The welds in bosses, spokes, and rims must be thoroughly sound and free from all defects, as any defective welding will necessitate the rejection of the wheel. The wheels are to be turned or planed on the faces of the bosses, and turned on the face and edges of the rims; they are to be tooled round the axle and crank-bosses, and the spokes are to be chipped and neatly finished by hand. They are to be forced on the axles by hydraulic pressure of $1\frac{1}{2}$ tons per square inch of the area of the hole for the axle, and each wheel is to be secured by a strong steel key, let halfway into the axle (on the same side as the crank-boss in the coupled wheels), carefully fitted all ways, having a taper on the flat of 1 in 96, and driven in with a sledge-hammer, or tup. Welds.
How finished.

The crank-pin holes of the coupled wheels are to be bored out taper and countersunk, and the pins are to be pressed in by hydraulic pressure, and riveted up cold. Crank pins to be of "Vickers' " mild cast-steel. Wheels fixed on axles.
Crank-pin holes

Tires.

The tires to be of Vickers, Sons, & Co.'s cast-steel ("Australia Brand"), $2\frac{3}{4}$ " thick on the tread. They are to clip the wheel-rims on the outer edge, and to be bored out and shrunk on tight, and secured with screwed studs. They are to be stamped with the maker's name and date of manufacture. Tires.
How fastened.

The flanges of the middle pair of driving wheels to be reduced to half the thickness of the others. Thin flanges.

Axles.

The axles throughout to be of Vickers, Sons, & Co.'s cast-steel, and of the following dimensions:—Bogie, $5\frac{1}{4}$ " diameter in the middle, with bearings $5\frac{1}{2}$ " diameter by 10" long; leading and trailing coupled, $6\frac{1}{2}$ " diameter in the middle; driving, $6\frac{3}{4}$ " diameter, the whole of the driving bearings being 7" diameter by $8\frac{1}{2}$ " long. The main driving axle to be turned 7" diameter on the eccentric seats. Axles.

All axles to be stamped with the maker's name and date of manufacture.

Axle-boxes.

Axle-boxes.

- Driving.** The boxes for the coupled axles are to be of wrought-iron (case-hardened), and fitted with semi-circular bearings of hard gun-metal. They are to be planed to fit the axle-box guides, and fitted with syphon-tubes and covers.
- Keeps.** The brasses are to be finished $\frac{1}{8}$ " shorter than the journals. The axle-box keeps are to be of cast-iron; in the case of the trailing, suitably shaped for the spring-hangers and pins.
- Bogie axle-boxes.** The bogie axle-boxes to be of cast-iron, planed to fit the axle-box guides, to have hard gun-metal bearings, cast-iron keeps, two syphon holes in each box, and wrought-iron covers.

Springs.

- Buckles.** The bearing and side check springs are to be manufactured by makers of good repute only, and to be of the best spring steel, and stamped by the maker. The ends of the upper plates are to be made with eyes slotted in the middle to receive the links, and bored to receive the pins. The buckles are to be of wrought-iron, shrunk tightly on; those for the bogie springs are to be made with a shank or pillar forged solid with the buckle, to sit on the axle-box. The pins, links, and link-brackets on frames are to be well case-hardened. All spring-links to be made with solid eyes and plain pins (no screwed ends to be used). Driving-spring pillars to be $1\frac{1}{2}$ " diameter.
- Testing.** Each spring must be tested before being used, and should sustain a load producing double the working displacement, without permanent set or deflection.

Boiler.

- Material.** All the plates used in the boiler shell and dome, as well as the angle-irons and rivets, are to be of the best Yorkshire iron, manufactured either by the Lowmoor, Bowling, Monkbridge, or Taylor Bros., care being taken in bending the plates to leave the "brand" of the manufacturer visible outside. The brand of iron to be used to be named in Tender.
- Plates to be planed.** All the plates, butt-strips, and hoops to be planed or turned on their edges. Prevailing thickness of plating in boiler shell (when not otherwise specified) to be $\frac{1}{2}$ ".
- Barrel.** The barrel is to be 10' 4" long, and 4' 5" diameter, outside. It is to consist of three plates, with one longitudinal joint each, placed in a line between water-level and base of dome, alternately right and left side of engine, and circumferential butt joints; the longitudinal joints to have lap-plates both inside and out, and to be double riveted, zig-zag, the circumferential joints to have outside lap-plates only, and to be single riveted, the lower portion, for one-third of the circumference, to be protected inside by lap-plates $\frac{1}{4}$ " thick.
- Front tube-plate.** The front tube-plate, $\frac{1}{8}$ " thick, is to be flanged, to take the smoke-box side-plates. It is to be carried down, flanged and bolted, to the smoke-box floor-plate. It is to be attached to the boiler by an angle-iron $4\frac{1}{2}$ " by $3\frac{1}{4}$ " by $\frac{1}{8}$ " thick, turned inside and on the face and edges, single riveted to the tube-plate, and double riveted to the boiler-barrel. The edge of the front barrel-plate is to butt closely against tube-plate.
- Fire-box casing.** The front fire-box casing-plate is to be $\frac{3}{16}$ " thick, flanged forward with a radius (outside) of $1\frac{1}{4}$ ", to overlap the barrel-plate outside, and flanged backwards at the sides to form a lap joint inside the side-plates. The back casing-plate is to be flanged with a radius (inside) of 3", to form a joint with the side-plates in a similar manner. The sides and top are to be formed of three plates, which are to lap each other and the barrel, as well as the front and back casing-plates, and are to be single riveted throughout, except at the horizontal joints, which are to be double riveted, zig-zag. The side-plates are to be lapped round the lower corners of the front and back plates, and riveted thereto, to form a double thickness for the mud-plugs.
- Dome.** A wrought-iron dome, 1' 9" diameter inside, and 2' $11\frac{1}{2}$ " high, is to be fixed on the middle plate of the boiler-barrel. It is to consist of a double-flanged seating, 6" high at shallowest part, formed out of specially-rolled L iron or plate, welded up solid, the lower flange curved suitably to the boiler-barrel, the upper flange to be $1\frac{1}{8}$ " thick (after being turned and faced). The upper portion of the dome to consist of a hemispherical-ended cylinder, terminating below, in a faced flange $1\frac{1}{8}$ " thick, made similar to the seating, the whole being welded up solid. The lower joint-face to be recessed $\frac{1}{8}$ " deep, to fit a corresponding projection on the upper face. The lower flange of dome-seat to be single riveted to boiler-barrel; the hole in the barrel to be 1' 4" diameter, the edge of the barrel-plate being stiffened by two wrought-iron rings $2\frac{1}{4}$ " x 1" (riveted one inside and one out).
- Man-hole.** There is to be a man-hole, 1' 1" diameter, on the crown of the fire-box casing, fitted with a wrought-iron ring (double riveted), forming a seating, to which is to be attached, by $\frac{7}{8}$ " studs, a wrought-iron cover.
- Safety valves.** The wrought-iron cover is to be turned on both sides, and at the outer edge underneath is to be recessed to take the upper edge of the brass moulding of the clothing. It is to be bored, and fitted on the upper side, to take the columns of two Ramsbottom's $3\frac{1}{2}$ " safety valves and other fittings, all of which, except the spring, the lever, and their attachments, are to be of gun-metal. The valves to be set to a working pressure of 140 lbs. per square inch.
- Crown plate L irons.** The top fire-box casing-plate is to have two double transverse rows of angle-iron bent to the proper curve and firmly riveted to the plate, to carry the roof stay slings.
- Longitudinal stays.** The smoke-box tube-plate and the back fire-box casing-plate are to be stayed to each other by seventeen longitudinal wrought-iron through-stays (eleven threads per inch), made with forged heads, and screwed with copper washers into the back casing-plate; front end $1\frac{1}{2}$ " diameter, and parallel, body part $1\frac{1}{8}$ " diameter, back end $1\frac{3}{8}$ " diameter (largest), and tapering 1 in 16. They are to be adjusted to the tube-plate by a nut and copper washer on each side. The upper portion of the back casing-plate, where the stays and fire-box fittings are attached, is to be strengthened by a $\frac{1}{2}$ " plate inside, suitably riveted. The longitudinal through-stays are to be supported at mid-length by a plate $\frac{1}{2}$ " thick, and not less than 4" wide, riveted to the barrel, and by slings where required.
- Copper fire-box.** The plates (as well as the stays and rivets) of the fire-box are to be made of the best selected copper, manufactured either by the Broughton Copper Co., Pontifex & Wood, Vivian & Sons, Pascoe, Grenfell, & Sons, or Nevill, Druce, & Co. They are to bear the maker's stamp, which is to be placed so that it can be seen after the boiler is finished. The

The fire-box plates are to be $\frac{1}{2}$ " thick, except the portion of the front plate which receives the tubes, and which is to be $\frac{2}{5}$ " thick.

Strips must be cut off the plates, and they, with the bars for the stays and rivets, must stand the test of being bent double when cold, without any sign of cracking. If any cracks appear in any of the strips or bars they must be annealed, and if, after being annealed, the same do not stand the test of bending cold, the plates or bars from which such test pieces have been cut must be rejected. Testing.

All copper stays to be thoroughly annealed before being screwed.

The tube and back plates are to be flanged to a radius of 1" inside at the top and round the tube space, otherwise $1\frac{1}{2}$ ", to make lap-joints with the roof and side-plates. Tube and back plates.

The sides and roof are to be in one plate, the top corners bent to a 5" radius. Sides and roof.

Special care and attention should be directed to all corners of the copper-box, as any signs of cracking or injury will necessitate rejection. Care in flanging.

The prevailing water-space between the outer and inner plates at the bottom is to be $2\frac{3}{8}$ " all round. Water-space.

The joint at bottom of fire-box and casing is to consist of a solid wrought-iron forged ring $2\frac{1}{2}$ " deep at the shallowest part, with $\frac{7}{8}$ " iron rivets. The plates, both inside and out, reach to within $\frac{1}{8}$ " of the bottom of the ring, and the centre-line of the rivets is to be $1\frac{3}{8}$ " above the bottom of the same. Bottom ring.

The ring is to be brought down at the corners to take a double row of rivets, and at the sides, to carry the ash-pan.

The fire-hole is to be oval, $11\frac{1}{2}$ " x $14\frac{1}{2}$ ", the joint being formed by a solid wrought-iron ring $2\frac{3}{8}$ " wide (planed on both sides), with $\frac{7}{8}$ " rivets countersunk on the outside, and finished flush. Fire-door ring.

The roof of the fire-box is to be strengthened by wrought-iron girders, $2\frac{1}{2}$ " thick by not less than 7" deep at the middle, carefully bedded at the ends to the front and back edges of the box. Roof stays.

The space between the top of the box and the girders is to be not less than $1\frac{1}{2}$ ". The top of the box is to be attached to the girders by 1" set-screws (standard Whitworth thread), tapped into the girders from below. The screws must be a tight fit in the holes in the roof-plate, the throats being left full and screwed well home, the corners of the head next the plate being chamfered off. Wrought-iron ferules to be used as distance-pieces, covering as little area as possible. Space between roof-stays and box. Roof-bolts.

Twelve safety-links, with oblong holes (to permit the free expansion of the fire-box crown, when heated) are to be suspended between the six intermediate girders and the transverse angle-irons on the roof of the casing, the girders being forged with suitable lugs for this purpose. Safety-links.

The roof-plate is to be fitted with a fusible lead plug $1\frac{1}{4}$ " diameter at the point (tapered 1 in 6), and screwed 10 threads per inch, and bored and tapped $\frac{7}{16}$ ". The box is to be stayed to the shell by copper stays $\frac{7}{8}$ " diameter, screwed 10 threads per inch, centred not more than $4\frac{1}{2}$ " apart C. to C., screwed tightly into both plates, riveted over at both ends, and with a sufficiently large head inside. The thread is to be turned off in the water space. The first rows on the sides are to be centred $8\frac{1}{16}$ " from the outside of the front and back casing-plates, and at the front and back $7\frac{1}{2}$ " from the outside of the side casing-plates. The tube-plate is stayed to the barrel-plate below the tubes by eight 1" copper stays, screwed 10 threads per inch, tapped into the copper plate and into wrought-iron sockets riveted to the barrel, and riveted over on the outside. Lead plug. Copper stays. Lower barrel stays.

All rivets used in the boiler-shell are to be $\frac{3}{4}$ " diameter, centred $1\frac{3}{4}$ " apart, except those attaching the angle-iron to the front tube-plate, which are to be $\frac{1}{2}$ " diameter, and those in the fire-door and foundation and manhole rings, which are to be $\frac{7}{8}$ " diameter, centred $1\frac{7}{8}$ " apart. Those in the copper box (excepting the foundation ring) are to be of copper, and $\frac{3}{4}$ " diameter. All the rivets must completely fill the holes, and the riveting is to be done by steam or hydraulic power, wherever it is possible to do so, for which special appliances must be provided. Rivet-holes, if necessary, to be adjusted by ryming; no drifting to be allowed. Rivets. Steam riveting.

At each bottom corner of the fire-box casing there is to be a gun-metal wash-out plug $1\frac{1}{4}$ " diameter (at small end), fitting into a gun-metal bush 2" diameter screwed into the casing-plate. There is also to be an oval mud-hole with suitable cover, &c., at lowest part of throat-plate; also two $1\frac{1}{4}$ " plugs in the front tube-plate, on a level with the lowest row of tubes. There are also to be two $1\frac{1}{4}$ " plugs at the back of the fire-box casing, above the level of the top of the copper box (for filling). All the foregoing are to be screwed 10 threads per inch, and tapered 1 in 16. Wash-out plugs.

A brass blow-off cock, fitted with a pipe leading to ash-pit, is to be fixed by a flange and studs to the fire-box casing on left side, and worked by a handle placed conveniently above the side platform. Blow-off cock.

The fire-bars are to be of wrought-iron, carried on two round wrought-iron bars shaped at the ends to fit into suitable brackets bolted to the prolonged portion of the fire-box foundation ring. These carrier bars are to be drilled and fitted with pegs (not tapered) of $\frac{7}{8}$ " round iron centred 2" apart, to regulate the spacing of the fire-bars. Fire-bars.

The ash-pan is to be of wrought-iron, the full length and width of the fire-box, and is to have a tight-fitting damper door at both front and back, with a hinge-bar running the full length of the door, and worked from the foot-plate by suitable levers and rods, having convenient notches and lips. They must also have springs to prevent rattling and flying out of gear. The bottom is to be stiffened by cross angle-irons, inside, at front and back ends. Ash-pan.

The fire-door is to consist of two sliding wrought-iron plates, and is to be provided with a wrought-iron deflector and fender mouth-piece. Fire-door.

The fire-box to be fitted, at front end, with a fire-brick arch, supported by angle-irons attached to the side-plates by studs. Brick arch.

A swan-necked cast-iron pipe 4" diameter is to be fixed in the steam dome. The lower portion is to be attached by an angle-iron bracket to the dome base. It is to be surmounted by a gridiron regulator valve of gun-metal, working on a cast-iron seat having suitable ports, placed as high in the dome as possible, and worked by levers and rods from the foot-plate. Regulator.

The stuffing-box is to be of gun-metal, with suitable stops to limit the travel of the handle, and stamped "Shut" and "Open" on the right and left hand respectively. Stuffing-box.

A copper pipe, 4" diameter inside, and No. 9 W.G. thick, is to connect the regulator with the pipe in the smoke-box. It is to be fitted to the regulator pipe by a gun-metal cone, brazed on and secured by a circular wrought-iron clip, cast-iron split bush, and two bolts, the hole in the clip being large enough to slip over the cone; it is to terminate at the front end in a gun-metal flange (brazed on), and to be bolted to the tube-plate by seven $\frac{3}{4}$ " studs. Steam-pipe.

T pipe in smoke-box. There is to be a cast-iron T pipe in the smoke-box fixed by the studs which secure the flange of the steam-pipe. Copper pipes 4" diameter inside, and No. 7 W.G. thick, with gun-metal flanges brazed on, are to connect the T pipe with the cylinders.

They are to be bent round the sides of the box to clear the line of tubes. The copper pipes are to project 1" through the bottom flanges into the valve-chests. Circular recesses are to be cut in the valve-chest castings for corresponding projections on the flanges of the steam-pipes to fit into.

A No. 2 Roscoe's lubricator to be attached to each side of smoke-box, with copper pipe leading into centre of cylinders.

Flue-tubes.

Material and make. The tubes are to be of brass, solid drawn, and of the best quality, manufactured either by the Broughton Copper Company, Elliott's Metal Company, Allan, Everett, & Sons, J. Wilkes & Company, or other good makers, subject to the approval of the Inspecting Engineer.

Number and diameter. They are to be 189 in number, and 2" outside diameter, swelled to 2 $\frac{1}{16}$ " diameter in front tube-plate, and are to bear the maker's stamp. Thickness, No. 10 W. G. at the fire-box, and No. 12 W. G. at the smoke-box end.

Care must be taken to make the tubes perfectly steam-tight at both ends by rolling them with Dudgeon's expanders.

Steel ferules. Tapering steel ferules are to be inserted at both ends.

The tubes are to project $\frac{3}{8}$ " beyond the fire-box tube-plate, and $\frac{3}{8}$ " beyond the smoke-box tube-plate when fixed, and they are not to be rolled over or beaded at the ends.

Smoke-box.

The smoke-box to be of the "extended" type; plates, L irons, rivets, and forgings to be of the best Staffordshire iron.

The sides of the smoke-box are to be attached to the tube-plate by $\frac{5}{8}$ " rivets, and to be carried down and bolted to the frames. The front-plate is to be connected to the side-plates by an angle-iron (riveted), and to be stiffened round the doorway by a 3" L iron (riveted).

Door. The door is to be circular and dished, flanged 1 $\frac{1}{2}$ " all round the edge, and carried by two wrought-iron hinges. It is to be fitted with a $\frac{1}{4}$ " protecting liner, attached by rivets and ferules, with an air space of $\frac{3}{4}$ " at the edges. It is to be kept closed by a central handle with a minor locking handle and screw, with a removable horizontal cross-bar.

The smoke-box must be made perfectly air-tight, by bringing down the plates square into the corners.

The exhaust-pipe is to be of cast-iron, with branches leading from each cylinder and uniting at the centre; the diameter at the top is to be 4 $\frac{3}{4}$ " inside. All the joints to be planed and scraped metal to metal.

Spark-arrester. Spark-arresters to be fitted of the best design known for the prevention of burning matter being emitted.

Chimney. The chimney to be of wrought-iron, the base being formed of a plate welded up without seam, and shaped on a block to suit the curve of the smoke-box. The barrel is to be made of one plate with a butt joint and inner lap-plate. It is to be fitted into and riveted to the base. It is to be surmounted by a polished copper top. All the rivets in the chimney are to be countersunk outside, and finished flush. The extreme height from rail to chimney top is to be 13' 6".

Blower. A blower-cock is to be fixed on the boiler behind the chimney, worked from the foot-plate by a spindle passing through the right-hand rail. A copper pipe is to lead the steam to the top of blast-pipe.

A No. 2 Roscoe's patent lubricator is to be fixed on each side of the smoke-box, with a copper pipe leading into the centre of each cylinder.

Hand-rail. A hand-rail is to be fixed to the front of the smoke-box, continuous with the side-rails.

Injectors.

Injectors. Two No. 9 Giffard's injectors (Gresham and Craven's make), are to be provided. They are to be carried by wrought-iron brackets bolted to under-side of cast-iron foot-plate, and fitted with waste-water cock and copper pipe to carry the waste water below the edge of the platform.

Injector-pipe. The injectors, clack-boxes, and cocks are to be of gun-metal, and the steam, suction, delivery, and overflow pipes of copper, with gun-metal flanges. The steam pipe is to be 1 $\frac{3}{8}$ " diameter inside, No. 11 B.W.G.; the delivery pipes 1 $\frac{3}{8}$ " diameter, and No. 10 B.W.G.; and the suction pipes 1 $\frac{3}{8}$ " diameter, No. 12 B.W.G. The injector feed-pipes to be carried by wrought-iron hangers attached to the under-side of the foot-plate.

Fire-box Fixings.

The fire-box fixings are to consist, in addition to those already mentioned, of the following:—

Gauges, &c. One Bourdon's patent metallic pressure gauge, indicating up to 200 lbs. per square inch, with cock and copper pipe. Two glass gauges (one right and one left side), with top and bottom cocks, and waste-water cocks and copper pipes, fixed to back casing-plate with stout gun-metal flanges and studs. One whistle, connected with a branch from the body of the hind safety-valve, and placed at such a height as to enable the steam to pass above the cab roof. There is also to be an iron socket screwed into the back casing-plate, to carry the gauge-glass lamp, and a wrought-iron tray (with angle-iron rim) fixed with studs, above the fire-door. All the cocks and fittings are to be made of gun-metal, unless specially named to the contrary, and all fittings screwed into the boiler are to have 11 threads to the inch, unless otherwise specified.

Clothing.

Boiler clothing. The boiler is to be covered with dry pine battens, 1 inch thick, tongued and grooved. At each joint of the lagging-plates a wrought-iron hoop, 2" wide by $\frac{3}{8}$ " thick, is to be put on (in two halves), screwed together with countersunk screws to metal joint-blocks let in through the battens and bearing on the boiler; also distance-pieces, about 20 inches apart, bearing on the boiler, to adjust the hoops to the proper distance. All are to be finished flush with the outer surface of the wood lagging, and covered with sheet-iron, No. 16 W.G., and bound together round the barrel and over the fire-box casing with hoop-iron.

Dome casing. The dome is to be enclosed in a helmet-shaped casing of charcoal sheet-iron. Polished brass mouldings are to be fitted round the back corners of the fire-box casing, the smoke-box angle-iron, and under the safety-valve seating.

The front corners of the fire-box casing are to be fitted with mouldings of charcoal sheet-iron.

The

The House.

The house is to consist of a front weather screen of $\frac{3}{8}$ " sheet-iron, carried by an angle-iron, secured Cab. to four suitable wrought-iron brackets riveted to the top of the fire-box casing, and of a curved $\frac{1}{4}$ " sheet-iron roof-plate, stiffened at front and back ends by a light $2\frac{1}{2}$ " angle-iron, and fitted with longitudinal $2\frac{1}{2}$ " light angle-irons to take the wrought-iron supporting pillars. The roof-plate is to extend backwards the full length of the foot-plate, and in front of weather-screen $12\frac{1}{2}$ ", and is to be attached to the latter by a light 2 " L iron. The outer edges of the roof-plate, along the sides, are to have light 1 " L irons from end to end to act as gutters.

The weather-screen is to be $5' 9\frac{1}{2}"$ wide in body part, widened out at top to meet side L irons. It is to be fitted with two swivelling circular windows, fixed in brass frames, &c. The pillars are to be connected $3'$ above the foot-plate by a polished wrought-iron hand-rail, and the space is to be filled up by a $\frac{3}{8}$ " wrought-iron panel-plate fastened to the platform by light 2 " L iron. The gaps at front end between panel-plates and fire-box casing are also to be filled up by $\frac{3}{8}$ " wrought-iron plates.

Brakes.

An efficient hand-brake is to be fitted to the engine, as well as the tender, consisting of an $1\frac{3}{8}"$ screw spindle with a square thread, having a $\frac{3}{8}"$ pitch with a $12"$ double-ended hand-lever at top, and an $11"$ lever on brako-shaft at lower end with a suitable screw-nut. The handle for working it is to be placed on the left-hand side of the foot-plate, and is to be carried on a hollow cast-iron pillar bolted to the foot-plate by four $\frac{3}{4}"$ bolts. There is to be a wrought-iron hanger, with cast-iron block, fitted to each of the six driving wheels, and a wrought-iron brake-shaft $3\frac{1}{4}"$ diameter carried by cast-iron brackets bolted to the frames, and having the arms forged on solid, the screw-arm being forked and bored to take the screw-nut.

The right-hand end of the shaft is to be made with an arm suitable to couple up with a steam-brake cylinder, which is to be bolted to the frame-plate, and controlled by a steam-cock on back casing-plate, fitted with all necessary pipes, &c.

Efficient gear to be provided for supplying a jet of water from the tender to the tire of each wheel of engine and tender, immediately above each brake-block (for cooling), the whole to be controlled by suitable handles, &c., from tender foot-plate.

Hand-rails.

There are to be polished hollow wrought-iron hand-rails along the sides of boiler, supported by three cast-iron carriers on either side, each bolted to a short piece of L iron riveted to the barrel of the boiler. The hand-rail to be continuous round front of smoke-box, and suitably attached to the same.

Sand-boxes.

Large cast-iron sand-boxes, capable of carrying 7 cubic feet of sand each, are to be fixed to the platforms, forward of the front coupled wheels, and worked, both sides simultaneously, by suitable levers and rods from the foot-plate.

The sand-pipes to be of wrought-iron, $1\frac{3}{4}"$ diameter inside, attached by suitable flanges and studs to the boxes, and bent in such a way as to convey the sand as near as possible to the tread of the wheel.

Lamp-brackets.

A head-lamp bracket to be fixed on each side of the front buffer-beam, in line with buffers.

Painting.

After being tested, the boiler is to receive two coats of metallic oxide paint, and when dry the clothing is to be put on. When finished the engine is to receive not less than two coats of lead colour in oil. The whole of the surfaces requiring it are then to be filled up with hard stopping, and after being well rubbed down smooth are to receive a third coat of lead colour in oil, and to be finished with two coats of selected colour in oil and two coats of varnish.

Tool-box and Tools.

Each engine is to be provided with a portable wooden tool-box $3' 3"$ by $2' 0"$ by $1' 9"$ (to be carried on the top of the tender), made of oak or tallow-wood, bound with iron at the corners, and the lid covered with galvanized sheet-iron; to have strong hinges, hasp and padlock, and till inside at one end; also two monkey-wrenches (one large and one small); one heavy hammer; one light hammer; one copper hammer; two flat chisels; two cross-cut chisels; two pin-punches; one complete set of screw-keys to fit all nuts; two short keys for piston glands; two short keys for valve spindles; light close-ended keys for all syphon covers; one fire-bucket; one fire-shovel; one fire-dart; one fire-pricker; one rake; one pinch-bar (large); one tube-plug socket-rod and six tube-plugs; two 15-ton traversing screw-jacks, with ratchet, ratchet head, and jackbars; two oil-cans (one large and one small); two oil-feeders (one large and one small), copper tallow-kettle, hand-brush, and gauge-lamp.

Pitch of Screws.

The threads of all bolts, studs, and nuts are to be cut to Whitworth's standard, unless where specially stated to the contrary. Where fine threads are specified, eleven threads per inch are to be used, except in the case of piston-rods, the threads of which are to be six per inch. All bolt-heads and nuts are to be hexagonal, and measured across the corners are to equal twice the diameter of the bolt (except in the larger sizes of bolts, in which case the next size less for heads and nuts may be taken if more suitable). The size across the flats will not therefore be Whitworth's standard.

Lubrication.

Special care is to be taken in designing oil-cups, &c. (especially for reciprocating parts of the gear), to prevent the oil being thrown out and wasted when the engine is in motion.

Wire-gauge.

The Birmingham wire-gauge is to be used.

Case-hardening.

Case-hardening.

All the motion-work, brake-work, the nuts of the cylinders and glands, and all journals, pins, joints, and rubbing surfaces about the engine and tender (except where of brass, cast-iron, or steel) shall be thoroughly case-hardened to a depth of $\frac{1}{16}$ " and so hard as to wholly resist filing.

Specimens of case-hardening, which have been hardened in the same boxes with the work, will be broken in the presence of the Inspecting Engineer or his deputy.

TENDER.

(Contents, 2,500 gallons.)

General Arrangement.

The following are the leading particulars of the design and construction of the Tender (based on the assumption of a rigid or fixed wheel-base, not exceeding 11', and plate frames); and it is to be clearly understood, that in the event of bogie being adopted in lieu of rigid wheel-base, the details and dimensions as here set forth are, of course, subject to modification, but must still be adhered to as far as practicable, a certain amount of latitude being allowed to meet the conditions of enlarged tank, &c.

The tender to be of the ordinary horseshoe type, with the addition of a well underneath the tank 10' long, 4' 1" broad, and 1' 6" deep inside, and extending over the front and middle axles. The fuel space (shaped in the tank) to be 7' 9" long (from the front end), and 2' 6" wide; the whole to be carried on six wheels 3' 7" diameter at the tread; wheels 5' 6" apart C. to C.; total wheel-base 11'.

Wheels.

Bodies to be of wrought-iron, 3' $1\frac{1}{2}$ " diameter, and to have ten spokes each. They are to be made of the same material, put together and finished in the same way as the engine wheels.

Tires.

To be of the same material, brand, section, and method of fastening as specified for the engine tires, with flanges on all the wheels.

Axles.

To be of the same material and brand as specified for the axles of the engine; to be $5\frac{1}{2}$ " diameter in the middle, parallel for a distance of 2' 6", to run into $6\frac{1}{8}$ " diameter at the collars, which are to be $\frac{3}{8}$ " broad; the wheel seats to be 6" diameter; the journals to be $4\frac{1}{2}$ " diameter by 8" long and parallel; the radius of the corners being $\frac{3}{4}$ ". The distance from C. to C. of bearings to be 6' 2".

Axle-boxes.

To be of fine-grained hard cast-iron. The castings to be clean and free from flaws of every description. To be planed to fit the axle-box guides, but to be left $\frac{1}{8}$ " wider between the flanges, to allow of lateral motion. The bearings to be of hard gun-metal, octagonal on crown, and perfectly bedded into the axle-boxes. Two syphon-tubes to each box; the tubes to be continued through the cast-iron into the brass bearings for a $\frac{1}{4}$ ". The keeps to be of cast-iron, and planed to fit the axle-boxes (so that they can be put up and taken down by hand without hammering), and secured by two $\frac{5}{8}$ " round wrought-iron pins. The covers to be of cast-iron, recessed in the top to take the ends of spring pillars. The lid to be of cast-iron, secured by a wrought-iron pin.

Bearing.

Keeps.

Covers.

Axle-box Guides.

To be of fine close-grained cast-iron, free from flaws of every description. To be planed on the face, edges, and flange, and to be fastened to the frames by four tight-fitting $\frac{7}{8}$ " turned bolts in each, the bolts to be countersunk into frames, the nuts to be secured by split pins.

Axle-fork Keeps.

To be of wrought-iron, a good fit on the forks, and secured by a $\frac{7}{8}$ " bolt at each end.

Springs.

To be of the same material as specified for the engine springs. The spring pillars to have two wrought-iron guides each, fastened to the inside of frames. The wrought-iron spring link carriers also to be attached to the inside of the frames.

Framing.

The frames are to be of the same material as specified for the engine frames, and are to be $\frac{7}{8}$ " thick, running from buffer-plate to buffer-plate, and formed each of one solid plate. The minimum depth to be 12", and above the axle-boxes 1' $2\frac{1}{2}$ ", deepened at the front end to take the brake shaft and footsteps. The main frames to be braced together at the front end by a $\frac{5}{8}$ " wrought-iron vertical plate (serving as a buffer-plate, *q.v.*) 1' 2" deep, and a $\frac{1}{2}$ " vertical plate 1' $2\frac{1}{2}$ " deep, united by two horizontal $\frac{1}{2}$ " plates 1' 9" wide; also at back end by a $\frac{1}{2}$ " vertical plate (serving as a buffer-plate) 1' deep, united to a $\frac{1}{2}$ " horizontal plate 1' 6" wide, and finally by two intermediate $\frac{1}{2}$ " vertical plates, each 1' deep, the whole riveted together with suitable L irons, &c.

"Well."

There are to be two $\frac{1}{2}$ " wrought-iron longitudinal stretchers, each in one continuous plate, running from the front intermediate cross-stay to the hind buffer-plate, and spaced 4' 1" apart. The longitudinal stretchers to form the well sides, the front plate of well to be $\frac{3}{8}$ " thick, and spaced 10" from the back of the front cross-stay; the back of the well being formed by the back intermediate cross-stay, suitably deepened.

The middle cross-stay divides the well, consequently care must be taken to cut holes in it to allow the water to circulate, also a hole large enough to admit of a man passing through. The intermediate cross-stays will be secured to the longitudinal stretchers and throughout the well by angle-irons.

Foot-plate,

Foot-plate, Draw-plates, &c.

The foot-plate to be $\frac{3}{8}$ " thick, the extreme width over platform being 7' 6". The front horizontal draw-plate to be $\frac{1}{2}$ " thick, and spaced 6 $\frac{1}{2}$ " below the foot-plate, and fastened to buffer-plate, frames, and front cross-stay plate by 2 $\frac{1}{2}$ " angle-iron and $\frac{3}{4}$ " rivets. The horizontal stiffening-plate to be $\frac{1}{2}$ " thick, and 4' below the draw bar horizontal plate, and to be flanged down at the front, and fastened to the buffer-plate, and secured to the frames and vertical cross-stay plate by 2 $\frac{1}{2}$ " angle-iron and $\frac{3}{4}$ " rivets.

On the underside of the stiffening-plate will be fixed two wrought-iron feed-pipe carriers, to be securely fastened and braced together. The distance from C. to C. of feed-pipes to be 2' 11". The draw-bar pin is centred 1' 3 $\frac{1}{2}$ " back from the buffer-plate. The draw-shackle pin holes to be 5 $\frac{3}{4}$ " from the back of the buffer-plate and 1' 10" apart C. to C.; strengthening plates to be riveted on round the holes in the plates. A wrought-iron (case-hardened) rubbing block to be securely fixed to front buffer-plate, to bear against the wedge block on engine, and securely riveted to plate, with laterally extended landings; no rivets to pierce the middle of block.

Two wrought-iron water-tight sand-boxes are to be placed on the foot-plate at the front end of the tank, one on each side, each capable of holding 2 cubic feet of sand, and fitted with cast-iron water-tight lids, also with suitable valve and gear for working same, the filling hole to be 4 $\frac{1}{2}$ " diameter.

The sand-pipes to be of wrought-iron, the same size as for the engine, and bent so as to convey the sand as near the tread of the front wheels as possible. There is to be a polished wrought-iron hand-rail on each side, at front end, supported by two wrought-iron pillars, and secured to the tank. The left-hand one to have a boss forged on to take the brake-spindle. Two substantial wrought-iron double shackle screw-couplings are to be provided with each Tender; screw, 2" diameter; shackle and link-iron, 1 $\frac{1}{2}$ " diameter.

Brake.

The general design and arrangement to be similar to that specified for the engine brake; the handle to be on the left-hand side of the tender. The shaft to be 3 $\frac{1}{4}$ " diameter, with all the levers forged on solid; the whole to work in cast-iron bushes in the frames. There is to be a wrought-iron hanger and cast-iron brake-block (clipping the flanges) to each wheel. The hangers to be suspended by means of stout wrought-iron pins passing through the frames and liners riveted to the longitudinal stretchers. The hangers for the trailing-wheels to be prolonged to form life-guards.

Back Buffer-plate.

This to consist of a wrought-iron plate $\frac{1}{2}$ " thick, 12" deep, and 7' long, secured to frames and longitudinal stretchers by 2 $\frac{1}{2}$ " angle-iron ($\frac{3}{4}$ " rivets). The horizontal draw-plate to be 8 $\frac{3}{4}$ " below the bottom of the tank, to be $\frac{1}{2}$ " thick and 1' 6" broad, fastened to frames and buffer-plate by 2 $\frac{1}{2}$ " angle-iron ($\frac{3}{4}$ " rivets).

The vertical (draw-spring) plate to be 2' 6" long, 12" deep, and $\frac{1}{2}$ " thick, secured to the horizontal plate and bottom of tank by 2 $\frac{1}{2}$ " angle-iron ($\frac{3}{4}$ " rivets); $\frac{3}{4}$ " strengthening-plates to be riveted on to the back of the buffer-plate and front of the vertical plate. Two buffers, of same type as those specified for the engine, to be fastened to buffer-plate by four 1" bolts in each. Height from top of rail to centre, 3' 4"; distance apart from centre to centre, 5' 9". A stout wrought-iron draw-hook to be provided, having a shank passing through the buffer-plate and vertical draw-plate, and fitted with a powerful volute spring, secured by a washer and split cotter. A case-hardened wrought-iron socket is to be securely attached to the hind buffer-plate, to give sufficient surface for the shank of the hook to work in. Two safety-chains (links, 1" iron) terminating in stout hooks, to be securely attached to the buffer-plate, at a distance of 1' 6" apart.

Tool-box.

A plate-iron tool-box is to be built at the back of the tank, and of the full width of the same, with a hinged lid, hinges, and staple, catch, and lock complete.

Tank.

The thickness of the top and side plates to be $\frac{1}{4}$ ", and the bottom to be $\frac{3}{8}$ ". The top, bottom, and sides to be well stayed to each other by L irons, &c. A curved wrought-iron moulding to extend along the upper edge (outside) of sides and back of tank.

A wrought-iron man-hole ring made of $\frac{3}{8}$ " plate, 18" diameter, 8 $\frac{3}{4}$ " high, flanged at the bottom, is to be riveted on to the top of tank, centred 1' 6" from back of same. It is to be fitted with a wrought-iron cover and handle. The hole to be cut in the tank top is to be 1' 4 $\frac{1}{4}$ " diameter, round which will be supported a wrought-iron sieve, made out of $\frac{1}{8}$ " plate, to be 1' 4" diameter at the top, 1' 3 $\frac{1}{2}$ " diameter at the bottom, and 4' 0 $\frac{1}{2}$ " long.

The tank to be supplied at the back end with a wrought-iron lifting shackle in each corner, with strengthening corner-plates. At the front end, over the front axle, on the inside of the coal bunker, two bent plates will be riveted for the same purpose. A lamp-bracket to be fixed respectively on the left and right hand side at the back end of tank. The feed-valves to be circular, and of gun-metal, with central guide pin, and situated one on each side of the tank, protected by proper strainers, and worked from the top by levers, &c., on circular castings with inclined planes. The vertical rods to be weighted. A brass cock $\frac{3}{4}$ " bore to be fitted to the outside of the tank at the front end and near the bottom (for drawing water into a bucket). The well to have a man-hole 15" diameter, cut in the bottom plate at a distance of 2' 4" from the back plate of well, to have a thickening piece 2" broad and $\frac{3}{8}$ " thick, riveted round the hole on the inside by $\frac{3}{8}$ " rivets, countersunk flush on the bottom. The cover to be $\frac{3}{8}$ " thick, 1' 7" diameter, fastened on by $\frac{5}{8}$ " studs; pitch, 3 $\frac{1}{2}$ ".

Feed-pipes.

The feed-pipes to be of copper, 1 $\frac{1}{2}$ " bore, and No. 12 W.G. thick, and the feed connection between the engine and tender to consist of strong indiarubber hose-pipe, 2 $\frac{1}{8}$ " bore, stiffened with spiral spring inside (tested to 200 lb. pressure per square inch), and fitted with brass union joints at the engine end.

Painting.

The inside of the tank and well to be thoroughly served with three coats of best metallic oxide paint, and the other parts outside to be filled up, rubbed down, and painted in the same manner as the Engines.

W. SCOTT,

February, 1886.

Locomotive Engineer.
GENERAL

GENERAL CONDITIONS, IF ENGINES ARE BUILT BY ENGLISH OR FOREIGN
MANUFACTURERS.

Everything necessary to be provided.	Everything necessary to the proper finish and equipment of the engine and tender must be supplied, whether stated in this specification or not, and no advantage is to be taken of any omission of detail in the specification or any plans which may be supplied for guidance, as the contractor may, by applying to the Inspecting Engineer, obtain full explanation of any part of the work not sufficiently specified or otherwise particularized.
Alterations.	The Commissioner reserves to himself the right to supply, after tenders have been lodged and accepted, a set of "Working Plans" for the contractor's guidance; and in such event said plans will have to be rigidly adhered to, both as regards general design and detail. Any alteration or modification of detail which shall be ordered by the Inspecting Engineer during the progress of the work, as being in his opinion necessary for the proper execution of the contract in accordance with the spirit of this specification, shall be executed by the contractor without extra charge.
Suggestions from contractor.	Any suggestion that the contractor may desire to make, with the object of improving or economising, in his opinion, the working of the engine, or of modifying the mode of manufacture, or the material specified to be used, or the details or dimensions, are in every case to have the previous written consent of the Inspecting Engineer, before being carried out.
Materials used. Workmanship. Inspection.	All the materials used are to be of the very best description of their respective kinds, and the work is to be executed in the most approved, substantial, and workmanlike manner, according to the direction and to the satisfaction of the Inspecting Engineer, who is to have power to inspect the manufacture, either personally or by deputy, in all its branches and details, in such manner as he may think fit, and to reject at any stage, any work or material of which he may disapprove, as not being in accordance with the spirit and intention of the specification; and his decision on any point of dispute or doubt which may arise in reference to the contract, shall be final and binding on the contractor.
Sub-letting.	The contractor shall not assign or sublet the contract, or allow any portion of the work to be done other than in his own establishment (except where implied and provided for by the clauses of this specification), unless with the previous written consent of the Inspecting Engineer.
One set of templates and patterns to be used.	The work is to be finished to one set of templates and patterns, so that the engines and tenders may be exact duplicates of each other, and that all moving parts, including the wheels and axles, must be interchangeable.
Numbering of parts.	The maker's (progressive) number to be stamped upon all parts of each engine and tender, for identification; also maker's name, date, and place of manufacture, to be exhibited upon a brass plate fixed to each engine.
Testing.	All brackets having been riveted on, the whole of the studs and mud-plugs screwed in, and all mountings fitted on (previous to being put in the frames), each boiler shall be tested (without the clothing) in the presence of the Inspecting Engineer or his deputy, first with water to a pressure of 200 lbs. per square inch, and afterwards in steam at the intended working pressure.
Finishing.	When complete and finished in every respect, the engines and tenders shall, after having been satisfactorily tested (in steam) in the maker's yard, be delivered in accordance with the terms of the "Form of Tender."
Protection of bright work.	For the purpose of transit, all bright work to be thoroughly protected against rust by a coating of white lead and tallow, and all parts (other than those in packing cases) to be substantially protected from damage by wood battens or other suitable means. The bearings of the wheels and axles are also to be coated with white lead and tallow, and are then to be lapped with flannel which has been soaked in the lead and tallow, and afterwards tightly and closely lapped with spun-yarn which has been first soaked in the mixture. The outer surface of the spun-yarn is then to be well coated with boiling pitch and tar, and protected overall by battens and wood secured by hoop iron. All studs or joints on the boiler or framing must be protected by wood, and all holes must be plugged (to prevent pinch-bars being inserted when loading or unloading). The cylinders are not to be removed from the framing for transit. Stout cross-stretchers of wood are to be inserted between the axle forks at the front and hind ends of the engine, to prevent any straining of the frames.
Protection of bearings.	
Studs, &c., to be protected.	The movable pieces must be packed in strong cases made of deals $1\frac{1}{4}$ " thick, strengthened by battens placed about 2' 6" apart, and the ends and sides bound down with stout hoop iron, well nailed. All loose pieces in each case must be packed with distance-pieces of wood to prevent any of them moving; and the contractor will be held responsible for any damage arising (during transit) from neglect of this.
Cylinders not to be removed. Cross-stretchers	
Packing cases.	The cases containing the bright work are to be lined with stout sheet tin or zinc, and soldered perfectly watertight, the lids of these cases being fastened down with screws.
Tin linings.	Each case and each unpacked portion of every engine and tender must be marked and numbered, as may be directed, to facilitate the shipment of the parts in the required order.
Marking.	The price named in the "Form of Tender" must include the cost of all templates, royalties, plans, and other charges for the use of patents (if any) involved, and of the delivery of the engines in steam, as per terms of "Form of Tender," to the satisfaction of the Inspecting Engineer or Commissioner for Railways, as the case may be.
Price named to include all costs.	The contractor must deliver complete, as per specification, the various engines and tenders by not later than the dates respectively named in his "Form of Tender," and should he fail to do so, a sum at the rate of £20 per week per engine will be deducted, by way of liquidated damages, from the price named in the "Form of Tender."
Delivery within contract time.	The contractor will be required to execute a formal deed of contract with the Agent-General of the New South Wales Government in London, or the Commissioner for Railways, Sydney, New South Wales, embodying this specification, the terms of the "Form of Tender," and all other conditions necessary to ensure the due completion of the contract, as stated in the "Form of Tender."
Bond to be executed.	Detailed packing lists must be furnished in duplicate written copies, giving the outside measurement of each package, as well as the weight thereof, as nearly as possible.
Packing lists.	Payment will be made for each engine as follows:—90 per cent. in cash in London, on receipt by the Agent-General for New South Wales of the bills of lading, together with a certificate from the Inspecting Engineer, that the terms of this specification, as to the completion and packing, &c., &c. of the engines, have been fulfilled.
Payment.	And

And it is hereby expressly declared that the giving of a certificate by the Inspecting Engineer in London, that the work done by the contractor has been satisfactorily executed and completed up to the period of delivery, shall be a condition precedent to the contractor's having any right of action or lawful claim to the payment of the 90 per cent., to be made under this specification.

The balance of 10 per cent. will be paid by the Agent-General, on receipt by him of a certificate that each engine has run 2,000 miles on the Government Railways of New South Wales to the satisfaction of the Locomotive Engineer of the Government; and if any engine or engines should fail to run the specified 2,000 miles to the satisfaction of the Locomotive Engineer, the contractor will be called upon to make good the defects. If he fail to do so within reasonable time, the Commissioner for Railways shall spend any such sum (not exceeding in the total the 10 per cent. on the contract price of the engine or engines that shall have arrived in the Colony) as may be considered necessary, in the opinion of the Locomotive Engineer, to make the engine or engines conform to this specification, such sum to be deducted by way of liquidated damages from the forementioned balance of 10 per cent.

A complete set of working plans or drawings (on vellum) to be supplied by the contractor to the Agent-General or Commissioner for Railways, as soon as the whole of the working plans or drawings shall have been completed.

Each Tenderer to submit (if possible), along with his tender, an outline plan, showing the general features and design of the engine and tender which he proposes to supply, along with a skeleton specification of the leading particulars of the same.

Should the rate of progress made with the work be such as to prevent, in the opinion of the Inspecting Engineer, the engines being delivered within the time specified in the "Form of Tender," the Commissioner for Railways or the Agent-General shall have full power and authority, after due notice given to the contractor, to cancel the contract forthwith, upon which all moneys due to the contractor under this contract shall be forfeited.

Tenderers in Europe or America may either tender to the within specification, or if they wish to depart from it in respect of substituting bar for plate frames, cast-steel for wrought-iron centres for wheels, other brands of copper, brass, and iron for those mentioned, will be allowed to submit alternative tenders, provided that they adhere to the general dimensions of the engine, and clearly and minutely specify the nature of the departure they propose to make from the specification.

CHAS. A. GOODCHAP,
Commissioner for Railways.

Department of Public Works,
Railway Branch,
Sydney, 1st June, 1886.

GOVERNMENT RAILWAYS OF NEW SOUTH WALES.

Form of Tender for manufacture of Engines in England or Foreign Countries.

THE undersigned, having read the attached Specification, (No. 188A), hereby offer to supply the Government of New South Wales with Locomotive Engines and Tenders, made in accordance with the various requirements, particulars, and conditions set forth in said Specification, on the following terms as to delivery and payment viz. : Engines (with their Tenders), delivered in steam at _____, at the price of £ _____ each, the whole to be completed and delivered within _____ months from date of official acceptance of Tender; and further promise and agree to be firmly bound by and faithfully to adhere to all the conditions and requirements of the said Specification, and to forfeit to the New South Wales Government, or its lawful representatives, the sum of £20 sterling per Engine and Tender per week (to be deducted from the abovenamed contract sum by way of liquidated damages) for each and every week that each Engine (with its Tender) shall remain undelivered after the time herein specified for delivery.

We are,
Your obedient Servants,

Name
Address

To the

N.B.—This Tender must not be detached from the Specification. The Government do not bind themselves to accept the lowest or any Tender.

GOVERNMENT RAILWAYS OF NEW SOUTH WALES.

Specification No. 188A for a Four-coupled, outside-cylinder Passenger (Bogie) with Engine and Tender.

Number required—Twelve, delivered in steam at Sydney; Four, delivered in steam at Newcastle.

PRINCIPAL DIMENSIONS.

ENGINE:—	ft.	in.
Gauge of Railway	4	8½
Cylinders—diameter	1	7
" stroke	2	2
Coupled wheels, D. and T. (front and back of fire-box)—4.		
" " diameter of do. (tread)	5	6½
" " distance from C. to C. do. approximate	8	3
" " bogie, number—4.		
" " " diameter, tread (if possible not less than)	3	7
" " " distance from C. to C.	6	10
" " " base (total) ... do. approximate	21	8
Fire-box length of foundation ring (not less than) do....	5	9
" breadth do. do. do.	3	6
Tubes, minimum number—198.		
" diameter outside	0	2

Boiler,

		ft. in.
Boiler, diameter (internal minimum), barrel portion (if possible)	4 4
" length do. do. approximate	10 4
" centre line, height from rail (if possible not to exceed)	7 0
Working steam pressure in boiler, 140 lbs.		
Weight on rails, per pair of Driving Wheels (in steam), if possible not to exceed	15 tons.
TENDER (horse-shoe, with well) ; minimum content, 2,500 gallons :—		
Wheels, number—if all fixed wheel-base—6.		ft. in.
" diameter (tread)	3 7
" base (total)	11 0

General Arrangement.

The general arrangement and design to be in accordance with a plan to be prepared by the contractor, in which the following leading particulars are to be faithfully embodied and adhered to, viz. :—Cylinders to lie horizontal and to be situated outside the frames, and not to exceed 6 ft. 3 in. C. to C. apart, valve-chests on top (as in American practice),—connecting rods to be next to the crank bosses, with coupling rods outside of and close to them,—frames sufficiently prolonged and arranged in front of cylinders to take the buffer beam, &c. An extended smoke-box (as in American practice),—with efficient deflector-plate and spark-arrester inside—frames thoroughly and efficiently stayed to one another at front end, and arranged underneath to suit the design of bogie exhibited by the Inspecting Engineer for this purpose. Steel slide-bars arranged as usual for outside cylinder engine, viz. :—one above and the other below C' line of piston-rod. Beyond this, the entire boiler and fire-box arrangement, size, and position of driving and trailing wheels, framing (aft of the motion plate), platforms, foot plating and buffer plates, fire-box fixtures, brake gear, as well as those details of the engine which are unaffected by the re-arrangement of cylinders and bogie shall be in conformity with the working drawings or plans exhibited, or directions issued, by the Inspecting Engineer, in connection with this specification for the contractor's guidance, and any departure from the same is only permissible with the written consent and authority of the said engineer.

The successful tenderer shall make his own copies of the various drawings or plans exhibited for his guidance, and prepare, at his own cost, any further detail or other drawings which may be necessary in carrying out the work, such extra drawings to be subject to approval.

Cylinders.

The cylinders are to be made of fine close-grained cast-iron, perfectly sound and good castings in all respects, and as hard as can with difficulty be bored and planed. They are to have stout flanges, and to be bolted to the frames by tight-fitting turned bolts $1\frac{1}{8}$ " diameter, all the holes being bored out and rymered true for this purpose.

Slide-valves.

The slide-valves are to be of hard gun-metal, stiffened by two suitable ribs inside the exhaust chamber, the valve-faces scraped true, and the corners of the ports rounded to $\frac{3}{4}$ " radius.

Cylinder covers.

The cylinder and steam-chest covers are to be truly planed or turned and scraped to faces, and the joints made metal to metal ; all nuts to be case-hardened ; those in the smoke-box are to be of gun metal.

Mud-cocks.

The front covers are to be fitted with $\frac{1}{8}$ " polished covering plates, secured by set-screws, the holes for which must pass through the covers. Each cylinder is to be fitted with mud-cock at each end, worked simultaneously by suitable cross-shafts, rods, and levers from the foot-plate, the handle to be situated on left side of engine. Cylinders, valve-chests, and passages to be efficiently clothed and covered in.

Pistons and Cross-heads.

The pistons to be of cast-iron with cast-iron packing rings $\frac{3}{4}$ " wide and $\frac{1}{16}$ " thick. Piston-rods to be of mild cast-steel 2" diameter with coned ends, secured to the pistons by screwed wrought-iron nuts (6 threads per inch), the nuts being secured by split pins ; front end of piston rod (reduced in diameter) to be carried forward through front cylinder cover, with suitable stuffing-box, gland, and sleeve. The pistons are to be turned $\frac{1}{32}$ " less than the diameter of the cylinders, and the rings $\frac{1}{4}$ " larger than the cylinders, and cut and sprung into their places. The pistons to have $\frac{3}{8}$ " clearance at each end of the cylinders. The cross-heads to be of wrought-iron, case-hardened, the bearing-pins of mild steel.

Slide-bars and blocks.

Each cylinder to have two slide-bars, which are to be of cast-steel, as hard as possible, 5" wide, with $\frac{1}{8}$ " copper liners at both ends for adjustment ; the bars to be placed 12" apart vertically. The slide-blocks to be of hard cast-iron, not less than 15" long, with flanges $\frac{1}{2}$ " thick and 1" in depth.

Connecting-rods.

Clearing of pistons.
Cross-heads.

The connecting-rods are to be of wrought-iron, forged in one length, without weld ; the small end to be, by preference, solid,—the large end to have a wrought-iron strap and tapering bolts, or to be forked and finished with a block and stout tapering bolt. The brasses (both ends) to be in two halves, those at the large end being tightened with a steel cotter, and those at the small end with a tapering steel block, wrought-iron (case-hardened) liner, screwed bolt, &c. Brasses to be flat-ended, corners rounded to $\frac{3}{4}$ " radius.

The oil-cups and syphons are to be forged on solid, and finished with screwed brass covers. The bearings are to be of the best hard and tough gun-metal.

Coupling-rods.

The coupling-rods are to be of the same material as the connecting-rods, and similarly made and finished, including the solid forged oil-cups and syphons.

They are to be parallel in the body, and to have solid ends to receive the gun-metal bearings, which are to be in two halves, of similar design to those of the connecting-rod. Each bearing is to have a steel cotter secured and finished similarly to those for the connecting-rods. The crank-pins to be of Vickers' mild cast-steel, and to be fitted on the ends with screwed (case-hardened) wrought-iron nuts, secured by parallel steel split cotters. Bearings to be $3\frac{1}{2}$ " diameter by $3\frac{1}{2}$ " wide.

Link-motion.

Link-motion.

The form of link-motion or valve-gear, exhibited in the margin, to be used, the links, levers, pins, valve radius-rod, &c., to be of wrought-iron, thoroughly case-hardened. The work, generally, to be finished bright, and the working joints and surfaces to be liberally proportioned. Intermediate rocking shaft, &c., as in American practice.

The valve-spindle is to work in a stuffing-box and gland at the back end, and in a bushed boss in the steam-chest cover at the front end, and is to be connected to the valve-rod by a tapered socket and steel cotter, secured by a split pin. Valve-spindle.

The whole of the link-motion and gearing, as well as the connecting-rods, coupling-rods, and all parts of the engine and tender that have to stand a working strain, such as spring-links, brake-work, &c., are to be made (except when otherwise specified) of best charcoal iron, or carefully selected best Yorkshire scrap iron, clean and well hammered, thoroughly sound, and free from all defects. Oil-holes must be provided to all working joints. Material for link-motion.

Framing.

The framing to be of the type known as "plate frame"—of the very best quality, and manufactured by makers of good repute only. Material. How made.

Each frame is to be $1\frac{1}{8}$ " thick from front buffer-plate to off-set for motion-plate; from thence to back buffer-plate 1" thick, and broad enough to form axle-forks out of the solid plates. Thickness, &c.

The plates are to be slotted in pairs (or more). They are to be securely attached by the bogie bolster-plate, the smoke-box floor-plate, front-plate, and tube-plate, the motion bracket, a cross-stay in front of fire-box, the plate in front of the hind buffer plank, and the draw-plate and buffer-plates. Slotted in pairs. Cross-stays.

The axle-forks are to be fitted with cast-steel horn-blocks, those of the driving-axle being united in one solid casting. They are to be fastened to the frames by $1\frac{1}{8}$ " turned bolts, driven in tight, and secured by split pins. The back blocks for the coupled axle boxes are to be fitted with case-hardened wrought-iron parallel liners, the blocks being cast with suitable bosses to receive two $\frac{7}{8}$ " bolts with counter-sunk heads for securing the liners. The forks are to be stayed together by wrought-iron keeps, with jaws slightly tapered to fit the ends of the forks, and drawn on tight by $1\frac{1}{8}$ " turned bolts, provided with split-pins at the backs of the nuts. The motion-bracket is to consist of a stout wrought-iron plate thoroughly secured to each frame. Horn-blocks. Fork-keeps. Motion-bracket.

The engineman's foot-plate is to consist of a $\frac{3}{8}$ " wrought-iron plate, secured firmly to the frames by suitable L irons and rivets. On each side of the foot-plate a plate carrying two footsteps is to be fixed. Engineman's foot-plate. Footsteps.

The main frames are to be provided at either end with stout L irons securely riveted on, and serving as seats for the two vertical transverse end plates, the hind one $\frac{3}{4}$ " thick, forming a buffing plate, the front one $\frac{5}{8}$ " thick, forming a portion of the buffer-beam, which is further stiffened by plate-gussets with angle-irons to transmit the thrust of the buffer to the frames. Transverse end plates.

The front buffer-beam is to be of well-seasoned oak 1' 6" deep by 6" thick. Turton's patent engine buffers to be used, having volute springs and wrought-iron plungers with solid heads. The cases are to be either wrought-iron or steel, and are to be securely bolted to the beam. The back buffer-plate to be provided with an adjustable wrought-iron (case-hardened) wedge block, &c., as in American practice, in lieu of spring buffers. (*Vide* plan exhibited.) Buffers to pattern H $1\frac{1}{2}$ of Turton's Catalogue, 22" long over all, heads 13" diameter. Buffers.

The draw-gear between engine and tender is to consist of one wrought-iron draw-bar $2\frac{1}{2}$ " diameter, with a circular hole $2\frac{5}{8}$ " diameter at tender end, and a slot $2\frac{5}{8}$ " x 3" at engine end, also two safety draw-bars $1\frac{3}{4}$ " x $1\frac{3}{8}$ ". Draw-gear. Main intermediate.

The front buffer-beam is to have a wrought-iron hook fitted with an indiarubber spring on the inside, and a wrought-iron washer-plate inside and out, secured by a nut and split cotter. There are also to be two safety-chains and hooks. The frames are to be adapted at the front end to take the cylinders, and to be carried down behind the bogie to carry the motion-bracket, &c., and between the D. and T. wheels to carry the compensating lever. A wrought-iron life-guard to be fixed to the front of each frame. Side platforms $\frac{3}{8}$ " thick, running from front buffer-beam to back of engineman's foot-plate, to be fixed to the frames by suitable angle-irons, brackets, &c. Front. Life-guards. Side platforms.

The frames are also to be fitted with wrought-iron brackets to carry the four brake-hangers, and with wrought-iron brackets to take the spring-links, &c. Brackets and guides.

Extreme width over side platforms (if possible not to exceed)...	...	ft. in.
Total length of buffer-beam	...	7 9
Distance from centre to centre of buffers	...	8 3
Distance from top of rail to centre of buffers (when engine is in steam)	5 9
	...	3 3

Bogie.

The bogie to be of the centre-pin type, in accordance with the drawing exhibited for this purpose.

Wheels.

The wheel-bodies to be of wrought-iron 5' 1" diameter, made of the best-selected, well-hammered scrap-iron, and neatly smithed and hand-dressed. The spokes to be forged solid with T-ends (unless special appliances be provided for dabbing on the rim-pieces under the steam-hammer, or by hydraulic pressure), which when veed up shall form the rims. The D. and T. wheels to have eighteen spokes each. Three of the spokes are to be welded solid together high enough to form the boss to take the crank-pins. The heads of the other spokes are to be formed in a suitable die, so that when they are laid together with the crank-boss they shall form a solid boss for the axle and crank-pin, after which a washer (as thick as possible) shall be soundly welded on each side. D. and T. wheels.

The revolving and reciprocating parts of the engine are to be balanced by blocks forged solid in the wheels. Balance weights. The

Bogie wheels.

The bogie wheel-bodies, 3' 1½" diameter (if tread diameter equals 3' 7"), are to have ten spokes each, to be put together and finished after the same manner as the D. and T. wheels.

Welds.**How finished.****Wheels fixed on axles.**

The welds in the bosses, spokes, and rims must be thoroughly sound and free from all defects, as any defective welding will necessitate the rejection of the wheel. The wheels are to be turned or planed on the faces of the bosses, and turned on the faces and sides of the rims; they are to be tooled round the axle and crank-bosses, and the spokes are to be chipped and neatly finished by hand. They are to be forced on the axles by hydraulic pressure of 1½ ton per square inch of the area of the hole for the axle, and each wheel is to be secured by a strong steel key bedded for half its depth into the axle (on the same side as the crank-boss in the D. and T. wheels), carefully fitted sideways, and with a taper on the flat of 1 in 96, and driven in with a sledge-hammer or tup.

The crank pin-holes are to be bored out to a taper of 1 in 48 and countersunk. The pins are to be of Vickers' mild cast-steel. They are to be forced in by hydraulic pressure and riveted up cold.

Tires.

All the tires to be of Vickers' cast-steel, "Australia" brand, 5½" wide and 2¾" thick on tread; the section and method of fastening to be as shown on drawing exhibited.

Axles.

The axles throughout to be of Vickers' mild cast-steel, the best quality, and of the following dimensions, viz.: in the middle, bogie wheels 5¼", driving and trailing 7" diameter; journals, bogie 5¾" diameter by 8" long, driving and trailing 7½" diameter by 9¼" long. The axles to be stamped with maker's name and date of manufacture. The right-hand crank is to lead. In turning the bearings and other portions of the axles, care to be taken to avoid breaking the continuity of the metal by making small corners; no radius less than ½" will be allowed. Wheel-seat diameter of bogie axles, 6¾". Wheel-seat diameter of driving and trailing axles, 8½".

Axle-boxes.

The D. and T. axle-boxes to be wrought-iron thoroughly case-hardened, and fitted with bearings of hard gun-metal, in accordance with drawing to be exhibited for this purpose, the brasses being forced in a dead tight fit. The boxes to take the springs from below; to be truly planed to fit the axle-box guides, and fitted with wrought-iron syphon-tubes and covers. The brasses to be finished transversely ⅛" shorter than the axle-bearings.

Bogie axle-boxes.

The bogie axle-boxes and their keeps to be, by preference, of hard gun-metal, truly planed to fit the axle-box guides.

All axle-boxes to have two syphon-holes in each, and to be provided with sheet-iron covers.

Springs.**D. and T. springs.**

The bearing-springs are to be of the very best quality, and manufactured by makers of good repute only, and to bear the stamp of the maker. The ends of the upper plates of the D. and T. springs are to be made with solid eyes, slotted in the middle to receive the links, and bored to receive the pins. The buckles are to be of wrought-iron, shrunk tightly on, and to be forged so as to form eyes out of the solid, for attachment to the axle-box hanger.

Buckles.**Bogie springs and buckles.**

The bottom plates of the bogie springs are to be reduced to 4¼" broad at the ends, where the spring-links rest, the tip of bottom plate being turned down to retain the links. The buckles are to be of wrought-iron shrunk tightly on, and to be made so that a wrought-iron carrier-bar 3" diameter can pass through them (under the springs), to form the attachment to the bogie-frames. Each plate is to be nibbed and slotted near the ends, to keep the plates in position. The plates (in all the springs) to be secured to buckle by a ⅞" steel pin passing through spring and buckle, and riveted over countersunk.

Corners rounded. Pins, &c., case-hardened.

Care must be taken to have the inner corners of all the buckles well-rounded, the corners of the upper and lower spring-plates being rounded to suit. The spring-pins, links, and link-brackets to the frames are to be well case-hardened.

Testing.

Each spring must be tested before being used, by being loaded until the original camber in the D. and T. springs is reduced by 3½", and the bogie springs by 5", and they should resume their original camber on the removal of the load.

Compensating lever.

Between the D. and T. springs on each side of the engine there is to be a wrought-iron compensating lever, formed of a solid forging swelled out at the middle for the fulcrum-pin, and with a forged jaw at each end to receive the joint-pins which take the screwed links or hangers, and which are each to have two nuts and a split pin. Each lever is to be attached to the frame by a bossed wrought-iron bracket, with a hole 3" diameter to receive the wrought-iron cross-shaft.

Boiler.**Material.**

All the plates used in the boiler-shell and dome, as well as the angle-irons and rivets are to be made of the best Yorkshire iron, manufactured by either the Lowmoor, Bowling, Monkbridge, or Taylor Bros., care being taken in bending the plates to leave the name of the manufacturer visible outside. The brand of iron to be used to be named in tender.

Plates, thickness, &c.

All the plates of the barrel and fire-box casing, with the exception of the throat-plate, which is to be ⅝" thick, are to be ½" thick, and planed on their edges.

Barrel.

The barrel is to be not less than 10' 4" long, and (if possible) 4' 5" diameter outside, with "butt" joints throughout, and to consist of three plates only, the longitudinal joint to be situated between the water-level and the base of the dome, to have lap-plates both inside and out, and to be double riveted (zig-zag); the transverse joints to have outside lap-plates only (solid welded rings), and to be single riveted.

Front tube-plate.

The front tube-plate, ⅜" thick is to be flanged forward to take the smoke-box side-plates. It is to be attached to the boiler by an angle-iron 4¾" x 3¾" x ¾", turned inside on the face and edges, and double riveted to the boiler-barrel.

Fire-box casing.

The front fire-box casing-plate is to be flanged forward with a radius of 1¼" outside, to take the barrel-plate, with a lap-joint (outside), and is to be flanged backwards at the sides to form a lap-joint (inside) with the side-plates.

Fire-box casing.

The back casing-plate is to be flanged forward, to form a joint (inside) with the side-plates in a similar manner.

The

The sides and top of the fire-box casing are to be formed of three plates, which are to lap each other and the barrel (as well as the front and back casing-plates), and are to be single-riveted throughout, except at the horizontal joints, which are to be double-riveted (zig-zag). The side plates are to be extra lapped round the lower corners of the front plate, and riveted thereto, to form a double thickness for the mud-plugs. Fire-box casing.

A wrought-iron dome, 1' 9" diameter inside, and 3' 0" high from boiler-barrel, is to be fixed on the the third plate of the barrel, having the same vertical centre-line as the driving-axle. It is to consist of a double-flanged seating, 6" high at shallowest part, formed out of specially-rolled L iron or plate, welded up solid, the lower flange curved suitably to the boiler-barrel, the upper flange to be $1\frac{1}{8}$ " thick (after being turned and faced). The upper portion of the dome to consist of a hemispherical-ended cylinder, terminating below in a stout-faced flange $1\frac{1}{8}$ " thick, made similar to the seating, the whole being welded up solid. The lower joint-face to be recessed $\frac{1}{8}$ " deep, to fit a corresponding projection on the upper face. The lower flange of dome-seat to be single-riveted to boiler-barrel; the hole in the barrel to be 1' 4" diameter, the edge of the barrel-plate being stiffened by two wrought-iron rings $2\frac{1}{4}$ " x 1" (one inside and one out). Dome.

There is to be a man-hole 1' 1" diameter on the crown of the fire-box casing, fitted with a wrought-iron ring (double-riveted), forming a seating, to which is to be attached a wrought-iron cover. Man-hole.

The wrought-iron cover is to be turned on both sides, and at the outer edge underneath is to be recessed to take the upper edge of the brass moulding of the clothing. It is to be bored, and fitted on the upper side to take two Ramsbottom's valves ($3\frac{1}{2}$ " diameter), and other fittings shown on the drawing to be exhibited. Safety-valve.

The top fire-box casing-plate is to have two transverse rows of double angle-irons bent to the proper curve, and firmly riveted to the plate, serving for attachment of the roof girder slings. Top casing-plate stiffened.

The smoke-box tube-plate and the back fire-box casing-plate are to be stayed to each other by ten longitudinal wrought-iron stays screwed 11 threads per inch, made with solid heads, and screwed through the casing-plate, with copper washers at the back, and adjusted and attached to front tube-plate by nuts and copper washers, inside and out. Longitudinal stays.

The upper portion of the back casing-plate, where the stays and fire-box fittings are attached, is to be strengthened by a $\frac{1}{2}$ " plate on the inside, suitably attached by rivets.

The longitudinal stays, as well as the regulator rod, are to be supported at mid-length by cross-plates $\frac{1}{2}$ " thick, and not less than $4\frac{1}{2}$ " wide, riveted to the boiler-barrel.

The copper fire-box is to be approximately 5' 9" long, and 3' 6" wide inside at foundation ring and 5' $6\frac{1}{4}$ " deep. Copper fire-box.

The plates, stay-bolts, and rivets of the fire-box are to be made of the best selected copper, manufactured either by Broughton Copper Company, Pontifex and Wood, Vivian & Sons, or Pascoe, Grenfell, & Sons. They are to bear the maker's stamp, which is to be placed so that it can be seen after the boiler is finished. Material.

The plates are to be $\frac{1}{2}$ " thick, except the portion of the front plate which receives the tubes, which is to be $\frac{1}{4}$ " thick. Strips must be cut off the plates, and they, with the bars for the stays and rivets, must stand the test of being bent double when cold, without any signs of cracking. If any cracks appear in any of the strips or bars they must be annealed, and if after being annealed any strips or bars do not stand the test of bending cold, the plates or bars from which such test pieces have been cut must be rejected. Thickness of plates.
Testing.

Special care must be taken to anneal all the stay-bolts before cutting the threads.

The tube and back-plates are to be flanged to a radius of not less than 1" inside at the top and sides, to make the lap joints with the sides and roof-plates. Tube and back-plates.

The sides and roof are to be in one piece, the upper corners of the sides and roof-plate to have a large radius inside. Sides and roof.

During inspection special attention will be directed to all the corners of the copper-box, and if any plate shows signs of cracking or injury of any kind it will be rejected. Care in flanging.

The water-space between the outer and inner plates all round at foundation ring is to be $2\frac{1}{2}$ ". The plates of the fire-box and casing are to be attached at the bottom by a solid forged ring $2\frac{1}{2}$ " deep at shallowest part, with $\frac{7}{8}$ " rivets. The ring is to be brought down at each corner to take a double row of rivets, and at the sides to carry the ash-pan. Water-space.
Fire-box ring.

The fire-hole is to be oval, the plates being connected by a solid wrought-iron ring, planed on both sides, and secured by $\frac{7}{8}$ " rivets, countersunk on the outside, and finished flush. Fire-hole rivets.

The roof of the copper-box is to be strengthened by seven rectangular wrought-iron girders, not less than 6" deep in the centre (except the centre one, which is to $5\frac{3}{4}$ " deep), to be carefully bedded at the ends to the front and back edges of the box. Roof stays.

The space between the top of the box and the girders is to be not less than $1\frac{1}{2}$ ", nor more than 2". The top of the box is to be attached to the girders by 1" stud-bolts tapped into the girders from below. These bolts must be a tight fit in the holes in the roof-plate, the throats being left full, and screwed well home, the corners of the heads next the plate being chamfered off; wrought-iron ferules $1\frac{1}{8}$ " diameter outside to be used as distance-pieces. Space between roof-stays and box.

Four safety-links, with oblong holes (to admit of the top of the copper-box rising when heated), are to be suspended between two of the girders and the transverse angle-irons on the roof of the casing, the two girders being forged with suitable lugs for this purpose. Safety-links.

The roof-plate is to be fitted with a fusible gun-metal plug $1\frac{1}{2}$ " diameter at the point (tapered 1 in 6), and screwed 10 threads per inch, and bored out in the middle, and tapped $\frac{7}{16}$ " to receive the alloy. Lead plugs.

The walls of the box are to be stayed to the shells by copper stays either $\frac{7}{8}$ " or 1" diameter, screwed 10 threads per inch, placed not more than 4" apart C. to C., screwed tightly into both plates, and riveted over at both ends (leaving a sufficiently large head inside). The end vertical rows at the sides are to be centered $8\frac{1}{2}$ " from the outer face of the front and back casing-plates, and at the front and back $7\frac{1}{2}$ " from the outer face of the side casing-plates. Copper stays.

The tube-plate is to be stayed to the lower portion of the boiler-barrel by not less than seven 1" copper screws (10 threads per inch), tapped through the copper plate into wrought-iron sockets (riveted to the boiler-barrel), and finally riveted over inside the box. Throat stays.

All

- Rivets.** All rivets used in the boiler are to be $\frac{3}{4}$ " diameter, spaced $1\frac{3}{4}$ " apart C. to C., except those attaching the angle-iron to the front tube-plate, which are to be $\frac{1}{2}$ " diameter and $1\frac{2}{3}$ " pitch, and those in the fire-hole and foundation rings, which are to be $\frac{7}{8}$ " diameter, spaced $1\frac{1}{2}$ " C. to C. Those in the copper box are to be made of copper. All the rivets must completely fill the holes, and must be closed up by steam or hydraulic power wherever it is possible to do so.
- Wash-out plugs.** There is to be a tapered brass wash-out plug $1\frac{3}{4}$ " diameter (at large end) situated at each of the two front bottom corners of the fire-box, and two $1\frac{3}{4}$ " plugs at the back of the box (above the level of the fire-box crown), and two $1\frac{1}{4}$ " plugs in the front tube-plate, below the level of the lowest row of tubes; all are to be screwed, 10 threads per inch, and tapered 1 in 8.
- Mud-hole.** There is to be an oval mud-hole, with suitable wrought-iron bolt, nut, and cover, situated at the bottom and centre of the back casing-plate.
- Blow-off cock.** A brass blow-off cock (flanged) is to be fixed by studs to the bottom of the back casing-plate, and worked by a socket key from the foot-plate, the key being cranked at top to form a handle, and swelled out in the shaft to fit the hole in the foot-plate, and secured to square of the cock-plug by a strong split pin.
- Fire-bars.** The fire-bars to be of wrought-iron $3\frac{1}{2}$ " x 1", carried on two wrought-iron cross-bearers, which are $3\frac{1}{4}$ " diameter, and shaped at the ends to fit into suitable brackets, bolted to the prolonged portion of the fire-box bottom ring. These cross-bearers are to be drilled and fitted with pegs (not tapered) of $\frac{7}{8}$ " round iron placed 2" apart C. to C. to regulate the spacing of fire-bars.
- Ash-pan.** The ash-pan is to be of wrought-iron, the full length and width of the fire-box, and is to have a tight-fitting door at both front and back, swung on a hinge bar running the full length of the door, and worked from the foot-plate by suitable levers and rods. The bottom is to be stiffened by three cross angle-irons.
- Fire-door.** The fire-door is to consist of two sliding wrought-iron plates, and is to be provided with a wrought-iron deflector.
- Brick arch.** The fire-box to be fitted with a fire-brick arch, supported by angle-irons attached to the side-plates by studs.
- Regulator.** A swan-necked cast-iron pipe, 4" internal diameter, is to be fixed in the steam dome. The lower portion is to be attached by an angle-iron bracket to the dome base. The top of this pipe is to be fitted with a gridiron regulator of cast-iron, having a gun-metal slide or valve worked by levers and rods from the foot-plate. The regulator rod to be made so that it can be put in or taken out without interference with the steam-pipe.
- Stuffing-box.** The regulator stuffing-box is to be of brass, with suitable stops to limit the travel of the handle, and stamped "Shut" and "Open" on the right and left hand respectively.
- Steam-pipe.** A copper pipe, 4" diameter inside, and No. 9 W.G. thick, is to connect the regulator with the elbow-pipe in the smoke-box. It is to be fitted to the regulator-pipe by a brass cone (brazed on), secured by a circular clip and two bolts, the hole in the clip being large enough to slip over the cone, the front end of the pipe is to be attached to the front tube-plate by a brass flange (brazed solid to the pipe), and having seven wrought-iron screwed studs.
- Elbow-pipe in smoke-box.** There is to be a cast-iron T pipe in the smoke-box fixed by the studs which secure the flange of the steam-pipe. Two copper pipes, $3\frac{1}{2}$ " diameter inside, and No. 9 W.G. in thickness, with brass flanges, (brazed solid) are to connect the T pipe with the cylinders. They are to be close to the sides of the smoke-box, so as to clear the line of tubes. The lower ends of these copper pipes are to project 1" beyond the flange into the cylinder casing, and a circular recess or groove is to be cut in the joint of the cylinder for a corresponding projection in the flange of the steam-pipe to fit into it.

Flue Tubes.

- Material and make.** The tubes are to be of the best quality solid drawn brass, manufactured by the Broughton Copper Company, of Manchester; Elliott's Metal Company; Allan, Everett, & Sons; J. Wilkes & Company, of Birmingham; to be first approved, in writing, by the Inspecting Engineer.
- Number and diameter.** They are to be 198 in number, and 2" outside diameter, and are to bear the maker's stamp. They are to be No. 10 W.G. thick at the fire-box end, and No. 12 do. at the smoke-box end. Front ends swelled to $2\frac{1}{16}$ " diameter in smoke-box tube-plate.
- Care must be taken to make the tubes perfectly steam-tight at both ends by rolling them with Dudgeon's expander.
- Steel ferules.** Turned tapering steel ferules are to be inserted at both ends of the tubes. The tubes are to project $\frac{1}{8}$ " beyond the fire-box tube-plate, and $\frac{3}{8}$ " beyond the smoke-box tube-plate when fixed, and they are not to be rolled over or beaded at the ends.

Smoke-box.

- The sides of the smoke-box are to be attached to the tube-plate by rivets, and to each frame by a wrought-iron thickening strip riveted to the side plates, and bolted to the frame-plates. Side plates to be connected to front plate by an angle iron (riveted), the latter plate to be bolted at bottom to the floor of the smoke-box.
- Door.** The door is to be circular and dished, and carried by two wrought-iron hinges. It is to be fitted inside with a liner attached by rivets and ferules, with an air-space of $\frac{1}{2}$ " at the edges. It is to be kept closed by a removable horizontal cross-bar, and a central handle with a minor locking handle and screw.
- Exhaust-pipe.** The exhaust-pipe is to be of cast-iron, and is to be surmounted by a movable cap or nozzle. The joints of the exhaust-pipe and cap are to be planed.
- Spark-arrester.** Spark-arresters are to be fitted of the best design known for the prevention of burning matter being emitted.
- Chimney.** The chimney to be of wrought-iron, the base being formed of a plate welded up without seam, and shaped on a block to suit the curve of the smoke-box. The barrel is to be made of one plate with a butt joint and inner lap-plate, and fitted into and riveted to the base. It is to be surmounted by a polished copper top. All the rivets in the chimney are to be countersunk and flush outside. The extreme height of the chimney from the rail is not to exceed 13 feet 6 inches.

A blower-cock is to be fixed on the boiler behind the chimney, or otherwise neatly arranged, worked by a handle (passing through the right-hand rail) from the foot-plate, a copper pipe leading the steam inside the smoke-box. Blower.

A No. 2 Roscoe's lubricator is to be fixed on each side of the smoke-box, with copper pipe leading into the centre of each cylinder. Lubricators.

The hand-rail in front of the smoke-box to be a continuation of the side-rails. Hand-rail.

Fire-box fixings.

The fire-box fixings are to consist, in addition to those already mentioned, of the following:—

One Bourdon's gauge, to indicate 200 lbs. per square inch, with cock and copper pipe. Two glass gauges, with top and bottom cocks, and waste water-cock and copper pipe, the top and bottom cocks to be screwed into the plate $1\frac{1}{4}$ " diameter, 11 threads per inch. There is to be a whistle fixed to front of cab, and connected by a copper pipe to the injector steam-cock branch. There is to be also an iron socket screwed into the back casing-plate to carry the gauge-glass lamp, and a wrought-iron tray with angle-iron rim fixed with studs above the door. All the cocks and fittings are to be made of brass, unless specially named to the contrary, and all fittings screwed into the boiler are to have 11 threads to the inch, unless otherwise specified.

There are to be two No. 9 Giffard's injectors (Gresham and Craven's make), one fixed on each side of the engine in such a position that the handles can be readily reached for adjustment by the driver. Each injector is to have a steam-cock fixed on a special branch casting, placed on the top of fire-box casing-plate, and to have a clack-box fixed on the centre line of the boiler near the front end. Each clack-box flange is to be secured by W.I. studs to a wrought-iron seating riveted to the boiler. Injectors.
Steam-cocks.

The injectors as well as the cocks and clack-boxes are to be of gun-metal, and the steam, suction delivery, and overflow pipes of copper, No. 10 W.G. thick. Materials of injectors, &c.

Clothing.

The boiler is to be covered with dry pine battens, tongued and grooved. At each joint of the lagging plates a wrought iron hoop, $2\frac{1}{4}$ " by $\frac{5}{16}$ ", is to be put on in two halves, provided with distance-pieces 20" apart, and screwed together with countersunk screws and metal joint blocks let in through the battens, bearing on the boiler, the whole finished flush, covered with sheet iron No. 14 W.G., and bound together round the barrel and over the fire-box with hoop-iron straps secured by screws.

The dome is to be enclosed in a helmet-shaped casing of polished brass. Polished brass mouldings are to be fitted round the back corner of the fire-box casing, the smoke-box angle-iron, and under the safety-valve seating. Dome casing.

Cab.

The cab over the foot-plate is to be of the modern English type covered in at the sides, and is to consist of wrought-iron plates and L irons; front plate $\frac{5}{16}$ " thick, side plates $\frac{1}{8}$ " thick, and roof plate No. 12 W.G. It is to be fitted in front with spectacle glasses in brass frames, made to open and shut. The roof plate is to have a light angle-iron $1" \times 1"$ fixed on the edges, running fore and aft, to carry off the drip.

Brakes.

An efficient hand-brake is to be fitted to the engine, as well as the tender, consisting of a $1\frac{3}{8}$ " screw spindle with a square thread, having a $\frac{3}{8}$ " pitch with a 12" double-ended hand-lever at top, and an 11" lever on brake-shaft at lower end, with a suitable screw-nut. The handle for working it is to be placed on the left-hand side of the foot-plate, and is to be carried on a hollow cast-iron pillar bolted to the foot-plate by four $\frac{3}{4}$ " bolts. There is to be a wrought-iron hanger, with cast-iron block, fitted to each of the four driving wheels, and a wrought-iron brake-shaft $3\frac{1}{4}$ " diameter carried by cast-iron brackets bolted to the frames, and having the arms forged on solid, the screw-arm being forked and bored to take the screw-nut.

Wrought-iron hangers with cast-iron blocks (clipping the flanges) are to be fitted to each of the four driving wheels. Hangers.

A strong wrought-iron brake-shaft not less than $3\frac{1}{4}$ " diameter is to be carried by wrought-iron brackets, with cast-iron bushes, secured to the frames; it is to have the arms forged on solid, the screw-arm being forked and bored to take the screw-nut. Brake-shaft.

Both engine and tender must be fitted with all the necessary appliances for working the latest improvements of the Westinghouse automatic air-brake on the tender and carriages. The air-pump for the Westinghouse brake must be fixed to the left-hand frame between the D. and T. wheels, and the pipes and nozzles on the tender must be arranged to suit those on the present rolling stock. Westinghouse brake.

Gear to be provided for supplying a jet of water from the tender to the tire of each wheel of engine and tender (except bogie wheels), at the root of the flange, immediately above the brake-block. Two branched $\frac{1}{2}$ " wrought-iron pipes, with two brass cocks, one for engine and one for tender, to be connected with the tank and worked from the foot-plate; the nozzles to be of brass, with $\frac{3}{16}$ " bore at the ends, screwed on to the pipes. Water-jet to tires.

Hand-rails.

Polished hollow wrought-iron hand-rails to be carried on each side of the engine by castings bolted to short wrought-iron brackets, which are riveted to the boiler.

Sand-boxes.

A sand-box (content, not less than 4 cubic feet) is to be fixed in front of each driving wheel, fitted with valve, and worked conveniently by gear from the foot-plate. The valves in both boxes are to be worked simultaneously. The boxes must be perfectly watertight.

Sand-pipes.

Brass pipes $1\frac{1}{2}$ " inside diameter, are to be fixed and bent so as to convey the sand as near as possible to the tread of the wheels.

Lamp-brackets.

Two lamp-brackets to be fixed on the front platform—one on the right and one on the left-hand side. Painting.

Painting.

After being tested, the boiler is to receive two coats of metallic oxide paint; and when dry, the clothing is to be put on. When finished, the engine is to receive not less than two coats of lead-colour in oil. The whole of the surfaces requiring it are then to be filled up with hard stopping, and after being well rubbed down smooth, are to receive a third coat of lead-colour in oil, and to be finished with two coats of selected colour in oil, and two coats of varnish.

Tool-box and Tools.

Each engine is to be provided with a portable wooden tool-box 3' 3" by 2' 0" by 1' 9" (to be carried on the top of the tender), made of oak or tallow wood, bound with iron at the corners, and the lid covered with galvanized sheet-iron, to have strong hinges, hasp, and padlock, and till inside at one end; also two monkey-wrenches (one large and one small); one heavy hammer; one light hammer; one copper hammer; two flat chisels; two cross-cut chisels; two pin punches; one complete set of screw-keys to fit all nuts; two short keys for piston glands; two short keys for valve spindles; light close-ended keys for all syphon covers; one fire-bucket; one fire-shovel; one fire-dart; one fire-pricker; one rake; one pinch-bar (large); one tube-plug socket rod and six tube-plugs; two 15-ton traversing screw-jacks, with ratchet, ratchet head, and jackbars; two oil-cans (one large and one small); two oil-feeders; (one large and one small), copper tallow-kettle, hand-brush, and gauge-lamp.

Pitch of Screws.

The threads of all bolts, studs, and nuts are to be cut to Whitworth's standard, unless where specially stated to the contrary. Where fine threads are specified, eleven threads per inch are to be used, except in the case of piston-rods, the threads of which are to be six per inch. All bolt-heads and nuts are to be hexagonal, and measured across the corners are to equal twice the diameter of the bolt (except in the larger sizes of bolts, in which case the next size less for heads and nuts may be taken if more suitable). The size across the flats will not therefore be Whitworth's standard.

Wire-gauge.

The Birmingham wire-gauge to be used.

Case-hardening.

All the motion-work, brake-work, the nuts of the cylinders and glands, and all journals, pins, joints, and rubbing surfaces about the engine and tender (except when of brass, cast-iron, or steel) shall be thoroughly case-hardened to a depth of $\frac{1}{16}$ -inch, and so hard as to wholly resist filing.

Specimens of case-hardening, which have been hardened in the same boxes with the work, will be broken in the presence of the Inspecting Engineer or his deputy.

TENDER.

(Content, 2,500 gallons.)

General Arrangement.

The following are the leading particulars of the design and construction of the tender, based on the assumption of a rigid or fixed wheel-base, not exceeding 11 feet, and plate-frames; and it is to be clearly understood that, in the event of bogie being adopted (in lieu of rigid wheel-base), the details as here set forth, are of course subject to modification, but must still be adhered to as far as practicable. A certain amount of latitude is also allowed to meet the conditions of enlarged tank, &c.

The tender to be of the ordinary horseshoe type, with the addition of a well underneath the tank, 10 feet long, 4 feet 1 inch broad, and 1 foot 6 inches deep, and extending over the front and middle axles. The fuel space (shaped in the tank) to be 7 feet 9 inches long from the front end, and 2 feet 6 inches wide; the whole to be carried on six wheels (unless bogies be adopted), 3 feet 7 inches diameter at the tread; wheel centres, 5 feet 6 inches; total wheel-base, 11 feet.

Wheels.

Bodies to be of wrought-iron, 3 feet $1\frac{1}{2}$ inch diameter, and to have ten spokes. They are to be made of the same material, put together, and finished in the same way as the engine wheels.

Tires.

To be of the same material, section, and method of fastening, as specified for the engine wheels. To have flanges on all wheels. Centre tires not to be reduced in flanges.

Axles.

To be of the same material as specified for the axles of the engine; to be $5\frac{1}{2}$ inches diameter in the middle, and to be parallel for a distance of 2 feet 6 inches, to run into $6\frac{1}{2}$ inches diameter at the collars, which are to be $\frac{1}{2}$ inch broad; the wheel-seats to be 6 inches diameter; the journals to be $4\frac{1}{2}$ inches diameter and 8 inches long; the radius of the corners being $\frac{3}{4}$ ". The distance from C. to C. of bearings to be 6 feet 2 inches.

Axle-boxes.

To be of a fine-grained hard cast-iron. The castings to be clean and free from flaws of every description. To be planed to fit the axle-box guides, but to be left $\frac{1}{8}$ " wider between the flanges, to allow of lateral motion. The bearings to be of hard gun-metal perfectly bedded into the axle-boxes, and octagonal at the crown. Two syphon-tubes to each box; the tubes to be continued through the cast-iron into the brass bearings for a $\frac{1}{4}$ ". The keeps to be of cast-iron and planed to fit the axle-boxes (so that they can be put up and taken down by hand without hammering), and secured by two $\frac{5}{8}$ -inch round iron pins. The covers to be of cast-iron, recessed in the top to take the ends of spring pillars. The lid to be of cast-iron, secured by a wrought-iron pin.

Axle-box

Bearings.

Keeps.

Cover.

Axle-box Guides.

To be of fine close-grained cast-iron, free from flaws of every description. To be planed on the face, edges, and flange, and to be fastened to the frames by four $\frac{7}{8}$ -inch turned bolts in each, driven in tight, the bolts to be countersunk into frames, the nuts to be secured by split pins.

Axle-fork Keeps.

To be of wrought-iron, a good fit on the forks, and secured by a $\frac{7}{8}$ " bolt at each end.

Springs.

To be of the same material as specified for the engine springs. The spring pillars to have two guides each, fastened to the inside of the frames. The spring-link carriers also to be attached to the inside of the frames.

Framing.

The frames are to be of the same material as specified for the engine frames, and are to be $\frac{3}{4}$ -inch thick, running from buffer-beam to buffer-beam, and formed each of one solid plate. The minimum depth to be 12 inches, and above the axle-boxes 1 foot $2\frac{1}{2}$ inches, deepened at the front end to take the brake shaft and footsteps. The main frames to be braced together at the front ends by a $\frac{5}{8}$ " wrought-iron vertical plate (serving as a buffer-plate, *q. v.*) 1 foot 2 inches deep, and a $\frac{1}{2}$ " vertical plate 1 foot $2\frac{1}{2}$ inches deep, united by two horizontal $\frac{1}{2}$ " plates 1 foot 9 inches wide; also at back ends by a $\frac{1}{2}$ " vertical plate (serving as a buffer-plate) 1 foot deep, united to a $\frac{1}{2}$ " horizontal plate 1 foot 6 inches wide, and finally by three intermediate $\frac{1}{2}$ " vertical plates, each 1 foot deep, the whole riveted together with suitable L irons.

There are to be two $\frac{1}{2}$ " wrought-iron longitudinal stretchers, each in one continuous plate, running from the front intermediate cross-stay to the hind buffer-plate, and spaced 4 feet 1 inch apart. The longitudinal stretchers will form the well sides, and the front plate of well is to be $\frac{3}{8}$ -inch thick, and spaced 10 inches from the back of the front cross-stay; the back of the well being formed by the back intermediate cross-stay.

The middle cross-stay divides the well, consequently care must be taken to cut holes in it to allow the water to circulate, also a hole large enough to admit of a man passing through. The intermediate cross-stays will be secured to the longitudinal stretchers and throughout the well by angle-irons.

Foot-plate, Draw-plates, &c.

The foot-plate to be $\frac{3}{8}$ " thick, the extreme width over platform being 7 feet 6 inches. The front horizontal draw-plate to be $\frac{1}{2}$ " thick, and spaced $6\frac{1}{2}$ " below the foot-plate, and fastened to buffer-plate, frames, and front cross-stay plate by $2\frac{3}{8}$ " angle-iron and $\frac{3}{4}$ " rivets. The horizontal stiffening-plate to be $\frac{1}{2}$ " thick and 4" below the drawbar horizontal plate, and to be flanged down at the front, and fastened to the buffer-plate, and secured to the frames and vertical cross-stay plate by $2\frac{1}{2}$ " angle-iron and $\frac{3}{4}$ " rivets.

On the underside of the stiffening-plate will be fixed two feed-pipe carriers, to be securely fastened and braced together. The distance from C. to C. of feed-pipes is 2' 11". The drawbar pin is centred 1' $3\frac{3}{8}$ " back from the buffer-plate. The draw-shackle pin holes to be $5\frac{3}{4}$ " from the back of the buffer-plate and 1' 10" apart C. to C.; strengthening plates to be riveted on round the holes in the plates. A wrought-iron (case-hardened) rubbing block to be securely fixed to front buffer-plate to bear against the wedge block on engine.

Two water-tight sand-boxes are to be placed on the foot-plate at the front end of the tank, one on each side, each capable of holding 2 cubic feet of sand, and fitted with cast-iron water-tight covers, the filling hole to be $4\frac{1}{2}$ " diameter, and provided with suitable valve and gear for working same.

The sand-pipes to be of brass, the same size as for the engine, and bent so as to convey the sand as near the tread of the front wheels as possible. There is to be a polished wrought-iron hand-rail on each side, supported by two wrought-iron pillars, and secured to the tank. The left-hand one to have a boss forged on to take the brake-rod. Two substantial wrought-iron double-shackle screw couplings are to be provided with each tender; screw, 2" diameter; shackle and link-iron, $1\frac{1}{2}$ " diameter.

Brake.

The general design and arrangement to be similar to that specified for the engine brake, the handle to be on the left-hand side of the tender. The shaft to be $3\frac{1}{4}$ " diameter, with all the levers forged on solid, including one 1' $0\frac{1}{2}$ " long, for coupling up to the Westinghouse gear; the whole to be supported by cast-iron carriers in the frames. There is to be a wrought-iron hanger and cast-iron brake-block (clipping the flanges) to each wheel. The hangers to be suspended by means of stout W.I. pins passing through the frames and carriers, fastened to the longitudinal stretchers. The hangers for the trailing-wheels to be prolonged to form life-guards.

Back Buffer-beam.

This to consist of a wrought-iron plate $\frac{1}{2}$ " thick, 12" deep, and 7' long, secured to frames and longitudinal stretchers by $2\frac{1}{2}$ " angle-iron, $\frac{3}{4}$ " rivets. The horizontal draw-plate to be $8\frac{3}{4}$ " below the bottom of the tank; to be $\frac{1}{2}$ " thick and 1' 6" broad, fastened to frames and buffer-beam by $2\frac{1}{2}$ " angle-iron.

The vertical (draw-spring) plate to be 2' 6" long, 12" deep, and $\frac{1}{2}$ " thick, secured to the horizontal plate and bottom of tank by $2\frac{3}{8}$ " angle-iron. $\frac{3}{4}$ " strengthening-plates to be riveted on to the back of the buffer-beam and front of the vertical plate. Two buffers, of same type as those specified for the engine, to be fastened to buffer-beam by four 1" bolts in each. Height from top of rail to centre, 3' 3"; distance apart from centre to centre, 5' 9". A wrought-iron draw-hook to be provided, having a shank passing through the buffer-beam and vertical draw-plate, and fitted with a powerful volute spring, secured by a washer and split-cotter. A case-hardened wrought-iron socket is to be fitted to the hind buffer-beam, to give sufficient surface for the shank of the hook to work in. Two safety-chains to be securely attached to the buffer-beam, at a distance of 1' 6" apart.

Tool-box.

A plate iron tool-box is to be built at the back of the tank, and of the full width of the same, with a hinged lid, hinges, and staple, catch, and lock complete.

Tank.

Tank.

Plating, &c.

The thickness of the top and side plates to be $\frac{1}{4}$ " and the bottom to be $\frac{3}{8}$ ". The top, bottom, and sides to be well stayed to each other by L irons, &c., as per drawing. A curved wrought-iron moulding to extend along the upper edge (outside) of sides and back of tank.

Man-hole.

A wrought-iron man-hole ring made of $\frac{3}{16}$ " plate, 18" diameter, 8 $\frac{1}{2}$ " high, flanged at the bottom, is to be riveted on to the top of tank in the centre, 1' 6" from its centre to the back of tank. It is to be fitted with a wrought-iron cover and handle. The hole to be cut in the tank top is to be 1' 4 $\frac{1}{4}$ " diameter, round which will be supported a wrought-iron sieve, made out of $\frac{1}{8}$ " plate, to be 1' 4" diameter at the top, and 1' 3 $\frac{1}{2}$ " diameter at the bottom. It is to be 4' 0 $\frac{1}{2}$ " long.

Feed-valves.

The tank to be supplied at the back end with wrought-iron lifting shackles in each corner, with strengthening corner-plates. At the front end, over the front axle, on the inside of the coal bunk, two bent plates will be riveted for the same purpose. A lamp-bracket to be fixed respectively on the left- and right-hand side at the back end of tank. The feed-valves to be circular, and of gun-metal, with central guide pin, and situated one on each side of the tank, protected by proper strainers, and worked from the top by levers, &c., on circular castings with inclined planes. The vertical rods to be weighted. A brass cock $\frac{3}{4}$ " bore to be fitted to the outside of the tank at the front end and near the bottom (for drawing water into a bucket). The well to have a man-hole 15" diameter, cut in the bottom plate at a distance of 2' 4" from the back plate of well, to have a thickening piece 2" broad and $\frac{3}{8}$ " thick, riveted round the hole on the inside by $\frac{5}{8}$ " rivets, countersunk flush on the bottom. The cover to be $\frac{3}{8}$ " thick, 1' 7" diameter, fastened on by $\frac{5}{8}$ " studs, pitch 3 $\frac{1}{2}$ ".

Man-hole in well.

Feed-pipes.

Feed-pipes.

The feed-pipes to be of copper, 1 $\frac{3}{4}$ " bore, and No. 12 W.G. thick, and the feed connection between the engine and tender to be strong indiarubber hose-pipe, 2 $\frac{1}{2}$ " bore, stiffened with spiral spring inside (tested to 200 lbs. pressure per square inch), and fitted with brass union joints at the engine end.

Painting.

The inside of the tank and well to be thoroughly served with three coats of best metallic oxide paint, and the other parts outside to be filled up, rubbed down, and painted in the same manner as the engines.

June, 1885.

W. SCOTT,
Locomotive Engineer.

GENERAL CONDITIONS, IF ENGINES ARE BUILT BY ENGLISH OR FOREIGN
MANUFACTURERS.

Everything necessary to be provided.

Everything necessary to the proper finish and equipment of the engine and tender must be supplied, whether stated in this specification or not, and no advantage is to be taken of any omission of detail in the specification or drawings, as the contractor may, by applying to the Inspecting Engineer, obtain full explanation of any part of the work not sufficiently shown or understood.

Alterations.

The Commissioner reserves to himself the right to supply, after tenders have been lodged and accepted, a set of working plans for the contractor's guidance; and in such event said plans will have to be rigidly adhered to, both as regards general design and detail.

Suggestions from Contractor.

Any alteration or modification of detail which shall be ordered by the Inspecting Engineer, during the progress of the work, as being in his opinion necessary for the proper execution of the contract in accordance with the spirit of this specification, shall be executed by the contractor without extra charge.

Any suggestion that the contractor may desire to make with the object of improving or economising, in his opinion, the working of the engine, or of modifying the mode of manufacture, or the material specified to be used, are to be forwarded in writing to the Inspecting Engineer. If approved of, the authority to carry them out will be given in writing by the said Engineer, otherwise they will not be allowed.

Materials used. Workmanship. Inspection.

All the materials used are to be of the very best description of their respective kinds, and the work is to be executed in the most approved, substantial, and workmanlike manner, according to the direction and to the satisfaction of the Inspecting Engineer, who is to have power to inspect the manufacture, either personally or by deputy, in all its branches or details, in such manner as he may think fit, and to reject at any stage, any work or material of which he may disapprove, as not being in accordance with the spirit and intention of the specification; and his decision on any point of dispute or doubt which may arise in reference to the contract shall be final and binding on the contractor.

Sub-letting.

The contractor shall not assign or sublet the contract, or allow any portion of the work to be done other than in his own establishment (except where permitted by any of the foregoing clauses of this specification), unless with the previous written consent of the Inspecting Engineer.

One set of templates and patterns to be used.

The work is to be finished to one set of templates and patterns, so that the engines and tenders may be exact duplicates of each other, and that all moving parts, including the wheels and axles must be interchangeable.

Numbering of parts.

The maker's (progressive) number to be stamped upon all the parts of each engine and tender for identification; also, maker's name, date, and place of manufacture to be exhibited upon a brass plate fixed to each engine.

Testing.

All brackets having been riveted on, the whole of the studs and mud-plugs screwed in, and all mountings fitted on, previous to being put in the frames, each boiler shall be tested (without the clothing) in the presence of the Inspecting Engineer or his deputy, first with water to a pressure of 200 lbs. per square inch, and afterwards in steam at the intended working pressure.

Finishing.

When complete and finished in every respect, the engines and tenders shall, after having been satisfactorily tested in the maker's yard, be delivered in accordance with the terms of the tender.

Protection of bright work.

For the purpose of transit, all bright work to be thoroughly protected against rust by a coating of white lead and tallow, and all parts (other than those in packing cases) to be substantially protected from damage by wood battens or other suitable means. The bearings of the wheels and axles are also to be coated with white lead and tallow, and are then to be lapped with flannel which has been soaked

Protection of bearings.

in

in the lead and tallow ; afterwards tightly and closely lapped with spun-yarn which has been first soaked in the mixture. The outer surface of the spun-yarn is then to be well coated with boiling pitch and tar, and each bearing is to be protected by battens of wood secured by hoop-iron. All studs or joints on the boiler or framing must be protected by wood, and all holes must be plugged to prevent pinch-bars being inserted when loading or unloading. The cylinders are not to be removed from the framing. Cross-stretchers of wood are to be inserted between the axle-forks at the front and hind ends of the engine, to prevent any straining of the frames. Studs, &c., to be protected.
Cylinders not to be removed.
Cross-stretchers

The movable pieces must be packed in strong cases made of deals 1½" thick, strengthened by battens placed about 2' 6" apart, and the ends and sides bound down with stout hoop-iron well nailed. All loose pieces in each case must be packed with distance-pieces of wood to prevent any of them moving, and the contractor will be held responsible for any damage arising from neglect of this. Packing cases.

The cases containing the bright work are to be lined with stout sheet tin or zinc, and soldered perfectly water-tight, the lids of these cases being fastened down with screws. Tin linings.

Each case and each unpacked portion of the engine must be marked and numbered, as may be directed, to facilitate the shipment of the parts in the required order. Marking.

The price named in the tender must include the cost of all templates, royalties, and other charges for the use of patents (if any) involved, and of the delivery of the engines in steam, to the satisfaction of the Inspecting Engineer. Price named to include all costs.

The contractor must deliver complete, as per specification, the various engines and tenders by the dates respectively named in his form of tender ; and should he fail to do so, a sum at the rate of £20 per week per engine will be deducted, by way of liquidated damages, from the price named in the form of tender. Delivery within contract time.

The contractor will be required to execute a formal deed of contract with the Commissioner for Railways, Sydney, New South Wales, or the Agent-General of the New South Wales Government in London, embodying this specification (the terms of tender) and all other conditions necessary to ensure the due completion of the contract. Bond to be executed.

Detailed packing lists must be furnished in duplicate written copies, giving the outside measurement of each package, as well as the weight thereof, as nearly as possible. Packing lists.

Payment will be made for each engine as follows :—90 per cent. in cash in London, on receipt by the Agent-General for New South Wales of the bills of lading, together with a certificate from the Inspecting Engineer, that the terms of this specification, as to the completion and packing, &c., &c., of the engines, have been fulfilled. Payment.

And it is hereby expressly declared that the giving of a certificate by the Inspecting Engineer in London, that the work done by the contractor has been satisfactorily executed and completed up to the period of delivery, shall be a condition precedent to the contractor's having any right of action or lawful claim to the payment of the 90 per cent. to be made under this specification.

The balance of 10 per cent. will be paid by the Agent-General, on receipt by him of a certificate that each engine has run 2,000 miles on the Government Railways of New South Wales, to the satisfaction of the Locomotive Engineer of the Government ; and if any engine or engines should fail to run the specified 2,000 miles to the satisfaction of the Locomotive Engineer, the contractor will be called upon to make good the defects. If he fail to do so within reasonable time, the Commissioner for Railways shall spend any such sum (not exceeding in the total the 10 per cent. on the contract price of the engine or engines that shall have arrived in the Colony) as may be considered necessary, in the opinion of the Locomotive Engineer, to make the engine or engines conform to this specification, such sum to be deducted by way of liquidated damages from the formentioned balance of 10 per cent. Balance payment.
Mileage to run.
Contractor to make good defects.

A complete set of working plans or drawings (on vellum) to be supplied by the contractor to the Agent-General or Commissioner for Railways, as soon as the whole of the working plans or drawings shall have been completed.

Each Tenderer to submit (if possible) along with his tender an outline plan, showing the general features and designs of the engine and tender which he proposes to supply, along with a skeleton specification of the leading particulars of the same.

Should the rate of progress made with the work be such as to prevent, in the opinion of Inspecting Engineer, the engines being delivered within the time specified in the Form of Tender, the Commissioner for Railways or the Agent-General shall have full power and authority, after due notice given to the contractor, to cancel the contract forthwith, upon which all moneys due to the contractor under this contract shall be forfeited. Progress of work.
Cancelling contract.

Tenderers in Europe or America may either tender to the within specification, or if they wish to depart from it in respect of substituting bar for plate frames, cast-steel for wrought-iron centres for wheels, other brands of copper, brass, and iron for those mentioned, will be allowed to submit alternative tenders, provided they adhere to the general dimensions of the engine, and clearly and minutely specify the nature of the departure they propose to make from the specification.

CHAS. A. GOODCHAP,
Commissioner for Railways.

Department of Public Works,
Railway Branch,
Sydney, 1st June, 1886.

GOVERNMENT RAILWAYS OF NEW SOUTH WALES.

Form of Tender for Manufacture of Engines in England or Foreign Countries.

THE undersigned, having read the attached Specification (No. 188A), hereby offer to supply the Government of New South Wales with Locomotive Engines and Tenders, made in accordance with the various requirements, particulars, and conditions set forth in said Specification, on the following terms as to delivery and payment, viz. : Engines (with their Tenders) delivered in steam at the price of £ each, the whole to be completed and delivered within months from date of official acceptance of Tender, and further promise and agree to be firmly bound by and faithfully to adhere to all the conditions and requirements of the said Specification, and to forfeit to the

New South Wales Government, or its lawful representatives, the sum of £20 sterling per engine and tender per week (to be deducted from the abovenamed contract sum by way of liquidated damages) for each and every week that each Engine (with its Tender) shall remain undelivered after the time herein specified for delivery.

We are,
Your obedient Servants,

Name
Address

To the

N.B.—This Tender must not be detached from the Specification. The Government do not bind themselves to accept the lowest or any Tender.

GOVERNMENT RAILWAYS OF NEW SOUTH WALES.

Specification No. 188A for a Four-coupled, outside-cylinder Passenger (Bogie) with Engine and Tender.

Number required—Twelve, delivered in steam at Sydney; Four, delivered in steam at Newcastle.

PRINCIPAL DIMENSIONS.

ENGINE:—		ft. in.
Gauge of Railway	4 8½
Cylinders, diameter	1 7
" stroke	2 2
Coupled Wheels, D. and T. (front and back of fire-box)—4.		
" " diameter of do. (tread)	5 6½
" " distance from C. to C. do. approximate	8 3
" " bogie, number—4.		
" " " diameter, tread (if possible not less than)	3 7
" " " distance from C. to C.	6 10
" " " base (total) ... do. approximate	21 8
Fire-box length of foundation ring (not less than) do	5 9
" breadth do. do. do.	3 6
Tubes, minimum number—198.		
" diameter outside	0 2
Boiler, do. (internal minimum) barrel portion (if possible)	4 4
" length do. do. approximate	10 4
" centre line, height from rail (if possible not to exceed)	7 0
Working steam pressure in boiler, 140 lbs.		
Weight on the rails, per pair of Driving Wheels (in steam), if possible not to exceed	15 tons.
TENDER (Horse-shoe, with well) minimum content 2,500 gallons:—		
Wheels, number—if all fixed wheel-base—6.		
" diameter (tread)	3 7
" base (total)	11 0

General Arrangement.

The general arrangement and design to be in accordance with a plan to be prepared by the contractor, in which the following leading particulars are to be faithfully embodied and adhered to, viz.:—Cylinders to lie horizontal, and to be situated outside the frames, and not to exceed 6 ft. 3 in. C. to C. apart, valve-chests on top (as in American practice),—connecting rods to be **next to the crank bosses**, with coupling-rods outside of and close to them,—frames sufficiently prolonged and arranged in front of cylinders to take the buffer-beam, &c. An extended smoke-box (as in American practice) with efficient deflector-plate and spark-arrester inside—frames thoroughly and efficiently stayed to one another at front end, and arranged underneath to suit the design of bogie exhibited by the Inspecting Engineer for this purpose. Steel slide-bars arranged as usual for outside cylinder engines, viz.: one above and the other below C' line of piston-rod. Beyond this, the entire boiler and fire-box, arrangement, size, and position of driving and trailing wheels, framing (aft of the motion plate), platforms, foot-plating and buffer-plates, fire-box, fixtures, brake-gear, as well as those details of the engine which are unaffected by the re-arrangement of cylinders and bogie shall be in conformity with the working drawings or plans exhibited, or directions issued by the Inspecting Engineer, in connection with this specification for the contractor's guidance, and any departure from the same is only permissible with the written consent and authority of the said Engineer.

The successful tenderer shall make his own copies of the various drawings or plans exhibited for his guidance, and prepare, at his own cost, any further detail or other drawings which may be necessary in carrying out the work, such extra drawings to be subject to approval.

Cylinders.

The cylinders are to be made of fine close-grained cast-iron, perfectly sound and good castings in all respects, and as hard as can with difficulty be bored and planed. They are to have stout flanges, and to be bolted to the frames by tight-fitting turned bolts 1½" diameter, all the holes being bored out and rymered true for this purpose.

Slide-valves.

The slide-valves are to be of hard gun-metal, stiffened by two suitable ribs inside the exhaust-chamber, the valve-faces scraped true, and the corners of ports rounded to ¼" radius.

Cylinder covers.

The cylinder and steam-chest covers are to be truly planed, or turned and scraped to faces, and the joints made metal to metal; all nuts to be case-hardened; those in the smoke-box are to be of gun-metal. The front covers are to be fitted with ½" polished covering plates, secured by set-screws, the holes for which

which must not pass through the covers. Each cylinder is to be fitted with mud-cock at each end, worked simultaneously by suitable cross-shafts, rods, and levers from the foot-plate, the handle to be situated on left side of engine. Cylinders, valve-chests, and passages to be efficiently clothed and covered in. Mud-cocks.

Pistons and Cross-heads.

The pistons to be of cast-iron with cast-iron packing rings $\frac{3}{8}$ " wide and $\frac{1}{16}$ " thick. Piston-rods to be of mild cast-steel 3" diameter with coned ends, secured to the pistons by screwed wrought-iron nuts (6 threads per inch), the nuts being secured by split pins; front end of piston-rod (reduced in diameter) to be carried forward through front cylinder cover, with suitable stuffing box, gland and sleeve. The pistons are to be turned $\frac{1}{32}$ " less than the diameters of the cylinders, and the rings $\frac{1}{4}$ " larger than the cylinders, and cut and sprung into their places. The pistons to have $\frac{3}{8}$ " clearance at each end of the cylinders. The cross-heads to be of wrought-iron, case-hardened, the bearing pins of mild steel.

Slide-bars and Blocks.

Each cylinder to have two slide-bars, which are to be of cast-steel, as hard as possible, 5" wide, with $\frac{1}{8}$ " copper liners at both ends for adjustment; the bars to be placed 12" apart vertically. The slide-blocks to be of hard cast-iron, not less than 15" long, with flanges $\frac{1}{2}$ " thick and 1" in depth.

Connecting-rods.

The connecting-rods are to be of wrought-iron, forged in one length, without weld; the small end to be, by preference, solid,—the large end to have a wrought-iron strap and tapering bolts, or to be forked and finished with a block and stout tapering bolt. The brasses (both ends) to be in two halves, those at the large end being tightened with a steel cotter, and those at the small end with a tapering steel block, wrought-iron (case-hardened) liner, screwed bolt, &c. Brasses to be flat-ended, corners rounded to $\frac{3}{4}$ " radius. Clearing of pistons. Cross-heads.

The oil-cups and syphons are to be forged on solid, and finished with screwed brass covers. The bearings are to be of the best hard and tough gun-metal.

Coupling-rods.

The coupling-rods are to be of the same material as the connecting-rods, and similarly made and finished, including the solid forged oil-cups and syphons.

They are to be parallel in the body, and to have solid ends to receive the gun-metal bearings, which are to be in two halves, of similar design to those of the connecting-rod. Each bearing is to have a steel cotter secured and finished similarly to those for the connecting-rods. The crank pins to be of Vickers' mild cast-steel, and to be fitted on the ends with screwed (case-hardened) wrought-iron nuts, secured by parallel steel split cotters. Bearings to be $3\frac{1}{2}$ " diameter by 3" wide.

Link-motion.

The form of link-motion or valve-gear, exhibited in the margin, to be used; the links, levers, pins, valve radius-rod, &c., to be of wrought-iron, thoroughly case-hardened. The work, generally, to be finished bright, and the working joints and surfaces to be liberally proportioned. Intermediate rocking shaft, &c., as in American practice.

The valve-spindle is to work in a stuffing-box and gland at the back end, and in a bushed boss in the steam-chest cover at the front end, and is to be connected to the valve-rod by a tapered socket and steel cotter, secured by a split pin. Valve-spindle.

The whole of the link-motion and gearing, as well as the connecting-rods, coupling-rods, and all parts of the engine and tender that have to stand a working strain, such as spring-links, brake-work, &c., are to be made (except when otherwise specified) of best charcoal iron, or carefully selected best Yorkshire scrap iron, clean and well hammered, thoroughly sound, and free from all defects. Oil-holes must be provided to all working joints. Material for link-motion.

Framing.

The framing to be of the type known as "plate frame"—of the very best quality, and manufactured by John Brown & Co., Monkbridge, or Parkgate Iron Companies. Material—how made.

Each frame is to be $1\frac{1}{2}$ " thick from front buffer-plate to offset for motion-plate; from thence to back buffer-plate 1" thick, and broad enough to form axle-forks out of the solid plates. Thickness, &c.

The plates are to be slotted in pairs (or more). They are to be securely attached by the bogie bolster-plate, the smoke-box floor-plate, front-plate, and tube-plate, the motion-bracket, a cross-stay in front of fire-box, the plate in front of the hind buffer plank, and the draw-plate and buffer-plates. Slotted in pairs. Cross-stays.

The axle-forks are to be fitted with cast-steel horn-blocks, those of the driving-axle being united in one solid casting. They are to be fastened to the frames by $1\frac{1}{2}$ " turned bolts, driven in tight, and secured by split pins. The back blocks for the coupled axle-boxes are to be fitted with case-hardened wrought-iron parallel liners, the blocks being cast with suitable bosses to receive two $\frac{3}{4}$ " bolts with counter-sunk heads for securing the liners. The forks are to be stayed together by wrought-iron keeps, with jaws slightly tapered to fit the ends of the forks, and drawn on tight by $1\frac{1}{2}$ " turned bolts provided with split-pins at the backs of the nuts. The motion-bracket is to consist of a stout wrought-iron plate thoroughly secured to each frame. Horn-blocks. Fork keeps. Motion-bracket.

The engineman's foot-plate is to consist of a $\frac{3}{8}$ " wrought-iron plate; secured firmly to the frames by suitable L irons and rivets. On each side of the foot-plate a plate carrying two footsteps is to be fixed. Engineman's foot-plate. Footsteps.

The main frames are to be provided at either end with stout L irons securely riveted on, and serving as seats for the two vertical transverse end plates, the hind one, $\frac{3}{4}$ " thick, forming a buffing plate, the front one, $\frac{5}{8}$ " thick, forming a portion of the buffer-beam, which is further stiffened by plate gussets with angle-irons to transmit the thrust of the buffer to the frames. Transverse end plates.

The front buffer-beam is to be of well-seasoned oak 1' 6" deep by 6" thick. Turton's patent engine buffers to be used, having volute springs and wrought-iron plungers with solid heads. The cases are to be either wrought-iron or steel, and are to be securely bolted to the beam. The back buffer-plate Buffers.

plate to be provided with an adjustable wrought-iron (case-hardened) wedge-block, &c., as in American practice, in lieu of spring buffers. (*Vide* plan exhibited.) Buffers to pattern H 1½ of Turton's Catalogue, 22" long over all, heads 13" diameter.

Draw-gear.
Main intermediate.

The draw-gear between engine and tender is to consist of one wrought-iron draw-bar 2½" diameter, with a circular hole 2⅝" diameter at tender end, and a slot 2⅝" x 3" at engine end, also two safety draw-bars 1¾" x 1⅜".

Front.

The front buffer-beam is to have a wrought-iron hook fitted with an indiarubber spring on the inside, and a wrought-iron washer-plate inside and out, secured by a nut and split cotter. There are also to be two safety-chains and hooks. The frames are to be adapted at the front end to take the cylinders, and to be carried down behind the bogie to carry the motion-bracket, &c., and between the D. and T. wheels to carry the compensating lever. A wrought-iron life-guard to be fixed to the front of each frame. Side platforms ⅝" thick, running from front buffer-beam to back of engineman's foot-plate, to be fixed to the frames by suitable angle-irons, brackets, &c.

Life-guards.
Side platforms.

Brackets and guides.

The frames are also to be fitted with wrought-iron brackets to carry the four brake-hangers, and with wrought-iron brackets to take the spring-links, &c.

		ft. in.
Extreme width over side platforms (if possible not to exceed)	...	7 9
Total length of buffer-beam	8 3
Distance from centre to centre of buffers	5 9
Distance from top of rail to centre of buffers (when engine is in steam)	3 3

Bogie.

The bogie to be of the centre-pin type, in accordance with the drawing exhibited for this purpose.

Wheels.

The wheel-bodies to be of wrought-iron, 5' 1" diameter, made of the best-selected, well-hammered scrap-iron, and neatly smithed and hand dressed. The spokes to be forged solid with T-ends (unless special appliances be provided for dabbing on the rim-pieces under the steam-hammer, or by hydraulic pressure), which when veed up shall form the rims. The D. and T. wheels to have eighteen spokes each. Three of the spokes are to be welded solid together, high enough to form the boss to take the crank-pins. The heads of the other spokes are to be formed in a suitable die, so that when they are laid together with the crank-boss they shall form a solid boss for the axle and crank-pin, after which a washer (as thick as possible) shall be soundly welded on each side.

D. and T. wheels.

Balance weights.

The revolving and reciprocating parts of the engine are to be balanced by blocks forged solid in the wheels.

Bogie-wheels.

The bogie-wheel bodies, 3' 1½" diameter (if tread diameter equals 3' 7"), are to have ten spokes each, to be put together and finished after the same manner as the D. and T. wheels.

Welds.

How finished.

Wheels fixed on axles.

The welds in the bosses, spokes, and rims, must be thoroughly sound and free from all defects, as any defective welding will necessitate the rejection of the wheel. The wheels are to be turned or planed on the faces of the bosses, and turned on the faces and sides of the rims; they are to be tooled round the axle and crank-bosses, and the spokes are to be chipped and neatly finished by hand. They are to be forced on the axles by hydraulic pressure of 1½ ton per square inch of the area of the hole for the axle, and each wheel is to be secured by a strong steel key bedded for half its depth into the axle (on the same side as the crank-boss in the D. and T. wheels), carefully fitted sideways, and with a taper on the flat of 1 in 96, and driven in with a sledge-hammer or tup.

The crank-pin holes are to be bored out to a taper of 1 in 48 and countersunk. The pins are to be of Vickers' mild cast-steel. They are to be forced in by hydraulic pressure and riveted up cold.

Tires.

All the tires to be of Vicker's cast-steel, "Australia" brand, 5½" wide and 2¾" thick on tread; the section and method of fastening to be as shown on drawing exhibited.

Axles.

The axles throughout to be of Vickers' mild cast-steel, the best quality, and of the following dimensions, viz.: in the middle, bogie wheels, 5¼"; driving and trailing, 7" diameter; journals, bogie, 5¾" diameter by 8" long; driving and trailing, 7⅝" diameter by 9¾" long. The axles to be stamped with maker's name and date of manufacture. The right-hand crank is to lead. In turning the bearings and other portions of the axles, care to be taken to avoid breaking the continuity of the metal by making small corners; no radius less than ½" will be allowed. Wheel-seat diameter of bogie axles, 6¾"; wheel-seat diameter of driving and trailing axles, 8½".

Axle-boxes.

The D. and T. axle-boxes to be wrought-iron thoroughly case-hardened, and fitted with bearings of hard gun-metal, in accordance with drawing to be exhibited for this purpose, the brasses being forced in a dead tight fit. The boxes to take the spring from below; to be truly planed to fit the axle-box guides, and fitted with wrought-iron syphon-tubes and covers. The brasses to be finished transversely ⅜" shorter than the axle-bearings.

Bogie axle-boxes.

The bogie axle-boxes and their keeps to be, by preference, of hard gun-metal, truly planed to fit the axle-box guides.

All axle-boxes to have two syphon-holes in each, and to be provided with sheet-iron covers.

Springs.

The bearing-springs are to be of the very best quality, and manufactured by makers of good repute only, and to bear the stamp of the maker. The ends of the upper plates of the D. and T. springs are to be made with solid eyes, slotted in the middle to receive the links, and bored to receive the pins. The buckles are to be of wrought-iron, shrunk tightly on, and to be forged so as to form eyes out of the solid, for attachment to the axle-box hanger.

D. and T. springs.

Buckles

The

The bottom plates of the bogie springs are to be reduced to $4\frac{1}{4}$ " broad at the ends, where the spring-links rest, the tip of bottom plate being turned down to retain the links. The buckles are to be of wrought-iron shrunk tightly on, and to be made so that a wrought-iron carrier-bar 3" diameter can pass through them (under the springs), to form the attachment to the bogie frames. Each plate is to be nibbed and slotted near the ends, to keep the plates in position. The plates (in all the springs) to be secured to buckle by a $\frac{7}{16}$ " steel pin passing through spring and buckle, and riveted over, countersunk.

Bogie springs and buckles.

Care must be taken to have the inner corners of all the buckles well rounded, the corners of the upper and lower spring-plates being rounded to suit. The spring-pins, links, and link-brackets to the frames are to be well case-hardened.

Corners rounded. Pins, &c., case-hardened.

Each spring must be tested before being used, by being loaded until the original camber in the D. and T. springs is reduced by $3\frac{1}{2}$ ", and the bogie-springs by 5", and they should resume their original camber on the removal of the load.

Testing.

Between the D. and T. springs on each side of the engine there is to be a wrought-iron compensating lever, formed of a solid forging swelled out at the middle for the fulcrum-pin, and with a forged jaw at each end to receive the joint-pins which take the screwed links or hangers, and which are each to have two nuts and a split pin. Each lever is to be attached to the frame by a bossed wrought-iron bracket, with a hole 3" diameter to receive the wrought-iron cross-shaft.

Compensating lever.

Boiler.

All the plates used in the boiler-shell and dome, as well as the angle-irons and rivets, are to be made of the best Yorkshire iron, manufactured by either the Lowmoor, Bowling, Farnley, Monkbridge, or Taylor Bros., care being taken in bending the plates to leave the name of the manufacturer visible outside. The brand of iron to be used to be named in Tender.

Material.

All the plates of the barrel and fire-box casing, with the exception of the throat-plate, which is to be $\frac{9}{16}$ " thick, are to be $\frac{1}{2}$ " thick, and planed on their edges.

Plates, thickness, &c.

The barrel is to be not less than 10' 4" long, and (if possible) 4' 5" diameter outside, with butt joints throughout, and to consist of three plates only, the longitudinal joint to be situated between the water-level and the base of the dome, to have lap-plates both inside and out, and to be double riveted (zig-zag); the transverse joints to have outside lap-plates only (solid welded rings), and to be single riveted.

Barrel.

The front tube-plate, $\frac{1}{2}$ " thick, is to be flanged forward to take the smoke-box side-plates. It is to be attached to the boiler by an angle iron $4\frac{7}{8}$ " x $3\frac{3}{4}$ " x $\frac{3}{4}$ ", turned inside on the face and edges, and double-riveted to the boiler-barrel.

Front tube-plate.

The front fire-box casting-plate is to be flanged forward with a radius of $1\frac{1}{2}$ " outside, to take the barrel-plate, with a lap-joint (outside), and is to be flanged backwards at the sides to form a lap-joint (inside) with the side-plates.

Fire-box casing.

The back casing-plate is to be flanged forward, to form a joint (inside) with the side-plates in a similar manner.

Fire-box casing.

The sides and top of the fire-box casing are to be formed of three plates, which are to lap each other and the barrel (as well as the front and back casing-plates), and are to be single-riveted throughout, except at the horizontal joints, which are to be double-riveted (zig-zag). The side plates are to be extra lapped round the lower corners of the front plate, and riveted thereto, to form a double thickness for the mud-plugs.

Fire-box casing.

A wrought-iron dome, 1' 9" diameter inside, and 3' 0" high from boiler-barrel, is to be fixed on the third plate of the barrel, having the same vertical centre-line as the driving-axles. It is to consist of a double-flanged seating, 6" high at shallowest part, formed out of specially-rolled L iron or plate, welded up solid, the lower flange curved suitably to the boiler-barrel, the upper flange to be $1\frac{1}{8}$ " thick (after being turned and faced). The upper portion of the dome to consist of a hemispherical-ended cylinder, terminating below in a stout-faced flange $1\frac{1}{8}$ " thick, made similar to the seating, the whole being welded up solid. The lower joint-face to be recessed $\frac{1}{8}$ " deep, to fit a corresponding projection on the upper face. The lower flange of dome-seat to be single-riveted to boiler-barrel; the hole in the barrel to be 1' 4" diameter, the edge of the barrel-plate being stiffened by two wrought-iron rings $2\frac{1}{4}$ " x 1" (one inside and one out).

Dome.

There is to be a man-hole, 1' 1" in diameter, on the crown of the fire-box casing, fitted with a wrought-iron ring (double-riveted), forming a seating, to which is to be attached a wrought-iron cover.

Man-hole.

The wrought-iron cover is to be turned on both sides, and at the outer edge underneath is to be recessed to take the upper edge of the brass moulding of the clothing. It is to be bored and fitted on the upper side to take two Ramsbottom's valves ($3\frac{1}{2}$ " diameter), and other fittings shown on the Drawing to be exhibited.

Safety-valve.

The top fire-box casing-plate is to have two transverse rows of double angle-irons bent to the proper curve, and firmly riveted to the plate, serving for attachment of the roof girder slings.

Top casing-plate stiffened.

The smoke-box tube-plate and the back fire-box casing-plate are to be stayed to each other by ten longitudinal wrought-iron stays, screwed 11 threads per inch, made with solid heads, and screwed through the casting-plate, with copper washers at the back, and adjusted and attached to front tube-plate by nuts and copper washers, inside and out.

Longitudinal stays.

The upper portion of the back casing-plate, where the stays and fire-box fittings are attached, is to be strengthened by $\frac{3}{8}$ " plate on the inside, suitably attached by rivets.

The longitudinal stays, as well as the regulator rod, are to be supported at mid-length by cross-plates $\frac{1}{2}$ " thick, and not less than $4\frac{1}{2}$ " wide, riveted to the boiler-barrel.

The copper fire-box is to be approximately 5' 9" long, and 3' 6" wide inside at foundation ring, and 5' 6 $\frac{1}{4}$ " deep.

Copper fire-box.

The plates, stay-bolts, and rivets of the fire-box are to be made of the best selected copper, manufactured either by Broughton Copper Company, Pontifex and Wood, Vivian & Sons, or Pascoe, Grenfell, & Sons. They are to bear the maker's stamp, which is to be placed so that it can be seen after the boiler is finished.

Material.

The plates are to be $\frac{1}{2}$ " thick, except the portion of the front plate which receives the tubes, which is to be $\frac{1}{4}$ " thick. Strips must be cut off the plates, and they, with the bars for the stays and rivets, must stand the test of being bent double when cold, without any signs of cracking. If any cracks appear in any of the strips or bars, they must be annealed; and if after being annealed any strips or bars do not stand the test of bending cold, the plates or bars from which such test pieces have been cut must be rejected.

Thickness of plates. Testing

Special

- Special care must be taken to anneal all the stay-bolts before cutting the threads.
- Tube and back-plates.** The tube and back-plates are to be flanged to a radius of not less than 1" inside at the top and sides, to make the lap-joints with the sides and roof-plate.
- Sides and roof.** The sides and roof are to be in one piece, the upper corners of the sides and roof-plate to have a large radius inside.
- Care in flanging.** During inspection special attention will be directed to all the corners of the copper-box; and if any plate shows signs of cracking or injury of any kind, it will be rejected.
- Water-space.** The water-space between the outer and inner plates all round at foundation ring is to be $2\frac{1}{2}$ ". The plates of the fire-box and casing are to be attached at the bottom by a solid forged ring $2\frac{1}{2}$ " deep at the shallowest part, with $\frac{7}{8}$ " rivets. The ring is to be brought down at each corner to take a double row of rivets, and at the sides to carry the ash-pan.
- Fire-box ring.**
- Fire-hole rivets.** The fire-hole is to be oval, the plates being connected by a solid wrought-iron ring, planed on both sides, and secured by $\frac{7}{8}$ " rivets, countersunk on the outside, and finished flush.
- Roof stays.** The roof of the copper-box is to be strengthened by seven rectangular wrought-iron girders, not less than 6" deep in the centre (except the centre one, which is to be $5\frac{3}{4}$ " deep), to be carefully bedded at the ends to the front and back edges of the box.
- Space between roof-stays and box.** The space between the top of the box and the girders is to be not less than $1\frac{1}{2}$ ", nor more than 2". The top of the box is to be attached to the girders by 1" stud-bolts tapped into the girders from below. These bolts must be a tight fit in the holes in the roof-plate, the throats being left full, and screwed well home, the corners of the heads next the plate being chamfered off; wrought-iron ferules, $1\frac{3}{8}$ " diameter outside, to be used as distance-pieces.
- Safety links.** Four safety links, with oblong holes (to admit of the top of the copper-box rising when heated), are to be suspended between two of the girders and the transverse angle-irons on the roof of the casing, the two girders being forged with suitable lugs for this purpose.
- Lead plug.** The roof-plate is to be fitted with a fusible gun-metal plug $1\frac{1}{2}$ " diameter at the point (tapered 1 in 6), and screwed 10 threads per inch, and bored out in the middle, and tapped $\frac{7}{8}$ " to receive the alloy.
- Copper stays.** The walls of the box are to be stayed to the shell by copper stays either $\frac{7}{8}$ " or 1" diameter, screwed 10 threads per inch, placed not more than 4" apart C. to C., screwed tightly into both plates, and riveted over at both ends (leaving a sufficiently large head inside). The end vertical rows at the sides are to be centered $8\frac{1}{2}$ " from the outer face of the front and back casing-plates, and at the front and back $7\frac{1}{2}$ " from the outer face of the side casing-plates.
- Throat stays.** The tube-plate is to be stayed to the lower portion of the boiler-barrel by not less than seven 1" copper screws (10 threads per inch), tapped through the copper plate into wrought-iron sockets (riveted to the boiler-barrel), and finally riveted over inside the box.
- Rivets.** All rivets used in the boiler are to be $\frac{3}{4}$ " diameter, spaced $1\frac{3}{4}$ " apart C. to C., except those attaching the angle-iron to the front tube-plate, which are to be $1\frac{3}{8}$ " diameter and $1\frac{7}{8}$ " pitch, and those in the fire-hole and foundation rings, which are to be $\frac{7}{8}$ " diameter, spaced $1\frac{1}{2}$ " C. to C. Those in the copper box are to be made of copper. All the rivets must completely fill the holes, and must be closed up by steam or hydraulic power wherever it is possible to do so.
- Steam-riveting.**
- Wash-out plugs.** There is to be a tapered brass wash-out plug $1\frac{3}{4}$ " diameter (at large end) situated at each of the two front bottom corners of the fire-box, and two $1\frac{3}{4}$ " plugs at the back of the box (above the level of the fire-box crown), and two $1\frac{3}{4}$ " plugs in the front tube-plate, below the level of the lowest row of tubes; all are to be screwed, 10 threads per inch, and tapered 1 in 8.
- Mud-hole.** There is to be an oval mud-hole, with suitable wrought-iron bolt, nut, and cover, situated at the bottom and centre of the back casing-plate.
- Blow-off cock.** A brass blow-off cock (flanged) is to be fixed by studs to the bottom of the back casing-plate, and worked by a socket key from the foot-plate, the key being cranked at top to form a handle, and swelled out in the shaft to fit the hole in the foot-plate, and secured to square off the cock-plug by a strong split pin.
- Fire-bars.** The fire-bars to be of wrought-iron $3\frac{1}{2}$ " x 1", carried on two wrought-iron cross-bearers, which are $3\frac{1}{2}$ " diameter, and shaped at the ends to fit into suitable brackets, bolted to the prolonged portion of the fire-box bottom ring. These cross-bearers are to be drilled and fitted with pegs (not tapered) of $\frac{7}{8}$ " round iron placed 2" apart C. to C. to regulate the spacing of the fire-bars.
- Ash-pan.** The ash-pan is to be of wrought-iron, the full length and width of the fire-box, and is to have a tight-fitting door at both front and back, swung on a hinge bar running the full length of the door, and worked from the foot-plate by suitable levers and rods. The bottom is to be stiffened by three cross angle-irons.
- Fire-door.** The fire-door is to consist of two sliding wrought-iron plates, and is to be provided with a wrought-iron deflector.
- Brick arch:** The fire-box to be fitted with a fire-brick arch, supported by angle-irons attached to the side-plates by studs.
- Regulator.** A swan-necked cast-iron pipe, 4" internal diameter, is to be fixed in the steam dome. The lower portion is to be attached by an angle-iron bracket to the dome base. The top of this pipe is to be fitted with a gridiron regulator of cast-iron, having a gun-metal slide or valve worked by levers and rods from the foot-plate. The regulator rod to be made so that it can be put in or taken out without interference with the steam-pipe.
- Stuffing-box.** The regulator stuffing-box is to be of brass, with suitable stops to limit the travel of the handle, and stamped "Shut" and "Open" on the right and left hand respectively.
- Steam-pipe.** A copper pipe, 4" diameter inside, and No. 9 W.G. thick, is to connect the regulator with the elbow-pipe in the smoke-box. It is to be fitted to the regulator pipe by a brass cone (brazed on), secured by a circular clip and two bolts, the hole in the clip being large enough to slip over the cone; the front end of the pipe is to be attached to front tube-plate by a brass flange (brazed solid to the pipe), and having seven wrought-iron screwed studs.
- Elbow-pipe in smoke-box.** There is to be a cast-iron T pipe in the smoke-box fixed by the studs which secure the flange of the steam-pipe. Two copper pipes, $5\frac{1}{2}$ " diameter inside, and No. 9 W.G. in thickness, with brass flanges (brazed solid) are to connect the T pipe with the cylinders. They are to be close to the sides of the smoke-box so as to clear the line of tubes. The lower ends of these copper pipes are to project 1" beyond the flange into the cylinder casing, and a circular recess or groove is to be cut in the joint on the cylinder for a corresponding projection in the flange of the steam-pipe to fit into it. Flue

Flue Tubes.

The tubes are to be of the best quality solid drawn brass, manufactured by the Broughton Copper Company, of Manchester; Elliott's Metal Company; Allan, Everett, & Sons; J. Wilkes & Company, of Birmingham; to be first approved in writing by the Inspecting Engineer. Material and make.

They are to be 198 in number, and 2" outside diameter, and are to bear the maker's stamp. They are to be No. 10 W.G. thick at the fire-box end, and No. 12 do. at the smoke-box end. Front ends swelled to $\frac{1}{16}$ " diameter in smoke-box tube-plate. Number and diameter.

Care must be taken to make the tubes perfectly steam-tight at both ends by rolling them with Dudgeon's expander.

Turned tapering steel ferules are to be inserted at both ends of the tubes. Steel ferules

The tubes are to project $\frac{1}{8}$ " beyond the fire-box tube-plate, and $\frac{3}{8}$ " beyond the smoke-box tube-plate when fixed, and they are not to be rolled over or beaded at the ends.

Smoke-box.

The sides of the smoke-box are to be attached to the tube-plates by rivets and to each frame by a wrought-iron thickening strip riveted to the side-plates, and bolted to the frame-plates. Side-plates to be connected to front-plate by an angle iron (riveted), the latter plate to be bolted at bottom to the floor of the smoke-box.

The door is to be circular and dished, and carried by two wrought-iron hinges. It is to be fitted inside with a liner attached by rivets and ferules, with an air-space of $\frac{1}{2}$ " at the edges. It is to be kept closed by a removable horizontal cross-bar, and a central handle with a minor locking handle and screw. Door.

The exhaust-pipe is to be of cast-iron, and is to be surmounted by a movable cap or nozzle. The joints of the exhaust-pipe and cap are to be planed. Exhaust-pipe.

Spark-arresters to be fitted of the best design known for the prevention of burning matter being emitted. Spark-arrester.

The chimney to be of wrought-iron, the base being formed of a plate welded up without seam, and shaped on a block to suit the curve of the smoke-box. The barrel is to be made of one plate with a butt joint and inner lap-plate, and fitted into and riveted to the base. It is to be surmounted by a polished copper top. All the rivets in the chimney are to be countersunk and flush outside. The extreme height of the chimney from the rail is not to exceed 13 feet 6 inches. Chimney.

A blower-cock is to be fixed on the boiler behind the chimney, or otherwise neatly arranged, worked by a handle (passing through the right-hand rail) from the foot-plate, a copper pipe leading the steam inside the smoke-box. Blower.

A No. 2 Roscoe's lubricator is to be fixed on each side of the smoke-box, with copper pipe leading into the centre of each cylinder. Lubricators.

The hand-rail in front of the smoke-box to be a continuation of the side-rails. Hand-rail.

Fire-box Fixings.

The fire-box fixings are to consist, in addition to those already mentioned, of the following:—

One Bourdon's gauge, to indicate 200 lb. per square inch, with cock and copper pipe. Two glass gauges, with top and bottom cocks, and waste-water cock and copper pipe, the top and bottom cocks to be screwed into the plate $1\frac{1}{4}$ " diameter, 11 threads per inch. There is to be a whistle fixed to front of cab, and connected by a copper pipe to the injector steam-cock branch. There is to be also an iron socket screwed into the back casing-plate to carry the gauge-glass lamp, and a wrought-iron tray with angle-iron rim fixed with studs above the door. All the cocks and fittings are to be made of brass, unless specially named to the contrary, and all fittings screwed into the boiler are to have 11 threads to the inch, unless otherwise specified.

There are to be two No. 9 Giffard's injectors (Gresham and Craven's make) one fixed on each side of the engine, in such a position that the handles can be readily reached for adjustment by the driver. Each injector is to have a steam-cock fixed on a special branch casting, placed on the top of fire-box casing-plate, and to have a clack-box fixed on the centre line of the boiler near the front end. Each clack-box flange is to be secured by W.I. studs to a wrought-iron seating riveted to the boiler. Injectors.

The injectors as well as the cocks and clack-boxes are to be of gun-metal, and the steam, suction delivery, and overflow pipes of copper, No. 10 W.G. thick. Materials of injectors, &c.

Clothing.

The boiler is to be covered with dry pine battens, tongued and grooved. At each joint of the lagging plates a wrought-iron hoop $2\frac{1}{4}$ " by $\frac{5}{16}$ " thick is to be put on in two halves, provided with distance-pieces 20" apart, and screwed together with countersunk screws, and metal joint blocks let in through the battens, bearing on the boiler, the whole finished flush, covered with sheet-iron No. 14 W.G., and bound together round the barrel and over the fire-box with hoop-iron straps secured by screws.

The dome is to be enclosed in a helmet-shaped casing of polished brass. Polished brass mouldings are to be fitted round the back corner of the fire-box casing, the smoke-box angle iron, and under the safety-valve seating. Dome casing.

Cab.

The cab over the foot-plate is to be of the modern English type covered in at the sides, and is to consist of wrought-iron plates and L irons; front plate $\frac{5}{16}$ " thick, side plates $\frac{3}{8}$ " thick, and roof plate No. 12 W.G. It is to be fitted in front with spectacle glasses in brass frames, made to open and shut. The roof-plate is to have a light angle-iron 1" x 1" fixed on the edges, running fore and aft, to carry off the drip.

Brakes.

An efficient hand-brake is to be fitted to the engine, as well as the tender, consisting of $1\frac{3}{8}$ " screw spindle with a square thread, have a $\frac{3}{8}$ " pitch with a 12" double-ended hand lever at top, and an 11" lever on brake-shaft at lower end, with a suitable screw-nut. The handle for working it is to be placed on

on the left-hand side of the foot-plate, and is to be carried on a hollow cast-iron pillar bolted to the foot-plate by four $\frac{3}{4}$ " bolts. There is to be a wrought-iron hanger, with cast-iron block, fitted to each of the four driving wheels, and a wrought-iron brake-shaft $3\frac{1}{4}$ " diameter carried by cast-iron brackets bolted to the frames, and having the arms forged on solid, the screw-arm being forked and bored to take the screw-nut.

Hangers. Wrought-iron hangers with cast-iron blocks (clipping the flanges) are to be fitted to each of the four driving wheels.

Brake-shaft. A strong wrought-iron brake-shaft not less than $3\frac{1}{4}$ " diameter is to be carried by wrought-iron brackets, with cast-iron bushes, secured to the frames; it is to have the arms forged on solid, the screw-arm being forked and bored to take the screw-nut.

Westinghouse brake. Both engine and tender must be fitted with all the necessary appliances for working the latest improvements of the Westinghouse automatic air-brake on the tender and carriages. The air-pump for the Westinghouse brake must be fixed to the left-hand frame between the D. and T. wheels, and the pipes and nozzles on the tender must be arranged to suit those on the present rolling stock.

Water-jet to tires. Gear to be provided for supplying a jet of water from the tender to the tire of each wheel of engine and tender (except bogie wheels), at the root of the flange, immediately above the brake-block. Two branched $\frac{1}{2}$ " wrought-iron pipes, with two brass cocks, one for engine and one for tender, to be connected with the tank and worked from the foot-plate; the nozzles to be of brass, with $\frac{3}{16}$ " bore at the ends, screwed on to the pipes.

Hand-rails.

Polished, hollow, wrought-iron hand-rails to be carried on each side of the engines by castings bolted to short wrought-iron brackets, which are riveted to the boiler.

Sand-boxes.

A sand-box (content, not less than 4 cubic-feet) is to be fixed in front of each driving-wheel, fitted with valve, and worked conveniently by gear from the foot-plate. The valves in both boxes are to be worked simultaneously. The boxes must be perfectly water-tight.

Sand-pipes.

Brass pipes $1\frac{1}{2}$ " inside diameter, are to be fixed and bent so as to convey the sand as near as possible to the tread of the wheels.

Lamp-brackets.

Two lamp-brackets to be fixed on the front platform—one on the right- and one on the left-hand side.

Painting.

After being tested, the boiler is to receive two coats of metallic oxide paint, and when dry the clothing is to be put on. When finished, the engine is to receive not less than two coats of lead-colour in oil. The whole of the surface, requiring it are then to be filled up with hard stopping, and after being well rubbed down smooth, are to receive a third coat of lead-colour in oil, and to be finished with two coats of selected colour in oil and two coats of varnish.

Tool-box and Tools.

Each engine is to be provided with a portable wooden tool-box 3' 3" by 2' 0", by 1' 9" (to be carried on the top of the tender), made of oak or tallow-wood, bound with iron at the corners, and the lid covered with galvanized sheet-iron, to have strong hinges, hasp, and padlock, and till inside at one end; also two monkey-wrenches (one large and one small); one heavy hammer; one light hammer; one copper hammer; two flat chisels; two cross-cut chisels; two pin punches; one complete set of screw-keys to fit all nuts; two short keys for piston glands; two short keys for valve spindles; light close-ended keys for all syphon covers; one fire-bucket; one fire-shovel; one fire-dart; one fire-pricker; one rake; one pinch-bar (large); one tube-plug socket-rod and six tube-plugs; two 15-ton traversing screw-jacks, with ratchet, ratchet-head, and jackbars; two oil-cans (one large and one small); two oil-feeders (one large and one small), copper tallow-kettle, hand-brush, and gauge-lamp.

Pitch of Screws.

The threads of all bolts, studs, and nuts are to be cut to Whitworth's standard, unless where specially stated to the contrary. Where fine threads are specified, eleven threads per inch are to be used, except in the case of piston-rods, the threads of which are to be six per inch. All bolt-heads and nuts are to be hexagonal, and measured across the corners are to equal twice the diameter of the bolt (except in the larger sizes of bolts, in which case the next size less for heads and nuts may be taken if more suitable). The size across the flats will not therefore be Whitworth's standard.

Wire-gauge.

The Birmingham wire-gauge to be used.

Case-hardening.

All the motion-work, brake-work, the nuts of the cylinders and glands, and all journals, pins, joints, and rubbing surfaces about the engine and tender (except when of brass, cast-iron, or steel) shall be thoroughly case-hardened to a depth of $\frac{1}{8}$ -inch, and so hard as to wholly resist filing.

Specimens of case-hardening, which have been hardened in the same boxes with the work, will be broken in the presence of the Inspecting Engineer or his deputy.

TENDER.

(Content 2,500 gallons.)

General Arrangement.

The following are the leading particulars of the design and construction of the tender, based on the assumption of a rigid or fixed wheel-base, not exceeding 11 feet, and plate frames; and it is to be clearly understood that in the event of bogie being adopted (in lieu of rigid wheel-base), the details as here set forth are, of course, subject to modification, but must still be adhered to as far as practicable. A certain amount of latitude is also allowed to meet the conditions of enlarged tank, &c.

The tender to be of the ordinary horseshoe type, with the addition of a well underneath the tank, 10 feet long, 4 feet 1 inch broad, and 1 foot 6 inches deep, and extending over the front and middle axles. The fuel space (shaped in the tank) to be 7 feet 9 inches long from the front end, and 2 feet 6 inches wide; the whole to be carried on 6 wheels (unless bogies be adopted), 3 feet 7 inches diameter at the tread; wheel centres 5 feet 6 inches, total wheel-base 11 feet.

Wheels.

Bodies to be of wrought-iron, 3 feet $1\frac{1}{2}$ inch diameter, and to have ten spokes. They are to be made of the same material, put together, and finished in the same way as the engine-wheels.

Tires.

To be of the same material, section, and method of fastening, as specified for the engine wheels. To have flanges on all wheels. Centre tires not to be reduced in flanges.

Axles.

To be of the same material as specified for the axles for the engine; to be $5\frac{1}{2}$ inches diameter in the middle, and to be parallel for a distance of 2 feet 6 inches, to run into $6\frac{1}{2}$ inches diameter at the collars, which are to be $\frac{1}{2}$ -inch broad; the wheel-seats to be 6 inches diameter; the journals to be $4\frac{1}{2}$ inches diameter and 8 inches long; the radius of the corners being $\frac{3}{4}$ ". The distance from C. to C. of bearings to be 6 feet 2 inches.

Axle-boxes.

To be of fine-grained hard cast-iron. The castings to be clean and free from flaws of every description. To be planed to fit the axle-box guides, but to be left $\frac{1}{8}$ " wider between the flanges to allow of lateral motion. The bearings to be of hard gun-metal perfectly bedded into the axle-boxes, and octagonal at the crown. Two syphon-tubes to each box; the tubes to be continued through the cast-iron into the brass bearings for a $\frac{1}{4}$ ". The keeps to be of cast-iron, and planed to fit the axle-boxes (so that they can be put up and taken down by hand without hammering), and secured by two $\frac{5}{8}$ -inch round iron pins. The covers to be of cast-iron, recessed in the top to take the ends of spring pillars. The lid to be of cast-iron, secured by a wrought-iron pin.

Axle-box Guides.

To be of fine close-grained cast-iron, free from flaws of every description. To be planed on the face, edges, and flange, and to be fastened to the frames by four $\frac{7}{8}$ -inch turned bolts in each, driven in tight, the bolts to be countersunk into frames, the nuts to be secured by split pins.

Axle-fork Keeps.

To be of wrought-iron, a good fit on the forks, and secured by a $\frac{3}{8}$ " bolt at each end.

Springs.

To be of the same material as specified for the engine springs. The spring pillars to have two guides each fastened to the inside of the frames. The spring-link carriers also to be attached to the inside of the frames.

Framing.

The frames are to be of the same material as specified for the engine frames, and are to be $\frac{7}{8}$ -inch thick, running from buffer-beam to buffer-beam, and formed each of one solid plate. The minimum depth to be 12 inches, and above the axle-boxes 1 foot $2\frac{1}{2}$ inches, deepened at the front end to take the brake-shaft and footsteps. The main frames to be braced together at the front ends by a $\frac{5}{8}$ " wrought-iron vertical plate (serving as a buffer-plate, *q.v.*) 1 foot 2 inches deep, and a $\frac{1}{2}$ " vertical plate, 1 foot $2\frac{1}{2}$ inches deep, united by two horizontal $\frac{3}{4}$ " plates 1 foot 9 inches wide; also at back ends by a $\frac{1}{2}$ " vertical plate (serving as a buffer-plate) 1 foot deep, united to a $\frac{1}{2}$ " horizontal plate 1 foot 6 inches wide, and finally by three intermediate $\frac{1}{2}$ " vertical plates, each 1 foot deep, the whole riveted together with suitable L irons.

There are to be two $\frac{1}{2}$ " wrought-iron longitudinal stretchers, each in one continuous plate, running from the front intermediate cross-stay to the hind buffer-plate, and spaced 4 feet 1 inch apart. The longitudinal stretchers will form the well sides, and the front plate of well is to be $\frac{3}{8}$ -inch thick, and spaced 10 inches from the back of the front cross-stay; the back of the well being formed by the back intermediate cross-stay.

The middle cross-stay divides the well, consequently care must be taken to cut holes in it to allow the water to circulate, also a hole large enough to admit of a man passing through. The intermediate cross-stays will be secured to the longitudinal stretchers and throughout the well by angle-irons.

Foot-plate, Draw-plates, &c.

The foot-plate to be $\frac{3}{8}$ " thick, the extreme width over platform being 7 feet six inches. The front horizontal draw-plate to be $\frac{1}{2}$ " thick, and spaced $6\frac{1}{2}$ " below the foot-plate, and fastened to the buffer-plate, frames, and front cross-stay plate by $2\frac{1}{2}$ " angle-iron and $\frac{3}{4}$ " rivets. The horizontal stiffening-plate to be $\frac{1}{2}$ " thick and 4" below the drawbar horizontal plate, and to be flanged down at the front, and fastened to the buffer-plate, and secured to the frames and vertical cross-stay plate by $2\frac{1}{2}$ " angle-iron and $\frac{3}{4}$ " rivets.

On the underside of the stiffening-plate will be fixed two feed-pipe carriers, to be securely fastened and braced together. The distance from C. to C. of feed-pipes is 2' 11". The drawbar pin is centred 1' $3\frac{1}{2}$ " back from the buffer-plate. The draw-shacklepin holes to be $5\frac{1}{4}$ " from the back of the buffer-plate and 1' 10" apart C. to C.; strengthening plates to be riveted on round the holes in the plates. A wrought-iron (case-hardened) rubbing block to be securely fixed to front buffer-plate to bear against the wedge-block on engine.

Feed-pipe carriers.

Volute spring buffers.

Two

Sand-boxes.

Two water-tight sand-boxes are to be placed on the foot-plate at the front end of the tank, one on each side, each capable of holding 2 cubic feet of sand, and fitted with cast-iron water-tight covers, the filling hole to be $4\frac{1}{2}$ " diameter, and provided with suitable valve and gear for working same.

Hand-rails.

The sand-pipes to be of brass, the same size as for the engine, and bent so as to convey the sand as near the tread of the front wheels as possible. There is to be a polished wrought-iron hand-rail on each side, supported by two wrought-iron pillars, and secured to the tank. The left-hand one to have a boss forged on to take the brake-rod. Two substantial wrought-iron double shackle screw couplings are to be provided with each tender; screw, 2" diameter; shackle and link-iron, $1\frac{1}{2}$ " diameter.

Brake.

The general design and arrangement to be similar to that specified for the engine brake, the handle to be on the left-hand side of the tender. The shaft to be $3\frac{1}{4}$ " diameter, with all the levers forged on solid, including one 1' $0\frac{3}{4}$ " long, for coupling up to the Westinghouse gear; the whole to be supported by cast-iron carriers in the frames. There is to be a wrought-iron hanger and cast-iron brake-block (clipping the flanges) to each wheel. The hangers to be suspended by means of stout W.I. pins passing through the frames and carriers, fastened to the longitudinal stretchers. The hangers for the trailing-wheels to be prolonged to form life-guards.

Back Buffer-beam.

This to consist of wrought-iron plate $\frac{1}{2}$ " thick, 12" deep, and 7' long, secured to frames and longitudinal stretchers by $2\frac{1}{2}$ " angle-irons, $\frac{3}{4}$ " rivets. The horizontal draw-plate to be $8\frac{3}{4}$ " below the bottom of the tank; to be $\frac{1}{2}$ " thick and 1' 6" broad, fastened to frames and buffer-beam by $2\frac{1}{2}$ " angle-iron.

The vertical (draw-spring) plate to be 2' 6" long, 12" deep, and $\frac{1}{2}$ " thick, secured to the horizontal plate and bottom of tank by $2\frac{1}{2}$ " angle-iron. $\frac{3}{4}$ " strengthening-plates to be riveted on to the back of the buffer-beam and front of the vertical-plate. Two buffers, of same type as those specified for the engine, to be fastened to buffer-beam by four 1" bolts in each. Height from top of rail to centre, 3' 3"; distance apart from centre to centre, 5' 9". A wrought-iron draw-hook to be provided, having a shank passing through the buffer-beam and vertical draw-plate, and fitted with a powerful volute spring, secured by a washer and split-cotter. A case-hardened wrought-iron socket is to be fitted to the hind buffer-beam, to give sufficient surface for the shank of the hook to work in. Two safety-chains to be securely attached to the buffer-beam, at a distance of 1' 6" apart.

Tool-box.

A plate-iron tool-box is to be built at the back of the tank, and of the full width of the same, with a hinged lid, hinges, and staple, catch and lock complete.

Tank.

Plating, &c.

The thickness of the top and side plates to be $\frac{1}{4}$ ", and the bottom to be $\frac{3}{8}$ ". The top, bottom, and sides to be well stayed to each other by L irons, &c., as per drawing. A curved wrought-iron moulding to extend along the upper edge (outside) of sides and back of tank.

Man-hole.

A wrought-iron man-hole ring made of $\frac{1}{16}$ " plate, 18" diameter, $8\frac{3}{4}$ " high, flanged at the bottom, is to be riveted on to the top of tank in the centre, 1' 6" from its centre to the back of tank. It is to be fitted with a wrought-iron cover and handle. The hole to be cut in the tank top is to be 1' $4\frac{1}{4}$ " diameter, round which will be supported a wrought-iron sieve, made out of $\frac{1}{8}$ " plate, to be 1' 4" diameter at the top, and 1' $3\frac{1}{2}$ " diameter at the bottom. It is to be 4' $0\frac{1}{2}$ " long.

Feed-valves.

The tank to be supplied at the back end with wrought-iron lifting shackles in each corner, with strengthening corner-plates. At the front end, over the front axle, on the inside of the coal-bunk, two bent plates will be riveted for the same purpose. A lamp-bracket to be fixed respectively on the left and right-hand side at the back end of tank. The feed-valves to be circular, and of gun-metal, with central guide pin, and situated one on each side of the tank, protected by proper strainers, and worked from the top by levers, &c., on circular castings with inclined planes. The vertical rods to be weighted. A brass cock $\frac{3}{4}$ " bore to be fitted to the outside of the tank at the front end and near the bottom (for drawing water into a bucket). The well to have a man-hole 15" diameter cut in the bottom plate at a distance of 2' 4" from the back plate of well, to have a thickening piece, 2" broad and $\frac{3}{8}$ " thick, riveted round the hole on the inside by $\frac{5}{8}$ " rivets, countersunk flush on the bottom. The cover to be $\frac{3}{8}$ " thick, 1' 7" diameter, fastened on by $\frac{3}{8}$ " studs, pitch $3\frac{1}{2}$ ".

Man-hole in well

Feed-pipes.

Feed-pipes.

The feed-pipes to be of copper, $1\frac{1}{4}$ " bore, and No. 12 W.G. thick, and the feed connection between the engine and tender to be strong indiarubber hose-pipe, $2\frac{1}{8}$ " bore, stiffened with spiral spring inside (tested to 200 lbs. pressure per square inch), and fitted with brass union joints at the engine end.

Painting.

The inside of the tank and well to be thoroughly served with three coats of best metallic oxide paint, and the other parts outside to be filled up, rubbed down, and painted in the same manner as the engines.

W. SCOTT,

Locomotive Engineer.

June, 1886.

GENERAL CONDITIONS IF ENGINES ARE MANUFACTURED IN THE COLONY.

Everything necessary to be provided.

Everything necessary to the proper finish and equipment of the engine must be supplied, whether stated in this specification or not, and no advantage is to be taken of any omission of detail in the specification or plans, as the contractor may obtain full explanation of any part of the work not sufficiently shown or understood.

Alterations.

Any minor alteration or modification of detail which shall be ordered by the Locomotive Engineer during the progress of the work, as being in his opinion necessary for the proper execution of the contract in accordance with the spirit of this specification, shall be executed by the contractor without extra charge, provided the cost of such alteration or modification of detail shall not exceed £5.

All

All the materials used are to be of the very best description of their respective kinds, and the work is to be executed in the most approved, substantial, and workmanlike manner, according to the direction and to the satisfaction of the Locomotive Engineer, who is to have power to inspect the manufacture, either personally or by deputy, in all its branches or details, in such manner as he may think fit, and to reject at any stage any work or material of which he may disapprove as not being in accordance with the spirit and intention of the specification; and his decision on any point of dispute or doubt which may arise in reference to the contract shall be final and binding on the contractor, unless the latter avail himself of his right of arbitration.

Materials used.
Workmanship.
Inspection.

The contractor shall not assign or sublet the contract, or allow any portion of the work to be done other than in his own establishment (except where permitted by any of the foregoing clauses of this specification), unless with the previous written consent of the Locomotive Engineer.

Sub-letting

The work is to be finished to one set of templates and patterns, so that the engines may be exact duplicates of each other, and that all moving parts, including the wheels and axles, may, if necessary, replace each other in the different engines.

One set of templates and patterns to be used.

The maker's (progressive) number to be stamped upon all the parts of each engine for identification; also maker's name, date, and place of manufacture, to be exhibited upon a brass plate fixed to each engine.

Numbering of parts.

All brackets having been riveted on, the whole of the studs and mud-plugs screwed in, and all mountings fitted on, previous to being put in the frames, each boiler shall be tested without the clothing in the presence of the Locomotive Engineer or his deputy, first with water to a pressure of 200 lb. per square inch, and afterwards in steam at the intended working pressure.

Testing.

When complete and finished in every respect, the engines will be placed by the contractor on the Railway Line, Sydney as directed in accordance with the terms of the tender.

Finishing.

The price named in the tender includes the cost of all templates and royalties, and other charges for the use of patents (if any) involved, and of the delivery of the engines in steam, to the satisfaction of the Locomotive Engineer.

Price named to include all costs.

The contractor will be held responsible for all defects in materials or workmanship until each engine shall have run at least 2,000 miles, such defects to be made good at his expense.

Mileage to run.

The contractor must deliver complete, as per specification, the engines by the dates respectively named in his tender; and should he fail to do so, a sum at the rate of £5 per week per engine will be deducted by way of liquidated damages from the price named in the tender.

Delivery within contract time.

No certificate will be given in respect of this contract after the date specified in the tender for its completion until the whole of the engines shall have been properly completed to the satisfaction of the Locomotive Engineer.

If at any time the progress made with the work by the contractor should not be such as to satisfy the Locomotive Engineer that the engines will be supplied within the prescribed time, the Commissioner shall have power and authority to cancel the contract forthwith, and to take possession of all materials connected with the contract upon which any advance has been made by him.

Progress of work.
Cancelling contract.

If the contractor become insolvent, have his estate placed under sequestration, or shall make an assignment of his estate for the benefit of his creditors, it shall be lawful for the Commissioner for Railways, without previous notice to the contractor, or to the Official or other Assignee or Assignees of his insolvent estate, or to the Trustee or Trustees under the assignment, to take such of and all portions of the engines and tenders, whether completed or not, from the contractor and of the Assignees or Trustees of his estate, and re-contract with any other person or persons to proceed with and complete the said engines and tenders upon such terms, stipulations, and conditions as shall be deemed expedient.

Insolvency.

The contractor will be required to execute a formal deed of contract with the Commissioner embodying the specification (and the terms of the tender) and the conditions necessary to ensure the due completion of the contract as stated in the Form of Tender.

Bond to be executed.

If required, temporary advances will be made on the certificate of the Locomotive Engineer, to the extent of 80 per cent. on the value of the work done in completing, to the satisfaction of the said Engineer, the following main parts of the engine, viz. :—

Advances

- (1.) The boiler.
- (2.) Cylinders (in pairs).
- (3.) Motion-work, including connecting and coupling-rods (in sets).
- (4.) Frames (in pairs).
- (5.) Wheels and axles (in sets).

Each of these parts of the engines being completed ready for erection, a further payment up to the extent of 90 per cent. of the value of each engine will be made upon delivery, in steam, on the rails, the final balance of 10 per cent. will be retained until completion of the stipulated mileage.

These temporary advances, however will not be made more frequently than once a month.

The advances to be previously secured by a bond to be entered into by the contractor, and two approved sureties.

Final payments will only be made as aforesaid on the certificate of the Locomotive Engineer that each engine has completed to his satisfaction 2,000 miles, in steam, on the rails.

Final payments.

And it is hereby expressly declared that the obtaining a certificate that the work done by the contractor has been satisfactorily executed or completed shall be a condition precedent to his having any right or cause of action in respect of any work done, or materials provided, or any right of action or claim to the payments from time to time to be made hereunder, as well as to the final payment upon completion of the contract.

Obtaining of certificate.

Wherever the names of manufacturers or special brands of material to be used are inserted in the specification, the material so specified will have to be inspected and approved by the Inspecting Engineer of the Government, in London, before any advances are made in respect of them.

Special brands of material.

The following portions only of each engine may be imported; the remainder must be manufactured in the Colony of New South Wales :—

Wheels and axles finished, including tires and crank-pins, but without eccentrics.

Buffer-springs and buffers, complete, ready for fixing.

Domes and dome seat, welded and flanged, but not bored, faced, or drilled.

Copper plates for fire-boxes, flanged (but not bent, drilled, or planed), and copper bars for Boiler-plates,

Parts to be imported.

stays.

Boiler-plates, as plates, not flanged, bent, drilled, or planed.
 Injectors for boilers, finished, ready for fixing.
 Lubricators for cylinders, finished, ready for fixing.
 Steam-pressure gauges, finished, ready for fixing.
 Safety-valve springs or spring balances.
 Steel slide-bars as forgings, not planed (except roughly to ascertain soundness), shaped, or drilled.
 Brass boiler-tubes.
 Copper pipes without flanges.
 Steel piston-rods as forgings, not turned (except in the rough to ascertain soundness.)
 Frame-plates, slotted, but not drilled, and without fixings of any kind.
 All steel and steel castings unfinished.
 Engine-springs with buckles complete and ready for fixing.

Arbitration.

Should any question arise as to the cancellation of the contract, or should the Locomotive Engineer and the contractor be unable to agree as to the price to be paid for extras, or upon any other point or matter except design and workmanship, both of which are expressly exempted and reserved from arbitration, the question in dispute shall be referred to arbitration, and shall be settled by the award, order, or determination of one or more disinterested engineers to be appointed to arbitrate thereon as hereinafter: That is to say, if the Commissioner of Railways and the contractor concur in the appointment of a single arbitrator, then the matters and questions aforesaid shall be referred to and decided by such single arbitrator; but if the Commissioner for Railways and the contractor cannot concur in the appointment of a single arbitrator, each party, on the request in writing of the other party, shall by writing under his hand nominate and appoint an arbitrator, to whom such questions and matters mentioned in this proviso shall be referred. Every such appointment shall be delivered to the arbitrator, and be deemed a submission to arbitration on behalf of the party by whom the same shall have been made; and neither party shall have power to revoke the same without the consent in writing of the other, nor shall the death of either party operate as a revocation. And if for twenty-one days after the notice in writing by the contractor or by the Locomotive Engineer, that the contractor and the Locomotive Engineer cannot agree, shall have been served, and for seven days after a request in writing to appoint an arbitrator shall have been served by the one party on the other party, such last-mentioned party fail to appoint such arbitrator, then upon such failure, the party making the request, and having himself appointed an arbitrator, may appoint such arbitrator to act on behalf of both parties; and the arbitrator may proceed to hear and determine the matter or question covered by this proviso between the contractor and the engineer aforesaid, and in such case the award or determination of such single arbitration shall be final.

If, before the matter so referred shall be determined, any arbitrator appointed by either party shall die or become incapable, the party by whom such arbitrator was appointed may nominate and appoint in writing some other engineer to act in his place; and if for the space of seven days after notice in writing from the other party for that purpose, he fail to do so, the remaining or other arbitrator may proceed *ex parte*; and every arbitrator so to be substituted as aforesaid shall have the same powers and authorities as were vested in the former arbitrator at the time of his death or disability as aforesaid.

If more than one arbitrator shall be appointed, such arbitrators shall, before they enter into the matter or question referred to them, nominate and appoint by writing under their hands, an umpire to decide on any such points on which they shall differ; and if such umpire shall die or become incapable of acting, they shall forthwith, after such death or incapacity, appoint another umpire in his place, and the decision of every such umpire on the matters referred to him shall be final.

If in either of the cases aforesaid the said arbitrators shall refuse, or shall for seven days after request of either party neglect to appoint an umpire, the Governor for the time being of the Colony of New South Wales shall appoint an umpire, and the decision of such umpire on the matters on which the arbitrators shall differ shall be final.

If a single arbitrator shall be appointed, and he shall die or become incapable to act before he shall have made his award, the matters referred to him shall be determined by arbitration under this clause as if such arbitrator had not been appointed.

If more than one arbitrator shall be appointed, and either of them shall refuse, or for seven days neglect to act, the other arbitrator may proceed *ex parte*; and the decision of such other arbitrator shall be as effectual as if he had been the single arbitrator appointed by both parties.

If more than one arbitrator shall be appointed, and neither of them shall refuse or neglect to act as aforesaid, then if such arbitrators shall fail to make their award within fourteen days after the day on which the last of such arbitrators shall have been appointed, the matters so referred to them shall be determined by the umpire appointed as aforesaid.

The arbitrator, or arbitrators, or their umpire, may call for the production of any documents in the possession or power of either party which he or they may think necessary for determining the questions or matters in dispute and so referred, and may examine the parties and their witnesses, and may inspect the works and view the place out of, from, or in respect of which, any of the matters referred to shall have arisen.

The award of the arbitrator or arbitrators, or umpire, shall be in writing, ready to be delivered to either party within three weeks from the appointment of such arbitrator, or the last of such arbitrators. This submission may be made a Rule of the Supreme Court. The amount of costs shall be decided by the arbitrators, arbitrator, or umpire.

It is to be distinctly understood and agreed by and between the Commissioner for Railways and the Contractor, that the appeal to arbitration from the certificate or decision of the Locomotive Engineer shall be limited only to such of the matters in the above proviso mentioned as subjects for the arbitration of engineers as shall be set forth in the notice in writing given as hereinbefore provided by the party requiring such arbitration; and that nothing in this clause contained shall extend to or affect or be construed to extend to or affect any decision, determination, or certificate of the Locomotive Engineer, or any other matters or questions than those in respect of which an appeal shall lie under the proviso above contained. And furthermore, that all questions as to design and workmanship are absolutely and expressly reserved and exempted from arbitration as aforesaid. If

If upon arbitration in respect of claims made by the contractor the sum awarded to the contractor shall be less than one-half of the amount of his said claim, all the costs, charges, and expenses of and incident to the said arbitration and award shall be borne and paid by the contractor; but if the amount awarded shall exceed one-half of the amount of said claim, then each party shall pay his own costs, and one-half of the arbitrators' and umpire's fees.

No work or material applied to the engine shall be deemed an extra, unless it be used in the construction of some appliance which is without corresponding use or purpose in the sample engine or is not named or indicated in the specification and plans, or unless the principal dimensions of the engine (as given on page No. 1 of the specification) or the thickness of the plates, or of the boiler-tubes, or of the tires (on the tread) are thereby increased.

Department of Public Works,
Railway Branch,
Sydney, 30th November, 1886.

CHAS. A. GOODCHAP,
Commissioner for Railways.

FORM OF TENDER FOR MANUFACTURE OF ENGINES IN THE COLONY.

GOVERNMENT RAILWAYS.

Tender for the supply of Engines for the New South Wales Government Railways (to be manufactured in the Colony of New South Wales.

Contract No.

I (or we) hereby offer to supply and deliver, in steam, on the Government Railway Lines, at Redfern or Eveleigh, as may be directed, Engines and Tenders, constructed in strict accordance with Specification No. for the following sums:—

£ each engine and tender (pounds sterling).
And I (or we) hereby undertake to deliver the first engine and tender by the 188 , and to deliver the remaining engines and tenders at the rate of engines and tenders per calendar month from the abovenamed day, thereby completing the whole contract by the 188 .

And I (or we) hereby agree to forfeit to the Commissioner for Railways a sum or sums, at the rate of £5 (five pounds sterling) per engine and tender per week, to be deducted by way of liquidated damages from the abovenamed prices respectively, or from any money due, or that may become due to me (or us) for every week, or part of a week, during which any of the abovenamed engines and tenders shall remain undelivered beyond the time or times respectively named above for their delivery, in steam, at the abovenamed Station.

I (or we) hereby name Mr. (occupation) (address) and Mr. (occupation) (address) as sureties, to enter into a Bond with the Commissioner for Railways in the penal sum of £250 (two hundred and fifty pounds sterling) per engine and tender for the due performance of the contract.

(Signed)

(Address)

(Date) 188 .

GOVERNMENT RAILWAYS OF NEW SOUTH WALES.

Specification No. 191 for a Six-coupled, outside-cylinder Goods Engine (Bogie), with Tender.

Number required—Twenty, delivered in steam at Sydney; Eight, delivered in steam in Newcastle.

PRINCIPAL DIMENSIONS.

ENGINE:—	ft.	in.
Gauge of Railway	4	8½
Cylinders, diameter	1	7
" stroke	2	0
" " distance C. to C.	6	8½
Wheels, 6 coupled and 2 bogie.		
" diameter coupled (tread)	4	0
" " bogies	2	9
Wheel-base, bogie to 1st driver	8	0
" " 1st driver to main	5	7
" " main driver to trailer	5	5
" " total	19	0
Fire-box, length inside at top	5	10½
" " " at bottom (measured on the level)	6	0
" breadth	3	5¾
Tubes, number 189.		
" diameter (outside)	0	2
Boiler, barrel	4	5
" length, barrel part	10	4
" height of C. above rail	6	9
Working pressure, 140 lbs.		
Distance between frame plates	4	1¾
TENDER (Horse-shoe, with well):—		
Wheels, number—6.		
" diameter (tread)	3	6½
" base, total	11	0
Water carried, 2,500 gallons.		

General

General Arrangement.

The general arrangement and dimensions of the several parts of the engine and tender are to be made exactly in accordance with the foregoing principal dimensions, together with such detail and other drawings as may be hereafter exhibited in connection with the specification, for the contractor's guidance.

Preparation of drawings.
Error in drawings.

In accordance with this specification, the contractor shall prepare a complete set of working (full size and general) drawings, showing the forms and dimensions of every detail of the engine and tender; and it is to be understood that the approval of such drawings by the Inspecting Engineer, shall in no way whatever relieve the Contractor of the whole or any part of the responsibility for possible error in design or dimensions, or any other matter incompatible with construction, or at variance with this specification (unless approval of such variations shall have been previously given by the Inspecting Engineer), and any loss arising therefrom shall be borne by the contractor.

The engine is to be carried on a two-wheeled bogie and six coupled wheels.

Springs.

The springs of the main driving and trailing wheels are to be coupled by balance beams, to equalize as much as possible the weight on the rails, and provision is to be made, by supplying extra beams (and fixings attached to the frames to receive the same), to enable the springs of the leading pair of driving wheels to be also coupled at any time to those of the main driving wheels, or the engine to be worked with the front driving springs independent, as may be required. The fulcrum pins and various joints of these connections to be made an easy fit, and with special provision for efficient lubrication throughout.

The flanges of the middle pair of driving wheels are to be reduced to half the thickness of the others.

Cylinders.

The cylinders are to be placed horizontally, and are to be made of fine close-grained cast-iron, perfectly free from honeycomb, and of the utmost degree of hardness compatible with the requirements of machining.

The flanges are to be bolted to the frames by turned bolts driven in a dead tight fit, all the holes being bored out and rymered true with those in the frames.

Slide-valves.

Valve-faces.

The slide-valves are to be of hard gun-metal; they are to be stiffened by two suitable ribs outside, the valve-faces to be scraped through, and in slotting the ports the corners are to be rounded to $\frac{5}{8}$ " radius. The junctions of the valve-face with the sides of the chest, top and bottom, are to be recessed $\frac{1}{8}$ " deep and $\frac{1}{16}$ " wide, with a round-nosed tool, to facilitate the scraping of the valve-face.

Lap and lead.

Cylinder covers.

The slide valves are to have $\frac{1}{8}$ " lead, $\frac{7}{8}$ " outside lap, and no inside lap.

Mud-cocks.

The cylinder and steam-chest covers are to be truly turned and planed and scraped to faces, and the joints made metal to metal; all nuts to be case-hardened. The front and back covers are to be fitted with polished covering plates. Each cylinder is to be fitted with a mud-cock at each end, worked simultaneously by suitable cross-shafts and rods from the foot-plate; also, each valve-chest to have one mud-cock at back end, similarly worked.

Pistons and Cross-heads.

The pistons to be of cast-iron, with cast-iron packing rings $\frac{3}{4}$ " wide and $\frac{7}{16}$ " thick. Piston-rods to be of mild cast-steel with coned ends, secured to the pistons by screwed wrought-iron nuts (6 threads per inch) with split pins; front end of piston-rod (reduced in diameter) to be carried forward through front cylinder cover, with suitable stuffing-box, gland, and sleeve. The pistons are to be turned $\frac{1}{32}$ " less than the diameter of the cylinders, and the rings $\frac{1}{4}$ " larger than the cylinders, and cut and sprung into their places. The pistons to have $\frac{3}{8}$ " clearance at each end of the cylinders. The cross-heads to be of wrought-iron, case-hardened, the bearing-pins of mild steel.

Cross-heads.

Slide-bars and Blocks.

Slide-bars.

The slide-bars to be of cast-steel, as hard as possible, with copper liners at both ends for adjustment.

Slide-blocks.

The slide blocks to be of hard cast-iron, with guide flanges 1" deep and shoulders front and back of cross-head (to take the strain off the socket).

Connecting-rods.

Connecting rods.

The connecting-rods are to be of wrought-iron, forged in one length, without weld; the small end to be solid,—the large end to be forked and finished with a block and stout tapering bolt. The brasses (both ends) to be in two halves, those at the large end being tightened with a steel cotter, and those at the small end with a tapering steel cotter block, and wrought-iron (case-hardened) or steel liner. Brasses (except from small end) to be flat-ended. Length, 6' from centre to centre.

The oil-cups are to be forged on solid, and finished with screwed brass covers. The bearing brasses are to be of the best hard and tough gun-metal.

Coupling-rods.

Coupling-rods.

The coupling-rods are to be of the same material as the connecting-rods, and similarly made and finished.

They are to be parallel in the body, and to have solid ends to receive the gun-metal bearings in two parts. Each bearing is to be secured by a steel cotter, and made and finished similarly to those for the connecting-rods. The joint is to be in front of the main driving wheel, the pin being secured by a $\frac{1}{2}$ " split pin passing through it and the outer jaw.

NOTE.—The section of the body part of the connecting and coupling rods to be suitably proportioned to the size of cylinders, &c.

Link-motion.

Links.

The link-motion is to be of wrought-iron, and got up bright throughout. It is to be well fitted, and all joints and rubbing surfaces and pins are to be thoroughly case-hardened. The links are to be curved, and are to be suspended from the centre, the weigh-bar shaft being above.

The

The valve-spindles are to have glands and stuffing-boxes at both ends, and are to be connected to the valve-rods by iron socket joints and pins with steel cotters secured by split pins, the joint being suitably guided. The buckles, which are to be in one piece (solid) with the spindles, are to be accurately fitted to the valves. The valve-rods are to be suspended from the cross-stay plate by iron links, pins, &c.

The link-blocks are to be of cast-steel or iron case-hardened, suitably guided at front end.

The eccentric rods and straps are to be of wrought-iron, with solid oil-cups, and brass covers screwed in; and the rods are to be made with T ends, and attached to the straps, each by two $1\frac{1}{8}$ " bolts, secured by double nuts and split pins.

The two halves of the straps are to be bolted together by 1" bolts, with square heads, and to have brass distance-pieces 1" thick between the lugs, secured by double nuts and split pins. They are to be fitted with gun-metal semicircular liners. The bolts to be screwed, 11 threads per inch.

The larger part of the eccentric sheaves is to be of cast-iron, and the smaller part of wrought-iron, unless steel castings be substituted for both. The two parts are to be bolted together by two $1\frac{1}{8}$ " screwed pins with steel split cotters. Each sheaf to be fixed on the axle by a steel key, well fitted halfway into the axle, also by two tight-fitting steel set-screws projecting through into the axle, and secured with lock nuts. Set-screws to be tempered.

All pins and joints in the link-motion are to be a good fit, and thoroughly case-hardened.

The weigh-bar shaft is to be made with solid arms, soundly welded on. The outer, or "reversing arm," is to be forged in one piece with the bar, the weld (if any) being at the mid-length of the arm. It is to be carried in cast-iron brackets, with bearings 4" long.

The reversing-gear to consist of a double-threaded left-hand steel screw $2\frac{5}{8}$ " diameter, with square threads 2" pitch, engaging a wrought-iron (case-hardened) nut 8" long, the whole to be carried in a cast-iron bracket fixed on the right-hand side of the engine.

The screw is to have suitable thrust, &c., bushes, and to be fitted with a circular collar and catch, to secure it in any position.

The link-motion is to be balanced by two cast-iron weights.

The whole of the link-motion and gearing, as well as the connecting-rods, coupling-rods, and all parts of the engine and tender that have to stand a working strain, such as spring links, brake-work, &c., are to be made (except when otherwise specified) of best charcoal iron, or carefully selected best Yorkshire scrap, of the finest quality, clean, well hammered, and free from all defects. Oil-holes must be provided to all joints.

Framing.

The framing to be of the type known as "plate-frame," and manufactured by John Brown & Co., Monkbridge, or Parkgate Iron Cos. The plates to be $1\frac{1}{4}$ " thick, weldless throughout.

They must be broad enough to form axle-forks out of the solid plates, and are to be slotted in pairs.

They are to be fastened together by the front buffer-plate,—by a horizontal $\frac{3}{4}$ " plate extending from front buffer-beam to behind the smoke-box tube-plate (flanged upwards along the sides), forming the bottom of the smoke-box,—by a $\frac{5}{8}$ " vertical cross-stay plate (flanged all round) behind the steam-chests, and by a $\frac{3}{8}$ " horizontal plate (flanged downwards along the sides) beneath the steam-chests,—by a $\frac{3}{4}$ " vertical cross-stay plate which carries the valve-rod guides,—by a $\frac{3}{4}$ " vertical cross-stay plate (flanged) in front of the fire-box, and behind the fire-box by a cast-iron draw and foot-plate.

The axle-forks are to be fitted with cast-steel horn blocks, those of the main driving and leading coupled axles being united in one piece. The front blocks of each axle are to be fitted with case-hardened wrought-iron parallel liners, the blocks to be cast with suitable bosses to receive $\frac{7}{8}$ " bolts with counter-sunk heads, for fastening the liners. The main driving and leading coupled blocks are also to have long bosses for guiding the spring pillars. The forks are to be stayed together by wrought-iron keeps.

The motion bracket, which is to be $1\frac{1}{4}$ " thick, is to be flanged and secured to the outside of the frames by 1" turned bolts, the flange to run from top to bottom edge of frame (platform iron made to suit).

The cross-stay plates are to be $\frac{3}{4}$ " thick, flanged and secured to the frames by $\frac{7}{8}$ " rivets.

The engineman's foot-plate is to be of cast-iron suitably cored out for the drawbar and shackles, and firmly secured to the frames by $1\frac{1}{8}$ " turned bolts. A central buffing wedge-block to be provided.

The draw-gear is to consist of a central wrought-iron bar, $2\frac{1}{2}$ " diameter, and two safety shackles $1\frac{1}{4}$ " x $1\frac{3}{4}$ ", with suitable wrought-iron pins.

A hinged flap-plate, suitably curved, is to cover the space between the engine and the tender.

The buffer-plate is to be of wrought-iron or steel, bolted to the angle-irons riveted at the ends of the frames, and stiffened at either side by corner brackets, to transmit the thrust of the buffers to the frames.

Turton's patent buffers are to be supplied, pattern H $1\frac{1}{2}$ in Turton's catalogue, centred, 5' 9" apart and 3' 4" from rail.

The front buffer-plate is to have a stout wrought-iron draw-hook, fitted with an indiarubber spring and washer-plate on the inside, secured by a nut and split cotter. There are also to be two safety chains (links made of 1" iron) and hooks.

There are to be side platforms continuous from the front buffer-plate to the rear end of the foot-plate, attached to the frames by angle-irons, and by the corner brackets for carrying the brake-hangers; the outer edge of the platforms to be stiffened by a 3" angle-iron.

The upper portions of the wheels are to be covered in by cast-iron splashers, secured to platforms by bolts.

The frames are to be fitted with suitable wrought-iron brackets, to take the equalizing beams and spring links.

Bogie.

The bogie is to have two wheels and a radial arm, the weight from the engine being transmitted through a large cast-iron slide plate.

The entire frame is to be of cast-iron, in one piece, and carefully annealed.

The bogie is to be fitted with the ordinary laminated bearing springs, and to have side check-springs of the same type.

Frames.

Bearing-springs.

Wheels.

All the engine wheels are to be of wrought-iron, forged out of the best selected well hammered scrap, and neatly smithed and hand-dressed.

Coupled wheels. The spokes to be forged with solid T ends (unless special appliances be provided for dabbing on the rim pieces under the steam-hammer). The six coupled wheels to have fifteen spokes each, and to be suitably bossed for the crank-pins and axle-ends.

The whole of the wheels to be manufactured according to the most approved modern method, and as far as possible die forged.

Bogie wheels. The bogie wheels are to have nine spokes each, and to be made and finished after the same manner as the coupled wheels.

Welds. The welds in bosses, spokes, and rims must be thoroughly sound and free from all defects, as any defective welding will necessitate the rejection of the wheel. The wheels are to be turned or planed on the faces of the bosses, and turned on the faces and edges of the rims; they are to be tooled round the axle and crank-bosses, and the spokes are to be chipped and neatly finished by hand. They are to be forced on the axles by hydraulic pressure of $1\frac{1}{2}$ tons per square inch of the area of the hole for the axle, and each wheel is to be secured by a strong steel key, let halfway into the axle (on the same side as the crank-boss in the coupled wheels), carefully fitted all ways, having a taper on the flat of 1 in 96, and driven in with a sledge-hammer, or tup.

Wheels fixed on axles. The crank-pin holes of the coupled wheels are to be bored out taper and countersunk, and the pins are to be pressed in by hydraulic pressure, and riveted up cold. Crank-pins to be of Vickers' mild cast-steel.

Crank-pin holes. The crank-pin holes of the coupled wheels are to be bored out taper and countersunk, and the pins are to be pressed in by hydraulic pressure, and riveted up cold. Crank-pins to be of Vickers' mild cast-steel.

Tires.

Tires. The tires to be of Vickers, Sons, & Co.'s cast-steel ("Australia" brand), $2\frac{3}{4}$ " thick on the tread. They are to clip the wheel-rims on the outer edge, and to be bored out and shrunk on tight, and secured with screwed studs. They are to be stamped with the maker's name and date of manufacture.

Thin flanges. The flanges of the middle pair of driving wheels to be reduced to half the thickness of the others.

Axles.

Axles. The axles throughout to be of Vickers, Sons, & Co.'s cast-steel, and of the following dimensions:— Bogies, $5\frac{1}{4}$ " diameter in the middle, with bearings $5\frac{1}{2}$ " diameter by 10" long; leading and trailing coupled, $6\frac{1}{2}$ " diameter in the middle; driving, $6\frac{3}{4}$ " diameter, the whole of the driving bearings being 7" diameter by $8\frac{1}{2}$ " long. The main driving axle to be turned 7" diameter on the eccentric seats.

All axles to be stamped with the maker's name and date of manufacture.

Axle-boxes.

Driving. The boxes for the coupled axles are to be of wrought-iron (case-hardened), and fitted with semi-circular bearings of hard gun-metal; they are to be planed to fit the axle-box guides, and fitted with syphon-tubes and covers.

Keeps. The brasses are to be finished $\frac{1}{8}$ " shorter than the journals. The axle-box keeps are to be of cast-iron; in the case of the trailing, suitably shaped for the spring-hangers and pins.

Bogie axle-boxes. The bogie axle-boxes to be of cast-iron, planed to fit the axle-box guides, to have hard gun-metal bearings, cast-iron keeps, two syphon holes in each box, and wrought-iron covers.

Springs.

The bearing and side-check springs are to be manufactured by makers of good repute only, and to be of the best spring steel, and stamped by the maker. The ends of the upper plates are to be made with eyes slotted in the middle to receive the links, and bored to receive the pins. The buckles are to be of wrought-iron, shrunk tightly on; those for the bogie springs are to be made with a shank or pillar forged solid with the buckle, to sit on the axle-box. The pins, links, and link-brackets on frames are to be well case-hardened. All spring links to be made with solid eyes and plain pins (no screwed ends to be used). Driving spring pillars to be $1\frac{1}{2}$ " diameter.

Testing. Each spring must be tested before being used, and should sustain a load producing double the working displacement, without permanent set or deflection.

Boiler.

Material. All the plates used in the boiler shell and dome, as well as the angle-irons and rivets, are to be of the best Yorkshire iron, manufactured either by the Lowmoor, Bowling, Farnley, Monkbridge, or Taylor Bros., care being taken in bending the plates to leave the brand of the manufacturer visible outside. The brand of iron to be used to be named in tender.

Plates to be planed. All the plates, butt-strips, and hoops to be planed or turned on their edges.

Barrel. Prevailing thickness of plating in boiler shell (when not otherwise specified) to be $\frac{1}{2}$ ".

The barrel is to be 10' 4" long, and 4' 5" diameter, outside. It is to consist of three plates, with one longitudinal joint each, placed in a line between water-level and base of dome, alternately right and left side of engine, and circumferential butt joints; the longitudinal joints to have lap-plates both inside and out, and to be double riveted, zig-gag, the circumferential joints to have outside lap-plates only, and to be single riveted, the lower portion, for one-third of the circumference, to be protected inside by lap-plates $\frac{1}{4}$ " thick.

Front tube-plate. The front tube-plate, $\frac{1}{2}$ " thick, is to be flanged, to take the smoke-box side-plates. It is to be carried down, flanged, and bolted to the smoke-box floor-plate. It is to be attached to the boiler by an angle-iron $4\frac{1}{2}$ " by $3\frac{1}{2}$ " by $\frac{1}{2}$ " thick, turned inside and on the face and edges, single riveted to the tube-plate, and double riveted to the boiler-barrel. The edge of the front barrel-plate is to butt closely against tube-plate.

Fire-box casing. The front fire-box casing-plate is to be $\frac{1}{16}$ " thick, flanged forward with a radius (outside) of $1\frac{1}{4}$ ", to overlap the barrel-plate outside, and flanged backwards at the sides to form a lap joint inside the side-plates. The

The back casing-plate is to be flanged with a radius (inside) of 3', to form a joint with the side-plates in a similar manner. The sides and top are to be formed of three plates, which are to lap each other and the barrel as well as the front and back casing-plates, and are to be single riveted throughout, except at the horizontal joints, which are to be double riveted, zig-zag. The side-plates are to be lapped round the lower corners of the front and back plates, and riveted thereto, to form a double thickness for the mud-plugs.

A wrought-iron dome, 1' 9" diameter inside, and 2' 11½" high, is to be fixed on the middle plate of the boiler-barrel. It is to consist of a double-flanged seating, 6" high at shallowest part, formed out of specially-rolled L iron or plate, welded up solid, the lower flange curved suitably to the boiler-barrel, the upper flange to be 1½" thick (after being turned and faced). The upper portion of the dome to consist of a hemispherical-ended cylinder, terminating below in a faced flange 1½" thick, made similar to the seating, the whole being welded up solid. The lower joint-face to be recessed ½" deep, to fit a corresponding projection on the upper face. The lower flange of dome-seat to be single riveted to boiler-barrel; the hole in the barrel to be 1' 4" diameter, the edge of the barrel-plate being stiffened by two wrought-iron rings 2¼" x 1" (riveted one inside and one out). Dome.

There is to be a man-hole, 1' 1" diameter, on the crown of the fire-box casing, fitted with a wrought-iron ring (double riveted), forming a seating, to which is to be attached by ¾" studs a wrought-iron cover. Man-hole.

The wrought-iron cover is to be turned on both sides, and at the outer edge underneath is to be recessed to take the upper edge of the brass moulding of the clothing. It is to be bored, and fitted on the upper side to take the columns of two Ramsbottom's 3½" safety valves and other fittings, all of which, except the spring, the lever, and their attachments, are to be of gun-metal. The valves to be set to a working pressure of 140 lbs. per square inch. Safety valves.

The top fire-box casing-plate is to have two double transverse rows of angle-iron, bent to the proper curve and firmly riveted to the plate, to carry the roof stay-slings. Crown plate
L irons.

The smoke-box tube-plate and the back fire-box casing-plate are to be stayed to each other by seventeen longitudinal wrought-iron through-stays (eleven threads per inch), made with forged heads, and screwed with copper washers into the back casing-plate; front end 1¼" diameter and parallel, body part 1½" diameter, back end 1¾" diameter (largest), and tapering 1 in 16. Longitudinal
stays.

They are to be adjusted to the tube-plate by a nut and copper washer on each side. The upper portion of the back casing-plate, where the stays and fire-box fittings are attached, is to be strengthened by a ½" plate inside, suitably riveted. The longitudinal through stays are to be supported at mid-length by a plate ½" thick, and not less than 4" wide, riveted to the barrel, and by slings where required.

The plates (as well as the stays and rivets) of the fire-box are to be made of the best selected copper, manufactured either by the Broughton Copper Co., Pontifex & Wood, Vivian & Sons, Pascoe, Grenfell, & Sons, or Nevill, Druce, & Co. They are to bear the maker's stamp, which is to be placed so that it can be seen after the boiler is finished. Copper fire-box.

The fire-box plates are to be ½" thick, except the portion of the front plate which receives the tubes, and which is to be ¾" thick.

Strips must be cut off the plates, and they, with the bars for the stays and rivets, must stand the test of being bent double when cold, without any sign of cracking. If any cracks appear in any of the strips or bars, they must be annealed; and if, after being annealed, the same do not stand the test of bending cold, the plates or bars from which such test pieces have been cut must be rejected. Testing,

All copper stays to be thoroughly annealed before being screwed.

The tube and back-plates are to be flanged to a radius of 1" inside at the top and round the tube space, otherwise 1½", to make lap-joints with the roof and side-plates. Tube and back
plates.

The sides and roof are to be in one plate, the top corners bent to a 5" radius. Sides and roof.

Special care and attention should be directed to all corners of the copper box, as any signs of cracking or injury will necessitate rejection. Care in flanging.

The prevailing water-space between the outer and inner plates at the bottom is to be 2⅝" all round. Water-space.

The joint at bottom of fire-box and casing is to consist of a solid wrought-iron forged ring 2⅝" deep at the shallowest part, with ¾" iron rivets. The plates, both inside and out, reach to within ⅝" of the bottom of the ring, and the centre-line of the rivets is to be 1⅝" above the bottom of the same. Bottom ring.

The ring is to be brought down at the corners to take a double row of rivets, and at the sides to carry the ash-pan.

The fire-hole is to be oval, 11½" x 14½", the joint being formed by a solid wrought-iron ring 2⅝" wide (planed on both sides), with ¾" rivets countersunk on the outside, and finished flush. Fire-door ring.

The roof of the fire-box is to be strengthened by wrought-iron girders, 2½" thick by not less than 7" deep at the middle, carefully bedded at the ends, to the front and back edges of the box. Roof stays.

The space between the top of the box and the girders is to be not less than 1½". The top of the box is to be attached to the girders by 1" set-screws (standard Whitworth thread), tapped into the girders from below. The screws must be a tight fit in the holes in the roof-plate, the throats being left full and screwed well home, the corners of the head next the plate being chamfered off. Wrought-iron ferules to be used as distance-pieces, covering as little area as possible. Space between
roof-stays and
box.
Roof bolts.

Twelve safety links, with oblong holes (to permit the free expansion of the fire-box crown, when heated) are to be suspended between the six intermediate girders and the transverse angle-irons on the roof of the casing, the girders being forged with suitable lugs for this purpose. Safety links.

The roof-plate is to be fitted with a fusible lead plug, 1¼" diameter at the point (tapered 1 in 6), and screwed 10 threads per inch, and bored and tapped ⅞". The box is to be stayed to the shell by copper stays ¾" diameter, screwed 10 threads per inch, centred not more than 4⅝" apart C. to C., screwed tightly into both plates, riveted over at both ends, and with a sufficiently large head inside. The thread is to be turned off in the water-space. The first rows on the sides are to be centred 8⅞" from the outside of the front and back casing-plates, and at the front and back 7⅝" from the outside of the side casing-plates. The tube-plate is stayed to the barrel-plate below the tubes by eight 1" copper stays, screwed 10 threads per inch, tapped into the copper plate and into wrought-iron sockets, riveted to the barrel, and riveted over on the outside. Lead plug.
Copper stays.
Lower barrel
stays.

All rivets used in the boiler-shell are to be ¾" diameter, centred 1¼" apart, except those attaching the angle-iron to the front tube-plate, which are to be ⅝" diameter, and those in the fire-door and foundation and man-hole rings, which are to be ⅞" diameter, centred 1⅝" apart. Those in the copper-box (excepting Rivets.

- (excepting the foundation ring) are to be of copper, and $\frac{3}{4}$ " diameter. All the rivets must completely fill the holes, and the riveting is to be done by steam or hydraulic power, wherever it is possible to do so, for which special appliances must be provided. Rivet-holes, if necessary, to be adjusted by ryming; no drifting to be allowed.
- Steam riveting.**
- At each bottom corner of the fire-box casing there is to be a gun-metal wash-out plug $1\frac{1}{4}$ " diameter (at small end), fitting into a gun-metal bush 2" diameter screwed into the casing-plate. There is also to be an oval mud-hole with suitable cover, &c, at lowest part of throat-plate; also, two $1\frac{1}{4}$ " plugs in the front tube-plate, on a level with the lowest row of tubes. There are also to be two $1\frac{1}{4}$ " plugs at the back of the fire-box casing, above the level of the top of the copper-box (for filling). All the foregoing are to be screwed 10 threads per inch, and tapered 1 in 16.
- Wash-out plugs.**
- A brass blow-off cock, fitted with a pipe leading to ash-pit, is to be fixed by a flange and studs to the fire-box casing on left side, and worked by a handle placed conveniently above the side platform.
- Blow-off cock.**
- The fire-bars are to be of wrought-iron, carried on two round wrought-iron bars shaped at the ends to fit into suitable brackets bolted to the prolonged portion of the fire-box foundation ring. These carrier bars are to be drilled and fitted with pegs (not tapered) of $\frac{7}{8}$ " round iron, centred 2" apart to regulate the spacing of the fire-bars.
- Fire-bars.**
- The ash-pan is to be of wrought-iron, the full length and width of the fire-box, and is to have a tight-fitting damper door at both front and back, with a hinge-bar running the full length of the door, and worked from the foot-plate by suitable levers and rods, having convenient notches and lips; they must also have springs to prevent rattling and flying out of gear. The bottom is to be stiffened by cross angle-irons, inside, at front and back ends.
- Ash pan.**
- The fire-door is to consist of two sliding wrought-iron plates, and is to be provided with a wrought-iron deflector and fender mouth-piece.
- Fire-door.**
- The fire-box to be fitted at front end, with a fire-brick arch, supported by angle-irons attached to the side-plates by studs.
- Brick arch.**
- A swan-necked cast-iron pipe 4" diameter is to be fixed in the steam-dome. The lower portion is to be attached by an angle-iron bracket to the dome-base. It is to be surmounted by a gridiron regulator valve of gun-metal, working on a cast-iron seat having suitable ports, placed as high in the dome as possible, and worked by levers and rods from the foot-plate.
- Regulator.**
- The stuffing-box is to be of gun-metal, with suitable stops to limit the travel of the handle, and stamped "Shut" and "Open" on the right and left-hand respectively.
- Stuffing-box.**
- A copper pipe 4" diameter inside, and No. 9 W.G. thick, is to connect the regulator with the T pipe in the smoke-box. It is to be fitted to the regulator pipe by a gun-metal cone, brazed on, and secured by a circular wrought-iron clip, cast-iron split bush, and two bolts, the hole in the clip being large enough to slip over the cone; it is to terminate at the front end in a gun-metal flange (brazed on), and to be bolted to the tube-plate by seven $\frac{3}{4}$ " studs.
- Steam-pipe.**
- There is to be a cast-iron T pipe in the smoke-box fixed by the studs which secure the flanges of the steam-pipe. Copper pipes 4" diameter inside, and No. 7 W.G. thick, with gun-metal flanges brazen on, are to connect the T pipe with the cylinders.
- T pipe in smoke-box.**
- They are to be bent round the sides of the box to clear the line of tubes. The copper pipes are to project 1" through the bottom flanges into the valve-chests. Circular recesses are to be cut in the valve-chest castings for corresponding projections on the flanges of the steam-pipes to fit into.
- A No. 2 Roscoe's lubricator to be attached to each side of smoke-box, with copper pipe leading into centre of cylinders.

Flue-tubes.

- The tubes are to be of brass, solid drawn, and of the best quality, manufactured either by the Broughton Copper Company, Elliott's Metal Company, Allan, Everett, & Sons, J. Wilkes & Company, or other good makers, subject to the approval of the Inspecting Engineer.
- Material and make.**
- They are to be 189 in number, and 2" outside diameter, swelled to $2\frac{1}{16}$ " diameter in front tube-plate, and are to bear the maker's stamp. Thickness, No. 10 W.G. at the fire-box, and No. 12 W.G. at the smoke-box end.
- Number and diameter.**
- Care must be taken to make the tubes perfectly steam-tight at both ends, by rolling them with Dudgeon's expanders.
- Steel ferules.**
- Tapering steel ferules are to be inserted at both ends. The tubes are to project $\frac{1}{2}$ " beyond the fire-box tube-plate, and $\frac{3}{8}$ " beyond the smoke-box tube-plate when fixed, and they are not to be rolled over or beaded at the ends.

Smoke-box.

- The smoke-box to be of the "extended" type; plates, L irons, rivets, and forgings to be of the best Staffordshire iron.
- The sides of the smoke-box are to be attached to the tube-plate by $\frac{5}{8}$ " rivets, and to be carried down and bolted to the frames. The front plate is to be connected to the side plates by an angle-iron (riveted), and to be stiffened round the doorway by a 3" L iron (riveted).
- Door.**
- The door is to be circular and dished, flanged $1\frac{1}{2}$ " all round the edge, and carried by two wrought-iron hinges. It is to be fitted with a $\frac{1}{4}$ " protecting liner, attached by rivets and ferules, with an air-space of $\frac{3}{4}$ " at the edges. It is to be kept closed by a central handle with a minor locking handle and screw, with a removable horizontal cross-bar.
- The smoke-box must be made perfectly air-tight, by bringing down the plates square into the corners.
- The exhaust-pipe is to be of cast-iron, with branches leading from each cylinder and uniting at the centre; the diameter at the top is to be $4\frac{3}{4}$ " inside. All the joints to be planed and scraped metal to metal.
- Spark-arrester.**
- Spark-arresters to be fitted of the best design known for the prevention of burning matter being emitted.
- Chimney.**
- The chimney is to be of wrought-iron, the base being formed of a plate welded up without seam, and shaped on a block to suit the curve of the smoke-box. The barrel is to be made of one plate, with a butt joint and inner lap-plate. It is to be fitted into and riveted to the base. It is to be surmounted by a polished copper top. All the rivets in the chimney are to be countersunk outside, and finished flush. The extreme height from rail to chimney top is to be 13' 6".
- A

A blower-cock is to be fixed on the boiler behind the chimney, worked from the foot-plate by a Blower spindle passing through the right-hand rail. A copper pipe is to lead the steam to the top of blast-pipe. Hand-rail. A No. 2 Roscoe's patent lubricator is to be fixed on each side of the smoke-box, with a copper pipe leading into the centre of each cylinder.

A hand-rail is to be fixed to the front of the smoke-box, continuous with the side-rails.

Injectors.

Two No. 9 Giffard's injectors (Gresham and Craven's make) are to be provided. They are to be Injectors. carried by wrought-iron brackets bolted to under-side of cast-iron foot-plate, and fitted with waste-water cock and copper pipe to carry the waste water below the edge of the platform.

The injectors, clack-boxes, and cocks are to be of gun-metal, and the steam, suction, delivery, and Injector-pipes. overflow pipes of copper, with gun-metal flanges. The steam pipe is to be $1\frac{3}{8}$ " diameter inside, No. 11 B.W.G.; the delivery pipes $1\frac{5}{8}$ " diameter, and No. 10 B.W.G.; and the suction pipes $1\frac{5}{8}$ " diameter, No. 12 B.W.G. The injector feed-pipes to be carried by wrought-iron hangers attached to the under-side of the foot-plate.

Fire-box Fixings.

The fire-box fixings are to consist, in addition to those already mentioned, of the following:—

One Bourdon's patent metallic pressure gauge, indicating up to 200 lbs. per square inch, with cock Gauges, &c. and copper pipe. Two glass gauges (one right and one left side), with top and bottom cocks, and waste-water cocks and copper pipes, fixed to back casing-plate with stout gun-metal flanges and studs; one whistle, connected with a branch from the body of the hind safety-valve, and placed at such a height as to enable the steam to pass above the cab roof. There is also to be an iron socket screwed into the back casing-plate, to carry the gauge-glass lamp, and a wrought-iron tray (with angle-iron rim) fixed with studs above the fire-door. All the cocks and fittings are to be made of gun-metal, unless specially named to the contrary, and all fittings screwed into the boiler are to have 11 threads to the inch, unless otherwise specified.

Clothing.

The boiler is to be covered with dry pine battens, 1 inch thick, tongued and grooved. At each Boiler-clothing. joint of the lagging-plates a wrought-iron hoop, 2" wide by $\frac{3}{8}$ " thick, is to be put on (in two halves) screwed together with countersunk screws to metal joint-blocks let in through the battens and bearing on the boiler; also distance-pieces, about 20 inches apart, bearing on the boiler, to adjust the hoops to the proper distance. All are to be finished flush with the outer surface of the wood lagging, and covered with sheet-iron, No. 16 W.G., and bound together round the barrel and over the fire-box casing with hoop-iron.

The dome is to be enclosed in a helmet-shaped casing of charcoal sheet-iron. Polished brass Dome casing. mouldings are to be fitted round the back corners of the fire-box casing, the smoke-box angle-iron, and under the safety-valve seating.

The front corners of the fire-box casing are to be fitted with mouldings of charcoal sheet-iron.

The House.

The house is to consist of a front weather screen of $\frac{3}{16}$ " sheet-iron, carried by an angle-iron, secured Cab to four suitable wrought-iron brackets riveted to the top of the fire-box casing, and of a curved $\frac{1}{8}$ " sheet-iron roof-plate, stiffened at front and back ends by a light $2\frac{1}{2}$ " angle-iron, and fitted with longitudinal $2\frac{1}{2}$ " light angle-irons to take the wrought-iron supporting pillars. The roof-plate is to extend backwards the full length of the foot-plate, and in front of weather-screen $12\frac{1}{2}$ ", and is to be attached to the latter by a light 2" L iron. The outer edges of the roof-plate, along the sides, are to have light 1" L irons from end to end, to act as gutters.

The weather-screen is to be 5' $9\frac{1}{2}$ " wide in body part widened out at top to meet side L irons. It Weather-screen. is to be fitted with two swivelling circular windows, fixed in brass frames, &c. The pillars are to be connected 3' above the foot-plate by a polished wrought-iron hand-rail, and the space is to be filled up by a $\frac{3}{8}$ " wrought-iron panel-plate fastened to the platform by light 2" L iron. The gaps at front end between panel-plates and fire-box casing are also to be filled up by $\frac{3}{8}$ " wrought-iron plates.

Brakes.

An efficient hand-brake is to be fitted to the engine, as well as the tender, consisting of an $1\frac{3}{8}$ " screw spindle with a square thread, having a $\frac{3}{8}$ " pitch with a 12" double-ended hand-lever at top, and an 11" lever on brake-shaft at lower end with a suitable screw-nut. The handle for working it is to be placed on the left-hand side of the foot-plate, and is to be carried on a hollow cast-iron pillar bolted to the foot-plate by four $\frac{3}{4}$ " bolts. There is to be a wrought-iron hanger, with cast-iron block, fitted to each of Hangers. the six driving wheels, and a wrought-iron brake-shaft $3\frac{1}{4}$ " diameter carried by cast-iron brackets bolted Brake-shaft. to the frames, and having the arms forged on solid, the screw-arm being forked and bored to take the screw-nut.

The right-hand end of the shaft is to be made with an arm suitable to couple up with a steam-brake cylinder, which is to be bolted to the frame-plate and controlled by a steam cock on back casing-plate, fitted with all necessary pipes, &c.

Efficient gear to be provided for supplying a jet of water from the tender to the tire of each Water-jet to wheel of engine and tender, immediately above each brake-block (for cooling), the whole to be controlled tires. by suitable handles, &c., from tender foot-plate.

Hand-rails.

There are to be polished hollow wrought-iron hand-rails along the sides of boiler, supported by three cast-iron carriers on either side, each bolted to a short piece of L iron riveted to the barrel of the boiler. The hand-rail to be continuous round front of smoke-box, and suitably attached to the same.

Sand-boxes.

Large cast-iron sand-boxes, capable of carrying 7 cubic feet of sand each, are to be fixed to the platforms forward of the front coupled wheels, and worked, both sides simultaneously, by suitable levers and rods from the foot-plate.

The

Sand-pipes.

The sand-pipes to be of wrought-iron, $1\frac{3}{4}$ " diameter inside, attached by suitable flanges and studs to the boxes, and bent in such a way as to convey the sand as near as possible to the tread of the wheel.

Lamp-brackets.

A head-lamp bracket to be fixed on each side of the front buffer-beam, in line with buffers.

Painting.

After being tested, the boiler is to receive two coats of metallic oxide paint, and when dry the clothing is to be put on. When finished, the engine is to receive not less than two coats of lead-colour in oil. The whole of the surfaces requiring it are then to be filled up with hard stopping, and after being well rubbed down smooth are to receive a third coat of red colour in oil, and to be finished with two coats of selected colour in oil and two coats of varnish.

Tool-box and Tools.

Each engine is to be provided with a portable wooden tool-box 3' 3" by 2' 0" by 1' 9" (to be carried on the top of the tender), made of oak or tallow-wood, bound with iron at the corners, and the lid covered with galvanized sheet-iron; to have strong hinges, hasp, and padlock, and till inside at one end; also two monkey-wrenches (one large and one small); one heavy hammer; one light hammer; one copper hammer; two flat chisels; two cross-cut chisels; two pin punches; one complete set of screw-keys to fit all nuts; two short keys for piston glands; two short keys for valve-spindles; light close-ended keys for all syphon covers; one fire-bucket; one fire-shovel; one fire-dart; one fire-pricker; one rake; one pinch-bar (large); one tube-plug socket-rod and six tube-plugs; two 15-ton traversing screw-jacks, with ratchet, ratchet-head, and jackbars; two oil-cans (one large and one small); two oil-feeders (one large and one small), copper tallow-kettle, hand-brush, and gauge-lamp.

Pitch of Screws.

The threads of all bolts, studs, and nuts are to be cut to Whitworth's standard, unless where specially stated to the contrary. Where fine threads are specified, eleven threads per inch are to be used, except in the case of piston-rods, the threads of which are to be six per inch. All bolt-heads and nuts are to be hexagonal, and measured across the corners are to equal twice the diameter of the bolt (except in the larger sizes of bolts, in which case the next size less for heads and nuts may be taken if more suitable). The size across the flats will not therefore be Whitworth's standard.

Lubrication.

Special care is to be taken in designing oil-cups, &c. (especially for reciprocating parts of the gear), to prevent the oil being thrown out and wasted when the engine is in motion.

Wire-gauge.

The Birmingham wire-gauge is to be used.

Case-hardening.

All the motion-work, brake-work, the nuts of the cylinders and glands, and all journals, pins, joints, and rubbing surfaces about the engine and tender (except where of brass, cast-iron, or steel) shall be thoroughly case-hardened to a depth of $\frac{1}{16}$ ", and so hard as to wholly resist filing.

Specimens of case-hardening, which have been hardened in the same boxes with the work, will be broken in the presence of the Inspecting Engineer or his deputy.

TENDER.

(Contents, 2,500 gallons.)

General Arrangement.

The following are the leading particulars of the design and construction of the tender (based on the assumption of a rigid or fixed wheel-base not exceeding 11', and plate frames); and it is to be clearly understood that, in the event of bogie being adopted in lieu of rigid wheel-base, the details and dimensions as here set forth are, of course, subject to modification, but must still be adhered to as far as practicable, a certain amount of latitude being allowed to meet the conditions of enlarged tank, &c.

The tender to be of the ordinary horseshoe type, with the addition of a well underneath the tank 10' long, 4' 1" broad, and 1' 6" deep inside, and extending over the front and middle axles. The fuel space (shaped in the tank) to be 7' 9" long (from the front end), and 2' 6" wide; the whole to be carried on six wheels 3' 7" diameter at the tread; wheels 5' 6" apart C. to C.; total wheel-base, 11'.

Wheels.

Bodies to be of wrought iron, 3' $1\frac{1}{2}$ " diameter, and to have ten spokes each. They are to be made of the same material, put together and finished in the same way as the engine-wheels.

Tires.

To be of the same material, brand, section, and method of fastening as specified for the engine tires, with flanges on all the wheels.

Axles.

To be of the same material and brand as specified for the axles of the engine; to be $5\frac{1}{2}$ " diameter in the middle, parallel for a distance of 2' 6", to run into $6\frac{1}{2}$ " diameter at the collars, which are to be $\frac{1}{2}$ " broad; the wheel seats to be 6" diameter; the journals to be $4\frac{1}{2}$ " diameter by 8" long, and parallel; the radius of the corners being $\frac{3}{4}$ ". The distance from C. to C. of bearings to be 6' 2".

Axle-boxes.

Axle-boxes.

To be of fine-grained hard cast-iron. The castings to be clean and free from flaws of every description. To be planed to fit the axle-box guides, but to be left $\frac{1}{8}$ " wider between the flanges, to allow of lateral motion. The bearings to be of hard gun-metal, octagonal on crown, and perfectly bedded into the axle-boxes. Two syphon-tubes to each box; the tubes to be continued through the cast-iron into the brass bearings for a $\frac{1}{4}$ ". The keeps to be of cast-iron and planed to fit the axle-boxes (so that they can be put up and taken down by hand without hammering), and secured by two $\frac{5}{8}$ " round wrought-iron pins. The covers to be of cast-iron, recessed in the top to take the ends of spring pillars. The lid to be of cast-iron, secured by a wrought-iron pin.

Bearings

Keeps.

Covers.

Axle-box Guides.

To be of fine close-grained cast-iron, free from flaws of every description. To be planed on the face, edges, and flange, and to be fastened to the frames by four tight-fitting $\frac{7}{8}$ " turned bolts in each, the bolts to be countersunk into frames, the nuts to be secured by split pins.

Axle-fork Keeps.

To be of wrought-iron, a good fit on the forks, and secured by a $\frac{7}{8}$ " bolt at each end.

Springs.

To be of the same material as specified for the engine-springs. The spring pillars to have two wrought-iron guides each, fastened to the inside of frames. The wrought-iron spring-link carriers also to be attached to the inside of the frames.

Framing.

The frames are to be of the same material as specified for the engine frames, and are to be $\frac{7}{8}$ " thick, running from buffer-plate to buffer-plate, and formed each of one solid plate. The minimum depth to be 12", and above the axle-boxes 1' 2 $\frac{1}{2}$ ", deepened at the front end to take the brake-shaft and footsteps. The main frames to be braced together at the front end by a $\frac{5}{8}$ " wrought-iron vertical plate (serving as a buffer-plate, *q.v.*) 1' 2" deep, and a $\frac{1}{2}$ " vertical plate 1' 2 $\frac{1}{2}$ " deep, united by two horizontal $\frac{1}{2}$ " plates 1' 9" wide; also at back end by a $\frac{1}{2}$ " vertical plate (serving as a buffer-plate) 1' deep, united to a $\frac{1}{2}$ " horizontal plate 1' 6" wide, and finally by two intermediate $\frac{1}{2}$ " vertical plates, each 1' deep, the whole riveted together with suitable L irons, &c.

Well.

There are to be two $\frac{1}{2}$ " wrought-iron longitudinal stretchers, each in one continuous plate, running from the front intermediate cross-stay to the hind buffer-plate, and spaced 4' 1" apart. The longitudinal stretchers to form the well sides, the front plate of well to be $\frac{3}{8}$ " thick, and spaced 10" from the back of the front cross-stay; the back of the well being formed by the back intermediate cross-stay, suitably deepened.

The middle cross-stay divides the well, consequently care must be taken to cut holes in it to allow the water to circulate, also a hole large enough to admit of a man passing through. The intermediate cross-stays will be secured to the longitudinal stretchers and throughout the well by angle-irons.

Foot-plates, Draw-plates, &c.

The foot-plate to be $\frac{3}{8}$ " thick, the extreme width over platform being 7' 6". The front horizontal draw-plate to be $\frac{1}{2}$ " thick, and spaced 6 $\frac{1}{2}$ " below the foot-plate, and fastened to buffer-plate, frames, and front cross-stay plate by 2 $\frac{1}{2}$ " angle-iron and $\frac{3}{4}$ " rivets. The horizontal stiffening-plate to be $\frac{1}{2}$ " thick and 4' below the drawbar horizontal plate, and to be flanged down at the front, and fastened to the buffer-plate, and secured to the frames and vertical cross-stay plate by 2 $\frac{1}{2}$ " angle-iron and $\frac{3}{4}$ " rivets.

On the underside of the stiffening-plate will be fixed two wrought-iron feed-pipe carriers, to be securely fastened and braced together. The distance from C. to C. of feed-pipes to be 2' 11". The drawbar pin is centred 1' 3 $\frac{1}{2}$ " back from the buffer-plate. The draw shackle-pin holes to be 5 $\frac{3}{4}$ " from the back of the buffer-plate and 1' 10" apart C. to C.; strengthening plates to be riveted on round the holes in the plates. A wrought-iron (case-hardened) rubbing block to be securely fixed to front buffer-plate, to bear against the wedge block on Engine, and securely riveted to plate, with laterally extended landings; no rivets to pierce the middle of block.

Feed-pipe carriers.

Intermediate rubbing block.

Two wrought-iron water-tight sand-boxes are to be placed on the foot-plate at the front end of the tank, one on each side, each capable of holding 2 cubic feet of sand, and fitted with cast-iron water-tight lids, also with suitable valve and gear for working same, the filling hole to be 4 $\frac{1}{2}$ " diameter.

Sand-boxes.

The sand-pipes to be of wrought-iron, the same size as for the Engine, and bent so as to convey the sand as near the tread of the front wheels as possible. There is to be a polished wrought-iron hand-rail on each side, at front end, supported by two wrought-iron pillars, and secured to the tank. The left-hand one to have a boss forged on to take the brake-spindle. Two substantial wrought-iron double-shackle screw couplings are to be provided with each Tender; screw, 2" diameter; shackle and link-iron, 1 $\frac{1}{2}$ " diameter.

Hand-rails.

Screw couplings.

Brake.

The general design and arrangement to be similar to that specified for the engine brake; the handle to be on the left-hand side of the tender. The shaft to be 3 $\frac{1}{4}$ " diameter, with all the levers forged on solid; the whole to work in cast-iron bushes in the frames. There is to be a wrought-iron hanger and cast-iron brake-block (clipping the flanges) to each wheel. The hangers to be suspended by means of stout wrought-iron pins passing through the frames and liners riveted to the longitudinal stretchers. The hangers for the trailing-wheels to be prolonged to form life-guards.

Back Buffer-plate.

This to consist of a wrought-iron plate $\frac{1}{2}$ " thick, 12" deep, and 7' long, secured to frames and longitudinal stretchers by 2 $\frac{1}{2}$ " angle-iron ($\frac{3}{4}$ " rivets). The horizontal draw-plate to be 8 $\frac{1}{4}$ " below the bottom of the tank, to be $\frac{1}{2}$ " thick and 1' 6" broad, fastened to frames and buffer-plate by 2 $\frac{1}{2}$ " angle-iron ($\frac{3}{4}$ " rivets).

The

The vertical (draw-spring) plate to be 2' 6" long, 12" deep, and $\frac{1}{2}$ " thick, secured to the horizontal plate and bottom of tank by 2 $\frac{1}{2}$ " angle-iron ($\frac{3}{4}$ " rivets); $\frac{3}{4}$ " strengthening-plates to be riveted on to the back of the buffer-plate and front of the vertical plate. Two buffers, of same type as those specified for the engine, to be fastened to buffer-plate by four 1" bolts in each. Height from top of rail to centre, 3' 4"; distance apart from centre to centre, 5' 9". A stout wrought-iron draw-hook to be provided, having a shank passing through the buffer-plate and vertical draw-plate, and fitted with a powerful volute spring, secured by a washer and split-cotter. A case-hardened wrought-iron socket is to be securely attached to the hind buffer-plate, to give sufficient surface for the shank of the hook to work in. Two safety-chains (links, 1" iron) terminating in stout hooks to be securely attached to the buffer-plate, at a distance of 1' 6" apart.

Tool-box.

A plate-iron tool-box is to be built at the back of the tank, and of the full width of the same, with a hinged lid, hinges, and staple, catch, and lock complete.

Tank.

Plating, &c.

The thickness of the top and side plates to be $\frac{1}{4}$ ", and the bottom to be $\frac{3}{8}$ ". The top, bottom, and sides to be well stayed to each other by L irons, &c. A curved wrought-iron moulding to extend along the upper edge (outside) of sides and back of tank.

Man-hole.

A wrought-iron man-hole ring made of $\frac{1}{8}$ " plate, 18" diameter, 8 $\frac{3}{4}$ " high, flanged at the bottom, is to be riveted on to the top of tank, centred 1' 6" from back of same. It is to be fitted with a wrought-iron cover and handle. The hole to be cut in the tank top is to be 1' 4 $\frac{1}{4}$ " diameter, round which will be supported a wrought-iron sieve, made out of $\frac{1}{8}$ " plate, to be 1' 4" diameter at the top, 1' 3 $\frac{1}{2}$ " diameter at the bottom, and 4' 0 $\frac{1}{2}$ " long.

Feed-valves.

The tank to be supplied at the back end with a wrought-iron lifting-shackle in each corner, with strengthening corner-plates. At the front end, over the front axle, on the inside of the coal bunker, two bent plates will be riveted for the same purpose. A lamp-bracket to be fixed respectively on the left and right-hand side at the back end of tank. The feed-valves to be circular, and of gun-metal, with central guide pin, and situated one on each side of the tank, protected by proper strainers, and worked from the top by levers, &c., on circular castings with inclined planes. The vertical rods to be weighted. A brass cock $\frac{3}{4}$ " bore to be fitted to the outside of the tank at the front end and near the bottom (for drawing

Man-hole in well.

water into a bucket). The well to have a man-hole 15" diameter cut in the bottom plate, at a distance of 2' 4" from the back plate of well, to have a thickening piece 2" broad and $\frac{3}{8}$ " thick riveted round the hole on the inside by $\frac{5}{8}$ " rivets, countersunk flush on the bottom. The cover to be $\frac{3}{8}$ " thick, 1' 7" diameter, fastened on by $\frac{5}{8}$ " studs; pitch, 3 $\frac{1}{2}$ ".

Feed-pipes.

The feed-pipes to be of copper, 1 $\frac{3}{4}$ " bore, and No. 12 W.G. thick, and the feed connection between the engine and tender to consist of strong indiarubber hose-pipe, 2 $\frac{3}{8}$ " bore, stiffened with spiral spring inside (tested to 200 lb pressure per square inch), and fitted with brass union joints at the engine end.

Painting.

The inside of the tank and well to be thoroughly served with three coats of best metallic oxide paint, and the other parts outside to be filled up, rubbed down, and painted in the same manner as the engines.

W. SCOTT,

Locomotive Engineer.

February, 1886.

GENERAL CONDITIONS, IF ENGINES ARE BUILT BY ENGLISH OR FOREIGN MANUFACTURERS.

Everything necessary to be provided.

Everything necessary to the proper finish and equipment of the engine and tender must be supplied, whether stated in this specification or not, and no advantage is to be taken of any omission of detail in the specification or any plans which may be supplied for guidance, as the contractor may, by applying to the Inspecting Engineer, obtain full explanation of any part of the work not sufficiently specified or otherwise particularized.

Alterations.

The Commissioner reserves to himself the right to supply, after tenders have been lodged and accepted, a set of *Working Plans*, for the contractor's guidance; and in such event, said plans will have to be rigidly adhered to, both as regards general design and detail.

Suggestions from contractor.

Any alteration or modification of detail which shall be ordered by the Inspecting Engineer, during the progress of the work, as being in his opinion necessary for the proper execution of the contract in accordance with the spirit of this specification, shall be executed by the contractor without extra charge.

Materials used. Workmanship. Inspection.

Any suggestion that the contractor may desire to make, with the object of improving or economising, in his opinion, the working of the engine, or of modifying the mode of manufacture, or the material specified to be used, or the details or dimensions, are in every case to have the previous written consent of the Inspecting Engineer before being carried out.

All the materials used are to be of the very best description of their respective kinds, and the work is to be executed in the most approved, substantial, and workmanlike manner, according to the direction and to the satisfaction of the Inspecting Engineer, who is to have power to inspect the manufacture, either personally or by deputy, in all its branches and details, in such manner as he may think fit, and to reject at any stage any work or material of which he may disapprove, as not being in accordance with the spirit and intention of the specification; and his decision on any point of dispute or doubt which may arise in reference to the contract shall be final and binding on the contractor.

Sub-letting.

The contractor shall not assign or sublet the contract, or allow any portion of the work to be done other than in his own establishment (except where implied and provided for by the clauses of this specification), unless with the previous written consent of the Inspecting Engineer.

One set of templates and patterns to be used.

The work is to be finished to one set of templates and patterns, so that the engines and tenders may be exact duplicates of each other, and that all moving parts, including the wheels and axles, must be interchangeable. The

The maker's (progressive) number to be stamped upon all parts of each engine and tender, for identification; also maker's name, date and place of manufacture, to be exhibited upon a brass plate fixed to each engine. Numbering of parts.

All brackets having been riveted on, the whole of the studs and mud-plugs screwed in, and all mountings fitted on (previous to being put in the frames) each boiler shall be tested (without the clothing) in the presence of the Inspecting Engineer or his deputy, first with water to a pressure of 200 lb. per square inch, and afterwards in steam at the intended working pressure. Testing.

When complete and finished in every respect, the engines and tenders shall, after having been satisfactorily tested (in steam) in the maker's yard, be delivered in accordance with the terms of the "Form of Tender." Finishing.

For the purpose of transit, all bright work to be thoroughly protected against rust by a coating of white lead and tallow, and all parts (other than those in packing cases) to be substantially protected from damage by wood battens or other suitable means. The bearings of the wheels and axles are also to be coated with white lead and tallow, and are then to be lapped with flannel which has been soaked in the lead and tallow, and afterwards tightly and closely lapped with spun-yarn which has been first soaked in the mixture. The outer surface of the spun-yarn is then to be well coated with boiling pitch and tar, and protected overall by battens and wood secured by hoop-iron. All studs or joints on the boiler or framing must be protected by wood, and all holes must be plugged (to prevent pinch-bars being inserted when loading or unloading). The cylinders are not to be removed from the framing or transit. Stout cross-stretchers of wood are to be inserted between the axle-forks at the front and hind ends of the engine to prevent any straining of the frames. Protection of bright work.
Protection of bearings.
Studs, &c., to be protected.
Cylinders not to be removed.
Cross stretchers.

The movable pieces must be packed in strong cases made of deals 1½" thick, strengthened by battens placed about 2' 6" apart, and the ends and sides bound down with stout hoop-iron, well nailed. All loose pieces in each case must be packed with distance-pieces of wood to prevent any of them moving, and the contractor will be held responsible for any damage arising (during transit) from neglect of this. Packing cases.

The cases containing the bright work are to be lined with stout sheet-tin or zinc, and soldered perfectly water-tight, the lids of these cases being fastened down with screws. Tin linings.

Each case and each unpacked portion of every engine and tender must be marked and numbered, as may be directed, to facilitate the shipment of the parts in the required order. Marking.

The price named in the "Form of Tender" must include the cost of all templates, royalties, plans, and other charges for the use of patents (if any) involved, and of the delivery of the engines in steam, as per terms of "Form of Tender," to the satisfaction of the Inspecting Engineer, or Commissioner for Railways, as the case may be. Price named to include all costs.

The contractor must deliver complete, as per specification, the various engines and tenders by not later than the dates respectively named in his "Form of Tender;" and should he fail to do so, a sum at the rate of £20 per week per engine will be deducted, by way of liquidated damages, from the price named in the "Form of Tender." Delivery within contract time.

The contractor will be required to execute a formal deed of contract with the Agent-General of the New South Wales Government in London, or the Commissioner for Railways, Sydney, New South Wales, embodying this specification, the terms of the "Form of Tender," and all other conditions necessary to ensure the due completion of the contract as stated in the "Form of Tender." Bond to be executed.

Detailed packing lists must be furnished in duplicate written copies, giving the outside measurement of each package, as well as the weight thereof, as nearly as possible. Packing lists.

Payment will be made for each engine as follows:—90 per cent. in cash in London, on receipt by the Agent-General for New South Wales of the bills of lading, together with a certificate from the Inspecting Engineer, that the terms of this specification, as to the completion and packing, &c., &c., of the engines, have been fulfilled. Payment.

And it is hereby expressly declared that the giving of a certificate by the Inspecting Engineer in London, that the work done by the contractor has been satisfactorily executed and completed up to the period of delivery, shall be a condition precedent to the contractor's having any right of action or lawful claim to the payment of the 90 per cent. to be made under this specification.

The balance of 10 per cent. will be paid by the Agent-General, on receipt by him of a certificate, that each engine has run 2,000 miles on the Government Railways of New South Wales to the satisfaction of the Locomotive Engineer of the Government; and if any engine or engines should fail to run the specified 2,000 miles to the satisfaction of the Locomotive Engineer, the contractor will be called upon to make good the defects. If he fail to do so within reasonable time, the Commissioner for Railways shall spend any such sum (not exceeding in the total the 10 per cent. on the contract price of the engine or engines that shall have arrived in the Colony) as may be considered necessary, in the opinion of the Locomotive Engineer, to make the engine or engines conform to this specification, such sum to be deducted by way of liquidated damages from the forementioned balance of 10 per cent. Balance payment.
Mileage to run.
Contractor to make good defects.

A complete set of working plans or drawings (on vellum) to be supplied by the contractor to the Agent-General or Commissioner for Railways, as soon as the whole of the working plans or drawings shall have been completed.

Each tenderer to submit (if possible), along with his tender, an outline plan, showing the general features and design of the engine and tender which he proposes to supply, along with a skeleton specification of the leading particulars of the same.

Should the rate of progress made with the work be such as to prevent, in the opinion of the Inspecting Engineer, the engines being delivered within the time specified in the "Form of Tender," the Commissioner for Railways or the Agent-General shall have full power and authority, after due notice given to the contractor, to cancel the contract forthwith, upon which all moneys due to the contractor under this contract shall be forfeited. Progress of work.
Cancelling contract.

Tenderers in Europe or America may either tender to the within specification, or if they wish to depart from it in respect of substituting bar for plate frames, cast-steel for wrought-iron centres for wheels, other brands of copper, brass, and iron for those mentioned, will be allowed to submit alternative tenders, provided that they adhere to the general dimensions of the engine, and clearly and minutely specify the nature of the departure they propose to make from the specification.

CHAS. A. GOODCHAP,

Commissioner for Railways.

Department of Public Works,

Railway Branch,

Sydney, 1st June, 1886.

GOVERNMENT

GOVERNMENT RAILWAYS OF NEW SOUTH WALES.

Form of Tender for manufacture of Engines in England or Foreign Countries.

THE undersigned, having read the attached Specification (No. 180A), hereby offer to supply the Government of New South Wales with locomotive engines and tenders, made in accordance with the various requirements, particulars, and conditions set forth in said specification, on the following terms as to delivery and payment viz. : engines (with their tenders) delivered in steam at at the price of £ each, the whole to be completed and delivered within months from date of official acceptance of Tender, and further promise and agree to be firmly bound by and faithfully to adhere to all the conditions and requirements of the said specification, and to forfeit to the New South Wales Government, or its lawful representatives, the sum of £20 sterling per engine and tender per week (to be deducted from the abovenamed contract sum by way of liquidated damages) for each and every week that each engine (with its tender) shall remain undelivered after the time herein specified for delivery.

We are,

Your obedient Servants,

(Signed)

(Address)

To the

N.B.--This tender must not be detached from the specification. The Government do not bind themselves to accept the lowest or any tender.

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(REMOVAL OF LOCOMOTIVE ENGINES FROM DUBBO TO WELLINGTON.)

Ordered by the Legislative Assembly to be printed, 28 June, 1887.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 24th March, 1887, That there be laid upon the Table of this House,—

- “ (1.) Copies of all papers, documents, and correspondence in connection with the removal of the locomotive engines from Dubbo to Wellington.
 “ (2.) Copies of all papers and documents showing the cost of the engine-sheds at Wellington.
 “ (3.) A Return showing the loss, if any, sustained by the country through such locomotives being at Wellington instead of Dubbo.”

(Mr. Penzer.)

SCHEDULE.

NO.	PAGE.
1. Letter from E. Barton, M.P., to Commissioner for Railways, and reply thereto. 25 November, 1881	2
2. Petition signed by D. A. Ferguson, Esq., Mayor of Wellington, in favour of erection of workshops at Wellington. 7 October, 1882	2
3. Petition presented by D. A. Ferguson, Esq., M.P., in favour of Wellington as a locomotive depôt, and minutes thereon. 10 April, 1883	3
4. Minute by Locomotive Overseer <i>re</i> changing the position of locomotive depôt and estimated cost of same. 7 January, 1884	4

RAILWAYS.

No. 1.

E. Barton, Esq., M.P., to The Commissioner for Railways.

Sir,

107, Elizabeth-street, Sydney, 25 November, 1881.

I understand that the question of a locomotive depôt for the Western Line beyond Bathurst is under consideration. It was my intention to ask the favour of a personal interview with you, for the purpose of pointing out the manifest advantages offered by Wellington as a site for such depôt. Business pressure has during this week prevented me from seeing you, and to-morrow I shall leave town for two or three days. I can only write a few lines on the subject, and shall defer the greater part of what I have to urge until I shall be again in Sydney.

I understand that the object is to choose a convenient site between Bathurst and Nyngan. The distance is about 234 miles. Wellington, a little short of half-way, is an admirable site. Dubbo, about as much over half-way, is an undesirable site for many reasons, among which is the fact that very little land is available in the vicinity of Dubbo Station, unless it be determined to purchase some at a high figure. I hear sufficient land for the purpose is available at and about the Wellington Station. If it were not, the expense of obtaining it would be far less in that township than at Dubbo, and the convenience, I submit, is equal, unless there be some very heavy departmental reason to the contrary. Leaving further consideration to be put before you at an early opportunity,

I am, &c.,

EDMUND BARTON, M.P.

Mr. Scott for report, B.C., 29/11/81.—CH.A.G. A locomotive depôt is not required beyond Bathurst at present.—W. SCOTT, 7/2/81. Commissioner.

The Commissioner for Railways to E. Barton, Esq., M.P.

Sir,

Department of Public Works, Railway Branch, Sydney, 11 February, 1882.

Referring to your letter of the 25th November last, suggesting that Wellington should be the site for any proposed locomotive depôt between Bathurst and Dubbo, I have the honor to inform you that the matter has been referred to the Locomotive Engineer, who reports that a locomotive depôt is not required beyond Bathurst at present.

I have, &c.,

CH. A. GOODCHAP,
Commissioner for Railways.

No. 2.

Petition.

To the Honorable the Minister for Public Works in and for the Colony of New South Wales.

The humble Petition of the inhabitants of the town and district of Wellington,—

RESPECTFULLY SHOWETH:—

That at a public meeting, held at Wellington on the 7th October, 1882, and convened by the Mayor of Wellington by advertisement in the *Wellington Gazette* newspaper, the following resolution was carried unanimously:—"That in the opinion of this meeting the claims of Wellington as a site for the Western Railway workshops ought to be recognized by the Commissioner for Railways."

That the grounds on which the above resolution is based are as follows:—

Firstly.—That there is abundance of land within the area of the station reserve at Wellington for the purpose of erecting workshops.

Secondly.—That Wellington is a stopping-place for engine-drivers and others (the next stage being Bathurst, distant over 100 miles), and the proper distance between Bathurst and Nyngan for the workshops. And

Thirdly.—That there are extensive mines of coal, iron, and copper in the neighbourhood of Wellington, which might be of great benefit in connection with the railway workshops.

That at the public meeting aforesaid a resolution was carried unanimously requesting and empowering the Mayor of Wellington, as Chairman of the meeting, to sign this Petition on behalf of the meeting.

Your Petitioners therefore pray that railway workshops may be erected at Wellington. And your Petitioners will ever pray.

Signed, on behalf of the aforesaid meeting,

D. A. FERGUSON,
Mayor.

No. 3.

No. 3.
Petition.

To the Honorable the Minister for Public Works.

The humble petition of the inhabitants of Wellington,—

RESPECTFULLY SHOWETH :—

That, at a public meeting held at Wellington, on the 10th day of April, 1883, convened by the Mayor of Wellington, and by advertisement in the *Wellington Gazette*, the following resolution was carried unanimously :—“That this meeting is of opinion that it is desirable the attention of the Government should be drawn to the superior advantages Wellington offers as the site for the intended locomotive depôt.”

The grounds on which the above resolution is founded are as under :—

- 1st. That there is abundance of land within the area of the station reserve at Wellington for the purpose of erecting locomotive sheds or depôt.
- 2nd. That Wellington is a stopping-place for engine-drivers and others (the next stage being Bathurst distant 100 miles) and the most convenient distance between Bathurst and Nyngan for the sheds or depôt.

At the public meeting aforesaid, a resolution was carried unanimously, requesting the Chairman of the meeting to sign the petition on behalf of the meeting.

You petitioners therefore pray that the locomotive depôt may be erected at Wellington.

And your petitioners will ever pray, &c., &c.

Signed, on behalf of the abovementioned public meeting,

ROBT. RYGATE, J.P.,

Chairman.

Presented by David A. Ferguson, M.P. For Mr. Goodchap.—F.A.W., 18/6/83.

Wellington, from its position in regard to the divisions of the running, will, I believe, be found to be the best position for locomotive running shed and depôt. Will Mr. Scott inform me what has been done, and what is required to be done. Is there a running shed at Dubbo?—CH.A.G., 26/6/83.

I VISITED Wellington on Sunday last, and find that the present house used by drivers and firemen is of wood, and that it is full of insects.

Before anything is done in this matter, I consider that a complete plan should be prepared, showing the whole yard, and the proposed building to be erected.

It is absolutely necessary to erect a new running shed at Wellington (that at Dubbo is entirely out of place, as I have before pointed out), and the Dubbo yard is even now too small for traffic requirements.

I therefore recommend that a new shed, drivers' house (of brick and stone), and the appliances for establishing a locomotive depôt be at once put in hand. There is a splendid 50-foot American turntable there lying useless, a coal stage, and sand-house, plenty of land available, and a splendid water supply from river, &c., &c. I think the same design which I have proposed for Goulburn should be carried out also at Wellington.

THOS. MIDELTON.

The Commissioner.

30/6/83.

Locomotive Engineer's Office, Redfern, 14 June, 1883.

Memo. to the Locomotive Overseer.

I HAVE arranged for the three trains, Nos. 1, 29, and 37, down goods, to run from Bathurst to Wellington and Wellington to Nyngan, and their returns, 38, 40, and 46 up, from Nyngan to Wellington, and from the latter station to Bathurst. This will necessitate the engines being washed out and cleaned at Wellington, instead of at Dubbo. I would therefore recommend that 6-inch water-pipes be laid from the water-crane, east of station platform, to the ash-pit at level stage, and that a hydrant be erected at the ash-pit, for washing out engines, at once.

J. TURTON.

Sir,

Locomotive Engineer's Office, Redfern, 14 June, 1883.

Now that the extension, Nevertire to Nyngan, is opened, it will be necessary to run the engines in sections—Bathurst to Wellington, Wellington to Nyngan and return. This will necessitate an engine-shed to accommodate at least twelve engines being built at Wellington, and the gradual shifting of the residences of the men from Dubbo to Wellington, which latter station will become the depôt. The above arrangement will equalize the work and hours of the engines and men.

J. TURTON,

Locomotive Overseer.

It has been evident to me, since I was at Bathurst, relieving Mr. Turton, that what he recommends above would be sure to be wanted as we opened further west.

I therefore beg to refer you to my 83-3,448, herewith. This matter should, I consider, be settled without delay, as Wellington seems a natural place for a locomotive depôt.—THOS. MIDELTON, 30/6/83.
Locomotive Engineer.

Locomotive Engineer's Office, Bathurst, 21 September, 1883.

Memorandum to Locomotive Overseer.

I AM of opinion it would benefit the Department if the accommodation for engines asked for at Wellington Station was provided without delay. Considerable inconvenience to the Bathurst men is caused by there being frequently no men at Wellington, from Dubbo, to relieve them. If temporary accommodation is provided—that is, siding room, and means for washing out and cleaning the engines there, those now stationed at Dubbo can run from Wellington to Nyngan or Narramine, as required. It will also be much better for the engines, as they will not then have to pass through so many hands between departure from, and arrival at, Bathurst. The men, also, would be less harassed than they occasionally are.

J. TURTON.

The

I have held the same opinion a long time.—J.M.

I do not at all agree with this temporary work; it spoils the whole thing in making permanent arrangements.—T.M.

The plans for Goulburn shed are nearly finished; they will also do for Wellington. I asked for a plan of Wellington yard from Mr. Cowdery. I think when we get this, steps should be taken to put in roads, &c., even if the shed is not built immediately; this would relieve us immensely, and if the general plan is agreed upon, we can add at any time as required.—T.M., 28/9/83. Locomotive Engineer.

Locomotive Engineer's Office, Bathurst, 19 October, 1883.

Memorandum to the Locomotive Overseer.

To make a commencement with the contemplated change of locomotive depôt from Dubbo to Wellington, I propose to run the stock trains as follows:—From Bathurst to Wellington and return alternate days, Wellington to Narramine and return same day, with engines class 93. Or, Wellington to Nyngan and return alternate days, as required; Narramine to Nyngan and return, alternate days, stock or goods trains, as required, with Bogie engines. This arrangement will enable me to work the traffic on the heaviest part of the road with engines of 93 class, and the Bogies are quite capable of working it west of Narramine. To enable me to carry this out, it will be necessary to lengthen the locomotive siding between the main line and coal stage, and the road over the turntable, at Wellington, each 100 yards. This will enable me to clean and do other necessary work to engines, and will provide the necessary standing accommodation. I would recommend this be done at once, so that the proposed change can be effected on the issue of the contemplated new time table.

J. TURTON.

No. 4.

Minute by the Locomotive Overseer to The Locomotive Engineer.

Proposed Locomotive Depôt at Wellington, G.W.R.

REFERRING to the question of making Wellington a locomotive depôt instead of Dubbo, I herewith forward for your approval tracing No. 867 and this recommendation, feeling confident that what is proposed will further the work of the Department in the best and most economical manner.

As you are aware we have for two years actually made Wellington the depôt, as all engines (except the two which work the mail trains) running between Bathurst and Dubbo change hands at Wellington, and it has been found from actual experience that Wellington is the natural and best place for a locomotive depôt, and I consider that immediate steps should be taken to put in hand what I propose, which is as follows:—

On tracing 867 is shown the existing roads (as far as it concerns this Department) and these portions are coloured blue; what I propose is coloured pink and is in fact a duplicate of the Goulburn yard as now being put in for our use. I have shown a running shed at the left of the turntable, which is also a duplicate of the Goulburn shed, except that it will hold sixteen instead of thirty engines, but if sufficient land is resumed outside the railway fence for future extensions this will make matters simple in case we should require to extend the shed accommodation. As there is nothing on the land except a small wooden house the work could be started at once, that it is to say, the roads could be put in and everything done as shown on the said tracing, except erecting the shed; this could be left until after the Goulburn shed is erected and used, when the same drawings will come in for use at Wellington. The roads will give us all the accommodation we require, except shelter, but if you consider it desirable to erect the shed at once it will, of course, be a more complete work. The Dubbo shed is very small and also most inconveniently placed for locomotive purposes, and when we move from there to Wellington the old shed would do remarkably well for the Traffic Department as a carriage shed or for outward goods. You will remember some time ago I submitted plans (according to your orders) showing what was wanted for the accommodation of the drivers (changing) at Wellington; there is ample space for what I proposed for them between the through road and the fence.

This recommendation, and the tracing 867 herewith, will, I hope, fully meet your minute of 17/10/83, or your 83-6,562.

THOS. MIDELTON, 7/1/84.

Please refer to Commissioner's 83-15,284.

Engineer for Existing Lines, Sydney, 15 February, 1884.

Memo. to Mr. Avern.

REFERRING to my 84-237 of the 12th instant requesting you to return 84-447, relative to the estimated cost in detail of proposed loco. additions, &c., Wellington, I wish you to forward this paper at once as it is urgently required by Commissioner.

GEO. COWDERY,

Per D. H. ARMSTRONG.

I return these papers as requested, and I regret that having for the last month had to be absent so much from head quarters in connection with the Board for Inquiry into the carriage of live stock, I have been unable hitherto to give the matter attention.—F. M. AVERN, 17/2/84. Mr. Cowdery.

Please forward reply to Commissioner's minute, as the matter is urgent.—G.C., per G.L. Mr. Avern.

I have seen Mr. Cowdery on this subject and he thinks it best that Mr. Parry should work out an entirely new scheme as he does not approve of the one submitted by Mr. Midelton, I therefore return these papers. It will be necessary for the purpose of replying to Commissioner's minute to ascertain from Mr. Scott the cost of a 50-foot traverser—also from the Engineer-in-Chief, or from the Accounts, Railways Department, the cost of locomotive arrangements at Dubbo.—F.M.A., 22/2/84. Mr. Cowdery.

Will Mr. Scott please inform of the cost of a 50 feet traverser.—G.C. (per G.L.), 25/2/84. Locomotive Engineer. The one I ordered in England for the new running shed at Eveleigh, cost there £1,200, including engine and capstan complete.—W.S. (per R.J.S.), 27/2/84. Mr. Cowdery. Will

Accountant

Accountant please inform me the cost of locomotive arrangements at Dubbo.—G.C. (*per G.L.*), 7/3/84. Accountant. Engine-shed and pits, £2,315 3s.; coal stage, £299 14s. 6d.; tank and pit, £333 5s.; total, £3,448 2s. 6d. Existing Lines.—B.C., 13/3/84.—W.W. Will Mr. Scott please forward me at his convenience a detail estimate of these proposed works.—G.C., 2/4/84. Locomotive Engineer. Mr. Midelton for estimate.—W. Scott, 9/4/84. The proposed work will be a duplicate of that at Goulburn (except as regards size of shed). I estimate the work at £9,065, as per Dr. 867, exclusive of water columns (there are two there at present). Shed to hold sixteen engines.—T.M., 16/6/84. Locomotive Engineer. Mr. Cowdery.—W.S. (*per D.C.M.L.*), 20/6/84. Mr. Parry for report.—23/6/84. Plan herewith, showing engine shed with roads through (with no traverser), to accommodate twelve engines, estimated cost, £5,600; shed with six roads, to accommodate eighteen engines, will cost about £7,600. My estimate for Mr. Midelton's scheme with traverser, is £10,500.—J.P., 31/7/84. I do not see how Mr. Parry can estimate for what I propose, seeing that no details of shed are given.—T.M., 30/8/84.

No. 5.

The Council Clerk, Dubbo, to the Secretary for Public Works.

Municipal District of Dubbo Council Chambers,

Dubbo, 30 June, 1884.

Sir,

In pursuance of resolution of Council Meeting, held 16 June, 1884, I am instructed by the Mayor and Aldermen of the above Municipal District, to respectfully offer to the Government, for the purpose of erecting railway workshops and other railway works, all that piece and parcel of land comprising 5 acres, situated on the north of railway line, within the municipality of Dubbo, and adjoining station yard, and being the eastern end of the recreation reserve north of railway line.

I have, &c.,

T. W. HEAYDON,

Council Clerk.

Railways.—J.R., B.C., 2/7/84. Mr. Cowdery for report.—R.J.S., B.C., 7/7/84. Mr. G. R. Cowdery for report.—G.C. (*per G.L.*), 10/7/84.

No. 6.

The Council Clerk, Wellington, to D. A. Ferguson, Esq., M.P.

Sir,

Council Clerk's Office, Wellington, 18 July, 1884.

In compliance with a resolution passed at a public meeting, I have the honor, by direction of the Wellington Municipal Council, most respectfully to request that you will be pleased to wait upon the Commissioner for Railways and point out to him that, in consequence of the great depression that afflicts all classes, business people, mechanics, labourers of every description, &c., it would be a great benefit to the town of Wellington if the workshops, cleaning sheds, &c., connected with the railway line, were at once commenced. Such work would help to relieve the stagnation that exists and stimulate private enterprise.

That Parliament has voted the money for the purpose, and we have been led to believe that Wellington is the place decided upon at which these buildings are to be erected, a decision which is in uniformity with its position as regards distance, and is unanimously approved of by all those employed in working the line. That the mutual advantages, sanitary condition, and general convenience of the position commend it to the travelling public and those who employ the railway as a carrier for merchandise and live stock.

And to point out the desirableness of at once commencing this work, which is absolutely requisite for the safe working of the line.

I have, &c.,

W. H. FORWOOD,

Council Clerk.

No. 7.

The Council Clerk, Dubbo, to The Secretary for Public Works.

Sir,

Municipal District of Dubbo, Council Chambers, Dubbo, 29 July, 1884.

In reference to letter of June 30, 1884, *re* park for railway purposes, the Council have reconsidered the matter, and beg to offer to the Department, for the erection of railway workshops and other railway works of a permanent character, the whole of that portion of park at Dubbo north of railway line, and of which part only was previously offered.

I have, &c.,

T. W. HEAYDON,

Council Clerk.

Railways.—J.R., B.C., 31/7/84. Mr. Cowdery.—R.J.S., B.C., 4/8/84. Mr. G. R. Cowdery for report. Previous paper, 84/5,374, was forwarded to you, 10/7/84.—G.C. (*per G.L.*), 5/8/84. Mr. G. R. Cowdery. See my report on my 84/1,641, forwarded to you 5/8/84.—G.R.C. (*per A.M.*), 7/8/84. Engineer for Existing Lines. Full report herewith.—G.C. (*per G.L.*), 8/8/84. Commissioner.

Railway Department, Existing Lines Branch, Office of District Engineer,
Bathurst, 5 August, 1884.

Memorandum to G. Cowdery, Esq.

I beg to inform you I have examined the land, and interviewed the Mayor of Dubbo in connection with the offer of the corporation to convey to the Railway Department land for the erection of workshops, &c. I find the land offered is that which lies between Gipps and Bourke Streets, and a portion of 11 acres

21·8 perches of recreation reserve on the northern side of the railway opposite the station. I pointed out to the Mayor that the same quantity of land, viz., 5½ acres, running parallel to the yard for the whole of its length would be much more suitable for railway requirements, as it would give plenty of length for siding accommodation.

This would leave a narrower strip of land, 21 chains long facing Erskine-street, which would be of no use for recreation purposes, and which I believe the corporation have no power to sell. The Mayor, however, intimated he believed the Council would be willing to convey the whole of the land, 11 acres 21·8 perches, to the Department. Should a branch line leave Dubbo for Coonamble further siding accommodation will be necessary. I also believe that Dubbo will be a large depôt within a very few years, bordering, as it does, on the flat country westward. Should the corporation offer the whole of the land, as already intimated by the Mayor, I would strongly recommend that the offer be accepted, believing, as I do, that in a very few years it will be required.

The land in question is very suitable for the purposes offered, being perfectly flat and adjacent to the railway yard.

G. R. COWDERY,
Acting District Engineer.

No. 8.

Minute by The Commissioner for Railways.

PLEASE draw up statement showing amount expended at Dubbo and Wellington to this time, for locomotive sheds, how many engines can be taken in at each place, how many are taken in at each place, and how many are taken.

If Wellington be made the station for running shed what is proposed to be done with the building at Dubbo?

How many engines can be stabled by the plan proposed by Mr. Midelton? I see that by Mr. Cowdery's plan twelve can be stabled, to be increased to nineteen by extension of shed.

What is proposed to be done with present running-shed at Wellington?—CH. A.G., 6/8/84.

Locomotive Engineer.—R.J.S. B.C., 8/8/84. Urgent. Locomotive Overseer.—W.S. (*per* D.C. M'L.), 12/8/84.

There is a running-shed at Dubbo, which holds four engines only; I do not know its cost. There is no running-shed at Wellington; but what I propose is to build a new shed half the size of the Goulburn shed, and from the same drawings as per plan No. 867 herewith. It will shelter sixteen engines, and can be extended to any size at any time without interfering with the proposed arrangements; my shed will be easily and cheaply worked; that proposed by Mr. Cowdery will be (the long shed) old fashioned, and extremely costly to work. I still recommend what I proposed on my paper of 7th January, 1884 (L.E., 84-152) herewith, and should be glad to have the work carried out as soon as possible, as the opening to Byrock on the 2nd ultimo will make it clearer than ever that Wellington must be the depôt. I do not agree in any way with the plans (herewith) submitted by Mr. Cowdery.—THOS. MIDEルトON, 30/8/84.

Where there is sufficient land available (as in this case) to allow of a running-shed being built and at the same time admit of the engines being taken in and out by points and crossings, I am opposed to the use of traversers in a small shed such as will be required for Wellington. I quite approve of Mr. Cowdery's plan, as it will, according to Mr. Cowdery's estimate, be much less expensive, and answer the purpose at all events equally as well as if a traverser were used, I therefore recommend that Mr. Cowdery's plan be adopted, and the work proceeded with at once.—W. SCOTT, 3/9/84. Commissioner.

For Minister's approval.—CH. A.G., 9/9/84. Approved.—F.A.W., 17/9/84. Mr. Cowdery, B.C.

No. 9.

Minute by The Commissioner for Railways.

THE proposal is to make Wellington the running-shed station. There are recent papers on the subject upon which I have asked for information respecting the number of engines at present stabled at Dubbo and Wellington. At no distant time Mudgee will be connected with Wellington by rail, and it is probable that the traffic beyond Wellington will be taken by the route from Wellington to Mudgee and by the Colo River route to Penrith, and thence to Sydney. It is moreover far more likely that the line to Coonamble will go from Mudgee, not Dubbo. In the traffic arrangements Wellington will be a far better changing station than Dubbo.

The report of the Locomotive Engineer may be obtained.—CH. A.G., 11/8/84.

Locomotive Engineer, B.C. Locomotive Overseer, in connection with other papers sent to him on this subject yesterday.—D.C. M'L., 13/8/84.

I have always held that Wellington must be the locomotive depôt and not Dubbo, and I now think so stronger still after reading the Commissioner's minute of 11/8/84 above. We have always changed men there, but not engines, as they run through to Nyngan and Dubbo; and when we open to Byrock and Bourke, then Wellington will, with Nyngan and Bourke, be the three locomotive depôts west of Bathurst. We have now more land at Dubbo than we can possibly want for some years to come.—T.M., 26/8/84. Locomotive Engineer.

I concur.—W. SCOTT, 3/9/84. Commissioner. As the land is offered for workshops, &c., its acceptance would be deemed to be a tacit promise to make Dubbo the changing station for engines, &c. I think that it would be injudicious to accept the land on such terms.—CH. A.G., 6/9/84. Approved.—F.A.W., 9/9/84.

No. 10.

The Commissioner for Railways to The Council Clerk, Dubbo.

Sir, Department of Public Works, Railway Branch, Sydney, 12 September, 1884.

I have the honor to acknowledge the receipt of your letter of the 29th July last, addressed to the Honorable the Minister for Public Works, offering to this Department the whole of that portion of the Park at Dubbo north of the railway line, but while thanking you for the kind offer, have to state that I am unable to accept it, as the Department has already sufficient land at Dubbo for all requirements.

I have, &c.,

CH. A. GOODCHAP,
(Per G.B.),
Commissioner for Railways.

No. 11.

Minute by The Commissioner for Railways.

BEFORE inviting tenders I wish some questions put in previous papers answered. First, when running shed is erected at Wellington, what is proposed to be done with Dubbo shed? What number of engines are now stabled at each place? As there is no shed at Wellington, how are the engines now stabled there cleaned, and where? Will Dubbo shed still be used, and why? I must have a programme drawn out, showing the whole case, what is now being done, and what is required between Bathurst and Byrock (or Bourke).
Mr. Cowdery. CH.A.G., B.C., 26/2/85.

I presume Mr. Scott will answer these questions.—G.C. (per D.A.A.), 27/2/85. Locomotive Engineer. Locomotive Overseer.—R.J.S., 2/3/85. As soon as the shed accommodation is ready at Wellington the shed at Dubbo will not be required, but as a shed of same size has been approved of some time back for Orange, I recommend that the Dubbo shed be removed to there. For particulars of present and proposed arrangements of working, see report herewith.—W. SCOTT, 9/3/85. The Commissioner.

REPORT of the Locomotive Engineer.

THERE are no engines stabled at Wellington. At present the Bathurst goods engines, twelve in number, run through to Dubbo in consequence of want of accommodation at Wellington, but as this is too long a run for the men, they change at Wellington with the Dubbo drivers. Under this necessarily imperfect arrangement, the engines only run three double trips per week, whereas, when proper accommodation is supplied at Wellington, the same engines will be enabled, if necessary, to run five double trips per week, besides which the drivers and firemen will be, as regards mileage and time on journey, more easily and advantageously employed. In addition to the foregoing, three of the Bathurst passenger engines run through to Dubbo now.

There are fifteen engines in the Dubbo district, viz., nine passenger and six goods. The grades being very easy in this district many of the passenger engines run goods trains when necessary. The majority of these are now stabled at Dubbo, only a few being stationed at Nyngan and Byrock. When the accommodation at Wellington is available, all the engines now stationed at Dubbo will be removed to Nyngan.

When the line is opened to Bourke, it is intended to arrange for the engines to be run as follows:—Bathurst to Wellington, 104 miles; Wellington to Nyngan, 129 miles; Nyngan to Bourke, 126 miles. The time occupied in these runs will be about the same, as the grades between Bathurst and Wellington are much heavier than on the other sections.

Commissioner.

W. SCOTT, 9/3/85.

For approval of Minister.—CH.A.G. Approved.—F.A.W., 11/5/85.

No. 14.

The Commissioner for Railways to Mr. J. Ahearn.

Sir,

Department of Public Works, Railway Branch, Sydney, 19 May, 1885.

I have the honor to accept your tender dated 12th instant, for the construction and erection of an engine-shed and pits at Wellington, on the Great Western Railway, in accordance with plan and specification, and to the entire satisfaction of the Engineer for Existing Lines.

Please forward deposit receipt for cash security mentioned in the specification in order that the bond may be prepared by the Crown Solicitor.

I may add there are a few errors in the schedule of prices, which will require to be corrected, and have to request that you will wait upon Mr. Cowdery in order that they may be rectified.

I have, &c.,

CH. A. GOODCHAP,
Commissioner for Railways.

Herewith I submit detailed estimates for these works, amounting to £2,767 5s. I may state that the contractor (Mr. Ahearn) for the new engine-shed, has not yet commenced work. His agent (Mr. King) is unable to purchase suitable bricks. It is now about six weeks since the tender was accepted, and no material yet on the ground.—A.F.W., 7/7/85. Engineer for Existing Lines. I recommend this work be carried out as per tracing and estimate. Mr. Ahearn has been written to with reference to carrying out the works of the new shed.—G.C., 4/8/85. Commissioner. Recommended.—CH.A.G., 6/3/85. Approved.—F.A.W., 7/8/85. Mr. Watson to carry out.—G.C. (*per G.L.*), 8/8/85. Please send tracing referred to showing position of new roads and coal stage, without which I cannot give orders to carry out the works.—A.F.W., 11/8/85. Engineer for Existing Lines. Carry out the work according to your detailed estimate.—G.C. (*per G.L.*), 12/8/85. Mr. Watson.

Mr. Hollis to carry out all the new roads shown on the accompanying tracing. Engine coaling road to be first laid in, as it is urgently required by the traffic. Mr. Mayo to erect,—1. Coal stage, shown on tracing 150 feet long by 15 feet wide. 2. Gate and fencing to be removed and re-erected for Maxwell-street crossing. 3. Carriage examiner's house to be removed and re-erected. 4. Present drivers' barracks to be removed and re-erected on site selected by Mr. Turton.—A.F.W., 13/8/85.

No. 16.

Minute by The Locomotive Engineer.

THE Commissioner is desirous of knowing what arrangements have been made for working the Western Line between Bathurst and Wellington since the extension to Bourke. Please therefore let me have, as early as possible, a detailed statement shewing the present arrangement of running trains, the number of engines and where stationed, and how far these arrangements will be affected when depôts at Wellington and Nyngan are completed.

Mr. Turton.

W.S.,

Per (R.J.S.), 26/11/85.

Report attached.—J. TURTON, 7/12/85.

Sir,

Sir, Locomotive Engineer's Branch, Bathurst, 17 December, 1885.

Re your M.P. 85-2,552 re working between Bathurst and Wellington since opening of the extension to Bourke, I have to report as follows:—Four sets of drivers and firemen have been transferred from Dubbo to Wellington to work the Bathurst engines and trains to and fro between those stations, so as to facilitate the traffic, avoid damage to engines, and disputes arising therefrom, and save the expense of men travelling as passengers to and fro between Dubbo and Wellington to work those trains. I also stationed one Bogie engine at Wellington, to run between Orange and Wellington, but as this train is now discontinued, I have stationed one of class 93 in her place to work with other two of same class that I am now stationing there to work between Wellington and Dubbo with trains from and to Bathurst. I purpose, as soon as the engine-shed at Wellington is finished, to station five other engines of same class to work in with the engines from Bathurst up and down on alternate days. This will affect a considerable saving in lodging expenses for men, and also do away with the necessity of sending engines attached from Bathurst to work up stock trains to a very great extent. Those engines are frequently sent at very short notice, as many as ten or eleven extra engines being required in one day in addition to those of the ordinary trains. The above arrangements will work in with the projected new arrangement for working west of Bathurst and Wellington when the latter and Nyngan and Bourke are established as depôts. The three engines first mentioned will then work as follows:—One to Narramine and back to Wellington daily; the other two each twice daily between Wellington and Dubbo, or to Narramine and back, as may be required, but I anticipate two engines will be required to work between Wellington and Dubbo. I have stationed in Bathurst District thirty-four engines in all, namely, fourteen of class 93, goods; six of class 205, goods; one American Passenger, class 304; five Express engines, class 30; and five double Bogie Passenger, class 79, working as follows:—

Three, class 304, Sydney Mail.

Two, „ 30, Dubbo Mail.

Three „ „ 37 Down, 16 Up, mixed, Bathurst and Dubbo and Dubbo Mail.

Twelve „ 93, Goods, Bathurst and Dubbo, and two same class stationed at Wellington from to-morrow, working between there and Dubbo.

Five, class 205, Goods and Stock, Bathurst and Dubbo.

Five, „ 79, Ordinary Trains, Bathurst and Orange, Wellington or Dubbo, attached or single; pilots and shunting, Bathurst yard.

On account of the number of extra engines required daily to be sent from Dubbo, attached or as second divisions, I have found it impossible to adhere to a running table as formerly, and drivers have to be arranged to run as may be required. I have now seven sets of drivers and firemen stationed at Wellington, three sets having been sent from Bathurst; all these men are working trains between Wellington and Dubbo.

Locomotive Engineer.

J. TURTON.

The Commissioner is desirous of knowing what arrangements have been made for working the Western line between Wellington and Bourke since the extension to the latter place. Please, therefore, let me have as early as possible a detailed statement, showing the present arrangement of running trains, the number of engines and where stationed, and how far these arrangements will be affected when depôts at Wellington and Nyngan are completed.—W.S. (per R.J.S.), 26/11/85.—MR. HUBBARD.

My report attached, showing that it is impracticable to make Wellington a Locomotive Depôt, and abolishing Dubbo as such, without a large increase in the present working expenses; also, statement showing a week's work ending 26th November, 1885, the number of live-stock trucks, cattle and sheep (other live stock not included), loaded at Dubbo and stations west of Dubbo, and all particulars asked for.—J. P. HUBBARD, 29/11/85. Locomotive Engineer.

Sir, Locomotive Engineer's Branch, Dubbo, 29 November, 1885.

I have to report on your 85-2,553 of 26/11/85, Locomotive Engineer's M.P. 85-7,392, Commissioner's M.P. 85-16,196, in reference to Wellington and Nyngan being made Locomotive Depôts.

If it is intended to make Wellington a Locomotive Depôt, and to abolish Dubbo as such, I consider it to be impracticable and unworkable without entailing a very large addition to the present working expenses.

The gradients on the line between Dubbo and Wellington, and *vice versa*, being too heavy to admit of only taking half a load, as is brought over from Narramine to Dubbo, and *vice versa*.

All trains are divided at Dubbo. One train arriving from Narramine has to be made into two trains for Wellington and Bathurst, and so on to Penrith.

Two additional mail engines at least would be required to run the mail-trains between Wellington and Nyngan, as the present engines now doing the work could not run (or work) the mail-trains between Wellington and Dubbo, or *vice versa*, they not being powerful enough. Eight or ten additional goods engines would also be required to be stationed at Wellington to carry on the present traffic, as will be seen on referring to the attached running sheets of work actually now being performed for week ending 26th November, 1885; or engines will have to be sent right through from Bathurst to Dubbo. They will require turning, coaling, cleaning, and necessary repairs as is now done; as, for example, on Friday, 20th November, 1885, seven engines hauled the traffic from stations west of Dubbo, and thirteen engines were required to take the same to Wellington for Bathurst; on the 24th instant six engines hauled the traffic to Dubbo, and fourteen engines were required to take it on from Dubbo to Wellington for Bathurst and Penrith. This, of course, includes the Dubbo traffic; thus showing the engines must come to Dubbo in any case.

Without a relay of engines, eight or ten are kept at Wellington to run between Wellington and Dubbo, and *vice versa*.

It is not as if it was non-perishable goods that a short train could be kept continually running between Wellington and Dubbo to collect the goods at that point. Live stock admits of no delay, and, as I stated before, a double number of engines must be in readiness, cleaned, turned, coaled, &c., at Dubbo, to take the live-stock trains right through to Wellington, Bathurst, and on to Penrith.

I respectfully submit, you can no more abolish Dubbo as a Locomotive Depôt than you can Penrith without entailing a very large addition to the present working expenses.

My views are well known in the matter.

I

I arranged some time since (about two months ago) with Messrs. Turton & Stanger to send one of the through trains at any time to Wellington, and thus let those gentlemen see how it will work.

I do not wish to be considered as putting obstacles in the way; but, at the same time, I am bound to state what, in my opinion, will be the result, namely, two Locomotive Depôts (one at Wellington and the other at Dubbo), additional engines and men, and consequently a very large increase in the working expenses.

The following will, no doubt, be considered a startling statement, but nevertheless it is true that the present system of running the mail-trains between Dubbo and Bourke, 225 miles, with the three present engines now doing the work, namely, Nos. 14, 15, and 16 (class 14), the engines and men running 900 miles per week will bear comparison with cost per train-mile, not only with any other mail-train in the Australian Colonies, but also with any English or Continental railways. Our cost per train-mile is much less.

The proper system, in my opinion, is to run the engines and men through from Bathurst to Dubbo (133 miles) down one day, up the next, and a day off; half the men to run from Bathurst end, the other half from Dubbo end. All the men would be home on Sundays. It could be so arranged, and thus abolish Wellington as a Locomotive Depôt.

If any complaint is made of the distance from Bathurst to Dubbo for the men to run 133 miles, then the same objection would apply more forcibly from Wellington to Nyngan, 129 miles, it being a much hotter climate than from Bathurst to Wellington.

Attached are all the particulars asked for, and a running sheet for last week ending 26th November, 1885. This statement (or report) is based on the present traffic now actually being carried on, and Wellington could only be made a Locomotive Depôt when there was actually nothing to do, *i.e.*, no traffic.

It often occurs, through the erratic movements of live stock, that engines are required at short notice at Dubbo. Engines could not be obtained so readily from Wellington as at Dubbo, and therefore lead to delay.

I wish to direct your attention to the large number of live-stock trucks loaded and carried through from Dubbo and stations west of Dubbo for the last two months, namely, October and November. The return includes fifteen trucks of sheep to be loaded at Bourke to-morrow, the 30th November, 1885:—

Loaded at stations west of Dubbo for eastwards	1,570
Do. Dubbo stock-yards for eastwards	817
					Total	2,387 trucks.

This does not include live stock other than cattle and sheep.

Locomotive Engineer.

J. P. HUBBARD.

I forward this for your information, and any remarks you may have to offer. Please obtain Mr. Stanger's views on the matter. It would appear from Mr. Hubbard's report that a depôt at Wellington is a mistake; but I am aware that before it was decided on full inquiry was made.—W.S. (*per* R.J.S.), 30/11/85. Mr. Turton. Reports attached.—J. TURTON, 8/12/85. Locomotive Engineer.

Sir,

Locomotive Engineer's Branch, Bathurst, 7 December, 1885.

Re Mr. Hubbard's report on the impracticability of working the traffic from Wellington, as a depôt, to Nyngan and Bourke, I make the following replies to his statements:—

I do not see why it is impracticable, neither does he show why, and I am sure it will effect a reduction of working expenses, as, when engines are stationed at Wellington, they will be available at short notice for up stock trains, and those save unnecessary expense in running extra engines attached from Bathurst, as is now the rule.

The gradients will be no worse between Dubbo and Wellington when the latter is the depôt than they are now, and the work can be more efficiently carried on by having engines at command at Wellington.

Trains will always have to be divided at Dubbo or Narramine. This should be done at the latter place as much as possible; the Nyngan engines running on to Wellington with full loads, and Wellington engines bringing on remainder to be sent on as specials to Bathurst.

I can see no reason why two additional mail engines will be required to run between Wellington and Nyngan. Two of the express or ordinary Bogie express engines can do this, as previously, which will relieve two of Mr. Hubbard's engines of class 14, for other work, and I understand it is contemplated to do away with the mail train between Nyngan and Bourke, and to run a mixed train instead, as one train daily is enough for the work of that section.

I am of opinion that the goods engines now stationed in Bathurst and Dubbo Districts are sufficient for the work if proper arrangements are made. There is at present one regular goods train and one mail train running each way daily between Dubbo and Nevertire and Dubbo and Bourke, but several specials run with stock occasionally; but it must be remembered that one ordinary Bogie engine will bring a load of thirty trucks easily between Byrock and Narramine.

Mr. Hubbard says seven engines have hauled the traffic west of Dubbo, and he has twenty engines in all. By this it would appear that some of his engines should be transferred to Wellington, which I have no doubt could well be done without putting him to inconvenience. One engine on Dubbo to Byrock, or I may say Bourke, is equal to two on Bathurst section. He has twenty and I have thirty-four engines, and I have to run trains to Sydney, Eskbank, and Wallerawang, as well as to Orange, Wellington, and Dubbo.

Whether perishable (which I take to be stock) or not, the trains can be worked through more expeditiously and economically with engines stationed at Wellington, as they can start with a clean fire and ashpan, and in every way better prepared for the rough and heavy part of the journey, and by being coaled at Wellington, a very considerable saving in cost of freight of coal will be effected, and delays coaling engines passing Wellington, and cleaning fires and ashpans at Store Creek, will be altogether avoided, and the traffic generally facilitated, added to which, the engines can, if required, make three single, and possibly two double trips, in thirty-six hours, which is a consideration when we are short of them.

I can see no comparison between Penrith and Dubbo, and cannot see what is to cause an increase in the expenses, but can see the reverse.

I am quite aware of the views of Mr. Hubbard on the matter, but must disagree with them, and he might, if so inclined, have assisted me on many occasions, by sending one or two of his engines through to Wellington or Bathurst.

Mr. Hubbard, of course, is right to give his opinion, but as I before stated, I can see no reason for an increase in expense of working the new arrangement of depôts. It merely requires, in my opinion, a rearrangement of the engines and men, and an earnest desire, on the part of both officers and men, to arrange and work for the best interests of the Department.

The present system of running the mail west of Dubbo is against the Commissioner's instructions *re* working the men over hours, and which must be very hard on them in the hot climate of Dubbo District.

The better system is for the mail engines and men to run from Bathurst to Wellington and back in the day, as previously done, and from Wellington to Nyngan, down one day and up next, with Bogie-engines.

This objection has, I am informed, been made by the men of Dubbo mail, but inducements were held out to them to cause them to put up with it. By Mr. Hubbard's own showing, he has more engines than the traffic west of Dubbo requires, and I fail to see why Wellington could only be made a depôt if the traffic failed altogether.

To meet the erratic movements of live stock, engines could be obtained at short notice at Bourke, Nyngan, or Wellington, as required, and this would save or prevent the necessity for sending engines empty from Dubbo to either of the stations west, before named, for running up stock trains.

As a further reason why Wellington is most suitable for a depôt, the Traffic Inspector's Office is there, and earlier and more accurate information can be obtained there than at Dubbo for making arrangements at Bathurst or stations west.

In conclusion, I may mention that the number of extra engines sent from Bathurst to Dubbo during last month (November) is sixty-five. This will shew the advisability of establishing the depôt at Wellington, as, although during that time most of those engines were required at short notice, Mr. Hubbard only sent one of his engines through to Bathurst.

J. TURTON.

Locomotive Engineer.

Locomotive Engineer's Branch, Bathurst, 3 December, 1885.

In response to the Locomotive Engineer's minute on Mr. Hubbard's report as to the working of engines between Wellington and Bourke, I now beg to state as fully as possible my views on the matter.

I will commence by saying that now I have been nearly two years stationed at Wellington. No one has had a better opportunity of judging of the present system, which is to let the engines work through to and from Bathurst, while the men change at Wellington, and I cannot too strongly condemn it as being opposed to efficient and economical railway working. An engine now, between the time of leaving the shed at Bathurst to returning, passes always through the hands of three sets of men, and occasionally of four sets. It would be difficult to exactly show what this means in increased wear and tear to the engines and expense of repairs, but I really believe if it could be got out it would horrify the Commissioner.

Again, the men, when taking charge of an engine at Wellington, have only 15 minutes allowed them in which to oil and examine the engine. This is not enough; it has frequently happened that a mishap has occurred to an engine directly after leaving Wellington, a cottar working out, for instance, the man in charge of the engine at the time is held responsible for the mischief, though probably it began many hours before. Of course, had the men time to properly examine the engine, there would be no excuse for them, but I say that in many cases they have not the necessary time without seriously delaying the traffic.

Another objection to the present system is, that frequently engines have not enough coal on them to work the trains through; and then from 10 to 25 minutes is lost taking coal. This has not been so common an occurrence this year since the engines have been burning Lithgow coal; but last year, with Wallerawang coal, hardly an engine passed with a full load without requiring coal. And I would express my opinion that 103 miles over such gradients as exist between Bathurst and Wellington is a very fair distance for one trip; and that a driver, before commencing it with an important train, such as live stock, should have a fair start by having a clean fire and empty ashpan and smoke-box. There would not then be so much danger of fires along the line, and better time would be kept. I do not think anyone is an advocate for continuing the present system, but I have thought it well to point out the chief objections to it.

The last two objections apply with equal force to Mr. Hubbard's proposal to work the trains through between Bathurst and Dubbo, with men and engines from each depôt. And a third objection to this course is the long hours the men would be on duty, running to time they would be at least eleven and a half hours over the trip, and it is a common occurrence for the down night trains to be one, two, and even three hours late. This running through between Dubbo and Bathurst was tried two or three years ago, but had to be abandoned on account of the complaints made by the men.

Mr. Hubbard considers the proposal to make Wellington a depôt, is both impracticable and unworkable without a very large increase of the present working expenses. I think the traffic can be worked by engines stationed at Wellington with great efficiency, and I think, also, with greater economy than under the present system. I cannot see that the gradients between Wellington and Dubbo in any way affect the question, as under any mode of working they remain the same. It will always in any case require about double the engine-power to work trains this side of Dubbo; and Mr. Hubbard loses sight of the fact that there are now five regular goods trains from Bathurst to Dubbo, two of which only go beyond Dubbo. In the same way from Nyngan to Dubbo there are only two goods trains, whereas from Dubbo to Bathurst there are five; this means that the through train takes to, or picks up at, Dubbo the load of a train starting from, or arriving at, Dubbo. This has been and always will be the mode of working on account of the change of gradients, no matter where the engines are stationed. Mr. Hubbard appears to base all his statements on the live-stock traffic which, coming at the same time as the wool, has for the last three months been very heavy, but which it is not fair to represent as the normal condition of things. An engine takes into Dubbo, say, twenty-six trucks of sheep from Nyngan, now that engine is taken off, and the train divided, two fresh engines being put on to take the train to Bathurst. If the proposed change is made, the engine bringing in this train to Dubbo will simply back half

half the load on to another brake van, which has now to be done, and will at once complete her journey to Wellington, where the Bathurst engine and men will be ready. The half put off will be brought on, either by an engine which has taken a down train, which goes on further than Dubbo, or by an engine sent from Wellington. There would be no increased cost in this. At present, engines to work up-stock specials have to be sent empty from Bathurst, though in some cases some of these engines assist to work the empty sheep vans, &c., which can be done equally well under the new system.

One point Mr. Hubbard overlooks is, that there will be a saving of about, on the average, £15 a week in the haulage of coal alone. Now, all the coal required for the Bathurst engines on the up journey has to be hauled 133 miles to Dubbo, and there loaded on the engines.

I do not believe the total number of engines between Bathurst and Bourke will need to be increased unless by one mail engine. A proportion of the Bathurst engines will need to go to Wellington to work the 30 miles they now work, and a proportion of the Dubbo engines will need to go to Wellington to work the portion of the line now worked by Dubbo engines.

As for Mr. Hubbard's statement that the run from Wellington to Nyngan is equally hard on the men, as the run from Bathurst to Dubbo, I must most entirely disagree with him, for though both the mileage and time are nearly equal, though both slightly in favour of the Wellington and Nyngan section, the work is much less severe owing to the different state of the gradients, &c., on the two sections.

Another statement to the effect that, owing to the erratic movements of live stock, engines are required at short notice, which can be better supplied at Dubbo than Wellington is not worth much when I say that during the last three months, when the traffic has been so heavy that both men and engines were severely taxed, I have frequently begged of Mr. Hubbard to assist by sending one of his engines to Bathurst when one has been required at short notice to avoid upsetting all arrangements and depriving men of their rest. He has only once sent his engine through, and then not his men, which was really no assistance at all.

Four engines will certainly be required to work the mail between Wellington and Bourke, and it is true that more powerful engines will be required from Wellington. Engines of class 256 will be the most suitable. They could work any load from Wellington to Nyngan that will ever be required on the mail, as I believe there will be no difficulty in getting the sleeping car left at Wellington. It is not required beyond this was proved last year when, for one month, the passengers were counted, and it was found that the sleeping car simply robbed the first-class carriages of their passengers.

Mr. Hubbard's views have undergone a singular change since it was first proposed to remove the depôt from Dubbo to Wellington, now about two and a half years ago. Then he seemed to hail with delight the prospect of going to Wellington, and even asked a party in Wellington to look out for a piece of land for him; but since I have been sent to Wellington, Mr. Hubbard has appeared to oppose the proposed change.

C. H. STANGER.

No. 17.

Memo. by Mr. C. H. Stanger to The Locomotive Foreman.

Sir,

Locomotive Branch, Wellington, 26 January, 1886.

Finding that the three goods engines I have here are not sufficient for working the whole of the trains between Wellington and Dubbo and one occasionally to Bathurst when there is not time to procure an engine from Bathurst, I have seen Mr. Hurst and arranged with him to take over, subject to your approval, another goods engine instead of a Bogie engine which Mr. Turton had arranged to hand over to me. Now that the district is divided, I consider it more important than ever to avoid sending Bathurst men and engines beyond Wellington; but on busy days I am compelled to send engines through. This will not often be necessary when I have a fourth goods engine.

C. H. STANGER,
26/1/86.

I should be glad if you could visit Wellington and report.—J.C., 27/1/86. Mr. Loughry.

Four goods engines (Nos. 1, 2, 93, and 95) and a proportionate number of men have been transferred from Dubbo to Wellington. There are now eight engines stationed at Wellington, including those previously transferred from Bathurst. The goods traffic being slack at the present time this number will, I think, meet the requirements.—E. A. LOUGHRY, 23/2/86. Locomotive Engineer. Seen.—W. SCOTT, 26/2/86.

Sir,

Locomotive Branch, Wellington, 26 January, 1886.

I wish to call your attention to the advantages to be gained by having the pilot engine for up-mail moved from Dubbo to Wellington at once. In the first place, it is very rarely indeed that the load from Dubbo exceeds thirteen vehicles, and these can be brought as far as Wellington by one engine of the class No. 268 now working these trains. By attaching the pilot at Wellington there would be a saving of three hours time for both driver and firemen whenever the pilot is on the mail.

And secondly, I should have the advantage of having a passenger engine here ready for any emergency, and could also frequently make use of this engine to assist stock trains, for which purpose it would serve as well as a goods engine.

I might say that a pilot engine will soon never be required between Dubbo and Wellington, as it is the intention of the Traffic Department to entirely break up the mail train here, and only to run beyond Wellington a train consisting of equal to nine vehicles. I think it will be advisable, so soon as you are able, to provide me with two engines capable of taking a load of (say) ten vehicles up the 1" in 40 banks between Wellington and Dubbo, and suitable for the level straight road between Narramine and Nyngan (the class 256 would, I think, be very suitable for this purpose) for the engines of the mail trains to be changed at Wellington and again at Nyngan.

For the present, I would suggest that Mr. Hubbard hand over to me a Bogie engine in good order, as I have no fitter at present, with a set of suitable men for working a pilot engine on the mail trains, and one cleaner.

Locomotive Foreman.

C. A. STANGER.

Sir,

Sir,

Locomotive Branch, Bathurst.

I would recommend that four goods engines, class 93, and two Bogie engines, class 79, be transferred from Dubbo to Wellington, to work between Wellington and Nyngan. I can spare one Bogie engine of the class named. I believe the above, with the three of class 93 already transferred from Bathurst, will be ample to carry on the traffic for some time to come.

Locomotive Engineer.

J. TURTON,
15/1/87.

Can Mr. Hubbard arrange this?—W. SCOTT, 16/6/86.

Yes. These engines (six) can be removed at any time from Dubbo to Wellington. At the same time, to prevent any unnecessary delay to traffic, I would call attention to my previous suggestion that one train at a time can be taken over, *i.e.*, run through between Wellington and Nyngan, and *vice versa*.—J. B. HUBBARD, 24/1/86. Locomotive Engineer.

No. 18.

The Hon. Secretaries, Dubbo Railway League, to Sir Patrick Jennings.

Dear Sir Patrick,

Dubbo, 17 February, 1886.

It has been rumoured in town for some time past that the Commissioner for Railways has issued instructions to remove the engines usually stationed at the Dubbo engine-shed to Wellington, and to make the latter town the changing station for all traffic between there and Bourke. On this rumour a public meeting was called here; but as we had nothing definite to go on, it was decided to ask the Members for the district to make inquiries from the Commissioner as to the truth of the report, and, if found that such change is contemplated, to protest against it.

Dubbo has always been the changing station, and for the best of reasons, that it is the starting point for the level country. The heaviest traffic between Bourke and Dubbo has always been done with one engine, but a second, and frequently a third engine, is required from here to Wellington, and *vice versa*; so that if Wellington is made the changing station as reported, engines will have to be sent here daily to take the traffic from here, thus making expenses heavier on an already expensively worked section. Will you, with Mr. Cass, make the necessary inquiries at your earliest convenience, and let us know the result.

Yours &c.,

W. G. MORGAN,
P. M'ENCROE,

Hon. Secretaries Dubbo Railway League.

Dear Mr. Cass,

Dubbo, 17 February, 1886.

A rumour has been prevalent in town for some time past that the Railway Department have issued instructions to have the engines usually stationed at Dubbo removed to Wellington, with the object of making the latter town the changing station for the traffic between there and Bourke. On this rumour a public meeting was held here a week or so since; but as we had nothing definite to work upon, it was decided that the Secretaries of the Railway League should communicate with the Members for the district, and ask them to inquire from the Commissioner as to the truth of the report. Apart from the great loss to Dubbo people such a change would be, in removing the railway employes to Wellington, a great departmental error would be made in thus altering the traffic. You are aware that Dubbo is the starting point for the level country; and if the rumoured change is made, two or three engines would be doing the work now done with one. We are writing to Sir Patrick also in this matter, and hope that you and he will see the Commissioner as early as possible, and learn from him if such change is contemplated; also, let us know the result.

Yours &c.,

W. G. MORGAN,
P. M'ENCROE,

Hon. Secretaries Railway League.

With Mr. Cass's compliments to the Honorable W. J. Lyne, Minister for Works. Let nothing be done until the question can be more fully considered.—W.J.L., 3/3/86. I should like to see Mr. Scott on the matter, with a statement of all the reasons for the proposed change.—CH.A.G., 18/2/86. I have seen the Commissioner. Report herewith.—W. SCOTT, 22/2/86.

REPORT by Locomotive Engineer.

Removal of Locomotive Depot from Dubbo to Wellington.

It is for obvious reasons a rule on all railways to arrange the locomotive depôts, so as to equalise as much as possible the number of miles to be run by the engines, and the number of hours the enginemen and firemen will require to be on duty. Keeping these two very important points in view, there can be no doubt that Wellington is the proper place for the locomotive depôt, as the distances are—Bathurst to Wellington, 103 miles; Wellington to Nyngan, 130 miles; Nyngan to Bourke, 126 miles. The usual number of hours the enginemen and firemen would require to be on duty on these runs are—Bathurst to Wellington, ten hours; Wellington to Nyngan, ten hours; Nyngan to Bourke, ten hours. When the Bathurst men ran to Dubbo they were continually complaining of the number of hours they were kept on duty, and forwarded a petition to the Commissioner on the subject. With the view of removing this grievance, the Bathurst men were relieved at Wellington, and their engines were run to Dubbo by another set of men, which involved in nearly all cases a third set of men bringing the same engines back to Wellington, and frequently a fourth set of men taking them back to Bathurst, which system was found to be a prolific source of trouble and expense, through engines breaking down and causing trains to be late; and to such an extent did this prevail that it became necessary to station an officer at Wellington to control it as much as possible. A subsequent petition was received from the Dubbo men, wherein they complained of being away from their homes for a considerable number of hours, for which they were not paid.

paid. This resulted from the steps taken to relieve the Bathurst men (before referred to), by running from Dubbo to Wellington and back, which necessitated their standing several hours at Wellington. They were actually on duty only about forty hours per week, and received a full week's wages.

As regards the contention that Dubbo should be the depôt, as it is the starting point of the level country, the same argument would apply to Narramine, as the change of grade between Dubbo and there has an equal effect in reducing the hauling power of the engine. It is not, however, intended to remove all the engines from Dubbo, so that the additional power that will be required on that account will be available when necessary. As a matter of fact the empty running of engines will not be more by the depôt being at Wellington than it has or would be if at Dubbo.

On the grounds of economy alone I submit there are sufficient to justify the making of Wellington the locomotive depôt, as will be seen by the following statement, showing the amount that is and will be saved by the depôt being at Wellington instead of at Dubbo, based on past experience:—

	Per week.
To extra haulage of coal to Dubbo for six goods engines, 126 tons	£15 15 0
Do. of 10 tons of coal per week for mail engine	1 5 0
„ Time claimed to be paid for by four sets of men when standing idle at Wellington, <i>vide</i> petition	12 0 0
„ Cost of additional attention required to engines engaged running from Bathurst to Dubbo, consequent on the unusual practice of having so many different sets of men running the same engine	6 0 0
„ Salary of officer specially stationed at Wellington to control working of engines through depôt being at Dubbo	5 0 0
„ Extra haulage of carriages to and from Dubbo and Wellington saved by making Wellington the changing station	5 0 0
	£45 0 0

equal to £2,340 per annum.

W. SCOTT, 22/2/86.

No. 19.

Mr. R. Davidson to The Secretary for Public Works.

Honorable Sir,

Darling-street, Dubbo, 4 March, 1886.

I trust you will kindly pardon the intrusion of my humble remarks. At present there appears to be a multiplicity of opinions about the erection of the new sheds at Wellington. Yet the glaring error must be patent to any ordinary mind that the originators of this fallacious plan of judiciously dividing the different sections of the Western line from Bathurst to Bourke has, and ever will prove to be, the result of an erroneous calculation, if nothing else. Common sense suggests that the proper place for the erection of the new sheds was Kerr's Creek, which is 65 miles 45 chains from Bathurst and 68 miles 28 chains from Dubbo. If it had been arranged for the trains to change, or rather the men, at Kerr's Creek, the men could have run from Bathurst to Kerr's Creek and back to Bathurst, and the same from Dubbo and back for one day's work, which I have no doubt would meet with the approval of the majority of the men; and such a plan would be an immense saving to the country—3s. per night for each engineman, 3s. for each fireman, and 3s. for each guard, would be saved in the shape of all night from home expenses. Also the apparently insurmountable difficulty of equitably protecting the public interests, and judiciously working the railways of New South Wales, so that instead of the railways being a public burden they would soon be a public benefit, which, in the present state of the public finances, is a most material consideration. The thing is quite simple: it takes two engines to bring from Bathurst the same load that one engine can draw from Dubbo to Bourke; therefore the trains have, and always will have, to be made up in Dubbo. Where then is the proof of skilful management in expending such a large sum of public money in the erection of new sheds in Wellington, the thing speaks for itself; the engines are not required at Wellington, what use can the new sheds be. Perhaps they are being erected as monuments of error similar to the stone sheds erected at Wallerawang and Junee Junction, which were erected with three roads in each to accommodate eight engines each, and seldom or ever has more than one engine in each shed.

I have, &c.,

R. DAVIDSON.

File with other papers upon this matter.—W.J.L., 5/3/86.

No. 20.

Minute by The Secretary for Public Works.

Proposed removal of engine-sheds, Dubbo to Wellington.

A DEPUTATION from Wellington, introduced by D. A. Ferguson, M.P., accompanied by Messrs. Davies, Kidd, Smith, and Taylor, M's.P., waited upon me to-day, with reference to the proposed removal of the engine-sheds from Dubbo to Wellington. It was represented that the decision to have the engine-sheds at Wellington was the outcome of long and careful deliberation on the part of responsible railway officers who recommended Wellington as the most suitable site both for the location of the men and in view of the economical working of the railway. In pursuance of the decision arrived at, running sheds had been erected, as well as drivers quarters, at Wellington, and to reverse the previous arrangement would be to render useless the large sum expended in the erection of the locomotive buildings.

It was represented that Wellington was at a convenient distance from the next depôt, Bathurst, the distance between these two points being a fair day's work for the engines and men, while Dubbo was a point too far; that there was an excellent water supply at Wellington while the climate was better, and general supplies for the men were more easily obtainable than at Dubbo. It was said that coal was to be had

had at Dubbo, but the deputation pointed out that excellent coal was to be found nearer the line at Wellington than at Dubbo. In regard to coal haulage, it was pointed out that the location of the sheds at Wellington would mean a saving of some thousands of pounds annually. The deputation pointed out that the matter had already received the sanction of the previous Ministers who considered the matter, and was recommended by the proper and competent officers who had to deal with it.

I informed them that I had not yet had an opportunity of perusing the papers connected with this case, so as to make myself perfectly acquainted with the facts, and I could not therefore at the present moment give them any definite decision.

The matter had previously come under my notice, when a petition was presented by Mr. D. A. Ferguson to the effect that it was rumoured some movement was on foot to have the sheds removed to Dubbo, &c., but, on inquiry, I found there was no truth in it at the time. I knew nothing more of the matter until a few days ago, when a deputation waited upon Sir Patrick Jennings, but the Premier made no promise whatever, and Sir Patrick had not attempted to influence me in any way. He simply mentioned to the deputation that he was not going to offer any bribe to them by saying "this or that," and the opinion he held as a private member he retained as a Minister of the Crown, and without promising anything he said the whole matter would be reconsidered.

That was precisely the state of the case. Mr. Cass had waited on him the other day, when he referred incidentally to the question of coal, and pointed out that the working of coal in the locality would effect to some degree the establishment of the shed. The saving further would not be so extensive as they anticipated, as from a report before me, favourable to Wellington, it was said the saving would be equal to about £2,340 per annum, about £900 being for the haulage of coal.

I stated I could give them no definite reply to-day. I would thoroughly investigate the matter and give a decision, not in the interests of Wellington or Dubbo, but in the interests of the economical working of the railways. Expenditure had taken place at both Dubbo and Wellington, and this would be taken into consideration when deciding the question. With regard to the men themselves there did not appear to be any unanimous feeling in the matter, some seeming to prefer Wellington, others Dubbo. I promised finally to go carefully into the whole matter.

W.J.L., 15/3/86.

No. 21.

Minute by The Secretary for Public Works.

Proposed removal of engine-sheds to Wellington.

A DEPUTATION, introduced by Mr. Cass, M.P., and consisting of Mr. Muller, Morgan, Penzer, Caro, M'Enroe, and Phillips, waited upon me to-day with reference to the proposed removal of the engine-sheds from Dubbo to Wellington. The deputation represented Dubbo interests and spoke against the proposal to remove the sheds.

It was represented that five engines had been removed, and since the removal of the engines two required to run light or empty four days per week, and four or five two days per week between these two places in consequence of the different loads that had to be hauled. One engine could haul as many as from thirty-five to forty trucks between Dubbo and Bourke, keeping good time, while thirteen trucks constituted a load between Dubbo and Wellington, so that an engine could take three times the load west that it could take east, and consequently all trains had to be "split up" at Dubbo, and this was one reason why the depôt should be there. It had been stated that Bathurst and Wellington, and Wellington and Nyngan formed fair limits for a day's work, but the deputation urged the division was not equitable, and such sections as Bourke to Nyngan, Nyngan to Dubbo, Dubbo to Orange could be worked cheaper and with much more advantage than the scheme proposed, as the sections would be about equal distances, and Dubbo in particular would be found to be a convenient and economical site for one depôt. It was said further that the local officers were in favour of the retention of Dubbo, and it was understood they had made reports recommending Dubbo as being the most natural and eligible station for the works. At the present time three engines worked the mail trains between Dubbo and Bourke at an expenditure they estimated at £1,255; if the depôt were changed to Wellington they considered four engines would be required, and in addition to the first cost of the extra engine the working expenses would be increased to £1,916 per annum for the mail trains alone on this section, while under the system of working light engines—the engine that ran the down mail to Nyngan, on Friday, would have to return to Wellington, on Saturday, to run the down mail on Sunday; and the engine that took the up mail to Wellington on Sunday, would have to run light back to Nyngan, on Monday, to bring up mail on Tuesday. If any other system were adopted it would require six engines to work the mail.

It had been said that the saving by the adoption of Wellington would be £3,000, but the deputation alleged there would be a loss of £10,000 per annum by extra working if the change were made. It was represented that only on Wednesday last in connection with the stock traffic seven engines had to run from Wellington to Dubbo empty in order to take up the divided loads.

In addition there was abundant evidence that coal existed in the vicinity of Dubbo, and a diamond drill was now being put down to try the seams, and satisfactory results were anticipated; this was an important consideration, and should weigh heavily in favour of Dubbo as the site. Again sooner or later there was bound to be undertaken an extension from Dubbo to Coonamble, and a connecting line from Werris Creek to Dubbo to join the western and northern systems, and this would make Dubbo the most important junction in the west. In view of this it would be unwise to establish a depôt at Wellington as the working would prove both expensive and inconvenient.

In reply I informed them that I intended to give this matter my most serious consideration, and would lose no time in coming to a decision. I had had a deputation from Wellington to see me in the matter, and in connection therewith had looked carefully through the papers, but I find that so far the responsible officers of the Department had reported in favour of the establishment of the depôt at Wellington, and action had been taken accordingly. I had seen no report from the local officers in favour of Dubbo, and was surprised to hear the assertion that they were suppressed; this, however, I felt confident was not a fact, and I promised to have enquiry made to ascertain if reports were made, and, if so, why they were not submitted.

They

They (the deputation) submitted a most exhaustive statement in favour of the claims of Dubbo, and in considering the matter, the facts they had urged would be fully taken into account, and I would obtain a full departmental report as to the merits of their claim. It seemed to me the question in some degree was whether the depôt should be on the top or at the foot of a hill. The arguments they had advanced in regard to the existence of coal in the vicinity of Dubbo, and the probability that it would become an important junction were matters of weight, and would be duly considered. I should be guided not by the interests of Dubbo or Wellington, but by what would be best in the interests of the economical working of the Department; if Wellington offered superior advantages I would unhesitatingly decide in favour of Wellington; but if on the other hand Dubbo seemed to me the best site I would approve of its selection, and the settlement of the question would depend upon what was best in the interests of the Department and the country.

W.J.L., 26/3/86.

No. 22.

Minute by The Chief Clerk.

Locomotive Depôt.—Wellington *versus* Dubbo.

WITH reference to the further papers sent by you to this office in connection with the removal of the locomotive depôt from Dubbo to Wellington, I notice that the copy of the report said to have been sent in by the Shed Inspector Horsefield is absent. The Minister wishes to have a copy of it at once. The matter is urgent, and I shall be glad if you will give it early attention.—D.C.McL., 12/4/86. Locomotive Engineer.

It will be seen by telegram from Inspector Hubbard that there is no report from Mr. Horsefield.—W.S. (per C.A.N.), 14/4/86. Commissioner.

Telegram from Mr. Inspector Hubbard, Dubbo, to Mr. Locomotive Engineer Scott.

14 April, 1886.

YOUR telegram received. There is no report from Shed Inspector Horsefield *re* depôt Dubbo and Wellington.

No. 23.

Précis.

Question of the conflicting claims of Wellington and Dubbo to be adopted as a locomotive depôt on the Western line.

THIS question was probably discussed on papers of an earlier date than any which I have been able to obtain; but the following statement will, I trust, be sufficiently to the point for the Commissioner's purposes.

In June, 1883, a petition was presented to the Minister by certain inhabitants of Wellington, embodying resolutions passed at a public meeting, setting forth (1) that there was abundance of land within the railway reserve at Wellington for the erection of workshops and a depôt; (2) that Wellington was a stopping-place for the engine-drivers and others, and was the proper distance between Bathurst and Nyngan for workshops; and (3) that there were in the neighbourhood extensive mines of coal and copper. For these reasons the petitioners prayed that workshops might be erected there.

The Commissioner minuted that he believed Wellington, from its position in the division of the running, was the best position for running-sheds and depôt. Would Mr. Scott say what has been done, and what was required? Was there a running-shed at Dubbo?

Locomotive Engineer obtained reports on the subject from Mr. Turton, to the effect that the extension Nevertire to Nyngan having been opened, it would be necessary to run the engines in sections, Bathurst to Wellington, and Wellington to Nyngan and return; but this would necessitate the erection of running-sheds at, and the gradual removal of the men to, Wellington, which should be the depôt. Also from the Locomotive Overseer, who minuted that ever since he was on duty at Bathurst it had been evident to him that what Mr. Turton recommended would have to be done as we moved further west.

On the 21st September Mr. Turton further wrote, that it would greatly benefit the Department if the accommodation asked for at Wellington were provided promptly; that the Bathurst men were often much inconvenienced by there being no men from Dubbo to relieve them at Wellington. Temporary sidings and washing out and cleaning appliances might be provided. It would be a good thing for the engines, as they would not pass through so many hands, and the men would be less harassed. The Locomotive Overseer concurred, except in respect of providing any accommodation of a merely temporary character.

Nothing further transpired (so far as the papers show) until the 7th January, 1884, when Mr. Midelton submitted plan No. 867, and stated that it had been found from actual experience that Wellington was the natural place for a locomotive depôt. The Dubbo shed was inconveniently placed for locomotive purposes, and on the completion of the Wellington, arrangements would do for traffic purposes. Went on to describe what he proposed for Wellington. Shed to accommodate sixteen engines, and to be worked by a traverser.

Locomotive Engineer minuted that if four roads were put in, in addition to those shown in the plan, the shed would accommodate twenty-four instead of sixteen engines, and that he did not see the use of a traverser for so small a shed, as it took up one-third of the space without any benefit.

Commissioner minuted (25/1/86) for a detailed estimate and cost of additional roads if traverser were dispensed with. What was cost of Dubbo arrangements? Application was made to the Engineer-in-Chief for amount of expenditure at Dubbo, which was given at £3,447.

Mr. Midelton stated the cost of his scheme for Wellington (duplicate of Goulburn) at £9,065, to hold sixteen engines.

Mr.

Mr. Cowdery did not approve of Mr. Midelton's scheme, and submitted a new plan, with roads to accommodate (without traverser) twelve engines, cost £5,600, with six roads for eighteen engines, cost £7,600. Estimated the cost of Mr. Midelton's scheme at £10,500.

Commissioner minuted Locomotive Engineer to draw up a statement of expenditure to date at Dubbo and Wellington, and to show how many engines could be stabled at each place, and how many were accommodated. If Wellington were made the depôt, what would be done with the buildings at Dubbo? By Mr. Cowdery's plan twelve engines could be accommodated, to be increased to nineteen by extension of shed. How many engines would Mr. Midelton's accommodate? What would be done with the present Wellington shed? Mr. Midelton reported that there was at Dubbo a shed for four engines and none at Wellington; that what he proposed was to build a shed half the size of Goulburn, and to the same plans, for sixteen engines, to be extended at any time and that Mr. Cowdery's scheme was old fashioned; and costly to work, and he did not approve of it at all.

So far as the papers show, no further action was taken at that time.

Soon after the Dubbo claim came on the *tapis*.

Under date of 30th June, 1884, the Council Clerk, Dubbo, wrote to the Minister, offering, by direction of the Council, to give 5 acres of land for the erection of railway workshops. The District Engineer having pointed out to the Mayor (Dubbo) that another piece of land at the disposal of the Council would be more suitable, the Council Clerk again wrote (29/7/84) offering to give the entire area—11 acres 21 perches.

Commissioner minuted that it was proposed to make Wellington the running-shed station; that, on recent papers, he had asked as to the number of engines stabled respectively at Dubbo and Wellington; that, at no distant date, Mudjee would be connected with Wellington by rail, and it was probable the traffic beyond Wellington would be taken by that route to Mudjee, and by the Colo River route to Penrith and thence to Sydney. The line to Coonamble, also, would probably go from Mudjee. Wellington would be a far better changing station than Dubbo. Locomotive Engineer to report.

Locomotive Overseer had also held that Wellington must be the locomotive depôt, and was confirmed in that view by Commissioner's minute. Wellington, Nyngan, and Bourke would be the locomotive depôts west of Bathurst. We already had more land at Dubbo than we should want for some years to come. Locomotive Engineer concurred.

Commissioner minuted that as the land was offered for workshops, its acceptance would be a tacit promise to make Dubbo the changing station, and it would be injudicious to accept the land on that basis.

The Council Clerk was advised accordingly (12/9/84).

On the 3rd September, 1884, Mr. Scott minuted that where there was sufficient land to admit of engines being taken out by points and crossings, he was opposed to the use of a traverser for a small shed like Wellington. Recommended Mr. Cowdery's plan for adoption.

Commissioner referred to Mr. Secretary Wright, who signified his approval.

Mr. Cowdery having recommended inviting tenders for the Wellington shed, Commissioner minuted (26/2/85) that before doing this he would like to know,—

- (1.) What would be done with the Dubbo shed after the completion of the Wellington shed?
- (2.) As there was no shed at Wellington, how were engines now stabled there, cleaned, and would Dubbo shed still be used, and how?
- (3.) How many engines were stabled at each place now? A programme must be prepared of what was being done and required between Bathurst and Byrock or Bourke.

Mr. Scott reported (9/3/85) that no engines were stabled at Wellington. The Bathurst goods engines (twelve in number) ran through to Dubbo because there was no accommodation at Wellington; but as this was too long a run for the men they changed engines with the Dubbo drivers. Only three double trips per week were thus run; but when accommodation was available at Wellington the same engines would be able to do five double journeys a week, and the men would be more easily and advantageously worked. In addition to this three passenger engines ran through to Dubbo. In the Dubbo district there were nine passenger and six goods engines; but the grades being easy many of the passenger engines ran goods trains. The majority of these were now stabled at Dubbo; but as soon as accommodation was available, the Dubbo engines would be removed to Nyngan. On the opening to Bourke the engines would run as under:—Bathurst to Wellington, 104 miles; Wellington to Nyngan, 126 miles; Nyngan to Bourke, 129 miles, which, as the grades between Bathurst and Wellington were heavy, would occupy about the same time.

Commissioner minuted (12/3/85) to call for tenders. The Dubbo shed for four engines not to be disturbed, as it might be required for branch lines.

Tenders were invited accordingly, and the tender of Mr. John Ahearn for the sum of £5,392 14s. 8s. was accepted by Mr. Secretary Wright.

In July of the same year an estimate of £2,767 5s. for a coal stage at Wellington, was recommended by the Commissioner and sanctioned by the Minister.

In October following an expenditure of £358 10s. for laying water pipes was approved by the Commissioner as being part of the work already sanctioned by the Minister.

Under date of 21/11/85 the Commissioner minuted that there was in Dubbo a shed which should not be pulled down, because it would be required when the line was opened to Coonamble. A statement should be furnished showing how the traffic would be worked where the engines would be stabled, &c.

The Locomotive Engineer thereupon requested Inspector Hubbard to state his views; and that officer reported in strong terms against the selection of Wellington as the depôt. Mr. Hubbard stated,—

1. That the scheme of abolishing Dubbo as the depôt was impracticable without entailing a large additional expenditure.
2. That the grades between Dubbo and Wellington were too heavy to admit of taking only half a load, as is brought from Narramine to Dubbo, and *vice versa* (*sic*).
3. Trains arriving from Narramine having to be made into two trains for Wellington, Bathurst, and Penrith.
4. That two additional engines at least would be required to work the mail between Wellington and Nyngan, the present engines not being powerful enough.

5. And that eight or ten additional goods engines would be required at Wellington, as would be seen by the running-sheets for week ending 26th November, 1885, or engines would have to be sent right through from Bathurst to Dubbo, and would require turning, oiling, clearing, and repairing, as was now the case.
6. Mr. Hubbard went on to state on the 20th November seven engines sufficed for the traffic west of Dubbo; while for the same traffic thirteen engines were required from Wellington to Bathurst; that on the 24th six engines hauled the traffic to Dubbo, while fourteen engines were required thence to Wellington.
7. It was not, Mr. Hubbard added, as if there were non-perishable goods, which could be collected at any time by a train running continuously, but there was live stock, which admitted of no delay, and for which a double number of engines must be kept in readiness at Dubbo.
8. Dubbo could no more be abolished as a depôt than could Penrith, without great extra expense.
9. Had arranged with Messrs. Turton and Stanger to run a through train at any time to Wellington, in order that they might see how it worked.
10. The result of having two depôts—Wellington and Dubbo—would be that additional engines and men would be required, and expenditure be largely increased. It was, however, never proposed to have two depôts, one at Wellington and one at Dubbo.
11. Mr. Hubbard continued that the mail between Dubbo and Bourke, 225 miles, worked with three engines of class 14, engines and men working 900 miles a week, would bear comparison with any mail train in Australia or Europe, the cost per train-mile being much less.
12. Wellington should be abolished as a depôt. Engines and men should run through from Bathurst to Dubbo, 133 miles, up one day and down the next, half the men to work from Bathurst and half from Dubbo, by which arrangement the men would be home on Sundays.
13. If objection were made to the length of the run from Bathurst to Dubbo (133 miles), the same objection would apply and with greater force to the run from Wellington to Nyngan (129 miles), it being a much more trying climate. Wellington could only be made a depôt if there were nothing to do—if there were no traffic. The movements of live stock were erratic, and engines were often required at short notice at Dubbo, where they could be more readily obtained than at Wellington. In October and November 2,387 trucks of cattle and sheep had been loaded at Dubbo and stations west of Dubbo.

[*Note.*—The foregoing is the report of Mr. Hubbard which could not be found, and was supposed to have been mislaid, and with regard to which imputations of unfair suppression were made. It was found in the Minister's room on a file of papers referring to Nyngan arrangements, with which it has a remote connection; but no suspicion existed that it was with those papers, and it was quite by accident that it was discovered.]

Mr. Hubbard's report was forwarded by Mr. Scott to Mr. Turton for any remarks he might have to make. Mr. Turton accordingly reported upon the several issues raised by Mr. Hubbard to the following effect:—

1. That Mr. Hubbard did not show why the arrangement of making Wellington a depôt to work the traffic from was impracticable. He (Mr. Turton) was sure expense would be saved by the arrangement, because engines would then be available for stock trains instead of sending them from Bathurst, as was now done.
2. That the gradients between Dubbo and Wellington would be no worse when the latter was made the depôt than they were now, and
3. That trains would always have to be divided at Dubbo or Narramine. It should be done as far as possible at Narramine, the Nyngan engines running on to Wellington with full loads, and the Wellington engines bringing on the remainder as specials.
4. That there was no reason why two additional mail engines should be required between Wellington and Nyngan, two of the express or ordinary bogie engines being able to do the work, thereby relieving two of Hubbard's No. 14 engines. Moreover, it was in contemplation to do away with the mail train between Nyngan and Bourke, and to run a mixed train instead.
5. That in his (Mr. Turton's) opinion the goods engines now stationed at Bathurst were sufficient for the work under proper arrangements. There was one regular goods train and one mail train between Dubbo and Nevertire and Nyngan, and stock specials ran occasionally, but one ordinary engine would take thirty trucks between Narramine and Byrock.
6. It would appear that Mr. Hubbard had too many engines, if his statement were correct that seven engines hauled the traffic west of Dubbo. If this fact were as stated some of Mr. Hubbard's twenty engines should be transferred to Wellington. An engine on the Dubbo to Bourke section was equal to two on the Bathurst section. He (Turton) had thirty-four engines, and he had to run trains to Sydney, Eskbank, Wallerawang, Orange, Wellington, and Dubbo.
7. Whether goods were perishable or not there was more expedition and economy in working trains with engines stationed at Wellington, inasmuch as they could start with a clean fire and ash-pan, and there would be a large saving in freight of coal by coaling at Wellington. Moreover the engines could, if required, make three single or two double journeys in thirty-six hours, a great consideration if we were short of engines.
8. Could see no comparison between Dubbo and Penrith.
9. Could not agree with Mr. Hubbard's views. That officer might have assisted often by sending one of his engines through to Wellington or Bathurst.
10. Saw no reason why the proposed rearrangement of depôts should increase expenditure.
11. It only required a readjustment of engines and men, and for all to exert themselves in the interests of the Department.
12. The best arrangement was for the men to work from Bathurst to Wellington in one day, and from Wellington to Nyngan up one day and down the next with bogie engines.
13. The men had objected to the length of the run—Bathurst to Dubbo, but they had been induced to put up with it.

14. By Mr. Hubbard's own showing he had more engines than he required, and it was not easy to see why Wellington could only be made a depôt if there were no traffic. To meet the erratic movements of the stock traffic, engines could be obtained from Bourke, Nyngan, or Wellington which would save the cost of sending engines empty from Dubbo. The Inspector's office was at Wellington, and more accurate information could be obtained there for making arrangements with Bathurst and stations west. The number of extra engines sent from Bathurst to Dubbo in November was sixty-five, which would further show the desirability of having the depôt at Wellington. Although those engines were required on short notice, Mr. Hubbard only sent one of his engines through to Bathurst.

Mr. Stanger also lodged a report, upon which Mr. Turton's report would seem to have been based; but as the former places some facts in a forcible light, I will give a *resumé* of such of his remarks as seem to have an important bearing on the subject. Mr. Stanger was strongly in favour of the establishment of the depôt at Wellington. He pointed out that under present arrangements an engine passed through the hands of three sets of men, increasing the expenditure to an extent which would horrify the Commissioner. The men had only fifteen minutes at Wellington to examine the engines, which was not sufficient, and the men were often blamed for a mishap which they might have had nothing to do with. Again, the supply of coal taken in would often not last the distance (Bathurst to Dubbo), and ten minutes to twenty-five minutes were lost en route in taking in a supply. With such gradients as existed between Bathurst and Wellington 103 miles, was a fair distance for one trip. A driver should start with a clean fire and empty ash-pan and smoke-box, which would diminish the risk of fires along the line. The gradients could not in any way affect the question, because under any system of working they would remain the same. Mr. Hubbard lost sight of the fact that it would always take double engine-power to work the traffic on the Bathurst side of Dubbo, and the trains would be arranged accordingly. Mr. Hubbard based his argument upon the fact of the live-stock traffic coming on with the wool; but it was not fair, because that was not the normal condition of things, but even so the change would be beneficial. An engine brought into Dubbo (say) twenty-six trucks of sheep; two fresh engines had to be put on there to take the train into Bathurst, and his arrangement would not involve any increased expense; quite the contrary, because at present engines had to be sent from Bathurst to work up stock specials. Mr. Hubbard also lost sight of the fact that under the proposed arrangement there would be a saving of at least £15 a week in coal haulage. Did not believe the mail engines would have to be increased beyond one engine; and was quite sure that the total number of engines between Bathurst and Bourke would not have to be increased. The run from Wellington to Nyngan was clearly not so hard upon the men as that from Bathurst to Dubbo, because the grades in the former were so favourable. During the last three months the live stock traffic had been heavy, and engines had been required on short notice. He had frequently begged Mr. Hubbard to assist by sending one of his engines to Bathurst; but only once had he done so, and then not with his own men, so that it was no help at all. Four engines would be required for the mail from Wellington to Nyngan, more powerful engines; but engines of class 256 would suffice for the purpose, as the sleeping car could be left at Wellington. Mr. Stanger wound up his report by stating that in the last two or three years Mr. Hubbard's views on this subject had undergone a great change, that when the proposed change was first mooted he hailed the project of going to Wellington with delight, and made arrangements to buy land there, and that it was only since he (Stanger) had been stationed at Wellington that Mr. Hubbard had set his face against the establishment of that place as the depôt.

About this time Mr. D. A. Ferguson, M.L.A., inquired of Mr. Secretary Lyne as to the truth of a report which had reached him, to the effect that the workmen and business of the Locomotive Department were about to be located finally at Dubbo, and the Commissioner replied (12/12/85) that there was not any truth in the report.

The matter was soon after brought under the notice of the Minister, in the interests of Dubbo. Under date of 7/2/86, the Secretary of the Dubbo Railway League addressed Sir Patrick Jennings, stating that it was rumoured that the Commissioner for Railways was about to remove the engines from Dubbo to Wellington with the view of making the latter the changing station for the traffic between there and Bourke; that Dubbo had always been the changing station, because it was the starting point for the level country. The heaviest traffic between Dubbo and Bourke had always been done with one engine, but thence to Wellington two and sometimes three were required, and therefore, if Wellington were made the changing station, engines would have to be sent daily from Dubbo to take on the traffic, thus largely increasing the cost of an already costly section.

Mr. Scott, in reply to Commissioner, minuted that on all Railways the practice was to locate the depôts as to equalise the miles worked by the engines, and the number of hours worked by the men. In this view Wellington was the proper place for a depôt. The distances would be Bathurst to Wellington, 103 miles, Wellington to Nyngan, 130 miles, Nyngan to Bourke, 126 miles, and in each case the period of duty of the men would be the same—ten hours. When the Bathurst engines ran on to Dubbo the men petitioned the Commissioner on the subject of long hours; and, with a view to relieve them, the engines were changed at Wellington, the men taking their engines to Dubbo, which involved in nearly every case a third set of men to take the engines back to Wellington, and frequently a fourth set to take them on to Bathurst. This caused much trouble and expense through engines breaking down; and an officer had to be stationed at Wellington to regulate the arrangement. It also elicited a complaint from the Dubbo men that they were kept away from their homes for a number of hours, for which they were not paid. They worked in fact only forty hours, and had to be paid a full week's wages. The contention that the depôt should be at Dubbo, because that was the starting point of the level country, would apply with equal force to Narramine, the change of grade between that place and Dubbo having an equal influence in reducing the hauling power of the engine; and there would in fact be no more empty running by having the depôt at Wellington than if it were at Dubbo. The saving by having the depôt at Wellington instead of at Dubbo would amount to £2,340 per annum.

A letter to the same purport was addressed by the Secretary of the Dubbo League to Mr. Cass, M.L.A., who handed it to the Minister. Mr. Secretary Lyne minuted that nothing further would be done until the question had been more fully considered.

On the 4th March, 1886, a Mr. Davidson addressed a letter to the Minister condemnatory of the proposal to make Wellington the depôt.

On the 12th *idem* a meeting was held in Wellington to protest against the delay in establishing the depôt in that town.

The

The outcome of the meeting was that a deputation, introduced by Mr. Ferguson, M.L.A., waited upon the Minister.

Hereon Mr. Secretary Lyne minuted that the deputation had represented that the decision to have the running sheds at Wellington was due to the recommendation of the responsible officers, on the ground that it was the most suitable location for them, and for the economical working of the line; that, in this view, a running shed and quarters for the men had been erected at Wellington; and that to reverse that decision would sacrifice the outlay. It was further represented that the distance of Wellington from Bathurst made it a fair day's run for engines and men, while Dubbo was too far; and that the climate of Wellington was good, and supplies easily obtained there. That, in regard to the plea that coal could be obtained at Dubbo, this mineral was found near Wellington; and, by the selection of the latter place, some thousands of pounds in the haulage of coal would be saved annually. Moreover, the previous Minister, on the advice of the officers, had approved of Wellington.

Mr. Lyne went on to say that he informed the deputation that he could not at present give a decision, not having had time to peruse the papers; that the matter had first come under his notice when a petition was presented to him by Mr. Ferguson relative to a rumour that the sheds were to be removed—a measure which had not then been entertained; that he heard nothing more about the matter until a deputation waited on the Premier, who made no promise, and had not attempted to influence him (Mr. Lyne), but simply told the deputation that he could only promise that there should be a reconsideration of the matter. That, the Minister continued, was the state of the case. He had informed Mr. Cass that the working of coal in the locality would influence the decision. The saving would be about £2,340 per annum; not so much as had been anticipated. As regarded the men, the feeling did not seem to be unanimous. His decision, which would be given in a few days, would not be given in the interests of Wellington or Dubbo, but of the economical working of the railway.

The partisans of the Dubbo interest next had their turn. On the 26th March a deputation, introduced by Mr. Cass, waited upon the Minister to protest on behalf of Dubbo. The Minister minuted that it was represented by the deputation that five engines had been removed; that, since the removal, two engines had had to run light or empty four days a week, and four or five two days a week between the two places; that one engine could haul thirty-five or forty trucks between Dubbo and Bourke, and keep good time, while thirteen trucks were a load between Dubbo and Wellington, and consequently all trains were split at Dubbo, and that was the reason why the depôt should be there. The deputation urged that Bourke to Nyngan, Nyngan to Dubbo, and thence to Orange would be the most equitable division of sections, and could be worked more cheaply and advantageously than those proposed. The local officers were in favour of Dubbo being the depôt, and had so reported; but their reports had been suppressed. At present three engines worked the mail between Dubbo and Bourke at a cost of £1,255; but if the depôt were at Wellington, four engines would be required at a cost of £1,916 for the mail-trains alone in this section, and that under any other system of working it would take six engines to run the mail. That it had been stated that £3,000 a year would be saved by having the depôt at Wellington; but, on the contrary, £10,000 a year would be expended in extra working if that measure were adopted. The deputation further represented that, on the previous Wednesday, in connection with the stock traffic seven engines had to run empty from Wellington to Dubbo to take up the divided trains; that there was abundant evidence of the existence of coal in the vicinity of Dubbo; and that sooner or later there was bound to be an extension from Dubbo to Coonamble, and also to Werris Creek, which would make Dubbo the most important junction in the west.

The Minister informed the deputation that he would give the matter his most serious consideration; that a deputation from Wellington had waited upon him, and he found, on examining the papers, that the responsible officers of the Department were unanimously in favour of Wellington, and measures had been taken accordingly; that he had seen no reports in favour of Dubbo, and was confident there was no foundation for the assertion that such reports had been suppressed; but inquiry should be made. The deputation had urged the claims of Dubbo exhaustively, and all the facts stated should have full consideration. The presumption of coal existing near Dubbo, and of that place becoming an important junction, would have full weight. He would not decide in the interests of Wellington nor of Dubbo, but would do what was best for the interests of the Department and of the country.

The foregoing is a *précis* of the papers which bear on the subject. There are many newspaper articles dealing with the question; but I have abstained from noticing them, because they do not deal with the real merits, but are of a one-sided character, and would therefore only tend to embarrass a consideration of the case.

The imputation of Inspector Hubbard's report having been suppressed is dealt with at page 18 of this *précis*, where it is shown that the document was fairly dealt with in the ordinary course of business, and that there was no ground whatever for the charge which was made by the Dubbo deputation.

C.A.B., 11/5/86.

No. 24.

Minute by Commissioner for Railways.

I UNDERSTAND that great expense in the management of the Locomotive Branch in the Western District is being incurred, because Mr. Stanger and Mr. Hubbard are not acting in concert.

Mr. Scott will be good enough to suspend both these officers unless they can act in unison. I will not have the public money wasted by their neglect, carelessness, or want of good management.

CH. A.G., 8/6/86.

REPORT by Locomotive Engineer.

IMMEDIATELY upon receipt of this paper I sent for these officers, and distinctly gave them to understand that, unless they acted in harmony, I should be compelled to make a change which would not be to their advantage. They each, in presence of each other, gave expression to their zeal for the interests of the Department influencing them on all occasions. Upon my referring to the article in the *Dubbo Dispatch*, about the unnecessary empty running of engines, and asking if there was any truth in the statement, Mr. Hubbard stated that he thought there was some justification for it, and while disclaiming any knowledge

knowledge of who was supplying information to the newspapers, he thought the making of Wellington a depôt was a mistake. He stated he considered that the proper load for the goods engines run in the district should be thirty live stock vehicles between Dubbo and Narramine; and that should one of the engines be unable to bring such a load, he would conclude it was not in good order. As this assertion was in direct conflict with the opinion of Mr. Stanger (which was supported by Mr. Loughry, whom I specially directed to inquire into the loads for engines in this district), I asked Mr. Hubbard to well consider what he said, pointing out to him the result of previous inquiry; but he still adhered to it, upon which I referred to previous reports on the same subject from Mr. Hubbard himself, wherein he asserted that twenty-six was the load on this section of the line, and asked him to reconcile it with his statement just made, that thirty could be taken and time kept, when he said, after some consideration, that what he meant was that an engine could take thirty, but if run from day to day he considered twenty-six a fair load.

Mr. Stanger asserts most positively that twenty-six live stock vehicles are as many as the 93-class of engine can take on this portion of the district without running considerable risk of losing time (which is very important on a single line, and particularly with live stock traffic), and expressed his desire to have the fullest inquiry made into his management, as he is prepared to justify the running of every light engine in his district.

I instructed both Mr. Hubbard and Mr. Stanger to report fully on the statements made in the *Dubbo Dispatch*, and gave them clearly to understand that the facts should be fully stated, irrespective of the steps taken to make Wellington a locomotive depôt.

When I received the reports, which, I may state, were chiefly confined to a repetition of the statements previously made in my presence, I forwarded Mr. Stanger's report to Mr. Hubbard, and Mr. Hubbard's report to Mr. Stanger, for any comments they might desire to make on them, but I regret to say the result has not been at all satisfactory, as they still adhere to their previous assertions, which are of a most conflicting nature. As Mr. Hubbard stated he could not particularly point out cases where an assisting engine had been sent unnecessarily, I could not decide if such had been done without I accepted Mr. Stanger's unsupported statements, so I have given instructions for a return to be compiled from the drivers' daily report sheets (which are in this office) showing the number of assisting engines run during three months of 1885 (when Mr. Hubbard had control), compared with the number run during a like period of the present year; also the load in each case, and the cause of detention of such trains, if any existed.

The great importance of this case, which has such a very important bearing upon the welfare of the Department, and the belief that the facts can only be arrived at by a searching inquiry on the spot, where testimony can be obtained from traffic officials, as well as those who work and are responsible for working the engines, induces me to recommend that a Board, representing both Traffic and Locomotive Branches, be appointed to investigate the matter thoroughly. Although not specially relating to the unnecessary light running of engines, which is said to be the practice, I submit that the causes which led to the making of Wellington a locomotive depôt should not be overlooked, as there is little doubt the jealousies that exist between the residents of Dubbo and Wellington about the best position for locomotive depôt will form a lasting subject for newspaper criticisms.

The Commissioner.

W. SCOTT, 28/6/86.

Minute by The Commissioner for Railways.

I WILL not comment upon the state of affairs which these papers disclose until the inquiry suggested has taken place.

I approve of the recommendation that the inquiry be remitted to locomotive and traffic officers who will be most at liberty and capable of conducting this inquiry.

I should like officers to be selected whose status is higher than that held by the Locomotive Inspectors.

CH. A.G.

Locomotive Engineer to arrange for the inquiry.—D.C.M'L., 30/6/86. Mr. Cobb will represent this branch. Please appoint an officer of your own branch.—W. SCOTT, 2/7/86. Traffic Manager. Mr. Richardson will represent this branch.—W. V. READ., 4/7/86.

Report from Messrs. Richardson and Cobb herewith. It appears that Mr. Hubbard without being able to bring anything forward in support of his views, considers that the statements in the *Dubbo Dispatch* are well grounded. Mr. Stanger on the contrary has satisfied the Board that the statements were inaccurate in most instances, and that when engines have been run light it was unavoidable, and would have to be done irrespective of whether the depôt was at Dubbo or Wellington. It is evident that until one of these inspectors is stationed at Nyngan, as I before recommended, there will be conflict between them which will be prejudicial to the best interests of the Department.—W. SCOTT, 16/7/86. Commissioner.

REPORT by Board appointed to inquire into alleged unnecessary running of light engines.

IN accordance with instructions we proceeded to Wellington and Dubbo on Wednesday night last, to inquire into the subject matter of an article in the *Dubbo Dispatch* of 8th June *re* alleged unnecessary running of light engines in May, caused through removal of engine-sheds from Dubbo to Wellington. From a perusal of the locomotive books at Wellington, and the traffic books at Dubbo, we find that twenty-six light engines (goods) were run between Wellington and Dubbo in the month of May, as under:—

1	May, Dubbo to Wellington, 3 engines.	17	May, Wellington to Dubbo, 1 engine.
4	" Wellington to Dubbo, 1 engine.	18	" " " 2 engines.
5	" " " 1 "	20	" Dubbo to Wellington, 1 engine.
6	" Dubbo to Wellington, 1 "	21	" " " 1 "
7	" " " 1 "	22	" " " 1 "
7	" Wellington to Dubbo, 1 "	25	" Wellington to Dubbo, 1 "
11	" " " 3 engines.	27	" " " 1 "
11	" Dubbo to Wellington, 1 engine.	28	" " " 2 engines.
12	" " " 1 "	31	" " " 1 engine.
12	" Wellington to Dubbo, 1 "		
15	" " " 1 "		
		Total 26 engines.

With

With the exception of two engines which ran on 11th and 12th May, caused by the night officer, Dubbo, not sending telegrams in time, the whole of the light engines run were unavoidable. For illustration take the three on 1st May:—two ran with double loads on No. 1 down on night of 30th April, and one to assist No. 29 down on 1st May, and there being no corresponding up traffic on 1st, 2nd, or 3rd engines had to return empty. On 18th May, there were two light engines on down journey, there being only fifty-six trucks on down journey, and 100 trucks on the up. Again on the 28th May there were two light engines on down journey; but there were only eighty-nine trucks against 115 trucks on the up journey. It is, therefore, absolutely necessary an engine must run light one direction or the other, whether engines are at Wellington, Dubbo, or Bathurst. In the first case mentioned, viz., 1st May, if engines had been stationed at Dubbo they would have to have been sent empty in first place to Wellington to bring in down traffic; or if engine had run through from Bathurst to Dubbo, they would have had to return empty. The same thing applies to both other cases referred to on the 18th and 28th. If engines had been stationed at Dubbo they would have started loaded from Dubbo, but would have to have returned empty. The removal of the engines from Dubbo to Wellington causes no additional light running, as stated by Dubbo newspaper; but it equalizes the work of drivers and mileage of engines, as the distance from Wellington to Bathurst is 104 miles, with fifteen staff stations to work, and on heavy grades throughout; and from Wellington to Nyngan is 129 miles, but grades are easy, and only eight stations. Some time ago the goods engines ran through from Bathurst to Dubbo; but it was found the men could not do the work, and they had to be changed at Wellington, and men had to be brought as passengers from Dubbo to run the trains on. This cost great expense, besides rendering it impossible to fix the blame upon anyone for damage done to engines. Having the depôt at Wellington saves at least two trains per week in the haulage of coal between Wellington and Dubbo, as engines can coal at Wellington; and if they cannot carry quite sufficient for run from Wellington to Nyngan and back, they could take a little coal, not more than one-fifth they now take at Dubbo.

With reference to Mr. Stanger's reply to the remarks in the *Dubbo Dispatch* we find that all he says is borne out by facts and records of the office. He keeps a record of the movements, and loads of every engine under his control. Mr. Hubbard, however, keeps no records, and was unable to give us a single instance of unavoidable light running as he says he kept no record, but based his report upon hearsay, and on broad grounds as he calls it. In his report of 16/6/86 referring to the article in Dubbo newspaper, he says the station-master told him fifty-five light engines had run between Dubbo and Wellington in May last, but on perusal of traffic books we find they agree with Mr. Stanger, and show only twenty-six. He also says that if Wellington is made the depôt for engines it will still be necessary to keep the large staff of workmen at Dubbo. We fail to see why, when the engines are removed from there it will require a staff of mechanics. Concerning engines from Wellington having often to be detained for loads, same thing would apply to them if at Dubbo; they would have to wait, but at other end of section. We cannot agree with Mr. Hubbard when he says that if mail is run with engines from Wellington it will require three and three sets of men. Two are now used, and only two would then be required, and men would be away from home only one night per week. We cannot understand Mr. Hubbard's remarks *re* coaling; why should he have to haul coals to Nyngan to coal engines which start from Wellington? They would coal at Wellington, and if required could take a little more at Dubbo, certainly not have to go to Nyngan for it. Mr. Hubbard in his verbal statement to us said he was sure the locomotive charges, since removal of engines to Wellington, were very much higher than before. We have referred to the accounts in Locomotive Engineer's Office, Sydney, and find the charges in May, 1885, between Bathurst and Byrock were £3,296, and in May, 1886, £3,548, or an increase of £250; but in the latter there are 48 miles more of line to work, which at £10 12s. per mile would increase the expenses to over £500, instead of which it is only £250. £10 12s. is the locomotive charges per mile open in May, 1885, between Bathurst and Byrock. We have not gone fully into each item mentioned in article of the *Dubbo Dispatch*, as we have satisfied ourselves Mr. Stanger has answered them thoroughly and correctly.

JOHN COBB.
HARRY RICHARDSON.

14/7/87.

[Extract from *The Dubbo Dispatch*.]

Economy with a vengeance.

THE Minister for Works and the Commissioner complain that our railways do not pay. Considering the way in which the Locomotive Department is managing matters on this line, it would be wonderful indeed if the railways would pay. During the month of May, we have ascertained that at least forty engines ran light from Wellington to Narramine or Dubbo. As each of these engines costs 3s. per mile to run, and as owing to their removal from Dubbo to Wellington, there were 30 miles of running, which would have been unnecessary if the engines had remained here, there is a dead loss of £4 10s. per run, or £180 for the month. Further than this, the locomotive authorities, in order to bolster up their Wellington blunder, have issued instructions which make running between Dubbo and Bourke nearly twice as expensive as it used to be. A few months ago it was a common thing for a single engine to bring in thirty-three laden trucks from Narramine to Dubbo. As only thirteen can be taken from Dubbo to Wellington, this necessitated three engines to take the load from here that one brought. So as to make the running of light engines as unnecessary as possible, orders were recently issued that only twenty-six trucks were to be brought from Narramine. An instance of how that worked occurred on Friday last. Train No. 68 with stock had twenty-seven trucks on at Narramine; but as one truck more than the regulation number was on, an engine was sent right from Wellington to help on 68. Actually an engine was run light 50 miles at a cost of £10 10s. to bring a load that one engine could, with perfect ease, have brought here. Of course, the object is obvious, the more so when the subsequent facts are taken into consideration. The engine load from Dubbo to Wellington is set down by the same orders at thirteen trucks. When the twenty-seven trucks reached here on Friday, the load was divided, and although on the light gradient, where thirty-three trucks have often been brought with one engine, it was thought advisable by the Wellington Inspector to send an extra engine to bring on twenty-seven trucks. Yet the regulation is immediately broken here, and fourteen trucks sent with one engine to Wellington. Why this inconsistency? why thus sticking to the general order, when over a light gradient, where the engine could not possibly be strained, and thus ignoring of it over the heavy gradient, where there was every possibility of hurting the engine? The motive is as plain as a pike-staff. It must be as obvious to Messrs. Lyne and Goodchap as ourselves

ourselves. It seems the veriest farce, the Minister and the Commissioner cudgelling their brains over time-tables, designed to save a few pounds, while here under their very eyes, there is a loss last month of £180, and a loss that will increase as the traffic augments. On June 2nd, five light engines ran, and when the wool commences to come in and stock to travel, that will be a daily occurrence. We should think these facts, which are under rather than over-stated, ought to hasten the Minister's decision as to the relative merits of Dubbo and Wellington, as the site of changing sheds. The Wellington blunder has already cost the country enough. Perpetuating it is only throwing good money after bad.

With Mr. Morgan's compliments to the Commissioner.

I heard of this blundering or more than blundering from another source this morning, and wrote a minute to the Locomotive Engineer on the subject. I will not allow Mr. Stanger or Mr. Hubbard to play ducks and drakes with the revenue to carry out any scheme which either may favour. Mr. Scott will at once inquire into this representation and take immediate steps to end this folly.—CH. A.G., 8/6/86. Please see my report on your 86-9,400 of this date.—W.L., *per* R.E.S., 28/6/86. The Commissioner.

No. 25.

Memo. from Mr. Inspector Stanger.

Sir,

Locomotive Engineer's Branch, Wellington.

Whilst I am preparing my report upon Wellington as a locomotive depôt, &c., I would suggest that Mr. Turton be invited to furnish a report upon the improvement or otherwise that he finds in the running of his engines and men now that they go no further than Wellington. As the change was made principally with the object of removing various objections in the old system, I imagine that such report from Mr. Turton would be of the greatest value.

Locomotive Engineer.

C. H. STANGER,
12/6/86.

Although the information referred to is not required specially it may serve to throw some additional light on the working, I shall therefore be glad if Mr. Turton will furnish a report showing the result of the change by Wellington having been made a depôt.—W. SCOTT, *per* R.J.S., 15/6/86. Mr. Turton.

Report attached.—J. TURTON, 17/6/86.

Sir,

Locomotive Engineer's Office, Bathurst.

Re your M.P. 86-3,064, dated 14th instant, *re* the benefit derived from the locomotive depôt being established at Wellington, I have to report as follows:—There are very few complaints from the men in consequence of working long hours, as used to prevail before it was, or disputes as to damage to engines, which also were of common occurrence, making it impossible in many cases to bring home to offenders the punishment due to them. The engines now rarely pass through the hands of two sets of men from time of departure to return to Bathurst, as the men who run them down return with them the same or next day. This effects a saving of stores and cost of repairs through damage to engines and failures on the road of, I am sure, considerable value. Fewer engines are now run light or attached each way between Bathurst and Dubbo, as Mr. Stanger, in emergency, sends his engines to Bathurst as pilot, or with special or other trains, he having sent fourteen so during the period, 1st March to 16th June, 1886, whilst in the corresponding period of 1885 Mr. Hubbard only sent four. This shows considerable benefit to the Department, as engines were often sent from Bathurst to Wellington or Dubbo, and returned light or attached to light trains, and sometimes were detained at Dubbo for several days against my repeated remonstrations. There is also an absence of detention of trains at Wellington on down, and Orange on up trip, through engines having to take coal in transit, as they frequently had formerly to do. There is also a saving of time in not having to clean fires on up trip at Store Creek, which was a source of frequent detention and inconvenience to traffic. There is also an absence of disputes that used to take place between the men when changing at Wellington, which were a source of continued annoyance. I consider the establishment of Wellington depôt for the true interests of the Department, and has proved itself so to the present.

Locomotive Engineer.

J. TURTON.
17/6/86.

No. 26.

Messrs. Inspectors Hubbard and Stanger to The Locomotive Engineer.

Sir,

Locomotive Engineer's Branch, Dubbo.

In obedience to your instructions, given to me at Sydney, on 11th June, 1886, to furnish a further report on the respective merits of Dubbo and Wellington as the best and most economical place for a permanent locomotive depôt, I beg to say that all my previous reports in this matter have been confirmed, in my opinion, from the experience gained since Wellington engines have been running to Nyngan, since middle of February last, now nearly four months. I am satisfied that Dubbo is the best place, and as I have already stated, it is just as reasonable to remove locomotive depôt from Penrith or Picton as to remove locomotive depôt from Dubbo. The station-master assures me there were at least fifty-five light engines run between Wellington and Dubbo during the past month (May). How many more would have been required you might judge by referring to the large number (237) of copies of telegrams, &c, attached. Assuming that Dubbo depôt had been closed, and no engines available at Dubbo to pick up the running, the number of light engines would have been much greater.

The question now resolves itself into this:—Assuming that Dubbo is closed as a locomotive depôt (which I maintain is an impossibility), there must still be a staff of hands—examiners, oilers, fuelmen, &c., &c., stationed here. The boiler-maker, two fitters and mates, of course, could either do their work at Nyngan or Dubbo; but such a large number of engines coming to Dubbo would require someone to attend to them.

Wellington

Wellington men and engines laying over at Dubbo from one day to another to save light running expense, and incurring expenses so laying over and proceeding west towards Nyngan the following day, makes other expenses to be allowed to the men shunting engine, and men required at Dubbo.

C Mail engines changed at Wellington would require three sets of men, and three engines besides that, others having to be used from Nyngan to Bourke.

Specials required from Dubbo to Narramine, assisting engines, &c., &c.

E Also night shed men would still be required if depôt was removed from here (same as now) to save Wellington men from making excessive overtime. Wellington men are delayed here for hours at a time, or working on their engines. Other times they are booked off here until the following day, then proceed to Nyngan or Nevertire, incurring more expense than if the engines and men were stationed at Dubbo.

B You will easily see by scanning over the large number of copies of telegrams, &c., that the above are facts without any exaggeration, and which cannot be disputed; and that on several occasions Dubbo engines and men have been used to run trains both east and west of Dubbo, owing to no Wellington engines being at Dubbo to take up the running. I am of opinion now—same as before—one or two, or even three or four, loaded stock trucks, in addition to twenty-six (the ordinary load) in cases of emergency, can be brought comfortably from Narramine to Dubbo without much loss of time (if any) with good management, and the engine is in fair order. On 2nd October, 1885, driver Richard Tate, with engine No. 15, class 14, brought from Narramine to Dubbo fifteen loaded trucks of live stock without any difficulty.

D Coal haulage is another important item. Now, as the Wellington engines (except the Bathurst mails) have not to be coaled at Dubbo, the coal must be hauled to Nyngan, 99 miles further west; and, on occasions of engines running to Nevertire, occasionally require coal at Dubbo, either before or after returning, before they can go on to Wellington. Coals have also to be taken occasionally at Dubbo by engines running from Wellington to Nyngan and *vice versa*; in fact, if it was not for Dubbo being in the position it is in, Wellington could not be worked at all, unless by an increase in the number of men, and a corresponding increase in the working expenses, to carry on the traffic.

I may here illustrate a little story in support of Dubbo in preference to Wellington as a depôt. For instance, suppose that I am Cobb & Co., general carriers. From Nyngan to Dubbo one horse is sufficient, from Dubbo to Wellington requires two horses; which of the two named places would be the most suitable and economical for my stables? Most assuredly I would say Dubbo, to save the horse travelling 30 miles before he commences his work, as well as exhaustion, and taking my chance of the back loading. The most economical place to keep either horses or engines would, in my opinion, be the place where the heavy work always commences; my horses or engines are then always fresh, and ready on the spot to

F meet the exigencies of the traffic.

Wellington, under other circumstances, would be an excellent place for a locomotive depôt; but, at present, the circumstances do not exist, and, therefore, Dubbo is the most suitable place. If the gradients were cut down, so that the same load could be taken on to Wellington as is brought to Dubbo by the same engine, then Wellington would answer very well.

If it is considered advisable to make a changing station between Bathurst and Dubbo, then Orange would be the best place, as the gradients, both east and west, are about equal. A round trip from Bathurst to Orange and back, and a single trip from Orange to Dubbo; but, as stated in my previous reports, running the engines right through from Bathurst to Dubbo and *vice versa* is, I believe, far the best and most economical plan, requiring a less number of engines to do the same work.

I think a perusal of the telegrams will clear up any misunderstanding that might exist, and show that Dubbo must be the locomotive depôt, if economy of working is to be the standard.

J. P. HUBBARD,

Locomotive Engineer.

16/6/86.

I forward this report for any comments you may desire to make upon the several matters dealt with in it. I have sent yours to Mr. Hubbard in like manner.—W. SCOTT, 21/6/16. Mr. Stanger. Reply herewith. I would particularly wish to call your attention to the paragraph in Mr. Hubbard's report which I have marked c. I do not think it well to trouble you with a mass of papers; but I can, if required, prove all the assertions made in my reports.—C. H. STANGER, 24/6/86. Locomotive Engineer.

Comments on Mr. Hubbard's report of 16/6/86, in reference to Dubbo or Wellington as a Locomotive Depôt.

I AM very glad to have the opportunity of commenting on and correcting some of the statements in Mr. Hubbard's report of the 16th instant.

For convenience of reference I have placed capital letters against the sentences I refer to, and corresponding letters against my remarks.

(A) The total number of light Wellington engines run during month of May was forty-eight, and I think it strange that Mr. Hubbard should prefer to obtain information as to the number of light engines from the station-master at Dubbo, and to make use of that information, when I, on the 15th instant, sent to him, in accordance with a promise made in Sydney in your presence on the 11th instant, a statement showing the numbers of the light engines, the names of their drivers, and the stations between which they ran for the month of May. Had Mr. Hubbard made use of that official document, he would have found that instead of fifty-five only twenty-six engines ran light between Wellington and Dubbo, though it is not perhaps surprising that he prefers to make use of the larger number.

(B.) Mr. Hubbard's method of putting in with his report that huge bundle of telegrams, &c., is most misleading and unfair; he quotes the number, 237, but numbers 207 and 208 are missing. These papers instead of each referring to separate cases, as Mr. Hubbard seems to imply, do nothing of the kind. For instance, Nos. 200, 201, 202, 203, 204, all refer to the working of one train, as also do Nos. 143, 144, 215, 216, and Nos. 221, 222, 223, and so on in many other instances. It really appears as though Mr. Hubbard expected these telegrams, &c., to carry weight from their bulk. If they are intended to show that some engine power is necessary in Dubbo they are unnecessary, as I have already admitted that. Many of these papers are altogether irrelevant; some are from driver in charge at Nyngan to Mr. Hubbard. I have spent hours in going through them, and if they are intended to show neglect or bad management on my part, I submit that with the exception of two instances they fail; these two cases are those shown in Nos. 104, and 221, 222, 223. (C.)

(C.) I cannot conceive how Mr. Hubbard can dare to state this when he well knows from January to August, 1884, the mail was worked between Wellington and Nyngan by two engines and two sets of men.

(D.) As regards this, I very much regret that in pointing out the saving made in coaling at Wellington, I omitted to allow for the cost of haulage of the extra coal now required to be put on the engines at Nyngan; this during month of May amounted to about £17, and must be set off against the saving to the extent of £75 for same month, made by coaling engines at Wellington.

(E.) Great difficulty has been found in working the traffic under the old time-table; but I believe the new one will simplify matters. At the worst I do not believe the present system, with all its faults, is more expensive than the old ones between Wellington and Nyngan, whilst the advantages to the Bathurst District are enormous.

In any case, when both Dubbo and Wellington are under one Locomotive Inspector a great improvement must ensue. I would here mention that if a siding, as has been suggested, is put in at 287 miles, it will, roughly speaking, halve the cost of working Dubbo and Narramine.

(F.) It is strange that although Mr. Hubbard lays so much stress upon the advantages of putting engines on fresh at Dubbo during the months of September, October, and November last year, when he had control of providing the engine power for the up trains to Bathurst, when both engines and men were overworked and though I frequently begged him to assist by sending one of his engines to Bathurst when one was required at short notice, Mr. Hubbard only once during those three months sent one of his engines to Bathurst.

Locomotive Engineer.

C. H. STANGER, 24/6/86.

WELLINGTON as a Locomotive Depot.

IN reporting as to whether the present system of working the trains between Wellington, Dubbo, and Nyngan, by engines and men stationed at Wellington, is any improvement upon the other systems previously tried, I think it well as briefly as possible to describe those other arrangements.

When the line was opened to Dubbo, the trains were, I believe, worked by engines and men stationed at Bathurst running through to Dubbo one day and back the next. This practice had at last to be stopped, owing to the men complaining to the Commissioner of the long hours. Then men were sent to Dubbo to meet the trains at Wellington, taking over the engines from the Bathurst men, and working the trains between Wellington and Dubbo. This changing at Wellington was regulated from Dubbo, and often the greatest confusion prevailed. It was no uncommon thing for a set of Dubbo men to be ordered to work a train through from Dubbo to Bathurst, leaving the Bathurst men, who had worked the engine to Wellington on the down trip, to go into Dubbo to do shed duty. Having done this, they would often travel to Wellington in the brake-van of an up goods train, and on arrival at Wellington would take the engine and work the train on to Bathurst, the Dubbo men who had worked the train to Wellington often returning as passengers; thus men would travel both ways "passengers" needlessly. Serious disputes often arose between drivers about any damage done to an engine, the men who delivered up the engine saying all was right, and the other side maintaining the engine was in that damaged condition when they took charge. Considerable inconvenience was also experienced at Bathurst through instructions relating to the working of the engines and men not being carried out. To meet this difficulty, it was decided in the beginning of 1884 to send me to Wellington to look after the interests of the Department by seeing that no time was lost in changing the men, and also by seeing the condition the engines were in when handed over from one driver to another. This mode of working continued for about eighteen months after my arrival, when the Dubbo men petitioned the Commissioner about the time they lost in Wellington when waiting for return trains. They represented that they were often away from home (say) twelve hours, and only made about six hours' time; and to make a full week they were nearly always away from home. Mr. Cobb came up to inquire into this grievance among others, and, if possible, to find a remedy, when I suggested that the men should live at Wellington instead of Dubbo, and that they should be considered on duty all the time they were away from home, with the exception of reasonable meal-hours. As the Bathurst engines then stood at Dubbo when waiting for return trains, it was possible for the men to be employed on shed duty to these engines in Dubbo; this was found to be a decided improvement. Up to this, from the opening of the line, the trains had been worked by one engine from Bathurst to Dubbo, and fifteen minutes at the least was taken up in handing over the engine from one set of men to another. Between leaving the shed at Bathurst and returning to it an engine always passed through the hands of three, and often four sets of men. It would be difficult to show exactly what this meant in increased repairs, but it was very heavy. Again, it frequently happened that some mishap occurred to an engine immediately after leaving Wellington, when the driver in charge of the engine at the time was held responsible, though possibly the mischief began hours before, and often the man had not had time to properly examine the engine before leaving Wellington. Another objection to sending the engines through was that they often had not enough coal on them, and then from ten to fifteen minutes would be lost here taking coal. These objections were so weighty, that in December last Mr. Turton, whose district then extended to Dubbo, took the opportunity of some new sidings here being ready for use to station four engines here to work the trains to and from Dubbo. This plan answered well; the Bathurst engines remained in the hands of one set of men during the round trip, and great benefit was found to result from the engines being clean when going on to the trains at Wellington, 103 miles over such gradients as exist between Wellington and Bathurst being quite enough for an engine for one trip. When more accommodation was ready here, the original intention was carried out; and five engines with men being transferred from Dubbo, the whole of the goods traffic to Nyngan was worked from Wellington. This system is still in operation, and I have no hesitation in saying is the best that has yet been tried. Roughly speaking, an engine can take double the load west of Dubbo that it can take on this side. The engine of the through down train, on arrival at Dubbo, has its load made up with the through portion of a preceding train which ran no further than Dubbo. In the same way the load of an up through train is divided in Dubbo; one portion coming through at once, and the other forming a load for a train which commences its journey at Dubbo. It is absurd for anyone to say that a greater total amount of engine power is required in working from Wellington. So long as the gradients between Wellington and Dubbo remain the same, the location of the engine power cannot affect the amount required.

I think it would be well if the Traffic Department were asked if they find any improvement in the running of the trains between Dubbo and Bathurst. I have reason to believe they find a great improvement since the engines were changed at Wellington. In the first place, five minutes suffices for changing the engines, whereas fifteen used to be required. Then time is saved at Store Creek, where the engines used to rake out when they had to run through from Dubbo, and better running time is kept, the engine having a clean fire, &c.

As Wellington has been made a depôt chiefly with the object of improving the working of the Bathurst men and engines, Mr. Turton's report upon the result, after the six months' trial which has elapsed, would be very valuable at this time.

It has been represented that the run from Wellington to Nyngan, 129 miles, is equally hard on the men, as the run from Bathurst to Dubbo, 133 miles, but this is not correct. In the first place, the time occupied between Wellington and Nyngan is two hours less, and in the next, the work is much lighter for three-fourths of the journey.

One point should not be overlooked, and that is, that there is a saving of about £75 each month in the freight on the haulage of coal, about 600 tons, that had to be taken to Dubbo before Wellington was made a depôt, for the Bathurst engines to work the up trains to Bathurst and for the Dubbo engines to work the down trains to Nyngan, is now only carried to Wellington, and the freight on this between Wellington and Nyngan is saved.

The full benefit of the change will not be felt until it is completed, and the mail engines changed here, and the Dubbo depôt moved on to Nyngan. One engine will need to be left in Dubbo. A powerful passenger engine will be the most suitable to do any shunting in Dubbo yard, to assist trains to and from Narramine, and also occasionally to run out to Trangie or Nevertire for light loads of live stock, &c.

Certain alterations, I believe, have been made in the new time table about to come into force, which, although not made with that object, will greatly assist the working of this Department over this district. These alterations will also to a great extent remove the one objection to the present system that I am now about to allude to, and I think it only right that, having pointed out the benefits of the new system, I should also point out the one drawback, viz., that there is now more light running between Wellington and Dubbo than there was. It is caused in this way:—Nine, or at the most ten, engines are sufficient to work the traffic between Wellington and Nyngan in its present condition; it happens often that five of these engines are away at Nyngan, and, at the same time, there may be a rush of down traffic, then the remaining engines, after working down trains to Dubbo, have to return light to Wellington to work other down trains. This light running, which I admit to be due to the present system of working, amounted in the month of May to 270 miles, which at 15s. 2d. per mile, amounts to £17 8s. 9d., less than one fourth of what is saved in the haulage of coal.

In conclusion, Sir, I hope and think I have a right to expect that it will not be thought I am advocating Wellington as the depôt from any personal motives; it is, on the contrary, only because I see, as an experienced railway man, that the advantages in favour of it as against Dubbo are overwhelming. For myself, I am ready to go to-morrow to any part of the line you may see fit to send me to.

Locomotive Engineer.

C. H. STANGER, 16/6/86.

Alleged extravagant working of Live Stock Trains between Narramine and Dubbo.

BEING called upon to explain my action with regard to the working of the live stock trains between Narramine and Dubbo, and also to show cause why I should not be suspended for that line of action, I beg to submit the following:—

As I believe an article in the *Dubbo Dispatch* of the 8th instant, headed "Economy with a vengeance," has led the Commissioner to take this course with regard to me, I think it well to deal with that article first. For convenience of reference, I have placed a number against each assertion on the attached copy, and will deal with them each in order.

1. Strange to say is under the mark, as forty-eight light engines ran during May, eight more than stated.
2. Is, of course, exaggerated, as the cost of running an engine is not 3s., but 1s. 3½d. a mile.
3. Is also a gross exaggeration. Only nine of these light engines would have been saved if the engines remained in Dubbo.
4. I need only state to be grossly untrue.
5. Is also untrue, as live stock are evidently meant when thirty-three trucks are mentioned. I cannot find any evidence of more than twenty-eight trucks having ever been taken by one engine between Narramine and Dubbo.
6. This also is untrue, as fourteen trucks of live stock have now been taken for six months regularly between Dubbo and Wellington.
7. The reasons given for this order are incorrect.
8. It is true that No. 68 up, on Friday, the 4th instant, had twenty-seven trucks of live stock on, but it is not true that an engine was sent light from Wellington to Narramine (50 miles) for this.
9. Is also incorrect, as the orders concerning the loads referred to did not apply to this side of Dubbo.
10. Is similar to No. 5, and the same answer applies.
11. No regulation was broken in this.
12. Hardly requires an answer.
13. Is grossly untrue.
14. Is in keeping with the other assertions; one light engine ran on 2nd June, not five.

There are two points in particular in this article, that probably have led to the Commissioner taking the action he has:—One is (I have placed a mark A against the paragraph), where it states that thirty-three trucks of live stock used to be a load, and that now only twenty-six are taken; the other is (marked B) that I sent an engine light from Wellington to Narramine to assist a train with only twenty-seven on. Both of these will bear investigation.

When I took over the working of the trains to Nyngan, in February last, I found that the greatest uncertainty prevailed as to what constituted a load. I thereupon set to work to determine the most profitable loads, having due regard to safety, efficiency, and economy. This I did by theory first. Calculating the power of engines, class 93, which are those used in this district, I found that on a 1 in 40 gradient (of which there

there are several between Wellington and Dubbo), after making the proper allowance for the internal friction of the engine, that 143 tons, exclusive of the weight of the engine itself, was the theoretical load at ten miles an hour. Now, 14 trucks of live stock and a brake van weigh 145 tons, and this load, from everyday experience, we find to be the utmost that these engines can take over 1 in 40 gradients; so here theory and practice are pretty well agreed.

The heaviest gradient west of Dubbo is between mileage 282.30 and 283.40, and is 1 in 55, being a little over a mile long. Using the same figures as in calculating the loads for the 1 in 40 gradients, it will be found that 203 tons, exclusive of the weight of the engine itself, is the theoretical, at 10 miles per hour. This is equal to twenty trucks of live stock and a brake-van; but, of course, on a short gradient, only a little over a mile long, a greater load can be taken than over one 3 miles long. In this case, it is approached by a falling gradient of 1 in 120, about $1\frac{1}{2}$ miles long; for this I allowed 25 per cent., making the load 25 trucks of live stock and the brake van. This was the result I got from theory alone. Having heard that 26 trucks and the brake-van had been a common load, and that twenty-seven trucks had been taken, I questioned some of the drivers. All admitted that twenty-six trucks could be taken in the time allowed, but that it was a heavy load; also, that twenty-seven had been taken with some lost time; moreover, that on one occasion twenty-eight had been taken, but with the greatest difficulty and risk. I could hear nothing of more than twenty-eight having been taken with one engine. On the 4th May last, No. 60 up live stock train was arranged to run with thirty trucks. I arranged for an assisting engine to go to Narramine, but through some oversight among the traffic people this engine, although in readiness in Dubbo, was not sent out. On arrival at Narramine the driver, W. Young, of No. 60, having a remarkably good engine (No. 95), started away with the thirty trucks. He lost a lot of time before reaching the 1 in 55 bank, and had only got a little way up when the up mail caught up to No. 60, and had to push the live stock train over the bank. This shows conclusively how much beyond the power of the engine is a load of thirty trucks. I attach the driver's report. The time allowed to these fast live stock trains is one hour for the 22 miles from Narramine to Dubbo. Having regard to the importance of these trains not being delayed, and also remembering that only two years since a Royal Commission inquired into this matter, I consider I was only studying the interests of the Department in trying to get such a load fixed, as the engines could keep time with without running down hill with these heavy loads at a dangerous pace. Should anything occur to make it suddenly necessary to pull up at the foot of the 1 in 120 bank, the driver, with the brake power at his command, could not possibly do so. I therefore submitted to you a list of such loads as can be efficiently worked, which, with very little alteration, you were pleased to approve of.

To make sure of my ground before writing this, I went to Narramine on Monday last, and in company with Mr. Hornidge returned in the brake van of No. 68 up, which train had twenty-seven trucks of live stock on. Although it was a fine dry night and an engine in good order was on the train, and after running down the 1 in 120 gradient with steam on at about 4.5 miles an hour we only crawled up the latter half of the 1 in 55 bank at about 4 miles an hour, and although the driver did his best and had his engine in full gear, with plenty of steam, eleven minutes was lost thus, also clearly showing that twenty-seven is too many for keeping good time and for safe working.

When a train is arranged to run with a certain number of trucks we can never depend upon that number being adhered to. Possibly an earlier train has started with one less than its number or a truck on that train has been put off at some station with hot boxes to be taken on by a later train. In many other ways an additional truck may be unexpectedly put on to a train. Then if this train has been arranged for to take twenty-six, the extra truck making twenty-seven, can be brought, but if the train was arranged to take twenty-seven and an extra truck put, most serious consequences might follow. It is for these reasons that I considered it advisable, as charged against me in paragraph B in the article in *Dubbo Dispatch*, to send out to Narramine an engine to assist a train when there are twenty-seven trucks on. On the occasion referred to, No. 68 up on 4th June, the engine did not run light from Wellington, but worked No. 29 down goods to Dubbo, and then ran light to Narramine from Dubbo. Supposing this sending the engine to Narramine was unnecessary, the actual expense incurred was £2 16s. 10d.; but as the men would have been paid their wages in any case, that amount (6s. 8d.) must be deducted, leaving the actual unnecessary expenditure at £2 10s. 2d., instead of £10 10s. as stated; but I humbly submit it was to the interests of the Department to incur that expense to ensure bringing in this important train without delay.

Again, I am charged with making the engine take fourteen trucks of live stock and the brake van from Dubbo to Wellington. This I have shown to be only a fair load. Thirteen used to be the load, but six months ago I increased it by one truck, mainly because fourteen is a suitable load for Mr. Turton's large engines of the Mogul type, class 215.

It is strange that I should be charged with cutting down the loads of engines. I have just shown that, on my own responsibility, I increased the loads of engines (class 93) between Wellington and Dubbo, and I was chiefly instrumental in the early part of 1884 in getting the loads of the mail engines (class 265) increased from eleven to twelve vehicles. I several times took off at this station the pilot engine supplied by Dubbo, and returned it to Dubbo when there was only one engine load on the train.

In conclusion, I can only leave myself in the hands of the Commissioner. This district, in its present unsettled state, is a very difficult one to work, and I have worked from early morning to midnight often, and I can only ask that the fullest inquiry be held, when I am sure that, instead of being held culpable, the energy and zeal I have displayed will not go unrewarded.

I have omitted to mention that since I took over the working to Nyngan only two engines have returned light from Nyngan, and one of these worked a load from Dubbo to Wellington. On these two occasions there had been a rush of through down traffic with no immediate up traffic for these, consequently they had to be brought back to carry on the work.

Locomotive Engineer.

C. H. STANGER,
17/6/86.

As there is a considerable discrepancy between your and Mr. Stanger's statements, I forward Mr. Stanger's for any comments you may have to make upon it, and will send yours to Mr. Stanger in like manner.—W. SCOTT, 21/6/86. Mr. Hubbard.

Report herewith.—J. P. HUBBARD, 24/6/86.

Sir,

Sir,

Locomotive Engineer's Branch, Dubbo, 24 June, 1886.

In accordance with your minute of 21/6/86, No. 86-3,148 of 18/6/86, for any comments I may have to make on Mr. Stanger's statements, *re* paragraph from the *Dubbo Dispatch*, of Tuesday, 8th June, 1883, I beg respectfully to say that I cannot be held accountable for any newspaper extract appertaining to the question of Dubbo or Wellington being made a permanent locomotive depôt. At the same time, I am convinced that my opinion is fully verified in stating that Dubbo is the natural and most economical place to work the traffic from, for the reasons already fully set forth in my previous report.

I can readily believe Mr. Stanger being on duty from early morn to midnight often to make ends meet. If Wellington was the proper place for changing, there should be no difficulty come in. I can only say to this, I had no trouble at Dubbo when I knew traffic requirements when I made my arrangements, the traffic being very far in excess of the present. The loads taken between Dubbo and Narramine must affect the question at issue, *viz.*, the permanent locomotive depôt to be either at Dubbo or Wellington; and if the loop-line siding is put in at about mileage 286 west (and which I recommended to be done in my report of 6/11/85) 8 miles west of Dubbo, it would then only require a bank engine to take from or assist into Dubbo loads that would require three engines to take away to Wellington, and so save light running to Narramine (22 miles) as against 8 miles.

I now take exception to certain statements made by Mr. Stanger, and produce documentary evidence to show that he is in error in the case of engine No. 95, driver W. Young, 60 up live stock train, with thirty loaded stock trucks and brake van (total 31), on 4th May, 1886.

Mr. Stanger says:—"On the 4th May last, No. 60 up live stock train was arranged to run with thirty trucks. I arranged for an assisting engine to go to Narramine, but through some oversight among the traffic people, this engine, although in readiness in Dubbo, was not sent out. On arrival at Narramine, the driver (W. Young) of 60, having a remarkably good engine (No. 95) started away with the thirty trucks. He lost a lot of time before reaching the 1 in 55 bank, and had only got a little way up it when the up mail caught up to No. 60, and had to push the live stock train over the bank. This shows conclusively how much beyond the power of the engine is a load of thirty trucks. I attach the driver's report."

On inquiry, and referring to the two reports from driver W. Young, of No. 60 up live stock train, on 4th May, 1886, and driver Charles Richards, of No. 20 up mail, same date, who overtook and assisted No. 60 up live stock train over the crown of the hill, there was no time lost, the journey from Narramine to Dubbo being run in less than one hour, *viz.*, fifty-five minutes—Narramine, depart 3:40 p.m.; Dubbo, arrive 4:35 p.m.; distance 22 miles. It appears to me that the driver's statement is not taken into consideration in this matter, as the driver, W. Young, states, "No time was lost." Please see driver W. Young's report, also driver C. Richards', of No. 20 up mail, who states:—"I had caution notice of No. 60 up live stock having left at 3:40 p.m. (twenty minutes ahead of the mail). I received the signal at 4 p.m. to leave for Dubbo, and I did so, running to time. On approaching Willardra, I saw No. 60 up live stock near the top of the bank; I ran up close, and I assisted him about 200 yards over the top. The train (No. 60 up live stock) was going at that time 6 or 7 miles per hour, and I feel confident that the driver could have taken them over easy. I arrived at Dubbo at 4:40 p.m.; usual time. I believe live stock train had thirty on and the van."

The driver of No. 60 up (W. Young), by the mere fact of his starting with his heavy load only twenty minutes ahead of the up mail from Narramine, shows that he himself was confident of being able to take the train clear into Dubbo, 22 miles, and as he was going, according to Richards' statement, 6 or 7 miles an hour, 200 yards from the top of the bank, he was doing very well indeed, even if he topped the bank at 4 miles per hour.

Mr. Stanger then goes on to state:—"On Monday last (14th June) and in company with Mr. Hornidge, returned in the brake-van of No. 68 up, which train had twenty-seven trucks of live stock on. Although it was a fine dry night, and an engine in good order was on the train, and after running down the 1 in 20 gradient with steam on at about 40 miles an hour, we only crawled up the latter half of the 1 in 55 bank at about 4 miles an hour, although the driver did his best, and had his engine in full gear with plenty of steam, 11 minutes were lost thus, also clearly showing that twenty-seven is too heavy for keeping good time and for safe running."

Mr. Stanger says he rode in the brake-van. I think he would have been better able to see what was done if he had gone with the driver on the engine. It is also very unfortunate that if the engine No. 164 was in such good order that she should have been taken into the shop the very next day for general repairs, and I had to send my boiler-maker to Wellington to work on her, and I believe he is still doing so.

The most satisfactory way would have been to have handed the same engine over to me for a trip with a similar load. I should also like to ask Mr. Stanger, at what rate of speed his load of fourteen live stock and brake-van with engines of 93 class have to run down Sandy Creek, between Dubbo and Murrumbidgee, to get up the bank of 1 in 40, and also to get up Foster's bank, between Ponto and Maryvale.

J. P. HUBBARD.

Locomotive Engineer.

No. 27.

Telegram from The Secretary for Public Works to D. A. Ferguson, Esq., M.P.

Wellington, 28 August, 1886.

Re your inquiry about the engine-sheds. In view of the great expense that has taken place in their erection at Wellington, I do not feel justified in removing them; but two or three engines, for which there is room in the Dubbo shed, will be stationed there to assist the heavy traffic between the two stations.

W. J. LYNE,

Secretary for Public Works.

No. 28.

Minute by The Secretary for Public Works.

Re question of Engine-sheds, Dubbo and Wellington.

WITH reference to the question of the establishment of running sheds on the Western Line, either at Dubbo or Wellington, I have given the matter much consideration, and have personally visited both stations in order to familiarize myself with the actual circumstances of the case.

I find that at Wellington an extensive running-shed, engine drivers' quarters, &c., have been provided at a cost of many thousand pounds (about £10,000), and it appears to me that, in view of that great expense, I cannot order the removal of the shed from Wellington, but had I been in office when the question was first considered, I would have had no hesitation in saying that the depôt should be at Dubbo, and I cannot conceive why it should have been established at Wellington. A much heavier train load can be hauled between Bourke and Dubbo than between Dubbo and Wellington, and there is consequently a great deal of dead running between the two last mentioned places, which would have been obviated had the engines been stationed at Dubbo, and a large annual expense would be saved by the Department.

The only argument that presents itself to my mind in favour of Wellington, is that it better proportions the distance between the engine depôts on either side, viz., Bathurst and Nyngan, and possibly offers a better climate for the men, although I cannot see that there can be much variation in the climate, as the difference in altitude between Dubbo and Wellington is only about 130 feet.

From information I gathered it seems to me judicious that two or three engines should be stationed at Dubbo during the wool season, to meet the traffic requirements, and I believe this will effect a saving to the Department. I inspected the shed at Dubbo, and find there is ample room for four or five engines in it.

W.J.L., 16/11/86.

A RETURN showing the loss (if any) sustained by the country through such locomotives being at Wellington instead of Dubbo.

No loss has been sustained, as will be seen by reference to the Locomotive Engineer's report of 22/2/86, in paper No. 18 of this Return, which shews that a saving of £2,340 per annum will be effected in the working expenses by the engines being at Wellington instead of Dubbo.

1887.
(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(REMOVAL OF SLEEPING-CARS FROM WELLINGTON TO DUBBO.)

Ordered by the Legislative Assembly to be printed, 12 July, 1887.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 22nd June, 1887, That there be laid upon the Table of the House,—

“(1.) Copies of all letters, papers, and correspondence with reference to “the removal of the sleeping-cars and carriages from Wellington to “Dubbo.”

(*Mr. Melville.*)

SCHEDULE.

NO.	PAGE.
1. Letter from Mayor of Dubbo, <i>re</i> inconvenience to travellers by carriages standing in the sun all day at Dubbo, with minutes and reply. 31 January, 1887	1
2. Letter from Council Clerk, Dubbo, to Secretary for Public Works, complaining of inconvenience caused through carriages being changed at Wellington instead of Dubbo, with minutes and reply. 16 February, 1887.....	2
3. Letter from Council Clerk, Wellington, conveying thanks of Council for action taken by the Department. 26 February, 1887	3
4. Extract from letter to Minister for Mines from Mayor of Dubbo, <i>re</i> alteration of place for changing the carriages. 3 March, 1887.....	3
5. Minute by Commissioner, <i>re</i> sending carriages on to Dubbo, as formerly, with Traffic Manager's reply and letter to Mr. Penzer, M.P., and decision that Dubbo is to be the changing station for sleeping-car. 1 April, 1887.....	3

No. 1.

The Mayor, Dubbo, to The Commissioner for Railways.

Sir,

Municipal District of Dubbo, Town Hall, Dubbo, 31 January, 1887.

I have the honor, on behalf of my Council, as per instructions, to respectfully draw your attention to the inconvenience and discomfort which passengers by rail are subjected to on the journey from Dubbo to Bathurst, especially arising from the fact that the carriages arriving at Dubbo in the morning are left standing in the yard at Dubbo without any protection from the sun until the time of departure in the evening. Consequent upon which the carriages are like heated ovens, and sickening to travellers, especially to ladies; again, the water provided for passengers, standing all day, often, in the carriages, as stated above, is altogether unfit for use.

Trusting you will give these matters your consideration, with a view to bringing about a more desirable state of things,—

I have, &c.,

N. MULLER,

Mayor.
Inform

507—

Inform that instructions have been given to obviate this by making Wellington the changing station for the sleeping-car, as formerly.—A.R., 1/2/87. I see this has reference to all carriages. Please say if this can be remedied.—A.R., 1/2/87. Traffic Manager.

I have gone thoroughly into this question, and am satisfied that Wellington is the most suitable place for changing the passengers into clean carriages, because the work of changing can be accomplished while the passengers are taking breakfast or tea respectively. My intention is that the whole of the carriages which go from Sydney by the mail shall be taken off at Wellington and a fresh lot put on, in which the passengers can continue their journey in comfort. The Sydney carriages can then be put under cover at Wellington all day (in the engine-shed), and there cleaned and put in readiness for the up mail in the evening. This is being done with the sleeping-car at present under the authority of the Minister and the Commissioner; therefore there seems to be no good reason why the arrangement should not extend to all the carriages. Such an arrangement would effectually get rid of the trouble of the Dubbo Municipal Council. It can be carried out at once, if agreeable.—W. V. READ, 24/2/87. Commissioner.

Approved. Care must be taken in exchanging the personal luggage which passengers carry in the carriages with them.—CH.A.G., 26/2/87. Traffic Manager. Acting-Inspector Duff to note.—W.V.R., 3/3/87. This has been arranged and carried out. Fresh carriages are now attached at Wellington, instead of Dubbo, since 12th instant.—A. DUFF, 13/3/87. Traffic Manager. Now arranged.—W. V. READ, 14/3/87.

Sir,

Department of Railways, Sydney, 17 March, 1887.

Referring to your letter of the 31st January last, in which you represent the discomfort caused to passengers by rail through the absence of any covering for the carriages while waiting at Dubbo Station, I have the honor to inform you that the evil complained of has been remedied by transferring passengers arriving by mail train at Wellington into fresh carriages.

I have, &c.,

A. RICHARDSON,

(For the Secretary of Railways).

Council Clerk, Dubbo.

No. 2.

The Council Clerk, Dubbo, to The Secretary for Public Works.

Sir,

Municipal District of Dubbo, Town Hall, Dubbo, 16 February, 1887.

I have the honor, under instructions from my Council, to inform you that on the 31st day of January last, a letter was sent by my Council to your Department through the Commissioner for Railways, requesting that the sleeping-car at Dubbo should be placed under shelter from the heat from the time it arrived in Dubbo, viz., 9:30 a.m., until it left for Sydney at 4 p.m., each day.

Since the letter in question was sent, my Council has been informed that the sleeping-car has been taken off and does not run any further than Wellington.

My Council desire me to represent to you the great inconvenience that arises to the public through the action of the Government in not running the car to Dubbo, insomuch that persons travelling by sleeping car as far as Wellington, have now to remove their luggage to another carriage if proceeding to Dubbo or past that Station, and in the latter case have on their arrival at Dubbo, owing to a change of carriages, again to remove their luggage to the carriages in waiting at Dubbo.

This is a great inconvenience to persons travelling west past Wellington, and is one of the reasons urged why the car should run to Dubbo, as heretofore.

My Council also desire to mention that Dubbo, being a central town, is the station where passengers from Coonamble, Cobborah, The Bogan, and The Macquarie, and surrounding districts, book to and from Sydney, and consequently more people travel to and from Sydney and Dubbo, than to and from Sydney and Wellington.

My Council further direct me to respectfully point out to you, that if it is considered necessary to place the sleeping-car under shelter at Wellington, as they are given to understand, it is equally necessary that the carriages which run to Dubbo in the morning and remain there until 4 o'clock in the afternoon, should also be protected from the heat of the sun and the inclemency of the weather, as more persons travel by these carriages than do in the sleeping-car.

Trusting that the matter referred to will receive prompt and favourable consideration,—

I have, &c.,

T. W. HEAYDON,

Council Clerk.

Please acknowledge, and let me see papers. The Council seem to misunderstand the reason of the stoppage at Wellington, which was not so much for the protection of the carriages as to save empty running.—J.S., 18/2/87. I should like to have a statement of the earnings of this car. Traffic Manager.—D.C.McL., 19/2/87.

During the six months ended 31st January last the sleeping-car on the Western Line earned £1,616 17s. 6d. for sleeping berths, and that, of course, was irrespective of Members of Parliament or others who travelled free. As the Commissioner knows, the whole of the Western mail train which goes from Sydney, sleeping-car included, is left at Wellington, and a fresh train put on there.—W. V. READ, 10/4/87. Commissioner.

For Minister's information.—CH.A.G., 14/4/87. Inform.—J.S., 15/4/87.

Sir,

Department of Railways, Sydney, 20 April, 1887.

Referring to correspondence that has passed relative to the stoppage of the Western sleeping-car at Wellington, and asking that it might be run on to Dubbo, I have the honor, by direction of the Commissioner for Railways, to inform you that the matter has had inquiry, but the result tends to show that the present arrangement is more suitable, alike to the Department and the majority of travellers.

I have, &c.,

D. VERNON,

Secretary for Railways.

Council Clerk, Dubbo.

No. 3.

No. 3.

The Council Clerk, Dubbo, to The Commissioner for Railways.

Sir,

Council Clerk's Office, Wellington, 26 February, 1887.
I have the honor, by direction of the Wellington Municipal Council, most respectfully to convey to you their thanks for your favourable consideration of the question of the sleeping-car being detached at Wellington.

I have, &c.,

W. H. FORWOOD,
Council Clerk.

No. 4.

Extract.

EXTRACT from letter to Minister for Mines from Mayor of Dubbo, dated 3/3/87.

You will pardon me for troubling you on a matter outside of your Department. As you will remember, at the interview you granted my Council during your late visit to Dubbo, we casually brought up in conversation the fact of the sleeping-car being cut off at Wellington.

I have written the Honorable the Minister for Works on the matter, also drawing attention to the fact that first and second class carriages are still left exposed in the yard at Dubbo, and thus, without shelter, are extremely heated and uncomfortable for passengers, besides the detriment to rolling-stock.

As I before said, you will pardon me for intruding this matter, but I shall feel glad if you can at all help us in the redress sought.

Will Traffic Manager please deal with this matter, if he has not already done so?—A.R., 20/4/87.

No. 5.

Minute by The Commissioner for Railways.

Sleeping carriage to be sent on to Dubbo instead of Wellington.

WILL Traffic Manager look into this and let me know what he recommends. The people of Dubbo are now lamenting that they asked for the change.

CH. A. G., 1/4/87.

I cannot recommend any departure from the present practice, by which the train which goes from Sydney is left at Wellington and put under cover there all day. After breakfast the passengers get into a fresh and clean train, and of course the same is done on the up journey at night. The arrangement is a very convenient one to Department, and must be agreeable to passengers.—W. V. READ, 5/4/87. Commissioner.

Inform Mr. Penzer, M.P.—CH.A.G., 8/4/87.

Sir,

Department of Railways, Sydney, 14 April, 1887.

Referring to your personal interview, urging that the sleeping-car now detached at Wellington may be taken on to Dubbo, I have the honor to inform you that the matter has had inquiry, and the result tends to show that the present arrangement is the more suitable alike for the Department and the majority of travellers.

I have, &c.,

J. Penzer, Esq., M.P., Sydney.

C. A. GOODCHAP,
Commissioner for Railways.

Mr. Penzer has expressed his dissatisfaction with this reply. He urges that it reflects upon him the charge of having made a misrepresentation. His assertion was that the majority of travellers disliked the arrangement. This letter gives his statement a direct contradiction. I sought to disabuse his mind of the impression, but he still, while accepting the disclaimer, asserts that the majority of the travellers favour the idea of the sleeping-car going on to Dubbo.—CH.A.G., 20/4/87.

The Minister has decided that the sleeper is to run through to Dubbo permanently, to commence to-morrow (Friday) night. Be sure there is no mistake about the running commencing to-morrow night, as Mr. Penzer and others are going up.—CH.A.G., 21/4/87. Traffic Manager. Instructions issued accordingly.—W. V. READ, 21/4/87. Commissioner.

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(PROPOSED REMOVAL OF WORKSHOPS FROM JUNEE TO WAGGA WAGGA.)

Ordered by the Legislative Assembly to be printed, 11 July, 1887.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 6th August, 1886, That there be laid upon the Table of this House,—

“Copies of all letters, minutes, reports, or other documents having reference to the proposed removal of the Government Railway Workshops from Junee Junction to Wagga Wagga, together with an estimate of the additional cost of carrying on the work at Wagga Wagga.”

(Mr. Abigail.)

Mr. Inspector Close to The Acting Locomotive Engineer.

Government Railways, Locomotive Engineer's Branch,

Sir,

Wagga, 22 July, 1882.

Re Junee as our depôt for the Wagga District. In the running of regular trains a saving would be effected by centralizing and consolidating the Locomotive Staff, but it is in the irregular traffic that the greatest economy would be effected. This running cannot very well be shown in schedule form, as special trains are run at uncertain periods down the south-west from Junee and up on the main line, according to the exigencies of the traffic. It is a very rare occurrence for a special train to start from Junee for the down journey on main line. Junee has in fact a very large preponderance, as far as traffic is concerned, over any other main line station in the Wagga district. During the past twelve months a large number of engines have been sent from Wagga to work and assist trains from Junee and from Junee to Wagga for washing-out purposes. In going through the books I find it is almost impossible to get the correct number of engines that have been run, as in many cases they have been sent as extra engines attached to other goods trains, and we cannot very well state now unless statistics could be obtained from Traffic Branch whether their utility as assistant engines commenced at Wagga or Junee. From what I have seen of the traffic I should say it is a very rare occurrence for more than a single load for each train to start from Wagga, but a very common occurrence from Junee. Engines running from Junee to Harden would not require to be cleaned there as they are at present; this small item alone would give a saving of more than £300 per year. I believe I am within the mark when I state that at least £1,000 per year would be saved to the Locomotive Department. The running of the trains would come in rather badly with the present time-table, but this arises principally from the fact that the time-table has been adjusted for Wagga as a depôt. In case it is decided to make Junee our principal depôt for this district, it would be necessary to erect water-cranes at each end of Wagga platform, so that trains running from Junee to Albury could take water. A permanent water supply at Junee is also indispensable.

I have, &c.,

J. CLOSE,

Locomotive Inspector.

282—A

Mr.

Mr. Inspector Close to The Locomotive Overseer.

Government Railways, Locomotive Engineer's Branch,

Sir,

Wagga, 22 July, 1882.

I wish to point out for your special consideration the large saving that would be effected by making Junee the head-quarters of the Locomotive Inspector and Staff of the Wagga District. I understand that at the time Wagga was chosen as the depot for this district, the branch line from Junee to Hay was not under consideration.

This branch line has had the effect of making Junee the principal depot for traffic in this district. A large number of specials of live stock run into Junee from the branch line referred to. To work these specials from Junee to Homebush necessitates engines running light from our main line depôt at Wagga to Junee, a distance of 22 miles. This also involves the engines running light on the return journey from Junee to Wagga, making in the case of every extra or special engine required from Junee a distance of 44 miles run unnecessarily.

This means, in the course of a year, a very large sum in wages to men, wear and tear of permanent way, locomotive stock, and, what is equally important, the loss of the engine's services during the time occupied in unnecessary running. During the busy season the greater portion of my men are thus engaged in working the extra traffic from Junee, making Junee, in fact, the head centre for locomotives, but keeping the head-quarters nominally at Wagga.

Junee should also, I think, be made the break-station for men working the down mail trains from Goulburn; these men at present run from Goulburn to Wagga, a distance of 175 miles, and from the time of their coming on duty at Goulburn and going off duty on their return there, occupies a period of over 24 hours, not more than five of which are available for rest, and those in the middle of the day.

There is, I am aware, a difficulty in the way of making Junee the head-quarters of the Locomotive Staff. I allude to the want of water there. Very little need be taken by the main line engines. On the down journey engines water at Bethungra; they can run from that station to Junee and return without requiring water at Junee. On the up journey engines can take water at Wagga and run to Junee and return. The distances from Junee are 18 and 22 miles respectively. For washing out engines: On the up journey they can be washed out at Harden; on the down journey at Albury, and occasionally at Wagga. Two regular goods trains per day have their terminus at Wagga. These two trains can be so worked as to wash out engines at Wagga when required. For extraordinary circumstances a small supply of water might be obtained by well sinking.

If the Locomotive Overseer approves of what I have proposed, I would suggest that a driver in charge be placed at Wagga, to do what shunting is required there, and to look after the two goods engines which would start from there per day.

I have, &c.,

J. CLOSE,

Locomotive Inspector.

Memo. from Mr. Inspector Close to The Acting Locomotive Engineer.

Government Railways, Locomotive Engineer's Branch,

Wagga, 22 August, 1882.

Re assistant engines on main line through mail trains. It is and has been the custom for assistant engine to run the whole journey from Goulburn to Wagga and *vice versa* with the mail. I have been going into this matter and find that in nearly every instance there is no real necessity for the assistant engine to run further than Junee. A single engine will take thirteen vehicles, brake-van included, between Junee and Wagga; it is a very rare occurrence for the load to exceed that number. I calculate that on an average there are 250 assistant engines on the mail in the course of a year; this multiplied by 44 miles the double distance between Junee and Wagga = 11,000 miles; taking the expense of working at 2s. 6d. per mile run, equals £1,375 per annum saving to be effected to the Locomotive Department by stopping the assistant engine at Junee. I think if you look into this you will find my suggestion worth adopting.

J. CLOSE,

Loco. Inspector.

I understand this to mean that two engines are to work between Goulburn and Junee, and a Wagga engine to work train from Junee to Albury and back.—T.M. No; the assistant engine only to come off at Junee when there is one, and that is nearly every day.—J.C., 31/8/82. Can this be done without any increase of the staff at Junee? If so, it will be an economical matter as it will save a lot of coal being hauled to Wagga. The engine could, of course, turn on the triangle. If no increase of staff is required I think you might try the experiment and report the result.—T.M. Messrs. Close and Allan.

I cannot arrange for a Wagga engine to work the mail from Junee to Albury until water cranes are erected at Wagga platform. I could do so then without difficulty and without increasing the staff. I could arrange it now with one engine and set of men extra as follows:—Wagga engine to work No. 42 up to Junee and return to Wagga with 27 down mail; same engine to work No. 10 up mail, Wagga to Junee, and return to Wagga with 35 down. Arrangements for water are as follows:—Goulburn engines take water at Bethungra, run on to Junee, and return to Bethungra; distance 36 miles. Wagga engines take water at Wagga, and run to Junee and return to Wagga; distance 44 miles. In neither case will water be required at Junee. I applied for water cranes to be erected at Wagga platform on 19/8/82.—J. CLOSE, Loco. Inspector.

Water cranes are being made for this and other similar cases.—T.M., 6/9/82. Mr. Close.

Memo. from Mr. Inspector Close to The Locomotive Overseer.

Government Railways, Locomotive Engineer's Branch,

Sir,

Wagga, 25 August, 1882.

I beg again respectfully to repeat my request to allow locomotive inspector and timekeeper to reside at Junee. At present my time is about equally divided between Wagga and Junee. Junee, being the real working centre of the district, requires the greater portion of my time, but I am not able to give this, as I reside at Wagga. The work at Wagga bears no comparison to that at Junee. All
throughout

throughout the busy season the greater part of my engines and men will have to be kept at Junee; in fact there is nothing to prevent nearly the whole of them being kept there, even under present circumstances. It would greatly simplify the traffic, and effect a wonderful saving to the Locomotive Department, if I were resident there. If you think fit to grant my request I shall not require the man I applied for as sub-inspector. This will in itself effect a saving of £234 per annum. I shall be glad if the Locomotive Overseer will take this into consideration at once.

J. CLOSE,
Locomotive Inspector.

Mr. Inspector Close to The Acting Locomotive Engineer.

Sir,

Wagga, 10 September, 1882.

I desire to inform you that, with a view to the more economical working of the Locomotive Department in this district, I have made certain departmental alterations. I give below the alterations I have made, and the approximate saving that will be effected.

Alteration No. 1.—I have caused the engine that now runs nearly regularly as assistant to down mail to be taken off the train at Junee, instead of Wagga, as was formerly the case, leaving one engine to haul the train between Junee and Wagga, instead of two. I estimate that not less than 250 extra, or assistant, engines are run on the down mail in the course of the year, and the alteration made saves 11,000 miles of running for locomotives per annum. This, at 2s. per mile, equals £1,100. It also saves the freight on three trucks of coal per week hauled between Junee and Wagga. This equals £107 4s. per annum, or a total saving effected on alteration No. 1 of £1,207 4s. per annum—a very important item.

2.—Two engines have been regularly stationed at Junee to work occasional trains on south-west to Darlington, &c., the engines and men that worked the mixed trains being stationed at and running from Wagga to Hay. This caused the occasional engines stationed at Junee to be run empty to Wagga to be washed out; by stationing the whole of the men who work the South-Western traffic at Junee, it enables me to run the occasional engines to Hay working mixed trains. At Hay there is every facility for engines being washed out, so that the running empty to Wagga for washing-out purposes is entirely done away with. I estimate that fifty trips per annum between Junee and Wagga of empty engines are thus saved; this at 44 miles, the distance from Junee to Wagga and return, equals 2,200 miles; this at 2s. per mile equals £220. There is also the freight on four trucks of coal per week by coal only being hauled to Junee instead of Wagga; this, at 13s. 9d. per truck, equals £143; this, plus £220, equals £363 per annum. In consequence of stationing the whole of the South-western men at Junee it was also necessary that we should work the main line mail from Junee to Albury instead of its being worked by the Goulburn men to Wagga as was formerly the case. The Goulburn engines being coaled now at Junee instead of Wagga effects a further saving in freight of coal hauled of £143 per annum; this, added to the above-mentioned £363, equals £506 per annum saved to the Department by alteration No. 2.

3. In consequence of Wagga being the depôt for main line engines, No. 11 down goods has always run into that station, and No. 36 up goods always started from there. These two trains, though marked as occasional on the time-table, have run regularly for nearly 12 months past. Mr. Roberts, the Traffic Inspector, has consulted with me, and I find the two trains I have mentioned have been run into Wagga for the convenience of the Locomotive Department. It has been arranged for No. 11 down to run to Junee only in future, and No. 36 up to start from there. Allowing that it will probably be necessary to run into Wagga in the busy months, say fifty times in the year (it will certainly not exceed that) it leaves 263 trips between Junee and Wagga, which equals 11,572 miles saved, equal to £1,157 2s. haulage; of coal saved equals £71 9s. per year; fuel saved, 65 tons at 25s. per ton, equals £81 5s. As the trips of these particulars trains are shortened the engines will not require to be cleaned at Harden, but can run from Junee to Harden and return; this will save about £100 a year, or give a total saving in this alteration of £1,409 14s. per annum.

4. I have transferred the pilot engine and men to Junee to stand there instead of Wagga. This engine is usually required for specials over and above the regular traffic either on south-west or on main line. Formerly, if required to run a special on south-west, the engine would run from Wagga to Junee empty. As the engine is now stationed at Junee it is equally available for either main line or south-west, and there will be no useless running. I estimate the saving from this at £100 per annum at the least.

Note.—Although this engine and set of men have no regular trains to run, the mileage of the engine compares very favourably with the regular train engines.

The alterations I have mentioned have all been carried out, and have as a consequence involved the removal of a considerable portion of the men from Wagga to Junee. The total direct saving appears to be £3,012 18s. per annum. The indirect saving it is almost impossible to estimate. I will enumerate a few of the advantages I have gained.

Under the previous system I had not sufficient engines or men to work through the busy months; I believe at least two more engines and sets of men would have been required. I have been enabled to spare drivers and firemen (one set at a time) for holidays, which I could not otherwise have done. It has reduced the mileage of men running mail train between Goulburn and Wagga to a reasonable day's work, by their now only running as far as Junee; it also gives them a reasonable period of rest before commencing the return journey. It has increased the mileage of the men who formerly ran the mail trains from Wagga to Albury, as they now run them from Junee. It has not increased their pay, as the work they have to do still comes within a reasonable day's work. Less Newcastle coal will be used than formerly, also Erith; and in fact, less stores of all descriptions.

Hoping what I have done will meet with your approval,

I have, &c.,
JOHN CLOSE,
Loco. Inspector.

Mr.

Mr. Inspector Close to The Acting Locomotive Engineer.

Sir,

Junee, 29 September, 1882.

I desire to enter fully into the circumstances which have lately caused a number of men to be transferred from Wagga to Junee, and, to enable you to thoroughly understand the matter, I must refer back to 2nd July, or two days previous to the opening of south-western line to Hay. On the date mentioned there were stationed at Junee—5 engines, 5 drivers, 5 firemen, 3 cleaners, 1 pumper, and 1 examiner—total 20. On July 4, the mixed mail trains which had formerly run between Junee and Carrathool were made to run between Wagga and Hay. This portion of the year being the slack season and the loads not heavy, I found that I could work the mixed trains from Wagga to Hay, and *vice versa* without changing engines on the road, consequently I removed 3 drivers, 3 firemen, and 2 cleaners, from Junee to Wagga. Within the last three or four weeks the traffic on south-west increased so much that I found it was no longer possible to run one engine from Wagga to Hay, as they could not carry sufficient coal for the journey, consequently, I had to remove a similar number of men and engines back to Junee that I had ten weeks previously taken from there. This left the portion of south-west train (No. 42-up) that started from Wagga to be worked by men that reside at Wagga as far as Junee, and, as when the engine got to Junee it must have a train to work back to Wagga or return there empty, I caused the main line engine of 27 down mail to be taken off the train at Junee, and the engine that would otherwise have had to return to Wagga empty, to work No. 27 down mail on to Wagga. As the mail engines that were stopped at Junee had to be cleaned, coaled, &c., for their return journey, I was compelled to remove two cleaners and one fuelman from Wagga to Junee to do this. The only alternative would have been to have started fresh men and kept men at Wagga that I did not want. The next thing to which I have to refer is purely a traffic affair. The Traffic Inspector decided not to run No. 11 down goods past Junee; and No. 36 up goods, which had formerly started from Wagga, was made to start from Junee. Mr. Roberts informed me it was not necessary, as far as the traffic was concerned, to run these trains south of Junee. Both trains are occasional, and not regular trains on time-table. This compelled me to remove two goods' engines, two drivers, two firemen, and three cleaners from Wagga to Junee. I could not possibly have acted otherwise under the circumstances.

I also, on account of the great increase in south-west traffic, required an additional driver and fireman at Junee. I removed the night driver and fireman in charge of Wagga engine-shed to Junee, as I could do without one at Wagga. This saved me from starting additional men.

The position of affairs about September 15th was this: There were nine engines stationed at Wagga, ten at Junee, and one working water trains; two Goulburn engines also run daily into Junee, Monday excepted. The engines at Junee are much heavier worked than those stationed at Wagga, and require a great deal more repairs. Consequently I had the alternative of running the engines empty to Wagga for repairs or sending the fitters to the engines; I adopted the latter alternative on the ground of economy. The total number of persons affected by these arrangements, and removed to Junee, is twenty-seven,—that is, up to date (fourteen married and thirteen single). As far as the single men are concerned there are lodgings to be obtained at the two hotels; there is also a private boarding-house. There are five tents, which will accommodate ten men, in the railway yard, and a tank-house, 26 feet square. Eight of the married men prefer to reside in Junee, and the remaining six have raised no objection. Several of the men have purchased ground, and are erecting houses for themselves; there are also four brick cottages to be commenced next week. The effect of these alterations is that it has enabled me entirely to dispense with running empty engines to Wagga to wash out or repair. If you will kindly refer to pay-sheets for the last five or six weeks, you will find that not a single empty engine has run during that period, nor will it be necessary in future, thus saving a very large sum of money to the Department.

In concluding my report, I wish to state that I have been guided by no other motive than serving the Department to the best of my ability, and I am willing, nay, anxious, that my conduct throughout should be submitted to the most searching inquiry. My own personal interests would be best served by remaining in Wagga. I have refrained from purchasing ground in Junee so that my motives could not be called in question; and I fearlessly assert that any man, placed in a similar position to mine, could not have done otherwise without grossly neglecting his duty to the Department. If the state of affairs were restored that existed on July 4th, the present traffic could not be conducted without an increase of two extra engines and eight extra men; and I trust, as I have simply done my duty, I shall be supported by my superior officers.

I have, &c.,

JOHN CLOSE,

Loco. Inspector.

Secn.—T.M., 30/9/82.

Minute by The Commissioner.

RAILWAY GRIEVANCES AT JUNEES.

In the *Echo* of this afternoon there is a telegram from the *Echo's* own correspondent at Junee, setting forth certain grievances, mostly as regards the scarcity of water at Junee in connection with engine service, which, it is alleged, the men have. Please report.

Loco. Engineer.—CH.A.G., 22/1/84.

Mr. Midelton.—W.S., per C.A.N., 23/1/84. Full report herewith.—T.M., 25/1/84. Loco-motive Engineer.

EXTRACT

EXTRACT from "The Echo," Sydney, January 22, 1884.

RAILWAY GRIEVANCES AT JUNEES.

(By Telegraph—From our own Correspondent.)

Wagga, Tuesday.

(1.) Great dissatisfaction exists at Junees Junction amongst the railway employees, and the engine-drivers especially. (2.) The men say they would rather abandon their houses and return to Wagga than remain in possession of them at Junees. (3.) Only one locomotive man has bought an allotment and built a house on it, the remainder having built on Government land. (4.) Quite a number get provisions from Wagga. This state of things has lasted about eighteen months. (5.) Eight drivers and firemen now living with their families at Wagga have declined to take them to Junees, owing to the want of water there. One man would not go to Junees, and on being sent for by the Department, he had to pay his railway fare there. One engine-driver would not go until he received a telegram as guarantee for a railway pass. (6.) No provision is made for the men who frequently arrive in the township after all the lodging houses are closed, and they are compelled to get their night's rest where they can. (7.) They say if the engines would be distributed between Harden and Narrandera and Wagga, and the men given regular positions, the present inconveniences, would be, to some extent, obviated. (8.) The only water obtainable for drinking purposes is taken to Junees by train from Wagga, from a dam 5 miles away from the town, where a number of locomotives are washed out daily. (9.) Two trucks of this water are sent daily to the railway refreshment rooms; each truck contains three tanks, holding 400 gallons each. (10.) The men do not get their proper "spell day," which they should have once a week, as the boilers require washing out twice a week. (11.) The engine men are afraid to let out the water from their engines, in order to clean them properly, owing to there not being sufficient water to refill them, and a great loss of time has been occasioned in consequence. (12.) Some of the boilers of the engines, in use only three years, are all to pieces, in consequence of the manner in which they have been worked. (13.) One engine has been laid up at Junees with 14 stays on one side, and 11 on the other side, broken. (14.) There is only one boiler-maker employed to repair the boilers at Junees. (15.) The mail train, on Tuesday, could not cross the Junees bank, and had to be pushed behind by another engine, although the safety regulations forbid this practice. This was necessitated by the fact that the front engine had not sufficient water to take it on to Wagga. (16.) Frequently engines have not sufficient supplies, but the journey from Junees to Wagga is down hill, and this assists them in completing the journey. (17.) Although the engines should properly be cleaned out after each trip, they are sometimes run for 300 miles at a stretch. If the men had regular runs, they would have good opportunities to clean the engines after each run.

Report from Inspector Close.

Re Railway grievances at Junees, M.P., 84/512, attached.

I HAVE perused the newspaper cutting on paper attached, and will reply to the assertions made in detail.

(No. 1.) I do not believe that any general dissatisfaction exists amongst the employees; the large majority of the men are well content to remain at Junees. Dissatisfaction undoubtedly exists; but it can be localized amongst three or, at the most, four men. These men are employed at Junees, but still reside in Wagga; and I am satisfied that two of the men I refer to are determined to use every pretext to avoid residing at Junees.

(No. 2.) I do not believe there is any truth in this paragraph.

(No. 3.) This paragraph is untrue. I have made inquiry, and, as far as I can learn, there are at least twenty of the locomotive employees who have purchased ground at Junees, six of whom have erected houses on their own property, twelve reside in houses of their own, erected on Government land, and there are ten who are tenants of the Government.

(No. 4.) I am not in a position to be able to answer this paragraph.

(No. 5.) This paragraph is also partially untrue. In place of there being eight drivers and firemen, who still reside at Wagga, although employed at Junees, there are six—viz., four drivers and two firemen. One of the firemen, by name Daniel O'Sullivan, was transferred to Junees at his own request, in preference to going to Albury; the other, Timothy Finn, was promoted from being cleaner at Wagga to fireman at Junees, in place of a fireman dismissed from there. The four drivers who still have their homes in Wagga, are named G. Brett, H. Shephard, G. Piper, and J. Hughes. I believe the dissatisfaction is limited to the two first named. With reference to the man paying his railway fare, it was the man's own fault. Daniel O'Sullivan worked an engine from Junees to Wagga; he was to leave the engine there, and return to Junees, passenger; he omitted to get a "pass" to return with before leaving Junees, and, as a consequence, the station-master at Wagga refused to allow him to return without one, and he was made to pay his fare. There is no truth in the statement that one engine-driver would not go until he received a telegram as guarantee for railway "pass"; no telegram was ever sent by me for any such purpose.

(No. 6.) This paragraph is also untrue. There is very good provision made for all drivers and firemen who run into Junees. A good brick building is erected, containing two large rooms, a lobby, and kitchen; this is at all times available for drivers and firemen.

(No. 7.) The traffic could not be worked without a large increase in both men and engines if they were distributed in the manner mentioned. The men and engines are at present stationed where we can get the maximum of work out of them at the minimum of cost. When the traffic is itself irregular men cannot be given regular positions.

(No. 8.) It is quite true, that at present, and for some three or four weeks past, the only water obtainable for drinking purposes has been brought by the water-train from Wagga. There has been a long period of dry weather, and the ordinary sources of supply, viz., water-tanks to the houses, have proved insufficient, this is the case at all stations now, from Harden to Albury, and Junees to Hay, and even Wagga itself; all railway employees having to be supplied by the water-train. I presume the dam mentioned, is the one known as Mr. Hammond's, and on which we have a pumping station. No engines are washed out there, or ever have been.

(No.

These men, Brett and Shephard, worked under me in Tasmania, where, I am sure, if they had such a miserable excuse as they here seem to have, would have been ashamed to speak of it in the service of a Railway Company.—T.M.

Quite right.—T.M.

(No. 9.) The refreshment-rooms are supplied, I believe, with water from Wagga.

(No. 10.) This is not true; the drivers get one shed day a week, which is all they are entitled to; boilers do not require washing out twice a week, once a week is quite sufficient, and with proper attention on the part of a driver, an engine will run longer than a week without washing out. Some five weeks ago we were very busy, and drivers did not in all cases get a shed day once a week, but they were given one whenever it was possible to do so; the present traffic admits of them having one, and sometimes two shed days a week.

If they are (as I intend them to be) washed out with hot water we shall use very little water, and not allow the boilers to cool, in which case Junees will, even as it is, not fail for want of water.—T.M.

(No. 11.) This is again not true. I know of no instance where a driver has been afraid to blow his engine off, or where any loss of time has been occasioned. I do know of an instance where one driver named Shephard was wilfully neglecting to blow his engine off before starting with his train, until his attention was called to it by the Shed Inspector, who passed the remark to Shephard that he would be losing time, and putting it down to the water.

(No. 12.) All the boilers of engines stationed at Junees are in good order; there is not the slightest foundation for the statement that some of them are all to pieces.

(No. 13.) Engine 149, I presume, is the one referred to as having stays broken. This engine has just been fitted with twenty new copper stays in the fire-box, fifteen on the right side, and five on the left side next the tube-plate, this can in no way be attributed to the water or the want of it. This engine is a Dub's bogie, and I believe that several of the same class have had stays given way in the fire-box. I cannot state the cause of this with certainty, but it is certainly not the water; perhaps the Locomotive Overseer could throw some light on this.

This is true, and it is to be accounted for by the water space being contracted at this spot.—T.M.

(No. 14.) One boiler-maker at Junees is quite sufficient. This of itself proves that boiler and fire-box repairs are not excessive.

(No. 15.) With reference to mail train being pushed behind by another engine, no safety regulation is broken by this practice. The rule referred to is No. 393, and reads: "No engine shall be used to push a train unless in cases of shunting or assisting up steep gradients." It is and has been for some time our constant practice when an engine has an unusually heavy load, to send an engine to assist the train (pushing it behind) up the Junees bank, by doing so it enables an engine to take four or five more waggons than it otherwise could do. The gain in pushing up the bank instead of placing the engine in front is that it runs 3 miles only, whilst in the other case it would have to run 15 miles. I cannot see the slightest danger attached to this practice—the pushing engine invariably runs on the staff, and it is a certain saving to the Department. In the particular case of which mention is made the train was not overloaded. Driver, George Piper, who worked it, states that whilst the engine had been getting up steam the injectors had been blowing back, causing the water in his tank to get over heated. When he took his engine round the triangle, about half-an-hour previous to his time of leaving, the injectors worked right; his engine was then low in steam. When the steam had risen to 130 lbs. in his engine he could not get his injectors to work—this was caused, I have no doubt, by the water in his tank getting hot. He had plenty of water in the tank and a full boiler, and the shunting engine was sent to give him assistance up the bank to give him a chance to get his injectors started, and he got them to work immediately he had turned the bank, and the assistant engine was not required further.

(No. 16.) Engines invariably have enough water on leaving Junees to carry them to the next watering station.

(No. 17.) It is not necessary to clean engines after each trip; some of the trips run are very short ones, and to clean them after such trips would merely be a waste of time and stores. They are at all times kept as clean as the time at our disposal will admit of.

J. CLOSE,
24/1/84.

Locomotive Overseer.

Loco. Engineer.—J.M., 25/1/84. The Commissioner.—W. SCOTT, 30/1/84. For the Minister's information.—CH. A.G., 8/2/84. Seen.—F.A.W., 9/2/84.

The Engine-drivers and Firemen of Junees Junction to G. C. Loughnan, Esq., M.P.

Sir,

Junees Junction, 21 January, 1884.

We beg most respectfully to suggest to you that thousands of pounds now charged to the Locomotive Department could be avoided, and when enginemen and firemen could be at home nearly every night, also where enginemen could have their own engine; the enginemen having the same engine always it could be carefully looked after, as an engineman respects an engine the same as if it was a human being.

At the present time the engine-cleaners have a different engine every day, and there is not the interest taken in the engine as if the men always had the same one. Further, the engines are never but half cleaned, thereby causing them to wear out much quicker, and when a man has a "shed day" at Junees Junction on the engine he cannot do it justice for the want of water, thereby causing the trains to run late through the boilers not being washed out.

If the enginemen were stationed at Wagga Wagga, Narrandera, and Harden, there would not be one-third the haulage of coal that there is at the present time.

For example: The mail engines would take sufficient coal at Goulburn to carry them from Goulburn to Harden and return, thereby saving an annual haulage of coal in trucks of 250 tons; that is, only allowing for one engine.

Further example: An engine could take as much coal at Harden as would take her from Harden to Wagga and return, thereby saving a haulage of coal past Harden for the mail engines going to Wagga of about 300 tons annually.

Further example: A mail engine could load as much coal at Wagga as would take her from there to Albury and return, thereby saving a haulage of coal to Albury.

Further

Further example: The goods engines could take as much Bowenfels coal as would take them from Harden to Wagga and return, thereby saving a haulage of coal past Harden for goods engines of about 10 tons per week.

In the next place, an engine could take as much coal at Wagga as would take her from there to Narrandera and return, thereby saving a haulage of coal of about 40 miles.

Again, an engine could take as much coal at Narrandera as would carry her from Narrandera to Hay and return, thereby saving a haulage of coal to Hay, a distance of 106 miles.

If the engines were stationed at the above-mentioned towns there would be justice done to the said engines, as there is a permanent supply of water at the said towns and every convenience for locomotive purposes, whereas at Junee Junction there is not sufficient water for household purposes. There are no doctors at Junee, and one would think that Inspector Close's aim was to make the men as miserable and uncomfortable as he could, by compelling the men to run to a different destination every day, where no provision is made for them. It very often happens when we arrive at our journey's end the hotels are closed, and we are compelled to sleep anywhere, whereas every man would have a regular run and avoid the misery.

To show you how things are carried on at Junee Junction, the water that is used there for locomotive purposes is dirty, blown out of the boilers; the same water is repumped and used over and over again, thereby causing the stench from the water unbearable.

We are confident that every locomotive workman at Junee Junction would sacrifice everything they have at Junee to be removed from such a polluted village.

To show you the scarcity of water at Junee, the mail train had to be pushed over Junee bank on Tuesday morning, the 13th inst., as she had not sufficient water to take her to Wagga. At the same time it is not allowed to push a passenger train.

If you were to consider this letter over, and inquire into the working of Junee Junction from the enginemens at Junee, and kindly call a meeting, to be held at Junee, consisting of the locomotive men, you would then hear their grievances, as we sincerely trust you will take our cause up, and represent our cases to the Honorable Members of the Houses of Parliament, and cause an inquiry to be held.

If the engines were stationed at Wagga, Narrandera, and Harden, there would not be any cause for a water supply for Junee.

We have, &c.,

THE ENGINE-DRIVERS AND FIREMEN OF JUNEE JUNCTION.

Commissioner, for report.—F.A.W., 22/2/84.

Minute by The Commissioner for Railways.

WITHOUT, for the present, remarking upon the gross impropriety of the men going outside the Department for redress of alleged grievances until they have endeavoured to obtain, by appeal, that redress from the constituted authorities, and upon the evil effect which such a course of action must necessarily have upon the discipline of the staff, I wish to know from the Locomotive Engineer what truth there is in the allegations made, and whether the system of running, which these men advocate, would result in the economic working they represent it would.

I do not wish the men interrogated as to their connection with this paper; it would doubtless be repudiated by several, if not by all, while it is probably true that it has emanated from two or three only who have before striven to gain their ends by disparaging the management.

It is just possible, however, though not very likely, that the officers have overlooked, as being more economical, the system of running which the men advocate. If it would result in a saving I should not discard it because it has originated with the men, however irregular and subversive of discipline that action has been. Please report early.

CH.A.G., 23/2/84.

Mr. Midelton for report.—R.D.S., 27/2/84. Mr. Close first for his report.—J.M., 27/2/84.
Received per mail on 28/2/84; reply sent to-night.—J. CLOSE, 28/2/84.

Memo. by Mr. Inspector Close.

Junee, 28 February, 1884.

I HAVE carefully perused the printed petition with attached papers, and have answered the statements therein contained in detail (attached). It is necessary, however, to say a few words in reply to the written petition purporting to emanate from the drivers and firemen at Junee Junction. I have carefully read the Commissioner's Minute, and have strictly refrained from interrogating the men in any way. My answer to remaining portion of Commissioner's Minute you will find fully answered by the answer to clause 4, 3rd section of printed petition. If any saving to the Department could be effected by working the trains in the manner proposed, I would only be too ready to adopt it; but it is not so, it would involve the Department in heavy additional expense. Since I have been in charge of this district I have discharged my duties conscientiously and fearlessly in the interest of the Department I serve, and it has been my whole study to work the district as cheaply as possible, and I shall be very much mistaken if the returns for the year 1883 do not show this. I have in no way oppressed the men in doing this, unless they consider it oppression to do a fair day's work for a day's pay. From calculations I have made I believe a saving has been effected to the Government of at least £7,000 a year, and an inquiry will undoubtedly prove this.

I have not the slightest doubt that the written petition emanates from three or four discontented men, and I have on a previous paper mentioned two men, who are not now in this district, as being, I believe, the principal instigators of this. There is apparent, if not positive, proof of their connection prior to these men leaving the district. I could not pick up a Wagga paper without finding the most trivial

trivial things taking place at the Junction tortured and misrepresented, to bear meanings to suit their own views. In the paper I refer to these items suddenly ceased with the withdrawal of the men, and have not since reappeared.

There is also another person, a fireman named Edward M'Sullea, whom I strongly suspected of giving information to the press. My suspicion is confirmed to absolute certainty by four lines in the attached petition. They are, almost word for word, a similar sentence to one that occurs in an application from M'Sullea to Locomotive Overseer, for a pass, handed to me on January 17th or 18th last, by M'Sullea. It was not forwarded because the pass was not required; I removed him to Albury instead, in place of a fireman sick.

I have attached it to this, and if you will read and compare the lines I refer to, it will satisfy you that it is the work of the same person.

J. CLOSE, 28/2/84.

Memo. by Locomotive Foreman.

I MUST express my regret to find that our men, if it is the employees, taking such an extravagant and unjustifiable course as they have taken. Considering the privileges they enjoy, and the extreme courtesy extended to them on all occasions, I am indeed surprised that they do not fully appreciate their positions, and do their utmost to help the Department forward in a true and proper spirit. I am quite sure Mr. Close has done his utmost to work conscientiously, and to do that which has been best, to work cheaply and efficiently. The running proposed has been well considered long before the petitioners named it, and has been abandoned for the reasons given.

T. MIDDLETON, 1/3/84.

Memo. by Mr. Inspector Close.

I ATTACH with this, a copy of memo. from previous Inspector of Wagga District (Mr. Park), to Locomotive Overseer, of date 28 February, 1880, and prior to the engine sheds at South Wagga and Junee being built. It will be seen from Mr. Park's memo. that he had a very clear perception of the situation. As his memo. appears to have an important bearing on the case, I have attached the copy to present papers.

J. CLOSE.

[Enclosure.]

COPY of Memo. forwarded to Locomotive Overseer by Locomotive Inspector of Wagga District (Mr. Park), on 28th February, 1880.

Memo. 660.

SOME months since you called for a "return" showing the shed room which would be required for engines at South Wagga and Albury. It was sent in, stating that room for twelve would be required at South Wagga at that time no decision had been come to as to whether the branch line would be constructed from Junee to Narrandera, and consequently this was not taken into consideration in making out the "returns."

If it is not absolutely decided to build the shed at South Wagga, I would offer the suggestion that it be built at Junee, for the following reasons:—The staff would have to be increased but very little in comparison, to what would be required if one is built at South Wagga, and one at Junee for engines working on the branch line.

One inspector could do the work of both lines, saving the wages of a man in charge, and it would save at least the wages of one driver and fireman, one carriage examiner, one fuelman, of the pumper at Wallace Town, and probably of one or two cleaners; leaving out the cleaners, there would be a direct saving of about £14 per week, or about £700 a year, and the work being concentrated in one place, I have no doubt many other expenses could be avoided, and the work done much more economically than if carried out at two places. Other advantages are, that one spare engine would answer the purpose where two would be required; it would be available for either main line or the branch; it would equalize the running more for the drivers of mail and passenger trains, it being 153 miles from Goulburn to Junee, and I think 100 miles from Junee to Albury, instead of 175 miles from Goulburn to South Wagga, and 78 miles from Wagga to Albury; it would be more convenient for repairs at the junction of the two lines, and if tools were placed there, many repairs might be done there, which now necessitates engines being sent to Sydney.

I would also suggest that the carriage shed should be built at Junee instead of at Wagga Wagga. I do not think it practicable to run the carriages through from Sydney to Albury, as there would not be more than two hours for the carriage examiner to examine the train and do the necessary work after a run of nearly 400 miles; I think the better plan would be to have a separate set of carriages to run between Sydney and Junee, and a set between Junee and Albury. If the shed is built at Junee it will be available for both lines, and a spare carriage would answer the same purpose of two, if the shed is built at Wagga. I have heard that the want of water at Junee is a great drawback, but judging from the appearance of the country, on the left side of the line on the down journey, I should think one or more reservoirs might be easily constructed at comparatively little cost, and for the water to run into the yard by gravitation. If this could be done it would save the cost of pumping engine, and the wages of a pumper, which at £2 8s. per week, would pay the interest at 6 per cent. on over £2,000. This would go a good way towards paying the cost of constructing one or more dams across the gullies, and the water so provided would be better for locomotive purposes than water obtained from a well.

H. H. PARK.

Petition presented to the House from Residents of Wagga Wagga.

Re Mismanagement and Abuses said to exist at Junee Junction.

1. That it has day by day become more apparent that the present arrangements for the effective working of railways on the Southern and South-western lines are inefficient, and not conducive to the public convenience or welfare.

2. That to show that this is so, the following facts are quoted:—

1st. That when the railway was opened as far as North Wagga Wagga, only about 2 miles from the Murrumbidgee—now known as Bomen—very great expense was incurred by the Department in erecting engine-sheds, goods-sheds, turn-tables, homes for railway employees, and particularly in procuring a water supply for the use of the engines.

2nd. That when the extension across the Murrumbidgee River to South Wagga Wagga was opened, again very great expense was incurred in the erection of engine-sheds, goods-sheds, turn-tables, and cottages for the employees. This latter expense is estimated by people who are well able to judge, at a little over £8,000.

3rd. That this expense was gone to because it was found expedient to remove the engines from North Wagga Wagga, where—although but 2 miles from the river—it was found impossible to procure a full and proper supply of water for locomotive purposes.

4th.

- 4th. That arrangements were made at South Wagga Wagga by the erection of pumping machinery and tanks, whereby a constant supply from the Murrumbidgee River was obtained; and that the cost of the construction of such works was considerable.
- 5th. That, lately, the whole of the locomotive plant has been removed from South Wagga Wagga to Junee Junction, and, therefore, the costly buildings and plant at Bomen and South Wagga Wagga now lie empty, and by reason of disuse are falling into disrepair—buildings and plant, too, which cost the country, at the very lowest, approximately, £12,000.
- 6th. That without any warning whatever, without any reason being given, the whole staff and engines were, by one stroke of the Departmental pen, removed to Junee Junction, a place which was never intended by the engineers who constructed the line as a head locomotive station, because they were aware, and Mr. Whitton still asserts, that on account of its natural disadvantages, and by reason of there being no permanent water there, Junee Junction is unfitted for such a station, and the costly appliances erected by the Government at Bomen and South Wagga, at the expense of the Colony, rendered useless.
3. That to still further point to the necessity for an inquiry into the abuses said to have arisen from this removal of the Locomotive Staff to Junee Junction, the following facts are quoted:—
- 1st. That the most essential element for the proper working of locomotives, and therefore of the railway lines, is entirely wanting at Junee Junction. That element is water. Bore after bore has been put down by the Government, and yet no water has been reached sufficient in quantity to meet the demands of the Locomotive Department, and experts affirm that the formation of the country at and around Junee Junction precludes any probability that water will ever be obtained there by sinking.
- 2nd. That owing to this entire absence of water at Junee Junction the Colony is put to great expense, because all the water used at that place has to be drawn either from Wagga Wagga (a distance of 22 miles), Narrandera (a distance of 61 miles), or Yass (a distance of 100 miles).
- 3rd. That from the places named in section 2, over 30,000 gallons of water are drawn to Junee Junction weekly, at an approximate cost to the Colony of not less than £4,000 yearly.
- 4th. That, owing to there being no water in sufficient quantity at Junee Junction to wash out the boilers—the nearest places being Narrandera (61 miles), Wagga Wagga (22 miles), and Harden (59 miles)—the engines stationed at Junee Junction are becoming deteriorated in value; for the water which is used—being mainly drawn from Hammond's dam, purchased at great cost by the Government, a mere surface-drainage water now rapidly drying up—is necessarily very muddy; and the fact that there is insufficient water to wash out the boilers at Junee Junction, combined with the fact that it is impossible to get a supply of water nearer than the places abovenamed for washing-out purposes, leads to a condition of the boilers which means absolute deterioration, loss of power, and liability to accident.
- 5th. Owing to the want of a full supply of water, which at all times it is now impossible to obtain, engines are unable to perform their work, and as a consequence, trains run late, much to the inconvenience of travellers. This inefficiency of trainage power, too, must some day lead to a deplorable accident, the dread of which must militate against the use of the railways to the travelling public.

4. That again, to show that there is no necessity for bolstering up Junee Junction at so much loss to the Colony, it is affirmed that by making the stages shorter, that is—from Harden to Narrandera, from Narrandera to Hay, from Harden to Wagga Wagga, and from Wagga Wagga to Albury, the hauling of coals over the distance from Wagga Wagga to Albury, and from Narrandera to Hay would be unnecessary, and thereby a great saving would be made to the State; that on these short stages Lithgow coal could be used, whereas to enable the engines to travel the long stages it is necessary to have coal carried all the way from Newcastle.

5. That your Petitioners deem that they have laid sufficient facts before your Honorable House to warrant it in granting the prayer of their Petition, which is that your Honorable House will be pleased to appoint a Select Committee to inquire into the mismanagement and abuses said to exist in the working of the Southern and South-western Lines, with power to call for persons and papers, as regards those portions between Harden and Hay and Harden and Albury.

And your Petitioners, &c., &c.

“Said” to exist—this is cleverly put. There is certainly no evidence or facts in the petition to show that mismanagement or “abuses” do exist at Junee.—T.M.

Mr. Inspector Close's Report on the Petition *re* Mismanagement and Abuses “said” to exist at Junee Junction.

1. That it has day by day become more apparent that the present arrangements for the effective working of railways on the Southern and South-Western Lines are inefficient, and not conducive to the public convenience or welfare.

A GENERAL statement like the above can only be answered by a denial. I assert positively that as far as the general management for working the traffic in this district is concerned it is as efficient as any other section of our lines. If the persons who have drawn up this petition will enter into details and show

T.M.

where the public convenience has suffered by locomotive mismanagement I shall be prepared to answer each charge as made.

2. That to show that this is so, the following facts are quoted:—

1st. That when the railway was opened as far as North Wagga Wagga, only about 2 miles from the Murrumbidgee—now known as Bomen—very great expense was incurred by the Department in erecting engine-sheds, goods-sheds, turn-tables, homes for railway employees, and particularly in procuring a water supply for the use of the engines.

The above extract either betrays ignorance on the part of the persons who have drawn up the petition or else shows a deliberate intention to pervert facts to their own views. The public convenience was in no way affected by the abandonment of Bomen as a locomotive depôt; nor is the abandonment of this station any reflection upon the Loco. Department. I believe I am right in stating that the facts leading to the formation

formation and abandonment of this depôt, are as follows:—When the Southern Line was being constructed, and had reached North Wagga—now known as Bomen—it was expected that Bomen would remain a terminus for some considerable time, in fact, until the viaducts and iron bridge between Bomen and Wagga were completed. Provision (temporary) was therefore made at Bomen for the engines which

A shed to hold four engines was built, and a 40-foot turn-table put in; water was obtained by the contractors, and we took our supply from their temporary tank until we erected a tank of our own and a pump also.—T.M.

ran into that station; a small engine-shed was erected, and two or three cottages for the employees; a 40-foot turn-table was also put down. No water supply was ever provided to the engine-shed at Bomen, but a pump and tank was placed on a lagoon 1½ miles distant, to which the engines ran for water. I believe I am correct in stating that the reason why Bomen engine-shed was not provided with water, was, that it being a temporary depôt only it was not considered advisable to go to any more expense than could be avoided. On the completion of the engine-shed at Wagga Wagga, the temporary station at Bomen was abandoned. It will thus be seen that expense incurred at Bomen has no bearing whatever upon the case.

2nd. That when the extension across the Murrumbidgee River to South Wagga Wagga was opened, again very great expense was incurred in the erection of engine-sheds, goods-sheds, turn-tables, and cottages for the employees. This latter expense is estimated by people who are well able to judge, at a little over £8,000.

A shed with three roads to accommodate twelve engines was erected at Wagga Wagga, but the shed at Junee was finished before the Wagga shed.—T.M.

It is correct that an engine-shed, goods-shed, turn-table, and eight cottages for employees were erected at Wagga Wagga. I am not in a position to be able to state the cost of these, but it appears to me that the inference intended to be conveyed is, that by the withdrawal of the men and engines all this expense has been wasted, and the appliances rendered useless. Such is not the case, the engine-shed is constantly used for the housing and washing out of the engines, but not to the same extent as formerly, and no doubt a smaller engine-shed would suffice; the goods-shed is equally as much used

T.M.

and required now as formerly; turn-table also is used by one, and occasionally two engines per day; three of the loco. cottages are vacant, caused by the withdrawal of loco. staff. The loss in rental of these is trifling in comparison to the saving effected by their removal. The expense incurred in providing a water supply

Correct.—T.M.
A new water-crane has recently been put up at each end of the Wagga platform.—T.M.

for the engines was judicious, and the supply is equally as much required now as it was before the men's withdrawal; all engines running through Wagga take water there, and there are at least six engines per week washed out there.

3rd. That this expense was gone to because it was found expedient to remove the engines from North Wagga Wagga, where—although but 2 miles from the river—it was found impossible to procure a full and proper supply of water for locomotive purposes.

In my answer to clause 1 of the Petition I have fully explained how the depôt at North Wagga came to be abandoned. It was not at all impossible to procure a full and proper supply of water at Bomen, only as I have previously pointed out, this being a temporary station, it was not advisable to incur the additional expense. The engines and men were removed from Bomen to Wagga, about the month of

From the large shed erected at Junee it appears the Engineer-in-Chief thought Junee the best place. I don't think there can be much doubt about where the chief depôt should be—Junee or Wagga.—T.M.

No. 669 attached.—T.M.

March, 1882, although Mr. Park, who held the position of Inspector of the Wagga District just prior to the removal, was of the same opinion as myself, that the head locomotive depôt should be at the junction (Junee). The removal of the men and engines to Wagga took place during the first month I was in charge of this district, and I merely carried out a pre-arrangement. As bearing on Mr. Park's opinion as to where the men and engines should be stationed, please refer to his memo. No. 669, forwarded to the Loco. Overseer on 28th February, 1880. It appears from this memo, a copy of which is in this office, that as far back as February, 1880, and prior to the erection of the engine-shed at Wagga Wagga, Mr. Park formed a correct opinion as to where the men and engines should be stationed, and offered the suggestion that one engine-shed only be erected, and that at Junee. The reasons given by him are the same as eventually caused the men's removal, but of course with the increase in the traffic, the saving effected became much greater than Mr. Park could have anticipated.

This was a wise expenditure.—T.M.

4th. That arrangements were made at South Wagga Wagga, by the erection of pumping machinery and tanks, whereby a constant supply from the Murrumbidgee River was obtained, and that the cost of the construction of such works was considerable.

The above clause is answered by clause 2nd, as I have already pointed out; the pumping machinery is equally as much required now as at any time previous, consequently the above clause has no bearing on the case.

5th. That lately the whole of the locomotive plant has been removed from South Wagga Wagga to Junee Junction, and therefore the costly buildings and plant at Bomen and South Wagga Wagga now lie empty, and by reason of disuse are falling into disrepair—buildings and plant, too, which cost the country, at the very lowest, approximately £12,000.

On previous papers I have proposed that the Bomen shed be pulled down and re-erected at Junee, where it will be of great use to this Department.—T.M.

The Petitioners might add there is also a shed at Albury, Narrandera, and Hay, not fully used by any means.—T.M.

Reasons have been given to the head of the Department, and that is all that is necessary, I think.—T.M.

they were aware, and Mr. Whitton still asserts, that on account of its natural disadvantages, and by reason of there being no permanent water there, Junee Junction is unfitted for such a station—and the costly appliances erected by the Government at Bomen and South Wagga at the expense of the Colony rendered useless.

6th. That without any warning whatever, without any reason being given, the whole staff and engines were, by one stroke of the Departmental pen, removed to Junee Junction—a place which was never intended by the engineers who constructed the line as a head locomotive station, because they were aware, and Mr. Whitton still asserts, that on account of its natural disadvantages, and by reason of there being no permanent water there, Junee Junction is unfitted for such a station—and the costly appliances erected by the Government at Bomen and South Wagga at the expense of the Colony rendered useless.

For the reasons that have governed and caused the removal of the men and engines from Wagga to Junee Junction, I must refer you to my reports, in which all the removals from Wagga to Junee are fully explained. I am not aware what Mr. Whitton's opinion is, but as the large preponderance of traffic has concentrated itself at Junee, there must the engines be also. The expense would be enormous to run the engines of all trains that start from Junee for stations north and south-west into Wagga, and I need only refer you to the special train returns for the past seventeen or eighteen months to fully prove this. As a general thing, two goods trains each way per day are found to be amply sufficient for all the goods traffic between Junee and Albury; whilst on the down trip between Harden and Junee as many as thirteen engines have run, and on the "up" trip between

same.

In this respect Junee is like Picton, there is no water there either.—T.M.

same stations I have known eleven or twelve engines to leave on one day. It is quite true that there is no permanent water supply at Junee, or indeed any supply at all, and the outcry raised against the bad water at Mr. Hammond's dam at Old Junee is simply moonshine and set afloat from interested motives. The water from this dam has been used ever since the South-western line has been opened, and would still have to be used even were the engines stationed at Wagga. A chemical analysis of this water by the Government Analyst proved that this water exercised no prejudicial effect upon the boilers; indeed comparing the water from this dam with that taken at other watering stations, notably Albury, Cootamundra, Harden, and Rocky Ponds, it can be said to be good; it is not as good as river water, nor can it be expected to be so. From the position of Junee Junction it is favourably situated in one respect, viz., that a large water supply is not required; I should consider 20,000 gallons per day a very good supply, and equal to all our requirements. The watering stations on main line to the north and south of Junee are less than half a stage distant, consequently engines running into Junee have sufficient water to return to the watering station. They not only have sufficient, but a surplus, and it is from this surplus that emergencies, such as emptying a boiler or tank, are supplied; some little inconvenience has been caused at times, but nothing that can or has affected the travelling public, or caused any loss to the men, or to the Government. No doubt it is extremely desirable that a permanent water supply be procured at the Junction, as I believe persons who reside

outside the railway premises are at times put to great inconvenience from the want of water, and sooner or later this want must be supplied. The people themselves are to a great extent to blame in this matter; the natural rainfall of the district is enough to supply every one, were it properly conserved in tanks. The purpose for which the Locomotive Department requires the water is for the washing out of engine-boilers. This we cannot do at Junee; our engines are washed out at present at the different break stations in the district, viz., Wagga Wagga, Albury, Harden, Narrandera, and Hay. They are not run to any of the stations named specially for the purpose of being washed out, but work the trains there in the ordinary course of traffic, and are washed out when necessary before their return. It is again reiterated in clause 6 that the costly appliances at Bomen and Wagga are, in consequence of the removal to Junee, rendered useless. I can only reiterate in reply that the appliances at Wagga have not been rendered useless, but are extremely valuable, whilst the appliances at Bomen are rendered useless in any case.

There is very little difficulty about this.—T.M.

I don't know that water is the "most essential element." It seems to me that coal is; and perhaps in sinking for water we may come on coal, and so satisfy the Petitioners perfectly.—T.M.

3. That to still further point to the necessity for an inquiry into the abuses said to have arisen from this removal of the locomotive staff to Junee Junction, the following facts are quoted:—
1st. That the most essential element for the proper working of locomotives, and therefore of the railway lines, is entirely wanting at Junee Junction—that element is water. Bore after bore has been put down by the Government, and yet no water has been reached sufficient in quantity to meet the demands of the Locomotive Department, and experts affirm that the formation of the country at and around Junee Junction precludes any probability that water will ever be obtained there by sinking.

Water is, as I have stated in my answer to the previous clause, entirely wanting at Junee Junction.

This seems to indicate that water can be got by means of a few cast-iron segments being made.—T.M.

Bore after bore has been put down, and, from the insufficient appliances at the command of the men employed, have been in every case abandoned when water was struck. I believe I am correct in stating that in most of the bores put down water was struck at depths ranging from 100 to 120 feet. The bores were given up because with the appliances the men had (an ordinary shell auger worked by hand) they could not work deeper. A shaft was also sunk about 4 miles from the Junction, in which water was struck. This shaft appears to have been also given up, although a considerable amount of water was coming in at the time; "about 400 gallons an hour, I believe," and no attempt has since been made to test the supply by means of pumping. There is at present 35 or 40 feet of water in this shaft, and, as far as I am able to judge, of good quality.

The most essential element, "coal," is evidently wanted here.—T.M.

The Petitioners can only mean the water taken in the tenders to Junee. It is absurd to say that water is drawn from Yass to Junee except as I indicate.—T.M.

2nd. That owing to this entire absence of water at Junee Junction, the Colony is put to great expense, because all the water used at that place has to be drawn either from Wagga Wagga (a distance of 22 miles), Narrandera (a distance of 61 miles), or Yass (a distance of 100 miles).

3rd. That from the places named in section 2, over 30,000 gallons of water are drawn to Junee Junction weekly, at an approximate cost to the Colony of not less than £4,000 yearly.

To the statements contained in the above clause I give a most unqualified denial. During the time I have been in charge of this district (*i.e.*, for the past two years), not one drop of water has ever been hauled to Junee for the use of locomotives. The statement I have made can easily be proved by an inspection of the books of Traffic Department; nor is it necessary to haul water, and my answer to clause 6

On previous papers I have expressed the opinion that hauling water in tanks from Wagga is, perhaps, the cheapest way of getting water there.—T.M.

fully explains this. But I maintain that even supposing water was hauled to Junee for general purposes, such as washing out, &c., it would be cheaper to do so than to run all the engines from Junee to Wagga and back, a distance of 44 miles, for the water each engine might require. The case stated simply appears to me to amount to this, whether it is cheaper to run each engine to Wagga for its water, or to run one engine from Wagga to Junee hauling sufficient water to serve the whole—for washing out engines and for emergencies; not for ordinary running purposes. I say it is most decidedly cheaper to run the water to the engines, instead of running the engines to the water. It is asserted that 30,000 gallons of water per week is drawn to Junee Junction. A certain quantity of water, I am unable to say how much, is brought by the water train to Junee for the use of persons unconnected with the Loco. Department, namely, fettlers. These men are, and always have been, supplied with water by the water train, because, living in bark houses, they have no means of conserving a supply for themselves. There are also a few other employees, both traffic and loco., who are just at present receiving their supply for domestic purposes from the water train. The supply to the few loco. employees is comparatively insignificant, and does not exceed 2,000 gallons a week; it will be a liberal estimate to estimate that this costs 24s. a week, and this is not for the whole year, but only for the two or three dry summer months. The water train I have referred to supplies water to all fettlers from Albury to Goulburn, and from Junee to Hay; it ran

before

before the engines were removed to Junee, and would continue to run if they were taken away from there, so that it will be seen that the statement made that it costs £4,000 per year to haul water to Junee either is made in ignorance of the facts or is a wilful misstatement.

4th. That, owing to there being no water in sufficient quantity at Junee Junction to wash out the boilers—the nearest places being Narrandera 61 miles, Wagga Wagga 22 miles, and Harden 59 miles—the engines stationed at Junee Junction are becoming deteriorated in value, for the water which is used, being mainly drawn from Hammond's dam, purchased at great cost by the Government—a mere surface drainage water now rapidly drying up—is necessarily very muddy; and the fact that there is insufficient water to wash out the boilers at Junee Junction, combined with the fact that it is impossible to get a supply of water nearer than the places abovenamed for washing-out purposes, leads to a condition of the boilers which means absolute deterioration, loss of power, and liability to accident.

The statement made in the above clause, that from the absence of water at Junee the boilers are becoming deteriorated in value, is not true, and can easily be ascertained on inspection. The water used in this district, two stations excepted (Cootamundra and Albury), is remarkably free from corrosive properties, and we do not use a large quantity of water from Hammond's dam. At present we are not using more than 3,000 gallons per day from the dam, and as I have before explained, the water at this dam has no prejudicial effect on the boilers. I believe I am correct when I state that Hammond's dam has not been purchased by the Government. A charge is made (of £78 per year) for the water taken.

5th. Owing to the want of a full supply of water, which at all times it is now impossible to obtain, engines are unable to perform their work, and as a consequence trains run late, much to the inconvenience of travellers. This inefficiency of trackage power, too, must some day lead to a deplorable accident, the dread of which must militate against the use of the railways to the travelling public.

It is not true that engines have at any time been unable to perform their work in consequence of an insufficient supply of water, nor have any trains run late in consequence; and it would be extremely desirable if the persons who have drawn up the petition would state specially the particular instances when trains have run late through an insufficiency of water. As it is, the charge is a general one, and it is impossible to do more than give it a general denial.

6th. That again to show that there is no necessity for bolstering up Junee Junction at so much loss to the Colony, it is affirmed that by making the stages shorter—that is, from Harden to Narrandera, from Narrandera to Hay, from Harden to Wagga Wagga, and from Wagga Wagga to Albury, the hauling of coals over the distance from Wagga Wagga to Albury, and from Narrandera to Hay would be unnecessary, and thereby a great saving would be made to the State. That on these short stages Lithgow coal could be used, whereas to enable the engines to travel the long stages it is necessary to have coal carried all the way from Newcastle.

I have in my previous answers shown that there is no bolstering up of Junee at the expense of the Colony, as will be amply verified on inquiry, and the suggestion made that the stages be altered and made from Harden to Narrandera, Narrandera to Hay, Harden to Wagga, and Wagga to Albury, would, if carried into effect, be an enormous additional expense. It would mean in the first instance forming two additional locomotive depôts (Narrandera and Wagga). I need not point out the expense involved in this, as no doubt you are fully aware of it. One large depôt can always be managed much more economically than if the engines and men were divided and split up into three small depôts. The assumption that sufficient coal could be carried on the tenders to run from Harden to Narrandera and return is a false one. The double distance is 240 miles. We have no engine that will carry coal sufficient to run that distance. It appears also to be assumed that an engine could run from Narrandera to Hay and return taking sufficient coal on the tender at Narrandera to run the double trip, the distance (double) is 212 miles. Our engines will not carry coal to run that distance. I do not myself see how it is possible to run the engines from Harden to Narrandera profitably, and the south-western regular trains do not run in conjunction with the main line goods trains, so that a break of several hours would take place at Junee. Again, the engines used on the two sections (main line and south-west) are of a different type; on the south-western, Bogie passenger engines being used for goods trains, and on the main line 6-wheel coupled goods engines; the reasons for this are, that the grades on south-western being lighter than the grades on main line, a 4-wheel coupled Bogie passenger engine can haul as heavy a load on south-western as a 6-wheel coupled goods engine on main line, and what is still more important can run its load at a much higher rate of speed; this, on a line where the only regular trains are mixed goods and passenger, is an important consideration, and means a saving of several hours effected in the arrival of passengers and goods at Hay. In the case of live stock trains too, I think it is infinitely more preferable to use Bogie passenger engines for hauling them on south-western than goods engines. In conveying live stock from stations south-western to Homebush, time is a most important consideration, and time is saved by the use of Bogie passenger engines for live-stock trains on south-western line. It would not be economical to use the class of engine last mentioned for live stock trains on main line, I mean between Junee and Harden, for the following reasons:—A Bogie passenger engine can haul from Narrandera to Junee fourteen trucks of sheep or cattle; but from Junee to Harden the same class of engine can haul eleven trucks only of sheep or cattle, consequently three trucks of its load would have to be left behind at Junee or an additional engine attached; the same applies in the reverse direction, namely, from Harden to Narrandera. It is for this reason that when a live stock train arrives at Junee from south-western that a goods engine is attached; by its greater power it compensates for the heavier grades, it can take the same load from Junee to Harden that the passenger engine has hauled from Narrandera to Junee.

The second part of clause 4 states, that on main line between Harden and Albury the stages should be from Harden to Wagga and Wagga to Albury, this would be the reverse of economical, it would mean the maintenance of Wagga as a depôt with all its concomitants of shed inspectors, day and night, with firemen as their assistants; this expense is at present absolutely saved. The engines, also, in the intervals between trains, would lie where they could not be utilized, as the traffic between Junee and Albury is a regular traffic and it is a rare occurrence for a goods special to run, as the break stations are at present, viz., Harden to Junee and Junee to Albury; the engines in the interval between trains are lying where they can be most profitably utilized, that is they are available to be run in three directions, either up or down the main line and down the south-west; this matter is fully explained in my former memo. of 28/8/83. I am satisfied that by concentrating the

the engines and men in the depôt from which they can be most profitably used, has effected a very large saving to the Government, and I am quite content to await the result of any inquiry the Department may initiate.

The more the matter is inquired into the more economical will be the results, and the clearer it will be shown that what has been done is right.—T.M.

I find I am omitting to notice the statement made that Newcastle coal is used on the long stages. This is not true. There is no Newcastle coal used between Junee and Albury and between Junee and Hay, Bowenfels coal alone is used for these stages. A little Newcastle coal is used for the engines working the express and mail trains between Junee and Goulburn, and you will find on reference to the requisitions sent to you for Newcastle coal that we are not now using one fourth of the quantity that we formerly used when the engines were stationed at Wagga; this fact speaks for itself.

Running engines from Wagga to Narrandera and back. I find, on re-perusal, I have not touched upon this point. This could only be done by putting on additional trains, as the south-west trains do not run into Wagga but stop short at Junee, consequently additional trains would be required between Wagga and Junee.

J. CLOSE, 28/2/84.

Memo. by Mr. T. Midelton.

Report, in reply to written Petition, and also to the printed document herewith.—T.M., 2/3/84.

Re Commissioner's Minute Paper 84/5,762 herewith.

I NEED not point out how easy it is to "suggest" that thousands of pounds now charged to the Locomotive Department could be avoided—where engine-men and firemen could be at home nearly every night—where "engine-men could have their own engine, &c., &c." But the engine-drivers and firemen of Junee Junction will have some difficulty in showing how to carry into practical effect what they "state" or "suggest," especially under existing circumstances. I am not to be understood to mean that what they "suggest" is impossible to accomplish, but I do mean that it is impracticable, unnecessary, wrong, and inconsistent with good management.

- 1st. Whenever the traffic arrangements will admit of it, drivers are always allowed to keep to one engine and one run—that is, the engine-man always has the same engine; but if this rule were observed with each driver we should (as an inspection of the time-table will readily show) want about double the number of engines we have at present. It is manifestly absurd to expect to work a locomotive engine 8 hours per day, and then put her into the shed because the men cease work after 8 or 9 hours' duty.
- 2nd. It is stated that "the engine-cleaners have a different engine every day, &c., &c." I see no hardship in this, and a sensible cleaner, who wished to make himself efficient, would rather like this change, as it means greater experience for him. Again, if the engines are not half cleaned as stated it is because they cannot be allowed to stand idle long enough. I think firemen would show a disposition to help if they occasionally wiped their engines over when standing at a station, waiting, perhaps three-quarters of an hour or so, for a train to pass; this is what I should call "respecting an engine the same as if it were a human being."
- 3rd. *Re* shed days at Junee.—These are, as Mr. Close points out, made at other stations, or rather the washing out of boilers is done at other places, and if it occasionally happens that a boiler is washed out at Junee, it could be done with the hot water in the said boiler; there is no great difficulty about this, and I intend (as soon as I can possibly find time) to wash boilers out in this way and use the steam from them for heating the fresh water which will take the place of the dirty, and so keep the boiler hot instead of cooling it as is now (erroneously) done. Drivers have fixed notions now about washing out boilers, and I think it time it was moved. I am not aware of any train in the Junee district being caused to run late through the boilers not being washed out.
- 4th. "If the engine-men were stationed at Wagga, Narrandera, and Harden," it would entail a large extra expense, and I fail to see how the haulage of coal could be lessened one third.
- 5th. It is said that mail engines should take coals at Goulburn, and run to Harden and back, but it is not stated how the mail engine which runs from Harden to Wagga and back is to be provided with coal at Harden. It is presumed I suppose, that coal is to be got at Harden without hauling it there. Besides the mail leaves Goulburn (now, 2/3/84) at 2:55 night, gets to Harden at 7:2 a.m., "up" mail leaves Harden at 9:5 a.m., reaches Goulburn at 12:55 noon; I wonder if either of the Junee drivers would like to work this train down and back to this time, five days a week, and have a shed day? To do the down journey one day, and the up journey the next would not pay, it would mean but 94 miles per day, or 4½ hours work per man per engine.

I will not go further into the "suggestions," neither will I ask the "suggesters" to make out a table of their proposed running in accordance with the traffic time table, as I feel certain they will not come out economically for the Department, but highly so for themselves perhaps; I fancy they would have to ask the Traffic Manager to alter the time table to suit their running, instead of as now, our having to suit our running to the time table.

We do not, as you well understand, take any more coal to Hay and Albury than is absolutely necessary for emergencies. It seems to me the petitioners would be quite satisfied if they could either get away from Junee, or get water there; the tall talk about the engines, the running, &c., is not by any means well thought out by them, it is merely suggestions, so far.

It is evident, too, that there is nothing in the statement that "every locomotive workman at Junee Junction would sacrifice everything they have at Junee to be removed from there." This is entirely in their own hands of course; but I do not remember having received any resignations.

When the down mail train is very heavy, it is sometimes necessary (or expedient rather) to help her over the Junee bank—this is done by an engine pushing the train, on the straight, about 2 miles,—she then returns, so saving a run of 20 miles to Wagga and 20 miles back unnecessarily.

I trust you will consider the petitioners' letter over and inquire into the working of Junee Junction ; but not for the engine-men alone, that would be manifestly unfair. The more severe the inquiry the better it will be for the officers of the Department, as I feel sure they are in the right.
The Locomotive Engineer. THOS. MIDELTON, 2/3/84.

Petition of residents of Wagga Wagga, *re* removal of engines, &c., to Junee.

Memo. by The Chief Clerk.

The enclosed Petition is submitted for Commissioner's information and directions.—D.C.M'L., 12/3/84.

[Enclosure.]

SOUTHERN AND SOUTH-WESTERN RAILWAYS.

(PETITION AGAINST INEFFICIENT WORKING OF—RESIDENTS OF WAGGA WAGGA.)

Received by the Legislative Assembly, 20 February, 1884.

To the Honorable the Speaker and Members of the Legislative Assembly of New South Wales, in Parliament assembled.
The humble Petition of the undersigned residents and inhabitants of the District of Wagga Wagga,—

HUMBLY SHOWETH :—

1. That it has day by day become more apparent that the present arrangements for the effective working of railways on the Southern and South-western lines are inefficient, and not conducive to the public convenience or welfare.

2. That to show that this is so the following facts are quoted :—

- A 1st. That when the railway was opened as far as North Wagga Wagga—only about 2 miles from the Murrumbidgee—now known as Bomen, very great expense was incurred by the Department in erecting engine-sheds, goods-sheds, turn-tables, homes for railway employees, and particularly in procuring a water supply for the use of the engines.
- B 2nd. That when the extension across the Murrumbidgee River to South Wagga Wagga was opened, again very great expense was incurred in the erection of engine-sheds, goods-sheds, turn-tables, and cottages for employees. This latter expense is estimated, by people who are well able to judge, at a little over eight thousand pounds (£8,000).
- C 3rd. That this expense was gone to because it was found expedient to remove the engines from North Wagga Wagga, where—although but 2 miles from the river—it was found impossible to procure a full and proper supply of water for locomotive purposes.
- D 4th. That arrangements were made at South Wagga Wagga by the erection of pumping machinery and tanks, whereby a constant supply from the Murrumbidgee River was obtained, and that the cost of construction of such works was considerable.
- E 5th. That lately the whole of the locomotive plant has been removed from South Wagga Wagga to Junee Junction, and, therefore, the costly buildings and plant at Bomen and South Wagga Wagga now lie empty, and, by reason of disuse, are falling into disrepair, buildings and plant, too, which cost the country, at the very lowest, approximately, twelve thousand pounds (£12,000).
- F 6th. That without any warning whatever, without any reason being given, the whole of the staff and engines were, by one stroke of the Departmental pen, removed to Junee Junction, a place which was never intended by the engineers who constructed the line as a head locomotive station, because they were aware, and Mr. Whitton still asserts, that on account of its natural disadvantages, and by reason of there being no permanent water there, Junee Junction is unfitted for such a station, and the costly appliances erected by the Government at Bomen and South Wagga, at the expense of the Colony, rendered useless.
- G 3. That to still further point to the necessity for an inquiry into the abuses said to have arisen from this removal of the locomotive staff to Junee Junction, the following facts are quoted :—
- H 1st. That the most essential element for the proper working of locomotives, and therefore of the railway lines, is entirely wanting at Junee Junction—that element is water. Bore after bore has been put down by the Government, and yet no water has been reached sufficient in quantity to meet the demands of the Locomotive Department; and experts affirm that the formation of the country at and around Junee Junction precludes any probability that water will ever be obtained there by sinking.
- I 2nd. That owing to this entire absence of water at Junee Junction, the Colony is put to great expense, because all the water used at that place has to be drawn either from Wagga Wagga (a distance of 22 miles), Narrandera (a distance of 61 miles), or Yass (a distance of 100 miles).
- J 3rd. That from the places named in section 2, over thirty thousand gallons (30,000) of water are drawn to Junee Junction weekly, at an approximate cost to the Colony of not less than four thousand pounds (£4,000) yearly.
- K 4th. That owing to there being no water in sufficient quantity at Junee Junction to wash out the boilers, the nearest places being Narrandera (61 miles), Wagga Wagga (22 miles), and Harden (59 miles), the engines stationed at Junee Junction are becoming deteriorated in value, for the water which is used being mainly drawn from Hammond's dam, purchased at great cost by the Government, a mere surface drainage water, now rapidly drying up, is necessarily very muddy; and the fact that there is insufficient water to wash out the boilers at Junee Junction, combined with the fact that it is impossible to get a supply of water nearer than the places abovenamed for washing-out purposes, leads to a condition of the boilers which means absolute deterioration, loss of power, and liability to accident.
- L 5th. Owing to the want of a full supply of water, which at all times it is now impossible to obtain, engines are unable to perform their work, and, as a consequence, trains run late, much to the inconvenience of travellers. This inefficiency of trainage power, too, must some day lead to a deplorable accident, the dread of which must militate against the use of the railways to the travelling public.
- M 4. That, again, to show that there is no necessity for bolstering up Junee Junction at so much loss to the Colony, it is affirmed that by making the stages shorter, that is, from Harden to Narrandera, from Narrandera to Hay, from Harden to Wagga Wagga, and from Wagga Wagga to Albury, the haulage of coals over the distance from Wagga Wagga to Albury, and from Narrandera to Hay, would be unnecessary, and thereby a great saving would be made to the State. That on these short stages Lithgow coal could be used, whereas to enable the engines to travel the long stages it is necessary to have coal carried all the way from Newcastle.
- N 5. That your Petitioners deem that they have laid sufficient facts before your Honorable House to warrant it in granting the prayer of their petition.
- Your Petitioners therefore humbly pray that your Honorable House may be pleased to appoint a Select Committee to inquire into the beforementioned matters, with power to call for persons and papers.
- And your Petitioners, as in duty bound, will ever pray.

[Here follow 489 Signatures.]

I wish a report upon this representation—paragraph by paragraph.—CH. A. G., 18/3/84. Locomotive Engineer. Further report herewith; I fancy the Commissioner has not seen Mr. Close's report of 28/2/84, and mine of 2/3/84.—T. M., 20/3/84. Locomotive Engineer.

Minute

Minute of The Locomotive Foreman.

Re Petition from Residents Wagga Wagga.

In reply to clause 1, &c., I trust the following will suffice:—

Considering the petitioners cannot possibly have sufficient or correct data concerning the management &c., of the Locomotive and Traffic Departments in the Wagga district, I do not see how they can arrive at any other conclusion but the erroneous one they have recorded in their petition; I have often read similar sentiments (at home) in the daily papers about the best managed lines in the United Kingdom.

Clause 2. (No comment required.)

Clause A 1. This is magnified; an engine-shed, a turn-table, a goods-shed, and a few houses (built of wood) were erected and duly utilized, and now they are intended to be used elsewhere as soon as possible. There was no great difficulty or expense incurred in getting water as it was close to long viaduct, which is but a few hundred yards from the Bomen station.

Clause B 2.—This is also magnified in engine-sheds, goods-sheds, turn-tables, and cottages; but the management is not responsible for the appliances put down at either place, viz., Bomen or Wagga Wagga.

Clause C 3.—This is the first time I ever heard that it was impossible to get a full supply of water at Bomen, and I think the clause must be the result of pure imagination.

Clause D 4.—This is rather a proof of good management, I think, than the reverse, seeing that we can now take water at the Wagga station either on the up or down journey.

Clause E 5.—It is proposed to move the (costly) Bomen shed to Junee. The Wagga shed is still used when required, and so is the turn-table daily. The petitioners seem to think that if Wagga shed had been used instead of Junee that there would have been no building and costly plant lying empty and idle. It is clear if the one is used the other must necessarily be somewhat idle, whether we use Junee or Wagga shed.

Clause F 6.—This is very extravagant, warning was given, reasons were found, but not to the petitioners, it is true. Seeing that the engineers who constructed the lines made Junee, Bomen, and Wagga Wagga, locomotive depôts, it is difficult to tell which place really was intended for the chief depôt, and as necessity has indicated Junee, I consider the management good in remaining there.

Clause G 3.—Requires no comment.

Clause H 1.—This seems satisfactory in a measure seeing that a dam has been made at Junee, but up to now it has held no water; it is satisfactory to know that exertions have been made to obtain it by boring.

Clause I 2.—I am not aware of a drop of water being drawn to Junee from Wagga, Narrandera, or Yass in the sense the petitioners regard it. We fill up all tenders at these stations, and so take as much to Junee as possible, but as this is done at all stations (Picton especially) the argument used is fallacious.

Clause J 3.—Suppose this were true the question arises—would it not cost more to haul coal for Junee to Wagga for locomotive purposes than it does to haul water from Wagga to Junee?

Clause K 4.—The engines at Junee are becoming deteriorated the same as at all other stations, but not any more than if they had been stabled at Wagga or Bomen. I look upon the remaining portion of this clause and the whole of clause L 5 as rather sensational.

Clause M 4.—Is ill considered and wholly wrong, that is to say, if good and economical management is to be practised.

Clause N 5.—It seems to me questionable whether the petitioners would be fully satisfied if their prayer were answered as requested; I think they would only be wholly satisfied by a sudden removal from Junee to Wagga Wagga.

T.M., 20/3/84.

Minute by The Commissioner for Railways.

Commissioner's Minute Paper, 86/8,544.

THE scheme to bring water from Wagga to Junee is to cost £25,000, not £60,000, as stated (*vide Telegraph*, May 25th, 1886); the estimate, however, is being revised. I will treat this paper as a revival of the proposal to make Wagga the running shed station.

When the question was last discussed, it was shown that while there were only 2 engines employed on goods trains between Harden and Albury, there were 20 to 23 engines running between Harden and Junee, and Junee and South-western line.

To make Wagga the running shed station, it would involve the running of 22 engines to and from Wagga daily, which would leave and pick up again their trains at Junee.

Estimating the cost of running each engine at 1s. 6d. per mile, the cost would amount to, in round figures, £75 a day, or allowing for 20 engines only, £66 a day, equal to £20,000 a year; but then there is a proposal to make Narrandera a running shed station.

I wish the matter carefully gone into in the light of existing train running, and a statement prepared showing the effect, as regards cost of running, if Harden, Wagga, and Narrandera, were made locomotive depôts.

Mr. Laughry, Mr. Derbyshire, and Mr. Close, might form Board of Inquiry. CH.A.G., 29/5/86. Mr. Scott.

Commissioner's 86/8,544. Loco. 86/2,782.—Please arrange to fully inquire into this matter as directed by the Commissioner, and report as early as possible.—W. SCOTT. Mr. Laughry. Joint report attached.—E. A. LAUGHRY, 8/6/86. Loco. Engineer. The Commissioner.—W. SCOTT, 8/6/86.

Report of Board of Inquiry.

REPORT of Board of Inquiry in *re* making changing stations for Junee District at Harden, Wagga, and Narrandera.

Memorandum to Loco. Engineer.

Government Railways, Locomotive Engineer's Branch,

Junee Junction Station, 8 June, 1886.

WE have to report that in accordance with your instructions conveyed to us on your 86/2,782, Commissioner's 86/8,544, we proceeded from Sydney to Junee on 5th instant, for the purpose of holding an inquiry on the subject mentioned above.

We

We have carefully studied the matter in all its different phases, and find that to carry out the proposed arrangement would entail a very large additional expenditure on the Department, the details of which are as follows:—In consequence of ruling grades on south-west and on main line south of Junee being lighter than on main line north of Junee, engines of different types have to be used for each section; under the proposed change engines of the same class would be used over the two sections; this, we need scarcely point out, would not be economical working, more especially on the run from Narrandera to Harden. Engines leaving Narrandera with a full load of live stock to Junee would require to be assisted from there to Harden; it would follow that a light engine would have to be sent from Wagga for this purpose; the engine would of course have to return from Harden to Wagga light—thus making 103 miles of empty running and 59 miles with about one-quarter of its load. We estimate this to cost £16 11s. per train; this at two trains per day, £33 2s.:—

Equal to	£	s.	d.	
...	10,360	6	0	per annum.

Engines running in the contrary direction, viz., from Harden to Narrandera, would on arrival at Junee, owing to the change of grade, have only 60 per cent. of a load from Narrandera, 60 miles distant; but making a liberal allowance for traffic that may be picked up at Junee from stations south would probably increase its load to 75 per cent., leaving engines still deficient by 25 per cent. of a full load; we estimate this would be a loss to the Department of £3 per train; this at two trains per day = £6, or	1,878	0	0	„
--	-------	---	---	---

Engines running between Wagga and Harden.

Owing to the change of grade as previously mentioned, engines for each round trip would have to run 44 miles of the distance with 25 per cent. short of a full load; this would entail a loss of £4 8s. per train; this, at two trains per day = £8 16s., or	2,754	8	0	„
--	-------	---	---	---

The engines that run south-west, mixed trains between Junee and Hay, would require to leave Wagga and return from Junee empty; this 44 miles per day at 1s. 6d. = £3 6s., or	1,204	10	0	„
--	-------	----	---	---

The assistant main line mail engine, which is not required south of Junee, would also have to go on to Wagga empty. This engine runs on an average once a week—equal to	171	12	0	„
---	-----	----	---	---

Under the proposed arrangement an additional Locomotive Depôt would be formed, with all its concomitants of Sub-Inspectors, Shed Inspectors, their firemen, clerk, and storeman. Cost of this would be—

One Sub-Inspector at	275	0	0	„
Two Shed Inspectors at £245 each	490	0	0	„
Two firemen at £170 each	340	0	0	„
One storeman at £100	100	0	0	„
One clerk at £105	105	0	0	„
Office expenses	25	0	0	„

The present consumption of coal at Junee is about 30 tons per day; under proposed arrangement half this would go to Wagga and half to Narrandera, 22 miles and 60 miles respectively. Haulage of coal 15 tons per day to Wagga (from Junee) at 1½d. per ton per mile = £2 1s. 3d., or	645	11	3	„
---	-----	----	---	---

Haulage from Junee to Narrandera, 15 tons per day at 1½d. per mile = for 60 miles to £5 12s. 6d. per day, or	1,760	12	6	„
--	-------	----	---	---

To the above items should be added a further cost, which we can only estimate approximately, viz., that caused by working the comparatively short sections from Wagga to Albury and Narrandera to Hay. The men working on these sections could not be fully employed, but would have to be paid full time. The single run in each case would be under, and the double run over a day's work, we estimate extra cost at £600 per annum	600	0	0	„
---	-----	---	---	---

Gross total	£20,709	19	9	„
-------------	---------	----	---	---

From the above amount has to be deducted the saving that would be effected in the carriage of water to Junee. It appears to be assumed that were the proposed change carried into effect, the necessity for bringing water to Junee would cease. This is not the case. The necessity for bringing water to Junee arises through the temporary failures of Hammond's Dam, the 32-mile Tank, S.-west, and the permanent failure of water supply at Bethungra. So that even were Junee abolished as a depôt, it would still be necessary to bring water there for the use of engines running through; there would, however, be a reduction, which we estimate would be ¼rd of the quantity at present carried. Reckoning that the total cost of present water service is £3,900 per annum, this would leave £1,300 to be deducted from the £20,709 19s. 9d., leaving nett cost of proposed change at £19,409 19s. 9d. per annum.

Before concluding our report, we feel it our duty to point out other anomalies that would be created were proposed change carried into effect, which cannot well be estimated in cost. The figures we have given are based on the existing traffic, which is lower now than at any time during three or four years past. We need only refer you to special train returns for 1882, 1883, and 1884, to prove this fact. Two of these returns are with attached papers, which please see. Were the traffic to assume the proportions that it has done in former busy seasons, the preponderance of it would be between Junee and stations North and S.-west; this could only be met by running light engines from Wagga to Junee. This would not only result in a large increase on the figures we have given, but would result, as in former years, in delays and confusion to traffic.

There

There is another item which has an important bearing on the case, and was indeed one of the first causes which led to the formation of a locomotive depôt at Junee, viz., the long runs of Goulburn to Wagga mail-men. The distance ran was 175 miles, which was excessive. In addition to this the interval between down and up trains did not admit of sufficient rest before commencing the return journey. When the locomotive depôt was at Wagga the Locomotive Inspector found it necessary to spend the whole of his time at Junee, in order to be able to successfully manipulate the constantly fluctuating traffic from that point. He has also found from the experience of the past three years, during which time the locomotive power has been stationed at Junee Junction, that he has been able to successfully cope with the traffic at a saving of time and minimum of cost as regards motive power.

JOHN CLOSE.
E. A. LAUGHRY.
G. DERBYSHIRE.

Memo. by The Chief Clerk.

CHANGING Stations—Junee, Wagga, Harden, and Narrandera,—proposal to dispense with Junee and substitute the other places.

*In connection with the above please state, for the Commissioner's information, the probable cost of removing the locomotive sheds, at Junee, to Wagga, and what provision would be required at Narrandera and Wagga in addition to what there is already at those places.

*The Commissioner further wishes to know whether any additional building in connection with running shed is being erected at Junee, and directs that if there be work should be stopped.

Also, when the joint report of the Locomotive Engineer and the Engineer for Existing Lines, relative to the cost of pumping water from Wagga to Junee, or some other scheme for getting water at Junee, will be ready. The Commissioner is assured that a dam at Old Junee, with a pipe service to Junee, would meet the case.

Please report fully with the least possible delay.
Engineer for Existing Lines.

D.C.M'L., B.C., 15/6/86.

Mr. Stephens, for report on paragraphs marked *.—G.C., 18/6/86. This is being prepared.
I expect to have it completed by to-morrow evening.—R.D.S., July 12/86. Mr. Cowdery. Herewith attached.

Memo. by Mr. R. D. Stephens.

Office of District Engineer, Goulburn, 15 July, 1886.

Re changing Stations—Junee, Wagga, Harden, and Narrandera. Proposal to dispense with Junee.—
Your M.P., 86/3,750.

THE instructions are—to give "the probable cost of removing the loco. sheds at Junee to Wagga."

In the estimates to follow, I have acted on these instructions, though I hardly think that that can have been the original intention, for Wagga already has a large running-shed, and it would not be desirable to leave Junee without a shed of some kind. I am inclined to believe that the intention was to remove the workshops to Wagga, but to leave the Junee running-shed standing. I have, however, as stated above, carried out the orders as given.

Wagga.

Removing and re-erecting Junee running-shed and workshops:—		£	s.	d.
Foundations to running-shed	240	0	0
Three long inside engine-pits	770	0	0
Three 43-feet outside engine-pits	290	0	0
Foundations to workshops	280	0	0
Two 100-feet pits inside workshops	450	0	0
Carpenters' work (this includes the lining of corrugated iron roof)	2,350	0	0
		<u>£4,380</u>	<u>0</u>	<u>0</u>

New Work.

		£	s.	d.
New sand furnace...	150	0	0
Loco. Inspector's office	250	0	0
Loco. Inspector's residence	550	0	0
New workshop for waggon repairs	450	0	0
Laying on gas	220	0	0
Putting in new roads and alterations to those now existing	1,800	0	0
		<u>3,420</u>	<u>0</u>	<u>0</u>
Removing and re-erecting coal stage	200	0	0
		<u>£8,000</u>	<u>0</u>	<u>0</u>

To this has to be added cost of taking down, loading, unloading, and re-erecting the extensive machinery now in use in the Junee locomotive workshops. This is usually done by the Locomotive Department, and I consider ought to be estimated for by them. It, however, consists of—

- One overhead 20-ton crab-winch for lifting engines.
- One 4-feet wheel-lathe with overhead 3-ton crane.
- One 12-inch screw and surfacing gap-lathe.
- One 8½-inch " " "
- One 6-inch " " "
- One large radial drilling-machine.
- One 1¼-inch screwing-machine.
- One 14-inch stroke shaping-machine.

One

One steam-power grindstone.
 One 5-forged fan.
 Two blacksmith's forges, with fittings.
 100 feet of $\frac{3}{4}$ " shafting, with pulleys and belts for do.
 One 10-horse vertical engine and boiler.

I do not like to venture myself on an estimate for the removal and re-erection of these, but, with the above information, this can readily be done in Sydney.

Narrandera.

The existing shed would suffice, but provision would have to be made for Locomotive Inspector and engine drivers and firemen:—

Locomotive Inspector's office	£250	0	0
" " " residence	550	0	0
12 drivers' and firemen's cottages... ..	4,800	0	0
Drivers' barracks	300	0	0
	<hr/>		
	£5,900	0	0

Should this proposed change be actually carried out, it will materially affect the Traffic's present arrangements. It might, therefore, be advisable to consult them as to their requirements—but possibly this has already been done.

R. D. STEPHENS.

P.S.—There are no additional buildings in connection with the Junee running-shed being built at the present time.
 George Cowdery, Esq.

Memo. by Mr. D. C. M'Lachlan.

Re Changing Stations for Junee District at Harden and Narrandera.

WITH reference to the joint report on the above matter made by Messrs. Close, Laughry, and Derbyshire, and dated 8th inst., the Commissioner wishes to know where the runs for the engine drivers are at present (Goulburn to Junee, Junee to Albury, Junee to Hay?), and also how the runs would be regulated if Wagga and Narrandera were substituted for Junee.

The Commissioner further desires to be informed when the joint report of the Locomotive Engineer and the Engineer for Existing Lines as to the estimated cost of pumping water from Wagga to Junee, or some other scheme for getting water at Junee, will be ready. The Commissioner is assured that a dam at Old Junee would meet the case, with a pipe line to Junee.

Certain items of cost of superintendence and management are put down in report as being incurable if Wagga be made depôt, but what about saving at Junee? Is it proposed to remove that establishment to Narrandera?

Is any additional building in connection with running shed being erected at Junee? if so, Commissioner says work should be stopped.

Please reply to each of the inquiries with as little delay as possible.
 Locomotive Engineer.

D. C. M'L., 15/6/86.

Mr. Laughry will please furnish the inquiries—drivers' runs, &c., as early as practicable.—
 R.J.S., 17/6/86. Urgent. Joint report attached.—E. A. LAUGHRY, 22/6/86. Locomotive Engineer.
 The Commissioner.—W.S., per R.J.S., 23/6/86.

Memo. to Locomotive Engineer.

Locomotive Engineer's Branch, Junee Station, 22/6/86.

In reply to Commissioner's 86-9,884, your 86-3,104, we have to state the runs at present are as follows:—

Mail trains ... Goulburn and Junee	153 miles...	8 hours on duty.
" " " Junee and Albury	99 " ...	5½ " "
Express trains... Goulburn and Junee	153 " ...	7 " "
" " " Albury to Junee and back... ..	198 " ...	8¼ " "
Goods trains ... Junee and Harden and back	118 " ... *12	" "
" " " Junee and Albury	99 " ...	7½ and 8½ hours.
" " " Junee and Hay	167 " ...	†10¼ hours.
" " " Junee and Narrandera and back	120 " ... †10¼	" "

Under proposed arrangement "runs" would be:—

Mail trains ... Goulburn and Wagga	175 miles...	9¼ hours on duty.
" " " Wagga and Albury	77 " ...	4 " "
Express trains... Goulburn and Wagga	175 " ...	8 " "
" " " Albury and Wagga and back	154 " ...	8¼ " "
Goods trains ... Wagga and Harden	80½ " ...	8¼ and 9 hours on duty.
" " " Wagga and Albury	77 " ...	§5½ hours on duty.
" " " Wagga and Narrandera	82 " ...	6¼ " "
" " " Narrandera and Hay	107 " ...	§7 " "
" " " Harden and Narrandera	119 " ...	9¼ " "

In reply to last query on Commissioner's memo. *re* items of expense for management, &c., shown on our previous report, we beg to explain—we assume that under proposed arrangement the existing staff and appliances at Junee would be removed from there to Wagga, and the additional staffs mentioned in our report would be required at Narrandera where an additional loco. depôt would be formed.

E. A. LAUGHRY.
 G. DERBYSHIRE.
 J. CLOSE.

¶ Men's runs are from four to five trips a week and a shed day. † Five days per week and shed day. ‡ Not continuously employed on this run, but get short days on mail trains between Junee and Albury. § The time shown in this needs explaining, it is the same as is occupied in running at present from Albury to Junee and return; it is accounted for by the fact that the men running the train would be on duty until their return to Albury which would be the same as at present. § These "runs" as mentioned in our previous report would be considerably affected; as in these cases the men and engines could not be fully employed.

Railway Employees' Statement.

To the Commissioner for Railways, Sydney,—

Sir,

Junee Junction, 16 July, 1886.

We, the undersigned railway employees of Junee Junction, humbly beg to submit for your consideration the subjoined statement.

From expressions of public opinion we are led to believe that it is the intention of the Government to remove the engine-sheds and workshops from Junee to Wagga.

We wish to submit for your favourable consideration the hardships and almost absolute ruin that this would entail upon us as employees.

The careful savings of years that have been accumulated by self-denial, and have been expended in building houses for the comfort of ourselves and families, would become absolutely worthless.

It has been in a great measure compulsory for us to build owing to the limited accommodation in the town.

Judging from the large amount of money that has been expended by the Government in the erection of buildings and workshops, thus giving stability to the town of Junee, we have been induced by these signs to invest our all.

The following amounts of moneys that have been invested by us is a proof of the careful and prudent habits of industry and energy.

We trust the foregoing statement will meet with your very favourable consideration.

[Here follows 43 signatures, representing £1,085 10s.]

Memo. by Mr. D. C. M'Lachlan.

WITH reference to the report of the Board of Inquiry relative to the proposal to dispense with Junee as a changing station, and substitute Wagga, Harden, and Narrandera, the Commissioner desires to know whether the trains enumerated therein are the trains now running—whether, for instance, there are two live stock trains between Narrandera and the North daily.

The Commissioner further wishes you to furnish a general report upon the rest of the estimated train-running as given in the enclosed.

Traffic Manager, Redfern. Urgent.

D. C. M'L., 17/6/86.

To Inspector Roberts, Junee,—Attached.—Be good enough to let me have your full report on this matter at your early convenience.—W. V. READ, *per* W.M., 22/7/86.

Memo. by Mr. G. Roberts.

Junee Junction, 26 July, 1886.

Re making Changing Stations for Junee district at Harden, Wagga, and Narrandera.

I PURPOSE dealing seriatim with the appended report of the Board of Inquiry, in *re* making the changing stations for No. 3 District South at Harden, Wagga, and Narrandera.

1. There is no doubt that the statements advanced by the Board are substantially correct, particularly with regard to the ruling grades on south west and on main line south of Junee Junction being easier than from Junee northwards; also the consequent necessity for different class of engine on that account.

Ever since the opening of the south-western line, bogie, or passenger engines have, as a rule, been used for trains on that branch, the advantage gained being an increased speed than would otherwise have been the case had goods engines been employed. This, in the case of live stock, is a great consideration, it must be admitted. The recognised load of live stock or wool on south-west line is fourteen trucks, as against ten on main line for bogie engines.

The load of a goods engine on main line being exactly that of a bogie on the branch. Assuming, therefore, that the engines are stationed at Wagga, the question naturally arises as to what action is to be taken on arrival of a train at Junee Junction with a full load of fourteen trucks? Is the same engine to proceed to Harden with a reduced load equal to ten waggons, or are arrangements to be made for a goods engine to run light from Wagga, to take on the full load to Harden. In the latter case what would be done with the engine from the branch? Is it to remain at Junee Junction, or be run empty to shed at Wagga? If the other course were adopted the delay to waggons left at Junee Junction would be a serious matter, especially so in the case of live stock, and would undoubtedly lead to endless complaints; let alone the decided objection senders have to their consignments being separated. They would contend, what is the use of a drover with stock in transit, if the whole are not conveyed by one train and the Department only allows one pass.

Respecting the estimate based on two live stock trains running between Narrandera and the North daily, I beg to state that for the years 1884, and 1885 (which give a fair average), live stock trains proper averaged one per day; but in addition to this there is an average of rather less than one train per day conveying live stock and goods between Narrandera and the North, which makes the estimate correct.

In making my estimate, I have assumed that every train ran with a full load, which, however, was not always the case, many instances occurring where consignments have amounted to more than a load for one, but not a full load for two engines, so that my calculation is more likely to be under than over the number of trains per day given.

2. The allowance of 15 per cent. of traffic being picked up at Junee Junction for south-west branch stations from south of that station is altogether over-estimated, seeing that the mixed trains running between Wagga and Hay would take all the traffic between those places, leaving nothing for other trains so that the loss would be even greater than it is put down at.

3. Under the proposed change, engines of all main line trains would have to run to Wagga, this would double the number now running there, which of course makes this estimate, as far as I am in a position to judge, correct.

4. From a traffic point of view, it is not necessary to run the south-western mixed trains between Wagga and Junee Junction, because, under existing arrangements, the requirements of the traffic between those stations are met by No. 22 up, leaving Wagga at 8 a.m. daily (Sundays excepted), with goods, passengers, &c., and running to Junee in time to catch No. 1 down mixed, from there to Hay. Again, No. 53 down takes passengers, goods, &c., arriving by No. 2 up, south-west mixed, from Junee Junction to Albury, so that if the engines of Nos. 1 down and 2 up south-west mixed trains are to be stabled at Wagga 44 miles of light running must follow, so as to have them available for the return trip from Junee Junction.

The

The present trains, viz., Nos. 22 up and 44 up, and Nos. 53 and 23 down, cannot be dispensed with between Junee, Wagga, and Albury, without completely upsetting the time-table and the present satisfactory working of this section of the line. Further, Nos. 3 and 4, south-west occasional trains, only run when sufficient traffic offers between Junee Junction and Narrandera, and *vice versa*; but in the busy season these trains, I may say, almost run daily (Sundays excepted), so that if engines are to be stationed at Wagga a very considerable amount of empty running must ensue. The same argument applies to Nos. 5 and 7 down, and Nos. 6 and 8 up, south-western trains, but these do not run so frequently. No. 4 up, goods, is a regular train running between Junee and Harden daily (Sundays excepted), so that the engine for it would have to run light from Wagga. The same may be said of No. 14 up, occasional, when running.

5. The assistant main line mail engine runs on an average once a week, and possibly oftener, but is not required beyond Junee Junction, as one engine can, owing to the easy grades, manage that train between Junee Junction and Albury and *vice versa*, without the slightest difficulty. Consequently a lot of useless running, equal to 44 miles per week at the least, would be brought about by the change of depôts. The guards' running would not be effected.

6, 7, 8. These matters concern the Locomotive Branch only; but I wish to observe that the carriage of coal and water is only estimated, and nothing added for extra haulage of stores, which item would amount to a good sum in the course of 12 months.

9. I have no doubt it would add to locomotive expenses if any alteration is made in existing arrangements, and the same may be said of the traffic if guards are to run in charge of light engines between Wagga and Junee and *vice versa*, or if trains now starting from Junee are required to do so from Wagga, and return there on completing the trip.

10. Under any circumstances water will be required at Junee Junction, but, of course, not to the same extent as under present working.

11, 12. The heaviest passenger traffic is between Junee Junction and Albury (as compared with that on S.W. and Jerilderie branches), for which express and mail trains are run. There is only one goods train between Junee and Albury and *vice versa*, while we have a mixed train running between Junee and Hay and *vice versa*, five days a week, besides several occasional trains over the same branch; and, owing to the severe drought now extending over many months, the latter service has been adopted, but will, no doubt, have to be increased again on a change in the seasons, which, from all appearances, has already set in.

In the years 1881 and 1882, and a portion of 1883, when the Locomotive Inspector and engine were stationed at Wagga and Bomen, we experienced the very greatest difficulty in conducting the traffic on the South-Western branch-line, owing to the engines being located so far from the point where their work really commenced. Numerous delays to traffic resulted through my being unable to give the requisite notice for engines to come to Junee Junction. Apart from this, there was the greatest danger to fettlers, &c., in having to look out for engines at all hours run on short notice between Junee and Wagga, let alone the objectionable issue of "line clear reports," which could not be avoided.

Matters at this juncture compelled me, at great personal inconvenience and pecuniary loss, to break up my home at Wagga, and remove to Junee Junction, so as to be the more capable of successfully coping with the fluctuating traffic, which I have been enabled to do ever since. I have no doubt the same will apply with equal force to the Locomotive Branch, as, when the engines were stationed at Wagga, and had to run the S.W. branch trains, drivers and firemen were loud in their complaints at not being able to get home regularly—in many instances having to run south-west again before going home.

The estimates given by the Board of Inquiry appear to have been arrived at purely from a locomotive point of view; but there are matters in connection with the case which would involve considerable outlay by the Traffic Department. There is, for example, the expense of guards running with light engines, if thought necessary, or by making the trains at present running to Junee terminate at Wagga. There is a good brick guards' barracks built at Junee Junction, but nothing of the kind provided or required at Narrandera as yet.

There are also a great number of Government cottages at Junee Junction that were erected for employees, but which would be useless there if the men are required to reside at Wagga. Considering the increase in telegraphic business this change would occasion an additional operator at Wagga, and a night officer at Narrandera would be wanted. The Wagga operator at present is also parcels clerk, and a night officer is not wanted at Narrandera. In the busy season too it would be very awkward having to turn engines coming from south-west required to take trains north.

My guards would also be very scattered and difficult of employing fully, besides the number would have to be increased.

As the change would result in the formation of another locomotive depôt at Narrandera, it would add largely to my difficulties in working the traffic, so much so, that I consider it would very likely necessitate the appointment of an assistant traffic inspector, to help me in successfully manipulating the traffic of the different sections of the line under my supervision, which, in point of mileage, is far in excess of that allotted to other gentlemen performing similar duties.

In conclusion, permit me to point out that ever since the depôt has been formed at Junee Junction there has been no difficulty in working the traffic, or of obtaining engines on short notice, and I say, without hesitation, that viewing the whole question from a traffic point, I maintain that Junee Junction is the centre from which any one is best able to manage the section, and with the least expense to the Department.

The Traffic Manager.

G. J. ROBERTS,
Traffic Inspector, 26/7/86.

Commissioner,—There are not two live-stock trains between Narrandera and the North daily at the present time, as business never was so slack as at present. However, now that there is a change of weather a good revival may soon be expected, and for an average season the mileage quoted is, if anything, under estimated. Of course the expenditure chiefly affects the Locomotive Branch, but it also, in a minor degree, affects the traffic expenditure, and to a considerable degree the traffic working. I am of opinion that the engine depôt should be at Junee. I enclose a report from Inspector Roberts on the subject.—W.V.R., 7/8/86.

1887.

(SECOND SESSION.)

—
LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

—
RAILWAY ROLLING STOCK.

(LOCOMOTIVES, TRUCKS, &c., AT GOULBURN, JUNEE, AND BATHURST.)

—
Ordered by the Legislative Assembly to be printed, 18 March, 1887.
 —

[Laid upon the Table of the House in accordance with promise made by the Honorable the Secretary for Public Works, in answer to Question No. 7, on Votes and Proceedings, No. 121, of the 2nd September, 1886.]

(1.) *Question—*

The number of engines stationed at Goulburn, Junee, and Bathurst respectively?

Answer—

Goulburn, 31; Junee, 32; Bathurst, 29.

(2.) *Question—*

The number of men employed in the engineering workshops, viz., fitters, turners, boiler-makers, and others, engaged in general repairs at Goulburn?

Answer—

Locomotive branch, 20.

(3.) *Question—*

The like information as regards Junee and Bathurst?

Answer—

Junee, 30; Bathurst, 29.

(4.) *Question—*

Have any locomotives, or trucks, or portions of either, been forwarded from Goulburn to Junee for repairs; if so, the number?

Answer—

The bogie-wheels of two of the Goulburn engines were turned up at Junee, the engines being there at the time.

(5.) *Question—*

The number of trains that run in and out of Junee (exclusive of water trains), Bathurst, and Goulburn during each week?

Answer—

Junee, 96; Bathurst, 231; Goulburn, 170. Note: The number of engines which come into Junee for repairs is far in excess of the number of regular trains given. The total number of trains run by Junee Engines is 164 per week. In addition to the locomotive work, there are in this district 15 steam pumping engines to be kept in repair.

(6.) *Question—*

The total amount of revenue derived at Goulburn, Bathurst, and Junee respectively during 1885?

Answer—

Goulburn, £104,445 1s. 10d.; Junee, £18,756 17s. 4d., and Bathurst, £71,895 19s. 8d.

(7.) *Question—*

The number of apprentices under indenture to the Government in the Engineering Departments at Goulburn, Junee, and Bathurst?

Answer—

There are no indentured apprentices, but there are three boys classed as apprentices at Junee; there are none at Bathurst or Goulburn.

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAY TIRES AND AXLES.

(CORRESPONDENCE, &c.)

Ordered by the Legislative Assembly to be printed, 24 March, 1887.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 11th December, 1885, That there be laid upon the Table of this House,—

“Copies of all correspondence, reports, and minutes thereon, or attached
 “to, having reference to the purchase or supply of Railway Tires and
 “Axles that has taken place with the Government, the Commissioner for
 “Railways, and the Agent General, whether by public tender or otherwise,
 “with Messrs. Vickers & Co., or any other British manufacturers, or their
 “representatives, since 1st January, 1880, to date.

(*Mr. Abigail.*)

The Secretary for Public Works to Messrs. Cameron & Co.

Gentlemen, Department of Public Works, Railway Branch, Sydney, 20 December, 1879.

I have the honor to inform you that duplicate steel tires are required for the American passenger engines, supplied by Messrs. Burnham, Parry, Williams, & Co., of the Baldwin Locomotive Works, Philadelphia, and forward herewith an indent for the same, and I have to request that they may be supplied with the least possible delay.

I have, &c.,

JOHN LACKEY.

Indent for duplicate steel tires for the American passenger engines, supplied by Messrs. Burnham, Parry, Williams, & Co., Philadelphia, U.S.A. Makers' Nos., 4,074, and 4,398.

12 steel tires of the best quality for driving and trailing wheels.

8 tires of the same material for the engine bogie.

They are to be supplied in the rough, with all proper allowance for turning up on the sides and treads, but are to be bored out with allowance for shrinking on, if the makers can guarantee that they will be of the proper size, and accept all liability in case of any error in the inner diameter; otherwise, the tires must be supplied unbored, with proper allowance for boring and shrinking.

To be delivered at Sydney. Required as early as possible.

The Secretary for Public Works to The Agent-General.

Sir, Department of Public Works, Railway Branch, Sydney, 22 January, 1880.

I have the honor to inform you that an order was forwarded to Messrs. Cameron & Co., of New York, on the 20th ultimo, for steel tires for American engines, and to state that the Treasury has been requested to place the sum of £140 to your credit to meet the cost of same.

I have, &c.,

JOHN LACKEY.

R. W. Cameron & Co. to The Secretary for Public Works.

Sir, 23, South William-street, New York, 6 February, 1880.

We have the honor to acknowledge the receipt of your esteemed communication of the 20th December last, covering indent for steel tires for American passenger engines, which we have had pleasure in forwarding to Messrs. Burnham, Parry, Williams, & Co., with a request that they get them ready for shipment at the earliest possible moment.

We note that we are to recoup ourselves for the cost by drawing on the Agent-General in London,—

And have, &c.,

R. W. CAMERON & CO.

R. W. Cameron & Co. to The Secretary for Public Works.

Sir,

New York, 4 March, 1880.

We have now the honor to advise the shipment, per barque "Eidern," of the twenty steel tires for the American passenger engines supplied by Messrs. Burnham, Parry, Williams, & Co., as per your indent of 20th December last. We also enclose invoice of same, showing the cost to be £255 16s. 8d., for which, as instructed, we have drawn upon the Agent-General, in London, sending him shipping documents. The barque "Eidern" is loaded, and will sail for Sydney direct in a day or two.

We have, &c.,

R. W. CAMERON & CO.

INVOICE of tires shipped by R. W. Cameron & Co., on board barque "Eidern," Hertz, master, bound for Sydney, New South Wales, and consigned to order, for account and risk of whom it may concern.

In execution of indent dated Sydney, 20th December, 1879.

Twenty steel tires, as undernoted, furnished by Messrs. Burnham, Parry, Williams, & Co., of Philadelphia, for two American passenger engines supplied by them.

12 flanged steel tires bored $57\frac{1}{2}''$ x $5\frac{1}{2}''$ x $3\frac{1}{8}''$, 12,472 lb. @ $7\frac{1}{2}$ c.	\$935 40
8 do bored $25''$ x $5\frac{1}{2}''$ x $2\frac{3}{8}''$, 3,090 lb. @ $8\frac{1}{2}$ c.	262 65

1,198 05

$2\frac{1}{2}$ per cent. commission 29 95

1,228 00

@ \$4 80c. £255 16 8

Insurance to be attended to by Agent-General for N. S. Wales, in London.

R. W. CAMERON & CO.

New York, 26 February, 1880.

The Secretary for Public Works to The Agent-General.

Sir,

Department of Public Works, Railway Branch, Sydney, 10 February, 1880.

I have the honor to forward herewith indent for waggon fittings required for 1880 (under the five years contract for rolling stock) and shall be glad if you will obtain and forward same as early as possible.

I have, &c.,

JOHN LACKEY,

Secretary for Public Works.

INDENT for waggon fittings required for 1880, under the five years contract for rolling stock.

800 pairs 3-foot waggon wheels and axles, same as those ordered under indent by mail 29th June, 1877, and by cablegram of 10th April, 1879.

To be delivered in Sydney as early as possible.

Mr. G. N. Vickers to The Locomotive Superintendent.

Dear Sir,

"Royal Hotel," Sydney, 30 March, 1880.

Hearing that an indent is on its way to England for 800 pairs of wheels on axles in which Yorkshire iron axles are specified, I beg leave to ask you to alter this so as to substitute cast-steel for iron axles.

Steel axles have been almost universally adopted as having been found superior to iron, as they possess greater toughness than iron, and their durability is much greater, as the journals maintain their surface very much longer. You will doubtless have noticed one bent cast-steel carriage axle at the Exhibition, which shows the toughness and strength of the material.

Hoping that you will approve of my suggestion,

I remain, &c.,

G. N. VICKERS.

THE material specified for the axles of the 800 pairs of wheels for which the indent is now on its way to England, is Taylor Bros. iron, being a repetition of previous indents.

Taylor Bros.' axles long held the position of being amongst the best of their kind, but iron axles are now being extensively superseded by steel ones, as the latter material not only gives a stronger axle, but the bearings run cooler and last longer on account of the greater smoothness and hardness of the material. It would be well, therefore, to substitute steel axles in those wheels about to be let, and in order to ascertain the comparative merits of "cast" and "Bessemer" steels for axles, I recommend that they be ordered half and half of each material, as per the following telegram:—

"Axles of indent 80-479, of 10th February, to be steel, half Vickers, half Patent Shaft. Hasten delivery."

This alteration will not increase the cost.—R.H.B., 1/4/80. Commissioner.

Approved.—J.L., 7/4/80.

Cablegrams sent as follows:—"800 axles, indent tenth February, to be steel, half Vickers, half Patent Shaft. Hasten delivery."—D.C.M'L., 7/4/80.

Mr. James Brown to The Commissioner for Railways.

Sir,

Sydney, 23 December, 1881.

The object of this is to ask your permission to Messrs. Cammell & Company's name being inserted for cranks or straight axles and tires in specifications through the Agent-General accompanying indents for locomotives.

I

I may mention that for many years the firm I represent has given considerable attention to the manufacture and selection of steel (cast steel) for cranks and tires, and have supplied the same largely to all our Home railways, as well as to the Austrian, Belgian, Spanish, and various British Colonial and Continental railways.

Sir John Hawkshaw's Inspector (Madras and Oude and Rohilcund railways), recently stated, with regard to a series of tests for ductility and strength, which were conducted on Messrs. Cammell & Company's crank steel, that "the results were the best that had ever gone into Westminster."

In asking you the favour referred to I am under some disadvantage, inasmuch as, up to the present Messrs. C. C. & Co. have not been permitted the opportunity of sending out to you any of their manufactures in the lines indicated, still I trust from the list of railways I have given you which they have supplied, and from the long standing of the firm, it may be your pleasure to give them consideration.

I am, &c.,

JAMES BROWN.

Forward to Mr. Scott for report. In the indents which are going to England for sixty locomotives I think Vickers' crank axles are stipulated for. If there be other firms whose crank axles are as good, we might get the advantage of competition.—C.A.G., B.C., 23/12/81.

I have no objections to a portion of the axles for the sixty new engines being made by Messrs. C. Cammell & Company, of the very best quality, most suitable for the purpose as a trial of their make.—W. Scott, 28/12/81.

I hear from Mr. Downes that the car wheels supplied by Cammell & Co. are not very well fitted to the axles—display, in fact, slovenly work.

The papers on the subject of the carriage springs supplied by this firm, do not moreover, contribute to confidence in them.

And there is some reason to believe that the steel rails they have supplied are not made by the Landore Siemen process, but by Bessemer process, the former being specified. On the whole, I am not disposed to comply with Mr. Brown's request that Cammell & Co. be invited to tender for axles.—C.A.G., 2/1/82.

Inform that a compliance with his request is declined.—C.A.G., 3/1/82.

The Commissioner for Railways to Mr. James Brown.

Sir,

Department of Public Works, Railway Branch, 5 January, 1882.

With reference to your letter of the 23rd instant, asking my permission to Messrs. Cammell & Co.'s name being inserted for cranks or straight axles and tires in the specifications through the Agent-General, accompanying indents for locomotives, I have the honor to inform you that I am unable to grant a compliance with your request.

I have, &c.,

CHAS. A. GOODCHAP.

Sir John Robertson to The Secretary for Public Works.

My dear Lackey,

I have just been told by a gentleman from England that railway wheels and axles, tires, springs, buffers, cast steel, boiler plates, files, and other railway material, are, when contracts are called for by the Agent-General, confined to Messrs. Vickers, Sons, & Co., of Sheffield, and the Patent Shaft Company.

The effect of this is that, doubtless by arrangement, Vickers & Company supply the locomotive portions, and the other Company the other portions, thus there can be no competition.

It is worth while to ascertain whether the authorized tenderers are confined to two, and why. There are Sir John Brown & Co., of Sheffield, Charles Cammell & Company, and many others quite equal to the other firms.

SIR JOHN ROBERTSON.

Is the Commissioner aware if this is the case. It seems undesirable that the means of competition should be so limited.—J.L., 10/2/82.

Messrs. D. & W. Robertson to The Commissioner for Railways.

Dear Sir,

Central Exchange Buildings, Sydney, 16 February, 1882.

With reference to the conversation which you had with our Mr. Atkinson this morning with regard to our supplying sample sets of the railway wheels and axles, springs and buffers by the great firm of Sir John Brown & Co., Limited, for whom we act as sole Colonial agents, we shall have much pleasure in supplying the same on the terms and conditions suggested by Mr. Atkinson, viz., that should the sample sets not prove to your satisfaction under every fair and reasonable test to be applied under your direction, we shall at once remove the goods, and no liability will attach to your Department. What we propose to bring out is a complete set of wheels, axles, springs, and buffers for one locomotive and one tender, and one complete set of wheels and axles, springs, and buffers for one waggon, all manufactured to the specifications of your Department, the plans and specifications to be obtained with your consent from the Agent-General in London.

We would cable Sir John Brown & Company to apply to the Agent-General and to ship the sample sets by steamer as soon as possible.

Of the result we have no fear whatever, and there will be an important saving to your Department

We have, &c.,

D. & W. ROBERTSON.

Mr. Scott for Report.—C.A.G., B.C., 16/2/82.

Mr. W. Scott to the Commissioner for Railways.

82/1,377.

Steel Tires and Axles.

Sydney, 10 March, 1882.

WHEELS, tires, and axles are very important working parts of railway rolling stock, upon the quality and reliability of which the safety of life and property constantly depends. Such being the case, care has been taken to procure the best and most reliable material from the most reputed manufacturers, and to discard, at the first indication, and without favour, that which fails or becomes doubtful.

Acting upon this principle, we have always found Vickers' steel to be the most reliable material, and in consequence have been thus compelled to confine ourselves to it. With

With a view, however, to more extended competition, the patent shaft or Brunswick steel was inserted in a recent indent, but, owing to the failure of one of these axles, prudence constrains us to discard this make until the reliability or otherwise of their axles now running shall have been proved. However, as it is desirable, if possible, to encourage wholesome competition, I am not unwilling to include the under-mentioned firms, providing the tenders of Nos. 2 and 3 are not accepted unless the quality of the material is guaranteed equal to Vickers', to stand the same test, and the price sufficiently favourable to justify the Consulting Engineer in England in recommending the acceptance of either of these tenders.

No. 1. Vickers & Sons.

No. 2. C. Cammell & Co.

No. 3. John Brown & Co.

W. SCOTT.

Commissioner.—Return showing the quantity of wheels and axles, crank axles, tires, springs, and buffers, cast-steel files, and boiler-plates imported during the past ten years, and giving the name of the manufacturer in each case. The above return, verbally asked for, is enclosed.—A. RICHARDSON, 17/2/82.

Mr. W. Scott to The Commissioner for Railways.

Steel Axles and Tires.

The Commissioner,

Sydney, 17 March, 1882.

Referring to my 82-1,377, I now enclose copy of my letter, No. 82-1,144, to Mr. Mirrls, and his reply thereto (82-1,535).

With the view of ascertaining whether or not it would be advisable to purchase from other firms than those from whom we now obtain axles and tires, I recommend that our Consulting Engineer in London be asked:—

- 1st. The test that Vickers' steel will stand for tires?
- 2nd. The test that Vickers' steel will stand for axles?
- 3rd. What other firms can produce steel to stand the same test?

I need scarcely point out to the Commissioner that the extremely steep gradients and sharp curves on our railways subject the axles and tires to an extraordinary strain, and renders it necessary that none but the very best material be used in their manufacture.

W. SCOTT.

The Acting Locomotive Engineer to The Locomotive Superintendent Victorian Railways.

Sir,

1 March, 1882.

Will you please be good enough to inform me what brand of crank axle, iron or steel, carriage and waggon axles, you have in use on the Victorian Railways; also similar information with reference to tires. And will you kindly say, from your long experience, which brand you prefer, and whether you have had any failure of carriage or waggon axles, giving the brands, &c., and oblige.

I have to acknowledge receipt of press copy of Report of Board of Trade, England, with best thanks.

I have, &c.,

W. SCOTT,
Acting Locomotive Engineer.

The Locomotive Superintendent Victorian Railways to The Acting Locomotive Engineer.

Dear Sir,

Melbourne, 13 March, 1882.

In reply to your letter of the 1st March, asking for information respecting axles and tires, the practice of the Victorian Railways now is to use steel tires and steel axles of every description, both for carriages and trucks. The brands of the crank axles are Krupp of Prussia and Vickers of Sheffield. It is only recently we have been using steel axles for carriages and waggons. They were formerly wrought iron, faggoted either by ourselves, or imported from England from the Patent Shaft and Axletree Company. We have had failures in both crank and waggon axles. The last axle broke about a couple of months ago. It was a truck axle of the Patent Shaft and Axletree Company's, and was badly made. We have also had straight leading steel axles snap in two like a carrot, these were made in the early days by Charles Cammell & Co., of Sheffield. We have all brands and shapes upon the Victorian Railways, but we are gradually working to uniformity. Most of our steel tires and axles are from Vickers, Son, & Co., Sheffield, who appear to give satisfaction in the quality of their manufactures.

I have, &c.,

S. MIRRLS,

Loco. Supt.

Minutes.

Minutes by Commissioner.

I wish to see Mr. Scott in this matter.—CH.A.G., 20/2/82. Let me have the other papers on this subject, with Minister's minute thereon.—CH.A.G., 28/2/82. Herewith.

I had a return prepared showing the names of firms from which the importations referred to were obtained during the past ten years. I forwarded it to Mr. Scott with a request that he would see me on the subject. What has been done in the matter?—CH.A.G., 26/2/86.

Storekeeper to see my remarks on the list he forwarded, then forward to Mr. Scott, who will please report with special reference to wheels, tires, and steel axles.

It is not the case, as was represented to Sir John Robertson, that railway supplies have been obtained from two firms only, when ordered from England.

It will be seen from returns herewith that supplies have been obtained from nearly 100 different firms, and that those firms specially referred to, viz., Sir John Brown & Co. and Cammell & Company, are included in the list of those who supply the Department with goods.

With regard to wheels, tires, and axles, it has been usual to specify certain firms from which those supplies should be obtained.

Even these special items have not been confined, I see, to Vickers and the Patent Shaft Company, although recently it has been stipulated that crank axles should be made of Vickers' steel, and straight axles either of Brunswick or Vickers' steel.

Tires are stipulated to be made of Vickers' steel, and I understand Vickers and Krupp (from whom we used to order) are recognized as the best tyre manufacturers in the world. Where so much depends, as regards the safety of the public, upon the quality of the material supplied, it can be well understood that the Department is anxious to go only to the best firms for special supplies of the kind.

Mr. Scott, however, will please report upon the desirability of widening the list as regards the supply of tires and axles.—CH.A.G., 2/3/82.

The Commissioner's remarks referred to have been duly noted, and information supplied. The papers are now forwarded to Mr. Scott.—A.R., 6/3/82. Storekeeper.

Colonial manufacturers of new engines provide their own wheels, axles, springs, and buffers, under their contract, in accordance with the specifications, and I understand they have indented for the number they require. English manufacturers contract for the supply of the engines complete, of which wheels, &c., form a part, the only conditions imposed are, Vickers and Sons cast steel axles and tires, and Turton's or Spencer's springs, so that, as a matter of fact, the tenders for wheels and buffers are open to all, J. Brown & Co. included, except for tires, axles, and springs.

It will thus be seen that the whole thing is resolved into a question of the material to be used for tires and axles, consequently I referred the Commissioner to my report 82-1,377, and now, further, to my 82-1,536. The principle adopted *re* axles and tires has been carried out with regard to springs, as the reliability of the latter is next in order of importance to that of tires and axles. If a set of wheels, axles, springs, and buffers is supplied on the terms and conditions offered, we shall have to take out a set with Vickers' tires and axles, now running, in order to experiment upon a material the reliability of which, as far as our experience goes, has not been proved, and considering the responsibility to be incurred by the trial of material not recommended to us by our Consulting or any other Engineer, and the fact that though one set specially prepared might turn out well, the success or failure of one set could be no criterion, compared with the result of about fifteen years' experience of the reliability of a great number of Vickers & Sons' axles and tires.

I recommend that the acceptance of this offer be postponed until we receive the reply of our Consulting Engineer to the questions in my 82-1,536.—W. SCOTT, 18/3/82. Commissioner.

Where is the paper referred, 82-1,536, and also 82-1,377?—CH.A.G., 22/3/82. Inform of the steps proposed to be taken in regard to the selection of firms to compete for axles and tires.—CH.A.G., 1/4/82. Approved.—J.L., 5/4/82.

The Commissioner for Railways to Messrs. D. & W. Robertson.

Gentlemen, Department of Public Works, Railway Branch, Sydney, 13 April, 1882.

With reference to your letter of the 16th February last, respecting the sample sets of railway wheels, and axles, springs, and buffers, manufactured by the firm of Sir John Brown & Company (Limited), which you wish tested on the lines of this Colony, I have the honor to inform you that, with the view of ascertaining whether it would be advisable to purchase materials from other firms than those from whom axles and tires are obtained, the Consulting Engineer in England has been asked the test that Vickers' steel will stand for tyres and axles, and what other firm can produce steel to stand the same test.

Under the circumstances, it is not necessary that the quality of Sir John Brown & Company's manufacture should be tested in the Colony, as no doubt the merits of the materials supplied by the firm you represent will receive due consideration at the hands of the Consulting Engineer.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.

Mr. James Brown to The Commissioner for Railways.

Sir, Sydney, 29 March, 1882.

Referring to the question of cast-steel cranks, about which I wrote you a short time ago, asking that Messrs. Cammell & Co., Sheffield, might have the opportunity of supplying your Government, I now beg to enclose you a list, which I have recently received, showing the relative number of cranks supplied by the firm for the years 1879, 1880, 1881.

As you will notice, the supply in 1880 was 42 per cent. more than in 1879, and in 1881 an increase of 118 per cent. over 1880, and above 200 per cent over 1879.

I trust these particulars will be so far satisfactory to you as to obtain from you the sanction to Messrs. Cammell & Co.'s name appearing in future indents for locomotives through the Agent-General, and also that they may be permitted to have your favours for duplicate cranks which your Government may require from time to time.

I have, &c.,

JAMES BROWN.

Secn. See proposal in regard to testing steel for tires and axles; the Inspecting Engineer to test; the quality to be equal to Vickers' to admit of competition.—C.A.G., 5/4/82.

The Secretary for Public Works to The Agent-General.

Sir,

Department of Public Works, Railway Branch, Sydney, 17 April, 1882.

With the view of ascertaining whether or not it would be advisable to purchase axles and tires for our rolling stock from other firms than those from whom we now obtain them, I have the honor to request that you will have the goodness to instruct the Consulting Engineer to furnish a report.

1st. As to the test that Vickers' steel will stand for tires.

2nd. Do do do do for axles.

3rd. The names of any other firms which can be relied upon to produce steel to stand the same test.

The extremely steep gradients and sharp curves on our railways subject the axles and tires to an extraordinary strain, and render it necessary that none but the very best material be used in their manufacture.

The axles of the Patent Shaft Co. have not proved, in three separate instances, reliable (two having failed in New South Wales, and one in Victoria recently), and as, in consequence, we have been specifying in our orders for tires and axles that Vickers' steel should be used, the representatives in the Colony of other steel makers (notably Sir John Brown & Co. and Messrs. Cammell & Company) have been urging the Department to try their make of steel for these supplies. Hence the request for the test which I now make.

I have, &c.,

JOHN LACKEY,
Secretary for Public Works.

Mr. James Brown to The Commissioner for Railways.

Sir,

Sydney, 10 May, 1882.

By recent mail Messrs. Cammell & Company (Limited) forward me a tracing of their cast-steel wheel, "Mansell section," with cast-steel tire, which I enclose you with this. You will see the design of the centre is to combine strength with elasticity.

Should it be your pleasure to give Messrs. Cammell & Company a trial order, I am sure you would be well pleased with the result of the working.

Messrs. C. C. & Co. inform me that they have supplied several lots of these wheels recently, and that they are giving very satisfactory results.

I have, &c.,

JAMES BROWN.

Mr.

Mr. J. Brown to The Commissioner for Railways.

Sir,

Sydney, 10 May, 1882.

Messrs. Charles Cammell & Co. (Limited), Sheffield, desire me to draw your attention to their speciality in iron axles, viz., "Homogeneous Charcoal Iron."

They have been making these now for some considerable time, and from the many tests supplied, and the satisfactory results obtained, they have every confidence in recommending them to your notice.

They have supplied to the Great Indian Peninsular Railway, since 1879, over 13,000 of these axles for carriage and waggon purposes, besides various quantities to many other railways, and it is from the very excellent working of these, and the proved strength and ductility of the material, that they solicit an order from you.

As you know many engineers prefer iron for axles, owing to the extra toughness it possesses over steel, and it was to meet this requirement that Messrs. Cammell & Company have laid themselves out, obtaining, as a result, a material having the ductility of iron, but combining, at the same time, largely the strength of steel.

I trust it may be your pleasure to permit Messrs. Cammell & Company the opportunity of filling an order for you in this particular line of their manufacture.

I am, &c.;

JAMES BROWN.

List of engines with bad cranks.

Krupp's steel crank has run the greatest mileage, and is the engine with the largest driving wheel, which is the best test of all as the *leverage is greater*. I forward this for your information, as my experience is that Krupp's steel is the best for tires, but for axles I have no data.

THOS. MIDELTON,

Commissioner, 4/8/82.

I should like to see Mr. Midelton on this matter.—C.A.G., 10/8/82.

Please let me have the No. of miles that have been run with each good crank axle, the maker's name, &c.—C.A.G., 14/8/82. Please also say the No. of outside cylinder engines we have. We have 122 outside cylinder engines—axle return herewith.—THOS. MIDELTON, Commissioner, 16/10/82.

R.J.S., 16/10/82.

Minute by Commissioner.

I wish an analysis made of these returns, with a view to ascertain as far as possible, the percentage of good and bad axles of each kind.

The iron axles seem to have been the best; there are no bad iron axles reported, and they have run the largest number of miles. Of course the good steel axles may last as long or longer than the iron axles; they have not been sufficiently long in use to admit of comparative tests in this respect; but then a good number have failed, and I should like to have the percentage of failures to the total supply of each manufacturer.—Ch.A.G., 23/10/82. Loco. Engineer, B.C.

It would seem from the analysis that Vickers' steel axles are far from being the best. Whether this arises from defective design or material I do not know. The iron axles seem to have lasted the longest; but then our experience of them is not large, nor is it large of other manufacturers' steel axles, and therefore the axles made by Vickers' may, by this means of comparison, be placed at an undue disadvantage.

If the engineer (Mr. Midelton) is prepared to design an axle, and to recommend that it be made of faggotted iron, I will order some as an experiment.—C.A.G., 13/11/82.

Be good enough to let me have papers *re* last indent for tires half Vickers' and half Krupps'.—C.A.G., 3/1/83.

Let me see letter to Agent-General. Did we mention that the indent was to be divided between Vickers and Krupp.—C.A.G., 5/1/83.

Ask Mr. Midelton to see me about this.

I have seen Mr. Midelton, who informs me that he mentioned Krupp's tires because he considered they were, at all events, as good as Vickers', and under such circumstances it was not undesirable to widen the area of competition. This being so, I concur with Mr. Midelton.—C.A.G., 10/1/83.

The

The Agent-General to The Secretary for Public Works.

Report on Tests of Vickers' Steel.

Sir, 5, Westminster Chambers, Victoria-street, S.W., 12 January, 1883.

Referring to your letter of the 17th April last, in which you requested me to obtain a report from the Consulting Engineer,—

1. As to the test that Vickers' steel will stand for tires.
2. As to the test that Vickers' steel will stand for axles.
3. The names of any other firms which can be relied upon to produce steel to stand the same test.

I have the honor to transmit herein, for your information, the report of Mr. Fowler, as requested by you.

I have, &c.,
SAUL SAMUEL.

Mr. John Fowler to The Agent-General.

Sir, 2, Queen Square Place, Westminster, S.W., 8 November, 1882.

Your letter of the 23rd June, enclosing a communication from the Minister for Public Works, of 2nd March, respecting steel tires and axles, has had my serious attention, and I have now the honor to submit my report.

The questions referred to me for consideration are:—

1. The test that Vickers' steel will stand for tires.
2. The test that Vickers' steel will stand for axles.
3. The names of any other firms which can be relied upon to produce steel to stand the same test.

With reference to the first and second questions, I put myself in communication with Messrs. Vickers, and the following extract from a letter, dated 1st July, will best explain the character of the tests which Messrs. Vickers guarantee their tires and axles will sustain:—

“The tests which we consider the best for the double purpose of safety and durability necessarily differ as between tires and axles.

“Before describing them, we think it important to call your attention to one result of our experience, viz., that a shock, or drop test, is absolutely necessary. It is customary to rely upon a certain amount of elongation under tensile as a sufficient test for safety, but we have found that steel may elongate to a great extent, even after the tire from which the piece tested was cut had quickly broken under blows or shocks, and too much reliance must not be placed on elongation.

“The necessary qualities of steel to constitute a good tire are two, viz., *safety* and *durability*, necessitating two modes of testing.

“The safety test:—‘A monkey, or tup,’ weighing 20 cwt., is so arranged that it can be let fall from any given height up to 33 feet, upon a tire placed in a running position on a solid foundation of cast iron, and no tire should be considered safe unless it will bear deflecting, by repeated blows, one-sixth of its internal diameter, without showing any sign of cracking—thus, a 3-foot internal diameter tire must take a permanent set of 6 inches, and a 6-foot tire must bend 1 foot without sign of fracture, and so on.

“Our ‘Australian’ tires, and every tire we now make, we guarantee to stand this test.

“2. *The test for durability* we make on a piece machined cold to a standard size, out of a tire which has already stood the safety test. This piece is tested to ascertain what tensile strain it will bear, and its elongation is also observed. We consider no tire as sufficiently durable unless it bears a strain of *at least* 48 tons per square inch (with about 10 per cent. to 15 per cent. elongation).

“The test which we consider best for axles is the safety test, as for the tires, but with some difference.

“The axle to be tested is placed on bearings 3 feet apart, on the same solid foundation as the tires, and the 20-cwt. monkey is let fall on the centre between the bearings from a clear height of 25 feet, the axle *being reversed after each blow*.

“We guarantee our carriage axles to sustain, without crack, at least ten such blows.

“A piece machined cold, from the axle, after being tested as above, will bear a strain of from 27 to 30 tons per square inch.

“Our tires and axles will generally exceed these tests (which we guarantee). The tires frequently bear 52 tons per square inch, and the axles also frequently bear sixty blows from 33 feet without fracture; but as ten blows from 25 feet give an abundantly safe axle, we fix this as our guarantee.”

Such are Messrs. Vickers' tests; and in order to ascertain if other firms could supply tires and axles of the above quality, I have, at different times, requested the following firms or makers to furnish me with specimens for testing purposes:—

Messrs. Krupp.

„ Sir John Brown & Co.

„ Cammell & Co.

„ Taylor & Co.

The Patent Shaft.

The Monkbridge Company.

I also obtained and tested tires and axles taken at random from the bulk in course of manufacture by Messrs. Vickers for the New South Wales Railways.

The results of my experiments, briefly stated, are that Messrs. Vickers' tires and axles exceeded the tests guaranteed by them; that no other makers' tires stood the said test, and that one-half of the axles also failed to stand the test; indeed, a single axle of Messrs. Vickers itself bore a greater number of blows than was sustained collectively by four axles supplied by as many different firms enumerated in my list.

With two exceptions, every maker supplied a tire which failed under the falling-weight test before the required degree of bending had been attained, and in those *two cases* the steel was soft, as compared with Messrs. Vickers', the highest tensile resistance which could have been safely guaranteed by these firms being 40·9 tons and 36·73 tons per square inch, respectively, as compared with Messrs. Vickers' 49·48 tons.

With one exception, every maker supplied axles which failed with less than half the number of blows sustained by Messrs. Vickers' axle.

I am of opinion, therefore, that the high reputation enjoyed by Messrs. Vickers' tires and axles is well justified by the results of my tests, and I am not able to submit the names of any other firms which can be relied upon to supply steel to stand the same test.

I am, &c.,
JOHN FOWLER.

The Secretary for Public Works to The Agent-General.

Sir, Department of Public Works, Railway Branch, Sydney, 6 January, 1883.
I have the honor to enclose herein an indent for steel crank axles, and shall be glad if you will obtain and forward the same to the Colony as early as possible.

I have, &c.,
HENRY COPELAND.

Indent for steel crank axles.

Six Steel crank axles as duplicates for goods engines supplied by Messrs. Beyer, Peacock, & Co., Nos. 93 to 102, and 106 to 117. Maker's Nos., 1,643 to 1,648, 1,675 and 1,676, 1,683 and 1,684, and 1,753 to 1,764. Made of Vickers' steel dimensions as per attached tracing. To be delivered in Sydney as early as possible.

Mr. James Brown to The Acting Locomotive Engineer.

Sir, Sydney, 31 January, 1883.
Referring to my letter, May 10th, 1882, addressed to the Commissioner, *re* Messrs. Cammell & Company's "homogeneous charcoal iron" for waggon and carriage axles, and my recent interview with you, I have pleasure in submitting the following prices for straight-rolled axles, 5 dia. x 7 ft. 1 in. long, with roughed-out journal, 1,000 axles, delivered in Sydney Harbour, and guaranteed for a period of twelve months:—£4 18s. 6d. each.

I should also have pleasure in quoting you a price for crank axles from the same material, guaranteed for a similar period.

Hoping to receive a favorable reply,

Yours, &c.,
JAMES BROWN.

Please write and ask Mr. Brown to supply more information respecting this material, "homogeneous charcoal iron:"—1st. Say where it is employed in England for railway axles. 2nd. Is he willing to supply an axle for me to test here in his presence? 3rd. Has he the results of any tests to give or show me?—T.M., 23/3/83.

Mr. James Brown to The Acting Locomotive Engineer.

Dear Sir, Melbourne, 4 April, 1883.
Yours of the 29th ultimo, *re* axles, has been forwarded to me here. I purpose returning to Sydney the end of this week, and will then give you a call.

I shall be able to give you particulars of the test that the axles will stand.

Yours, &c.,
JAMES BROWN.

Mr. S. Yardly to Mr. W. Scott.

Sir, Cast-steel Tires.
5, Westminster Chambers, S.W., 8 January, 1883.
Referring to the order for 1,062 cast-steel tires, which was received from the Honorable the Secretary for Public Works on the 7th December last, in which it stated that they were to be manufactured by Messrs. Vickers, Sons, & Company, or Messrs. Krupp, I now enclose, by desire of the Agent-General, a copy of a letter from Mr. Fowler on the subject, and have to request that you will be so good as to state whether, in your opinion, it would be desirable to procure the tires from Messrs. Vickers, Sons, & Co., or if you would recommend that Messrs. Krupp be allowed to tender for the supply, as well as Messrs. Vickers.

I am, &c.,
S. YARDLY,
Secy., New South Wales Government Agency.

Mr. John Fowler to The Agent-General.

Sir, 2, Queen Square-place, Westminster, S.W., 6 January, 1883.
This indent for steel tires states that they should be of Vickers' or Krupp's make. The quality, and also the price, of these two manufacturers being different, I would suggest that, as Mr. Scott, the Locomotive Superintendent, is in London, he be asked which of the two qualities he considers it would be most advantageous to order.

I am, &c.,
JOHN FOWLER,
(*per* J. D. BALDREY).

Mr.

Mr. W. Scott to The Agent-General.

Department of Public Works, Railway Branch,

Locomotive Engineer's Office, London, 9 January, 1883.

Sir,

In reply to your letter of the 8th, *re* the indent for tires for the Government Railways, New South Wales, I have had considerable experience of both Vickers & Sons' and Krupp's tires. The latter is a very good tire to wear, but is liable to fracture. We have had several of Krupp's tires broken through the tread when under vehicles, but fortunately they were discovered before any damage was done. This, however, was not the case in the late accident on the Hobson's Bay Railway, in Victoria, which was caused by a Krupp tire breaking, causing loss of life and heavy compensation. I would most strongly advise that the tires now indented for be ordered from Vickers & Sons, they being the most reliable. I have not in all my experience on the New South Wales railways ever seen one instance of a broken Vickers' tire.

Yours, &c.,

W. SCOTT.

The Agent-General to The Secretary for Public Works.

Indent for Steel Tires.

5, Westminster Chambers, Victoria-street S.W., 9 February, 1883.

Sir,

With reference to your order for 1,062 cast-steel tires, received under cover of your letter of the 27th September last, No. 3,632, I have the honor to forward herein copies of correspondence between the engineers and myself in regard thereto, from which you will perceive that Mr. Scott has recommended that the order should be placed with Messrs. Vickers & Company for the entire quantity. I have therefore acted accordingly.

I have, &c.,

SAUL SAMUEL.

Minute by Commissioner.

The recent test of the quality of steel made by Vickers and by other steel manufacturers, conducted under the personal inspection of Mr. Fowler, in England, seems to justify Mr. Scott's conclusion that it would be better to give the whole of this indent to Vickers without competition.

It will be seen by the papers that previously I had inquired into the reasons for making it optional whether Vickers' or Krupp's tires should be ordered.

At the same time, while agreeing with Mr. Scott's conclusion, I cannot concur in his reasons for it. The accident which occurred on the Hobson's Bay line in Victoria was through no defect in the tire as manufactured; it was allowed to be worn down much below the minimum, and no tire, even Vickers', could withstand the strain which, in its attenuated condition, the tyre was called upon to stand, and failed to do, on the occasion referred to.—C.A.G., 3/4/83. Locomotive Engineer.

I can with confidence repeat Mr. Scott's words. I, too, have had considerable experience of both Vickers' and Krupp's tires in England, perhaps before either were used in this Colony, and I always found the latter a very good tire to wear, and that is why I prefer them; but I never found them any more liable to fracture than Vickers' or other makers', neither can I find any records here or obtain any information about the "several" Krupp's tires which have broken through on the "tread" when under vehicles. There is an old Krupp's tire in the yard, which is $1\frac{1}{2}$ in. thick, and has a crack through it, and a Bessemer tire broke through (a bolt-hole) some time ago, pieces of which I have.

Mr. Scott has been misinformed respecting the late accident on the Hobson's Bay railway. The tire which broke at Jolimont and caused the accident was one of steel, made by Messrs. Taylor Brothers, of Leeds, and not one of Krupp's make; and when I consider that it was only $\frac{5}{8}$ of an inch thick on the tread, and was further weakened by having at least a $\frac{3}{4}$ hole in it. These facts appear to my mind in the same light as they evidently have to yours, judging from your minute of the 3/4/83, which I am now replying to, that it rather proves the good quality of the Taylor steel than the bad, to have stood so long; and I further consider, if the said tire had been properly fastened to the wheel, so that it could not have come off, the derailment would not have happened at all.—THOS. MIDELTON, 15/4/83. The Commissioner.

Mr. James Brown to The Acting Locomotive Engineer.

Sir,

Sydney, 12 April, 1883.

Replying to yours of the 29th ultimo, Messrs. Cammel & Company's axles are in use on the various English lines, including:—Manchester, Sheffield, and Lincolnshire, London, Brighton, and South Coast, Caledonian and Great Western, and large quantities have been supplied to the Great Indian, Peninsula, Bombay, Baroda, and C. J. Railway.

These axles will show a tensile strength of from 26 to 28 tons, with an elongation of from 25 per cent. to 30 per cent., and a reduction of area of 55 per cent. to 60 per cent.

In the event of the Commissioner entrusting to me an order for these, I am willing to guarantee the above result.

Yours, &c.,

JAMES BROWN.

Mr. James Brown to The Commissioner for Railways.

Sir,

Sydney, 9 February, 1883.

Understanding that an indent will shortly be passed forward to the Agent-General including carriage and waggon wheels, I take this opportunity of soliciting, on behalf of Messrs. Cammel & Company, Sheffield, that they may have the opportunity of having their tires and axles for those specified to the wheel manufacturers, from whom tenders will be obtained.

The Company are leading manufacturers in all classes of steel, employing the highest brands of Swedish irons, and they have and do supply all the leading railway Companies in the class of goods to which I refer.

Among these railways are The Great Western, Midland, North Eastern, Caledonian, London, Brighton, and South Coast railway; Great Indian, Peninsular, Oude and Rohilcund, Indian State, Odessa, &c., &c., &c.

I may mention that they have a plant equal to, and, in many instances, superior to any house in the steel trade, and whatever guarantee or test such irons as Messrs. Vickers & Company or Krupp give, the same can be given and fulfilled by Messrs. Cammell & Company.

Messrs. Cammell & Company have at times addressed themselves to the Agent-General, Mr. Fowler, and Mr. Baldry, on the matter, but it appears this rests on a recommendation being made from Sydney.

I should therefore, on behalf of Messrs. Cammell & Company, esteem it a favour if you would instruct the Agent-General to specify to the wheelmakers their make of tires and axles for some portion of the indent now in preparation, and of others that may be despatched. Hoping to receive a favourable reply.

I have, &c.,

JAMES BROWN.

Forward for report of Locomotive Engineer.—C.A.G., 28/2/83. I see no reason why Messrs. Cammell & Company should not be included with Krupp and Vickers for tires and axles. The waggon wheels are made by other firms generally, in fact always I believe.—J.M., 9/3/83. Commissioner.

I have referred to the Locomotive Engineer the result of some tests of axles and tires, by various manufacturers, which the Inspecting Engineer in England, Mr. John Fowler, has had made at our own request. Mr. Midelton may further report upon this matter when he has perused the papers I have referred to.—C.W.G., 13/3/83.

The Commissioner,— Steel Tires and Axles.

In obedience to your minute of the 13th March, 1883, on your M.P. 83-2,694 herewith, I have the honor to report as follows,—

Having very carefully read and considered all the papers on this subject, especially the report furnished by Mr. John Fowler, C.E., 83-1,725, and Mr. Scott's letter with you, 83-2,561, I confess I hardly see why Mr. Scott, in his letters to you of the 10th and 17th March, 1882, suggested that Mr. Fowler should report, &c., when he seemed so thoroughly convinced that no other but Vickers' steel should be used here for tires and axles, and he still seems to hold that view; this being the case, it is strange that the "Brunswick Steel" was introduced at all, when Vickers' steel has always been found to be the most reliable material. It is probable that Mr. Scott is not responsible for the introduction named.

I notice the first question put to Mr. Fowler is, "The test that Vickers' steel will stand for tires and axles." This, in my opinion, is virtually informing him that we accept Vickers' steel as the best procurable, and that there is no necessity for going further to obtain any better material, and that, whatever test their steel stands, we shall be satisfied with it.

I consider that, instead of asking Messrs. Vickers to name or explain the character of the tests which they guarantee their tires and axles to sustain, it would have been more satisfactory if we, or Mr. Fowler, had stated the tests we wished to apply, and the conditions, &c., under which they should be carried out. If Messrs. Vickers were asked to supply the information referred to, I think, in fairness, the other makers should also have been asked to do the same thing.

I see no reason why the "tests" laid down by Messrs. Vickers is to be considered *correct*, and with all due respect to that eminent firm, and to Mr. Fowler, I decline to accept their views. I do not either see why the other firms named, Messrs. Krupp, Brown, Cammell, Taylor, The Patent Shaft Co., and the Monkbridge Co., should supply material for testing purposes on the conditions laid down by another firm, viz., Messrs. Vickers & Sons.

I observe that Mr. Brown, in his letter to you of February 9th, 1883, states that, whatever guarantee or test such firms as Messrs. Vickers & Sons or Krupp give, the same can be given and fulfilled by Messrs. Cammell & Co.

Mr. Fowler states that with two exceptions every maker supplied a tire which failed under the falling-weight test before *the required degree of bending* had been obtained.

I really cannot accept this as satisfactory, as not a word is said about size or weights of any of the tires.

The results obtained by Mr. Fowler left him, of course, no alternative but to reply to No. 3 question by saying, "I am not able to submit the names of any other firms which can be relied on to supply steel to stand the same test."

I must here point out that I differ wholly with Messrs. Vickers' views respecting tests, as I consider them unnatural and unfair, both for tires and axles, as neither are subjected to the strains their tests impose, in practice. Tires, to be properly and consistently tested, should bear a bursting and, consequently, a tensile strain at the same time; this is exactly what they have to stand when in use, and, of course, the test can be made as great as one pleases.

Tires should not be tested with a falling weight; it is, as an author says, "A rough and ready way," and not only that, but extremely unscientific, too. The falling weight puts the material of a tire in "compression." It would, as you a few days ago remarked to me in your office, be as consistent to test a boiler with a falling weight as it is to test a tire that way. Axles should be tested with a light falling in weight on their journals (and not in the centre); this should be resisted by bearings placed where the wheel sits; they should also bear a severe "Torsional" strain at the same time, such as is put upon them when they have to traverse sharp curves, and over bad joints, crossings, &c., &c.

I send herewith, Vol. LXVII, minutes of proceedings of the I.C. Engineers, where, on page 353, may be seen a paper written by Mr. B. Baker, C.E., on "Steel for Tires and Axles."

I have read this paper over several times, and I notice that Mr. Fowler has accidentally arrived at almost exactly the same result in one or two cases as Mr. Baker has; the figures I have marked in blue pencil are exactly the same, singularly enough.

Tires stood a tensile strain of 40.9 tons and 49.48 tons per square inch respectively. I also herewith send a record of some tests recently made in Victoria, where the tensile strength of Vickers' steel axles is 13½ tons: the least, in fact, of the three makers named.

From

From all the information I can obtain here, I find that Krupp's steel (the first imported) was used in 1867, and that the steel produced by that firm is still giving great satisfaction; their crank axles and tires are certainly equal in every respect, in my opinion, to any other maker; and I know that Messrs. Cammell & Company supply many of the best English lines with their tires and axles; therefore I entirely agree with the recent letter from the Agent-General (83-3,423) herewith, in which he suggests whether it would not be desirable to allow some other brands of steel to be used in the manufacture of tires and axles in addition to that of Messrs. Vickers & Sons.

I would also respectfully suggest that pieces of steel shall be cut from old tires and axles, say 8 inches long and 1 inch square; these pieces to be marked (here), so that we shall know who is the manufacturer, and then sent Home to Mr. David Kircaldy of the Grove, Southwark, to be tested by him; and that he be requested to furnish us with a report saying which specimen he considers the best in all respects for use for tires and axles respectively, and to say whether he knows of any other better material for such purposes.

Mr. Kircaldy has the finest testing works in the world, and he has devoted his whole life to that kind of thing, therefore his report will be most valuable; it certainly cannot be biassed, as he will not know whose steel he is testing.

I am sorry Mr. Scott, who was in London when Mr. Fowler conducted the experiments he refers to, was not present to see what took place. He may have been invited by Mr. Fowler to attend, but perhaps was unable to do so.

THOMAS MIDELTON.

Mr. James Brown to The Commissioner for Railways.

Sir,

Will you kindly oblige me with a reply *re* my letter to you dated 9th February, as to indents for carriage and waggon wheels, through the Agent-General.

Sydney, 7 March, 1883.

I am, &c.,

JAMES BROWN.

The Agent-General to The Colonial Secretary.

Brand of Steel for Tires and Axles.

Sir,

5, Westminster Chamber, Victoria-street, 9 March, 1883.

In continuation of my letter of the 9th February last, in which I replied to the telegram of the Honorable the Commissioner for Public Works of the 1st idem, complaining of the delay in the execution of the order for wheels, axles, and springs, I have the honor to suggest, for your consideration, with the view to save expense in future orders for wheels and axles, whether it would not be desirable to allow some other brands of steel to be used in the manufacture of tires and axles, in addition to that of Messrs. Vickers & Sons.

There are several steel manufacturers of undoubted reputation in the United Kingdom who would give ample guarantees as to the quality of their brands, and, having in view the very high rate paid to Messrs. Vickers & Sons, it appears to me that a very considerable saving would be effected by reasonable competition, and the interests of the Government none the less observed if it were so; moreover, at present Messrs. Vickers have a monopoly, and any manufacturers who may succeed in obtaining an order from this Department for wheels and axles is entirely dependent upon that firm for the supply of the tires and axles, a condition of things not altogether desirable when quick deliveries are necessary.

I have, &c.,

SAUL SAMUEL.

Forwarded to the Locomotive Engineer in reference to conversation I had with him on this subject *re* Mr. Fowler's report that Messrs. Vickers' steel used for axles and tires was the only steel that stood the test.

While I was taken by surprise by this statement, which seemed to me, without other and rebutting testimony, to give Vickers a monopoly of our orders, I asked Mr. Midelton to furnish me with a full report on the subject.*

I also made arrangements with Mr. Scott that he should visit the Brunswick steel-works, with the view of ascertaining the quality of the steel they make for axles and tires.

I am not less surprised than pleased with this representation of the Agent-General—pleased because he seems to differ from Mr. Fowler as to the exclusive quality of Vickers' steel; and surprised,—first, because he made no comment upon Mr. Fowler's report when he forwarded it to the Colony; and, second, because, when we requested him to divide the last indent for tires between Krupp and Vickers, he sought Mr. Scott's advice in the matter, and upon it gave the whole order to Vickers.—C.A.G., 26/4/83.

Seen. I entirely agree with the views of the Commissioner and the Agent-General.—T.M., 30/4/83.

The Acting Locomotive Engineer to The Commissioner for Railways.

Department of Public Works, Railway Branch, Sydney, 26th April, 1883.

Indent for Waggon Tires, as per No. 791, tracing herewith.

KRUPP's or Cammell & Company's 700 Flanged Hoop Tires of Vickers' steel for railway waggon wheels. Internal diameter, 31½ inches. The section of tires to be exactly the same as that of 200 of same size indented for on September 27th last. The measurement given is for the tires in the "rough" state.

* See Report at page 15.

Allowance has been made for turning and boring in the Colony. Each tire to be stamped on its concave side with figures denoting its internal diameter.

Estimated cost of indent, £3,410. Code name, "Common."

THOMAS MIDELTON.

I have not received Mr. Midelton's report upon Mr. Fowler's paper *re* tests made of axles and tires. The Agent-General, in the face of Mr. Fowler's report, has recommended that the steel of other makers be taken, to widen the area of competition.

I do not desire to ignore the Agent-General's recommendations, and yet with the uncombated report of Mr. Fowler, C.E., before me, I do not see how the Department can be justified in ordering other than Vickers' axles and tires. Mr. Midelton will please report.—C.A.G., 7/5/83.

I have since read Mr. Midelton's report, and am disinclined to recommend that those tires be given exclusively to Vickers & Sons. I would prefer that tenders be invited, say from Vickers, Cammell & Co., and Krupp, and that we specify the tests which those tires shall withstand.

Will Mr. Midelton prepare a specification for the purpose.—C.A.G., 8/5/83.

Tire-testing.

The Commissioner,—

In reply to your minute of 8/5/83, on your M.P., 83/3,689, I have the honor of submitting the following specification, tracing, &c., which indicates the test I propose for steel tires in future:—

- 1st. Inspecting Engineer shall select for testing as many tires as he may think fit, say, 1 in every 100.
- 2nd. The tires selected shall be turned and bored to the minimum working thickness of $1\frac{1}{4}$ inches on the "tread-line"; this line, of course, to be distinctly marked on the periphery of the tire with a sharp-pointed tool when the tread of the said tire is being turned.
- 3rd. They are then to be heated as though they were to be shrunk on to a wheel skeleton, then taken out of the furnace and allowed to cool gradually.
- 4th. After this they are to be marked with a fine line at every foot of the circumference, such line to be truly square with the outer face of the tire, and to run across the "tread-line" so that the elongation of the material of the tire can be accurately measured and recorded. The true diameter of the tire to be taken on the tread-line, and recorded before any strain is put upon it.
- 5th. The foregoing being complete, the tire shall then be placed over the segments of the testing machine (see tracing 808), these segments being turned to exactly the size of the internal dial of the tire, pressure is then to be applied to the ram of the press until the tire fractures or elongates to such an extent that the machine will not burst it; when sufficient test has been applied, the elongation of the metal per foot, the pressure per square inch of section the metal withstood, and the total pressure applied to be duly registered. If the tire fractures, a photograph of the face of the fracture should be taken, so as the grain of the metal can be seen.
- 6th. If the tire elongates perceptibly under a pressure of from 10 to 12 tons per square inch of sectional area, the lot from which it was selected should be rejected.
- 7th. If a tire fractures under a pressure of 35 tons per square inch of sectional area, the lot to be rejected.
- 8th. The temperature of the air when a test is supplied should be about 60 degrees.
- 9th. While pressure is being applied to a tire, it would be advisable to subject it to blows on the tread if it can be done with a "flatter" and sledge-hammer without damaging the "tread-line and cross-lines."

The foregoing is a test which is as near as it is possible perhaps to apply to resemble actual daily working and the strains which tires have to undergo.

The tracing indicates the general idea of the proposed testing machine, and if placed in Messrs. Tange Bros.' hands to make, I have no doubt we should secure a good machine, well suited for the purpose it is intended; the same machine would do for any size tires up to 5 feet 6 inches diameter, by simply having segment cast for each size of tire to be tested.

I trust the Commissioner will pardon the delay herein. I have made a great many attempts to complete this work, but on account of the excessive duties I have lately had, I could not do more than I have done.

I suggest that the foregoing conditions and the tracing be sent to Messrs. Tange Bros. and to the Inspecting Engineer, and if it is decided to have a testing machine constructed, it shall become the property of the Government, and be used in England when required.—THOS. MIDELTON, 14/9/83.

I have addressed this to the Commissioner in reply to his minute to me on the subject. I trust the Locomotive Engineer will fully understand.—T.M.

Let me see the proposed conditions for testing tires in print. Draw up a paper for the printer.—C.A.G., 29/9/83.

Mr. Scott has the papers about the tests applied by Mr. Fowler, and the Agent-General's letter recommending extended area of competition for axles and tires. Will Mr. Scott report upon this?—C.A.G., 5/10/83.

Judging by the tire and axle tests of the Inspecting Engineer, and also from our own experience, I believe Messrs. Vickers & Sons to be the best makers. For obvious reasons, it is desirable to widen the field of competition. By the use of the Mansell rings the risk from fracture is reduced to a minimum, so that I consider that, in addition to Messrs. Vickers, Messrs. Krupp and Messrs. Cammell & Company should be considered eligible to tender, as I consider they are the next best makers.—W. SCOTT, 9/10/83.

Indent for Steel Tires for Engine and Tender Wheels.

Sydney, 12 September, 1883.

Weldless hoop tires of the very best quality, tracing No. 840, to be ordered from Messrs. Vickers, Krupp, or Cammell & Company.

No. required.	Internal diameter of tires.	Width of tires.	With or without Flanges.	For engines or tenders.
	Inches.	Inches.		
50	42 $\frac{3}{8}$	5 $\frac{1}{2}$	Flanged.	Engines.
20	31 $\frac{3}{8}$	5 $\frac{1}{2}$	"	"
50	54 $\frac{3}{8}$	5 $\frac{3}{8}$	"	"
100	60 $\frac{3}{8}$	5 $\frac{3}{8}$	"	"
20	63 $\frac{3}{8}$	5 $\frac{3}{8}$	"	"
50	30 $\frac{3}{8}$	5 $\frac{3}{8}$	"	"
100	37 $\frac{1}{8}$	5 $\frac{3}{8}$	"	Tenders.
34	37 $\frac{1}{8}$	5 $\frac{3}{8}$	Flangeless.	"
100	36 $\frac{3}{8}$	5 $\frac{3}{8}$	Flanged.	"
34	36 $\frac{3}{8}$	5 $\frac{3}{8}$	Flangeless.	"

Required to be of the same sections as the engine and tender tires indented for on 27th September last. The measurements given are for the tires in their rough state. Allowance has been made for turning and boxing in the Colony. Each tire to be stamped on its concave side with figures denoting its internal diameter.

Estimated cost of indent, £4,840. Required in Sydney as early as possible. W. SCOTT.

Before sending this indent I wish to have some expression of opinion from Mr. Scott as to the maker or proposed maker of these tires. There is a somewhat curious correspondence herewith, which requires explanation. I refer to Mr. Fowler's report upon Vickers' steel for axles and tires, and the steel of other manufacturers tested by him, and then to the subsequent letter received from Agent-General, in which, in the face of the conclusion which Mr. Fowler's report would lead to, he urges that the area of competition should be widened, as the prices charged by Vickers are so high, &c. This recommendation is again a curious commentary upon the Agent-General's own action in deciding to order from Vickers only an indent for tires, which we requested might be divided between Vickers and Krupp.—C.A.G., 18/9/83.

Judging by the tire and axle tests made by the Inspecting Engineer, and also from our own experience, I believe Messrs. Vickers & Sons are the best makers, but as it is, for obvious reasons, most desirable to increase the area of competition, and by the use of the Mansell rings for fastening the risk from fracture is reduced to a minimum, I would suggest that, in addition to Messrs. Vickers & Sons, Messrs. Krupp and Messrs. Cammell & Company, be considered eligible to tender, as I consider they are the next best makers.—W. SCOTT, 9/10/83.

Locomotive Engineer's Office, 1 March, 1884.

INDENT for tires for engines and tenders, to be ordered from approved makers.

No. required.	Forged size inside diameter.	Thickness of tread of tire.	Width of tire.	
2	5 feet 4 $\frac{1}{8}$ inches	3 inches	5 $\frac{3}{8}$ inches	} Tracing No. 840.

Required at Newcastle. W. SCOTT.

Tires for Railway Rolling Stock.

WE sent away some little time ago—about a month or six weeks—an indent for tires, specifying for approved brand. The term is rather a wide one, and I fear that by open competition, unless a good test be provided, we may have indifferent tires supplied, and jeopardise the safety of the travelling public. In the matter of tires and axles we cannot be too careful.

Let me have indent.—C.A.G., 15/4/84.

In the indent which we have sent recently to England for tires we have mentioned no particular makers. I have before me an axle which looks more like cast iron, and which broke suddenly under one of our cars. I need not point out the danger the train was in by this failure. I must recommend that a cablegram be sent to England, as follows:—

“Indent 1st March, tires, confine competition to Cammell, Krupp, and Vickers, and subject to test approved by Mr. Fowler.”—C.A.G., 23/4/84.

Approved.—F.A.W., 23/4/84.

Indents for Carriage and Waggon wheels and axles.

The Commissioner,—

Herewith I forward indents for 2,900 pairs of carriage and waggon wheels and axles, and in doing so desire to point out that of the 1,100 pairs recently indented for 500 pairs were (I learn through an unofficial source) ordered from the Brunswick Steel Company. Our experience of this Company's axles shows

shows that they are not reliable, three having broken under our waggons whilst running. I would therefore suggest that, as Mr. A. Vickers is now in Sydney, you have an interview with him, with the view of inducing him to make such a reduction in price as may make it worth while placing with his firm the order for the whole of the 2,900 pairs now required.

I need scarcely add that the tires and axles hitherto supplied by Messrs. Vickers have given us entire satisfaction, not one of them having broken, and that the firm enjoys a very high reputation both in England and France.

W. SCOTT, 7/5/84.

I have communicated with Mr. Vickers on this subject, and he at first offered to supply the wheels with axles and tires complete at £18 7s. 6d. per pair. This price compares very favourably, looking to the superiority of the tires and axles, with the prices at which we have previously obtained these supplies, but there is no speciality in regard to the wheels, and I therefore wished to limit the order to Vickers & Sons to the axles and tires. He then offered to supply the latter at £22 per ton, that being the lowest price to the trade in England. They had previously charged this Government the uniform price of £26 per ton.

I pointed out to Mr. Vickers that I considered £22 a ton a high rate in view of the fact that we proposed to name his firm only for these supplies, and his letter of this date followed, offering to reduce the price to £18 per ton on certain conditions, viz., that we do not make known the price to wheel-makers and others in the trade.

I share with the Locomotive Engineer the anxiety he expresses to get the best material only for our tires and axles, and as Vickers' price has been reduced to the lowest point, I must recommend the Minister to stipulate for Vickers' axles and tires at the terms he offers.

The Inspecting Engineer (Mr. Fowler) has already reported that Vickers' axles and tires, are the best made, and our experience supports this conclusion.—C.A.G., 29/5/84.

Have Vickers' axles been subject to a trial; if not, I think they should be tested fully before any definite action is taken to limit our supply to that firm.—F.A.W., 29/5/84.

Yes; they have been subjected to the fullest trial. At the request of the Government, Mr. John Fowler wrote to all the established firms in England to make samples of their best axles and tires, and he took promiscuously from Vickers' establishment some tires and axles they were making for us to test them against those specially made. In every case Vickers' material surpassed those submitted; in fact, other tires and axles could not approach those made by Vickers. I have always contended that price—in such vital portions of the rolling-stock as axles and tires—should be only considered when other conditions were equal, and though Vickers' prices were higher than most of the other manufacturers, we nevertheless ordered Vickers' supplies.

I have taken the opportunity of Mr. Vickers being here to represent to him the necessity, if orders are to be continued to him, for his reducing his charges, and he has consented to reduce them from £26 to £18 per ton, provided that the price is not made known; the axles have recently been tested in the Colony, and the test fully bears out Mr. Fowler's tests.—C.A.G., 30/5/84. Approved.—F.A.W., 30/5/84.

Make copy of Mr. Vickers' letter, and return to him in letter accepting his terms. Send copy of letter to Agent-General, and request that the conditions of the contract in regard to the non-divulgence of prices may be observed.—C.A.G., 30/5/84.

Mr. Albert Vickers to The Commissioner for Railways.

Sir,

The Union Club, Sydney, 16 May, 1884.

In pursuance of a conversation with you this morning, I have the honor, on behalf of Vickers, Sons, & Co. (Limited), to tender for the supply of 2,900 pairs of wheels and axles to the drawing of the Department.

The tires and axles to be of Vickers' cast steel of the best quality they make, and subject to the test usually made by your Inspecting Engineer, for which purpose 2 per cent. of axles and tires shall be made and tested free of charge.

The wheels, when finished, to be also, of course, subject to the usual inspection.

2,800 pairs of 3 ft. 0½ in. diameter wheels, at £18 5s., price per pair delivered free on board in Liverpool.

2,800 pairs of 3 ft. 0½ in. diameter wheels, at £18 7s. 6d. per pair delivered f.o.b. in London.

100 pairs of 3 ft. 6½ in. diameter wheels, at £20 5s. " " Liverpool.

100 pairs of 3 ft. 6½ in. diameter wheels, at £20 7s. 6d. " " London.

The prices are the lowest at which any Company have ever tendered, and we trust the Department may favour us with an acceptance of it.

I am prepared to accept the same price for any increased number beyond 2,900 pairs, up to, but not exceeding, 5,000 pairs in all.

I have, &c.,

ALBERT VICKERS,

Managing Director of Vickers, Sons, & Co. (Limited).

Will Supt. of Stores please let me know how these prices compare with the prices for Vickers' axles obtained through Agent-General, and also the Brunswick axles.—C.A.G., 17/5/84. Urgent.

The last importations are as under—

Dec., 1883. Supplied by the Patent Shaft and Axle-tree Company.
3 ft. 0½ in. wheels (waggon) with Vickers' cast-steel axle and tyres:—
English cost.....£17 10s. per pair.
Vickers' price£18 7s. 6d. „

3 ft.

3 ft. 6½ in. carriage with Vickers' cast-steel axles and tires:—
 English cost.....£19 18s. 6d. per ton.
 Vickers' price..... £20 7s. 6d. ”
 3 ft. waggon per pair, £17 2s. No carriage received with these axles.

A.R. The Commissioner, 20/5/84.

I have seen Mr. Scott, as directed. Considerable alterations for improving and strengthening the wheels and axles were made in the specification. Mr. Scott cannot say reliably what this would amount to in increased cost, but thinks the difference would not be far short of £3 per pair of wheels and axles. The difference will not certainly be ascertained on receipt of first invoice, for 1,100 pairs ordered on Oct. 3rd, 1883, to the new design. This advice may be expected shortly.—A.R., 27/5/84.

Price paid for Vickers' cast-steel tires for carriages and waggons during last two years:—
 Date of invoice— January 31st, 1882—500—£26 per ton.
 April 19th, 1883 — 95—£26 ”
 May 11th, 1883 —440—£26 ”
 June 9th, 1883 —115—£26 ”

A. RICHARDSON.

Weight of tires—Waggon, 3 ft. 0½ in.—3 cwt. 2 qr. 23 lb.
 Carriage, 3 ft. 6½ in.—4 cwt. 1 qr. 5 lb.

Price of 3 ft. 6½ in. wheels with Vickers' tires but no axles:—
 £8 3s. 6d. each = £16 7s. per pair.
 With Vickers' tires and axles, £19 8s. 6d. per pair.
 Diff. cost of axles, £3 11s. 6d.

Price of Taylor Bros.' iron axles for carriages and waggons, £21 18s. 9d. per ton.

A. RICHARDSON, 28/5/84.

Mr. Albert Vickers to The Commissioner for Railways.

Sir,

The Union Club, 27 May, 1884.

In the event of your inserting our name alone for the tires and axles required for wheels to be indented for, I hereby undertake that we will quote no higher price to any wheelmaker than £22 per ton.

I am, &c.,

ALBERT VICKERS,

A Managing Director of Vickers, Sons, & Co., Sheffield.

The Locomotive Engineer to The Commissioner for Railways.

Dear Sir,

Locomotive Engineer's Office, 28 May, 1884.

After leaving you this morning I called upon the Superintendent of Stores, and obtained from him the prices paid for previous supplies of Vickers' cast-steel tires, which I enclose.

I am, &c.,

W. SCOTT.

Mr. Albert Vickers to The Commissioner for Railways.

Sir,

Union Club, Sydney, 28 May, 1884.

In reference to my tender of recent date for the supply of wheels and axles, in view of your expressed preference not to make a contract with my firm here in the Colony, but rather to insert our name alone on my undertaking not to charge wheelmakers tendering more than a fixed figure for the tires and axles, I have to point out to you that our general trade with wheelmakers would be injured, because we are not willing to sell tires and axles generally as low as we are willing and anxious to sell to the Government. I beg, therefore, to suggest a mode by which the Government can obtain the benefit of the utmost reduction in price we are prepared to make, and yet protect us from the anticipated injury above indicated, viz. :—

We hereby offer to sell to the Government 2,900 axles and 5,800 tires, at £18 per ton, and agree to deliver them free of freight charges at the works of any wheelmakers in England.

The Government will then be in a position to invite tenders for the wheels and axles complete, the Government delivering the tires and axles in the forged state free at the works of the wheelmakers.

The object of this offer, as far as we are concerned, will be the clearer when I state that we are constantly receiving orders from wheelmakers at much higher prices than we name above, and these wheelmakers would object to pay more for other orders than they do for yours, and so break down our general prices, whereas we desire only to make this concession to your Government.

A condition we must ask is, therefore, that all due care be asked not to have this our price divulged.

In regard to future orders we shall be glad to try to continue at same price, but we cannot bind ourselves beyond some specified number, say 5,000 axles and 10,000 tires for delivery any time during 1884–1885. Should you accept this offer, I beg you to give me, with your acceptance a copy of this letter.

I am, &c.,

ALBERT VICKERS.

The Commissioner for Railways to Mr. Albert Vickers.

Sir,

Department of Public Works, Sydney, 31 May, 1884.

I have the honor to acknowledge the receipt of your letter of the 28th instant, offering to supply to this Government 2,900 axles and 5,800 tires, and further supplies required during the years 1884 and 1885, at £18 per ton, delivered free at the works of any wheelmaker in England, and have to inform you that your offer is accepted.

I enclose copy of your letter. A copy will also be sent to the Agent-General, with a request that he will not divulge the price at which you have undertaken to supply.

I have, &c.,

CHAS. A. GOODCHAP,

Commissioner for Railways.

The

The Secretary for Public Works to The Agent-General.

Sir, Department of Public Works, Railway Branch, Sydney, 31 May, 1884.

I have the honor to inform you that Mr. Vickers' tender to supply 2,900 axles and 5,800 tires, and further supplies required during 1884 and 1885, at £18 per ton, delivered free at the works of any wheelmaker in England, has been accepted.

I enclose a copy of Mr. Vickers' letter, and shall be glad if you will observe his wish that his price may not be divulged.

I have, &c.,

F. A. WRIGHT,

Secretary for Public Works.

P.S.—The indent for wheels will follow.

Minute by Commissioner.

I wish also an explanatory letter written to Agent-General of the reasons we have taken this step about the axles and tires, and say that several axles of the Brunswick Steel Company's make (Patent Shaft Company) have failed with us, one so completely that a portion of it is being sent to him to show what wretched unreliable material it is made of,—that a test has been made here of Taylor's, Patent Shaft Company's, and Vickers' axles, and the last named have been proved to be so immeasurably superior that it has been decided to order them in future. Advantage was taken of one of the Directors of Vickers & Company being in Sydney to make a contract with him, the particulars of which have already been communicated, and that a large quantity of axles and tires sent out for the Victorian railways have been condemned as being of inferior quality; and looking at the great risk that is being run by the use of inferior axles and tires, it has been decided, though we may pay a little more for them, to obtain those which have been tested and found to be of the best quality.—C.A.G., 2/6/84.

The Secretary for Public Works to The Agent-General.

Sir, Department of Public Works, Railway Branch, 9 June, 1884.

I have the honor to enclose herein indent for fittings required under five years' contracts, ending December, 1888, for the Great Southern, Western, Richmond, and Northern Lines, and shall be glad if you will obtain and forward the same to the Colony as early as possible.

I have, &c.,

ALEX. STUART,

Secretary for Public Works.

INDENT for fittings required under five years' contract, ending December, 1888, for Great Northern Line:—

800 pairs of waggon wheels and axles to drawing No. 817 (already in possession of the Agent-General) 3'0 $\frac{1}{2}$ " diameter on tread, 6'3 $\frac{1}{4}$ " C to C journals (with new tire fastenings); code name, "Assurance."*

40 pairs of carriage wheels and axles to drawing No. 818 (already in possession of the Agent-General) 3'6 $\frac{1}{2}$ " diameter on tread, 6'4 $\frac{1}{4}$ " C to C of journals (with new tire fastenings); code name, "Precaution."*

1,200 ordinary waggon bearing springs, to drawing No. 184 (already in possession of the Agent-General), for four-wheeled goods stock; code name, "Alpha." To have wrought-iron buckles, as shown on drawing No. 879 herewith.

100 nests spiral bearing springs, for bogie passenger stock, to drawing No. 189 (already in possession of the Agent-General); code name, "Nest."

157 new standard draw and buffer springs, for passenger and goods vehicles, to drawing No. 887 herewith, code name "Spiral," or to tracing No. 892 herewith, code name "Sterne."

1,200 volute springs for side chains to drawing No. 226 (already in possession of the Agent-General); code name, "Safety."

To be delivered at Newcastle.

It should be distinctly understood that if the "Sterne" springs be supplied the price paid for them should not exceed that of the Timmins springs; code name, "Spiral."

Indent for fittings required under five years' contract, ending December, 1888, for Southern, Western, and Richmond lines.

2,000 pairs of waggon wheels and axles, to drawing No. 817 (already in possession of the Agent-General), 3'0 $\frac{1}{2}$ " diameter on tread, 6'3 $\frac{1}{4}$ " C to C of journals (with new tire fastenings); code name, "Assurance."

60 pairs of carriage wheels and axles, to drawing No. 818 (already in possession of the Agent-General), 3'6 $\frac{1}{2}$ " diameter on tread, 6'4 $\frac{1}{4}$ " C to C of journals (with new tire fastenings); code name, "Precaution."

2,000 nests of spiral bearing springs to drawing No. 189 (already in possession of the Agent-General), for bogie passenger, stock; code name, "Nest."

5,000 bearing springs to drawing No. 184 (already in possession of the Agent-General), for four-wheeled goods stock with buckles as per drawing No. 879 herewith; code name, "Alpha."

200 break-van bearing springs (fourteen plates) to drawing No. 600 (already in the possession of the Agent-General); code name, "Van."

100 break-van bearing springs (eleven plates) to drawing No. 565 (already in possession of the Agent-General); code name, "Compo."

3,000 steel volute buffer springs to drawing No. 194 (already in the possession of the Agent-General); code name, "Volute."

2,395 new standard draw and buffer springs for passenger and goods vehicles, to drawing No. 887 herewith; code name, "Spiral," or to drawing No. 892 herewith; code name, "Sterne."

3,000 volute springs for side chains to drawing No. 226 (already in possession of the Agent-General); code name, "Safety."

To be delivered at Sydney.

It should be distinctly understood that if the "Sterne" springs be supplied the price paid for them should not exceed that of the "Timmins" springs; code name, "Spiral." Engine

* Cast-steel tires and axles.

Engine and Tender Tires.

The Commissioner,—I enclose herein an indent for the supply of engine and tender tires for the Great Southern, Western, and Northern lines, and it will be observed that a "code" name has been given to each description of tire.

All our engine and tire sections and diameters are embraced therein, and future indents will be made out in the same form as the present one.

In cases of emergency cablegrams would simply indicate the number required and code name. *Vide* my M.P. 83/2,436, Commissioner's 83/6928, forwarded by Commissioner on 11/4/83, the other particulars being obtained in London from inspection of the schedule.

Two photographic blue-print *fac-similes* are also herewith.

W. SCOTT, 14/8/84.

Recommended.—C.A.G., 25/8/84. Approved.—F.A.W., 4/9/84.

The Secretary for Public Works to The Agent-General.

Sir, Department of Public Works, Railway Branch, Sydney, 16 September, 1884.

I have the honor to enclose herein an indent for engine and tender tires (for renewals), the whole to be in accordance as regards section and internal diameter with the accompanying tire schedule, tracing No. 916, and shall be glad if you will obtain and forward the same to the Colony as early as possible.

I think it would be advisable to obtain offers from the recognised good makers for these articles; but if Messrs Vickers & Son are prepared to supply them at a price which compares favourably with the others—that is, quality considered—their offer should be accepted in preference to any other, as their tires have been found to be the most reliable make we have used.

I have, &c.,
F. A. WRIGHT,
Secretary for Public Works.

The Locomotive Engineer to The Commissioner for Railways.

Locomotive Engineer's Office, 16 September, 1884.

INDENT for engine and tender tires (for renewals), the whole to be in accordance as regards section and internal diameter with the accompanying Tire Schedule—Tracing No. 916.

Where required.	Number of each required.	Code Name.	Internal diameter forged.
			ft.
Required in Sydney by sailing ship as soon as possible	350	" Camera "	42 $\frac{1}{4}$
	950	" Canton "	37 $\frac{1}{4}$
	50	" Castle "	42 $\frac{1}{2}$
	75	" Camden "	36 $\frac{1}{2}$
	100	" Cement "	42 $\frac{3}{8}$
	45	" Citron "	36 $\frac{3}{8}$
	75	" Credit "	36 $\frac{3}{8}$
	50	" Tackle "	27 $\frac{1}{4}$
	50	" Taurus "	60 $\frac{3}{4}$
	50	" Tavern "	30 $\frac{3}{8}$
	50	" Rafter "	24 $\frac{3}{8}$
	100	" Ramble "	30 $\frac{3}{8}$
	40	" Dangar "	42 $\frac{3}{4}$
	20	" Dental "	31 $\frac{3}{8}$
	10	" Depute "	67
	Required in Newcastle by sailing ship as soon as possible	20	" Landan "
20		" Latent "	42 $\frac{3}{4}$
60		" Camera "	42 $\frac{1}{4}$
24		" Tackle "	27 $\frac{1}{4}$

Also the following waggon tires for renewals :—

Where required.	No. of each required.	Internal diameter forged.	Remarks.
		ft.	
In Newcastle (by sailing ship) as soon as possible	24	32 $\frac{3}{8}$	} Section to be as shown on tracing No. 791; code name, "Common"; in possession of Agent-General.
	24	32 $\frac{7}{8}$	

All the foregoing tires to be in the "rough" or forged state. Internal diameter to be stamped on inside of each tire, and code name painted on (in white) also.

I would recommend that the Agent-General be requested to obtain offers from the recognised *good makers*, but that if Messrs. Vickers & Son are prepared to supply them at a price which compares favourably with the others—that is quality considered—their offer should be accepted. I much prefer Vickers' make, and if their offer be at all reasonable I recommend its acceptance in preference to any other, as their tires have been proved to be the most reliable make we have used.

Estimated cost of whole indent, £17,035.

W. SCOTT,
Locomotive Engineer.

Recommended.—CHAS. A. GOODCHAP, 5/9/84. F.A.W., 5/9/84.

The Secretary for Public Works to The Agent-General, London.

Sir,

Department of Public Works, Railway Branch, Sydney, 2 October, 1884.

In further reference to my letter to you of the 31st ultimo, *re* order for Vickers' axles and tires, I may say that the reason which induced the Government to give the order was on account of the failure of several axles of the Brunswick Steel Company's make (Patent Shaft Company) and the proved superiority of the Vickers' manufacture over all others. One axle of the Brunswick make failed so completely that a portion of it is being sent to you to show what wretched and unreliable material it is made of.

A test was made here of Taylor's Patent Shaft Company's and Vickers' axles, and the last named have been proved to be so immeasurably superior that it has been decided to order them in future. Advantage was taken of one of the Directors of Vickers & Company being in Sydney to make a contract with him, the particulars of which have already been communicated.

I may add that a large quantity of axles and tires sent out for the Victoria railways have been condemned as being of inferior quality; and looking to the great risk which is being run by the use of inferior axles and tires, it has been decided, though we may pay a little more for them, to obtain those which have been tested and found to be of the best quality.

I have, &c.,

F. A. WRIGHT.

Crank axle required for engine No. 77.

The Commissioner,—

In consequence of the breaking of the crank axle of engine No. 77, at Macdonaldtown, on the 2nd inst., it is necessary that another should be obtained at the earliest possible date to replace it, and I recommend that the following cable be at once despatched to the Agent-General:—"Despatch one Hull," which means by the cable code in Agent-General's possession: "Despatch per first steamer one steel crank axle for engine No. 77."

W. SCOTT, 11/11/84.

Prepare cablegram.—C.A.G., 14/11/84.

The Secretary for Public Works to The Agent-General.

Sir,

Department of Public Works, Railway Branch, Sydney, 29 November, 1884.

I have the honor to confirm my cablegram to you of the 19th instant, respecting a crank axle required for engine No. 77, viz., "Despatch one Hull," which means by the cable code in your possession: "Despatch per first steamer one steel crank axle for engine No. 77."

I have, &c.,

F. A. WRIGHT.

The Secretary for Public Works to The Agent-General.

Sir,

Department of Public Works, Railway Branch, Sydney, 26 November, 1884.

I have the honor to enclose herein an indent for workshop machinery and spare engines, wheels, &c., for the Great Northern Railway, and shall be glad if you will obtain and forward the same to the Colony as early as possible.

I have, &c.,

F. A. WRIGHT.

Indent for workshop machinery and spare engines, wheels, &c., for Great Northern Railway. EIGHT pairs of Ehrhardt's patent portable steelyard weighing machines, to suit double-headed rails, and similar in all respects to those already supplied.

One pair leading wheels and axles.

" driving " "

" trailing " "

Two pair bogie " "

These wheels and axles are required for renewals for the outside cylinder bogie goods engines supplied by Messrs. Beyer, Peacock, & Co. makers' Nos., 2,073, &c. The whole to be fitted and finished, eccentrics and crank-pins included, and ready for immediate use on arrival. The tires and axles to be of Vickers' manufacture, and the workmanship and material generally to be of the highest and best standard.

One pair of outside cylinders (right and left) for the same class of engine—18 in. bore x 26 in.; stroke precisely similar to those indented for on 6/8/84.

The material and workmanship to be of the highest standard.

The wheels, axles, and cylinders to be obtained from Messrs. Beyer, Peacock, & Co., Manchester. Required at Newcastle.

Cablegram.

Vickers,

Railway Commissioner, Sydney.

"SEEN Agent-General about the 2,000 engine tires, £24 per ton, lowest possible price; if accepted, we offer make five years' contract same price, and extend to same term. Existing contract for carriage-tires and axles, although last, leaves only 30s. ton profit; can't conceive why contract for carriage-tires and leave engine-tires for open tender—latter bring ten times greater risk. Cable reply to Agent-General, who knows of this message."

Telegram from Mr. Vickers respecting tires for engines, received 10 p.m., 5/12/84.

Mr. VICKERS proposes to supply indent at £24 a ton, and to extend these terms to all engine tires required in next five years.

How does £24 compare with prices previously paid to Vickers and others?

I should like to have both axles and tires of Vickers' steel, as all authorities concur in the opinion that they are superior to any, but we may be asked to pay too much without competition, although, as I have repeatedly said, in the working parts of wheels, upon the security of which life and safety so much depend, I am not disposed to consider price as the only criterion.

As

As regards axles for carriages and waggons, we brought, by a judicious pressure, Mr. Vickers' price down from £24 a ton to £18. I am disposed to favourably entertain another bargain if one can be made.—C.A.G., 6/12/84. Mr. Scott for report.

The price asked, £24 per ton, is considerably below what we have been paying for these goods. The tires last received from Messrs. Vickers cost £32 per ton; we have not imported any other make for some years. I am not, of course, aware of the prices of the other tenders received by the Agent-General, but I do not think we can get reliable engine tires at a less price than £24 per ton, and, in view of the dependence to be placed upon those of Messrs. Vickers' manufacture, I am strongly of opinion that we should accept their offer to supply this order at £24 per ton.

It is of the utmost importance that we should obtain goods of this class, of the very best make, even when the prices are a little higher, as I believe it is more than compensated for in the greater security we ensure in running our trains, and, in my opinion, in material of this description the best article is the most economical in the end.

I much prefer Messrs. Vickers' make of tires, and strongly recommend that this order be placed in their hands, at the price quoted, viz:—£24 per ton.—W. SCOTT, 10/12/84. The Commissioner,

No doubt the appearance of competition has brought down Vickers' price; I should be loth to accept other tires even if the old price, £32 per ton, had been maintained; but £24 per ton I strongly recommend acceptance.—CH.A.G., 12/12/84. Approved.—F.A.W., 12/12/84.

Cablegram to Agent-General as under.

ACCEPT Vickers' tender for engine tires, £24, for five years.—CH.A.G., 12/12/84.

SAMUEL,—

Accept Vickers' tender for engine tires, £24, for five years.—F. A. WRIGHT. Secretary for Public Works, *per* C.A.G. London.

Mr. James Brown to The Commissioner for Railways.

Dear Sir,

Sydney, 24 December, 1884.

Referring to my interview with you last week, *re* a matter of 2,000 engine tires, for which Messrs. Cammell & Co. has quoted in London £20 per ton.

I have another cable from them intimating that they are willing to let this price stand to your Government for a period of five years.

The quality to be of their special best, suitable for the Colonial climate, and equal to any that can be submitted to you.

Hoping you will forgive my persistency in this matter, and accept the fact of my duty to the firm I represent as an apology for this letter.

I am, &c.,

JAMES BROWN.

The Locomotive Engineer has reported against the use of Cammell's tyres—their wheels have disappointed us; acknowledge receipt, and say cannot entertain proposal.—CHAS. A. GOODCHAP, 30/12/84.

The Commissioner for Railways to Mr. J. Brown.

Sir,

Department of Works, Railway Branch, Sydney, 31 December, 1884.

Referring to your letter of the 24th instant, respecting the adoption of Messrs. Cammell & Company's tires upon the railways of this Colony, I have the honor to inform you that the matter has been considered, but I am unable to entertain your proposal.

I have, &c.,

CHAS. A. GOODCHAP,

Commissioner for Railways.

Cablegram.

Vickers,

Railway Commissioner, Sydney.

"AGENT-GENERAL declines sign contract according your telegram of acceptance, because of subsequent competing offer. We beg Government instruct agent adhere our contract."—31 December, 1884.

The Agent-General to The Under Secretary for Public Works.

London.

"CAMMELLS, learning of contract from their Sydney agent, offer to supply engine-tires at £20 per ton. Vickers knows of your instructions in telegram fifteenth, but this offer not formally accepted by me. Shall I adhere to your instructions, or invite competition."

SAMUEL, 24/12/84.

Railways.—J.R., 30/12/84.

I hardly think it would be fair to alter decision simply because a rival firm having heard of Vickers' price has cut below him to the extent of £4 a ton, but still the question is one for Minister's decision, and to enable Mr. Wright to finally decide, I wish to have Mr. Scott's report, 1st, as regards the probable quality of Cammell & Company's tires at £20 per ton. (Tires can be obtained at all manner of prices, but the best tires at £30 a ton are worth more than inferior ones at £20).

In this case, after having previously paid £32 a ton for the best tires made, we are offered the same tires at £24 a ton.

2nd. If Mr. Scott considers Cammell & Company's tires will probably be good enough, what will the probable saving be on our requirements at a difference of £4 a ton?—CH.A.G., 3/1/85.

Mr. Scott.—Urgent.

Engine Tires ordered from England.

Please see your minute of 3/1/85. We have at present in store a number of Cammell's carriage and waggon tires, and we are now boring out and turning up a number of them. We find them very irregular

irregular in hardness, and quite white in colour; some of them are so hard that a tool will scarcely cut them, and others are moderately soft.

With Vickers' tires we find, in working them, that they are all of an uniform hardness, tough, and a good colour; and my opinion is that the very hard tires of Cammell & Company's make are not nearly so reliable as Vickers', and may at any time break under vehicles when running. There is much more labour in working Cammell's tires than Vickers', and this is of some consideration in fixing the first cost.

The man now turning up Cammell's tires reports that it took him sixteen hours to turn up one pair, and in other cases nine to ten hours, while Vickers' can be done in from seven to eight hours. It is impossible, when turning up very hard tires, to cut them lightly after they have been running under vehicles, and we are compelled to take off a good cut to get under the hard worn tread. In this way they are cut to waste, and when they get thin are liable to break.

With the ordinary hard tires, such as Vickers', we can take a light cut off just sufficient to turn them true, and this is done in much less time than it takes to cut hard tires, such as Cammell's, besides the saving of material, and consequent longer life of the tire.

I think it is one of the worst policies that could be pursued to purchase tires merely because they are cheap. The first consideration should be quality, and I have no hesitation in stating that Vickers' manufacture is infinitely to be preferred to that of Cammell's.

This is an article, in the equipment of a railway, which may prove dear at any price. One accident with a bad tire would no doubt eat up much more than the saving of a few pounds in first cost, and the Department would be censured—justly so, too—for purchasing cheap material at the sacrifice of safety in running. Cheapness in this case merely means, I fear, inferiority. No doubt Messrs. Vickers & Company could reduce their price below Cammell's, but it would only mean getting an inferior article. Tires, like anything else, can be got at all prices, but for a really good and reliable article we must be prepared to pay a fair price.

We know Vickers & Company's tires, and as they offer them at a greatly reduced price for a five years' contract, I not only strongly recommend, but urge, that Messrs. Vickers & Company's offer be accepted in preference to Cammell's.—W. SCOTT, 5/1/85. Commissioner.

I think the Minister should adhere to his decision to obtain these tires from Vickers.—C.A.G., 7/1/85. Approved.—F.A.W., 7/1/85.

The two enclosed cablegrams are forwarded for transmission through the usual course.—D. VERNON, per D.C.M'L., B.C., 9/1/85. Urgent.

London, Vickers & Sons. "Refer to Agent General."—CHARLES A. GOODCHAP, 9/1/85.

London, Samuel. "Adhere to instructions about engine tires."—F. A. WRIGHT, per CHAS. A. G., 9/1/85.

Mr. James Brown to The Commissioner for Railways.

Dear Sir,

Sydney, 6 January, 1885.

In reply to yours of the 31st ultimo, I wish to draw your attention to the fact that Messrs. Chas. Cammell & Company, Limited, Sheffield, are in no ways anxious to press on you the adoption of their manufactures, on any other footing than that of quality, to be submitted to testing either at Home or here, as you may desire.

Up to the present we have had no opportunity of competing for the supply of these manufactures to your Government.

All the indents so far passed Home, Messrs. Cammell & Company inform me, are either specified to a particular "house" or (irrespective of our price and the offers we make to submit tests) placed with the same firm.

You will easily understand the awkward position I occupy to the firm I represent, inasmuch as they have the confidence of your Government in the matter of steel rails, not only looked at by the quantities that have previously been supplied, but by your present contract extending over a period of three years.

They naturally wish to know how it is that while in the matter of rails, which they have hitherto often supplied, they have the confidence of the New South Wales Government, yet on the question of tires and axles they have been excluded.

Messrs. Cammell & Company write me, and that naturally, that if they are not permitted to supply the New South Wales Government in the matter of tires and axles, of course they cannot be expected ever to have the opportunity of gaining your confidence.

I trust you will look upon this letter as in no way disrespectful, but the pressure my house puts upon me compels me to ask you to kindly look into the matter before giving such a decision as your note implies.

I am, &c.,
JAMES BROWN.

P.S.—I have recently seen, from England, copy of a report submitted to the Agent-General by Mr. John Fowler; so far as this question is concerned, that report does not touch it.—J.B.

Acknowledge receipt, and put with other papers.—CHAS. A. G., 8/1/85.

Mr. James Brown to The Secretary for Public Works.

Sir,

Sydney, 7 January, 1885.

May I take the liberty of addressing you a few lines on the subject of the manufacture of tires and axles by Messrs. Charles Cammell & Company (Limited), Sheffield.

I may mention I have had repeated opportunities of seeing the Commissioner, who has at all times met me most cordially, but from some cause I am unable to understand is prevented from permitting my house the opportunity of business with your Government in the matter of tires and axles.

My letter addressed to the Commissioner, yesterday, will show you how the matter stands, and I trust you will be able to give Messrs. Cammell & Company (Limited) at least an opportunity of obtaining

the position the seek to occupy in relation to your Government in the matter of trade. Apologising for thus troubling you,—

I am, &c..

JAMES BROWN.

The Minister has had Mr. Scott's report upon the merits of Vickers' tires, and the inferiority of Cammell & Company's, and has decided that his directions for the importation of Vickers' tires for our rolling stock must be adhered to.—C.A.G., 8/1/85. Approved.—Inform.—F. A. W., 9/1/85.

The Commissioner for Railways to Mr. James Brown.

Sir, Department of Public Works, Railway Branch, Sydney, 12 January, 1885.

I have the honor to acknowledge the receipt of your letter dated 7th instant, addressed to the Secretary for Public Works, asking on behalf of Messrs. Cammell and Company, of Sheffield, for permission to tender for the supply of tires and axles. In reply, I am directed by Mr. Secretary Wright to inform you that the matter has been considered, but, under the report of the Locomotive Engineer, he is unable to approve of a compliance with your request.

I have, &c.,

CHAS. A. GOODCHAP,

Commissioner for Railways.

Mr. Albert Vickers to The Secretary for Public Works.

Sir,

London, 8 January, 1885.

We beg to address you with reference to the telegraphic communications which have already passed between us, the Commissioner for Railways, and the Agent-General, with reference to a contract for engine tires, and we do so in the belief, founded upon a long course of business with your Government, that we may rely upon receiving the most courteous attention and the fairest treatment.

We need hardly recall your attention to the many contracts into which we have entered with your Government, and the satisfactory way in which they have been performed.

We had not pressed for a contract for engine tires, thinking that the benefit which the railways of the Colony derived from the use of our manufacture was sufficient to ensure us orders for the engine tires also.

Recently, however, the Agent-General received instructions to invite tenders for engine tires, and in dealing with the tenders to give a certain preference to us, founded, no doubt, upon what we venture to think the well-grounded character for superiority which our manufactures have acquired.

In the course of an interview between Sir Saul Samuel and our Mr. Albert Vickers, the inconvenience attending such a course was a matter of discussion. We have never pretended that our tires were so cheap in the price per ton as those of other makers. We believe that our manufactures are much superior in quality to others, and we ask a price higher than that asked by them, but we believe the higher price is more than compensated for by the immunity from accidents which the use of our material ensures. Such a state of things we submit makes the ordinary course of tender quite inapplicable.

To announce in the conditions of tender that a preference would be given to a particular maker would probably prevent any tenders from being sent in.

To abstain from announcing it, and yet to give the preference, would be open to the suspicion of unfairness, which, if the preference were not given, it would be equivalent to excluding us altogether, and contrary to the instructions of the Department.

It was finally arranged with the Agent-General that Mr. Albert Vickers should send a telegram to the Commissioner for Railways on his own responsibility naming the lowest price at which we could supply the same quality of engine tires as we have hitherto sent to the Colony, a copy of which telegram should be sent to the Agent-General.

We accordingly sent him the telegram of the 4th ultimo (of which we now enclose you a copy), and we immediately sent a copy to Sir Saul Samuel.

The price we named in this telegram of £24 per ton is, we have no doubt, more than would be asked by other makers, but we repeat that the difference in price is far more than compensated for by the inestimable advantage of security from accidents to which steel of a less perfect quality is seriously liable.

There are some articles in which the usefulness and price are exactly proportioned to each other, but when the frightful consequences to which the fracture of a single engine tire may lead are considered we venture to submit to you that the question whether it is cheaper to use perfect steel or steel of an inferior kind cannot be measured by a difference in price of a few pounds per ton.

We have no doubt that these considerations were strongly felt by your Department, who are so familiar with the questions, and you therefore sent to the Agent-General on the 17th December the telegram accepting our offer for the supply of engine tires for the ensuing five years.

On the 19th December our Mr. A. Vickers called at the office of the Colony at Westminster, and the Agent-General being out, Mr. Yardly made an appointment for an interview on the 23rd December.

Mr. Albert Vickers, however, was unfortunately prevented by illness from calling until the 31st December, when he took with him the form of contract to discuss with the Agent-General, who then informed him that he could not now go on with it, as other makers had made offers subsequent to the receipt of the telegram from you on the 17th December.

We think we may fairly assume that these other offers were at a lower price, otherwise we cannot understand the Agent-General's hesitation.

Now, we cannot help thinking that it could not be your intention, after your telegram of the 17th December, to leave us open to any such competition, the possibility of an offer at a lower price was we are sure present to your mind. You are well aware that all over the world we are receiving higher prices for our steel than any other makers. Of course, upon your telegram of the 17th December being communicated to us, we began to make arrangements for the future in connection with it, for the large amount involved in it rendered that necessary.

In the remarks we have made we do not in the slightest degree imply any complaint against the conduct of the Agent-General, whose desire has been throughout to act as he considered best for the interests of the Colonial Government, but we submit that it would be neither for the advantage of the Colony, nor just to us, to recede from the determination which was conveyed in the telegram of the 17th

December,

December, and to expose us, and indeed to expose the interests of the Colony, to a competition for low-priced engine tires, a competition into which the quality of our manufacture would prevent us from entering with any hope of success.

On the 31st December we sent the Commissioner for Railways a second telegram, of which we enclose a copy, and we trust that before this letter reaches you we may have received an intimation that your telegram of the 17th December is to be adhered to, because, no matter what subsequently happened, the fact remains that as far as your own judgment and intention were concerned you have signified to London your acceptance of the offer we made you.

We have, &c.,

ALBERT VICKERS.

The Secretary for Public Works to The Agent-General.

Sir,

Department of Public Works, Railway Branch, Sydney, 13 February, 1885.

I have the honor to enclose herein an indent for Vickers' steel crank axles for engines of classes Nos. 17, 93, 14, 127, 67, and 285 respectively, and shall be glad if you will obtain and forward the same to the Colony as early as possible.

I have, &c.,

F. A. WRIGHT,

Secretary for Public Works.

Indent for Vickers' steel crank axles for engines of classes Nos. 17, 93, 14, 127, 67, and 285 respectively.

No. required for each class of engine.	Description.	No. of tracing.	Code name.	Class of engine.
6	Steel crank axles	881	Seventeen	No. 17.
*12	„	883	Nut	„ 93.
3	„	881	Fourteen	„ 14.
*3	„	883	Bolt	„ 127.
2	„	882	Brass	„ 67.
2	„	883	Leeds	„ 285.

To be obtained from Messrs. Vickers, Son, & Co. (Limited), Sheffield, and to be in accordance with the standard crank axle code tracings in the Agent-General's possession.

Three of the above for 93 class and the three for 127 class to be despatched by steamship promptly.

Required at Sydney as soon as possible.

NOTE.—If the Agent-General can arrange to substitute one of Cammell's homogeneous charcoal iron axles for one of the steel axles of the 93 class there would be no objection to give the same a fair trial on the Government railways.

THOS. MIDDLETON,

Acting Locomotive Engineer.

I really do not see why we should be at the cost of trying these experiments. We know the value of Vickers' steel axles, and it is for other manufacturers to demonstrate the superiority of theirs. I have told Mr. Wilson, who is the representative partner of the firm on a visit to Sydney, that if he will send out one of their homogeneous charcoal iron axles we will try it on our lines, and if it proves to be of value we will pay for it, and if superior to Vickers' we will order more of them. In the reasonableness of this proposal he has concurred. It is only fair that vendors of new articles should take some risk in proving the superiority of their wares, and have a right to be thankful that such good terms, as I have named can be obtained.—CHAS. A. GOODCHAP, 2/2/85.

I concur.—F.A.W., 5/2/85. Locomotive Engineer.—D.C.M'L., 5/2/85. Seen.—W. SCOTT, 10/2/85. Commissioner. Prepare indent, leaving out the note *re* Cammell's charcoal iron axles.—D.C.M'L., 10/2/85.

The Secretary for Public Works to The Agent-General.

Sir,

Department of Public Works, Railway Branch, 23 February, 1885.

I have the honor to enclose herein an indent for cast-steel tires for four-wheeled passenger stock for "Renewals," and shall be glad if you will obtain and forward the same to the Colony as early as possible.

I have, &c.,

F. A. WRIGHT,

Secretary for Public Works.

Indent for Cast-steel Tires for Four-wheeled Passenger Stock for "Renewals."

Three hundred flanged cast-steel tires (in the rough or forged state), to be in exact accordance as regards sections, internal diameter and thickness, &c., with that represented in Tire Schedule, Drawing No. 920, in the Agent-General's possession. Code name

Internal forged diameter, 37 $\frac{3}{4}$ -inches. Required in Sydney. The first fifty to be despatched by earliest steamship; the balance by sailing ship as soon as possible. The whole to be of "Vickers," manufacture.

The Secretary for Public Works to The Agent-General.

Sir,

Department of Public Works, 2 March, 1885.

Referring to my letter to you of the 9th August, 1881, on the subject of tendering in England for works and supplies being confined to a list of selected firms, I have the honor to request you will have the goodness to arrange that in future no restrictions shall be placed on tendering, as it is obvious to the interest of the Government that the field of competition should be as wide as possible.

I have, &c.

GEORGE R. DIBBS,

Secretary for Public Works.

The

The Secretary for Public Works to The Agent-General.

Sir, Department of Public Works, Railway Branch, Sydney, 27 March, 1885.
I have the honor to enclose herewith an indent for spare wheels and axles for Ashbury's bogie passenger carriages on the Great Northern, Southern, and Western Railways (Renewals), and shall be glad if you will obtain and forward the same to the Colony as early as possible.

I have, &c.,

F. A. WRIGHT,
Secretary for Public Works.

INDENT for Spare Wheels and Axles for Ashbury's Bogie Passenger Carriages on the Great Northern and Southern and Western Railways (Renewals.)

TWELVE pairs of 42 $\frac{1}{2}$ -inch wheels mounted on axles, as shown in blue print of drawing, No. 963 herewith.

The wheel bodies to be of wrought-iron, the tires and axles of Vickers' cast-steel of same quality, as recently supplied to this Government for similar purposes.

The whole of the material and workmanship to be of the highest and best standard.

The wheels to be forced on thoroughly tight to the axles, with hydraulic pressure of not less than 60 tons, and no keys to be used. Wanted as soon as possible by sailing ship. 6 pairs in Sydney; 6 pairs in Newcastle.

The Secretary for Public Works to The Agent-General.

Sir, Department of Public Works, Railway Branch, Sydney, 31 March, 1885.
I have the honor to enclose herein an indent for cast-steel engine and tender tires (for renewals), Great Northern Railway, and shall be glad if you will obtain and forward the same to the Colony as early as possible.

In connection with this indent I also forward you the enclosed fragmentary tracing, showing an alteration to be made in the engine and tender tire schedule in your possession, as follows, viz., the words "and tender" to be struck out, and the additional code name "Daring," with its accompanying particulars, interpolated, and the border bracket altered to suit; all, in fact, as indicated on the tracing.

By comparing the enclosed with the existing tire schedule this can be done easily.

I have, &c.,

F. A. WRIGHT,
Secretary for Public Works.

INDENT for Cast-steel Engine and Tender Tires for Great Northern Railway (renewals). The whole to be of Vickers' manufacture.

Number of Tires required.	No. of Engine or Tender.	Internal forged diameter.	Code Name.	No. of Plan.
		Inches.		
18	11 (tender)	36 $\frac{1}{2}$	"Camden"	Tracing No. 916.
24	23 "	36 $\frac{1}{2}$	"Daring"	Engine and Tender Tire
16	27 (engine—driving) ...	60 $\frac{3}{4}$	"Taurus"	Schedule (in Agent-
28	47 (engine—bogie)	30 $\frac{3}{4}$	"Tavern"	General's possession).

To be forwarded by steamer for Newcastle as early as possible.

Messrs. Vickers, Sons, & Co. to The Commissioner for Railways.

Sir, London, 13 February, 1885.
Since our letter to the Minister of Public Works of the 8th ultimo, we duly received on the 10th idem, the following cable message:—"Refer to Agent-General.—Wm. Bede Dalley, Secretary."

On calling upon Sir Saul Samuel, we were pleased to find that he had received the authority asked for in our cablegrams and letter above referred to and that the contract would be signed so soon as prepared by the Solicitor.

It remains for us, therefore, only to express our thanks, and to assure you that nothing shall be left undone by us in the making of the tires to ensure satisfaction to the Government.

When this letter reaches you our contract for waggon tires and axles will have only eight months still to run, and we should be glad to renew the same for five years, if the Government would increase the price of the axles from £18 per ton to £21 per ton, leaving the price of the tires still at £18 per ton.

We find that the axles we have made under the present contract actually cost us more to make than we receive for them, causing us a positive loss.

This may seem extraordinary to you, seeing the price at which other makers offer axles, but it arises from two causes, viz.:—

1st. To obtain the required quality, we can only employ the most expensive brands of iron in making the steel.

2nd. We hold that it is absolutely necessary to cut a large proportion of each ingot to waste, as we recognize the fact, which few steelmakers do, that where an ingot is cast the impurities in the steel, as well as part of the carbon, rise towards the top end until the steel ceases to be fluid—when this top end is used the result must be a dangerous axle.

We would not go thus into details were the distance between us not so great, rendering correspondence and explanation so much more difficult.

At the date of our cablegram of the 4th December we were still under the impression that we made a small profit out of the axles, but later experiences prove that we have a loss. In hope, therefore, that you will see your way to meet us as to price in the event of an extension of the contract for five years, as we propose.

We have, &c.,

Vickers, Sons, and Co. (Limited),
ALBERT VICKERS.

While

While I am of opinion that we will be better served in these lines by Messrs. Vickers than any other firm that I know of, I am disinclined to recommend this offer for approval in view of the Minister's minute of 23rd March, Commissioner's 85/2,107. in reference to open competition for our supplies.

However, the question of having the best and most reliable material in our tires and axles is of the most vital importance, and I consider the matter deserves favorable consideration.

I may state that I know the prices they are now supplying them for are very low for their quality of material.—W. SCOTT, 29/4/85. The Commissioner.

The Minister's minute was not intended, I believe, to affect special classes of material, such as axles, &c., but only to extend the area of competition generally in cases where it has been usual to limit the competition to three or four firms for material and supplies of ordinary character—in fact, in the Minister's letter to Agent-General, exemption was made of those articles, which, in the indent, were specified to be of a certain make or class.

The Minister, I am aware, shares with myself and the Locomotive Engineer an anxious desire to secure the safest and best material for axles and tires, as so much depends upon the quality of those articles in safely working the traffic. I am not, however, disposed to recommend such a large increase as £3 on £18; an increase of 10 per cent. should satisfy the manufacturers—say £1 16s.—C.A.G., 2/5/85.

I am not disposed to consent to any increase of price. The manufacture of steel is being cheapened year by year, and I fail to see anything to justify Messrs. Vickers & Son in asking for an increased price. Unless they will accept present rates, tenders must be invited.—F.A.W., 7/5/85.

Inform.—CHAS. A. GOODCHAP, 7/5/85.

The Commissioner for Railways to Messrs. Vickers, Sons, & Co.

Gentlemen, Department of Public Works, Railway Branch, Sydney, 11 May, 1885.

I have the honor to acknowledge the receipt of your letter of the 13th February last, respecting your contract for waggon tires and axles, and expressing your willingness to renew the same upon its expiry for a further period of five years, if I consent to increase the price of the axles from £18 to £21 per ton.

In reply, I have to inform you that I have laid the proposition before the Secretary for Public Works, who, after giving it careful attention, is unable to consent to any increase of price. The manufacture of steel is being cheapened year by year, and he fails to see anything to justify the request for an advanced price.

Unless, therefore, your firm accepts the present rate for supply of axles, I shall have no alternative but to invite fresh tenders.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.

The Secretary for Public Works to The Agent-General.

Sir, Department of Public Works, Sydney, 7 April, 1885.

Referring to correspondence which has passed on the subject of tendering in England for works and supplies required by this Department, I have the honor to inform you that I have given the subject earnest consideration, and it seems to me that the present custom of limiting the tendering to certain firms, except when the indents specially specify it, is an unwise one, and deprives the Colony of the advantage that would be gained were full and open competition allowed. I shall be glad, therefore, if you will give effect to the desire of the Government in this matter.

I have, &c.,

F. A. WRIGHT,
Secretary for Public Works.

Mr. Edward Jeffreys to The Commissioner for Railways.

Dear Sir, Monkbridge and Iron Works, Leeds, 27 March, 1885.

I have telegraphed to-day as follows:—"Monkbridge special steel carriage tires, seventeen engine, nineteen delivered Liverpool, for contract yearly supply three or five years."

This quotation is for the very best quality of our special steel (not Bessemer) for engines and carriages, the best that can be made to suit your climate, for a quantity to be supplied during the next three or five years.

I enclose you a copy of some certificates I took with me to Australia, a copy of which I believe I left you. Should you entrust us with a share of your orders for steel tires, you may rely upon the quality being first-rate and suitable for your climate, after the knowledge I have obtained in visiting your Colony.

Yours, &c.,

(For the Monk-bridge Iron and Steel Company),

EDWARD JEFFREYS,
Partner.

Special steel carriage tires, 17s. per cwt., f.o.b.

Special steel engine tires, 19s. per cwt., f.o.b. The Locomotive Engineer, 18/5/85.—C.A.G. The prices are low, but the quality of the material in tires should be the first consideration, As I have no knowledge of the quality of the tires turned out by this firm, I cannot recommend that their offer be entertained at present. I may state, however, that I am making inquiries about them.—W. SCOTT 21/5/85. The Commissioner.

Mr. G. P. Wilson to The Commissioner for Railways.

Sir, Sydney, 27 May, 1885.

Referring to the interview I had with you this morning, resulting from a previous one in January last, relative to sample engine tires, I now wish you to be good enough to receive into your Railway Department twenty crucible steel engine tires and ten axles, manufactured by my firm, Chas. Cammell & Company, of Sheffield, for the purpose of testing upon equal terms with those of any other brand you may select. Awaiting your early reply.

I remain, &c.,

G. P. WILSON.

Minute

Minute by Commissioner.

I understand that these tires, though made of engine tire steel, are not to the dimensions of engine wheels, but to the truck wheels, I do not know whether they will be of service to us or not, but I presume the character of the steel for engine tires can be ascertained by test, and there is no objection to the test being made at Mr. Wilson's risk and cost. Also the axles, though what kind of axles they are is not stated, whether engine axles, carriage, or truck axles.

There is no objection to these samples being received, as samples, without the Department accepting any responsibility as regards purchase, &c.

Inform to-day, and ask the Superintendent of Stores to arrange for the articles being received. He might see Mr. P. Wilson at the address given. I believe the tires and axles are on board some ship. Anything done will of course be at Mr. Wilson's risk and cost.—C.A.G., 28/5/85.

Superintendent of Stores.—D.C.M'L., 29/5/85.

The Commissioner for Railways to M. G. P. Wilson.

Sir,

Department of Public Works, Railway Branch, 29 May, 1885.

Referring to your letter of the 27th instant, asking that this Department may receive twenty crucible steel engine tires and ten axles manufactured by Messrs. Charles Cammell & Company, of Sheffield, for the purpose of being tested on these railways with those of any other brand on equal terms, I have the honor to inform you that there is no objection to test the relative merits of the tires and axles, but it must be at your risk and cost, and without the Department accepting any responsibility as regards purchase, &c.

The Superintendent of Stores (Mr. Richardson) will call upon you to arrange for their delivery.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.

I have now got delivery of these tires and axles at Redfern Yard, but instead of twenty tires and ten axles, twenty-five of each have been sent. I presume the Locomotive Engineer will be directed as to testing, &c.—A.R. The Commissioner, 4/6/85.

Has Mr. Scott recommended that a trial be made of Cammell & Company's charcoal homogeneous crank axles?—C.A.G., 4/6/85.

I have not recommended any trial of these axles as I know nothing of them excepting what is shown in these papers; I do not, however, see any objection to their being tried as proposed by you; I may add that Messrs. Cammell's Agent (Mr. Brown) has been very anxious to have them introduced for trial on our lines.—W. SCOTT, 10/6/85. The Commissioner. Seen.—C.A.G., 18/6/85.

Locomotive Engineer for report as to manner in which he proposes to test the tires and axles.—D.C.McL., 5/6/85.

As we have not got a proper machine for testing tires and axles, I would suggest that this matter be allowed to stand over until the machine specially ordered for the purpose arrives and is erected at Eveleigh.

The machine by means of which previous tests were carried out was not adapted for the purpose, and entailed a considerable amount of labour and time.—W. SCOTT, 10/6/85. The Commissioner.

Very well. If they are found to be as good and cheaper than those of Vickers they should be accepted in preference.—C.A.G., 13/6/85.

The Agent-General to The Colonial Secretary.

Sir,

Westminster, 5 June, 1885.

I have the honor to acknowledge the receipt of your letters of the 9th March last and 17th April respectively, covering communications from the Works Department dated the 2nd March, No. 2,270, and 7th April, No. 1,892, in which I am directed to arrange that in future no restrictions shall be placed on tendering for materials required by the Government.

I transmitted a copy of the Works Department's letter to the Inspecting Engineer (Mr. John Fowler), and I enclose for your information a copy of his reply thereto.

I may state that it has always been my practice to afford facilities to manufacturers to tender for supplies to the Government, and no instance has ever occurred where any person considered competent to fulfil a contract has been refused permission to tender; but persons are not invited to tender who, after due inquiry, I find are not likely satisfactorily to carry out a contract that may be entrusted to them, and who are not makers of the article required.

As you point out, a large proportion of the goods ordered through this Department are specified to be supplied by certain manufacturers. Even in these cases it is the practice to invite tenders from the firms indicated, who are not aware whether they are in competition with others.

A reference to the schedules of tenders forwarded to you from time to time will show you that a considerable number of manufacturers are invariably invited to tender, and that the range of competition is considerable, and, in fact, comprehends all the manufacturers of repute.

It may here be well to mention, in connection with your letter of the 16th March last, No. 1,593, that Messrs. Fowlers, of Leeds, name has been for many years on the list of tenderers for Government supplies.

If it be your desire that I shall advertise through the Press for tenders for all supplies, I will, of course, comply with your wishes, but it will lead to inconvenience, expense, and delay, and possibly to embarrassment, as all manner of persons will tender, regardless of their ability to carry out their contract.

I have, &c.,

SAUL SAMUEL.

The Secretary for Public Works.—A.S., 13th July, 1885. The Under Secretary for Public Works.—J.B., per P.N.S. B.C., 14th July, 1885. Submitted.—J.R., 16/7/85. I am perfectly satisfied with the Agent-General's explanation.—F.A.W., 16/7/85.

Mr.

Mr. John Fowler to The Agent-General.

Sir, 2, Queen Square Place, Westminster, 14 May, 1885. I beg to acknowledge the receipt of your letter of the 5th May, enclosing copy of a letter from the Secretary for Public Works, requesting that no restrictions should be placed on tendering for materials required by the Colonial Government, and that the field of competition should be as wide as possible.

The system is, as you are aware, now practically adopted. On receipt of an indent from the Colony a list of all the best manufacturers is submitted to you, and you then invite these firms to tender. Every facility is given to other manufacturers to send in tenders, and no exceptions are made, except in the case of well-known incompetent persons, who do not execute good work, or are otherwise unfit to be entrusted with important contracts, and commission agents, it being essential in the interests of the Government to deal direct with manufacturers only.

By this method we obtain, I believe, the most perfect and practically unrestricted competition, and carry out the intentions of the Government in what has been found by experience to be the best manner. I am, &c., JOHN FOWLER.

The Agent-General to The Secretary for Public Works.

Sir, Westminster, 12 June, 1885. Referring to the undermentioned telegrams from the Honorable the Colonial Secretary, of the 15th December last, "Accept Vickers' tender for engine tires, £24, for five years," I have the honor to forward herein for your information, a copy of the contract entered into with Messrs. Vickers & Company for the supply of the tires in question during the period named.

I have, &c., SAUL SAMUEL.

CONTRACT.

THIS Agreement, made the 1st day of June, 1885, between Vickers & Company, Limited, a Company incorporated under the provisions of the Companies Act, 1862, and carrying on business at the River Don Works in Sheffield (hereinafter referred to as "the Company"), of the one part, and Sir Saul Samuel, Knight Commander of the Most Distinguished Order of St. Michael and St. George, the Agent-General of the Colony of New South Wales (who, as well as any person succeeding him in the said office of Agent-General, is hereinafter referred to as "the Agent-General"), for and on behalf of the Commissioner of Railways, a corporation sole created by the Act of the Legislature of the said Colony, 22nd Victoria No. 19 (who is hereinafter referred to as "the Commissioner"), of the other part, witnesseth as follows:—

1. For the consideration hereinafter mentioned the Company promises to and agrees with the Commissioner in the manner following: The Company will for the period of five years, to be computed from the 1st day of January last, manufacture for the Commissioner, and deliver free on board such ships at London or Liverpool as the Agent-General shall from time to time direct, all such engine and tender tires in the rough or rolled state as the Agent-General or the Engineer for the time being in England of the Commissioner (who is hereinafter referred to as "the Engineer") shall, for and on behalf of the Commissioner, from time to time require the Company to manufacture.

2. All such tires shall be manufactured according to the several sections from time to time prepared by the Engineer, and shall be, as regards quality, of the highest character of steel manufactured by the Company, and known as the Australian quality, and shall be branded "Australia, Vickers & Co.," followed by the date of the manufacture, the letters "N.S.W.G.," and having the internal diameter stamped on the inside of each tire, and code name painted on in white, or such other marks and stamps as may be required by the Engineer.

3. Such tires as may be selected by the Engineer, or by any person appointed by him in that behalf (any person so appointed being included in the expression "the Engineer" whenever it hereinafter occurs), not exceeding 2 per cent. of the number of tires comprised in any one order, shall, in the presence of the Engineer, be tested by blows from a weight of one ton falling from such height as the Engineer may determine, and shall stand deflection to the extent of one-sixth of their diameters without fracture, except when the tire is 3 inches thick in the tread and less than 3 feet inside diameter, in which case a deflection to the extent of 1/8 of the diameter will be required; and after the tires have been subjected to the falling-weight test, a piece shall be machined, cold, out of each tire, the said piece of tire being tested for tensile strength without being reheated.

4. The tensile-strength tests shall be for the engine tires as near 48 tons per square inch as possible, but not less than 46 tons nor more than 50 tons; and for the tender tires, as near 42 tons per square inch as possible, but not less than 40 tons, with an elongation of not less than 10 per cent. in 10 inches.

5. If any of the tires subjected to the tests aforesaid shall, in the opinion of the Engineer (whose decision upon this, as upon all other matters, shall be binding and final), fail as regards either the falling-weight test or the tensile-strength test, the Engineer may, on behalf of the Commissioner, reject not only the tires which shall have so failed, but the whole of the tires of which those selected and tested as aforesaid formed a portion; or he may direct that the said tires, or any of them, shall be subjected to such further testing as he shall think proper.

6. The Engineer shall have power, if he shall think fit, to order any tire or portion of a tire to be sent to be tested at a public testing-place; and all the expenses of testing, whether at the works of the Company or at a public testing-place, shall be borne by the Company.

7. The Company will deliver on board, within six calendar months from the date of these presents, the number of tires comprised in the first order to manufacture given by the Agent-General or by the Engineer, in England, of the Commissioner, and will deliver on board the number of tires comprised in each subsequent order within two months from the time when such order shall have been given, provided that the number of tires comprised in such order shall not exceed 300; and if the number of tires shall exceed 300, then with a proportionately extended period.

8. In case the Company shall not deliver on board the number of tires comprised in any order within the time when the same ought to be delivered, according to the provisions hereinbefore contained, the Company will pay to the Commissioner, or to the Agent-General on his behalf, as liquidated damages, and not as a penalty, the sum of five pounds for every day which shall have elapsed from the time when the said tires ought to have been delivered until the day when they shall have been delivered; and the Company shall not be entitled to any extension of the time hereinbefore fixed for delivery on account of any of the tires comprised in any order having been rejected by the Engineer under the power hereinbefore conferred upon him.

9. None of the tires to be manufactured under the provisions of this agreement shall be delivered on board until the Engineer shall have fully examined and tested and shall have seen them weighed; the expenses of such testing, weighing, and all other such expenses to be borne by the Company.

10. The Engineer in New South Wales of the Commissioner may, within thirty days after any tires manufactured under the provisions of this agreement shall have been landed in New South Wales, reject any of them which, in his opinion, shall be faulty or defective, and the Company will, upon being informed by the Agent-General of such rejections, forthwith manufacture other tires in place of those so rejected and such extra tires as may be needed for testing at the works; and will, after the same shall have been examined, and, if necessary, tested in the manner hereinbefore mentioned, deliver them on board within such period, not being more than six weeks from the day when the Company shall have been so informed as aforesaid, as the Agent-General shall direct; and will also repay to the Agent-General, for and on behalf of the Commissioner, a sum bearing the same proportion to the total amount paid by or on behalf of the Commissioner as a premium or premiums for the insurance of the shipment of tires of which the tires so rejected formed a portion, as the value of the tires so rejected, assuming them not to have been faulty or defective, would have borne to the entire value of such shipment.

11. In consideration of the premises the Agent-General, for and on behalf of the Commissioner, and not binding himself personally, promises to and agrees with the Company in the manner following:— The Commissioner will pay to the Company at the rate of £24 per ton for the tires to be manufactured and delivered on board under the provisions of this agreement.

12. Payment will be made by the Agent-General, on behalf of the Commissioner, within fourteen days after the Agent-General shall have received the invoices and clean bills of lading for the tires delivered on board, after deducting from the price calculated at the rate aforesaid the amount, if any, which shall have become due to the Commissioner as liquidated damages under the provisions hereinbefore contained if the same shall not have been paid by the Company, and also the value of any tires which shall have been rejected by the Engineer in New South Wales, according to the power in that behalf hereinbefore conferred on him, if tires in place of tires so rejected shall not have been manufactured and delivered on board, and also the amount paid in respect of the insurance of the tires so rejected if such amount shall not have been repaid according to the provisions in that behalf hereinbefore contained.

13. Except, as next hereinafter mentioned, the Commissioner will not during the said period of five years hereinbefore mentioned obtain any engine or tender tires from any manufacturer or persons other than the Company: Provided, nevertheless, and it is hereby declared by the parties to these presents, that if the Engineer shall at any time be of opinion and shall certify that the Company is not proceeding with proper dispatch in the manufacture of any tires comprised in any order to manufacture, given by the Agent-General or the Engineer in England to the Company, it shall be lawful for the Agent-General to cancel the order so given, and to obtain from any other manufacturer or manufacturers, person or persons, and not only on that occasion, but also if he shall think proper on any future occasion or occasions, all such engine or tender tires as the Commissioner may require.

14. The Agent-General will engage freight, and will give such notice to the Company of the name or names of the ship or ships by which any tires are to be shipped as to allow a reasonable time to the Company for dispatching the tires from the place of manufacture to London or Liverpool, as the case may be, and delivering them on board.

In witness whereof the Company have hereunto caused their common seal to be affixed, and the said Sir Saul Samuel, but not so as to make himself in any way personally responsible, has signed these presents in the name and on behalf of the Commissioner, the day and year first above written.

The common seal of Vickers and Company (Limited) affixed, by order of the Board, in the presence of—

J. EDWARD VICKERS,	}	Directors.	}	of Vickers, Sons, & Co., Limited.
JOHN CROSSLEY,				
H. C. COOLEY, Secretary.				

Forward to Locomotive Engineer, who has previous papers, which should be put with this and returned. It will be observed that the contract is a very binding one. Not only are the tires subject to very severe tests in England, and to the inspection, &c., of the inspector there, but in the event of the Engineer in the Colony being dissatisfied with them on arrival they can be returned at contractors' expense and cost, and others supplied.—C.A.G., 11/8/85.

Messrs. Vickers, Son, & Co. to The Commissioner for Railways.

Sir,

London, 10 July, 1885.

We have the honor to acknowledge receipt of your valued favour of the 11th May, in reply to our letter of the 13th February, as to renewal of contract for waggon tires and axles, and we regret to find that you have not seen your way clear to agree to an increased price for the axles.

We have not found our costs cheapened in any way. The only manner in which we could reduce them would be by using inferior materials, and this we cannot do, as it is incompatible with the maintenance of the high standard of our tires and axles for safety and durability.

We are therefore reluctantly compelled to say that we are unable to accept a renewal of the contract for axles at present price, having, as already stated, no margin for profit.

The utmost that we could do would be to meet you half way, and, should you agree to this, we shall have pleasure in renewing the existing contract for five years from 31st December next, at £18 per ton for the tires, and £19 10s. per ton for the axles, delivered anywhere in England.

If you do not see it to your interest to accept this offer, we are agreeable to extend the contract for the tires only for five years from 31st December next, at £18 per ton, but we would fain hope that,

taking

taking the quality of our axles into consideration, you will see your way to meeting us in price as above proposed.

In any case we should much like to be informed of your decision by cable, addressed "Vickers, London," and for this purpose we beg to indicate two code words, viz. :—

First.—The Government accepts your offer to supply all their requirements for waggon tires and axles for five years, from 31st December, 1885, at £18 per ton for the tires, and £19 10s. per ton for the axles.

Second.—The Government accepts your offer to supply all their requirements for waggon tires for five years, from 31st December, 1885, at £18 per ton.

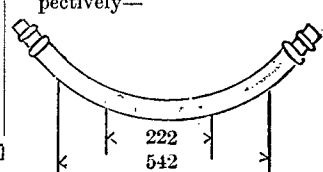

Our reason for requesting you to favour us with a cable reply is that, beyond the satisfaction of having your decision at a comparatively early date, we may ease our contract by the necessary purchases of Swedish iron, which may rise in price at any moment.

As showing the quality of our axles, it will doubtless interest your Engineering Department to peruse the enclosed record of tests which we have just received from the Inspector of the Mudi Railway, of France.

You will observe from this that the axle remained unbroken after twelve blows from a 20-cwt. tup falling from Cd. 33 feet, and eight further blows from Cd. 37 feet.

We have, &c.,
Vickers, Son, & Co. (Limited.),
ALBERT VICKERS.

End of standard test.		20	11 44	162	Not broken after 20 blows. 8 blows given in excess of the specification.	Proportion of area with the initial diameter when broken —silky colour = 0,516.	The original diameter of the ten- sile, viz. 16 ^m /m was reduced to 11.5 when broken, the original area was 201 □ millimetres and when broken = 103.8. Dis- tance between the blocks sup- porting the axle = 1 ^m 560 = 61½ inches. The measurements of deflection are always taken from the top part of the axle with a beam compass, and the axle was also turned so that the figures may be always taken in the same direction.					
Extra blows.		20	11 50	106								
In addition to the tensile a square bar of 12" by 1½ is cut parallel to the tensile and is bent by one tap of 10 cwt. falling 8".												
In the present instance that bar has been bent to contact with- out signs of fracture with 26 blows.												

Sheffield, le July 4, 1885.

Le Controleur d'Usines,
J. VITRUET.

Messrs. C. Cammell & Co. (Limited) to The Commissioner for Railways.

Sir,

Sydney, 27 August, 1885.

We take the liberty of again respectfully soliciting from you an opportunity to do business with your Government in the matter of tires and axles.

We are in a position to quote you prices, either delivered in London or Sydney, such as we believe will compare favourably with any make which you may now have in use.

We ask for no favours, but only to be permitted to do business with the Government of New South Wales in the lines of trade referred to.

In the matter of quality our facilities for manufacture and the purchase of metals are such that we know we can meet your wishes in any detail you may specify, giving hardness and toughness combined, or equal mildness, as some engineers prefer.

If you will receive a price from us (conditions as to testing to be complied with, such as you may have found it necessary in your experience to adopt) we believe our figures will be such, in no way losing sight of quality, as to bear out our statement.

Moreover, we are also prepared to enter into an agreement with your Government for the supply of these articles for a period of either three or five years.

Awaiting your reply,—

We are, &c.,
CHARLES CAMMELL & Co. (LIMITED),
(Per JAMES BROWN).

Minute by Commissioner.

Axles and Tires, Carriages and Waggon.

Will Superintendent of Stores let me know if we ever obtained axles and tires (or either) from Brown, Bailey, Dixon, & Co., (Limited) of Sheffield, and if so, at what price per ton. Will Mr. Richardson please state the average price paid for steel axles per ton, for tires per ton (waggon and carriage), up to the time the last order was given to Vickers & Company at £18 a ton. If the price per ton cannot be quoted, owing to the practice of their being quoted as per axle or per tyre, please approximate it.—C.A.G., 3/9/85.

1st. We do not appear to have ever imported any tires or axles from Brown, Bailey, & Dixon.

2nd. The average cost per ton of steel carriage and waggon tires for the eight years ending 31st December, 1883, has been £26 4s. 1d. per ton, gathered as under:—

		£	s.	d.				
All from Vickers, Sons, & Co.	}	1876	26	15 0	per ton, f.o.b., London	
		1877	25	4 4	" "	
		1878	27	0 3	" "	
		1879	None imported.					
		1880	26	15 3	" "
		1881	25	13 9	" "
		1882	26	0 0	" "
		1883	26	0 0	" "

During the eight years referred to only two shipments of carriage and waggon axles were received, and both of them in 1876:—Taylor Bros. & Company, £21 18s. 9d., iron; Vickers, Sons, & Company, £35 7s. 8d., cast steel.—A. RICHARDSON.

Minute by Commissioner.

If for the eight years these be a record only of Vickers' axles and tires, I must ask Superintendent of Stores to go further back. We have had other axles and tires—Cammell & Company, I think, certainly the Patent Shaft and Axle Company's axles (Brunswick steel) and Krupp's tires, and others I believe. They may not, or some of them may not, have come out separately, but attached to wheels. If Mr. Richardson will consult with Mr. Scott he will learn how the matter stands.—C.A.G., 9/9/85.

I think Vickers & Company reduced their price about 1883, or beginning of 1884, to £22 a ton, a price which I afterwards got them to reduce to £18. I ask to have very exact information on this point.—C.A.G., 9/9/85.

Superintendent of Stores.—I shall be much obliged by your furnishing at your early convenience a statement of the several prices paid to Vickers & Company for waggon axles and tires. I would like the return to show the number of axles or tires received at each particular price, and if the several indents or orders can be distinguished it will be a convenience.—D.C.M'L., B.C., 15/9/85.

Urgent. Return herewith. The fact should be noted to which I am about to draw the Commissioner's special attention in another paper, that although Vickers & Company entered into a special contract with the Commissioner for the supply and delivery, at any wheelmakers in England, of tires and axles required during 1884 and 1885, at £18 per ton, they have charged £26 16s. 9d. per ton for 800 axles for renewals. This supply is certainly outside the letter of their contract, but the action hardly seems to me to carry equity or common fairness with it.—A.R. The Secretary, 19/9/85.

RETURN showing prices per ton, f.o.b., in England, paid Messrs. Vickers, Sons, & Co., for Carriage and Waggon Tires and Axles in satisfaction of Indents.

*Axles and Tires supplied by Vickers.

Messrs. C. Cammell & Co. to The Commissioner for Railways.

Sir,

Sydney, 16 September, 1885.

Referring to our letter of 27th August, and your reply thereto, we are now in a position to offer to the Railway Department of this Colony our crucible cast-steel tires and axles for rolling stock, at the following rates; the same guaranteed to fulfil all the conditions and tests usually imposed by you on any contractor who has been supplying you with this material.

In accordance with your letter of May 29 a number of tires and axles of our standard type and temper, for India and the Colonies, were sent to your stores, are now at Eveleigh, and the quality of those can be taken as the sample to which we guarantee any of the material that may be supplied by us.

We

We would point out that as we enjoy the privilege of supplying all the English and Indian railways, without exception, and also all the Australian Colonies except New South Wales, we are anxious that the tires and axles in question should as early as possible be subjected to test, together with, and on the same footing, as those of the brand you may now be using. This comparison of material, together with the prices we quote, we believe will place us in a position to secure some share of your orders.

The prices we here submit for the material are alternative for delivery, f.o.b., any English port, or into your stores at Eveleigh; and we are prepared in the latter case to await the approval of the goods by your engineer before receiving payment.

	In London.			Delivered Sydney.

Crucible Cast Steel Carriage and Waggon Tires.....	0	16	9	0	17	6	} per cwt.
" " Axles.....	0	16	6	0	17	0	
" " Engine Tires	1	1	6	1	2	3	

We have, &c.,

JAMES BROWN,
(For Cammell & Co., Limited).

Note.—These rates would hold good for not less than two years, or for any further period that might be agreed upon.—J.B.

Locomotive Engineer for report. If Mr. Scott is satisfied that these axles are as good as Vickers' I think we might give an order for them. Vickers was offered to contract for five years for tires and axles, at £18 a ton, which compared most favourably with the price we had been paying, but they have written to say that, while they accept for the tires, they cannot take the contract for axles at £18 and keep to their standard, which they profess not to depart from.

With our experience, I certainly do not like to try a new departure in regard to axles, but I shall be guided by the Locomotive Engineer. If he thinks Cammell & Company's axles might be tried, I will recommend the Minister to give an order for them.—C.A.G., 18/9/85.

Cammell & Co.'s Axles and Tires.

Messrs. Cammell & Company's offer appears a very fair one, as the prices quoted are much lower than we are paying Messrs. Vickers, and if it were not for the great importance attached to our having the best article I would have no hesitation in recommending it to your favourable consideration. In view of the serious consequences involved in the use of inferior axles and tires, I cannot accept the responsibility of recommending that any be ordered, except upon the conditions that they be subjected to and stand an equal test in England as those supplied by Messrs. Vickers & Company.

I will not, of course, have any objection to test those sent us for that purpose as soon as we have our appliances completed, which will not I fear be for many months yet, but I would point out that even should the test prove them to be equal to those supplied by Vickers, the question would have to be considered whether they were not a special lot selected for the purpose.

As regards the statement that Messrs. Cammell & Company's axles and tires were in use on all English and Indian railways, as well as in all the Colonies except New South Wales, I consider it is not deserving of much attention. Although I am not in a position to say definitely with reference to the English and Indian railways, I think it will be found that they are not in such general use there as Mr. Brown desires we should conclude they are. As regards their use in the other Colonies, I find upon inquiry there is very little foundation for the assertion.

On the Victorian lines they have none of Cammell & Company's carriage or waggon tires in use, but they have some of their steel axles, which are not long enough in use to enable an opinion to be formed as to their quality.

On the South Australian lines none of Cammell & Company's axles are in use, and only a few tires, imported in 1881 and 1882, but their present practice is to confine orders to Krupp, Vickers, and Monk-bridge Companies.

On the Queensland railway, no axles and tires of Cammell & Company's manufacture have been received during the past ten years, but previous to that a few engine tires of their make were received, which were softer than Messrs. Vickers, which are now in use there.—9/10/85, W. SCOTT.

Minute by Commissioner.

The papers which should be placed with this are the papers from England, about four years ago, showing the results of certain tests made by Mr. Fowler, at our request, when our axles began to fail. We stipulated for certain tests, and asked Mr. Fowler, through the Agent-General, to take indiscriminately from the stocks of various steel-axle manufacturers (Cammell & Company were amongst the number) samples of their make, and to test them as prescribed. This was done, and Mr. Fowler reported that they all failed except Vickers & Company. Mr. Midelton afterwards reported upon these papers at my request.—C.A.G., 16/10/85.

I now enclose a statement, showing as far as possible, from whom the tires and axles have been obtained when supplied by the wheel-makers.

I also enclose return showing the prices paid for axles and tires respectively when imported separately.

I have found it impossible (as I verbally explained to the Commissioner) to get out with any degree of satisfaction the cost of tires and axles, when these have been supplied by the wheel-makers, and charged for together with the wheels.

It is, however, sufficiently clear that the Department has invariably got its tires and axles cheaper under these circumstances than when ordered specially for renewals.

The most noteworthy instance of this is the latest. During 1884 and 1885, Vickers & Company contracted with the Commissioner for the delivery of tires and axles at £18 per ton, at any wheel-makers in England, but have charged £26 16s. 9d. per ton for 800 axles imported during that period for renewals.—A.R., 22/9/85.

* Same description as those of Owen's Co. Indent, February, 1867.
 † Indent says to be exactly similar to those indented for May, 1876.
 ‡ Indent says half the axles to be Vickers', and half to be of Patent Shaft and Axle-tree Co.'s make.
 § Indent says as per tracings 818 and specification.
 ¶ Indent says as per tracings 817 and specification.
 ¶¶ Tires and axles supplied by Vickers & Co., £18 per ton.

Vickers & Co.'s carriage and waggon axles and tires.

VICKERS & COMPANY seem to have commenced to supply the Department with carriage and waggon wheels and axles in 1876, in which year they sent in a quantity of each at the price of £26 15s. per ton for the tires, and £35 7s. 8d. per ton for axles.

In 1881 Vickers & Company reduced the price for tires only to £26, at which price they continued to supply for some years.

On the 7th May, 1884, the Locomotive Engineer submitted an indent for 2,900 pairs of carriage and waggon wheels and axles, stated that he had learned unofficially that out of the previous indent 500 pairs had been obtained from the Brunswick Steel Company, whose axles had before proved unreliable, and recommended that arrangements should be made with Mr. Vickers, who was then in Sydney, for that and future supplies.

Commissioner accordingly saw Mr. Vickers, and, as the outcome of this interview, the latter wrote on the 16th May, stating that he was prepared to supply 2,900 pairs of wheels and axles, 3' 0½", made of Vickers' best cast-steel, and subject to all tests and inspection, at the price of £18 5s. per ton, f.o.b., at Liverpool, or £18 7s. 6d., f.o.b., at London, and 100 pairs, 3' 6½", at £2 per pair extra.

Commissioner minuted that this price was favourable, considering the superiority of the articles, but that Vickers' speciality was the axles and tires, and he wished the order to Vickers to be limited to them; that Vickers had offered to supply the tires and axles alone at £22 per ton (their lowest price to the trade in England), instead of £26, as before, and that he had pointed out to Mr. Vickers that £22 was a high price, considering they were to have the exclusive supply.

This brought another proposal from Mr. Vickers, who, on the 28th idem, wrote intimating that they would supply the 2,900 axles and 5,800 tyres at the price of £18 per ton, and deliver them free at the works of any wheel-maker in England, stipulating, however, that strict secrecy should be observed in regard to this arrangement, and stating that they would not bind themselves to this price beyond 5,000 axles and 10,000 tyres, delivered in 1884 and 1885.

In reply to an inquiry by the Minister, Commissioner minuted that Vickers' axles and tires had been subjected to the fullest trial, that Mr. John Fowler had obtained from established firms prepared specimens of their axles and tires, and had tested them against others taken at random from a quantity supplied by Vickers, and that the former could not approach those made by Vickers. Trials made in the Colony had fully borne out Mr. Fowler's test.

The Minister approved, and, under date of 31st May, 1884, Commissioner wrote to Mr. Vickers, intimating that his proposal to supply 2,900 and 5,800 tires at the price of £18 per ton, and any further quantity required during 1884 and 1885 on the same terms had been accepted.

Full particulars were also forwarded to the Agent-General.

Under date of 13th February, 1885, Vickers & Company wrote referring to the approaching termination of the period for which they had undertaken to supply the axles and tires, and stating that they could not enter into a new engagement on the same terms, but were prepared to take a five years' contract if the price of the axles were increased to £21.

Commissioner replied on the 11th May that the Minister could see no justification for an advance in price, and that if they could not continue to supply upon existing terms the only course would be to call for tenders.

Vickers & Company now (July 10th) write that present prices leave them no margin of profit, but they are prepared to meet the Commissioner half way, and supply the axles at £19 10s. per ton, and to take a five years' contract at this rate from 31st December—the tires to be £18, as at present.

Superintendent of Stores (with whom the papers have been for the last few days) directs attention to the circumstance that while Vickers & Company, in compliance with the terms of their engagement, have charged £18 per ton for tires and axles, delivered to the wheel-makers, they have charged £26 16s. 9d. for 800 axles supplied for renewals; and remarks that, although the latter supply may be outside the letter of the contract, it is hardly equitable to increase the price.

NOTE.—I venture to think that as axles, weight for weight, are admittedly a more expensive article than tires, Vickers and Company, when supplying axles alone, are entitled to some advance on the price they were to receive for the two together, with, I imagine, a very considerable preponderance of the less costly article.—C.A.B., 22/9/85.

Minute by Commissioner.

It seems that Vickers & Company have charged, through the Agent-General, about the average price which has been charged for years for axles and tires (between £26 and £27 a ton). When one of the firm was in the Colony I got him to reduce this rate to £18 a ton for tires and axles supplied by them to our wheel contractors. I do not think the Agent-General, after this arrangement, should have paid £26 16s. 9d. for the supplies ordered by him to come direct; in fact, I can see no reason why the price I secured should have been exceeded, unless extra work was done. I think £2 a ton is charged for dressing and cutting, and those sent out to the Colony separately may be dressed, &c. Please inquire.—C.A.G., 23/9/85.

Vickers & Co.'s axles.

Superintendent of Stores.—The Commissioner is under the impression that the practice has been to charge £2 per ton extra for dressing and cutting axles, and he will thank Superintendent of Stores to say if the fact is so, and if the 800 axles sent direct to the Colony, and for which Vickers charges £26 16s. 9d., were so manipulated.—G.B., 24/9/85.

I think it is the tires, and not the axles, which are so treated. Will Mr. Scott please say.—A.R.

I think it must be the axles that are referred to, as the 800 recently received were turned and finished in the bearings, and the body part left rough-turned for fitting to the wheels.—W. SCOTT, 25/9/85.

As far as the invoices are concerned, there is no special charge shown such as is referred to.

The indent for the 800 axles for renewals provides "that the journals and collars are to be finished, and the wheel-seat portions only rough-turned."—A.R.

The Secretary,—25/9/85.

Acting Secretary.—This is a reply to Commissioner's inquiry at the end of this minute—our prices within.—C.A.B., 25/9/85.

I would like to see the Minister about this matter. I think the Agent-General should be requested to explain why he paid Vickers & Company £26 16s. 9d. for axles, when we had arranged for their supply at £18. Certainly the arrangement we made was confined to axles supplied to our wheelmakers in England; and it is also true that the manufacturers have represented that they lost money by the agreement, and that they cannot continue to supply at the price; but from the fact that they now offer to go on supplying at £19 10s. per ton affords sufficient evidence that the Agent-General has submitted to a higher charge than was equitable. The charge should not have been more, I think, than £22, some £2 having to be added for extra work, turning and finishing of the journals to fit them for the wheel-seat.

Vickers' and Company's axles and tires have been used by us from the earliest times with few exceptions, and when we have used other axles and tires we have been disappointed and have had to revert to Vickers.

I do not wish the Department to make any change, but certainly we cannot consent to give £26 16s. 9d. per ton for axles which, at the outside, should not cost more than £22.

We made a good agreement when we arranged for their supply to our wheelmakers at £18 per ton, and even if we have to pay £19 10s. it will still be an infinitely better arrangement than we obtained before—for it will be seen by the prices that the average price has been over £26—but we should also get our supplies for renewals at about £22, instead of £26 16s. 9d.—C.A.G., 25/9/85.

I concur with the Commissioner.—F.A.W., 29/9/85.

See Messrs. Vickers' request in their letter of the 10th July last; send cablegram, as under:—

Commissioner of Railways to Vickers, London.

“FIRST.”

This word implies as arranged.

The Government accepts your offer to supply all their requirements for waggon tires, and axles for five years from 31st December, 1885, at £18 per ton for tires, and £19 10s. per ton for axles.

Write letter confirming this, and pointing out that it must apply to all axles or tires whether supplied to our wheelmakers in England or sent to the Colony for renewals.

Inform also Agent-General, and say that we cannot understand why £26 16s. 9d. was paid for the last imported axles. Ask him to obtain explanation, and get refund of apparently excess charge.—C.A.G., 29/9/85.

The Secretary for Public Works to Messrs. Vickers, Sons, & Co.

Gentlemen, Department of Public Works, Railway Branch, Sydney, 6 October, 1886.

I have the honour to inform you that on the 1st instant, I cabled to you “First,” which, in terms of your letter of July 10th was to be the code in the event of your offer to supply waggon tires and axles for the term of five years from the 31st December next, the tires at the existing rate of £18 per ton, and the axles at £19 10s. per ton being accepted.

I now beg to confirm the intimation conveyed to you, and to state that your offer to supply waggon tires and axles at the rates and for the period stated above has been approved and accepted, and it must be clearly understood that this arrangement is intended to embrace all waggon tires and axles supplied to the order of this Government, whether sent to wheelmakers in England or to this Colony for renewals.

I have, &c.,

CHARLES A. GOODCHAP,
Pro Secretary for Public Works.

The Secretary for Public Works to The Agent-General.

Sir, Department of Public Works, Railway Branch, Sydney, 6 October, 1885.

I have the honor to inform you that Messrs. Vickers & Co. having intimated their inability to continue to supply waggon tires and axles after the 31st December next at the rate of £18 per ton on the ground that that rate does not afford them any margin of profit, a new arrangement has been made with the firm, under which they will supply all waggon tires and axles required by this Government in the five (5) years ending 31st December, 1890, at the following rates:—

Tires	£18 per ton.
Axles... ..	£19 10s. „

Such arrangement to embrace all waggon tires and axles supplied to the order of this Government, whether sent to the wheelmakers in England or to the Colony for renewals.

I observe that the last 800 waggon axles sent out to the Colony by you are charged by Vickers & Sons at the rate of £26 16s. 9d. per ton. This charge is inexplicable, because, adding a liberal allowance for extra work done to the axles, it would not come to anything like this rate.

I shall be obliged by your making inquiries upon the point, and obtaining a refund should it turn out that there has been an overcharge.

I have, &c.,

F. A. WRIGHT,
Secretary for Public Works.

Mr. James Brown to The Commissioner for Railways.

Sir, Sydney, 4 December, 1885.

I have from Messrs. Cammell & Company (Limited), Sheffield, a few printed lists of the tests to which the 700 cast-steel tires were subjected by Mr. John Fowler. One of these lists I have pleasure in passing you.

I am, &c.,

JAMES BROWN.

P.S.—You will notice the test requirements were fulfilled.—J.B.

Messrs. Vickers, Sons, & Co. to The Secretary for Public Works.

Sir, Via Brindisi, London, 9 October, 1885.

At 3:30 p.m. yesterday we received your valued telegram, “First.—George R. Dibbs, Secretary,” for which we beg to thank you.

The word “First” we take to be the code word named in our letter of the 10th of July last to the Commissioner for Railways, meaning—“The Government accept your offer to supply all their requirements

ments for waggon tires and axles for five years, from the 31st December, 1885, at £18 per ton for the tires, and £19 10s. for the axles," and we write at once to express our sense of the favour conferred on us by the kind compliance with our request to advise us of the decision of the Government by telegraph, which enables us to make the necessary arrangements for materials, &c., and for which we are greatly obliged.

Waiting your communications by mail on the subject, we beg to assure you that our utmost endeavour shall be to supply the best tires and axles for the purpose that we know how to make.

And we have, &c.,

VICKERS, SONS, & CO. (LIMITED),
(ALBERT VICKERS).

Messrs. Vickers, Sons, & Co., to The Secretary for Public Works.

Sir,

London, 19 November, 1885.

We have the honor to acknowledge receipt of your valued favour of the 6 October, confirming the intimation, already conveyed to us by cable message of the code word "First," of the acceptance of an offer to supply the Government with all their requirements for waggon tires and axles for the five years from 31st December, 1885, at £18 per ton for the tires and £19 10s. for the axles, for which please accept our best thanks.

With reference to the last paragraph of your letter, we agree that it is clearly understood that this arrangement embraces all the waggon tires and axles which the Government may require during the said five years, whether for wheels to be made in England or elsewhere, or for repairs in New South Wales.

We have, &c.,

VICKERS, SONS, & CO.

The Agent-General to The Secretary for Public Works.

Sir,

Westminster, 4 December, 1885.

Referring to your Despatch 85/4,512, of the 6th October last, on the subject of the price charged by Messrs. Vickers, Sons, & Company for the supply of the 800 axles ordered in your letter 84/5,619, dated 20th June, 1884. I have the honor to inform you that I have been in communication with Messrs. Vickers & Company on the subject, and have been furnished with an explanation by them in regard to the price charged for the tires, copy of which is enclosed for your information.

I have, &c.,

SAUL SAMUEL.

Messrs. Vickers, Son, & Co., to The Agent-General.

Sir,

River Don Works, Sheffield, 28 November, 1885.

In further reply to your letter of the 25th instant, on the subject of the price charged for the 800 finished axles supplied by us in 1884 to the above indent, as we find that Mr. Albert Vickers will be absent from London for some days, we beg to write to you instead of Mr. Vickers calling upon you.

On referring to our books we find the following was our estimate for these 800 axles:—

	£	s.	d.
800 axle forgings 3 cwt. 1 qr. 10 lb. each, 2,671 cwt. 1 qr. 20 lb., at 18s.	2,404	5	9
16 axle forgings for testing, 53 cwt. 1 qr. 20 lb., at 18s....	48	1	9
Cost of finishing 800 axles and packing for shipment, at 20s.	800	0	0
Total	3,252	7	6

From this you will see that we based our estimate for the axles on our contract price of 18s. per cwt., a price that we have had to explain officially to the New South Wales Government we find too low to leave us a margin for profit, and to this price for the forgings we have added the cost of finishing the axles and protecting the finished parts for shipment.

The packing was carefully done, the axles being first wrapped with spun-yarn dipped in tallow, and then protected by lagging secured by iron bands.

We beg to submit that in comparing the price per ton of finished axles with that of the forgings the loss of weight in finishing them must be taken into consideration.

Hoping you will find our explanation of the price of the finished axles satisfactory,—

We remain, &c.,

VICKERS, SON, & CO. (LIMITED),
JOHN CROSSEY.

Mr. R. Waddington to The Commissioner for Railways.

Dear Sir,

Sydney, 16 March, 1886.

I am aware that recently you entered into a contract with Messrs. Vickers & Sons for the supply of tires and axles for five years, but this I understand was solely for new work, not for renewals.

I wish now to put a proposal before you that Messrs. Brown, Bayley, Dixon, & Co. should have the supply of all renewals of tires and axles.

This firm bear a high reputation for the manufacture of good material, and get their share of work on the English railways, and they will guarantee to supply you with a tire equal in every respect to that now obtained from Messrs. Vickers & Sons, at the price of £17 per ton.

Kindly give this your favourable consideration.

I am, &c.,

RICHARD WADDINGTON.

Will papers *re* Vickers' contract be put with this?

Not necessarily. Please ascertain whether the contract made with Vickers for tires and axles was for *all* tires, &c., or whether for renewals or new work. Mr. Waddington first quoted £18 a ton for tires, and

and upon my stating we paid no more to Vickers, he expressed surprise, having been under the impression we were paying £24 a ton; and he then said he would reduce his offer to £17 a ton.—CHAS. A. G., 20/3/86.

Contract for Tires and Axles.

Superintendent of Stores,—The papers relative to the contract with Vickers for tires and axles are not immediately available. The Commissioner wishes to know whether that contract was for all supplies, or for the supplies for new stock only. If you can furnish the information without reference to the papers, I shall be much obliged by your doing so; it will save time.—G.B., B.C., 22/3/86.

Please see copy of minute enclosed. I judge that the new agreement referred to covers all deliveries, whether at wheel-makers', for new stock, or f.o.b. London, for renewals. Tires, £18; axles, £19 10s.—A.R., 24/4/86. The Secretary.

Memorandum from Mr. W. Pratt to Mr. Braid.

Sir,

Locomotive Engineer's Branch, Redfern, 14 July, 1886.

I beg to report, for your information, as regards Cammell's crucible cast-steel tires, a pair of tires were bored out in the usual way, and were riveted up on Tuesday night, 13th, and on Wednesday morning my attention was called to the same tire. This tire I found burst right through the rivet-hole on one side.

Tire dated 9/84.

W. PRATT.

For the information of Locomotive Engineer. From inquiries I have made, I find that this is the first that has broken in the way mentioned.—S. BRAID, 15/7/86. Who is the maker of this tire?—W.S., 21/7/86. Mr. Cobb. Cammell's crucible cast-steel.—J.C. Loco. Engineer.—20/7/86.

Forwarded for your information. I have examined the tire, and find the material is white and hard, and the fracture coarse. It is very fortunate that the defect was discovered before the tire left the shop.—W. SCOTT, 19/8/86.

This crucible cast-steel has recently been introduced by Cammell & Company for axles and tires. What number are there in stock? Pray be careful about using them.—CHAS. A. G., 26/8/86. Locomotive Engineer.—26/8/86.

Will you please inform me the number in stock, also the number issued, and the dates of issue?—W. SCOTT, 3/9/86. Superintendent of Stores.

Number received 700
 ,, issued 623

Balance in stock 77

For dates of issue see attached list.—A.R. Locomotive Engineer, 7/9/86.

It will be seen that there are only 77 of these tires out of 700 not in use.—W. SCOTT, 8/9/86. Commissioner.

Minute by Commissioner.

TESTING of axles and tires sent by Cammell & Co., about June, 1885, 25 of each.

By Mr. James Brown's letter, 16th September, 1885, these waggon tires and axles seem to be offered at 17s. 6d. per cwt. for tires and 17s. per cwt. for axles delivered in Sydney.

It would seem that the tires and axles sent to be tested are made of engine-tire steel. It is not quite clear that if the test should turn out satisfactorily we shall be supplied with axles and tires of engine-tire steel at the prices named.—I fear not, as engine tires are quoted in Mr. Brown's letter at £1 2s. 3d. per cwt; but this is a matter that could be settled when the articles have been tested.

Mr. Scott proposed, in his minute of 10/6/85, to test these tires and axles when the testing machine ordered from England had arrived, and had been placed at Eveleigh.

Has this been accomplished? if so, the test should be made, and Mr. Brown afforded an opportunity of being present.—CHAS. A. G., 24/8/86. Locomotive Engineer.

The

The testing machine has not yet been erected, and consequently I have not been able to have them tested. The delay in erection has arisen through the shops not being sufficiently advanced to have the appliances fixed in connection with them.—W. SCOTT, 8/9/86.

I forward herewith, for your information, communications received from the several Locomotive Engineers of the Colonies, conveying their experience of Cammell & Company's tires and axles, in answer to inquiries made by me.—W.S., 8/9/86. The Commissioner.

The Locomotive Superintendent, Victoria, to The Locomotive Engineer.

Dear Scott,

Locomotive Superintendent's Office, Melbourne, 1 October, 1885.

In reply to yours of 28th ultimo, *re* Chas. Cammell & Co's., tires and axles.—We have no Cammell's carriages or waggon tires in use that I am aware of, but have a number of their steel axles; they have not been in use running long enough to enable me to give you the information desired, but I attach you a sheet showing impact and tensile tests of same made in June, 1882.

I have, &c.,

S. MIRLS,

Locomotive Superintendent.

The Locomotive Engineer, Adelaide, to The Locomotive Engineer, Sydney.

Dear Sir,

Locomotive Engineer's Office, Adelaide, 2 October, 1885.

In answer to your inquiry of the 28th September, I beg to inform you that we have no crank axles of Chas. Cammell & Co.'s make, and I am not aware of having any straight axles by them.

We have a few tires imported in 1881 and 1882, but our present practice is to get our tires either from Krupp, Vickers, or the Monkbridge Company.

I am, &c.,

WILLIAM SHOW,

Locomotive Engineer.

The Locomotive Engineer, Brisbane, to The Locomotive Engineer, Sydney.

Dear Sir,

Locomotive Engineer's Office, Brisbane, 6 October, 1885.

In reply to your letter of the 28th ultimo, I beg to inform you that, so far as I can ascertain, none of Chas. Cammell & Co.'s steel tires and axles have been imported for these railways during the last ten years. Previous to 1876 a few Cammell engine tires were received, which appear to be rather softer than those we now get from Vickers.

There may possibly be some Cammell steel axles in some of our old engines, but they have never come immediately under my notice in any way.

I am, &c.,

T. THORNIBLOW,

Locomotive Engineer.

The Assistant Locomotive Superintendent, Melbourne, to The Locomotive Engineer, Sydney.

My dear Sir,

Locomotive Superintendent's Office, Melbourne, 19 October, 1885.

In reference to your inquiries (No. 85-2,030) as to my experience in New Zealand with the steel tires supplied by the firm of Cammell & Co., I beg to inform you that for about nine years we used tires supplied by that firm very extensively, both for engines and rolling stock. The only fault I ever had to find with them was that they were too soft, and for this reason they were to some extent superseded by those bearing Vickers' Australian brand. My first experience of Cammell's tires dates even further back, as this was one of the firms that were always mentioned in the specifications for supplies to the North British Railway of Scotland.

I must apologise for not answering your letter sooner, but I have been away from home nearly constantly, for the last three weeks.

Yours truly,

ALLISON D. SMITH,

Assistant Locomotive Superintendent, Victoria.

Seen.—W. SCOTT, 21/10/85.

The Traffic Manager to The Commissioner for Railways.

I BEG to report, for the Commissioner's information, that the axle of the brake-van attached to "42 up," on the 13th instant broke at Springwood, about 3.30 p.m., and the leading pair of wheels went off the road.

The luggage, parcels, &c., were transferred into a carriage as far as Glenbrook, when the push-up van of No. 17 was attached to the passenger train, No. 42 up, and sent to Sydney.

The line was cleared by 12.50 a.m. on Sunday morning, 14th instant.

I will report further in a day or two.

W. V. READ (*per* N.W.), 15/11/86.

Broken axle on eight-wheel passenger brake-van, No. 13, at Springwood, 13/11/86.

The Commissioner,—I have to report, for your information, that driver Robert Baker, engine No. 306, with No. 42 "up" passenger-train (Bathurst to Sydney), on the 13th instant, when at about 75 yards west of Springwood, the leading axle of brake-van No. 13 broke. At this point the brakes would be put on to stop the train at the platform, when the axle broke. The end appears to have struck the air-pipe and broke it, thus causing the brake to go on full and stop the train suddenly, and so saved further damage, with the exception of slightly bending of some rods, &c. A van was taken from one of the goods trains, and No. 42 up-passenger was brought to Penrith about 35 minutes late.

The fracture is close to the wheel-boss in the inside, and shows an old flaw of some standing, extending nearly half through the axle-maker's name—"Cooper, Leeds, October." Only the wheels of the broken axle were off the road. The main line was blocked, and the traffic was worked through the loop, thus preventing delay to other trains.

W. SCOTT (*per* C.A.M.), 15/11/86.

To await return of papers.—I have asked certain questions thereon in connection with the subject.—C.A.G., 20/11/86. For Minister's information.—Further inquiry is being made on other papers. Seen.—W.J.L., 20/11/86.

Leading axle of brake-van, attached to No. 42 up-passenger, broke at Springwood, 13/11/86. WITH reference to my memorandum, p. 86/4,820A, 15th instant, *re* the above occurrence, it is stated that the axle had a very bad flaw in it. The Loco. Engineer will no doubt have reported this to the Commissioner. W. V. READ (*per* N.W.), 22/11/86.
The Commissioner.

Minute by The Commissioner.

Broken axle on 8-wheel passenger B van, No. 13, at Springwood, 13/11/86; maker's name, "Cooper, Leeds."

1. When was this axle ordered?
2. How long has it been in use?
3. Though the brake-van was one with eight wheels it was not, I assume, a bogie frame, or the wheels would not probably have left the rails?
4. I gather from the report that the flaw was in a position not easily detected—"close to the boss on the inside"?
5. Have we any more of the same class of axle in use?
6. Whose axles are being used with the other wheels of this brake van?

To Locomotive Engineer.—B.C.

CH.A.G., 17/11/86.

1st question.—Was delivered with the van in 1868.

2nd " —Eighteen years.

3rd " —It was not a bogie frame.

4th " —It was close to the boss, and could not easily be detected.

5th " —Yes.

6th " —Similar axles—they were all delivered with the van.

GEO. DOWNE, 25/11/86.

Seen. I assume this axle is an iron one. It had better be broken to ascertain if the iron is crystallized.—CH.A.G., 9/12/86. Locomotive Engineer.

Testing of tires and axles.

SOME time back a minute was addressed to Mr. Scott, asking him to state for Commissioner's information when it was probable that the erection of the testing apparatus would enable him to test, and report upon, the samples sent in by Cammell & Co.

I have not seen any reply to that minute.

D.C.M'L., B.C., 8/12/86.

To Locomotive Engineer. Urgent.

I shall be ready to have this put in operation as soon as the Existing Lines Branch have completed the framework, &c.—W. SCOTT, 13/12/86. The Commissioner. Mr. Cowdery, D. C. M'L., 14/12/86. The framework, &c., will be ready in about a week.—G.C. (*per* G.L.), 18/12/86. Secretary.

I AM informed by Mr. Cowdery that his part of the work in connection with the testing apparatus at Eveleigh is "about completed."

Can you now let me know when you expect to have the apparatus ready for use, and when the Commissioner may expect to receive your report "on the testing of Cammell & Company's tires and axles?"
Locomotive Engineer. A. RICHARDSON, B.C., 5/1/87.

Mr. Downe,—Will you be good enough to get the necessary information?—W. SCOTT, 11/1/87.

A test of the arrangement is ready to be made to-day, and I have written the District Engineer to make water connection to feed tank of boiler. If no alterations are required the tests can be proceeded with at once.—GEO. DOWNE, 12/1/87.

Memo. to The Assistant Locomotive Engineer.

Re Cammell & Co.'s tires and axles.

MR. JAMES BROWN, agent for Cammell & Co., is in Melbourne, and will not be back until next Wednesday.
W. SCOTT, 15/1/87.

I would suggest deferring the test until Messrs. Cammell & Co.'s agent can be present.—GEO. DOWNE, 15/1/87. Urgent. I concur. It would be well to inform Mr. Vickers also.—W. SCOTT, 17/1/87. Assistant Loco. Engineer. Noted; and Mr. Vickers being in Melbourne, I requested his representative to inform him by wire.—GEO. DOWNE, 17/1/87. Locomotive Engineer. Mr. Brown has called, and I have arranged to have the tests made on Thursday next at 11 a.m.—W. SCOTT, 21/1/87. Assistant Loco. Engineer. As the testing machine is now ready, the Commissioner's instructions can now be carried out.—W. SCOTT, 17/1/87. Mr. Downe.

The testing machine is now ready, and I intended to test the tires to-day. I find, however, that the representative of Messrs. Cammell & Co. is out of town, and would not return before Wednesday next. I have deferred the test so that he might be present.—W. SCOTT, 17/1/87. Commissioner.

Please report results of tests.—A.R., 20/1/87. Locomotive Engineer.

Mr.

Mr. J. Brown to The Locomotive Engineer.

Sir,

121 Bathurst-street, Sydney, 31 January, 1887.

The three tires I am sending in to your Eveleigh Works to-night, for testing, are of very stiff temper, being in tensile strength from 50 to 55 tons; you will probably find that only a small deflection can be obtained. This class of tire is preferred by some engineers because a more uniform and economical result can be obtained in the wearing.

Yours, &c.,

JAMES BROWN,

Representative and Agent to Charles Cammell & Co. (Limited).

To Locomotive Engineer,—Will the Locomotive Engineer be so good as to say if the tire and axle testing apparatus at Eveleigh is now ready for use, and if there is a prospect of Commissioner soon having a report upon the testing of Cammell & Co.'s samples?—D.M'L., B.C., 7/2/87.

The drop tests have been completed, but the tensile tests are now being arranged for. I hope to be able to report fully in about ten days.—W. SCOTT, 14/2/87. The Commissioner.

Report of Locomotive Engineer.

Axles and tires.

I BEG to submit the result of the tests made (*See Appendix*) which indicate in tabulated form the merits and demerits of the various tires and axles subjected to trial, from which it will be seen that those manufactured by Messrs. Vickers, Sons, & Co. were tested, as well as those by Messrs. Cammell & Co., for the purpose of instituting a comparison of their relative value.

The three axles, Nos. 1, 3, and 5, were taken from the twenty-five specially sent out by Cammell & Co. for testing. The amount of deflection at every blow indicates softness in the material, which is more of the nature of iron than steel, and unsuitable for railway rolling stock. Drop tests
(axles).

Nos. 2, 4, and 6, Vickers & Co.'s, were taken indiscriminately from a number in store, and may be considered a fair average quality of those supplied by that firm. The results were satisfactory.

These tests exceeded in severity the requirements of the "recognized" tests.

Nos. 1, 3, and 5 tires, Vickers & Co., were also taken indiscriminately from a number in store. Could be considered of an average quality, and stood more than the "recognized" test, viz., to compress one-sixth of the diameter without showing fracture, proving themselves to be of the proper degree of hardness for wear, and reliable. Drop tests
(tires).

Nos. 2, 4, and 6, Cammell & Co., were taken from the twenty-five specially sent out by that firm for testing, and proved too soft, and more the nature of iron than steel.

Nos. 7 and 8, Cammell & Co., were taken indiscriminately from a number in store. No. 7 proved too hard and unreliable; No. 8 stood the "recognized" test, and proved itself to be of the proper degree of hardness, and the only reliable tire tested of this firm's manufacture.

Nos. 9, 10, and 11, Cammell & Co., were tires which Mr. Brown, representative of the firm, requested (as per letter which is attached) to have tried, and they proved to be unreliable.

These tests were made on pieces cut from Nos. 1 and 3 tires, Vickers & Co.'s, and Nos. 2 and 8, Cammell & Co.'s previously "drop tested." Tensile tests
(tires)

In the case of No. 2, which was, as previously mentioned, supplied specially for testing, the ultimate stress is little better than the best bar iron.

The results of these tests show plainly the superiority of Messrs. Vickers, Sons, & Co.'s tires over those of Messrs. Cammell & Co., in that they possess a tensile strain and limit of elasticity exceeding them; and I am also of opinion that they would run a greater mileage at less cost, and thus prove more economical to the Department.

The Commissioner.

W. SCOTT,
28/2/87.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

IMPORTED RAILWAY MATERIAL.

(MACHINERY, &c.)

Ordered by the Legislative Assembly to be printed, 18 March, 1887.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 2nd September, 1886, That there be laid upon the Table of this House,—

“(1.) The number of sets of stock-switches, point rods, chair-slides, and lever-stands imported during the last two years, and the cost of same, per set, delivered from the store ready for use.”

“(2.) The cost of machinery imported expressly for carrying out this work and the cost of same made at permanent-way workshops.”

(*Mr. Hugh Taylor.*)

IMPORTED RAILWAY MATERIAL.

1. *Question*—

The number of sets of stock-switches, point rods, chair-slides, and lever-stands imported during the last two years, and the cost of same per set, delivered from the store ready for use?

Answer—

Total number of T. R. switches imported for extensions during the last two years, 390; average cost per set, £17 12s. 10d. Total number imported for renewals, 304; average cost per set, £17 12s. 5d. Total number of D. H. switches for renewals, 38; average cost per set, £13 9s.

2. *Question*—

The cost of machinery imported expressly for carrying out this work, and the cost of same made at permanent-way workshops?

Answer—

Hitherto the switches have been made by machines, which are used for all classes of work. Two special machines for this work were imported some time ago at a cost of £380 each. One of these machines is now being fixed. The cost of switches made at the permanent-way shops is £15 11s. 6d.; a pair of English-made switches and stock rails weigh 15 cwt. 2 qr. and 14 lb., and a pair of those made in the permanent-way workshops with stock rails weigh 13 cwt. 1 qr. and 22 lb. This extra weight, coupled with the fact that the English switches are made of specially rolled section of steel for the purpose, will account for the difference in cost. Those made in the workshops are not equal in strength to the imported ones, nor have they the wear-resisting qualities. They are made of the usual rail section, which accounts for the difference in weight, and are not used on the main line.

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(RESUMPTION OF PROPERTY OF EDWARD IRBY ON BLUFF RIVER.)

Ordered by the Legislative Assembly to be printed, 5 July, 1887.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 10th May, 1887, That there be laid upon the Table of this House,—

“Copies of all letters, minutes, reports, plans, and other documents having reference to the resumption of the land and buildings, by the Commissioner for Railways, on portion 186, Bluff River (extension Glen Innes to Tenterfield) the property of Edward Irby; also, the amount paid as compensation for the same.”

RAILWAYS.

No. 1.

Mr. Irby's Claim.

Great Northern Railway—Extension from Glen Innes to Tenterfield.

I HEREBY offer to accept from the Commissioner for Railways, as purchase money for the land (including buildings and fences erected thereon) of which I am the owner in fee simple, delineated on the tracing plan attached to the notice of land taken, and numbered Part No. 3 Abstract No. 3, which I hereby acknowledge to have received, containing 62 acres 1 rood and 33 perches, more or less, and as compensation for damage by severance, by the railway, or otherwise caused by the execution of the railway works, as particularly set forth in the subjoined Schedule of Claim, the sum of £7,600 5s., which sum I declare to be my full claim in respect of the matters aforesaid.

Dated this 22nd day of January, 1883.

EDWARD IRBY,
Tenterfield.

To the Commissioner for Railways, Sydney.

SCHEDULE of Claim.

Land resumed:—Reference Nos., 50, 1, 2, 3, and 4; area, 10 acres 25 perches; cultivation; estimated value, £25 per acre; total value, £251 10s. Reference Nos., 174 to 187 inclusive; area, 52 acres 1 rood 9 perches; pasture; estimated value, £3 per acre; total value, £156 10s.

Nature and description of improvements taken:—Fences, 42 rods at 4s., £8 8s.; other improvements—total destruction of No. 186 as a water mill property, for which purpose only it was purchased and improved, £7,000; damage by severance or otherwise, £183 17s.; total amount of claim, £7,600 5s.

EDWARD IRBY.

No. 2.

E. Irby, Esq., to The Commissioner for Railways.

Sir,

Tenterfield, 22 January, 1883.

I have the honor to direct your attention to the necessity of providing me with suitable passages for stock under the Great Northern Railway now in course of construction through my run.

I am given to understand that level crossings will be granted me, but I wish to point out that to take a herd of cattle from one part of the run to another over the rails will be a difficult and certainly a dangerous thing to do, and I may say I only depasture cattle on Bolivia.

In place of certain culverts it would be advisable to build larger bridges, and I respectfully apply to have a bridge placed under the line at 362 miles 26 chains; the Engineer tells me that a 20-foot culvert is to be built here, but this will not be nearly sufficient.

I would suggest that three or four timber openings of say 30 feet each should be built, the centre spans to take the water (which is a considerable stream at times), and those on the sides to be available for cattle to be driven through.

A passage for cattle would also be urgently required at 360 miles 74 chains, but a culvert of 26 feet would be sufficient there.

I have, &c.,

EDWARD IRBY.

The Engineer-in-Chief.—D.V. (*pro* Commissioner), 31/1/83. Mr. Wade.—W.H.Q., 2/2/83. This can be considered when land valuer's report on number of crossings to be allowed Mr. Irby is received.—W.B.W., 13/2/83. The land valuer has just furnished a list of crossings, Glen Innes to Tenterfield. One is recommended for Mr. Irby at 368 miles 68 chains 50 links.—W.H.Q., 14/2/83. Mr. Wade. At 360 miles 74 chains, a timber opening 10 feet wide with wings can be given.—W.B.W., 23/2/83. A 20-foot culvert will be put in at 362 miles 26 chains. A bridge is out of the question.—J.W., 23/2/83. Mr. Mayes to note.—W.F.M., 4/3/83. 20-foot culvert, at 362 miles 26 chains; level crossing, at 368 miles 68 chains 50 links; 10-foot timber opening, at 360 miles 74 chains.—W.H.Q., 10/3/83. Mr. Drewett. Noted on section.—J.W.D., 12/3/83.

No. 3.

Minute by Mr. Land-Valuer Thompson.

Great Northern Railway—Glen Innes to Tenterfield.

PARTICULARS of Claim:—Claimant and owner, Edward Irby; reference numbers, 50 to 54, 174 to 176, 179, 183, 185 to 187; area taken, 62 acres 1 rood 33 perches; amount of claim, £7,600 5s.

REPORT.

THE lands taken from Mr. Irby are situated in four separate localities, and their character and positions are shown below.

Nos. 50 to 54 are within $2\frac{1}{2}$ miles of Glen Innes, and the land from which they are taken is bounded on the east by the Great Northern Road, and on the west by Furracabad Creek. They are naturally clear of timber, and the soil is black and fertile, but rather too swampy for cultivation in wet seasons. There is water on both sides of the railway line.

Nos. 174 to 176 are situated at Bolivia, 38 miles from Glen Innes. They are heavily timbered with white box and gum. They are well grassed. The soil is light. They are unenclosed and unimproved.

No. 179 is on the Great Northern Road, 41 miles from Glen Innes. It is heavily timbered with white gum. Grass is abundant, but of inferior quality. A level crossing is necessary at 364 miles 45 chains for Mr. Irby's use.

Nos.

Nos. 183 to 187 are pasture lands of middling quality. They are heavily timbered. On No. 186 is erected a water-mill; the building is 41 ft. 6 in. long and 41 ft. wide, and consists of a central portion two stories high, with a lean-to of one story on each side. The central part is roofed with galvanized iron, and the rest of the building is shingled. It is built of a strong timber framework, and the walls of slabs, well fitted and securely fixed. It is worked by a large overshot wheel 20 ft. diameter. The site is well chosen and well adapted for its purpose. About 6 feet is taken off the corner of this building. An old cottage, in semi-ruinous condition, is also taken, and an old enclosure, not now of any value. The following proposal with regard to the mill was made to Mr. Irby, of course subject to approval, viz. :—That entrance to the mill be given by a 26-foot timber opening at 369 miles 31 chains, and exit therefrom by a similar opening at 369 miles 38 chains, and that the fence on the eastern side of the line be set as close as practicable to the foot of the embankment; and further, that compensation for depreciation of value of the mill would be recommended at 25 per cent. of that value. This proposal, which I submit was of a very liberal character, was declined by Mr. Irby. It is therefore necessary—part of the building having been taken—to compensate Mr. Irby for the full value of the mill property in accordance with the decision of the Supreme Court in the special case *Phillips v. The Commissioner for Railways*, given on the 1st September, 1876. In estimating the value of the mill, I had the assistance of the Clerk of Works, Tenterfield.

Valuation.	£	s.	d.
10 acres 24 perches, at £15 per acre (Nos. 50 to 54)	152	5	0
52 acres 1 rood 9 perches, at £3 per acre (Nos. 174 to 187)	156	18	6
12 rods fencing at 7s. 6d. per rod	4	10	0
64 rods fencing at 5s.	16	0	0
Damage by severance, £50, £5, £20, £75... ..	150	0	0
Value of mill, fixed machinery, race, &c.	1,000	0	0
Disturbance of trade... ..	250	0	0
Cottage taken	30	0	0
Forced sale at 10 per cent.	30	18	6
	£1,790	12	0

J. B. THOMPSON,
Railway Land Valuer.

27/8/83.

The Commissioner for Railways.

Amount claimed, £7,600 5s.; amount recommended, £1,790 12s.—J.B.T., 27/8/83. Approved
for schedule.—CH.A.G. Land Valuer.—B.C., 31/8/83. Scheduled.—J.B., 6/9/83. Ex. Min.
83-39, 25/9/83.—J.B. Offer made.—J.B., 10/10/83.

Sir,

Department of Public Works, Railway Branch, Sydney, 10 October, 1883.

With reference to your letter of the 22nd day of January, 1883, claiming £7,600 5s. as compensation for loss of 62 acres 1 rood and 33 perches of land, together with buildings erected thereon, taken by the Great Northern Railway, and damages occasioned thereby, I have the honor to inform you that the loss and damage has been subjected to competent valuation, and such valuation having been confirmed by His Excellency the Governor and Executive Council, I have to offer you the sum of £1,790 12s. in full satisfaction of all claims for the said loss and damage, and all injuries of every nature which may be sustained by you by reason of the taking of the said land, and of the railway works; and in case you should not accept the amount offered, I have to request that you will proceed as required by the Government Railways Act, 22 Victoria No. 19, that the matter may be settled without delay.

The offer is made subject to your producing a satisfactory title to the estate, or interest claimed by you, in the land referred to. Should the above offer be accepted, I have to request that you will be good enough to transmit an abstract of your title to this office, in order that the Crown Solicitor may be instructed to prepare the necessary conveyance.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.

E. Irby, Esq., Tenterfield.

Glen Innes and Tenterfield Railway Extension.

Sir,

Tenterfield, 16 October, 1883.

I do myself the honor to inform you that I am duly in receipt of your communication of the 10th instant, apprising me of the amount—£1,790 12s.—offered me as compensation for the 62 a. 1 r. 33 p. of land resumed by the Government for railway purposes, and all losses occasioned thereby, and think it due to myself to state, that finding portion of my Bluff River water-mill building was absolutely taken, and believing the whole building would be destroyed, and the special site—a water power for a 20-ft. overshot wheel—lost to me, I made a claim in proportion to what I believed the whole loss would be to me, and which I could fairly estimate at an income of from £500 to £700 per annum; and I did so under the impression that the Government would resume the whole of the valuable property encroached upon. Finding now that such resumption is declined, it would be worse than useless my contending that point, as it must involve a law-suit. I therefore must be content to make the best of a bad job, and accept the compensation offered.

If the building and machinery are not destroyed during the progress of the works, and access is given through the embankment—which I believe is 30 ft. high at that spot—to the small plot of ground enclosed by it and the Bluff River, and upon which the mill is erected, I may be able to work it after the completion of the railway if I can get a miller to reside on such a confined spot; but it would be impossible to carry on the mill business whilst the railway works are in progress. One large piece of rock has been sent smashing through the roof, and I am told I must look to the contractor for compensation for all damage done under bombardment. So that between the contractors on one side blasting and banking, and the Government on the other forcing, as it were, a co-partnership in the building, with the avowed purpose of running a fence through it, I really may be in a worse case than you have been led to believe through those appointed as valuers; and although I prefer accepting the compensation offered to the almost

almost certain alternative of an appeal to the Law Courts, I still think I am in duty bound to myself, and you also, to place the subject as clearly before you as I can, so that should it be evident that the compensation offered is really less than strict justice demands, an amendment can be made, should such not be directly opposed to the rules of the service.

Before deciding upon the sum, I would ask for compensation. I asked my managing partner in the mill to write out his views on the subject, and I committed my own to paper, and I now enclose the two documents under a separate cover, so that you may see exactly the light we each viewed the matter in; and having photographed the mill at different times, I have printed one or two and affixed them on the other side, as they give a correct idea of the utter isolation of it through the works now carried on.

No. 1, taken some years ago, gives a very good idea of the whole position, showing from the rocky nature of the ground on the left, the fluming on to the wheel and tail race of about 18 feet in depth, that all access to the mill by drays on that side is utterly impossible, and on the right the cutting comes through the hill close to the hut on the top, and the 30-foot embankment runs through the cottage in front of the mill, making a total eclipse of the latter; and the fence will run along verandah of hut and through skillion of mill.

No. 2 shows the flume carrying the water to the wheel, and impossibility of access to mill, excepting through the embankment.

No. 3 shows skillion, fence is to run through, and nature of country on other side the mill.

No. 4, taken whilst survey was going on, shows the ground the embankment will cover, the base extending to waggon, so blocking the mill completely in, and the miller's residence—which is not seen—completely out.

Mr. Anderson, I may say, that when writing to Mr. Thompson, the valuator, said that, believing the Government would wish to act both fairly and liberally in the matter of compensation, I should abide by the offer made. I shall therefore forward abstracts of titles as soon as possible, and can only trust, should it be evident the compensation offered is not adequate to the injury inflicted, it may be increased to what is considered more in accordance with strict justice.

The Commissioner for Railways.

I have, &c.,
EDWARD IRBY.

All the circumstances connected with this resumption have been carefully considered, and no increase in the amount of the offer can be recommended by the Land Valuer.—J.B.T., 23/10/83.
Commissioner.

Dear Sir,

Waterdale, 16 November, 1882.

I beg to draw your attention to some very important facts in connection with the extension of the Great Northern Railway from Glen Innes to Tenterfield and our property on the Bluff River, Bolivia, known as the Champion Flour Mill, Bluff River, Bolivia.

Knowing you are well acquainted with the country where our mill is situated, I will not describe it, but proceed to facts.

1. The above railway passes not only through our land but through the mill, also thereby causing the destruction of part if not the whole mill. This mill cannot be removed, for being worked by water power the present position is the only one where we can secure fall enough to work the mill, and the only position where the mill would be safe from floods.
2. The railway embankment through our property and near the mill, being 30 feet high, which is higher than the mill, we can derive no benefit from the railway either in fetching wheat to the mill or taking flour from it. This would be a very serious drawback and loss to us.
3. The embankment being so very close to the mill, the mill-race and the river completely shuts the mill in, and makes it impossible for drays, carts, or teams to get up to the mill; and even should a bridge be left in the embankment for teams to pass in and out, it would be useless, for the embankment is so very close to the mill and race that the drays and teams could not come in. This is a very serious matter, and one which completely ruins the mill business.
4. The destruction caused by the railway going through our property and so close to our mill, and thereby destroying our mill business, deprives me of my chief means of support, deprives me of my livelihood, and takes from me the business which I have been partner in and manager of for the last 12 years. This, dear sir, is a very serious loss to me, and one we should not lose sight of when we apply for compensation.

The mill is a first class one and in perfect working order, everything good and strong, and with a widespread good name. The mill is able to grind 100 bushels of wheat per day, and this with only one man to work the mill, thereby showing that everything must be good and compact. Owing to the very dry weather we have had these last few seasons the mill has not been kept in full work owing to the scarcity of water, but even then after paying all expenses I am able to show a good profit. With a good dam to hold water, or with a small steam engine, a very large business can be done at our mill—a business that would turn me in not less than £500 a year. And, dear sir, another great fact is this, that the business would increase every season, for every week we see farmers selecting within a few miles of our mill; and I am fully convinced that within a few years—say four or five—enough wheat will be grown within a radius of 10 miles to keep our mill at work all the year round.

These, dear sir, are the few facts I wish to draw your attention to, that they may be a guide to you when you apply for the compensation, which should not be less than £7,000.

Trusting you will look into this business properly, and have our claims put properly before the Government.

I remain, &c.,
A. G. ANDREWS.

E. Irby, Esq., Tenterfield.

MEMO. of Edward Irby's remarks and opinion in reference to his water-mill property, at Bluff River, now doomed to destruction through the railway works connected with the extension of the Northern Line from Glen Innes to Tenterfield.

NOTICING the Commissioner for Railways' advertisement calling upon those who objected to the proposed extension of the Great Northern Line to Tenterfield, to send such, with specified reasons, addressed to him,

him, I replied to such, as an objection, on account of the probable injury or interference with the trade of my mill property, but at that time was under the impression that although the line would come inconveniently close to the building, the rails would only be a few feet higher than the surface of the ground where passing it, and referred to gates being put up to afford the necessary access and egress; but when I became alive to the fact that the property might be seriously injured I thought it my duty to obtain the inspection and report of a competent judge, and who gave his opinion according to his then knowledge and belief, that the building at all events would not be touched, but since then, he ascertaining that the line of fencing would go through the building, has sent me an amended valuation, but merely based on the intrinsic value of the building, plant, and 40 acres freehold on which it stands. Having now made a personal inspection, I find that the property as a site for the mill is totally destroyed, and I am consequently compelled to take the whole subject into my most serious consideration.

The site for this mill was chosen by myself and an engineer some 12 years ago, through the grand and exceptional natural and other advantages offered, giving a fall of water sufficient for an overshot wheel of 20 ft. diameter, its close proximity to the main stream and at same time perfect immunity from all floods, and in addition to these, its most excellent trade position, it being the only mill between Tenterfield and Glen Innes, 14 miles from the former, and 46 miles from the latter place, so being in the midst of a large agricultural district, and only about three quarters of a mile from the main road between the places mentioned.

As a whole this mill site and property is unique, and has been the admiration of all who have visited it, and the gentleman whose survey has destroyed or leads to its destruction, has spoken of it in the highest terms of commendation as a property of ever increasing value.

The mill is complete in every respect, having two pairs of stones running, silk-dressing machine, &c., &c., and with present appliances can get through 600 bushels of wheat per week, but putting it down at 400 bushels actually to be ground, and half that grist at 9d. per bushel, and the other purchased, giving the usual estimated profit of 1s. 6d. per bushel, it would give an annual return of £1,170, and allowing a deduction of £470 for expenses, it would leave an income of £700, and which sum would fairly represent a capital of £10,000, and this without taking into consideration the increased value to this property through the extension of the northern line of railway, if constructed at a reasonable distance from, instead of running absolutely into the building.

In consequence of the unusual dryness of the last two or three seasons, the mill has not been kept up to its usual work, and an engine as an auxiliary power, has been purchased, but as the railway will cut off all access to the mill it is useless to go to the expense of placing it in position, or indeed to re-engage a miller, or make any attempt to carry on the business; and it would only be common justice on the part of the Government to at once enter into possession of this 40 acres freehold, which embraces the mill buildings, water power, and other advantages combined, such as, to the best of my belief, cannot be met with in any other part of this district. The water power this spot afforded was the great inducement to me enter into the mill business; that being destroyed, I have neither the wish to, nor thought of, shifting this or putting up another building for a similar purpose at any other spot. It is not for me to express any opinion as to whether the destruction of this valuable property could have been avoided, it is only now left to me to ask for a fair, and at the same time, full compensation for the loss I have to sustain of an annual income, and which I believe I am perfectly justified in estimating at the capital already mentioned, viz., ten thousand pounds (£10,000).

Tenterfield, 20 November, 1882.

EDWARD IRBY.

Sir,

Department of Railways, Sydney, 29 October, 1883.

In reply to your letter of the 16th instant, accepting the offer made to you by the Department, for land resumed for railway purposes, but demurring to the inadequateness of the amount, I have the honor to inform you that all the circumstances in connection with the resumption in question have been carefully considered, and I am unable, under report from the land valuer, to sanction any increase in the amount already offered.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

Mr. E. Irby, Tenterfield.

No. 4.

E. Irby, Esq., to The Commissioner for Railways.

Sir,

Tenterfield, 16 October, 1883.

Having only just received notice that the Government declines resuming my mill property on the Bluff River, although absolutely taking a portion of the building, I have the honor to direct your attention to the necessity of providing me with a suitable passage through the embankment as close to the mill as the present state of the works will admit, both to give access to the mill building, and also to the water, as the 280 acres of land connected with the mill is cut off from the whole of its water frontage. I would also ask that the fencing, instead of being erected in the building, as at present marked out, should, for the length of the building and 10 rods on each side, be put up as close to the embankment as may be considered safe. With another communication I post at the same time with this, I enclose photos., showing the position of the mill, and herewith I enclose a tracing, showing the railway line as it affects the said mill.

I have, &c.,

EDWD. IRBY.

Land Valuer.—L.P.I. (*pro* Secretary), 20/10/83.

A level crossing is recommended at 369 m. 47 c. Mr. Irby has already declined a proposal to have the fence placed at the foot of the embankment, and to have timber openings constructed, which compelled the payment to him of the full value of the mill: it is therefore submitted that it is not now expedient to make the concessions asked for.—J.B.T., 23/10/83. Commr.

Reply accordingly.—D.V. (*pro* Commr.), 24/10/83.

Sir,

Sir,

Department of Railways, Sydney, 29 October, 1883.

In reply to your letter of the 16th instant, asking for a passage through the embankment close to your mill on the Glen Innes and Tenterfield Extension, I have the honor to inform you that a level crossing has been recommended at 369 m. 47 c., and I am therefore unable to comply with your request. I may add that you have already declined the proposal to have the fence erected at the foot of the embankment, and to have timber openings constructed, thereby compelling the Department to pay to you the full value of the mill.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

E. Irby, Esq., Tenterfield.

No. 5.

E. Irby, Esq., to The Commissioner for Railways.

Glen Innes and Tenterfield Railway Extension.

Sir,

Tenterfield, 6 November, 1883.

I have the honor to acknowledge the receipt of your two letters, dated the 29th ultimo, informing me in the one that you cannot sanction any increase to the amount awarded as compensation for the injury done to my mill property, and, in the other, that you refuse to allow me access to the mill or water, through the embankment on that mill property, as a consequence of my declining to accede to a hastily proposed arrangement for access to the mill; and I feel it due to myself to offer some few explanatory remarks in reference to my so declining.

Directly the tender for the railway construction was accepted, it was, I presumed, open to the contractors to commence the work at my mill at any time that might suit their convenience, and I knew it must be impossible for the mill work to go on at the same time; and directly I became aware that the line of fencing would go absolutely through the building, completely cutting off all business access to it, and the embankment would be just about the same elevation as the mill, and the base line only 8 yards from the building, I considered the property destroyed for the purpose for which I had purchased and improved it. I consequently abandoned it, but allowed a married man to live in the miller's cottage in consideration for his doing what he could to preserve the mill and machinery from wanton destruction by the navvies and their camp followers.

About four months elapsed after the contract was taken, before I was supplied with a tracing, showing what property of mine was resumed for this extension, and called upon to fill up the schedule of claim handed to me. In the meantime I had asked Mr. Andrews to draw up a statement of his view of the injury to the property, and I drew up one of my own—both of which I have transmitted to you—and in filling up the schedule I adopted Mr. Andrews' valuation, as being lower than mine.

Just about six months after sending that schedule to your Department the valuator came to make his assessment, and during that long period not a hint was given to me as to the intention of the Department in reference to this special inquiry and claim.

The mill was inspected by the valuator on his way to Tenterfield, and Mr. Andrews, who had been in charge of the mill ever since its construction, and was deeply interested in its working, accompanied him. On their arrival in Tenterfield, I was told that an offer was made by the valuator to have two timber openings constructed through the embankment for access to the mill.

The valuator was pressed for time, and I consequently had to come to a hurried determination as to whether I would agree to this or rest my claim for full compensation upon the actual resumption of the property; and as it appeared to me most doubtful whether, under all the circumstances, I should be able to work the mill even if I had access to it, and as I should receive very little compensation if I worked upon the openings as sufficient, I deemed it my wisest plan to ask for full compensation; but to prove I had not the slightest wish to act in a spirit of extortion, I handed the valuator my written intention of accepting the amount of compensation offered to me, believing the Government would wish to act not only justly but liberally; and I do not think that I should have said a word about increased compensation had not the valuator himself said that it was possible a revision might be made if I could show just and reasonable grounds for such.

It is still doubtful to me whether it would be worth my while to go to the expense of repairing the damage done to the building and machinery and try to work it again, even if I had access through the embankment granted, and I will give it another inspection before finally deciding upon removing it; but I will also transmit a separate formal letter upon the subject of an opening being left for access to water.

In conclusion, I must say I think it very hard to be reproached with a compulsory action against your Department on my part. For the benefit of the farming population as well as my own, I went to the great expense of erecting this mill and bringing the water to it, the site being nine miles from my homestead; and this was done some twelve years ago, when a railway near it was not dreamed of. And if it was even necessary, now the railway is being constructed, to bring it in the direction of the mill,—by keeping it two chains further away, and giving a right of access, my property would have been left intact and no compensation required.

I have, &c.,

EDWARD IRBY.

No. 6.

E. Irby, Esq., to The Commissioner for Railways.

Railway Extension from Glen Innes to Tenterfield.

Sir,

Tenterfield, 7 November, 1883.

On going into the matter of preparing abstracts of titles in reference to the lands resumed by the Government for railway extension, I find I have been in considerable error from the outset, as portions set out in the tracing supplied to me should have been in the names of my son, Mr. Edward L. Irby, and my son-in-law, Mr. Edward V. Carr, acting as trustees for my wife; and I also find one of these lots has since been sold by them.

Again,

Again, I cannot give titles to other portions till I receive a release from a sister in England, and which I expect by an early mail, and I find my solicitor has already forwarded these abstracts of title to your Department, so they can either be retained or returned till the necessary release is received.

My son and son-in-law are willing to accept the compensation as included in mine, and will forward their abstracts of title with mine; and they will write to purchaser of piece they sold—from which only three perches is resumed—and ask him to accept the compensation and forward abstract of title.

I would here mention that in the schedule of claim I forwarded—a copy of which I annex—I made a separate claim for distinct portions, but the compensation offered to me is included in a lump sum; might I therefore request the amounts of compensation offered should be given as they bear upon those distinct portions. Those for which the necessary titles can be at once given could then be disposed of without further delay.

I have, &c.,

EDWARD IRBY.

Railway Extension—Glen Innes to Tenterfield.

SCHEDULE of Claim.

Tenterfield, 7 November, 1883.

Land resumed:—Reference Nos., 50, 1, 2, 3, and 4; area, 10 acres 25 perches; cultivation; estimated value, £25 per acre; total value, £251 10s. Reference Nos., 174 to *187; area, 52 acres 1 rood 9 * 186 Mill. perches; pasture; estimated value, £3 per acre; total value, £156 10s.

Value and description of improvements taken:—Fence, 42 rods at 4s., £8 8s.; damage by severance or otherwise, £183 17s.; total destruction of No. 186 as a mill property, for which purpose only it was purchased and improved, £7,000; total amount of claim, £7,600 5s.

MEMO.—Compensation offered and accepted, £1,790 12s. (For explanation see correspondence).

E. I.

No. 7.

E. Irby, Esq., to The Commissioner for Railways.

Sir,

Tenterfield, 7 November, 1883.

In my letter of yesterday's date, in which I acknowledged your two letters dated the 29th ultimo, I mentioned my intention of addressing a second letter specially referring to the necessity of my being granted an opening for access to water, and I now do myself the honor of calling your attention to the facts connected with such request.

In consequence of the expensive improvements made and erected on my freehold property of 40 acres marked on the tracing supplied by your Department as No. 86, I applied for an additional 600 acres to make up the complete selection; but when the District Surveyor proceeded to measure he found that from the special natural features of the country an area of 240 acres would command a water frontage for 600 acres, and consequently I shall only be allowed the smaller quantity.

By a reference to the tracing you will observe that at Nos. 183-5 and 6 the whole of my water frontage is cut off by the railway, so that I not only have lost the 360 acres of land through having too large a frontage to the water, but now I am cut off from the whole of such frontage, and have not a single opening left for access to the water.

In your letter, as indicated by marginal number, I am informed that a level crossing has been recommended at 369 m. 47 ch., but even if such is granted at that spot, wherever it may be, I need hardly point out that a level crossing is useless as a means for depastured stock to get to water.

On referring to the tracing I find the 369 mile is marked on No. 186, and presuming the 47 chains would extend northwards, the level crossing would be far beyond the property I am referring to.

I can only point out the injustice that will be done me if no proper access to water is given in this 230 acre block, and ask you to leave it to the proper officer to recommend where such should be given.

I have, &c.,

EDWARD IRBY.

Land Valuer.—G.B., 13/11/83. Mr. Irby's cattle can get access to the severed land under the Bluff River bridge without difficulty. A level crossing was recommended for Mr. Irby's use at 368 m. 68 ch. 50 lk. on 12/2/83. This is within the 240 acres to which he refers.—J.B.T., 28/11/83. Commissioner. Is the level crossing to be given? Ask Engineer-in-Chief.—CH.A.G., 30/11/83. Yes.—W.H.Q., 8/12/83. Commissioner. Inform.—CH.A.G., 13/12/83.

Sir,

Department of Railways, Sydney, 19 December, 1883.

In reply to your letter of the 7th ultimo further respecting the facilities which you ask for, to enable you to cross the railway line, now under construction from Glen Innes to Tenterfield, for the purpose of watering your stock, I have the honor to inform you that the matter has been referred to the Land Valuer, and I find that your cattle can get access to the severed land under the Bluff River bridge without difficulty. A level crossing will also be given at 368 m. 67 ch. 50 lks. This is within the 240 acres to which you refer.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

Mr. E. Irby, Tenterfield.

Sir,

Tenterfield, 8 January, 1884.

In doing myself the honor to acknowledge the receipt of your letter dated 19 December, 1883, it is at the same time a simple duty to point out the error the Land Valuer has fallen into in reference to facility afforded by the Bluff River bridge for the watering of stock depastured on my mill property of 230 acres.

The mill property is totally distinct from the station property, and does not extend west beyond the northern road from Glen Innes to Tenterfield. A further reference to my letter of 7 November, 1883, and the railway tracing, will show that the whole of the water frontage is severed from that property.

Should

Should the "Bluff River bridge" mentioned be the new one to be erected for the railway, I may point out that that bridge will be on a freehold property purchased by trustees for my wife, and is distinct from either the mill or station property. Having from the first stated my intention of abiding by the decision of the Land Valuator, I consider that I am cut off from further contention in this matter, so apologising for the trouble I have already given your Department.

The Commissioner for Railways.

I have, &c.,
EDWARD IRBY.

Land Valuer.—G.B., 15/1/84. Seen. No further action asked for—J.B.T., 18/1/84.
Commissioner.

No. 8.

E. Irby, Esq., to The Commissioner for Railways.

Glen Innes and Tenterfield Railway Extension.

Sir, Tenterfield, 13 November, 1883.

Referring to mine of the 7th instant, on the subject of the abstracts of titles for lands resumed in above-mentioned railway extension, I have the honor to inform you that all the abstracts forwarded by my solicitor to the Department, including Nos. 50, 1, 2, 3, and 4, can be acted upon and executed as the Act requires.

The title to No. 174, from which only 3 perches are resumed, is in the hands of Mr. Barrett, of the "Bolivia Hotel," who is now in England, and about which I of course cannot interfere.

I have, &c.,
EDWARD IRBY.

£7,600 5s.
62a. 1r. 33p.
£1,790 12s.

No. 9.

E. Irby, Esq., to The Commissioner for Railways.

Northern Line—Glen Innes and Tenterfield Extension.

Sir, Tenterfield, 23 July, 1884.

I do myself the honor to ask your attention to the following, in reference to a crossing for cattle on Bolivia Run. At first I was informed that a double width underbridge would be left; then a place was marked for an overbridge at 362 miles 3 chains; now I am told it is proposed to leave a level crossing of the ordinary width at the south mouth of 92 cutting, and at the 361 m. 61 c. peg.

It is now my duty to point out that cattle and horses only are being depastured on Bolivia Run, and that during the branding and mustering season some four or five thousand head of stock will have to cross the line at this spot, and if the crossing is only made the ordinary width there will be great danger of cattle breaking on to the line; to obviate which, in a great measure, I would respectfully suggest that if such level crossing is finally decided on, it should be of double the ordinary width.

I have, &c.,
EDWARD IRBY,
Lessee of Bolivia Run.

Engineer-in-Chief.—R.J.S. (*pro* Commissioner), 29/7/84. Land Valuer.—W.H.Q., 4/8/84. Mr. Irby's request is a reasonable one, and it is recommended that it be complied with if possible.—J.B.T., 6/8/84. Commissioner. Engineer-in-Chief.—R.J.S. (*pro* Commissioner), 8/8/84. Mr. Wade.—W.H.Q., 9/8/84. Double 10-foot gates and crossing approved by Engineer-in-Chief.—W.B.W., 12/8/84.

No. 10.

E. Irby, Esq., to The Commissioner for Railways.

Sir, Tenterfield, 13 October, 1884.

I do myself the honor to call your attention to the following facts in connection with the Glen Innes and Tenterfield Railway Extension:—

I have a farm about two miles north of Glen Innes (mileage as mentioned in margin) severed by the line. When the Government Valuator was in Tenterfield he told me he would visit the farm and decide with my manager there, where communication between the severed portions should be given me; my manager, however, subsequently told me he had not seen the valuator.

Now the line is constructed, and the contractors' engine running through the farm. The only communication at present left me is a low culvert over a water-course, under which sheep and calves could pass in dry weather; but as my farm is purely agricultural, and I have no sheep, I am positively cut off not only from the whole of my water frontage, but also from communication with about 70 acres of the best of my land on the western side of the railway. As, however, a Government road runs through my farm, and the rail crosses it, I presumed, as a matter of course, that a public crossing would be made there, but being informed yesterday by a Government officer that there was no intention of so doing, I am compelled to call your attention to it, as I am completely cut off from access to that portion—nearly one-third of my farm.

I might mention there is a Government reserve joining my farm on the eastern side of the railway, and if I was allowed an acreage out of that reserve equivalent to what is cut off on the western side, there would be no necessity for the expense and danger of a crossing to connect the severed portions, and no injustice would be inflicted on the public, as I am the only land-owner on each side of that road so crossed by the line.

I have, &c.,
EDWARD IRBY.

Land Valuer L.P.I. (*pro* Secretary), 22/10/84. A level crossing is recommended at 326 miles 32 chains.—J.B.T., 27/10/84. Commissioner. Approved.—D.V. (*pro* Commissioner), 31/10/84.

Sir,

326-7 miles.

Sir,

Department of Railways, Sydney, 5 November, 1884.

With reference to your letter of the 18th ultimo, asking that a crossing may be made over the Glen Innes to Tenterfield Railway to connect the severed portions of your land, I have the honor to inform you that a level crossing will be provided at 326 miles 32 chains.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

Edwd. Irby, Esq., Tenterfield.

No. 11.

E. Irby, Esq., to The Crown Solicitor.

Sir,

Tenterfield, 13 November, 1884.

Mr. Robinson, solicitor, has handed me your communication of the 9th ultimo, to him—as noted in margin—thinking it best for me personally to submit my explanation in reference to its subject matter, and I now have the honor to say that shortly after my writing my letter to Commissioner for Railways, dated 7th November, 1883, and referred to in your said letter, I found there was no bar to my giving a clear title to the land resumed at Glen Innes, and wrote at once to the Department to say so.

The communication from the Railway Department—as noted in margin—informed me that a lump sum of £1,790 12s. was granted as compensation for 62 a. 1 r. 33 p. of my land resumed—giving me no clue as to the portions or amounts paid for each, included in such lump sum.

The next communication from the Department—as noted in margin—informed me that vouchers for £221 19s. 6d. and £1,308 18s. 10d., compensation for land, &c., resumed for railway purposes, had been forwarded to the Treasury; no intimation being given as to the resumed land these sums referred to. It was, however, evident to which the larger sum referred; but the smaller amount I believed was the compensation for the Glen Innes property.

On my return to Tenterfield after an absence of some months, and having no advice in reference to the balance—£259 13s. 8d.—still due to me, I requested Mr. Robinson to address you upon the subject, and your reply, handed to me, was the first intimation I received that such balance was the compensation for the land resumed at Glen Innes.

In conclusion, I can only repeat there is no bar to my giving a clear title for the land resumed at Glen Innes—the abstracts for which were duly transmitted by Mr. Robinson.

I have, &c.,

EDWARD IRBY.

Sir,

Crown Solicitor's Office, Sydney, 17 November, 1884.

I have the honor to forward herewith letter received from Mr. Irby, relative to the balance of compensation money due to him. I await your instructions in the matter.

I have, &c.,

JOHN WILLIAMS,

Crown Solicitor.

The Commissioner for Railways.

Land Valuer.—L.P.I. (*pro* Secretary), 22/11/84. The abstract of title has not yet been furnished for the following portions:—Portion 9, 42 acres 3 roods, parish of Bolivia, county of Clive; portion 10, 42 acres 3 roods, parish of Bolivia, county of Clive; portion 11, 42 acres 3 roods, parish of Bolivia, county of Clive; portion 96, 640 acres, parish of Bolivia, county of Clive; portion 26, 240 acres, parish of Joudal, county of Clive; portion $\frac{2}{3}$, 52 acres, parish of Joudal, county of Clive.—J.B.T., 4/12/84. Commissioner. Inform.—CHAS. A. G.

Sir,

Department of Railways, 9 December, 1884.

Referring to your letter of the 13th ultimo, addressed to the Crown Solicitor, which has been forwarded to this office, respecting balance of amount due to you as compensation for land resumed, Glen Innes to Tenterfield extension, I have the honor to inform you that the matter cannot be settled until abstract of title has been furnished for the following portions:—Portion 9, 42 acres 3 roods, parish of Bolivia, county of Clive; portion 10, 42 acres 3 roods, parish of Bolivia, county of Clive; portion 11, 42 acres 3 roods, parish of Bolivia, county of Clive; portion 96, 640 acres, parish of Bolivia, county of Clive; portion 26, 240 acres, parish of Joudal, county of Clive; portion $\frac{2}{3}$, 52 acres, parish of Joudal, county of Clive.

I have, &c.,

CHAS. A. GOODCHAP,

Commissioner for Railways.

Edward Irby, Esq., Tenterfield.

Sir,

Tenterfield, 13 January, 1885.

As instructed by Mr. E. Irby of this town, we have the honor to forward you herewith, under separate cover, abstract of the title of Messrs. Edward De Crespigny Irby and Edward Priestly Carr, as tenants in common to portions 10 and 11, parish of Bolivia, and portion $\frac{2}{3}$, parish of Tenterfield.

We are sorry the abstract should appear in the condition it does, but we are unable to procure better material here at present.

We also have the honor to enclose herewith a letter addressed to you by Mr. Irby relating to the above matter.

We have, &c.,

ROBINSON & PANTON.

The Commissioner for Railways.

Land Valuer.—D.C.M'L., 15/1/85. Description and tracing of land, abstract of title, and certificate of identity, herewith.—J.B. (*per* A.B.), 30/1/85. Commissioner.

Sir,

Tenterfield, 5 January, 1885.

Absence from Tenterfield has caused the delay in my replying to your communication dated December 9th, 1884, as noted in margin. I now beg to say that the whole of the misunderstanding in reference to the subject, arises from my never having been informed as to what portions of my property resumed, the special sums for compensation were granted.

When first communicating with your Department upon the subject of abstracts of title, it was explained that portions 9, 10, 11, and $\frac{2}{3}$, were freeholds purchased by my eldest son, Edward De C. Irby, and my son-in-law, Edward Priestly Carr, as trustees for my wife, and that portion 9 had been sold and transferred by them to Mr. Elijah Barrett, of Bolivia Hotel.

I now enclose abstracts of title to the other portions 10, 11, and $\frac{2}{3}$. but as the remaining portions mentioned in your communication—96 and 26—are free selections, the title to same rests with the Lands Department, to which I must refer you.

I have, &c.,

EDWARD IRBY.

No. 12.

E. Irby, Esq., to The Commissioner for Railways.

Sir,

Tenterfield, 17 January, 1885.

Immediately after the receipt of your communication of 5th November, 1884, informing me that a level crossing would be provided at 326 m. 32 ch., I addressed Cobb & Co. in reference to it, as the want of communication between severed portions of my land was becoming a serious matter to me, and they were ready to act as soon as they had official intimation where these level crossings in the vicinity of the town of Glen Innes were to be made. I received the following intimation from them yesterday:—“This morning we received from Mr. Wright, the District Engineer, a list of both public and private level crossings for this contract, and we find there is to be a level crossing at 326 m., but no mention of one at 326 m. 32 ch.” I may mention it is a public road the line crosses at both 326 m. and 326 m. 32 ch., but that all the land on each side of the road crossed at 326 m. 32 ch. is my private property; but as it is a public road, I presume if a level crossing is made there a gate-keeper must be kept at it; at the same time, as the public could not be injured if it was closed, the question arises whether it would not be better to give me a level crossing on my own property at about (say) 326 m. 50 ch., where the natural surface is on a level with the rails, the gates at which could be in my care, and which spot would have been pointed out to the Government Valuator had he visited the farm according to his promise, and in all probability adopted as the spot for the crossing.

I have, &c.

EDWD. IRBY.

Land Valuer.—D.C.M'L., 22/1/85. The Engineer-in-Chief should be informed that a gate is required at 326 m. 32 ch., and has been recommended by the Land Valuer. As there is no traffic on (or likely to be) this road, the keys ought to be handed to Mr. Irby.—J.B.T., 27/1/85. Commissioner. Forward to Engineer-in-Chief.—Ch.A.G., 31/1/85. Mr. Wade.—W.H.Q., 3/2/85. Mr. Wright to note remarks of Land Valuer.—W.B.W., 13/2/85. Noted.—J.W., 16/2/85.

No. 13.

Messrs. Robinson and Panton to The Commissioner for Railways.

Sir,

Tenterfield, 11 April, 1885.

With reference to your letter, No. 84/11,123, dated 9 December, 1884, and addressed to Mr. Edward Irby, we are instructed to inform you that portion 96, 640 acres, and portion 26, 240 acres, parish of Joudal, county Clive, therein referred to, are conditional purchases, upon which the balances have not yet been fully paid, and in respect of which Mr. Irby holds certificates of conformity, abstract of which we have the honor to forward you herewith, and to request that the sum of £206 19s. 4d., being the amount of compensation money due to Mr. Irby in respect of the resumed parts of the said two portions, may be paid to Mr. Irby as soon as the practice of your Department will permit.

We also have the honor to inform you that the three portions, 10, 11, and $\frac{2}{3}$, parish of Joudal, mentioned in your said letter, are freeholds, and that the transfer of the resumed parts has been forwarded by us to the Crown Solicitor; and further, that portion 9, parish of Bolivia, also mentioned in your said letter, does not belong to Mr. Irby, but to some person named Barrett.

We have, &c.,

ROBINSON & PANTON.

Land Valuer.—L.P.I. (*pro* Secretary), 14/4/85. Abstract of title, two descriptions and tracings of land, and two certificates of identity, herewith.—J.B. (*per* A.B.), 10/6/85. Commissioner.

No. 14.

The Crown Solicitor to The Commissioner for Railways.

Sir,

Crown Solicitor's Office, Sydney, 20 April, 1885.

I have the honor to inform you that this matter has been completed, and to forward herewith voucher for payment of the purchase money, £52 14s. 4d., the amount of which may be paid to Joint Stock Bank, Tenterfield, as therein authorized.

I have, &c.,

JOHN WILLIAMS,

Crown Solicitor.

Examiner.—

11

Examiner.—D.C.M'L., 21/4/85. This claim is scheduled in the name of Edward Irby, but voucher is in favour of E. De Crespigny Irby and E. P. Carr. I presume it is necessary to re-schedule.—T.S. (*pro* Examiner), 27/4/85. Secretary. Will Land Valuer please say.—D.C.M'L., 28/4/85. Must be re-scheduled.—J.B. (*per* A.B.), B.C., 29/4/85. Commissioner. For Commissioner's approval.—G.B., 30/4/85. Approved.—Ch.A.G., 1/5/85. Land Valuer.—G.B. Re-scheduled.—J.B., 8/5/85. Ex. Min. 85-14, 2/6/85.—J.B. (*per* A.B.) Pay £52 14s. 4d.—Ch.A.G. Voucher forwarded for payment.—T.S. (*pro* Examiner), 5/8/85.

No. 15.

E. Irby, Esq., to J. Wright, Esq.

Sir,

Vesuvius Farm, Glen Innes, 14 September, 1885.

I must again address you upon the necessity of my having communication across the railway line between the severed portions of my farm, about 50 or 60 acres; and the whole of the water frontage being cut off from the whole, 251 acres, comprising the farm. There is, as you are aware, a passage across the line on a public road, which also severs my farm, such road giving access to the Glen Innes creek from a public reserve, and it is utterly impossible that I can be placed in any responsibility in reference to the gate at such crossing. At the present time and for months past there are people camped on that reserve, and they are daily morning and evening driving some 14 or 16 horses through the gates at that crossing to water; and to get at my creek frontage to water my own stock I at present am compelled to drive them out of my paddocks into that public road, where they may get mixed with any other stock feeding there, and all may go across the line together. Again, the gates are so hung that when open for passage across the line they do not close the line, so that stock of whatever description can turn either to the left or right along the line, and there would be less danger to an engine and train going slick through a gate than jumping over the carcass of a beast.

In a former letter on this subject, I pointed out the ease with which access could be given across the line to my water frontage from the chief grazing portion of my farm; it is a level crossing at a cutting close to my northern boundary. At this spot, being on my own ground, I could take charge of the key, but I shall positively decline to take charge of the key of a gate on a public road.

The matter is becoming of such serious import to me that I must take legal advice how to act should my appeal be of no avail.

I have, &c.,
EDWARD IRBY.

District Engineer's Office, Bluff River, 19 September, 1885.

Memo. to The Engineer-in-Chief.

I BEG to forward herewith a letter from Mr. Edward Irby in reference to the public crossing at 326 miles 32 chains, in which he now appears to object to the proposal of the Land Valuer (memo. Engineer-in-Chief, 84/3,479), and wants a private crossing at 326 miles 62 chains.

A crossing at the latter point would undoubtedly be of more service to him than the public crossing at 326 miles 32 chains, and I would respectfully recommend his request to your favourable consideration.

JOHN WRIGHT.

Land valuer.—W.H.Q., 25/9/85. Crossing recommended at 326 miles 62 chains for Mr. Irby's private use.—J.B.T., 2/10/85. Commissioner. Engineer-in-Chief.—G.B. (*pro* Commissioner), 7/10/85. Mr. Wright.—W.H.Q., 9/10/85. Mr. Irby and contractors informed.—J.W., 12/10/85.

No. 16.

C. A. Lee, Esq., M.P., to The Commissioner for Railways.

Sir,

Legislative Assembly, Sydney, 23 November, 1885.

Referring to your letter of the 19th December, 1883, No. 83-9,583, in reply to Edward Irby's request to have access left for his cattle to get to water, and in which it is stated the intention of the Department is to make a level crossing at 368 m. 68 c. 50 l.; and also referring to yours of 29th October, 1883, No. 83-9,037, informing Mr. Irby that a level-crossing had been recommended at 369 m. 47 c., I have to direct your attention to the fact that this matter has escaped notice, and Mr. Irby is desirous that the level-crossing should be made at 369 m. 47 c., which would give ready access to the water and to the old mill property to remove the machinery therefrom. There can be no doubt that unless a crossing is left at this point Mr. Irby's cattle will, on this side, be completely cut off from the water. The proposed crossing at 368 m. 68 c. 50 l., going through the 240 acres, will not give any access to the mill property on account of the rocky nature of the intervening land.

I would suggest a gate and gatekeeper, as it will be an important crossing place.

I have, &c.,
C. A. LEE.

Land Valuer.—G.B., 26/11/85. This should be referred to the Engineer-in-Chief.—J.B.T., 27/11/85. Commissioner. Engineer-in-Chief.—G.B. (*pro* Commissioner), 28/11/85. Mr. Wright for report.—W.H.Q., 2/12/85.

District Engineer's Office, Bluff River,

7 December, 1885.

Memorandum to the Engineer-in-Chief.—
THE crossing applied for by Mr. Irby at 369 m. 47 c. is one of the least important upon the whole length, as it will only give access to a few acres of ground and a small water frontage, which could and will, I have no doubt, be as readily reached by way of the openings in the Bluff River bridge.

To

To suggest a gatekeeper at this place is most absurd and unreasonable—as well put a gatekeeper at every private crossing—and I feel assured that Mr. Lee knows nothing whatever about the place or he would not have made such an unreasonable suggestion. When this crossing is made Mr. Irby cannot utilize it for taking his machinery from the mill without going to considerable expense in making a dray road through hard granite rock, and I question if Mr. Irby will ever use it for watering stock. I shall, before giving instructions to the contractors to construct the crossing, ask Mr. Irby to meet me on the ground and give more particulars as to what he really wants.

JOHN WRIGHT.

Vesuvius Farm, Glen Innes,
14 December, 1885.

Memo. to John Wright, Esq., District Engineer, Bluff River.

Not meeting you on Friday, I felt satisfied my memo. in reply to yours had not been received. I could see plainly that a crossing at 369 m. 47 c. would be useless.

I can only quietly submit to the frightful injustice inflicted on me by the Railway Department in destroying a property that would give an income of some £400 per annum, and giving compensation based upon the official estimate of the mere value of the mill building.

EDWARD IRBY.

Bluff River, 29 December, 1885.

Memo. to the Engineer-in-Chief.

In reference to the private crossing for Mr. Irby at 369 miles 47 chains, on my showing him upon the ground that the crossing would be of no service to him for either watering his stock or removing the machinery from the mill, he requested me not to put in the crossing at all.

JOHN WRIGHT.

No. 17.

E. Irby, Esq., to Mr. District Engineer Wright.

Sir,

Tenterfield, 23 January, 1886.

Mr. Keating, my superintendent at Bolivia, has pointed out to me the necessity of private gates being left at Cobb & Co.'s Main Camp, to enable us to work amongst our cattle on Hurry's Hill country to the east of the line, so I write to ask if you will kindly take this request into your consideration, and if satisfied it is a reasonable one, recommend it to the head of your department.

I am, &c.,

EDWARD IRBY.

I saw Mr. Keating to-day in reference to the above letter from Mr. Irby, and upon making inquiries as to the reason why the application was made so late, Mr. Keating informed me that he was under the impression that the old road would not be altered; had such been the case there would have been a public crossing at 356 miles, through which they could have brought the cattle to the head station. The diversion of the old road between 355 and 357 miles, of course, renders the public crossing at 356 miles unnecessary, but the railway fence cuts $6\frac{1}{2}$ miles of the run off, and there is no access to it unless through Cadell's or Collins' properties. I really think Mr. Irby's request for a crossing is reasonable, and would most respectfully recommend that a private crossing be granted him at 356 miles 45 chains.—J. WRIGHT, 25/1/86. The Engineer-in-Chief.

Land Valuer.—W.H.Q., 27/1/86. Construction of crossing at 356 miles 45 chains is recommended by Land Valuer.—J.B.T., 3/2/86. Commissioner. Engineer-in-Chief.—G.B. (*pro* Commissioner), 10/2/86. To be carried out.—W.B.W., 12/2/86. Mr. Wright.

No. 18.

The Crown Solicitor to The Commissioner for Railways.

Sir,

Crown Solicitor's Office, Sydney, 5 March, 1886.

I have the honor to inform you that this matter has been completed, and to forward herewith voucher (for £206 18s. 1d.) for payment of the purchase money, the amount of which may be paid to the Australian Joint Stock Bank, Tenterfield, as therein authorized.

The original voucher herein was lost on being sent for signature.

I have, &c.,

JOHN WILLIAMS,

Crown Solicitor.

Voucher correct, and forwarded for payment.—T.S. (*pro* Examiner), 19/3/86.

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(CONSUMPTION OF COAL ON SOUTH-WESTERN LINE FOR 1886.)

Ordered by the Legislative Assembly to be printed, 20 April, 1887.

[Laid upon the Table of the House in accordance with promise made by the Honorable the Secretary for Public Works, in answer to Question No. 19 on Votes and Proceedings of 22nd March, 1887.]

RETURN showing:—

- “(1.) The consumption of coal in 1886 on the South-western Railway and all its branches, including that used for stationary engines and all other Government works.
- “(2.) The amount paid per ton for the coal so used on the above railway.
- “(3.) The difference in price paid for Lithgow and Newcastle coal used on the said railway.
- “(4.) The cost per ton per mile for carrying the coal consumed on the said railway.
- “(5.) The number of tons of coal which the Government carried for public use by the said railway, and the rate per ton per mile.”

(19.) Consumption of Coal on South-western Railway:—Mr. JONES's questions.

(1.) What was the consumption of coal last year on the South-western Railway and all its branches, including that used for stationary engines, and all other Government works?

Answer: 4,372 tons 11 cwt.

(2.) What did the Government pay per ton for the coal so used on the above railway?

Answer: 4s. 5d. per ton.

(3.) What was the difference in price paid for Lithgow and Newcastle coal used on the said railway?

Answer: Newcastle coal is not used on the South-western Line.

(4.) What does it cost per ton per mile for carrying the coal consumed on the said railway?

Answer: It is estimated at 18s. 6d. per ton.

(5.) What number of tons of coal did the Government carry for public use by the said railway, and at what rate per ton per mile?

Answer: 497 tons; three farthings per ton per mile.

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

GAS-WORKS, RAILWAY DEPARTMENT.

(PURCHASE OF, FROM J. L. CASTNER)

Ordered by the Legislative Assembly to be printed 20 April, 1887

[Laid upon the Table of the House in accordance with promise made by the Honorable the Secretary for Public Works, in answer to Question No 3, on Votes and Proceedings of 23rd July, 1886]

SCHEDULE

NO		PAGE.
1.	Minute of Chief Clerk, dated 7th January, 1884, asking for papers of Castner's supply of gas to carriages and particulars of contract, with minute	2
2.	Letter from J. L. Castner, dated 15th January, 1884, to Commissioner respecting contract for fitting gas apparatus and supplying gas to railway carriages, with statement of claim	2
3.	Minute of Commissioner to Mr. Cowdery, and instructions to write to Mr. Castner asking for detailed statement of claim, with such letter, dated 18 January, 1884	2
4.	Inventory of works and plant sent in by Mr. Castner, dated 21st January, 1884, with minutes, correspondence, &c., in connection therewith	3
5.	Departmental valuation of J. L. Castner's gas works, with minute of Commissioner, and report by Mr. Cowdery thereon, dated 7th March, 1884	3
6.	Statement respecting provisions of agreement with J. L. Castner, dated 1st March, 1884	4
7.	Minute of Commissioner, dated 18th March, 1884, relative to appointment of arbitrators to make valuation of gas-works and appliances, with letter to Mr. Castner, dated 19th March 1884, in respect of the appointment by Mr. Castner of an arbitrator	4
8.	Letter from Mr. Castner, in reply to preceding letter of the Commissioner dated 20th March, 1884, with minutes thereon	4
9.	Letter from Secretary of Railways, dated 27th March, 1884, to Secretary, Gas Company, Sydney, asking him whether there would be any objection to Mr. Bush acting as arbitrator on behalf of the Government	5

No. 1.

Minute by The Chief Clerk.

ALL papers *re* Castner's supply of gas carriages required.—G.B., 7/1/84. Very urgent.

THE particulars of the contract are as follows:—

Contract expires on 14th May, 1884, or sooner, if the Commissioner so determines, on giving one month's notice.

The Commissioner is to take over, at the termination of the contract, all buildings erected, all plant, implements, and appliances which have been in use by the contractor. The cost of such is to be determined by valuers, one to be appointed by Commissioner, and one by contractor. The two so appointed to nominate a third party. All materials required in connection with the contract to be carried free by rail. The monthly amount for the Southern and Western lines is £260, and for the Northern line £90.

The prices to be paid for fitting the different carriages, &c., are as follows:—

	South and West.			North.		
	£	s.	d.	£	s.	d.
Ordinary carriages	40	0	0	35	0	0
American „	57	15	0	50	10	0
Ashbury „	80	0	0	70	0	0
Sleeping „	80	0	0	70	0	0

D.C.M'L., 8/1/84.

Mr. Castner will send in a statement of the amount he claims for the building.

We will then make offer. If an agreement cannot be arrived at, each side will appoint a valuer, who will appoint an umpire, and the decision of the valuers, or if they fail to agree, the decision of the umpire to be final.—C.A.G. J. L. Castner, 11/1/84.

No. 2.

J. L. Castner, Esq., to The Commissioner for Railways.

Sir,

Railway Gas-works, Sydney, 15 January, 1884.

Referring to our conversation on Friday last respecting my contract with you for fitting gas apparatus and supplying gas to railway carriages, I beg to hand you herewith a statement of the amount of my claim, as provided for in contract above referred to, dated June 2/82, that is to say, for all buildings erected by me. Also, all such plant, implements, and appliances which have been in use in the performance of said contract, which I am prepared to hand over to you on the payment of the amount so claimed, or such sum as we may agree upon, or as may be awarded by valuers, as per conditions of contract.

I have, &c.,

JOHN L. CASTNER.

Sydney, 15 January, 1884.

THE Commissioner for Railways, Dr. to John L. Castner.

For the whole of my gas-works at Redfern, Bathurst, Newcastle, and Junee, consisting of buildings, retorts, scrubbers, purifiers, gas-holders, reservoirs, engines, boilers, pumps, compressor, mains, services, and material on hand, all in good working order, as now, with the right to use my Patent Regulator for railway carriages on your railway during its currency..... £35,935 12 6

No. 3.

Minute by The Commissioner for Railways.

MR. COWDERY will please make a valuation in detail when he has received from Mr. Castner a valuation in detail. I cannot accept a lump sum in this way.

Write to Mr. Castner to this effect.

C.A.G., 15/1/84.

The

The Commissioner for Railways to J. L. Castner, Esq.

Sir,

Department of Railways, Sydney, 18 January, 1884.

Referring to your letter of the 15th instant, respecting your contract for supplying gas to the railway carriages, and handing therewith a statement of your claim, as provided for in the contract in question, in the event of the Department taking over your plant, &c., I have the honor to inform you that I am unable to accept the statement in a lump sum, as tendered by you, and have therefore to request that you will be good enough to furnish me with a valuation and estimate in detail.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.

No. 4.

J. L. Castner, Esq., to The Commissioner for Railways.

Sir,

Railway Gas-works, Sydney, 21 January, 1884.

As you have requested, I beg to hand to you herewith an inventory of works and plant at my several gas-works, and which I value as under :—

At Redfern	£13,875	3	3
At Bathurst	5,276	8	4
At Junee	4,535	5	4
At Newcastle	5,534	2	9
			£29,220 19 8
Right to use my Patent Regulator on your railway carriages during its currency—9 years		5,000	0 0
There is also material on hand at the following stations for use. Its present value is—			
At Redfern	£1,485	16	6
At Bathurst	29	9	11
At Junee	76	3	0
At Newcastle	123	3	5
			£1,714 12 10
			£35,935 12 6

This will vary in quantity and value according to amount added or used.

I have, &c.,

JOHN L. CASTNER.

I cannot credit that Mr. Castner's works can be worth this amount of money; depreciation must be taken into consideration, and a large amount written off on this account. Mr. Cowdery must be careful in making a valuation in detail, and employ competent mechanics and builders in all cases of doubt. This will be previous to an offer being made, and even after that we must have the valuation settled by arbitration if Mr. Castner will not accept our offer.—C.A.G., 21/1/84.

I have attended to this matter myself, and forward herewith detailed valuation of the whole of the works.—G.C., 14/2/84.

In what way has Mr. Cowdery valued the plant—at the price it would cost to replace, or at that cost with a sum for depreciation? He will remember that the buildings, machinery, and plant have been in use for some time.—C.A.G.

Let me know the exact meaning of term "right to use Mr. Castner's Patent Regulator" during currency nine years. When was it patented—what superiority has it over other regulators? Mr. Castner can have no claim for the fittings he has put on carriages for use of his gas; he has already been paid for those fittings, and if they include, as I assume they do, the regulator referred to, we have a right to their use on those particular carriages. The question of right of use will be confined to carriages not yet fitted and to be fitted by us. Shall we want this regulator for new carriages, and is it worth £5,000 for that purpose?—C.A.G., 18/2/84.

No. 5.

Departmental Valuation of J. L. Castner's Gas-works.

Castner's Gas-works.—Summary of Valuation.

	£	s.	d.
Buildings, &c., at Redfern	11,931	19	6
Do. do. Bathurst	4,764	5	6
Do. do. Junee	4,835	2	9
Do. do. Newcastle	5,573	4	6
			27,104 12 3
Right to use Patent Regulator on railway carriages during currency—9 years		5,000	0 0
			£32,104 12 3

There is also material at the above-named stations valued by Mr. Castner at £1,714 12s. 10d. The value, however, fluctuates daily, but when the buildings and plant are finally taken over a correct estimate can be made.

GEO. COWDERY, 14/2/84.

My

My valuation is for the plant as it now stands. The buildings, although plain, are all sound, and the machinery, &c., to the best of my judgment, is worth what I have put down for it. As to the Patent Regulator, it was patented about three years ago. I know of no other regulators in the colonies for the purpose. Mr. Castner has no claim for the fittings on carriages now in use, and we have a right to use them; his claim is for those not yet fitted, and which will require to be fitted by us if we continue to use gas. With regard to the value of the patent, I put the same question to Mr. Castner as you put, when he informed me that he had employed an actuary, a Mr. Durham, to work out the value, showing me the original paper at the same time, and as it was valued at nearly double what Mr. Castner asked for it I put it down.—G.C., 20/2/84.

Will Mr. Cowdery see me about this. The regulator must be an instrument for determining or regulating the quantity of gas passed from the cylinders to the gas-pipes—to reduce the pressure. There is a similar instrument used in all kindred systems. Pintsch's system, I presume, has a regulator. I should like to know the basis upon which the value of Mr. Castner's regulators is fixed. Why £5,000? Is there a recognised charge for the use of each regulator? What is the cost of the regulator without patent rights?—C.A.G., 23/2/84.

Report herewith.—G.C., 7/3/84.

This regulator is for the purpose the Commissioner states. Pintsch's system is on the same principle; but as it has not been patented in the Colony by that firm it cannot now be used, and I know of no other system. I do not know how Mr. Castner arrived at the amount of £5,000. The actuary's estimate was obtained subsequently, I understand, by Mr. Castner. In view of Mr. Durham's estimate, which was nearly double Mr. Castner's amount, and seeing that the working of the whole system is dependent for its success upon the regulator, I think it would pay the Commissioner to buy the patent right. I do not know exactly how Mr. Durham's estimate was calculated, but have an idea that it was based upon the profits of the system reckoned at 6 per cent. compound interest for the period of years which the patent has to run. If the Commissioner did not purchase the patent right, I think it would cost us more to have to purchase regulators as they were required: during this time Mr. Castner would charge us his own price.—G.C., 7/3/84.

No. 6.

Statement respecting Mr. J. L. Castner's contract.

Mr. John L. Castner's contract for supplying the railway carriages with gas. THE agreement provides that, whether the contract runs the full time or is terminated by one month's notice, the Commissioner for Railways shall and will take over from the contractor all buildings erected by the contractor, and also all plant, implements, and appliances * * * the Commissioner for Railways paying to the contractor such amount of compensation as may be determined by two valuers (arbitrators), one to be appointed by the Commissioner for Railways, and one by the contractor. Provision is also made for the appointment of a referee or umpire, termed in the agreement a "third valuer."—C.A.B., 1/3/84.

No. 7.

Minute by The Commissioner for Railways.

LEAVING out of the question for the present the purchase of Mr. Castner's interest in the Patent Regulator, estimated at £5,000, and of the cost of supplies, I think it is desirable that the value of the buildings and appliances for gas-making should be referred to arbitration, Mr. Castner naming a valuer, and the Department one, the two choosing an umpire in the usual way.

Mr. Castner estimated the value £29,221, and Mr. Cowdery's valuation is £27,105. I think it will be better that the value should be arrived at by independent valuers, the cost of the valuation to be divided equally between Mr. Castner and the Department. If the Minister approves, Mr. Castner should be called upon to name his arbitrator first.—C.A.G., 18/3/84.

Approved.—F.A.W., 19/3/84. Write at once.—D.V., 19/3/84.

The Commissioner for Railways to J. L. Castner, Esq.

Sir,

Department of Railways, Sydney, 19 March, 1884.

With reference to your letter of the 5th January last, submitting the amount you claim for the buildings, plant, implements, and appliances used by you in connection with your contract for the supply of gas to this Department, and which it is provided are to be taken over from you at the termination of the contract, I have the honor to inform you that, leaving out of the question for the present the purchase of any interest you may have in the Patent Regulator, and of the cost of supplies, it has been decided that the amount which should be paid to you as the value of the buildings and appliances is to be ascertained by arbitration. The amount is to be arrived at by two independent valuers, one to be nominated by you, the other by the Department, the two choosing an umpire in the usual way, and the cost of such proceeding to be divided equally between yourself and the Department.

If you concur in the proposal I shall be glad to be furnished with the name of the valuer you propose to appoint.

I have, &c.,

CH. A. GOODCHAP,
Commissioner for Railways.

No. 8.

J. L. Castner, Esq., to The Commissioner for Railways.

Sir,

Railway Gas-works, Sydney, 20 March, 1884.

Referring to your letter of the 19th instant, in answer to my letter of the 15th January, wherein I submitted the amount I claim for buildings, plant, implements, and appliances which have been
in

in use by me in the performance of my contract to supply gas to railway carriages, I beg to say that I have no option, but must, in terms of the contract, consent to the matter being settled by arbitrators, as it is therein stated that "the Commissioner for Railways aforesaid shall and will take over from the contractor all buildings erected by the contractor, and also all such plant, implements, and appliances which have been in use by the contractor in the performance of his said contract. The Commissioner aforesaid paying to the contractor such amount of compensation as may be fixed and determined by valuers, one to be appointed by the Commissioner for Railways aforesaid and one by the contractor, and such third valuer as the said two valuers so appointed as aforesaid may by writing under their hands before entering upon the said valuation appoint. The decision of the said valuers or any two of them to be binding in all respects upon the parties hereto." Therefore, I nominate and appoint John Yelverton Mills, Esq., of the firm of Mills & Pile, auctioneers and valuers, 130, Pitt-street, Sydney, as my valuer and arbitrator, and shall be glad to be furnished with the name of the valuer you have appointed.

I have, &c.,
JOHN L. CASTNER.

Minute of Commissioner.

I would suggest that the Gas Company be asked to allow their engineer to act as our arbitrator; he would know better than any the value of machinery used for gas-making, &c.—C.A.G., 21/3/84.

Minute of Secretary for Public Works.

Approved.—F.A.W., 25/3/84.

No. 9.

The Secretary for Railways to The Secretary, Gas Company.

Sir, Department of Railways, Sydney, 27 March, 1884.

I am directed by the Commissioner to inquire whether your Company have any objection to allow your engineer, Mr. Bush, to act as arbitrator on behalf of this Department, for the purpose of determining the amount that it is to pay to the contractor for lighting the railway premises and carriages with gas, for the plant and apparatus used in connection therewith, and which is about to be taken over by the Department.

Soliciting the favour of your early reply,—

1/4/84.

Please appoint Mr. Wark, junior, Bathurst, to act for me *re* Gas Valuation, but nothing is to be done after appointment is made until Crown Solicitor is communicated with.

Letter to Mr. Wark, 4/4/84.

No. 12.

The Secretary for Railways to W. Wark, Esq.

Sir, Department of Railways, Sydney, 1 April, 1884,

I have the honor to inform you that the terms of agreement made with Mr. J. L. Castner, the contractor for lighting the railway premises and carriages with gas, provides that the Department is to take over at a valuation at the termination of the contract all plant and apparatus used in connection therewith. It has been decided that the amount to be paid is to be ascertained by arbitration, and I am directed by the Commissioner to ask whether you will consent to act as arbitrator on behalf of the Department.

I have, &c.,
D. VERNON,
Secretary for Railways.

J. N. Wark, Esq., to The Secretary for Railways.

Dear sir, Gas-works, Bathurst, 2 April, 1884.

In reply to your letter 84-8,870 on this subject, to which I wired that the name given was that of my son who is residing at Kurrajong, I now wish to say that being resident here I would at any time be willing to be of service to the Department.

I have, &c.,
Pro J. N. WARK,
J. H. SIMSON.
Prepare

Prepare letter appointing Mr. J. N. Wark as valuer for Commissioner. He was formerly Gas Engineer to the Company here, and is the constructor and proprietor of the Bathurst and Wagga Gas-works.—D.V., 3/4/84.

No. 14.

The Secretary for Railways to The Crown Solicitor.

Sir,

Department of Railways, Sydney, 3 April, 1884.

Referring to the agreement entered into by Mr. J. L. Castner with the Commissioner for Railways for fitting and lighting the railway carriages with gas, I have the honor to inform you that it has been decided to take over the buildings and plant used in connection with this contract, in accordance with the conditions of such agreement. Mr. Castner has been called upon to nominate a valuer, and steps have been taken for the appointment of one on behalf of the Commissioner.

The Commissioner will now be glad if you will favour him with your advice as to the further and best course for the Department to adopt in bringing the matter to a settlement in accordance with the conditions of the agreement.

I have, &c.,

DONALD VERNON,
Secretary of Railways.

I recommend Mr. Wark be appointed. I have written to Crown Solicitor, who will advise me as to the best course to take in regard to the progress of the valuers with the valuation.—C.A.G., 4/4/84.

Approved.—F.A.W., 4/4/84.

The Commissioner for Railways to J. N. Wark, Esq.

Sir,

Department of Railways, Sydney, 4 April, 1884.

I have the honor to appoint you to be valuer on my behalf for the purpose of determining the amount that is to be paid to Mr. J. L. Castner under the agreement set forth in the attached paper, for the buildings, implements, and appliances used by him for fitting and lighting the railway carriages with gas.

Mr. Castner has appointed Mr. J. Y. Mills, of Pitt-street, Sydney, to be valuer on his behalf, and you should place yourself in communication with him for the purpose of making all necessary arrangements; but, before actually commencing your valuation, I have to request that you will be good enough to wait upon me at your earliest possible convenience.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.

The Crown Solicitor to The Commissioner for Railways.

Sir,

Crown Solicitor's Office, Sydney, 4 April, 1884.

I have the honor to acknowledge the receipt of your letter of date 3rd April instant, with reference to your agreement with Mr. J. L. Castner for fitting and lighting the railway carriages with gas, and your taking over the buildings and plant used in connection with that contract. You request me to advise as to the further and best course for the Department to adopt in bringing the matter to a settlement in accordance with the conditions of the agreement.

By the agreement referred to you are upon the expiration of the contract on the 14th May next to take over all the buildings erected by Mr. Castner, and all plant, implements, and appliances which have been in use by him in the performance of the contract, paying for same such compensation as may be fixed and determined by valuers, one to be appointed by you, one by Mr. Castner, and a third by the two valuers so appointed, the decision of any two to be binding.

It seems to me that the question to be determined really is, whether the reference under the agreement as to the mode in which the amount to be fixed by you is to be considered as an arbitration or as a valuation. I think it must be considered as an agreement for a valuation.

The difference appears to me to be this: if the agreement was for an arbitration, you are entitled to attend before the arbitrators, and call witnesses as to value; but if it is a valuation, the valuers may, if they think fit, inspect the property, and determine its value upon their own judgment, and without taking evidence as to value; and no legal objection can be taken to their so doing.

I think, from the wording of the agreement, if the question came before the Court, it would be held that the reference was to the persons appointed as valuers only, and that it was intended that they should of their own judgment decide as to the value of the buildings and plant to be paid for by you.

An agreement apparently in somewhat similar terms to that referred to was held by the Court of Exchequer not to be for an arbitration. The case is thus referred to in "Russell's on Arbitration," page 221.

By agreement in writing, A agreed to buy of B brewery premises, and the plant, &c., at a valuation to be made by certain valuers, or their umpire. The umpire was to be chosen by the valuers before entering on the valuation. The valuers could not agree upon an umpire. It was held that the Court had no power to appoint an umpire under section 12 of the Common Law Procedure Act, 1854, as this was not an arbitration within the Act, since there had been no difference between the parties as to the price before the agreement to settle it by a valuation.

Probably no objection could be taken to the valuers assisting their own judgment by calling evidence as to value; and you may, if you think it desirable, request the valuers to allow you to produce witnesses to value; but, as I have mentioned, you have no legal right to insist upon evidence being taken; and if the valuers think fit to act upon their own judgment they have a right to do so.

I have, &c.,

JOHN WILLIAMS,
Crown Solicitor.

No. 15.

No. 15.

J. Y. Mills, Esq., to The Secretary for Railways.

Dear sir, Land Sale Rooms, 130, Pitt-street, Sydney, 10 April, 1884.
To save time, and assist the arbitrators in Castner v. Commissioner's case, will you please let me have any papers you may have bearing on the case as to buildings, plant, or any agreements.

Yours truly,
J. Y. MILLS,
Arbitrator.

Replied to, and printed copy of agreement forwarded.—D.V., 10/4/84.

No. 16.

J. L. Castner, Esq., to The Commissioner for Railways.

Sir, Sydney, 19 April, 1884.

Herewith I beg to hand you copy of award of valuers appointed in accordance with and under the authority of agreement or contract between you and myself, dated the 8th day of June, 1882, and which I have taken up, and also list of buildings, plant, &c., &c., which I now hand over to you, as instructed by the valuers.

The amount of the award, £35,966 6s. 11d., as well as one-half of costs of the valuation, £178 17s. 6d, or a total of £36,145 4s. 5d., being due to me, I shall be glad to have, in accordance with the award.

I have, &c.,
JOHN L. CASTNER.

In the matter of a certain memorandum of agreement made the eighth day of June, in the year of our Lord one thousand eight hundred and eighty-two, between John Louis Castner, of the one part, and the Commissioner for Railways of the other part, and of the valuation thereunder of the compensation for buildings, plant, implements, and appliances which have been in use by the said John Louis Castner in the performance of the said agreement or contract.

We, the undersigned, being two of the valuers appointed under and in pursuance of the above-mentioned memorandum of agreement of eighth day of June, one thousand eight hundred and eighty-two, between the above-named John Louis Castner, of the one part, and the Commissioner for Railways of the other part, do hereby fix and determine the amount of compensation payable by the said Commissioner for Railways to the said John Louis Castner in respect of all buildings erected by the said John Louis Castner, and also of all such plant, implements, and appliances which have been used by the said John Louis Castner in the performance of the said contract or agreement, at the sum of thirty thousand nine hundred and sixty-six pounds six shillings and eleven pence, if the same be paid within five days from the date of this award; and if not so paid, then we fix and determine such compensation at that sum with interest at the rate of six pounds per centum per annum from that date until paid.

The costs and charges in this valuation and award to be divided equally between the said John Louis Castner and the Commissioner for Railways, which we fix at the sum of three hundred and fifty-seven pounds fifteen shillings.

Witness our hands, this eighteenth day of April, one thousand eight hundred and eighty-four.
Signed in the presence of me, the third valuator, and } J. Y. MILLS.
I hereby approve of the same,—ALEX. DEAN. } J. N. WARK.

We hereby fix and determine the compensation to be paid to the above-named John Louis Castner for the right to use Castner's Patent Gas Regulator on the railways of the Colony during the continuance of the patent, which we understand is to be decided by us, at the sum of five thousand pounds, to be paid within the time and subject to the penalty for non-payment mentioned in the above award with reference to the compensation thereby awarded.

Signed in the presence of me, the third valuator, and } J. Y. MILLS.
I hereby approve of the same,—ALEX. DEAN. } J. N. WARK.

No. 17.

Minute by The Commissioner for Railways.

It will be seen that the valuers have gone beyond the scope of the matter remitted to them. I expressly declined to remit for their consideration the value of the supplies on hand, not recognising that they came under the head of plant, implements, and appliances. The supplies are not fixed quantities, but variable, and a day's consumption would make a difference in quantity on hand and available to be taken over. Again, Mr. Castner's interest in the regulator as patentee was not to be considered. I see that the valuers have, notwithstanding, in an addendum to their valuation, taken this into account and awarded £5,000.

I have not seen the original award, but only this copy forwarded by Mr. Castner. I at first refused to receive it in this shape, but believe that Mr. Castner had a right to take up the award and furnish me with a copy, the valuers' duty being finished when one party to the valuation or arbitration has taken up the award.

Will Crown Solicitor advise me if I can ignore the award by reason of the valuation of assets in excess of those contained in the submission.—C.A.G., 19/4/84.

J. L. Castner, Esq., to The Commissioner for Railways.

Sir, Sydney, 22 April, 1884.

As I have no intimation from you as to who is to take charge of the gas-works, I, by the directions of the valuers appointed, handed over to you on the 19th instant, I write to say that I have instructed the foreman whom I have had in charge of the different works to continue the operations as usual, and to purchase supplies, if any are required, as has been the custom while the works were under my control

control, for and on your account. This I have done that the operations may continue, and to prevent disappointment. I have also kept on the same staff, subject to your option to employ them, and they remain with that understanding.

Mr. Downton, my chief clerk, who holds power of attorney from me, will keep all accounts of expenditure and wages, and render the same to you for payment, and deal with them in such way as you may direct.

There are a number of carriages in hand being fitted with gas apparatus, which I will have finished as soon as possible, and render account for them in the usual way.

I have, &c.,

J. L. CASTNER.

No. 18.

The Commissioner for Railways to J. L. Castner, Esq.

Sir,

Department of Railways, Sydney, 24 April, 1884.

Referring to your letter forwarding a copy of an award or valuation made by the valuers appointed to determine the amount due to you for the building, implements, and appliances used for fitting and lighting the railway carriages with gas, I have the honor to inform you that the question whether the valuers in their valuation have not gone beyond the scope of the inquiry remitted to them has been referred to the Crown Law Officers, and until I am advised on the matter I cannot take any action in regard to the award.

I have, &c.,

CHAS. A. GOODCHAP,

Commissioner for Railways.

Mr. Castner left for Melbourne last evening, and letter could not be served upon him. It was left at his office.—D.C.M'L., 24/4/84.

I delivered the letter to the boy in Mr. Castner's office.—P.E.R., 24/4/84.

To Secretary,—The annexed voucher has been sent to me for my signature, but I don't quite understand why I should be asked to certify for a portion of the month—J. HIGGS, 24/4/84.

Mr. Castner is proceeding in the award of the valuers. We are not bound by the contract to take over the works till some time in May. The valuers have gone out of their way to regulate that we shall pay the award from a certain day in April, or interest upon that amount, and, constructively, that we shall take over the works on the 19th April.—C.A.G.

Probably a similar account has been sent in to Traffic Manager, S. and W. Let me know at once, and submit with papers on subject of award.—C.A.G., 29/4/84.

Yes, a voucher was submitted up to the 19th April, but in the absence of the Commissioner I directed that it should stand over till the end of the month, as usual.—W. V. READ, *per* D.K., 29/4/84. Commissioner.

No. 19.

The Commissioner for Railways to J. L. Castner, Esq.

Sir,

Department of Railways, Sydney, 12 May, 1884.

As the agreement under which you have been fitting the railway carriages with appliances for burning gas will terminate on the 14th instant, I have instructed Mr. Scott, the Locomotive Engineer, that on the morning of the 15th instant he is to take over from you the buildings, plant, implements, and appliances, in terms of the agreement. The question of the validity of the award given by the valuer under the said agreement is still under the consideration of the Crown Law Officers.

You will doubtless have on hand a quantity, more or less, of the materials which are used in fitting the carriages and making the gas. These can be, if you wish it, utilised by the Department, and I shall have no objection to purchase them of you. I have intimated to Mr. Scott that he can arrange this with you; but he must do nothing which will in any way involve the Department in any dispute about the Patent Regulator, the question of the purchase of which I cannot entertain.

I have, &c.,

CHAS. A. GOODCHAP,

Commissioner for Railways.

No. 20.

The Commissioner for Railways to The Crown Solicitor.

Sir,

Department of Railways, Sydney, 12 May, 1884.

Herewith I have the honor to hand you a statement of the facts in connection with the arbitration in Mr. J. L. Castner's case.

This statement is furnished with a view to satisfy the inquiries raised by the Attorney-General in his opinion, which I now return.

I have, &c.,

CHAS. A. GOODCHAP,

Commissioner for Railways.

Mr. J. L. Castner's agreement to fit the railway carriages with appliances for burning gas, and to supply gas for the purpose.

On the 8th June, 1882, Mr. Castner entered into an agreement with the Commissioner for Railways to fit the railway carriages with appliances for lighting them with gas, and to supply gas for the purpose at a schedule of prices, the currency of such agreement to be for five years, viz., from 14th May, 1879, to 14th May, 1884. The agreement provides that all materials used in connection with the contract should be carried by the railways free of charge, that the contractor should be furnished with a free pass on the railways, that the Commissioner might at any time terminate the agreement by one month's notice in writing, and that upon the termination of the contract, either by such notice or by effluxion of time, the Commissioner should take over from the contractor all buildings, and all plant, implements, and appliances that may have been used in carrying out the said contract; and the amount of compensation to be paid to the contractor be ascertained by two valuers, one to be appointed by the Commissioner, and one by the contractor and umpire.

On the 15th January, 1884, Mr. Castner, in consequence of a conversation he had had with the Commissioner in view of the approaching termination of the contract, sent in his claim in lump for compensation under the agreement, such claim amounting to £35,935 12s. 6d., described as being for buildings, and for retorts, scrubbers, purifiers, gas-holders, reservoirs, engines, boilers, pumps, compressors, mains, and services, all of which undoubtedly belong to the category of plant, implements, and appliances as mentioned in the agreement. But it includes also materials on hand, and right to use my Patent Regulator during its currency of the patent, both of which items, it appears to the Commissioner, are altogether outside such category.

On

On the 18th January the Commissioner wrote to Mr. Castner acknowledging this letter, and intimating that he could not accept a claim in lump for compensation, and a detailed statement was thereupon furnished.

But on the 19th March, when it had been finally decided to resort to arbitration for the purpose of determining the amount to be paid as compensation for the buildings and plant, the Commissioner replied further to the above quoted letter of Mr. Castner's that "leaving out of the question for the present the purchase of any interest you may have in the Patent Regulator, and of the cost of supplies, it has been decided that the amount which should be paid to you as the value of the buildings and appliances is to be ascertained by arbitration." The letter went on to request Mr. Castner to nominate his arbitrator, which he proceeded to do without any demur or protest against the Commissioner's express exclusion of the patent right, or right of user, of the regulator, and of the materials in hand, from the proposed valuation.

Mr. J. N. Wark was appointed to arbitrate on behalf of the Department, and in giving him his instructions an inventory was handed to him of the articles to be valued, in which, for the reasons already stated, the patent right of the regulator and the materials on hand were not included.

The arbitrators in their award gave Mr. Castner the sum of £30,966 6s. 11d. as the value of the buildings, plant, implements, and appliances, in which they included the value of materials on hand, and they awarded him £5,000 for the patent right of the regulator.

They decreed, moreover, that the amount, £35,966 6s. 11d., should be paid on the 19th April, twenty-five days before the date fixed by the agreement for the termination of the contract, and that if not paid within five days of that date interest at the rate of 6 per cent. should be allowed.

The Commissioner holds that in valuing as assets the patent right of the regulator and the materials on hand (which, in his letter to Mr. Castner, and in his instructions to the arbitrator for the Department, he had specially excluded from the valuations), and in decreeing that the Commissioner shall take over the buildings and appliances, and pay the compensation before this date fixed by the agreement, the arbitrators have gone beyond the scope of the duty entrusted to them, and, more than this, that in the award they have ignored and overridden the conditions of the agreement under which Mr. Castner holds this contract.

The Commissioner is desirous to know if, by this procedure on the part of the arbitrators, the award has not been rendered invalid, and if he cannot ignore it, or, failing this, whether he has not reasonable ground for applying to a competent Court to have the award pronounced null and void.—C.A.B.

The Locomotive Engineer,—

The contract held by John L. Castner for fitting and supplying the railway carriages with gas will terminate on the 14th instant, and the Department will have to take over the buildings, plant, and appliances under the agreement.

I request, therefore, that you will be so good as to demand possession the first thing on the morning of the 15th instant of the buildings and property; and you will have to instruct your assistants at Newcastle, Junee, and Bathurst to the same effect, if necessary, by wire.

Possession will, doubtless, be given, and you will make arrangements for carrying on the business, keeping on the existing staff for the purpose, for the present at all events.

There will, doubtless, be a quantity, more or less, on hand of the materials used by Castner in fitting the carriages and in making the gas which it will be convenient for the Department to purchase, and an account of them will have to be taken for the purpose of payment; but in carrying on the operations you will no doubt have to indent upon this stock immediately, and before an account could be taken. It will be necessary, therefore, for you to keep an account of the material which you use, to be added to the general account when completed.

I shall be glad if you will favour me with your opinion as to the advisability of allowing Castner to complete the fitting of any carriages he may have on hand, should there be any such. It might be inconvenient and undesirable to take over from Castner carriages which have been partially fitted by him.

Do nothing, however, which will involve the Department in any way with the Patent Regulator.

CHAS. A. G., 2/5/84.

Will Locomotive Overseer please give this his immediate attention, and cause the necessary directions to be given for the inspectors to take over the plant, &c., and direct the staff on and after the 15th instant, as mentioned above. Copy of this paper should be sent; I attach an additional one.—W.S. (*per* D.C.M'L.), 13/5/84.

Urgent. It would be well to wire to-day.—D.C.M'L. Instructions sent.—T.M., 13/5/84. Locomotive Engineer.

No. 21.

J. L. Castner, Esq., to The Commissioner for Railways.

Sir,

Railway Gas-works, Sydney, 14 May, 1884.

I am in receipt of your letter of the 12th instant.

You appear to have overlooked the fact that you have already, under the terms of our agreement, become the purchaser of the property from me, and that for some time past I have been merely carrying on the operations at your expense and risk so as to prevent any inconvenience to you or the public, in terms of my letter of the 22nd April, 1884.

I am not prepared to enter into any fresh contract with you such as you suggest with the materials in use, as they are your property under the award, but will render you an account of supplies purchased and expenses incurred since the date of the award.

I have, &c.,

JOHN L. CASTNER.
(*Per* H.D.)

Reply to this that whether I am the purchaser or not will be decided by the Crown Law Officers, to whom I have remitted the question. It is my intention to upset the award or valuation if I can legally do so.—CH.A.G., 14/5/84.

No. 22.

The Commissioner for Railways to J. L. Castner, Esq.

Sir,

Department of Public Works, Railway Branch, Sydney, 15 May, 1884.

I have the honor to acknowledge your letter of the 14th instant, intimating that I have overlooked the fact that I have under the agreement become the purchaser of the property (presumably to the unused materials), and that you have for some time been carrying on the operations at my risk and expense.

In reply I have to inform you that I do not concur in the views which you give expression to, that whether I am the purchaser or not of the materials in question will depend upon the decision of the Crown Law Officers, to whom I have remitted the question, and that it is my intention to upset the award if I can legally do so.

I have, &c.,
CHAS. A. GOODCHAP,
Commissioner for Railways.

No. 23.

The Crown Solicitor to The Commissioner for Railways.

Crown Solicitor's Office, Sydney, 15 May, 1884.

I HAVE the honor to return the papers relating to the contract with Mr. Castner as to the supply of gas, &c., and to the valuation recently made thereunder, and to state that I have submitted a case to the Attorney-General for his opinion, and I now forward herewith copies of his advising thereon.

I have, &c.,
JOHN WILLIAMS,
Crown Solicitor.

In re Agreement between J. L. Castner and the Commissioner for Railways.

Opinion upon case originally submitted.

I DO not think that the agreement can be considered as a reference to arbitration. It is an appraisal valuation, which differs from an arbitration in this: that while the former precludes differences from arising, it does not settle difficulties which have arisen. This is the recognised distinction between cases of appraisal and cases of arbitration. (See Judgment of the Master of the Rolls in *Collins v. Collins*, L.J., Eq., vol. 28, p. 186). In order to constitute an award there must be a decision in the nature of an arbitration; and besides the submission of the parties, an intention on the part of the persons deciding to decide as arbitrators, or, in other words, there must be an *animus arbitrandi*. (Russell on Arbitrators, Title award, p. 249.)

I presume that the second matter submitted does not require answering. If I had regarded the agreement as a reference to arbitration, and if the Commissioner's statement as to the award comprehending matters not submitted to the arbitrators is accurate, on that ground (*vide* case cited at p. 668 of Russell) a motion might have been based to set it aside.

W.B.D., A.G., 24/4/84.

I APPREHEND, on a second reading of the case, that I have misconceived the exact question submitted in the second inquiry. I am asked—assuming that there is no award—how can the claim under the appraisal valuation be resisted. Before answering I would like to be informed by the Commissioner what is precisely intended by the statement that the valuation embraces matters not submitted to the valuers. I presume Mr. Castner forwarded to the Commissioner particulars of his claim, which particulars were forwarded to the valuer appointed by the Commissioner to act upon. Now it will be necessary that I should know whether the list of items on the paper accompanying the valuation differs, and in what way, from the paper submitted in the first place, or whether it is to be understood that the list forwarded to the Commissioner embraced items not contemplated by the agreement. At present I am unable to perceive any ground for claim of the patent rights of Mr. Castner.

W.B.D., A.G., 24/4/84.

Opinion on case as resubmitted.

REFERRING to the minute (without signature and undated) forwarded to the Crown Solicitor, under letter of date 12 May, I perceive that the matter of the arbitration is treated as an award. I have already pointed out that in my opinion it is not an award. If it were it might have been set aside, because the arbitrators had exceeded their authority by including in their valuation matters expressly withdrawn from them by the Commissioner, which would have been a good ground for setting aside an award. I think the best course for the Commissioner to pursue will be to refuse to receive the present valuation (as comprising matters not submitted), and to inform Mr. Castner that as the materials to hand were not to form portion of the valuation the valuation must be referred to the valuers. But as to the special valuation, what is confined to the patent right, the Commissioner absolutely declines to recognise it.

W.B.D., A.G., 14/5/84.

In the event of Mr. Castner refusing to refer the matter back, the only course open to the Commissioner is to refuse to recognise the claim, leaving Mr. Castner to such legal remedy as he may be advised to employ.

W.B.D.

No. 24.

Instructions as to use of Mr. Castner's materials.

Locomotive Engineer's Office, Sydney, 15 May, 1884.

THE following message has been received per telephone from Acting Secretary, and is forwarded for your information and immediate attention:—

Tell Mr. Scott to be sure not to take any of Mr. Castner's materials for making gas. Negotiations are now going on, and it might be fatal to our interests if we take any of the material left by Mr. Castner.

W.S. (*per* D.C.M'L.)

Gas Supply for Carriages.

The Locomotive Engineer to The Locomotive Foreman, Newcastle.

PLEASE note specially that nothing is to be done which will involve the Department with regard to the Patent Regulator used by Mr. Castner for fitting the carriages until you receive further directions in the matter.—W.S. (*per* D.C.M'L.), 15/5/84.

Noted.—J. W. BOAG, 17/5/84. Locomotive Engineer.

Telegram from Inspector Close, Junee, to The Locomotive Inspector.

16 May, 1884.

YOUR memorandum *re* not using Castner's material for gas-making. Gas was made out of Castner's material yesterday, and I must continue using them for the present until materials are supplied, or stop the supply of gas to vehicles. The materials required are kerosene shale, oil, tar, Newcastle slack coal, and oxide of iron. Please advise by wire what to do.

The

The Locomotive Engineer,—

I have just telephoned to you not to use or in any way to interfere with Mr. Castner's stock of materials used by him in fitting the carriages and making the gas. This is intended to confirm those instructions, and to obviate the risk of misunderstanding.

You will understand that the instructions in reference to the materials given to you in a recent minute are hereby cancelled.—G.B., B.C., 15/5/84.

Telephone received 3.30 p.m., 15th, when it was too late to stop the use of Mr. Castner's materials. We had been using them all day, and all the carriages had been filled. If we had not used the material the carriages would have been run in darkness until we got a supply of our own. Instructions have, however, been given for materials to be at once obtained for our own use, and when these are to hand we will discontinue using Castner's.—D.C.M'L., 16/5/84.

No. 25.

Statement in respect of Claim by J. L. Castner, Esq.

Mr. Mitchell,—

Please give bearer a statement of all material on hand this morning belonging to Mr. Castner for making gas—quantity of coal, shale, kerosene, and all other stores.

W. SCOTT,
(Per D.C.M'L.)

Government Gas-works, 15 May, 1884.

Stock on hand.

7½ tons Newcastle coal.	18 pressure gauges (assorted).
2 tons mountain coal.	16 gross assorted burners (Dunks).
3 tons shale.	5 lb. tool steel (B.D. & Co.)
20 barrels tar oil, 700 gallons @ 3d.	17 lb. English sole leather (Lassetter).
7 bags=21 cwt. oxide of iron for purifying.	9 lb. copper tubing.
1 load=1 square yard of clay luting @ 7s.	30 lb. brass castings, compressing pump repairs (W. Crane).
2 barrels English fire-clay (Milne Bros.)	6 heavy ¾ brass cocks for yard work (W. Crane).
19 lb. Tuck's patent packing (Briscoe Bros.)	6 glasses for Lady Parkes, style extra (Richardson).
7½ lb. hemp patent packing (Briscoe Bros.)	6 lamp tops for repairs (Milne Bros.)
2 drums=10 gallons lubricating oil (Fell & Co.)	30 ft. ¾ 3-plg. hose for filling carriages (B.D. & Co.)
21 lb. white lead (Keep).	1 lb. sewing twine.
20 lb. red paint (Keep).	122 lb. old brass.
10 lb. tallow.	41 sheets 6 x 4 x ½ steel for cylinders.
2½ gallons boiled oil.	82 heads for cylinders.
1 gallon kerosene.	10 3-ft cylinders to finish.
1 gallon black varnish.	14 4-ft. cylinders on hand.
11 lb. brass and copper wire.	1 6-ft. cylinder on hand.
36 files (assorted).	

No. 26

The Locomotive Engineer to Mr. Boag.

Newcastle Gas-works.

ENCLOSED is an inventory of the plant and appliances that should have been on hand on the 15th instant, when this Department took possession of the gas-works belonging to Mr. Castner at Newcastle Station.

Please have an examination made of the premises, and report how far the items and quantities mentioned in this statement agree with those actually on hand on the 15th instant.

This matter should have special and careful attention, and I shall be glad to have your report as early as possible.

W.S. (per D.C.M'L.), 17/5/84.

I have made a careful examination of the Newcastle Gas-works, and forward herewith my report thereon.—J. D. BOAG, Loco. Engineer, 26/5/84.

Mr. Boag to The Locomotive Engineer.

Sir,

Newcastle, 23 May, 1884.

In accordance with your instructions of the 17/5/84 on your M.P. 84/3,574, my 84/1,352, I have made careful examination over the whole of the buildings, machinery, and stock in connection with the Newcastle Gas-works, and beg to report that I found the building, plant, and appliances on the ground exactly as enumerated in your inventory. There are a few discrepancies in the stock of gas-fittings, &c., for fitting gas-burning apparatus in the carriages, and I attach a list showing the quantities stated in you inventory and the quantities on hand when the works were taken over on the 15th May, 1884.

THOS. BOAG,
26/5/84.

Précis.—Arrangements with Mr. G. L. Castner for lighting the railway carriages with gas.

UNDER date of 10th July, 1877, Mr. Castner wrote to Commissioner offering to supply and fit apparatus for lighting the carriages with gas for £40 per carriage, and to supply gas, and to keep apparatus in repair for five years, at £2,000 per annum. The G.N. Lines, and any distance the railway might be extended, in the same proportion, to be in working order in six months.

Under instructions from Commissioner, Traffic Manager then reported the cost of the existing mode of lighting the carriages, and a trial was made of Mr. Castner's scheme, which Mr. Mason reported had proved a success.

Mr. Castner was then informed that before adopting any new system of lighting the carriages inquiry would be made as to the most improved modes in vogue in England.

The Agent-General was accordingly written to, and he obtained and forwarded to the Commissioner two reports on the subject from Mr. John Fowler, C.E. As these reports are dealt with, and their purport stated in Commissioner's minute of 21st November, 1878, to be presently quoted, I will not further refer to them here.

On the 21st October, 1878, Mr. Castner wrote to Commissioner, referring to the intimation made by the latter, that before giving a final answer he would obtain information as to the mode of lighting adopted in England; stated that he (Mr. Castner) had visited England and America, and was now prepared to fit the carriages after the most approved method; that as lines have been increased he must re-state terms. Is prepared to fit all carriages on Southern and Western lines at £40 each, and to supply gas and to maintain apparatus for an annual payment of £2,400, and in same proportion for Great Northern lines, and any extensions; all to be ready in twelve months. Other conditions as before.

Hereon Commissioner minuted condemning the old light, and stating that there could be no doubt we must use gas, and if Castner's terms are reasonable would be disposed to accept his offer. Asked Locomotive Engineer to report.

Mr. Burnett replied that there could be no question of the superiority of gas, but that Castner was not in a position to submit plans, and that without further information he was unable to give an opinion as to the reasonableness or otherwise of Castner's offer.

On the 21st November, 1878, Commissioner wrote a minute on the subject for submission to Minister, stating that some time before Mr. Castner had made a successful experiment in lighting the railway carriages with gas; that a final decision had been postponed until inquiries had been made as to the mode of lighting adopted in England; that Mr. John Fowler, who was consulted, had recommended a postponement of the matter (Agent-General's covering letter of 4th January, 1878), promising a further communication on the subject; that subsequently Mr. Fowler wrote advocating the introduction of the system (Agent-General's covering letter of 1st July, 1878), and that in the meantime Castner (whose system was almost identical with that of Pintsch) had returned from England with all needful plans and appliances; that the terms upon which Castner would do the work were not much, if at all, in excess of cost with present appliances; that Castner's price is £40 per carriage for fitting, and £2,400 per annum for gas and repairs of fittings; the term to be for five years. Thought we could not do better than to close with Castner, and recommends the acceptance of his offer.

This Mr. Secretary Sutherland minutes "approved."

Thereupon (29 November, 1878) Commissioner wrote Mr. Castner recapitulating the terms of the latter's proposal, and referring to a recent interview stated that according to Castner's verbal undertaking he was to have carriages running lighted with gas in January, 1879; that he was to enter into an agreement that the contract was to be liable to be annulled at three months' notice, or at any time if Commissioner were dissatisfied with the quantity or quality of the gas, or with the lighting arrangements, in which case all appliances would become forfeited to the Department. On these conditions was prepared to accept Castner's offer.

On the 2nd December, 1878, Castner replied formally accepting these conditions.

Commissioner thereupon instructed Locomotive Engineer to give Castner access to the carriages for the purpose of fitting, and in reply to an inquiry by Locomotive Engineer intimated that all carriages lighted with oil were to be dealt with.

Under this arrangement the work was carried on for a considerable period, but frequent misunderstandings arose between the then Locomotive Engineer and Mr. Castner with reference to the suitability and strength of the work of the fittings, and the Locomotive Engineer refused to certify Castner's accounts for payment. This, on two occasions, led to the initiation by Castner of legal proceedings against the Department for the recovery of moneys due to him. The Department, it turned out, had no case, and in both instances the amount had to be paid with costs. How this arose is sufficiently shown by several minutes by the Commissioner to the then Locomotive Engineer, by the opinions of the Crown Solicitor and of Messrs Stephens and Salomons, who had a consultation on one of the cases, and by a minute of the Minister

In June, 1880, Castner voluntarily offered to assign the whole of his buildings and plant to Commissioner as security for the due fulfilment of his agreement on condition that a sum of money then due to him was paid to him without further demur, but on being called upon by the Crown Solicitor to execute the necessary deed he retracted his offer; and Commissioner minuted that as the plant is on the railway premises, and can only be used for railway purposes, that alone is sufficient security.

On the 23rd July, 1881, Commissioner minuted that the papers *re* Castner's gas arrangements were in such a state of confusion that he feared some matters of importance might escape attention; that Mr. Scott, on 80-1,626, stated the number of burners in a carriage was a fair index to the quantity of work in fitting up a carriage; that, on the figures supplied by Mr. Scott, Castner was informed that he would be paid £57 15s. for American carriages; that Castner was not asked to concur in the proposition, and was not informed of the basis upon which the calculation was made. It had been ascertained after the lapse of a year, and the frequent payment of accounts at that rate, that the figures upon which the calculation was based were erroneous, but Commissioner held that we could not withhold payment at that rate or recover what had been paid in excess. That if we had offered the proportionate sum which Mr. Burnett showed

showed to be due it was not certain that Castner would have accepted it, seeing that we had only allowed him, as it was, £17 15s. for work for which he claimed £40.

Referring to certain statements made by a discharged servant of Mr. Castner's, Commissioner went on to say that there now remained to be considered the allegations made by Mr. Robertson that in consequence of bad gas, bad lamps, insufficient supply of gas, and defective apparatus, the lamps frequently go out—that the gas gives off an abundance of smoke and an offensive odour. Upon the question of bad lighting Commissioner's own observations were in direct contradiction of Robertson's statement.

Subsequent investigation went to prove that the allegations made by this man were without foundation.

On 3rd January, 1882, Castner wrote to Commissioner referring to an interview he had had with him, and stated that he was prepared to enter into an agreement on the following terms, to continue to supply gas on existing terms, viz.: on South and West £260 per month, and on Great Northern Lines £90 per month, carriages on Great Northern Lines to be fitted at £35, £57 15s., and £80 respectively. Commissioner at expiration of contract to take over all buildings, plant, &c., at a valuation to be arrived at by two arbitrators and an umpire, who shall decide the amount to be for said plant and contract. All materials for said works and service to be carried free, and contractor to be furnished with a free pass on the railway.

Commissioner minuted that these were terms agreed upon between himself and Castner, to be formulated into an agreement, with general conditions contained in former agreement. Minister approved, and Crown Solicitor was instructed.

Crown Solicitor thereupon wrote that the information was not sufficient. Pointed out that on south and west Castner was to supply gas "as at present." Did not know what he was doing at present. Nothing was said of number of carriages, number of lights to each carriage, or times during which light is to be supplied. Same applied to Northern lines; was not stated what the several sums to be paid on Northern lines were for. Nothing said of duration of contract. Asked in reference to arbitration clause what was meaning of Mr. Castner in speaking of amount to be paid for plant and contract. Asked if power was to be taken to terminate contract in case of non-fulfilment of conditions.

Commissioner replied forwarding specification containing particulars required, and explaining that Castner's reference to compensation meant that compensation is to be given in the event of Commissioner taking over the contract before the time fixed for its expiration. An agreement was drawn up accordingly, and duly executed by Castner.

Under date of 15th January, 1884, in view of the approaching termination of the contract (on the 14th May) Castner, referring to a conversation he had had with Commissioner, wrote enclosing a claim amounting to £35,935 12s. 6d., purporting to be valuation of buildings, plant, implements, and appliances used in his gas-making business, and including the patent right of the regulator.

Under date of 19th March, 1884, Commissioner replied with reference to the amount claimed by him for his buildings, plant, implements, and appliances, that leaving out of the question for the present the purchase of any interest Castner might have in the regulator and of the supplies, it had been decided to refer the matter to arbitration.

Per letter of 21st January, 1884, Castner submitted valuation in detail, which includes £1,714 12s. 10d. for materials in stock, and, as stated above, £5,000 for patent right of regulator.

Hereon Commissioner minuted that he could not understand how Castner's works could be worth so large a sum of money, that a large amount should be written off for depreciation, and directed Mr. Cowdery to be very careful in making his valuation, stating that we should have to go to arbitration if Castner would not accept a reasonable sum. Mr. Cowdery to employ competent men.

Mr. Cowdery thereupon submitted his detailed valuation, amounting to £32,104 12s. 3d., and stated that he had attended to the matter himself.

Commissioner minuted asking how Mr. Cowdery had arrived at his valuation, he should bear in mind that the things have been in use for years, and that depreciation has to be taken into account. Asked to be informed of the exact meaning of the expression "right to use Mr. Castner's patent regulator." When was regulator patented, and is it superior to other regulators? Mr. Castner could have no claim to fittings on the carriages for which he has been paid, and if they include the regulator we have a right to use it on those particular carriages. Question of right of user must refer to new carriages only. Shall we want it for new carriages, and is it worth £5,000?

Mr. Cowdery replied that his valuation is for plant as it stands; that the regulator was patented three years ago, and that he knows of no other regulator in the Colony for the purpose; that Mr. Castner has no claim for fittings now in carriages, but for new carriages, if we continue to use gas; and that the value of the patent was arrived at for Mr. Castner by an actuary, who put the value at nearly double what Mr. Castner claims.

Commissioner thereupon minuted that every similar system must require a regulator. Pintsch's, for instance; would like to know basis of Castner's valuation of the regulator—why £5,000? What is cost of regulator without patent rights?

Mr. Cowdery replied that Castner's system is the same in principle as Pintsch's system, has not been patented in the Colony, and cannot be used. Does not know how Castner arrived at £5,000; but it turns out that it was not based on the actuary's estimate. Thinks it would pay to purchase patent, as it would probably cost more to purchase regulators as required. Commissioner, referring to the difference between Mr. Castner's valuation and Mr. Cowdery's, minuted that the better course would be to arrive at the amount to be paid by arbitration, and Minister approved.

On the 19th February, 1884, Mr. Castner was written to to that effect, and asked to appoint an arbitrator.

Per letter of 25th idem Mr. Castner assented to this arrangement, and nominated Mr. J. Y. Mills as his arbitrator.

After the post of arbitrator for the Department had, with Minister's consent, been offered to the Engineer for the Sydney Gas-works, through his employers, and refused by them on the ground that they could not spare his services, it was offered to Mr. J. N. Wark, who accepted it, and Minister approved his appointment.

Per letter of 4th April, 1884, Mr. Wark was appointed valuer on Commissioner's behalf to determine the amount to be paid to Mr. Castner under the agreement for "buildings, implements, and appliances" used by him in fitting and lighting the railway carriages with gas. On

On the 4th April, 1884, the Crown Solicitor, in response to an inquiry of Commissioner's, gave it as his opinion that the agreement does not provide for an arbitration, but for a valuation, and that the valuers may decide the question of value upon their own judgment, and without hearing evidence on the subject.

On the 19th idem Mr. Castner submitted copy of the valuers' award, amounting to £35,966 6s. 11d., and £178 17s. 6d., half the costs of the valuation, to be paid forthwith.

Hereon Commissioner minuted that the valuers had gone beyond the scope of the matters remitted to them; that not looking upon supplies as coming under the head of plant, implements, and appliances, he had expressly declined to remit the value of supplies for their consideration; that the value of supplies is not a fixed quantity, but variable; that the interest of Mr. Castner in the regulator was not to be considered, but the valuers had awarded £5,000 for it. Crown Solicitor to say if the award can be ignored by reason of this valuation of assets in excess of those contained in the submission. Crown Solicitor, thereupon, obtained and forwarded the Attorney-General's opinion on the case.

On the 22nd April, 1884, Castner wrote that as he had had no intimation who was to take charge of the gas-works handed over on the 19th idem, he had instructed the foreman to continue operations and to purchase supplies on Commissioner's account, and had "left on" the old staff; that Mr. Downton, his chief clerk, who holds a power of attorney, would keep accounts of all expenses and wages and hand them to Commissioner for payment, and that there are a number of carriages in hand which would be completed as soon as possible.

On the 24th April, 1884, Commissioner addressed a letter to Mr. Castner referring to the award of the valuers, and stating that the question whether the valuers had not gone beyond the scope of the inquiry remitted to them had been referred to Crown Law Officers, and until advised on matter could take no action in regard to award. (Note.—This letter was taken to Mr. Castner on the day it was written, but it was found that he had started for Melbourne the previous evening, and it was therefore left with the person in charge of Castner's office.)

On the 30th April, Traffic Manager asking what arrangements had been made for the supply of gas during Castner's absence, and stating that there is very little of the necessary material at the works.

Mr. Castner's accounts for supply of gas for April, or rather for a portion of April, are in obedience. Traffic Manager (N.) forwarded to Commissioner an account for gas supplied up to April 19, minuting that he did not know why he had been called upon to certify for a portion of a month.

Hereon "Commissioner minuted Mr. Castner is proceeding on the award of the valuers. We are not bound by contract to take over works until some time in May. The valuers have gone out of their way to regulate that we shall pay the award from a certain day in April, interest upon the amount, and, constructively, that we shall take over the works on the 19th April. Probably a similar account has been sent to Traffic Manager, South and West. Let me know at once."

Traffic Manager (South and West) replied that a similar account had been sent to him, but in Commissioner's absence he had held it over.

I may say that I have made myself acquainted with the purport of every paper on the file, and I can state without hesitation that in no stage of the negotiations with Castner was the patent right in the regulator referred to. The first intimation made directly by Castner that he claimed a property in the regulator is contained in his lump valuation submitted on the 15th January, 1884.—C.A.B.

Loco. Engineer.—Mr. J. L. Castner's gas arrangements. I request you will be good enough to prepare and submit an inventory and valuation of the stores and materials on hand on the 14th instant, or rather on the morning of the 15th instant, when you took charge of the gas-works. You will have no difficulty in speedily accomplishing this if the instructions contained in my former minute to keep an accurate account of the stores and materials used by yourself have been carried out—G.B., B.C., 30/5/84.

Loco. Overseer.—D.C.M'L., 31/5/84. Urgent. This is being attended to.—T.M., 2/6/84.

No. 28.

J. L. Castner, Esq., to The Commissioner for Railways.

Sir,

Railway Gas-works, Sydney, 30 May, 1884.

Referring to our agreement this morning *re* settlement of the gas-works award, and the arrangement for the revaluation of stores, I shall be glad if you will appoint a time, and an officer to meet me, for this purpose, with a view to an early adjustment of the matter.

I have, &c.,

JOHN L. CASTNER,
(*Per* H.D.)

Loco. Engineer.—G.B., B.C., 2/6/84. The inventory of all stores and materials on hand will be completed on Wednesday, and Mr. Castner's representative might attend at this office on Thursday morning, when the whole matter can be gone into and disposed of.—W. SCOTT, 2/6/84. Commissioner.

No. 29.

The Commissioner for Railways to J. L. Castner, Esq.

Sir,

Department of Railways, Sydney, 4 June, 1884.

In reply to your letter of the 30th ultimo, *re* settlement of the gas-works award and the arrangement for the revaluation of the stores, I have the honor to inform you that the inventory of all stores and materials on hand has been completed, and your representative can attend at the office of the Locomotive Engineer to-morrow (Thursday) morning, when the whole matter can be gone into and disposed of.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.

Locomotive Engineer.—G.B., B.C., 4/6/84. Mr. Castner's representative called and exhibited authority from Commissioner to examine our statement of stock on hand, plant, &c.—D.C.M'L.

No. 30.

Arbitration in the matter of Mr. J. L. Castner's Contract for supplying Gas.

THE award of the arbitrators in this matter (made on the 19th April, 1884) was that the Commissioner should pay the sum of £36,145 4s. 5d., and that if not paid in four days, interest on the amount should be allowed at the rate of 6 per cent. The sum so awarded was made up thus:—

Buildings and plant	£29,329	1	8
Patent right of regulator	5,000	0	0
Materials on hand	1,637	5	3
Half costs of arbitration	178	17	6

£36,145 4 5

Subject to the submission of this award, Mr. Castner, by his attorneys, Messrs. J. Y. Mills and Henry G. Downton, made certain proposals for carrying on the business of supplying gas.

These proposals they now abandon, and agree to accept the amount awarded, less the £5,000 awarded for the patent right of the regulator, and the £1,637 5s. 3d., the amount at which the stores and materials were valued, which will leave £29,507 19s. 2d.

This sum they will accept without interest, and make over to the Government all right and title to the Patent Regulator without further payment beyond the said sum of £29,507 19s. 2d.

The stores and materials to be revalued, as on the 14th May, 1884, and to be paid for upon such revaluation.

Please see note from Mr. Mills of 5th instant enclosed.*

Will Crown Solicitor please prepare the release, omitting to insert amounts.

Pro Commissioner, G. B., B. C., 5/6/84.

No. 31.

The Locomotive Engineer to The Commissioner for Railways.

I HAVE had the stock of stores and materials on hand at the various gas-works on the 15th ultimo carefully taken, and enclose herein statements showing the value as per Mr. Castner's inventory and the value of the articles actually on hand on the 15th ultimo, *i.e.*, allowing Mr. Castner's prices in each case. The particulars are as follows:—

	Value claimed by Castner.			Value of goods on hand, 15/5/84.		
	£	s.	d.	£	s.	d.
Sydney	1,373	19	6	1,349	6	0
Newcastle	156	10	0	90	11	4
Bathurst	55	18	5	45	1	10
Junee	57	13	0	46	1	8
	1,644	0	11	1,531	0	10

This gives a difference in favour of the Department of £113 0s. 1d. In going through the stocks it has been found that there are a number of articles on hand which are not shown in Mr. Castner's list, and they are given in the list marked A.

There is an item in dispute of some 600 gallons of tar oil, which Mr. Castner's representative says is at Bathurst, and not accounted for in the stock list sent from there. I have written to-day to ascertain whether it is there or not.

W. SCOTT,

Per D. C. M'L., 7/6/84.

No. 32.

The Crown Solicitor to The Commissioner for Railways.

Sir,

Crown Solicitor's Office, Sydney, 6 June, 1884.

I have the honor to inform you that Mr. Mills has left the Letters of Registration granted to John Louis Castner with me, and informs me that it is not intended that the Letters of Registration shall be assigned to you, as I was informed was to be the case, by the gentleman who brought the papers from your Department; but that you are to have leave to use the patent upon all railways now, or at any time hereafter, in use in New South Wales, Mr. Castner retaining the right to use, or to license the use of, the patent in respect of all other matters.

I have, &c.,

JOHN WILLIAMS,
Crown Solicitor.

The Commissioner for Railways to The Crown Solicitor.

Sir,

Department of Railways, Sydney, 9/6/84.

With reference to your letter of the 6th instant, and the question which has been raised whether it was the absolute property of the patent of the gas regulator, or the right of user only, which, under the terms of compromise, recently arranged with Mr. Mills, Mr. Castner was to make over to the Commissioner, I have the honor to inform you that in my conversation with Mr. Mills I received the distinct impression that it was the actual patent right which Mr. Castner was to assign, and in the memorandum which I made at the time, and which Mr. Mills signed, I think that view is expressed.

As, however, Mr. Mills disclaims any intention of conveying that impression, and insists that all he had in his mind, or indeed in his power, to concede was the right to use the regulator on the railways of the Colony, I cannot, without impugning his veracity, refuse to accept his statement, believing that by a want of clearness he failed to convey what was really in his mind; and as I learn that the patent may have

a

* This note cannot now be found.

a value in the Colony outside its uses for railway and tramway purposes, I shall be satisfied if the right to use the regulator on the railways and tramways, present and future, be assigned to the Commissioner, provided such right of user be so secured that it shall not be affected by any subsequent sale or assignment of the patent by Mr. Castner.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.

J. L. Castner's release.

The Acting Secretary,—

The Commissioner expressed a wish to know what were the precise words he made use of with reference to the Patent Regulator in the minute which he wrote of the terms agreed upon with Messrs. Mills and Downton.

When at the Crown Solicitor's office to-day I took the opportunity of referring to the minute, and I found that it reads thus: "Granting to the Government all right and title to the Patent Regulator without further payment."

This is the minute which is signed by Messrs. Mills and Downton in token of their acceptance of the conditions.—C.A.B., 11/6/84.

My words represented what transpired, "it was all right and title to the Patent Regulator" the Department sought and obtained for the Government.—CHAS. A.G., 12/6/84.

No. 33.

Mr. D. C. M'Lachlan to Mr. Badham.

MEMO.—Before Mr. Castner's matter is settled I desire to let you know that we have discovered a very great discrepancy in the brickwork at the Bathurst works. In Mr. Castner's list it is given at 38,270 cubic feet, while there only actually appears to be 12,764 cubic feet. This is a very large discrepancy, and represents some money.

I think you should look into it before the final statement is made. I shall be glad to hear from you *re* the matter.

In haste,

Yours truly,
D. C. M'LACHLAN.

Arrangement with Castner.

Acting Secretary,—I have just received the annexed memo from Mr. D. M'Lachlan questioning the correctness of the measurements of brickwork at Bathurst, upon which the valuation of the arbitrators was based. It therefore impeaches the valuation of the arbitrators; but I fancy that under the terms of the compromise lately agreed to that valuation cannot now be disturbed, even if a mistake be proved.—C.A.B., 11/6/84.

I think that such a serious error as this should be considered. The valuers should be communicated with, and requested to again measure this brickwork, with a view to a modification of the value.—CHAS.A.G., 4/6/84. Mr. Cowdery.—G.B., B.C., 11/6/84.

Before replying to this minute I should like to be furnished with the papers *re* valuation.—G.C., 12/6/84. Commissioner.

My estimate, 38,270 cubic feet, was the cubic contents of buildings, and not brickwork only.—G.C., 12/6/84. Seen.—CHAS.A.G., 12/6/84.

J. L. Castner, Esq., to The Commissioner for Railways.

Sir,

Railway Gas-works, Sydney, 2 July, 1884.

I shall be glad if you will kindly let the bearer have a copy of the papers *re* gas-works award, which were signed in your office by Messrs. Mills and Downton on the 30th May last.

I have, &c.,

JOHN L. CASTNER,
(*Per* H.D.)

Where is this?—G.B., 2/7/84. With Crown Solicitor, with the other papers. Shall I obtain Commissioner's minute? That is what Mr. Castner's representative wants, and it can be separated from the papers without detriment to Crown Solicitor's action.—C.A.B., 2/7/84. Acting Secretary.—Can I supply this?—G.B. Commissioner. Yes.—CHAS.A.G., 2/7/84. Copy of Commissioner's minute of 30/5/84 forwarded to Mr. Downton.—C.A.B., 3/7/84.

No. 34.

The Crown Solicitor to The Commissioner for Railways.

Sir,

Crown Solicitor's Office, Sydney, 4 July, 1884.

I have the honor to forward herewith draft release, and copy of same for execution, and the assignment of the interest in the patent so far as the railways are concerned, which I have made in triplicate. One copy you will notice is engrossed on the letters of registration, one copy to register, and the other for you to retain.

I thought it advisable to have one copy indorsed on the letters of registration in order to give notice to any future purchaser of your rights in the matter.

As the power of attorney does not contain the usual declaration of notice of non-revocation, &c., I submitted a case to Mr. Attorney-General as to whether it should be accepted. When the assignment has been executed it should be returned to me at once, as it has to be registered within three days of the date thereof.

I have, &c.,

JOHN WILLIAMS,
Crown Solicitor.
Accountant,

Goods supplied at Redfern Gas-works—*continued.*

The Commissioner for Railways to J. L. Castner, Esq.

Sir,

Department of Railways, Sydney, 14 October, 1884.

I have the honor to acknowledge your letter of the 11th instant, enclosing a duplicate copy of an account amounting to £188 18s. 4d., for gas fittings and stores found in stock by our officers on the 15th May last, but not included, you say, in the award of the 19th April, stating that, inasmuch on finding in some cases that the quantity on hand on the former date was less than the quantity called for in the award list, I deducted the value, I am bound to pay for the goods which are in excess of the amount dealt with in the award, and requesting me to pay the above sum in accordance, you allege, with an understanding between myself and your attorney when they agreed to the retaking of stock.

In reply, I beg to state that I do not concur in the views you express. The value of the stores for which you now seek to obtain extra payment was included in the lump sum which was put down for stores in the original valuation. For that sum, under the award, I was to have all the stores which were then in stock. Whether the valuers had made a detailed inventory I did not know, and I certainly never questioned the accuracy of the amount entered under this head. As you are aware, I made no objection to the valuation of the stores, and it was upon totally different grounds that I refused to accept the award of the arbitrators.

The revaluation was necessarily based upon the original valuation, and was never intended to rectify any mistakes or omissions the arbitrators may have fallen into. It had, in fact, no other object than to bridge over the period between the 19th April, when the valuation was made, and the 15th May, when I took over the works by including interim receipts and excluding interim issues. There was no such deduction of value as you assume on account of stores found less in hand on the latter date.

Under the circumstances set forth above, I cannot recognize your claim for extra payment for those stores.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

SPECIAL TRAINS USED BY AND EXPENSES OF MINISTERS.

(RETURN OF, SINCE 1883.)

Ordered by the Legislative Assembly to be printed, 9 June, 1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(FREE PASSES ISSUED TO LADIES.)

Ordered by the Legislative Assembly to be printed, 8 June, 1887.

[*Laid upon the Table of the House, in accordance with promise made by the Honorable the Secretary for Public Works, in answer to Question No. 6 in Votes and Proceedings, No. 31, of the 11th May, 1887.*]

(1.) *Question—*

The names of the ladies possessed of free railway passes ?

Answer—

The only lady at present possessed of a free pass is Miss Cowper, to whom was transferred the life pass held by her late father, Sir Chas. Cowper, for distinguished services rendered to the Colony.

(2.) *Question—*

The names of the ladies who have travelled free on charitable missions ?

Answer—

From 1st January, 1879, to present time, the following ladies have received passes :—Miss St. Clair, Miss Fitzpatrick, Miss Long, Mrs. C. Fraser, Signora Steffani, Miss Newcombe, Miss Hill, Miss Stafford, Mrs. M'Donald, and Miss Kennedy.

(3.) *Question—*

What were the charitable missions ?

Answer—

The following are the purposes for which the passes were issued :—Charity concert in connection with church at Campbelltown ; charity concert in connection with St. Patrick's Church, Burrowa ; charity concerts at Lithgow ; Orphanage at Goulburn ; charity concerts, Orange ; building fund of church at Picton ; Juvenile Industrial Exhibition at Lithgow.

(4.) *Question—*

What constitutes an "artist" entitled to travel free on our railways ?

Answer—

A person professing and practising one of the liberal arts, who is giving his or her services gratuitously on behalf of some charitable object.

Department declined liability Claim not entertained Department declined to admit liability. This was a claim for compensation for injuries sustained in a collision in Park street on 26/12/80. The claimant sought to recover £,000 damages. The action was tried on 8/8/81 when the jury returned a verdict for plaintiff for £250, which, with interest thereon amounted to £251 7s 6d. Claim not entertained.
Bennett, Edwin Moore and wife						Moore and wife	520 4 0				This was a claim in respect of injuries sustained in a collision between a motor and tram, in Mevic Park on 12/4/81. The correspondence and reports on the subject were transmitted to the Crown Solicitor, upon whose advice and in view of the medical testimony, it was decided to settle the claim without recourse to litigation.
Jones, Arthur	Jones, A	Jones, A		50 0 0	26 15 8			Nil			Mr Jones claimed £100 as compensation for injuries sustained in a collision on the Randwick line on 2/10/81. Subsequently (after the Department had declined to admit liability) a writ was issued and claim augmented to £200. The action was tried on 27/12/81, when a verdict for £50, by consent, was entered. Claim not entertained.
Culliton, Mary Gribbay, D Scholes, Isaac	Gribbay, D		Gribbay, D								This action was tried on 22/2/82, and a verdict for the Commissioner was entered. Claim not entertained.
O'Brien, Francis	O'Brien, F	O'Brien, F		250 0 0	124 1 3						O'Brien claimed compensation for injuries alleged to have been sustained by him in a collision between a tram motor and a horse and cart, of which he was driver. Department declined to admit liability. Subsequently a writ was received claiming £5,000 damages. The action was tried on 13/3/82 and the jury returned a verdict for plaintiff with £250 damages. Claim not entertained.
Hoare, Fl Tierney, Mcl. Spring, Wm. Finlay, Robt Palmer, Jas Watson, R. A			...			Tierney, M Spring, Wm Finlay, R	11 1 0 11 1 0 20 0 0				Claim not entertained.
Bates, Mrs Kidney, A	Kidney, A	Kidney, A.		250 0 0	118 12 3	Watson, R. A	20 0 0				Department declined to entertain claim. Mr Arthur Kidney claimed £1,000 as compensation for injuries alleged to have been sustained by him in a collision which occurred near Randwick. The Department was making inquiries into the claim when a writ was received and claim increased to £2,000. The action came on for trial on 1/4/82, when the counsel for defendant consented to a verdict for £250.
Purser, Jas Meyers, M. E Moore, S Brd, Richd.						Purser, Jas Moore, S Brd, R.	175 0 0 20 0 0 15 0 0				Claim declined.
Bowden, R.	Bowden, R.	Bowden, R.		550 0 0	127 14 7						Mr Robert Bowden claimed £1,000 as compensation for injuries alleged to have been received by him in a collision which occurred near Randwick. The matter was referred to the Crown Solicitor for advice, but before a reply could be communicated to Mr Brown what action the Department intended to adopt in the case a writ was received and claim augmented to £2,000. The action was tried on 1/6/82, when the Jury returned a verdict for plaintiff, with damages, £550.

Mrs. Cooper claimed £2,000 as compensation for injuries alleged to have been sustained in a collision between a Camden tram, in which she was a passenger, and some ballast waggons which were stationary in a siding near Campbelltown. The case went to trial and resulted in a verdict for plaintiff, damages, £550.

Claim not entertained.

This was a claim for £2,000 for compensation for injuries alleged to have been sustained through having been precipitated from a tram-car when rounding the curve at the intersection of Elizabeth and Liverpool streets. The action was tried and resulted in a verdict being returned for defendant.

Claim not entertained.

This was a claim in respect of injuries alleged to have been sustained by being knocked down by a Botany tram opposite Redfern Railway Station, just after he had alighted from a tram proceeding in an opposite direction. The Department declined to admit liability on the ground that the accident was entirely attributable to Landy's own want of vigilance and care. Subsequently a writ for £1,000 damages was received. The trial was concluded on 9/3/83, when the jury brought in a verdict for plaintiff; damages, £150 and interest.

Claim not entertained.
do.

Claim not entertained.

Claim not entertained.

Mr. M'Grath claimed compensation for injuries alleged to have been sustained by being run into by a Glebe Point tram, on the Glebe Point Road, on 15/4/83. In view of the departmental reports, which were to the effect that the accident was the result of claimant's own want of care, Commissioner declined to entertain claim. Subsequently a summons was received claiming £100 damages. The action was tried on the 26/6/83, when a verdict in favour of plaintiff, with damages, £31 10s. In delivering judgment His Honor stated that there was no evidence of negligence on the part of the defendant, but in view of the decision of the Supreme Court in the case of *Toohy v. Commissioner for Railways*—for particulars of which *vide* page No. 7—he gave a verdict for plaintiff.

Claim not entertained.

This was a claim in respect of injuries sustained through being run over by a tram in Devonshire-street, opposite Railway steps, on 23/12/82, caused, the claimant alleged, by the negligence of the tramway officials. Commissioner declined to admit liability, and a writ was received claiming £1,000 damages. Subsequently, however, the claim was increased to £3,000. The action was tried when the jury returned a verdict for plaintiff, damages £1,500. A *rule nisi* for a new trial was moved for and refused.

Claim not entertained.

Department declined to admit liability.

This was a claim for £30 as compensation for injuries and loss alleged to have been sustained at Waverley by being run into by a tram while riding a horse. Commissioner declined to admit liability; a writ was then issued to recover the amount named. The case was tried on 7/8/83, when a verdict for defendant was returned.

* Inclusive of interest.

(1.) The number of cases brought or threatened against the Commissioner for Railways for injuries sustained by persons from the tram motors or cars.	(2.) The number of cases tried.	(3.) The number of verdicts lost by the Commissioner.	(4.) The number of verdicts obtained.	(5.) The amount of moneys paid for verdicts and for costs respectively.		(6.) The number of cases settled.	(7.) The moneys paid on such settlements.	(8.) The number of cases in which a settlement was offered by plaintiffs, and the amounts which were asked on such settlements.		(9.) The amounts paid in excess of sums offered in settlement in cases which were continued after such offers of settlement.	Remarks.

A writ was issued and claim laid at £1,000. The action was tried on 15/6/83, when the jury by a majority gave a verdict for plaintiff, damages £1,000.
Roberts, Jane	Roberts, J.	Roberts, Jane.	This was a claim for compensation in respect of injuries alleged to have been sustained by being precipitated to the ground while in the act of alighting from a tram-car at the Liverpool-street stopping-place. Mrs. Roberts attributed the accident to the default of the conductor, whom she alleged sounded the whistle for the tram to start before she was allowed sufficient time to properly alight therefrom. Department declined liability on the ground that claimant attempted to leave the tram while in motion, and that consequently no claim could be entertained. On 16/7/83 a writ was received claiming £200 damages. The action was tried on 1/9/83, when a verdict for defendant was entered.
Henn, Wm.	Henn, Wm.	30 0 0	Claim not entertained.
Ellis, Solomon	do.
Keen, John	do.
Steel, Wm.	Steel, W.	Steel, W.	251 1 10	139 11 8	On the 7th May, 1883, Steel applied for compensation for injuries alleged to have been sustained through the negligence of the tramway officials on the Newtown Road. Under the reports furnished the claim could not be entertained. A writ was then issued claiming £1,000 damages. The case was tried on 20/11/83, when the jury returned a verdict for plaintiff with damages £250.
Maxwell and wife...	Maxwell & wife.	Maxwell & wife.	750 0 0	156 1 6	Mr. and Mrs. Maxwell claimed £1,000 as compensation for injuries alleged to have been sustained through an accident which occurred on the Camden tram line on 13/3/82. In view of the medical testimony and departmental reports, the Commissioner offered to Mrs. Maxwell (whom it appeared received slight injuries only) a free pass to some country station, where she could recruit her health, and £3 3s. per week for a month with which to defray her hotel expenses. This offer, which was made without prejudice, was declined, and on 30/8/83 a writ was received claiming £2,000 damages. The action was tried on 23/11/83, when the jury returned a verdict in favour of plaintiff, damages £750.
St. Clair, N.	Claim not entertained.
Clarke, Geo.	do.
Hoolahan, Mrs.	Department declined to admit liability.

Hayes, E.	do.
Tierney, Joseph J.	do.
Falconer, Mrs. W.	Falconer, Mrs.	Falconer, Mrs.	3,500 0 0	163 16 5	On the 17/4/83, Mrs. Falconer applied for compensation for the death of her husband, who was killed on 6/4/83 by being run over by a Botany tram, near the junction of George and Pitt Streets. Mrs. Falconer was informed that the Department declined to admit liability, but that a sum of £100 would be placed on the Estimates for her as a gratuity. This offer was refused. Subsequently a writ was received claiming £5,000 damages. The action was tried on 22/11/83, when the jury brought in a verdict for plaintiff with damages £3,500. Subsequently a <i>rule nisi</i> for a new trial was moved for (13/2/84), on the ground that the damages were excessive, and that the verdict was against evidence. The rule was, however, refused.

Claim not entertained.
do.

do.
Mr. Davison claimed £300 as compensation for injuries alleged to have been sustained in a collision between a Newtown tram and a 'bus, on which he was a passenger, near the intersection of George-street West and Harris-street. The Commissioner offered without prejudice to defray claimant's medical expenses incurred in connection with the accident. The offer was refused, but Mr. Davison intimated his willingness to accept £200, which proposal, however, was not entertained. Subsequently, 1/9/83, a writ was received claiming £1,000 damages. The action was tried on 29/5/84, when the jury returned a verdict for plaintiff for £200.

Claim lapsed.

Mr. Hill claimed compensation for injuries alleged to have been sustained in a collision between a tram and a 'bus, in Oxford-street, on 11/2/84. Subsequently a writ was received claiming £2,000 damages. The action was tried, and the jury brought in a verdict for plaintiff, damages £900. A new trial was moved for, on the ground that the amount of verdict was excessive. The full Court directed that, unless the plaintiff consented to the reduction of the damages, which they considered excessive, from £900 to £450, a *rule nisi* for a new trial would be granted. The plaintiff consented to the reduction.

Mr. Rigby claimed compensation for injuries alleged to have been received in a collision between a tram and a milk-cart of which he was driver, on the Glebe Point Road. The Commissioner declined to admit liability, on the ground that the accident was the result of Rigby's own want of care. Subsequently a writ was received, and the damages laid at £2,000. The action was tried on 3/10/83, when the jury brought in a verdict for defendant. Plaintiff then applied for a new trial, in which he was also unsuccessful.

Mr. and Mrs. Sharp claimed £300 as compensation for injuries alleged to have been sustained in a collision near Campbelltown, between a Camden tram and some ballast waggons. The Medical Officer of the Department who examined the claimants was of opinion that the injuries were only of a light and temporary nature. In view of this testimony it was considered that a small sum would amply compensate the claimants for the injuries received. Claimants, however, refused to settle the matter for a small amount, but intimated their willingness to accept £200. This offer was not entertained, but the Commissioner stated he would give without prejudice £50 in full satisfaction. This proposal was also declined, and a writ was received claiming £300 damages. The Commissioner then paid into Court the amount he had previously offered in settlement as sufficient compensation. The action was tried on 20/9/83, when the jury returned a verdict for defendant, *i.e.*, they were of opinion that the sum paid into Court was sufficient to compensate plaintiff for the injuries sustained. This verdict rendered plaintiff liable for costs of both sides, which, claimant stated, if enforced would ruin him. Subsequently the Crown Solicitor received from Mr. Sharp the amount (£265) of taxed costs, but the then Minister for Public Works (Mr. Wright) directed that half this amount should be remitted to Mr. Sharp.

Mr. Joseph claimed £75 as compensation for injuries sustained and expenses incurred in a collision in Liverpool-street. Under reports furnished claim was declined. Subsequently a summons was issued claiming £200 damages. The action was tried on 18/9/84, when the jury brought in a verdict for plaintiff, damages £122.

This was a claim for compensation in respect of injuries alleged to have been sustained in a collision between a tram and a cab of which claimant was driver, on the Enmore Road. The damages were laid at £500. The action was tried on 25/9/84, when the plaintiff was non-suited on the ground that no evidence of negligence on the part of defendant was shown, and that plaintiff was guilty of contributory negligence.

M'Hugh, Terence
Stafford, Joseph	Stafford, J.	10 0 0
Brown, Hy.	Brown, H.	Brown H	This was an application for compensation for injuries alleged to have been received through being knocked down by a motor at the corner of Elizabeth and Oxford Streets, Paddington. The claimant attributed the accident to the negligence of the driver of the motor. The Department repudiated liability. Subsequently a writ was issued claiming compensation for the injuries sustained in the manner indicated. The case was tried on 16th April, 1885, when a verdict for the defendant was returned. Plaintiff then moved for a new trial, which was granted on 27/4/85. The second trial is still pending.
Toohey, Michael	Toohey, M.	Toohey, M.	*1,479 5 10	409 8 5	Toohey, M.	400 0 0	1,079 5 10	Mr. Toohey claimed compensation for injuries and loss sustained in a collision between a Waverley tram and a dray of which he was driver, at the intersection of Market and Elizabeth Streets. In view of the departmental reports Commissioner informed Messrs. Slattery & Heydon that he would be prepared without prejudice to accept a reasonable offer of settlement. Messrs. Slattery & Heydon replied that their client would accept £400, which offer the Commissioner declined to entertain. Subsequently, 17/1/82, a writ was received claiming £2,000 damages. The first trial resulted in the jury returning a verdict in favour of the defendant. Mrs. Toohey (her husband having died in the meantime), however, obtained a new trial (in which she obtained £1,350 damages), the two points raised being—1st. Whether the injury sustained by Michael Toohey was the result of negligence on the part of the persons who had the management of the motor, and whether there was negligence on the part of the unfortunate man whereby he contributed to the accident; and, 2, which His Honor called the more important question, whether the running of steam motors upon a rail or tramway in the street in which the accident occurred is not a common nuisance. The Full Court decided that His Honor Mr. Justice Fawcett, who adjudicated in the original trial, was wrong in directing the jury that there was legal power to run steam motors, and on that ground, as well as on the ground that the verdict was against evidence, granted a rule absolute for a new trial. From this decision the Commissioner appealed to the Privy Council with the result that that Tribunal confirmed the judgment of the Full Court as to the question of negligence, but ruled that the use of steam motors in the streets was legal.

Patterson, T. J.	This is a claim for compensation in respect of injuries sustained in a collision in Oxford street. Patterson at the time was an employe of the Department, and was acting fireman of motor No. 22, which was run into by motor No. 61, which was in a disabled condition, and which broke away from motor No. 7 in Oxford-street when being hauled to Randwick, and collided with motor No. 22, whereby Patterson received injuries which incapacitated him from resuming work until 31st March of the succeeding year, although it may be mentioned, Dr MacCulloch certified on 11/11/84 that Patterson was then sufficiently recovered to be able to perform light duties. Patterson received full pay from date of accident (30/8/84) until 31/3/85. He continued in the service until 15/11/85, when he left without giving notice. On the 11/12/85 Messrs. Cope & King, solicitors, wrote, on behalf of Patterson, claiming compensation for the injuries received in the manner related. Department declined liability, and on the 14/1/86, the solicitors named wrote asking for the appointment of a nominal defendant against whom proceedings could be taken to recover damages. Case pending.
Carey, Edwd.	Carey, E..	Carey, E..	100 0 0	*5 5 0	This was an application for compensation in respect of injuries and damage alleged to have been sustained by claimant in a collision between a tram motor and a day of which he was driver, near Randwick workshops, on 17/10/84. The claim was resisted, and on 1/4/86 a summons was received, claiming £100 damages. The action was tried on 5/6/86, when a verdict for plaintiff was returned for the amount claimed. Subsequently a <i>rule nisi</i> for a new trial was moved for and refused.
Fegan, T. R.	Fegan, T. R.	Fegan, T. R.	†201 18 6	234 12 9	Mr. Fegan claimed compensation for injuries alleged to have been sustained in a collision between a tram and a cab of which he was driver, in George street West, on the 9th July, 1885. In view of the reports furnished the claim was not entertained. A writ was issued, claiming damages, the amount of which was not stated. The action resulted in a verdict for plaintiff, with damages £200. Subsequently a <i>rule nisi</i> for a new trial was applied for and refused.
Bench, Richd.	Bench, R.	Bench, R.	15 0 0	19 10 6	Bench..	75 0 0	Mr. Bench claimed compensation for injury and loss alleged to have been sustained by him in a collision between a Newtown tram and a cart of which Bench was driver, in Elizabeth street, on 10/12/85. In view of the departmental reports, the Commissioner decided to offer, without prejudice, £25 in full satisfaction, &c. This offer was declined. Mr. Bench, however, intimated his willingness to accept £75 and legal expenses incurred by him in consequence of the accident. This offer the Commissioner declined to entertain. Subsequently a summons was received claiming £100 damages. The case was tried on 5/6/86, when a verdict for plaintiff, with £15 damages, was returned.
Coles, J. W.	On the 20th May last, Mr. Coles claimed compensation for injuries alleged to have been sustained by his son (Percy), though having been thrown off a Leichhardt tram, on 13/5/86, near the junction of Norton-street and Parramatta Road. Matter not yet decided.
Passmore, W.	Decided not to entertain claim.
Purvis, F. K.	Claim not entertained.
Wigley, W. J.	This was a claim in respect of injuries alleged to have been sustained by claimant through a spark emitted from the motor of a Marrickville tram in which he was a passenger. As the motor in question was fitted with an efficient spark-catcher, which was in perfect order at the time of the occurrence, the claim was not entertained.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

DISMISSAL OF MR. JOHN HIGGISON.

(CLERK IN STORES DEPARTMENT AT RANDWICK TRAM-SHEDS.)

Ordered by the Legislative Assembly to be printed, 27 April, 1887.

Copies of papers relative to the dismissal of Mr. John Higgison, Clerk in Stores Department at Randwick Tram-sheds.

List of Officers employed in the Tramway Branch Store, together with name, age, date of appointment, and duties, also salary.

Name.	Age.	Date of present Appointment.	Salary, &c.	Duties, &c.
			Per annum. £	
R. J. Dobson ...	37	October 9, 1879 ...	235	Storekeeper.
T. J. Gardiner ...	32	June 1, 1883 ...	220	Balancing ledger, making out vouchers, and attending to shipping, &c.
J. Higgison ...	34	October 3, 1884 ..	150	Stock Clerk.
J. Crickard ...	33	August 13, 1885 ..	120	Clerk in charge of issues and posting ledger.
R. J. Dabois ...	20	July 1, 1882 ...	105	Requisition Check Clerk.

Minute of Mr. Secretary Sutherland.

* * * * *

It seems to me that this is a large staff to manage a branch store, the cost being £830 per annum. I should like inquiry made to see if the present officers cannot manage without further assistance, or in fact if less officers could not do the work.

J.S., 5/3/87.

Minute of Commissioner.

* * * * *

Mr. Richardson and Mr. John Vernon will please look into this. Perhaps the largeness of the staff is owing to the unnecessary keeping of details.

CHAS. A.G., 8/3/87.

Report of Board of Inquiry.

WE have inquired into this matter, and find that abandoning an amount of detail in the charging of the issues (which we consider, and the Locomotive Superintendent concurs in considering, quite unnecessary), not only will the filling up of the vacancy caused by Mr. Coleman's retirement be obviated, but it will also be possible to dispense with the services of another clerk.

Moreover, by the discontinuing of issuing stores at night, which we and the Locomotive Superintendent also consider can easily be rendered unnecessary by the placing of a small store under the control of the night foreman of the shops, the services of the night issuer may also be dispensed with.

The information with regard to the issues which it is proposed shall in future be dispensed with, is the charge of stores to each distinct car and motor by number instead of to cars generally and motors generally.

The clerks dispensed with will be—

Mr. Coleman (already retired)	£150
„ Higgison	150
„ J. Cleary, night issuer, at 8/-	146
	<hr/>
	£446

Cleary is a comparatively old hand, and a good workman, and in this scheme of retrenchment his services would not be dispensed with. He would take up day labour, and a man more recently appointed and of less use to the Department would receive notice to leave.

In the case of Mr. Higgison, there are others junior to him, but he has proved a failure as a clerk. He was sent to Bathurst in charge some years ago, and got things there into a deplorable mess, later he was placed in the telephone office, at Redfern, and on being sent to Randwick, it was on the distinct understanding that his services might only be temporarily required. There has been no particular fault to find with him there, but he is simply inefficient, and Mr. Crickard, his junior, who is to be retained and for whom an increase of salary is recommended, is able, according to Mr. Dobson's report (and as one of us, Mr. Richardson, can well imagine) to do as much work as Mr. Higgison and Mr. Coleman united.

Mr. Crickard is at present in receipts of only £120. He is a very valuable and assiduous clerk, and we recommend that he be paid at the rate of £150.

This will still leave the saving to be effected at £400 per annum.

A. RICHARDSON,
Assistant Secretary.

I concur in the above, with the exception that being unacquainted with the employees dealt with, I am unable to judge of their qualifications.

JOHN VERNON,
Assistant Accountant.

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

TRAMWAY FROM KOGARAH TO SANS SOUCI.

(CORRESPONDENCE, &c.)

Ordered by the Legislative Assembly to be printed, 5 May, 1887.

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated 16th March, 1887, That there be laid upon the Table of this House,—

“(1.) Copies of all petitions, letters, and other documents from any person to the Minister for Works, in reference to the construction of a Tramway from Kogarah to Sans Souci.

“(2.) Also, copies of all letters, minutes, and other documents which may have passed between the Minister for Works or the Commissioner for Railways to the parties applying to have the Tramway constructed, or to any other person, bearing upon the subject.

“(3.) The names of the parties so applying, and copies of all agreements entered into between the Minister for Works, or any other person in the Department, with reference to the said Tramway.”

(Mr. Fletcher.)

No. 1.

The Council Clerk, West Botany, to The Secretary for Public Works.

Sir, Council Chambers, West Botany, 24 August, 1881.
I have the honor, by direction of the Mayor, respectfully to ask when it will be convenient for you to receive a deputation to urge upon the Government the advisability of constructing a line of Tramway from the nearest proposed Railway Station (Illawarra Railway), to be erected on the south side of Cook's River Dam, along West Botany-street, Scarborough, Sandringham, and Sans Souci.

An early reply will be esteemed a favor.

I have, &c.,

THOS. LEEDER,

Council Clerk.

Might be considered, I think, when Railway has been constructed.—CH.A.G., 29/8/81.

The Under Secretary for Public Works to The Council Clerk, West Botany.

Sir, Department of Public Works, Railway Branch, 26 August, 1881.
Referring to your letter of the 24th inst., I am directed to inform you that the Secretary for Public Works will receive the deputation on the subject of a Branch Tramway from the proposed Illawarra Railway towards Sandringham, &c., on Friday, the 2nd September next, at 12:30 p.m.

I have, &c.,

GERALD HALLIGAN,

For Under Secretary.

No. 2.

The Council Clerk, West Botany, to The Secretary for Public Works.

Sir, 167, York-street, Sydney, 11 March, 1882.
I am directed by the Mayor respectfully to ask when it would be convenient for you to receive a deputation recently appointed at a public meeting held at Sans Souci, upon the subject of construction of Tramway line from Cook's River to Sans Souci, *via* West Botany-street, Scarborough, North and South, Hastings, Scarborough Park, and Sandringham.

Be pleased when appointing the time to give me three clear days notice in order that the members of the deputation may be advised.

I have, &c.,

THOS. LEEDER,

Council Clerk.

Railways.—J.R., B.C., 16/3/82.
immediate report.—G.C., 20/3/82.

Mr. Cowdery.—G.B., B.C., 17/3/82. Mr. Hyndman, for
Engineer for Existing Lines, with plans and report.—R.A.H.,

No. 3.

Report by Engineer for Existing Lines on proposed route of Tramway.

I EXAMINED yesterday with Mr. Bowmer, Mayor of West Botany, the proposed line of Tramway extension from Cook's River to Sans Souci, following West Botany-street, to its intersection with Bay-street; thence by Bay-street about half-way to the beach; thence parallel to the beach, through private property to Frederick-street; by Frederick-street to the Sandringham Road; and then through private property to Sans Souci.

I understand that all the land-owners are willing to give what land is required for the Tramway free. The openings in Cook's River dam would require strengthening. West

West Botany-street ascends at first by a steep grade which might be improved, and then descends by easy gradients to Muddy Creek, where a bridge will be required, for which I believe £650 is already provided by the Government. This would scarcely be sufficient for Tramway purposes.

The line from here is almost level to Sans Souci and might be considered a surface line, and the country is all very light sandy soil.

Where the roadway in West Botany-street and Bay-street has been partially made only about 16 feet wide, it would be necessary to increase the width. The roads are not less than a chain wide. The distance is about 7 miles.

The greater number of inhabitants reside about West Botany-street. There are at present very few houses about Sandringham and Sans Souci.

I have had no time to make a plan of the subdivisions, but attach a copy of the plan of parish of St. George, borrowed from the Survey Department.

R.A.H., 24/3/82.

Engineer for Existing Lines,—The Illawarra Railway will run parallel with the road to Sandringham as far as Kogarah. The question is whether the Tramway to Lady Robinson's Beach, &c., should not start from the Railway line at Kogarah.—CH.A.G., 27/3/82.

No. 4.

Petition.

PETITION of the inhabitants of Kogarah to the Honorable John Lackey, M.L.A., Minister for Public Works.

THE petition of the inhabitants and landed proprietors of Kogarah humbly and respectfully sheweth:—

That a public meeting was held at the "Gardeners' Arms Hotel," Kogarah, on Thursday, the 9th day of March, 1882 (Mr. Henson, M.L.A., occupied the chair), to take into consideration the route proposed by the Municipal Council of West Botany for the construction of the proposed Tramway from Cook's River to Sans Souci, George's River; also, to take into consideration the desirableness of urging upon the Government the necessity of constructing a line of Tramway from a suitable point at the Illawarra Railway, thence along the public road *via* Kogarah Junction, Scarborough Park, and terminate at Sans Souci, George's River, was carried by a large majority.

Your petitioners are of opinion that a Tramway, constructed through the Municipality of West Botany, and terminating at Sans Souci, George's River, would prove detrimental to the interests of the inhabitants of Kogarah and the district in general.

Your petitioners consider that the interest of the inhabitants of West Botany would be served by the Tramway terminating at Sandringham instead of Sans Souci, George's River; the latter place more properly belongs to the Kogarah district, and the only place that could suitably be adopted for a terminus.

Your petitioners have toiled hard for upwards of twenty years in forming and maintaining the road between Cook's River and George's River for the purpose of improving their district when it was only a wild bush; and your petitioners consider it would be impolitic on the part of the Government to deprive their district of a Tramway and grant a Tramway to West Botany; by so doing it would divert the traffic off the Rocky Point Road, its legitimate route, and thereby cause the inhabitants of Kogarah to consider it an act of injustice towards them.

In conclusion we earnestly submit the foregoing to your earnest consideration; and your petitioners, as in duty bound, will ever pray.

Signed by R. HUGH KELLY and 101 others.

The Hon. the Minister for Public Works,—

Sir,

WE, the undersigned, do hereby agree and declare that we will surrender a portion of our land to the Government without fee or remuneration of any kind whatever, sufficient for a Tramway line to pass through from the Illawarra Railway to Sans Souci, George's River:—

WM. R. KENDALL, Cambridge-street, South Kingston.
JOSEPH WALZ, Rocky Point Road.

Railways, B.C., 19/4/82.—J.R. Mr. Cowdery, B.C., 20/4/82.—G.B. The direction of the Tramway to George's River at Sandringham and Sans Souci will depend upon how far the Railway line to Illawarra can be made use of for a portion of the route.—CH.A.G., 20/4/82.

WE, the undersigned, owners of land through which it is proposed to apply to the Government for the construction of a line of Tramway through West Botany Municipality, touching Scarborough Park, Sandringham, and Sans Souci, hereby signify our willingness to surrender to the Government, without monetary consideration, a sufficient quantity of our respective lands for the construction of such line, and we do hereby bind ourselves to execute all necessary documents under our respective hands and seals when required so to do.

Signed by JOHN ENGLAND and 13 others.

MEMO.:

Department of Public Works, Sydney, 12 November, 1885.

Proposed Tramway, Kogarah to Sans Souci and Sandringham.

MR. F. W. KING, representing the owners of certain lands, called to ask for an appointment for a deputation to place before the Government the desirability of making a Tramway as above, the owners being prepared to contribute towards the cost of the work.

J.R., 12/11/85.

Friday, 20th, at 11. Inform.—J.R., 12/11/85. Done. Railways, for the necessary information to enable the Minister to reply, B.C., 12/11/85.—J.R.

WILL

WILL Mr. Cowdery have an inspection of the route made and rough estimate prepared by this day week, when deputation is to wait upon the Minister.

As land required is promised free, the most direct route should be adopted.

Consideration should also be given to the fact that there is a private tram-line to Lady Robinson's Beach, and to the suggestion that perhaps the cheapest route would be to take the line in that direction to Sandringham and Sans Souci.

A railway line was at one time surveyed close to the beach; the pegs could probably be followed, and that route reported upon. CH.A.G., 13/11/85.

Proposed Tramway from Kogarah to Sandringham and Sans Souci.

MR. COWDERY and myself have inspected the proposed route, and after carefully examining the locality, the route shown roughly in blue on attached tracing is recommended, as being not only the most direct but also the cheapest of construction.

The tram-line would leave the main line at Kogarah station, then, for a distance of about 30 chains, pass along Belgrave and another street and through subdivided land into Rocky Point Road, which it will follow for about 25 chains; thence through private lands, and close to Scarborough Park, into Walter-street (South Scarborough), which it will follow until reaching "Sandringham Hotel"; thence through private lands for a short distance, when it can be taken on the reserve along the foreshore to "Sans Souci Hotel," where the terminus would be, either at the back of the hotel, or the line might be taken a few chains further, to a point about or near the Rocky Point Road, as required.

Except for the first half-mile about, the line would be almost level, and little or no earthworks will be required beyond forming. The grades on the first half-mile would be very easy, and consequently several cars can be drawn easily when required.

The line could be constructed without guard-rails in ordinary ballast for its whole length, except about half-a-mile at the commencement and at crossing-places, and consequently would be very cheap in cost of construction.

The length of this line will be about $3\frac{1}{2}$ miles, and the cost is estimated at £2,500 per mile, or about £8,750 in all.

The line would pass through some allotments of subdivided land in the township of Kogarah, and if these allotments are already sold probably some compensation will be required.

The line can be connected to the main Illawarra Railway, and might be used for goods traffic if required.

MAX THOMSON, 19/11/85.

Commissioner.—G.C., 19/11/85.

No. 5.

Minute by The Secretary for Public Works.

Department of Public Works, Sydney, 20 November, 1885.

Representations made by Deputation *re* Tramway, Kogarah to Sans Souci.

A DEPUTATION, introduced by Mr. Henson, Mr. Judd, and Mr. Stephen, M's.P., also present, waited upon me to-day with reference to a Tramway from Kogarah to Sans Souci, *via* Sandringham.

They stated the line would be an easy one to construct, the country being level throughout, that the distance would only be about 3 miles, and that it would create a large traffic. At the present time, with the present imperfect means of reaching the shore of Botany Bay and the gardens at Sandringham and Sans Souci, a large number of pleasure seekers visited these places, while there was a fair resident population; but if the Tramway were made the holiday traffic upon it would be very large, and the regular travellers would be much greater. In connection with this matter they pointed out that not only would this traffic make the Tramway remunerative but it would give a large additional revenue to the Illawarra line, and so prove a rich feeder to that railway.

As a further inducement to the Government to construct the line, the deputation stated the land required would be given free, and a sum of from £4,000 to £6,000 contributed towards the cost, and the guarantee in this matter is enclosed, to which further names are to be added.

A rough tracing is also enclosed showing the proposed route.

I informed them that I had given attention to the matter, and was in possession of a report speaking most favourably of the line, the report mentioning, that, in addition to the passenger traffic, which promised to be large, there would probably be a considerable quantity of fruit carried from gardens in the vicinity.

The line, as pointed out, would be an easy and economical one to construct, and it would bring directly an increase of traffic to the Illawarra line. I stated I knew something of the locality, and felt certain that no more favourable line as a "feeder" to the Illawarra railway could be proposed, and I promised to submit the matter, with my recommendation, for the consideration of my colleagues.

Their liberal offer to give the land required free, and contribute towards the cost of the line, was quite a new feature in railway proposals, and would greatly assist the object they had in view.

W.J.L., 20/11/85.

A more accurate survey should, I think, be first made, and a book of reference with plan prepared, showing the land and area that will be required.—CH.A.G., 25/11/85. For Minister's approval.—CH.A.G.

Minute of Minister:—Let survey, &c., as suggested, be made. The line should be so taken as to give access to the longest water frontage, if the distance from point to point and the cost is not materially increased.—W.J.L., 8/12/85.

Mr. Cowdery.—D.C.M'L, 9/12/85. Mr. Thomson to have survey made and submit plan with book of reference, &c.—G.C., (*per* G.L.), 10/12/85. Urgent. Mr. Halligan to carry out as soon as possible. See me first as to route.—M.T., 11/12/85. Mr. Baxter is now making survey of the route.—E.M.H., 10/2/86. A surveyor is now engaged on this line.—M.T., 10/2/86. When will the work be completed?—G.C., 11/2/86. Mr. Thomson. Survey plan and section will be completed about end of April.—M.T., 12/2/86.

No. 6.
Petition.

The Hon. the Secretary for Public Works, Sydney,—

The humble Petition of the undersigned property holders and residents of Sans Souci, Sandringham, and George's River,—

SHOWETH:—

1. That the Illawarra railway line is already opened to Kogarah, a distance of $2\frac{1}{2}$ miles from George's River, Sans Souci, and Sandringham.

2. That the districts known as Sans Souci and Sandringham are well known as favourite watering-places, and pleasure resorts for the Sydney public, being beautifully situated on the banks of George's River, and the shores of Botany and Kogarah Bays.

3. That there is already a considerable population in the said districts, and many new buildings, betokening a progress of settlement, are in course of erection.

4. The proper development of these marine suburbs is retarded, for want of good means of communication with the city, and your Petitioners desire that the same may be connected with the railway line at its nearest point, at Kogarah, by a tram line.

5. Your Petitioners believe that such a line could be inexpensively constructed, inasmuch as the route is almost a dead level free from engineering difficulties.

6. Your Petitioners believe that such a tram line would at once be remunerative, and command a large traffic, and would point out that on the 9th November last over 5,000 people visited Sandringham, Sans Souci, and the neighbourhood, despite the difficulties of transit, whilst omnibuses ply daily to and from Kogarah station.

7. The expense of construction of such a line as your Petitioners desire is estimated at about £15,000, and no more.

8. Your Petitioners are willing to give whatever land may be necessary from their holdings, for the purposes of such tram-line and stations, and to contribute the amounts set out opposite to their names as in the guarantees attached to this Petition, towards the cost of the construction of the line.

9. Your Petitioners also desire to point out that every person using the said tram-line will also use the Illawarra railway line, to which it will act as a feeder, so that consequently the revenue of that railway line will be increased.

Your Petitioners therefore pray that you will cause the necessary steps to be taken for the construction of a tram-line from the before mentioned suburbs, to the nearest point on the railway line at Kogarah.

And your Petitioners, as in duty bound, will ever pray.

JOHN B. CARROLL.

T. CLARK.

J. H. CARRUTHERS.

JAS. ARCHBOLD.

H. M'KEON.

W. E. RUST.

GEORGE WELLS.

WILLIAM PRITCHARD.

J. W. DUESBURY.

W. R. KENDALL.

IN consideration of the Government constructing a Tramway from Kogarah, at the Illawarra railway line, to Sans Souci and Sandringham, following the Rocky Point Road as a route from Mr. Carroll's fence to Sans Souci, we agree to give any of our land necessary therefor, and the following contributions, and further * * * * * If the Government, on survey, approve of any deviation in the route, we shall agree to the same, provided such tram starts at or near Kogarah, and terminates at or near Sans Souci and Sandringham:—

	£		£
B. Carroll	200	H. M'Keon	120
Reform L. I. and B. Co. ...	1,500	C. M. Berghofer... ..	20
W. E. Rust	120	J. Clark	25
Jas. Archbold	120	W. R. Kendall	400
M. Hambery	40	J. W. Duesbury	130
W. Moyse	20	George Wells	20
W. Pritchard	30		

No. 7.

Mr. F. M. King to The Chief Clerk, Department of Public Works.

Dear Sir,

Sydney, 3 May, 1886.

Re Tramway from Kogarah to Sans Souci and Sandringham, is this survey sufficiently advanced to ask for a report from the Engineer, as I wish to arrange that a deputation of the inhabitants of that district should interview the Minister for Works on the subject?

If you will kindly so arrange, and let me know as soon as possible, you will oblige

Yours, &c.,

FRANCIS M. KING.

Railways, B.C., 5/5/86.—J.R. Mr. Cowdery.—L.P.I., *per* Secretary, 6/5/86. Full report and sections, with rough plan of routes, herewith; both are practicable, but that along the main road is less costly, provided the line can be made on the side of the road.—G.C., 7/5/86. Commissioner.

If the public will subscribe £6,000, and give what land is required, upon condition that line is taken along the road, I should recommend that course, the line to terminate a little below Sandringham, or to form a loop, joining the line at Rocky Point Road again (see plan).—CH.A.G., 7/5/86.

Railway

Railway Department, Sydney, 3 May, 1886.

Kogarah to Sans Souci and Sandringham Tramway.

Memo. to the Tramway Engineer,—

I BEG to submit herewith plans and section of the proposed Tramway from Kogarah to Sans Souci and Sandringham, together with the Surveyor's report on the proposed lines.

WALTER SHELLSHEAR.

Mr. E. M. Halligan to The District Engineer.

Railway Department, District Engineer's Office, 30 April, 1886.

Sir, I have the honor to submit herewith plan and section of tramway Kogarah to Sans Souci and Sandringham. The surveys have been carried out by Mr. Licensed-Surveyor Baxter of this office.

You will observe that there are two routes shown on plan:

1st. One is along the main road from Kogarah to Sans Souci, and thence along Government reserve to Sandringham.

2nd. The second is midway between main road and Botany Bay, mostly through private land (which will have to be resumed) to Sandringham, and thence along reserve to Sans Souci.

Both routes will serve these two great watering places.

The first route (*via* main road) has been advocated by several deputations who have promised to give sufficient land free of charge to widen the road to 100 feet, as well as £6,000 towards construction of line.

This line, although along main road, could be laid on the 30 feet extra width given to road, and could be of open ballast, thus saving the permanent-way from wear and tear of vehicular traffic. It is shorter than route one, and the gradients are easy.

Route two requires a lot of land to be resumed, and no contributions towards making. The gradients are easy. At present the line could be laid open ballast, but where it passes along streets will have to be metalled. Route two has been permanently surveyed, but route one has only been sectioned. Will you please say if a survey is to be made of this route *via* main road?

I beg to suggest it to your consideration, as I think it the best both in the interests of the public and the Department.

I have, &c.,

EDWIN MOLLOY HALLIGAN.

No. 8.

Minute by The Secretary for Public Works.

Department of Public Works, Sydney, 7 May, 1886.

Tramway—Kogarah to Sans Souci.

A DEPUTATION, consisting of Messrs. Hammond, Henson, Judd (M's.P.), Soul, Carruthers, Carroll, F. King, M'Keon, Curran, Kendall, and Hogben waited upon me to-day with reference to the construction of a Tramway from Kogarah to Sans Souci. They handed in the statement enclosed, showing the amounts that the persons interested were prepared to give, viz., £5,125; in addition almost the whole of the land required would be given free, and the road along which the Tramway would run would be widened. The route they wanted to have adopted was that *via* the Rocky Point Road to Sans Souci, but if the Tramway were taken by the other route proposed (Moore's Swamp and Sandringham) their contributions would not hold good; and it was stated that should the line be taken that way the owners of land along the route would neither give the land required free nor contribute to the cost.

I stated that the offer to give the land free and to contribute to the cost was a new feature in Tramway construction, and this proposal would greatly aid the object they had in view. Personally I was in favour of the scheme, but I wished to make further inquiries as to the alternate routes before I finally decided upon any course of action.

W.J.L.

Let all available information be submitted.—W.J.L.

Mr. Cowdery *re* cost of each route.—CH.A.G., 11/5/86.

No. 9.

M. J. Hammond, Esq., M.P., to The Secretary for Public Works.

Sir,

Assembly, 8 June, 1886.

Herewith enclosed please find a letter from the Sans Souci Tramway League, containing the names of a number of persons who are ready to contribute towards the construction of the same.

I have, &c.,

M. J. HAMMOND.

[Enclosure.]

[Enclosure.]

The Hon. Secretary, Sans Souci Tramway League, to M. J. Hammond, Esq., M.P.

Dear Sir,

Tramway Reform Land and Co.'s Offices, Pitt-street, Sydney, 4 June, 1886.

A large number of your constituents, residing at or owning property at Sans Souci, have formed themselves into a League for the purpose of obtaining the Tramway from Kogarah Railway Station, or from the line thereabouts, to Sans Souci. The League now wish you to take charge of the matter as senior Member for Canterbury, inviting your colleagues to assist in the matter.

The facts regarding the Tramway are as follows:—

The line is to branch off at Kogarah, through Gray-street to the Rocky Point Road; thence along that road about 5 chains to a point where two surveys have been made, one along Moore's swamp and another along the Rocky Point Road to Sans Souci. The total distance is about 3 miles, and estimated cost about £13,000.

The landholders and residents are quite opposed to the swamp route, and will not subscribe or give land towards it; but if the road route is adopted they will subscribe £5,125, and possibly £6,000, towards construction, together with all land necessary, save in case of small allotment-holders. Further, we agree to widen the road to 99 feet width for over 2 miles. The grade is easy, and two surveys are complete, with pegs down.

There are at Sans Souci two large hotels and a third in erection, some very large residences (Mr. Rust's, Mr. Cole's, Mr. Pritchard's, Mr. Ennis'), and a number of small ones, besides a public school.

The district is a favourite one, having large water frontage to George's River, Kogarah Bay, and Botany Bay.

Two deputations have been very favourably received by the Minister on the subject, and with energetic action it is now possible to have the vote on the Estimates.

The work will cost the country only £7,000 to £8,000, and will be worth to it £13,000; that is to say, the country will benefit by the expenditure of £13,000 at a cost of £8,000.

We also desire a wharf to be erected at the end of the Rocky Point Road, where the Government have land for that purpose, and Mr. H. M'Keon agrees to lease the same for ten years at 10 per cent. on the outlay.

If you can arrange for the Minister to inspect we shall be happy to meet and entertain him for a day.

It will be necessary to watch the progress of "Ennis' Estate Bill," now before the House, with a view of inserting a clause to compel the trustees to join with the other landholders in subscribing at the rate of £10 per acre, and in widening the road. These people have 50 acres, in front of which the tram runs, but they say that being a trust estate they cannot contribute. They are applying to Parliament for power to sell, and the Bill should be amended so as to give them power or compel them to join in with other landowners in contributing.

I enclose a list of subscribers, &c., and if the Minister instructs the Crown Solicitor to prepare a more binding document, I shall be happy to get it executed.

I have, &c.,

FRANCIS M. KING,

Hon. Secretary, Sans Souci Tramway League.

[Sub-enclosure.]

SUBSCRIPTIONS promised to the Kogarah to Sans Souci Tramway:—

		£			£
J. B. Carroll	200		J. Macpherson	100	
Reform Land Investment and Building Company ...	1,500		H. G. Swyny	900	
W. Rust	120		J. B. Christian	140	
J. G. Archbold	120		J. W. Duesbury	130	
Matthias Hamburger	40		Geo. Wells	20	
W. Moyse	20		L. J. Marks	410	
W. Pritchard	30		Jos. Gannon	60	
H. M'Keon	120				
C. W. Berghofer	20				£4,455
J. Clark	25				
W. R. Kendall	400		J. R. Ennis' Estate should give for their 51 acres		
W. Longfield	10		(and the land required)	510	
F. Gannon	40				
J. M'Call	50				£4,965

Kindly submit previous papers.—W.J.L., 8/6/86.

Has the cost of each route been prepared? Value of land by the beach route must be estimated. Please also submit estimate showing extra cost of line after passing along the Rocky Point Road *via* Sans Souci to Sandringham, instead of terminating at Sandringham carried along the road until it reaches the Rocky Point Road again—a kind of circle at the Sandringham end, thus:—

B.C., 19/6/86.—C.U.A.G. Mr. Cowdery. Mr. Thomson for estimates, and full reply to Commissioner's minute.—G.C., 21/6/86. Please furnish estimate in detail as per Commissioner's minute, also value of land required for the beach route.—M.T., 22/6/86. D.E., Sydney.

No. 10.

M. J. Hammond, Esq., M.P., to The Secretary for Public Works.

Sir,

Legislative Assembly, 4 August, 1886.

In respect of the proposed Tramway from Kogarah to Sans Souci, I should feel obliged if you would inform me whether anything has yet been decided in reference to that matter. The favor of an early reply will be thankfully received.

I have, &c.,

M. J. HAMMOND.

Please inform Mr. Hammond how matters stand, and submit papers to me.—W.J.L., 5/8/86. Mr. Cowdery.—L.P. (*pro* Secretary). Mr. Shellhear for report as to what has been done.—G.C., (*per* G.L.) 6/8/86. Very urgent. Mr. Halligan.—W.S. (*per* H.J.M.), 9/8/86.

Trial surveys have been completed and estimate is being made, but owing to pressure of work these last three weeks I have been unable to finish estimate. I hope to submit detail estimate before the 20th of this month.—E.M.H., 9/8/86. D.E.

Report herewith.—W.S., 9/8/86. The Tramway Engineer. Trial survey has been completed; two detail estimates will be ready in about a fortnight.—G.C. (*per* G.L.), 10/8/86. Commissioner. Inform Mr. Hammond and resubmit papers.—D.C.M'L., 11/8/86.

The

The Commissioner for Railways to M. J. Hammond, Esq., M.P.

Sir,

Department of Railways, 13 August, 1886.

With reference to your letter of the 4th instant, asking whether anything has yet been done in the matter of the proposed Tramway from Kogarah to Sans Souci, I have the honor, by direction of Mr. Secretary Lyne, to inform you that trial surveys have been completed and a detailed estimate will be furnished in the course of a few weeks.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.

I should like to see estimates, &c., early.—W.J.L., 7/7/86. Mr. Cowdery.—D.C.M'L., 7/7/86. Please submit estimates as soon as possible.—M.T., 8/7/86. Estimates herewith. I recommend the land valuer submit an estimate of the value of land required.—G.C., 23/8/86. While estimating the value of the land, efforts should be made to get the owners to grant it free of cost or at any rate to make some concession.—CH. A.G., 25/8/86.

Memo. to District Engineer.

Office of District Engineer, Sydney, 20 August, 1886.

HEREWITH I forward estimate for construction of tram line Kogarah to Sans Souci, and Sandringham, as asked for on accompanying papers. The estimate is taken from the *trial, plan, and section*, and is made up of four parts as requested by Commissioner. As to the value of land to be resumed I would suggest that papers be sent to land valuer and that either Mr. Baxter or myself should accompany him through the line of route. Route No. 2 follows the Rocky Point Road, but as the petitioners have promised to widen this road 33 feet by giving the necessary land, I have estimated for an open ballast road; crossings will of course be made where necessary. The total cost will be £20,902.

E. M. HALLIGAN.

NEW SOUTH WALES RAILWAYS.

Department of Engineer for Existing Lines—Government Tramway Kogarah to Sans Souci and Sandringham.

Rough bill of estimated quantities and cost.

No.	Item.	Quantity.	Rate.	Amount.	Total Amount.

Value of land, &c., &c., see Report.—E.M.H.

No. 11.

M. J. Hammond, Esq., M.P., to The Secretary for Public Works.

Sir, Legislative Assembly, 27 August, 1886.
 I should feel obliged to you if you would inform me whether further progress has been made in your department in reference to the proposed Tramway from Kogarah to Sans Souci; also, whether the Government, on the terms originally agreed to, will be good enough to place on the next Estimates a sum to cover the cost of its construction. If so, please instruct me as to what is the next step to be taken to facilitate the settlement of the matter.
I have, &c.,
M. J. HAMMOND.

Please inform Mr. Hammond how matter stands.—W.J.L., 30/8/86. Has any payment been offered?—W.J.L., 30/8/86.
Mr. Cowdery.—D.C.M'L., 3/9/86. Nothing has been done since estimate was forwarded to Commissioner. No payment has been made that I am aware of.—G.C., 6/9/86.
 Commissioner. Has the Minister decided that the line is to be constructed on payment of £6,000 by subscribers, and the conveyance of the land required?—CH.A.G., 8/9/86. For submission to Cabinet.—W.J.L.

No. 12.

M. J. Hammond, Esq., M.P., to The Secretary for Public Works.

Sir, Legislative Assembly, 9 October, 1886.
 I am again requested by letter to ask the Government to decide whether they are prepared to accept the promised contributions, and to proceed with the construction of the proposed Sans Souci Tramway.
 In apologising for so often writing on the subject, let me beg that the matter may be dealt with at the earliest possible convenience.
I have, &c.,
M. J. HAMMOND.

Kogarah to Sandringham.

WRITE subscribers on their representation, "£6,000 first to be paid and free conveyance of all land required," and say, directly money is paid line will be commenced; the Government wish to give the work to the unemployed.
CH.A.G., 28/10/86.

Approved.—W.J.L., 28/10/86.

The Commissioner for Railways to M. J. Hammond, Esq., M.P.

Sir, Department of Public Works, 28 October, 1886.
 Referring to your several letters of recent date, urging the construction of a Tramway from Kogarah to Sans Souci, I have the honor to inform you that directly the amount of £6,000 is contributed towards the cost of this work, as promised, and an understanding is entered into by those interested, giving free conveyance to the Department of the land required, the line will be at once commenced.
 I may add that Mr. Secretary Lyne is desirous, should the above terms be complied with, of giving the work to the unemployed, and I shall therefore be glad to know, as early as possible, what determination has been arrived at by those concerned.
I have, &c.,
CH. A. GOODCHAP,
Commissioner for Railways.

No. 13.

Mr. D. E. Blacke to The Commissioner for Railways.

Kogarah, Sans Souci, and Sandringham Tram League.

Sir, 246 Pitt-street, Sydney, 18 November, 1886.
 Herewith I have the honor to hand you cheques and promissory-notes for moneys subscribed and paid up to this date, to be paid to you in terms of the guarantee, which I also hand you herewith, in consideration of the Government constructing a Tramway from Kogarah station to Sans Souci and Sandringham, *via* the Rocky Point Road.
 The remaining subscriptions will be handed to you as soon as they are received.
Yours, &c.,
D. E. BLACKE,
Secretary and Co.-Trustee, said League.

GUARANTEE.

In consideration of the Commissioner for Railways agreeing to construct a tram-line from Kogarah to Sans Souci and Sandringham, *via* the Rocky Point Road, we agree on demand to pay to him the several sums set opposite to our names and to do the other acts mentioned here below.—Dated this 27th day of August, 1886.

Amount of Contributions.	Will you give requisite land for the line?	Will you widen the Rocky Point Road, and how?	Signatures.
£ 1,500	Yes	Will give whatever is necessary to make road 100 feet wide along our land.	The Reform Land Investment and Building Company (Limited)—D. E. Blacke, Manager.
50	My area is too small	Does not adjoin road	J. H. Carruthers.
300	Yes	do do	A. G. Carruthers.
120	Yes	do do	H. M'Keon.
200	Yes	Will widen from land let to James Justice (now Smith) to M'Call's, from a point there to a line 33 feet wide at M'Call's grant line.	John B. Carroll.
5	Area too small	Cannot as my house is too close	C. W. Berghopher.
25	Not unless on Rocky Point Road..	Will widen road to make it 100 feet wide by giving a strip 33 feet to a point, provided tram is laid on or near the centre of road.	J. Clark.
10	Yes, if taken off frontage to Rocky Point Road.	Will give what is necessary to make road 100 feet wide, provided tram runs along Rocky Point Road.	W. F. Langfield.
400	Yes	If necessary to make the same 100 feet wide	W. Kendall.
130	Yes, unless the route is through land already subdivided.	No land fronting the road provided the route traverses the Rocky Point Road to the point.	The Haymarket Permanent Land, Building, and Investment Company (Limited).
100	Holdsworth, Macpherson, & Co.
40	Yes, 34 feet in width.....	Does not adjoin Rocky Point Road	Matthew Hamburger.
40	No land available	Fred. Gannon.
235	Yes	Does not adjoin road	J. B. Christian.
£900, if line traverses Rocky Point Road to Sans Souci.	Yes	Yes, as far as our land goes.....	H. G. Swyny.

Memo. to Accountant,—I have to inform you that the Minister has approved of the construction of the tram-line to Sans Souci, on condition that those interested pay the Department the sum of £6,000. The amount is to be subscribed and cheques sent in to this office.—D.C.M'L., 19/11/86.

Sans Souci Tramway:—Please let Mr. Judd know how matter stands.—W.J.L., 16/11/86. Mr. Cowdery for particulars.—D.C.M'L., 16/11/86. Urgent.

The surveyors are now hard at work surveying and staking out the line as finally approved, which work will be completed as soon as possible. Previous papers, Commissioner's 86-5,100, were returned, 13/11/86.—M.T. (*pro* Engineer), 16/11/86. Commissioner.

Please submit at once for Commissioner's information a part plan of the proposed route from Kogarah Station to the Rocky Point Road (a tracing of the large scale plan). Then, referring to my memo., 86-132, prepare plan, section, and estimates for the line to be continued on from Sandringham, and to join the line again at the point marked H on the Rocky Point Road.—M.T., 2/11/86.

D.E., Sydney. Urgent. Mr. Halligan.—W.S., 3/11/86.

Tracing herewith. I would suggest that portion of line, from A to B on tracing, be made at foot of latter instead of alongside present railway line. The grades will be easy, and the earthwork considerably less, consequently cheaper. The municipality, I think, will have no objection.—E.M.H., 10/11/86. District Engineer,

Tracing herewith; the plan of the line is now in hand.—W.S., 10/11/86. The Deputy Engineer.

The Commissioner asked me for a tracing showing the route of this line from the railway to Rocky Point Road; tracing now herewith. As directed verbally by the Commissioner, the permanent survey and plans for this line are now in hand, and will be completed with all possible speed.—M.T. (*pro* Engineer), 13/11/86. Commissioner.

The Engineer makes no comment upon Mr. Halligan's suggestion as to the portion of line from A to B being made at foot of latter, instead of along the railway line.—Ch.A.G., B.C., 16/11/86. Mr. Cowdery. I did not refer to this matter in my minute 13/11/86 because I understood that the tracing was required by the Mayor of Kogarah with reference to the forming and metalling of Gray-street. I have since gone into the details and find that the suggestion of Mr. Halligan cannot be carried out, as it would not enable us to join the tram-line with the railway as intended. Mr. Halligan made the suggestion under the belief that the tram-line was not to join with the main line.—M.T. (*pro* Engineer), 17/11/86. Commissioner.

Those interested have paid in some portion of the contribution. The particulars had better be given in these papers, and the form of receipt also which I drew up in acknowledgment of the money.—Ch.A.G., 22/11/86. Accountant.—D.C.M'L., 23/11/86. Copy of receipt and list of contributions herewith.—W.W., 25/11/86. Secretary. Will Mr. Cowdery please say what he is doing in this matter, and whether everything is in readiness to commence the work in the event of directions being given to that effect.—D.C.M'L., 25/11/86. Please say when survey will be completed and plans, &c., ready.—M.T., 26/11/86. District Engineer, Sydney. Mr. Halligan.—W.S., 29/11/86. Plans will be ready by the 20th of this month.—E.M.H., 1/12/86. District Engineer. The Deputy Engineer.—W.S., 1/12/86. Plans, &c., will be submitted at the end of this month.—M.T. (*pro* Engr. for Ex. Lines), 1/12/86. Secretary.

11

No. 14.

Mr. H. M'Keon to The Commissioner for Railways.

Re Kogarah and Sans Souci Tramway.

Sir,

Windsor Lodge, Tempe, 19 November, 1886.
 Some time ago I promised to subscribe to the cost of this Tramway. I now beg to withdraw my name from the list of subscribers and notify that it is not now my intention to subscribe thereto.

I am, &c.,

H. M'KEON.

No. 15.

Mr. D. E. Blacke to The Commissioner for Railways.

Kogarah, Sans Souci, and Sandringham Tram League.

Dear Sir,

246, Pitt-street, Sydney, 24 November, 1886.

Two of the parties who signed the guarantee given to you *re* the Tramway for above League have demurred to paying up, and in order to compel them to pay the amount subscribed for by them it will oblige if you will give me or any other person you prefer the necessary authority to procure payment by legal means, and my Company as above, and other subscribers, would be prepared to *indemnify you against loss* in the matter.

I need scarcely add, that in any event the non-payment of the abovementioned sums won't affect the case as the whole sum can be made up by the rest, but we consider it unfair to let these guarantors repudiate their engagements to the prejudice of the others.

I enclose a letter just received from Mr. H. M'Keon (£120); the other is Mr. Hamburger (£53).

I am, &c.,

D. E. BLACKE,

Secretary and Co-trustee, K., S. S., and S. Tram League.

Mr. H. M'Keon to Mr. D. E. Blacke.

Sir,

Tempe, 23 November, 1886.

In answer to your communication of yesterday, I can only inform you that I never promised to pay the Tram League or your Company any moneys; what I promised was to the Commissioner for Railways, and I informed him on the 19th inst. that it was not my intention to now contribute to the Tramway. I also intimated the same to you on the 17th instant. Circumstances have occurred that render it impossible for me to do so.

I am, &c.,

H. M'KEON.

Will Mr. Cowdery please return the papers. I do not see that we can take the step desired by the writer of this letter. Until a certain sum is subscribed we refuse to construct, and any action taken or to be taken in connection with the raising of this amount seems to be quite outside the jurisdiction of the Department.—A.R. Engineer for Existing Lines, B.C., 30/11/86.

Previous papers returned herewith.—M.T. (*pro* Engineer), 1/12/86. Secretary. Please read my minute of the 30th Nov. I do not think the Department can intervene as requested by Mr. Blacke.—A.R., 2/12/86. I am of same opinion. We simply cannot commence until conditions are fulfilled.—D.V., 2/12/86. Inform.—D.C.M'L., 2/12/86.

The Commissioner for Railways to Mr. D. E. Blacke.

Sir,

Department of Public Works, Railway Branch, 3 December, 1886.

With reference to your letter of the 26th ultimo, in which you state that two of the guarantors of part of the cost of the proposed Tramway to Sans Souci have declined to pay the amounts promised by them, and ask that you may be empowered to take legal proceedings against them, I have the honor to inform you that I am unable to intervene as requested, but the work cannot be commenced until their conditions of the guarantee are fulfilled.

I have, &c.,

CHAS. A. GOODCHAP,

Commissioner for Railways.

(Per A.R.)

No. 16.

Mr. D. E. Blacke to The Commissioner for Railways.

Dear Sir,

246, Pitt-street, Sydney, 7 December, 1886.

Herewith please receive a further sum of £651 1s. towards the £6,000 fund for the above referred to Tramway.

I annex copy of a receipt I had to give Messrs. Beaumont & Christian for their contribution included in the above sum (now handed to you), the terms of which are binding on the trustees, and are a condition of this payment, but agreed to by the Hon. the Minister for Works.

Those interested are willing to give you the necessary undertaking for the balance of the £6,000 so that the work may be gone on without any delay.

Yours, &c.,

D. E. BLACKE,

Secretary.

Accountant, for Cashier.—D.C.M'L., 7/12/86.

246, Pitt-street, Sydney, 25 November, 1886.

RECEIVED from Messrs. Beaumont & Christian cheque, value £347, being subscription towards the fund of £6,000, payable to the Government in consideration of the latter constructing a Tramway from Kogarah Railway Station to touch on Sandringham, and the said sum of £347 is returnable to the donors

donors should the line not go into or through the property of J. and W. Christian, now known as Sandringham, on which is the "Prince of Wales Hotel," as per the assurance given on the 22nd instant by the Minister for Works to Messrs. Carruthers, Hammond, and Blacke.

D. E. BLACKE,
Secretary and co-Trustee
Kogarah, Sans Souci, and Sandringham Tram League.

Department of Public Works, Railway Branch, Sydney, 8 December, 1886.
RECEIVED from Kogarah, Sans Souci, and Sandringham Tramway League the sum of £651 1s. sterling, being on account construction of Tramway.

J. R. NEALE,
Cashier.

No. 17.

Mr. D. E. Blacke to The Commissioner for Railways.

Kogarah, Sans Souci, and Sandringham Tramway.

Dear Sir,

246, Pitt-street, Sydney, 7 December, 1886.

Referring to our conversation this afternoon respecting matters in relation to this Tramway, I beg now to enclose for your use the sketch plan I referred to, which shows three distinct routes, every one of which would meet the approval of the Engineer, but the one suggested by me is that which goes through Concannon's land, and the acquirement of this small piece of land by the Government could be effected for a very small sum, it being mostly in gardens of Chinamen.

I have, &c.,
D. E. BLACKE,
Secy. and Co-Trustee.

Mr. Cowdery, for report, B.C., 8/12/86.—CH.A.G. Take the cheapest, if suitable. Mr. Thomson, for report.—G.C., 9/12/86. For report.—M.T., 9/12/86. District Engineer. Mr. Halligan.—W.S., 10/12/86. Route shown on accompanying tracing in green will be the cheapest, and as suitable as any, so I presume will be adopted when line is being made.—E.M.H., 3/1/87. District Engineer. The Deputy Engineer.—W.S., 3/1/87. Route shown on accompanying tracing in green will be the cheapest.—G.C., 4/1/87. Secretary. Engineer for Existing Lines.—A.R., B.C., 7/1/87. Mr. Thomson.—G.C. (*per* G.L.), 10/1/87. Please note and carry out accordingly.—M.T., 10/1/87. District Engineer, Sydney. Mr. Halligan.—W.S., 12/1/87. Mr. Shellshear has verbally informed me of some intention to adhere to old line. Will he please say?—E.M.H., 19/1/87. District Engineer.

I understand there is some difficulty in passing through Mr. Concannon's property, as he objects to the line which would pass very close to his house, and he could compel the Department to resume the house, and also to give him six months' notice before entering upon the land. Will the Engineer please say if the above difficulty can be got over, or, if not, what route is to be adopted? Mr. Concannon has no objection to the line shown in red.—W.S. (*per* H.J.M.), 20/1/87. The Tramway Engineer.

In order to avoid Concannon's land it has been decided to adopt the route shown in black ink. Please lay out the line accordingly.—M.T. (*per* Engineer), 21/1/87. District Engineer, Sydney. Noted; deviation plotted on working plan, and marked out on ground.—W.S., 29/1/87. The Deputy Engineer. Secretary.—M.T. (*per* Engr. for E. Lines), 31/1/87.

No. 18.

Mr. D. E. Blacke to The Commissioner for Railways.

Kogarah, Sans Souci, and Sandringham Tram League.

Dear Sir,

246, Pitt-street, Sydney, 9 December, 1886.

I have now the honor to hand you herewith the above Company's promissory-notes, as per memo. at foot hereof, amounting together to £849 11s. 6d, which, with Mr. L. I. Marks' £410, will make up the £6,000 contributed by the land-owners in consideration of the Government constructing the Tramway from Kogarah to Sans Souci and Sandringham, as per arrangement.

Yours, &c.,
D. E. BLACKE,
Secretary and co-Trustee.

Do do do 12 ,, ,,				500	0	0
				£6,000	0	0
				W.W., B.C., 10/12/86.		

Commissioner.

The Commissioner wishes stated on these papers the names of the persons signing the promissory-notes. Then send papers to Mr. Cowdery to furnish a list of the persons through whose lands the lines will pass, and to say whether in each instance we hold an unconditional guarantee to give the land free to the Department. Please deal with the matter quickly.—D.C.M'L., 14/12/86. Engineer for Existing Lines.

Please furnish list of owners of land through which the line passes.—M.T., 10/12/86. Mr. Halligan,—W.S., 17/12/86.

The line passes through the following properties:—South, Elliott, Concannon, Kendall, Knight, Christian Bros., A. G. Carruthers, and the Reform Land and Building Co. Tracing of plan will be sent to-morrow, if possible, showing all land to be given, &c.—E.M.H., 3/1/87. District Engineer.

List of names of owners herewith.—W.S., 4/1/87. The Deputy Engineer.

The line passes through the properties of South, Elliott, Concannon, Kendall, Knight, Christian Brothers, A. G. Carruthers, and the Reform Land Investment and Building Company, all of which but the first three have promised to give the land required.—M.T. (*per* Engineer for Existing Lines), 6/1/87. Secretary.

I suppose we had better write to the three first persons.—A.R., 10/1/87. Commissioner. No, Mr. Thomson will visit the locality, and I will see him with the Engineer afterwards.—CHAS. A.G., 11/1/87.

Sandringham and Sans Souci Tramway:—The Commissioner wishes to know when work can be started, or what it is that delays the matter. He would like to see the work commenced by the 10th January if it is to be done by task, as in the case of Randwick; or if tenders are to be invited, the advertisements to be in the papers by the 10th proximo.—D.C. M'L., 31/12/86. Mr. Cowdery.

Please report at once as to how this matter stands, and if work can be commenced on the 10th proximo. Previous papers, 86/1396, are with you.—M.T. (*per* Engr.), 31/12/86. District Engineer, Sydney.—Specially urgent.

The plan and section of this Tramway will be ready on Tuesday, the 4th proximo, evening, when the work could be started, if done by task-work, provided necessary permanent way material can be supplied. I may point out that this line is nearly 5 miles in length, and during the progress of the permanent survey the surveyor was considerably delayed by wet weather. The survey was only started on the 10th November, so there has been no unnecessary delay.—W.S., 31/12/86. The Deputy Engineer.

If the work is to be carried out as task-work by the unemployed, it can be commenced on the 10th instant; if to be done by contract it will take some time longer to prepare specifications, &c.; but tenders may be invited on the 10th for plans, &c., to be seen on a subsequent date.—M.T. (*pro* Engr for E. Lines), 3/1/87. Secretary.

A.R., 5/1/87. For Minister's decision as to how work is to be carried out.—CH.A.G., 6/1/87.

Minute by The Secretary for Public Works.

ARE there now unemployed to be obtained? If so this had better be carried out by task-work; if not, by contract. W.J.L., 6/1/87.

Engineer for Existing Lines,—A.R., B.C., 6/1/87. Urgent. Mr. Thomson to say if sufficient unemployed can be obtained for this work.—G.C., 7/1/87.

I dare say that there are sufficient unemployed to be had, but experience on the Randwick to Waverley Tram-line has shown that they do not care much for the work, and cannot agree amongst themselves. Altogether this is not a very satisfactory way of carrying out this kind of work; the men do not understand it, and it takes a great deal more of supervision on our part to get the work properly done. The better and more satisfactory way would be to have the work done by contract, when there would be only one party to deal with instead of a number who are always disagreeing amongst themselves, and consequently cause increased trouble.—M.T., 8/1/87. Tramway Engineer.

I recommend this work be carried out by contract.—G.C., 8/11/87. Commissioner. For Minister's decision.—CH.A.G., 11/1/87.

Minute by The Secretary for Public Works.

THERE are a number of unemployed now requiring work, and they have informed me they are prepared to take pick and shovel work. Under these circumstances the work should be carried out as on the Waverley to Randwick Tramway. I should like to know to-day when some of these men can be put on. W.J.L., 13/1/87.

Engineer for Existing Lines.—D.C.M'L., B.C., 13/1/87. Mr. Shellshear to arrange to start this work on Monday next as directed.—G.C., 14/1/87. Note!—W.S., 17/1/87. Tramway Engineer. Inform me as soon as any of these men are employed, and do not delay in employing them.—G.C., 18/1/87. District Engineer, Sydney.

Work was started this morning; about thirty of the unemployed are now at work; it was quite impossible to make the necessary preparations before as all the tools and plant had to be collected and sent to Kogarah.—W.S., 19/1/87. Tramway Engineer.

For Commissioner's information.—G.C. (*per* G.L.), 20/1/87.

Minute

Minute by The Commissioner.

THE tram-line from Kogarah to Sans Souci runs by Grey-street, and from Grey-street to Mr. J. B. Carroll's land. The road is only 1 chain wide. The neighbouring proprietors, however, Mr. Canham and others, are prepared to give free 10 feet, provided that the Department is at the expense of moving the fences back. Mr. Carroll will see those people and arrange to get the land; therefore lay out the line as if the road were of the required width.—CH.A.G., B.C., 31/12/86. Mr. Cowdery.

Mr. Shellshear to make arrangements accordingly.—G.C., *per* G.L., 3/1/87. Mr. Halligan.—W.S., 4/1/87. Mr. Carroll informs me that Canham or Fitzgerald, M'Call (the only owners besides himself) refuse now to give any land at all.—E.M.H., 14/1/87. District Engineer. Tramway Engineer.—W.S., 14/1/87. Commissioner to see.—G.C., 17/1/87. Let me see plan showing where this land is.—CH.A.G., 20/1/87. Engineer for Existing Lines, 20/1/87. Plans forwarded to Commissioner to-day to be transmitted to the Clerk of the Executive Council.—M.T., *per* Engr. for E. Lines, 20/1/87. Commissioner.

Office of District Engineer, Sydney, 18 January, 1887.

Tramway Engineer,—As requested by telephone this morning I forward herewith plan, section, and description of line Kogarah to Sans Souci. The book of reference has not yet been prepared.—W.S.

Plan, section, and description herewith; the book of reference will be prepared without delay.—G.C., 18/1/87. Commissioner.

Tramway from Kogarah to Sans Souci:—The Tramway commences at Kogarah Railway Station and runs parallel to the Illawarra line as far as Grey-street; thence along Grey-street; thence a short distance along Concannon-street; thence across the Emerson Junction Estate to the Rocky Point Road; thence along the Rocky Point Road to near the shores of George's River; thence for a short distance through the property of Robert Kendall; thence for a short distance through the 100 feet reserve; thence across the property of R. Kendall (owner), John Frazer (lessee); thence across the property of H. Knight; thence along the 100 feet reserve; thence across the property of James and Wm. B. Christian; thence along Clareville Avenue to a point 4 miles 5 chains from the point of commencement. It is further proposed to continue the said Tramway along Clareville Avenue, Russell Avenue to the Rocky Point Road, meeting the above-mentioned line at a point 2 miles 14½ chains from the point of commencement.—G.C., 18/1/87.

No. 20.

Mr. D. E. Blacke to The Commissioner for Railways.

Kogarah, Sans Souci, and Sandringham Tram League.

Dear Sir,

246 Pitt-street, Sydney, 4 January, 1887.

Re piece of land for Tramway purposes adjoining Concannon's property at Concannon-street, Kogarah, I have now the pleasure to enclose a letter dated yesterday, from Messrs. Hardie and Gorman, containing copy of a letter from Mr. F. H. Reuss, junior, consenting to dedicate to you for Tramway purposes land as shown on sketch (also herewith handed you), which sketch I received from your engineer; this still further clears the way for running through Concannon's place. Leaving this matter in your hands for completion of the transfer,

I am, &c.,

D. E. BLACKE,

Secretary and Company's Trustee.

Engineer for Existing Lines.—A.R., B.C., 6/1/87.

[Enclosure.]

Hardie and Gorman to Mr. D. E. Blacke.

Emerson's Junction Estate.

Dear Sir,

133 Pitt-street, Sydney, 3 January, 1887.

Enclosed we have now the pleasure to hand you copy of letter received from Mr. Reuss, signifying his willingness to dedicate to the Commissioner for Railways that portion of the land required for the extension as per plans now returned to you.

We presume you will have the necessary documents prepared in terms of Mr. Reuss' letter.

Yours, &c.,

HARDIE & GORMAN.

[Sub-enclosure.]

Dear Sir,

Pitt-street, Sydney, 3 January, 1887.

I hereby consent to dedicate, for the purpose of extending and widening Concannon-street at Kogarah, so as to enable the proposed Tramway to pass through my land, the two parcels coloured red and blue on tracing herewith, on the understanding that Mr. Concannon fulfils his promise to remove his rough fence back to the correct straight boundary.

Yours, &c.,

F. H. REUSS, JUNIOR.

Please note and submit tracings showing the land at once, with bearings and dimensions, &c.—M.T. (*per* Engineer), 7/1/87. District Engineer, Sydney. Mr. Halligan.—W.S., 8/1/87. Please return plan and section of this line; nothing can be done without them. They are now with the Deputy Engineer.—E.M.H., 11/1/87. District Engineer. Will the Engineer please return plan and section of this line?—W.S., 12/1/87. The Tramway Engineer. Plan and section herewith.—G.C., 12/1/87. Mr. Shellshear. Mr. Halligan.—W.S., 13/1/87. The line at this place being now altered (see papers), this land will not be required, so I presume will not be taken. Please say.—E.M.H., 24/1/87. District Engineer. The land is not required, and will therefore not be taken.—W.S., 27/1/87. Mr. Halligan. Noted.—E.M.H., 28/1/87. District Engineer. The Tramway Engineer.—W.S., 27/1/87. A deviation having been made in the line, this land will not now be required.—M.T. (*pro* Engineer for Existing Lines), 31/1/87. Secretary. Inform.—A.R., 2/2/87.

The

The Commissioner for Railways to Mr. D. E. Blacke.
 Sir, Department of Public Works, Railway Branch, 8 February, 1887.

Referring to your letter of the 4th ultimo, with enclosures, in which you intimate that Mr. F. Reuss, junr., has consented to dedicate, for the purposes of the Kogarah, Sans Souci, and Sandringham Tramway, certain land shown on an accompanying sketch, I have the honor to inform you that a deviation having been made in the line, this land will not now be required.

I have, &c.,
 CHAS. A. GOODCHAP,
 Commissioner for Railways, per D.V.

No. 21.

Mr. D. E. Blacke to The Commissioner for Railways.

Kogarah, Sans Souci, and Sandringham Tram League.

Sir, 246, Pitt-street, Sydney, 11 January, 1887.

I have the honor to give you the following particulars of land required for the Tramway, as per sketch plan furnished by the engineer.

Commencing at K. the line turns off into Gray-street, but to suit the engineer's ideas the line has been surveyed through a very small portion of land belonging to Mr. J. South and Mr. J. W. Elliott, neither of whom have ever promised to give the land, nor did the Tram League include their promises. The strip required is infinitesimal, and if resumed its value would be under £100. A small divergence in the line would avoid this resumption, although the line might not be made so neat and correct. The line then follows Gray-street and Concannon-street until it meets Reuss & Co.'s land and Concannon's land. Messrs. Reuss & Co. are affected very slightly by the survey, and agreed to give the land.

With reference to Concannon, I have always pointed out in my correspondence from the very inception of the project that at this point it would be necessary to resume a small area of land (see my letter of 4th June, 1886, forwarded through Mr. M. J. Hammond). Mr. Concannon has been interviewed by me without success. It will be necessary to resume a strip, amounting to about one-third of an acre, for the line, and a severed portion of about an acre.

The total value of the land is about £500, and the severed portion should nearly realize that sum.

From Concannon's land to Mr. Carroll's, marked on the plan A, the difficulties in widening the road at present are insurmountable, nor did the League or the land-owners ever undertake to widen the road at that point.

Eventually, no doubt, the road will be widened by the land-owners as they subdivide. The land-owners undertaking has always been specified as commencing at the point marked A. From this point Mr. Carroll owns from A to B on one side, and Mr. F. Clarke on the other side.

These parties have agreed to widen the road to 99 feet, as I have shown on the plan in red lines.

From B to C on both sides belongs to the Australian Mutual Building Company, and that Company agrees to give the strip as shown on the plan.

From C to D belongs to Mr. J. M'Call on the western side, and to the Australian Mutual Building Company on the eastern side.

M'Call has hitherto refused to give the land.

From D to E belongs to Innes Estate, the trustees of which profess their desire to give, but state the condition of the trust precludes their doing so. It would be necessary to resume this, but no doubt no compensation would be asked.

On the eastern side of the road, E to G, are twelve small allotments, the holders of which it is difficult to find.

From G to H, owned by Mr. M'Pherson, the land will be given. From that point the remainder of the line, $2\frac{1}{2}$ miles, no difficulty whatever occurs, all the land for widening of the road for tramway purposes being given by the documents already in your possession, save and except the portion marked X.Y. on Clareville Estate Avenue, which is involved in a trust estate and cannot be given.

The line touches this portion near Y by a couple of feet, and I should recommend a survey be ordered so as to keep it free from this land.

In conclusion, I would point out that the line along the Rocky Point Road can be constructed and is surveyed along the road which is 66 feet wide at present; from Mr. M'Pherson's land no difficulty exists in widening the road, but up to that point in some cases difficulties do exist, and perhaps it would be well to let the road stand as it is at present up to that point, instead of allowing one owner here and there to mar its uniformity.

The solicitor to the League advises that no conveyances are necessary with regard to the land given along the roads; a simple document dedicating the land for road purposes is quite sufficient, but in any case the legal difficulty need not stand in the way as we undertake to carry out legally what we have proffered to do.

Yours, &c.,
 D. E. BLACKE,
 Secretary and Co. Trustee.

No. 22.

Mr. J. B. Thompson to The Commissioner for Railways.

Land Valuer's Office, Sydney, 13 January, 1887.

Estimated cost of resumptions on the Kogarah Tramway.

As verbally instructed I now beg to submit an estimate of the cost of certain resumptions on the proposed Tramway from Kogarah to Sans Souci, &c.; these resumptions are part of two allotments in Grey-street, and parts of allotments in a subdivision of the Emerson Junction Estate. The latter are upon a line suggested as an alternative to that passing through Concannon's homestead, and it is shown in blue on the annexed tracing. The cost of the allotments in Grey-street will be about £60, and of those in the subdivision about £830, being at the rate of £5 per foot frontage taken, and which will include sufficient to compensate for depreciation of allotments partly taken. I therefore estimate the cost of these resumptions at about £900. The cost by the line shown in red on tracing will be fully as much.

J. B. THOMPSON,
 Railway Land Valuer.
 Papers

Papers and tracing herewith. I recommend the blue line be taken; we shall have all the other land required free.—CH.A.G., 14/1/87. If Minister approves, the plans &c., should be submitted to the Governor and Executive Council.—CH.A.G., 14/1/87.

Minute by The Secretary for Public Works.

Approved.—W.J.L., 14/1/87.

Minute by The Secretary for Public Works.

I AM informed that work was not commenced at the Kogarah tramway this morning. I should like to have the reason for the delay in starting.

Urgent.

W.J.L.

The tools are now being conveyed on to this work, and arrangements have been made for a number of the unemployed to start on Wednesday morning.—G.C., 17/1/87. This should have been commenced this morning, as was decided. The tools might have been conveyed since Wednesday, the date I made a promise to the deputation of unemployed.—W.J.L., 17/1/87.

Minute by The Commissioner.

I BEG to point out to the Minister that the approval of the Governor and Executive Council to the construction of this line has not been obtained, as required by the Railway Act. The Minister approved of this authority being obtained a few days ago; but there has been no meeting of the Executive Council since that date. It will be illegal to proceed with the work before that authority is obtained, and I request the Minister's sanction to stop the Engineer from proceeding with it.

CH.A.G., 17/1/87, 5:40 p.m.

There have been two meetings of the Executive—one on Saturday, and one to-day.—W.J.L., 17/1/87. I did not see this paper till 5:40 p.m. to-day. Mr. Richardson will please see me the first thing to-morrow morning, with minute of Minister for Executive Council's approval.—CH.A.G., 17/1/87, 6 p.m.

The minute for approval of Governor and Executive Council has been sent to Under Secretary for Public Works, but Mr. H. M'Lachlan tells me the Minister has written a minute for the line to be proceeded with.—A.R., 18/1/87.

The Minister said he would write a minute, but I have not seen it yet.—CH.A.G., 18/1/87.

Office of District Engineer, Sydney, 15 January, 1887.

Kogarah to Sans Souci Tramway.

Memo. to Tramway Engineer,—

WILL Mr. Cowdery please inform me if it is intended to use D railway trucks on this Tramway, or is the line to be laid with the ordinary guard-rails for Tramway stock only?

WALTER SHELLSHEAR,

per H.J.M.

Will Commissioner please say if D trucks are to be used; we cannot use guard-rails, as the groove would be too wide for vehicular traffic.—G.C., 15/1/87. Commissioner.

This line has not yet been approved by the Governor and Executive Council, and cannot be proceeded with. I will see Mr. Cowdery about the use of D trucks. Is there not a proposal to use the rails of the Windsor and Richmond line?—CH.A.G., 18/1/87.

No. 23.

Minute by The Secretary for Public Works.

Department of Public Works, Sydney, 18 January, 1887.

Tramway to Sans Souci.

I AM informed that through some oversight Executive authority has not been obtained for the construction of the Sans Souci Tramway. Under ordinary circumstances I would advise delay, pending the necessary authority being obtained, but under the exceptional circumstances of this case I think the work might be commenced in anticipation of the formal authority. The matter has already been before the Cabinet, and approved by them, conditional on the greater portion of the land required being given free, and a sum of £6,000 subscribed towards the cost of the line.

The land promised has been given, and the amount referred to paid to the Government, and as a number of the "unemployed" have been gathered together to work on the Tramway, I think the work should be at once started, and the formal authority obtained at the first meeting of the Executive Council.

W.J.L.

Minute sent to Public Works for Executive, 87-268.—18/1/87. The work is being proceeded with I think, is it not?—A.R., B.C., 19/1/87. The work is being proceeded with. The plan is now with the Clerk of the Executive Council, and it is now urgently required by me for the purpose of preparing book of reference.—G.C., 20/1/87. The plan, I understand, was borrowed yesterday by Mr. Armstrong of your office from the Clerk of the Executive.—D.C.M'L., 21/1/87. Mr. Cowdery. The plan has been received and will be returned on Monday.—G.C., *per* G.L., 21/1/87. Secretary. In four days to see if Executive has approved of plan, &c. Immediately this is obtained please see that Proclamation is inserted in *Gazette* and newspapers.—D.C.M'L., 21/1/87.

No. 24.

Memo. to The Tramway Engineer.

Office of District Engineer, Sydney, 24 January, 1887.

I FORWARD herewith approximate estimate of the Tramway from Kogarah to Sans Souci.

WALTER SHELLSHEAR, *per* H.J.M.

W.S., 24/1/87. M.T., 24/1/87.

Kogarah to Sans Souci and Sandringham Tramway:—There has been some modification in the plans of this line. I wish to know the cost of it to Sandringham, omitting the loop—land, construction, rolling-stock.—CH.A.G., 21/1/87. Engineer for Existing Lines.

The cost of construction is estimated at about £11,431, as per detailed estimate herewith.—M.T., 24/1/87. Tramway Engineer. The cost of construction will be about £11,431. The land valuer will give value of land, and Locomotive Engineer cost of rolling-stock.—G.C., 24/1/87. Commissioner. Land valuer, B.C., 25/1/87. Land to be resumed will cost about £900.—J.B.T., 27/1/87. Commissioner.

Construction (£2,813 per mile)	£	11,431
Land	900
Rolling-stock—6 cars, at £350	2,000
Do 3 motors, at £1,000	3,000
						£17,331

I think the permanent-way material will not cost more than £4 a ton, and the cost for permanent-way, laying, &c., will be reduced to £5,000, making the cost about £16,000
Less £6,000 subscribed by residents 6,000

£10,000

CH.A.G., 28/1/87. Mr. Cowdery to see.—A.R., B.C., 29/1/87. I wish to see the Deputy Engineer about this line, rails, &c.—CH.A.G., 3/2/87. Engineer for Existing Lines. I have seen Mr. Thomson; there will be no delay in laying in the rails; and they will be taken out of the Windsor line as fast as they are required for the Kogarah line.—CH.A.G., 7/2/87.

No. 25.

Mr. J. N. Elliott to The Secretary for Public Works.

Sir,

Kogarah, 22 January, 1887.

I have discovered that the tramway line leading through Kogarah to Sandringham, now being formed, is laid down to pass through a portion of my land, adjoining Gray-street, Kogarah. I respectfully take the earliest opportunity of protesting against this being carried out as intended.

I am led to enter this protest for many reasons. The line as laid down cuts through the *top* of my land, and consequently, in addition to the loss of land, deprives me of the *main road frontage*, thus injuring my property to a very great extent.

Trusting this matter will receive your immediate attention,—

I have, &c.,

JOHN W. ELLIOTT.

P.S.—At this particular point there is nothing whatever to prevent the tramway line being carried along the main road.

For immediate inquiry.—J.S., 24/1/87. Do not go on any private land till line is proclaimed.—CH.A.G., 25/1/87. Noted.—M.T. (*pro* E.E. Lines), 27/1/87.

Minute by the Commissioner.

It seems to me that it is not absolutely necessary to take Elliott's land. No doubt the line has a better contour by its running through Elliott's land, but it is possible, though perhaps a little less slightly, to keep the road and curve into Gray-street below Elliott's property. The fact is, the decision of the Supreme Court in Daintrey's case at Randwick, when it was held that we had not power to dedicate to road purposes land taken for railway purposes, might give a value to this taking far in excess of the real damage done.

CH.A.G., 27/1/87.

Engineer for Existing Lines, B.C. Urgent.

I find by carefully laying down the line round this corner that it cannot be done without encroaching on the footpath unless curves of a smaller radius be put in, and that would prevent the use of D trucks over the line.—G.C., 27/1/87. Commissioner.

I have seen the Minister about this, and he has promised to get the Executive sanction for construction of line expedited.—CH.A.G., 28/1/87. Everything now complete.—A.R., 29/1/87.

The Under Secretary for Public Works,—

I HAVE the honor to forward herewith for the approval of His Excellency the Governor and the Executive Council the plan of the Kogarah to Sans Souci and Sandringham Tramway.

Description:—Commencing Kogarah Railway Station; thence to near the shores of George's River; thence to a point in Clareville Avenue, 4 miles 5 chains from point of commencement; thence along Russell Avenue to the Rocky Point Road, joining the tramway line at a point 2 miles 14½ chains from the point of commencement, being a total distance of 4 miles 70 chains.

I shall be glad if you will obtain the necessary approval.

A. RICHARDSON (*pro* Commissioner for Railways).

Executive Council.

Submitted. Prepare minute.—J.R., 19/1/87.

No. 26.

Minute for The Executive Council.

Tramway from Kogarah to Sans Souci and Sandringham.

Department of Public Works, Sydney, 19 January, 1887.

I HAVE the honor to submit, for the approval of His Excellency the Governor and Executive Council, a draft notification prepared by the Commissioner for Railways in terms of the Acts 43 Victoria, No. 25, and 46 Victoria, No. 26, of the construction of a line of Tramway from Kogarah to Sans Souci and Sandringham: "Commencing at Kogarah Railway Station; thence to near the shores of George's River; thence to a point in Clareville Avenue, 4 miles 5 chains from point of commencement; thence along Russell Avenue to the Rocky Point Road, joining the tramway line at a point 2 miles 14½ chains from the point of commencement, being a distance of 4 miles 70 chains."

JOHN SUTHERLAND.

The Executive Council advise that authority be granted for the construction of the tramway line from Kogarah to Sans Souci and Sandringham.—A. C. BUDGE, Clerk of the Council.

Ministry confirmed, 27/1/87. Approved.—CARRINGTON.
Railways.—J.R., B.C., 29/1/87.

Mr. Vogel, for *Gazette*, 29/1/87. Advertisement sent to *Gazette* and Sydney daily papers, 29/1/87.

In a month, 29/1/87. The notice is incorrect—the loop-line is not to be made. Issue amended Proclamation.—CH.A.G., 4/2/87. Amended notice herewith, 4/2/87.

GOVERNMENT TRAMWAYS.

Extension—Kogarah to Sans Souci and Sandringham.

THE Commissioner for Railways appointed by Act of Council, 22 Victoria No. 19, hereby gives notice that His Excellency the Governor, with the advice of the Executive Council, deems it expedient to make and complete a Tramway between Kogarah, Sans Souci, and Sandringham; and, in pursuance of the Acts of Parliament 43 Victoria No. 25 and 46 Victoria No. 26, to erect certain works and conveniences in connection therewith: Commencing at Kogarah Railway Station; thence to near the shores of George's River; thence to a point in Clareville Avenue, 4 miles 5 chains from the point of commencement; thence along Russell Avenue to the Rocky Point Road, joining the tramway line at a point 2 miles 14½ chains from the point of commencement, being a total distance of 4 miles 70 chains; and that for that purpose certain parcels of land which are particularly set out and coloured red in the map or plan and book of reference to be seen at the Office of the Commissioner for Railways, Phillip-street, Sydney, are required to be taken by the Commissioner for Railways, and that all parties interested in the said land or affected by the said works are hereby required to set forth, in writing, to the said Commissioner, within one month from the publication of this notice in the *Government Gazette*, any well-grounded objection that may appear to them to exist to the making of the said Tramway, or to the erection of the said works.—Dated at Sydney, this 27th day of January, in the year of our Lord one thousand eight hundred and eighty-seven.

(L.S.) CHAS. A. GOODCHAP,

Commissioner for Railways.

The seal of the Commissioner for Railways was affixed hereto, at Sydney, this 27th day of January, 1887, in the presence of,—

J. E. PICKERING.

Engineer for Existing Lines.—It has been necessary to alter the Proclamation for the Kogarah-Sandringham Tramway. Will Mr. Cowdery please peruse and say if correct, according to the Commissioner's recent directions.—A.R., B.C., 7/2/87.

The Proclamation has been examined and found correct, in accordance with the Commissioner's recent directions.—M.T. (*pro* E. E. Lines), 7/2/87. Secretary. Will the Commissioner please sign? —A.R., 7/2/87.

I think that the better plan will be to let the Proclamation stand. The protest invited by it can constructively come from the Department in respect of the loop line, and the Governor and Executive Council will be asked to confirm the line without that addition to it. The confirmatory Proclamation must be worded to meet the case.—CH.A.G., 8/2/87.

Let

Let me know what the loop will cost; it may be well after all to proceed with it if the cost is not great.—CH.A.G., 15/2/87. The cost of extending the line to join in with main line at Rocky Point Road, *via* Russell Avenue, will be about £2,200.—M.T. (*pro* E. E. Lines), 15/2/87. Commissioner. To await objections to be made under the notice.—CH.A.G., 16/2/87.

Tramway to Sans Souci and Sandringham.

REFERRING to *précis* lately submitted, I shall be glad if you will ascertain what determination, if any, has been arrived at.

The prescribed number of days having elapsed since publication of the proclamation, the notice of confirmation may now be published.

Shall this be done or shall it be published?

C.A.B., 28/2/87.

Where are the papers? Urgent.—D.C.M'L., 28/2/87. Submitted with *précis*, 24/2/87.—C.A.B., 28/2/87. The papers are, I believe, before the Minister. Are we to prepare the notice of confirmation?—D.C.M'L., 28/2/87. I have seen the Commissioner, and he says that the notice of confirmation should be sent on at once—provision to be made in it for the making of the loop. The confirmation notice should be drawn on the same lines as the Proclamation.—D.C.M'L., 1/3/87. Mr. Badham. Confirmation notice herewith.—1/3/87. For Minister's consideration.—CH.A.G., 3/3/87. Approved.—J.S., 29/3/87. Notice of confirmation sent to Public Works for transmission to Executive Council.—D.C.M'L., 30/3/87.

The Under Secretary for Public Works,—

I HAVE the honor to forward, for the approval of His Excellency the Governor and Executive Council, notice of confirmation of plan and book of reference of the Kogarah to Sans Souci and Sandringham tramway.

I shall be glad if you will obtain the necessary approval.

CHAS. A. GOODCHAP,
Commissioner for Railways (*per* A.R.)

29/3/87.

Minute for the Executive Council.

Department of Public Works, Sydney, 31 March, 1887.

No valid objection having been taken to the proclaimed plan and book of reference of the line of Tramway from Kogarah to Sans Souci and Sandringham, I have now the honor to submit these documents for confirmation by His Excellency the Governor and the Executive Council, together with the usual notice for publication in terms of the Act 22 Victoria No. 19.

JOHN SUTHERLAND.

The Executive Council advise that the plan and book of reference of the proposed Tramway be now confirmed, in terms of the Act 22 Victoria No. 19.—ALEX. C. BUDGE, Clerk of the Council.

Minute, 87-24.—5/4/87. Confirmed, 13/4/87. Approved.—CARRINGTON, 5/4/87.
Railways.—J.R., B.C., 16/4/87.

GOVERNMENT TRAMWAYS.

Extension, Kogarah to Sans Souci and Sandringham.

Notice of Confirmation of Plan and Book of Reference.

WITH reference to the notice of the Commissioner for Railways, dated the 27th day of January last, relative to the taking of certain lands required for the purpose of making a Tramway between Kogarah, Sans Souci, Sandringham, and its junction with the tramway line, at a point 2 miles 14½ chains from point of commencement, being a total distance of 4 miles 70 chains, and to make and complete certain works and conveniences in connection therewith: Notice is hereby given that no valid objection having been made to the taking of the said lands or to the construction of the said works, the said plan and book of reference have been duly confirmed by His Excellency the Governor, with the advice of the Executive Council, in accordance with the Act of Council 22 Victoria No. 19.

CHARLES A. GOODCHAP,
Commissioner for Railways.

THE seal of the Commissioner for Railways was affixed hereto, at Sydney, this 5th day of April, in the year of our Lord one thousand eight hundred and eighty-seven, in the presence of,—

L. P. IREDALE.

No. 27.

Mr. T. Saywell to The Commissioner for Railways.

Sydney Investment Land and Finance Co.,
139, Pitt-street, Sydney, 3 February, 1887.

Sir,

I trust you will pardon the liberty I am taking in writing you with regard to the construction at the Government expense of the proposed Tramway to Sans Souci.

In doing so, I wish to lay before you a few facts, and if you approve of my remarks I would ask you to favour me by appointing any time that would be most convenient for you to see me, when I shall no doubt be able to convince you of the great loss such a line would be to this Colony.

I simply wish to state that I have, as you are aware, completed, and am now running a Tramway from Rockdale Station to Lady Robinson's Beach, a distance of 1½ mile, at a cost of over £10,000, and with new cars and spare engines, now nearly ready, will cost in all 13 or £14,000; this I have done single handed at my own expense and without asking one penny from the Government, and notwithstanding that I have built it as economically as possible it does not even pay working expenses.

I therefore ask, do the Government want to saddle the Colony with an outlay of at least £24,000, in addition to the £6,000 given by the land speculators for the construction of this line, which will never even pay for the wages, independent of the interest on the outlay?

Of course if the Government has guaranteed that the line shall be constructed, I suppose Parliament will be the only one to rescind same, and as I can prove what I have here asserted, I contend that the work should not be allowed to proceed unless it can be proved that it will be a profitable undertaking, which is simply absurd to suppose in the fact of the present trams with their immense traffic not paying, and I firmly believe that if the work is carried out, that six months will convince the Government of its mistake, the result of which will be the taking up of the rails.

Trusting you will favour me with an appointment for interview.

Yours, &c.,
THOMAS SAYWELL.

Mr. Saywell is wrong about the cost of the line; it will not be £24,000 in excess of the £6,000 subscribed; if worked with economy I think the line will more than pay its working expenses; it will not depend upon the passenger traffic only; a goods traffic will be conducted upon it. I will see Mr. Saywell on Wednesday morning, at 11 a.m.; simply make the appointment without saying anything of the prospects of the line.—Ch.A.G., 7/2/87. Mr. Saywell, 7/2/87.

Commissioner saw Mr. Saywell, I think.—D.C.M'L., 9/2/87. Yes. Mr. Saywell bases his estimate upon the loss he has sustained by his Tramway. I wish to see all the papers about the Sandringham Tramway, and should like to have a *précis*, I understand that two omnibuses are employed at present to run between Sandringham and the Railway Station. They must earn £10 a week to pay; a Tramway should earn at least double, *i.e.*, £20 a week; it will be run in connection with the trains only, so the expenses will not exceed that amount, and all earnings above £20 a week will be profit.—Ch.A.G., 10/2/87.

Please put papers with this quickly, and send to Mr. Badham for *précis*.—D.C.M'L., 10/2/87. Papers herewith.—J.S., 11/2/87.

Mr. T. Saywell to The Secretary for Public Works.

Dear Sir,

139 York-street, Sydney, 11 February, 1887.

I wish to draw your very serious and immediate attention to the tramway-line now being constructed from Kogarah station to Sans Souci, a distance of about 4 miles, which, in my opinion, will not cost less than £30,000, and which I understand is being constructed at Government expense, with the exception of the small item of £6,000 subscribed or promised by a few land speculators.

To show you the utter fallacy of this wild scheme, you would actually be building a line in direct opposition to your present Illawarra line, now running to that beautiful watering-place, Como, and if you compare the great advantages it already possesses over Sans Souci, and then look at your returns for Como, even in holiday seasons, you cannot but admit that that portion of the line does not attract the number of visitors that its natural beauty deserves.

In the face of this you would be creating a direct opposition to your own already constructed railway.

You are no doubt aware that I have, during the last 12 months built, and am now running, at my own expense, single-handed, and without asking one penny from the Government, a tram service, in conjunction with the Illawarra railway, the line only 1½ mile long, costing over £10,000, built as economically as possible, and notwithstanding the attractions of the sea baths (also constructed by me at a further outlay of £8,000) and Lady Robinson's Beach, the receipts for the twelve months show a clear loss of £1,370 10s. 4d.; therefore, how is it possible that a line such as the Kogarah-Sans Souci, which must cost at least £30,000, and which cannot be worked more economically than mine, can be anything else than a very serious loss to the Government of this Colony?

I would therefore suggest that the Government at once seriously consider this matter before any more money is laid out, rather than saddle the country with an outlay of at least £24,000 (in addition to the £6,000 before mentioned) for this tram line, which was never asked for by the public, and which will never pay for wages, independent of the interest upon the outlay.

I again most respectfully urge that this matter be at once looked into, and if I am allowed, can prove all I have written and urged against this unwise course.

And I would ask is it fair to private enterprise to subsidise such a line, in the place of what I have done, and that to at such a loss?

If the line is carried out I am convinced that a few months after it has been running the rails will be taken up again.

I now enclose you a copy of my tramway takings and expenditure for the twelve months, independent of office and management expenses, which shows a clear loss of £1,370 10s. 4d., added to which I have been at the loss of an action for injuries to a lad, costing me £723, making in all a total loss of £2,093 10s. 4d. for the twelve months.

After your perusal of same I leave the matter for the present in your hands, feeling assured that you will see justice done to

Yours, &c.,
THOMAS SAYWELL.

Minute by The Secretary for Public Works.

I do not see that action could now be stayed, even if it were deemed desirable to do so. The contribution of £6,000 has been accepted and the work commenced by the late Government, and nothing it appears to me can now be done. J.S., 14/2/87.

No. 28.

Minute by The Secretary for Public Works.

Department of Railways, Sydney, 17 February, 1887.

I SHOULD like to have a statement showing the progress made with the Sandringham Tramway—the estimated cost, &c. I should also like to see plans and section, and to have information to-morrow.

Urgent.

JOHN SUTHERLAND.

Mr. Thomson to see me to-morrow with statement of cost incurred, progress made, with plan and section.—CH.A.G., 17/2/87.

Memo. to Deputy Engineer,—

Office of District Engineer, Sydney, 18 February, 1887.

As per telephonic instructions of this morning, I have to report that the progress made in construction of Tramway, Kogarah to Sans Souci, is as follows:—

Formation about half completed.

Permanent way laid about half mile.

Estimated cost of construction is £11,432. The approximate cost of construction to date is £385, exclusive of surveys.

The section was forwarded to Phillip-street this morning.

W.S.

For Commissioner's information.—M.T. (*pro* Engr. for E. Lines), 18/2/87. Commissioner.

Cost—Gross construction	£12,632	Includes loop.

Less £6,000 subscribed	6,000	
		<u>£13,632</u>	

See particulars and cost of work done on enclosed paper.—CH.A.G., 18/2/87.

I should like to have *précis*, as I would like to have full particulars showing how the work came to be undertaken.—J.S., 21/2/87. Urgent. Obtain papers and forward to Mr. Badham.—D.C.M'L., 21/2/87. Urgent. Papers herewith, 21/2/87.

No. 29.

J. H. Carruthers, Esq., M.P., to The Secretary for Public Works.

Sir,

130, Pitt-street, Sydney, 23 February, 1887.

I beg to request that you will not permit the progress of the Tramway from Kogarah to Sans Souci to be impeded by the agitation of either any persons interested in preventing its construction or of any section of the press unless upon very good cause clearly shown.

For your information I may state, that your predecessor, Mr. Lyne, received three deputations on the subject, and caused inquiries and surveys to be made during a period of over eighteen months. Finally he approved of the line, and obtained the approval of his Cabinet. The Executive Council also approved of the line, as evidenced by the *Gazette* notices in reference thereto, under the hand of the Governor.

The estimated cost of constructing the line is somewhat over £14,000 to Sandringham, and with a loop of 65 chains, about £16,000; but this estimate includes a double line for portion of the distance, which, however, I believe, is not being so constructed. Of this sum £6,000 has already been subscribed and paid to the Government by landholders and residents. Most, in fact nearly all, the land required is given, and the tram route is being widened to 100 feet mainly by voluntary gifts, but in one or two cases by resumption. The total cost to the country, all told, cannot exceed £14,000, and to make the line pay a return of 4 per cent. on that amount will not need a large traffic.

The line as now being constructed is a light railway, with curves and grades suitable for goods trains and small railway locomotives.

The question, will the line pay at once, is hardly in point, for the same question might be applied to making roads. The convenience and requirements of the public demand good roads at the State expense, and in many cases already railways have been constructed to assist in developing districts at

a loss in the running of the trains. The question is: Have the districts of Sandringham, Sans Souci, and Kogarah any advantages of position, climate, and scenery sufficient to warrant that, with better communication, they will speedily rise to be capable of making this tramway a revenue providing concern?

Three years ago there was no railway to Kogarah, and it was a mere village, with about 200 residents. Now it has its rail communication, and its population is over 3,000 souls, with churches, school, banks, school of arts, &c., &c. Sandringham and Sans Souci are far before what Kogarah was, and with a Tramway they will advance with great rapidity.

The traffic to these places is at present conducted by omnibuses, two lines of which ply daily. On holidays numbers of other omnibuses ply, together with vans, vehicles, &c. The average number of visitors at present on holidays is 2,000 to 2,500, and on Saturdays and Sundays 400 to 500. The daily traffic is also fair, but is mainly residents—from 50 to 100.

The coach-fare is 1s. from Kogarah to Sandringham—a prohibitive tariff.

I am informed by an experienced engineer that the line can be worked at a cost of £35 per week, or about £1,830 per annum. If the fares are fixed at 6d. each way, then a similar traffic to what already exists will give a return of over £5,000 per annum, without goods traffic. The expense of maintaining line, repairing stock, &c., &c., will hardly absorb the margin left by the above sums, and consequently a good revenue may fairly be expected at once. In addition to which the returns from the Illawarra line will be largely increased by the train-fares, Redfern to Kogarah.

If Saywell's tram does not pay it is simply owing to the low fares, for the tram is liberally patronised.

The work on the line has proceeded well, and the cost of construction is the lowest known in tram construction. To interfere now means an avoidance of a legal obligation with the subscribers, with possible complications regarding their claims, and an injustice to a large number of residents and others, whose fair claims to better communication were recognised.

I enclose a letter from the Mayor of Kogarah, appearing in this day's *Herald*, and I trust that the claims of my constituents concerned will be justly upheld by you.

Yours, &c.,

J. H. CARRUTHERS.

I should like to see the *précis* in this matter.—J.S., 24/2/87.

[Enclosure.]

EXTRACT from "S. M. Herald," February 23rd, 1887.

THE SANS SOUCI TRAMWAY.

(To the Editor of the Herald.)

Sir,

So that the public may not be misled by the vague and groundless rumours lately set afloat with regard to the above Tramway, I desire to place before your readers a few facts sufficient to show that all that has been done to induce the carrying-out of the work has been done openly, honourably, and with regard to the proper interests of the public. First of all, let me direct the attention of all to the source of the present opposition, as disclosed in your issue of this date. Mr. Thomas Saywell, the proprietor of a Tramway from Rockdale to Lady Robinson's Beach, has written a letter of protest to the Minister for Works, and has made some very rash statements as to the cost, &c., of the Sans Souci Tramway, concluding his letter with an appeal to the Government to see that justice is done to him. It is very clear, however, that the justice Mr. Saywell desires is to have established for his Baths, Hotel, and Land Company a monopoly of the speedy and easy steam communication by rail and tram.

The justice the public requires, however, is not identical with that of the monopolist, and the opposition of such an one must be taken at its true value.

Mr. Saywell says his tram does not pay him; *ergo*, the Sans Souci Tram will not pay, and should not be constructed. Saywell's Tram does not pay, and never will pay, until it is managed on different principles from those which prevail at present. It was constructed as part of a speculation to enable its proprietors to sell their land at a profit. This land has been sold at a large profit. Next, baths and a large hotel have been constructed, and the tram runs to make these pay. In every case Saywell's Tram has been made to subserve the greater speculations of the New Brighton Estate, the Brighton Hotel, and the baths. As a sample of the way in which the tram is worked, we find return tickets per train to Rockdale with tram passage and admission to the baths, sold by Saywell & Co. for one shilling, of which sum 7d. is for railway fare, 3d. for admission to baths, leaving 2d. per head to cover the cost of printing, and of running passengers to and from the beach. The traffic is enormous (exceeding over 8,000 on Boxing Day), but is mainly made up of holders of the above shilling tickets, but with such a ridiculous fare as above there can be no wonder that the tram ledger shows a balance on the wrong side to Mr. Saywell. Moreover, great complaint is made against the irregular manner in which the trams run, and casual visitors are often compelled to walk from the beach to Rockdale station in the absence of a tram. I think inquiry will show that whilst Mr. Saywell is deserving of great praise for his plucky enterprises at Lady Robinson's Beach, yet, as against a loss on his Tramway, he has been largely rewarded for the boldness of his ventures by the splendid sales of his land, and by the returns from his hotel and baths. He should not, however, assume that he is to be guaranteed and protected by the State in a monopoly to the injury of the rest of a large district.

As to the Sandringham or Sans Souci Tramway, everything in connection with it has been open and above board. The daily press has from time to time published full and ample reports of the depositions to Ministers, and of all other proceedings in connection with the matter. The late Minister for Works caused proper reports to be made by his officers, and three surveys were made by his engineers and their reports made public. The offers of the landowners to assist by a money contribution and by free gift of the major portion of the land—all these were matters of full publicity. Finally, the approval of the Minister was obtained on the evidence of facts before him and before the public. His approval was followed by that of his Cabinet. The assent of the Executive Council was obtained in due course, and the *Government Gazette* and daily papers contained the usual notices under the hand and seal of his Excellency the Governor "by the advice of the Executive Council."

The whole sum promised, viz., £6,000, has been actually paid to and received by the Government, and the land promised has been bound by legal documents. The work has been commenced and contracts let, so that fully one-half the expenditure necessary has been incurred. As to cost, the officers of the Department, tried, efficient, and practical men, have estimated the total as £16,000 cost to the country, and from my personal experience of the actual work done, and the easy nature of the country, I am satisfied that the estimate, if anything, is excessive.

Now, as to the expediency of constructing this Tramway: In the first place, the districts of Sans Souci and Sandringham are too well known to need description at length. They are admittedly the most beautiful around Sydney, being surrounded on three sides by the lovely and placid waters of Botany Bay, George's River, and Kogarah Bay. The climate is simply perfect, being tempered by cool sea breezes, whilst the water frontages are either clean, sandy beaches, or lawn-like shores to deep waters. The area opened up by a Tramway includes not only Sandringham and Sans Souci, but the opposite shores of the river, Towra Point, Commons Point, Sylvania, and a large portion of the Holt-Sutherland Estate. Already two large and well-conducted hotels are established there, with two first-class boarding establishments. Along the road many snug homesteads and orchards are to be seen, whilst the whole of the shores of Kogarah Bay are fringed with mansions and

villas

villas erected at large expense. Two beautiful public parks exist, Scarborough Park and Cook Park, the former a picture to look upon, with its picturesque garden, lake, and canal. Cook Park has only lately been established, but it is well worthy of being made accessible to the public. The trustees already are taking the necessary steps to cause public baths to be erected near the proposed tram terminus, in a well-sheltered bight where deep water with firm sandy bottom is to be had at all tides. Numbers of new houses are in course of erection along the tram route, and at Kogarah there is already a population of over 3,000 souls. On holidays, with the poor means of transit afforded by second-rate omnibuses, vans, &c., there is generally over 1,500 visitors to Sandringham, whilst on ordinary days two lines of 'buses are kept in full work. The benefit of the proposed tram will not be felt locally only, but by the people of Sydney, who will not fail to largely use a means of introducing them to pleasure-grounds far and above most others near to Sydney. The fares to be charged will be fixed, and must be fixed so as to bring in a fair income, and not as in Saywell's Tram at rates that cannot pay. The revenue that the Department will derive will not be from the tram alone, but from the increased number of travellers on the railway line, to which the tram will act as a feeder. That revenue is an item which Mr. Saywell has omitted to mention in his letter *re* his tram.

If this line is a speculator's line, remember, other lines, and in fact all railway lines, must be similar to the same extent; but in no other case has the Government been able to obtain a large money grant with free gift of land. I have no doubt but that the line will pay from the very first, and pay well; but, even if it does not, the Government has £6,000 as a contribution to exhaust as a first return before they have to write it off as a losing concern. The unemployed have been put to many works, cleaning roads, clearing lands, dredging rivers, &c., but none of these promise the return or justify the expense of their employment so much as this Tramway.

The Field of Mars Tramway is about to be commenced, without any outside assistance. Is it to be compared with this line for cost or prospects of return? The Camden-Campbelltown Tramway has been constructed and run for not one-tenth of the reasons that can be adduced in favour of this line.

Not only will the travelling public benefit by easy communication, not only will the Government benefit by its increased returns, but the municipalities interested will, by the increased value of property, receive larger rates, and be able better to improve their boroughs.

The people of Sandringham and Sans Souci, speculators or otherwise, have exhibited a sound public spirit in coming forward with their money and their land, and in laying out a tram route 100 feet wide; and until better authority than that of an interested opponent is shown that a public wrong has been done, public credit and praise should be awarded, and public support accorded to the enterprise of these people.

The district of which I have the honour to be Mayor, viz., Kogarah, was three years ago a mere village, of far less pretensions than the Sandringham of to-day. Three years of the benefits of easy communication with Sydney have increased its population tenfold, and have raised it to one of the most thriving of our suburbs. I look forward with great confidence to the same, and greater progress, occurring at Sandringham, with its unequalled beauties of scenery, climate, and situation.

I am, &c.,
EDWARD HOGBEN.

No. 30.

J. H. Carruthers, Esq., M.P., to The Commissioner for Railways.

Re Sans Souci Tramway.

Sir, Sydney, 130, Pitt-street, 25 February, 1887.

In our conversation a few days ago, with reference to the construction of the loop line, I pointed out several facts which I desire now to reiterate more clearly.

The length of the loop is 65 chains, and the cost of constructing, so I am informed, £1,800. The total distance by tram to Sandringham proposed terminus is 4 miles 5 chains as along the Sans Souci line. To return that way means a total journey to and from Kogarah of 8 miles 10 chains, with stoppage of 7 minutes (say) for shunting.

The distance by the loop from Sandringham to Kogarah is 3 miles, or a trifle under. Over a mile of haulage will be saved by using the loop in the return journey, and 7 minutes shunting will be saved, together with expense of shunting points and line.

The trains leaving Kogarah for Hurstville returns to Kogarah in about 35 minutes. By using the loop one single tram and engine could perform all the ordinary service, as it could run right round 7 miles in 35 minutes, there being no delay for shunting. It would be absolutely impossible for the one tram to perform the service by running to Sandringham, via Sans Souci, and returning the same way, as the distance, 8 miles 10 chains, would have to be performed in 28 minutes (35, less 7 for shunting).

There would be no necessity with the loop to erect water tanks, &c., as the engines could get enough water at Kogarah for a 35 minutes' run; but if they had to stay at Sandringham, as they would without the loop, water tanks and supply would have to be provided there.

The wear and tear of the rails, consumption of the coals, &c., all will be less owing to the less distance of the loop. In case, moreover, special trams were desired for Sandringham they could be run there direct by the loop, saving 1 mile. As to the inconvenience to people at Sans Souci having to catch the out-going tram to bring them to Kogarah, that is more than compensated for by the convenience of a tram to every train, and the time extra to them is but a couple of minutes, and that time is saved to the Sandringham people.

If it were possible, as I believe it is, to have the tram completed by the Easter holidays, then a very large traffic will be obtained at once, and the fares, if fixed at not less than 6d. the journey each way, will amount up to a large sum.

Yours, &c.,
J. H. CARRUTHERS.

Papers *re* Sandringham Tramway submitted with *précis*.—C.A.B., 2/3/87.

J. & W. Christian to The Commissioner for Railways.

Sir, Sydney, 15 March, 1887.

We herewith forward tracing showing proposed road in red to be dedicated by us at some future date to the Municipality of West Botany, and which we now agree to allow the Commissioner for Railways to use for tramway purposes, as though it were now a proclaimed road.

J. & W. CHRISTIAN.

Engineer for Existing Lines.—A.R., B.C., 18/3/87. District Engineer, Sydney, to note.—M.T., 21/3/87. Noted.—W.S., 23/3/87. The Deputy Engineer. Forwarded for Land Valuer's information.—M.T., 24/3/87. Land valuer. Information noted.—J.B.T., 28/3/87. Secretary.

No. 31.

J. H. Carruthers, Esq., M.P., to The Commissioner for Railways.

Sir,

Sydney, 130, Pitt-street, 28 March, 1887.

In view of keeping down the expense of construction of the tram-line to Sans Souci, I beg to call your attention to the great amount of cartage now necessitated there, through the non-connection of the line at two points near the station, where small lots are being resumed.

The cartage incurs an extra 1s. or 2s. per ton on all material over and above what the cost would be if trucks could be used, as would be the case if the connections referred to were made.

I believe that the sole delay in the matter is caused by the want of notices to the landowners under your signature—until these are served no entry being permitted on the land.

Under the circumstances, I beg to urge on you the necessity for the matter to be expedited so that the sections of the line may be connected, and the saving in carriage thereby effected.

Perhaps the delay is caused from the want of the confirmation notices by the Executive.

Yours, &c.,

J. H. CARRUTHERS.

This is being attended to. Minister's approval has been obtained, and it will be submitted to first Executive meeting.—A.R., B.C., 30/3/87. Engineer for Existing Lines. Mr. Shellshear to note.—G.C., 30/3/87. Noted.—W.S., 31/3/87. Tramway Engineer. Noted.—G.C. (p. G.L.), 1/4/87. Secretary.

No. 32.

Mr. D. E. Blacke to The Commissioner for Railways.

Sir,

246, Pitt-street, Sydney, 28 March, 1887.

Will you be good enough to inform me would the Government be willing to lease the Tramway, Kogarah to Sans Souci, on the terms of a ten-years lease at £4 per centum per annum on the outlay of the Government on the matter?

If so, kindly state the amount of the outlay, so that I may submit to my principals who, if everything be satisfactory, are willing to negotiate for such lease.

I have, &c.,

D. E. BLACKE.

Register, and submit.—A.R., 29/3/87. Not a very liberal offer.—A.R., 30/3/87. Inform that the question of leasing the Tramway has not yet received the consideration of the Government.—CH.A.G., 31/3/87.

The Secretary for Railways to Mr. D. E. Blacke.

Sir,

Department of Railways, 5 April, 1887.

In reply to your letter of the 28th ultimo, in which you ask whether the Government would be willing to lease the Tramway, Kogarah to Sans Souci, I have the honor, by direction of the Commissioner for Railways, to inform you that the question of leasing the Tramways has not yet received the consideration of the Government.

I have, &c.,

A. RICHARDSON,

(For the Secretary of Railways).

No. 33.

Précis.

TRAMWAY FROM KOGARAH STATION TO SANS SOUCI AND SANDRINGHAM.

THE scheme of laying down a Tramway from the Illawarra Railway to Sans Souci was first mooted in 1882, when a petition or memorial in favour of it was presented to Mr. Secretary Lackey, and a number of the landholders signed an undertaking to give the necessary land free of cost. An examination of the route was made by the Existing Lines Branch, but no further definite action was then taken.

So the matter rested until 1885, when in November of that year the Minister (Mr. Secretary Lyne) was asked to receive a deputation on the subject.

The Commissioner thereupon (13/11/85) wrote a minute, directing Existing Lines Branch to inspect the route and prepare a rough estimate in readiness for the deputation. The shortest route, he said, should be taken, and consideration should be given to the circumstance that there was already a private line to Lady Robinson's Beach. Perhaps the cheapest plan would be to take the line in that direction to Sandringham and Sans Souci. The railway line, which had been surveyed along the beach, might be followed and reported upon.

The District Engineer accordingly examined and reported upon a practicable route, stating that the line would be about $3\frac{1}{2}$ miles long, and would cost, approximately, £2,500 a mile, or £8,750 in all; it might, if desired, be connected with the Illawarra Railway and be used for goods traffic.

The proposed deputation waited upon the Minister and represented that the line was easy of construction, the country being level; that, with the present imperfect means of access, a large number of pleasure-seekers went to Sandringham and Sans Souci, and these would be largely increased on the completion of a Tramway; that the regular traffic would be considerable; and that the land required would be given free, and also from £4,000 to £6,000.

The Minister informed the deputation (in effect) that he concurred in what they had stated, their very liberal proposals would much assist the object they had in view, and he would strongly recommend the matter to his colleagues.

Hereon Commissioner minuted that before anything was done a survey of the line should be made, and a plan and book of reference be prepared.

Mr. Secretary Lyne gave directions accordingly, adding that the longest water frontage was to be taken if it would not materially increase the distance and cost.

Engineer

Engineer for Existing Lines submitted (7/5/86) a report giving particulars of two routes— (1.) Along the main road from Kogarah to Sans Souci, and thence along the Government Reserve to Sandringham. (2.) Through private land which would have to be purchased. No. 1, the report stated, was advocated by many persons who were prepared to give land to widen the road to 100 feet, and to give £6,000 towards the cost.

Commissioner minuted that if the persons interested would subscribe £6,000 and give the land on condition that the line was carried along the road he would certainly recommend that route.

On the same day a deputation waited upon the Minister to urge the construction of the line, and they stated that if it were carried along the Rocky Point Road £5,125 would be contributed and most of the land would be given free; but if any other route were adopted nothing would be given.

Mr. Secretary Lyne informed the deputation that personally he was in favour of the scheme, but he would like to make further inquiry before coming to a decision.

The Minister then called for all available information, and the papers were again submitted, but no decision was arrived at.

On the 8th June, 1886, the Hon. Secretary of the Sans Souci Tramway League wrote to Mr. Hammond, M.L.A., reviewing what had been done in the matter, and the offers which had been made, and urging him to aid them.

This letter was forwarded to the Minister by Mr. Hammond, and the Minister called for the immediate submission of an estimate.

Mr. Cowdery submitted an estimate accordingly of £20,902 without land; but the Minister did not express any determination.

On the 27th August, 1886, Mr. Hammond wrote to Mr. Secretary Lyne asking what progress had been made.

Commissioner, in reply to an inquiry from the Minister, intimated that nothing had been done, and that the matter hinged upon the Minister's decision whether the line was to be constructed upon payment of £6,000 and the conveyance of the land by the promoters.

Mr. Secretary Lyne then (16/9/86) minuted the papers "for submission to Cabinet," but there is nothing to show whether they came under the consideration of the Cabinet, and no further action is recorded until October 28th, 1886, when Commissioner minuted (with the approval of the Minister) that the Government having decided to give this work to the unemployed, the subscribers should be informed that on payment of the promised subsidy the Tramway would be commenced.

Mr. Hammond was so informed by letter of 28/10/86.

It appears by a memo. of the accountant's that soon after this a large sum of money was paid, and on the 9th December, 1886, Mr. D. E. Blacke advised, and the accountant acknowledged, receipt of the balance of the £6,000.

On the 31/12/86 Commissioner minuted that the work was to be carried on the same way as on the Randwick line, and that he would be glad to know when it could be started. Mr. Thomson reported that if the work were to be done by the unemployed it could be commenced on the 10th January, but if by contract time would be required for preparing specification.

Commissioner referred for the Minister's decision.

Commissioner minuted, that if any unemployed were available they must do the work; if not, it must be done by contract.

Mr. Thomson reported that there were unemployed, but they did not like the work, and they did not agree among themselves, and altogether the arrangement was not satisfactory.

Mr. Cowdery recommended that the work should be done by contract.

Mr. Secretary Lyne replied that a number of unemployed men had expressed their willingness to do pick and shovel work, and that they must do this work in the same way as on the Randwick line.

On the 13th January, 1887, the land-valuer, at Commissioner's request, submitted a report with reference to the land required for this tramway, and suggested that a small deviation (marked in blue on the plan) should be made.

This would involve resumptions, land-valuer stated, to the amount of about £900.

Commissioner recommended the blue line, as all the other land would be given free, and minuted that if Minister approved the plans would have to be submitted to the Governor in Council.

Mr. Secretary Lyne approved.

A few days after, Commissioner minuted that the line had not yet been approved by the Executive, adding that Mr. Lyne promised to write a minute, but he (the Commissioner) had not yet seen it.

On the 17th January the Minister asked, by minute, why the work had not been started on the Sans Souci Tramway. It ought, he said, to have been commenced that morning.

It appeared that there had been difficulty about obtaining tools, and Commissioner minuted, moreover, that the approval of the line by the Executive had not been obtained, and that it would be illegal to proceed without it. The Minister had approved of this authority being obtained, but there had been no meeting of the Executive since that date. He would be glad if the Minister would authorize him to stop the work until properly sanctioned.

The Minister replied that there had been two meetings of the Executive, viz., on the 15th and 17th January.

[It has been ascertained by inquiry at the office of the Clerk of the Council that the two meetings referred to by Mr. Lyne were special meetings, summoned for a special purpose; that ordinary business was not transacted at them, and that, being special, the Department had no knowledge of their being held.]

Per minute of 18/1/87, the Minister decided that the work should be proceeded with, without, and in anticipation of, Executive sanction, and operations were started accordingly.

An application for Executive sanction of the line was prepared by the Under Secretary, and bears date January 19th, but before Mr. Secretary Lyne could sign the minute the Ministry went out of office, and the minute in question was one of the remnants when Mr. Secretary Sutherland took office.

Mr. Secretary Sutherland signed the minute as a matter of routine, and the line was approved of by a minute of the Governor in Council, dated 25th January, 1887.

On the 21st January, 1887, Commissioner minuted that, in view of a modification which had been made in the plans, he would like to know the entire cost of the line, omitting the loop.

An estimate was furnished showing cost of construction £11,431, and land £900.

Commissioner minuted,—		
Construction	£11,431
Land	900
Six cars at £350	2,100
Three motors at £1,000	3,000
		£17,431

but he (Commissioner) did not think the permanent way material would cost more than £4 a ton, and the cost of laying, &c., would be reduced to £5,000, making the cost about £16,000 from which deduct subsidy £10,000

Under date of 3 February, 1887, Mr. Thomas Saywell addressed a letter to the Commissioner, requesting an interview on the subject of the Sans Souci and Sandringham Tramway, and stated that he, single-handed and entirely at his own expense, had constructed a Tramway $1\frac{1}{4}$ mile long, from Rockdale to Lady Robinson's Beach, at a cost of £13,000 or £14,000, and it did not even pay working expenses. Why then, he asked, should the Government saddle the Colony with an expenditure of at least £24,000, in addition to £6,000 contributed by the land speculators, for a line which would not pay the wages. The work should not be allowed to proceed unless it could be shown that it would be a profitable undertaking. The present trams even with their immense traffic were not paying, and if this line were laid six months would convince the Government of their mistake; the rails would be taken up.

Commissioner minuted that Mr. Saywell was mistaken as to the cost. It would not be £24,000 in addition to the £6,000 subscribed. Believed the line if worked economically would more than pay working expenses.

Subsequently Mr. Saywell had an interview with Commissioner, who afterwards minuted that Mr. Saywell based his estimate on the loss he had sustained by his Tramway. Two omnibuses were now running between Sandringham and the Railway Station, and they must earn £10 a week to pay; a Tramway should earn at least £20, and as it would be run in connection with the trains only, the expenses would not exceed that sum, and all earnings in excess of £20 would be profit.

Under date of 11/2/87, Mr. Saywell addressed Mr. Secretary Sutherland with reference to the "wild scheme" (as he terms it) of a Tramway to Sans Souci.

Mr. Saywell states that this Tramway would run in direct opposition to the Illawarra Line to Como, and to that beautiful place the holiday traffic returns would show an inadequate number of visitors were attracted. His (Mr. Saywell's) tramway showed a clear loss on the year's working of £1,370 10s. 4d. How then could such a line as that from Kogarah to Sans Souci, at a cost of at least £30,000, be anything but a loss to the Government? Was it fair to private enterprise to subsidise such a line after what he (Saywell) had done at his own cost? Mr. Saywell enclosed a Dr. and Cr. statement confirmatory of his assertions that his loss had been £1,370.

On the 11th February, 1887, the Minister asked for the plan and section and a statement of cost incurred to date. Commissioner submitted a statement of the probable cost of the line as under:—

Construction (including loop)	£13,632
Land	1,000
Rolling Stock	5,000
		£19,632
Less subscriptions	6,000
		£13,632

Expenditure to date was also stated to be £385.

Mr. Secretary Sutherland expressed a wish to have *précis* of the case. Mr. Carruthers, M.L.A., now (23/2/87) addressed the Minister in urgent terms in favour of this line, stating all that is herein set forth on that side of the question, and expressing a firm conviction that even with existing traffic (he gives some statistics) the line would pay. Mr. Carruthers encloses a letter (in print) from the Mayor of Kogarah on the subject. C.A.B., 24/2/87.

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RANDWICK AND WAVERLEY TRAMWAY.

(PARTICULARS RESPECTING.)

Ordered by the Legislative Assembly to be printed, 12 July, 1887.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 5th April, 1887, That there be laid upon the Table of this House,—

“(1.) Copies of all letters, minutes, and other documents relating to the construction of the Tramway between Randwick and Waverley.

“(2.) The total cost of making the said Tramway.

“(3.) The names of the parties from whom land was resumed for the said Tramway, and the sum paid, or to be paid to each.”

(*Mr. See.*)

SCHEDULE.

NO.	PAGE.
1. Minute from Superintendent of Tramways to Commissioner, suggesting the continuation of line from Waverley to connect with Randwick line, with replies and estimate of cost. 18 October, 1882	2
2. Surveyor Davidson's report on trial survey with minutes. 23 July, 1883	3
3. Letter from Mayor of Randwick, forwarding petition asking for construction of line, with minutes. 12 June, 1884	4
4. Minute by Assistant Engineer for Existing Lines. 25 February, 1885	4
5. Minute by Commissioner, with replies. 5 June, 1885	4
6. Minute by Minister asking for papers, and Cabinet's approval of construction of line. 12 November, 1885.....	5
7. Minute by Commissioner forwarding plan, section, and book of reference for approval. 22 December, 1885	5
8. Plan, &c., forwarded to Cabinet for approval, and approval given. 22 December, 1885	5
9. Minute by Engineer for Existing Lines, asking if work is to be gone on with at once, &c. 7 January, 1886	6
10. Minute by Commissioner for Railways, that there is no pressing necessity for line. 13 February, 1886	6
11. Minute by Under Secretary for Works, forwarding tenders for report, with reply. 16 February, 1886	6
12. Extract from <i>Evening News</i> , <i>re</i> proposed destruction of Randwick Reserve, by construction of tramway, with minutes. 18 February, 1886	7
13. Letter from Messrs. Duncan and Cowie, asking cause of delay in accepting their tender, with minutes and return of deposit. 25 March, 1886	8
14. Letter from Messrs. Butcher and Trickett, M's.P., asking Minister to receive a deputation, with Minister's reply to deputation, and minutes. 30 March, 1886.....	8
15. Minute by Commissioner, <i>re</i> inviting tenders for new route, with replies. 27 April, 1886	9
16. Letter from J. C. Neild, M.P., <i>re</i> deputation to wait on Minister, and report of same. 22 June, 1886 ..	9
17. Letter from W. J. Trickett, M.P., to Minister, asking how matter stands. 28 June, 1886	10
18. Letter from Council Clerk, Waverley. 10 August, 1886	10
19. Minute from Engineer for Existing Lines to District Engineer, for plan and section and estimate of cost, with replies and further minutes <i>re</i> resumption of land from Wesleyan Church. 1 September, 1886.....	10
20. Minute by Commissioner, that line is to be commenced by the unemployed at once. 28 October, 1886	12
21. Minute by Commissioner to Engineer for Existing Lines, to accompany him over route, with further inter-Departmental correspondence. 2 November, 1886	12
22. Minute by Chief Clerk, asking for cost of making the line, with reply from Accountant. 5 July, 1887	13
23. Minute by Chief Clerk, asking for list of persons from whom land was resumed, with price paid, or to be paid, and reply from land valuer. 5 July, 1887	13

RANDWICK AND WAVERLEY TRAMWAY.

No. 1.

The Superintendent of Tramways to The Commissioner for Railways.

Sir,

I wish to suggest to you the advisability of continuing the Waverley line from its present terminus to connect with the Randwick line.

I think the best route would be *via* Frenchman's Road;—that matter, however, the Engineer would be able to decide.

I have, &c.,

J.R., 18/10/82.

I shall be glad to obtain Mr. Cowdery's report in this matter. It seems to me desirable that a junction should be made with the line to Coogee from Waverley, so as to give the residents the benefit of access to the sea-shore. It will also be desirable to have the line to give readier access to the workshops at Randwick. Will Mr. Cowdery have survey made and estimate of cost furnished?—CH.A.G., 21/10/82.

Mr. Hyndman for survey and estimate.—G.C., 26/10/82. Mr. Hyndman. Trial survey made; approximate estimate £24,200.—R.A.H., 30/10/82. Tramway Engineer. Commissioner.—G.C., 2/11/82. What will make this line so expensive? The distance I think is little more than a mile.—CH.A.G., 11/11/82. I should like to have estimate in general detail.—CH.A.G. Mr. Cowdery, B.C. Mr. Hyndman.—G.C., 13/11/82. Detailed estimates herewith.—R.A.H., 23/2/83. Commissioner.—G.C., 2/3/83.

Engineer for Existing Lines Office, Sydney, 1 November, 1882.

Extra Tramway to Randwick.

DETAILS of estimate line from Waverley terminus by Albion-street, Frenchman's Road, and Avoca-street, to terminus at Randwick—1 mile 50 chains; loop, by Ellison-street, to workshops, 12 chains; total distance, 1 mile 62 chains.

	£
1 mile 62 chains, double line	16,525
Forming road and kerbing, &c., guttering where needed	5,000
Points and crossings	475
	£22,000
Ten per cent. possible extras	2,200
	£24,200

Mr. Hyndman.

G. W. TOWNSEND.

If Mr. Hyndman is under the impression that he has furnished me with a detailed statement, he is mistaken. I take leave to say that the estimate submitted cannot be justified, even by making it a double line or putting in a sum of £5,000 for kerbing and guttering, an expenditure which is not required.

I am quite sure that the line could be constructed for the following:—

5,000 cubic yards excavation	£750
180 tons rails and fastenings	1,500
3,000 sleepers	750
Concreting, 30s. a yard	4,500
Metalling in tar metal	2,000
Reforming road	1,000
Points and crossings	475
Incidentals, 10 per cent.	1,097
Laying permanent-way	500
	£12,572

I should be glad to be shown in what way a single line of tramway, to connect Waverley with Randwick line (say) at junction of Cowper-street with present line, will cost more than £13,000?—CH.A.G., 6/3/83.

Mr. Cowdery. Mr. Hyndman for immediate report.—G.C., 9/3/83; urgent. 1 mile 62 chains single line, without allowing for forming, kerbing, and guttering, but with any other incidental expenses, will cost about £10,831. Please see note, 10/3/83, on paper attached.—R.A.H. Tramway Engineer. Why should it be double line? The line to Waverley is single.—CH.A.G. I estimated for double line as I was informed that no more single lines were to be laid, and all that were single now were to be doubled eventually.—GEO. WM. TOWNSEND, 10/3/83.

When the survey was made, I asked Mr. Suttor, who made it, if there would be much forming and kerbing, guttering, &c., to do. He said, "Yes; nearly the whole way." I have not seen the ground, but if Mr. Suttor's statement is correct, and I have no doubt it is, £5,000 is not an excessive estimate for (say) a mile of such work. The price given is the bare cost for double line, £16,525; incidental expenses, 10 per cent., £1,653; forming, kerbing, and guttering, £5,000:—£23,178. Please inform me what forming, kerbing, and guttering is to be charged to in making estimate.—GEO. WM. TOWNSEND, 10/3/83. Engineer for Tramways.

Commissioner.—G.C., 4/4/83. I do not consider that justice is being done the Department by estimates being made in this slipshod manner.—CH.A.G., 9/4/83.

Mr.

Mr. Hyndman says that the cost of a single line, without kerbing and guttering, will be £10,831. I do not see why the line should be a double one, nor do I see that the street should be kerbed and guttered at the expense of the Tramway Department. The roads or streets are for the most part unmade, and such drainage as is required to keep the line free from water would not cost much more than £6,000. £12,000 should be ample for the line, not £24,200.—C.H.A.G., 9/4/83. Mr. Cowdery, B.C.

Mr. Hyndman, for further report; and see me with reference to this.—G.C., 14/1/83. Estimate herewith.—R.A.H., 15/5/83. Tramway Engineer. Forwarded to Commissioner, with estimate attached.—G.C., 18/5/83. Commissioner.

Government Tramways.

Detailed estimate of single line, 142 chains, Waverley to Randwick:—

Excavation	£468	6
Concrete (Department finding everything)	2,811	6
Tarred metal do do	1,374	56
Screenings	718	52
Rails, guards, and fastenings	2,030	6
Laying rails, guards, and fastenings	390	5
Sleepers	624	8
Points and crossings	372	0
Labour	840	0
Incidental expenses	1,200	0
	£10,831	18
Forming, pitching, and metalling 1 mile 80 chains, at £50... ..	4,000	0
	£14,831	18

The road that will be traversed by this tramway is nearly entirely unformed, and generally very uneven in surface. When we make the line we shall have to form the street, when, I have no doubt, there will be some kerbing and guttering necessary, as was the case in Pymont Bridge Road. We shall in many places have to alter the level of the road, and wherever we do so, the whole of road will need reforming.
Engineer for Existing Lines. R.A.H., 15/5/83.

Commissioner.—G.C. Please have plan, section, book of reference, and specification prepared.—C.H.A.G., 27/5/83. Mr. Cowdery, B.C. Mr. Hyndman to furnish as early as possible.—G.C., 29/5/83. Mr. Townsend for survey.—R.A.H., 31/5/83. Put in hand, 10/7/83. This work has been delayed through surveyors being all engaged on other urgent work. Mr. Davidson has now started on permanent staking of this line.—R.A.H., 12/7/83. Engineer for Tramways. Commissioner.—G.C., 13/7/83. Seen.—D.O. (*pro* Commissioner), 16/7/83.

No. 2.

Mr. Surveyor Davidson's Report on Trial Survey.

Sir,

Tramway Survey Camp, Randwick, 23 July, 1883.

I have the honor to report upon the proposed line of tramway between Waverley and Randwick as follows:—

I have surveyed an alternative route near the Randwick end, diverging from the original trial line at the corner of Avoca-street and Frenchman's Road, and thence through reserves principally to junction with existing line at the corner of Allison and Belmore Roads.

The adoption of this line would entail but 30 chains of ordinary railway construction from the point of divergence (with easy grades), as against some 56 chains of street construction by original line, thus also shortening the total distance by about 26 chains.

I have further ascertained that there would be no objection to carrying the line through the reserves, but there is one small portion of unimproved Church property which would probably require to be purchased.

At the Waverley end, the route over Albion-street is the shorter, and would require no sharp curves.

I would, therefore, recommend that the proposed line commence at the Waverley terminus, Albion-street; thence along Albion-street and Frenchman's Road to corner of Avoca-street, Randwick; thence across reserves, *via* recreation ground, to connect with existing line at the junction of Albion and Belmore Roads.

I may add that the adoption of this line would obviate the necessity for an additional loop to the Randwick Workshops.

The Engineer for Tramways, Sydney.

I have, &c.,

PERCY DAVIDSON.

Plan of trial survey herewith.—R.A.H., 24/7/83. Tramway Engineer. I recommend the adoption of the trial line surveyed by Mr. Davidson, if approved; I will then have it staked out, and forward estimate of cost, plan and section herewith.—G.C., 31/7/83. Commissioner.

I think the cost of this line should be ascertained, with a view to the consideration of the question whether it should be adopted. It would afford the people of Waverley direct access to Coogee, and remove in a great measure the demand for an outlet at Bondi, which will be a most difficult route. In addition to the advantage the line will be to the public, it will be of considerable advantage to the Department, enabling it to return the rolling stock to the sheds at Randwick by a very short route, saving a large amount of running. It will make a circular line, which, I think, would be largely availed of by excursionists.—C.H.A.G., 20/8/83. Resubmit in a month.—F.A.W., 31/8/83.

No. 3.

The Mayor of Randwick to The Secretary for Public Works.

Sir,

Randwick, 12 June, 1884.

I have the honor, by direction of the Randwick Municipal Council, to forward herewith a petition from a large number of the residents and land owners of this borough praying that "the Waverley and Randwick lines of tramway may be connected."

The Council fully endorse the object of the petition, and beg to urge upon you the desirability of carrying out this work.

I have, &c.,

WALTER BRADLEY,
Mayor.

[Enclosure.]

To the Mayor and Aldermen of the Borough of Randwick.

Gentlemen,

We, the undersigned owners of property and occupiers of houses in the borough of Randwick, respectfully request that the Municipal Council will be pleased to urge upon the Government the desirableness of connecting the Waverley and Randwick lines of tramway.

The chief ground upon which we base this request, is that many of us who reside in the northern part of the borough, including St. Mark's, Bishopscourt, and Grand View Estates, are at present much inconvenienced by the distance we have to travel to reach the tram. Moreover, the proposed junction of the two lines of tramway would greatly benefit the borough generally by inducing the settlement of a large population on the route; and, we have reason to believe, would facilitate the working of the lines mentioned by enabling the Tramway Department to establish a circular or continuous line from Sydney through Randwick and Waverley and *vice versa*.

The question of forming the junction we advocate has already engaged the attention of the officers of the Tramway Department, as evidenced by the fact that one or more routes have been surveyed, and we think that an expression of the wishes of the residents, forwarded through the Council, would go far towards securing a favourable decision at the hands of the Minister for Works.

[Signed by ALFRED SYDNEY and sixty-four others.]

Railways, B.C., 17/6/84.

I believe this line, as a loop-line, would pay well. It will cost £14,000, the interest upon which, at 5 per cent., is £700 a year. It will be a great convenience to the Department, and working expenses will benefit to fully half the amount stated by the saving effected in running. Where are the plans and books of reference?—CH. A.G., 21/6/84; urgent.—Mr. Cowdery, B.C.

Mr. Townsend for plan, section, and book of reference and specification. Mr. Hyndman was requested to furnish these in May, 1883.—G.C., 24/6/84. Mr. Townsend; urgent. This work is in hand, and being pushed forward as quickly as possible.—R.T., 2/7/84. Tramway Engineer. When will plans, &c., be ready?—G.C., (*per G.L.*), 4/7/84. Mr. Townsend. Plan and section are ready. Proof of specification not yet received from Government Printer. All will be forwarded as soon as corrected copy is received from printer.—R.T., 7/7/84. Tramway Engineer.

No. 4.

Minute by The Assistant Engineer for Existing Lines.

Tramway—Waverley to Randwick.

Existing Lines Office, Sydney, 25 February, 1885.

THE plan, estimate, and specification for a tramway from Waverley to Randwick were submitted by Mr. Townsend, District Engineer for Tramways, about August or September last.

The forwarding of these for Commissioner's sanction was not carried out, because at the time a new style of permanent-way for tramways was being schemed, and it was thought that it might be tried on this Waverley to Randwick line. This occupied some time; finally the permanent-way shown on drawing No. 4 was worked out, and the estimate and specification revised to suit. The specification was then put in the printer's hand, but on receiving the proof from the printer it was discovered that the forming of the streets had not been provided for. This had to be gone into, and the schedule and specification again revised. No. 3 drawing was also made.

The subject is now complete with one exception, that the specification does not mention from what place or places 2,697 cubic yards of side cutting is to be obtained. I think the papers had better be returned to Mr. Thomson and registered in his office, and resubmitted to you in the regular way.

FRED. M. AVERN.

Engineer for Existing Lines.

Mr. Thomson for section, and prepare specification ready for tendering without delay. Read Mr. Avern's minute with reference to filling required.—G.C., 20/3/85. Plans have been corrected, specification prepared and printed, and everything is now ready to invite tenders. The extra filling required can be obtained from the streets and reserve through which the tram passes.—M.T., 29/3/85. Engineer for Existing Lines.

No. 5.

Minute by The Commissioner for Railways.

Tram-line—Waverley to Randwick.

I AM not aware that this line has been approved of yet.

CH. A.G.

Mr. Cowdery, B.C., 5/6/85. Instructions were given on Commissioner's M.P., 82/4,860, to prepare plan, section, book of reference, and specification. The cost of this line exclusive of land will be about £8,750.—G.C., 16/6/85. Commissioner. For Minister's decision. The line would be of great advantage

advantage to the Department, and would enable us to work a circular traffic *via* Waverley, Randwick, and Sydney. The outlay is less than I expected.—CH.A.G., 18/6/85. Please submit plan, &c. Mr. Cowdery, B.C. Plans and section herewith, also six tracings of land required to be resumed.—G.C., 30/6/85.

Commissioner.—There are only two pieces of land which will have to be taken and paid for, viz., 1 rood 9 perches from trustees of Presbyterian Church, and a small piece of 38 perches from James Monaghan. We do not take the land through the reserve, the Act gives us power to run through it.—CH.A.G., 1/7/85.

The whole cost should be under £10,000. It will be a very convenient line to the Department, and a popular line forming a circle, including Waverley, Coogee, and Randwick.—CH.A.G., 1/7/85. Papers returned by Minister without action.—D.C.M'L., 10/10/85.

No. 6.

Minute by The Secretary for Public Works.

Tramway—Charing Cross to Randwick.

LET me have papers.

W.J.L., 12/11/85.

Papers herewith. For Cabinet.—W.J.L., 12/11/85. Cabinet approves.—G.R.D., 15/12/85. Call for tenders.—CH.A.G. See whether we have rails, &c.; urgent. Mr. Cowdery, B.C., 16/12/85.

No. 7.

Minute by The Commissioner for Railways.

Extension of Tramway from Waverley to Randwick.

I HAVE the honor to forward for the approval of the Governor and Executive Council, the plan, section, and book of reference of the proposed extension of the tramway from Waverley to Randwick.

Description :

Commencing at the present terminus at Waverley and terminating at Allison Road, Randwick, being a distance of 1 mile 26 chains.

Draft proclamation herewith together with papers.

I shall be glad if you will obtain the necessary approval.

Under Secretary for Public Works.

CH.A.G., B.C., 22/12/85.

Government Tramways—Extension Waverley to Randwick.

THE Commissioner for Railways, appointed by Act of Council 22 Victoria No. 19, hereby gives notice that His Excellency the Governor, with the advice of the Executive Council, deems it expedient to make and complete a tramway between Waverley and Randwick, and in pursuance of the Acts of Parliament 43 Victoria No. 25, and 46 Victoria No. 26, to erect certain works and conveniences in connection therewith: Commencing at the present tramway terminus at Waverley, and terminating at Allison Road, Randwick, being a distance of 1 mile 26 chains; that for that purpose certain parcels of land which are particularly set out and coloured red in the map, or plan and book of reference to be seen at the office of the Commissioner for Railways, Phillip-street, Sydney, are required to be taken by the Commissioner for Railways, and that all parties interested in the said land or affected by the said works are hereby required to set forth in writing to the said Commissioner within one month from the publication of this notice in the Government Gazette, any well-grounded objection that may appear to them to exist to the making of the said tramway, or to the erection of the said works. Dated at Sydney, this 22nd day of December, in the year of our Lord one thousand eight hundred and eighty-five.

CH. A. GOODCHAP,
Commissioner for Railways.

The seal of the Commissioner for Railways was affixed hereto, at Sydney, }
this 22nd day of December, 1885, in the presence of,—

L. P. IREDALE.

No. 8.

Minute for The Executive Council.

Tramway Extension from Waverley to Randwick.

Department of Public Works, Sydney, 22 December, 1885.

I HAVE the honor to submit, for the approval of His Excellency the Governor and the Executive Council, plan, section, and book of reference of the proposed extension of the tramway from Waverley to Randwick, commencing at the present terminus at Waverley and terminating at Allison Road, Randwick, being a distance of 1 mile 26 chains, in accordance with law.

A draft notification, for publication in the Gazette, is also submitted for the approval of His Excellency the Governor and Council.

WILLIAM JOHN LYNE.

The Executive Council approve of the proposed extension of tramway from Waverley to Randwick, as set forth in the plans and book of reference herewith submitted.—ALEX. C. BUDGE, Clerk of the Council. Minute 85-54, 22/12/85; confirmed, 22/12/85.—CARRINGTON. Railways.—J.R., B.C., 30/12/85. Advertisements sent to Sydney daily papers, 30/12/85.

No. 9.

Minute by The Engineer for Existing Lines.

I FORWARD herewith duplicate tracings of land required to be resumed, as also book of reference. Please say if work is now to be advertised. G.C., 7/1/86.
Commissioner.

Yes.—CH.A.G., 8/1/86. Engineer for Existing Lines, 9/1/86. Draft advertisement inviting tenders herewith.—G.C. (*per* G.L.), 11/1/86. Commissioner.

Department of Public Works, Railway Branch, Sydney, 11 January, 1886.
TENDERS will be received at this office, until 11 o'clock on Tuesday, the 16th February, from persons willing to contract for the construction of a single line of tramway from Waverley to Randwick, being a distance of 1 mile 26 chains about.

Plans may be seen and copies of specification, form of tender, schedule of quantities, and further particulars obtained at the office of the Engineer for Tramways, 44, Phillip-street, Sydney.

Tenders are to be endorsed "Tender for Construction of Tramway—Waverley to Randwick."

The Commissioner does not bind himself to accept the lowest or any tender.

CH. A. GOODCHAP,
Commissioner for Railways.

Insert.—CH.A.G. Advertisement sent to *Gazette*, Public Works, and Sydney daily papers.—D.C.M'L., 13/1/86. Have notices been served?—CH.A.G., 13/1/86. Land valuer. No; tracings have only just been received. Notices will be prepared at once.—J.B., B.C., 13/1/86. Commissioner.

No. 10.

Minute by The Commissioner for Railways.

I do not think there is any pressing necessity for this line of tramway.

I believe it would pay very well, even in the direction of saving working expenses; but since I advocated the line the question of leasing the lines generally has been brought prominently forward, and has assumed an air of reality. Till it is finally decided I should not recommend the construction of any new line of tramway.

CH.A.G., 13/2/86.

Resubmit with tenders, when received for the reason given. I shall not recommend the acceptance of a tender for this work.—CH.A.G., 13/2/86.

No. 11.

Minute by The Under Secretary for Public Works.

Sir,

Department of Public Works, Sydney, 16 February, 1886.

The tenders, fifteen in number, for the work specified in the margin are referred to you for report, and you will have the goodness, as early as possible, to return them to me direct for submission to the Minister.

The Commissioner for Railways.

I have, &c.,

JOHN RAE.

Construction of
single line of
tramway—
Randwick to
Waverley.

Construction of single line of tramway—Waverley to Randwick:—Mr. Cowdery may report upon these tenders, but no information is to be given to tenderers nor prospect held out of any tender being accepted. The question of acceptance of a tender for this work, or indeed of the carrying out of the work at all will have to be considered; circumstances have changed in regard to tramway extensions since it was determined to invite tenders for this work. Please state cost of the work complete, supply of rails, gravel, &c.

CH.A.G., 16/2/86.

Analysis of tenders herewith. The cost will be as follows:—

Cowie & Duncan's tender	£5,277	3	9
Rails and guards, 136 tons, at £8	1,088	0	0
10,900 wood screws, 2.5 tons, at £20	30	0	0
10,350 blocks, 8 tons, at £12	96	0	0
10,350 bolts, 2.3 tons, at £20	46	0	0
1,210 fish-plates, 2.2 tons, at £15	33	0	0
2,420 fish-bolts, 0.8 tons, at £20	16	0	0
2,420 ferrules, 0.2 tons, at £15	3	0	0
Points and crossings, 3 sets	120	0	0
Carting material to site, 155 tons, at 5s.	38	15	0
Gravel, 1,300 tons, at 10s.	650	0	0
Total	£7,397	18	9

This does not include the cost of any land that may require to be resumed.
Commissioner.

G.C., 24/2/86.

CONSTRUCTION

CONSTRUCTION of Tramway—Waverley to Randwick—Analysis of tenders:—

No. 12.

Extract.

Extract from *Evening News*, 18th February, 1886.

The Trams—Proposal to destroy Randwick Reserve.

IN the face of the large sums of money which have recently been allotted for reserves in the several suburbs, and the numbers of applications for the resumption of land for parks, &c., now in the hands of the Government, the Tramway Department, it is said, proposes to break up the Randwick Reserve, a valuable block of land, on which a considerable sum of money has been spent in converting it into a recreation ground and park for the use of residents and visitors. At the Randwick Council meeting on Tuesday night, a petition was received from the Randwick and Coogee Cricket Club, praying the Mayor and aldermen to exert their influence to prevent the Government from resuming a large portion of the Randwick recreation ground for tramway purposes, and to urge the Government to so deviate from its plans as not to interfere with the already limited area available for the use of the residents, and the cricket and football clubs in the borough. The aldermen unanimously expressed their indignation at the proposal of the Government to destroy the reserve, and it was decided that a deputation, consisting of the Mayor and Aldermen Wilson and Pearce, should wait on the Minister for Works to urge upon him to have the plans altered in order to leave the reserve intact. It was mentioned that the portion of the park proposed to be resumed included the pavilion and a fine avenue of trees, which separated the park from a portion of the tram-line, and on which over £300 had already been spent in effecting improvements.

I believe there is a street running along the back of the reserve. Could not the tram-line (if it be constructed) be taken along that street, if it exists, as I believe it does?—CH.A.G., 21/2/86. Mr. Cowdery, B.C. Mr. Thomson to say.—G.C., 22/2/86.

There is a line 33 feet wide along the back of the reserve, but the line could not be taken along that, as we would not be able to make a junction with the Randwick line. By resuming a strip of land, however, 33 feet wide, as shown on tracing attached, the line can be diverted so as to leave the recreation reserve intact, except a small piece of the corner. I think this would be the preferable course to adopt.—M.T., 1/3/86. Tramway Engineer.

I have examined this on the ground, and approve of tracing attached.—G.C., 3/3/86. Commissioner.

The line is objected to by many of the residents, and I promised Mr. See that nothing final should be done till the question had been thoroughly considered. Could not the line be located without going through the recreation reserve? Please submit plan of route, and show how deviation of line could best be made with the least possible expense.—CH.A.G., 3/3/86. Mr. Cowdery, B.C.

Tracing herewith, showing deviation.—G.C., 4/3/86. Commissioner. Ask Mr. See, M.P., to call and inspect the plan showing deviated course.—CH.A.G., 6/3/86.

The Commissioner for Railways to J. See, Esq., M.P.

Sir,

Department of Railways, Sydney, 10 March, 1887.

With reference to your personal interview respecting the objections entertained by many residents of Randwick to the proposed route of the Waverley-Randwick tramway through the recreation reserve, I have the honor to inform you that a plan has been prepared showing the deviation which will be necessary to avoid encroachment upon the reserve in question, and I shall be glad if you will call at this office at your early convenience and inspect the plan.

I have, &c.,

CH. A. GOODCHAP,

Commissioners for Railways.

J. See, Esq., M.P., to The Commissioner for Railways.

Dear Sir,

Sydney, 16 March, 1886.

I send herewith a map of Randwick. Cook-street, as you will notice, intersects Francis-street, and is close to the Belmore-street tram shed. This really should be the route of the tram-line, and will save the resumption of much land. Kindly let me have the map back, as it is the property of the Borough Council.

JOHN SEE,

Mayor of Randwick.

Minute

Minute by The Commissioner.

MR. COWDERY for further report. I wish to curtail the expense of this work, and must ask Mr. Cowdery to say if a line can be run through the streets rather than through land which will have to be taken and paid for at a high rate.

Could not a line be run from the Frenchman's Road, curving into Avoca-street, through the piece of land in possession of the Crown formerly set apart for a Roman Catholic School; thence by Avoca-street to Francis-street, curving into that street by making use of the corner shown as a reserve; and then by Francis-street to Cook-street (taking a small corner to curve into Cook-street); and then by Cook-street to a junction with the Randwick line. CH.A.G., 19/3/86.

Mr. Thompson for report.—G.C., 22/3/86; urgent.

No. 13.

Messrs. Cowie and Duncan to The Commissioner for Railways.

Waverley and Randwick Tramway.

Sir,

58, Derwent-street, Glebe, 25 March, 1886.

We are anxious to know the delay in accepting our tender *re* the construction of the above line of tramway. We have, &c.,

COWIE & DUNCAN.

Was their tender the lowest.—D.C.M'L., 26/3/86. Have we returned their deposit? Yes; they are the lowest tenderers, and their deposit has not been returned.—J.S., 26/3/86. The deposit, £75, made by Duncan & Cowie with their tender for construction of tramway—Randwick to Waverley—may be returned to them.—G.B. (*per* Commissioner), 16/4/86. Under Secretary for Public Works. Deposit returned.

No. 14.

W. J. Trickett and R. Butcher, Esq's., M.P., to The Secretary for Public Works.

Dear Sir,

Sydney, 30 March, 1886.

We have the honor to ask that you will receive a deputation on Friday next to consider the following matters. Kindly name an hour that will be convenient:—

- (1.) Extension of tramway from Waverley to Randwick.
- (2.) Extension of twopenny section tram-fare beyond Begg-street, Paddington.

We are, &c.,

W. J. TRICKETT.
R. BUTCHER.

I have arranged to see the deputation at 12.45 p.m. on Friday.—W.J.L., 31/3/86.

Minute by The Secretary for Public Works.

THE deputation, Messrs. Trickett and Butcher, with representatives of the Paddington Council, waited upon me to-day with reference to the proposed tramway from Waverley to Randwick. They urged that, as tenders had been received and the people were expecting the work, the extension might be gone on with.

I informed them that tenders had been received, as they stated; but, owing to the cost, the tenders had been declined. The matter was, however, having attention, and inquiries were now being made to ascertain whether, by adopting a new route, the probable cost of the line could not be much reduced. I stated it was expected the Engineer's report would be ready in a few days.

W.J.L., 3/4/86.

Mr. Cowdery.—G.B., B.C., 7/4/86; urgent. Mr. Thomson for full reply to Commissioner's minute of 19/3/86 on attached papers.—G.C. (*per* G.L.), 9/4/86; very urgent. Report herewith.—M.T. (*per* W.S.), 27/4/86. Commissioner.

Memo. to The Engineer for Existing Lines.

Waverley to Randwick Tramway—proposed deviation.

Office of District Engineer, Sydney, 27 April, 1886.

IN order to avoid the necessity for resuming private land in the construction of the tramway from Waverley to Randwick there are two possible alternate routes.

The first is along Avoca-street, Francis-street, and Cook-street to a junction with the present Randwick line in Belmore-street.

In the first case the line will be about 13 chains longer than the original line; and it will be necessary to resume a little land at the corner of Francis-street and Cook-street. The junction will be in the direction of Coogee, and if the line is to be used as a circular one between Sydney, Waverley, Randwick, and back to Sydney, it will be necessary to shunt in Belmore-street, Randwick.

The second line will be about 7 chains longer than the original line, but 6 chains shorter than the deviation by way of Francis-street and Cook-street, and, as Avoca-street joins Allison Road at an angle, no land will require to be resumed, and, as the junction is in the direction of Sydney, no shunting will be necessary in working the traffic on the circle between Sydney, Waverley, Randwick, and back to Sydney.

The cost of the line along Francis-street and Cook-street, exclusive of land resumption, will be about £1,200 more than the original line, as the streets are not formed, and there will have to be a large amount of excavation and filling to bring the streets up to the requisite levels.

The

The cost of the line along Avoca-street and Allison Road will be about £500 more than the original line. Avoca-street and Allison Road are both formed and metalled, and there is, therefore, a good bed for the tramway without any extra excavation or filling.

On the Francis-street line the grades are steeper, and there are two sharp curves. On the Avoca-street and Allison Road line the grades are flatter, and there is only one sharp curve.

MAX THOMSON.

No. 15.

Minute by The Commissioner for Railways.

Tramway—Waverley to Randwick.

WHAT is being done about the survey of suggested route? When can tenders be invited for new route?
CH.A.G., 27/4/86.

Mr. Cowdery; urgent.

Will Commissioner please decide, on report attached, which route is to be taken, so that permanent plan and section may be made.—G.C., 29/4/86. Commissioner. Please submit plan showing the two routes.—CH.A.G., 30/4/86. In estimating cost of original line was the value of the land to be taken included?—CH.A.G., 30/4/86. Mr. Cowdery; urgent. Mr. Shellshear for plan showing both routes, and also for reply to latter part of Commissioner's minute.—G.C., 3/5/86. Mr. Shellshear.

THE two alternative routes have been plotted on the working plan herewith. The section of the Avoca-street, Francis-street, and Cook-street line is attached to the papers, from which it will be seen that there is a large amount of earthwork required to form the streets before the tramway can be constructed.

A section along Avoca-street and Allison Road is forwarded with the working plan. These streets being formed, there will be no extra earthwork, and the grade is much easier than in the case of the Avoca-street, Francis-street, and Cook-street route.

The estimated cost of the original line as per lowest tender, including rails, &c., is £7,397 18s. 9d. The estimated cost of the line *via* Avoca-street, Francis-street, and Cook-street, including rails, &c., is £8,597 18s. 9d. The cost of the line *via* Avoca-street and Allison Road, including rails, &c., is £7,897 18s. 9d.

The above estimates are exclusive of land resumptions. The original line passes through several valuable blocks of private land, the resumptions of which would add largely to its cost. The Francis-street and Cook-street line would require a corner to be resumed, which would add to its cost. The Avoca-street and Allison Road line would be constructed throughout on the public streets, and there would be no item for resumption of land.

The Tramway Engineer.

W.S., 25/5/86.

Plan herewith showing the two routes, of which the one *via* Avoca-street and Allison Road (shown in blue) is recommended, being the cheapest, and of easy gradient, as well as passing along streets already formed. In the estimated cost of original line, the value of land to be resumed was not included.—G.C., 28/5/86. Commissioner.

There are grave objections to the route by Avoca-street and Allison Road. The objections are taken by the residents. The route by Cook and Francis Streets must be adopted (if any). Please ascertain what the cost of the land will be.—CH.A.G., 29/5/86.

Mr. Cowdery, B.C. Mr. Thompson.—G.C., 31/5/86.

Please show on plan the extent and area of land to be resumed at corner of Francis-street and Cook-street, and if this route is adopted it will be necessary to have a junction with the present line leading towards Sydney, as indicated on plan in pencil, for which purpose the corner between Cook-street and the present line will also have to be resumed. Please plot this on the plan also, and furnish approximate value of all land to be resumed.—M.T., 1/6/86. Mr. Shellshear.

Mr. Halligan.—W.S., 5/6/86. Plan and section will be ready this week. If this route is adopted, the revised specification can be prepared in a few days.—W.S., 23/6/86. The Tramway Engineer. Commissioner.—G.C., 24/6/86.

No. 16.

J. C. Neild, Esq., M.P., to The Under Secretary for Public Works.

Dear Sir,

Sydney, 22 June, 1886.

Re arrangement made with you verbally for a deputation to the Minister for Friday, *re* Randwick tramway. Kindly let me know to-morrow (Wednesday morning) at my office, 26, Bridge-street, at what hour Mr. Lyne will receive the said deputation.

Very truly yours,

JNO. C. NEILD.

Friday, 25th, at 12:30; Mr. Neild informed.—J.R., 23/6/86.

Minute by The Secretary for Public Works.

Tramway—Waverley to Randwick.

A DEPUTATION consisting of Messrs. Neild, Garrard, Hawthorne, Davies, M's.P., Allen, and Griffiths, waited upon me to-day, relative to the above proposed tramway.

They represented the matter had been in abeyance for a considerable time, and urged that the work should be carried out without delay. It would prove not only a convenience to the people in the locality, and prove a remunerative extension, but it would be of great advantage to the Department in giving a direct line between the Randwick running sheds and Waverley terminus, &c. I informed them

that I had been so occupied in another place (listening to a nine-hours speech by Mr. Neild), during the last few days, that I had had no opportunity of looking through the papers and examining the reports sent in relative to this matter, and I was therefore unprepared to give them an answer. I would lose no time in going through the papers and deciding what action should be taken, and I had little doubt the line would ultimately be constructed.

W.J.L., 25/6/86.

No. 17.

W. J. Trickett, Esq., M.P., to The Secretary for Public Works.

Sir,

Legislative Assembly, Sydney, 28 June, 1886.

I notice by the *Sydney Morning Herald* of Saturday, that a "deputation" is reported to have waited on you relative to the continuation of the tramway line from Waverley to Randwick. I am at a loss to know what public meeting or what body of persons deputed the gentlemen who waited on you to do so, as my constituents have always done Mr. Butcher and myself the honor to advise us of any public meetings; and one of the deputation (Mr. Jones) now tells me that the only request he had to attend was from Mr. J. C. Neild.

My object in now writing is to urge the construction of the line—a work I have always advocated—as the Commissioner and the records of the Department can prove, and I shall be glad to be advised how the matter is progressing, and to hear that, what was long ago promised me, is carried out.

It is convenient for gentlemen to come in at the last moment (when a matter is near completed) and try and get the credit of it, and I therefore now (while protesting against the attempt to ignore Mr. Butcher and myself), ask for the carrying out of the promise made me.

Yours, &c.,

W. J. TRICKETT.

Please acknowledge and submit report as to present position of this matter.—W.J.L., 30/6/86. Receipt acknowledged, 30/6/86. State on this paper what the last proposal is; what stage it is in; estimated cost of construction, land, &c.—CH.A.G., 3/7/86. Mr. Badham, B.C.

The last proposal as approved by Commissioner's minute of 29/5/86, was to carry the line by way of Francis-street and Cook-street. Plans will be ready in a day or two. Estimate of cost not yet prepared. Nothing yet done as regards land by this route, very little land, however, will be required.—C.A.B., 5/7/86.

See tracing. Commissioner. Are plans now ready.—CH.A.G., 13/7/86. Mr. Cowdery.

Memo. to the Tramway Engineer,—

District Engineer's Office, Sydney, 8 July, 1886.

I forward herewith plan and sections of deviations, Waverley to Randwick tram-line. Please have route decided so that specification may be prepared. Papers returned to you on 23/6/86 (86-458), with original plan and section.

Commissioner.

WALTER SHELLSHEAR (*per* H.G.M.)

No. 18.

The Council Clerk, Waverley, to The Under Secretary for Public Works.

Sir,

Borough Council Chambers, Waverley, 10 August, 1886.

I have the honor by direction of the Borough Council of Waverley, respectfully to request that you will have the goodness to inform me at earliest opportunity as to when the proposed tram-line from Waverley to Randwick will be started. The reason for the inquiry is, that portion of the route is along Albion-street within this borough, and this street is now in an impassable condition. In view of the early construction of the tram-line, this Council has not considered it right to expend any large sum of public money upon a work which might immediately be destroyed, but the public compelled to travel on the street are growing so impatient at the delay that the Council must make some improvement in the thoroughfare, and beg that with your usual courtesy you will afford the fullest information in your power.

I have, &c.,

ROBERT T. ORR.

I am not satisfied that this tram-line is absolutely necessary just now. I submit, however, the plans for the Minister's decision.—CH.A.G., 16/8/86.

No. 19.

Minute by The Engineer for Existing Lines.

It has been decided by the Commissioner that from corner of Avoca and Cowper Streets the route of the line is to pass through the reserve into Francis-street (as shown in blue pencil); thence as shown in green till junction with present line. Please have new plan and section of the whole line prepared accordingly, and submit without delay, with estimate of cost. The usual style of permanent-way (not longitudinal sleepers) is to be adopted, the part through the reserve being ballasted only.—G.C., 1/9/86.

District Engineer; urgent. Plan now in hand, and will be submitted with estimate as soon as possible.—W.S., 10/9/86. Tramway Engineer.

LEGISLATIVE ASSEMBLY, WEDNESDAY, 8 SEPTEMBER, 1886.

(4) Tramway between Randwick and Waverley:—Mr. Neild, for Mr. Trickett, asked the Secretary for Public Works,—Referring to answer given to Mr. Trickett on 18th August, what decision has been come to with regard to the tramway from Randwick to Waverley?

MR. WANT answered,—Pressure of other business has prevented the consideration of this question, but it will be decided upon an early day.

MR. THOMPSON promised to visit the locality and to lay out the line across the reserve (gravel reserve) in the way I pointed out.—CH.A.G., 14/9/86. Engineer for Existing Lines.

Mr. J. See, M.P., was to appoint a day to go over the route with me, but has not yet done so. Irrespective of this, however, I have gone over the proposed route of the line which is now being laid out, and plans, &c., prepared as directed by the Commissioner.—M.T., 16/9/86. Commissioner. There

There must be no unnecessary delay in view of the Minister's answer to question asked in House.—
 CH.A.G., 17/9/86. Mr. Cowdery. Mr. Thomson.—G.C. (*per G.L.*), 20/9/86. Please hurry on this
 work as quickly as possible. When will plans and section be ready?—M.T., 27/9/86. District Engineer.
 Plan and section will be ready in a fortnight.—E.M.H., 23/9/86. Plans and estimate, &c., will be sub-
 mitted in about two weeks.—G.C., 28/9/86. Commissioner. Submit plans on the 7th instant.—
 CH.A.G., 2/10/86. Mr. Cowdery. Plan and section herewith; estimate and detail drawings are in
 hand. It will be necessary to resume a small piece of land corner of Cook and Francis Streets, and also a
 part of the Wesleyan Church land, corner of Cook-street and Allison Road.—G.C., 6/10/86. Commissioner.
 Why take the Wesleyan Church land? A siding at the junction with existing line would enable
 an engine to change ends of tram, and to go to workshops by present route.—CH.A.G., 7/10/86. Mr.
 Cowdery. Mr. Thompson for report.—G.C., 11/10/86. A siding or two cross-over roads in present
 line will answer the purpose, only more time will be occupied in shunting the engine round and blocking
 the traffic on the main Randwick line.—M.T., 11/10/86. Tramway Engineer. This can be arranged
 without taking the Church land.—G.C., 11/10/86. Commissioner. Submit with detailed estimate not
 later than the 20/10/86.—CH.A.G., 13/10/86. Mr. Cowdery. Mr. Thompson.—G.C., 14/10/86.

Plan, section, and detailed estimate herewith, also tracings of land to be resumed. The estimated
 cost of the line is £8,475, exclusive of the cost of land. Referring to my minute, 11/10/86, will the
 Commissioner please say whether the line is to be worked by means of a triangle as shown on plan
 (necessitating the resumption of land from the Wesleyan Church), or whether it is to be worked by means
 of over roads and shunting on the main Randwick line.—G.C., 16/10/86. Commissioner.

Mr. Thomson to see me.—CH.A.G., 21/10/86. Submit plan with cross-over road.—CH.A.G.,
 23/10/86. Please see me with reference to having alteration plotted on plan, and submitting amended
 estimate.—M.T., 25/10/86. Mr. Fisher. Amended estimate and plans herewith.—G.F., 28/10/86.
 The Deputy Engineer. Amended plan, section, and estimate herewith, also four tracings of land to be
 resumed. The cost of the line, as per amended estimate, will be about £7,535, exclusive of cost of land.—
 M.T., 29/10/86. Engineer for Existing Lines. I have received instructions to carry out this work, will
 Commissioner please arrange for land valuer to resume the land. Tracings herewith.—G.C., 29/10/86.
 Commissioner.

Submit plan and book of reference. It will be seen by the Tramway Act that we can go through
 reserves free of cost. I believe the land we go through, said to belong to Randwick Council, is a reserve.
 Is it not?—CH.A.G., 29/10/86.

I said in my minute of 16/8/86 that I was not satisfied that this tramway was absolutely necessary.
 I still hold the opinion that it will not pay as a traffic line, but it may save us some expense in returning
 motors, &c., by a shorter route to the stables. However, the expenditure on this account alone would be
 hardly justifiable.—CH.A.G., 29/10/86. Engineer for Existing Lines.

Mr. Thomson for plan and book of reference.—G.C., 1/11/86. Please submit amended plan, section,
 and book of reference at once. In the meantime nothing is to be done with regard to our arrangements for
 having this work done by the unemployed.—M.T., 1/11/86. District Engineer, Sydney. Please have survey
 and section made for deviation through the reserve, as shown in pencil on plan, and submitted with book of
 reference at once.—M.T., 4/11/86. District Engineer, Sydney. Plan and book of reference are being
 prepared as expeditiously as possible.—E.M.H., 13/11/86. District Engineer. Book of reference and
 amended plan (deviation through reserve) are now being prepared, and will be submitted without delay.—
 M.T., 13/11/86. Commissioner.

Memo. to the Deputy Engineer.

District Engineer's Office, Sydney, 9 October, 1886.

I FORWARD herewith duplicate tracings, showing land to be resumed in connection with tramway—Waverley
 to Randwick.

WALTER SHELLSHEAR.

Please say if there are any special reasons why we should resume the whole property of the
 Wesleyan Church. If there are not, it will be sufficient to resume to within 33 feet of the tramway, as
 marked by me in pencil on tracing.—M.T., 8/10/86. District Engineer, Sydney.

Mr. Halligan.—W.S., 12/10/86. New tracings herewith. It is necessary, on account of depth
 of cutting through this property, to resume 40 feet.—E.M.H., 15/10/86. District Engineer. The
 Deputy Engineer.—W.S., 15/10/86. Please see my minute, 16/10/86, attached.—G.C., 16/10/86.
 Commissioner.

W.S., 12/11/86. M.T., 16/10/86.

No. 20.

Minute by The Commissioner for Railways.

Tramway—Randwick to Waverley.

THE Minister wishes this line prepared, so that it may be commenced at once by the unemployed by task-work. It should be cut up into sections, so that parties of eight or twelve can do it by task.

CH.A.G., 28/10/86.

Will Mr. Cowdery please give this his earliest and best attention. The Minister is anxious to have the matter arranged with the utmost expedition.—D.C.M'L., 28/10/86. Mr. Thomson to make the necessary arrangements.—G.C., 29/10/86. I wish to see Mr. Waring to-morrow morning, at your office, with reference to this matter.—M.T., 29/10/86. District Engineer. Mr. Waring.—W.S., 30/10/86. Seen Mr. Thomson, and arranged to go over this line, 1/11/86. I have just returned from there, having been over the work.—J. WARING, 1/11/86. District Engineer.

No. 21.

Minute by The Commissioner to The Engineer for Existing Lines.

PLEASE make arrangements for accompanying me to Randwick to-morrow, at 2 p.m., to see route of tram-line, to meet the Minister for Education, Mr. Sec, and others.

B.C., 2/11/86.

CH.A.G.

Mr. Cowdery,—

Plan to be taken—proposal to make use of Cowper-street and Cross-street, instead of going across reserve, which has been resumed for educational purposes.—CH.A.G. I met the Commissioner on the ground yesterday, and arranged to deviate the route of the line through the reserve in order to keep clear of the land required for educational purposes. Amended plan, &c., is now being prepared.—G.C., 4/11/86. Commissioner.

Is the work going on?—W.J.L., 12/11/86. Engineer for Existing Lines.—D.C.M'L., 12/11/86. No; the amended plan and section referred to in my 4/11/86 are now being prepared.—M.T. (*pro* Engineer), 12/11/86. Commissioner. I expected the pick and shovel work to be in full swing long before this; this can, surely, be carried on along the section of the line not affected by the alteration.—W.J.L., 12/11/86. Engineer for Existing Lines.—A.R., B.C., 12/11/86. Previous papers are with you, please return at once.—M.T. (*pro* Engineer), 12/11/86. District Engineer, Sydney. Previous papers herewith.—W.S., 13/11/86. Engineer for Existing Lines. Previous papers returned herewith. Please see Commissioner's minute, 29/10/86, on Commissioner's 86-4,379. The earthworks can be carried out along the parts not affected by the deviation.—M.T., 13/11/86. Commissioner. Will the Minister say if the work is to be proceeded with.—CH.A.G., 15/11/86. Yes.—W.J.L., 16/11/86. Mr. Cowdery.—D.C.M'L., 18/11/86. Mr. Thomson to have the work proceeded with without delay.—G.C., 18/11/86. Please complete the arrangement previously made for carrying out this work by piece-work (the unemployed), and let the work be commenced at once.—M.T., 18/11/86. District Engineer, Sydney. Mr. Waring to note.—W.S., 19/11/86. Noted.—J.W., 20/11/86. District Engineer.

Noted. There are a large number of pick and shovel men who have been working at the Petersham Viaduct and the Darling Harbour sidings who have received notice on account of slackness of work. I presume these men will get the preference in connection with the work.—W.S., 20/11/86. The Deputy Engineer.

Our old hands should be given the preference, but on the same conditions as the work would be let to the unemployed. When will work be commenced?—M.T., 22/11/86. District Engineer, Sydney. Mr. Waring to note.—W.S., 23/11/86. Noted. This work will be started not later than Monday morning, the 29 November inst.—J.W., 23/11/86. District Engineer. Deputy Engineer.—W.S., 24/11/86. The work will be commenced on Monday next; tools, &c., having to be prepared, a start could not be made before.—M.T., 25/11/86. I attach duplicate tracings of land to be resumed from T. O'Sullivan in connection with this work.—M.T., 25/11/86. Tramway Engineer. The work will be commenced on Monday next, duplicate tracings attached showing land to be resumed.—G.C., 26/11/86. Commissioner. Will Minister approve of notice being served taking the land required. He will see that the Engineer proposes to start the work on Monday.—CH.A.G., 27/11/86. Approved.—W.J.L., 29/11/86. Mr. Cowdery.—D.C.M'L., 29/11/86. Seen. I presume tracings will be forwarded on to land valuer.—M.T. (*pro* Engineer for Existing Lines), 30/11/86. Secretary. Land valuer.—D.C.M'L., 1/12/86. Tracings received.—J.B.T., 1/4/87. Secretary. No plan or book of reference has been supplied to the land valuer by the Engineer for Existing Lines.—J.B.T., 16/5/87. Secretary. Engineer for Existing Lines.—A.R., B.C., 18/5/87. Mr. Shellshear,—Was any land resumed for this tramway?—G.C., 19/5/87. The only land resumed for this tramway is a corner of Mr. T. O'Sullivan's land, at the junction of Francis-street and Cook-street. Duplicate tracing sent to the Engineer on 7/10/86.—WALTER SHELLSHEAR, 21/5/87.

Memo. to The Tramway Engineer.

Waverley to Randwick Tramway.

Office of District Engineer, Sydney, 27 May, 1887.

I BEG to forward herewith book of reference for the above tramway. This was asked for by the land valuer a few days ago.

WALTER SHELLSHEAR.

Duplicate tracings have already been supplied. Book of reference herewith.—G.C., 27/5/87. Secretary. Land valuer.—A.R., B.C., 30/5/87. Received.—J.B.T., 31/5/87. Secretary.

No. 22.

Minute by The Chief Clerk.

REFERRING to Resolution of the Legislative Assembly, dated 5th April, "That there be laid upon the table of the House, a Return showing the total cost of making the tramway from Waverley to Randwick," I shall be glad if you will furnish the same as early as possible to complete full return.

Accountant.

D.C.M'L., 5/7/87.

The amount paid for this work up to date, is £7,900.—F.J.W., 7/7/87. Secretary.

No. 23.

Minute by The Chief Clerk.

REFERRING to Resolution of the Legislative Assembly, dated 5th April last, "That there be laid upon the table of the House, a Return of persons from whom land was resumed for the Waverley to Randwick Tramway, with amounts paid or to be paid to each," I shall be glad if you will furnish the same as early as possible to complete full Return.

D.C.M'L., 5/7/87.

Land valuer.

Return herewith.—J.B.T., 6/7/87. Secretary.

No. 1.

Mr. W. H. Head to The Secretary for Public Works.

Deputation—Abolition of Tolls, Botany Road

Hon Sir,

Beaconsfield-terrace, Botany Road, 14 September, 1885

I am instructed to inform you that a meeting of the Alexandria Council and the Botany Road Toll Abolition League took place at the Alexandria Town Hall, on the 11th instant, when the following resolution was duly passed—'That a deputation consisting of the aforesaid Council and League wait upon the Hon the Minister for Works to ascertain his views in removing the toll from the Botany Road'

I am instructed to most respectfully ask could you make it convenient to receive the aforesaid deputation And we will, as in duty bound, ever pray

Yours, &c,

W H HEAD,

Secretary to the League

Mr Rae will please fix a date—F A W, 15/9/85 Friday, 18th, at 12. Inform—J R, 15/9/85.
Mr W H Head informed, 15/9/85 Roads—J R, B C, 15/9/85. Previous papers—W C B, 16/9/85.

No. 2.

The Under Secretary for Public Works to Mr. W. H. Head.

Sir,

Department of Public Works, Sydney, 15 September, 1885.

In reply to your letter of the 14th instant, I am directed to inform you that the Secretary for Public Works will receive the deputation, not to exceed six in number, from the Alexandria Council and the Botany Toll Abolition League, on the subject of the removal of the toll-bar from the Botany Road, on Friday, the 18th inst, at 12 o'clock

I have, &c,

JOHN RAE

No. 3.

Minute Paper.

Roads Department, Sydney, 17 September, 1885.

Deputation

UPON inquiry at the Department of Public Works, I am informed that the only deputation fixed for to-morrow on any business connected with this Department is the following—

W H. Head, 12 o'clock—Abolition of tolls, Botany Road

No. 4.

Minute by Commissioner for Roads.

Abolition of Tolls, Botany Road

17 September, 1885

THE Trust Acts under the 4th VICTORIA No 72—the Parish Roads Act If all the road were within municipal limits, I would advise the resignation of the Trust, if the municipalities undertook to keep the road good; but this is not the case, 5 miles of the road not being within any municipality I cannot recommend the course taken with respect to the Cook's River Road—that is, to proclaim it as one of the main roads of the

the Colony, and that the Department take it over. Legal complications might arise out of that course; and I am of opinion that the best course will be to allow matters to remain as they are, for the short time that may elapse pending the passing of Local Government Act, which will, no doubt, provide for such cases, and the abolition of tolls where objected to.
Act herewith. W.C.B., 17/9/85.

No. 5.

Minute by The Secretary for Public Works.

Sydney, 18 September, 1885.

Deputation—Abolition of Tolls, Botany Road, 12 o'clock.

THE deputation introduced by Mr. J. Sutherland, M.P., waited upon me to-day, and represented the injury occasioned by the retention of the toll-bar in Botany Road, while tolls in almost every other instance had been abolished. The principal sufferers were a number of persons, van-men, and others, who had made their residences just outside the toll-bar, and, consequently, had to pay each time they passed through. I informed them that I recognised the disability under which they laboured, and was ready to admit that their case was somewhat of a hard one; at the same time a remedy could be afforded if the trustees resigned their positions, and the municipalities took over the road so far as it lay within their boundaries. The Alexandria Council, through the Mayor who was present, was against this, pointing out that the road within their boundary passed through, for some distance, vacant land; but I asked him to endeavour to arrange with the Waterloo Council to take over the maintenance of the road so far as the population extended, and I would then endeavour to arrange with the Road Trusts, as to the abolition or removal of the toll outside the municipal boundary. The Mayor promised to communicate with me in the matter after calling a meeting of those interested.

F.A.W., 19/8/85.

Roads.—J.R., B.C., 22/9/85. Resubmit with reply.—W.C.B., 23/9/85.

No. 6.

The Council Clerk, Alexandria, to The Secretary for Public Works.

Sir,

Town Hall, Alexandria, 29 September, 1885.

Adverting to a deputation that waited upon you some little time ago relative to the abolition of the toll-bar on the Botany Road, I have the honor by direction of the Mayor to inform you that a conference was held at the Town Hall here on the 25th instant, between the Alexandria and Waterloo Councils, for the purpose of considering the advisability of accepting the control of that portion of the Botany Road, extending from Boundary-street to the toll-bar in question. After considerable discussion, in which it was pointed out that the Councils were not in a position, financially, to bear the increased expenditure, a resolution was moved, and carried to that effect.

I have, &c.,
NELSON VAUGHN,
Council Clerk.

Acknowledge, 3/10/85. The paper herewith show action taken, and opinion of the late Minister (Mr. WRIGHT).—W.C.B., 28/10/85. Under Secretary.—B.C. Inform Council Clerk.—J.R., 2/11/85.

No. 7.

Mr. W. H. Head to The Secretary for Public Works.

Hon. Sir,

Beaconsfield-terrace, Botany Road, 13 October, 1885.

I am instructed to inform you that a meeting of the Botany Road Toll Abolition League, took place at the "Empress of India Hotel," Botany Road, on the 12th instant, when the following resolution was duly passed:—That a deputation consisting of the aforesaid League wait upon the Honorable the Minister for Works to ascertain his view in removing the toll from the Botany Road.

I am instructed to most respectfully ask, could you make it convenient to receive the aforesaid deputation.

And we will, as in duty bound, ever pray, &c., &c.

W. H. HEAD,
Secretary to the League.

Inform deputation, advisable to wait till my successor is appointed.—H.S.B., 21/10/85. W. H. Head, informed, 21/10/85. Roads.—J.R., B.C., 22/10/85/. Previous paper.—W.C.B., 26/10/85, 859,218, herewith, 27/10/85. The Councils of Waterloo and Alexandria were asked to take over the road from Boundary-street to the toll-bar, but they have declined to do so. The Government have no power without an Act. The Local Government Bill will abolish the bar. Inform that a deputation under the circumstances, is unnecessary, 3/11/85. Put all the papers together. This toll-bar has been abolished.—W.J.L., 15/12/85.

No. 8.

The Under Secretary for Public Works to Mr. W. H. Head.

Sir,

Department of Public Works, Sydney, 21 October, 1885.

In reply to your letter of the 13th instant, requesting an appointment to wait upon the Secretary for Public Works in regard to the abolition of the toll-bar on the Botany Road, I am directed to inform you that the matter must stand over until a successor to the present Secretary for Public Works has been appointed.

I have, &c.,
JOHN RAE.

No. 9.

No. 9.

Mr. T. Leeder to The Principal Under Secretary.

Sir,

438 George-street, Sydney, 8 November, 1885.

I have the honor by direction of the trustees of the Botany Road toll-bar to enclose herewith a scale of tolls, which the trustees propose to be levied and taken at the toll-bar on the Botany Road, in lieu of those now levied and taken, as shown by scale also enclosed, under the Parish Roads Act, 4 Vic. No. 12.

It will be noted that the revised scale of tolls is considerably lower than the existing scale.

And I am respectfully to request that you will be pleased to have the necessary proclamation published in the Government Gazette, as required by the 21st section of the Act above referred to, and to take effect from the 1st January next; and as the trustees desire to let the tolls early in December, for the ensuing year, I am to ask you to be kind enough to expedite issue of the proclamation.

I have, &c.,

THOS. LEEDER,

Secretary to Trustees.

The Under Secretary for Public Works — C.W., B.C., 16/11/85 Roads.—J.R., B.C., 16/11/85.
Mr. Hiles,—See me with the Act.—W.C.B., 16/11/85. Act submitted, 16/11/85. Letter to Secretary,
Botany Road Trust. I recommend that the reduced rates be proclaimed.—W.C.B., 16/11/85. Under
Secretary.—B.C. Submitted.—J.R., 18/11/85, approved. Mr. Hiles,—Has proclamation gone on?
W.C.B., 2/12/85.

This proclamation is at present with the Executive Council.

Botany Road Toll-bar.

Existing Scale of Tolls.

For every sheep, lamb, or goat	d.
For every ox or head of neat cattle	0½
For every horse, mare, or gelding, ass or mule	2
For every cart, dray, or vehicle with two wheels, drawn by one horse or other animal	3
For every additional horse or other animal	6
For every wain, waggon, or other carriage with four wheels, drawn by one horse or other animal	3
For every additional horse	8
	3

Proposed Scale of Tolls.

For every sheep, lamb, or goat	d.
For every ox or head of neat cattle	0½
For every horse, mare, or gelding, ass or mule	1
For every cart, dray, or other vehicle with two wheels, drawn by one horse or other animal	2
For every additional horse or other animal	3
For every wain, waggon, or other carriage with four wheels, drawn by one horse or other animal	2
For every additional horse	6
	2

No. 10.

The Commissioner for Roads to Mr. T. Leeder.

Department of Public Works, Office of Commissioner for Roads.

Sir,

Sydney, 16 November, 1885.

Referring to your letter of the 5th instant, addressed to the Principal Under Secretary, respecting the reproclaiming of the Botany Road Toll-bar, I have to request that you will have the goodness to furnish to this office a copy of the last proclamation, or the date of the Gazette in which it was published, in order that the necessary action may be taken.

I have, &c.,

WILLIAM C. BENNETT,

Commissioner and Engineer for Roads.

No. 11.

T. M. Williamson, Esq., M.P., to The Under Secretary for Public Works.

Sir,

Temple Court, King-street, Sydney, 19 November, 1885.

A short time back a deputation waited upon Mr. Wright, the then Minister for Works, in reference to the removal of the toll-bar on the Botany Road (a parish road), and within the boundaries of the boroughs of Waterloo and Alexandria. Mr. Wright on the occasion referred to promised that action would be taken in the matter, but up to the present nothing has been done. I may state, for your information, that the Government tramways occupy the greater portion of this road, and that the residents south of the toll-bar are, in addition to paying toll dues, compelled to pay rates to the boroughs before-mentioned. This must appear to you a great injustice to these people. The trustees of the road contemplate putting up the toll-bar for auction sale within a week or so, and if allowed so to act will cause a further delay of twelve months in settling this question. In order to save expense, I would suggest the trustees being served with a notice not to let the toll for more than one month. Hoping you will cause that portion of the road before-mentioned to be proclaimed a main road.

Yours, &c.,

THOS. M. WILLIAMSON.

Acknowledged, 20/11/85. Roads — J.R., B.C., 20/11/85. Previous papers (urgent) — W.C.B.,
23/11/85. Werk—state all papers are now before the Minister, 23/11/85. I have to apply for the
papers. Most likely the minute on same will apply, but it is of importance the Trust should be asked
not to lease bar for 1886. They are about to do so at once.—W.C.B., 23/11/85. Under Secretary.—
P.W.O., B.C., 25/11/85.

No. 12.

Mr. T. Leeder to The Commissioner for Roads.

Sir,

438, George-street, Sydney, 25 November, 1885.

In reply to your letter dated 16th instant, requesting to be furnished with the date of Gazette of last proclamation, relative to collection of tolls at the Botany Road toll-bar (formerly called Mudbank and Cook's River Road), I have the honor to inform you that the proclamation containing the scale of such tolls was published in the Gazette, No. 124, dated 18th November, 1853, and that a further proclamation (which is the last one) was published in Gazette, No. 37, dated 3rd March, 1863. May I ask you to kindly expedite issuing of the fresh proclamation for the reasons stated in my letter of 5th instant, addressed to Principal Under Secretary.

I have, &c.,

THOS. LEEDER,

Secretary.

Mr. Hiles.—W.C.B., 26/11/85. Papers asking for Minister's approval of reproclamation are now before the Minister, 26/11/85. It is important this should not be delayed, or the public will have the additional toll to pay all the year.—W.C.B., 26/11/85. Under Secretary.—B.C. Submitted.—J.R., 27/11/85. There is a minute for Executive Council approving of this. Send letters on, informing Council and Mr. Beaumont, 1/12/85. Put with papers. Roads for proclamation.—J.R., B.C., 1/12/85.

No. 13.

Question in Legislative Assembly.

THURSDAY, 26 NOVEMBER.

2. DR. RENWICK to ask the Secretary for Lands,—

- (1.) Has there been an election of trustees for the year 1885 for the parish road leading from Sydney to Botany, known as the Mudbank and Cook's River Road?
- (2.) By what authority are tolls collected on this road?

Answers given in the House by MR. ABBOTT,—

- (1.) Trustees were elected in the beginning of 1885, for three years.
- (2.) By authority of trustees, under Parish Roads Amendment Act, 4 Vic. No. 12.

No. 14.

Minute by Commissioner for Roads.

Question in House for Tuesday, 1st December.

19. MR. WILLIAMSON to ask the Secretary for Public Works,—Will he cause notice to be at once served on the trustees of Mudbank and Cook's River Road (called Botany Road) toll-bar, requesting that, pending the abolition of such toll-bar, the lease of same be not disposed of for a longer period than one month.

Minute by Commissioner for Roads.

This matter should be arranged. The papers are with the Under Secretary, recommending proclamation to reduce tolls, as proposed by trustees. It will take some weeks for the formalities. Mr. Beaumont, the Chairman of the Trust, was here the other day and stated they should be obliged to lease the bar at the old high rates if the proclamation was not issued without delay. I think the Trust should be written to, as suggested in the above question, and informed that they might assume that the reduction in rates would be made before 1 January, and that they might let bar at the reduced rates, as proposed by them. Immediate action should be taken as there will be loud complaints if rates are not reduced when it is known that trustees advised reduction.—W.C.B., 28/11/85. Under Secretary.—B.C. Urgent.

Approved. Let proclamation be submitted at to-morrow's Executive, and advise Mr. Williamson, and the writer of letter of 28 November.—G.R.D., 30/11/85. T. M. Williamson, Esq., M.P., Mr. Beaumont, informed, 30/11/85. Prepare proclamation.—J.R., 30/11/85. Done, 1/12/85.

No. 15.

The Under Secretary for Public Works to T. M. Williamson, Esq., M.P.

Sir,

Department of Public Works, Sydney, 30 November, 1885.

Referring to your representations on the subject of the lease of the toll-bar, on the Botany Road, I am directed to inform you that the proclamation reducing the rates to be charged at the toll-bar in question will be issued without delay.

I have, &c.,

JOHN RAE.

No. 16.

The Under Secretary for Public Works to Mr. Beaumont.

Sir,

Department of Public Works, Sydney, 30 November, 1885.

Referring to your personal representations on the subject of the toll-bar on the Botany Road, I am directed to inform you that the proclamation reducing the rates to be charged at the toll-bar in question will be issued without delay, and the bar might be let at the reduced rates, as proposed by the trustees.

I have, &c.,

JOHN RAE.

No. 17.

No. 17.

Question in Legislative Assembly.

TUESDAY, 1 DECEMBER, 1885.

19. MR. WILLIAMSON to ask the Secretary for Public Works,—Will he cause notice to be at once served on the trustees of the Mudbank and Cook's River Road (called Botany Road) Toll-bar, requesting that pending the abolition of said toll-bar, the lease of same be not disposed of for a longer period than one month.

MR. LYNE answered,—A proclamation is being prepared, reducing the tolls, and a letter has been written to the trustees requesting them to lease the tolls from month to month at reduced rates.

No. 18.

Minute for the Executive Council.

Department of Public Works, Sydney, 1 December, 1885.

Reduction of Rates, Botany Road Toll-bar.

I HAVE the honor to submit, for the approval of His Excellency the Governor and the Executive Council, a draft proclamation amending the rates to be charged at the toll-bar on the Botany Road, in accordance with law.

WILLIAM JOHN LYNE.

The Executive Council advise that the reduced rates proposed for the Botany Road Toll-bar be approved as herein recommended.—ALEX. C. BUDGE, Clerk of the Council. Min. 85-48, 1/2/85. Confirmed, 8/12/85. Approved.—A.L., 1/12/85.

No. 19.

As to sale of lease of Toll-bar.

MONDAY, 14 DECEMBER.

Lease of Botany Toll-bar for the year 1886.

ANDREW Allan has received instructions from the trustees to sell by auction, at the toll-bar, near Waterloo Mills, on Monday, the 14th December, at half-past 3 o'clock,—

The lease of the dues and tolls of the above for 1886, from 1st January to 31st December.

Terms at sale.

N.B.—Botany Road Toll-bar—Scale of fees:—

	Present scale.	New scale.
For every sheep, lamb, or goat	0½d.	0¼d.
For every ox or head of cattle	2d.	1d.
For every horse, mare, or gelding, ass or mule	3d.	2d.
For every cart, dray, or other vehicle with two wheels drawn by one horse or other animal	6d.	3d.
For every additional horse or other animal	3d.	2d.
For every van, waggon, or other carriage with four wheels, drawn by one horse or other animal	8d.	6d.
For every additional horse	3d.	2d.

Office, 143 King-street.

Department of Public Works, Sydney, 4 December, 1885.

ACCORDING to the above advertisement, the lease of the tolls *re* Botany Toll-bar, for twelve months, is to be sold on the 14th instant. I shall be glad to hear if this is correct; and, if so, why the arrangements made, or to be made, are not for a monthly lease.

W.J.L.

Mr. Beaumont explained to me that the lease, though for twelve months, would contain a proviso that it can be put an end to at any time by giving one month's notice.—J.R., 4/12/85.

No. 20.

Memo. by The Secretary for Public Works.

Removal of Toll-bar to Ricketty-street.

MR. Williamson desires that the Botany Road Toll be moved to Ricketty-street, which is just outside the municipalities of Waterloo and Alexandria. W.J.L., 2/12/85.

Report. Roads for report.—B.C., 3/12/85. This can only be done by proclamation, taking days, and there is now a proclamation reducing the toll in train. I do not think this second proclamation could be got ready in time. In addition, there will most likely, as in all such cases, be found ways of evading bar at new site, and there will be the cost of shifting or building toll-house. I think it is better to wait and try to arrange for abolition.—W.C.B., 4/12/85. Under Secretary.—B.C.

No. 21.

Minute by The Commissioner for Roads.

Proclamation of Main Roads.

11 December, 1885.

I BEG to submit herewith, for the approval of the Minister, an amended proclamation of main roads, and have to request that the usual steps be taken for the proclamation and publishing of the same.

W.C.B., 11/12/85.

Under Secretary, Public Works. Put with papers *en route* to Executive Council.

No. 22.

No. 22.

T. M. Williamson, Esq., M.P., to The Secretary for Public Works.

Sir,

Temple Court, King-street, Sydney, 7 December, 1885.

Having promised, on last Friday night, to abolish the Cook's River and Mudbank (now called the Botany) Road Toll-bar, if you had power so to do, I deem it my duty to bring under your notice the proceedings of a similar case. The Cook's River Road (a Trust road) was declared a main road by His Excellency Sir Hercules Robinson, on 2nd November, 1875. All the papers relating to such proclamation are now with Colonel Wells, of the Roads and Bridges Department, and who will undoubtedly furnish you with all information in relation thereto. Upon a perusal of the papers in question, I am satisfied that you will be convinced that you have full authority to give effect to your said promise.

Would you therefore exceedingly oblige by directing the immediate issue of the proclamation necessary for the purpose before referred to, as the trustees contemplate disposing, by public auction, the right to collect tolls, &c., on next Monday.

Yours &c.,

T. M. WILLIAMSON,
(per M.A.)

No. 23.

Memo. by The Secretary for Public Works to T. M. Williamson, Esq., M.P.

Department of Public Works, 8 December, 1885.

I SPOKE to Mr. Bennett yesterday, *re* the Botany Road Toll-bar, and shall be glad if he will take the necessary action to do away with the same. W.J.L.

Mr. Bennett.—J.R., B.C., 8/12/85. Colonel Wells.—As I have pointed out this is not a desirable precedent to follow on the eve of the introduction of local Government Act, in addition, the cases are not parallel.—W.C.B., 8/12/85. Minute herewith.—F.W., 8/12/85.

No. 24.

Minute by Assistant Engineer Wells.

Sydney, 8 December, 1885.

I NOTE the Commissioner's minute, and in the main concur therewith, particularly as in the case of two municipalities adjoining a toll-bar established by them, still exists. I would, however, point out that there is so far a parallelism between the Cook's River and Botany Road Trusts, in that the total moneys received at a very remunerative toll-bar, are expended solely on a very few miles of road to a great extent, within municipal limits I believe, and that the extension and feeding roads do not derive any contribution therefrom. The case merely shows what I have frequently adduced, is correct, *viz.*, that the time has come, Botany should establish a municipality. The papers relating to the proclamation of the Cook's River Road and tributaries, as main roads of the Colony, are forwarded herewith. Does the Commissioner wish to have the necessary steps for proclamation taken?

F. WELLS.

On the distinct understanding that the respective municipalities take charge of road within their limits, and with a view to the proclamation of a municipality at Botany, by which arrangement the maintenance of this road will be divided between the Tramway Department and the municipalities without any subsidy, I recommend that the road be proclaimed a main road, and the toll to be abolished from 1st of January; the proclamation reducing tolls to be stopped, a new proclamation of main roads made, and the portions within existing municipal limits to be proclaimed out of the Main Roads Schedule, under clause 17 in that Act, and in the municipal control as in clause or section 118 of Municipalities Act.—W.C.B., 9/12/85. Under Secretary.—B.C.

Let the necessary steps be taken at once to abolish this toll, the proclamation referred to, to be stopped.—W.J.L., 9/12/85. Roads.—J.R., B.C., 9/12/85. Mr. Flynn, urgent.—W.C.B., 9/12/85. The Trust should be informed at once as they are about to sell on Monday.—W.C.B., 10/12/85.

No. 25.

Memo. by Chief Clerk, Roads Department.

Toll, Botany Road.

THE Works have taken steps to stop proclamation. The trustees should be written to at once as the sale of tolls takes place on Monday, informing them that it is intended to proclaim the road a main road of the Colony; and to take steps for withdrawal from sale of tolls on the road. Should not this letter be written by Works. P.F., 10/12/85.

Commissioner, Yes. Done, 10/12/85.

No. 26.

Minute for The Executive Council.

Department of Public Works, Sydney, 11 December, 1885.

Proclamation of Botany Road and Parramatta and Windsor Road as Main Roads.

I HAVE the honor to submit for the approval of His Excellency the Governor and the Executive Council, a draft proclamation amending the schedule of the main roads of the Colony, so as to include the road, Sydney to Banks' Meadow (Botany Road), and the road Parramatta to Windsor, in terms of the Main Roads Management Act. WILLIAM JOHN LYNE.

The Executive Council advise that the roads referred to be proclaimed as main roads in terms of the Act specified.—ALEX. C. BUDGE, Clerk of the Council. Minute 85/52, 15/12/85. Confirmed, 18/12/85. Approved.—CARRINGTON, 15/12/85. For His Excellency's signature and the seal of the Colony.

Colony. The Principal Under Secretary.—J.R., B.C., 23/12/85. Sealed and submitted for His Excellency's signature. The Private Secretary.—C.W., B.C., 29/12/85. The Under Secretary for Public Works.—C.W., B.C., 31/12/85. P.W.O., 4/1/86. Roads.—J.R., B.C., 5/1/86. Mr. Airey got all the papers.—W.C.B., 6/1/86.

No. 27.

Proclamation amending Schedule of Main Roads.

NEW SOUTH WALES, } Proclamation by His Excellency the Right Honorable CHARLES ROBERT, BARON
to wit. } CARRINGTON, Knight Grand Cross of the Most Distinguished Order of Saint
(L.S.) } Michael and Saint George, Governor and Commander-in-Chief of the Colony of
CARRINGTON, } New South Wales and its Dependencies.
Governor.

WHEREAS by the Main Roads Management Act Amendment Act of 1871, it is enacted that the schedule of the Act 21 Victoria No. 8, and so much of the said Act as limits the provisions and operations thereof to the three main roads described in the said Schedule, shall be repealed from and after the publication of the first proclamation under the said Main Roads Management Act of 1871; and whereas it is further enacted by the said last-mentioned Act, that it shall be lawful for the Governor, with the advice of the Executive Council, to proclaim from time to time, as occasion shall require, a schedule of Roads, which, on the publication thereof in the Government Gazette, shall be the schedule of main roads within the meaning, and under the operation of the Main Roads Management Act. Now, I, the Right Honorable CHARLES ROBERT, BARON CARRINGTON, the Governor aforesaid, with the advice of the Executive Council, in pursuance of the power and authority vested in me by the Main Roads Management Act Amendment Act of 1871, do, by this my proclamation under the said Act, hereby declare that the following is the schedule of roads, which, on the publication of this proclamation in the Government Gazette, shall be the schedule of main roads within the meaning, and under the operation of the Main Roads Management Act, that is to say:—

Schedule of Roads.

Great Western Road—Sydney to Warren.
Great Southern Road—Ashfield Cross Roads to Albury.
Great Northern Road—Morpeth to Maryland.
Road—Goulburn to Cooma.
" Tarago to Braidwood.
" Bombala *via* Tantawangalo to Merimbula.
" Bathurst to Cowra.
" Orange, by Boree to Forbes.
" Wallerawang to Mudgee.
" Glen Innes to Grafton.
" Milson's Point, *via* Lane Cove Road to Peat's Ferry Road.

" Balmain, over Iron Cove Bridge, and Parramatta Bridge to Ryde.
" Sydney to Banks' Meadow (Botany Road.)
" Parramatta to Windsor.

Given under my hand and Seal, at Government House, Sydney, this thirtieth day of December, in the year of Our Lord one thousand eight hundred and eighty-five, and in the forty-ninth year of Her Majesty's Reign.

By His Excellency's Command,
WILLIAM JOHN LYNE.

GOD SAVE THE QUEEN!

No. 28.

Minute for The Executive Council.

Department of Public Works, 11 December, 1885.

Abolition of Toll-bars, Botany Road—Parramatta to Windsor.

IN accordance with the 14th section of the Main Roads Management Act, 21 Victoria No. 8, I have the honor to request the authority of His Excellency the Governor and the Executive Council to the abolition of tolls levied and taken at the following toll-bars, *viz.*:—The Botany Road (Sydney to Banks' Meadow), and the road from Parramatta to Windsor, to take effect from the 1st proximo, such roads having been included in the amended schedule of the proclaimed main roads of the Colony.

WILLIAM JOHN LYNE.

The Executive Council advise that the toll-bars on the roads referred to, be abolished.—ALEX. C. BUDGE, Clerk of the Council. Min. 85/52, 15/12/85. Confirmed, 18/12/85. Approved.—CARRINGTON, 15/12/85. Botany Road Proclamation published as a main road. Notice sent to papers that tolls will not be collected after to-morrow. Roads.—J.R., B.C., 29/12/85.

No. 29.

Minute by The Under Secretary for Public Works.

Department of Public Works, Sydney, 21 December, 1885.

ALTHOUGH the proclamation as a main road has had the effect practically of abolishing the toll-bar hitherto leased by the trustees, I submit that it is desirable to publish a notice that tolls will not be levied and taken on the road after 31st instant.

J.R.

Submitted,

Submitted, 21/12/85. The notice referred to would be advisable; but as a matter of courtesy it would be well to write to the Trust, and add something complimentary as to the way that Trust has performed its duties for over thirty years.—W.C.B., 21/12/85. The Secretary, Botany Road Trust informed, 21/12/85. Get the proclamation through, and send the within notices out, the day of publication, 22/12/85. If published send out notices, 29/12/85. Notices sent to daily papers, 30/12/85. These notices have been sent to-day. The proclamation will appear to-morrow, so that both will appear on same day.—J.R. Roads.—B.C., 30/12/85.

The road from Sydney to Banks' Meadow, Botany Road, having been proclaimed a main road under the Act 21 Vic. No. 8, the papers are now transferred to the Department for future action. The Botany Road Trust have been informed by the Works Department. Copy of proclamation herewith.—C.B.A., 5/1/86. Mr. Flynn.—B.C.

Notice in daily papers, 31/12/85.

It has been notified for public information by the Department of Public Works, that after 31st instant, tolls will not be levied or collected at the Botany Toll-bar, Meadow Bank Road.

No. 30.

The Under Secretary for Public Works to Mr. T. Leeder.

Sir,

Department of Public Works, Sydney, 21 December, 1885.

In reference to the change in the administration of the Botany Road, which has now become a main road of the Colony, I am directed to inform you that tolls will not be levied or taken at the bar on the road after the 31st instant. I am to request that you will be good enough to convey to the members of the Trust, the appreciation of the Government of the manner in which that body has performed the functions during the past thirty years.

I have, &c.,

JOHN RAE.

No. 31.

J. Sutherland, Esq., M.P., to The Secretary for Public Works.

Sir,

Sydney, 11 January, 1886.

In reference to the proclamation recently published abolishing the collection of tolls on the road, Meadow Bank, I have the honor to request that you will inform me what steps you propose to take in reference to making good the loss that will be sustained for the maintenance of the roads recently provided for by the tolls in question.

I have, &c.,

JOHN SUTHERLAND.

Acknowledged, 12/1/86. Roads, for immediate report.—J.G., 11/1/86. J.R., B.C., 12/1/86. Previous papers.—W.C.B., 14/1/86. 86/31, herewith, 15/1/86.

Mr. Sutherland might be informed that road was proclaimed a main road on condition that the respective municipalities took charge of the lengths within their limits, and that a municipality was to be formed at Botany to take charge of that part. A proclamation, transferring to municipalities, as provided for in Act, will be issued in a few days.—W.C.B., 16/1/86. Under Secretary.—B.C.

Submitted.—J.R., 19/1/86. Inform.—J.G., 19/1/86. John Sutherland, Esq., M.P., informed, 21/1/86. Roads.—J.R., B.C., 22/1/86. File.—W.C.B., 23/1/86.

No. 32.

The Under Secretary for Public Works to John Sutherland, Esq., M.P.

Sir,

Department of Public Works, Sydney, 21 January, 1886.

In reply to your letter of the 11th instant, inquiring as to what provision it is proposed to make for the maintenance of the Botany Road in lieu of the tolls lately collected at Meadow Bank, I am directed to inform you that the road in question was proclaimed a main road on the condition and assurance that the respective municipalities through which it passes, would take charge of the lengths within their limits, and that a municipality was to be formed at Botany to take charge of the portion in that vicinity; I am to add that a proclamation transferring the portions of this road to the municipalities interested, as provided for in Act, will be issued in the course of a few days.

I have, &c.,

JOHN RAE.

No. 33.

Mr. T. Leeder to The Secretary for Public Works.

Sir,

438 George-street, Sydney, 29 January, 1886.

Adverting to your Under Secretary's letter of 21st ultimo, that the Botany Road had now become a main road of the Colony, and that tolls would not be levied and taken at the bar on this road after the 31st ultimo.

I have the honor by direction of the Board of Trustees of such road to inform you, that pursuant to the direction contained in the above letter, they ceased to collect the tolls at the said bar on the 31st ultimo.

At a meeting of the trustees, held this day, the subject of the road being kept in good repair was discussed, and I was directed to ask whether the Government would be willing to set apart an adequate sum for such purpose, and hand the same over to the trustees for expenditure in the maintenance of the road.

The revenue derived last year from the sale of the tolls amounted to £2,899, which, added to the Government mileage money, £175, made a total revenue of £3,074; but the trustees had determined upon reducing the scale of toll, which they estimate would have reduced the revenue this year had the tolls been let, to about £2,100, inclusive of the mileage money.

The revenue derived from the toll enabled the trustees to keep the road in thorough good condition (the distance being 7 miles), and as they are anxious that the road should henceforth be maintained in the like good order, I am directed to state that they are quite willing to give their time and attention for

for that purpose, if the Government favourably consider this application by granting them an adequate sum for the purpose. It may here be added that the trustees have all the necessary tools and appliances for carrying on the work of maintaining the road.

The favour of an early reply is respectfully solicited.

I have, &c.,
THOS. LEEDER,

Secretary to Trustees.

Roads, for report.—J.G., 30/1/86. J.R., B.C., 4/2/86. Previous papers.—W.C.B., 5/2/86. 86/185, herewith, 6/2/86.

Might be informed that the bar was abolished on the distinct understanding given by Mr. Williamson, M.P., that no expense whatever should be caused to the Government thereby; that the municipalities of Redfern, Waterloo, and Alexandria would take charge of their respective portions, and that a new municipality would be formed at Botany to take charge of that portion not now within municipal limits.—W.C.B., 8/2/86.

Under Secretary.—B.C. Submitted.—J.R., 10/2/86. Approved.—J.G., 11/2/86. Mr. Thomas Leeder informed, 12/2/86. Roads.—J.R., B.C., 12/2/86. File.—W.C.B., 23/2/86.

No. 34.

The Under Secretary for Public Works to Mr. T. Leeder.

Sir,

Department of Public Works, Sydney, 12 February, 1886.

In reply to your letter of the 29th ultimo, expressing the willingness of the late trustees of the Botany Road (now a main road) to continue the supervision of necessary repairs, provided a sum of money is granted in lieu of the tolls collected at the bar, at Meadow Bank, abolished on the 31st December last, I am directed to inform you that the toll-bar was abolished on the distinct understanding given by Mr. Williamson, M.P., that no expense for future maintenance should be borne by the Government; the municipalities of Redfern, Waterloo, and Alexandria taking charge of the lengths passing through their respective boundaries, and a municipality was to be formed at Botany which would have the care of the remaining portion of the road in question. Therefore the offer of the gentleman referred to cannot be entertained.

I have, &c.,
JOHN RAE.

No. 35.

The Mayor of Waterloo to Mr. T. Leeder.

Sir,

Municipal Council, Waterloo, 30 March, 1886.

In reply to your communication of the 3rd instant (and its enclosure from the Works Department of the 12th ultimo), having reference to the abolishment of the tolls on the Botany Road, which states that the three Councils interested would be expected to take charge of the lengths passing through their respective boundaries, I have the honor to inform you that, by resolution passed at an adjourned conference representing the three boroughs held here yesterday, this Council, for itself and the other Councils represented, "declined to take over the said road, which they considered should be maintained in the same manner as other main roads of the Colony, and that a sum of money should be placed on the Estimates for that purpose."

This conference also protested against the mode adopted in "the abolishment of the tolls collected for its maintenance," inasmuch as the Councils represented at this conference received no intimation from the Government of their intention to abolish the same.

Under the circumstances, the conference thinks it desirable that a deputation should wait upon the Chief of the Department, to reconsider their decision, and give effect to the views of this conference.

I have, &c.,

GEO. ANDERSON,
Mayor of Waterloo, and Chairman of Conference.

No. 36.

Mr. T. Leeder to The Secretary for Public Works.

Sir,

438 George-street, Sydney, 6 April, 1886.

I have the honor, by direction of the trustees of the Botany Road, to acknowledge receipt of your letter of 12th instant, intimating that the toll-bar on the Botany Road was abolished on the distinct understanding given by Mr. Williamson, M.P.—that no expense for future maintenance should be borne by the Government; the municipalities of Redfern, Waterloo, and Alexandria taking charge of the lengths passing through their respective boundaries, and that a municipality was to be formed at Botany which would have the care of the remaining portion of the road in question. And, in reply, I am to inform you that the trustees are in receipt of a communication from the chairman of a conference (George Anderson, Esq., Mayor of Waterloo) of the three municipalities before-named, held upon the subject of the abolishment of the tolls, and intimating that the conference protested against the mode adopted in the abolishment of the tolls collected for the maintenance of the road, inasmuch as the Councils represented at that conference received no intimation from the Government of their intention to abolish the same, and, further, that they declined to take over the said road, which they considered should be maintained in the same manner as other main roads of the Colony.

I have, &c.,

THOS. LEEDER,

Secretary to Trustees.

Acknowledged, 8/4/86. I would like to have a special report from Mr. Bennett on this matter.—W.J.L., 7/4/86. Urgent. Roads.—J.R., B.C., 9/4/86. Previous papers this day.—W.C.B., 10/4/86. 86/1,285, herewith, 10/4/86. My

My minute, 9/12/86, states the conditions on which the bar was recommended to be abolished. The proposal was most strongly urged by Mr. Williamson, M.P., and also hastened, as the lease of the bars was about being sold. There was no time to confer with the municipalities, and it was understood that Mr. Williamson was the exponent of their views, as the representative of the district. If the municipalities definitely decline to take over the road, I would recommend that the main road be again proclaimed, omitting this, and that the bars, at the old rates, be reproclaimed, and handed over to the trustees. It is very desirable that some special legislation be enacted, repealing all these trusts, and making it imperative on the Councils to take charge of all roads within their limits.—W.C.B., 13/4/86.

Under Secretary.—P.W.O., B.C., 14/4/86. Submitted.—J.R., 14/4/86.

No. 37.

Mr. C. Harris to The Secretary for Public Works.

Sir,

Town Hall, Waterloo, 15 May, 1886.

At a conference held here a few weeks since, the question of the future maintenance of the Botany Road was mooted.

Referring to a letter from your office, 83/893, some doubt was thrown upon the liabilities of Redfern, Waterloo, and Alexandria in the matter; and by a resolution passed at the conference, the representatives declined to take over the road, which they considered should be maintained in the same manner as the Cook's River and other main roads of the Colony; and a deputation was directed to be formed to interview you on the subject. In accordance with this, I have to ask the favour of an interview, and shall feel obliged by your naming a time when it will be convenient to receive it.

A reply will oblige.

I have, &c,

C. HARRIS (*pro* Mayor),

Secretary.

Please arrange for Friday next. Meantime I should like to have full report on this matter.—W.J.L., 17/5/86. Inform Friday, 21st instant, at 11.30.—J.R. C. Harris, Esq., informed, 17/5/86. Roads.—J.R., B.C., 17/5/86. Previous papers.—W.C.B., 18/5/86.

No. 38.

The Under Secretary for Public Works to Mr. C. Harris.

Sir,

Department of Public Works, Sydney, 17 May, 1886.

In reply to your letter of the 15th instant, I am directed to inform you that the Secretary for Public Works will receive the deputation, not to exceed six in number, from the Borough Councils of Redfern, Waterloo, and Alexandria, on the subject of the maintenance of the Botany Road, on Friday, 21st instant, at 11.30 a.m.

I have, &c.,

JOHN RAE.

No. 39.

Minute by The Secretary for Public Works.

Department of Public Works, Sydney, 21 May, 1886.

Re abolition of Toll-bar, Botany Road.

A DEPUTATION representing Redfern, Waterloo, and Alexandria, consisting of Messrs. Anderson, Lander, Jesson, Geddes, Bowman, and Leeder, with Messrs. Sutherland and Williamson, M's P., waited upon me to-day with reference to the abolition of the Botany Road Toll-bar, and the question of the maintenance of the road; and submitted the following resolutions arrived at, at a conference between the municipalities, regarding the responsibility of maintaining the road. They stated that they had not been consulted with reference to the abolition of the toll, nor had they agreed to become responsible for the maintenance of the road. It was understood that when the toll was abolished the road was proclaimed a main one, and that its control was therefore taken over by the Government in the same way as the Newtown and South Head Roads, which they looked upon as standing on similar grounds. They did not think the Government should call upon them to undertake the control of the road, and in fact they could not afford to do so; while moreover, the road was in a sense, a Military one, as it lead to the Botany Head Forts. The Government by the Tramways, already kept one-third of the road in order, and they thought the Roads Department should maintain the other two-thirds. I informed them that through Mr. Williamson's exertions and energetic endeavours in bringing the matter forward, the Government had decided to abolish the toll, at the same time understanding that it was agreed the municipalities through which the road passed, would take over the maintenance of the same. It was impossible that they had no knowledge of the matter, for it had been frequently referred to in the Press, and in reply to a question put by Mr. Williamson in the House, I had stated that the toll was to be abolished. It was distinctly understood the road would be taken over by the municipalities, and it was scarcely fair now for them to attempt to repudiate that arrangement; further, they were not asked to keep the whole of the road in repair, but simply two-thirds, as the Tramway had already controlled one-third. It seems to me the municipalities should show a better feeling of self-help and self-reliance, not only in this, but in connection with local works generally; and I stated, if they adhered to their proposal not to take over the road, I would have to consider whether I would re-establish the toll, although I would regret to have to adopt that course, but I had been strongly recommended to take it. It seemed to me their action was hardly honest, and the point they took, that they had not been officially informed, untenable, as the decision was made public and must have been made known to them. I could say nothing further, but trusted they would reconsider their decision and carry out the agreement come to with Mr. Williamson, rather than attempt to throw the whole responsibility upon the general revenue, as in that case I would have to consider seriously the re-establishment of the toll.

W.J.L.

Mr. Bennett.—J.R., B.C., 25/5/86. Seen; file—W.C.B., 26/5/86.

No. 40.

No. 40.

T. M. Williamson, Esq., M.P., to The Secretary for Public Works.

Dear Sir, Sydney, 10 June, 1886.
Enclosed please to find copy resolutions *re* maintenance of the Botany Road. I shall feel obliged by your giving this your earnest attention.
Yours, &c.,
T. M. WILLIAMSON,
(*per* G.M.)

The Council Clerk, Waterloo, to T. M. Williamson, Esq., M.P.

Sir, Waterloo, 9 June, 1886.
At a meeting held here yesterday, representing the Boroughs of Redfern, Alexandria, and Waterloo, the following resolutions passed unanimously. I need not dilate, but call your attention to the spirit of them, in order to arrive at a just and satisfactory conclusion. According to the opinion of an expert, if the road is not quickly repaired in two months hence, it will require double the amount.
I have, &c.,
CHARLES HARRIS.

[Copy of Resolutions].

Moved by Alderman Sharp (Redfern), seconded by Alderman Geddes (Waterloo):—

1. That this Meeting, and the Councils represented here, decline to take over the said road, which they consider should be maintained in the same way as other Main Roads of the Colony.

Moved by Alderman White (Waterloo), seconded by Alderman Cole (Waterloo):—

2. That the Government be respectfully requested to take immediate action to put the said road in a proper state of repair, as further delay will entail a much greater outlay.

By the Mayor of Redfern, seconded by the Mayor of Alexandria:—

3. That a copy of the foregoing resolutions be sent to the Minister for Works and to the representatives of the district, and that the latter be respectfully requested to use their best endeavours to obtain a sum of money for its maintenance.

Considering all the circumstances connected with this matter, I must decline to accede to the request.—W.J.L., 11/6/86. Informed.—T. M. Williamson, Esq., M.P., 12/6/86. Roads.—J.R., B.C., 12/6/86.

As the municipalities now decline to carry out understanding under which road was proclaimed a main road, and rely on clause in their Act exempting such roads, I now recommend that proclamation be issued under 17th clause, Main Roads Act, herewith, excepting the portions of this road within municipal limits from the operation of the Act. This is the only safe alternative to rescinding proclamation of main roads, and re-establishing toll-bar.—W.C.B., 12/6/86.

Under Secretary.—B.C. Submitted, 14/6/86. Ask Mr. Williamson, M.P., to see me.—W.J.L. T. M. Williamson, Esq., M.P., 22/6/86. Roads.—J.R., B.C., 30/6/86. File.—W.C.B., 30/6/86.

No. 41.

3. That a copy of the foregoing resolutions be transmitted to the Minister and the representatives for the district.

N.B.—All these resolutions passed unanimously.

No. 44.

T. M. Williamson, Esq., M.P., to The Secretary for Public Works.

Dear Sir,

Sydney, 2 July, 1886.

Your letter of 29th June last to hand, and I may state that Mr. Bennett's minute was not written in my presence, but was apparently endorsed on the papers before I saw him, and when perusing it I distinctly stated that "I could not attempt to bind the municipalities to any arrangements, knowing that when interviewing Mr. F. A. Wright, late Minister for Works, the municipalities distinctly declined to take over the road." Mr. Bennett then replied "that having made the minute it would be for the Minister to decide." I subsequently saw you, when it was decided to abolish the toll without any conditions.

During our interview in reference to the road, you will recollect that I always denied giving the assurance as mentioned by Mr. Bennett, and if the papers are perused it will be noticed that no letter of mine refers in any way to the municipalities taking charge of the road, even after the decision to abolish the toll; my letters do not endorse the minute of Mr. Bennett.

I regret very much that a misunderstanding should have arisen in reference to this matter, and I hope that you will deem it expedient to place a sum of money on the Estimates for the repair of the road.

I have, &c.,

T. M. WILLIAMSON,
(per G.M.)

Please put with papers referring to Botany Road Toll.—W.J.L., 3/7/86. Acknowledged, 5/7/86.
Roads.—J.R., B.C., 6/7/86. Previous papers.—W.C.B., 7/7/86. 86/5,891, herewith, 7/7/86.

Minute by The Commissioner for Roads.

WHAT I have stated is correct, that the minute was made in Mr. Williamson's presence, and that he most distinctly stated, more than once, and at more than one interview, that the Government should be at no cost by the abolition of the tolls. He was himself the suggestor of the new municipality to take in the portion of road not included in existing municipalities, and stated that the present or the then existing Trust was an impediment to the establishment of such municipality.

There is no misunderstanding on my part, it was clear, distinct, and precise that the Government were not to be put to any expense by the change.

The *status quo ante* can be restored by another proclamation, and then the Trust can re-establish the bar. W.C.B., 7/7/86.

Under Secretary.—B.C. Submitted.—J.R., 8/7/86.

No. 45.

Report by Mr. J. M. Smail.

Sewerage Office, Botany, 17 July, 1886.

Subject:—Present state of Botany Road.

THE late wet weather has caused the road outside the limits maintained by the Tramway Department to cut up very much. The water channels and pipe-crossings are becoming blocked with *debris*, &c., and require cleaning out.

It would be advisable to have the road attended to as soon as possible, as a continuance of wet weather will increase the evil.

It would be a pity to have this road, which has been a very good one, fall into disrepair, as it is doing at present.

A short time back two of the culverts had to be repaired to prevent accident to the public.

The branch road (Lord's Road) which was maintained by the Trust out of toll fees, is also in bad repair, and requires metalling.

The general opinion of residents who use the road is that it would be better to reinstitute the toll, and keep the road good, than to have a bad road without the toll.

J. M. SMAIL.

I recommend that the toll be re-proclaimed, as the municipalities will not take charge, and that the old rates be maintained. I also recommend that the late Trust be asked to resume charge, and that a proclamation rescinding the one making this a main road should be issued.—W.C.B., 17/7/86.

Under Secretary.—B.C. Submitted.—J.R., 19/7/86.

No. 46.

Mr. T. Leeder to The Under Secretary for Public Works.

Sir,

438 George-street, Sydney, 21 September, 1886.

The Botany Road, as you are aware, having been declared a main road of the Colony, and the tolls abolished from 1st January last, the trustees of the road in question have resigned their respective offices.

Under

Under these circumstances, I have the honor, by direction of Mr. Beaumont, late Chairman of the Trust, to return to the Government, through you, the enclosed letter from the Treasury Department, dated 16th August last, addressed to the Botany Road Trust, notifying payment into Union Bank to credit of trustees, of £100 for repair of the road from Sydney to Banks' Meadow (Botany Road); also blank form of voucher annexed, the receipt of which I would ask you to kindly acknowledge.

I have, &c.,

THOS. LEEDER.

Acknowledged, 24/9/86. Roads.—J.R., B.C., 24/9/86. Mr. Airey to see me at once, on his return, on this.—W.C.B., 5/10/86. £100 was issued in general issue on the 11 August, which might be transferred to the Department.—C.B.A., 18/10/86.

I do not think the Department should assume charge of any part of this road, though proclaimed a main road. Mr. Williamson undertook that it should be taken charge of by Municipal Councils; that a new body be made to take over all outside present limits, now in no one's charge.—W.C.B., 19/10/86. Under Secty.—B.C.

P.W.O., 20/10/86. Submitted, 21/10/86. Minister will see Mr. Bennett.—J.R. I will wait on the Minister when advised that he is disengaged.—W.C.B., 28/10/86. Under Secty.—B.C. On Monday.—W.J.L., 13/11/86. Mr. Bennett.—J.R., 15/11/86.

Please have proclamation prepared, vesting the portion of this road within municipal limits, in the Municipal Councils, and the portion outside municipal limits will have to be taken over by the Department, or handed over to trustees.—W.J.L., 15/11/86.

Roads.—J.R., B.C., 15/11/86. Mr. Flynn, very urgent.—W.C.B., 16/11/86. Proclamation vesting charge in municipalities prepared, and sent to Crown Solicitor for opinion.—F.W.

No. 47.

The Under Secretary for Finance and Trade to The Botany Road Trust.

Gentlemen,

The Treasury, New South Wales, Sydney, 16 August, 1886.

I beg to inform you that there has been this day paid to the credit of your public account, at the Union Bank, in an account termed "Road Account, No. 152," the sum of one hundred pounds (£100), for the purpose of enabling you to pay for the repair of the road from *Sydney to Banks' Meadow (Botany Road)*.

I have to request that you will be so good as to draw against this account on the Public Cheque Forms only, and to insert in the body of the cheques drawn the words above (*in italics*), as well as the number of your road account, as above stated, in order that they may be identified by the bank, otherwise they will not be honored; and that, should your signatures not be already known at the bank, you will, as a precautionary measure, furnish specimens thereof to the manager before any cheques are drawn.

I have also to request that no cheques may be issued without the signatures of the whole of the trustees, unless an authority, signed by all members of the Trust, be forwarded to the bank, requesting the manager to honor cheques drawn on the account signed by one or more of the trustees, as may be found most convenient.

A further supply of the accompanying forms can be obtained from the Government Printer.

I have, &c.,

J. D. CRONIN,

For the Under Secretary for Finance and Trade.

No. 48.

Draft Proclamations.

Roads Department, Sydney, 29 November, 1886.

Proclamation of Charge of Botany Road to be vested in Municipalities.

HEREWITH are three draft forms of "proclamation" to except portions of the Sydney and Banks' Meadow Road (old Botany Road) from the operation of the Main Roads Act, under the provisions of clause 17 of the Main Roads Act, 21 Victoria No. 8, and clause 118 of the Municipalities Act, 31 Victoria No. 12. I would suggest that these proclamations be submitted to the Crown Solicitor for opinion as to form and legality.

F. WELLS,

Assistant Engineer for Roads.

Under Secretary.—W.C.B., B.C., 29/11/86.

The Crown Solicitor.—J.R., B.C., 2/12/86.

No. 49.

T. M. Williamson, Esq., M.P., to The Commissioner for Roads.

Dear Sir,

Sydney, 1 December, 1886.

Would you kindly inform me if any steps are to be taken with a view of remedying the defective state of Botany Road? I expect daily to hear of a serious accident occurring through the present bad state.

Re Bay-street, Botany, could you give any information in respect of improving the bad state of the road?

Yours, &c.,

THOS. M. WILLIAMSON.

Inform, proclamation has been issued transferring charge to Municipal Councils; that steps will be taken as to remainder of road, but the Government are not responsible. Inquire from Col. Wells, about Bay-street, or refer papers to me.—W.C.B., 2/12/86. Inform, in addition, that local officer reports no work wanting in Bay-street. Inform, Mr. Logan, 2/12/86. T. M. Williamson, Esq., M.P., informed, 4/12/86.

15

No. 50.

The Commissioner for Roads to T. M. Williamson, Esq., M.P.

Sir,

Department of Public Works,
Office of Commissioner for Roads, 4 December, 1886.

With reference to your letter of the 1st instant, asking whether any steps are to be taken with a view of remedying the defective state of Botany Road, I have to inform you that a proclamation has been issued transferring charge to Municipal Councils. Steps will be taken as to remainder of road, but Government is not responsible.

The local officer states that no work is wanting in Bay-street.

I have, &c.,

WILLIAM C. BENNETT,
Commissioner and Engineer for Roads.

No. 51.

T. M. Williamson, Esq., M.P., to The Secretary for Public Works.

Dear Sir,

Sydney, 7 December, 1886.

I have just received a letter from the Commissioner for Roads (a copy of which is enclosed) in answer to my inquiries as to when Botany Road was to be repaired. He states that a proclamation has been issued, transferring the charge to the Municipal Councils. This, I believe, has been done within the last two or three weeks, and without repairing the road. I presume you are aware that the Council did not give their consent to this course of procedure, but on the contrary, refused to accept the control of the road; and for the guidance of the Department, I may state that I will advise the municipalities not to interfere with the Road, and treat the action of the Commissioner as *ultra vires*, in consequence of the blundering manner in which he has transacted all matters in reference to the road. It is clear to me and to many of the peoples' representatives, that the time has arrived when some reformation should be made in this Department; a person has only to glance at the formation of Bay-street, Botany, and the new road from Ryde to Parramatta, to be satisfied that incompetency exists in the Department, and it is to the interest of the public that a searching investigation should be made, with a view of preventing a loss of thousands of pounds to the country.

In conclusion, I desire to call your attention to the fact that this is the only road in the Metropolitan District of Sydney, in respect of which such a high-handed course has been pursued.

Hoping the above will receive your immediate attention.

Yours, &c.,

THOS. M. WILLIAMSON.

How does this matter (Botany Road) stand?—W.J.L., 15/12/86. Roads.—J.R., B.C., 15/12/86.

Mr. Williamson stated the Councils would take charge of the road, and that a municipality would be established at Botany, when the Trust was removed, as that was the only obstacle.

I admit the blunder of not having the arrangement in writing, but it was done very hurriedly at Mr. Williamson's instance, to prevent sale of bar. I am quite prepared for any searching investigation as to my competency, but it should be conducted by persons competent to judge. In letter herewith, 86/14895, the allegation as to work on Ryde and Parramatta Road is withdrawn; the allegation as to Bay-street is equally groundless.—W.C.B., 16/12/86.

Under Secretary.—B.C. Under Secretary.—P.W.O., B.C., 18/12/86. Submitted.—J.R., 20/12/86. Inform in terms of Mr. Bennett's minute.—W.J.L., 20/12/86. T. M. Williamson, Esq., M.P., informed, 21/12/86. Roads.—J.R., B.C., 21/12/86. File.—W.C.B., 23/12/86.

No. 52.

The Under Secretary for Public Works to T. M. Williamson, Esq., M.P.

Sir,

Department of Public Works, Sydney, 21 December, 1886.

In reply to your letter of the 7th instant, with respect to the Botany Road, I am directed to inform you that the toll-bar on this road was abolished on the distinct understanding given by you verbally, that the Municipal Councils on the line of road would maintain the portions within their respective boundaries, and that a municipality was to be established at Botany, which would take charge of the portion outside limits of boroughs already formed. The Department, therefore, is not responsible for the maintenance of the road in question.

I have, &c.,

JOHN RAE.

No. 53.

The Crown Solicitor to The Under Secretary for Public Works.

Sir,

Crown Solicitor's Office, Sydney, 15 December, 1886.

I have the honor to return herewith the memo. of the Assistant Engineer for Roads, forwarding three drafts of proclamations excepting portions of roads from the operation of the Main Roads Act, and to state that I think that such drafts may be adopted.

Of course, I am not aware whether the Mayor and Council of the several municipalities have agreed to accept charge of these roads, and that these proclamations are issued with their concurrence.

I have, &c.,

JOHN WILLIAMS,
Crown Solicitor.

T. M. Williamson, Esq., M.P., to The Secretary for Public Works.

Dear Sir,

Sydney, 23 December, 1886.

I have just received a letter dated 21st instant, from the Under Secretary, and I beg to state that no such promise was made by me, and this I am prepared to support in any Court of Law; in fact there is not one word in any correspondence from me that can justify such a conclusion. If Mr. Bennett makes this assertion he is labouring under an hallucination. I have therefore to request that the road be immediately repaired in order to save any unpleasantness.

I have, &c.,

THOS. M. WILLIAMSON.

Forward to Mr. Bennett.—W.J.L., 23/12/86. Roads.—J.R., B.C., 29/12/86. I am confident that such promise was made. I do not usually labour under hallucinations.—W.C.B., 29/12/86. Under Secretary.—B.C. No. 68.

Précis.

Department of Public Works, Sydney, 21 January, 1887.

Botany Road.

IN December, 1885, in compliance with the urgent representations made by Mr. Williamson, M.P., and others, Mr. Secretary Lyne directed that a proclamation should be issued abolishing the Botany toll-bar, and constituting the road in question, a main road of the Colony. This course was taken on the recommendation of the Commissioner for Roads, whose minute on P.W., 85/10,275, is to the following effect:—

"On the distinct understanding that the respective municipalities take charge of road within their limits, and with a view to the proclamation of a municipality at Botany, by which arrangement the maintenance of this road will be divided between the Tramway Department and the municipalities, without any subsidy, I recommend that the road be proclaimed a main road, and the toll to be abolished."

The understanding referred to has been the result of interviews between Mr. Williamson, M.P., and Mr. Bennett. No steps appear to have been taken to provide for the maintenance of the road, and on the

the 20th May, 1886, a deputation from the municipalities interested, waited upon the Minister in reference to the matter. They stated that they had not been consulted with respect to the abolition of the toll, nor had they agreed to become responsible for the maintenance of the road. Mr. Secretary Lyne informed the deputation of the understanding upon which the tolls were abolished, and stated that if the municipalities refused to take charge of the road, the question of the re-establishment of the toll would have to be considered.

Considerable correspondence has since taken place, but nothing has been done towards the repair of the road; and by minute of 15/11/86, Mr. Lyne directed that a proclamation be prepared, vesting the portion of this road within municipal limits, in the Municipal Councils,—the portion outside to be dealt with by the Department.

The Borough of Waterloo decline to take charge unless the road is first placed in repair, and a deputation in reference to the whole question is to wait upon the Minister on the 28th instant at 11 a.m.

All papers are enclosed herewith.

J.R.

Append list of correspondence.—J.R. Done, 24/1/87.

No. 69.

Minute by The Secretary for Public Works.

Department of Public Works, Sydney, 19 January, 1887.

Maintenance of Botany Road.

I UNDERSTAND that the municipalities wish the road, as far as it lies within their limits, to be put in order before the road is handed over to them. The papers do not disclose what amount will be required to have this done, but it seems to me that in view of all the circumstances connected with this matter, the Government might pay to the respective Councils the amount that would be required to put the road in fair repair, and the Councils to do the necessary work. With regard to the portion outside municipalities, I do not see any other course open but that the Government will keep it in repair either directly or by handing an annual vote over trustees.

It has been suggested that the road from Redfern-street to the old toll-bar might be wood-blocked, the cost to be divided between Railway, the Roads Department, and the municipalities, the latter paying one-fourth or one-fifth the cost, and if the work could be done reasonably it would appear to be the wiser course, as the maintenance charges at present are very heavy.

W.J.L.

Roads.—J.R., B.C., 18/1/87. Resubmit when Mr. Dyson is in office.—W.C.B., 19/1/87.

No. 70.

No. 70.

Deputation to The Secretary for Public Works.

Roads, Sydney, 27 January, 1887.

UPON inquiry at the Department of Public Works, I am informed that the only deputation fixed for to-morrow on any matter connected with this Department is the following:—At 11 a.m.—Maintenance of Old Botany Road.

Not having the papers, I am not able to give dates, but they will show that some months ago this road was made a main road at the most pressing instance of Mr. Williamson, M.P., on his undertaking, that the respective municipalities took over charge, and that a new municipality to be formed at the Botany end, so that the Government should not be at any expense. As the municipalities declined to take charge, a proclamation transferring charge to them was made some few days ago (dates with papers).

In the mean time a claim was made by Commissioner for Railways for extra metal, said to have been used on the road. This was replied to by a minute that the road was not in charge of this Department, which it never was.

Now there is a movement to get the road wood-paved at the cost of the Government, or to give the Councils a sum to take over road.

The cost of doing the portions of road within each municipality is stated below; that is, 1st, putting metal sides in order, so that road could be taken over; 2nd, estimated cost of wood-paving road, exclusive of tramway:—

						Metal Road.	Wood-paving.
Redfern...	£600	£10,800
Waterloo	400	21,600
Alexandria	400	21,600
						£1,400	£54,000

The Botany Road Trust Act is still in existence, the steps taken to set Trust aside and abolish bar, were similar to those advised by the Crown Law Officers in the case of the Cook's River Road, but the entire can be set aside by a further proclamation, and re-establishing the bar, paying road trustees an equivalent to the rent lost. This, I think, would be a retrograde step, as toll-bars are an obsolete means of collecting revenue.

Or if the Minister thinks fit, the Councils might be given £1,400 between them, if they agree to take over road.

The timber paving is, I think, out of the question in the present state of the finances.

W.C.B., 27/1/87.

Under Secretary—B.C.

No. 71.

Minute by The Secretary for Public Works.

Department of Public Works, Sydney, 28 January, 1887.

A DEPUTATION consisting of the Mayors of Redfern, Waterloo, and Alexandria, with several of the Aldermen waited upon me to-day, with reference to the state of the Botany Road. There has been some misunderstanding in this matter in connection with the abolition of the toll-bar on the Botany Road; the Department believing that when this step was taken the municipalities would take over the road, and thus relieve the Department of further responsibility. The Councils contend, however, that they gave no such undertaking, and contend that the Department should fully maintain the road, as it is essentially a main road, and that, with one exception, the Department maintain the leading roads out of Sydney. Owing to the dispute as to maintenance the road has fallen into a bad state of repair, and is in fact dangerous, and they urged that immediate steps should be taken to have the road put in order. I informed them that I was aware the maintenance of this road had been a vexed question for some time, and I was personally aware the road was now in a very bad condition; in fact, as a representative of Redfern, I had written to the Department before I became a Minister, urging that provision should be made for the repair of this road. Since the matter had come officially before me, I had called for the papers and reports, and I found the cost of putting the road in repair would be, for the portions within the boundary of Redfern, £600; within the boundary of Alexandria, £400; and Waterloo, £400; and I promised that immediate steps would be taken to have the road put in order. A large quantity of metal—broken by the unemployed—being available, and when this was done, the question of the future maintenance of the road would have to be settled, and they would then be asked to take it over.

With reference to the question of wood-blocking, I found no direct recommendation was made by the late Minister; but a suggestion had been made to him to have the work done. I have called for a report and estimate in the matter, and found that the estimated cost of the work was £54,000, for the portion between Redfern-street and the old toll-bar, and in view of the state of the public finances I could not for one moment consent to entertain the proposal.

I shall be glad if Mr. Bennett will take immediate steps to have the road put in order.

JOHN SUTHERLAND.

Roads.—J.R., B.C. 29/1/87. Mr. Dyson to at once carry out the Minister's instructions; note and return this paper.—W.C.B., 7/2/87. Mr. Dyson.—B.C. Noted.—E.D.D., 9/2/87. File.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

MANLY BEACH AND PITTWATER ROADS.

(PETITION FROM INHABITANTS OF MANLY AND SURROUNDING DISTRICTS.)

Received by the Legislative Assembly, 28 April, 1887.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the undersigned, inhabitants of Manly, Manly Vale, Balgowlah, Middle Harbour French's Forest, Pittwater, and the surrounding districts,—

HUMBLY SHOWETH:—

That your Petitioners beg to bring under the notice of your Honorable House the deplorable and almost impassable state of the Government Roads leading from Manly Beach, Manly Vale, Middle Harbour to Pittwater, the head of Middle Harbour, French's Forest, the Government Reserves, and the neighbourhood.

That no public money has at any time been used towards making such roads, the only improvements on these roads have been done at the private cost of the inhabitants, who are in humble circumstances, and cannot afford to make and maintain the public roads of their district.

That on several previous occasions representations have been made to the Government as to the necessity which exists for your Petitioners to have reasonable means of travelling and carrying on their usual avocations, so that your Petitioners may not be put to the present great hardship and inconvenience, loss, and delay, by the absence of proper roads.

Your Petitioners therefore humbly pray your Honorable House will be pleased to take their petition into favourable consideration, and grant such relief to your Petitioners as the urgency of the case deserves.

And your Petitioners, as in duty bound, will ever pray, &c.

[Here follow 61 signatures.]

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

ROAD, MOUNT VICTORIA TO JENOLAN CAVES.

(REPORT OF MR. NARDIN, ENGINEER.)

Ordered by the Legislative Assembly to be printed, 12 May, 1887.

Mr. Assistant Engineer E. A. Nardin to The Commissioner and Engineer-in-Chief.
Road to the Jenolan Caves.

Sir,

Lithgow, 16 March, 1887.

I got back from Jenolan last night, having throughout the trip experienced very rough weather.

The work now stands in this position, viz., completed road 21 feet wide 106 chains, 18 feet wide 50 chains, and 57 chains in progress to be made 18 feet wide also; in all, 2 miles and 53 chains.

The expenditure to date has been £1,318 16s. 1d., and the further sum of £640 will be required to finish to the distance above mentioned. This gives an average of about £9 4s. per chain.

Of the remaining 211 chains it is not intended at present to carry out the bottom part (where the work is the most costly in character), nor can the erection of a bridge over the Caves River, or the continuation of the road through the Grand Arch be carried out with present funds.

Beyond the point to which under existing arrangements the work will be carried, the cuttings will be made only 16 feet wide, and rough box culverts put in, excepting at Fern Creek, where an 8-foot culvert will be required.

An examination of the whole line does not suggest any modification of it that would avoid rock; here and there a possible small saving in this respect could be made by introducing frequent alterations of grade, but I would not advocate the adoption of such a course. The character of the country is very changeable, some portions of the work, which before being opened out seemed to contain most rock, have turned out better shifting than others which showed scarcely any; and while much of the rock is very bad to shoot, some can be worked without powder. Under such conditions it is impossible from only surface indications to select the line which, while fulfilling other conditions, has the least rock in its course.

The £2,000 odd still available will be expended in continuous work, and it is possible that it will suffice to do another 2 miles, and make a pathway for the remainder of the distance. This, however, greatly depends upon the quantity of rock which is uncovered, and also upon the batter it will be needful to give the banks. In any case, Mr. Cummins has instructions to wind up the work when the expenditure has reached £4,000.

With regard to letting the rest of the work by contract, I am doubtful whether, as we have gone so far under the present system of task-work, and as far better men apply for employment, it would be advantageous to do so. This is a question which should be at once decided, as upon it depends the necessity or otherwise of forwarding larger supplies of explosives and more tools. The requisition for steel bars and dynamite has been cut down one-half. There are ninety-one men now at work, most of them being in rock, and there are other good men applying daily. If the present system is to continue, then in my opinion, the number of men employed should at once be largely increased, in order to take advantage of the time remaining before the winter fairly sets in. The altitude at the top of the range is about 3,800 feet, consequently the rainfall is considerable, and much time would be lost through wet weather, should the work be extended through the winter months.

Commissioner's Minute:—
It is evident the high price is appreciated.

In the first consignment of tools $\frac{3}{8}$ -inch drills were supplied. They had already seen much service, they make too small a bore for powder, are too short, and many of them will not stand pointing any longer.

There still remains in the Magazine nearly a ton of powder; and the larger drills are required as being more suitable for powder blasting. On these grounds, and believing it would be better to adhere to the present system of task-work, I endorsed, by telegram, Mr. Cummins' requisition for explosives and steel bars.

Commissioner's Minute:—
Surely they could be made whatever bore was required by the smith keeping up point. Take care of them; they will sell for mason's points. The larger steel bars may be more allowable than I thought at first sight, on account of the decreased cost of steel since. I have been used to deal with such matters.

The level-pegs have been put in as far as 3 miles 50 chains, at the grade of 1 in 22; but, as those put in with the clinometer do not coincide, I have instructed Mr. Henschman to take flying levels to near the bottom point and equalize the grade, with due regard to certain prominent croppings of rock, which must be shunned.

Commissioner's Minute—I do not think they are sufficient; I want Mr. Henschman's services elsewhere.

The continuous wet weather, the work connected with the plan, and the constant necessity there is for verifying the levels as the work proceeds, are assigned as reasons why the longitudinal section has not yet been completed.

This being a work of considerable magnitude (a good day's journey from Mr. Cummins' headquarters), it is difficult to see how the services of Mr. Henschman can be at present dispensed with.

Mess accounts we should not be troubled with; the work may be now considered out of the relief category.

Mr. Targett's duties are to take charge of the tools and explosives and to keep the time and mess accounts. These will give him full occupation, particularly if more men are to be employed to push the work through.

I think it had better be removed first opportunity. I wish to know what the men have been earning.

While I was on the ground several men declined to complete their sections, so far as the rock was concerned; and they, after the usual grumbling, finally accepted what was offered for the amount of work done. The rock upon those sections may remain until some future time, there being room for the traffic without its being removed. The payments so made were calculated on such a basis as to leave a good margin for the work undone, and, as before stated, the road in these cases is available for traffic.

The culvert gang is no longer employed upon this work, and Mr. Cummins will arrange with the ordinary men for the rest of the timber-work required.

It would be advisable to instruct Mr. Cummins as soon as possible in regard to these matters.

I have, &c.,

E. A. NARDIN,
Assistant Engineer.

Minute by Commissioner.

MR. CUMMINS,—Carry out and supply information asked for; and state if all the dynamite is wanted, and what tools. Continue to let work as at present.

W.C.B., 18/3/87.

ROADS.

No. 1.

Mr. J. Mullen to A. Stokes, Esq., M.P.

Dear Sir,

Condobolin, 20 August, 1886.

I beg to inform you that I have got what we term in colonial parlance the "sack." Yesterday the Superintendent was here and gave me my *conge*.

The reason assigned for so doing may be briefly stated thus:—The morning of the day in question the Superintendent called at my residence to ascertain why I was not at my post on the roads.

In explanation I told him that for several days previous I was suffering from a severe attack of neuralgia, and was not in a fit state to face the heavy rains then falling.

In reply to my explanation, he stated that he would discharge me for being absent, and would send, on Sunday, a man to replace me.

Now, Sir, I regard this act as being a burning injustice. When a man is ill, why should he be asked to do what he knows will seriously militate against health? Humanity shudders, and the heart sickens at the bare thought, and no one possessed of a scintilla of humanity would make such demand.

Had there been any valid reasons assigned for my discharge, and that they were truthful, I would not have troubled you with this hastily written epistle.

The roads are in good condition, and have been always honestly and faithfully maintained by me where necessary.

I may also mention that I have been in this billet now over seven years, under several superintendents, and have never before been reprimanded by any of them for lack of duty or absence.

I wish you to interview the Minister in reference to my dismissal, being fully impressed with the conviction that through him justice will be done.

I have, &c.,

JNO. MULLEN.

Mr. Morton for report. Resubmit with reply.—P.H.F., 25/8/86.

No. 2.

Memo. by The Commissioner for Roads.

Department of Roads and Bridges, Sydney, 24 August, 1886.

MR. STOKES, M.P., called on me on this day with a view to the restoration of Mullen, a maintenance man, discharged by Mr. Morton.

Mullen stated he was discharged for being off his work ill with neuralgia, and that it was raining, that Mr. Morton was arbitrary, &c.

I pointed out to Mr. Stokes that I was bound to support Mr. Morton as long as he was right. Mr. Stokes wished me to restore Mullen on condition of not being off his work again, as Mr. Innes, a Magistrate, had recommended him. I pointed out that as long as Mr. Morton was retained in his place he could not be ignored. He objected to Mr. Morton, a boy, being placed over a man of 60. I pointed out that similar anomalies occurred throughout the Service. He objected to Morton's youth. I pointed out that no old man could do the work, that we must have young men at the pay. I offered to send the letters to Mr. Morton to report on. He said he would only justify himself, and that some one outside the Department should deal with the question. I said that if Morton's report was not in every way satisfactory another officer would be sent to report. He said that Government officers always supported each other, and that a Magistrate should be appointed to inquire, naming Mr. Innes. I pointed out that he had already taken sides, and was not neutral. He then proposed another Magistrate. I said I could not deviate from the Departmental course. He then declined further action and left.

I have sent a telegram to Mr. Morton for report.

Mr. Flynn will please file this for reference.

W.C.B., 24/8/86.

No. 3.

Telegram from Messrs. Richards and Grey Innes to A. Stokes, Esq., M.P.

Condobolin, 23 August, 1886.

Do all you can for Mullen at once; conduct of Morton most arbitrary and unjustifiable.

H. A. RICHARDS.

H. W. GREY INNES.

Urgent.—Telegraph and ask for a report in this case from Messrs. Richards and Innes, J.P. Wire Mr. Morton for a report in reference to his action in the matter and instruct him not to fill Mullen's place until investigation held.—W.G.L., 25/8/86. Wire sent yesterday, rest with reply.—W.C.B., 25/8/86. Roads.—J.R., B.C., 25/8/86.

No. 4.

Telegram from The Commissioner for Roads to Mr. Road-Superintendent Morton.

25 August, 1886.

REPORT in very full detail circumstances attending removal of Mullen at Condobolin, and if any representations were made to you in his favour, and by whom. Do so at once.

W.C.B.

No. 5.

No. 5.

Report by Mr. Road-Superintendent Morton to The Commissioner for Roads.

Re removal of maintenance man Mullen.

Sir,

Roads Office, Forbes, 25 August, 1886.

On the 19th ultimo, Thursday, I was in Condobolin, and on the following morning I was engaged about the town. I was surprised that I did not see maintenance man Mullen out on his work, it being then nearly 10 o'clock, and raining at the time very steadily. I then went to his house and found him there. When I asked him the reason of his not being out, to which he made the excuse of his not being well.

I have had on previous occasions to find fault with this man, and as I considered his excuse to be frivolous on that occasion, I told him that his services would not any longer be required after the following Saturday. When his cheques were sent by post to the C.P.S. at Condobolin to pay him, no representations have been made to me by anyone in Condobolin on behalf of this man Mullen, and I discharged him solely from the reason that he had not been attending to his work.

I have, &c.,

O. G. MORTON,
Road Superintendent.

Memo.—I have since put on another man in his place.—O.G.M. Send to Under Secretary with Minister's minute for his information. Mr. Morton appears to have only done his duty.—W.C.B., 27/8/86. Under Secretary. Instructions for M.M. attached.

[Enclosure.]

CODE OF INSTRUCTIONS FOR MAINTENANCE MEN.

Terms of engagement.

It must be distinctly understood that the engagement of the maintenance men is directly with the road officer in charge of the district, and is only from day to day; the road officer being empowered to discharge at once, on payment of wages due, and receipt, at the nearest depôt or other suitable place directed, of the tools, &c., in charge of the men.

Charge of metalled road.

The maintenance man's first duty is to keep the metalled portions of his road at all times in good order. In new metalling he will maintain the uniformity of its surface and convexity by raking or picking in the ruts, being careful in black soil not to fill in with the mixed metal and soil that has been forced up by heavy traffic; this should be put aside until dry; it may then be broken up, and the soil separated from the metal by the rake or washed by rain, when the metal may be again used in maintenance. On a road that has been a long time metalled, but which has become rutty and worn thin in places, all ruts, hollows, and depressions should be filled in with clean small gauge metal. The road, wherever darning or patching is to be done, must be well scored with the pick, and the metal spread in thin layers. No blinding to be put on darning or patching, unless in very dry weather, and then only a thin layer of silt from drains or other gritty material.

Economy of metal.

The wear and tear of the surface of road to be carefully watched, and timely notice of any weak length given to the officer in charge, in order that he may provide for a supply of maintenance material when arranging for distribution of his funds.

Great care to be taken that no metal is wasted, or put on where not required; all loose stone to be collected and applied to the widening and maintenance of road.

Unwatering road.

Particular attention is to be paid to the surface of road in wet weather, as the lodgment of the water will then show where any weakness exists, and by picking a small outlet to the tabling it can be relieved from the water before patching.

Shape of road—Forcing, logs, &c., to be moved out of danger.

In raking in ruts care must be taken not to rob the sides of the road too much; every effort should be made in a new road, by logs, or other means, to spread the traffic and get the haunches of the road consolidated. Any logs, large stones, &c., that may be used for that purpose must, however, be removed clear of the formation when consolidated, as the law only permits their use as necessary for construction of road.

Free discharge of drains, &c.

The existing drains and watertables, all inlets and outlets at culverts, pipe drains, causeways, &c., to be carefully cleaned out, and all impediments to the discharge of water removed.

Culverts, &c.

It is of the greatest importance that the junction of the metalled road with any timber decking, whether to bridges or culverts, should be kept in good order, free from dips and holes. Such structures should be frequently examined underneath, to see that the substructure is in good repair; also, that gullies or ravines are prevented from forming by the timely application of stone or bough filling.

Clear bridges and culverts from flood and fire.

The decks of all bridges and culverts must be kept quite clean, and where scupper holes exist they must be kept free. No dry dung, straw, or rubbish must be allowed to accumulate on the deck, or long grass, twigs, boughs, or flood drift anywhere within 30 feet of the bridge or culvert, for fear of accident by fire. In flood time it is imperative by night or day that the maintenance man shall be on duty to fend off trees, logs, &c., from the most important bridges in his district, and otherwise protect them, if necessary, getting any additional labour or assistance he may require, communicating particulars at once to the officer in charge.

Sunday work.

No work, except in such cases and others of a similar urgency, is to be done on Sunday.

Holidays.

The holidays allowed are—Christmas Day, Good Friday, and the Queen's Birthday; but in cases of urgency, as flood danger, total obstruction, &c., the same rule will apply as on Sunday, and the men must attend to their work.

Bridge and culvert decks.

All loose or broken planks, or holes that may occur in bridge or culvert decks or covering of drain pipes, must be instantly repaired or fenced off in the best manner the means at immediate disposal will allow, and if temporary repair only can be thus effected, the maintenance man will at once communicate with the officer in charge of the district by telegraph, if available, acquainting him with the nature and extent of the damage, and asking for instructions.

Penalty

Penalty for neglect—dismissal.

As nothing is so dangerous to life and limb as any defect in this particular, the officer in charge will punish any negligence of this instruction by immediate dismissal.

Obstructions being total stoppages.

In the event of a landslip, large fallen tree, or other obstruction, completely stopping all traffic, the maintenance man will, without waiting for instructions, obtain such assistance as may be required to open a passage at least 10 feet wide, and communicate the facts to the officer in charge, who will instruct or arrange for thorough removal.

Destruction of undergrowth, &c.

The maintenance man will cut up by the roots and burn all undergrowth, thistles, burrs, or other noxious weeds that may be found growing upon the surface of roads.

Removal of stumps, and facilitating traffic on out-turns.

In all cases where trees obstruct or overshadow the road, or fallen logs, stumps, or impediments exist that confine the traffic to one track, he will remove the same and destroy by fire; or wherever a good out-turn from an undefined road can be made practicable by a little labour, he should point it out to the officer in charge. All stumps should be cut out at least 12 inches below the surface of the road.

Attention to warning by mail-drivers, &c.

Whenever it is reported by the driver of the mail coach, or other reliable traveller, that any great inconvenience or danger is encountered in any part of the length under a maintenance man's charge, he will at once visit, and if he can do so unaided, remove the difficulty. If it is too great for him to manage single-handed, he will report to the officer in charge; unless it is a positive stoppage, when he will act at once as previously directed.

Unmetalled roads.

On unmetalled portions, or roads only partly formed, the above rules will be adhered to as far as practicable; all drains must be cleared out; water running down the face of ridges must be diverted by judiciously cut mitre drains; all bog holes should be thoroughly cleared out, and soft material or mud thrown aside off the road, then filled up with ballast or approved material; any trees, saplings, or stumps that impede or confine the traffic should be removed, and roots cut out at least 12 inches below surface; all large stones on surface should be broken up, and boulders removed.

Prevention of injury to works, &c.

Any wilful injury to the road, bridges, culverts, or pipe drains, should be immediately reported to the officer in charge of district, and every effort should be made by the maintenance man to secure evidence to bring the offenders to justice.

Prevention of fraud.

Any fraud, or attempt at fraud, on the part of contractors or their men, or hidden inefficient work, or bad material, that may come to the knowledge of the maintenance man, should be reported immediately. No excuse will be admitted for any neglect or infraction of this instruction.

Hours—rainy weather.

The hours of work for maintenance men will be from _____ to _____ during which he shall not quit his length of road for a distance that is beyond hail, and in the event of necessity compelling him to go out of sight of the road for material or any other cause he shall leave his barrow in a conspicuous place, or make such other signal as may be directed, in order that he may be hailed by the officer in charge when making his rounds. *During heavy rain is the time the maintenance man's services, as above indicated, are most required, and he should visit the whole of his length during its continuation.* He will therefore be expected to provide himself with necessary waterproof clothing or other sufficient protection to enable him to work in all seasons.

Leave of absence.

No maintenance man shall quit his length without having first obtained leave from the officer in charge, who will use his discretion as to granting it, the time of such absence being noted, will be deducted from his pay at the end of the month.

Disobedience—Terms of service.

Any man who disobeys the orders of the officer in charge, or is neglectful, impertinent, or incompetent for the duty required of him, is liable to immediate dismissal; and any man who leaves his employment without giving a week's notice to the officer in charge, will forfeit any wages that may be due to him on leaving. In any case men will only be paid up to the time of their leaving, and for such time only as they are actually at work on the road.

Drunkenness.

Drunkenness, or its effects, during the hours of duty, will on no account be overlooked by the officer in charge.

Plant, tools, &c.

Plant and tools will be found by the Government, but the men employed will be held responsible for the careful use and custody thereof. They will from time to time be inspected by the officer in charge, and any deficiency—fair wear and tear excepted—will be deducted from the maintenance man's wages at the end of the month, and noted on pay-sheet. Any man leaving the employment must deliver up his tools or other plant confided to his care under the same conditions.

Repair of tools.

The maintenance man will arrange with such blacksmith as may be directed for the repair and sharpening of his tools, keeping a correct tally, and furnishing same to the officer in charge of district, who will take his certificate on the pay-sheet at the end of every quarter that there are no amounts due for repairs beyond those handed in. In default the maintenance man will be personally liable for any excess.

Spikes.

The officer in charge will furnish a supply of spikes for repair of bridges and culverts to the maintenance man, who must take care that he keeps up a reasonable supply to meet emergencies.

Penalties.

In the event of any infraction of the above rules the Superintendent or officer in charge will summarily inflict a fine of one day's pay for the first offence, two days' pay for the second, and will dismiss for the third. Penalties to be deducted from pay at the end of month, and shall be noted on pay-sheet.

Rules to apply to all men employed.

Every maintenance man employed by the Department to sign and subscribe to these rules, of which he will receive a copy, to be returned to the Superintendent at the close of his engagement before being finally paid off.

No. 6.

Messrs. Richards and H. W. Grey Innes, J.P., to The Secretary for Public Works.

Re dismissal of John Mullen from Roads Department, Condobolin.

Sir,

Condobolin, 28 August, 1886.

We have the honor to report that we have known John Mullen ever since he has been in the employ of the Roads Department, and have always found him most attentive to his duties.

On the occasion of Mr. Morton's visit, we can prove that he was suffering from a severe attack of neuralgia, and unable to work, and on that day it was raining heavily. It is the unanimous opinion of the residents that Mr. Morton's action was hasty and unjustifiable. Mullen having a large family dependent upon him, and during the past seven years he has never had a complaint lodged against him, we would therefore respectfully request you to give this matter your careful consideration, feeling sure that our representations can be indisputably proved.

We have, &c.,

H. A. RICHARDS & Co.

H. W. GREY INNES, J.P.

Please inform of action taken.—W.J.L., 1/9/86. Roads.—J.R., B.C., 3/9/86. Mr. Wood starts on this duty on Monday night.—W.C.B., 4/9/86. Under Secretary, B.C. Submitted.—J.R., 6/9/86.

No. 7.

Memo. from A. Stokes, Esq., M.P., to The Secretary for Public Works.

THE Honorable the Minister for Works.—Kindly say have you received a reply from Richards and Innes, J.P., *re* Mullen's case from Condobolin, Mullen being dismissed from his position as maintenance man on the roads?

A. STOKES.

Yes; reply gone down.—W.C.B., 27/8/86. Did Mr. Bennett wire to Messrs. Innes, J.P., and Richards, in accordance with my minute of the 25th instant?—W.J.L., 27/8/86. I did not, having sent wire to Morton on the previous day. I noted—that fact I now see—I should have wired to Messrs. Richards and Innes as directed, but overlooked. Shall I do so now?—W.C.B., 27/8/86. Yes.—W.J.L., 27/8/86. Sent; resubmit with reply.—W.C.B., 27/8/86.

No. 8.

Telegram from the Commissioner for Roads to Messrs. H. A. Richards and H. W. Grey Innes.

Sydney, 27 August, 1886.

AM instructed by Minister for Works to ask you to wire to him, free on service, a report in reference to dismissal of Mullen by Road Superintendent Morton. Also post detailed report.

WILLIAM C. BENNETT.

No. 9.

Telegram from Messrs. H. A. Richards and H. W. Innes to The Secretary for Public Works.

Condobolin, 28 August, 1886.

WE have known Mullen ever since he has been in the employ of the Roads Department, and have always found him most attentive to his duties. On the occasion of Mr. Morton's visit we can prove that Mullen was suffering from a severe attack of neuralgia, unable to work, and on that day it was raining heavily. It is the unanimous opinion of the residents that Mr. Morton's action was hasty and unjustifiable. Mullen having a large family dependent upon him, and during the past seven years he has never had a complaint lodged against him.

H. A. RICHARDS.

H. W. GREY INNES.

Under such a report as this Mr. Morton's conduct should be inquired into, and Mullen must be reinstated. Mr. Morton's report, upon the face of it, goes far to support this one. He says it was raining steadily, and Mullen complained he was unwell. I am informed Mr. Richards and Mr. Innes are most reliable men.—W.J.L., 28/8/86.

Roads.—J.R., B.C., 30/8/86. Mr. Wood to go to Forbes and Condobolin *en route* to Marsden's, and he can then report on this case.—W.C.B., 30/8/86. Mr. Bennett's instruction to Mr. Wood is indefinite. Has he gone? His instructions should be to inquire into Mr. Morton's conduct, and Mullen should before this have been reinstated.—W.J.L., 6/9/86. Mr. Wood left on Monday night.—J.R.

No. 10.

Memo. by The Secretary for Public Works.

I UNDERSTAND that the man Mullen at Condobolin has not yet been reinstated. I have twice written minutes in reference to this man, and should like to know whether the report I have heard is correct, and why my minutes have not been carried out?

W.J.L., 13/9/86.

Mr. Bennett.—J.R., B.C., 14/9/86. Reply herewith.—W.C.B., 14/9/86. Under Secretary, B.C. Submitted.—J.R., 14/9/86.

I have already had considerable and unnecessary trouble over this matter. Mr. Bennett will please carry out my instructions. I cannot quite gather from the accompanying minute whether or not this has been done. Surely he, in the latter part of the minute, does not wish it inferred that these regulations will be followed in preference to a direct instruction from the Ministerial head of the Department.—W.J.L., 14/9/86.

Mr. Bennett.—J.R., B.C., 14/9/86. I have telegraphed to Mr. Morton to reinstate this man Mullen as instructed.—W.C.B., 15/9/86. Under Secretary, B.C. Submitted.—J.R., 15/9/86. Seen.—W.J.L., 30/9/86. Roads.—J.R., B.C., 30/9/86. Put with papers.—W.C.B., 1/10/86.

Sydney, 15 September, 1886.
THE Minister's positive orders are that you reinstate Mullen at once. Proceed to Condobolin to do so.
WILLIAM C. BENNETT.

No. 12.

Telegram from Mr. A. P. Wood to The Commissioner for Roads.

Marsden's, 16 September, 1886.
HAVE been unable to report *re* Mullen, but am of opinion the man should not have been dismissed; shall be in office on Monday; Forbes to-morrow, where telegram will reach me.

It is my duty to forward this telegram for the information of the Minister. Mr. Wood should have sent a telegram to this effect from Condobolin.—W.C.B., 17/9/86. Under Secretary, B.C. Submitted.—J.R., 17/9/86. Place with other papers.—W.J.L., 20/9/86.

No. 13.

Report by The Commissioner for Roads.

Re reinstating Mullen, maintenance man.

14 September, 1886.
THE Minister directed the man to be reinstated and an inquiry held into the conduct of the officer, against whom no definite charge was made. I instructed Mr. Wood to proceed to Forbes and Condobolin to hold this inquiry. To reinstate the man Mr. Morton would have had to go to Condobolin, 57 miles and back, and would probably have missed Mr. Wood, he would have had to discharge the man appointed in this man's place and to pay him.

When the Minister's second message was received, Mr. Wood was leaving that night, so could have picked up Mr. Morton and gone on to Condobolin next day, which he did, and I expect to hear from him from Forbes this day.

To reinstate the man by telegram from this office would have been completely setting the officer, Mr. Morton, aside. He is a young man, was in the execution of his duty, travelling to Condobolin, regardless of the weather; he found this man, contrary to the printed instructions, off his work, without having given any notice, and, in accordance with the instructions, 1st paragraph, dealt with him at once.

By that paragraph of those instructions the engagement of the maintenance man is with the local officer. I never interfere between the officers and men, except to inquire when any accusation is made; then the officer, if in fault, can be punished, as he can in this instance; but I will say for Mr. Morton that he is a quiet, steady young man, who attends strictly to his duty.

I was waiting to receive result of inquiry to report on this matter to the Minister, when I should have informed him of the reasons why his orders could not be carried out.

If the Minister wishes the regulations altered I will do my best to obey, as bound to, but as long as they are in existence I have to be guided by them.—W.C.B., 14/9/86. Under Secretary, B.C.

No. 14.

Telegram from Mr. Road-Superintendent Morton to The Commissioner for Roads.

16 September, 1886.
WIRE received this morning; at present engaged with Mr. Wood at Marsden's; will put on Mullen at Condobolin as soon as I return.

For the information of the Hon. the Secretary for Public Works.—W.C.B., 16/9/86. Under Secty., B.C. Submitted for information.—J.R., 16/9/86. Inform Mr. Stokes.—W.J.L., 16/9/86. Alfred Stokes, Esq., M.P., 17/9/86. Roads.—J.R., B.C., 17/9/86. Resubmit when other papers are returned.—W.C.B., 20/9/86.

No. 15.

The Under Secretary for Public Works to A. Stokes, Esq., M.P.

Sir, Department of Public Works, Sydney, 17 September, 1886.

Referring to your personal representations with respect to the dismissal of Mullen, maintenance man at Condobolin, I am directed to inform you that employment will be given him on the return to Condobolin of the local roads officer, who is now at Marsden's.

I have, &c.,
JOHN RAE.

No. 16,

No. 16.

Mr. Assistant-Engineer Wood's Report on inquiry into Mr. Morton's conduct.

Sydney, 20 September, 1886.

I HAVE carefully inquired into the action of Mr. Morton, in the case of the maintenance man, Mullen, who was dismissed from his employment at Condobolin; and, after full consideration, can arrive at no other conclusion than that this dismissal was hasty and ill-advised.

I am led to this conclusion partly by Mr. Morton's own evidence and partly by that given by reliable informants who have had opportunities to judge of Mullen's character, all of whom agree that he was steady and attentive to his duties. I have discarded all statements based on mere surmise, and in regard to which the witnesses had no positive proof.

In accepting evidence outside the Department I am well aware that caution must be exercised and due allowance made for the ignorance of the witnesses as to the real duties of a maintenance man, of the rules under which he is bound, and of his relations to his superintending officer. It is quite possible for such a man to be steady and, as far as the public can judge, efficient, and yet be unfitted for his post, inasmuch as he may be insolent, insubordinate, and neglectful of instructions, all facts of which the outside public might not necessarily be cognizant.

In this case I am compelled to admit that I do not consider there was anything *positively* known by Mr. Morton, but unknown to the public, which could be considered to warrant summary dismissal.

It appears that Mullen has been working for over seven years as a maintenance man in and around Condobolin, and during two years of that time under Mr. Morton, whose chief ground of complaint is that he always had, when visiting that part of the district to point out work that required to be done, and this work it is admitted was always carried out by Mullen. From my experience, very few maintenance men do not require instructions, and, as in this particular case, the man had been retained so many years, during which time instructions were regularly given and acted on. I fail to see how this can be held to justify dismissal without any previous caution.

As regards Mullen's *attendance* on the roads we have the evidence of Mr. Innes, J.P. and licensing magistrate, of the sergeant of police, and of the officer of Condobolin Station, all of whom are most decided in their opinions in this man's favour and in their testimony to his conduct and attendance. On the day when Mr. Morton found him off the road Mullen was suffering, according to his own account, from an acute attack of neuralgia, and was unable to work; in this statement he is borne out by Mr. Innes, who saw him that day. There is no doubt that Mullen should have posted a letter to Mr. Morton stating that he was compelled to absent himself from work on that day; but as the man, judging by the evidence, was really ill, and as this was, as far as Mr. Morton knew, the first offence of the kind, I consider a reprimand and caution would have met the conditions of the case.

Mr. Morton, after dismissing Mullen, was evidently of a similar opinion, as he stated the same day to Mr. Jones, the stock inspector, that he intended to re-employ him.

Mr. Morton appears to have been influenced by a general feeling of dissatisfaction with Mullen, a feeling that the man was not doing his best, yet without any absolute proofs to condemn him, and it is quite possible that the feeling was correct, but Mr. Morton was unfortunate in his selection of time and reason for dismissing him.

Dealing, as I am compelled to, with the evidence before me, I am decidedly of opinion that Mr. Morton was too hasty and severe.

ARTHUR P. WOOD,
Assist. Engineer.

I think in view of the conclusion I have arrived at, and of this man's reinstatement, that it would be desirable to remove Mr. Morton to another district, and he should be advised to use more judgment in dealing with the men in his employ.—A.P.W.

Under-Secty, B.C. For the information of the Minister.—W.C.B., 20/9/86. Submitted.—J.R., 21/9/86. I think a reprimand and warning to be more careful in future should be sufficient punishment for Mr. Morton upon this occasion.—W.J.L., 22/9/86. Roads.—J.R., B.C., 23/9/86. Mr. Wood.—W.C.B., 24/9/86. Seen; but still think it would be advisable for the Commissioner to remove Mr. Morton to another district.—A.P.W., 24/9/86. Mr. Morton to be advised that he will have to move to Mudgee, and informed of Minister's minute. Mr. Adams, at Mudgee, to be advised that he will have to go to Forbes.—W.C.B., 25/9/86.

No. 17.

The Commissioner for Roads to Mr. Road-Superintendent Morton.

Sir,

Sydney, 28 September, 1886.

Referring to the recent inquiry held by Mr. Wood, Assistant Engineer, into the dismissal by you of John Mullen, maintenance man, I have to inform you that the Honorable the Minister for Works, has made the following minute on Mr. Wood's report:—

"I think a reprimand and a warning to be more careful in future, should be sufficient punishment for Mr. Morton on this occasion."

I have also to inform you that you must hold yourself prepared to move to Mudgee District when required.

I am, &c.,

WILLIAM C. BENNETT,
Commissioner and Engineer for Roads.

No. 18.

The Commissioner for Roads to Mr. Road-Superintendent Adams.

Sir,

Sydney, 28 September, 1886.

I have to inform you that it will be necessary that you should hold yourself in readiness to remove from Mudgee to Forbes, when so directed, as it has been decided to transfer Mr. Morton to the former place.

I am, &c.,

WILLIAM C. BENNETT,

Commissioner and Engineer for Roads.

No. 19.

Mr. Road-Superintendent Morton to The Commissioner for Roads.

Re maintenance man, Mullen, at Condoblin.

Sir,

Roads Office, Mudgee, 22 November, 1886.

As I have been censured by the Hon. the Minister for Works in connection with the above case, on the report furnished by Mr. Wood, Assistant Engineer, I think, in justice to myself, I might be informed in what way I have erred, so that in future the trouble connected with this case may, in similar cases, be avoided. I should have applied for this before, but was delayed through press of other business in leaving Forbes District.

I have, &c.,

O. G. MORTON.

Send the papers to Mr. Morton.—W.C.B., 23/11/86. Papers herewith. Mr. Morton, B.C., 24/11/86.

I have carefully read the Commissioner's minute, and Mr. Wood's report, *re* the dismissal of maintenance man Mullen. In closing the correspondence, I would ask to be allowed to thank the Commissioner for having sent the papers, and to express my appreciation of the manner in which he has dealt with the matter. It will be my endeavour in future to avoid being the subject of an adverse report from a superior officer, and I trust that I have not on this occasion lost the confidence which has hitherto been placed in me.—O.G.M., 26/11/86.

File.—W.C.B., 27/11/86.

No. 20.

Mr. Road-Superintendent Adams to The Commissioner for Roads.

Sir,

Roads Office, Forbes, 15 January, 1887.

Since placed in charge of this district the duties, dispositions, and qualifications of the maintenance men have received a more than ordinary share of my attention. They have, together with other particulars, been furnished each with a copy of Maintenance Men's Instructions. Regarding the manner in which these have been attended to by John Mullen, of Condobolin, it is desirable that I should make known to the Commissioner.

It will be remembered that Mullen was discharged by Mr. Morton some time ago, and for some cause or other reinstated.

Not many weeks after being reinstated he is found absenting himself from work all day on the 9th November, without asking leave of the officer in charge. This only came out through my having made an inquiry after his time for that month, otherwise it would not have been mentioned. For this he was fined in one day's pay.

About three weeks ago I had occasion to visit Condobolin, when it was found that parts of the metalled road under his charge were almost impassable, and which formed the subject for complaint by a number of the residents of Condobolin. One place in particular, near to the old public-house on the Forbes to Condobolin Road, he admitted not having visited since October, and which was a perfect quagmire. Other two pieces of macadam, in the village of Condobolin, were not being used; one was covered with rolling stones, and the other remained just as it left the hands of the contractor, over a year ago. Many of the drains had not been cleaned out for years, and the water-tables invisible in places. These he was obliged to pass day after day, which he did with the shovel over his shoulder. When defects were pointed out to him, he replied, in the most disrespectful manner, that "my predecessor did not allow it."

He has not more than three-quarters of a mile of metalled road altogether, the greater part of which is in Condobolin; so that he cannot complain of over-work. When asked what portions of road were under his charge he did not reply truthfully, as what he said does not correspond with instructions given him by Mr. Morton. In my opinion, Mullen is not capable of doing an ordinary day's work, which, combined with his unfitness, accounts in a great measure for the neglected state of the roads under him. His reinstating has been the subject of considerable comment, not only in Condobolin, but in Forbes and the surrounding district; and the position in which he imagines himself to be placed thereby may be fairly gathered from the tone of, and the matter contained in, one or two of his letters, which are herewith submitted. I refer the Commissioner specially to that dated the 7th January, which is his reply to a few necessary questions which it was my duty to put to him, and which he should in the first place have furnished had he complied with previous instructions. In the regulations furnished him for his guidance it states, that "any man who disobeys the orders of the officer in charge, or is neglectful, impertinent, or incompetent for the duties required of him, is liable to immediate dismissal."

Discipline cannot be maintained by an officer placed, as I am, over a man of this class, nor can I be held responsible for the state of the roads supposed to receive such a man's attention.

I had intended furnishing the above report soon after my visit to Condobolin, but has unavoidably been delayed through attention to more urgent duties.

I may refer the Commissioner to a paper by Mr. Morton from this office, dated 25th August, 1886, having reference to Mullen's character.

The

The Commissioner may think this report unnecessary, but I do not, and my reasons for taking the precaution may be easily inferred.

Mullen should have been discharged by me ere this, but for the liberal treatment he has already received at the hands of those who knew nothing of him.

He is at work on the road as usual, pending the execution of the Commissioner's instructions.

I have, &c.,

ALEX. ADAMS.

Previous papers.—W.C.B., 17/1/87. Minute herewith.—A.P.W., 17/1/87.

[Enclosures.]

Mr. J. Mullen to Mr. Road-Superintendent Adams.

Sir,

Your registered letter to hand with contents.

The bridge is finished according to contractor.

I direct your attention to decking to both Condobolin Bridges, neglected for nine months.

Yours, &c.,

JOHN MULLEN.

Received and replied, see letter book.—A.A., 3/12/86.

Condobolin, 1 December, 1886.

MEMO. from Mr. J. Mullen.

Condobolin, 31 December, 1886.

ENCLOSED please find saw-mill bill for 5s. ; also return for Henry Pettiford and Joseph Pritchard, one day each for selves, horses, and drays, in effecting repairs to Gulgo Bridge approach on 10th and 24th respectively.

For myself, in addition to full time for the month, I claim overtime from Saturday night, 11th, till Monday night, 20th, both nights inclusive ; also two Sundays from the above mentioned date.

The creek, about which you inquired, an embankment may be thrown across it.

JOHN MULLEN.

He stills claims this, although told he cannot get it. Received and replied, see letter book.—A.A., 3/1/87.

MEMO. from Mr. J. Mullen to Mr. Road-Superintendent Adams.

Condobolin, 7 January, 1887.

In reply to the numerous queries contained in your memo. I shall now dispose of them *seriatim*.

Imprimis.—The account rendered was done in accordance with Departmental custom under former Superintendents. Did you suppose Nicolas and Raymond would gratuitously donate the timber which you saw in use as patching on bridges, and which I plainly told you had been supplied by that firm ?

I certify that the account is correct in dimensions. I still retain in my possession, for emergency, one piece 4 feet long, 8 inches by 2 inches. In reference to horse and dray, their time as well as mine could not be returned until the last day of the month.

These returns I mailed you on 31st December. I was seen working in the main street all New Year's Day.

The creek, to which you again refer, is situated about 5 miles from Condobolin.

In future when you wish me to correspond with your office, please forward stamped envelope for reply.

JOHN MULLEN.

Mullen was personally instructed to return the time of horse and cart as soon as he had finished with them. The 24th December was the last day horse and cart was employed, and he sends in this time on the 31st, which did not reach this office until the 3rd January, after all quarterly and yearly returns were sent in.—A.A., 10/1/87. The Commissioner, B.C.

No. 21.

Report by Mr. Assistant-Engineer Wood.

Maintenance man Mullen, Condobolin District.

Roads Department, Sydney, 17 January, 1887.

I HAVE carefully read Mr. Adams' report on his maintenance man Mullen. This man was discharged by Mr. Morton in July last, and, under the instructions of the Honorable the Minister for Works, reinstated in his original position. I was at the time deputed to inquire into the particulars of the case, and on the evidence obtained reported that I did not consider that Mr. Morton had sufficient grounds for summarily dismissing this man after seven years' service, and this view was, in my opinion, strongly supported by Mr. Morton's own statement that he decided to reinstate Mullen on the same day that he dismissed him. This intention was, unfortunately, not carried out, and he was then re-employed in the manner above stated.

Mr. Adams now raises several grounds of complaint,—

- 1st. That Mullen absented himself from duty on the 9th of November without asking leave or giving any information as to his action. This is a decided breach of the rules under which he was employed, as the Prince of Wales' Birthday is not one of the holidays mentioned therein, and Mullen's conduct is the more censurable as absence from duty was the ground of his dismissal by Mr. Morton.
- 2nd. Mullen is directly charged by Mr. Adams with neglecting his roads ; his duties in this respect are clearly pointed out by the printed rules, and on the evidence of Mr. Adams as clearly neglected. When his attention is drawn to this he replies in a "most disrespectful manner."
- 3rd. Mr. Adams complains of the tone of Mullen (letters attached to report), and with just grounds ; as there can be no doubt as to the spirit in which they were written.

The escape this man has had from what was very probably a just dismissal when under Mr. Morton, has evidently failed to teach him a useful lesson ; while his reinstatement by outside influence has as evidently developed an impertinent and insubordinate spirit, and quite unfitted him for his position, under these circumstances, and to maintain proper discipline. Mr. Adams should be instructed to severely reprimand him, and finally caution him that the very next time he gives ground of complaint either as regards his work or the tone of his communications he will be summarily dismissed.

ARTHUR P. WOOD.

I got Mr. Wood's report on this, as he knew the man and the locality. Mr. Adams will read in the presence of a third person, a Government official, Mr. Wood, minute to this man, and if he is again insubordinate or disrespectful will dismiss him without further action. As a rule I never interfere between officers and maintenance men, as I consider that the officers are responsible for their work, and it only weakens the power of the officers to interfere.—W.C.B., 18/1/87. Mr. Adams, B.C.

Noted and returned.—A.A., 20/1/87. Has Mr. Adams, as instructed, read this to Mullen.—W.C.B., 24/1/87.

I have acted on the Commissioner's instructions, as near as time and circumstances would permit. Having been obliged to travel on more urgent duties in the eastern portions of district since the 20th instant, I thought it prudent to send a letter immediately to Mr. Grainger, the C.P.S. at Condobolin, embodying therein the summing up of Mr. Wood's minute, and asking him to read same in the hearing of Mullen. Same is herewith enclosed with telegram attached. If this is not sufficient a journey of 130 miles and four or five days absence will have to be undergone in order to read it in the presence of Mullen.—A.A., 31/1/87. To Commissioner for Roads.

Quite satisfactory, Mr. Adams should have explained in the first instance. See memo. on paper herewith.—W.C.B., 2/2/87. Noted.—A.A., 9/2/87.

No. 22.

Mr. Road-Superintendent Adams to Mr. J. Mullen.

Sir,

Roads Office, Forbes, 24 January, 1887.

I have to point out that the insubordinate spirit displayed in your late correspondence with this office has been of such a character as to warrant your immediate discharge. This impertinence may be attributed to the fact that you have lately been the recipient of considerable leniency, not only from outside influence, but also from the officers of this Department.

It is now my duty to finally caution you that the next time I have grounds for complaint, either as regards your work or the tone of your communications, you will be summarily dismissed.

Yours, &c.,

ALEX. ADAMS,

Superintendent of Roads.

Read by Mr. Grainger, C.P.S., in my hearing, this day of , 1887.

Witness—

I read this letter to Mullen (maintenance man here) in the presence of a witness, W. Kelly. Mullen refused to sign and subscribe to it, stating that he did not consider his late correspondence impertinent.—GRAINGER, C.P.S., Condobolin, 27/1/87. Road Superintendent, Forbes. In the presence of the C.P.S., Mullen emphatically refused to sign. He was accordingly paid off.—A.A., 10/3/87.

No. 23.

Telegram from Mr. J. Mullen to Mr. Road-Superintendent Adams.

Condobolin, 27 January, 1887.

RECEIVED your memo., did not see C.P.S. yet.

JNO. MULLENS,

Maintenance Man.

In order to save a 2d. stamp and an envelope, Mullen puts the Department to the expense of a telegram. He has already objected to correspond otherwise with this office. Other maintenance men would not be allowed to do this, why is he?—A.A., 31/1/87. The Commissioner.

Write Mullen at once not to send telegrams except on urgent matters. You cannot expect a maintenance man to correspond also. When next in this district see C.P.S., get papers from him, and if Mullen will not sign and be subordinate, pay him off; be sure to pay in presence of witness and get his receipt.—W.C.B., 2/2/87. Letter sent.—A.A., 9/2/87.

No. 24.

Memo. by The Secretary for Public Works.

Department of Public Works, Sydney, 14 March, 1887.

I SHOULD like a report on the enclosed.

J.S.

Roads.—J.R., B.C., 16/3/87. The other papers on action somewhere, I had them a day or two ago.—W.C.B., 17/3/87. Records, 17/3/87.

This man was discharged by Mr. Morton and restored before inquiry could be made by the peremptory order of Mr. Secretary Lyne. Mr. Wood however reported that the man should have been reprimanded, not dismissed. The officer, Mr. Morton, was removed; his successor, Mr. Adams, is the man referred to by Mullen in the most insubordinate letter herewith; in both cases he was absent as he states from ill-health. I cannot recommend his restoration, it would be subversion of all discipline.—W.C.B., 24/3/87. Under Secretary, B.C.

Submitted.—J.R., 26/3/87. Approved.—J.S., 6/4/87. Roads to inform.—W.F., for U.S., B.C., 7/4/87. Mr. Adams to note and return at once.—W.C.B., 7/4/87. Noted and returned.—A.A., 14/4/87. P.S.—If my treatment of this man is further questioned, I hope due notice will be given me.—A.A. Send memo. that an officer is always advised of any charges against him.—W.C.B., 16/4/87. Memo. sent.

Mr. J. Mullen to A. Stokes, Esq., M.P.

Re conduct of Road Superintendent.

Sir,

Condobolin, 20 February, 1887.

Wonderful to be said, but still more shameful to relate, are the facilities afforded the Forbes Road Superintendent, by which he is enabled to play the *role* of tyrant over his subordinates, and at the same time dupe his superiors into the belief that he is the *creme de la creme* of up-country officers.

From the enclosed papers, and my subsequent statement, it will be seen that I am the *bete noir* of this officers dire hostility. On the 22nd of December last this officer visited Condobolin for the first and only time since. On that occasion I was the recipient of not only considerable abuse, but his menacing gesticulations were provocation to the commission of a breach of the peace. In the interest of my helpless family I restrained my deeply wounded feelings, though, I confess that at the time, my capillary integument manifested a strong inclination to punch holes through the bottom of my hat. I hope this officer's pugnacious attitude, his impertinent and unofficial questions will not be further permitted by his Department else, in the plenitude of my irascible nature, I may be tempted to do something rash.

During flood time, from instructions received, I was in constant attendance on bridges day and night from the 11th to the 21st December. On Sunday night, the 19th of said month, whilst fending logs from bridge, I was bitten by some venomous reptile. In confirmation of this statement I enclose certificate of professional attendance. At the end of the month I furnished the local officer with a return of this overtime. His reply was, "Your application cannot be entertained." I think this treatment is most unjust especially when you find from the enclosed memo. that I have been fined one day's pay for taking a holiday on Prince of Wales' Birthday. Now, Sir, I may state, and memoranda will bear it out, that some fifteen days previous to issuing cheque for November wages, the officer had a return of my time. In that return I distinctly stated that I did not work on Prince of Wales' Birthday, believing it to be a general holiday. On the 22nd of December I was paid in full for November month, and believed then that I was justified in accepting cheque. On that occasion no reference was made by this officer to the 9th of November. How is it that I am fined for this day in February? Had I subscribed to the enclosed copy of letter in condemnation of the public the officers of his Department and myself, a fine for the Prince of Wales' Birthday would never have been imposed.

I have now stated my grievance *in puris naturalibus*.

I, therefore, most respectfully request that you will move for the production of all correspondence from that officer to me and my replies thereto from them, it will be seen whether I am guilty of the impertinence complained of in letter. Still further, I desire that he be called upon to state who are the officers of his Department against whom he wished me to subscribe.

He evidently thought that by his threat of dismissal I would sign anything even to the revocation of the Governor, the extinction of Australia, and the hanging of your humble servant. Have this matter thoroughly sifted in order that this tyrannical gasconading bully may be made aware that old colonists, though occupying subordinate positions, will not suffer to be treated as serfs.

Fiat justitia, ruat cælum.

I have, &c.,

JNO. MULLEN.

[Enclosures.]

Memo. from Mr. Road-Superintendent Adams to Mr. J. Mullen.

Roads Office, Forbes, 3 December, 1886.

WHAT is wrong with the decks of bridges at Condobolin, and why have they been neglected for nine months? In future please let me have a return of your time at the end of each month. Did you lose any time in November? When you correspond with this office address your letters to the Superintendent of Roads and not to me.

ALEX. ADAMS.

Memo. from Mr. Road-Superintendent Adams to Mr. J. Mullen.

20 December, 1886.

ATTACHED to voucher 234 is a cheque for your November wages. Please sign and witness as usual, and return to me as soon as possible. Your attention is also directed to the minute on letter enclosed.

ALEX. ADAMS,

Superintendent of Roads.

Memo. from Mr. Road-Superintendent Adams to Mr. J. Mullen.

Roads Office, Forbes, 24 January, 1887.

PLEASE call with the C.P.S. and receive cheque for your December wages. You will also sign and subscribe to the letter which that gentleman will read in your presence.

In future you will require to furnish this office with a report on the condition of the following roads, which are under your charge, when sending in your time, &c., at the end of each month.

The road to Forbes as far as the crossing at the old public-house; on the south side of river as far as the east end of Crampton's-lane; on all other roads leading out of Condobolin and under this Department on which bridges, culverts, or other works have been carried out for a distance of 10 miles.

All the streets in Condobolin, on cleared portions, you will simply fill up watercourses with ballast on the lines traversed by mail coach.

Please acknowledge receipt of this memo.

ALEX. ADAMS,

Superintendent of Roads, &c.

Memo. from Mr. Road-Superintendent Adams to Mr. J. Mullen.

Roads Office, Forbes, 7 February, 1887.

In your having declined to accept cheque for December wages, which is again herewith tendered, I have to point out that you did knowingly receive, retain, and make use of a cheque for more money than was your just due as wages for the month of November. You absented yourself one day from work in that month without having first obtained leave from your employer; for so offending you were fined in one day's pay. It is scarcely necessary to mention that it was only in reply to my query aent your time for November month, that you admitted your absence on that occasion.

You may employ horse and dray. Fill in gullies with earth of a binding nature, and guarded with stone facing and surface liable to be exposed to the action of water.

ALEX. ADAMS,

Superintendent of Roads.

Mr.

Mr. Road-Superintendent Adams to Mr. J. Mullen.

Sir, I have to point out that the insubordinate spirit displayed in your correspondence with this office has been of such a character as to warrant your immediate discharge. This impertinence may be attributed to the fact that you have lately been the recipient of considerable leniency not only from outside influence but also from the officers of this Department. It is now my duty to finally caution you that the next time I have grounds for complaint, either as regards your work or the tone of your communications, you will be summarily dismissed.

Roads Office, Forbes, 24 January, 1887.

Yours, &c.,
ALEX. ADAMS,
Superintendent of Roads,

Read by Mr. Grainger, C.P.S., in my hearing, this _____ day of _____, 1887.

Witness—

I hereby certify that the within letter is a true copy of the one forwarded to John Mullen by Alex. Adams.
Condobolin, 19th February, 1887. H. W. GREY INNES, J.P.

No. 26.

Medical Certificate.

I HEREBY certify that I attended John Mullen on the night of 19th December, 1886, when he was suffering from the bite of a poisonous animal, which I believe he received whilst watching the bridge across the Lachlan River at Condobolin.

Condobolin, 16 February, 1887.

HENRY DALTON, M.B., &c.

No. 27.

Petition.

The Honorable The Minister for Works, Sydney.

THE humble Petition of the undersigned, residents of Condobolin and District, for and on behalf of ex-maintenance man John Mullen. Respectfully sheweth:—

That the dismissal of the said John Mullen is a case so fraught with hardship to him and family as to demand your immediate and serious consideration. For nearly eight years he discharged the duties of maintenance man in and around Condobolin, in a manner so satisfactory to the public, that his dismissal has now evoked our sympathy. During that lengthened period his civility and strict attention to his duties warrant us in bringing under your notice the magnitude of the hardship to which he has been so unjustly subjected. He has a wife and large family solely dependent upon him for support; and your Petitioners deem it cruel in the extreme that a man, who so faithfully, honestly, and conscientiously discharged the duties incumbent on his position for such a long period should be summarily discharged at the caprice of the local officer.

Your Petitioners, therefore, respectfully request that you will give this case your most serious consideration by offering him employment in some other branch of the Service, or otherwise placing him beyond the surveillance of the officer, by whom he has been so harshly and unjustly treated, and your Petitioners, as in duty bound, will ever pray.

[Here follow 33 signatures.]

Acknowledged, 18/4/87. Roads.—J.R., B.C., 19/4/87. Previous papers.—W.C.B., 20/4/87. 87/3,155. Herewith, 21/4/87.

As a rule I never interfere between the road officers and the maintenance men. The officers are responsible for the work, and it would be quite impossible for this office to inquire into all details of this sort. No man has complained of this officer, Mr. Adams, before, but this is the second instance of a complaint by this man against the Superintendent over him—first in Mr. Morton's case, next in this. This letter is an evidence of his character.—W.C.B., 25/4/87.

Under Secretary, B.C. Submitted.—J.R., 27/4/87. Not to be reinstated, I suppose, is the purport of this minute.—J.R. I think so, but that is for the Minister to say. I think the man's own letter will show how unfit for any subordinate position he is.—W.C.B. Under Secretary, B.C., 30/4/87. Prepare papers.—J.S., 11/5/87. Roads to prepare Return.—J.R., B.C., 16/5/87. Mr. Flynn.—W.C.B., 17/5/87.

No. 28.

Mr. Road-Superintendent Adams, further *re* dismissal of Mullen.

Roads Office, Forbes, 11 May, 1887.

SINCE advised of Mr. Stokes' "notice of motion" in the Legislative Assembly, in *re* the above subject, it occurred to me that the following statement of facts should be furnished in addition to those already appearing on papers 87-713, &c.

The impertinent and insubordinate disposition displayed by this man has already been pointed out and proved. My previous assertions in reference to these developments have been borne out in the most striking manner by the glowing language used in his letter to Mr. Stokes, M.P., and dated the 20th February.

At the time he was discharged, and not for some weeks after, was I aware that such a production of unrighteousness was in existence. Mullen evidently laboured under the delusion that he was being badly used. An investigation of the local correspondence press book will reveal a different state of affairs. It will be found that his treatment has been similar to that of others, that he is not the first maintenance man discharged by me in this district for neglect of duty and insubordination, and that two or three others are "on their last legs," in consequence of similar offences.

In

In December last, a petition, signed by a number of the leading residents of Condoblin, amongst them Messrs. Stevenson and Bolton, J.'s P., was sent to this office, drawing my attention to the state of the Forbes Road, approaching Condoblin. Now, Mullen was paid for keeping this same piece of road in proper repair, and, strange to say, these are the same men who upheld Mullen, and condemned the action of Mr. Morton in discharging him.

One of the places referred to in the petition, about half a mile from the village, has just been repaired at the handsome sum of £55. Had Mullen attended to his duties as he should, and applied stakes and boughs, &c., to stop, scour, and induce deposit, this outlay could have been easily averted. Instead of being out at this kind of work in wet weather he remained at home. This has been proved beyond a doubt, for on an occasion of this kind he was found safely ensconced under the shelter of his own roof.

In addition to the above obstruction (now removed) there are three or four others of a minor nature to which his attention was directed on date of my first visit. These, on a subsequent occasion, were found in the same wretched state. He ignored my instructions.

On paper 87-713 reference was made to the state of crossing at old public-house, when I passed it on 22nd December. On that occasion, Mullen admitted not having visited it later than the month of October, a period of nine weeks. This admission, which I made a note of, he emphatically contradicted on a subsequent occasion.

When executing some repairs on the Euabalong Road he declined to inform me of a serious obstacle on that road, word reaching me from outside sources, and when asked why he did not inform, he replied that "it was not his business."

In Culugo-lane, on same road, traffic was all but interrupted, in consequence of extensive gorges, the results of his neglect in not guarding against scour. In order to keep the road open, he was authorised to employ horse and cart to execute immediate repairs, at the same time instructing him how to proceed. (*See letter with other papers, dated the 7th February.*) These instructions he completely set aside. I travelled by this road when repairs were done, in extremely wet weather, and found the material which he had deposited being swept out of sight and the gorge reforming. Note the result:—Mr. M'Lean's three-horse mail and passenger coach travelling to Euabalong broke down in this same spot a very short time after.

When discharged he objected to give up tools, &c., until threatened with legal proceedings.

This man's restoration last year has been considerably commented on throughout this district, and has had a very telling effect upon the disposition of other men in the district. One writes, a few days ago, to say that he will see the member for this district, whether through him he cannot compel the Department to refund "a day's wages," deducted from him lately for absence from duty.

ALEX. ADAMS,
Superintendent of Roads.

1887.
(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

BRIDGE OVER THE RIVER DARLING AT WENTWORTH.
(CORRESPONDENCE.)

Ordered by the Legislative Assembly to be printed, 3 May, 1887.

RETURN to an *Order* of the Honorable the Legislative Assembly, dated 30th March, 1887, That there be laid upon the Table of this House,—

“Copies of all papers, petitions, correspondence, reports, and plans in reference to the erection of a bridge over the River Darling at “Wentworth.”

(Mr. Abbott.)

Tracing of section of site for proposed Bridge, referred to in paper No. 4—Mr. Philben's Report	11

[805 copies—Approximate Cost of Printing (labour and material), £11 9s. 9d.]

BRIDGE OVER THE RIVER DARLING AT WENTWORTH.

No. 1.

Mr. J. H. Thomas to The Commissioner for Roads.

(65-138.)

In compliance with your instructions I visited Wentworth to examine the ana-branch of the Darling River, and after a careful perusal of the papers in connection with the subject, which I return herewith, beg to submit the following report:—

The site selected by Mr. Surveyor Wood is, in my opinion, the best adapted for a bridge; it is situated about 10 miles from Wentworth, and 2 from the confluence of the ana-branch with the River Murray, and is on the main road to Adelaide and the Upper Darling runs.

The sum of money voted (£500) is totally inadequate for the construction of a bridge capable of meeting the growing requirements of the traffic, although from the fact of there being but a trifling current and no timber ever coming down the creek, a very simple class of structure would be sufficient.

Hitherto this ana-branch has not been navigated, but at the time of my visit a steamer was about to make the attempt, in order to bring down a large quantity of wool, and in the event of its being successfully accomplished, of which there was little doubt, it would be followed by others; some provision should therefore be made in the bridge for allowing the boats to pass, although the navigation would be confined to three or four months in the year, as for a like period the creek has been known to be at this spot perfectly dry.

Timber (red-gum) suited for such a bridge can be obtained in the bends of the Murray, within 3 or 4 miles of the site, and the bed of the creek having about 2 feet of soft mud overlying a bed of clay, would make the pile-driving comparatively easy, but as it is not probable that any competent person would be found to tender in the immediate district, the contract would be tendered for by persons residing at a distance, and the conveyance of plant, &c., would cause them to allow of a wide margin in their estimates.

Taking all these circumstances into consideration, I do not think a bridge could be constructed to meet the requirements of the daily increasing traffic on this important road for a less sum than that named by you, viz., £4,000.

The water in the creek, which had been falling for the last two or three weeks, was at the time of my visit exactly at the level marked on Mr. Woods' section as "probable highest flood level," but I found unmistakable indications of its having been 1'35 higher.

As I could not procure a boat to take soundings with, without causing a delay of some days, I was compelled to content myself with checking the levels on either bank, and the distances, all of which agreed with section.

There are at present two punts at work at this crossing-place, but too small and inconvenient for general purposes. I think, therefore, that if the sum voted cannot be augmented, it would be as well to expend the £500 in the construction of a good serviceable punt, and in forming over the low swampy ground on the north-east approach a logged road of about 4 chains in length.

From the general geographical position of Wentworth, with reference to the three Colonies of Victoria, New South Wales, and South Australia, and its being situated at the junction of two such navigable rivers as the Darling and the Murray, I believe it will become the largest and most important town in the Riverina District, so that it is not improbable that at no distant date application may be made for a bridge over the Darling. I therefore made an inspection of its banks for some distance up; the river however being flooded, I did not feel warranted in going to any expense and delay in procuring boats to take soundings, but from the inspection made, I consider the best site for a bridge would be in a direct line with Sandwych-street. (*See lithographed plan of township.*)

It would be necessary that the bridge here should be of iron, as from what I saw of the timber there would be far greater difficulty in obtaining long lengths than even at Deniliquin, and it is of an inferior quality, quite unsuited for the construction of a large work.

The bed of the river is admirably adapted for the sinking of cylinders or screw piles.

A swing opening would have to be made, as from the lowness of the banks on either side, and the approaches being in a street, it would be impossible to get sufficient headway for the steamers.

There is some good durable stone to be procured on the banks of the Murray, 20 miles down the river, and good lime can also be obtained 8 miles up the river, at a place known as Mount Lookout, both of which could be landed at site for bridge by steamers.

Bricks are made and sold here for from £3 to £3 5s. per thousand; carpenters and other mechanics get from 12s. to 14s. per day, and labourers from 7s. to 8s.

Of course the ironwork for such a bridge could, if from England, be brought up from Adelaide by the steamers, and laid down on the spot.

JAS. H. THOMAS, 6/1/65.

Will Mr. Thomas be good enough to state if the log road proposed will give access to the punt or bridge at all levels of flood, and also if a bridge is built at a cost of £4,000, what the cost of making approaches available at all floods will be? The necessity for an opening for steamers will preclude a bridge being built at less cost, and previous to committing the Government to such an expenditure I should like to know how far it would be available at all times of flood. Is there any similar obstacle to this on the road from Deniliquin to Wentworth? Both the Darling and the Murrumbidgee have, I presume, punts. Did Mr. Thomas ascertain by enquiry what the obstacles were, if any, on the Adelaide side? My object is to ascertain if this, at Wentworth, is the greatest impediment to transit between Sydney and Adelaide; if so, the Government of New South Wales would be warranted in incurring a larger outlay than if it were a local want only. The bridge over the Darling has not been asked for, and as I presume there is a punt, must wait until the ana-branch bridge is built.—W.C.B., 17/1/65. Mr. Thomas. To be returned.

No. 2.

No. 2.

J. H. Thomas' reply to Minute on 65/138.

THE log road would give access to the proposed bridge during floods of the highest known level, and would not cost more than £100. The road to the bridge on the Wentworth side is, from the nature of the soil, very bad in wet weather, but has never been impassable.

As the necessity of an opening for steamers will of course depend upon whether the navigation of the ana-branch is practicable, I have written to know if the attempt I refer to in my report was made, and, if so, with what success.

There are several small creeks to be crossed between Deniliquin and Wentworth, but the only one that seriously impedes the traffic is the Gol Gol Creek, some 20 miles on this side of the Darling. This creek is crossed about 40 chains from its junction with the Murray River, and is often impassable for drays. At present there is being worked by the mail contractor a boat, by which light vehicles are taken over. A bridge here would not cost less than £1,200.

There is a large punt in excellent working order on the Darling at Wentworth, and another, although much inferior, on the Murrumbidgee at Balranald. The approach, for some 3 or 4 miles to the latter, is during flood times under water, white boards being fastened on the trees to indicate the line of road.

I should mention that by far the greatest amount of traffic to Wentworth is from Victoria *via* Swan Hill and Euston.

On the Adelaide side I was given to understand by the mail contractor the obstacles were but trifling.

Resubmit.—W.C.B., 10/2/65.

JAS. H. THOMAS, 4/2/65.

No. 3.

Mr. J. Higgins to The Secretary for Public Works.

Sir,

Wentworth, 30 December, 1876.

I am instructed by several clients, inhabitants of the town, to elicit information in reference to the erection of a bridge across the Darling at Wentworth. As from my own knowledge the work is of the greatest importance to the district, I have no doubt you will give the subject the attention it merits. So far as I can learn, I believe this work was contemplated, and plans prepared many years ago, which no doubt will be found deposited in the proper office, and as the parties interested are now fully determined to move in the matter, I will be glad to know what the Department may require to give effect to our wishes.

I have, &c.,

JOSEPH HIGGINS,

Solicitor.

Roads for report, B.C., 5/1/77.—J.R. There is a section of the Darling at Wentworth in the office; it is with the Wentworth punt papers; look it up.—W.C.B., 6/1/77. Cannot trace papers. There is a large batch of papers relating to this—some years old—look back.—W.C.B., 3/2/77. It may be under the head of "Bridge, Wentworth." Nothing recorded under the head of Wentworth. There are papers connected with a punt at Wellington.—J.S.W., 6/2/77. Look through Wentworth embankment and street papers. Is Mr. Philben aware of any previous action in this matter, or of any section having been taken for a bridge here; if so, please give reference; if not, send in section and report?—G.C.E., for Com. Mr. Philben, B.C., 5/3/77.

It is thought that Mr. Thomas made report and section in 1864, when surveying site for the bridge over the ana-branch. It is the opinion of most people out of Wentworth that the traffic would not warrant the erection of a bridge at Wentworth at present—an opinion with which I entirely concur. A Government punt at moderate scale of charges will suffice for many years to come.

Mr. Gunn, the present punt-owner, informed me the traffic was scarcely sufficient to pay for working his punt, and hence his high scale of charges.—G. PHILBEN, 13/3/77. The Commissioner, B.C. Look up report in question.—W.C.B., 17/3/77. Papers herewith. For Mr. Thomas' report; please see 65-138 and 65-368.—J.S.W., 19/3/77. Mr. Thomas' report herewith, by which Mr. Philben will see he did not make a section. Mr. Philben will please take section.—W.C.B., 19/3/77. Mr. Philben, B.C., 65-138 and 65-368 herewith, to be returned. Will take section and report as soon as other more important duties admit.—G. PHILBEN, 10/4/77. The Commissioner, B.C. Re-submit in a fortnight.—W.C.B., 13/4/77. Remind Mr. Philben.—W.C.B., 8/5/77. Mr. Philben, 9/5/77. File.

No. 4.

Mr. G. Philben to The Commissioner for Roads.

Sir,

Deniliquin, 25 July, 1877.

In compliance with the instructions contained in your minute on a letter from Mr. Higgins, of Wentworth, respecting the erection of a bridge over the Darling at Wentworth, I have now the honor to transmit herewith tracing section of the most suitable site, and to report that in my opinion the amount of traffic there at present would not warrant the erection of such a structure.

The traffic at present is confined to the mail coaches once a week from Menindie, from Balranald, and from Swan Hill, together with a few buggies now and then from some of the adjoining stations. There is a very good punt there at present, owned by Mr. Gunn, of Wentworth, and the only complaint I heard against it is that his charges are too high, and he states that the receipts scarcely cover the working expenses. Nearly the whole of the heavy traffic at this place is by water. Any bridge erected here should be either above high-flood level, at sufficient height to allow steamers to pass under it, or a swing or drawbridge. The former, I consider, would be unsuited to the locality, owing to the height to which the approaches would have to be raised. In my opinion a light pontoon bridge would suit best, and meet all the requirements of the case for many years to come.

Before

Before determining on the plans of a bridge, it will be necessary to sink trial shafts and make borings, as there is no knowing the depth of drift-sand through which the piers would have to be sunk. At the excavation and sinking of wells, drift sand is met about 10 to 12 feet from the surface.

The hopes entertained by Mr. Thomas as to the future of Wentworth, as set forth in his report on this matter, have not come to pass, but on the contrary, since the flood of 1870 Wentworth appears to be falling away, and in a languishing state, while other townships on the Darling have made considerable progress. After a careful consideration of the matter I am of opinion that it is not advisable to incur any great outlay in the erection of a bridge there, and that a pontoon bridge will be sufficient for the traffic for many years to come, and that the necessity for even that is not very great at present.

The portion of the streets tinted red* on the tracing† is metalled, and the dotted line from A to B is the line of the section taken. It appears to be the most suitable site. When taking the soundings the current was scarcely perceptible, as the Darling was backed up by the Murray River; the latter was rising, while the former was not, except by the backwater from the Murray.

I have, &c.,
G. PHILBEN.

Resubmit with papers.—W.C.B., 30/7/77. Papers now submitted.—J.S.W., 30/7/77. Re-submit when new schedules are being prepared.—W.C.B., 23/8/77. Noted.—G.C.E. File.

* Appendix.
† Not shown on tracing.

No. 5.

Resolution of Public Meeting, Wentworth.

EXTRACT from proceedings of a public meeting, held at the Court-house, Wentworth, on the 30th November, 1877,—Wm. Gunn, Esq., in the chair:—

Moved by Henry M'Cormack, Esq., J.P., seconded by Mr. John S. Upton, storekeeper,—“That our Member be requested to have a sufficient sum placed on the Estimates for the erection of a bridge over the Darling, at Wentworth.”

Roads for report, B.C., 3-5/1/78.—J.R. There are papers on this, and I think a section.—W.C.B., 5/1/78. Previous papers now submitted.—J.S.W., 7/1/78.

Mr. Philben reports that a bridge is not required here, and that the most they could expect would be a pontoon bridge; this I cannot recommend. The light timber in this country is worthless, and the heavy timber is unsuited for such a work. An iron bridge with steel lifting span of 60 feet, and two 85-foot spans on either side, as proposed for Balranald and Bourke, would cost £15,000. I do not think the traffic justifies the expenditure.—W.C.B., 7/1/78. Under Secretary, B.C. P.W.O., 9/1/78. Inform.—J.S., 10/1/78. Wm. Gunn, Esq., informed, 11/1/78. Roads, B.C., 12-15/1/78.—J.R. File.—W.C.B., 15/1/78.

No. 6.

The Under Secretary for Public Works to W. Gunn, Esq.

Sir, Department of Public Works, Sydney, 11 January, 1878.

Referring to your letter of 30 November last, requesting that a sum of money may be placed upon the Estimates for the construction of a bridge over the Darling River, at Wentworth, I am directed to inform you that, acting upon a report which has been received from the Commissioner for Roads, the Secretary for Public Works does not consider that the traffic would justify the expenditure that would be required for a suitable bridge at this place.

I have, &c.,
JOHN RAE.

No. 7.

The Mayor of Wentworth to C. W. Simson, Esq., M.P.

Sir, Municipal Chambers, Wentworth, 26 November, 1879.

I have the honor, at the request of the Municipal Council, to forward you a most numerous signed memorial to the Honorable the Minister for Public Works, praying that a sum may be placed on the Estimates for the erection of a bridge over the Darling, at Wentworth.

The necessity for this work has been brought to the notice of the Minister on previous occasions, and this Council trusts that the present memorial may have the effect of having the matter at once considered, and, if practicable, carried out.

I have, &c.,
WILLIAM GUNN,
Mayor.

Forwarded to the Honorable the Secretary for Public Works. This petition is the second or third application for a bridge at Wentworth, which has been reported to me from many sources as being a most necessary work. On the last occasion it was to be referred for report to the Engineer for that district, but his reply had not reached me. I have the honor to request that you will take the wishes of the petitioners into your favourable consideration, and place the necessary sum on the Supplementary Estimates for the purpose of erecting a bridge over the Darling River, at Wentworth.—C. W. SIMSON, 8 December, 1879.

Acknowledge.—

Acknowledge.—C. W. SIMSON, M.P., 10/12/79. Commissioner for Roads.—J.L., 10/12/79. B.C., 10-11/12/79. Previous papers.—W.C.B., 11/12/79. 78-130 herewith.—J.S.W., 12/12/79. Might be informed would be considered when next estimates are being prepared.—W.C.B., 13/12/79. Under Secretary.—P.W.O., B.C., 15/12/79. Approved.—J.L., 15/12/79. Colin W. Simson, M.P., 20/12/79. Roads.—G.H., B.C., 20-23/12/79. On the 7th January, 1878, I reported that the traffic would not justify the expenditure for a bridge here, which would amount to £15,000.—W.C.B., 30/12/79. Under Secretary.—P.W.O., B.C., 2/1/80. Mr. Simson, M.P., may be informed of the Commissioner's report.—J.L., 2/1/80. Colin W. Simson, M.P., 6/1/80. Roads.—G.H., B.C., 6/1/80. File.—W.C.B., 6/1/80.

No. 8.

Petition to The Secretary for Public Works.

To the Honorable the Minister of Public Works, Sydney,—

The memorial of the residents of Wentworth and the Lower Darling District,—

HUMBLY SHOWETH:—

1. That a bridge across the River Darling at Wentworth is urgently required. The number of mails (eight weekly), the traffic of stock, and the carriage of merchandise being large and constantly increasing, while the only means of crossing the river is by punt.

2. That the geographical position of Wentworth, at the junction of the two great water highways of Australia, and, being the most direct road from Sydney to Adelaide, renders facilities for crossing the river necessary.

3. That the revenue from the district is a very large one, and that the pastoral tenants, who are the principal contributors to that revenue, would be largely benefited by a bridge being erected across the Darling at Wentworth.

4. That the recent formation of a municipality at Wentworth has given a great stimulus to the prosperity of the district, which would be greatly accelerated by the erection of a bridge, tending greatly to increase traffic by giving facilities for it, and would foster settlement on the eastern side of the Darling and district generally.

5. That the portion of the township on the eastern side of the river is practically useless, as the business people, who would find desirable residences there were a bridge erected, would at present find communication with the Government offices in the township both inconvenient and expensive, viz., post and telegraph offices, custom-house, court-house, and land office, which are all on the western side of the river, and would also be practically without police protection.

6. That the greater part of the commonage for the town is on the east side of the river, and the inconvenience and expense of utilizing it is very great; also, that the supply of firewood on the west side of the river is limited, whereas on the eastern side there is abundance for the consumption of the town for many years.

7. That bridges are now being erected at Bourke and Balranald, neither of which towns have, in the opinion of your memorialists, such urgent claims to your consideration as Wentworth, which, from its being the port of entry for nearly all the merchandise consumed in the extensive Darling district, and a commercial depôt for its distribution to a large part of that district, must always command a large traffic.

8. And your memorialists therefore petition that you will cause to be placed on the Estimates such a sum as you may, in your wisdom, consider necessary for the erection of the bridge asked for.

And your memorialists, as in duty bound, will ever pray.

[Here follow 270 signatures.]

No. 9.

The Under Secretary for Public Works to C. W. Simson, Esq., M.P.

Sir,

Department of Public Works, Sydney, 20 December, 1879.

Referring to the petition forwarded by you from the Mayor and residents of Wentworth, requesting erection of a bridge over the Darling at that place, I am directed by the Secretary for Public Works to inform you that this matter has been noted for consideration, when the next Estimates are being prepared.

I have, &c.,

GERALD HALLIGAN,
Acting Under Secretary.

No. 10.

The Under Secretary for Public Works to C. W. Simson, Esq., M.P.

Sir,

Department of Public Works, Sydney, 6 January, 1880.

With reference to my letter to you of the 20th ultimo, on the subject of the erection of a bridge over the Darling at Wentworth, I am directed to inform you it appears from a report which has been received from the Commissioner for Roads, that the traffic would not justify the outlay necessary to construct the bridge in question, which would not amount to less than £15,000.

I have, &c.,

GERALD HALLIGAN,
Acting Under Secretary.

No. 11.

W. A. Brodribb, Esq., M.P., to The Secretary for Public Works.

Sir,

Buckhurst, Double Bay, 8 December, 1880.

I have the honor to bring under your notice the following resolution, passed at a meeting of the Wentworth electors, on the 17th ultimo, in the Court-house, Wentworth, the Mayor presiding.

* * * * *

2. It was proposed by Mr. Upton, seconded by Mr. Tonkin, "That a bridge over the River Darling is most urgently required. Visitors to the town, as well as residents, drovers, and others, all clamour for a bridge, it being patent to everyone that the want of a bridge is strongly felt by everyone, and that the town would have prospered far more than it has done if free traffic across the river could have been obtained in past years."

I have, &c.,

WM. A. BRODRIBB.

Ackgd., 11/12/80. Roads, B.C., 13/12/80.—J.R. Resubmit with papers, with which there is a section.—W.C.B., 14/12/80. Submitted, 14/12/80. Telegram sent Mr. Dooner; resubmit with reply.—W.C.B., 15/12/80. Mr. Dooner's report with my minute herewith.—W.C.B., 20/12/80.

No. 12.

Mr. P. Dooner to The Commissioner for Roads.

Sir,

Balranald, 16 December, 1880.

As instructed in your telegram of the 15th instant, I have to report on the proposed bridge over the Darling at Wentworth, as follows:—

I visited Wentworth in October last, and as I then heard it stated that it was the intention of the residents of Wentworth to ask the Government to bridge the Darling at Wentworth, I made general inquiries as to the traffic to be accommodated and other conveniences to the residents that accrue from a bridge being built over the Darling River at that place.

From such information as I could obtain it appears that about 150,000 sheep may cross the river in a year. The wool traffic is very small, as the wool is shipped at the sheds up the rivers. The general merchandise is brought to Wentworth by boat and landed on the town side of the river.

There is no settlement of any account in the district, and as it is a pastoral country the population is not likely to increase rapidly.

The chief traffic to be accommodated is the "up-river" mails, a few residents in the district, and the residents in the town who may desire to go up the river on business or pleasure. The traffic does not now warrant the large expenditure required to bridge the Darling River at Wentworth.

I may mention that the punt on the Darling, at this place, is private property, and the landing-places also private property, although there are good landing-places on Crown lands close by. The tolls charged on this punt are as follows:—

	£	s.	d.
Foot-passengers, each... ..	0	0	6
Saddle-horses, "	0	2	0
Lead-horses, "	0	1	6
Vehicles, per wheel	0	1	0
Sheep, per thousand	2	0	0
Cattle, each	0	1	0

The above scale of tolls is payable for every crossing; thus a buggy and pair of horses pay 7s. each crossing.

At Balranald the following tolls are charged, the punt being private property, but with landings on Crown lands:—

	£	s.	d.
Horses, each	0	1	0
Buggies, each wheel	0	0	6
Wagons, " "	0	1	0
Bullocks, each	0	1	0
Sheep, per thousand	1	0	0
Foot-passengers	0	0	6

The above toll is payable only once in twenty-four hours.

Now that a Municipality has been established at Wentworth, the Municipal Council have it in their power to license a punt, at a reasonable rate of tolls, which will meet the requirements of the traffic.

I have, &c.,

P. DOONER.

A bridge at Wentworth must be a drawbridge and very expensive. I concur with Mr. Dooner in thinking it unnecessary, as I have already reported, but I consider it advisable to build a punt here and put it to ply at the street referred to. This will compel the present owner to reduce his very exorbitant rates, the pressure of which causes the demand for a bridge.—W.C.B., 20/12/80.

Under Secretary, B.C. Approved.—J.L., 21/12/80. W. A. Brodrigg, Esq., M.P., 23/12/80.
Roads, B.C., 23/12/80.—J.R. File.—W.C.B., 29/12/80.

No. 13.

The Under Secretary for Public Works to W. A. Brodrigg, Esq., M.P.

Sir,

Department of Public Works, Sydney, 23 December, 1880.

With reference to that portion of your letter of the 8th instant, which relates to the erection of a bridge over the Darling River at Wentworth, I am directed to inform you that acting upon the report of the Commissioner for Roads to the effect that any bridge erected at the site in question must be a drawbridge, and would consequently be a very expensive structure, the Secretary for Public Works cannot authorize a compliance with your request.

I am to add however that a punt will be constructed, and will ply from the street referred to, thus compelling the owner of the present punt to reduce his exorbitant charges.

I have, &c.,

JOHN RAE.

No. 14.

No. 14.

The Under Secretary for Public Works to The Commissioner for Roads.

Sir, Department of Public Works, Sydney, 24 January, 1881.
 Referring to the extract of a letter from W. A. Brodrigg, Esq., M.P., forwarded to you by my B.C. minute of the 11th ultimo, on the subject of a bridge over the river Darling at Wentworth, also repairs of streets and roads in the vicinity of that town, I am directed by the Secretary for Public Works to request the favour of an early reply.

I have, &c.,
 JOHN RAE.

The reply was sent some days ago; Mr. Hiles to say when.—W.C.B., 25/1/81. Papers herewith, 80-7,386 bridge, 80-7,325 streets.

It will be seen by paper herewith that I replied to communication referred to of the 11th ultimo on the next day, and that Mr. Brodrigg was informed on the 23rd. I omitted to forward Mr. Dooner's telegram as to the streets now herewith, in which he states that the work in question is in progress.—W.C.B., 31/1/81. Under Secretary, B.C.

Inform Mr. Brodrigg.—J.R., 1/2/81. Done, 3/2/81. Roads, B.C., 5-7/2/81.—G.H. (for U.S.) File.—W.C.B., 8/2/81.

No. 15.

The Under Secretary for Public Works to W. A. Brodrigg, Esq., M.P.

Sir, Department of Public Works, Sydney, 3 February, 1881.
 Referring to your letter of the 8th December last, respecting works required in your electorate, I am directed to inform you
 * * * * *
 With reference to the proposal to erect a bridge over the Darling River at Wentworth, I am to state that owing to the great expense that would be necessary to provide a suitable structure, the outlay cannot be sanctioned at present, but that a punt will be provided at the place for crossing the traffic.
 * * * * *

I have, &c.,
 JOHN RAE.

No. 16.

W. A. Brodrigg, Esq., M.P., to The Secretary for Public Works.

Sir, 133, Macquarie-street, Sydney, 19 April, 1881.
 I have the honor to forward you a letter I have just received from Mr. D. Tomlinson, Honorary Secretary to the Wentworth Bridge Committee, and also the report of the proceedings of a large public meeting which took place on the 7th instant, with reference to a bridge over the Darling at the Wentworth township.

I venture to submit those documents to you in the hope that your colleagues and yourself will take into your serious consideration the unanimous resolutions passed at that meeting, and have a sum of money placed on the Estimates for the purpose of erecting the said bridge as early as possible.

I have, &c.,
 WM. A. BRODRIGB.

Acknowledged, 20/4/81. Road., B.C., 20-21/4/81.—J.R. Previous papers.—W.C.B., 21/4/81. 81-358 papers herewith, 26/4/81.

I have nothing to add to my minute on 80-7,386 herewith. A bridge here must be very expensive; it will have to be a lift or drawbridge. I think the provision of a punt to keep down the rates is all that is required at present. The railway will be here before very many years, and a road bridge would then be almost useless.—W.C.B., 26/4/81. Under Secretary, B.C.

Inform.—J.L., 6/5/81. W. A. Brodrigg, Esq., M.P., 7/5/81. Roads, B.C., 7/5/81.—J.R. File.—W.C.B., 7/5/81.

No. 17.

Mr. D. Tomlinson to W. A. Brodrigg, Esq., M.P.

Dear Sir, Wentworth, 13 April, 1881.
 I have the honor to place myself in communication with you, on behalf of the Bridge Committee, appointed by a public meeting held at Wentworth on Thursday, April 7th.

In the first place it will be necessary to give you a short outline of the methods that have been adopted for drawing the Minister for Public Works' attention to this long felt want.

Previous to the year 1879 two or three petitions from the Wentworth district were sent to the Public Works Department praying that a sum of money may be placed on the Estimates for carrying out the work in question. The answer to these petitions was always to the effect that the Minister was advised that the traffic would not warrant the expenditure.

In 1879, however, the people became more alive than ever to the fact that the absence of a bridge was materially hindering the progress of the town, and a committee was formed, which worked hard to secure for us the long wished for bridge. In communicating with Mr. Colin Simson, who was then Member for our district, he advised us to proceed by again drawing up a petition, which he promised to present to the Minister, and he held out hopes that we should be at last successful. In accordance with his advice a memorial was drawn up, which contained the arguments in favor of the expenditure we asked for. That memorial was numerously signed. I have not a record of the exact number, but I should think about 300 signatures were obtained—all signatures of men residing in the district, who would be benefited by the erection of a bridge.

That

That memorial was presented by Mr. Colin Simson to the Minister for Public Works in December, 1879, but unfortunately the only result was the old reply, which would seem to be stereotyped in the office, "that the Road Superintendent reported that the traffic was not sufficient to warrant the expenditure."

Since that nothing has been done until last week. We now respectfully ask your advice as to the best mode of renewing the agitation. Do you think it advisable for us to send in another petition? If so, would it be useful to back such petition up by a deputation to Sydney? Or would the petition sent in 1879 be available, and a deputation sent to support that be useful? Will you kindly suggest to the committee what you consider best to be done. Meanwhile I will draw up, for your information, and send by next post, an epitome of the principal arguments and reasons which make us think that we are asking for nothing that we are not justly entitled to from the Government.

I have, &c.,

D. TOMLINSON,
Hon. Sec. to Bridge Committee.

No. 18.

The Under Secretary for Public Works to W. A. Brodribb, Esq., M.P.

Sir,

Department of Public Works, Sydney, 7 May, 1881.

In reply to your letter of the 19th ult., requesting the erection of a bridge over the Darling, at Wentworth, I am directed to inform you it appears, from a report which has been received from the Commissioner for Roads, that the erection of a bridge would be a most expensive undertaking, and that the providing a punt to keep down the rates for crossing is all that is required at present, especially as a line of railway will be constructed before many years which would render a road bridge almost useless.

I have, &c.,

JOHN RAE.

No. 19.

W. A. Brodribb, Esq., M.P., to The Secretary for Public Works.

Sir,

No. 133, Macquarie-street, Sydney, 7 May, 1881.

I have the honor to enclose you a copy of a letter just received from Mr. D. Tomlinson, honorary secretary to the Bridge Committee at Wentworth, giving a list of reasons why a bridge should be erected over the Darling River at Wentworth. May I ask you, as the Member for Wentworth, to take this letter into your favourable consideration, and send your reply through me.

I have, &c.,

WM. A. BRODRIBB.

Acknowledged, 10/5/81. Roads, B.C., 11/5/81.—J.R. Previous papers.—W.B., 12/5/81.
Herewith, 12/5/81.

I have already stated that the railway question complicates this matter. At neither Bourke nor Balranald is the navigation of such importance, and at Wentworth the banks are higher and better defined than at Balranald, which makes the place more accessible by punt.—W.C.B., 13/5/81.

Under Secretary, B.C., P.W.O., 17/5/81. Inform.—J.L., 20/5/81. W. A. Brodribb, Esq., M.P., 23/5/81. Roads, B.C., 23/5/81.—J.R. File.—W.C.B., 27/5/81.

No. 20.

Mr. D. Tomlinson to W. A. Brodribb, Esq., M.P.

Dear Sir,

Wentworth, 22 April, 1881.

In accordance with the promise contained in my letter of the 13th inst., I now send you a list of some of the reasons in favour of the erection of a bridge over the River Darling at Wentworth:—

1st. The importance of our township as to geographical position, situated as it is at the junction of the two great water highways of Australia, ensures it an ever-increasing progress in direct proportion to the development of the natural resources of the Darling District. A bridge, by giving facilities for traffic, would both directly and indirectly hasten that development.

2nd. The existing traffic is very great, upwards of 138,000 sheep having crossed at the punt during the past fifteen months. Six mail coaches cross the river every week, also four coaches running in opposition to mails.

This traffic is only what is absolutely compelled to cross at Wentworth, as the present punt is not such as to entice people travelling with stock, or without, to come to Wentworth to cross. The punt is especially dangerous during the times that the river is low, owing to the steepness of the banks, and the traffic in proportion is almost prohibitory.

3rd. Therefore we feel confident that a bridge would result in an enormous increase of traffic, and would be a great benefit to both the residents in the township and to the pastoral tenants of the whole district.

4th. The township, as laid out on the eastern side of the river, is almost unoccupied, but were a bridge erected it would speedily be occupied, and in no long time would rival the western side, where the public offices and business sites are at present in prosperity.

5th. We think that our claims for a bridge are at least equal to those of Balranald or Bourke, at which places bridges are nearly completed, and we believe that a bridge here would benefit more people than those bridges.

6th. There is no bridge across the Darling from its junction with the Murray to Bourke, a distance of over 1,000 miles of settled country.

I hope that the foregoing will assist you in fighting for what the Wentworth people regard as a just claim, and what they believe will materially benefit the whole district, viz., the bridge at Wentworth.

I remain, &c.,

D. TOMLINSON,

Secretary to the Bridge Committee.

No. 21.

The Under Secretary for Public Works to W. A. Brodribb, Esq., M.P.

Sir,

Department of Public Works, Sydney, 23 May, 1881.

Referring to your letter of the 7th instant, enclosing communication from Mr. D. Tomlinson on the subject of the erection of a bridge over the river Darling at Wentworth, I am directed to refer you to my former letter to you to the effect that as the railway policy will complicate the question of the bridge it is considered desirable to defer any decision for the present.

I may point out that neither at Bourke nor Balranald is the navigation of such importance as at Wentworth; the banks being high and well defined, make the place more accessible by punt.

I have, &c.,

JOHN RAE.

No. 22.

The Council Clerk, Wentworth, to W. A. Brodribb, Esq., M.P.

Dear Sir,

Municipal Chambers, Wentworth, 26 October, 1881.

I am directed by the Municipal Council of Wentworth to request that you will, in terms of a resolution moved by the Mayor and seconded by Alderman Bowring, apply to have a sufficient sum of money placed on the present Estimates for the construction of a pontoon bridge over the Darling at Wentworth.

I have, &c.,

JOSEPH HIGGINS,

Council Clerk.

Receipt acknowledged.—J.R., 31/10/81. Roads, B.C., 3/11/81. Previous papers.—W.C.B., 4/11/81. 81/2,230 herewith, 7/11/81. Put with papers to be submitted when Mr. Dooner is in the office.—W.C.B., 8/11/81.

I do not think an expensive bridge necessary here, and it must necessarily be an expensive bridge, as a drawbridge and pontoon bridge would be most unsatisfactory; indeed little better than the punt, which I think is quite enough for the traffic.—W.C.B., 23/11/87.

Under Secretary, B.C. P.W.O., 25/11/81. Mr. Brodribb may be so informed.—J.R., 26/11/81. W. A. Brodribb, Esq., M.P., 28/11/81. Roads, B.C., 28/11/81.—J.R. File.—W.C.B., 29/11/81.

No. 23.

The Under Secretary for Public Works to W. A. Brodribb, Esq., M.P.

Sir,

Department of Public Works, Sydney, 28 November, 1881.

Referring to the letter of the Council Clerk of Wentworth, dated the 26th ultimo, requesting the construction of a pontoon bridge over the Darling River at that town, I am directed to inform you that the construction of a bridge at the place indicated would be too expensive a work, and a pontoon bridge as proposed would be most unsatisfactory, and little better than the present punt, which is considered quite sufficient for the traffic at present.

I have, &c.,

JOHN RAE.

No. 24.

The Council Clerk, Wentworth, to E. Quin, Esq., M.P.

(Extract from P.A. 83-10,409.)

Dear Sir,

Wentworth, 3 October, 1883.

I am directed by the Municipal Council to write to you in reference to the pressing wants of this locality.

That a sum of money be granted for the erection of a bridge over the River Darling at Wentworth, for ordinary traffic at such place as may be recommended by the officer representing the Harbors and Rivers Department.

I have, &c.,

JOSEPH HIGGINS,

Council Clerk.

Acknowledged, Roads, B.C., 23/10/83.—J.R. Previous papers.—W.C.B., 24/10/83. 81-4,976 herewith, 25/10/83.

Previous reports herewith point out that a bridge here must be an expensive lift or swing bridge, that the traffic does not justify outlay, and that the question is still further complicated by considerations as to railway extension.—W.C.B., 26/10/83. Under Secretary B.C., P.W.O., 29/10/83.

Submitted, 29/10/83.—J.R. Inform.—F.A.W., 30/10/83. Edward Quin, Esq., M.P., 31/10/83. Roads B.C., 31/10/83.—J.R. File.—W.C.B., 2/11/83.

No. 25.

The Under Secretary for Public Works to E. Quin, Esq., M.P.

Sir,

Department of Public Works, Sydney, 31 October, 1883.

Referring to the letter forwarded by you from the Council Clerk, Wentworth, urging the erection of a bridge over the Darling River at that township, I am directed to inform you it appears from the report which has been received from the Commissioner for Roads, that the bridge in question would be a very expensive structure, and the traffic does not justify the expenditure that would be necessary in its erection.

I have, &c.,

JOHN RAE.

No. 26.

Minute by The Secretary for Mines.

Punt over the Darling, at Wentworth.

WHEN I was in Wentworth, on the 8th of May last, a deputation of the townspeople waited upon me in reference to the erection of a bridge over the Darling, at that town. I heard all they had to urge in favor of their proposal, but to my mind they advanced no sound reasons why the Government should erect a bridge at the point indicated. It would be costly, and would serve few people, and I so informed them.

I then visited the proposed site of the bridge, where there is a Government punt. The punt is altogether unsuited for the ordinary traffic. It is old and unsafe, so rotten that it is dangerous to attempt to repair it.

I have no hesitation in stating that I think a new punt ought to be provided at this place without any delay.

I informed the deputation that on my return to Sydney I would recommend to the Government that a sum of money should be placed on the Estimates for next year for a new punt.

It is stated that the present punt is twenty years old, and that it is unsafe to place more than half a ton weight upon it.

9th July, 1885.

J. P. ABBO'TT.

The Commissioner for Roads,—Resubmit previous papers on bridge and punt.—W.C.B., 10/7/85. 83-9,138 bridge; 85-5,885 punt, herewith.—10/7/85. Will Mr. Flynn have these papers looked through, and select those proposing purchase of this punt with my report on same. I want to show circumstances.—W.C.B., 11/7/85.

No. 26A.

The Under Secretary for Public Works to The Under Secretary, Department of Mines.

Sir,

Department of Public Works, Sydney, 29 July, 1885.

In reference to the memorandum of the Honorable the Secretary for Mines, dated 9th instant, on the subject of the punt over the River Darling at Wentworth, I am directed to transmit to you herewith, for his information, copy of a minute of the Commissioner for Roads on the matter, with the decision of the Minister for Works thereon.

I have, &c.,

JOHN RAE.

EXTRACT from Report of Commissioner for Roads, referred to in foregoing letter.

WENTWORTH PUNT.

* * * * *
But the question is now complicated by the demand for a bridge, as per the newspaper extracts herewith, in which it is stated I estimated the cost at £30,000, which is an error. No estimate of the sort appears in the papers, and it could only have been in conversation that such a sum was mentioned. If so it must have been for a road and railway bridge. An iron bridge will cost about £15,000 and would involve the keeping of a man at the place, to open it for steamers, which outlay and annual cost, a traffic of about £200 a year at punt rates will certainly not justify.
* * * * *

WILLIAM C. BENNETT.

NOTE :—Minister's decision referred to in letter from Under Secretary Public Works to Under Secretary Department of Mines, dated 29/7/85, is :—That recommendation of the Commissioner for Roads, that tenders be at once called for a new punt, is approved of.

No. 27.

The Mayor of Wentworth to The Secretary for Public Works.

Sir,

Council Chambers, Wentworth, 19 August, 1885.

I have the honor, by direction of the Municipal Council, to forward you copies of resolutions passed at a public meeting, held here on July 1st, respecting the public punt and the erection of a bridge over the Darling, at Wentworth :—

Proposed by Arthur T. Brock, Esq., J.P.; seconded by William Crozier, Esq., J.P. :—“ That it is necessary for the protection of life and property that a bridge be erected over the Darling, at Wentworth, in lieu of the present punt.”

Proposed by Henry George Price, Alderman; seconded by William John Holding, Esq., J.P. :—“ That a petition to the Hon. the Minister for Works be prepared and signed by the rate-payers and property-owners of the district of Wentworth, praying that a bridge in lieu of the present punt be erected.”

A petition has accordingly been prepared, and is being numerously signed, and will, in due course, be forwarded to you.

I beg most respectfully to point out for your consideration that the takings of the Wentworth Ferry, during the year 1882, amounted to about £200 per annum. It has since steadily increased, despite
the

the bad seasons and small quantity of stock moving, and now amounts to over £300 per annum; therefore, at the same rates of increase in the year 1887, the takings of the ferry would be at least £450 per annum, without reckoning for any impulse of prosperity the town may receive (of which, as yet, it has had none) from any or either of the following causes:—

1. The return of good seasons.
2. Settlements in the district, consequent on the new Land Act.
3. With the return of confidence in pastoral pursuits improvements would go on.
4. Unforeseen developments.

The probability is that the takings of the ferry would far exceed the above estimate of £450, which of itself gives 4 per cent. on £11,250, a sum perhaps sufficient for an ordinary bridge, but as allowance has to be made for the passing of steamers, thereby considerably increasing the cost, I respectfully submit that this extra cost, which is on account of our bridge crossing a navigable highway of the Colony, should be treated as an expenditure for the benefit of the Colony at large, and not for our immediate neighbourhood.

Wentworth has been agitating during the last eight years for a bridge, and we trust that our prayer will be favourably considered and our Petition granted.

I have, &c.,

WILLIAM BOWRING,

Mayor.

Acknowledged, 25/8/85. Roads for report.—F.A.W., 24/8/85. B.C., 24–25/8/85.—J.R. Previous papers.—W.C.B., 25/8/85. Bridge papers submitted this morning with punt papers, 26/8/85.

Tenders are being invited for a punt. I think it should be proceeded with. In the event of a bridge being determined on the punt could be utilized elsewhere. The ferry revenue is only £132 per annum, not £300. I have before reported that pending settlement of the railway routes I could not advise the construction of a bridge here. It is possible a railway bridge may be necessary before very long. In any case the punt will suffice until the settlement of that question and the development referred to in this letter, will have had time to progress, so as to justify the expenditure of the large amount required for construction of bridge here, which should be an iron lifting bridge.—W.C.B., 27/8/85.

Under Secretary, B.C., P.W.O., 31/8/85. Submitted, 31/8/85.—J.R. Approved and informed.—F.A.W., 31/8/85. The Mayor of Wentworth, 1/9/85. Roads, B.C., 1/9/85.—J.R. File.—W.C.B., 2/9/85.

No. 28.

The Under Secretary for Public Works to The Mayor of Wentworth.

Sir,

Department of Public Works, Sydney, 1 September, 1885.

Referring to your letter of 19th ultimo, urging the erection of a bridge over the Darling River, at Wentworth, I am directed to inform you that tenders are being invited for a punt which will suffice pending the settlement of the railway route, and which, if a bridge be then found necessary, could be utilized elsewhere.

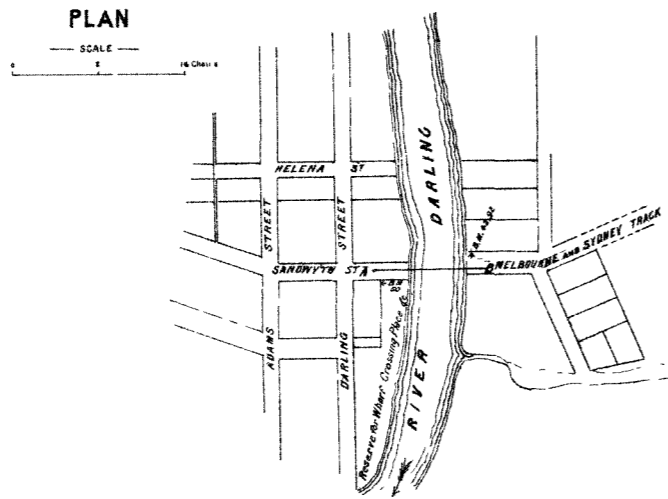

I have, &c.,

JOHN RAE.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

SAN FRANCISCO MAIL SERVICE.

(PETITION FROM WILLIAM MANDEVILLE BARKER, SOLICITOR.)

Received by the Legislative Assembly, 4 July, 1887.

To the Honorable the Speaker and the Members of the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of William Mandeville Barker, of Longueville Chambers, Young-street, Sydney, in the Colony of New South Wales, solicitor,—

HUMBLY SHOWETH :—

1. That your Petitioner is a solicitor of the Supreme Court of New South Wales, residing in this Colony, and is personally cognizant of the matters hereinafter set forth.

2. The Pacific Mail Steamship Company of New York for a period of eight years carried the mails between San Francisco, in the United States, and the Colonies of New Zealand and New South Wales, to the entire satisfaction of both Colonies, so that in April, in the year one thousand eight hundred and eighty-three, the Parliament of New Zealand, by resolution duly passed, authorized the renewal of the contract with the said Pacific Mail Steamship Company for the period of three years, and the Parliament of New South Wales, by resolutions unanimously carried, also authorised the renewal of such contract with the said Pacific Mail Steamship Company for two years, in the following terms :—

(1.) That, subject to the Imperial Government agreeing to continue to convey the mails to San Francisco as heretofore, the contract between the Colonies of New South Wales and New Zealand with the Pacific Mail Company be extended for a period not exceeding two years from the expiry of the present contract in November next, at an annual subsidy not exceeding fifty thousand pounds, of which the portion falling upon this Colony shall not exceed eighteen thousand seven hundred and fifty pounds and subject to the following conditions, viz. :—That it shall be optional for this Colony to withdraw from such extended contract at the end of twelve months, on giving three months previous notice, in the event of the Pacific Mail Company not having obtained from the United States Government, or from other sources, a contribution equal to one-third of the total annual subsidy for such extended contract, and in diminution of the contribution payable by the contracting colonies respectively. That the service shall be performed with the acceleration upon the present contract time of at least twenty-four hours on each voyage to and from Sydney and San Francisco during the first year, and during the second year at least forty-eight, subject to the terms, conditions, premiums, and penalties as heretofore, with this exception, that the company be relieved from keeping a fourth steamer, but that shall not absolve them from the penalties of any failure.

(2.) That the foregoing resolutions be transmitted by address to His Excellency the Governor.

3. The resolutions of the Parliaments of the two Colonies, drawn up by the Government of New South Wales and approved by the Government of New Zealand, were embodied in the contract which was drawn up by New South Wales and was accepted by the Pacific Mail Steamship Company, with the understanding that the resolutions meant that if the two Colonies made use of the service for two years they would pay the company for the two years, less any contribution which might be obtained from the United States, or from other sources, and that any such contribution would be equally divided betwixt the two contracting Colonies of New Zealand and New South Wales.

4. The contract imposed on the Pacific Mail Steamship Company that they should “endeavour to obtain” such contribution from the United States.

5. In compliance with this they faithfully used their “best endeavours to obtain” such contribution, and succeeded to a degree beyond their anticipations ; but (as usual when a Legislature makes alterations in its fiscal laws) the necessary arrangements were only to come into operation at a future date—namely, on the accession of the new President, about four months after the expiry of the first year of the renewed contract.

6. In response to the application of the Pacific Mail Steamship Company and others interested in the question that the United States should pay subsidies to foreign-going steamers carrying mails, and so that the Postmaster-General of the United States should be in a position to comply with the wish of your Honorable House in respect to contributing to subsidies, Congress enacted that, from the accession of the new President in April, one thousand eight hundred and eighty-five, the power, which the Postmaster-General of the United States possessed, of putting mails on board outgoing ships at a nominal fixed rate of payment should cease, and authorised him to agree to pay a subsidy for such services, and further placed at his disposal four hundred thousand dollars for the specific purpose of making such payments, and from which New South Wales would, so soon as the necessary arrangements were made, have received on application a fair share in diminution of any subsidy she might pay the Pacific Mail Steamship Company, or any other Company, as New Zealand now receives in diminution of her subsidy to the Union Steamship Company in virtue of these arrangements.

7. The Pacific Mail Steamship Company trusted and believed that the Government of New South Wales would accept this action of the United States as in fulfilment of the condition imposed upon them—that they should “endeavour to obtain” a contribution from the United States.

8. The Postmaster-General of New South Wales, however, declined to treat this as sufficient, and gave the notice which entitled him to withdraw at the end of three months, unless arrangements were in the meantime made for the continuance of the service.

9. Immediately after giving the notice the Postmaster-General of New South Wales entered into negotiations (as he advised the Postmaster-General of New Zealand he would do) with the Pacific Mail Steamship Company, to obtain a contribution from other sources, and the Pacific Mail Steamship Company agreed to make a contribution from their own funds of £7,000; and the Postmaster-General of New South Wales thereupon agreed to pay the Pacific Mail Steamship Company the reduced sum of eleven thousand seven hundred and fifty pounds in lieu of eighteen thousand seven hundred and fifty pounds during the second year of the contract, subject to the concurrence of New Zealand.

10. This arrangement having been made during the currency of the contract, the contribution should, in conformity therewith, and with the resolution of your Honorable House, have been shared with New Zealand.

11. Had this been done the Government of New Zealand would have had no cause of complaint against the Government of New South Wales; but the Postmaster-General proposed to keep the whole of the contribution for New South Wales alone, and in reply to a suggestion of the Pacific Mail Steamship Company, refused to share it with New Zealand.

12. The Postmaster-General of New Zealand thereupon complained that the action of the Postmaster-General of New South Wales, in retaining the whole of the contribution and leaving New Zealand to bear her whole subsidy was unfriendly, and intimated that the New Zealand Postal Act of 1881 put it in his power to prevent any such arrangement from being carried out.

13. This Act conferred the power on the Postmaster-General of New Zealand to declare any other colony a prohibited postal colony, and thereupon enabled the Post Office officials of New Zealand to go on board the mail steamers and take therefrom the mails in transit to or from such colony.

14. On the third day of December, one thousand eight hundred and eighty-four, five days after the expiry of the first year of the contract and one day before the advertised departure of the outgoing Pacific Mail Steamship Company's steamer from Sydney, the Postmaster-General of New South Wales announced in the usual course that mails would be made up for the Pacific Mail Steamship Company's steamship (no arrangement having then been made with New Zealand to divide the contribution of seven thousand pounds with her, the only arrangement being with the Pacific Mail Steamship Company to pay them eleven thousand seven hundred and fifty pounds for carrying such mails).

15. But subsequently to such announcement and on the same day (the third day of December) the Postmaster-General of New Zealand notified to the Postmaster-General of New South Wales that a prohibition order under the Postal Act of 1881 was on the point of being gazetted unless New South Wales at once agreed to pay New Zealand seven thousand pounds, being an amount equal to the whole and not a share only of the contribution which the New South Wales Government had contracted to receive from the Pacific Mail Steamship Company in terms of the resolutions of your Honorable House.

16. The same day the Postmaster-General of New South Wales agreed to pay New Zealand the said sum of seven thousand pounds.

17. In consideration of which the Postmaster-General of New Zealand did not insert the notice in the *Gazette* and did not interfere with the mails in their transit, and thus the way was left clear for the Postmaster-General of New South Wales to carry out his agreement with the Pacific Mail Steamship Company for conveying the mails for the said reduced subsidy of eleven thousand seven hundred and fifty pounds, the said Mail Company being no parties to the dispute betwixt the two colonies.

18. The Mail Company, in all good faith, and to the best of their power, had done their part in carrying out the wishes of your Honorable House, as expressed in the resolutions and in the contract based thereon, by “endeavouring to obtain,” &c., &c., and by obtaining, a recognition of the principle sought to be established by the resolutions of your Honorable House that the United States should contribute to the subsidy, and it only remained for the Government of New South Wales to enter on the necessary negotiations with the Postmaster-General of the United States, and to conclude a mutually satisfactory arrangement for contribution to the subsidy, as New Zealand has done; further, the Mail Company agreed to make a contribution from their own funds in diminution of the subsidy paid by the colonies for the second year of the contract, covering the period that must necessarily elapse before arrangements between the United States and the colonies should be completed.

19. The Postmaster-General of New South Wales announced and made up the mails for the United Kingdom, and the United States, and placed mails on board the Pacific Mail Company's steamers for conveyance to San Francisco and elsewhere, and has continued to use the Mail Company's boats precisely as he had done in the previous nine years. He further, without making any other arrangement than that to pay the company the said reduced sum of eleven thousand seven hundred and fifty pounds, instructed the Postmaster-General of London to forward to San Francisco all the letters posted in the United Kingdom addressed to New South Wales, Queensland, Victoria, and other colonies, marked via San Francisco, in order that they might be conveyed from San Francisco by the boats of the Pacific Mail Steamship Company; and the Postmaster-General of the United States, acting under instructions from the Postmaster-General of New South Wales, forwarded all such and other mails made up in the United States, by the Pacific Mail Steamship Company's boats.

20. All this was done on the sole authority of the Postmaster-General of New South Wales, who thus, so far from exercising his option of withdrawing from the service, claimed and used all the rights and benefits he possessed under the contract with the Pacific Mail Steamship Company, and for which he had agreed to pay them the reduced sum of eleven thousand seven hundred and fifty pounds, and for which, under the present mail contract, New South Wales pays considerably more, although precisely the same services, and no more, are rendered as the Pacific Mail Steamship Company performed in one thousand eight hundred and eighty-five, during which period, as previously, the mails to and fro were carried by the Pacific Mail Steamship Company with regularity, and to the entire satisfaction of the Postmasters-General of the Colonies of New South Wales and New Zealand.

21. Notwithstanding this the agreement to pay eleven thousand seven hundred and fifty pounds has never been carried out, and the Postmaster-General of New South Wales has paid nothing whatever to the Pacific Mail Steamship Company for carrying the mails for one thousand eight hundred and eighty-five, the second year of the renewed contract, although the resolutions of your Honorable House have never been rescinded, and the faith of the Colony still stands plighted to their fulfilment.

Your Petitioner therefore humbly prays that your Honorable House will take the foregoing matters into your consideration and do what your Honorable House think right under the circumstances.

And your Petitioner, as in duty bound, will ever pray, &c.

Dated this thirtieth day of June, A.D. 1887.

W. MANDEVILLE BARKER.

Witness—

JNO. PARKINSON,
Solicitor, Longueville Chambers, Sydney.

GENERAL POST OFFICE TOWER CLOCK.

No. 1.

The Government Astronomer to The Secretary for Public Works.

My dear Sir,

Sydney Observatory, 30 July, 1886.

When you spoke to me about the Post Office Clock, I understood it to be your wish that I should take the duty of calling for tenders and seeing the clock made, and, acting upon that, I have prepared all necessary plans and specifications, and was on the point of calling for tenders when it was pointed out to me that there was no authority for me to do so, and I confess that I am in serious doubt after reading your minute and that of the Postmaster-General. I enclose these, and should be very glad if you would tell me what I am to do. If I call for tenders I must be authorised to expend the money, I suppose.

Yours, &c.,

H. C. RUSSELL.

Please return the official paper, as all the others *re* this matter are with me.

Certainly my minute contemplated your carrying out the whole matter.—W.J.L., 30/7/86.

No. 2.

The Government Astronomer to The Under Secretary for Public Instruction.

My dear Sir,

Sydney Observatory, 4 August, 1886.

I have at last got the matter *re* clock decided. The Minister for Works says, "My minute contemplated your carrying out the whole matter." I saw Mr. Rae, and he said he thought that the Minister for Public Instruction should call for tenders for the clock, not the Works Department.

Mr. Lyne evidently thinks that I can call for tenders, but I cannot communicate with the Agent-General except as suggested in my letter herewith; and, as this kind of work is new to me, I am in doubt about it, and would have come up to see you this morning, but could not get out—hence this note. When the large telescope was purchased, I wrote, as on the present occasion, asking that the Agent-General should purchase for the Observatory, and it was done; so I suppose the same course is the right one now; if not, please let me know.

Yours, &c.,

H. C. RUSSELL.

P.S.—In the date for receiving tenders, I have contemplated the letter to the Agent-General leaving here on the 9th of this month. So, allowing tenderers four weeks at each end—Sydney and London—to study specifications, if the letter does not leave on the 9th, the date will need to be changed.—H.C.R.

No. 3.

The Government Astronomer to The Under Secretary for Public Instruction.

Sir,

Sydney Observatory, 4 August, 1886.

I have the honor to forward herewith plans and specifications for the new tower clock for the Post Office, and to request that these may be sent to the Agent-General, and that he may be instructed to call for tenders for this work in London as specified; also to call for separate tenders for the bells as specified, and that the date up to which tenders may be received be October 26th, 1886; also that advertisements be inserted in the *Sydney Government Gazette*, calling for tenders in Sydney, such tenders to be sent to the Agent-General in London; and that instructions be sent to accept no tender for the construction and erection of the clock as specified which exceeds two thousand five hundred pounds (£2,500), and no tender for making the bells which exceeds one thousand pounds (£1,000). I have retained copies of plans and specifications.

Advertisement for the *Gazette*, Sydney.—A tower clock required for the new Post Office, Sydney. Tenders to be sent in to the Agent-General in London, on or before 26th October. Plans and specifications may be seen at the Observatory, Sydney.

I have, &c.,

H. C. RUSSELL,

Government Astronomer.

Submitted.—E.J., 5/8/86. Approved.—A.R., 5/8/86. Letters to Agent-General and Principal Under Secretary, 6/8/86. Tenders invited in *Government Gazette*, Sydney, 6/8/86.

No. 4.

The Under Secretary for Public Instruction to The Principal Under Secretary.

Sir,

Department of Public Instruction, Sydney, 6 August, 1886.

I am directed by the Minister of Public Instruction to request that you will be good enough to forward the enclosed letter addressed to the Agent-General, asking him to invite tenders in London for a tower clock for the General Post Office, Sydney.

I have, &c.,

E. JOHNSON,

Under Secretary.

Forward, 9/8/86. Agent-General, 9/8/86.

[Enclosure.]

The Under Secretary for Public Instruction to The Agent-General, London.

Sir,

Department of Public Instruction, Sydney, 6 August, 1886.

I am directed to acquaint you that the Minister of Public Instruction will be glad if you will be so good as to invite tenders in London for a Tower Clock for the General Post Office, Sydney, in accordance with the accompanying plans and specifications. Separate tenders should be invited for the bells. Tenders may be received up to the 26th October next.

2. No tenders for the construction and erection of the clock which may exceed £2,500 should be accepted, nor should any tender for the bells be accepted which may exceed £1,000.

I have, &c.,
E. JOHNSON,
Under Secretary.

No. 5.

The Under Secretary for Public Works to The Under Secretary for Public Instruction.

My dear Johnson, Department of Public Works, Sydney, 5 August, 1886.
Would you be so good as to inform me what action has been taken in connection with the proposed clock for the General Post Office?
Yours, &c.,
JOHN RAE.

No. 6.

The Under Secretary for Public Instruction to The Under Secretary for Public Works.

My dear Mr. Rae, Department of Public Instruction, Sydney, 6 August, 1886.
In reply to your note of yesterday's date, I beg to state that Mr. Russell has prepared the requisite plans and specifications for the new tower clock to be placed in the General Post Office. In a letter received from him it is stated that you suggested that tenders for the work should be invited by the Minister for Public Instruction. Dr. Renwick is willing to do this. Will you kindly say whether there will be any objection to that course, inasmuch as the Post Office buildings are not in any way under the control of this Department.
Yours, &c.,
E. JOHNSON.

There will be no objection to the tenders being called for by Dr. Renwick. Mr. Lyne has already instructed Mr. Russell and desires that the work be carried out by him.—JOHN RAE, 6/8/86.

No. 7.

The Government Astronomer to The Under Secretary for Public Instruction.

Sir, Observatory, 11 September, 1886.
With reference to the enclosed copy of advertisement and minutes thereon, I have the honor to inform you that I waited upon the Honorable the Minister for Works this morning, and explained to him that, by putting the selection of the tender for the Post Office clock into the hands of the Agent-General, I thought two months' time would be saved, because it would not be necessary to send out the English tenders. But Mr. Lyne said he thought it would be better to receive all the tenders in Sydney, and if the Honorable the Minister for Public Instruction approved, that new advertisements should be inserted in the *Sydney Gazette*, extending the time for receiving the tenders in Sydney, and that they should be lodged with the Minister for Public Instruction. The English tenders cannot be here before (say) 10th December, and I would suggest that the time for receiving Colonial tenders might be extended to 10th December, and that advertisements be inserted in the *Sydney Gazette* once a week until that date. An advertisement similar to that already inserted, but with the date and place for receiving tenders changed, would serve the purpose.
I have, &c.,
H. C. RUSSELL,
Government Astronomer.

Submitted.—E.J., 15/9/86. Tenders should be received by the Agent-General in London, and forwarded here. They should also be invited in Sydney, with extended date, so that all the tenders may be opened simultaneously.—A.R., 15/9/86.

[Enclosure.]

EXTRACT from the *Government Gazette* of the 20th August, 1886.

Department of Public Instruction, Sydney, 10 August, 1886.

Tenders for Tower Clock for Post Office, Sydney.

TENDERS are invited for the erection of a tower clock at the General Post Office, Sydney.

Plans and specification may be seen at the Observatory, Sydney; on application to the Government Astronomer.

Tenders endorsed "Tender for Tower Clock, General Post Office, Sydney," must be lodged with the Agent-General, in London, at, or before, 10 o'clock a.m., on or before Tuesday, 26th October, 1886.

The Minister does not bind himself to accept the lowest or any tender.

ARTHUR RENWICK.

I submit the above advertisement for the consideration of the Minister, as I think it will be impossible for tenderers, English or Colonial, to comply with its requirements.—J.R., 8/9/86. Is there not some mistake?—W.J.L., 8/9/86.

I was instructed to call for tenders in London and Sydney, hence the Agent-General was named to receive the tenders. Four weeks was supposed to be long enough for the tenderers at either end to study the specifications, and the date was selected to suit the mails.—H.C.R., 8/9/86.

Would it not be well that some one should be named to receive tenders at this end.—W.J.L., 8/9/86.

No. 8.

The Agent-General, London, to The Colonial Secretary, Sydney.

Sir, 5, Westminster Chambers, Westminster, S.W., 21 January, 1887.

Referring to your Despatch 86-7,901, of the 9th August last, enclosing a letter from the Under Secretary of the Department of Public Instruction, together with a specification and plans for a tower clock and bells for the General Post Office, Sydney, I have the honor to inform you that on the 5th October I communicated with Lord Grimthorpe (late Sir Edmund Beckett), asking for his kind co-operation in the matter of the bells; and in reply I received his Lordship's letter of the 6th idem, suggesting that he could be most useful to your Government in revising the specifications both for the clock and bells, as the reforms that have taken place in those articles have been mainly due to his specifications; and further suggesting that he should be permitted to associate himself with the Rev. Canon Cattley, of Worcester Cathedral, respecting the bells. I therefore, on the 7th October, forwarded to Lord Grimthorpe the specifications of the clock and bells, together with the drawings, asking him whether he could suggest any alterations or improvements, and on the 9th idem he returned the specifications with so many amendments that I deemed it advisable to telegraph to you on the 11th, as follows:—

“Lord Grimthorpe (late Sir Edmund Beckett) recommends number of alterations in specifications for Post Office clock and bells. Advise you allow me to adopt his suggestions. Further time necessary for tenders. Reply.”

On the 30th October I received your telegram, informing me that the specification for the clock must stand, but that that for the bells might be altered if Lord Grimthorpe so desired. I accordingly, on the 3rd November, wrote his Lordship to that effect, to which letter he replied on the 4th, returning the bell specification with further amendment, and stating that he could not undertake to travel at the necessary time to wherever the bell foundry might be situate, consequently he would be unable to act as referee in the matter. I thereupon, on the 5th November, communicated with the Rev. Canon Cattley, asking him to be good enough to act as referee between the makers of the bells and myself, and on the 8th idem he replied, consenting to act. On the 19th I received a further communication from Canon Cattley, requesting that the Rev. C. D. P. Davies should be allowed to co-operate with him, as he did not care, owing to the state of his health, to be solely responsible.

On the recommendation of Lord Grimthorpe and Canon Cattley, I invited tenders from the following firms, viz.:—For the clock—Messrs. Lund & Blockley, London; Messrs. Potts & Co., Leeds; Messrs. Joyce & Co., Whitchurch; Messrs. Gillett & Co., Croydon; Messrs. Smith & Co., Derby; Messrs. Dent & Co., London. For the bells—Messrs. Gillett & Co., Croydon; Messrs. Taylor & Co., Loughborough.

In response to the invitations issued I have only received one tender for the clock and one for the bells, viz.:—For clock, Messrs. Joyce & Co.; for bells, Messrs. Taylor & Co.

I have also received a tender for the clock and bells from Mr. A. Tornaghi, of Sydney.

I enclose herewith the tenders referred to, together with letters from each of the undermentioned firms, who decline to tender, viz.:—Messrs. Lund & Blockley; Messrs. Potts & Co., Leeds; Messrs. Gillett & Co., Croydon; Messrs. Dent & Co., London.

Messrs. Smith & Co. have not acknowledged my invitation.

I attach for your information a copy of the specification for the clock, shewing the amendments suggested by Lord Grimthorpe, and the specifications for the bells, on which tenders were invited, as amended by his Lordship and the Rev. Canon Cattley.

Copies of the whole of the letters which have passed between the abovenamed gentlemen and myself are also attached.

I shall be glad to learn, as early as possible, the decision arrived at in regard to the tenders.

I have, &c.,
SAUL SAMUEL.

[Enclosures.]

The Agent-General to Sir Edmund Beckett.

Clocks and Bells for General Post Office, Sydney.

Dear Sir Edmund Beckett, 5, Westminster Chambers, 5 October, 1886.

I have received instructions from the Government of New South Wales to invite tenders for a clock and bells, to be placed in the tower of the General Post Office, Sydney. The drawing and specification of the clock have been furnished, and also the specification of the bells, and in the latter document I observe that it is therein stipulated that the bells are not to be shipped unless they are approved by yourself.

You would very greatly oblige the Government of the Colony if you would be pleased to aid me so far as you may be able in regard to this important matter, it being most desirable that both the clock and the bells should be of the very best description. I have therefore to ask you if you would be so good as to give me the benefit of your large experience and knowledge in these matters, in procuring what is required by my Government. They would, I am sure, very highly appreciate your good offices.

If convenient to yourself I shall be pleased to wait upon you at any time you may name. Permit me, however, to remark that my instructions are to get tenders in not later than the 26th instant. There is therefore very little time to comply with this direction.

I have, &c.,
SAUL SAMUEL.

Lord Grimthorpe to The Agent-General.

Dear Sir, Batch Wood, St. Albans, 6 October, 1886.

I shall not be in London until November, and leave here for several other places in a day or two; therefore I cannot see you now. But the bells will take some months to cast. The thing in which I could have been most useful to your Government would have been in revising the specifications, both for the clock and bells, as I have never yet seen one which did not require revision, and the reforms that have taken place in both those articles have been mainly due to my specifications compelling the makers to adopt them.

My

My musical ear is not good enough to rely on alone in judging whether bells are in tune, and I strongly advise you to associate with me for that purpose the Rev. Canon Cattley, of Worcester, who has several times acted with me in the same way. If you wish me to inspect the clock before it is finished, or (what would be better) to approve of the drawings, &c., when you have selected the maker, I will do so. Small improvements sometimes occur to one in work of that kind which a maker might not venture to introduce in the face of a rigid specification. I lately got one for a very large clock amended just in time by the maker, Potts, of Leeds (who made the great Lincoln Clock, which is second only to Westminster), writing to me for advice, which I gave to the effect that the specification was wrong, and he got it altered.

After Friday, my headquarters will be The Hall, Doncaster, till November.

I have, &c.,

GRIMTHORPE,
(late Sir E. Beckett).

The Agent-General to Lord Grimthorpe.

Dear Lord Grimthorpe,

5, Westminster Chambers, 7 October, 1886.

I beg to thank you for your letter of yesterday's date.

I venture to send you herewith copy of the specifications of the clock and bells for the Sydney General Post Office, with drawings of the former; in the hope that you will kindly favour me by saying at your earliest convenience whether you can suggest any alterations or improvements necessary to make them perfect.

I shall also be glad to hear whether you think it advisable for me to advertise for tenders, or to invite by circular the leading makers to tender. If the latter, will you kindly furnish the names of those most likely to turn out the best work.

I have, &c.,

SAUL SAMUEL.

Lord Grimthorpe to The Agent-General.

Dear Sir,

The Hall, Doncaster, 9 October, 1886.

I return these clock drawings and specification with such amendments and notes as occur to me. I do not wish (or know how if I did) to meddle with drawings. The pendulum suspension looks hardly strong enough for such a heavy pendulum. It is difficult to know what to advise about tendering, as I suppose that very few clockmakers here will undertake all the risks of sending out a competent man, which is very difficult indeed to find, under this very stringent contract. The only case that I know like it was the clock for Bombay University, made by Lund & Blockley, of Pall Mall, which I inspected. I think Lund himself went out with it. I forget how one for Adelaide (P. O. I think) was managed, for which I settled the drawings a good many years ago. Several designed by me in old Dent's time were simply sent to Turin, Toronto, and other places, and fixed there by local people. I think the best maker of very large clocks now is Potts, of Leeds. Whether one of his sons would go with it I do not know, nor whether he would undertake the turbine business. I found that any such contrivance for Westminster would cost far more than it would save, though that clock alone in England takes any considerable time in winding. You must pay a man for continually looking after it. There are a fair number of clocks here now with bells as heavy as and heavier than yours, which are wound every day or two (in the striking parts) by hand, and I hear no complaints about the cost of it.

The other good makers of large clocks are Joyce, of Whitchurch (Salop); Gillett & Co., of Croydon, who also cast their own bells; Smith, of Derby, but I know of no very large ones of his; nor do I know anything of the work of Dent & Co., Strand, of late, especially since the departure of their excellent old foreman Smith, who made the Westminster clock under me entirely, Dent being too ill to do anything then. "Dent," of Cockspur-street (whoever it really is now) has no factory of his own, or had none when I last knew anything of the shop. I know of no others at all likely to do such a job satisfactorily, if any would undertake it, under the (properly) stringent conditions as to accuracy. These will give you a sufficient competition if they will all tender. I never think it a good plan to require the clockmaker to supply large bells. Taylor's are far the best (of Loughborough), and 10 tons of bells involve more money than a clockmaker is likely to become responsible for to a bell founder, besides his own risks of the clock, especially with such enormous glass dials. I have known all the profit taken out of a job by the breaking of two dials of ordinary size.

This is all that occurs to me at present.

Yours, &c.,

GRIMTHORPE.

The Agent-General to Lord Grimthorpe.

Dear Lord Grimthorpe,

5, Westminster Chambers, 11 October, 1886.

I have duly received your letter from Doncaster, dated the 9th instant, and also the drawings and specification for the Sydney Post Office Clock.

I am indeed very greatly obliged to you for the observations you have been good enough to make, and also for the suggestions in regard to the specification.

I am to-day telegraphing to my Government in regard to the matter, and as the time is very limited to obtain tenders from good firms for such an important work, I have stated that it is necessary to extend the period during which tenders will be received.

I do not gather from your letter whether you would advise me to advertise for tenders, or simply invite a few of the most reputable manufacturers, including those whose names you have been good enough to mention to me. I am loth to trouble you with this matter while you are in the country, but if you would be kind enough to give me your opinion upon this point, I shall be greatly obliged to you.

Yours, &c.,

SAUL SAMUEL.

Lord

Lord Grimthorpe to The Agent-General.

Dear Sir,

The Hall, Doncaster, 12 October, 1886.

I meant to intimate that it is hardly worth while to go to the expense and trouble of advertising and showing the plans to clockmakers in general, if you get a sufficient competition among the best and only ones likely to undertake the work on your conditions. As you ask my opinion further, I think I should send the specification to those I mentioned, telling them you will send the drawings also (which I presume are printed in some way), if they wish it, and also if you like publish an advertisement that persons wishing to tender for the clock may apply at your office for the specification, but they must understand that you do not bind yourself to accept any tender. I really do not know what are the best papers to advertise in. I should think the *Building News*, which I understand has the largest circulation of the building newspapers, and I presume the principal daily papers.

I shall be generally here till the end of this month.

Yours, &c.,
GRIMTHORPE.

The Agent-General to Lord Grimthorpe.

Dear Lord Grimthorpe,

5 Westminster Chambers, 3 November, 1886.

Referring to previous correspondence which has passed between us in regard to the clock and bells required for the General Post Office in Sydney, I have to state that I have received a telegraphic message from my Government, in which I am directed to adhere to the specification of the clock as sent from Sydney. The Government will, however, be pleased to adopt your suggestions in regard to the specification for the bells, and I shall feel extremely obliged if you will inform me whether the specification which I now send you, is in order for issue to firms invited to tender.

I propose to advertise for tenders for the supply of the clock and bells as soon as I receive your reply.

Yours, &c.,
SAUL SAMUEL.

Lord Grimthorpe to The Agent-General.

Dear Sir,

33, Queen Anne Street, W., 4 November, 1886.

I have made a little further amendment in the bell specification where it was not quite definite enough before, and erasing my name and Canon Cattley's of Worcester (unless you have heard from him accepting the position of referee), as I cannot undertake to go to wherever the founder may live, at the time it may be necessary. I shall be interested to hear who respectively get the contracts for the clock and bells, if they are separated, as they ought to be, or for both, if any clockmaker will undertake both or either on the terms proposed.

Yours, &c.,
GRIMTHORPE.

The Agent-General to Canon Cattley.

Dear Sir,

5, Westminster Chambers, 5 November, 1886.

I beg to inform you that I have received instructions from my Government to call for tenders for the supply of a clock and bells for the General Post Office in Sydney, New South Wales, and I shall be glad to know whether you will kindly undertake to act as referee between the makers of the bells and myself in regard to their being, when completed, satisfactory both as to their notes and quality.

I have been in communication with Lord Grimthorpe on the subject, and I enclose the specification of the bells as amended by him.

I shall of course be pleased to pay any expenses which may be incurred by you, should you be so good as to undertake to act in the matter.

I am, &c.,
SAUL SAMUEL.

Canon Cattley to The Agent-General.

Dear Sir Saul Samuel,

St. Mary's Terrace, Worcester, 8 November, 1886.

In reply to your letter of the 5th instant, I beg to say that I will gladly render you any help in the matter of bells for Sydney, but I think I should prefer being associated with Lord Grimthorpe, as I have on many similar occasions of a like nature, notably for Adelaide Post Office; at all events, I will correspond with Lord Grimthorpe, and will write to you again. He and I have each had a rather serious attack of illness lately, though I am thankful to say we have both recovered. Still, for my own part, I am not anxious to undertake responsibility which would cause me travelling in winter.

Lord Grimthorpe and I are, I know, at one as to whom we should like you to employ both as to bells and clock. Perhaps you have had his Lordship's opinion. I shall be most glad if you get into the same groove as for Adelaide. That work gave most entire satisfaction. I think I had the pleasure of meeting you when you honored Worcester with a visit not long ago.

I hope to write to you again in a few days.

Believe me, &c.,
RICHARD CATTLEY.

The Agent-General to Canon Cattley.

Dear Canon Cattley,

5, Westminster Chambers, 9 November, 1886.

I thank you very much for your note of the 8th instant, in which you kindly promise me a further communication, in a few days, on the subject of the clock and bells required for the General Post Office in Sydney.

I shall feel greatly pleased if you and Lord Grimthorpe can make it convenient to act in the manner indicated in my letter of the 5th, and I am sure my Government will esteem it also a great favour.

I

I was sorry to hear that you have been so seriously indisposed, and am glad to learn that you have now recovered.

I have a pleasant recollection of our meeting at Worcester, and trust I may soon have the pleasure of again seeing you.

Believe me, &c.,

SAUL SAMUEL.

Canon Cattley to The Agent-General.

Dear Sir Saul Samuel,

St. Mary's Terrace, Worcester, 19 November, 1886.

I have had my correspondence with Lord Grimthorpe, and I gather that he does not incline to act as referee; neither do I care in the present state of my health to be solely responsible, and I would suggest that you should let me associate with myself a young cleric who is conversant with the subject of bells, and is more thoroughly versed in it than anyone I know. He has recently succeeded my venerable friend Mr. Ellacombe, the Devon clergymen who died at 93 last year, as editor of the bell column of a weekly paper, *Church Bells*. His name is Davies, he is a son of a late Vicar of Tewkesbury. If you like that arrangement I will either write to him or I will give you his address.

Lord Grimthorpe tells me he has given you the names of the firms with whom we work. There is only one bell-founder who is able to do such a job as this worthily, and I shall much regret if you get into other hands. I mean Taylor, of Loughborough. I have just completed a great work for a Worcestershire squire, by far the finest set of bells ever cast, twenty bells, the largest being 62 cwt. I have spent nearly £15,000; the whole thing has given unqualified satisfaction. Either Potts, of Leeds, or Joyce, of Whitchurch, are much the best for clocks. I rather prefer the latter. Gillett, of Croydon, good, but the head of firm has just died, and I fear there is no one to take his place. But I entirely agree with Lord Grimthorpe about your clock specification. There is far too much of it, and might lead you into any amount of law; in fact I do not see how any of the best clockmakers could tender on such a specification. I have several clocks made by Joyce in this neighbourhood, including a very grand one in the Cathedral. They are all going like chronometers. Joyce made the one for Adelaide. I think I told you I acted as referee, both for it and the five bells. I believe it continues to go admirably. It gave great satisfaction at the time.

The only remark I have to make about bell specification is section 46—"No allowance will be made," &c., &c. I know Lord Grimthorpe likes this, but I do not care to tie a man down too tightly. You allow a margin in hour bell, five to five and a quarter, in the same way I would allow a small license in the quarters. I am telling Lord Grimthorpe this when next I write to him, in a day or two.

Believe me, &c.,

RD. CATTLEY.

P.S.—I am writing close on post time, and will send back specification to-morrow.

The Agent-General to Canon Cattley.

Dear Canon Cattley,

5, Westminster Chambers, 24 November, 1886.

I am obliged to you for your note of the 19th instant, and shall be pleased if you will be so good as to associate with yourself the Rev. Mr. Davies in regard to the clock bells required for the General Post Office in Sydney, and may I trouble you to write to that gentleman as you suggest, and inquire whether he will kindly act with you in this matter.

I return herewith the specification, and shall be glad if you will make any alteration in section 46, which, in your judgment, you think desirable.

I am sorry to be of so much trouble to you, but I am anxious that the specification may be in every respect in harmony with your wishes.

Believe me, &c.,

SAUL SAMUEL.

Canon Cattley to The Agent-General.

Dear Sir Saul Samuel,

St. Mary's Terrace, Worcester, 3 December, 1886.

Lord Grimthorpe takes my view about section 46, as you can only bind a bell founder to weight of tenor bell. I would therefore suggest to omit 46, and alter section 44 to meet the case of this bell, allowing a margin of $\frac{1}{2}$ a ton instead of a $\frac{1}{4}$, which I think desirable, then you may, if you like, stipulate that bells should be cast without canons, and leave 46 accordingly. I know Lord Grimthorpe will like this. I am telling him of it. I hope it may end in your employing Taylor, of Loughborough. Your clock specification is far too elaborate and complicated. I should have liked a more simple one, and left it in the hands of two, or at least three, of the best men to tender for.

Believe me, &c.,

RD. CATTLEY.

P.S.—Mr. Davies will act with me. He wished to make other suggestions, but I tell him Lord Grimthorpe has been consulted and is satisfied, and we may well let *well alone*. His address is—REV. C. D. P. DAVIES, Redmarley, Gloucester.

Specification for Bells.

I suggest for section 44:—

The tenor bell to weigh from 5 tons to $5\frac{1}{2}$ tons, and no allowance will be made if in excess of that weight. Its diameter to be thirteen times the thickness of the sound-bow.

You cannot state any contract weight for quarter bells, and I would therefore omit section 46 as it now stands. You might substitute the following, which greatly simplifies matters when bells become worn with use:—

Section 46: The bells to be cast without canons in the same manner as the five largest bells in the Worcester Cathedral peal. This will admit of their being turned horizontally through any angle, by which means the hammers may be caused to hit upon a fresh part when one part has become worn.

Messrs.

Messrs. Lund & Blockley to The Secretary, New South Wales Government Agency.

Sir, 42, Pall Mall, S.W., 12 January, 1887.
Herewith we beg to return you the specification and drawings of the clock required for the Post Office, Sydney, New South Wales, and we regret to say that, after a very careful consideration of them, we have decided not to tender for its supply and erection at Sydney.

We are, &c.,
LUND & BLOCKLEY.

W. Potts & Sons to The Secretary, New South Wales Government Agency.

New Clock for Post Office, Sydney.

Dear Sir, Guildford-street, Leeds, 4 January, 1887.
May we enquire if any modifications in the design of the above clock would be permitted; and would venture to draw the attention of the Agent-General to the following suggestions:—

1. We would suggest that universal joints be introduced in the connections between clock and centre nest of bevel-wheels, and also between these and the dial, as we consider the present arrangement likely to cause stoppages (if omitted) from the rods binding.

2. We should also like to know if it will be insisted that the centre part of each dial be glazed with one sheet of clear glass, as, from experience, we find great liability to fracture in such large sheets.

3. That a short external counterpoise be attached to each hand, to lessen the twisting strain on the the arbors; and whether it is possible to increase the length of the inside counterpoise from 12 inches, as marked on drawings.

4. Is it imperative that the maker shall erect the clock at destination; also maintain it for the period named in specification?

5. Would the time stated for completion be likely to be extended, as eight months from signing of contract to completion seems very short, after taking into consideration the great distance from here?

Awaiting the favour of your kind reply,

We beg, &c.,
W. POTTS & SONS,
Per H.H.

The Secretary, New South Wales Government Agency, to W. Potts & Sons.

Gentlemen, 5, Westminster Chambers, 5 January, 1887.
I am desired by the Agent-General for New South Wales to acknowledge the receipt of your letter of the 4th instant; and, in reply, to state that he regrets that he has not the power or authority to alter the specification of the clock required for the General Post Office in Sydney in any particular. Will you, therefore, be so good as to send in your tender in strict accordance with the terms and conditions of the specification, which includes the cost of erection, &c., in the Colony.

Yours, &c.,
S. YARDLEY,
Secretary New South Wales Government Agency.

W. Potts & Sons to The Secretary, New South Wales Government Agency.

Clock for New Post Office Tower, Sydney.

Dear Sir, Guildford-street, Leeds, 8 January, 1887.
We are much obliged for your esteemed favour of the 5th instant.
As the conditions of your specification include the erection and maintenance of clock for a period of six months after completion, we extremely regret that the uncertainty attending the erection of work of this magnitude in such distant Colonies and the difficulty of sparing men for such lengthened periods, compel us to decline tendering.

We could make the clock all complete, ready for fixing, and would guarantee it to be perfect in every detail, if you could arrange for it being erected by local men at destination. We would also send details drawings with instructions for that purpose, if required, as usually done for clocks we have made for abroad.

Hoping to receive the favour of your further kind orders,

We beg, &c.,
WM. POTTS & SONS,
Per H.H.

Specifications and drawings returned by post.

Messrs. Gillett & Co. to The Secretary, New South Wales Government Agency.

Sydney Post Office Clock and Bells.

Steam Clock Factory, Whitehorse Road, Croydon (West),

Dear Sir, 11 January, 1887.
Whilst thanking Sir Saul Samuel for the opportunity given us to tender for the above we beg to say we do not propose to do so as there are so many points in the specification which we should not be willing to accede to.

We shall be happy to supply a clock and bells for the above according to our own specification. Specification returned herewith. Drawings per parcel post.

We remain, &c.,
GILLETT & CO.

Messrs.

Messrs. Dent to The Agent-General.

33 and 34 Cockspur-street, S.W., 1 January, 1887.

Messrs. Dent beg respectfully to acknowledge the receipt of Mr. Yardley's favour, with specification and drawings for the Sydney Post Office Clock, and to tender their best thanks to Sir Saul Samuel for his kindness, but their workmen are so fully engaged they are very reluctantly obliged to decline the competition.

They return the specification, &c. and apologise for the delay.

Messrs. J. B. Joyce & Co. to The Agent-General, London.

Sir,

Whitchurch, Shropshire, 10 January, 1887.

We enclose tender for a clock for Post Office tower, Sydney, but we could not undertake to complete a clock of this kind in less than twelve months. From the enclosed list you will see we are the makers of the great clock at Worcester Cathedral, the rate of going of this clock has been less than one second a month; also the clock for Sir E. Beckett's clock tower, the General Post Office, Adelaide, Royal Exchange, Manchester, and many other large buildings.

We can make a clock with four dials, 15 feet 8 inches diameter and 28-inch main wheel, after the design of the above clocks, for a very much less sum, if we could be allowed to send in specifications, drawings, and estimates.

We are, &c.,

J. B. JOYCE & CO.

Estimate for clock for Post Office tower, Sydney, New South Wales.

We undertake to make the clock—the dials, hammers, dial and bevel work, and all other work connected with the clock, as shown in drawings and specifications, including case for clock, wood-work, mason's and gas work, turbines, fixing clock, and bells, carriage by railway and sea, and all other work as named in specification and shown in drawings sent to us (excepting clauses 12 and 13 in general conditions, and clause 21 in specification)—for the sum of £3,825 net (three thousand eight hundred and twenty-five pounds).

J. B. JOYCE & CO.

Messrs. John Taylor & Co. to S. Yardley, Esq.

Sir,

Bell Foundry, Loughborough, 10 January, 1887.

Enclosed we have the pleasure to submit to you a tender in duplicate for the proposed bells for the Post Office clock tower, Sydney, New South Wales, and trust you will honor us with the order for the same. You will, sir, please note that we are unable to agree to clause No. 47 in the specification for the reason that, after the bells leave our works we have no further control over them whatever, and cannot tell whether they will have fair treatment or not. All we can do is to guarantee a sound casting of the proportions of metal specified.

We remain, &c.,

JOHN TAYLOR & CO.

John Taylor & Co. (successors to the ancient firms of Watts, Eayre, & Arnold, of Leicester and St. Neots),
Bell Founders, Loughborough.

ESTIMATE for five new bells for the clock tower of the Post Office, Sydney, New South Wales, to be cast according to the specifications and conditions (with the exception of clause 47) submitted to us, and marked F 1,441, which are herewith returned.

The bells to be charged for at the rate of £5 5s. per cwt., delivered on rails at Loughborough Station.

Terms: Net cash upon completion, January 10, 1887.

JOHN TAYLOR & CO.

CONDITIONS and Specification for Clock for Post Office Tower, Sydney, as amended by Lord Grimthorpe (late Sir Edmund Beckett).

(Lord Grimthorpe's amendments are shown in *italics*.)

(*These seem to have been originally intended for building, and are hardly suitable for making a clock in England.*)

GENERAL CONDITIONS.

INTERPRETATION CLAUSE.

1. The words "Superintending Officer" in these Conditions shall mean any person who may from time to time be appointed by the Government Astronomer to supervise or inspect the works or buildings, and the words "Government Astronomer" shall mean the Government Astronomer for the time being, or the Officer having charge of the Government Astronomer's Department.

ACCESS TO WORKS.

2. The Government Astronomer or any person authorized by him shall have free and uninterrupted access at all times to the works, or during working hours to any workshop or premises other than the site of the works or buildings contracted for, where materials may be in preparation for the purpose of this contract.

DISMISSAL OF WORKMEN, REMOVAL OF IMPROPER MATERIALS, &c.

3. The Government Astronomer shall have the power of immediately dismissing any agent or workman employed by the Contractor, and of having removed from the works or building (or any land belonging to the Government, or contiguous thereto) any materials, plant, or implements which in his opinion are insufficient for the purpose intended, or at variance with the meaning and intention of this

Specification. The cost of the removal of any such plant, materials, or implements to be paid by the Contractor, or may be deducted from any moneys due or to become due to him on account of the work or building.

INSTRUCTIONS TO BE OBEYED.

4. Should the Contractor refuse or neglect to carry out the instructions of the Government Astronomer or the Superintending Officer, all payments on account of this Contract will be suspended until such instructions have been complied with.

DRAWINGS, SPECIFICATIONS, &C.

5. The plans, sections, and drawings represent generally the form and dimensions of the several works. Where any discrepancy exists between the dimensions as indicated by the scale and those marked in figures, the figures are to be considered as correct, and are to be taken in all cases in preference to the measurements by the scale attached. And if there should be any discrepancy between the figures or dimensions, or the form of construction, or the material as indicated in the drawings, and the dimensions and materials given in the Specification, the directions of the Specification shall be adopted; and in all cases of defective description, or any ambiguity, the explanation given by the Government Astronomer shall be binding upon the Contractor. Also, anything contained in the drawings, and not in the Specification, or anything contained in the Specification and not shown in the drawings, shall be equally binding as if it were contained in both.

EXTRA WORKS, OMISSIONS OF WORKS, &C.

6. The Secretary for Public Works, on behalf of the Government or the Government Astronomer, shall have the power of making any deviation from, alteration of, or addition to the several works as they proceed, without invalidating the Contract. The value of such deviations, alterations, or additions, shall be ascertained and allowed for by the Government Astronomer or Superintending Officer at such rate as he shall consider to bear a due proportion to the other works in this contract; and the total value thereof shall be added to or deducted from the amount to be paid to the Contractor, as the case may be; and the fact of any deviation, alteration, or addition, having been made, shall not extend the time for the completion of the Contract.

It is to be distinctly understood that no deviation from the drawings or Specification will be sanctioned or permitted unless an order in writing, signed by the Government Astronomer, authorizing such deviation, be first obtained.

NET MEASUREMENTS.

7. All measurements of the works shall be made according to the actual dimensions, notwithstanding any general or local custom to the contrary.

LABOUR, MATERIALS, PLANT, &C.

8. The Contractor shall provide at his own costs and charges all materials, labour, tools, plant, tackle, machinery, scaffolding, &c., for the proper completion of the work. No materials provided for the work shall be removed or otherwise disposed of without the consent of the Government Astronomer.

DAMAGES, &C., TO BE PAID FOR BY CONTRACTOR.

9. All damage or injury that may happen to the works during their progress must be made good by the Contractor at his own expense, and the whole of the works must be delivered up complete in every respect, according to the drawings and specification.

SETTING OUT WORKS.

10. The works, where practicable, will be set out for the Contractor, but he must satisfy himself of their accuracy, as no work incorrectly set out or improperly executed will be paid for.

CONTRACTOR TO BE REPRESENTED.

11. The Contractor at all times during the progress of the works, when he is not personally superintending them, must have a responsible agent or overseer stationed on them to receive instructions from the Superintending Officer or Government Astronomer, and to represent the Contractor for all purposes of this Contract.

COMMENCEMENT AND PROGRESS OF WORKS.

12. The Contractor shall commence the works within fourteen days after the acceptance of Tender. And should the Government Astronomer be at any time dissatisfied with the mode of proceeding, or at the rate of progress of the works or any part thereof, the Secretary for Public Works, on behalf of the Government, shall have full power, without vacating this Contract, to take the works wholly or in part out of the hands of the Contractor, and to employ, procure, and make use of all labour and materials which he may deem necessary for completing the works, the cost of such labour and materials to be deducted from any money that may be then due, or may hereafter become due to the Contractor; and if the money then due, or thereafter becoming due, to the Contractor, shall not be sufficient for that purpose, the balance remaining unpaid may be recovered in an action for damages for breach of Contract, or as money paid for the use of Contractor.

CANCELLATION OF CONTRACT.

13. The Secretary for Public Works, on behalf of the Government, shall have the option, and full power and authority, in lieu of proceeding under the last preceding clause of these Conditions, if the Contractor fail to proceed in the execution of and to carry on the works in the manner and at the rate of progress required by the Government Astronomer, of cancelling this Contract so far as relates to the works remaining to be done, and in such case the moneys which shall have been previously paid to the Contractor on account of the works executed shall be taken by him as full payment for all works done under the Contract; and upon notice in writing under the hand of the Secretary for Public Works that he, under the authority of this Condition, cancels the Contract, being served upon the Contractor, or left at his last known place of abode, the Contract shall be cancelled, and thereupon all sums of money

money that may be due or unpaid to the Contractor, together with all implements in his possession, and all materials provided by him, upon the ground upon which the work is being carried on, or adjacent thereto, and all sums of money named as penalties for the non-fulfilment of the Contract within the time specified, shall also be forfeited and become payable to the Government, and the said implements and materials shall become and be the absolute property of the Government, and with the moneys so forfeited and payable as aforesaid shall be considered as ascertained damage for breach of Contract.

TIME OF COMPLETION TO BE NAMED IN TENDER.

14. The Contractor shall complete the whole of the works comprised in this Contract on or before the day of , one thousand eight hundred and ; and in the event of their non-completion at the specified time, should the Government not have proceeded under clauses Nos. 12 and 13 of these Conditions, or either of them, the Contractor shall forfeit and pay fifty pounds sterling per week, or for every part of a week, that shall elapse after such specified time until their completion, and which sum or sums may be deducted from any money payable to the Contractor under this or any other Contract. The Contractor to have no right to Certificate after the date specified for the completion of the Contract until the whole of the works shall have been properly completed to the satisfaction of the Government Astronomer.

COPIES OF DRAWINGS, &c.

15. All copies of drawings or specifications required by the Contractor for carrying on the works must be made at his expense, but should any copies of drawings or specifications be furnished to him at the expense of the Government, they must be returned to this office before a final Certificate for the work can be given, and the Contractor will be required to ascertain for himself that they are correct in all particulars.

LIABILITY OF CONTRACTOR.

16. The care and maintenance of all works under this Contract shall remain with the Contractor during their progress and until their completion, and also until the Government Astronomer shall, by notice in writing under his hand, have informed the Contractor that he has taken charge thereof; and until such notice shall have been given, the Contractor and his sureties shall be jointly and severally responsible for all accidents from whatever cause arising, and shall make good all damage thereto.

CONTRACTOR NOT TO SUB-LET WORKS OR ASSIGN MONEYS.

17. The Contractor shall not assign over or under-let this Contract, or any part thereof, or assign all or any of the moneys payable or to become payable under the Contract, or all or any part thereof, or any other benefit whatsoever arising, or which may arise under this Contract, to any other person, without the consent in writing of the Secretary for Public Works first obtained; and any permission to assign over or under-let works to be done under this Contract shall not discharge the Contractor from liability to see that the works so assigned or under-let are executed and completed in terms of this Contract.

BANKRUPTCY OR INSOLVENCY.

18. If the Contractor shall become insolvent, have his estate placed under sequestration, or shall make an assignment of his estate for the benefit of his creditors, the Secretary for Public Works, on behalf of the Government, may, without previous notice to the Contractor, or to the official or other assignee or assignees of his insolvent estate, or to the trustee or trustees under the assignment, take the works out of his or their hands and recontract with any other person or persons, or make any other arrangements he may think fit for the completion of the same, and may apply all materials on the land or adjacent thereto, belonging, or which, but for such insolvency, sequestration, or assignment would have belonged, to the Contractor, and all moneys then payable under this Contract, in and about the completion of the said Contract; and if the said materials and the said money shall be insufficient to complete the said works, the further cost of completing same shall be paid by the sureties to the said Bond; or the Secretary for Public Works, on behalf of the Government, may, at his option, declare the Contract to be cancelled, whereupon all money due under the said Contract shall be forfeited to, and all materials found and provided for the said works by the Contractor shall be forfeited to, and become the property of the Government, and the official assignee or trustee of the Contractor's estate shall not have any claim thereto, or in respect thereof.

SECURITY.

19. The Contractor will be required to provide two approved persons as Sureties to enter with him into a Bond to Her Majesty the Queen, in the penal sum of pounds, for the proper performance and completion of the Contract. The names of the persons proposed by him as Sureties must be stated in his Tender; the Secretary for Public Works, on behalf of the Government, having the power of rejecting such proposed Sureties should it be deemed advisable to do so.

Should the Contractor fail to procure such persons as may be deemed by the Secretary for Public Works, on behalf of the Government, to be eligible Sureties, within six days from the acceptance of the Tender, or should the Contractor fail to execute the Contract for the due performance of the works mentioned in the said Tender, or to execute and to procure the due execution by the persons so approved of as Sureties of the Bond required hereunder, for securing the due completion of the works to be done under the said Contract, within fourteen days after the acceptance of such persons as Sureties has been notified to him, the Secretary for Public Works, on behalf of the Government, will have the option of and full power and authority to declare such acceptance to be annulled.

No Tenderer shall proceed with the work tendered for until he has provided approved Sureties, has executed the required Contract, and has, with such Sureties, duly executed the Bond before-mentioned for the due performance of the said Contract—it being hereby declared that, for all or any work done or materials found and provided by the Contractor before the due execution of the said Contract and Bond, he shall not have any right of action, claim, or demand against the Government.

That no person having an interest in any work tendered for shall be eligible as sureties for the same contract.

PROGRESS

PROGRESS PAYMENT WITHOUT PREJUDICE, &c.

20. No certificate given to the Contractor for the purpose of any progress payment shall prevent the Government Astronomer from at any future time before the termination of the Contract, rejecting all unsound materials and improper workmanship discovered subsequently to the giving of the last previous Certificate; and notwithstanding the giving of any Certificate that portions or the whole of the works have been satisfactorily performed, the Government Astronomer may require the Contractor to remove and amend at any future time previously to the final payment on account of the construction or maintenance of the works, any work that may be found not to have been performed in accordance with the Contract; and the Contractor must remove and amend at his own cost all such work when so required, notwithstanding any approval made or given by the Superintending Officer; and the Government shall have power, on the report of the Government Astronomer that the work approved of as aforesaid is not in accordance with the Contract, to deduct from any moneys that may be due or that may become due to the Contractor the whole amount that has been paid on account of such work.

If, in the opinion of the Government Astronomer, further inquiry is necessary or desirable before any certificate is given, he shall have power to withhold such certificate for a period not exceeding one month from the date at which in the ordinary course the certificate would have been given.

None of the Conditions of this Contract shall be varied, waived, discharged, or released, either in law or in equity, unless by the express consent of the Secretary for Public Works, on behalf of the Government, testified in writing.

PAYMENTS.

21. The Contractor to make application in writing, not oftener than monthly, to the Government Astronomer, when he requires a payment of money on account of work done under this Contract, stating the amount required, and to accompany such application with a statement of the stage of progress which the work has reached, certified by a Magistrate, Clerk of Petty Sessions, or other Government Officer. Unless by reason of any neglect or default, which would cause stoppage or delay of payment under any of the preceding clauses, payments on account will, if practicable and desired, be made once in every month, up to the period fixed for the completion of this Contract; such payments on account will be made only on the Certificate of the Government Astronomer, at the rate of 80 per cent. upon his valuation of work actually and permanently fixed in the work or building contracted for, and the remaining 20 per cent. will be paid after the Government Astronomer has certified that the whole of the works have been completed to his entire satisfaction; and it is expressly declared that the obtaining a Certificate from the Government Astronomer that the work done by the Contractor has been satisfactorily executed or completed to his satisfaction shall be a condition precedent to the Contractor having any right or cause of action in respect of any work done or materials provided, and to the Contractor having any right of action or claim to the payments from time to time to be made hereunder, as well as to the final payment upon the whole of the work being finished.

Department of Public Works,
Colonial Architect's Office,
Sydney,

188 .

SPECIFICATION FOR A TURRET CLOCK FOR THE POST OFFICE TOWER, SYDNEY, N.S.W.

SPECIFICATION of Labour and Material required in the construction and erection of a Tower Clock, for the Sydney General Post Office, in accordance with the accompanying drawings, specifications, and general conditions of contract. To be made and erected to the satisfaction of the Government Astronomer for Her Majesty's Government of New South Wales.

1. The clock must show the time on four dials, 15 feet 8 inches (fifteen feet eight inches) in diameter, must strike the hours on a bell weighing 5 (five) tons, and the Westminster chimes on four bells weighing in the aggregate 5 (five) tons, and perform such other duties as are herein specified or shown in the drawings.

2. The frame of the clock must be of cast iron, and all in one casting, as shown in the drawings, and will not be accepted if made in several parts and bolted together. The thickness may be a little more but not less than that shown; its base must be planed and carefully fitted and bolted to the wrought iron bed-plate, which must be supplied with it, as shown. All holes must be truly bored and the brass bushes accurately fitted and secured with three equi-distant screws, so that they may be turned round when worn. The frame must be painted a dark bronze green, and worked up with the paint to a smooth surface on the outside.

3. The works of the clock must be enclosed in a glass case, as shown. All the woodwork of this must be made of well-seasoned mahogany or cedar, French polished; must be made in the parts, as shown, and fastened together with screws at the corners and top. The six upper side frames to be removable, but secured with good locks, and have two neat handles to be used in removing these side frames. The eight lower frames to be closely fitted to the openings and fastened with inside buttons, except the two end ones and that enclosing the pendulum, which must be locked, and all must be removable at pleasure. The whole case to be glazed with the best $\frac{1}{4}$ -inch (one quarter) plate glass and well finished in every respect. (*You must take care that there is proper ventilation through it and through the room, or damp will condense on the iron.*)

4. Every part of the clock must be made of good and sound materials as specified, porous or otherwise faulty castings and imperfect forgings will not be accepted. Each and every part must be of the dimensions shown in the drawings or otherwise specified, and the workmanship must be such that every part of the clock when made shall perfectly serve the purpose it is required for, and the judge of this fitness shall be the referee.

5. The teeth of all the wheels must be so formed as to secure, in the opinion of the referee, a smooth rolling* motion in which the teeth press evenly for their whole length and not at one end only, and be free from any rubbing friction.* In every wheel and pinion the teeth must be of uniform size, and all the spaces in any wheel or pinion, measured from centre to centre of the teeth, shall be uniform. (** The only teeth that roll are involute, not epicycloidal, and they are bad for the reason given in my book.*)

I should say, "The teeth are to be epicycloids of proper curvature for the size of the wheels and pinions, as defined in Sir E. Beckett's book."

6. All the wheels, bushes, and other parts of brass shall be made of metal composed of copper 8 (eight), zinc 1 (one), tin 1 (one). All axles to be of steel; all pinions to be of steel and cut out of the solid. (*I presume this is a proved composition.*)

7. Every wheel must be so made that it can be taken out without disturbing other wheels, as shown.

8. The form of escapement must be that known as the double three-legged gravity, the legs and pallet arms of brass, and the pallet faces of (*quite hard*) steel, so arranged as to reduce the risk of tripping to a minimum. All parts of the escapement to be polished and lacquered. (*Brass is heavy and weak for the long legs; I prefer steel. Some makers use Phosphor Bronze.*)

9. The pendulum must be that known as zinc and iron compensated, in which provision must be made for the free circulation of air between the acting parts. The bob must weigh 452 (four hundred and fifty-two) lb. and be made of lead. The pendulum must swing in $1\frac{1}{2}$ (one and a half) seconds, and must have a degree plate and a (*collar for small, sliding one back for several reasons*) neat movable weight(s) on the pendulum-rod for fine adjustment in addition to the motion provided for rough adjustment of rate. Two inches (*close*) under the bob (*or end of rod*) an iron shelf must be fixed to catch it if it falls. (*The bottom of the rod to be squared, to hold it while turning the nut.*)

10. The rate of the clock must not vary more than three seconds in any week, and its rate shall be determined from its automatic electric signals sent to the Observatory. These signals to be sent by 40 (60) gold pins fixed to the 60 (90) wheel on the axis of the seconds dial. (*It is impossible to make those off the train wheels accurate to a second. The pins should therefore be in the 90-wheel which divides the scape-wheel, together with the requisite contact-maker in the hour-wheel.*) (*One will do if put rightly.*)

11. To provide a second dial as shown, and on the face of the 60-wheel to insert 40 equi-distant gold pins one-eighth of an inch long and 0.06 inch in diameter, and provide a spring so adjusted that each pin on passing the spring will close an electrical circuit if required (*to make contact at the hour—see 24*)

12. The hour and quarter striking parts must be let off independently by an adjustable piece attached to the 90-wheel axis as shown, at the end of which are two pieces independently adjustable so as to let off the hour and quarter levers exactly. The first stroke of the hour bell within one second of the true time, and the quarters so that the last stroke in each case is four seconds before the completion of the minute, the long arms connecting the going and hour and quarter striking parts to be of wrought iron, faced in their working parts with hardened steel.

13. To provide (*long flies as usual—long enough to secure uniform velocity*) mechanism for governing the speed of the striking trains as shown in the drawings. These friction governors must be made with the same accuracy as if required for the driving clock of a telescope. The ratchet wheel must be made of steel; the other parts of brass and steel as shown in the drawings. The friction screws must be shod with hard and compact leather. The pieces fixed on the axis must be secured with well fitted keys. (*I doubt their use very much, and they will greatly increase the clock weight and strain. A telescope does no work in moving, indeed I am sure friction will not do for the quarters especially. (See end for further remarks.)*)

14. The winding barrels must be made of sheet iron three-sixteenths of an inch thick, joints brazed and provided with holes in which to fix the end of the wire ropes.

15. *Patent winding and maintaining gear as shown must be supplied to each winding barrel, and if necessary in the striking parts a ratchet and pawl to keep the whole from running back when wound. (*You only want maintaining to the going part.*) (**I only know of one patent winding and maintaining gear, and therefore this would be fatal to any competition. Several plans are equally good.*)

16. The cams for striking must be either of the form shown or the patent* adjustable steel-faced ones, in either case fixed as shown in the drawing. (**They have been used long ago, and I doubt if there is any real patent for them; and if once right they never want adjusting.*)

17. Winding gear as shown in the drawing must be provided so that the several barrels of the clock may be wound alternately by the same handle, either by hand or an hydraulic machine of approved form.

18. Self-acting cut-off apparatus must be supplied as shown (*or some other*) to prevent over-winding (*or straining of the ropes by stopping*).

18a. *Care must be taken that none of the ropes overlap in winding.*

19. An hydraulic machine, preferably of the turbine form, must be provided to wind the clock. Water is laid on at a pressure of 120 lb. to the square inch. (*I doubt if any clockmaker here will do that.*)

20. To provide as shown an apparatus for turning the gas on and off as required; one to serve for all four dials.

21. The whole to be completed in 8 (eight) months from the time of signing contract. (*Impossible if made here.*)

22. Contractor to receive half the contract money when the clock is erected and approved by the referee; to maintain the clock and all its parts, including the bells (see 47) in sound working order for 6 (six) months from that time; at the end of the first 3 (three) of these months to get one-quarter of the contract money on the certificate of the referee; and at the end of the 6 (six) months the balance of the money, upon producing a satisfactory certificate from the referee. (*This will be awkward for an English maker.*)

23. The well for the weights is $4\frac{1}{2}$ feet in diameter, and 80 feet deep, and will contain 7 feet of sand to receive the weights if a rope breaks. The weights must all work in this well as shown. The weights are five in number: *two on the hour striking train, one on the going train, and two on the quarter striking train. Each weight must be provided with a sufficient length of the best steel wire rope, $\frac{3}{8}$ -inch in diameter, to allow the weight to rest on the sand when run down. (**I see no use in 2.*)

24. The weights must be sufficient (*in the drawing the weights are specified, which is wrong*) to do the work required from them in each case; each weight must be provided with a sheave, as shown, and the sheave must be bushed with brass; the bar holding the weights to the sheave must be securely screwed into the bottom section of the weight, which must serve to hold the other sections (*or "shifters"*) in sufficient number to make the required weight; each of these sections must be slotted, so that it can be put on or off in the usual way, and must not exceed 50 (56) lb. in weight. The lowest or fixed section of each weight must be coned like an Armstrong shot (*Why?*), and weigh 150 lb.

25. To provide electrical contacts such that each time the lever which (*starts*) works the hour (*striking*) bell falls it shall close a circuit for one second. (*This seems to make the electrical part of paragraph 10 superfluous, or this is.*)

26. To provide a turbine with mechanism so that it will ring the fire-alarm on the treble bell, and arrange it that it may be set in operation by an electrical signal. (*No. 26 is ambiguous. I suppose you do not want every blow of the hour hammer to be telegraphed?*)

27. To make and set up four dials 15 feet 8 inches in diameter as shown in drawings and specifications.

28. The hour figures (*strong lines are much more visible*) and minute marks to be (made of the brass specified) in four parts as shown, each covering 90 degrees of the circle; these must be bolted direct to the stone by lugs and bolts shown in the drawings and fixed and supported by eight stays fixed with adjustable nuts to the angle-iron ring, which must be set in the inner ring of the stonework as shown, the screws fastening the stays to the brass frame showing hours and minutes, to be $\frac{5}{16}$ (five sixteenths) inch diameter, and put in as shown.

29. The clear space within the hour-figure ring to be glazed with one sheet (*Can that be got?*) of clear plate glass $\frac{1}{2}$ inch thick (if it is made), if not $\frac{3}{8}$ inch. This must be bedded all round in vulcanized rubber and fixed in its place by means of brass fillets. In the centre of it a hole 15 inches in diameter must be cut to receive the ring and supports for the hands. Inside the clear glass there must be a lining of opal glass $\frac{1}{8}$ (*too thin to handle in any size*) inch thick in as large pieces as it can be obtained, and these fixed in with brass clips screwed on to the brass fillets. The space behind the figures and minute marks to be glazed in the same way, except that cloth must be used instead of rubber to facilitate taking out the glass to get at the figures or hands for painting.

30. To provide and fit a central bush of brass to each dial, such bush to be screwed on the outside and fastened in with one nut, the whole to be carefully bedded in best white-lead putty; within this bush are to be fitted the friction rollers and all the parts shown in the drawing, and those necessary to make a bearing for the axis of the hands and the stays to the bush. To provide and fix for each dial four wrought-iron stays $\frac{3}{4}$ inch diameter, forked and pinned to the lugs on the nut of the brass bush, the inner ends to be screwed and fitted with double adjusting nuts to the girders.

31. To provide sheet copper (hard rolled) hands of the dimensions (*and section*) shown, made of 20 gauge copper and joints folded; hands to be riveted to brass ring, and screwed to brass bossed disc on the axis as shown.

32. To provide and fix for each dial eight Argand gas lamps with reflectors, so arranged as to make the most of the light and cast no shadows on the dials; to lay on gas to these lamps so that it may be turned on and off by the apparatus provided in the clock mechanism.

33. To provide smoke flues of No. 30 gauge copper of sufficient size to carry of all the products of combustion in the lamps, to take these through the carillon chamber to the height of 8 feet over the belfry floor, four in number, and each to be fitted with anti-down-draught cowls, copper strap, all tubing, and screw each side to lead plugs let into the stonework every 3 feet, with all necessary junctions, elbows, bends, &c.

34. To lay on gas in $1\frac{1}{2}$ -inch best gun-barrel piping, with all necessary elbows, bends, &c., from upper floor of General Post Office, with a 50-light meter in locked box to clock chamber, and distribute in copper tubing to different burners. The gas to be regulated by the clock mechanism provided for that purpose.

35. All holes required in the masonry for bolts, &c., will be cut for the Contractor.

36. The castings for the dial figures must be so made and fixed as to provide an even bed for the glass, so that in fixing the glass may not be broken.

37. To paint the hands, the dial figures and minute marks with two coats of the best black paint, and all other parts requiring painting to receive two coats of the best paint of approved colours.

38. To hang 5 (five) bells in the positions and manner shown in the drawings. All the bells to be hung in the same way.

39. To provide 6 (six) (*suitable*) necessary hammers for the bells, (*i.e., two for the fourth quarter bell*). Each hammer to have sufficient weight and lift to bring the full tone out of the bell it strikes (*and have adjustable check springs. The levers must fall on stops, not on the cams*).

40. The bell hammers to be hung and provided with sufficient means of adjusting the lift, and to be left on the lift after striking, as shown.

41. The contractor to erect the clock and all its attachments, including the bells, dials, &c., within the specified time. To provide all the scaffolding, labour, and material, except bells, required for making, erecting, and fixing.

To leave every part in working order to the satisfaction of the referee. He must also make good any damage done to the buildings by him.

42. *If any unforeseen difficulty arises in making the clock according to the specification, the maker is to communicate with the Agent-General, and to follow the instructions he may give thereon, or any person nominated by him for that purpose; or if the maker has any improvement to suggest he may do the same. If he thinks it expedient to make any part stronger than is shown in the drawings he may do so.*

43. *The whole of the work to be subject to inspection and approval before sending out of England by such person as the Agent-General may nominate as above.*

Further Remarks re par. 13 of Clock Specification.

There are times when the striking part are either not lifting the hour hammer, or when the work of lifting the quarters varies very much, and no friction will regulate that quickly enough—nothing but long flies.

At Westminster we had to alter the train and put much larger flies to get anything like uniform velocity. Too short flies are about the commonest fault in large clocks, often for want of room to put large ones. The work of driving a telescope is very nearly uniform.

The short tails of the quarter levers as drawn are too thin.

SPECIFICATION for Bells, as amended by Lord Grimthorpe and the Rev. Canon Cattley.

42. To provide five bells of the section described in Sir E. Beckett's book, and deliver them to order within four months.

43. All the bells to be made of metal composed of 13 lbs. of pure copper and 4 of pure tin, and to be perfectly sound, free from porosity and other defects, and homogenous as castings.

44. The tenor bell to weigh from 5 tons to 5½ tons, and no allowance will be made if in excess of that weight; its diameter to be thirteen times the thickness of the sound bow.

45. The four quarter bells to be of such weights as will produce the proper notes for the Westminster Chimes in accordance with the tenor bell; the treble's diameter to be twelve times the sound bow, and the others about 12½. The bells must be approved as perfectly satisfactory, both as to their notes and quality, by the Rev. Canon Cattley and the Rev. C. D. P. Davies before they are shipped.

46. The bells to be cast without canons in the same manner as the five largest bells in the Worcester Cathedral peal: this will admit of their being turned horizontally through any angle, by which means the hammers may be caused to hit upon a fresh part when one part has become worn.

47. The contractor to replace any bell broken by use within six months of erection.

No. 9.

Mr. A. Holmgren to The Under Secretary for Public Instruction.

Tender for Tower Clock, General Post Office, Sydney.

Dear Sir,

257, Kent-street, Sydney, 10 December, 1886.

I, the undersigned, hereby tender my price for the above contract (according to the conditions and specifications) for the sum of £3,934 (three thousand nine hundred and thirty-four pounds).

ADOLF HOLMGREN.

No. 10.

Mr. A. Tornaghi to The Minister of Public Instruction.

298, George-street, Sydney, 25 October, 1886.

Sir,

I beg to submit for consideration herewith.

Tender No. 1, for importing a clock for the General Post Office, Sydney, and tender No. 2 for a clock to be made in the Colony suitable to the new building, and at the same time would point out that similar tenders were sent addressed to the Agent-General, London, on the 10th September, 1886, in accordance with instructions in the *only* Gazette advertisement which appeared in Sydney.

I also forward copies of letters of 23rd and 25th March, respectively, which were sent to Colonial Architect for submission to proper authorities in support of my tenders.

I am, &c.,

A. TORNAGHI.

[Enclosures.]

Tender No. 1.

This Tender is only in competition with those who will have to import.

I herewith enclose second tender for consideration.

Sir,

298, George-street, Sydney, 25 October, 1885.

In pursuance of advertisement in the Government Gazette, I, the undersigned, do hereby tender to provide the materials and perform the works required by importation of the clock, bells, dials, &c., for the tower at General Post Office, Sydney, as nearly as can be carried out agreeably to the plan and specification for the sum of £3,750, and to complete the same within—the bells in six months, and the clock within two years.

A. TORNAGHI.

No. 2.

298, George-street, Sydney, 25 October, 1886.

I, THE undersigned, do hereby tender that I will undertake to make, supply, and erect an illuminated striking clock, to fit the tower and in harmony with the building of the General Post Office, Sydney.

The clock, bells, and dials to be of the very best material and workmanship, with all the latest known improvements.

Its functions to be performed with the greatest accuracy, and the time to be distinctly shown day and night, so as not to be surpassed by any known clock.

The weight of hour bell to be not less than 5 tons, with four chime bells for "quarters," the most suitable in weight, and tone to harmonize with the large bell.

The dials to be 15 feet 8 inches in diameter, of transparent glass, and nearly similar in construction to the clocks at Newcastle, Goulburn, &c.; to be lighted by four Argand burners to each dial (instead of twelve as specified), and so arranged with reflectors as to give equal light, and effect a saving of about £200 per annum.

To arrange for turning off and on, and lighting the gas at daylight and dusk the year round; also to switch on and off the wires connected with the light room, so as to show a flash of light at each stroke of the hour hammer, and thereby be able to distinguish the time at a great distance; also to construct apparatus (to connect with any stations) whereby certain mechanism could be set in motion from each so as to strike a rapid succession of blows on the bell, and thereby give an alarm in case of fire.

The bells to be ready to fix within six months of acceptance of tender, and the works and clock immediately the tower is ready for their reception within two years.

Hydraulic power will be arranged for the winding of the clock.

I am prepared to give a cash deposit for the due fulfilment of the work should such be necessary, and I will undertake to keep the clock in thorough going order, &c., for two years, the whole to be entirely subject to the approval and satisfaction of the Colonial Architect, for the sum of £5,480, and that no payment should be made to me if the work is not carried out as stated.

A. TORNAGHI.

N.B.—I would impress upon you the fact for due consideration, that an imported clock made to specification cannot be fixed in the tower without alteration to the inside thereof, whilst a clock made to suit the tower and building can be done in sections, and would save much expense in alterations and trouble.—A.T.

Mr.

Mr. A. Tornaghi to The Colonial Architect.

Sir,

298, George-street, Sydney, 23 March, 1886.

There is a rumour being circulated to the effect that the late Postmaster-General has recommended the acceptance of a tender sent in by a wine and spirit merchant for supplying the clock for the General Post Office. I trust this rumour is incorrect, for it would be a great injustice, as my tender for importing same is far below any sent in, whereas my tender for making clock in the Colony, erecting, and guaranteed, is only £5 in excess of the lowest tender, excepting mine for the importation of same. I may here add that the clock must be specially made to suit the tower. An imported clock would not suit, as too many alterations would be necessary.

I have the honor to call your attention to the fact that I am upwards of thirty years established in Sydney, and that during that period I have executed very many scientific, mathematical, and horological works, all of which I have given entire satisfaction.

I look upon the Post Office clock as a national undertaking, and desire to bring under your special notice that during my recent visit to Europe, I was permitted to inspect all the large clocks of any importance, both in England and on the Continent, where I had the opportunity of seeing all the latest ideas in horological inventions. This, with the practical knowledge I have acquired through long experience, makes me feel confident that if my tender is accepted, I will execute the work in a manner not surpassed by any clock known, either for its accuracy or workmanship, &c, &c.

I am also prepared to give security for the completion of the work within eighteen months from the acceptance of contract; and further, that no payment be made to me until the work gives satisfaction.

Trusting that you will be so kind as to place this communication before the authorities,

I have, &c.,

A. TORNAGHI.

Mr. A. Tornaghi to The Colonial Architect

Sir,

298, George-street, Sydney, 25 March, 1886.

With reference to my letter of the 22nd instant, *re* Post Office clock, I herewith enclose a list showing the different clocks I have erected for your Department, all of which I am pleased to say have given every satisfaction. I would especially bring under notice the Custom House Clock at Newcastle, for I feel confident that through your recent visit to Europe, you bear testimony to the effect that this clock is unsurpassed as a time-keeper, and is unexcelled for plainly showing the time either by day or night by any clock either in England or on the Continent.

It is now some years since this clock was erected, and since I have both added and gained more practical experience and knowledge (this is far above all the theory which may be brought to bear on this or any subject), and to carry out the work I feel confident beyond a doubt that I am able to make and erect the Post Office clock as tendered for, and bind myself to execute the work with all the latest known improvements, and am prepared to give a bond of security for the completion of same, as herein and as stated in my previous letter.

I would further bring under notice that if a clock is imported the great difficulty would be in erecting and fixing same, as the clock must be made to fit the tower, so that the necessary alterations, &c., which would be required would incur a lot of trouble and heavy expense, whereas if my tender is accepted no trouble whatever would arise; therefore I think that it would be rather an injustice to me, considering my long and approved of experience, and the terms upon which I offer to do the work (*viz*, that the Government shall not pay me unless the work is satisfactorily done and in the time stated); in fact it would be a disgrace to the Colony to send home such a national work when it can be executed here with more speed, guarantee, and with less expense.

Trusting that you will be so kind as to bring this before the proper authorities, I hope that they will well consider the matter and encourage colonial industry.

I have, &c.,

A. TORNAGHI.

No. 11.

A. Tornaghi to The Under Secretary for Public Instruction.

Tender for Tower Clock, General Post Office, Sydney.

Sir,

298, George-street, Sydney, New South Wales, 9 December, 1886.

In compliance with advertisement in Government Gazette (6077), I beg to submit tender "1," for importation of a clock, and tender "2" for making, &c, a clock in the Colony. These tenders being identical with previous tenders submitted as follows:—1st. To Public Works Department here on 24th February, 1885, which were unanimously recommended by the full Board for acceptance. 2nd. To Agent-General, London, on 10th September, 1886, in compliance with the only one advertisement which appeared in Sydney, and 3rd. To Minister of Public Instruction, Sydney, on 25th October, 1886, in reference to advertisement just quoted.

I also forward copies of letters of 23rd and 25th March last addressed to the Colonial Architect, in support of tenders, &c., previously sent in to Government—24th February, 1885.

I am, &c.,

A. TORNAGHI.

(The tenders and letters enclosed with above letter are copies of those printed on pages 15-16 of these papers.)

No. 12.

The Government Astronomer to The Under Secretary for Public Instruction.

Sir,

S.S. "Potosi," Adelaide, 7 March, 1887.

I have received and carefully read the letters and tenders referring to the new clock for the Post Office, Sydney, and I have the honor to recommend as follows:—

1. That Messrs. J. B. Joyce's tender for the manufacture and erection of the clock as per drawings and specifications of it, for the sum of £3,825, be accepted.

2. That Messrs. Taylor's, of Loughborough, tender for the manufacture of the bells, at £5 5s. per cwt., be accepted.

3. With regard to clauses 12, 13, and 21 in the specifications, objected to by Messrs. J. B. Joyce, these are the usual conditions of contract under the Colonial Architect's Department, and were inserted by me as a matter of form, and could be modified so as to meet Messrs. Joyce's objections.

4. Mr. Tornaghi's tender is slightly lower in price, but the clause "as nearly as possible in accordance with specifications" renders it, in my opinion, inadmissible, because under it any deviation from specifications is possible.

5. Messrs. Joyce's high character and success in making some of the largest and best clocks in England is a sufficient guarantee that the work will be successfully carried out.

6. I would suggest that a telegram (attached) be sent to the Agent-General, in accordance with the foregoing, and that while I am in England, I may be instructed to confer with the Agent-General in regard to any necessary modifications in the specifications for the clock, and generally under his directions to see after the due performance of the contracts.

I have, &c.,

H. C. RUSSELL.

Telegram: "Accepted Messrs. Joyce & Co.'s and Messrs. Taylor's, of Loughborough, tenders for clock and bells for new Post Office clock and bells."

Submitted.—G.M., 14/3/87.

The recommendations and suggestions of the Government Astronomer might now be forwarded for the consideration of the Secretary for Public Works, and his attention be specially drawn to the remarks of Lord Grimthorpe, Canon Cattley, and Messrs. Joyce themselves, as to the lessened cost if their own specifications were allowed.—J.I., 14/3/87. The Under Secretary for Public Works.—G.M., B.C., 14/3/87. Prepare *précis* of the whole case for the information of the Minister.—J.R., 15/3/87.

No. 13.

Précis.

Supply of Tower Clock and Bells for the General Post Office.

Department of Public Works, Sydney, 15 March, 1887.

SPECIFICATIONS and drawings for the supply of clock and bells for the tower of the General Post Office were originally prepared in the Colonial Architect's Department, and tenders invited in the Colony in accordance therewith in February, 1885. Of the tenders then received that of Mr. A. Tornaghi, for the sum of £5,480, providing for the manufacture of the clock in the Colony, was recommended by the Colonial Architect for acceptance. No tender was, however, accepted, but the matter was referred to the Government Astronomer, who offered to prepare fresh plans and specifications with the view of tenders being called in England and the Colony. The Cabinet decided this should be done, and plans and specifications were accordingly prepared by the Astronomer and forwarded to the Agent-General in London, tenders being called both in England and the Colony.

The Agent-General has now forwarded the tenders received, and other correspondence bearing on the subject.

From the accompanying schedule of the tenders received it will be seen that Mr. A. Tornaghi, of Sydney, whose tender was previously recommended for acceptance, is now the only tenderer for the supply and erection of both clock and bells. He gives two prices,—one for an imported clock, and the other for the manufacture in the Colony; and he urges the advisability of constructing the clock here.

The tender of Messrs. Joyce & Co. is for the manufacture of the clock, and the erection of clock and bells; that of A. Holmgren for clock only; and that of Messrs. Taylor & Co. for the supply of bells alone.

The Government Astronomer recommends the acceptance of the tender of Messrs. Joyce & Co. for the clock and erection, and of Messrs. Taylor & Co. for the bells; and the matter is now forwarded for the consideration of Mr. Secretary Sutherland by the Secretary for Public Instruction, who wishes attention to be specially drawn to the offer of Messrs. Joyce & Co. to supply a clock at much less cost if allowed to submit their own design.

J.R.

The Colonial Architect for report.—J.R., B.C., 17/3/87.

SCHEDULE of Tenders for Tower Clock and Bells, General Post Office.
TENDERS FOR CLOCK AND BELLS.

Name.	Amount.	Time.
A. Tornaghi, Sydney	£5,480 (to be manufactured in the Colony) ...	{ Clock—2 years. Bells—6 months. do
Do	£3,750 (to be imported)	
TENDERS FOR CLOCK ONLY.		
J. B. Joyce & Co., England.....	£3,825	{ 12 months. Not stated.
A. Holmgren, Sydney	£3,934	
TENDERS FOR BELLS ONLY.		
John Taylor & Co., England	£5 5s. per cwt. (in all, about £1,050)	Not stated.

Mr. Tornaghi being again the lowest tenderer, I see no reason to alter my report on tenders of 4th March, 1885, with the papers, and still recommend for acceptance his tender to provide and fix a clock and bells, the clock to be made in Sydney, for the reasons given in that report, and my subsequent letter of 27th March, 1886, also with the papers. The amount of Mr. Tornaghi's tender, £5,480, I consider reasonable.—J.B., 4 April, 1887.

The Colonial Architect is requested to furnish further details for the information of the Minister.—J.R., 26/4/87.

No. 14.

The Colonial Architect to The Under Secretary for Public Works.

Department of Public Works, Colonial Architect's Office,
Sydney, 9 May, 1887.

Sir,

In returning accompanying papers respecting clock, &c., for tower of the General Post Office, forwarded to me under blank cover on 26th ultimo,—

2. I do myself the honor to report that upon looking over the papers I find serious objections are raised by the English authorities—Lord Grimthorpe and Canon Cattley—to the specification prepared by Mr. Russell, which is said to require a “number of alterations,” and that “there is far too much of it; in fact, I do not see how any of the best clock-makers could tender on such a specification.”

3. Mr. Russell declines to entertain the tender of Mr. Tornaghi, because he states in it, “as near as possible,” in accordance with plan and specification; and although he undertakes to carry out the work to the approval and satisfaction of the Colonial Architect, and agrees that no payment shall be made if not carried out as stated, he recommends the tender of Messrs. Joyce & Co., which is higher than the tender of Mr. Tornaghi, also that clauses 12, 13, and 21 of specification, objected to by Messrs. Joyce & Co., be modified to meet the views of this firm; but if Messrs. Joyce & Co. are allowed to qualify their tender, why should not Mr. Tornaghi be allowed the same privilege?

4. When tenders are called for in England and the Colony, with the view of keeping the work in the Colony, it has been the practice to allow some percentage to the colonial tenderers; but Mr. Russell proposes to accept an English tender though higher than the colonial one of Mr. Tornaghi, who has, by his Government works in the Colony, proved himself quite competent to carry out in a satisfactory manner the erection of the clock and bells now tendered for by him.

5. If the recommendation of the Acting Colonial Architect on 4th March, 1885, had been accepted, the clock and bells would have been before now in use, and the long delay, through taking the work away from my Department during my absence in England, been prevented.

6. Mr. Russell, in his letter of 16th March, 1886, recommends that should the London tenders for the clock without the bells exceed £2,500 it be not accepted, but that the clock be made and erected in the Colony, and yet he now recommends a tender for £3,825, or £1,325 beyond his limit.

The tenders recommended by Mr. Russell, of Messrs. Joyce & Co., without the bells, £3,825, and T. Taylor & Co., £1,050 for the bells delivered at Loughboro' Station, amounting in all, without freight of bells, to £4,875, are £1,125 higher than the tender of Mr. Tornaghi for an imported clock, including bells and fixing; but I think, under all the circumstances of the case, the clock should be made in the Colony, and the lowest tender for the work in the Colony,—that furnished by Mr. Tornaghi, amounting to £5,480 including bells and fixing,—accepted, for the reasons given in my letter of the 27th March, 1886 (with the printed papers herewith), provided Mr. Tornaghi undertakes to carry out the work in twelve months from the date of acceptance of tender, and that he furnishes a certificate as to the satisfactory quality of the bells from Lord Grimthorpe, Canon Cattley, or other known and approved authority.

I have, &c.,

JAMES BARNET,
Colonial Architect.

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

ELECTRIC TELEGRAPHS.

(CASE OF BLAKENEY V. PEGUS.)

Ordered by the Legislative Assembly to be printed, 17 March, 1887.

RETURN to an *Order* of the Honorable the Legislative Assembly, dated 30th March, 1886, That there be laid upon the Table of this House,—

“Copies of all telegrams, memoranda, and correspondence between the Superintendent of Telegraphs, or Acting Superintendent of Telegraphs, and Mrs. Pegus, relating to the case of Blakeney *v.* Pegus, respecting a mis-sent telegram; as also copies of all correspondence from Mrs. Pegus to Superintendent of Telegraphs or Acting Superintendent of Telegraphs.”

No. 1.

Mr. E. W. Blakeney, Iluka, to The Postmaster-General, Sydney.

Sir,

8 August, 1884.

I beg respectfully to call your attention to the serious loss and inconvenience I have sustained through the negligence of an officer of the Telegraph Department.

On the 23rd June last, I received a telegram (copy enclosed), to the effect that my son James was dangerously ill; upon receipt of which I at once started on a journey of upwards of 120 miles, leaving my wife and family in a great state of alarm. Arrived at Palmer's Island I found out through the courtesy of the telegraph officer there, that the message I had received was not intended for me, but for a Mr. Walter Black of Yamba.

At a late hour in the same night a messenger arrived with a note from the operator at Yamba. (copy enclosed) asking for the return of the telegram mis-sent to me.

In consequence of the shock she received when the telegram was handed to me, my wife who has been slowly recovering from a long and painful illness suffered a relapse, and has been under medical treatment ever since, and is now forced to go to Sydney for further advice.

I may mention that two of my sons, named respectively James and Edward, are selectors in the Tweed District, and are at present felling timber, and of course I concluded that an accident had happened one of them.

I waited a considerable time for an apology to be made by the telegraph officer, Yamba, for the gross negligence displayed, but as no action was taken by that officer I wrote asking for expenses incurred by me in consequence of the mistake (I enclose copy), and received reply (copy of which I forward) a short note asking for amount of expense claimed by me in detail, but gives no answer as to whether these expenses will or will not be paid. Trusting you will give the matter your fair consideration, and will take such action as will lead to my being reimbursed for loss sustained.

I am, &c.,

EDWARD W. BLAKENEY.

Telegram from J. Hindmarsh to W. Blakeney.

Murwillumbah, 22 June, 1884.

JAMES very ill, would like to see you.

Mrs. E. H. Pegus to Mr. Blakeney.

Dear Mr. Blakeney,

The telegram sent over to you this afternoon, was for Mr. Black; please return the same to me.

Yours, &c.,

E. H. PEGUS.

Mr. E. W. Blakeney to Mrs. Pegus.

Dear Madam,

Iluka, 18th July, 1884.

I have been put to a considerable amount of expense through your error in sending me a telegram intended for Mr. W. Black, of Yamba; as this mistake was yours, I beg that you will let me know whether you are prepared to reimburse my outlay.

P.S.—An early reply will oblige.

Yours, &c.,

EDWARD W. BLAKENEY.

Mr. E. H. Pegus to Mr. E. W. Blakeney.

Dear Sir,

Clarence River Heads, 21 July, 1884.

In reply to your note *re* telegram sent to you in error, please let me know the amount of expense you were obliged to incur in this matter in detail.

Yours, &c.,

E. H. PEGUS.

Mr. Wilson for report.—E.C.C., 9/9/84.

Telegram from Manager, Sydney, to Station Mistress, Clarence River Heads.

15/9/84.

EXPLAIN please, how you came to deliver message on 22nd June, last, from Hindmarsh to Blakeney instead of Black.

Telegram from Station Mistress, Clarence River Heads, to Manager, Sydney.

15/9/84.

ON 22nd June, message to Mr. Black I took for Blakeney; instrument was marking very badly on that day. Shortly after sending message out discovered error, and I paid a messenger to go over to rectify the mistake immediately.

Submitted.—W.W., 24/9/84. This mistake was made by Mrs. Pegus, the operator at Clarence River Heads; but shortly after corrected the error which appears to have been too late to prevent Mr. Blakeney starting. She has been severely reprimanded for her carelessness. The Department cannot, of course, recognise any claim for expenses.—E.C.C., 25/9/84.

No. 2.

The Superintendent of Telegraphs, Sydney, to Mr. E. W. Blakeney, Iluka.

Sir,

26 September, 1884.

In acknowledging the receipt of your communication of the 8th ultimo, I have the honor to inform you that, upon inquiry, I find that the error in address of telegram, delivered in mistake to yourself, was caused by the Station-mistress at Clarence River Heads, and that upon discovering it, she immediately forwarded a message stating the case. I need hardly say I regret very much the annoyance and inconvenience to which you have been subjected, and in consequence the officer in fault has been severely censured; at the same time I beg to state that your claim for reimbursement of expense cannot be recognized by the department.

I have, &c.,

E. C. CRACKNELL.

No. 3.

No. 3.

The Acting Superintendent of Telegraphs to The Secretary to the Post Office.

(Urgent.)

3/2/85.

THE Station-mistress at Clarence River Heads (Mrs. Pegus) reports to me that Mr. Blakeney of Clarence River has served her with a summons claiming compensation (£200), on account of a telegram sent him in error on the 23rd June, 1884, and the case is to be proceeded with on the 13th instant. I beg to submit the matter for the information of the Postmaster-General, and to suggest that the opinion of Crown Solicitor be requested. Mrs. Pegus wishes to be advised whether she is at liberty to retain a solicitor to defend the case on behalf of the Crown.

Annexed are telegrams and letter from Mrs. Pegus.

P. B. WALKER.

Telegram from Mrs. Pegus to The Acting Superintendent of Telegraphs.

Yamba, 2/2/85.

MR. Blakeney has brought an action against me for £200, *re* telegram sent him in error 23rd June last, will be brought on 13th instant, bringing it as a test case. Kindly wire me instructions how to act in the matter.

Telegram from The Assistant Superintendent of Telegraphs to Mrs. Pegus, Yamba.

Sydney, 2/2/85.

I will submit the matter to the Postmaster-General, and let you know as soon as he sanctions matter.

P. B. W.

No. 4.

The Crown Solicitor, Sydney, to The Secretary to The Post Office.

Sir,

5 February, 1885.

I have the honor to return herewith the papers, received this morning, respecting the action brought against Mrs. Pegus, the telegraph Station-mistress at Clarence River Heads, and to state that, as it appears the case is to be tried on the 13th instant, there is not time to obtain the precise information which is required from Mrs. Pegus before the trial. I therefore beg to suggest that Mrs. Pegus should be informed that she may employ a local solicitor to defend the case on her behalf.

I have, &c.,

JOHN WILLIAMS.

No. 5.

Telegram from The Acting Superintendent of Telegraphs, to Mrs. Pegus, Yamba.

7 February, 1885.

You can employ a local solicitor. Do you require the papers? if so let me know in order that they can be returned to you by Monday's steamer.

No. 6.

Mrs. E. H. Pegus, Maclean, to The Acting Superintendent of Telegraphs.

Sir,

14 February, 1885.

In accordance with your telegram of the 7th instant, I retained Mr. R. L. Jenkins, a solicitor at Maclean, to conduct my defence in the action brought by W. Blakeney to recover damages, £200, from me for sending to him a telegram, which should have been sent to Mr. Black; the case was tried on the 13th inst., before Judge Murray, and a jury of four, at the Maclean District Court; the jury returned a verdict for Blakeney with damages £50. Mr. Fitzhardinge, my barrister, seems to think that I should appeal to the Supreme Court, as by the ruling of the Judge all those in charge of the Telegraph Offices, throughout the Colony may be cast in damages for any mistake, however caused, in sending messages.

Mr. Jenkins is writing to you this mail; will you be pleased to instruct me if I should appeal or take any other steps in the matter; I understand from Mr. Jenkins that notice of appeal must be given at once.

Mr. Fitzhardinge should be in Sydney on Monday, and has expressed his willingness to see you on the matter, if so requested.

I have, &c.,

E. H. PEGUS.

No. 7.

Telegram from Mrs. Pegus, Yamba, to The Acting Superintendent of Telegraphs.

16 February, 1885.

A nonsuit was so fully expected in my case that material evidence for the defence was not called. I sincerely trust you will not allow this matter rest, as it will make all officers in the Department liable, no matter from what cause a mistake may occur.

No. 8.

Mr. Richard Jenkins, Solicitor, Maclean, to The Acting Superintendent of Telegraphs.

Sir,

13 February, 1885.

I have the honor to inform you that in accordance with your telegram of the 7th instant authorizing Mrs. Pegus, the telegraph mistress, at Yamba, Clarence Heads, to employ a local solicitor to conduct the defence in an action brought by Blakeney against her and her husband, to recover damages for the negligent sending of a telegram, I was retained by Mrs. Pegus, and the case was tried by a jury at the Maclean District Court to-day the 13th instant.

I briefed Mr. Fitzhardinge, Crown Prosecutor, to appear for Mr. and Mrs. Pegus, who moved for a nonsuit on the ground that the action ought to have been brought against the Department; but His Honor Judge Murray held that the action was properly brought, and also ruled that Mrs. Pegus was liable, if the jury found negligence; and further that the defendants were liable for any amount Blakeney had to pay in consequence of any illness caused to his wife through the shock to her feelings upon receiving such a telegram.

The jury found a verdict for the plaintiff, damages £50.

Will you kindly advise me on behalf of Mrs. Pegus if I am to appeal to the Supreme Court against His Honor Judge Murray's ruling on these points.

Be pleased to reply by return mail or by telegram, as the memorandum of appeal must be filed within eight days from to-day.

I have, &c.

RICHARD JENKINS.

Minute of the Acting Superintendent of Telegraphs.

I beg to forward the accompanying letters from Mrs. Pegus and her solicitor in reference to the recent case of Blakeney v. Pegus, by which it will be seen that Mrs. Pegus has been found guilty of neglect in dealing with the telegram, and a verdict of £50 has been awarded by the jury. I have not the depositions before me, but from the tone of Mr. Jenkins' letter, it would appear that the verdict is not in accordance with his views, and he asks for instructions as to whether he should appeal to the Supreme Court to upset the verdict; the appeal will have to be made within the next five days, and as it is a most important case, I would recommend that the Crown Solicitor be instructed to consult with Mr. Crown Prosecutor Fitzhardinge, who acted as Counsel in the case, and advise what course should be taken.

P. B. WALKER,

16/2/85.

The Secretary to the Post Office. Perhaps the Crown Solicitor will be good enough to confer with the Crown Prosecutor, and advise as suggested,—S.H.L., B.C., 17/2/85.

No. 9.

Telegram from The Acting Superintendent of Telegraphs to Mrs. Pegus, Yamba.

17 February, 1885.

You had better appeal and give Mr. Jenkins instructions to do so at once, as he says this must be done to-day.

No. 10.

The Crown Solicitor to The Secretary to the Post Office.

Sir,

17 February, 1885.

I have the honor to return the papers relating to the action in the District Court at Grafton, Blakeney v. Pegus and another, and to state that I think it is clear that the Department is not liable, and that so far the Judge's ruling cannot be objected to; it may however, be doubted whether an action will lie against the defendant as whatever contract was entered into by the plaintiffs was with the Department, and not with the defendant personally, and on this ground probably an appeal may be made. The fact that a nonsuit was so confidently expected is no ground for applying to the Supreme Court, nor even for asking the Judge for a new trial. The defendant had the opportunity of calling witnesses, but did not think fit so to do; the fact that evidence, which might have been given, was not given, is owing to the deliberate action of the defendant. It is suggested that it is important that this judgment should be appealed against, as it establishes a precedent that officers of the Department are personally liable, this no doubt is so, but not if it is on the ground that the Department is liable. If it is admitted that the Department is liable for the neglect of a careless or incompetent officer, you may be called upon to pay heavy damages without probably being able to procure the evidence for the defence, which the postmaster, if personally sued would do.

Mr. Jenkins, in his letter of date 13th February instant, thinks the Judge's ruling should be objected to, on the ground that he held that the action should have been against the Department; I think the defence should have been that neither the Department nor the defendant was liable, and that damages might be given for the amount Blakeney had to pay in consequence of the illness caused to his wife through the shock to her feelings.

On the first point, I have before advised; as to the second, it would I think, be held that such damage did not of necessity, nor naturally arise from the defendant's action in the matter, and therefore, even if there is liability, it is not for such damage. Whether it is expedient to appeal however, is I submit, for the decision of the Hon. The Postmaster-General; if an appeal is made I would suggest that it can only be allowed on the ground that neither the Department nor the defendant was liable, and not as suggested, that the Department and not the defendant should have been sued.

I have, &c.,

J. WILLIAMS.

Submitted.—S. H. L., 19/2/85. The necessary steps for an appeal ought certainly to be taken on the grounds set out in the Crown Solicitors letter.—J. N., 19/2/85. The Crown Solicitor.—B. C., 19/2/85. Urgent.

No. 11.

Sir,

24 February, 1885.

At the request of Mr. R. Jenkins, Solicitor, Rocky Mouth, I have the honor to forward to you a copy of the Crown Solicitor's minute in the case *Blakeney v. Pegus*.

I have, &c.,

S. H. LAMBTON.

(NOTE.—For copy see No. 10.)

No. 15.

Mrs. E. H. Pegus, Yamba, to The Acting Superintendent of Telegraphs.

Sir,

24 February, 1885.

I beg to enclose three copies of telegrams that passed through my office to Mrs. Blakeney, which would tend to upset her much more than the one that her husband received from Mr. Hindmarsh. I sent them to show you that there was no shock caused by them, and I consider it a perfect fraud and try-on to extort money. Dr. Crabbe, of Rocky Mouth, maintains that Mrs. Blakeney was a patient of his at the time, and did not go or send to him; and if she had received a shock she would have required immediate medical attention and special medicine in her complaint.

No. 16.

Mr. E. T. Newell, Solicitor, Sydney, to The Secretary to the Post Office.

Blakeney v. Pegus and Wife.

Sir,

Waterloo Chambers, 458 George-street, 6 May, 1885.

Owing to a decision of the full Court (Supreme Court) a few days since, it has been rendered necessary that the defendants herein should have deposited with the Registrar of the District Court, Maclean, the amount of verdict and costs, with £30 to answer costs of appeal as a condition precedent to the rule *nisi* for new trial being made absolute. This has not been done, and as I understand, the circumstances of this case are such that if a new trial should be refused the Telegraph Department would pay the amount of verdict and costs, will you kindly inform me whether the department will, in order to get over the difficulty the defendants have been placed in by the money not having been deposited, and my inability to communicate with them before the motion is made, guarantee payment of amount of verdict and costs, including costs of appeal, in case the Court should refuse to grant a new trial, which is not at all likely, as the motion may be made to-day? Will you please let me have an immediate reply?

I have, &c.

E. T. NEWELL.

Write a reply in the affirmative, and send down to me at once.—S.H.L., 6/5/85. Approved.—J.N., 6/5/85.

The Secretary to the Post Office, to Mr. E. T. Newell, Solicitor, Sydney.

Sir,

6 May, 1885.

In reply to your letter of to-day's date, I am directed to inform you that the Postmaster-General agrees to the payment of the amount of verdict and costs, including costs of appeal in the case of *Blakeney v Pegus* and wife, should the Supreme Court refuse to grant a new trial.

I have, &c.,
S. H. LAMBTON.

No. 18.

Telegram from Mrs. E. H. Pegus, Yamba, to The Acting Superintendent of Telegraphs.

6 May, 1885.

MR. JENKINS, Solicitor, communicated the following to me last night at 9 p.m.:—Got telegram to-day from Sydney solicitor, says the Supreme Court ruled yesterday in an appeal case, that the amount of verdict and costs obtained in the District Court must be lodged with the Registrar of Court, in addition to £30 to abide result of appeal before it could be heard in the Supreme Court. That means that the amount of verdict, £50, costs, £31 1s. 4d, and £30 to abide result of appeal must be paid to the Clerk of Petty Sessions here at once, or else the case will be struck out and quashed; Blakeney's Solicitor, has found out that this has not been done here, and no one knew that it was necessary until at the appeal case yesterday. Mr. Jenkins has to make affidavit by to-morrow,—Wednesday's boat that the money is deposited or else the plaintiff will get a nonsuit—that is, the case will be struck out and not heard. The question is how to get the money up here in time; there is no time to apply to the Government. Mr. Jenkins' Sydney Solicitor wired him "get this deposited at once and wire him back and he would then have case postponed till his affidavit arrived on Friday." Mr. Jenkins wired me this morning that he had obtained the loan of amount. It is very urgent that the money be paid back to Mr. Jenkins by Thursday; would you kindly have the money sent to Mr. Jenkins at once by telegraph, as he states he must have the money by to-morrow.

E. H. PEGUS.

No. 19.

Telegram from Mr. Richard Jenkins, Solicitor, Maclean, to The Acting Superintendent of Telegraphs.

6 May, 1885.

BLAKENEY *v* Pegus and wife.—The Supreme Court ruled in an appeal case, day before yesterday, that before an appeal could be heard the amount of judgment obtained in the District Court together with £30 in addition to such amount to answer the costs of the appeal would have to be lodged with Registrar, District Court. I must request you to kindly remit me the sum of £111 1s. 4d., to lodge with Registrar, District Court here, being amount of judgment £81 1s. 4d., together with £30, as I have paid same out of my own pocket to avoid appeal being struck out of the business paper; reply at once.

RICHARD JENKINS.

This is an urgent case and the Crown Solicitor should be directed to have the amount required, £111 1s. 4d., paid over to Mr. Jenkins at once, as he appears to have paid it out of his own pocket.—P.B.W., 6/5/85. The Secretary to the Post Office.—B.C., Urgent. Submitted.—S.H.L., 7/5/85.

No. 20.

Minute of The Postmaster-General on extract from *Evening News*, 12/5/85.

IF, through negligence of the solicitor for Mrs. Pegus, the proper steps for an appeal have not been taken, it is clear that I cannot sanction the repayment to him of the money paid into Court. I think the judgment would have certainly been set aside by the full Court, for I cannot conceive on what grounds the defendant was liable, and if she was, the damages awarded are excessive.—J.N., 14/5/85.

Acting Superintendent, Telegraphs.—B.C., 15/5/85., Jas. D., (*pro* Secretary). I presume Mr. Jenkins is to be advised in terms of the Postmaster-General's minute, or should the matter be held over till we receive an official intimation from him giving the result of the appeal? Perhaps it would be as well to adopt the latter course in order that Mr. Jenkins may have an opportunity of explaining why action was not taken in time.—P.B.W., 18/5/85.

The Secretary to the Post Office.—B.C. Submitted.—S.H.L., 19/5/85. Nothing need be done at present. If Mr. Jenkins should make any application the matter can then be considered.—J.N. 19/5/85. Acting Superintendent of Telegraphs.—S.H.L., B.C., 20/5/85.

No. 21.

Mr. Richard Jenkins, Solicitor, Maclean, to The Acting Superintendent of Telegraphs.

Pegus v. Blakeney.

Sir,

20 May, 1885.

I have the honor to inform you that the above named action came on in the Supreme Court, before the full Court on Wednesday last, 13th inst., in the nature of a District Court appeal.

Mr. M. H. Stephen, Q.C., and Mr. G. B. Simpson were retained by me on behalf of the appellants, Mr. and Mrs. Pegus, to move to make absolute the order *nisi* granted herein on the following grounds: 1st. That His Honor Mr. District Court Judge Murray, was wrong in not nonsuiting the plaintiff in the action on the ground that the same was not maintainable. 2nd. That no cause of action was made out. 3rd. That His Honor Mr. District Court Judge Murray wrongly admitted certain evidence.

Mr.

Mr. Salomons, Q.C., who appeared in conjunction with Mr. O'Ryan for the respondent in the appeal case, raised a preliminary objection that a Judge in Chambers had no jurisdiction to grant the order *nisi*, and this being so, that the same must be discharged.

The Full Court upheld the objection raised, and discharged the order *nisi*, but without granting the respondent his costs of the appeal. I regret the result exceedingly, as counsel for the appellants were confident of success, had the matter been argued upon its merits.

I may respectfully invite your attention to a very clear report of this appeal case published in the *Sydney Morning Herald* newspaper of the 14th inst.

I have, &c.,

RICHARD JENKINS.

It would appear from Mr. Jenkins' explanation of this case, that he is not to blame for the case being quashed, and I do not see what further can be done in the matter. Mr. Jenkins appears to have borne all the costs of the appeal to no purpose, and as he has shown clearly that he is not to blame he should be reimbursed.—P.B.W., 26/5/85. The Secretary to the Post Office.

Submitted.—S.H.L., 27/5/85. Mr. Jenkins has not shown that he is not to blame. Nothing can be done till we know more about the matter, which will probably not be till the hearing of the rule *nisi*, which appears to have been granted on 22/5/85.—J.N., 1/6/85. Read. Inform Mr. Jenkins of Postmaster-General's decision.—P.B.W., 2/6/85.

No. 22.

The Acting Superintendent of Telegraphs, to Mr. R. Jenkins, Solicitor, Maclean.

Sir,

3 June, 1885.

In acknowledging the receipt of your letter of the 20th ultimo, in reference to the action, *Pegus v. Blakeney*, I have the honor to inform you by direction of the Postmaster-General that nothing further can be done by the Government in the matter until the result of the hearing of the rule *nisi*, which has been granted, is received.

I have, &c.,

P. B. WALKER.

No. 23.

Mr. Richard Jenkins, Solicitor, Maclean, to The Secretary to the Post Office.

Pegus and Wife v. Blakeney.

Sir,

5 June, 1885.

I have the honor to inform you that a rule *nisi* for a nonsuit or a new trial has been granted by the Supreme Court in this matter, and will come on for argument next term, which commences 27th July next.

As I have paid the sum of £111 1s. 4d. into the District Court here by way of a deposit, pursuant to the 94th section of the District Courts Act, and can ill afford to wait until this action is finally disposed of, may I respectfully request that the said amount, £111 1s. 4d. be paid to me as early as possible. It is made up as follows:—

Verdict obtained by Plaintiff in District Court here	£50	0	0
Plaintiff's taxed costs	31	1	4
Costs to abide results of Appeal	30	0	0
Total	£111	1	4

I have, &c.,

RICHD. JENKINS.

Submitted.—S.H.L., 8/6/85.

Let Crown Solicitor be asked to advise whether we ought to pay the amount claimed, or any of it. From what I can see there may have been a great deal of bungling about the case, and there is quite a possibility of the rule *nisi* being discharged in consequence, the result of which would be that the money paid into Court would be entirely thrown away, and the objectionable judgment would stand.

J.N., 9/6/85.

No. 24.

The Secretary to the Post Office, to The Crown Solicitor.

Sir,

13 June, 1885.

I am directed by the Postmaster-General to transmit herewith the papers in the case of *Blakeney v. Pegus*, amongst which is an application from Mrs. Pegus's attorney, Mr. Richard Jenkins, for the sum of £111 1s. 4d., which he has paid into Court under the District Courts Act to be paid to him as soon as possible by this Department. I am accordingly, to request that you will be good enough to state whether, under the circumstances of the case, this Department would be justified in paying this amount, or any part thereof.

I have, &c.,

S. H. LAMBTON.

No. 25.

The Crown Solicitor, to The Acting Superintendent of Telegraphs.

17 September, 1885.

I have the honor to return herewith the papers relating to the case, *Blakeney v. Pegus*, and in reply to your letter of date 13th June last, asking me to advise whether under the circumstances of the case your Department would be justified in paying the amount, or any part thereof, to state that I think, under the very peculiar circumstances of the case, the cost of the defence should be borne by the Department.

No

No doubt Mrs. Pegus has been guilty of a certain amount of negligence in forwarding a telegram addressed to William Black, to William Blakeney, but the punishment of compelling her to bear the costs of the action, considering the extraordinary course the proceedings have taken, would be out of all proportion to her offence. I think, upon the appeal to the Supreme Court, the verdict given in the District Court will be set aside, and that it is probable therefore, that all the defendant will have to pay will be certain portions of the costs incurred by her in defending the action; but if such should be the case the costs will amount to a considerable sum.

The defendant being dissatisfied with the ruling of the Judge of the District Court, made application to the Supreme Court within the proper time for a rule *nisi*. This application was initiated in due time; but a copy of the Judge's notes, upon which the motion had to be grounded, had not been obtained. The usual practice in such a case is to mention the matter to the Court, and to request that the application should be considered as commenced, and that time be allowed to procure the Judge's notes. This I am told was done, but the Court suggested that the application should be proceeded with, which was done, and the rule *nisi* granted, upon motion, however, made to make the rule absolute; the objection was taken that the motion for the rule *nisi* was not grounded on the Judge's notes, and the rule *nisi* was discharged.

The matter has since been brought under the consideration of the Court, and now awaits judgment. It will be seen therefore, that a very large proportion of the costs which the defendant will have to pay do not arise directly from her mistake with respect to the telegram.

It appears from Mr. Jenkins' letter of date 5th June last, that the defendant has had to pay £111 1s. 4d., into Court; in the event however, of her succeeding in the appeal, this sum will be repaid to her, and it cannot therefore be regarded as a disbursement made by her.

I beg to suggest that a reasonable advance be made to Mr. Jenkins for counsels' fees, &c., in the defence, and that upon its being ascertained what amount these proceedings have cost Mrs. Pegus it shall be paid; but I do not think I can recommend that the £111 1s. 4d., paid into court by her to abide the appeal, should be now paid.

Mr. Jenkins states in his letter that *he* can ill-afford to wait until the action is finally disposed of, for the repayment of this sum; but this must be a mistake. The £111 1s. 4d. has no doubt been advanced by Mrs. Pegus, and not by Mr. Jenkins.

I have, &c.,
J. WILLIAMS.

With reference to last sentence of this letter I may perhaps state, that the sum in question was paid by Mr. Jenkins, and not by Mrs. Pegus. Mr. Jenkins undertakes, in the event of the appeal being successful, to refund the amount, should his application for its payment to him now be acceded to. As it was on this application from Mr. Jenkins that the Pm.-G. desired the Crown Solicitor's advice; the information now furnished may perhaps enable Mr. Williams to advise further.—S.H.L., B. C., 19/9/85.

No. 26.

The Crown Solicitor to The Secretary to the Post Office.

Sir,

24 September, 1885.

I have the honor to return herewith the papers relating to the action, *Blakeney v. Pegus*, and in reply to your minute of date 19/9/85, to state that, if as stated by Mr. Jenkins—and I have no reason to doubt his statement—he has advanced the amount paid into Court to enable the appeal to be carried on, I think the amount should be paid to him, upon his handing to you an order or authority in such a form as will enable you to receive the amount lodged in Court, in the event of the appeal being successful; this is of course upon the supposition that you intend to indemnify Mr. and Mrs. Pegus from the result of the action.

I have, &c.,
J. WILLIAMS.

Submitted.—J.A.S. D., 25/9/85. The amount may be paid, taking the precautions suggested by the Crown Solicitor.—J.N., 7/10/85. Acting Superintendent of Telegraphs. Urgent.—S.H.L., 7/10/85. Accountant to see this done at once.—P.B.W., 7/10/85. Vouchers herewith; a letter should, I think, be written to Mr. Jenkins for his authority.—C.S.G., 9/10/85. I think the Registrar of District Court, Maclean, should be informed that we hold the authority.—C.S.G., 23/10/85. Yes, this may be done, and a copy of the authority sent for his information.—P.B.W., 23/10/85.

No. 27.

Mr. Richard Jenkins, Solicitor, Sydney, to The Registrar, District Court, Maclean.

Pegus v. Blakeney.

I, THE undersigned, as solicitor for Mr. and Mrs. Pegus do hereby authorize you to pay to the Acting Superintendent of Telegraphs, the sum of £111 1s. 4d., paid into the District Court at Maclean, by me as a deposit to abide the result of an appeal in the abovenamed action, should the said appeal result in favour of Mr. and Mrs. Pegus.

Dated this 12th day of October, A.D., 1885.

RICHARD JENKINS,
Solicitor for Mr. and Mrs. Pegus,
Victoria Chambers, Phillip-street,
Sydney.

Allowed at £133 17s. 1d.—FRED. CHAPMAN, Prothonotary, 23/12/85.

The attached amount of Mr. Richard Jenkins for costs in the case of Pegus v. Blakeney has been forwarded me to pass, but, as there are several items in the amount which appear to me have arisen through neglect on Mr. Jenkins' part, I think the papers should be forwarded to the Crown Solicitor with a request that he will look over the account, and state what he considers should be paid.

P. B. WALKER, 30/11/85.

Submitted.—S.H.L., 12/2/85. Approved.—J.S., 3/12/85. The Crown Solicitor.—S.H.L., B.C., 4/12/15.

No. 33.

The Crown Solicitor to The Secretary to the Post Office.

Re Pegus et uxor and Blakeney.

Sir,

7th January, 1886.

I have the honor to return herewith all the papers you sent me with your B.C., 4/12/85, and to state that the bill of costs furnished by Mr. Jenkins has been taxed and allowed at £133 17s. 1d., which amount you may now cause to be paid to Mr. Jenkins at your earliest convenience.

I have, &c.,

JOHN WILLIAMS.

Referred to the Superintendent of Telegraphs.—S.H.L., B.C., 8/1/86. Accountant to make out voucher.—P.B.W., 8/1/86. Voucher to Treasury.—9/1/86.

IRON COLUMNS FOR TELEGRAPH LINES.

No. 1.

EXTRACT from the *Sydney Morning Herald*, 15th June, 1886.

THE NEW IRON TELEGRAPH SUPPORTS.

To the Editor of the Herald.

SIR,—Is it too late to usefully protest against the disfigurement of the better parts of our city's street architecture by the extension of the system of uniform cast-iron balustrades, or whatever they should be called, for the support of cabled telegraph wires. Were the taste of its design a little better the work referred to might be considered by many as an improvement on the very heterogeneous style of awning supports to shop fronts, which it supersedes; but I think that no one can see it in front of our leading banks, &c., and of the open space containing the Town Hall and Cathedral without at least regret. A ready means of avoiding such disfigurement has I believe been for years in vogue in Europe, viz., to carry the cabled wires within a hollow iron kerbing substituted for the usual stonework, such receptacle being perhaps also available for minor gas and water pipes. The adoption of such substitute in front of the places referred to, as well as the proposed subways at street crossings, would not involve the waste of any material already supplied or contracted for, and at present the removal of but little already erected would be required. Were the George-street system continued along the west side of Pitt-street the present uninterrupted view of the "Post Office Carvings" might even be lost; surely their admirers would never consent to this.

I am, &c.,
E.W.

Seen.—F.B.S.

No. 2.

Mr. C. Binnie to The Superintendent of Telegraphs.

Dear Sir,

17 June, 1886.

In reply to yours of the 16th instant I must again draw your attention to the fact that the complaint of damage is not against the supports of the friezework, but the supports of the awning.

The frieze needs no support, as is shown by the fact that a line of (say) 200 yards of it stands unsupported by no more than its own fastenings at the foot of the posts in front of the Town Hall.

Yours, &c.,
CHAS. BINNIE.

No. 3.

The Superintendent of Telegraphs to Mr. C. Binnie.

Sir,

21 June, 1886.

In reply to your communication of the 17th instant, I have the honor to inform you that, as the ironwork in question is erected under the power given by the Electric Telegraph Act, you have no claim for compensation for alleged damage to your property.

I have, &c.,
E. C. CRACKNELL.

No. 4.

EXTRACT from *Sydney Morning Herald*, 22nd June, 1886.

THE NEW TELEGRAPH AND TELEPHONE WIRE SUPPORTS.

To the Editor of the Herald.

SIR,—Some people deem it their duty to rush into correspondence with newspapers at every opportunity, and generally write on subjects of which they are totally unacquainted. "E.W's." letter in your issue of the 16th is a sample of this style. He suggests that the iron frieze now being erected along the west side of George-street for carrying the telegraph and telephone wires should be replaced by subways, or hollow iron kerbing, and that the wires be run through these. Of course "E.W." is unaware of the fact that by placing the telephone wires in such inaccessible places as the latter, the working of the system would be seriously interfered with, and, further, the kerbing could not be made sufficiently large to accommodate the whole of the telegraph and telephone wires which the frieze is intended to carry. In Paris a very complete system of sewerage exists, and the cables, &c., are conducted within the sewers, where they can be inspected as required, and consequently there is no difficulty there; but to follow the plan here, we would require to construct subways or tunnels specially for the purpose, and as this would be a very expensive item, I feel sure the Government would not entertain such a proposal. From inquiries made I find that the telephone lines through the city number about 700, and as they must increase and extra telegraph wires must be provided for the increasing traffic, the quantity will become so great that it will be absolutely dangerous to put them overhead on the present poles.

Under the circumstances I think that the Officer-in-charge of the Electric Telegraph Department is deserving of some credit for his invention of the iron frieze for carrying these wires, and at the same time improving the appearance of our main thoroughfare, besides giving an opportunity to those who have not awnings to their premises to erect same substantially and cheaply. I am certain that when the work is completed the scheme will meet with general approval, and will need no protest.

If

If in the future the authorities should find it beneficial to adopt the electric light for illuminating the street it will be an easy matter to carry the leads for the lamps on this iron frieze, and the lamps themselves can be affixed thereto at a very low cost. The whole will form a very pleasing ornament to the city, and the proprietors of business premises especially will never regret its introduction. Numerous patents have been taken out for schemes for carrying telegraph wires, principally by subterranean passages, but not one of them has been a complete success, and therefore this new departure is entitled to a fair trial before being condemned.

I am, &c.,
ENGINEER.

EXTRACT from *Sydney Morning Herald*, 23rd June, 1886.

THE NEW IRON TELEGRAPH SUPPORTS.

To the Editor of the *Herald*.

SIR,—“Engineer” unfairly deals with my protest against the disfigurement of our leading architectural buildings. The suggestion was only to continue the subways, which have to be constructed at all street crossings, in front of such buildings, and of the Town Hall, Cathedral, &c., removing the portion of iron frieze so displaced to other shop fronts.

I have a reason to believe that the public companies and others who object to the vandalism of the present erection, would gladly defray the difference in the cost between the frieze and such subway along the few feet of frontage in which they are interested. The Manager of the A.J.S. Bank offered to do so before the frieze was actually in place. The size of such subway, whether in shape of kerbing or otherwise, is a matter of detail probably not alarming to other engineers.

I am, &c.,
E.W.

EXTRACT from *Sydney Morning Herald*, 26th June, 1886.

THE NEW TELEGRAPH AND TELEPHONE WIRE SUPPORTS.

To the Editor of the *Herald*.

SIR,—I did not intend to write further upon the above subject, but would like to point out that if “E.W.’s” suggestion to place the telegraph and telephone wires in conduits where they pass buildings such as the Town Hall, Cathedral, and Australian Joint Stock Bank, were carried out, it is clear that the whole aim of the inventor of the new iron supports to secure uniformity would be defeated. There would also be claims from proprietors of business premises for similar concessions, and we would have alternate stretches of frieze and vacant spaces. I quite understand that the protest is against the disfigurement of the buildings named; but surely the purpose for which the ironwork is being erected should be first considered. The placing of the wires on racks in dry places in the open air, instead of in damp underground passages, is a considerable advantage as regards the working of the lines, and as the iron-work is designed to enable this to be done, I do not see why exception should be taken to its erection.

I have, &c.,
ENGINEER.

No. 8.

EXTRACT from *Sydney Morning Herald*, 1st July, 1886.

PROCEEDINGS Legislative Council, 30th June, 1886.

TEMPORARY SUPPLY BILL.

MR. MACKELLAR moved the second reading of the Temporary Supply Bill. He explained that it provided for an expenditure of £510,000 on account of the Civil Service for the month of June, of £100,000 for the Harbours and Rivers Department for water supply (in anticipation of a loan vote), and £50,000 for electric telegraph construction.

The motion was agreed to, and the House went into Committee of the Whole to consider the Bill in detail.

The clauses preceding the schedule were agreed to.

On the schedule being submitted to the Committee,—

MR. DARLEY asked whether the telegraphic friezework now being erected in George-street was included in the sum of £50,000 provided for electric telegraph construction. He believed that in regard to the erection of the friezework, the Government were going to great expense, and were acting upon a wrong principle. In all large cities telegraphic wires were now carried underground. It was very dangerous

gerous to have a large mass of wires overhead. There was not only that objection to the frieze work, but by its use the beauty of private buildings of a public nature was destroyed. He alluded particularly to the Australian Joint Stock Bank, at the corner of King and George streets. The Pitt-street front of the General Post Office had been destroyed by those horrible carvings, and now they were to have the appearance of private buildings destroyed by that frieze work.

Mr. MACKELLAR said that he believed the work mentioned by the hon. gentleman was included in the Bill.

Mr. DANGAR saw no objection to the erection of the friezework. He was glad that uniformity in that matter was to be observed.

The schedule was agreed to.

The Bill was reported without amendment, was read a third time, and was returned to the Legislative Assembly with the usual message.

No. 9.

Mr. W. Humphreys to The Superintendent of Telegraphs.

Dear Sir,

Bond-street Chambers, 15 July, 1886.

I have inspected the sewer at Goulburn-street, and have decided to cut the friezework 18 inches; this will make this bay of frieze the same as the adjoining one, and will not be noticed. To alter the sewer would entail considerable expense, and cannot be entertained, as, besides opening up George-street might cause us to have to run along Goulburn-street east for some distance.

By shortening the frieze no perceptible difference will be made, and save considerable expense.

I am, &c.,

W. HUMPHREYS.

No. 10.

Messrs. D. & W. Robertson to E. O. Moriarty, Esq.

Dear Sir,

Central Exchange Buildings, York-street, Sydney, 19 July, 1886.

We have the honor to apply for payment of the sum of £7 10s., which we had to disburse in connection with the inspection of telephone verandah for Telegraph Department, which was inspected by Mr. James Orr, an officer in your Department.

As the outlay was made on account of the Telegraph Department, we presume you can get the sum from them, but we have to send the application through your Department.

We enclose receipt for the sum we paid Humphreys and Cracknell for the plans.

We are, &c.,

D. & W. ROBERTSON.

No. 11.

Minute by Mr. J. Orr.

I RECEIVED tracings from Messrs. D. & W. Robertson, through Humphreys and Cracknell, on behalf of the Telegraph Department, to enable me to proceed with the inspection. The tracings (2) are now in the possession of the Telegraph Department.

JAMES ORR, 23/7/86.

No. 12.

Minute by Mr. C. W. Darley.

THIS matter belongs entirely to the Telegraph Department. Messrs. D. & W. Robertson should be referred to that Department. Mr. Orr was practically an officer of that Department while he was inspecting the castings, &c.

C.W.D., 23/7/86.

No. 13.

Minute by The Superintendent of Telegraphs.

I KNOW nothing about this matter. We could have supplied these tracings if applied to.

No. 15.

Minute by The Engineer-in-Chief for Harbours and Rivers.

AT considerable inconvenience I allowed one of my officers to put himself in connection with the Telegraph Department for the purpose stated herein, during which time he was not under my orders, nor paid by me, and that gentleman states he was sent by Mr. Walker to Messrs. Robertson for the plans charged herein. I have nothing whatever to do with the matter, and can only return this paper to the Telegraph Department.

E.O.M., 3/8/86.

No. 16.

F. Abigail, Esq., M.P., to The Postmaster-General.

Dear Sir,

30 July, 1886.

Some time ago I spoke to you, and also to Mr. Cracknell, about the shopkeepers, whose verandahs you have had removed to erect the new telegraph arrangements, about allowing them to fix under the frieze a board for the name to be on. I have not received any reply, and it is a great source of annoyance as well as loss to the business people who allowed you to remove their names and verandahs. I ask, in their behalf, that this should now be directed and the required permission given, and you will oblige

Yours, &c.,

F. ABIGAIL.

No. 17.

The Superintendent of Telegraphs to The Postmaster-General.

THERE is no objection to the signboards being suspended under the friezework, but they should be uniform, and should harmonize with the colouring of the ironwork.

E.C.C., 3/8/86.

No. 18.

The Postmaster-General to The Superintendent of Telegraphs.

I AM afraid we cannot compel tradesmen to make their signs uniform or the colour harmonize with that of the ironwork.

Mr. Abigail may be informed that signs may be suspended under the frieze, and I trust the owners will endeavour to make the signs uniform in character, and of a colour that will harmonize with that of the ironwork.

No. 19.

The Secretary, General Post Office, to F. Abigail, Esq., M.P.

Sir,

General Post Office, Sydney, 6 August, 1886.

I am directed to acknowledge the receipt of your communication of the 30th ultimo, requesting that the shopkeepers on the west side of George-street may be allowed to fix signboards under the telegraph friezework.

In reply, Mr. Suttor desires me to intimate that signs may be suspended accordingly, but he trusts the owners thereof will endeavour to make such signs uniform in character, and of a colour that will harmonize with that of the ironwork.

I have, &c.,

S. H. LAMBTON,

Secretary.

No. 20.

Messrs. D. & W. Robertson to The Secretary, General Post Office.

Dear Sir,

5 August, 1886.

We hand you herewith account for £7 10s., which we paid to Humphreys and Cracknell for a copy of the plans of the telephone verandah material, at the request of Mr. Orr, the officer from the Harbours and Rivers Department, who inspected the ironwork for your Department.

Your kind attention to the account will oblige

Yours, &c.,

(For D. & W. ROBERTSON),

A.R.M.

P.S.—We sent receipt by Humphreys and Cracknell to the Harbours and Rivers Department for the amount paid by us, but they have not returned same to us.

We have nothing to do with this account.—E.C.C., 6/8/86.

No. 21.

No. 21.

The Superintendent of Telegraphs to Messrs. D. & W. Robertson.

Gentlemen,

13 August, 1886.

With reference to your letter of the 5th instant, addressed to the Secretary, General Post Office, respecting the amount due to you for tracing of plans of telephone verandah material, I have the honor to inform you that the charge cannot be recognized by this Department, as no directions were issued from this office for the preparation of the tracings.

I have, &c.,

E. C. CRACKNELL.

No. 22.

The Secretary, General Post Office, to The Town Clerk.

Sir,

Sydney, 6 August, 1886.

I am directed to acknowledge the receipt of your letter of the 13th May last, submitting for consideration the question of the desirability of having the telegraph columns and frieze recently erected on the west side of George-street, between Druitt and Bathurst streets, removed, and in lieu thereof a subway constructed for carrying electric telegraph cables.

In reply, I am to state that the Postmaster-General, having carefully considered the matter, thinks it would not be desirable to remove the telegraph posts and frieze, as he is informed by the Superintendent of Telegraphs that a subway cable would not be suitable, and he understands there is no longer any objection to the new work.

I have, &c.,

S. H. LAMBTON.

No. 23.

EXTRACT from *Daily Telegraph*, 24th August, 1886.

TELEGRAPH STREET ORNAMENTS.

To the Editor, Daily Telegraph.

SIR,—It seems strange that, with our so-much-vaunted responsible Government certain heads of Departments are permitted to exercise such autocratic power. The Colonial Architect, for instance, can treat with indifference the opinions of the many as to his Post Office caricatures; and now the Telegraph Manager “considers it not desirable to remove his iron friezes” from disfiguring one of the finest sites and two of the most prominent public buildings in the city. If the Mayor has the power, I trust he will exercise it by informing the Government that, if these apparent commencement-iron-scaffolding supporters (for they look but nothing else from the opposite side of the street) are not removed from the front of the Town Hall and Cathedral within a specified time they will be levelled with where they should have been originally laid.

Yours, &c.,

OBSERVER.

Read.—S.H.L., 24/8/86.

No. 24.

Messrs. Biddell Brothers to The Superintendent of Telegraphs.

Sir,

507 & 505 George-street, 26 October, 1886.

Your frieze, passing our door, is now up, and our splendid verandah, calculated to last twenty years, built at great cost and approved, demolished. The front of said verandah carried a board bearing our name, which board was detached and stands in our back premises. The raising of your verandah above ours left a space on the face of our premises bare and unsightly, to which such a board as above described should be applied.

We have now respectfully to request that such a board may be supplied and affixed to the front wall of our premises of the description and in the position indicated.

We are, &c.,

BIDDELL BROTHERS.

No. 25.

The Superintendent of Telegraphs to Messrs. Biddell Brothers.

Gentlemen,

4 November, 1886.

In acknowledging the receipt of your communication of the 26th ultimo, requesting that a board may be supplied by this Department and affixed to the front of your premises in lieu of one removed during erection of iron friezework for telephone wires, I have the honor to inform you that this work cannot be carried out by the Department, but there is no objection to your firm placing the board in position if you desire it.

I have, &c.,

E. C. CRACKNELL,

Superintendent of Telegraphs.

No. 26.

Mr. T. Hawkings to The Superintendent of Telegraphs.

Dear Sir,

12 November, 1886.

Will you kindly let me know when I am likely to get a settlement for work done on awnings in George-street. It is over five months since the work was finished, and there is still over £270 due to me. As I can get no satisfaction from the Accountant, I determined to see you on the matter, and have called several times at your office with that intent, but have never yet been fortunate enough to see you, so now take the liberty of writing. Trusting you will favour me with an early reply.

I am, &c.,

THOMAS HAWKINGS.

No. 27.

Minute by The Accountant, Electric Telegraphs.

Re Mr. Thos. Hawkings' letter of the 12th November, these accounts will be paid as soon as the further authority obtained. C.S.G., 17/11/86.

No. 28.

The Superintendent of Telegraphs to Mr. T. Hawkings.

22 November, 1886.

In reply to your communication of the 12th instant, I have to inform you that payment of your account will be made immediately the Postmaster-General sanctions the expenditure.

The Minister being in Melbourne at present, there will be some delay in obtaining his authority.

E. C. CRACKNELL,
Superintendent.

No. 29.

The Superintendent of Telegraphs to The Postmaster-General.

THE attached accounts have been rendered in connection with the erection of the ironwork along George-street, to carry the telephone wires, and are in excess of the sum authorised for this work, and I now beg to request the authority of the Postmaster-General to pay them out of the Loans Vote for construction and extension of telegraph lines generally.

E. C. CRACKNELL, 17/11/86.

The above amount includes all the ascertained claims for this work. In the final settlement there may be one or two extra accounts, but they are not likely to reach any large amount.—E.C.C., 1/12/86.

PARTICULARS of accounts, in excess of sum authorised, for erection of ironwork in George-street:—

Mort's Dock and Engineering Company	£412	7	6
Australian Gas-light Company	54	10	6
W. Humphreys	150	0	0
T. Hawkings (plumbing, &c.)	217	8	11
Triggs and Marr (ironwork, awnings, &c.)	262	13	2
						£1,097	0	1

No. 30.

The Postmaster-General to The Superintendent of Telegraphs.

I SHALL be glad if the Superintendent of Telegraphs will explain how the original estimate has been so far exceeded. F.B.S., 11/12/86.

No. 31.

The Superintendent of Telegraphs to The Postmaster-General.

THE reason the estimate for the erection of the iron friezework has been so much exceeded is in consequence of the exceptional character of the work, nothing of the kind having been attempted before there was no basis to work upon as a guide to the actual cost for the completion of the structure, and it appears from Mr. Humphreys explanation herewith, that he did not include the re-erection of the verandah roofs in his estimate.

There was also engineering work of an expensive nature, such as drilling and fitting the girders to the standards to provide for the inequalities in the levels of the street, almost every bay requiring a special adjustment, more particularly down Brickfield Hill and on to the Railway Station this work was tedious, and cost more than was anticipated.

There were also special tools to provide for this work which are still in store, and will come in useful for other works connected with the service.

Not

Not having had any experience in a matter of this kind I had insufficient data to guide me in checking the estimates submitted, and in asking for authority to expend £1,500 I was under the impression that it would have been ample to cover everything necessary, except the footway across George-street, which was not included in the amount in question.

In any future works of the kind an exact estimate can be arrived at, and although the cost may appear high it is not half the expense of a subway, the only other substitute for the conveyance of the cables and wires along the streets in large cities, which is claiming attention at present in most parts of the world.

Similar arrangements must be made in Pitt-street without delay, as no more wires can be placed on the poles between the General Post Office and the Exchange, and the other streets are becoming blocked with wires in the same way for which provision must be made. Except for the comparatively few telegraph wires, the public who use the telephone system have to pay proportionately, so that the ironwork in question is not really a charge upon the State.

E. C. CRACKNELL, 15/12/86.

No. 32.

Mr. W. Humphreys to The Superintendent of Telegraphs.

Dear Sir,

Bond Chambers, Sydney, 15 December, 1886.

In my first estimate for the supply and erection of the iron friezework along George-street, I have the honor to inform you that my prime estimate did not include the re-erection of the verandah-roofs. To have estimated this item would have been a very difficult matter, as in almost every instance special work has had to be provided for.

The estimate that I furnished you with had only reference to the erection of the friezework, and the cost of pipes for street crossings; this amount has not been exceeded.

I have, &c.,

W. HUMPHREYS.

No. 33.

The Postmaster-General to The Superintendent of Telegraphs.

THE attached accounts, amounting to £1,097, must, I am sorry to say, be paid, but this excess of the original estimate does not reflect much credit upon those having control of this work. Before answering a question in the Legislative Assembly I was told that £1,500 had been authorised for the erection of the columns and alterations to awnings, and in the minute asking for this amount it seems to me clear that it was intended to cover all expenses of erection.

F.B.S., 21/12/86.

No. 34.

The Superintendent of Telegraphs to The Postmaster-General.

IN reference to the under estimate for the friezework along George-street, I may state that I do not hold myself responsible for the excess in question. This being purely an engineering matter, and quite outside my sphere, I requested the Government to appoint Mr. Humphreys, the well-known Engineer, to supervise the construction of the ironwork, &c., which was approved of by the late P. M. G., Mr. O'Connor, which, I consider, relieved me of all responsibility as regards the engineering work. The real cause for the estimate being exceeded was the impossibility of determining the cost of re-erecting the verandah-roofs, and there being no guide from any previous work of the kind in any part of the world, I consider it excusable if a more accurate estimate could not be arrived at. Under these circumstances I consider that Mr. Suttor's minute, 21/12/86, cannot apply to me, and I must, in justice to myself, refuse to accept it as a censure.

As I have already pointed out in my minute, 15/12/86, that any future work of this kind, which will be required in several parts of the city, can now be accurately determined.

I may add that this system is entirely new, and has overcome a very serious difficulty in providing accommodation for hundreds of wires in large cities, which, at present, are unsightly, dangerous, and impracticable. It also offers verandah accommodation to shopkeepers, if they wish to avail themselves of it, and which has met with general approval.

E.C.C., 14/1/87.

Seen by P.M.G.—S.H.L.

No. 35.

Messrs. Triggs & Marr to A. Kethel, Esq., M.P.

Dear Sir,

185, 187, and 189, Clarence-street, 3 January, 1887.

We take the liberty of writing to you, as our Member for West Sydney, stating a grievance which we have with the Electric Telegraph Department. We have erected the whole of the wrought-iron for the roofs of awnings in George-street, for the above Department, for which we cannot get a settlement. There is a balance of very near £300 standing, for which we have made several applications, and cannot get any satisfaction. If you will kindly ascertain the reason of delay you will greatly oblige us, as we are in very much want of the money just now.

Forwarded to the Postmaster-General. I shall be glad to know how the matter stands.—A. KETHEL, 7/1/87.

No. 36.

No. 36.

The Secretary, General Post Office, to The Superintendent of Telegraphs.

Sir,

7 January, 1887.

I am directed to inform you that Messrs. Triggs and Marr, of Clarence-street, complain, through Mr. A. Kethel, M.P., that an amount of nearly £300, due to them in connection with the erection of the iron friezework along George-street, is withheld, and to request that you will be good enough to explain the matter as soon as possible, so that Mr. Kethel may be replied to.

I have, &c.,

S. H. LAMBTON.

No. 37.

The Secretary, General Post Office, to A. Kethel, Esq., M.P.

Sir,

7 January, 1887.

With reference to the communication from Messrs. Triggs and Marr, of Clarence-street, respecting their claim against the Electric Telegraph Department, for certain work in connection with the erection of the "iron friezework," along George-street, which you forwarded to this office to-day, I am directed to inform you that the matter has been referred to the Superintendent of Telegraphs, with a request that he will furnish an early report on the subject.

I have, &c.,

S. H. LAMBTON;

Secretary.

No. 38.

EXTRACT from Votes and Proceedings.

LEGISLATIVE ASSEMBLY, THURSDAY, 17 MARCH, 1887.

(1.) Frieze for Telephonic System:—MR. WALL asked the Postmaster-General,—

- (1.) What was the originally estimated cost, when in complete working order, of the frieze in George-street, now partially erected for the purposes of the telephonic system of this city?
- (2.) What are the sums of money which have been authorised to be expended on this work by various Postmasters-General?
- (3.) What amount has been expended on it with or without such authorisation?
- (4.) When will it be completed, and what additional sum of money is it estimated that it will cost to put it in complete working order?
- (5.) What period of time has elapsed since its commencement?
- (6.) Is the ironwork for this frieze obtained in the original contract sufficient for the purpose; if not, how much additional ironwork will be required to complete the frieze?
- (7.) Was there any error in measurement; and, if so, who is responsible for it?

MR. ROBERTS answered,—

- (1.) £4,600.
- (2.) £4,000, £1,500, £1,097;—total, £6,597. As regards the sum by which the original estimate has been exceeded, it should be mentioned that it was caused chiefly by the expense incurred in the re-erection of verandah-roofs, which was not included in that estimate, because it would have been a difficult matter to form an idea of the probable cost, as in almost every instance special work had to be provided for.
- (3.) The amount already expended is £6,331, which is covered by the authority (6,597). (*Vide* previous question.)
- (4.) So far as the frieze work is concerned, it is now complete; but there has been a delay in running the wires upon it, owing to a difficulty which arose with the Sydney Municipal Council in connection with the construction of a subway across George-street. The difficulty having now been removed, that work will shortly be commenced. About £650 will be required to complete the whole work; but from this amount the cost of the subway (about £300) should be deducted, as it is intended not only for the purpose of carrying the wires attached to the friezework, but also all the wires running to the west side of the city.
- (5.) It was commenced on the 1st March, 1886, and finished on the 30th September following.
- (6.) Yes.
- (7.) No. In justice to the Department I may be permitted to inform the Honorable Member that tenders for supplying the material required, and for the erection of the ironwork, were called for in April, 1884. Only one tender, which was for £8,500, was received; so that the House will perceive that, although the work has been undertaken by the Department, and the estimate exceeded, nevertheless a large saving has really taken place in the execution of the work.

No. 39.

EXTRACT from Votes and Proceedings.

LEGISLATIVE ASSEMBLY, TUESDAY, 29 MARCH, 1887.

(17.) Frieze for Telephonic System:—MR. BLACK (for MR. WALL) asked the Postmaster-General,—

- (1.) What are the particulars of the expenditure of the £1,500 and the £1,097 for the frieze work referred to in the Postmaster-General's answers of 17th March?

- (2.) How was it that, in calculating the estimate for this work, the telegraph authorities omitted to include the probable cost of the verandah roofs, when submitting the scheme for the approval of the Postmaster-General?
- (3.) How many men were employed by the Department between the 1st March, 1886, and 30th September following, upon the frieze, under the telegraph overseer carrying out the work?
- (4.) Has the pay of these men, and the salary of the overseer, been included in the total cost?
- (5.) What was the gross amount paid for this work to these men?
- (6.) If all the wires running to the west side of the city are to be carried on the frieze, what will it cost to remove the present poles and wires now in use in George-street?
- (7.) Has the Superintendent of Telegraphs given any estimate of the cost of this removal?
- (8.) Is he aware that many of the wires referred to in his answers to previous questions run to the railway station, and that the frieze work is only erected a short distance beyond Christ Church?
- (9.) How is it proposed to carry the wires over this intervening space?
- (10.) What is the name of the tenderer for this frieze at £8,500, referred to by the Postmaster-General?
- (11.) Has the cable for use on this frieze been purchased; if so, what did it cost, and who supplied it?
- (12.) Was the cost of this cable included in the original estimate for the work?
- (13.) Is he assured that not more than £650 will be required to place this in complete working order for the transmission of messages?
- (14.) Is he aware that his predecessor assured the House (as reported on page 2,825 of *Hansard* for 1886) that not more than the sum of £1,500, then under discussion, would be required to complete this work?
- (15.) How does he reconcile this statement with his own answer of 17th March—that, in addition to this sum, £1,097 has been already expended, and £650 will be required?

MR. ROBERTS answered,—

- (1.) £1,500 was expended in re-erection of verandahs, tools, extra ironwork, and wages; £466 18s. for iron pipes at street crossings; £150 for engineers' supervision; and £480 2s., further sum, for erection of verandahs.
- (2.) Will be answered by No. 15.
- (3.) From ten to thirteen men, between March and June, 1886; six, from 4th to 24th July; five, from 25th July to 30th September.
- (4.) The pay of the men has been included, but the salary of the overseer was omitted, he not being wholly employed on this work.
- (5.) £773 10s.
- (6.) No estimate has yet been made of this work.
- (7.) No.
- (8.) Yes.
- (9.) At the point where the friezework now ends the wires diverge in two or three directions, so that for the present it will not be necessary to carry it any further.
- (10.) John Sutton & Sons, for the supply of the frieze and its erection.
- (11.) Yes; cost £1,218—supplied by Callender's Bitumen Telegraph and Waterproof Company (Limited), and the India-rubber, Gutta-percha, and Telegraph Works Company (Limited).
- (12.) No.
- (13.) No; it is supposed about that amount will be required; but it cannot be determined until the contract for tunnel is accepted.
- (14.) Yes.
- (15.) The original estimate, submitted by the Superintendent of Telegraphs, on the 23rd October, 1883, namely £4,600 per mile, did not include the cost of altering or renewing verandah-roofs, but merely the purchase and erection of the frieze itself. The reason for this omission is that the matter of connecting the verandah-roofs with the frieze, at the cost of the Government, had not then been determined upon. After it had been decided that this should be done at the cost of the Government, the estimate for the erection of the frieze was increased from £600 to £1,500, in the belief that most of the old iron roofing could be used again. It proved, however, that very little could be reused; and not only that, but, to suit the peculiar construction of some of the buildings (those at the south end of George-street being very old-fashioned), considerable expense had to be incurred in making special purlins. This, and the tunnelling under George-street, which was not originally contemplated, caused the excess in the estimate.

No. 40.

The Superintendent of Telegraphs to The Secretary, General Post Office.

31 March, 1887.

REFERRING to my report that £650 would be required to complete the erection of the iron frieze work along George-street, and the construction of the subway to the Post Office, of which £350 was estimated for the former, I have now to state, for the information of the Postmaster-General, that accounts for erection have been received showing that the above amount will be sufficient, and to request his sanction for the expenditure of this sum.

E. C. CRACKNELL.

Submitted.—S.H.L., 4/4/87. Approved.—C.J.R., 5/4/87.

EXTRACT from Votes and Proceedings.

LEGISLATIVE ASSEMBLY, WEDNESDAY, 13 APRIL, 1887.

(12.) Frieze for Telephonic System:—MR. A. G. TAYLOR, for MR. WALL, asked the Postmaster-General,—

(1.) Referring to his answer to Mr. Wall's question of 29th March, asking particulars of the expenditure of £1,500 on the frieze work in George-street, will he please supply the details as to the expenditure of this sum?

(2.) What salary was the overseer paid whilst he was employed (though, as is said, not wholly) upon this frieze?

(3.) What are the particulars of the other work on which it is said the overseer was employed at the same time that he was in charge of the erection of this frieze?

(4.) Was the overseer's time properly kept, so that it might be known what proportion was devoted to the frieze and what to the other work, and a just amount charged against this frieze when calculating its cost.

(5.) In the specification and contract bond for this work laid upon the Table of this House, the railway bridge in George-street West is said to be the terminal point for this frieze—how is it then, that, in the answers of 29th March, the Postmaster-General says that it is not intended to carry it further than it is at present, this point being a considerable distance short of the termination originally decided upon?

(6.) Did the contractors who agreed to supply the ironwork for the longer distance mentioned in their bond deliver more than has been erected; if so, where is it stored, and how is it contemplated to utilize it?

(7.) If not, has any demand been made to them to supply the deficiency in this ironwork which they agreed to deliver; if not, what is the reason?

(8.) It is said that it will not be necessary to carry the frieze any further beyond Christ Church; but as this is no answer to my question 9, will the Postmaster-General please to say definitely how it is proposed to carry the wires over the intervening space to the Railway Station?

(9.) What is the length of this frieze, as erected, not measuring street crossings?

(10.) Why were not the old verandah-roofs along George-street thoroughly examined and reported upon before the work was recommended and entered upon?

(11.) Who is responsible for the neglect which the Postmaster-General says cost the Government £900 in excess of the estimate?

(12.) Is the cable, which it is stated cost £1,218, all of similar character?

(13.) Was it supplied separately by each firm direct to the Department, or was it sold to the Government by an agent in this city; if so, what was his name?

(14.) Were tenders called for its supply, or was it purchased without competition?

(15.) Will the Postmaster-General please to lay upon the Table copies of the invoices of this cable when answering these questions?

(16.) What was the date upon which this cable was ordered, and upon what date was it delivered, to whom, and where?

(17.) When was it paid for, and to whom was this payment made?

MR. ROBERTS answered,—

(1.) Re-erection of verandahs, £614 3s.; tools and extra ironwork, £98 15s. 6d.; engineer's supervision, £150; wages, £624 0s. 6d.; total, £1,486 19s.

(2.) The overseer's salary is at the rate of £295 per annum.

(3.) Supervising the erection of and repairs to city and suburban telegraph and telephone lines.

(4.) The time the overseer devoted to the frieze work was not kept separate from that which he devoted to his ordinary duties.

(5.) Because, at present, it is proposed to make the termination near Christ Church the point of divergencè of the wires.

(6.) Yes; the whole of the ironwork contracted for and specified for was delivered to the Bathurst-street store. The surplus is still in store, and will be utilized for future work of the kind.

(7.) Answered by previous question.

(8.) By overhead wires.

(9.) Nearly a mile.

(10.) It was not possible to ascertain what was required until the work had actually commenced. In almost every case there were special circumstances to be considered.

(11.) It does not appear that the excess of the estimate was due to neglect upon the part of anyone.

(12.) No.

(13.) It was supplied direct to the Department through the Agent-General.

(14.) The cable was ordered direct from the patentees.

(15.) Yes.

(16.) Ordered 30th June, 1884, delivered 8th August, 1885, to the Agent-General in London.

(17.) Callender's Bitumen Co. were paid, in London, on 19th August, 1885. The Gutta-percha Co. were paid, in London, on the 18th September, 1885.

No. 1.

Messrs. Montefiore, Joseph, & Co. to The Secretary, General Post Office.

Tender for Telegraph material.

Sir,

4 O'Connell-street, Sydney, 4 January, 1886.

As agents for Messrs. Ramsden, Camm, & Co., of London, we have the honor to tender for the supply to your Department of,—

150 tons extra best best galvanized iron charcoal annealed,—No. 6

100 „ „ „ „ „ „ „ 8

25 „ „ „ „ „ „ „ 10

2 „ „ „ „ „ „ „ 16

as per *Gazette* notice No. 7741.

We are not in a position to quote prices to-day, but we undertake to supply the wire in question at a price not exceeding that paid by Her Majesty's Post Office in London, at date of shipment, which price can be verified and invoices initialled by Mr. Preece, who would pass and test the wire on behalf of your Department.

509—

We

[1,005 copies—Approximate Cost of Printing (labour and material), £5 13s. 9d.]

We would guarantee further that the wire is the same quality as used by Her Majesty's Telegraph Office in London at date of shipment.

We do not hold stocks of wire here, but shall be prepared to deliver it in London for despatch hence within fourteen to twenty-one days from receipt of acceptance of this tender.

We have, &c.,

MONTEFIORE, JOSEPH, & CO.

WE agree to be responsible for the due performance of this contract, in the event of the tender being accepted.—Signed at Sydney, this 5th day of January, 1886.

W. H. ROWSELL.
W. C. W. BARTELS.

No. 2.

The Agent-General for New South Wales, London, to The Colonial Secretary.

5, Westminster Chambers, Westminster, S.W.,
28 May, 1886.

Sir,

I have the honor to enclose herewith for your information a copy of a letter I have received from Messrs. G. W. Share & Co. (on behalf of Messrs. Ramsden, Camm, & Co.), dated 21st instant, having reference to tenders for telegraph wire.

I have, &c.,
SAUL SAMUEL.

No. 3.

Messrs. G. W. Share & Co. to The Agent-General.

Ramsden, Camm, & Co., Iron and Steel Wire Manufacturers and Galvanizers,
72 King William Street, 21 May, 1886.

Sir,

In January last the Government of New South Wales invited tenders for the supply of best selected charcoal telegraph wire to British postal tests, and the house that represents us in Sydney cabled us over, asking us to cable back prices for same, which we accordingly did. Now the British postal specification and tests are very severe, and we understood that all telegraph wire for your Government would be properly tested before being despatched. We are therefore greatly astonished on receiving a letter from our Sydney house, giving us particulars of the prices at which this tender had been given out. We understand that the prices were as follows:—

No. 6.	No. 8.	No. 10.
£13 10s.	£13 17s. 6d.	£14 7s. 6d.

Duty paid and delivered free in Sydney.

Now these prices simply represent ordinary quality of galvanized wire, and in fact it is only very little over the price of ordinary galvanized fencing wire in England, and therefore it would be impossible for any firm to supply the class of iron which you expect within several pounds of the price accepted, and we think that the Government can see for themselves the impossibility of wire at such prices standing their tests. We are not afraid of competition when the tests are all made this side, as we then know that the best man will win, but we cannot help protesting against our being put to heavy expense for telegraphing, and then tenders should be accepted for something totally different to what is asked for. To give you an idea of the difference in prices, we may mention that our prices were as follows:—

No. 6.	No. 8.	No. 10.	No. 16.
£21 10s.	£22.	£23 5s.	£28 10s.

And these prices were without duty, and our prices were based upon the same class of wire that we are supplying to the Government here. We are sorry to trouble you with this long letter, but we beg at the same time that you will kindly understand that we are not complaining at all on the score of having lost the Tender (because this, after all, is only a matter of fair competition), but that wire should be accepted which, on the very face of it, shows to be something totally different to what is asked for.

Trusting that you will kindly on behalf of the English trade investigate this matter,

We remain, &c.,

G. W. SHARE & CO.,
(For Works).

No. 4.

Report of The Superintendent of Telegraphs.

Respecting wire supplied by local tenderers.

THE last tenders for wire were accepted in February, 1885, as follows:—Messrs. Rabone, Feez, & Co., 50 tons No. 6, at £13 10s. per ton; 50 tons No. 8, at £13 17s. 6d. per ton; 50 tons No. 10, at £14 7s. 6d. per ton; and in June, 1885, Messrs. J. Slater & Co. 100 tons No. 6, at £15 10s. per ton; 50 tons No. 8, at £14 6s. 6d. per ton, but the quality when tested did not satisfy me, and I have now submitted a paper recommending that the supply now required be tendered for in England through the Agent-General, and none but English brands should be accepted.
E.C.C., 20/7/86.

No. 5.

The Superintendent of Telegraphs to The Postmaster-General.

20 July, 1886.

I BEG to recommend, for the approval of the Postmaster-General, that the undermentioned material be ordered through the Agent-General in London for the use of this Department, viz., 100 tons No. 6 extra best best galvanised iron telegraph wire, at £22 per ton; 100 tons No. 8 extra best best galvanised iron telegraph wire, at £23 per ton; 2 tons No. 16 extra best best galvanised iron telegraph wire, at £29 per ton; 5 tons No. 14 hard-drawn copper wire, at £80 per ton; 100 cells Elwell Parker accumulators, at £5; 1 Elwell Parker dynamo for charging accumulators, at £130. The first four items to be paid out of loans.

With the confirmative standard tests for telegraph wire at the General Post Office, London.

E. C. CRACKNELL.

No. 6.

Minute by The Postmaster-General.

Is it intended to purchase these articles without calling for tenders?

F.B.S., 22/7/86.

No. 7.

Minute by The Superintendent of Telegraphs.

No; the Agent-General will call for tenders for the wire.

E.C.C., 24/7/86.

No. 8.

Minute by The Postmaster-General.

If tenders are to be invited why are prices given?

F.B.S., 29/7/86.

No. 9.

Minute by The Superintendent of Telegraphs.

As a guide for the amount required to be provided by the Agent-General.

E.C.C., 30/7/86.

No. 10.

Minute by The Postmaster-General.

THE information furnished in these minutes is so meagre that it is difficult for either the Minister or Agent-General to understand. I shall be obliged if the Superintendent of Telegraphs will prepare another letter giving more in detail what is really required.

F.B.S., 5/8/86.

No. 11.

Minute by The Superintendent of Telegraphs.

I BEG to recommend, for the approval of the Postmaster-General, that the Agent-General be requested to call for tenders for the undermentioned material, &c., for the use of this Department,—viz., 100 tons No. 6 extra best best galvanized iron telegraph wire; 100 tons No. 8 extra best best galvanized iron telegraph wire; 2 tons No. 16 extra best best galvanized iron telegraph wire; 5 tons No. 14 hard-drawn copper wire; 100 cells Elwell Parker accumulators; 1 Elwell Parker dynamo for charging accumulators. It should be stipulated that the wire supplied must be equal to the standard test of the General Post Office, London, and be finally approved by Mr. W. H. Preece, of the Postal and Telegraph Department, London.

The Elwell Parker accumulators and dynamo must also be subject to the approval of the same gentleman.

The probable cost of the items is £5,588, and the wire should be paid for out of loans.

E. C. CRACKNELL, 14/8/86.

Submitted.—S.H.L., 16/8/86.

Approved.—F.B.S., 16/8/86.

No. 12.

The Postmaster-General To the Agent-General.

Sir,

General Post Office, Sydney, 23 August, 1886.

I have the honor to request that you will be so good as to invite tenders for the supply of the undermentioned material required for the use of the Telegraph Department of this Colony, namely:— 100 tons No. 6 extra best best galvanized iron telegraph wire, 100 tons No. 8 extra best best galvanized iron telegraph wire, 2 tons No. 16 extra best best galvanized iron telegraph wire, 5 tons No. 14 hard-drawn copper wire, 100 cells Elwell Parker accumulators, 1 Elwell Parker dynamo for charging accumulators.

The quality of the wire supplied must be equal to the standard tests of the General Post Office, London, and the whole of the material approved by Mr. W. H. Preece, of that Department. The cost of these items is estimated at £5,588, and the Treasury Department has been requested to cause this amount to be placed at your disposal.

I have, &c.,

F. B. SUTTON,

Postmaster-General.

No. 13.

No. 13.

The Secretary, General Post Office, to The Principal Under Secretary.

Sir, General Post Office, Sydney, 23 August, 1886.
I am directed to forward a letter from the Postmaster-General to the Agent-General for the Colony in London, relative to the supply of a quantity of material required for the use of the Telegraph Department, and to request that you will be good enough to move the Colonial Secretary to transmit it to Sir Saul Samuel.

I have, &c.,
S. H. LAMBTON.

No. 14.

The Secretary, General Post Office, to The Under Secretary for Finance and Trade.

Sir, General Post Office, Sydney, 23 August, 1886.
The Agent-General has been requested to invite tenders for the supply of the under-mentioned material required for the use of the Telegraph Department of this Colony, namely:—100 tons No. 6 extra best best galvanized iron telegraph wire, 100 tons No. 8 extra best best galvanized iron telegraph wire, 2 tons No. 16 extra best best galvanized iron telegraph wire, 5 tons No. 14 hard-drawn copper wire, 100 cells Elwell Parker accumulators, and 1 Elwell Parker dynamo for charging accumulators.

The cost of the above is estimated at £5,588, and I am directed to request that you will be good enough to move the Treasurer to cause the necessary amount to be provided (the cost of the first four items—namely, the wire, estimated at £4,958—to be paid out of loans), and Sir Saul Samuel informed when this has been done.

I have, &c.,
S. H. LAMBTON.

No. 15.

Minute by The Acting Postmaster-General to The Secretary, General Post Office.

WITHOUT attaching undue importance to a communication made to the press, I think the system of inviting competition in England only for the wire required for the telegraphic service is open to adverse comment, and that Mr. Cracknell should, as early as practicable, furnish a report in explanation of the advantages derived by the Government from this system.

J.F.B., 12/2/87.

The Superintendent of Telegraphs, B.C.—S.H.L., 12/2/87.

No. 16.

Extract.

EXTRACT from *Sydney Morning Herald*, 10/2/87.

SUPPLY OF TELEGRAPH WIRE TO THE NEW SOUTH WALES GOVERNMENT.

To the Editor of the *Herald*.

Sir,—Through your columns I wish to call public attention to the following circumstance, which requires more explanation than is usually given to matters about which questions are asked in Parliament.

For some years past it has been the practice to call for tenders from those willing to supply the 200 or 300 tons of iron wire required for the use of the Electric Telegraph Department.

Last year this fair proceeding was departed from. I say fair, because it gave importers here an equal chance to obtain the contract.

According to all the information I can glean, but it is hard to find out anything at all on the subject, it appears that the order has been sent to some firm in England, and that the price agreed upon is very much higher than the same wire could be bought for in this market, independently of the freight and charges.

The old excuse of the wire here not standing the requisite tests has very probably been again made, but a reference to the correspondence called for by Mr. McElhone in 1879 will show that a similar attempt to baulk competition was at that time exposed, which, but for the determined action of Sir Saul Samuel, the then Postmaster-General, would have been successfully carried out.

At that time the Electric Telegraph authorities were only prevented paying a higher price than was necessary for wire by the fact that the Postmaster-General ordered an inquiry into the merits of the various samples to be made by a gentleman who was outside the influence of the Department. It was then found that the cheaper wire stood the tests better than the higher priced article recommended to the Postmaster-General for purchase as being so much the better article as to justify the cheaper one being refused in its favour.

Trusting that your influence will cause searching inquiry to be made,

I am, &c.,
IMPORTER.

No. 17.

The Superintendent of Telegraphs to The Postmaster-General.

WITH regard to the subject of calling for tenders in England for the supply of telegraph wire, referred to in a letter, published in the *S. M. Herald*, which has been forwarded for report by the acting Postmaster-General, I beg to submit a copy of my minute recommending the adoption of that course, from which it will be seen that I stipulated, as a necessary condition of the acceptance of any wire, that it should test, electrically as well as mechanically, up to the standard tests of the G.P.O., London, and be finally approved by Mr. W. H. Preece, the Chief Electrician of the Postal Telegraph Department of England. My reasons for making this stipulation will be explained further on; meanwhile I may be permitted to point out that I entered upon the matter very fully with Mr. Suttor, who approved of my recommendation (*Vide papers herewith*).

In

In matters of this kind, the usual practice of the Department is—when an article can be manufactured in the Colony, tenders for the supply of it are invited here, but when—as in the case of telegraph wire—it is known that it cannot be made in our own territory, then it becomes a question whether money can be saved by calling for tenders in England, thus dealing with the manufacturers direct; or, by asking for tenders in the Colony and dealing with the importer. My own opinion leans to the former course; but it seemed to me a question which could be definitely settled only by actual experience, and therefore I felt it my duty to test it in this case. It will be found that this wire will cost f.o.b. in London an average of about £10 9s. 6d. per ton, whereas, during the past two years the Government has paid importers an average of £14 6s. for wire of similar gauge but inferior quality. In other words by adopting the course of buying direct from the manufacturers, I believe—after deducting all charges—that there will be a saving of over £200 on the transaction as compared with the amount which we should have been called upon to pay if it had been carried out through importers.

Independently however of economic considerations I desire to point out, as forcibly as I am able, that my great object is to secure the very best material that can be got to enable the Department to meet the daily increasing demand upon its resources for speedy telegraphy, and this can only be done with wire of the best quality and conductivity. We have tried all sorts of ways to attain this end, but I believe it will eventually be found that the surest way to do so is by dealing direct with the manufacturer through the Agent-General, so that the necessary supervision can be carried on by officers of the British Postal Service during the process of manufacture.

It is suggested in the letter now under reply, that a cheaper, and consequently an inferior, wire is just as suitable for telegraph requirements as the quality I stipulate for. Those who make statements of this kind seem to me to be absurdly unacquainted with the subject upon which they venture an opinion. The electrical value of a wire depends upon its capability to convey currents at a high speed to long distances, *i.e.*, that its conductivity should be high, to be enabled to work the quick-speed instruments now in daily demand, but which cannot be done by low-class wire, very little better than that used for fencing purposes. It is a well-known law in electricity that the conductivity of a given wire is directly proportional to the square of its diameter, and to the purity of the iron, and, as an illustration of this, I may cite the case of the old No. 6 wire, between Sydney and Melbourne, which had not conducting power sufficient to work without repeaters at Albury, and which necessitated the employment of operators there day and night, to attend to the adjustment of the instruments. As the business between the two Colonies was increasing with great rapidity I found it necessary to recommend the construction of an entirely new line, of No. 4 wire, so that direct communication could be maintained between the two capitals. This was carried out, and the result has more than justified the expenditure, in the means which were thus placed at my disposal, for successfully meeting all the demands upon the Telegraph service in this direction.

In Great Britain quick-speed instruments are becoming so absolutely necessary that it has lately been determined to use copper instead of iron wire, because the former has a carrying capacity seven times greater than that of iron.

It does not appear to me to be necessary to say more in support of my recommendation in this matter, but I may conclude by adding, in special reference to "Importer's" letter,—

1. That the order was *not* sent to any firm in England. Tenders were called for by the Agent-General in the usual way, and he, no doubt, accepted the lowest.
2. That no price at all was "agreed on," and the same class of wire could certainly not be supplied cheaper by Sydney merchants, than we are getting it from England, as will doubtless be conclusively shewn, when the shipments are to hand.

E. C. CRACKNELL, 22/2/87.

No. 18.

Answers to Questions.

LEGISLATIVE ASSEMBLY—TUESDAY, 15 MARCH, 1887.

- (4.) Electric Telegraph Wire:—Mr. McELHONE asked the Postmaster-General,—
- (1.) Is it a fact that orders have been sent to England for telegraph wire required by the Department; if so, who was the order sent to, and what is the price per ton?
 - (2.) Is it not a fact that for some years tenders for supply of electric telegraph wire have been called for in the Colony; if so, what has been the price per ton paid?
 - (3.) Will he state why tenders have not been called for in the Colony for supply of wire required by the Electric Telegraph Department?

Mr. ROBERTS answered,—

- (1.) The Agent-General was requested to call for tenders in London for telegraph wire. The invoices are not yet to hand, but I am informed that the price, f.o.b. in London, is £10 9s. 6d. per ton. Upon this point, however, no authentic information is yet to hand.
- (2.) It has been the custom in the past to call for tenders in the Colony for the supply of wire; but there have been occasions previously when they have been called for in England. The price paid for wire supplied through importers during the last two years has averaged about £14 6s. per ton.
- (3.) Because it is believed that a considerable saving can be effected by purchasing direct from the manufacturer; and because such telegraphic wire is subjected to a special test, in the process of its making, by the London Postal Telegraphic authorities—wire so tested being thoroughly reliable and up to the requirements of the Department for working the quick speed instruments now employed.

Answers to Questions.

LEGISLATIVE ASSEMBLY—THURSDAY, 17 MARCH, 1887.

- (3.) Telegraph Wire:—Mr. WALL asked the Postmaster-General,—
- (1.) Was any telegraphic wire ordered from England during 1886 through the Agent-General or otherwise; if so, what is the quantity?
 - (2.) Were tenders called in London for the said wire?
 - (3.) What price or prices were paid for the said wire?
 - (4.) What are the names of the firms who tendered, and at what rates?

Mr.

Mr. ROBERTS answered,—

- (1.) Yes; 207 tons.
- (2.) Yes; by the Agent-General.
- (3.) The invoices have not yet come to hand; but I am informed that the price, f.o.b. in London, is £10 9s. 6d. per ton.
- (4.) The names of the tenderers are not yet known here.

Extract.

EXTRACT from *Sydney Morning Herald*, 18/3/87.

LEGISLATIVE ASSEMBLY—THURSDAY, 17 MARCH.

The SPEAKER took the chair at half-past 4 o'clock.

ANSWER TO QUESTIONS.

* * * * *

Mr. ROBERTS, in reply to Mr. Wall, without notice, said that the names of the tenderers for the supply of wire to the Post Office for this year could not be ascertained until the documents reached Sydney.

Mr. WALL: Will the hon. member lay the information on the table of the House as soon as received?

Mr. ROBERTS said that he did not feel inclined to make any promise of that sort, but it was open for the hon. member to move a resolution to that effect.

Mr. McELHONE asked whether the Postmaster-General was aware that for many years Mr. Jolly had the sole monopoly for the supply of wire to the Post Office.

Mr. ROBERTS said that he was not aware of any such fact.

Answer to Questions.

LEGISLATIVE ASSEMBLY—TUESDAY, 29 MARCH, 1887.

(18.) Telegraph Wire:—Mr. Black (for Mr. WALL) asked the Postmaster General,—

- (1.) What are the gauges of the 207 tons of telegraphic wire ordered from England during 1886?
- (2.) Was the money for the purchase of this wire in London remitted to the Agent-General; if so, when, and what was the amount sent?

Mr. ROBERTS answered,—

- (1.) Nos. 6, 8, and 10.
- (2.) On reference to the Treasury, I find that a letter of credit was forwarded to London in September, 1886, in favor of the Agent-General, for £4,958 for telegraph wire.

No. 22.

Answers to Questions.

LEGISLATIVE ASSEMBLY—TUESDAY, 29 MARCH, 1887.

(7.) Telegraph Wire:—Mr. McELHONE asked the Postmaster-General,—

- (1.) Will he be good enough to state the dates on which the tenders for telegraphic wire have been called for in England prior to 1886?
- (2.) Will he be good enough to give the particular items making up the average of £14 6s. per ton for the wire supplied through importers during the last two years?
- (3.) What will be the freight, charges, and commission for examination in London of the wire purchased through the Agent-General—will not these charges have to be added to the £10 9s. 6d. per ton, f.o.b. in London, referred to in the Postmaster-General's former answer of 15th March?
- (4.) Has it only just been believed by the Superintendent of Telegraphs that a considerable saving could be effected by purchasing direct from the manufacturer?
- (5.) Has the Superintendent of Telegraphs only just discovered that telegraphic wire is subjected to a special test in the process of its making by the London telegraph authorities?
- (6.) Will he give the names of the maker of such telegraph wire specified as specially tested by the telegraph authorities in London?
- (7.) How many years is it since the quick speed instruments, mentioned by the Postmaster-General in his answers of 15th March, were first used in the Telegraph Department of this Colony?
- (8.) What are the gauges of the various wires now in use for telegraphic purposes for these quick speed instruments?

Mr. ROBERTS answered,—

- (1.) On the 21st March, 1883.
- (2.) Rabone, Feez, & Co., 10th February, 1885, £13 10s.; Rabone, Feez, & Co., 10th February, 1885, £13 17s. 6d.; John Slater & Co., 16th June, 1885, £15 10s.; John Slater & Co., 16th June, 1885, £14 6s. 6d.
- (3.) Not known yet.
- (4.) No.
- (5.) No.
- (6.) Not known yet.
- (7.) 1881 and 1883; but repeaters have to be used on long circuits, if the wires have not sufficient carrying capacity. This is the case on the No. 6 wires, running to Brisbane and Melbourne, repeaters having to be used on these circuits at Glen Innes, Albury, and Deniliquin.
- (8.) Numbers 4 and 6.

No. 23.

Answers to Questions.

LEGISLATIVE ASSEMBLY—WEDNESDAY, 13 APRIL, 1887.

- (11.) Telegraph Wire:—*Mr. A. G. Taylor* (for *MR. WALL*), asked the Postmaster-General,—
- (1.) Upon whose recommendation did he request the Treasury authorities to forward a letter of credit for £4,958 to the Agent-General in September, 1886, to pay for telegraph wire?
 - (2.) As by answer given by him on 17th March, the House was informed that 207 tons of this wire were purchased at the rate of £10 9s. 6d. per ton, amounting to £2,168 7s. in all, will he please to say for what reason the sum of £2,790 in excess of the amount required was sent to the Agent-General?
 - (3.) Were any special firms mentioned as a guide to the Postmaster-General when ordering this wire—what were their names?
 - (4.) Were any probable prices stated in the recommendation—what were they?
 - (5.) Have the invoices for this wire yet arrived; if not when does he expect them, and will he lay copies of them upon the Table of this House?
 - (6.) How many firms usually tender for telegraph wire when tenders are called for in the Colony, and what are their names?

MR. ROBERTS answered,—

- (1.) Upon the recommendation of the Superintendent of Telegraphs.
- (2.) Will be answered by No. 4.
- (3.) No firms were mentioned.
- (4.) Yes; it was thought that the cost of the wire required would be about as follows, viz.—For No. 6, £22 per ton; for No. 8, £23 per ton; No. 16, £29 per ton; for No. 14 (copper wire), £80 per ton.
- (5.) They have not yet arrived, but are expected shortly. I shall have no objection to lay copies of them upon the Table of the House.
- (6.) Seven firms have of late tendered in the Colony for the supply of telegraph wire, viz.:—Messrs. Rabone, Feez, & Co., J. Slater & Co., J. Dunn & Co., M'Lean Brothers & Rigg, J. M'Donald, J. M'Gregor, and G. L. Cooper.
