sleepers carrying the rails are fixed.

The piers are each of them composed of eight Phoenix columns, 22 inches inside diameter, and with $\frac{1}{8}$ -inch thickness of metal. These, after sinking, are filled with concrete. All the columns have a batter of 1 in 12 longitudinally, and the outside ones 1 in 6 transversely.

Above the bottom of the river the columns are braced together by adjustable eyebars. The piers are surmounted by heavy transverse and longitudinal plate girders, to distribute the load over the columns.

It is proposed to sink the columns of the piers by means of a central water jet, in connection with others exterior to the columns. It is stated that the Phoenix method of construction allows of considerable deviation from a uniform batter if a boulder or log be met with in sinking.

The ironwork can be ready for shipment within four months from date of order, and can be erected in five months after the arrival at site.

MESSRS. FFORDE & YOUNG, Westminster.

Messrs. Fforde & Young, of Westminster, submit the following designs and tenders, viz. :—

No. 1. The cylinders being sunk to 90 feet below high-water, with timber piles the remainder of the distance : cost, £317,500.

No. 2. The cylinders being sunk to the depth shown on the section furnished by the New South Wales Government : cost, £337,500.

The superstructure in both cases is the same.

They also make an offer to supply the superstructure and ironwork, f.o.b. in the Thames as under :—

Steel superstructure...	£71,907
Wrought-iron in piers, castings, &c.	30,107

The designs show alternate spans of 357 feet and 221 feet over the main portion of the river, with a shore span at each end of 116½ feet.

The piers consist of two wrought-iron cylinders in riveted sections, 10 ft. 6 in. diameter and 28 feet from centre to centre, braced together at high-water line and at the top.

In tender No. 1 it is proposed to sink them by pneumatic means to a depth of 90 feet below high-water, and then on the bottom thus formed to sink piles, by pneumatic power or otherwise, to the depth shown on the Government section; the cylinders are afterwards filled up with concrete. It is maintained that the piles alone will carry the load without any allowance for the support of the stratum at the level of the bottom of the cylinders or for the fractional resistance at the sides of the latter, also that piles in such a position are according to experience indestructible.

Tender No. 2 assumes the wrought-iron cylinders to be sunk to the depths shown on the Government section, the excavation being made by dredging or otherwise.

Superstructure.

Superstructure.

The spans of 357 feet consist of two cantilevers of 119 feet each, and a central girder of 119 feet in length, the ends of the latter having expansion joints.

The cantilevers are balanced by a diagonal tie connecting the summit over the piers with a point on the girder of the 221 feet span. Alternate bearings on the piers are on expansion rollers. The depth of the cantilever over the piers is 57 feet, that of the central girder of the 357 feet span is 17 feet, and that of the 221 feet girder is 34 feet. The bracing is of the lattice type, and the joints riveted throughout.

The cross girders are attached to the underside of the main girders at the joints by means of a downward extension of the gusset plates. Longitudinal beams are fixed in four lines, one under each rail.

The bottom wind bracing is attached to the cross girders. The top bracing is carried out where the headway will admit of it.

The abutments are intended to be built of coursed rubble masonry, set in cement mortar.

The time required for the completion of the bridge is three years.

MESSRS. G. H. ROYCE & Co., SYDNEY, AND THE BUTTERLEY IRON WORKS.

Messrs. G. H. Royce & Co., of Sydney and the Butterley Iron Works, Alfreton, Derbyshire, submit the following design and tender, viz. :—

For bridge delivered	£158,211	5	3
Erection, completion, and maintenance	245,156	0	0
Total	403,367	5	3

This bridge consists of ten spans of 238 ft. 6 in. each, one span of 175 ft. 8 in., and one shore span at each end of 168 ft. 8 in.

The piers are formed of wrought-iron cylinders in pairs, 16 feet in diameter and 28 feet from centre to centre, with upper box-girder connecting pieces 5 feet wide and 7 feet deep. Half-inch plates are used for the main piers of the larger spans, and $\frac{1}{4}$ inch plates for the others. They are stiffened by outside straps 6 inches by $\frac{3}{8}$ inch, and internal T irons 6 inches by 3 inches by $\frac{1}{2}$ inch.

When the sinking is complete the cylinders are to be filled with concrete of cement, sand, and blue metal, in the proportions of 1, 2, and 5, respectively.

The abutments will be built of masonry, of the type usually adopted by the Department.

Superstructure.

The main girders of the smaller spans are all similar, and are of the lattice type, with the top and bottom flange straight.

The girders spanning the larger openings are also of lattice construction, but the upper boom is curved, the effective depth in the middle being 23 feet, and at the ends 16 ft. 6 in.

The upper boom is trough-shaped, while the lower one consists of a pair of riveted links formed of plates 2 feet deep and set on edge. The vertical struts are of plate and angle irons, with lattice stiffening. The diagonals consist of flat bars in pairs.

The cross-girders are plate girders, and are suspended from the lower end of the vertical struts by a pair of plates and secured by a pin. Longitudinal bearers are placed under each rail. Longitudinal sleepers are provided 6 inches in thickness, and 4-inch decking over the rest of the bridge.

The upper wind-bracing is fixed to the lateral braces, the lower wind-bracing is attached to the longitudinal bearers and is thus free of the main girders.

The time required for completion is three years after the first delivery of material in Sydney.

MESSRS. HANDYSIDE & Co., Derby.

Messrs. Andrew Handyside & Co., of Derby, submit the following designs and tenders, viz. :—

Tender for bridge with superstructure, according to design A ...	£456,000
Do do do B ...	435,000

Both designs are for the same span, and the piers are the same in both cases.

There are ten spans of 262 feet each, and two shore spans of 138 feet each.

Piers.

These consist each of a pair of steel cylinders, 28 feet from centre to centre. From the bottom of the foundation to the bed of the river there are two concentric rings 15 feet and 12 feet diameter, connected by diaphragms. From the bed of the river to 4 feet above high water the cylinders are continued 12 feet in diameter; from this level upwards the piers consist of octagon pillars, 10 feet across at the base and 8 feet at the top, braced together. The piers are to be filled with concrete to the base of the octagonal pillars. The process proposed for sinking the piers is as follows :—

A pair of pontoons will be provided, upon which the pair of cylinders will be put together; the latter will be sunk between the pontoons, ring after ring added, and sufficient concrete put in the pockets between the rings to keep the cylinders down. It is proposed to excavate by the process adopted at the Goorai Bridge in India, that is to say, by means of a rotary boring machine or plough, the excavated earth being removed by a syphon, which is made to act by pumping water into the cylinders.

Superstructure according to Design A.

The main girders are of lattice construction, with riveted joints, and are non-continuous. The depths are 32 ft. 2 $\frac{1}{4}$ in., and 17 ft. 8 $\frac{1}{4}$ in., for the longer and shorter spans respectively. The upper booms are of trough section; the lower consists of two series of plates on edge, stayed apart at intervals.

The

The diagonal ties are flat bars, the vertical struts the same, but stiffened with angle-iron and lattice bracing.

The cross girders are attached to the underside of the main girders, and are firmly secured by plates to a web at the lower end of the vertical struts. The longitudinal bearers are fixed under the centre line of each rail, and carry the longitudinal sleepers. The floor of the bridge is covered with steel buckle-plates.

Superstructure according to Design B.

The main girders are of the bowstring type, the depths being the same as in Design A. The forms of cross sections of the different members are similar to those in Design A, while the disposition of the cross girders, bearers, &c., correspond entirely.

It is intended to put together a complete span, main girders, cross girders, rail-bearers, and flooring on one pair of pontoons. The pontoons will be floated between a pair of piers, and the ends of the girders deposited on them at high tide. The span will be raised from this into the requisite position by hydraulic rams, the steel columns being built up under it.

The time required for the completion of the bridge is three years.

Messrs. Arrol Brothers, Glasgow.

Messrs. Arrol Bros., of Glasgow, submit two designs and tenders, which will be considered separately, viz. :—

Tender for design No. 1	£586,395
Or, with reduced masonry, shown on drawing No. 1A	580,000

This bridge has four spans of 432 feet, two of 430 ft. 6 in., and two shore spans of 153 ft. 6 in.

The piers consist of double skin wrought-iron caissons filled with concrete, and are of elliptical form ; the larger having bases of 70 feet by 33 feet, the smaller 55 feet by 24 feet, strengthened by three cross walls.

The cutting edges are of steel. Above the bed of the river, and to a point above high-water mark, the piers are carried up in brickwork ; above this again in masonry, with concrete filling. Provision is made for building the abutments in first-class style.

The long-span girders are 55 feet deep at the centre and 25 deep at the ends. They are of the lattice type, with riveted joints. Both booms are of trough section. The diagonal ties are flat bars ; the vertical struts consist of four angle-irons, with lattice bracing. A longitudinal brace runs from end to end of the girder at a length of 25 feet above the lower edge.

Plate cross girders are fixed inside the lower booms at the joints ; longitudinal bearers, with hard-wood capping, carry the rails. At the top of the longitudinal bearers a floor is formed of buckle-plates, flushed up level with asphalt concrete. Lateral and wind bracing is provided. A light lattice screen is fixed on the inside of the main girders, to protect the lower part of passing carriages from the wind.

The bearings of the main girders are ordinary roller and rocker bearings of steel on cast-iron bed plates.

It is proposed to build the lower lengths of the caissons on launching ways, and float them out between twin barges to site. The barges will be steadied in position by legs, as in use at the Tay Bridge, or by cross moorings, as may be convenient.

It is proposed to perform the excavation either by grab dredgers, ladder excavators, or by the method adopted at the Goorai Bridge in India (mentioned also in Messrs. Handyside's tender).

The girders will be built on shore and floated out, either on high level staging or barges, or placed on the masonry at a lower level, and raised by utilising the rise of the tide from time to time, and packing up under each lift.

The girders of the end spans would be erected on timber staging in the usual manner.

The time required for the completion of this bridge is four years.

Messrs. Arrol Bros.' tender for design No. 2 is £439,847 10s.

In this bridge there are five spans of 370 ft., two of 369 ft. 6 in., and two of 153 ft. 6 in. The superstructure is similar in character to that of design No. 1.

The main piers consist each of groups of four columns of wrought-iron, arranged in a rectangle 40 feet by 28 feet. The lower lengths are double-skinned and 18 feet in diameter, with steel edges ; above this they are strengthened with frames, the spaces being filled in with brickwork in cement. Near the level of the bed of the river the diameter is reduced to 13 feet, and they are then continued up to about 5 feet above the water, cast-iron being substituted as a material, and are braced together at the top with wrought-iron. Above this level the pier consists of a steel trestle secured to the concrete in the cylinders by long foundation bolts.

The erection of this bridge will be a modification of that of the other design.

MESSRS. REICHENBACH, GODFREY, & JONES, London.

Messrs. Reichenbach, Godfrey, & Jones submit one design and tender, the amount being £466,032 10s.

This bridge consists of two pairs of continuous girders and one pair of non-continuous girders, the latter of about 90 feet span. The continuous girders cover two spans of 392 feet each and two spans of 311 feet each.

The piers are of Portland cement concrete and masonry, partially provided with a thin iron skin. It is proposed to sink the foundations pneumatically for a certain depth, after which Poetschli's process of freezing the ground around the piers would be adopted, so that excavation could take place in the open. This part of the excavation would be done in sections, and would have to be timbered. The piers, from caisson level to high-water are of masonry, with a core of concrete, and above that of solid masonry.

The tender does not include the abutments.

The superstructure is of steel, and the bracing of the lattice type, with all joints riveted. The main girders are continuous over four spans, and deepened considerably over the piers, the bottom edge coming down below the 40 feet line of headway. They are also deepened in the centre of the spans, so that both top and bottom of the girders present an irregular line.

The top and bottom members are both composed of channel iron, strengthened and stiffened where necessary by plates.

The struts and diagonal ties consist of pairs of channel irons braced together. Lattice cross girders are suspended at the joints of the main girders, and there are four lines of plate girders to carry the rails. The floor is of buckle plates.

No time is mentioned for the completion of the bridge.

MR. JOHN DIXON, London.

Mr. John Dixon, of London, submits a design and tender, the amount being £486,100.

This design gives a bridge with ten spans of 257 feet each, and nine spans of 45 feet. The piers consist each of a group of four cylinders, braced together above high-water. The cylinders are of cast-iron, $1\frac{1}{4}$ inch thick, and are 10 feet in diameter, except for a length at the bottom, where they are 12 feet, and have steel cutting edges. The cylinders are afterwards filled with cement concrete 8 to 1.

Superstructure.

The short spans have lattice girders with parallel flanges. The girders of the main spans are of the lattice riveted type, with a covered upper boom, the depths at centre and ends being 33 feet and 21 feet respectively. The top and bottom booms are of trough section; the vertical struts are plate and angle iron, with lattice bracing. The diagonals consist of pairs of flat bars. Plate cross girders are attached to the inside of the main girders. Longitudinal bearers are placed under each rail; the floor is covered with steel buckle-plates.

Lateral and wind bracing is provided at the top of the main girders, the members consisting for the most part of lattice beams.

It is intended to perform the excavation with mechanical diggers.

The cylinder being complete to high-water level, the superstructure would be floated out and deposited; from this position it would be raised by hydraulic power as the piers are completed.

It is proposed to provide two cylinder sinking stages; these will consist of two large pontoons, through each of which will pass two wrought-iron cylindrical legs, to rest on the mud, and these will be worked by hydraulic power. Some of the mud would be previously dredged away to give a firmer base for the legs. Over the pontoons will be built a strong stage with overhead travelling crane.

The entire stage would be floated to site and moored. The abutments are to be of native stone.

Two years are required for the completion of this work.

MR. R. M. PARKINSON, East Dereham.

Mr. Richard M. Parkinson, of East Dereham, submits a tender, the amount being £584,898.

This design shows continuous girders throughout. There are seven openings of 338 feet and two of 269 ft. 9 in., one at each end.

The girders are to be fixed on one of the central piers; on the other piers and abutments they rest on adjustable hydraulic bearings and rollers.

The piers consist of cylinders 40 feet in diameter, with a central tube of 26 feet diameter, the space between these two rings being filled with concrete. A length of 60 feet of the outer skin at the lower end is of steel. On the completion of the sinking, concrete will also be filled into the middle for a height of 40 feet.

The abutments are rock-faced rubble.

Superstructure.

The main girders are 36 feet deep, with vertical struts and inclined ties. The lower boom is also supported half-way between each pair of attachments of the latter by an additional suspension bar. The upper boom forms an inverted trough in section. The verticals are of box section, while the inclined ties are flat bars; the attachment of the latter and also of the wind bracing is by pins.

The plate cross girders are bolted to the underside of the main girders, while the longitudinal bearers lie on the top of the cross girders and form troughs, in which the longitudinal sleepers and permanent way rails lie.

The floor is of 3-inch planking.

The time required for the completion of the bridge is four years.

FIVES-LILLE COMPANY, Paris.

The Fives-Lille Company submitted a design and a tender—£685,000, and afterwards reduced the latter to £515,000.

The design shows five spans of 550 feet each, and two shore spans of 73 feet each. The two end piers are elliptical in plan, the four principal ones are circular; the part above high-water is, however, the same in all cases. The lower part of the piers is of masonry, with a sheet-iron envelope resting on a wrought-iron caisson. When the sinking is complete the caissons and central shaft are to be filled up with concrete.

The

The principal piers have a diameter at the base of 57 ft. 5 in., and the sides of a batter of 1 in 25. The end piers, which are elliptical, have a base of 57 ft. 5 in. by 26 ft. 10 in.

There are two designs for the upper part of the piers; one being for ashlar masonry, while in the other there are four iron columns, braced together, and filled with concrete.

Superstructure.

The principal openings are spanned by a pair of bow-string girders, the upper members of which consist each of a pair of arched lattice beams jointed at the crown, the main ties consisting of links 24 ft. 7 in. long, with riveted ends and pin fastenings. The rise of the arch is 85 ft. 4 in.

The platform of the bridge is carried by vertical suspension bars, 49 ft. 2 in. apart, from which also the main tie is suspended.

The platform of the bridge consists in the first place of a pair of lattice girders, carried by the vertical suspension bars and placed in the same vertical plane as the main tie. To these girders lattice cross girders are attached at distances of 12 ft. 3½ in., and brackets fixed on to the latter carry the longitudinal bearers; upon the latter, cross sleeps are fixed to carry the rails.

The lateral bracing of the upper members of the main girders consists of lattice beams; the wind bracing is of bar and angle iron. The lower wind bracing is affected by an independent horizontal truss; all the members of this truss are of box form, with lattice webs. The longitudinal members of the truss are carried from end to end of the main girders between the platform girders and the main tie, and are secured to each vertical suspension-bar of the main girder. Each of these attachments is pierced by a pin, from which the main tie is suspended by a couple of links.

The proportion of cement to sand to be used for the work above ground is 674 lb. of cement to 1 cubic yard of sand, and for work under water 842 lb. of cement to 1 cubic yard of sand. For cement concrete the proportion of cement mortar to broken stone is 6 to 8.

It is proposed to excavate the foundations of the end piers by the compressed air method. The other and deeper piers would be sunk by excavating under water, but the compressed-air apparatus would be at hand if required for use at moderate depths.

In order to ease the descent of the caisson should it stick on one side, a pipe will be laid on all round the inside of the cutting edge, from which jets of water under pressure can be made to issue both vertically and laterally. This a patent of the firm.

The time required for the completion of this work is four years.

MR. D. MUNROE, Melbourne.

Mr. D. Munroe, of Melbourne, submits a design and tender, the amount of which is £702,384 3s. 4d.

The design divides the bridge into nine main spans of 289 ft. 6 in. each, and two spans of 144 ft. 8 in. each.

The piers consist of cast-iron cylinders in pairs, which, up to high-water, are 14 feet in diameter, with 1½ inch thickness of metal.

The bottom of the cylinders is to be filled for a depth of 7 feet with concrete; above this level only a shell of concrete 3 feet thick is to be used, the interior being filled up with broken stone and sand. The broken stone used for the concrete is to be called sandstone.

Above high water the cylinders taper upwards, and have a batter inwards, and are carried up to support the end pins of the girders. The cylinders are braced together above low water.

The abutments are ashlar masonry in local sandstone.

The main girders are of the fish-belly lattice type, and are 40 feet in effective depth at the centre. The top and bottom booms have the same section throughout. The top boom is trough shaped; the bottom one is made up of eyebars, and from the joints of these the platform is suspended.

The cross girders have zig zag lattice bracing, and are about 15 ft. 9 in. apart. The rails are carried by timber baulks on the top of the cross-girders. No decking of any sort is provided. Resistance to wind pressure is provided by angle-iron bracing to top boom, and a horizontal truss at the level of the platform.

THE DOMINION BRIDGE COMPANY, Montreal.

The Dominion Bridge Company of Montreal submit three designs and tenders for the superstructure delivered f.o.b. at London or Liverpool, as follows:—

Design A, consisting of one span of 120 feet, ten spans of 262 feet each, and one of 162 feet, £85,482.

Design B, consisting of one span of 120 feet, eight spans of 328 feet each, and one of 160 feet, £91,586.

Design C, consisting of eight spans of 343 feet each, and one span of 160 feet, £98,857.

These designs are for lattice-girder bridges of the American type, with pin fastenings. Details are given of design C only, but the construction would be the same in the other designs. The firm would undertake the erection of the superstructure, but has no facilities for undertaking the sub-structure.

MESSRS. P. & W. M'LELLAN, Glasgow.

Messrs. P. and W. M'Clellan, of Glasgow, submit a design and tender for the superstructure only, the amount being £92,535 6s. 2d.

The design shows one span of 120 feet, ten spans of 261 feet each, and one span of 160 feet.

The main girders are of the lattice type, with riveted fastenings and non-continuous. The girders of the small spans, as well as the large, are 26 ft. 1 in. in height. The top and bottom booms are of trough section; the vertical struts are pairs of plates, with angle-iron and lattice bracing; the ties are similar, but without the lattice bracing.

Plate cross girders are fixed to the vertical struts inside the main girders above the bottom boom. The longitudinal beams are in five pairs across the bridge, and carry a flooring of buckle-plates. Steel kerbs are also provided.

Remarks

Remarks and Recommendations.

Having carefully examined the whole of the designs sent in for this bridge, I will now proceed to deal with those which, in my opinion, appear the most suitable for the purpose intended.

I may, however, exclude the following tenders, for the reason given after each. The letters and numbers refer to those in the first column of the appended table.

- C 1 to 4.—Phoenix Bridge Company. The design of the piers is unsatisfactory, and iron is to be used in the superstructure instead of steel.
 F 1 and 2.—Messrs. A. Handyside & Co.
 G 1 and 2.—Messrs. Arrol Bros.
 H.—do.

These firms (F., G., and H.) decline to be responsible should any obstruction be met with in sinking the foundations for the piers.

- D 1 and 2.—Messrs. Fforde & Young. The piers are considered too weak.
 D 3.—Messrs. Fforde & Young. This tender is for steel and iron work only, without erection.
 E.—Messrs. Royce & Co., and the Butterley Co. The piers are too weak.
 I.—Messrs. Reichenbach, Godfrey, & Jones. I consider that in this case continuous girders are not admissible; no time is mentioned for the completion of the work, and the cost of the abutments is not included in the tender.
 J.—Mr. John Dickson. I consider that the design of the piers is not satisfactory.
 K.—Mr. R. M. Parkinson. In this case continuous girders are not admissible; the cost, £584,898, is too high, and the time required for completion, four years, is too long.
 M.—Mr. D. Munroe. The piers are, in my opinion, too small, and the cost, £702,384 3s. 4d. is too high.
 N.—The Dominion Bridge Co.
 O.—Messrs. P. & W. M'Lellan.
 These firms (N and O) tender for superstructure only.

The designs and tenders of three Companies now remain to be dealt with, viz. :—

- A 1 to 4.—The Edgemoor Iron Co.
 B 1 to 3.—The Union Bridge Co.
 L.—Fives-Lillie Co.

Tender No. 1 of the Edgemoor Co. is for superstructure only.

No. 2 is for the whole work, the piers consisting of 20-foot cylinders, in pairs, supported on piles, which I consider a most objectionable and dangerous form of design for this particular bridge.

No. 3. The piers consist of a pair of cylinders 20 feet in diameter at the base. The superstructure being in all cases the same, with spans of 293 feet; cost £296,350.
 No. 4 is for superstructure only.

Of the above, therefore, No. 3 only is suitable.

Tender No. 1 of the Union Bridge Company is for a bridge having piers 52 feet by 24 feet at base, with semicircular ends.

Tenders Nos. 2 and 3 it is not necessary to consider, as no drawings have been furnished.

The spans of the superstructure of No. 1 tender are 415 feet each, and the cost is £327,000. The piers in this design are better than those of No. 3 of the Edgemoor Co., as having a much larger base, and the spans 415 feet as against 292 feet of the latter Company, present a decided advantage. Therefore, of these two tenders and designs, I consider those of the Union Company preferable.

The superstructure of the Union Co.'s design is, as before stated, of the American type, with link and pin fastenings; and although the eyes are forged out of the solid bar, I do not consider this form of bridge as rigid or satisfactory as the riveted bridges of the English type, which have been constructed on the New South Wales railways. When the eyes are welded to the bars, a few bad welds would make this style of bridge a very dangerous structure, but when the eye bars are forged out of the solid, every care being taken in their manufacture and testing, these bridges may be used with safety.

The design of the Fives-Lille Co. complies with all the conditions issued for the guidance of tenderers, and is, in my opinion, the most perfect of all the designs submitted. The drawings have been prepared with the greatest care, and reflect every credit on the Company; but as the cost is £515,000, and a satisfactory bridge can be erected for £327,000, I should not be justified in recommending the more costly design for adoption.

I therefore recommend the acceptance of the tender No. 1 of the Union Bridge Co., the amount being £327,000, subject to the preparation and approval of full detailed drawings, and a proper specification of the whole of the work connected with this bridge.

The Commission appointed in England recommend the following additions to the design :—

- Extension of the horizontal stiffening bars.
 Strengthening to the third bay of bottom boom, and strengthening of the caisson.

In addition to these, I further advise an increase of depth to the longitudinal rail-bearers, with more perfect bracing between them, and a more definite specification for the concrete filling, for which Kiama bluestone is to be used, instead of sandstone as proposed by the Union Bridge Co.

The designs of Messrs. Arrol Bros. are particularly good, especially No. 1, the cost of which is £586,395. This is in excess of the tender of the Fives-Lille Co.; and as Messrs. Arrol Bros., do not comply with the printed conditions this design could not be taken into consideration.

To avoid delay in dealing with this matter, I have already sent on a memorandum recommending the acceptance of the Union Bridge Co.'s tender, copy of which is annexed.

A table giving the names of the tenderers, the principal features of the designs submitted, and the amounts of the different tenders, is appended to this report.

JOHN WHITTON.

HAWKESBURY

HAWKESBURY RIVER BRIDGE.—Table showing particulars of designs and Tenders received.

Reference.	Name of Tenderers.	Main Features of Design.		Time of Completion.	Amounts of Tenders.			Remarks.
		Piers.	Superstructure.		Piers.	Superstructure.	Totals.	
A 1	Edgemoor Iron Co.				£	£	£	Tender for superstructure only.

O	P. & W. Maclellan.....		Riveted lattice, with straight top, main spans 261 ft.			92,535/6/2	do do	

No. 22.

Mr. Augustus Morris to The Engineer-in-Chief for Railways.

Sir,

24, Bridge-street, Sydney, 22 December, 1885.

My friends the Edgemoor Iron Co., who sent in a design and tender (£350,000) for the construction of the railway bridge over the River Hawkesbury, which, they inform me, has been recommended, jointly with another design and tender, for favourable consideration, think that the London Board of Engineers have not fully appreciated the value of the piers and foundations they submitted. They have laid their plans before three eminent American engineers who are accustomed to the foundations proposed, and they ask me to forward to you their opinions and other papers bearing upon the discussion. Mr. Shaler Smith is, perhaps, the first bridge engineer in America, and he is the professional adviser to the Canadian Government.

Mr. Wilson is the consulting engineer to the Pennsylvania Railroad, and Mr. Whitmore is the engineer of 5,000 miles of railway. I leave the whole matter, without comment in your hands, feeling assured that you will very quickly grasp whatever merit there is in the question.

I have, &c.,

AUGUSTUS MORRIS.

No. 23.

The Agent-General to The Colonial Secretary.

Hawkesbury Bridge.

Sir,

5, Westminster Chambers, 18 September, 1885.

I have the honour to inform you that applications are being made to me by tenderers for the Hawkesbury Bridge for the return of their drawings, in the event of their offers not being accepted.

As the whole of the documents are now in course of transit to you, I beg leave to ask that, so soon as the Government have come to a determination in the matter, the drawings may be returned to this Department, to be distributed to the various parties furnishing the designs.

I have, &c.,

SAUL SAMUEL.

The Secretary for Public Works.—P.A.J., 28/10/85. The Under Secretary for Public Works.—C.W., B.C., 29 Oct., /85.

In the last letter received from Agent-General, dated 18 September last, he said the detailed drawings would be forwarded by next mail. In this letter he says, "As the whole of the documents are now in course of transit," &c., &c. The drawings should therefore have reached us before this letter was received, but I have not seen them. Please make inquiry.—CHAS. A.G., 3/11/85.

I have made every inquiry, but cannot find that these drawings have yet come to hand. The Principal Under Secretary assures me that they have not arrived, and promises to let you have them as soon as he gets them.—G.B., 7/11/85. Commissioner. Let me hear directly next mail arrives.—C.A.G., 9/11/85.

Bill of lading now endorsed by Principal Under Secretary. Will Superintendent of Stores please obtain the case, and let me have it as early as possible, and return these papers.—G.B., B.C., 21/11/85. Urgent.

I have made arrangements for the delivery of these plans to the Commissioner at the earliest moment possible.—A.R. The Secretary, 23/11/85. Case of plans has been received from the steamer to-day, and sent to Engineer-in-Chief.—G.B., 25/11/85. Has the Minister sent the papers to the Engineer-in-Chief?—C.A.G., 1/12/85. The Minister says "yes—days ago."—C.A.G., 9/12/85. Superintendent of Stores to see.—G.B., B.C., 12/12/85. Seen.—A.R., 14/12/85. The Secretary.

No. 24.

The Agent-General to The Colonial Secretary.

Sir,

5, Westminster Chambers, 2 October, 1885.

Referring to my previous communications to you on the subject of the proposed bridge over the river Hawkesbury, and especially to my despatch 370/85, of the 18th ultimo, I have now the honor to forward herewith bill of lading for one case, shipped per "Iberia" s.s., containing the plans and documents relating to the bridge, which are enumerated on the particulars attached hereto.

I have, &c.,

SAUL SAMUEL.

The Under Secretary for Public Works.—B.C., 13/11/85.

HAWKESBURY BRIDGE.

List of plans and documents contained in tin-lined case forwarded to the Agent-General, 18th September, 1885:—

Bundle A.—THE EDGEMOOR IRON COMPANY.

General elevations, designs A and B; 18 drawings of details—blue prints.

Paper A. Specification of superstructure.

„ B. Detailed estimate of tender No. 1.

„ C. „ „ „ 2.

„ D. „ „ „ 3.

„ E. Schedule of prices for sinking cylinders upon plan A.

„ F. „ „ „ B.

„ G. Detailed estimate of tender No. 4.

Bundle B.—THE UNION BRIDGE COMPANY.

General elevation and drawings of details, Nos. 1 to 7 inclusive.

Detailed specification and tenders.

Designs 1, 2, and 3.

Bundle

Bundle C.—THE PHOENIX BRIDGE COMPANY.

General elevation and drawings of details, A to F, inclusive.
Specification and tenders—designs 1, 2, 3, and 4.

Bundle D.—MESSRS. FFORDE & YOUNG.

General elevation and drawings of details—Nos. 1 to 7 inclusive.
Specification and tenders—designs 1 and 2.
Schedule of prices and diagram of strains.

Bundle E.—MESSRS. ROYCE & COMPANY.

General elevation and drawings of details—Nos. 1 to 7 inclusive.
Specification for superstructure by the Butterley Company.
Tender for erection by Royce & Company.
Detailed estimate for superstructure by Butterley Company.

Bundle F.—MESSRS. HANDYSIDE & COMPANY.

General Elevations—designs Nos. 1 and 2.
Drawings of details—Nos. 3 to 15 inclusive.
Specification and tenders—designs Nos. 1 and 2.

Bundle G.—MESSRS. ARROL BROTHERS.

General elevation—design No. 1, drawing No. 1.
" alternative design, drawing No. 1a.
Drawings of details—Nos. 2 to 7 inclusive.
Description and specification.
Tender for construction and erection; also, supplementary tender for materials for superstructure.

Bundle H.

General elevation—design No. 2, drawing No. 1.
Drawings of details—Nos. 2 to 7 inclusive.
Description and specification.
Tender for construction and erection.

Bundle I.—MESSRS. REICHENBACH & GODFREY.

General elevation and drawings of details—Nos. 1 to 7 inclusive.
Specification, tender, bill of quantities.
Strains on girders.
Letters of introduction, &c. to Agent-General.

Bundle J.—JOHN DIXON.

General elevation and diagrams of strains—drawing No. 1.
Drawings of details—Nos. 1 to 4 inclusive.
Specification, tender, estimate of weights and quantities.

Bundle K.—R. PARKINSON.

General elevation and drawings of details—Nos. 1 to 3 inclusive.
Diagram of strains—specification and detailed tender.

Bundle L.—FIVES-LILLE COMPANY.

No. 25.

Messrs. Eldred & Co. to The Secretary for Public Works.

Tender for the Hawkesbury Bridge.

Sydney, 7 October, 1885.

Sir,

Craving reference to our respects of 29th June last, we beg to advise that we have received instructions from our friends the Phoenix Bridge Company to communicate to you their willingness to reduce the amounts of the tender sent by them for the construction of the above bridge by 5 per cent., of which we have now to request you will be good enough to take note.

We remain, &c.,
ELDRED & CO.

No. 26.

Mr. R. W. Cameron to The Commissioner for Railways.

New York, 12 October, 1885.

My dear Goodchap,

Mr. Field has just called on me to say that he departs hence for Sydney by the present out going steamer *vid* San Francisco. Mr. Field is one of the leading members of the Union Bridge Company Firm, and visits your Colony in the hope of securing the contract for building the Hawkesbury River structure. His firm is certainly second to none in this Great Republic; but the purport of this is to introduce him to you socially, in order that he may enjoy the pleasure of your friendly acquaintance. I am quite sure you will be mutually pleased with each other, and thanking you in advance for your courtesy,

I have, &c.

R. W. CAMERON.

I have seen General Field, and issued a free pass over the railways for his use.—CHAS. A. G.

No. 27.

Messrs. Eldred & Co. to The Secretary for Public Works.

Tender for the Hawkesbury Bridge.

Sydney, 20 November, 1885.

Sir,

We crave reference to our respects of 29th June and 7th October last, regarding the tender entered by our friends, the Phoenix Bridge Company of Philadelphia, for the construction of the above bridge, and to intimate to you the following, which, we trust, will have your kindest consideration:—

1. In response to the call made for tenders they, in a letter addressed to the Agent-General, dated 12th May last, offered to make this bridge under four different sizes and styles for certain given amounts.

2. These amounts they altered in a telegram to Sir Saul Samuel, of 27th May, by an increase of \$150,000.

3. On receipt of copies of these from Philadelphia, we at once conjectured that they laboured under a misapprehension regarding certain points, and while advising your Department in ours of 29th June, that we were urging the Company to at least reduce this increase, we gave them information which we thought would warrant such a reduction. Under instructions received from them, we, in ours of the 7th ultimo, intimated to your Department that the Phoenix Bridge Company agreed to reduce the amended tender by 5 per cent.

4. Now, after more full and complete explanations by letter and cable, it appears that our conjecture was correct, and having never done work for this Colony, they formed inconceivably erroneous impressions, which prompted them to send the already mentioned amended tender of 27th May.

5. We are, however, now in receipt of a final instruction by cable, dated Philadelphia 10th inst. to restore the tender to the original sums contained in their above-mentioned first letter to Sir Saul Samuel, dated 12th May, 1885.

6. We trust, therefore, that you will be good enough to consider that as the only tender in force of the Phoenix Bridge Company of Philadelphia for the construction of the projected Bridge over the Hawkesbury.

7. The figures of their tender are now, therefore, to be taken as follows:—

Phoenix construction, substructure	\$627,000
Thirteen spans, superstructure	627,000
Total	\$1,254,000
E. & O. E.	
Plate, angle construction, substructure	\$627,000
Thirteen spans, superstructure	655,000
Total	\$1,282,000
E. & O. E.	
Phoenix construction, substructure... ..	\$547,000
Eleven spans, superstructure	717,750
Total	\$1,264,750
E. & O. E.	
Plate and angle construction, substructure	\$547,000
Eleven spans, superstructure	747,700
Total	\$1,294,700
E. & O. E.	

Other terms and conditions as contained in aforesaid letter being unchanged.

8. You will observe the rapidity with which they undertake this large work shall be completed, and as not only their reputation as first rank bridge builders, who, without a single failure, have already constructed over 70 miles of railway and other bridges, is guarantee of perfect work being done in this instance, but they and we feel convinced, that once seen, the quality of bridges put up by them will induce further work ; and as their representatives here, we trust their tender may be the one selected.

We have, &c.,
ELDRED & CO.

No. 28.

Messrs. Eldred & Co. to The Secretary for Public Works.

Sir,

Sydney, 26 November, 1885.

Referring to our official of 20th inst., affecting a tender for the construction of the Bridge over the Hawkesbury, we trust we may be forgiven for what may be considered as trenching on ground which is forbidden, but as all matters affecting the Colony may be deemed as of importance to each individual in it, and as our purpose is to convey the opinion of a recognized leader of his profession, we hope our temerity will not offend. You are doubtless aware of the high ability of Mr. W. W. Evans, Civil Engineer, of New York, and Member of the Institute of Civil Engineers of London, who, now a very old man, has spent a lifetime to good purpose in engineering matters all over the world. You know, also, that the high opinion entertained of his ability and probity prompted the Agent-General, or his advisers, to request him to act as member of the Commission of investigation of tenders for this Bridge, and which, owing to ill-health, at his advanced age, he was reluctantly obliged to refuse, although he thoroughly recognized and appreciated the compliment paid to him. Mr. Evans has all along felt much interested in the proposed great Bridge, as the following extracts of some of his letters, especially those last received, will show. He says : "It does not matter a penny to me who gets the work, but what bothers me and worries me is to see your Government waste a pile of money on a double track bridge when a single track bridge would do as well ; a double track bridge for a single track railway would be looked on here as an abominable extravagance, and any engineer here who would propose such a thing would not hold his position. I will venture to bet a round sum that the difference in cost between a single track bridge and a double track bridge over the Hawkesbury, put out at compound interest, would build a second bridge for a second track every fifteen years or less."

Quoting a circumstance which occurred during a visit to London in 1853, he goes on to say : "It was about this time that John Weale, of London, published his book called 'Examples of Railway Building,' in which he takes an English and an American railway and compares them. If you can find a copy of this work and read it, you will have some points to base an argument on against extravagance in railway building."

Again: "You will see in Mr. Mais' Railway Report on his tour round the world, plate 67, a picture of how we sometimes make a *single track bridge* answer for a double track railway." He finishes thus : "If you can get your Government to insist on single track bridges being built until it is clear that double tracks are required, you will be doing your Colony a good service." As you are aware, the designs furnished by our friends, the Phoenix Bridge Company, adopt the use of the well known "Phoenix" columns for the piers of the substructure.

Whether or not these columns have found favour in the eyes of the examiners we, of course, do not yet know, but it is a matter of certainty that, whereas the systems of the ordinary caissons would not allow of the single track being doubled, unless they are originally built for a double bridge, the Phoenix principle will allow of a complete single bridge being built now, and when an enlargement is demanded, additional columns can be added without interfering with the original bridge, indeed adding strength to it. By this method the money now to be expended would be reduced to the lowest possible point.

On this subject we can, if required, easily get from our principals, by cable, an estimate of what such single bridge would cost, and what the increase would be for its alteration—years hence, perhaps, and then reduced by cheaper improved iron—into a double bridge.

These points having all been brought to our notice by such a high recognized authority in a thorough going country as America, we think we are only discharging an imperative duty as colonists in placing his opinion before you, and trust we may have your indulgence for having done so.

We have, &c.,
ELDRED & CO.

As Mr. Evans is ignorant of the subject on which he has written I forgive him ; but I cannot excuse Messrs. Eldred & Co. for sending copies of his communications to this Department.

J.W., 17/12/85.

No. 29.

Messrs. Eldred & Co. to The Secretary for Public Works.

Tender for the Hawkesbury Bridge.

Sir,

Sydney, 21 December, 1885.

Referring to our respects of 20th ultimo, we have now to intimate that, being in receipt of letters from our friends, the Phoenix Bridge Company, confirming their telegram of 10th November, to which we referred under No. 5, they have now further authorized us to make an offer to construct only the superstructure of the said bridge at the corresponding prices set down in their original tender of May the 12th last.

Trusting you will be good enough to take note of this,

We remain, &c.,
ELDRED & CO.

Mr. Whitton.—J.R., B.C., 23/12/85.

No. 30.

W. H. Eldred to The Under Secretary for Public Works.

My dear Rae, Sydney, 7 January, 1886.
Will you kindly ask the Honorable the Minister for Works if he will have the goodness to grant me an interview, and when, as I am anxious to see him. Your reply will oblige,

Yours, &c.,

W. H. ELDRED.

I will see Mr. Eldred Monday next 2:30 p.m.—J.G., 8/1/86. Write at once.

No. 31.

Messrs. Eldred & Co. to The Secretary for Public Works.

Sir,

Sydney, 11 January, 1886.

We take the liberty of craving reference to our respects of 26th November last addressed to your predecessor.

A few days ago we learnt to our extreme astonishment and sorrow that we had unwittingly given offence to a highly esteemed officer of your Department, viz., Mr. Whitton, by the use of an expression taken from the letters we quoted.

We do not for a moment deny that the purport of the letter was, if by any straightforward means we might advance the claims of our constituents *re* the contract for the big bridge; but we most emphatically assure you that it never for a moment struck us that such an offence, as we have mentioned, existed in the letter. We must, however, admit now that our attention has been called to it that such an interpretation can be put upon it, and we consequently determined to wait upon you to express our unbounded regret, and to support this written assurance, that neither at the time of writing, nor at any other time, had we any intention of casting a reflection on such a long tried and faithful servant of the Colony as your Engineer-in-Chief, Mr. J. Whitton.

Requesting that you will be good enough to communicate to Mr. Whitton this expression of our apology and regret at the unintentional slight contained in our letter, We have, &c.,

ELDRED & CO.

Engineer-in-Chief.—J.G., 11/1/86. I had no intention of taking any further notice of this matter, as I am quite sure that so far as Captain Eldred is concerned the communication referred to had not his concurrence.—J.W., 15/1/86. Under Secretary, B.C. Submitted.—J.R., 18/1/86. Seen.—J.G., 18/1/86.

No. 32.

Minute by The Engineer-in-Chief for Railways.

Hawkesbury Railway Bridge,—Union Bridge Co.'s design.

Engineer-in-Chief's Office, Sydney, 22 January, 1886.

If the above Company approve of the following conditions, in addition to those already printed, I advise that their tender of £327,000 be accepted.

Complete working drawings and specification, to be furnished and approved before the contract is signed.

A schedule to be sent in stating the price at which any increase or diminution of work shall be allowed for.

The horizontal stiffener, extending from the inclined strut at the ends of the main girders, to be extended so as to stiffen two more of the vertical struts at each end.

The area of cross section of the bottom boom in the third bay to be increased, the tensile strain being somewhat in excess of the tensile strain named in the printed conditions.

The outer skin of the caisson, where it is flat and unsupported for a length of 14 feet between the centres of the cylinders sunk within it, would require staying to the cylinder and to an inner plate extending from the centre lines of the cylinder, at a distance of about 6 feet from the outer skin; also the thickness of some of the plates forming the caisson should be increased and stiffened by vertical and horizontal T and L bars at the joints.

The longitudinal bearers under the rails should be deepened and more securely braced.

The testing of the eye-bars to be carefully carried out in accordance with the most recently approved method.

The cement concrete for the caisson to be formed with Kiama bluestone instead of sandstone, as proposed, which will increase the cost about 6s. a cubic yard. The proportion of cement shall not be less than one part of cement to nine parts of broken stone, gravel, &c., each measured separately.

I propose that the contractors shall be paid this difference in the value of the concrete, which will amount to about £7,800, and by using this improved concrete the outer walls (18 inches in thickness) round the inside of the caisson, as suggested by the Board in London, may be dispensed with.

I also propose that the cost of strengthening the ironwork, named above, shall be paid to the contractors at prices to be agreed upon, the total cost not to exceed £15,000; but should any increase in strength be required to any other portions of the bridge, after the detail drawings have been prepared, the total cost of such additional ironwork and labour shall be provided at the expense of the contractors.

As I understood that all the detailed drawings and the specification of this bridge will be prepared in London, and the larger proportion of the ironwork manufactured there, I propose that in order to save time these be referred to Sir John Fowler, as Inspecting Engineer to the Government, whose decision in all matters affecting the stability of the bridge shall be binding on the contractors.

A formal contract can also be entered into in London by the Agent-General and the Union Bridge Company. As General Field, the agent of the Company, is anxious to leave the Colony not later than the 28th instant, I have written this paper as a provisional arrangement to enable him to do so. He should, however, be asked to give his sanction in writing to my proposals before leaving.

My report on the whole of the designs for this bridge will follow in a few days.

JOHN WHITTON.

The

The following minutes are endorsed on the Engineer-in-Chief's report of 22/1/86 :—

Minute by Secretary for Works.

For the favourable consideration of the Cabinet.—J.G., 25/1/86.

Minute of Premier.

The Cabinet concur in recommendation of the Minister for Works and the Engineer-in-Chief.—JOHN R., 25/1/86.

Minute by Commissioner.

Letter to General Field, the accredited representative of the Union Company, submitting these amendments and additions to the specification and conditions, and intimating that if he will, on behalf of his Company, express his acceptance of these terms the Agent-General will be instructed to enter into a contract with his Company for the construction of the work.—CHAS. A.G., 27/1/86.

Minute of Commissioner.

See letter from Mr. Field in reply agreeing to terms dated 27/1/86. Letter to Agent-General forwarding correspondence and requesting him to enter into contract upon the amended terms, impressing upon him the importance of the work being completed within contract time, viz, two and a half years after execution of contract, and intimating that a penalty should be exacted at £2,000 per week or a portion of a week the contract time is exceeded.—C.A.G., 1/2/86.

No. 33.

The Commissioner for Railways to General G. S. Field.

Sir,

Department of Railways, Sydney, 27 January, 1886.

Referring to the tender, No. 3, from the Union Bridge Company, New York, U.S.A., of which Company you are the accredited representative, for the construction of a bridge over the Hawkesbury River, N.S.W., I have the honor to inform you that if the above Company approve of the following conditions, in addition to those already printed, the Government of this Colony will instruct the Agent-General to accept their offer and to execute a contract embodying the printed and these additional conditions, viz :—

The Company to furnish complete working drawings and specifications, to be approved of by the Inspecting Engineer in England before the contract is signed.

The Company to submit a Schedule stating the prices at which any increase or diminution of work shall be allowed for.

The horizontal stiffener, extending from the inclined strut at the ends of the main girders, to be extended, so as to stiffen two more of the vertical struts at each end.

The area of cross section of the bottom boom in the third bay to be increased.

The outer skin of the caisson, where it is flat and unsupported for a length of 14 feet between the centres of the cylinders sunk within it, to be stayed up to the cylinder and to an inner plate extending from the centre lines of the cylinder at a distance of about 6 feet from the outer skin.

The thickness of some of the plates forming the caisson to be increased and stiffened by vertical and horizontal T and L bars at the joints.

The longitudinal bearers under the rails to be deepened and more securely braced.

The testing of the eye-bars to be carefully carried out in accordance with the most recently approved method.

The cement concrete for the caissons to be formed with Kiama bluestone, instead of sandstone as proposed. The proportion of cement to be not less than one part of cement to nine parts of broken stone, gravel, &c., each measured separately. This difference in the value of the concrete to be paid for at the rate of 6s. per cubic yard.

The cost of strengthening the iron work named above to be paid to the contractors at prices to be agreed upon, the total cost not to exceed £15,000. Should any increase in strength be required to any other portions of the bridge, after the detail drawings have been prepared, the total cost of such additional iron work and labour to be provided at the expense of the contractors.

As it is understood that all the detail drawings, specifications, &c., will be prepared in London, it has been determined in order to save time, that your Company shall submit, through the Agent-General, such drawings, &c., to be referred to Sir John Fowler, as Inspecting Engineer of the Government, and whose decision on all matters affecting the stability of the bridge shall be binding upon your Company.

In the event of the acceptance of these additional conditions, which must be at once communicated to me in writing, the Agent-General will be instructed to enter into contract with your Company for the construction of the bridge on the terms and conditions of your tender as amended.

I have, &c.,

CHAS. A. GOODCHAP.

No. 34.

The Union Bridge Company to The Commissioner for Railways.

Sir,

Sydney, 27 January, 1886.

We have your letter of this date relating to additional conditions in the matter of the contract for the Hawkesbury Bridge. We accept the additional conditions, and hereby amend our tender accordingly. We shall be able to present to the Agent-General, at his office in London, on or about 1st April, 1886, with the plans mentioned for the approval of the Inspecting Engineer in England. We trust that full instructions and all papers will have been received by that time, that no delay will occur in executing the contract, with a view of starting the work at once.

UNION BRIDGE CO.,
(By Geo. S. Field).

Agent-General advised, 1, 2, 86.

No. 35.

The Secretary for Public Works to The Agent-General.

Sir,

Department of Railway, Sydney, 1 February, 1886.

Referring to your letter of the 11th September last, covering tenders for proposed railway bridge over the Hawkesbury River, together with the Board of Engineers' and the Inspecting Engineer's reports, I have the honor to inform you that this Government has decided to accept, subject to certain amendments, the tender, No. 3, for £327,000, submitted by the Union Bridge Company of New York, for the construction of the bridge, the acceptance of such tender being recommended by the Board of Engineers and the Inspecting Engineer in England, and by the Engineer-in-Chief of this Colony.

The basis of the proposed amendments is set forth in the copy of letter enclosed, addressed to Mr. G. S. Field, the accredited representative of the Union Bridge Company.

Mr. Field, on behalf of the Company, has signified his acceptance of the new conditions in a letter dated 27th instant (copy enclosed), and is willing that the Company's tender be amended.

I shall be glad if you will enter as early as possible, on behalf of this Government, into the necessary agreement in this matter, on the basis of the tender and our amendments therein.

The time for the completion of the work to be as stated in the Union Bridge Company's offer, 2½ years, and the Company should be given to understand that no extension of time will be allowed, as it is most important that the bridge should be completed within the contract time. Penalties must, of course, be provided in the conditions for the non-fulfilment of the terms of contract, which should be £2,000 per week, or portion of a week, beyond the stipulated time.

I have, &c.,
J. GARRARD.

No. 36.

The Compagnie de Fives-Lille to The Minister for Public Works.

Sir,

Sydney, 29 January, 1886.

I have the honor to inform you that, at the invitation of the Government of New South Wales, the Compagnie de Fives-Lille, which I represent in Australia, have sent in a competitive design and tender for a bridge over the Hawkesbury River.

I hear that this contract is probably going to be given to an American firm.

I now respectfully beg to request you that the report of the engineers who have examined the designs should be communicated to me, that I may know on what grounds we have been discarded, and be allowed, as a matter of justice, to present my remarks in defence of the interests of my company before the Government arrive at a final decision.

I trust that you will consider my request entirely justified in consideration of the fact that we are the only Continental firm who have responded to the invitation of the Government, and that we have gone to a greater amount of trouble and expense than any of the other tenderers, in order to supply you with a first-class design and a *bona fide* tender.

I remain, &c.,

(Per pro Co. de Fives-Lille),

CLEMENT VAN DE VELDE.

Acknowledge this, and say that his letter will receive consideration.—J.G., 29/1/86. Done, 31/1/86. The Union Bridge Co.'s tender has been accepted.—D. C. M.L., 3/2/86.

There was a recommendation by the Board of Engineers I think, that in consideration of the interest taken in this matter of the bridge by eminent firms, who submitted most elaborate plans at considerable expense, an expression of the thanks of the Government might be tendered when intimating to those interested the result of the competition.—CH. A.G., 4/2/86.

Minute of Commissioner.

Keep this, in order that the recommendation may be acted upon generally when papers are returned. The Agent-General will be asked to write the letters when returning the plans to tenderers, &c., who sent their offers through him.—CHAS. A. G., 5/2/86.

No. 37.

Minute of Commissioner.

Proposed Railway Bridge over the River Hawkesbury.

The only action now remaining in respect of the tenders and designs received is to return to the unsuccessful tenderers their plans, &c., and to intimate to them the result.

Sir John Fowler in his report on these designs has a paragraph to the following:—"In my work of investigation of the drawings, tenders, and calculations which preceded the preparation of this report, I was much impressed with the amount of labour and expense which the parties tendering for the Hawkesbury Bridge must have incurred, and I would suggest that the New South Wales Government might perhaps be disposed, in communicating their final decision to the contractors, to recognize the fact of careful and laborious work in the preparation of the designs by the terms of their communication to the parties whose tenders are not accepted. If this suggestion be thought worthy of consideration, the mode of giving effect to it will be better determined at Sydney than by anything I can propose for the guidance of the Government."

There are thirteen unsuccessful tenders (some with more than one design, and three tenders for superstructure only.)

The terms of Sir John Fowler's recommendation or suggestion would seem to imply that the recognition should take a more substantial shape than words of appreciation and thanks.

A graceful way, perhaps, of recording the appreciation of the Government would be to have a gold medal struck with appropriate inscription, to be presented to each of the tenderers. The Agent-General could get this done in London, and present them on behalf of the Government.—C.A.G., 6/3/86.

Minute

Minute of Secretary for Works.

I do not object to the suggestion being carried out, but should like to know the cost likely to be incurred.—W.J.L., 16/3/86.

I suppose the cost would not exceed £150. Please ask some of the medallists.—C.A.G., 18/3/86. £150 will more than cover the cost of thirteen first-class medals.—D.C. M'L., 23/3/86. Approved cost not to exceed £100.—W.J.L., 22/4/86. Agent-General advised, 12/5/84.

No. 38.

Telegram from The Agent-General, London, to The Colonial Secretary.

London, 20 April, 1886.

HAWKESBURY Bridge settled, except penalty. Field agrees to £250 per week delay. Same premium, earlier completion. Fowler considers this usual condition. Recommends acceptance. Contractors to give Bank deposit receipt, payable to order Government in Sydney, for £10,000 instead sureties. Reply quickly. SAMUEL.

Government approve Fowler's recommendation Hawkesbury Bridge. Penalties, premium, and deposit, £10,000.—G.R.D. Inform,—C.A.G.

Minute of Commissioner.

I do not think the Government should be asked to pay premiums for earlier completion. The contractors will get returned the retention money and the deposit money, which should be sufficient compensation. The question whether £10,000 should be accepted as security for proper completion of contract instead of personal security should be referred for the opinion of the Engineer-in-Chief.—C.A.G., 21/4/86.

Approved.—W.J.L., 22/4/86. Engineer-in-Chief, *pro* Commissioner.—G.B., B.C., 24/4/86.

As the Union Company fixed the time for completion of this bridge themselves, I do not think they should be paid a premium for completing before that time. I am under the impression that Messrs. Cameron & Co., of New York, guaranteed the due completion of this bridge by the Union Co. I have not the original papers to refer to, but if this be so, it would be better to accept them as sureties instead of the cash security of £10,000 proposed.—J.W., 28 April, /86.

Minute of Premier.

Cabinet approve of premium and penalty being paid, and that the £10,000 security be accepted instead of sureties.—P.A.J., 29/4/86.

Dear Lyne,

Colonial Secretary's Office, Sydney, Thursday.

Samuel's cable *re* Hawkesbury Bridge,—Will you decide, and let me have your decision, as to the reply to be made? They are cabling from home for your decision. G.R.D.

Copy of cablegram sent by Colonial Secretary herewith.—D.C.M'L., 4/5/86. Government approve Fowler's recommendation Hawkesbury Bridge. Penalties, premium, and deposit £10,000 here.—GEORGE R. DIBBS, 29 April, /86.

No. 39.

The Secretary for Public Works to The Agent-General, London.

Bridge over the Hawkesbury River.

Sir,

Department of Railways, Sydney, 12 May, 1886.

I have the honor to inform you that the design and tender of the Union Bridge Company of New York for the above named bridge having been accepted, it only remains to return the plans to the unsuccessful tenderers, and to acquaint them with the result.

This I will ask you to do; but we can scarcely close our intercourse with the gentlemen who have devoted so much talent and time and labour to the matter with a bare intimation that they have been unsuccessful.

Sir John Fowler, in his report on the designs, writes as under:—

"In my work of investigation of the drawings, tenders, and calculations which preceded the preparation of this report, I was much impressed with the amount of labour and expense which the parties tendering for the Hawkesbury Bridge must have incurred; and I would suggest that the New South Wales Government might perhaps be disposed, in communicating their final decision to the contractors, to recognize this fact of careful and laborious work in the preparation of the designs by the terms of their communication to the parties whose tenders are not accepted. If this suggestion be thought worthy of consideration, the mode of giving effect to it will be better determined at Sydney than by anything I can propose for the guidance of the Government."

The terms of Sir John Fowler's recommendation would seem to imply that, in his opinion, the recognition by the Government should take a more substantial shape than mere words of appreciation and thanks.

In this view I cordially concur; and it seems to me that it would be a graceful mode of showing the appreciation of the Government to present to each of the unsuccessful tenderers a gold medal bearing a suitable inscription.

I shall be glad if you will take steps to have the requisite number of medals struck off, at a cost not exceeding £100, and that you will present a medal to each of the unsuccessful competitors, accompanied by a letter in suitable terms, expressive of the high appreciation of the Government of the talent displayed in the preparation of the respective designs.

I may add, that the sum of £100 will be placed at your disposal for this purpose.

I have, &c.,
WILLIAM JOHN LYNE.

No. 40.

The Secretary for Public Works to The Engineer-in-Chief for Railways.

Re Hawkesbury Bridge.

Department of Public Works, Sydney, 19 May, 1886.

I SHALL be glad if the Engineer-in-Chief will advise me if the Government have anything to do with the carriage of the materials from America for the Hawkesbury railway bridge. Have the Union Company an agent in Sydney? if so, please give name, and can Mr. Whitton say what has been done towards the commencement of the work?

W. J. L.

The Government has nothing to do with the carriage of the bridge material from America or elsewhere, the contract of the Union Company being to fix the bridge complete. I am not aware that the Company has an agent in the Colony. I understand that the detailed drawings for the bridge are being prepared in London.—J. W., 21/5/86. Seen.—W. J. L. Under Secretary.—B. C.

No. 41.

The Agent-General, London, to The Secretary for Public Works.

Hawkesbury Bridge.

Sir, 5, Westminster Chambers, London, 21 May, 1886.

Referring to your letter of the 1st February last, 86-1444, in which you desired me to enter into a formal contract for the construction and erection of the Hawkesbury bridge, upon the terms set forth in the tender of the Union Bridge Company of New York, forwarded in your before quoted communication, I have the honor to inform you that, yesterday, the formal contract was duly signed by General Field, on behalf of the Union Bridge Company, at this Department, and I hope by next mail, to be able to forward to you copies of the contract.

I take this opportunity to draw attention to the power of attorney held by myself on behalf of the Commissioner for Railways.

The power in question, in accordance with the opinion of Mr. Want, only gives me authority to enter into contracts for the purpose of purchasing plant and machinery for the Commissioner for Railways; and Mr. Want is of opinion that I should hold an authority having a more general power, as the one I now possess does not permit of me to enter into contracts such as that for the Hawkesbury bridge.

I have, &c.,
SAUL SAMUEL.

Minute of Commissioner.

The question of the sufficiency of the Agent General's authority to act for the Commissioner for Railways has been referred to Crown Solicitor by separate memo.

C.A.G.
17/7/86.

No. 42.

The Agent-General, London, to The Secretary for Public Works.

Hawkesbury Bridge.

Sir, 5, Westminster Chambers, London, 28 May, 1886.

20th May, 1886.
Contract.

In continuation of my letter P.W. 76-86, of 21st instant, I have now the honor to forward herewith the contract entered into with the Union Bridge Company of New York, U.S.A., for the construction of a bridge over the Hawkesbury River.

The signed drawings will be forwarded by a subsequent opportunity. I also enclose a copy of a letter addressed to me by the Inspecting Engineer, in regard to the final arrangements made respecting this contract.

I have, &c.,
SAUL SAMUEL.

Hawkesbury Bridge.

Sir, 2, Queen-square Place, Westminster, S.W., 27 May, 1886.

The contract with the Union Bridge Company for the above work being concluded, I have now to report the final arrangements made by myself and the contractors represented by General Field.

In settling the details of the specification, I have given due consideration to the instructions received from the Secretary of Public Works (February 1st), the correspondence between Commissioner of Railways (January 27th) and General Field; and also to the suggestions of the Engineer-in-Chief for Railways, embodied in a letter addressed to me and dated March 1st, 1886.

I am glad to be able to report that no difficulty has arisen in settling the contract in conformity with the spirit of my instructions, and on a satisfactory basis, the contractors having shown every desire to meet my views on all important points.

Detailed

Detailed drawings and specification.

The detailed drawings submitted to me here by the contractors differed in some respects from those accompanying their tender. The modifications were, however, in my opinion, improvements; and I accepted them, after making exact calculations of all stresses, and ascertaining that the section of metal proposed to be given to the different members of the bridge was in accordance with the maximum stresses which were specified.

In accordance with the suggestions of the Engineer-in-Chief, additional stays have been introduced in the caissons, and the thickness of some of the plates has been increased. Ample provision is thus made against every contingency.

Experience has disclosed a possible source of danger in exceptionally deep foundations, from the tearing of the iron caissons through a circumferential seam of rivet-holes, owing to the severe stress arising from the binding of the sand on the upper part of the caisson, and from the excavation being in advance of the cutting edge.

Under the contract this, as well as all contingencies of construction, is the sole responsibility of the contractors; but I thought it proper to point it out to General Field, and I suggested to him that the best way of completely guarding against all risk would be to make the outer skin of the caissons and the T bar covers of steel instead of iron, and to strengthen the riveting considerably. He at once saw it was vital to the interests of the contractors to take every precaution to guard against such a risk as I indicated, and he undertook, therefore, to substitute steel for iron, and therein strengthen the caissons, as suggested, without extra cost.

I have thus been able to make a very satisfactory settlement financially, the total extras amounting to £13,000 only, or about £10,000 less than the sum I was authorized to accede to, if necessary.

This £13,000 includes the £7,800 proposed in the letter of the Engineer-in-Chief, dated January 2nd, 1886, to be paid for the substitution of Kiama bluestone for sandstone in the concrete; and further includes the substitution of crushed sandstone for local sand in the mortar and concrete, and also the strengthening of the metal-work where indicated.

It is unnecessary for me to set forth the several clauses of the contract, which were all arranged after careful discussion and consultation with the solicitors. They have been specially framed with a view to prevent disputes arising hereafter, and are, in my opinion, fair and equitable as between the parties.

One of the points which received my most careful consideration was the clauses affecting the pier-work. The tender was for piers sunk through the material shown by the borings furnished to the contractors, and it was necessary to provide for the contingency of the material which may be met with in the excavation of the piers differing from that described in the borings, and which in very deep foundations is not unusual.

To meet this possible contingency, an arbitration clause has been introduced in the contract, which will provide a fair basis for settlement, in the event of any important difference arising as regards the character of the material sunk through.

Steel Superstructure.

The manufacture of the steel superstructure, with the exception of the eyebars, has been undertaken by Messrs. Arrol & Co., the contractors of the Forth bridge, which will be a sufficient guarantee of excellence of material and workmanship. The steel plates and bars will be rolled by Messrs. Colville, of Glasgow, one of the best makers; and the steel for the eyebars by the Steel Company of Scotland, also a firm of the highest reputation.

Caissons.

The manufacture of the steelwork and ironwork of the caissons has been undertaken by Messrs. Head, Wrighton, & Co., of Stock-on-Tees, who have much experience in this class of work.

Cement.

The whole of the cement will be supplied by Messrs. Burge & Barrow, of Rainham, who are in the first rank of cement manufacturers.

It is proper for me to state that, in sub-letting the work to the above firms, the contractors have been greatly guided by my experience and knowledge as to the works executed and character of the firms, and not merely by the price quoted.

I am, &c.,
JOHN FOWLER.

No. 43.

Telegram from The Agent-General, London, to Acalemma, Sydney.

Is Hawkesbury bridge deposit sackage lodged? Send credit, shipments now being made.

The Under Secretary for Public Works.—B.C., 15 July, 1886.

No. 44.

Telegram from Union Bridge Company, New York, to The Commissioner for Railways.

15 July, 1886.

Has deposit been made to your satisfaction?

See telegram to Colonial Secretary from Agent-General. Union Bridge Company propose making deposit in London. Mr. Secretary Lyne had no objection, provided expenses of transmission of money to Colony are borne by Company. Telegram sent to Agent-General through Colonial Secretary. When reply is received will reply to this cablegram.—C.A.G., 21/7/86.

Principal Under Secretary written to to-day, asking him to send cable to Agent-General.—27/7/86.

Minute

Minute of Commissioner.

Mr. Stokes, of Towns & Co., called upon me recently in respect of the security. Write to Towns & Co., stating that I have now received contract duly executed, on the 20th May. One of the conditions, of which is that £10,000 should be deposited in my favour in a Sydney Bank, as security, within sixty days. As the time will expire on the 20th July instant, point out that the deposit receipt of the Commercial Bank should be in my hands by that date.—C.A.G., 17/7/86.

Minute by Commissioner.

See telegram from Agent-General to Colonial Secretary, asking if deposit can be made in London. Reply, with Mr. Secretary Lyne's approval, sent. No objection, provided expenses of transmitting money to the Colony are borne by Company.—C.A.G., 29/7/86.

Messrs. Towns & Co., agents for the Union Bridge Company, written to to-day to provide a bank deposit receipt for £10,000, as security on the contract, on or before the 20th instant. Resubmit this on 20/7/86.—D.C. M'L., 17/7/86.

No. 45.

The Commissioner for Railways to Messrs. Town & Co., Sydney.

Gentlemen, Department of Railways, Sydney, 17 July, 1886.

Referring to your Mr. Stokes inquiry of a few days since, relative to the security to be deposited by the contractors in connection with their contract for the bridge across the Hawkesbury River, I have the honor to inform you that I received the contract for this bridge, duly executed, on the 20th May last, one of the requirements of which is that there shall be deposited in some bank in Sydney, approved of by me, the sum of £10,000, before the expiration of sixty days from the abovementioned date. As the sixty days will expire on the 20th instant, I have to point out that a deposit receipt on the Commercial Bank for £10,000 in my favour should be in my hands by that date.

I have, &c.,
C. A. GOODCHAP,
Commissioner for Railways.
(per D. V.).

No. 46.

Telegram from The Agent-General, London.

UNION Bridge Company have cabled credit sackage here. Reply quickly if I can accept and transfer to credit of Government in Colony.

Minute of Commissioner.

No objection, I presume; but all charges for bringing money out should be borne by contractors.—CHAS. A. G., 21/7/86.

Minute of Secretary for Works.

There is no objection if charges are paid. Send telegram.—W.J.L., 21/7/86.

Cablegram herewith for signature and transmission to Agent-General, 21/7/86. Union Bridge Company. Accept deposit. Charges of transfer to Colony must be borne by Company. Reply.—D.C.M'L. (pro Commissioner), B.C., 21/7/86. Principal Under Secretary. Very Urgent.

No. 47.

The Agent-General, London, to The Colonial Secretary.

Sir, Westminster Chamber, London, 23 July, 1886.

Referring to the telegrams that have recently passed between your Department and mine, respecting the deposit to be lodged by the contractors (the Union Bridge Company, New York), in respect of their contract for the Hawkesbury Bridge, I have the honor to inform you that Messrs. Brown, Shipley, & Co., of London, have received the amount from the Union Bridge Company to be handed over to me on account of the Commissioner of Railways, as provided for in their contract.

I have, accordingly, requested Messrs. Brown, Shipley, & Co. to pay the amount at once into the London and Westminster Bank to the credit of the Government account, and I propose to cause the said amount to be transferred to Sydney without delay; and I anticipate being able, by the next mail, to report to you that the transfer has been made.

I have, &c.,
SAUL SAMUEL.

No. 48.

Telegram from The Agent-General, London.

26 July, 1886.

UNION Bridge Company have lodged deposit, ten thousand, to credit Government, London and Westminster Bank.

Minute of Commissioner.

I think it would be better to have this money sent to the Colony, and deposited with some approved Bank in Sydney, to the order of the Commissioner for Railways, as provided by the 20th condition of the contract. If any complication arise this money should be at command.—CHAS. A. G., 30/7/86.

The Secretary for Public Works,—G.R.D., 2/9/86. The Under Secretary for Public Works.—B.C., 2 September, 1886. Railways.—B.C., 6/9/86.

The

The money has now, I understand, been received in the Colony. Please inquire at the Treasury whether the £10,000 has been paid to the credit of the Commissioner in one of our local banks. Ascertain this at once in order that we may reply to the Union Company's cablegram.—D.C.M'L., 20/9/86.

On inquiry at the Treasury, I find this money, £10,000, has been received and sent to the Commercial Bank, to be placed to the credit of the Commissioner. When deposit receipt is received, it will be forwarded by the Hon. G. Eagar to the Commissioner.—W.M., 21/9/6. The Chief Clerk.

No. 49.

The Under Secretary to The Commissioner for Railways.

Sir,

The Treasury, N.S.W., 1 October, 1886.

I have the honor, by direction of the Colonial Treasurer, to inform you that, under date 6th August last, the Agent-General advised that the Union Bridge Company of New York had lodged, in terms of its contract, a sum of £10,000 in the Commercial Banking Company of Sydney, London Office, as security in connection with its contract for the erection of the railway bridge over the Hawkesbury, and that such sum was in course of transfer to Sydney. The amount was placed to credit of the public account of the Government in the Commercial Bank here on 16th ultimo, and, inquiry at your office elicited the information that the conditions of contract provided that the money was to be placed on fixed deposit to your order with interest payable to the contractors. The Bank in question was asked to state what rate of interest they were prepared to allow, and their offer of 6 per cent. per annum for a fixed deposit for twelve months having been accepted by the Treasurer; the transaction was completed yesterday, and I am now to hand you, enclosed, a fixed deposit receipt of £10,000 as described in the margin hereof, and to request the favour of an acknowledgment of the same.

No. 31,805, dated 30th September, 1886, in favour of the Commissioner for Railways for £10,000, Commercial Banking Company of Sydney, fixed deposit for twelve months at 6 per cent.

I have, &c.,

G. EAGAR.

The Accountant.—D.V., 7/10/86. Received deposit receipt, £10,000, due 30th September, 1887,—W.W., 1/10/86. Accountant, entered.—W.W., Sec., B.C., 5/10/86.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAY FREIGHTS.

(REDUCED CHARGES, &c., DURING LAST SIX MONTHS OF 1885.)

Ordered by the Legislative Assembly to be printed, 18 March, 1887.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 27th August, 1886, That there be laid upon the Table of this House,—

“Copies of all letters, minutes, reports, or other documents, having reference to the introduction of the reduced charges on goods forwarded by railways in consignments aggregating 6 tons in weight, together with a statement showing, separately, to what extent the concession has been availed of by individual consignors and the various railway carrying firms of this Colony, for the last six months of the year 1885, the total tonnage carried and revenue earned by the railways being shown in each case, and also the approximate loss to the revenue as compared with the amount that would have been earned had not such reduction in ordinary rates been sanctioned.”

(Mr. Davies.)

SCHEDULE.

	PAGE.
1. Copies of Extracts from newspapers relative to railway rates at Wagga, with minutes	1
2. Report of Assistant Traffic Manager, dated 10th October, 1882, respecting Merchandise rates and traffic from Melbourne <i>via</i> Wodonga, with minutes, &c., relating thereto	2
3. Notice relative to reduction of Merchandise and Parcels rates, dated 14th October, 1882	4
4. Return showing name of senders, and weight of goods forwarded during six months ending 31st December, 1885, at mixed truck rate (£20) and the amount received, together with approximate amount of loss as against former tonnage rates, with summary thereof	4

No. 1.

Extract from *Evening News*, dated 25 September, 1882.

The Railway Rates at Wagga.

Wagga Wagga, Monday.

There is great dissatisfaction among mercantile men here in reference to the delay which has occurred in the publication of the revised railway tariff, which was promised two months ago. The reductions which have been made by the Victorian Railway Department are inducing traders to return again to Melbourne, and large orders are being sent to the Victorian Metropolis by houses whose trade has hitherto been almost exclusively done with Sydney. With the advent of fine weather, and the consequent facilities for team carriage, the struggle against the iniquitous differential rates between Albury and Wagga will be renewed, as goods can be landed here from Melbourne at much lower rates than those now charged from Sydney. For example, candles and jam can be landed here at 55s. per ton less than from Sydney, galvanized iron at 31s., sugar at 10s. per ton less, and other articles at rates lower than those of Sydney. Two of the largest firms here say that they have sent large orders to Melbourne owing to the effect of the New South Wales rates, and they have opened negotiations for the transfer of their trade altogether to the Melbourne market. They are determined to take their stand against the differential rates now that the season approaches, rendering traffic upon the roads a matter of no difficulty to teams.

98—A

Minute

[817 copies—Approximate Cost of Printing (labour and material), £7 9s. 10d].

Minute of Commissioner.

The new railway rates will come into operation on the 4th October next. The Traffic Manager should keep himself informed of the course of the traffic at Wagga. I discredit the statement that recourse is being had to the Melbourne market. As to carriage by road competing with the rates between Albury and Wagga, it is not possible I think.—CH. A. G., 28/9/82.

I regret to find that the "paragraph" is quite correct. The Victorian Railway Department reduced their rates on the 1st instant, from Melbourne to Wodonga to 30s. per ton for 1st, 2nd, 3rd, and 4th class goods, whereas they were previously 62s. 6d. per ton 1st class, and 65s. for 2nd, 3rd, and 4th classes. See my report of yesterday please.—W. V. READ, *per* D.K., 12/10/82. Commissioner.

Extract *Sydney Morning Herald*, 6 October, 1882.

Breakers ahead.

To the Editor of the *Herald*.

Sir,

4 October.

Are the Sydney merchants asleep in allowing Victoria to euchre them in railway freight? They are bringing goods from Melbourne to Wodonga for Wagga at 30s. per ton all round, teams from thence to Wagga 40s. per ton, thus landing them at the latter place at £3 10s. per ton. The same goods cost from Sydney to Wagga £6 10s. per ton, or a difference of 60s. per ton in favour of Victoria. Trade must gravitate to Melbourne unless immediate steps are taken by your Railway authorities to checkmate them. We want here to trade with our own city, but the difference is too great. I am, &c.,
WAGGA.

Minute by Commissioner.

A good horse team, eight horses, will carry 6 tons, that is £12 between Wagga and Albury; there would be no return traffic, or (say) at the outside 2 tons, in all £16 for the double trip; the double journey would take 10 days. If in constant work 30 trips in the year could be made, the gross earnings being 30 trips at £16 = £480. What would the expenses be? The teamster would have to be paid £110 a year, the wear and tear of plant and renewals would be £60 a year, the horse feed would be 10s. a week for each horse, or £4 a week, equal to (say) £200 a year, leaving a margin of £110 a year to meet interest upon capital and profit. It does not seem good enough.

It may be, however, that the traffic or trade is going to Melbourne from Wagga, of course it is expected that the Traffic Manager will watch the course of traffic and give me timely notice. I should like to see Mr. Roberts' local inspector's report on the representation made.—CHAS. A. G., 8/10/82. Traffic Manager, B.C.

I beg to refer the Commissioner to my report of this date respecting the rates between Melbourne and Wodonga and Echuca.—W. V. READ, *per* D.K., 11/10/82. Commissioner.

No. 2.

Report of Assistant Traffic Manager.

Merchandise Rates, Traffic from Melbourne, *via* Wodonga.

While in the Southern District I have taken occasion to make some inquiries respecting the rates charged on the Victorian lines for traffic coming into New South Wales, and I find that for general goods coming from Melbourne to stations north of Gerogery, and including all the country north of an imaginary line drawn straight from Jingalee, on the Murray; thence to the southern portion of the Urana swamp; thence to the south-west boundary of Thurowa station, to include in that line Cocketgedong, Colomaba, and Thurowa stations; thence in a northerly direction to the south-west boundary of Ugobit block "A," to include in that line Bundure, Yanko F east, and Ugobit block A; thence in a westerly direction along the south boundary of the river back blocks to the intersection of the Murrumbidgee River at Balranald, the rates to Wodonga have been reduced from 62s. 6d. per ton, first class, and 65s. for second, third, and fourth classes to 30s. per ton all round; and even upon Albury goods the same low rate is now charged for the following goods, carried in lots of not less than five tons, viz:—Wire, woolpacks, salt, rocksalt, timber, sugar, cement, tea, kerosene, candles, oilmen's stores, spirits in cases or casks, bottled beer, bar iron, and tanks of malt. These greatly reduced rates which came into operation on the 1st instant, have had the effect of driving the Wagga Wagga storekeepers and others to Melbourne for their supplies, particularly as, at the present time, the rate by team from Wodonga to Wagga Wagga for general goods is only 35s. per ton, and I even saw a letter dated the 3rd instant, from Messrs. Wm. M'Culloch and Co., of Wodonga, to Messrs. Wright, Heaton, and Co., of Wagga Wagga, intimating that they had had the offer of teams for 30s., and as low as 20s. per ton. This I am informed will continue until March next, during which timewool will be being conveyed to Wodonga by teams, and even after that time I am told the rate of carriage will not exceed 40s. per ton, and if that be so, the maximum rate from Melbourne to Wagga Wagga will henceforth be, allowing 5s. for forwarding charges at Wodonga, equal to £3 15s. per ton. Last week five bullock teams left Wodonga for Wagga Wagga with 25 tons of general goods, viz:—Groceries, drapery, sugar, wines, spirits, ironmongery, &c.; and two more teams were loading yesterday with ten tons of sugar and groceries.

Our existing rates from Albury to Wagga Wagga are as follow:—40s. 1st, 49s. 3d. 2nd, 67s. 9d. 3rd, 87s. 9d. 4th class, and to each of these would require to be added at least 5s. for forwarding charges and cartage from Wodonga to Albury. These rates, it must be admitted, were fixed high for obvious reasons, and the result, until the present reduction on the Victorian lines, has fully justified the step that was taken, but some alteration will now be necessary to counteract the action taken by the Victorian Railway Department.

My opinion is that the rates between Albury and Wagga Wagga should be left as they are, and that whatever concession is made should take effect from the Sydney end, whence the maximum rate for any class of goods (except explosives) should be £5 10s. per ton to stations on the Southern and South-western Lines distant over 305 miles from Sydney, and that a truck rate of £20 should be fixed for any or all kinds of 1st, 2nd, 3rd, and 4th class goods, not exceeding six tons; and if that be agreed to, the truck rate

rate for sugar would of course have to be reduced from £24 to £20. Assuming that 5 tons can be put in a truck, and it is very rarely indeed that such a weight of 3rd or 4th class goods can be got into one, in fact the average weight of trucks forwarded from Sydney to Wagga Wagga during September was 3 tons 16 cwt. 3 qr., that would be equal to £4 per ton, and I am inclined to think we would get that rate, but as the rates from Melbourne are now so very low I do not think we would get any more. It would hardly be possible to estimate the loss to the revenue consequent upon such a reduction, because, notwithstanding the reduction of the rate per ton, we would secure full loading for the trucks. I am having a return prepared of the 1st, 2nd, 3rd, and 4th class goods received at Wagga Wagga from Sydney during the first nine months of this year, but it will not be finished for several days yet, and a statement is also in course of preparation of the traffic that has come from Victoria into New South Wales at Albury during the six months ended 30th September ultimo.

The only possible way that the Victorian reduction could be resented would be by placing several heavy tolls on this side of the border, but I understand that the road between Albury and the Murray is within the Municipality of Albury, and that after leaving that town northwards, there are so many different roads which the teams could take, that such a plan would be impracticable, and therefore the only alternative is to lower our own rates.

When at Albury I was informed that after the extension from Albury to Wodonga is opened early next year, the Victorian Railway Department will have a goods shed at Albury, and that they will receive and deliver all their New South Wales goods there. If that be so, it will be so much the more in favour of that department.

I saw the first of the New South Wales wool (five teams) arrive at Wodonga from the Urana district, and I have ascertained that up to Saturday, the 7th instant, 426 bales of New South Wales wool have been taken to Wodonga by team and taken to Melbourne.

I always thought it was a great mistake to allow Victoria to bring their gauge of line into Albury.
—CHAS. A. G.,
12/10/82.

Traffic from Melbourne, *via* Echuca and River, to Hay.

These rates have also been reduced from 48s. to 30s. per ton for 1st, 2nd, 3rd, and 4th class goods, and when at Hay I was shown a letter from Messrs. Wm. McCulloch and Co. to the principal storekeepers (Messrs. Meakes and Fay, who informed me that during the past six weeks they had paid Messrs. McCulloch and Co. nearly £1,200 in freight alone, and that, all things being equal, they would much prefer dealing in Sydney), quoting a through rate of 57s. 6d. a ton for general goods from Melbourne to Hay, and 52s. 6d. for such traffic as corrugated iron, wire, &c. The insurance charges have, of course, to be added to these rates, but they are now also very low, being 10s. per cent. for iron, wire, &c., 20s. per cent. for liquids, drapery, produce, &c., and 40s. per cent. for sugar, salt, cigars, &c. I make full allowance for all these charges when I recommend a maximum truck rate of £20.

At Hay I was introduced to a Mr. Gordon, who has commenced the manufacture of soap in that district, and he called my attention to the high rate for silicate of soda as compared with soda crystals and soda caustic, and he informed me that of the former he uses about 30 tons per annum. I told him there were objections to the reduction of the rate for soda silicate, which he recognized, but he said he could not possibly pay 130s. per ton from Sydney when he can get it from Melbourne for about 60s. I have no doubt but that the £20 truck rate would secure the traffic, and I merely mention the incident in support of my recommendation.

Complaints were also made to me at Hay about the rates for gunpowder and other explosives from Sydney, which are at present £22 14s. for quantities in excess of 10 cwt., and £35 1s. for smaller quantities. As the revenue will not be affected to any material extent, I think the maximum rates from Sydney might be fixed at £10 and £15 per ton respectively for any line.

In the course of a few days the Western Line will be opened to Warren Road; and whether the maximum rate of £5 10s. per ton or £20 per truck should apply to that line is quite another matter. My opinion is that the reductions herein recommended should apply solely to the Southern and South-western Lines, and only because of the special circumstances of the case. I hope that at no very distant date we shall be able to raise the rates again as far as the more distant stations on the South-western Line are concerned, but that will only be possible after river dues have been imposed to such an extent as to raise the rates on the Victorian lines to the same amounts as are charged to those persons who live in that Colony (Echuca, for instance), or to those who do not live within the favoured imaginary line.

The wool traffic from Hay up to Saturday, the 7th instant, amounted to 1,688 bales forwarded to Sydney, and 10,645 bales to Melbourne, and it is generally believed in the Riverina district that next year we shall get a large number of the clips that this year are being forwarded to Melbourne.

I am strongly of opinion that if the reductions recommended are approved, they should be brought into operation at the earliest possible moment, because there can be little doubt, I think, that every day's loss of time since the reductions in Victoria will tend to alienate the trade from Sydney, particularly as far as Wagga Wagga is concerned. As regards the Hay trade, we have only been getting a very limited share of it yet, but I think the reduction proposed will tend more than anything else to induce the storekeepers to look to Sydney for their supplies.

The rates for live stock are, in my opinion, already low enough, and reductions are neither desirable nor necessary, even if it should be decided to abolish the stock tax in Victoria.

Our rates from Hay to Homebush are as follow:—

Cattle (say 10 head) £10 5s. per truck = £1 0s. 6d. per head; sheep (say 100 head) £8 10s. 3d. per truck = 1s. 9d. per head; while the rates to Melbourne are, Deniliquin to Melbourne—cattle (say 10 head) £6 7s. 9d. per truck = 12s. 5d. per head, driving to Deniliquin and depreciation, 5s. = 17s. 5d. per head.

Deniliquin to Echuca and Echuca to Melbourne, sheep (say 100 head) £6 0s. 3d. per truck = 1s. 2d. per head, driving to Deniliquin and depreciation, 7d. = 1s. 9d. per head.

The rates to Melbourne are of course exclusive of the Victorian Stock Tax; and the impression among the squatters is that our live stock rates are very reasonable.—DAVID KIRKCALDIE, 10/10/82. W. V. READ, ESQ., Traffic Manager.

Report to Commissioner that Mr. Kirkcaldie visited Hay, Wagga Wagga, and Albury, with a view of reporting on the effect of recent reductions in Victorian Railway Rates, &c., on our traffic, and that his report shows that to retain the Riverina, Wagga Wagga, and Albury traffic, it will be necessary to fix the maximum rates for all goods except explosives on the Southern and South-western Lines at £5 10s. per ton, and £20 per truck for distances over 305 miles.—W. V. R., 11/10/82. Commissioner.

I must recommend this. For the present the rates proposed will pay us, and we must sacrifice some of the profit we are making to retain the trade and get more of it. I shall be glad if the Secretary will obtain the Minister's approval, if possible, to-morrow, for I should like to advertise at once at Wagga Wagga and Hay what the new truck rates will be—£20 instead of £24—they should come into operation at once before the reduced rates of Victoria get too great a hold of the trade.—CHAS. A. GOODCHAP, 12/10/82.

Minute of Minister.

Approved,—J.L., 13/10/82. Traffic Manager please submit draft advertisement early to-morrow.—L.P.J., 13/10/82. Draft advertisement enclosed; I am issuing general order to-day, and will watch the effect.—W. V. READ, *per* D.K., 14/10/82. Commissioner.

No. 3.

Reduction of Merchandise and Parcels Rates.

Merchandise Rates.

On and after Monday, the 16th October, a truck rate of £20 will be charged for 1st, 2nd, 3rd, and 4th class goods conveyed from Sydney to stations on the Southern and South-western Lines for distances 305 miles therefrom, such load not to exceed 6 tons. Wire will, however, remain at £18 per truck as at present. For smaller consignments under the classes named the maximum rate to the stations indicated will be £5 10s. per ton.

For gunpowder and other explosives the rate for quantities in excess of 10 cwt. will be £10 per ton, and for smaller quantities £15 per ton.

Parcels Rates.

The maximum rates for parcels between Sydney and any station on the South and South-western lines will be reduced as follows:—

1 to 3 lb.	3 to 7 lb.	7 to 14 lb.	14 to 28 lb.	28 to 56 lb.	56 to 84 lb.	84 to 112 lb.
1/6	3/-	4/-	5/6	7/-	8/6	10/1.

And for every additional 28 lb. or part thereof 2/5.

For further particulars apply to the Traffic Manager or the station-masters.

Department of Railways,
Sydney, 14th October, 1882.

CHAS. A. GOODCHAP,
Commissioner for Railways.

No. 4.

RETURN showing the names of Senders and the weight of goods forwarded during six months ending 31st December, 1885, at mixed truck rate (£20), and the amount received, together with the approximate amount of loss as against former tonnage rates.

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(FREIGHT ON MERCHANDISE—CONCESSIONS TO MESSRS. BARTON & GOOLD.)

Ordered by the Legislative Assembly to be printed, 30 June, 1887.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 3rd August, 1886, That there be laid upon the Table of this House,—

“Copies of all Letters, Minutes, Reports, or other Documents, having reference to concessions made by the Railway Department since the year 1880 for the carriage of merchandise on the Railways of the Colony to Messrs. Barton and Goold or other persons engaged in business in the Northern, Western, and Southern Districts.”

(Mr. Dalton.)

SCHEDULE.

NO.	PAGE.
1. Letter from Barton and Goold asking that goods may be carried at reduced rate, Ministers approval and minutes. 13 April, 1880	1
2. Memo. from Traffic Auditor, recharge made for carriage of wire for Barton & Goold, with minutes. 12 March, 1883. 2	2
3. Memo. from Traffic Auditor, asking if authority for carrying Barton & Goold's goods at reduced rate is still in force, with minutes thereon. 16 March, 1883.....	2
4. Memo. from Traffic Manager, asking for papers on this subject, and minutes thereon. 30 April, 1883.....	3
5. Minute by Commissioner for Railways asking for information on subject and replies thereto. 28 July, 1886	3

No. 1.

Messrs. Barton and Goold to The Commissioner for Railways.

Sir,

Cobar, 13 April, 1880.

Having an extensive business in Cobar, and getting from 800 to 1,000 tons of goods per annum for our store, which we have hitherto obtained from South Australia, we desire to address you on the subject of railway freight, as we are naturally anxious to do business with the capital of the Colony in which we reside, if it is possible to do so without suffering a considerable loss.

Our Mr. Goold, being in Sydney on his way to Adelaide, has been interviewed by Messrs. Wright, Heaton, & Co., who made him such liberal proposals for road carriage from Orange to Cobar, that he considers, if the Railway Department are prepared to meet him at all in the shape of a reduction of rail freight, it may be possible for him to buy in Sydney instead of going on to South Australia, and as we are anxious to give Sydney the preference, we now address you in the hope that you may see your way clear to make a reduction, and beg to submit for your approval the following proposition, viz.:—We are prepared to forward to Orange within one month from date from 100 to 160 tons of general merchandise, comprising goods chargeable under first, second, and third class rates, provided you agree to convey the lot at £3 15s. 2d. per ton, or at second class rates. Even this concession would leave us at a disadvantage as compared with purchasing in South Australia, as the following table will show that the difference in carriage would still remain in favor of that Colony to the extent of from 15s. to 40s. per ton. In the

455—

first

[817 copies—Approximate Cost of Printing (labour and material), £3 3s. 11d.]

first instance the freight from Adelaide to Louth, is £4 per ton; carriage thence to Cobar, £2 per ton, and insurance 35s. per ton, making a total of £7 15s., as the cost of carriage per ton on general merchandise from Adelaide to Cobar. The cost from Sydney would be as follows:—Rail carriage from Sydney to Orange, as per proposed concession, £3 15s. 2d. per ton; carriage thence to Cobar £4 10s. by bullock teams, and by horse teams £5 10s., and commission 5s., making the total cost from Sydney per ton £8 10s. 2d. and £9 10s. 2d. respectively, according as the goods may be carried by bullock or horse teams. We might further point out that in obtaining supplies from South Australia, a considerable saving of time is effected.

Notwithstanding the advantage to be derived from dealing with Adelaide, we are prepared to obtain the whole of our supplies from Sydney, provided the Railway Department will treat our proposal in a liberal spirit.

Trusting to receive at once a favorable reply in order that we may without delay commence our purchases in Sydney.

We have, &c.,
BARTON & GOOLD.

May be taken at second class rates.—J.L., 21/4/80.

The Commissioner for Railways to Messrs. Barton & Goold.

Gentlemen,

Department of Railways, Sydney, 23 April, 1880.

In referring to your letter of the 13th instant, respecting the carriage of goods from Sydney to Orange for transmission to you at Cobar, and stating that you are prepared to forward within one month from 100 to 160 tons of general merchandise, on condition that it is carried at £3 15s. 2d. per ton, I have the honor to inform you that Mr. Secretary Lackey, with the view of encouraging the trade between Cobar and the Metropolis, has approved of these goods being carried on the special terms asked for, viz., at 2nd class rates.

I have, &c.,

C. A. GOODCHAP,
Commissioner for Railways.

Traffic Manager.—G.B., 24/4/80. Goods Superintendent to inform all concerned.—W.V.R., 26/4/80. Mr. Harper, Sydney Goods, will please note.—G. F. EVANS, 26/4/80. Noted. I presume this arrangement will apply to all down traffic for this Company all the year round, including special class traffic and gunpowder.—J. HARPER, 27/4/80. I should think so.—G. F. EVANS, 27/4/80.

No. The concession only specifies that 1st, 2nd, and 3rd class traffic for this Company is to be charged at 2nd class rates, all the year round of course. Special class traffic and gunpowder will be charged for according to rate sheet.—W.V.R., 28/4/80. Goods Superintendent.

No. 2.

Memo. from The Traffic Auditor.

MEMO. to Sydney Goods.—Please give your authority for charging wire and other 1st class goods in truck loads for Barton & Goold. Should not goods of 1st, 2nd, and 3rd class for Barton & Goold be charged at 2nd class rates?
H.J.W., *pro* Traffic Auditor.
12/3/83.

The Invoice Clerk charged according to the Rate Book, considering that the truck rate was a special one which did not apply to the ordinary conditions under which their 1st, 2nd, and 3rd class goods were carried.—J. HARPER, 13/3/83. Traffic Auditor. Can 1st class goods be charged at truck rate when conveyed for Barton & Goold? See our 80/2,335.—T.T.B., 14/3/83. Traffic Auditor.

The minute referred to applied to goods conveyed from Sydney to Orange only, and should not be extended to other stations without approval.—THOS. CARLISLE, 14/3/83. Mr. Bonamy. Noted.—T.T.B., 14/3/80.

No. 3.

Memo. from The Traffic Auditor.

I PRESUME the authority for charging trainage on Barton & Goold's 1st, 2nd, and 3rd class goods at 2nd class rates is still in force.

Traffic Manager.

THOS. CARLISLE, 16/3/83.

As Mr. Harper says he charged according to the book of merchandise rates, I do not think the invoice should be interfered with unless Traffic Auditor says it is wrong to do so. Will I get up the old papers, and go into the question afresh?—W. V. READ, 19/3/83. Traffic Auditor. The line has been extended, and the rates revised since 1880. I think the Commissioner's attention should be directed to the matter. The Department does not lose by the arrangement.—THOS. CARLISLE, 20/3/83. Mr. Kirkcaldie will, no doubt, know all about this arrangement.—T.L., 21/3/83. Should special arrangements (including this one) made prior to 4th October, 1882, not included in the book of merchandise rates now in force, be considered as still in operation? I think not.—P.J.T., 6/4/83.

It was decided two or three years ago to carry 1st, 2nd, and 3rd class goods to the Western Terminus (which was then Orange) for the Great Cobar Mining Company at 2nd class rates, and the arrangement is still in force, although when the line is opened to Nyngan it will very probably be abolished. It was on the 4th October last that a maximum truck rate of £18 was fixed for fencing wire and corrugated iron. Had the 7-ton lot in question been invoiced to Narromine at 2nd class rates, the trainage would have amounted to £35 19s. 10d., whereas it was charged at 1st class rates, and the trainage came to £28 18s. 8d. But even that is not in accordance with the rate-book, because the maximum rate for a truck of fencing wire (if it was fencing wire) is £18; and suppose the extra ton had been charged at 1st class rate, the total would only have been £22 2s. 8d. The arrangement made in 1880 should certainly have been adhered to. Do Messrs. Barton & Goold get much 3rd class traffic from Sydney.—W. V. READ, 15/5/83.

Goods

Goods Superintendent. Second class rates are still charged Barton & Goold for 1st, 2nd, and 3rd class goods, who have large consignments of latter class. I have instructed Invoice Clerk to charge all goods, except special and fourth, at 2nd class rates in future.—G.F.E., 17/5/83. Traffic Manager.

(1) Wright, Heaton & Co.	£5 9 6
(2) do	1 15 11
(3) do	1 0 5
						£8 5 10

(1). We got 6 tons of wire in six different consignment notes, all marked "part of truck load." Two of them we received on 30th, and four on 31st January. Redfern forwarded those received on 30th on that day, and those received on 31st went forward in a separate truck. The charge made is correct, seeing that six tons were not all in the same truck.

(2). Eight cases were consigned as containing wire, and charged 3rd class. It was colonial (N.S.W.) wire, and the charge being under a ton, should have been first-class. The exact account is 19/5.

(3). Is an error in weight, but the account is only 2½ cwts. on 3 cwts as claimed.—F.T., 5/4/83.

Inform and say that no allowance on the trainage of the wire can be made; the consignment was delivered to us on different days. The other accounts will be allowed.—W.H.C., 7/4/83. Wright, Heaton, & Co. informed. Goods Superintendent to arrange.—W.V.R., 16/4/83. Station Master, Dubbo, to arrange. Allow 19/5 on wire and 15/3 on groceries.—J.D., (*pro* Supt. EVANS), 16/6/83. Credited Wright, Heaton, & Co. for above amounts this day.—J.H., 18/4/83. S.M., Dubbo.

No. 4.

Memo. by The Traffic Manager.

OBTAIN the papers on which the Cobar Copper Co. were granted second class rates on all their traffic to Dubbo. The concession was made to get the trade, in supplies, from Adelaide, and there will not be any necessity to continue it when the railway is open as far as Nyngan, because we can then deliver their traffic at lower rates than by the overland route.—W.V.R., 30/4/83.

Herewith.—4/5/83. To what station is this Company's traffic now being forwarded, and is the concession of 2nd class rates on all 1st, 2nd, and 3rd class traffic still being allowed.—W.V.R., 5/5/83.

Goods Superintendent. To Narromine and Nevertire? Yes.—G. F. EVANS, 9/5/83.

The concession as per enclosed papers had reference only to goods to Orange. Why has it been allowed to other stations without fresh authority?—W.V.R., 18/5/83. Goods Superintendent. Mr. Harper for explanation.—G. F. EVANS, 19/5/83.

As the line extended westward, it appears to have been assumed that the privilege would be extended to the Company as the different termini were reached. The same Invoice Clerk to whom the original instructions were given has continued invoicing to the extreme Western stations, and the question not having been raised, it has been continued under the impression that the instructions were general, as far as the Cobar Company's goods were concerned.—J. HARPER, 25/5/83. Superintendent Evans.

Traffic Manager to see G. F. EVANS.—25/5/83. Without further instructions the concession must not be allowed after the opening to Nyngan.—W.V.R., 30/5/83. Goods Superintendent. Mr. Harpur to note.—G.F.E., 31/5/83. Noted.—G.H., 1/6/83. Mr. Paull to note.—G.F.E., 2/6/83. Noted.—C.P., 6/6/83. Inspector Hornidge to note and inform all concerned.—G. F. EVANS, 7/6/83. Noted.—M.A.H., 8/6/83. All concerned informed.—G. F. EVANS, 9/6/83. Traffic Manager.

No. 5.

Minute by The Commissioner for Railways.

1st, 2nd, and 3rd class goods for Cobar Company taken at 2nd class rates.

I SEE that Mr. Secretary Lackey approved of this on 21/4/80. How long was it in force? Ask Traffic Manager.—CH.A.G., 28/7/86.

The arrangement was in force from May, 1880, till 9th June, 1883. It was discontinued when the line was opened to Nyngan.—W. V. READ, 29/7/86. Commissioner.

I must have a *précis* of this case and a return of the goods sent, with statement showing revenue that would have been received (presupposing that they would have been sent by our railway) had ordinary rates been charged, and the amount that was received. There is a consignment of wire referred to, which under the arrangement should have been charged 2nd class, but which the rate sheet introduced subsequently to the arrangement, admitted of being carried at a cheaper rate. Was that lower rate allowed, and why?—CH.A.G., 29/7/86.

Per minute of 21/4/80 Mr. Lackey, then Minister, sanctioned a concession on the rates in favour of Messrs. Barton and Goold, of Cobar, viz., that goods of the 1st, 2nd, and 3rd class conveyed for them to Orange should be charged at 2nd class rates. I will thank you to let me have at your earliest convenience a return of the goods carried under that arrangement and the amount paid. Also a statement of the revenue we should have received if the same goods had been carried by us at ordinary rates. A consignment of wire was carried for this firm, and 2nd class rate should of course have been charged, but subsequent to the arrangement above referred to, a reduction in the rate for this commodity was sanctioned. Was the wire in question charged 2nd class under the arrangement, or was the lower rate allowed? If the latter, why?—D. C. M'L., 30/7/86. Traffic Manager.

This

This matter has been carefully looked into, and I find that, from the time the arrangement to carry 1st, 2nd, and 3rd class goods at 2nd class rates for Barton & Goold of Cobar, commenced in April, 1880, to the time it was discontinued in June, 1883, the trainage amounted (at the 2nd class rate) to £3,171 12s. 2d. If the traffic had been charged at the ordinary rate applicable to each class, the amount would have been £4,371 11s. 1d., so that the difference in favour of Barton & Goold was £1,119 18s. 11d. I am strongly inclined to think that the original papers will show that up to the beginning of 1880 all the Cobar traffic had reached its destination by river from Melbourne or Adelaide, and that but for the concession which was made the traffic would have continued to go that way, and would therefore have been lost to our railways. The wire was charged at 2nd class rate, that having been the rate chargeable at the time.—W.V.R., 12/8/86. Commissioner.

• CONCESSION made on freight of goods carried for the Cobar Company.

UNDER date of 13th April, 1880, Messrs. Barton and Goold wrote a letter stating that they were getting 800 or 1,000 tons of goods per annum for their store at Cobar; that hitherto they had obtained them from South Australia, but were very desirous of doing the business in Sydney; that Wright, Heaton, & Co. had made liberal proposals to them for the road carriage from Orange to Cobar, and that if the Railway Department would make a suitable reduction of freight from Sydney to Orange they might be able to buy in Sydney. They were prepared to forward to Orange within a month from 100 to 160 tons of goods, which under the tariff would be chargeable at 1st, 2nd, and 3rd class rates, if they could all be carried at 2nd class rates. This would still leave them at some disadvantage in dealing with Sydney, but nevertheless they were prepared to forego the advantage of dealing with South Australia if the Department would meet their views in the way proposed.

This letter, in some manner not explained, did not come into the Commissioner's hands, but went direct to the Minister, Mr. Secretary Lackey, who minuted to carry the goods at 2nd class rate. The concession accordingly was granted, and goods were conveyed for the firm named under that arrangement, which continued in force until the 9th June, 1883.

Commissioner now (29/7/86) minutes for a *précis* of the case, and for a return of goods forwarded under the arrangement, with a statement showing the revenue that would have been received had ordinary rates been charged, and the amount that was actually received, pointing out that there was a consignment of wire which should have been charged 2nd class under this arrangement, but which the rate sheet, introduced subsequently, admitted of being carried at a cheaper rate. Was the lower rate allowed, and why?

The Traffic Manager on 31/7/86 was called upon to furnish the information asked for by Commissioner, but (having had to send a clerk to Nevertire to obtain the details) the particulars have only to-day been received from the Traffic Manager.

Mr. Read reports that in the period referred to the amount paid by Barton & Goold (at 2nd class rate) was £3,171 12s. 2d., and that if ordinary rates had been charged the amount would have been £4,371 11s. 1d., the difference in favour of Barton & Goold being therefore £1,199 18s. 11d.

The wire referred to by Commissioner, Traffic Manager says, was carried at 2nd class rate. Mr. Read adds that up the time this concession was granted all the Cobar traffic had gone by river from Melbourne or Adelaide, and that if the concession had not been granted it would have continued to go by that route and would have been lost to the railway.

C.A.B., 12/8/86.

For Minister's information. As this matter was alluded to in Wright, Heaton, & Co.'s case (it is difficult to see how it bears upon it), the papers, when the Minister has seen them, will be forwarded to Crown Solicitor.—Ch.A.G., 14/8/86. Minute by Secretary for Public Works.—This case may be forwarded to the Crown Solicitor, but I cannot see anything in it but a special arrangement made between the Secretary for Public Works and Messrs. Barton & Goold.—W.J.L., 24/9/86.

RAILWAYS.

(BILLS OF QUANTITIES FOR RAILWAY WORKS—EXISTING LINES.)

*Ordered by the Legislative Assembly to be printed, 29 April, 1887.**[Laid upon the Table of the House in accordance with promise made in answer to Question No. 9, on Votes and Proceedings of 6th April, 1887.]*

- (9.) Bills of Quantities for Railway Works:—Mr. O'Sullivan asked the Secretary for Public Works,—
- (1.) When was the Order first given to the Department for Existing Railway Lines, and by whom, to supply bills of quantities of works to contractors?
Answer: On 2nd August, 1883, by the then Secretary for Public Works (F. A. Wright).
 - (2.) The number and amount of each contract that bills of quantities were furnished for?
 - (3.) The number of copies of bills sold for each contract?
 - (4.) The number of copies of bills prepared for each contract?
 - (5.) The cost of measuring, computing, compiling, and printing, including all stationery, of the bills for each separate work?
Answer: The information is furnished on annexed statement.
 - (6.) The total amount received for bills of quantities by the Government since the introduction of the principle up to the present date?
Answer: £450 12s. This amount includes the proceeds of sale of specifications, a copy of which is sold to contractors with each set, the set consisting of one copy of specification with form of tender and schedule of quantities attached, and one separate form of tender and schedule of quantities.
 - (7.) The total cost of preparing all the bills of quantities since the introduction of the system up to the present date?
Answer:—£327 8s. 8d. This sum represents the cost of printing and stationery only. No extra cost is incurred in computing quantities which have to be taken out in any case in order to estimate the cost of the work, and for office use.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(ORANGE TO MOLONG—BLAYNEY TO BOURKE)

Ordered by the Legislative Assembly to be printed, 20 April, 1887.

RETURN to an Order of the Honorable the Legislative Assembly of New South Wales, dated 2nd June, 1886, That there be laid upon the Table of this House,—

- “1. The amount of revenue and expenditure at the respective Stations on the Orange and Molong Railway from the date of opening to 31st May, 1886, together with a list of the number of passengers that have travelled to and from the various Stations, and the amount received at each.
- “2. The number of men or officials employed at each Station, and the amount of goods received and despatched therefrom respectively.
- “3. The same information with regard to the various Stations on the Railway from Blayney, Orange to Bourke.”

(Dr. Ross.)

RETURN showing Revenue and Expenditure, Number of Employés, and Tonnage of Goods of Stations on Molong Line, and Stations Blayney to Bourke, from 21st December, 1885, to 31st May, 1886.

No. 1.

A. Ryrie, Esq., M.P., to The Secretary for Public Works.

Sir,

June, 1883. ¶

Can you receive a deputation from the Braidwood district on Friday, the 22nd instant; the gentlemen comprising the deputation have all come down and are in Sydney.

I have, &c.,

ALEX. RYRIE.

For branch railway, Tarago to Braidwood—get information for Minister to-day for this.—J.R., 21/6/83.

Tarago is on the line from Goulburn to Cooma, now being made, Tarago being about 22 miles from Goulburn. From the railway map it will be seen that it is in contemplation to make a line from some point on the present G.S. Railway to Braidwood.—CH.A.G., 21/6/83.

EXTRACT

363—A

[817 copies—Approximate Cost of Printing (labour and material), £11 10s. 1d.]

EXTRACT from *Echo* 22 June, 1883.

RAILWAY EXTENSION TO BRAIDWOOD.

INTRODUCED by Mr. Ryrie, M.L.A., a deputation consisting of Mr. W. Clark, M.L.A., Mr. H. Badgery, M.L.A., Mr. R. Maddrell, chairman of a public meeting held at Braidwood, Mr. Thomas Stewart, and Mr. Rowland Hassall, waited this morning upon the Hon. F. A. Wright, Minister for Works, to ask that a light branch railway line should be constructed from Tarago to Braidwood. They urged that such a line would confer great advantages upon the district through which it passed, and quoted statistics showing that the country was rich in minerals, had immense timber resources, and was unusually good for agriculture. If a light line 26 miles in length were constructed, the district would become very prosperous, and the traffic would repay the cost of construction.

Mr. Wright replied that he was not in favour of the construction of light lines, as those branches we had were signal failures. Substantial lines should be constructed, and indeed the traffic they indicated would require a substantial line to carry it. At present, owing to the destruction of plans and surveys in the Garden Palace fire, the railway surveyors were kept very busy, but he could promise them that a trial survey should be made of the route they indicated, and when Parliament assembled, and he submitted a comprehensive scheme of railway policy, Braidwood would not be overlooked.

EXTRACT from M.-P. 83-3,327.

THE Minister for Works (Hon. F. A. Wright)—Instructions to make a trial survey for a light line of railway, from near Tarago to Braidwood. August, 1883.

No. 2.

EXTRACT from 48 Victoria, No. 26.

AN Act to authorize the raising of a loan for the Public Service of the Colony, and for other purposes. (Assented to 1 November, 1884.)

Tarago to Braidwood, 31 miles, £310,000.

No. 3.

Reports from Mr. Surveyor Simpson *re* Railway to Braidwood.

Mr. Surveyor Hotson to The Engineer-in-Chief.

Sir,

Braidwood, 5 January, 1886.

I have the honor to report that, in accordance with instructions conveyed to me in memo. dated 23rd December, I have examined the line of country from Tarago to Braidwood, *via* Larbert. The accompanying map shows the staked line of permanent survey and the route followed by me in the explanation just made.

The route diverges from the staked line at about 60 chains from the junction of the latter with the Cooma line at Tarago, and, after crossing the Goulburn and Braidwood Road, passes over a level tract of country until the Lake Bathurst Road is crossed, about 4 miles from Tarago—the elevation throughout this length being about 2,300 feet.

Thence it falls gradually along a flat valley, in which the Millended Creek is situated, to the crossing of the Boro Road, about 8½ miles from Tarago, the elevation being about 2,100 feet.

From this point there is a difficult country met with, falling towards Boro Creek.

The line would require to be very carefully chosen here, winding down around the spurs from the range lying to the west, so as to obtain workable grades, but avoiding the deep gulleys coming down apparently from Coghill Mountain.

The creek would probably be somewhere near where shown on plan, about 10 miles from Tarago, the height of creek bed being about 1,965 feet. A bridge of considerable dimensions would be required here.

After crossing some tributaries of Boro Creek, the line would rise thence along the slopes of the hills to a tableland, commencing at about 13½ miles from Tarago; the elevation here being about 2,100 feet.

From this position the line would be continued over a flat sandy scrub country, presenting no features of importance, until reaching the crossing of the Marulan Road, at about 16 miles from Tarago, and an elevation of 2,145 feet or thereabouts.

Thence the fall towards the Shoalhaven River would commence, being carried down around the slopes of a range of hills lying to the eastward of line. The level of river bed, where crossing would probably be made, at 19¼ miles from Tarago, is about 1,950 ft. by aneroid observation, which shows but little fall from the crossing of permanent survey, 7 miles up river. The most favourable point for crossing will probably be found at or near the position indicated.

A large flat, subject to floods, occupies the north bank, between this point and the village of Larbert, and the main channel in the vicinity of Larbert increases so greatly in width that the bridge and approaches could be constructed in that neighbourhood only at greatly increased cost.

At the point shown on plan the length of bridge would probably not differ materially from that on permanent survey, but a high bank on south side, and the general conformation of the country, appear to indicate that in this case a greater height would be required for the structure.

The line from this point would rise along slope of hill on south bank to a height of about 2,040 ft., falling again to crossing of Durran Durra Creek, at 1,980 ft. elevation, and 22 miles from Tarago.

Thence around range, and avoiding St. Omer Creek, the line would continue over a moderately easy country, rising to 2,255 ft., at about 26 miles from Tarago, and falling thence to Braidwood, the height of which at Gaol step is 2,142 ft., and at terminus of permanent survey 2,133·40 ft.

The total distance by route followed by me is about 30 miles.

I estimate the extreme length of line as probably 30½ miles, as against 29½ miles by permanent survey. There

There is a large extent of barren country traversed in portions of this route, but it does not compare very unfavourably in that respect with the line of permanent survey.

In the nature and extent of the works required the two routes appear to be similar, and so far as one inspection enables me to judge, the average cost per mile would not differ materially.

The village of Larbert is a place of no importance, the population being very small. The settlement on and near either route is not very great, but the promoters of the route now reported on claim that the settlers along line of permanent survey are already in a great measure provided with railway communication by their nearness to the Cooma line.

I have, &c.,

JOHN B. HOTSON.

I have not yet received the plan referred to by Mr. Hotson. The working section of the permanently staked line has, however, been plotted, and is a most favourable one for the whole distance between Tarago and Braidwood. The permanent survey has been completed, and as there do not appear to be any special advantages to be gained by adopting the Larbert route (the survey of which has only been asked for after the completion of the permanent survey), I do not think a trial survey need be made, and recommend that Mr. Hotson be allowed to break up his party and return to Sydney.—H.P., 11/1/86. The Engineer-in-Chief. Approved.—J.W., 12/1/86.

Mr. Surveyor Hotson to The Engineer-in-Chief.

Sir,

Braidwood, 5 January, 1886.

I have the honor to return under separate cover the compilation of parish maps between Tarago and Braidwood, on which I have shown the line of permanent staking, and the apparently best route, *via* Larbert, should a trial survey be required.

My report on the latter route is enclosed.

An accident having occurred to Mr. Caswell's level when he had commenced taking the cross levels yesterday, will delay the completion of the work for a day and I shall therefore be unable to leave on Friday as proposed.

In the absence of any instructions to the contrary, I shall leave with camp on Saturday or Sunday, so as to be enabled to proceed to Sydney by night train on Monday. Mr. Caswell will proceed to Goulburn and Crookwell survey as soon as possible.

I have, &c.,

JOHN B. HOTSON.

Received.—H.P., 12/1/86.

Mr. Surveyor Hotson to The Engineer-in-Chief.

Sir,

Braidwood, 10 January, 1886.

I have the honor to inform you that I have forwarded to Tarago, for despatch thence by rail to Sydney, a roll containing the completed working plans of permanent survey, in pencil, the book of reference, and two tracings, which I was instructed to return with working plans. A separate package contains field and level books.

I am informed that the lock-spitting, &c., will be completed on Wednesday next. I have to request instructions as to my examining work, and giving certificate for it, if required to do so.

I have, &c.,

JOHN B. HOTSON.

Received.—H.P., 13/1/86.

No. 4.

Telegram from A. Ryrie, Esq., M.P., to The Secretary for Public Works.

Braidwood Station.

WILL Monday be suitable for interviewing deputation? No reply to telegram.

ALEX. RYRIE.

Monday will not be convenient to Minister. Appoint Friday week, at 11 o'clock. Letter by post. In the meantime please state subject.—Telegram, 19/1/86.

The Under Secretary for Public Works to A. Ryrie, Esq., M.P.

Sir,

Department of Public Works, Sydney, 20 January, 1886.

Referring to your telegrams of the 18th and 19th instant, I am directed to inform you that the Secretary for Public Works will receive the deputation on Friday week, the 29th instant, at 11 o'clock a.m., and I am to request that in the meantime you will state the subject which it is proposed to bring before the Minister.

I have, &c.,

JOHN RAE.

A. Ryrie, Esq., M.P., to The Under Secretary for Public Works.

Sir,

Micalago, 24 January, 1886.

In reply to yours of the 20th inst., *re* Braidwood railway deputation fixed for Friday, 29th inst., I beg to say that the deputation wish to point out to the Minister that the sectional or final survey being now completed, that by request he will order the plans to be gone on with as little delay as possible, they wish to assure the Minister that the route surveyed is approved of by the residents of Braidwood and of the district, and they wish further to point out the benefits it will confer.

I am instructed by the members of the deputation to say that they will accept of Friday, the 29th, to wait upon the Minister.

I have, &c.,

ALEX. RYRIE.

Mr. Palmer.—W.H.Q., 28/1/86. The working plan and section of the Tarago and Braidwood extension are well advanced, and the Parliamentary plan, section, and book of reference will be completed in about ten days.—H.P., 28/1/86. The Engineer-in-Chief.

Department

Department of Public Works, Sydney, 29 January, 1886.

Railway—Tarago to Braidwood.

A DEPUTATION from Braidwood, introduced by Mr. A. Ryrie, M.P., waited upon me to-day to urge that an early commencement might be made with the Tarago to Braidwood Railway. It was represented that an agitation had been got up to have the line taken by a different route than that originally proposed—viz., *via* Larbert, but it was stated that the agitation was merely got up by those who would be personally benefited by the deviation.

It was stated that the original route was the most direct and economical one that could be chosen, while it would serve the greater number of people; no bridge over Reedy Creek was necessary, and crossing the Shoalhaven would be inexpensive.

If, however, the alternate line was adopted, the bridge over the Shoalhaven would be very costly, the country passed through was poorer and more sparsely populated, and it would not prove so suitable to the Braidwood people. They therefore protested against the deviation, and considered that even the expense incurred in a flying survey would not be justifiable. Mr. Ryrie stated he had property along the proposed alternative route, and although he would be personally benefited if it were adopted, he had to express his conviction that the original route was the best one that could be chosen.

It was further represented, in support of the early construction of the line, that the present traffic was very considerable both in passengers and goods, that its mineral resources, principally silver and gold, were becoming more developed, and would give a large traffic.

I informed them that I was glad to meet them, and would give due attention to their representations. At the same time I thought it very desirable that all possible information should be gathered before we definitely committed ourselves to any railway extension.

The want of obtaining sufficient information before approving of lines had in some instances caused extensions to be constructed which did not serve the best interests of the country, and I wished to guard against such mistakes by giving proper attention to all representations made, and having full inquiry before definitely deciding on any route.

I had anticipated that I would have been in possession of a report from the Engineer-in-Chief to have enabled me to give some decision in the matter, but until inquiry had been made I could say nothing definite. If the deviation seemed feasible, and to offer any advantages over the surveyed route, I would, in the interests of the community, have to defer action in connection with the latter until examination was made, but I promised that whatever was done would be done quickly, and that no time would be lost in coming to a decision.

I admitted that Braidwood, on account of its rising importance, merited my best consideration; and the arguments they put forward, coupled with Mr. Ryrie's support, were very weighty, but I could do nothing until the matter had had full consideration.

I shall be glad to see the Engineer-in-Chief in reference to this question.
The Engineer-in-Chief.

J.G., 29/1/86.

The Engineer-in-Chief is absent from Sydney on official business.—W.H.Q., 1/2/86.

No. 5.

F. Tait, Esq., M.P., to The Secretary for Public Works.

Sir,

Legislative Assembly, 12 April, 1886.

I understand a flying survey has been made of a proposed line of railway from Tarago to Braidwood *via* Larbert.

Will you kindly supply me with a copy of the surveyor's report, and oblige,

Yours, &c.,

FRANCIS TAIT.

Shall be glad if information asked for is supplied to Mr. Tait.—W.J.L., 14/4/86. Mr. Tait, M.P., enclosing copies, 22/4/86.

W. H. Quodling, Esq., to F. Tait, Esq., M.P.

Sir,

Sydney, 22 April, 1886.

Referring to your letter, dated 12th instant, to the Hon. the Minister for Works, I have the honor to forward the enclosed copies of reports on the following railway trial survey, viz., from Tarago to Braidwood *via* Larbert, *per* Mr. Surveyor J. B. Hotson.

I have, &c.,

W. H. QUODLING.

No. 6.

A. Ryrie, Esq., M.P., to The Under Secretary for Public Works.

Sir,

Sydney, 5 May, 1886.

Will you be good enough to inform me if the Minister will be able to receive a deputation on the subject of a railway from Tarago to Braidwood on Friday next, the 7th instant, at 11.30 a.m.

I have, &c.,

ALEX. RYRIE.

Inform application granted.—J.R., 5/5/86. Done, 5/5/86.

Minute by the Secretary for Public Works.

Deputation—A. Ryrie, M.P.—Railway from Tarago to Braidwood.

THE deputation, accompanied by Messrs. A. Ryrie, O'Sullivan, Hyam, and Dawson, M.'s P., waited upon me to-day with reference to the Railway from Tarago to Braidwood, and urged that the plans, &c., should be laid before Parliament as early as possible, and the line put in hand without delay.

They believe the railway could be made for less than was estimated, and one of the deputation suggested it might be made a light line. I

I informed them that the plans were ready, and I would take an early opportunity of looking into them. With regard to the suggestion that it should be made a light line, I stated that I was an advocate of light railways where the traffic was not extremely heavy, and on Sir John Fowler's recent visit to the Colony had taken occasion to obtain a report from him, and I found his views entirely coincided with my own. Wherever it was possible, I intended to have light lines constructed, and I would give attention to this extension to see if anything could be done in the way of reducing the cost of the line by laying it down on the lines suggested by Sir John Fowler, *i.e.*, with less sleepers and less ballast, the gauge, however, would have to be the same under the Railway Act, and the rails the usual weight to carry the rolling stock employed.

I promised to look through the plans and papers as soon as I had a convenient opportunity, and stated I saw no reason why action should be delayed in any way.—W.J.L., 7/5/86.

Re-submitted, 12/5/86.—CH.A.G. Could a cheap railway be constructed over this route, and if so, can the Engineer-in-Chief give me an idea of the cost?—W.J.L., 13/5/86. This line could not be constructed as a cheap railway, in consequence of the steep gradients and heavy cuttings.—J.W., 26/5/86. Seen.—W.J.L., 2/6/86.

No. 7.

The Engineer-in-Chief to The Secretary for Public Works.

Department of Public Works, Railway Branch, Engineer-in-Chief's Office,
Sydney, 27 May, 1886.

Railway, Tarago to Braidwood—Forwarding Parliamentary Plan, &c.

I HAVE the honor to forward herewith copies of the plan, section, and book of reference of the proposed railway from Tarago to Braidwood, to be laid before Parliament in accordance with section 9 of "The Government Railways Act of 1858."

JOHN WHITTON.

Report from Trial Survey Branch—Tarago to Braidwood.

THIS is an early settled district, and is for the most part fertile, well watered, and fit for agricultural settlement.

There is little, if any, Crown land along the route of the proposed railway, which is at no part very distant from the first-class macadamized road which now serves the district.

The country around Braidwood is chiefly in the hands of large landed proprietors, and from the nature of the country there is no probability of the railway being extended beyond Braidwood in any direction, except at an enormous cost.

TARAGO TO BRAIDWOOD.

THIS line, it will be seen, will leave the Southern Railway at Tarago, and pass thence to Braidwood, a distance of 29 miles, bringing it within 183 miles of Sydney. The districts through which the line would pass are capable of large production, but are handicapped owing to the want of a cheap and convenient means of transit. The statistics of the Braidwood district, which the railway would affect, are as follows:—

Land in cultivation. acres.	Total area of holdings.	Wheat. bus.	Maize. bus.	Barley. bus.	Oats. bus.	Potatoes. tons.	Hay. tons.	Horses.	Cattle.	Sheep.
5,661	242,200	39,319	3,091	1,977	7,083	623	3,174	3,461	22,407	39,937

This, of course, affords no fair criterion of the traffic that would be gained if a railway were made, as no doubt much larger production will follow the railway; and, in addition, the mineral resources of the district, which are considerable, are likely to be more fully developed, and an all-round benefit to the Colony will result. The railway will not only affect the Braidwood district, but will also, to some extent, serve a large district between it and the coast, and open up a large extent of available agricultural country. In addition to agricultural productions, there will be a considerable traffic locally in live stock; while stock will be travelled from the adjoining districts.

This line might be made, as proposed in other cases, as a cheap railway. The estimated cost can probably be reduced, and the working by running mixed trains in the daytime curtailed as much as possible. There is abundance of excellent timber in the district, which can economically be used in the construction of the railway, and form an item of traffic when the line is made.

The cost of the line is rendered heavy by the expense of the timber openings necessary and bridge over Shoalhaven River, these works absorbing £60,000 of the estimated cost.

The book of reference shows 142 portions of land will be taken.

THE description of this line, as supplied by the Engineer for Trial Surveys, is as follows:—

TARAGO TO BRAIDWOOD (Permanent Survey—Length—29 miles 12 chains.)

THIS proposed branch line leaves the Goulburn and Cooma line at the southern end of the Tarago Station, 158 miles from Sydney; thence across Merigan Creek to the Goulburn and Braidwood road; thence in a very straight direction to Reedy Creek; thence crossing the Bungendore and Braidwood road to Doughboy Creek; thence across Manar Creek, near the Manar homestead; thence via Spring Creek and down Blue's Creek to a crossing of the Shoalhaven River, about a mile and a half above the road-bridge across that river on the Goulburn and Braidwood road; thence passing to the back of the Braidwood race-course, and terminating close to the town of Braidwood, near the junction of the Tarago and Shoalhaven roads, at a point 29 miles from Tarago and 187 miles from Sydney. Appended are tables of the gradients and curves to be used on this extension; also an estimate of the cost of construction, prepared from the working section of the permanent survey. The sharpest curve has a radius of 20 chains, the steepest gradient used being 1 in 40. The estimate as now prepared, agrees very nearly with that supplied when the vote for the construction of this line was approved, the vote showing a small surplus.

BRANCH LINE OF RAILWAY FROM TARAGO TO BRAIDWOOD.

INFORMATION showing the Resources of the District.

Population.

THE population of the Braidwood electorate by the last census of 1881 was 6,948, and that of the adjoining coast districts, 11,484, making a total of 18,534, which has considerably increased since that date, and which will all participate in the advantages to be derived from this branch line of railway.

Productions.

The district is now looked upon as one of the most important in the southern part of the Colony for its grazing, agriculture, and mining combined.

Stock.

Stock.

There are some thousands of cattle fattened annually for market, the most of which find their way to Sydney and Melbourne. There are also a large number of horses, cattle, sheep, and pigs bred in the district, the former being famed throughout the Colony. In addition to the valuable horses which have distinguished themselves on the turf, a large number are exported annually for the Indian market. The character of the soil and climate render the district eminently suited for dairying pursuits, a large quantity of butter and cheese, beyond local consumption, being sent throughout the year to the neighbouring districts of Monaro and Queanbeyan, as well as to Sydney.

Agriculture.

There are 7,000 acres of land under cultivation, consisting of wheat, oats, barley, maize, hay, and potatoes, as well as 300 acres of orchards and vineyards. Many of the above products would be considerably increased in quantity if more speedy means of transit existed.

Mining.

The district abounds in minerals, consisting of gold, copper, silver, lead, tin, iron, coal, and shale. The quantity of gold sent to Sydney in 1882 and 1883 was 21,271 ozs., valued at £80,000. The value of machinery used for gold-mining purposes was £33,615 in 1883, and the number of miners employed 675.

Timber.

Around and to the eastward of Braidwood there are at present twelve saw-mills in full operation, and the railway will afford increased facilities for carrying timber to the interior from there, and additional mills will be erected to meet the growing demand, the timber consisting of iron and stringybark, with the best descriptions of gums, together with other timbers suitable for general purposes. It may be mentioned, as showing the suitability of this timber for railway purposes, that the contractor for the last extension of the Cooma line is at present obtaining the whole of the sleepers required from the Braidwood district, and now employs between 400 and 500 men in that work. The revenue from this source is very considerable, as the Government impose a license fee of £6 per annum for each man, and 2s. 6d. per tree on the reserved lands, and as these contractors pay as much for the carriage of the sleepers as for getting them, the benefit of a railway is self-evident.

Coaching and Passenger Traffic.

There are two coaches running daily between Braidwood and Tarago, carrying an average of twenty-five passengers per day, making a total between them of 9,125 during the year.

Imports.

The quantity of goods imported into Braidwood during the year exceeds 3,000 tons, which must necessarily come by train.

General Remarks.

Beyond what has been already advanced, it must be borne in mind that the district, from its elevated position and temperate climate, must attract the attention of all persons seeking health, and its proximity to the metropolis must render it the sanatorium of the Colony. In addition to its climatic advantages it is splendidly watered with five running streams, which at some future date will prove of immense value for wool-washing and manufacturing purposes. The district is an extensive plateau or steppe between the coast and the table-land, through which the Shoalhaven River flows for a distance of about 100 miles, the valley averaging from 30 to 50 miles in width along its course, and comprising an area of a million and a half acres, a large portion of which consists of fine pasture land, and the wooded portions of rich soil, which, when cleared, will prove as fertile as any similar lands in the coast districts, and bring in a large return to the revenue.

No. 8.

EXTRACT from Votes and Proceedings, No. 128.

Legislative Assembly—No. 128—Thursday, 16 September, 1886.

Railway from Tarago to Braidwood:—Mr. Lyne moved, pursuant to Notice, "That this House approves of the Plan, Section, and Book of Reference of the proposed Railway from Tarago to Braidwood, laid before the House on the 3rd August, 1886, in accordance with the 9th section of the Government Railways Act, 22 Vic. No. 19."

Debate ensued.

Question put:—Ayes, 36; noes, 8.

Resolved in the affirmative.

No. 9.

EXTRACT from Minutes.

Legislative Council—No. 75—Thursday, 14 October, 1886.

Railway Plans, Tarago to Braidwood:—Dr. Mackellar moved, pursuant to Notice, "That this House approves of the Plan, Section, and Book of Reference of a proposed Railway from Tarago to Braidwood, laid before the House on the 29th September last, in accordance with the 9th section of the Government Railways Act, 22 Victoria, No. 19."

Mr. Thornton moved, "That the Question be amended by the omission of all the words after the word 'That,' at the commencement, with a view to the insertion in their place of the words, 'the Question of the approval of the Plan, Section, and Book of Reference of a proposed Railway from Tarago to Braidwood, laid before the House on the 29th September last, in accordance with the 9th section of the Government Railways Act, 22 Vic., No. 19, be referred for the consideration and report of a Select Committee, with power to send for persons and papers; and that such Committee consist of the following members, viz., Mr. Dangar, Mr. King, Mr. Lackey, Mr. Alexander Campbell, Mr. Macintosh, Dr. Mackellar, Mr. Mort, Mr. Terry, Mr. Watt, and Mr. Piddington.'"

Debate ensued.

Question

Question put,—That the words proposed to be omitted stand part of the Question,—Ayes, 7 ; Noes, 14.
 Question,—That the words proposed to be inserted, in place of the words omitted, be so inserted—put and passed.

Question, as so amended,—That the Question of the approval of the Plan, Section, and Book of Reference of a proposed Railway from Tarago to Braidwood, laid before the House on the 29th September last, in accordance with the 9th section of the Government Railways Act, 22 Vic. No. 19, be referred for the consideration and Report of a Select Committee, with power to send for persons and papers ; and that such Committee consist of the following members, viz., Mr. Dangar, Mr. King, Mr. Lackey, Mr. Alexander Campbell, Mr. Macintosh, Dr. Mackellar, Mr. Mort, Mr. Terry, Mr. Watt, and Mr. Piddington,—then put and passed.

No. 10.

Question in Legislative Assembly.

Legislative Assembly—No. 142—Wednesday, 6 October, 1886.

Railway, Tarago to Braidwood.—Mr. Sydney Smith asked the Secretary for Public Works ;—Will he state the name or names of the official or officials who supplied the information which was distributed among Honorable Members during the consideration of the motion approving of the plans, sections, and books of reference of the Tarago to Braidwood Railway ?

Mr. Lyne answered,—The figures quoted in statement No. 1 were taken from the Statistical Register ; the information quoted relative to the gradients, cost of construction, was supplied by the Engineer-in-charge of Trial Surveys ; and the general information was given from my own knowledge of the locality. The information given in statement No. 2 was obtained from general sources. I said so when moving the adoption of the plans, and stated that although I could not altogether guarantee it, I would vouch for the correctness of the information in paper No. 1.

Legislative Assembly—No. 142—Wednesday, 6 October, 1886.

Railway, Tarago to Braidwood.—Mr. Sydney Smith asked the Secretary for Public Works,—If the whole of the produce and live stock, enumerated in the Return laid upon the Table of the House in connection with the Tarago to Braidwood Railway, were transmitted from Braidwood to Tarago, what would be the approximate railway revenue derived therefrom ?

Mr. Lyne answered,—£3,964 for the 29 miles.

No. 11.

A. Ryrie, Esq., M.P., to The Secretary for Public Works.

Sir,

Michalago, 4 December, 1886.

As I have to attend a Railway meeting at Braidwood, on Thursday, the 9th inst., I write to ask if you would forward me something I could read to the meeting with regard to your intention of causing a reduced estimate of its construction to be made out. If you recollect you approved of my getting the line referred to a Select Committee, and you then promised to do what I now state. There will be a large meeting—it was postponed for my attendance,—and I would like if you would oblige me by doing what I ask. The chief object of the meeting is to take steps to procure all statistics with reference to the resources, traffic, &c., of the district, to lay before the Select Committee. You could address me to Braidwood, to the care of Mr. John Wallace, as I hope to be there on Wednesday evening.

I am, &c.,

ALEX. RYRIE.

Please inform Mr. Ryrie, in regard to his inquiry, that the matter of the Railway is before the Legislative Council, and no doubt the Select Committee will be reappointed, when every information can be laid before them. So far as I am concerned I shall endeavour to have the line cheapened as much as possible, and as far as practicable make it a light line.—W.J.L., 6/12/86. Urgent.

The Under Secretary for Public Works to A. Ryrie, Esq., M.P.

Sir,

Department of Public Works, Sydney, 7 December, 1886.

In reply to your letter of the 4th instant, with respect to the proposed line of railway to Braidwood, I am directed to inform you that the matter is under the consideration of the Legislative Council, and that no doubt a Select Committee will be appointed to obtain all information necessary for the guidance of the members of that Chamber.

I am to add that the Secretary for Public Works will endeavour to cause the cost of construction to be reduced and make the length in question, as far as practicable, a light line of railway.

I have, &c.,

JOHN RAE.

Engineer-in-Chief.—CHAS. A. G. (*per* D.C.M'L.), 8/12/86.

THE estimate for this proposed line of railway was prepared with a view of its being constructed similarly to the main trunk lines of the Colony, and considering the nature of the country passed through, it is not I think by any means an extravagant one. My experience has been that in reducing estimates additional votes have been required to complete the works. If it should be intended to reduce the estimate for the construction of this line, instructions would be required as to the extent to which reductions would be authorized by the adoption of steeper gradients, lighter rails, &c., &c.—H.P., 13/12/86.

Not possible to make what is called a light line of this length, and I do not consider the estimate excessive.—J.W., 14/12/86. For Minister.—CH. A. G. Inform that the Engineer-in-Chief does not consider it possible to make it a cheap line.—W.J.L., 20/12/86.

The

The Commissioner for Railways to A. Ryrie, Esq., M.P.

Sir,

Department of Railways, Sydney, 24 December, 1886.

Referring to your letter, addressed to the Honorable the Minister for Public Works, respecting the proposal to submit a reduced estimate for the construction of a line of railway from Tarago to Braidwood, I have the honor, by direction of Mr. Secretary Lyne, to inform you that the matter has been referred to the Engineer-in-Chief, who reports that he does not consider it possible to make a cheap line between the places named.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.
(Per A.R.)

No. 12:

Minute by The Commissioner for Railways.

Railroad to Braidwood.

INQUIRY will no doubt be made as to the probable revenue to be received from the above line.

We should have to compete with the traffic by the Clyde; please find out what the rate is now by that service, and what the railway rate will be.

CH.A.G., 10/12/86.

Traffic Manager.

Goulburn, 16 December, 1886.

Railroad to Braidwood.

THE traffic (goods) to and from Tarago for the last two months was as follows:—

	ton	cwt.	qr.	lb.	ton	cwt.	qr.	lb.
October—Inwards	175	2	0	0				
„ Outwards	41	17	0	0				
					216	19	0	0
November—Inwards	137	13	1	0				
„ Outwards	131	5	1	0				
					268	18	2	0
					485	17	2	0

A large portion of the outwards of November consisted of wool; including this it only showed an average of 9 tons 6 cwt. 3 qr. 14 lb. per diem.

Taking 3rd class goods the rates are as follows:—

	£	s.	d.	£	s.	d.
Rail, Sydney to Tarago	4	8	1			
Team, Tarago to Braidwood	1	0	0	5	8	1
Sydney to Nelligen...	0	15	0			
Nelligen to Braidwood	1	5	0	2	0	0
Difference in favour of steamers				3	8	1

If the line Tarago to Braidwood was made 188 miles, Sydney to Braidwood, £5 2s. 7d., still showing a difference of £3 2s. 7d. per ton in favour of the steamers.

On the other hand we get all or nearly all the special class goods, as the steamer charges this class much higher than they do our 3rd class.

	£	s.	d.	£	s.	d.
Maize, Sydney to Nelligen...	1	5	0			
„ Nelligen to Braidwood	1	10	0	2	15	0
„ Sydney to Tarago	0	14	0			
„ Tarago to Braidwood	1	0	0	1	14	0

A difference of 21/- per ton in favour of New South Wales Railways.

If the Braidwood line was made, Sydney to Braidwood 188 miles, a difference of 39/- per ton.

Coaching Traffic.		£	s.	d.	£	s.	d.
September—Number of passengers,	395	178	13	2	209	12	4
October—	323	148	4	2	173	12	4
November—	364	128	0	10	151	13	11

It is estimated that not more than 100 passengers a month travel from Braidwood; the rest are local.

Traffic Manager.

ALEX. CRAWFORD.

I would like Mr. Crawford to get some information as to the amount of traffic likely to be directed to Railway by the opening of the line to Braidwood.—W.V.R., 17/12/86. Inspr. Crawford.

Traffic Managers' Office, Sydney, 23 December, 1886.

Inspr. Crawford,—Please let me have my 86-4,946^v re probable traffic that might be calculated upon for support of Braidwood extension. Commr. wishes to know what has been done in the matter. Very urgent.—W. V. READ (per C.F).

Railway to Braidwood.

THERE are considerable difficulties in forming anything like an accurate estimate of what traffic would likely be diverted to the railway if this line was made under existing rates. I am afraid very little would be diverted, as the difference of rates are to be marked.

There is little or no traffic derived from the country between Braidwood and Tarago, and no matter what rates might be charged to Braidwood the difference between water and rail carriage is so great that at most only a portion will be obtained; what that portion might be is difficult to say.

Between Braidwood and the coast are several towns and villages, such as Jembaicumbene, Monga, Rudsdale, Elencton, Araluen, Araluen West, and Major's Creek. All this traffic will still go to the coast except in cases where time is an object.

There can be little doubt that when this line is made the Steamship Co. will bid for the Braidwood traffic by a reduction of rates, and when the carriers are drawn off the road between Braidwood and Tarago, they will also bid for the coast traffic in conjunction with the Steamship Co. The population of Braidwood is a little over 1,000 souls. The town has made little or no progress for several years.

ALEX. CRAWFORD.

I have a strong impression that I reported upon the Braidwood traffic and rates a long time ago, although I cannot trace the paper. At all events, Mr. Crawford's reports bear out the opinion I have held all along, that while we shall continue to get all the Braidwood traffic which is carried at low rates, we shall not be able to command the higher classes of traffic in face of the very low rate by sea; and my own impression is, much as I should like to secure it, that the Department should not enter into a competition, at all events to any great extent, with persons who are carrying on a Colonial trade either by sea or land, and I do not suppose there is any such intention. Of course it is altogether different in the case of intercolonial traffic where we have to quote very low rates to secure as much as we can of the produce of our own Colony.—W.V.R., 5/1/87. The Commissioner.

There are other papers in the office about the Railway to Braidwood; let me have all papers at once, especially those referring to probable traffic.—CH.A.G., 9/1/87.

Plan enclosed. Will Traffic Manager please show on it the places from which traffic is likely to come by rail, and also the places from which it is probable traffic will be sent by sea. The Commissioner would like this early.—A.R., 21/1/87. Traffic Manager.

Inspector Crawford,—For early attention. Return papers as soon as possible.—W. V. READ, 22/1/87.

Braidwood Traffic.

UNDER existing rates I do not think that any traffic east, south-east, or south of Braidwood will go by rail, except in cases where time is of value.

I have endeavoured to show by blue pencil line, traffic that possibly might be attracted to the railway.

All inside the blue lines, even if intended for Nelligen, must pass through Rudsdale; from some parts it would be nearer to Braidwood, but then the great difference in rates will attract it to the coast. West of the blue line goes either to Bungendore or Queanbeyan. West and south to the coast. The Traffic Manager.

ALEX. CRAWFORD, 1/2/87.

Commissioner to see.—I have ascertained that the rates for general goods from Sydney to Nelligen is 25s. per ton measurement, and for dead weight 20s. per ton; whence, according to Inspector Crawford, the team carriage is 25s. per ton = 45s. to 50s. If the line were constructed from Tarago to Braidwood the ordinary mileage rates from Sydney would be 58/11 first and 101/8 third class, so that I should say even the traffic to the town and district of Braidwood would be doubtful.—W.V.R., 14/2/87.

The Commissioner has asked Mr. Badham to prepare *précis* of case. Submit papers.—D.C.M'L., 18/2/87.

Proposed Line—Tarago to Braidwood.

THE Commissioner will be glad to have further information relative to this line, probable traffic, cost of working, &c., &c., also * competition by sea.

The details already furnished by the Traffic Manager are not sufficiently full and explicit for Commissioner's purposes.

The Traffic Manager might place himself in communication with the Locomotive Engineer for any information the latter should furnish.

The Traffic Manager.

D.C.M'L., 22/1/87.

I have reported on the Commissioner's M.P. 87/644, on the question of the rates. I have endeavoured to get information as to the probable traffic, but it is a most difficult thing to do, because the great bulk of the Braidwood traffic is sent by sea to Nelligen. I do not think that even the construction of a railway to that town will secure the trade of the district in the face of the low water rates, and I am of opinion that the line will not pay.—W.V.R., 15/2/87.

The

* This, I think, has been asked for on other papers.

The Commissioner for Railways to A. Ryrie, Esq., M.P.

Sir,

Department of Railways, Sydney, 28 January, 1887.

Referring to your telegram of the 17th instant, addressed to the Under Secretary for Public Works, in which you solicit an interview for a deputation relative to the Tarago to Braidwood Railway, I have the honor, by direction of Mr. Secretary Sutherland, to inform you that he will be unable to deal with this matter before the Elections are over.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.
(Per A.R.)

No. 14.

Précis.

Proposed Line, Tarago to Braidwood.

The proposed line is 29 miles 12 chains in length, making the total distance, Sydney to Braidwood, by this route something less than 188 miles. It is said to run through land which, to a great extent, is in the hands of large proprietors.

The following statistics, which refer to year ending 31 March, 1886, will afford some idea of the resources of the district:—

Land under cultivation—Freehold, 3,776 acres; leasehold, 864 acres; the produce of which was as under:—

Wheat	14,682 bushels	Rye	65 bushels	Grain ..	800 tons
Maize	5,132 "	Potatoes	915 tons	Potatoes	900
Barley	592 "	Tobacco	526 cwt.	Hay	1,800
Oats	3,210 "	Hay	1,800 tons		3,500

It should be stated that in the agricultural returns for the year to which the above figures refer there was a remarkable falling off, notwithstanding that the area of land under cultivation was pretty nearly the same. The live stock of the district in the year 1885 (the most recent obtainable date) stood as under:—

Horses	3,323	*Sheep	48,298	48,298*	
Cattle	20,557	Pigs	1,573	4 lbs. of wool.	

The timber trade of the district is said to be very extensive, and there are in the town of Braidwood three tanneries, four boot factories, and two flour mills; but there are no manufactories which would tend to create a traffic.

The population of the town of Braidwood is over 1,000, and of the district, about 7,000.

The question of the traffic to be expected if the line be constructed has been dealt with by the Traffic Branch.

They state that the goods traffic to and from Tarago in the preceding two months was:—

October.—Inwards	Tons	175	2	0	0	
Outwards		41	17	0	0	
						216 19 0 0
November.—Inwards		137	13	1	0	
Outwards		131	5	1	0	
						268 18 2 0
Making a total of	Tons	485	17	2	0	

That a large part of the November outwards traffic consisted of exceptional goods (wool), and that including this the daily average was only 9 tons 6 $\frac{3}{4}$ cwt. For third-class goods the rates for freight were as follows:—

By land—

Rail—Sydney to Tarago...per ton	£4	8	1
Team—Tarago to Braidwood "	1	0	0
				£5 8 1

By sea—

Steamer—Sydney to Nelligenper ton	0	15	0
Team—Nelligen to Braidwood "	1	5	0
				2 0 0

Difference in favour of sea route £3 8 1

If this line were made to Braidwood the through rate (for 188 miles) would be reduced to £5 2s. 7d., but it would still show a difference in favour of the steamer of £3 2s. 1d.

They

They state that we get the bulk of the (unprofitable) special class goods for the simple reason that the steamer charges for that class of goods are made higher than ours. Take maize, for instance:—

By sea—		Steamer—Sydney to Nelligen per ton	£1 5 0	
		Team—Nelligen to Braidwood „	1 10 0	£2 15 0
By land—				
		Rail—Sydney to Tarago... .. per ton	£0 14 0	
		Team—Tarago to Braidwood „	1 0 0	1 14 0
Difference in favour of land route				£1 1 0

And if this line were made to Braidwood our charge to that town would be 16s., 39s. less than the cost by the sea route.

The coaching traffic to and from Tarago had been as under:—

							Passengers.	Amount.	Total Coaching.
								£ s. d.	£ s. d.
Say 400 per month, or 48,000 per year, at 5s. average fare between Tarago and Braidwood, equal to £1,200.	September	395	178 13 2	209 12 4	
	October	323	148 4 2	173 12 4	
	November	364	128 0 10	151 13 11	

It had been estimated, however, that of these only 100 per month were Braidwood people, the remainder being local people.

Mortua, Reisdale, and other places.

Under existing rates, if the railway were made, very little traffic would be diverted from the existing channels, and the rates for water-carriage are so very low that a reduction in our rates would have very little influence upon the traffic. At the best we should only secure a portion of the Braidwood local traffic; all the traffic of the towns between Braidwood and the coast would always go the coast, except in cases where time was an object. If the railway were made the steamer would always be prepared to bid for the traffic, even by a reduction of rates, and that the carriers driven off the road between Tarago and Braidwood would act in the same direction in concert with the steamers.

Traffic Manager concurred in these remarks. He was of opinion that if this railway were constructed we should secure such of the Braidwood traffic as would be carried at low rates, but that we should not be able to command the higher classes of traffic. He did not think, however, that we should enter into competition with persons who were carrying on a colonial trade, whether by sea or land.

Subsequently Mr. Read added that if this line were constructed the rates to Braidwood would be 1st class, 58/11, and 3rd class, 101/8, while the freight by steamer to Nelligen, and thence by team to Braidwood, was only 45/- to 50/-, and that he was doubtful of our securing the traffic even of the town and neighbourhood of Braidwood.—C.A.B., 9/3/87.

Required—statement Nos. 1 and 2, referred to in Mr. Lyne's answer to question asked in House, 6th October, 1886. (Herewith.)

Furnish particulars of amount voted for this line, £310,000.

Probable gross revenue from the statistics given for the 29 miles:—

Goods, special class	£	s.	d.
						525	0	0
Merchandise, 1st to 4th class...	1,500	0	0
						500	0	0
						225	0	0
Live stock	90	0	0
Wool	58	0	0
Passengers and mails	2,000	0	0
						£1,898	0	0
Working expenses—								
Per. Way—7 gangers...	800	0	0
20 men	2,000	0	0
1 Inspector	250	0	0
						£3,050	0	0
Traffic and Loco.—								
(Say) 30,000 miles at 3s.	4,500	0	0
						£7,550	0	0, or (say) £251 per mile.
Interest upon capital, 4 per cent.	12,400	0	0
						£19,950	0	0

CH.A.G.

Particulars filled in, showing a balance against the line of £15,052, but the calculations are based on the official statistics, and Commissioner thinks the figures of the statement presented to the House had better be made use of.—C.A.B.

Taking the figures given in the statement submitted to the House (which however are in some cases considerably in excess of the figures given in the Statistical Register for 1886), the following is an estimate of

of the anticipated traffic of this line (based upon the supposition that the entire agricultural produce of the district will be carried) in comparison with the annual cost of the line in working expenses and interest on capital cost:—

Working expenses	£	7,550	s.	0	d.	0
Interest on capital	£	12,400	s.	0	d.	0
Earnings, special class goods, viz. :—						
Cereals... ..		1,166	tons.			
Potatoes		623	„			
Hay		3,174	„			
		4,963	tons @ 3/-	£744		
Horses				238		
Cattle				560		
Sheep				90		
Wool				44		
Goods traffic				1,500		
				£3,176		
Add 20 per cent. for possible development of traffic				635		
				£3,811		
Passengers and Mails				2,000		
Balance against line				14,139		
				£19,950	19,950	0 0

Balance against line, £14,139.

Tarago to Braidwood—Mr. H. M'Lachlan's Statistics.

Proposed line, Tarago to Braidwood.

In compliance with the Commissioner's request I have to-day seen Captain Turner, the manager of the Illawarra Steamship Company, and he was good enough, in reply to my questions, to give me figures and information (as follows) which may be of some use to Commissioner.

Captain Turner was not very communicative, but I think his statements may be relied upon.

As regards Nelligen, he informed me that it is a very insignificant place—"no place at all" was the expression; and that the district round and beyond it is very thinly populated, without any centre of population, the places marked in the maps not being worthy the name. If it were not for the Braidwood and Araluen traffic it would not pay them to send a boat to Nelligen. They carry general merchandise down, and bring back a little produce, such as maize, potatoes, &c., chiefly from Moruya.

The Araluen traffic goes indifferently to Nelligen or Moruya, some shippers preferring the former, others the latter.

The Nelligen freight averages about £140 a month, and the Moruya freight about £250 a month. The rate of freight is much lower than the Traffic Manager stated. They charge 15s. a ton to either port for general merchandise—maize, 1s. 6d. a bag of 4 bushels (say) 2 cwt. equal to 15s. a ton, and similar charges for other produce.

The passenger traffic to both ports brings from £100 to £150 a month, the fare being 30s. single and 45s. return.

There has been, Captain Turner said, a remarkable falling off in the population of the town and district of Braidwood, consequent on the exhaustion of the gold-fields and in the amount of business transacted.

Formerly they carried 500 or 600 passengers, and ran three boats a week. Now they do not carry so many passengers in three months, and it hardly pays to run one boat.

Captain Turner describes the country between Nelligen and Braidwood as very wild and rough, offering no scope for agricultural operations, and only here and there affording good grazing.

If any other points occur to the Commissioner upon which Captain Turner would be likely to afford information, I shall be happy to call upon that gentleman again.

C. A. B., 16/3/87.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

BORENORE-FORBES RAILWAY.

(PETITION—INHABITANTS OF CUDAL, CARGO, TOOGONG, &c.)

Received by the Legislative Assembly, 23 March, 1887.

To the Honorable the Legislative Assembly, in Parliament assembled.

The humble Petition of the undersigned inhabitants of Cudal, Cargo, Toogong, Murga, &c.,—

SHOWETH:—

1. That your humble Petitioners have been amazed at the action of the Legislative Council in refusing their approval of the plans and book of reference of the Borenore-Forbes Railway, which is part of a line from Orange to Forbes which has been passed by their different Parliaments, by large majorities of the people's Representatives, and twice by the Chamber which has now refused its sanction.

2. That your humble Petitioners, considering the vital importance of obtaining direct railway communication with the Metropolis, and being fully convinced that the Borenore-Forbes line will prove one of the best paying lines in the Colony—a fact of which your Honorable House has been long convinced, now pray your Honorable House to take such immediate steps as will afford the Upper Chamber an opportunity of revising their former decision.

And your Petitioners will, as in duty bound, ever pray.

[Here follow 676 signatures.]

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAY COMMUNICATION FROM GRAFTON TO THE TWEED.

(PETITION IN FAVOUR OF RESIDENTS OF THE ELECTORATES OF GRAFTON AND THE CLARENCE.)

Received by the Legislative Assembly, 31 May, 1887.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the undersigned residents of the Electorates of Grafton and the Clarence,—

HUMBLY SHOWETH:—

That your Petitioners continue to be deprived of those advantages of Railway communication, enjoyed by the great bulk of the people of the Colony.

That the deprivation has become calamitous to your Petitioners, and most seriously affects the progress of profitable settlement in these Districts.

That in the opinion of your Petitioners, it is of the utmost national importance in view of promoting the settlement of the country, facilitating the interchange of commodities between conterminous Districts and with the Metropolis, and opening up profitable channels for the employment of labour, that the authorised lines of Railway from Grafton, especially that to the Tweed, should be constructed with the least possible delay.

Your Petitioners therefore humbly pray, your Honorable House to take the premises into your most favourable consideration, and give such relief as may be deemed meet.

And your Petitioners, as in duty bound, will ever pray.

[*Here follow 1,563 signatures.*]

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAY FROM GRAFTON TO THE TWEED.

(PETITION IN FAVOUR OF—F. B. GULLEY, MAYOR OF CASINO.)

Received by the Legislative Assembly, 9 June, 1887.

To the Honorable the Legislative Assembly of New South Wales.

The Petition of the undersigned (for and on behalf of the residents of Casino and the Upper Richmond River),—

HUMBLY SHOWETH:—

That your Petitioners, while having to bear a share of the cost of loans raised to provide railway communication in other parts of the Colony, and also suffer severely from the delay in carrying out improvements at the entrance to the Richmond River, are deprived of the great advantages of railway communication enjoyed by the residents of most other districts.

That the delay in proceeding with the construction of the authorized line of railway from Grafton to the Tweed most seriously retards the progress and development of the universally acknowledged natural resources of the districts through which the said line of railway will pass.

That in the opinion of your Petitioners the construction of the said line of railway is a matter of national importance as a means to facilitate an interchange of commodities between northern districts and with the metropolis, and your Petitioners would urge that the work should be undertaken with the least possible delay.

Your Petitioners therefore humbly pray your Honorable House to take the premises into your most favourable consideration, and give such relief as may be deemed meet.

And your Petitioners, as in duty bound, will ever pray.

Signed for and on behalf of the residents of Casino and the Upper Richmond River,—

F. B. GULLEY,
Mayor of Casino.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAY COMMUNICATION BETWEEN SYDNEY AND CANTERBURY.

(PETITION FROM INHABITANTS OF THE MUNICIPALITY OF CANTERBURY.)

Received by the Legislative Assembly, 20 April, 1887.

To the Honorable the Speaker and Members of the Legislative Assembly of New South Wales, in
Parliament assembled.

The Petition of the inhabitants of the Municipality of Canterbury,—

RESPECTFULLY SHOWETH :—

That your Petitioners do most respectfully beg that your Honorable House will take into your consideration the very great inconvenience that we are now experiencing through want of railway communication with Sydney.

That we would respectfully urge upon your Honorable House that this, the oldest settled district in the Colony, is still the most backward, and although within six miles of the metropolis our only means of transit is by omnibuses, many of us having to lose upwards of three hours daily going to and returning from business.

That there is a large and increasing population here, and many who at present own land in this district would immediately build but for the large amount of time lost in travelling to and fro by the present means of transit.

That your Petitioners therefore respectfully pray that your Honorable House will grant them relief by giving them railway communication with Sydney.

And your Petitioners, as in duty bound, will ever pray.

[*Here follow 221 signatures.*]

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAY FROM LIVERPOOL TO ST. PETERS.

(PETITION IN FAVOR OF—RESIDENTS OF LIVERPOOL AND DISTRICT.)

Received by the Legislative Assembly, 12 July, 1887.

To the Speaker and Honorable Members of the Legislative Assembly of New South Wales, in Parliament
assembled.

The humble Petition of the undersigned residents of Liverpool and District,—

SHOWETH :—

1. That your Petitioners are desirous of having a line of railway constructed from Liverpool to St. Peters, inasmuch as such a line will be 5 miles shorter than the present existing line to Sydney, and will afford a much needed additional track to run the Southern trains, now incessantly delayed from the blocking on the present line.

2. The area through which the proposed line will run is all suitable for suburban settlement, and being already well settled it will give a profitable passenger traffic.

Your Petitioners therefore humbly pray that your Honorable House will be pleased to pass the necessary measures to cause the line of Railway between Liverpool and St. Peters to be constructed.

And your Petitioners, as in duty bound, will ever pray.

Dated this 9th day of July, A.D. 1887.

[*Here follow 334 signatures.*]

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAY LOCOMOTIVES.

(PAPERS RELATIVE TO SUPPLY OF, WITH SPECIFICATIONS.)

*Ordered by the Legislative Assembly to be printed, 27 April, 1887.***The Locomotive Engineer to The Commissioner for Railways.**

Additional Engines required for new Extensions, &c.

In view of the number of additional miles that will be opened for traffic within the next two years, I beg to recommend tenders be invited at once for the number of engines required to work them.

On the Northern Line there are not sufficient goods engines now in stock to meet the traffic in the busy season; and when the line is opened to Tenterfield, we shall have very great difficulty in meeting the increased requirements, so that it is absolutely necessary that more locomotives be supplied at the earliest possible moment for that line.

While we have sufficient engine power to meet the traffic on the Southern and Western Lines at the present time, yet when the new extensions are opened (over 300 miles) an increase to our locomotive stock will be indispensable.

In view of the many advantages accruing from as few types of engines as possible being used, I strongly recommend that the terms of the specification for the two classes now required be strictly adhered to.

The class most suitable for our passenger traffic is that provided for in the Specification upon which tenders were last invited, and for which the Vulcan Foundry Company, of England, obtained the contract. The advantages gained by having even the same class made by the same makers are so considerable, and in view of the very low price at which the Vulcan Foundry Company are supplying, induces me to strongly recommend that an order for those now required be given to the same firm.

For the goods traffic I do not think that a more suitable engine than the Mogul class, Specification No. 191, can be obtained. We have now had some years experience of them, and, as regards loads hauled, economy in "Running Stores," and small cost of repairs and renewals, they have given general satisfaction. I therefore strongly urge that this type of engine be adhered to.

The following are the number of engines required, and the estimated cost:—

Great Northern Railway—

4 Passenger Engines, @ £2,450 each	= £ 9,800
8 Goods " @ £2,780 each	= 22,240

Great Southern and Western Lines—

12 Passenger Engines @ £2,450 each	= £29,400
20 Goods " @ £2,780 each	= 55,600
Total	<u>£117,040</u>

I intend to submit a separate paper upon the quantity and description of tank engines which will be required to meet increased requirements on our suburban lines.

W. SCOTT, 25/5/86.

I cannot concur in Mr. Scott's recommendation that for the reasons given the order for the sixteen passenger engines required be given to the Vulcan Company without competition.

We have not, I think, received the engines which the Vulcan Company obtained recently the contract for, and therefore cannot know much of the quality of the work; but even if it be all that can be desired, I do not think it right that we should depart from the approved system of inviting tenders.—C.A.G., 28/5/86.

The system of inviting tenders should not be departed from. It is represented that it is absolutely necessary these engines should be obtained. I therefore approve of tenders being called.—W.J.L., 29/5/86.

Re Railway Rolling Stock, &c.

With reference to the specification for twenty-eight goods and sixteen passenger engines, it seems to me, from a perusal of them, that they provide for a different type of engines to any we have now running, and their adoption would, in my opinion, be a serious mistake. There are many provisions that would make the engines unnecessarily complicated and costly, and debar Colonial makers from having any success in tendering. I think we might, for instance, substitute best steel for iron; it would be cheaper, and would give the locomotives a longer life.

Three-fourths of the trade we have over the mountains, on the steep gradients, could be best and cheapest carried by one class of engines, simple in construction and powerful in action; but we have a number of engines of various designs that it would pay the Department better in the long run to put on the scrap heap, if we could be sure of replacing them by a class of engines more suitable to our requirements.

I am not in favour of any increase in the rates for passengers and produce to augment our revenue, as, I believe, by improving our rolling stock we shall be able, with economical working, to improve our returns, so as not to require any increase. We have at present a large traffic in live stock which has proved unprofitable, both to the Railway Department and the owner, the latter asserting that the loss to him through delay in transit by rail, &c., is sometimes equal to 10% on the value of the consignment, and this must be taken in a degree as adding to the railway rates. We will always have a large traffic, either in live stock or dead-meat, and I do not think a permanent improvement will come until we have improved rolling stock for this traffic, both in engines and trucks. Stock trains should be run at almost the same speed as our mail and passenger trains, and should give precedence to nothing but them.

For the purpose of obtaining opinions as to the best class of engines for this purpose, I wish an early report from Mr. Midelton, now Superintendent of Tramway Rolling Stock, Mr. Midelton having had a large engineering experience both in England and the Colonies, and has already shown evidence of his ability with regard to his plans for the Goulburn running sheds, and in regard to his advice in connection with the Eveleigh workshops. He has already designed ten locomotives which, after two years' service, have proved to be the most economical in working that we have; and for these and other reasons, although he is not now in the Railway Locomotive Branch, I should like his opinions on this question.

JOHN SUTHERLAND.

Mr. Midelton.—A.R., B.C., 19/4/87.

Seen. My report was forwarded, on the morning of the 20th, to the Commissioner, as per request on paper, with Locomotive Engineer, original paper, dated 25/5/86, M.P., 86-8,560.—THOS. MIDEULTON, 22/4/87. Commissioner.

The Superintendent, Tramway Rolling Stock, to The Secretary for Public Works.

Additional Locomotives.

Sir,

After a careful perusal of the papers which provide for the addition of forty-eight locomotives to our present stock, I have the honor, in obedience to your command, to report as follows:—

In the original recommendations of the Locomotive Engineer, dated 25/5/86, I notice he writes there are "many advantages accruing from as few types of engines as possible being used. I strongly recommend that the terms of the specification for the two classes now required be strictly adhered to. The class *most suitable* for our passenger traffic is that provided for in the specification upon which tenders were last invited, and for which the Vulcan Foundry Company of England obtained the contract. The advantages gained by having even the same class, made by the same makers, are so considerable, and in view of the very low price at which the Vulcan Foundry Company are supplying, induces me to strongly recommend that an order for those now required be given to the same firm." Although Mr. Scott has had a very long experience here, I venture to assert that he is in error upon this question. We have had no experience of the engine which the Vulcan Foundry are now supplying, and I am at a loss to understand how Mr. Scott arrives at the conclusion that they are the most suitable for our passenger traffic. I have gone very carefully into the merits of the designs of these engines, and must express my conviction that their unsuitability will be established on trial; they cannot be successful unless they are ruinously *overloaded* on their (four) coupled wheels.

Referring to the Goods Engines, Mr. Scott states: "I do not think that a more suitable engine than the 'Mogul Class'—Specification No. 191—can be obtained. We have now had some years' experience of them, and, as regards *loads* hauled, economy in running stores, and small cost of repair and renewals, they have given general satisfaction. I therefore strongly urge that this type of engine be *ADHERED TO*." I will at once say that my views, based on a large experience of the running of these engines, are quite to the contrary, and the records will show that I tried to improve them when the second lot was being ordered in December, 1883 (*vide* Comr's. M.P., 83/19,720), but Mr. Scott opposed it; indeed, it is evident Mr. Scott now practically admits that the principal feature—the hauling power—is deficient, for he stipulates that the power of the new engines is to be *increased* 5 lb. by making the cylinders *one inch larger in diameter*, and by *shortening the stroke two inches*. I would point out in this connexion that, while the improvement as regards increased power is immaterial, Mr. Scott contradicts, by introducing it, his professed anxiety to limit the types of engines—for undoubtedly he thus introduces another class.

In reporting on Specification No. 188A for twenty passenger engines, it will be well to consider what has already been done in the matter of equipping our railways with locomotive engines. We, unfortunately, have no less than forty-two different "classes" at the present time of nearly every possible shape and dimensions, twenty-two of which are for passenger traffic, and the rest for goods traffic. This is objectionable and costly, for almost any railway could be properly worked with, at the most, six different "classes" of engine, and many lines could be worked with three.

We

We began in 1855 with a "class" which exerted a power of	93·10 lb.
In 1856 we had	79·85 "
" 1865	71·10 "
" 1867	112·70 "
" 1870	105·00 "
" 1875	168·00 "
" 1877	117·80 "
" 1877	123·40 "
" 1880	102·40 "
" 1883	104·00 "
" 1884	117·00 "
" 1884	140·40 "

I have here referred to twelve "classes," but do not think it necessary to name the other passenger engines which were introduced between 1855 and 1886, as they are all *less* powerful than the above.

As we have a large stock of the class which give off a power of 117·80 lb., this would lead some people to the conclusion that they were the best engines for our lines. But such is not the case, as it often—daily, I might say—happens to be necessary to put two of these engines on many of the passenger trains to work them to schedule time. The class of passenger engine introduced by me in 1884 (*vide* Com. M.P., 83/2,350, &c.), which exerts a power of 140·40 lb., has answered our requirements satisfactorily in every respect during the past two years on all lines; and the proof of it seems to reside in the fact that the author of the Specification 188A actually describes an engine *which will exert exactly the same power, but will be of totally different design and dimension*; and not only that, it will not be such a suitable engine for the New South Wales lines generally. It will have cylinders and wheels each larger in diameter than is necessary for the power required, and the insistent weight on the wheels will be *much more*—7½ tons per wheel—as against 6 tons. This, I need not remark, will be destructive to the permanent way, and to the engine itself.

The comparison between the two engines stands thus:—

Present Passenger Engine and Tender.

Cylinders—18" diameter, 26" stroke, 60" driving wheels, 6 wheels coupled, and 2-wheel'd bogie.
Power = 140·40 lb. as aforesaid.

Tender on 8 wheels carries 3,600 gallons of water and 6½ tons coal.

Proposed Passenger Engine and Tender.

Cylinders—19" diameter, 26" stroke, 66½" driving wheels, 4 wheels coupled, and 4-wheel'd bogie.
Power = 141·14 lb., or 742 lb. more.

Tender on 6 wheels carries 2,500 gallons of water and 3 tons of coal.

We here propose to introduce another "type of engine" of practically the same power, but which will in *practice* be certainly not so servicable an engine as the present one, but *why* it is done it is difficult to see. I contend it would be best in every way to go on reproducing the type which has proved to be the best, instead of further complicating matters and increasing our difficulties and expenses for no good purpose. It is more than probable that the weight on the coupled wheels of the proposed engine will largely exceed the weight specified, viz., 30 tons; if it does not, the engines will slip, and will require the use of a lot of sand, which will increase wear and tear of rails and tires, and cause other trouble. It is best to so proportion an engine that the use of sand shall be avoided, and this has been done in the engines we have; and as it is specified that each box shall hold 4 cubic feet of sand, it is evident that much is to be expected from the free use of it, if the load on the coupled wheels does not exceed 30 tons. To be a good reliable engine in all weathers, there should be not less than 9 tons on each of the (four) coupled wheels; but as that weight is *too much for our rails* it is proposed to put 7½ tons on each wheel, and that is excessive. In short, the engine *should have six* coupled wheels instead of *four* coupled wheels, and I cannot see a valid reason for proposing to have such engines. Quite the contrary; we should now reproduce in our own shops the engines and tenders we have found to answer our requirements best; and as locomotive builders only *manufacture* very little of our engines and tenders, I consider the Government should import the necessary raw material—consisting of steel plates for boilers, copper plates, boiler tubes, Staffordshire iron plates, steel tires, axles, &c., &c. (articles which cannot for some time be made in the Colony), direct from the various manufacturers of such articles, in the same way exactly that the locomotive builders do at home, and I dare say the Government could obtain such material at the same—perhaps lower—prices than they do. Then we could, with the splendid special machine tools and new workshops at Eveleigh, fully and profitably employ our skilled mechanics and others constantly in constructing new engines and repairing old ones, under the supervision of specially trained, expert officers, on the spot, and I feel confident that the total cost of engines built in this manner, under proper discipline and control, would not exceed the highest—perhaps the average—tender which will be received for supplying the engines now under consideration, as the profit now paid the manufacturers, cost of freight, inspection, trial, dismantling, and other items would about balance the extra price of labour here. Indeed, unless this is done, I do not see how the new Eveleigh Works, which have cost about £600,000, can be fully utilized. We have only recently been able to haul, with *one* engine, mail trains consisting of thirteen carriages, or 104 tons, exclusive of weight of engine tender and passengers, up a grade of 1 in 30 and over the 8-chain curves of the Western road; we cannot do *more* with the proposed new engine; they will not do as much, if constructed to the specification, which specification I might say is certainly a curious one. The first few lines run thus:—"Specification for a four-coupled, outside cylinder, passenger (Bogie), *with* engine and tender." Sixteen are to be delivered in Sydney, and four in Newcastle. Now, as it is almost certain that railway connection with the Southern and Northern lines will be established long before the delivery of the engines takes place, it would have been more convenient and economical for all of them to be delivered in Sydney.

The general arrangement of the engine, it is stipulated, is to be in accordance *with a plan to be prepared by the Contractors, in which certain leading particulars are to be faithfully embodied and adhered to*. For instance, the cylinders are to be 6 feet 3 inches apart, centre to centre, and the slide bars are to be 5 inches wide, the slide blocks ½ inch thick, the tires are all to be 5½ inches wide. Now, if these dimensions are faithfully adhered to, I think the bogie wheels will, in radiating, rub hard against the

main

main frames, or the slide-blocks or bars, on the sharp curves of the Western road, and serious results might occur, as the "clearance" is certainly not sufficient. The said specification is not only curious, but it is incongruous and amusing, as can be seen by comparing the above with the last clause on page 13, which states that "Tenderers in England or America may either Tender to the within Specification, or if they wish to depart from it—in almost every particular—they will be allowed to submit alternate 'Tenders', provided they adhere to the general dimensions of the engine." This practically means that the author of the specification describes an engine such as he thinks he wants, but he is so undecided in the matter that if any contractor will design and specify a better engine, he will accept it and his tender. A specification embodying such conditions could have been printed on half a sheet of foolscap, and the trouble and expense of preparing the present one entirely avoided.

I consider the engine and tender unnecessarily complicated, and consequently expensive to manufacture. To give an instance, it is specified that one of three makes of Yorkshire iron is to be used in the boilers, whereas *steel*, of far greater strength, and about half the cost, should have been used instead. The connecting rods are composed of no less than sixteen separate parts, whereas three only are necessary. The same argument also applies with equal force to the side rods, and nearly all the other details. There are to be four slide-bars where two only are required. The driving and trailing axle-boxes are to be of wrought iron, well case-hardened. This is wholly unnecessary, and very expensive. Brass boxes and keeps are to be used on the bogies. Cast iron is all that is necessary, and it is of course cheaper and better.

The steam "dome" in the boiler is very expensive to make; it is ugly; not only that, but it weakens the boiler, and it is utterly useless.

The regulator is of a class which is anything but good. The spark-arresters are to be of the "best design" known; that is very vague; surely something definite could have been specified.

The Roscoe lubricator is a very old device; there are many others less expensive and far more efficient lubricators to be had. A water-jet is to be applied to each tire of each wheel of the engine and tender for the purpose of "cooling," and it might have been added, for the purpose of causing the engine to "slip" on the rails unnecessarily, which they will do oftener than is convenient, even with a dry rail, as they have not sufficient weight on them to use up the cylinder power.

It is also difficult to see why the tender and train brakes only are to be worked by the Westinghouse gear. The engine brake is to be worked by *hand*, I notice, whereas the whole lot should be worked by one handle operating the Westinghouse gear to be thoroughly efficient and up to modern requirements.

The tender, which is to have a "well," is a costly and inefficient design; the water and coal capacity is small, and the coal will have to be piled up very high to enable the proper quantity to be carried. This is dangerous, as it often happens that large lumps drop off and sometimes strike the men engaged in repairing the road. There are only six wheels to the tender; this is a grave error, as each wheel will be excessively loaded. There should be eight wheels (two bogies), but it would seem that six wheels are preferred.

The side-lamp brackets should be put at the front end of tender, and *not* at the back, for many good reasons.

To sum this matter up, I consider that the author of the specification has ignored the main questions, of first cost, utility, simplicity, and efficiency; and I have no hesitation in saying that a simpler, a far more efficient, and less costly engine and tender could be made in our own workshops at Eveleigh than the one proposed. I should strongly recommend the construction in our own shops of twenty-five more of the 304 class of engine, which were designed for and intended to work five different kinds of traffic, viz., mail trains, fast cattle and goods, suburban passenger, and goods traffic, and shunting generally.

Specification No. 191 for Twenty-eight Goods Engines.

This specification describes what is known here as the 205 class of engine—indeed if it were not stipulated that the cylinders were to be 19" in diam. and 24" stroke, instead of 18" diam. and 26" stroke, it would exactly describe the 205 class of engine, a great many of which we have been supplied with by Messrs. Beyer, Peacock, & Co.; but the author of the specification is not content with introducing another class of passenger engine, but he wishes to have another class of goods engine also, without securing any benefit. The 205 class are well known to be the most sluggish engines we have, and there are grave defects in them, as at times enormous weights are thrown on the bogie and trailing wheels, on account of the absence of proper compensating levers in the required positions, and I notice that it is not intended to remedy this defect; therefore we are not only destroying the permanent way with the engines we have, but we propose to build a still *heavier* type to expedite the destruction. The 205 class are evidently poor copies of the American consolidated engines introduced in 1877, and intended to compete with them; but they have ignominiously failed, and if the proposed engines are built further failure will take place. I consider the consolidated type have proved themselves to be the best goods engines we have: they are lightly loaded per wheel, and are therefore easy on the road; they give off 200·00 lb. of power, and the proposed engine will give off 180·5 lb., only with *more* weight per wheel. I should strongly recommend that the new design be abandoned, and that twenty-five more of the consolidated engines be built in our Eveleigh Works. Nearly all the arguments I have advanced against the passenger engines can be made to apply to the proposed goods engines.

We now have eleven engines (of the 48 class) which are lighter, and give off 195·00 lb. of power—far more than is proposed; therefore we are taking a backward step by ordering less powerful goods engines than we now have.

As the recommendation indicates, the passenger engines are to be made by the Vulcan Foundry Co.; and it is evident that the goods engines are intended to be made by Messrs. Beyer, Peacock, & Co.

In my opinion it would be a serious mistake to have such engines constructed. I should advocate not only what I have hereinbefore stated, but I would construct a great many new engines of a more suitable type, in place of a lot of obsolete engines we seem to be unable to utilize. We have the best appliances for the purpose, and unless this is done, it is difficult to see what use the appliances can be put to; indeed, it is a huge co-operative concern, in my view, in which every railway man is personally interested; and, as the railways are State properties, the whole question is a national one.

I have, &c.,

THOS. MIDELTON,

Superintendent of Tramway Rolling Stock.

19 April, 1887.

GOVERNMENT

GOVERNMENT RAILWAYS OF NEW SOUTH WALES.

Specification No. 191 for a Six-coupled, outside-cylinder Goods Engine (Bogie),
with Tender.

Number required—Twenty, delivered in steam at Sydney; Eight, delivered in steam at Newcastle.

PRINCIPAL DIMENSIONS.

ENGINE:—	ft.	in.
Gauge of Railway	4	8½
Cylinders, diameter	1	7
" stroke	2	0
" " distance C. to C.	6	8¾
Wheels, 6 coupled and 2 bogie.		
" diameter coupled (tread)	4	0
" " bogies	2	9
Wheel, base, bogie to 1st driver	8	0
" " 1st driver to main	5	7
" " main driver to trailer	5	5
" " total	19	0
Fire-box, length inside at top	5	10½
" " " at bottom (measured on the level)	6	0
" breadth	3	5¾
Tubes, number 189.		
" diameter (outside)	0	2
Boiler, barrel, diameter (outside)	4	5
" length, barrel part	10	4
" height of C. above rail	6	9
Working pressure, 140 lb.		
Distance between frame plates	4	1¾
TENDER (Horse-shoe, with Well):—		
Wheels, number—6.		
" diameter (tread)	3	6½
" base, total	11	0
Water carried, 2,500 gallons.		

General Arrangement.

The general arrangement and dimensions of the several parts of the engine and tender are to be made exactly in accordance with the foregoing principal dimensions, together with such detail and other drawings as may be hereafter exhibited in connection with this specification, for the contractor's guidance.

In accordance with this specification, the contractor shall prepare a complete set of working (full size and general) drawings, showing the form and dimensions of every detail of the engine and tender, and it is to be understood that the approval of such drawings by the Inspecting Engineer, shall in no way whatsoever relieve the contractor of the whole or any part of the responsibility for possible error in design or dimensions, or any other matter incompatible with construction, or at variance with this specification (unless approval of such variations shall have been previously given by the Inspecting Engineer), and any loss arising therefrom shall be borne by the contractor.

The engine is to be carried on a two-wheeled bogie and six coupled wheels.

The springs of the main driving and trailing wheels are to be coupled by balance beams, to equalize as much as possible the weight on the rails, and provision is to be made, by supplying extra beams (and fixings attached to the frames to receive the same), to enable the springs of the leading pair of driving wheels to be also coupled at any time to those of the main driving wheels, or the engine to be worked with the front driving springs independent, as may be required. The fulcrum pins and various joints of these connections to be made an easy fit, and with special provision for efficient lubrication throughout.

The flanges of the middle pair of driving wheels are to be reduced to half the thickness of the others.

Cylinders.

The cylinders are to be placed horizontally, and are to be made of fine close-grained cast-iron, perfectly free from honeycomb, and of the utmost degree of hardness compatible with the requirements of machining.

The flanges are to be bolted to the frames by turned bolts driven in a dead tight fit, all the holes being bored out and rymered true with those in the frames.

The slide-valves are to be of hard gun-metal. They are to be stiffened by two suitable ribs outside, the valve-faces to be scraped true, and in slotting the ports the corners are to be rounded to $\frac{5}{8}$ " radius. The junctions of the valve-face with the sides of the chest, top and bottom, are to be recessed $\frac{1}{8}$ " deep and $\frac{3}{8}$ " wide, with a round-nosed tool, to facilitate the scraping of the valve-face.

The slide-valves are to have $\frac{1}{8}$ " lead, $\frac{2}{8}$ " outside lap, and no inside lap.

The cylinder and steam-chest covers are to be truly turned and planed and scraped to faces, and the joints made metal to metal; all nuts to be case-hardened. The front and back covers are to be fitted with polished covering plates. Each cylinder is to be fitted with a mud-cock at each end, worked simultaneously by suitable cross-shafts and rods from the foot-plate; also, each valve-chest to have one mud-cock at back end, similarly worked.

Pistons

Pistons and Cross-heads.

The pistons to be of cast-iron, with cast-iron packing rings $\frac{3}{4}$ " wide and $\frac{7}{16}$ " thick. Piston-rods to be of mild cast-steel with coned ends, secured to the pistons by screwed wrought-iron nuts (6 threads per inch), with split pins; front end of piston-rod (reduced in diameter) to be carried forward through front cylinder cover, with suitable stuffing-box, gland, and sleeve. The pistons are to be turned $\frac{1}{32}$ " less than the diameter of the cylinders, and the rings $\frac{1}{4}$ " larger than the cylinders, and cut and sprung into their places. The pistons to have $\frac{3}{8}$ " clearance at each end of the cylinders. The cross-heads to be of wrought-iron, case-hardened, the bearing pins of mild steel.

Slide-bars and blocks.

The slide-bars to be of cast-steel, as hard as possible, with copper liners at both ends for adjustment.

The slide-blocks to be of hard cast-iron, with guide flanges 1" deep and shoulders front and back of cross-head (to take the strain off the socket).

Connecting-rods.

The connecting-rods are to be of wrought-iron, forged in one length, without weld; the small end to be solid,—the large end to be forked and finished with a block and stout tapering bolt. The brasses (both ends) to be in two halves, those at the large end being tightened with a steel cotter, and those at the small end with a tapering steel cotter block, and wrought-iron (case-hardened) or steel liner. Brasses (except front small end) to be flat-ended. Length, 6' from centre to centre.

The oil-cups are to be forged on solid, and finished with screwed brass covers. The bearing brasses are to be of the best hard and tough gun-metal.

Coupling-rods.

The coupling-rods are to be of the same material as the connecting-rods, and similarly made and finished.

They are to be parallel in the body, and to have solid ends to receive the gun-metal bearings in two parts. Each bearing is to be secured by a steel cotter, and made and finished similarly to those for the connecting-rods. The joint is to be in front of the main driving wheel, the pin being secured by a $\frac{1}{2}$ " split pin passing through it and the outer jaw.

NOTE.—The section of the body part of the connecting- and coupling-rods to be suitably proportioned to the size of cylinder, &c.

Link-motion.

The link-motion is to be of wrought-iron, and got up bright throughout. It is to be well fitted, and all joints and rubbing surfaces and pins are to be thoroughly case-hardened. The links are to be curved, and are to be suspended from the centre, the weigh-bar shaft being above.

The valve-spindles are to have glands and stuffing-boxes at both ends, and are to be connected to the valve-rods by iron socket joints and pins with steel cotters secured by split pins, the joint being suitably guided. The buckles, which are to be in one piece (solid) with the spindles, are to be accurately fitted to the valves. The valve-rods are to be suspended from the cross-stay plate by iron links, pins, &c.

The link-blocks are to be of cast-steel or iron case-hardened, suitably guided at front end.

The eccentric-rods and straps are to be of wrought-iron with solid oil-cups, and brass covers screwed in; and the rods are to be made with T ends, and attached to the straps, each by two $1\frac{1}{8}$ " bolts, secured by double nuts and split pins.

The two halves of the straps are to be bolted together by 1" bolts, with square heads, and to have brass distance-pieces 1" thick between the lugs, secured by double nuts and split pins. They are to be fitted with gun-metal semicircular liners. The bolts to be screwed 11 threads per inch.

The larger part of the eccentric sheaves is to be of cast-iron, and the smaller part of wrought-iron, unless steel castings be substituted for both. The two parts are to be bolted together by two $1\frac{1}{8}$ " screwed pins with steel split cotters. Each sheaf to be fixed on the axle by a steel key, well fitted halfway into the axle, also by two tight-fitting steel set-screws projecting through into the axle, and secured with lock nuts. Set-screws to be tempered.

All pins and joints in the link-motion are to be a good fit, and thoroughly case-hardened.

The weigh-bar shaft is to be made with solid arms, soundly welded on. The outer, or "reversing arm," is to be forged in one piece with the bar, the weld (if any) being at the mid-length of the arm. It is to be carried in cast-iron brackets, with bearings 4" long.

The reversing gear to consist of a double-threaded left-hand steel screw $2\frac{3}{8}$ " diameter, with square threads 2" pitch, engaging a wrought-iron (case-hardened) nut 8" long, the whole to be carried in a cast-iron bracket, fixed on the right-hand side of the engine.

The screw is to have suitable thrust, &c., bushes, and to be fitted with a circular collar and catch, to secure it in any position.

The link-motion is to be balanced by two cast-iron weights.

The whole of the link-motion and gearing, as well as the connecting-rods, coupling-rods, and all parts of the engine and tender that have to stand a working strain, such as spring-links, brake-work, &c., are to be made (except when otherwise specified) of best charcoal iron, or carefully selected best Yorkshire scrap, of the finest quality, clean, well hammered, and free from all defects. Oil-holes must be provided to all joints.

Framing.

The framing to be of the plate-frame type, either wrought-iron or steel (Bessemer or Siemens), and manufactured by makers of good repute only. The plates to be $1\frac{1}{4}$ " thick, weldless throughout.

They must be broad enough to form axle-forks out of the solid plates, and are to be slotted in pairs.

They

They are to be fastened together by the front buffer-plate—by a horizontal $\frac{3}{4}$ " plate, extending from front buffer-beam to behind the smoke-box tube-plate (flanged upwards along the sides), forming the bottom of the smoke-box—by a $\frac{3}{8}$ " vertical cross-stay plate (flanged all round) behind the steam-chests, and by a $\frac{3}{8}$ " horizontal plate (flanged downwards along the sides) beneath the steam-chests—by a $\frac{3}{4}$ " vertical cross-stay plate which carries the valve-rod guides—by a $\frac{3}{4}$ " vertical cross-stay plate (flanged) in front of the fire-box, and behind the fire-box by a cast-iron draw and foot-plate. Fastened together.

The axle-forks are to be fitted with cast-steel horn blocks, those of the main driving and leading coupled axles being united in one piece. The front blocks of each axle are to be fitted with case-hardened wrought-iron parallel liners, the blocks to be cast with suitable bosses to receive $\frac{7}{8}$ " bolts with countersunk heads, for fastening the liners. The main driving and leading coupled blocks are also to have long bosses for guiding the spring pillars. The forks are to be stayed together by wrought-iron keeps. Horn-blocks.
Liners.

The motion-bracket, which is to be $1\frac{1}{4}$ " thick, is to be flanged and secured to the outside of the frames by 1" turned bolts, the flange to run from top to bottom edge of frame (platform L iron made to suit). Axle-fork keeps.
Motion-bracket.

The cross-stay plates are to be $\frac{3}{4}$ " thick, flanged and secured to the frames by $\frac{7}{8}$ " rivets.

The engineman's foot-plate is to be of cast-iron suitably cored out for the draw-bar and shackles, and firmly secured to the frames by $1\frac{1}{8}$ " turned bolts. A central buffing wedge-block to be provided. Engineman's foot-plate.

The draw-gear is to consist of a central wrought-iron bar, $2\frac{1}{2}$ " diameter, and two safety shackles $1\frac{1}{4}$ " x $1\frac{3}{4}$ ", with suitable wrought-iron pins. Draw-gear.

A hinged flap-plate, suitably curved, is to cover the space between the engine and the tender. Flap-plate.

The buffer-plate is to be of wrought-iron or steel, bolted to the angle-irons riveted at the ends of the frames, and stiffened at either side by corner brackets, to transmit the thrust of the buffers to the frames. Front buffer-plate.

Turton's patent buffers are to be supplied, pattern H $1\frac{1}{2}$,—in Turton's catalogue—centred, 5' 9" apart and 3' 4" from rail. Buffers.

The front buffer-plate is to have a stout wrought-iron draw-hook, fitted with an indiarubber spring and washer-plate on the inside, secured by a nut and split cotter. There are also to be two safety chains (links made of 1" iron) and hooks. Front draw-gear

There are to be side platforms continuous from the front buffer-plate to the rear end of the foot-plate, attached to the frames by angle-irons, and by the corner brackets for carrying the brake hangers; the outer edge of the platforms to be stiffened by a 3" angle-iron. Side platforms

The upper portions of the wheels are to be covered in by cast-iron splashers, secured to platforms by bolts. Splashers.

The frames are to be fitted with suitable wrought-iron brackets to take the equalizing beams and spring-links. Brackets for spring-link, &c.

Bogie.

The bogie is to have two wheels and a radial arm, the weight from the engine being transmitted through a large cast-iron slide-plate.

The entire frame is to be of cast iron, in one piece, and carefully annealed. Frames.

The bogie is to be fitted with the ordinary laminated bearing springs, and to have side check-springs of the same type. Bearing springs

Wheels.

All the engine wheels are to be of wrought-iron, forged out of the best selected well-hammered scrap, and neatly smithed and hand-dressed.

The spokes to be forged with solid T ends (unless special appliances be provided for dabbing on the rim pieces under the steam-hammer). The six coupled wheels to have fifteen spokes each, and to be suitably bossed for the crank-pins and axle-ends. Coupled wheels.

The whole of the wheels to be manufactured according to the most approved modern method, and as far as possible die forged.

The bogie wheels are to have nine spokes each, and to be made and finished after the same manner as the coupled wheels. Bogie wheels.
