CAUSES OF DEATH, SUBURBS, 1886 (MALES)—continued.

Table with multiple columns for age groups (Under 1 year, 1 to 2 years, etc.) and rows for various causes of death. The table is organized into classes: CLASS V.—DEVELOPMENTAL DISEASES, CLASS VI.—LOCAL DISEASES (with sub-orders 1-5), and includes a total row for each class. The columns include 'Total all ages', 'Under 1 year', '1 to 2 years', '2 to 3 years', '3 to 4 years', '4 to 5 years', 'Total under 5 years', '5 to 10 years', '10 to 15 years', '15 to 20 years', '20 to 25 years', '25 to 30 years', '30 to 35 years', '35 to 40 years', '40 to 45 years', '45 to 50 years', '50 to 55 years', '55 to 60 years', '60 to 65 years', '65 to 70 years', '70 to 75 years', '75 years and upwards', and 'Ages not specified'.

F 2.

DEATHS from all causes, of FEMALES, at different ages, in the SUBURBS OF SYDNEY, from the 1st January to the 31st December, 1886.

| CAUSES OF DEATH. | Total all ages. | Under 1 year. | 1 to 2 years. | 2 to 3 years. | 3 to 4 years. | 4 to 5 years. | Total under 5 years. | 5 to 10 years. | 10 to 15 years. | 15 to 20 years. | 20 to 25 years. | 25 to 30 years. | 30 to 35 years. | 35 to 40 years. | 40 to 45 years. | 45 to 50 years. | 50 to 55 years. | 55 to 60 years. | 60 to 65 years. | 65 to 70 years. | 70 to 75 years. | 75 years and upwards. | Ages not specified. |

| Total, Class VIII | 478 | 343 | 386 | 370 | 416 | 377 | 496 | 410 | 554 | 471 | 596 | 493 | 569 | 548 | 746 | 609 | 745 | 635 | 620 | 542 | 510 | 438 |
| TOTAL, ALL CLASSES | 5,877 | 3,992 | 6,284 | 4,479 | 6,082 | 4,118 | 6,638 | 4,593 | 6,753 | 4,783 | 7,596 | 5,220 | 7,116 | 5,133 | 8,325 | 5,895 | 8,900 | 6,382 | 8,501 | 6,086 | 7,776 | 5,672 |

NOTE.—In the foregoing table the deaths from each cause, which were recorded prior to 1886 under the old system of Nosology, have been re arranged, as far as possible, in accordance with the new system. As the new classification contains a much larger number of headings than the old, it is impossible to supply as full information for the years prior to 1886 as it is for 1886 and 1887. The following notes will show under what heads several diseases, which are specially enumerated for these two years, are grouped for the former years.—(a) "Epidemic Rose Rash" (Class I, order I) is included with "Diseases of the Integumentary System" (VI 2). (b) "Others from vegetable parasites," include 1 with "Others from animal parasites" (c) "Scoury" (III) included with "Purpura" (IV). (d) "Lupus" (VI 2) is included with "Cancer" (IV). (e) "Anæmia, Chlorosis, and Leucœthemia" (IV) classed with "Dropsy" (VIII). "Diseases of Menstruation" (VI 8), and "Other Diseases of Circulatory System" (VI 3). (f) "Atelactasis," "Imperforate Anus," and "Cleft Palate" classed with "Other Congenital Defects" (g) "Softening of Brain" (VI 1) and "Diseases of the Eye and Ear" (VI 2) included with "Others of Nervous System" (VI 1). (h) "Laryngismus Stridulus" (VI 1) classed with "Laryngitis" (VI 4). (i) "Epistaxis" (VI 2) included with "Other Diseases of Respiratory System" (VI 4). (j) "Endocarditis, Valvular Disease," "Hypertrophy of Heart," "Angina Pectoris," "Syncope," "Embolism," "Thrombosis," "Phlebitis," and "Varicose Veins" classed with "Other Diseases of Circulatory System" (k) "Senile Gangrene" (VI 3) included with "Septicæmia" (I 6). (l) "Others of Larynx and Trachea" with "Laryngitis." (m) "Gall-stones" and "Cirrhosis of Liver" with "Other Diseases of the Liver." (n) "Addison's Disease" (VI 6), "Uremia," and "Hæmaturia" (VI 7), with "Other Diseases of the Urinary System" (VI 7). (o) "Pelvic Abscess" and "Perineal Abscess" (VI 8) with "Abscess" (VIII). (p) "Caries, Necrosis" (VI 10) included with "Others" of same class.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

MEAT SUPPLY OF AUSTRALIA.

(GOVERNMENT STATISTICIAN'S REPORT ON.)

Ordered by the Legislative Assembly to be printed, 7 November, 1888.

[Laid upon the Table of the Honorable the Legislative Assembly of New South Wales by the Secretary for Mines, a copy of Mr. Government Statistician Coghlan's Report on the Meat Supply of Australia.]

Minute from The Chief Inspector of Stock to The Under Secretary for Mines.

Department of Mines, Stock Branch, Sydney, 29 October, 1888.
In submitting the accompanying valuable paper which has been prepared by Mr. Government Statistician Coghlan, and which forms a clear and exhaustive investigation as to the meat supply of the Australian Colonies, I have the honor to suggest that it be laid before Parliament, as it contains information of great value not only to those owners who are undecided as to whether they should stock their holdings with sheep or cattle but also to financiers and merchants throughout the colonies.

ALEX. BRUCE,
Chief Inspector of Stock.

The Government Statistician to The Chief Inspector of Stock.

Dear Sir,

Government Statistician's Office, Sydney, 24 October, 1888.

Some time last year I made an investigation as to the future of the meat supply of these colonies; but, as you are aware, I had for the most part to work on information which was very imperfect. Since then I have gone into the matter more thoroughly, working upon data much more reliable than was before at my disposal, and with the great advantage of being able to distinguish the consumption of beef from that of mutton, which is of first importance in this inquiry. I find the average consumption of meat is practically what I assumed it was; but the quantity of beef, instead of being only slightly more than that of mutton, is practically twice as great. The cast of cattle I make from an extended series of computations to be within a shade of $11\frac{1}{2}$ per cent., and of sheep rather more than 15 per cent. The only point regarding which there is uncertainty is the rate at which cattle increase. There is strong evidence in favor of not more than 1 per cent. being taken as the ratio of increase, but even if the rate be taken at 2 or even $2\frac{1}{2}$ per cent., the result is not greatly affected, as will be seen from the accompanying calculations.

Yours faithfully,
T. A. COGHLAN.

MEAT SUPPLY OF AUSTRALIA.

THE data required for an exact investigation of the prospects of the meat supply of Australia, are—

- (a) Rate at which population tends to increase.
- (b) Present and prospective consumption of meat.
- (c) Rate of increase of stock.
- (d) Cast or proportion of stock annually fit for market.

The figures in the following computations refer to the whole of continental Australia unless otherwise mentioned. The stock resources of New Zealand and Tasmania have not been considered, as the circumstances of the first-named colony, and perhaps of Tasmania, differ materially from those of the other divisions of the group.

(a) Increase of Population.

The population of Australia was—

| | | | | | | | | |
|-------------------|-----|-----|-----|-----|-----|-----|-----|-----------|
| At census of 1871 | ... | ... | ... | ... | ... | ... | ... | 1,566,592 |
| Do. 1881 | ... | ... | ... | ... | ... | ... | ... | 2,136,912 |
| At close of 1887 | ... | ... | ... | ... | ... | ... | ... | 2,800,578 |

The annual increase between the two census years was therefore at the rate of 3·15 per cent., and from the census of 1881 to the close of the year 1887 at the rate of 4·07 per cent. The ratio of increase has advanced considerably since the last census year, and for the coming decade may be assumed to be not less than 4·0 per cent. per annum.

(b) Consumption of Meat.

The total consumption of meat can only be exactly determined for two colonies, New South Wales and Victoria, but as about 77 per cent. of the whole population are located in these colonies, it will be obvious that inexactness in regard to the other colonies will not very greatly affect computations based on the known demand of the principal members of the group. By consumption is meant the number of stock slaughtered for local use only, meat for export purposes has therefore not been taken into account. The object of this inquiry is to determine the amount of the present surplus meat production and how long this surplus will continue, and as an export trade can only be maintained concurrently with a surplus, directly the local demand becomes level with the supply an export trade ceases to be practicable. Hence the reason of omitting from consideration the quantity of stock killed for export.

The consumption of stock in Victoria was,—

| Year. | Cattle. | Sheep. |
|-----------|---------|-----------|
| 1882..... | 295,942 | 1,940,750 |
| 1883..... | 245,328 | 1,762,121 |
| 1884..... | 234,420 | 1,839,601 |
| 1885..... | 218,378 | 1,751,635 |
| 1886..... | 210,209 | 2,145,823 |

this gives the average yearly consumption per inhabitant for the five years as 2·0 sheep, 0·25 cattle; but as the demand for beef appears to be declining, the average has been taken at 2·24 cattle per head. The consumption in New South Wales during 1887, was practically the same as in Victoria, and was also the mean of former years, viz.,—1·9 sheep and 0·25 cattle. In Queensland the consumption is not known, but from such information as there is to hand, it would appear that the annual requirements per inhabitant are extremely high, being probably not less than 2·0 sheep, 0·4 cattle. The total consumption in the three colonies, estimating on the population at the close of 1887, would be,—

| Colony. | Population. | Sheep. | Cattle. |
|----------------------|-------------|-----------------|---------------|
| New South Wales..... | 1,042,919 | × 1·9 1,981,546 | × 25 260,729 |
| Victoria | 1,036,110 | × 2·0 2,072,220 | × 224 232,089 |
| Queensland..... | 366,940 | × 2·0 733,880 | × 40 146,776 |
| Total | 2,445,969 | 4,787,646 | 639,594 |

The average consumption for these colonies is therefore, approximately, 2·0 sheep and 0·26 cattle. These figures may be safely adopted as the consumption per head of Australia, for whether South Australia or Western Australia consume more or less than above given, the average of Australia will not be sensibly affected.

(c) Increase of Stock.

The ratio at which the flocks and herds of the Colony tend to increase is a very doubtful item. An inspection of the returns accompanying this paper will show that there was a decrease in cattle year by year from 1881 to 1886, and a somewhat similar decrease in sheep from 1883 to 1886. The following table gives the number of stock in five-year periods since 1863, not for any individual year, but the average of the five years named:—

| From | To | Average Number of Sheep. | Average Number of Cattle. |
|-----------|-----------|--------------------------|---------------------------|
| 1863..... | 1867..... | 29,725,925 | 3,625,526 |
| 1868..... | 1872..... | 39,482,986 | 4,017,818 |
| 1873..... | 1877..... | 47,828,539 | 6,056,523 |
| 1878..... | 1882..... | 58,277,494 | 7,361,412 |
| 1883..... | 1887..... | 68,282,577 | 7,458,841 |

The mean annual increase for the above periods was:—

| From | To | Sheep. | Cattle. |
|-----------------|----------------|----------------|----------------|
| 1863-1867 | 1868-1872..... | 5·84 per cent. | 2·08 per cent. |
| 1868-1872 | 1873-1877..... | 3·91 " | 8·55 " |
| 1873-1877 | 1878-1882..... | 4·03 " | 3·98 " |
| 1878-1882 | 1883-1887..... | 3·22 " | 0·26 . " |

If there were any regularity in the above, the rate for the last period would naturally be preferred as indicating the probable future consumption. There is, however, not only no regularity, but the rates are conspicuously irregular. As regards sheep, the rate for the first five years—viz., 5·84 per cent.—is obviously high and not likely to be again experienced over any considerable number of years. The last three ratios are more regular, and it has appeared preferable to adopt the mean annual increase from 1873-1877 to 1883-1887 as the probable rate at which the sheep of Australia are likely to increase. This ratio is 3·62 per cent. per annum.

With respect to cattle the case is very different, and the adoption of any figure is not a matter of calculation but of opinion; to my mind 1 per cent. is about the ratio which would fit the present conditions of these colonies and is the mean rate of annual increase since 1880; but as will presently appear, the question is not very greatly affected even if 2·5 per cent. be taken as the prospective rate.

(d.)

(d.) Cast of Stock.

By the term cast is to be understood the number of stock fit for market or which could be profitably fattened,—*i.e.*, the number at that age when it would be more profitable to send them for slaughter than retain them for breeding in the case of cows and ewes, or for further growth in the case of non-breeders.

To arrive at the cast I have assumed an ideal herd in which there are 10,000 females of various ages, from calves to cows 8 years old, with a sufficient number of bulls. I have assumed that out of the progeny of this herd the bullocks become part of the cast at 5 years and the cows at 8 years. I have also assumed that the average number of calves obtained from 100 cows will be 70 and that half the calves will be females and half males. The death rate of all cattle has been assumed as 5 per cent. in each year; no account is taken of the effect of droughts and other causes of exceptional loss, nor is such needed. Whatever diminution a prolonged drought may inflict upon a herd, such will affect every description of stock in such a manner that though the total number may be considerably reduced the per centage of the cast will not be greatly affected, rising in years when the proportion of calves is small to 2 per cent. above, but on the other hand falling in years when there is a large number of young stock to 1 per cent. below the average given hereunder. At the end of fifteen years the original herd will have disappeared and the surviving progeny of the 10,000 cows would be 42,380, after allowing for cows and bullocks sent to market, and an annual loss of 5 per cent. on all stock. Of this number 4,725 would be cows 8 years and bullocks 5 years old; these would be the cast, and represent slightly over $11\frac{1}{2}$ per cent. of the whole herd.

Similarly for sheep—after allowing for wethers sent to market at 4 years and ewes at 7 years, and for an annual loss of 5 per cent. on all sheep—the cast would be rather more than 15 per cent., which, though apparently high, is borne out by the experience of New South Wales, wherein nearly 60 per cent. of the sheep of Australia are depastured.

Total Meat Consumption.

The total population of Australia at the middle of 1888 was 2,858,000, and the consumption at the rate of .26 cattle and 2 sheep per head would be,—

$$2,858,000 \times .26 = 743,080 \text{ cattle.}$$

$$2,858,000 \times 2 = 5,716,000 \text{ sheep.}$$

while the cast of stock for 1888 will be,—

| | | | | | | | |
|------------|-----|-----|-------------------------------|-----|-----|-----|------------|
| Cattle ... | ... | ... | 7,916,520 @ $11\frac{1}{2}$ % | ... | ... | ... | 884,000 |
| Sheep ... | ... | ... | 79,679,235 @ 15 % | ... | ... | ... | 11,951,885 |

Deducting the consumption from the cast would leave a surplus of,—

| | Supply. | Demand. | Surplus. |
|------------|------------|-----------|-------------|
| Cattle ... | 884,000 | 743,080 | = 141,000 |
| Sheep ... | 11,951,885 | 5,716,000 | = 6,235,885 |

The question of meat supply therefore resolves itself shortly into this: How long will a yearly supply of 884,000 cattle, increasing at the rate of 1 per cent., meet the food demands of a population increasing at 4 per cent., and at present requiring 743,080 head of cattle annually? also, how long will a supply of 11,951,885 sheep, increasing at the rate of 3.62 per cent., meet a demand for 5,716,000, increasing at the rate of 4.0 per cent.? As regards the supply of cattle, 884,000, increasing at 1 per cent., will be overtaken by 743,080, increasing at 4.0 per cent., in six years.

If, however, a greater rate of increase than 1 per cent. obtain, say, $1\frac{1}{2}$, $1\frac{3}{4}$, 2, or $2\frac{1}{2}$ per cent., the times will be as follows:—

| | |
|---------------------|--|
| At $1\frac{1}{2}$ % | supply will be overtaken in 6.5 years. |
| At $1\frac{3}{4}$ % | do do do 7.1 do. |
| At 2 % | do do do 9.0 do. |
| At $2\frac{1}{2}$ % | do do do 12.0 do. |

Whether the higher or the lower rate be adopted makes little practical difference, and it would seem from the above computations, that if the present rate of consumption continue, the demand for beef will overtake the supply in six to twelve years from the close of the current year.

The present annual surplus of cattle is produced entirely by Queensland, the other colonies show a considerable deficiency. Thus, in Victoria during the year 1887, the cast fell short of the consumption by about 72,000, in New South Wales by 37,000, and in South Australia the deficiency was about 31,000 head, making a total deficiency in these colonies of 140,000; Queensland, however, could have been in a position to export 300,000 head, so that the net annual surplus for Australia for that year was 160,000 cattle, while for 1888 this surplus will probably not exceed 141,000.

The case in regard to sheep is very different. The present demand for 5,716,000 sheep does not equal half the available supply, and, although, at the present time population tends to increase at a slightly greater ratio than the flocks of the country, it is impossible to believe that this rapid rate will long continue, so that the supply of sheep is never likely to be seriously trenched upon, and a very large surplus will exist for supplying markets outside Australia.

From the considerations above given it will be plain that the supply of beef is practically limited, while that of mutton is inexhaustible. There is, however, a marked tendency to reduce the consumption of beef, especially in Victoria, so that the time when supply and demand will be level may be a little retarded, but the reduction in consumption would require to be very considerable to appreciably affect the result indicated.

The further consideration of the permanence of the surplus of beef and mutton taken together under the common designation of meat need not be discussed, since the quantity of each that is consumed is known, to combine them together would only obscure the question, which is, after all, how long will the demand leave a surplus of each kind of stock.

T. A. COGHLAN,
Statistician.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

MINING.

(CORRESPONDENCE RESPECTING CANCELLATION OF GOLD LEASES NOS. 650 AND 661, HUNTER AND MACLEAY; ALSO APPLICATIONS FOR SAME LAND BY J. ABIGAIL AND ANOTHER AND T. A. PAULSON AND OTHERS.)

Ordered by the Legislative Assembly to be printed, 21 December, 1888.

[*Laid upon the Table of the Honorable the Legislative Assembly of New South Wales by the Secretary for Mines, copies of papers in connection with the cancellation of gold leases 650 and 661, Hunter and Macleay District; also, copies of applications for same land by J. Abigail and another, and T. A. Paulson and others.*]

Correspondence respecting Cancellation of Gold Leases
Nos. 650 and 661, Hunter and Macleay.

(1.)

Mr. H. Tagg to The Under Secretary for Mines.

Sir,

Coolongolook, 8 November, 1887.

I have the honor to bring under your notice the fact that the gold-mining lease, No. 22, gold lease 80, 10 acres, in favour of Dickson, Dickson, Paulson and party, and known as the Curreki Claim at Coolongolook, county of Gloucester, has been held for several years, and next to no work has been done on it.

They have had several extensions of time granted them on various pretexts, and the last extension of three months, and which will shortly expire, was for the erection of machinery, but no steps whatever have been taken to get any up or on the ground.

No efforts have been made during the long time they have held this ground to keep the water out, and no work whatever is being done at present on the claim.

I beg further to inform you that it was altogether owing to the holders of the above claim allowing their shafts to remain full of water which flooded me, and at last compelled me to abandon the adjoining claim No. 21, and held and worked by me.

I have the very highest opinion of the line of reef, and more especially the 10 acres, as it is on rich payable stone.

I believe it is the intention of the present leaseholders to allow the lease to be cancelled, and then to re-peg it out, thus shutting up and allowing this valuable property to lie idle.

Being the first to advise you to above effect, I beg to ask you to favour me with instructions how to proceed to be put in possession of the abovementioned ground.

Craving for the favour of a reply,—

I have, &c.,
HENRY TAGG.

(2.)

Mr. E. Easterbrook to The Under Secretary for Mines.

Sir,

Cape Hawke, 11 November, 1887.

I have the honor to bring to your notice of Dickson and Paulson party not carrying out their labour conditions, No. 22, gold lease 80, Curreki Claim, Coolongolook, county of Gloucester. My object is to put my own shaft deeper, which is 70 feet deep. I cannot go deeper until they work their claim. I am certain it is a good line of reef. I have had three years' trial at it; but they swamp me out whenever I attempt to commence work.

I am, &c.,

EDWARD EASTERBROOK,
Working Miner.

(3.)

Mr. T. A. Paulson to The Under Secretary for Mines.

Sir,

Coolongolook, 5 December, 1887.

I wish to apply for cancellation of gold lease 650, portion 22, situated at Coolongolook, county of Gloucester, parish of Tellaree, held by myself and Dickson; also lease No. 661, portion gold lease 75, situated at Coolongolook, county of Gloucester, parish of Tellaree, taken out by Paulson, T. Jones, and C. Jones. Out of the last twelve months the party has kept me and my two sons idle, with the exception of four months; and one gentleman in Sydney, who holds four shares, owes £80, and I cannot get a shilling from him. I hereby pray that you will cause these two abovementioned leases to be cancelled for nonpayment of rent, as I and my party are quite willing to pay rent, erect machinery, and work the two mines; and if such leases should be cancelled, I hope you will give me due notice, as all my labour and money for this last eight years lay in these two mines, and not on any occasion have I been the cause of the mines being suspended from labour, although I had to carry it through for the rest of the shareholders.

I have, &c.,

T. A. PAULSON.

May probably be informed that the matter is being dealt with on prior complaint.—E.F., 29/12/87. Inform.—G.E.H. (*pro* U.S.), 29/12/87.

(4.)

Notice to Messrs. A. F. Dickson and J. Dickson, jun., and T. A. Paulson.

Department of Mines, Sydney, 23 December, 1887.

You are hereby called upon to show cause, within thirty days, why gold lease No. 650 (H and M), delivered 12th December, 1884, under which you are lessees, should not be cancelled for non-observance of the conditions thereby imposed.

HARRIE WOOD,

Under Secretary for Mines.

I, ROBERT QUAYLE, of Bullahdelah, a first-class constable, do hereby certify that I have served upon the within-named Arthur F. Dickson, Joseph Dickson, jun., and T. A. Paulson the notice herein, by delivering to Joseph Dickson, jun. (personal), A. F. Dickson, by delivering it to his father at Bullahdelah, a true copy thereof, and T. A. Paulson by registered letter.

ROBERT QUAYLE,

Constable.

Bullahdelah, 4th January, 1888.

(5.)

Notice to Mr. A. H. Cooper.

Sir,

Department of Mines, Sydney, 23 December, 1887.

You are hereby called upon to show cause, within thirty days, why gold lease, No. 650 (H. and M.), delivered 12th December, 1884, under which you are one of the lessees, should not be cancelled for non-observance of the conditions thereby imposed.

HARRIE WOOD,

Under Secretary for Mines.

(6.)

Mr. Warden Fawcett to The Under Secretary for Mines.

Sir,

Bullahdelah, 23 December, 1887.

I take the liberty of saying that Mr. T. A. Paulson is a most respectable man, and I consider he has been victimised by his partners; he is willing to work, but kept idle by them. If the claims Curreki and Mountain Maid got into his hands good work would be made. As to Kerr's complaint about these claims, it comes with a bad grace from a man who will not work on his own. From something I have heard I think it probable that the complaint against Conway and Kerr's claim is to get rid of the drones. I hope if the leases of Curreki and Mountain Maid should be cancelled that Paulson may get timely information. With best wishes for the new year,—

I have, &c.,

CHARLES H. FAWCETT.

Inform Mr. Warden Fawcett that the complaint was made by Henry Tagg, and consequently beforehand notice must be sent to him in case the lease be cancelled.—H.W., 3/1/88. Warden informed by memo.

(7.)

Mr. W. Kirchner to The Under Secretary for Mines.

Sir,

G.P.O., Box No. 960, Sydney, 28 December, 1887.

With reference to my conversation with you this morning, relating to the leases noted below, I have to advise you that although my name does not appear as one of the registered lessees of these mines, yet I really own a third share in them, both as appears by legal documents drawn up by Mr. T. Marshall, solicitor, which I can produce to you if necessary. As these mines have cost me a very large sum of money, I now beg to respectfully request that you will keep me informed of what is passing between your Department and the parties mentioned below, as at present I am kept quite in the dark as to what is going on, and can get no information from the parties who are up the country, although I am quite prepared to pay my share of the working expenses so as to keep the mine afloat.

I have, &c.,

W. KIRCHNER.

Lease

Lease 650 (H. & M.), portion 22, Curreki Reef, Coolongolook, J. Dickson, A. F. Dickson, T. A. Paulson. Lease 661 (H. & M.), portion G.L. 75, Mountain Maid, Coolongolook, C. E. Gadsden, T. A. Paulson, parish of Telararee.—May perhaps be informed that the leases will probably be cancelled for non-compliance with the labour conditions.—E.F., 10/1/88.

Inform complaint of non-work has been lodged, and if same is not answered satisfactorily lease will most likely be refused.—G.E.H. (for the U.S.), 10/1/88. Approved.—F.A., 10/1/88. In view of the Warden's report Mr. Paulson might receive beforehand notice.—F.A., 18/1/88.

(8.)

The Under Secretary for Mines to Mr. T. A. Paulson.

Sir,

Department of Mines, Sydney, 31 December, 1887.

Referring to your letter of the 5th instant, in which you apply for a cancellation of gold lease No. 650, in the names of Dickson and yourself, and also of lease No. 661, held by Paulson and P. Jones, I have the honor to inform you that action has been taken in the matter on a prior complaint.

I have, &c.,

HARRIE WOOD,

Under Secretary.

(9.)

Mr. T. A. Paulson to The Under Secretary for Mines.

Sir,

Coolongolook, 12 January, 1888.

I have the honor to inform you that I was served with a notice, dated 23rd December, 1887, to show cause why gold lease No. 650 should not be cancelled. I also beg that it should be cancelled as soon as possible and that notice should be sent to me, as I am the principal shareholder, and I and my son have done nothing this last twelve months only waiting for the rest of the shareholders to work this 650 lease.

I have, &c.,

TONNOS A. PAULSON.

May probably await the thirty days, to afford opportunity for explanation from the other lessees.—E.F., 24/1/88. Approved.—G.E.H. (for U.S.), 24/1/88.

(10.)

The Under Secretary for Mines to Mr. W. Kirchner.

Sir,

Department of Mines, Sydney, 13 January, 1888.

Referring to your letter of the 28th ultimo, to the effect that you hold an interest in the leases noted below, although your name does not appear as one of the registered lessees of the mine, and in which you ask what is passing between the Department and the parties in respect to the leases, as you can gather no information as to what is being done, I have the honor to inform you that a complaint of non-work on the land has been lodged, and if the same is not answered satisfactorily the leases will probably be cancelled.

I have, &c.,

HARRIE WOOD,

Under Secretary.

Lease 650 (H. & M.), portion 22, Coolongolook, Dickson and Paulson. Lease 661, portion G.L. 75, C. E. Gadsden and T. A. Paulson.

(11.)

Mr. T. A. Paulson to The Under Secretary for Mines.

Sir,

21, Exchange Buildings, 30 January, 1888.

Re Curreki claim 650, I have the honor to inform you that I have seen Mr. Primrose, and he has instructed me to advise you that my address will be Coolongolook, *via* Bullahdelah, and that of Mr. Thomas Jones, care of Mr. West, solicitor, 53, Hunter-street, Sydney, to both of which addresses please send beforehand notices of the cancellation of the lease of the above claim, and oblige,—

Yours, &c.,

T. A. PAULSON.

Send notice as directed.—H.W., 30/1/88. Mr. Warden Fawcett may be asked if work has been resumed upon G.L. 650 H. & M.—G.E.H. (for U.S.), 24/2/88. Warden asked by memo., 28/2/88.

(12.)

Mr. H. Tagg to The Under Secretary for Mines.

Sir,

Coolongolook, 27 February, 1888.

I beg to recall to your attention my memo. of or about the 9th November, 1887, laying before you the reasons why the gold-mining lease No. 21, known as the Curreki, at Coolongolook, county of Gloucester, should be cancelled, and begging at the same time that you would favour me with early information of the cancellation. I now have the honor to inform you that the time allowed the present holders of the ground as the extension of non-labour for the erection of machinery has expired, and that no work whatever has been done on the ground. Begging that you will favour me with advice as to how I am to proceed,—

I have, &c.,

HENRY TAGG.

Request Warden to expedite his report and inform the writer the matter is still under consideration.—H.W., 6/3/88.

(13.)

(13.)

Telegram from Mr. Mining Registrar Quayle to Mr. Warden C. H. Fawcett.

7 March, 1888.

ARTHUR Dickson states work has not been resumed on gold lease No. 650. Mr. Dickson is now in Stroud, who can give you the information.

ROBERT QUAYLE,
Mining Registrar.

(14.)

Mr. Warden C. H. Fawcett to The Under Secretary for Mines.

Sir,

Stroud, 8 March, 1888.

Re gold lease No. 650 (H. and M.), Dickson and others, I do myself the honor to enclose a telegram from the Mining Registrar at Bullahdelah showing that work has not been resumed on that claim, as shown by the admission of one of the partners. I beg to say that I had no opportunity of questioning Mr. Joseph Dickson, jun., on the subject, as I was engaged at the Land Board.

I have, &c.,
C. H. FAWCETT,
Warden.

In view of this report, gold lease 650 may be cancelled for non-observance of the labour conditions.—H.W., 21/3/88. Submitted. Approved.—F.A., 21/3/88.

(15.)

The Under Secretary for Mines to Mr. H. Tagg.

Sir,

Department of Mines, Sydney, 13 March, 1888.

Referring to your letter of the 27th ultimo, in which you invite attention to your complaint, that the labour conditions were not being observed on gold lease No. 650 (H. & M.), I have the honor to inform you that this matter is still under consideration.

I have, &c.,
HARRIE WOOD,
Under Secretary.

(16.)

Minute for The Governor and Executive Council.

Recommending the cancellation of a certain gold-mining lease.

Department of Mines, Sydney, 3 April, 1888.

It is recommended to His Excellency the Governor and the Executive Council that the gold-mining lease of Crown lands specified in the annexed schedule be cancelled, the lessees having failed to fulfil the labour conditions contained therein.

FRANCIS ABIGAIL.

The Executive Council advise that the course herein recommended be approved.—A. C. BUDGE, Clerk of the Council. Min. 88/14, 10/4/88. Approved.—CARRINGTON, 10/4/88. Confirmed, 17/4/88.

SCHEDULE ALLUDED TO.

Hunter and Macleay Mining District.

No. 650; name, A. F. Dickson and others; portion No. 22; locality, county Gloucester, parish Teleraree; 10 acres; Bullahdelah, 142.

(17.)

The Under Secretary for Mines to T. A. Paulson, Esq.

Sir,

Department of Mines, Sydney, 19 April, 1888.

I am directed by the Secretary for Mines to inform you that the gold-mining lease noted in the margin, will be cancelled for non-fulfilment of the labour conditions contained therein.

H. and M. 650.

If you desire to lease the land, you may, after the notification of cancellation, which will appear in the *Government Gazette* of 22nd April, 1888, take possession after 12 o'clock at night of that day, and apply, in accordance with the regulations.

I have, &c.,
G. E. HERRING
(For the Under Secretary for Mines).

(18.)

Messrs. W. Jennings and John Perry to The Secretary for Mines.

Sir,

23 April, 1888.

Having applied in usual form necessary for a lease of 10 acres for gold-reefing purposes, the land we applied for is situated at Coolongolook, in the county of Gloucester, parish of Teleraree. The above land has been held by Paulson and party for a considerable time. They have not been working it for something like two years, which can be proved beyond doubt by the residents of the place. I learn further

further that they have something like 50 acres locked up in the same manner, which would, if worked, give employment to a large number of honest, hard-working miners, and I, John Perry, as a miner of many years experience, venture to address this letter to you, for we are prepared, should this application be favourably considered by you, to employ the necessary labour required and proceed to work at once. Our application has not been made through any spite or malice, but purely on legitimate grounds; for I fail to see how they could possibly have a claim to the above land when they have failed to comply with the labour conditions necessary. But I learn their object is to wait until the above ground has been gazetted, and then apply for the land again. There are a few of those Sydney brokers who are mixed up in this affair, so we trust you will give this your earliest consideration.

We have, &c.,
WILLIAM JENNINGS.
JOHN PERRY.

Have this carefully inquired into, and a report presented to me as soon as possible.—F.A., 23/4/88.
Mr. Warden Fawcett for report.—E.F. (for U.S.), B.C., 8/5/88.

The statement of Perry and Jennings as to their having applied for 10 acres of land at Coolongolook is untrue; also that *re* Paulson not working. Four claims, in which the latter is a shareholder, are about to be amalgamated, and pumping and crushing machinery brought up. As to holding inquiry, I see no necessity for it, and besides no complaint is made or fee paid.—CHARLES H. FAWCETT, Warden, Bullahdelah, B.C., 13/5/88.

Perry lodged a complaint for non-fulfilment of labour conditions on a lease at Coraki some time ago. What has been done? It adjoins the Mountain Maid.—F.A., 15/5/88.

Request Warden to inquire into and report upon complaint of non-fulfilment of labour conditions, and also to report whether the labour conditions are being observed on other leases in that locality.—H.W., 15/5/88. Very urgent.

(19.)

Mr. J. Dickson, jun., to The Secretary for Mines.

Gold-mining lease, H. and M., No. 650, in names of Arthur Frederick Dickson and Joseph Dickson, junr.

Sir,

Bullahdelah, 30th April, 1888.

I have the honor to request that you will give the abovenamed lessees the first opportunity to obtain a fresh lease of the 10 acres situated in the county of Gloucester, parish of Telerance, portion 22, comprised in the lease, and in support of my application I would urge the following facts:—

1. That the lessees have already spent at least £300 in developing the mine.
2. That the lessees made an amalgamation with the lessees of an adjoining mine known as the Mountain Maid, for the purpose of economically working the two properties conjointly.
3. That the lessees of the said Mountain Maid Mine at last declined to pay their share of the working expenses, and in consequence, the rent of both claims remained unpaid, although I and my co-lessee were willing, and offered the lessees of the said Mountain Maid Mine to bear our share thereof.
4. That I and my co-trustee are ready to work and develop the said mine should a fresh lease be granted to us.

I have, &c.,

JOSEPH DICKSON, Junr.

For report as early as possible.—F.A., 30/4/88.

(20.)

Telegram from The Under Secretary for Mines to Mr. Warden Fawcett.

4 May, 1888.

PLEASE state how matter of J. Perry and others' complaint of non-working of certain leases at Coolongolook now stands, and if any inquiry be necessary, when it will be held?

G. E. HERRING
(*pro* the Under Secretary).

(21.)

Telegram from Warden C. H. Fawcett to The Under Secretary for Mines.

5 May, 1888.

Re note working of leases at Coolongolook. The Mining Registrar at Bullahdelah wires, "No complaints have been made by Perry or Jennings that I am aware of."

C. H. FAWCETT,
Warden.

(22.)

Mr. T. A. Paulson to The Under Secretary for Mines.

Sir,

Sydney, 7 May, 1888.

I have the honor to ask you if any action has been taken or cancellation of gold-mining lease 661, Coolongolook, H. and M., parish of Telerance, for non-fulfilment of labour conditions, the same having been applied for by me some time back, and which the Minister promised I should get the prior notice of.

I have, &c.,

T. A. PAULSON,
Coolongolook.

(23.)

(23.)

Telegram from Warden C. H. Fawcett to The Under Secretary for Mines.

10 May, 1888.
Re Perry and Jennings. Their statement respecting having applied for 10 acres at Coolongolook is untrue; other statements are also; so I can give further particulars if required from Bullahdelah, where I attend revision of electoral lists on the 19th, on return from Forster and Bungwall, for which places I leave here on the 12th instant.

C. H. FAWCETT,
 Warden.

Is there any lease at Coolongolook standing in the name of Paulson, or in which Paulson's name occurs?—H.W., 16/5/88. Gold lease 661 (H. and M.), T. A. Paulson and others. Complaints lodged by Paulson.—E.F., 16/5/88.

(24.)

Telegram from The Under Secretary for Mines to Mr. Warden Fawcett.

10 May, 1888.
 It will be as well for you to report upon Perry and Jennings's papers when you reach Bullahdelah.
 G. E. HERRING
 (*pro* Under Secretary).

(25.)

Messrs. W. Jennings and J. Perry to The Secretary for Mines.

Sir,
 Sydney, 15 May, 1888.
 Having sent Mr. John Perry to Coolongolook to take up any available Crown lands for gold-mining purposes, upon his return he informed me that there are several gold-mining leases upon which the labour conditions have not been fulfilled, and amongst others the reef known as the Mountain Maid, being a lease of 10 acres, upon which little or no work has been done for over twelve months, and as far as we can ascertain, it is nearly two years since the abovementioned claim was working. Now, as this is opposed to the spirit and intention of the Gold-fields Regulations to hold land in this way, we therefore humbly beg that you will inquire into this matter, and should our statement be correct, trust that you will cancel the abovementioned lease, so that the same may be taken up and worked.

We remain, &c.,
 W. JENNINGS.
 J. PERRY.

Let this be carefully inquired into, and reported upon early. Use wire if necessary.—F.A., 16/5/88.

Inform Messrs. Jennings and Perry that only one lease is in force in the names of Paulson and others on the Mountain Maid line of reef, Coolongolook, but there are several claims in which Mr. Paulson holds interest. As to the lease the lessees are being called upon to show cause, and if they desire to reobtain possession of any of the claims they should proceed before the Warden. Call upon lessees of lease 661, and make a *précis* of the whole case.—H.W., 18/5/88.

(26.)

The Under Secretary for Mines to Messrs. W. Jennings and J. Perry.

Gentlemen,
 Department of Mines, Sydney, 19 May, 1888.
 With reference to your letter of the 15th instant, informing me that the labour conditions have not been fulfilled at several gold-mining leases at Coolongolook, amongst others, the Mountain Maid claim, I have the honor to inform you that only one lease is in force in the names of Paulson and others in the Mountain Maid Reef, Coolongolook, but there are several claims in which Mr. Paulson holds interest. As to the lease, the lessees have been called upon to show cause, and if you desire to obtain possession you should proceed before the Warden.

I have, &c.,
 HARRIE WOOD,
 Under Secretary.

N.B.—The latter portion of this letter appears too indistinct in the letter book to be copied verbatim.

(27.)

Notice to Messrs. T. A. Paulson, W. E. Kirchner, and C. E. Gadsden.

Department of Mines, Sydney, 21 May, 1888.
 You are hereby called upon to show cause, within thirty days, why gold lease No. 661, Bullahdelah, under which you are lessees, should not be cancelled for non-observance of the conditions thereby imposed.

HARRIE WOOD,
 Under Secretary.

I, ROBERT QUAYLE, first-class constable, of Bullahdelah, bailiff of the Warden's Court, do hereby certify that I served upon the within named T. A. Paulson personally and C. E. Gadsden and W. E. Kirchner, A. H. Cooper, the notice herein, by forwarding them a copy of the within notice to their address by registered letter on the 28th May, 1888.

ROBERT QUAYLE,
First-class constable, Bullahdelah.

(28.)

Messrs. W. Jennings and another to The Secretary for Mines.

Sir,

Sydney, 28th May, 1888.

We have the honor to draw your attention to the following facts in connection with the Curreki Reef, situate at Coolongolook. That reef was held originally by Paulson and party. Paulson made a complaint to the Mines Department for non-fulfilment of labour conditions on the lease (No. 650), and Mr. John Perry also laid a similar complaint. The lease, we understand, was cancelled, and Paulson was communicated with and went next day and took up the lease. We contend that Paulson who was one of the original lessees, had no legal right to make the said complaint against himself and party, because by so doing, he was really complaining about his own defaults. This was evidently done so as to force a forfeiture of the lease as against himself and party, and to enable him to obtain the lease in his own name. What subsequently transpired practically bears this out. We also contend that as Perry was the only *bona fide* complainant, he should have received notification of the cancellation of the lease from the Department, and have been given preference to apply for a lease. Mr. Perry was on the ground some weeks in expectation of the receipt of a notice of cancellation from the Department, but only received it after the lease was cancelled and again taken up by Paulson and a Mr. Hassall, we submit that the original lease in the name of Paulson and party having been cancelled upon a complaint raised by Paulson against his own party alleging their, and consequently his own defaults, as the ground for cancellation disentitles Paulson from becoming the new or any one of the new lessees. We also submit that Perry's complaint should have priority, because of its *bona fide* character. Under these circumstances we respectfully request that in the interests of justice, you will institute an inquiry, at which we are prepared to bear out the foregoing.

We have, &c.,

W. JENNINGS.
JOHN PERRY.

Messrs. Jennings and Perry are in error as to their statements in regard to their complaint, *re* lease 650. I have, I think, satisfied them that their request herein is not reasonable.—H.W., 28/5/88. Submitted.

See *précis*, *re* lease 650, and lease No. 661. Seen. I do not feel at all satisfied with the Warden's recommendation, after carefully reading the papers over again.—F.A., 1/6/88.

(29.)

Messrs. W. Jennings and J. Perry to The Secretary for Mines.

Sir,

Sydney, 31 May, 1888.

Referring to the complaint dated 23rd ult., and lodged by us against lease No. 661 (Mountain Maid), we understand that a Mr. Paulson has also lodged a complaint against the same lease. We might mention that Mr. Paulson was one of the original lessees, and consequently is complaining against his own defaults, which, we submit, he is not legally entitled to do. The following is the ground of our complaint, that the labour conditions on the lease referred to have not been complied with, as no work in connection therewith has been done by the present occupants of the lease for nearly two years. This, we submit, is opposed to the letter and spirit of the mining regulations, and we ask that the lease should be cancelled. We also submit that as the only *bona fide* complainants, we should be given the first notification of the cancellation of the said lease, and preference should be given us to apply for the new lease.

We have, &c.,

WILLIAM JENNINGS.
JOHN PERRY.

This should receive serious consideration before allowing any of the first applications any right in connection with this case.—F.A., 1/6/88.

(30.)

Mr. W. G. Kirchner to The Under Secretary for Mines.

Sir,

19 June, 1888.

With reference to your memo., to show cause why gold-mining lease No. 661, of which I am a lessee, should not be forfeited, I respectfully beg to state the mine has been full of water, and the delay has been caused by our endeavours to get suitable machinery. We are now prepared to resume working at once, and request you to allow us to hold our lease.

Respectfully yours,

W. G. KIRCHNER.

The time allowed for showing cause has now expired, and the only lessee who has attempted to show cause is Mr. Kirchner, and the cause shown by him is in fact an admission of non-work. Therefore there appears to be no need to refer to the Warden for inquiry before recommending cancellation, but I presume the usual practice of asking the Warden whether work has been resumed, will be followed in this case.—H.W., 22/6/88. Submitted.

Approved.—F.A., 22/6/88. Request reply at once.—H.W., 4/7/88.

(31.)

(31.)

Mr. W. G. Kirchner to The Under Secretary for Mines.

Sir, 22 Argyle-place, 19 June, 1888.
I respectfully beg to inquire if the mining lease No. 650, the Curreki, adjoining the Mountain Maid, or No. 661 of lease is forfeited, because I have received no notice of forfeiture of same, and have heard that it has been formed into a company by Messrs. Hassall and Woodhouse without my knowledge or consent. I am desirous to know if any steps can be taken to reinstate my right to above lease, namely the Curreki, No. 650.

Yours, &c.,

W. G. KIRCHNER.

Inform that lease No. 650 has been cancelled.—H.W., 22/6/88.

(32.)

The Under Secretary for Mines to Mr. Warden Fawcett.

28 June, 1888.

Gold lease No. 661 (H. & M.); portion, gold lease No. 75, parish of Teleraree.
WILL the Warden please report whether work has been resumed on the land demised under the above lease.

C. H. FAWCETT,
Warden.

(33.)

The Under Secretary for Mines to Mr. W. G. Kirchner.

Sir, Department for Mines, Sydney, 28 June, 1888.
In reply to your letter of the 19th instant, in which you inquire whether mining lease No. 650, known as the Curriki, has been forfeited, I have the honor to inform you that gold lease No. 650, Hunter and Macleay District, has been cancelled.

I have, &c.,

HARRIE WOOD,
Under Secretary.

(34.)

The Under Secretary for Mines to Mr. Warden Fawcett.

Department of Mines, Sydney, 28 June, 1888.

Gold lease No. 661 (H. and M.), portion gold lease No. 75, parish of Teleraree.

WILL the Warden please report whether work has been resumed on the land demised under the above lease.

GERARD E. HERRING
(for U.S.)

I beg to attach telegrams from Warden's clerk in reply.—CHARLES H. FAWCETT, Warden, B.C., 3 July, 1888. The Under Secretary for Mines. How does application No. 172 stand? Does it refer to the land demised by gold lease No. 661?—H.W., 4/7/88. Application No. 172, Bullahdelah Gold-mining Lease No. 678, Hunter and Macleay? Mr. Farr.—E.C.P., 5/7/88. Send telegram to Warden pointing out error, and asking whether work has been resumed on the Mountain Maid lease, No. 661.—H.W., 5/7/88. Very urgent.

(35.)

Telegram from Warden's Clerk, Bullahdelah, to Mr. Warden Fawcett.

2 July, 1888.

GOLD lease application, No. 75, was taken up on 9th June, 1879, by John Lulesan, and is now portion of gold lease application, No. 172, held by Francis Shaw and party.

R. QUAYLE,
Warden's Clerk.

(36.)

(41.)

Mrs. C. J. Kirchner to The Under Secretary for Mines.

Sir,

Undercliff, 22, Argyle-place, 28 July, 1888.

I had the honor to interview you some time ago with reference to the Curreki and the Mountain Maid mining leases. Since then, having had a severe illness, I have been unable to pursue the matter, and now write to inquire if the above lease has been granted to Messrs. Paulson and party. If it is within the power of the Department to delay the issue of the lease, for the sake of justice I respectfully beg such delay, as I shall now have the matter taken up. There is an amalgamation deed drawn up by a Sydney lawyer, and signed by the very parties, namely, Paulson and Jones, who have retaken up the Curreki. Messrs. James Fletcher & Company, 46, Castlereagh-street, are interesting themselves in my case, and we hope shortly to lay a statement before the Minister for Mines.

I remain, &c.,

C. J. KIRCHNER.

Leases No. 650 (H. and M.) cancelled, 24/4/88; No. 661 (H. and M.) cancelled, 20/7/88.

(42.)

Telegram from Warden's Clerk, Bullahdelah, to The Under Secretary for Mines.

13 August, 1888.

Re gold lease, portion 75, three applications have been received from A. S. Paulson, John Perry, and T. A. Paulson since it was cancelled.

ROBERT QUAYLE,

Warden's Clerk.

(43.)

Telegram from Warden's Clerk, Bullahdelah, to The Under Secretary for Mines.

14 August, 1888.

Re gold lease, portion No. 22, was applied for on the 30th April last. Can find no record of portion No. 75. Please state application number.

ROBERT QUAYLE,
Warden's Clerk.

(44.)

Mr. T. A. Paulson to The Under Secretary for Mines.

Sir,

22 August, 1888.

As I think you have been misinformed about me blocking up land and not working it, I will just give you a statement of the work that has been done since I have been in possession of it. One main shaft sunk 9 by 3 by 6, 87 feet deep; drove 10 feet in the old shaft, sunk 13 feet and drove 40 feet to the south and 30 feet to the north; stoped out 30 feet from the surface on the south side of the shaft. Out of this shaft we crushed 48 tons with the old battery that was here, and sent 8 tons to Sydney. On the north portion of the lease we sunk 35 feet and stoped out 15 feet to the north. Out of this shaft we also sent 2 tons to Sydney, which yielded at the rate of 2 ounces to the ton. There is about 30 tons at this mine on the surface, and I hope we shall soon have machinery, so we will be able to work it. The reason I asked for a cancellation of that lease was,—one man held four shares out of twelve, and for the last three months we worked all the payment I got was a valueless cheque, which is in my possession yet, for over £20. He owed about £60 more if the cheque had been good. I am one of the party who took up 20 acres. Although the lease is not granted we have sunk main shaft 32 feet deep, drove 24 feet into an old shaft for to get air, cleared a bad heavy cutting for a quarter of a mile road for to send 5 tons to Sydney for a trial, and we have about 40 tons of stone to grass, and erected an expensive shed. When I joined Dixson in the lease No. 650, I timbered 80 feet and sunk 25 feet, which is now 120 feet deep in the other shaft, which was 60 feet. I sunk 15 feet (this shaft was never worked for years, as it was too wet), and had 8 tons sent to Sydney and 2 tons up here. As regards Perry I can prove to you or whoever else it may concern, that he never did any work in the district, except a very limited time for wages only. It is rather hard, after so much labour with no return, to lose it, just as we expect to start to do some good.

I remain, &c.,

T. A. PAULSON.

This matter has been held over for some time in consequence of a letter from Mrs. Kirchner. She may perhaps be informed that unless she takes some steps at once the application will go on.—H.W., 23/10/88.

Submitted. Approved.—F.A., 25/10/88. As Mrs. Kirchner has failed to make good her claim, the application, No. 182, may go on.—H.W., 26/11/88. Submitted. Approved.—F.A., 27/11/88.

(45.)

The Under Secretary for Mines to Mrs. C. J. Kirchner.

Madam,

29 October, 1888.

Adverting to your letter of 28th July last requesting that the issue of leases of land known as the Curreki and the Mountain Maid claims, formerly held under gold leases Nos. 650 and 661, Hunter and Macleay, may be deferred, I have the honor, by the direction of the Secretary for Mines, to inform you that unless you take some steps at once the application will go on.

I have, &c.,

HARRIE WOOD,

Under Secretary.

Ask the Warden's Clerk at Bullahdelah whether any application except No. 190 has been made since the 10th August last to lease the land, portion No. 75, and if so to give the number of the application and the names of the applicants by telegram.—H.W., 17/10/88.

(46.)

Telegram from The Under Secretary for Mines to The Warden's Clerk, Bullahdelah.

17 October, 1888.

PLEASE say whether any application except No. 190 has been made since 10th August last for a lease of portion No. 75, and if so give number of application and names of applicants.

G. E. HERRING

(For the Under Secretary).

Application

Application for Gold Lease No. 661, Hunter and Macleay;
by J. Abigail and another.

(1.)

The Warden's Clerk, Bullahdelah, to Mr. Warden C. H. Fawcett.

Sir,

I forward herewith gold lease application No. 190, which was received at 10 p.m., on the 29th September last. The Warden's Clerk was absent from the office on that day, therefore could not receive it at an earlier hour.

I have, &c.,

R. QUAYLE,

Warden's Clerk.

[Enclosure.]

Application No. 190, at Bullahdelah, for a gold lease.

1. By whom application was received? Robert Quayle, Warden's Clerk.
2. At what place? Bullahdelah.
3. Date and hour when received? 29th September, at 10 p.m.
4. Receipt for first year's rent, No. 190? Date, 29th September, 1888.
5. To whom receipt was issued? John Perry.
6. Date when notice to survey was sent to surveyor? Previously surveyed.
10. Are the applicants holders of miners' rights? Yes.
11. Is the land applied for exempted from leasing under the 34th section of the Mining Act, 1874? No.
12. Is the time proposed for commencing work reasonable? Yes.
13. Is the number of men proposed to be employed reasonable? Yes.

CHARLES H. FAWCETT,

Warden.

Received, at Stroud, 2nd October, 1888. Carried to Bullahdelah for insertion of residence, 6th October, 1888.

Gold-mining lease regulations—Schedule 2—Application for Gold-mining leases.

To the Honorable The Secretary for Mines, Sydney,—

Sir,

Bullahdelah, 29 September, 1888.

We hereby make application for a gold-mining lease of that piece or parcel of land situated at Coolongolook, parish of Teleraree, county Gloucester, containing 10 acres, of which we took possession on the 21st day of September, at the hour of 2 o'clock in the afternoon, for the purpose of mining thereon and therein for gold, for a period of fifteen years, by L trenches at each angle thereof. The datum post is distant about 8 feet from the east corner, the area applied for.

Notice of our intention to make this application has been given, in accordance with the regulations in that behalf, and we also hand herewith the sum of £10, being the first year's rent in advance of the said land, and this land has been previously surveyed. We hereby acknowledge that this application is made upon the distinct understanding and condition that if we shall abandon or fail to proceed with it, or if it is refused, the Secretary for Mines for the time being may deduct from the sum of £10 deposited as aforesaid, any cost to which, in his opinion, the Crown may have been put in or about or in respect of this application; and this application shall thereupon become and be void, and the possession aforesaid shall cease and determine. And if the lease shall be granted we shall and will commence mining operations upon or in connection with the demised land within fourteen days from and after the granting thereof, and shall and will employ upon such land not less than five men during the first six months of the term thereby created, and not less than eight men during the remainder of such term. And shall and will at any time when called upon in terms of the regulations relating to gold-mining leases to do so, execute and take delivery of such lease, or failing therein, for a period of fourteen days, after being so called upon, we shall and will forfeit the said sum of £10, and all right, title, or interest in and to the said land and the possession thereof, and the said lease shall be forthwith cancelled.

We have, &c.,

JAMES ABIGAIL, Sydney.

JOHN PERRY, Coolongolook.

This application was received by me this 29th day of September, 1888, at the hour of 10 o'clock in the afternoon, and is numbered 190.

ROBERT QUAYLE, Warden's Clerk.

Questions to be answered by applicants to lease.

WHEN receiving an application to lease land for mining purposes, the Warden, Warden's Clerk, or an agent, as the case may be, shall require the applicant or applicants, or his or their agent, to answer the following questions, and shall take down such answers in writing. The statement when complete to be read over to, and signed by, the person furnishing the answers:—

1. Were you or each of you (applicants) the holder of a miner's right in force at the date of taking possession of the land referred to in application No. 190? Yes.
2. Do you produce them? Yes.
3. What was the date and hour of the day when you took possession of the land referred to in application No. 190? 21st September; 2 o'clock, afternoon.
4. Did you take possession by erecting posts and cutting trenches at each angle of the land? By erecting posts and cutting trenches.
If No. 4 be replied to in the affirmative, then 5, 6, and 7.
5. What was the diameter of the posts? 4 inches.
6. How high did they project above the surface when fixed in the ground? 4 feet.
7. What was the length of each arm of each trench, and what was the depth of each trench? 6 feet long, 9 inches deep.
8. If a substitute for post or trench was used describe it.
9. At which angle of the land is the datum post fixed? East corner of the area.
10. Did you affix a board or metal plate to the datum post? Metal plate.
11. What was written or painted on each board or plate? Applied for 10 acres of land for gold-mining purposes.—James Abigail, John Perry.
12. Where did you post the notices Schedule 1? Post Office, Coolongolook; Warden's office, Bullahdelah.
13. When did you post such notices? On 21st at Coolongolook, and on 22nd instant at Bullahdelah.
14. Did anybody claim or appear to be in possession of the land applied for or any portion of it? No.
15. Did you serve notice in the form Schedule 1 upon every such person, and when? No one to serve.
16. Have you obtained the consent of every such person to the granting of the lease for which you apply?

I, JOHN PERRY, on behalf of self and party, declare that the foregoing questions have been answered by me truthfully in every particular, and the answers thereto have been read over to me and are correctly taken down in writing.

JOHN PERRY.

Witness to signature,—

ROBERT QUAYLE, Warden's Clerk.

Gold-mining

Gold-mining lease Regulations—Schedule 6—Notice of Application and Deposit.

Sir, I have the honor to inform you that I have this day deposited with the Warden's Clerk at Bullahdelah the sum of £10, being the first year's rent in advance of 10 acres of land at Coolongoolook, for the purpose of gold-mining. The number of my application is 190.

Bullahdelah, 29 September, 1888.
I have, &c.,
JOHN PERRY.

The Under Secretary for Mines, Sydney.

(2.)

Telegram from Mr. Quayle, Warden's Clerk, to The Under Secretary for Mines.

Bullahdelah, 18 October, 1888.

No other application has been made for gold lease portion 75 than 190, 10th August.

ROBERT QUAYLE.

Ask Warden whether, in view of the fact that all applications for this land prior to the application have been refused, it would not be wise to point out to the objectors that their objections are likely to fail, and that consequently an inquiry might involve loss of time and money to both them and the applicants. Inform Mr. James Abigail, of Newtown, that no other application appears to have been lodged.—H.W., 18/10/88.

(3.)

Telegram from The Under Secretary for Mines to Mr. J. W. Abigail.

18 October, 1888.

No other application appears to have been lodged for portion 75.

G. E. HERRING
(For the Under Secretary).

(4.)

Telegram from The Under Secretary for Mines to Mr. Warden Fawcett.

18 October, 1888.

In view of the fact that all applications for portion 75 prior to application 190 have been refused, would it not be wise to point out to objectors that their objections are likely to fail, and consequently an inquiry might involve loss of time and money to both them and the applicants?

G. E. HERRING
(For the Under Secretary).

(5.)

Telegram from Mr. Warden Fawcett to The Under Secretary for Mines.

Stroud, 20 October, 1888.

SUPPOSING that all applications for application 190 had been refused, I instructed Warden's Clerk to notify to objectors that, for that reason, I advised them to withdraw objections, but now I am informed Paulson, of Coolongoolook, refuses.

C. H. FAWCETT,
Warden.

Inform Mr. James Abigail that Paulson refuses to withdraw objection; therefore inquiry must go on.—H.W., 20/10/88.

(6.)

Telegram from The Under Secretary for Mines to Mr. J. W. Abigail.

22 October, 1888.

PAULSON refuses to withdraw objections; therefore inquiry must go on.

G. E. HERRING
(For the Under Secretary).

(7.)

Mr. Warden Fawcett to The Under Secretary for Mines.

Sir, Warden's Court, Bullahdelah, 27 October, 1888.

I do myself the honor to forward the depositions taken this day by me in a case where Messrs. Hassell, Jones, and Paulson put in objections to the registration of application 190, applied for by Messrs. Abigail and Perry. It appears to me that objections should have been lodged to application No. 189 within fourteen days from date of application, of which no proof appears. I shall be glad to receive the Minister's decision in the case. Separate from the depositions is a statement that one of the objectors wished to make, as well as four exhibits.

I have, &c.,
CHARLES H. FAWCETT,
Warden.

The objections in point of fact amount to an assertion of title under a prior application, but as this application had been refused before possession had been taken for the purpose of application No. 190, it really amounts to no objection. The application 190 may therefore go on, and the objectors may be informed

informed of the grounds on which their previous application was refused. The objectors' deposit may be awarded towards the costs of the applicants if, in the opinion of the Warden, the cost to which they were put by reason of the inquiry equalled or exceeded that sum. The Warden may be asked to say what sum should be awarded out of the £5 deposited.—H.W., 3/11/88. Submitted.

Approved.—F.A., 5/11/88.

Warden's Court, Bullahdelah, 27th October, 1888.

Present:—CHARLES H. FAWCETT, Warden.

To consider objections to the registration of application, No. 190, put in by James Abigail and John Perry for the following reasons:—

1. That James Hassell, Thomas Jones, and Tonnos Andrees Paulson, the objectors applied for the same land on the 10th August, 1888, and now claim that they are entitled to possession and to have a lease granted to them.
2. That no objections were lodged with the Warden's Clerk to their application, No. 189, according to the Act.
3. That the only other application for the same land was that of James Abigail and John Perry.

THIS deponent, being sworn, states:—My name is *Tonnos Andrees Paulson*, and I reside at Coolongolook, and I am one of the objectors to an application, No. 190, put in by Messrs. James Abigail and John Perry; I represent the other objectors, Messrs. Hassell and Jones; I hold a miners' right, No. 7, taken out on the 4th January, 1888; I heard the objections read; the land referred to was taken up by myself and the other objectors on the 4th August, 1888; I applied for it on 10th of same month; within fourteen days after that there was no objection to our application lodged at the Warden's office, nor had we any notice from the Department that it had been refused; this application is for 10 acres, and there are only 8 acres in the land applied for, and I know this from having had the land surveyed about five years ago; on reference to the register I could not find that the applicants had paid any survey fees; I put in a plan of the ground showing that only two corners are marked by L trenches, that at the north-west corner being outside on Mr. Hassell's 2-acre lease; our application was on the 10th August, that of Messrs. Abigail and Perry was on the 29th September following; Messrs. Hassell and Jones were not on the ground when I marked it, but I took it up for their interest as well as my own; I have witnesses.

To J. Perry: I marked out the ground myself on the 4th August.

TONNOS ANDREES PAULSON.

Sworn before me at Bullahdelah, this 27th }
day of October, 1888,— }

CHARLES H. FAWCETT, Warden.

This deponent, being sworn, states:—My name is *Christian Frederick Norman*; I am a miner and reside at Coolongolook.

To T. A. Paulson: I remember the 4th day of August last, and saw you on that day peg out ground on the Mountain Maid reef at Coolongolook; I know the ground well, and I wrote out the notice to be placed on the datum tree.

To J. Perry: I did not cut the No. 99 on the datum tree; I came voluntarily to give evidence for my employer, and I expect to be paid my expenses; I do not remember what day of the week the 4th August was, but it was a working day.

C. F. NORMAN.

Sworn before me at Bullahdelah, this 27th }
day of October, 1888,— }

CHARLES H. FAWCETT, P.M., Warden.

This deponent, being sworn, states:—My name is *John Perry*; I am a miner and reside in Sydney; I hold a miner's right, No. 23, 19th April, 1888; I produce the notice of intention which was posted at the post-office at Coolongolook, and a copy at the Warden's office, Bullahdelah; it is dated 21st August, 1888, for 10 acres, on the old land known as the Mountain Maid, Coolongolook; the application for lease was put in on the 29th same month by supplement to the *Government Gazette* of the 20th September, 1888; the application of J. Hassall and others, No. 189, of 10th August, for 8 acres of land, parish of Teleraree, was refused by the Department of Mines on the 20th September, 1888; I put in telegram received from Gerard Herring, for Under Secretary for Mines, which states no other application appears to have been lodged for portion No. 75, dated 18th October, 1888.

JOHN PERRY.

Sworn before me at Bullahdelah, this 27th }
day of October, 1888,— }

CHARLES H. FAWCETT, Warden.

I, *Tonnos Andree Paulson*, wish to know why our application of the 10th day of August was refused, when no notice of objection was served on us within fourteen days after our application, after our having spent a deal of money and labour on that land.

TONNOS ANDREE PAULSON.

Made at Bullahdelah, this 27th }
day of October, 1888,— }

CHARLES H. FAWCETT, Warden.

EXHIBIT D.

Gold-mining Lease Regulations—Schedule 1—Notice of intention to apply for a Gold-mining Lease.

NOTICE is hereby given, that the undermentioned persons intend applying for a gold-mining lease of 10 acres of land, situated at Coolongolook, known as the Mountain Maid.

Possession of the said land was taken by L trenches and posts at each angle thereof on the 21st day of September, 1888, at the hour of 2 o'clock in the afternoon, and the datum post is on the eastern corner of the area applied for.

Application for the said lease will be lodged with the Warden's Clerk, at Bullahdelah, on or before the 30th day of September, 1888.

Dated at Coblolongook, this 21st day of September, 1888.

JAMES ABIGAIL.
JOHN PERRY.

(8.)

The Under Secretary for Mines to Messrs. Paulson and others.

Gentlemen,

6 November, 1888.

Referring to the objections lodged by you to gold lease application 190, at Bullahdelah, by Messrs. J. Abigail and J. Perry, I am directed by the Secretary for Mines to inform you, that in view of the evidence adduced at the inquiry into such objections, and the Warden's report thereon, and also of the fact that previous applications for the same land have been refused before possession thereof had been taken for the purpose of application 190, it has been decided that your objections cannot be entertained.

2. I have to add that your application of the 10th August, No. 189, was refused for the reason that the land thereby embraced was not available at date of taking possession, previous applications, viz., 187 and 188, being then pending.

I have, &c.,

HARRIE WOOD.

(9.)

15

(9.)

The Under Secretary for Mines to Mr. Warden Fawcett.

Sir,

6 November, 1888.

With reference to the inquiry held by you on the 27th ultimo into the objections by T. A. Paulson and others for gold lease application 190, of J. Abigail and J. Perry, I have the honor to inform you that it has been decided that such objections cannot be entertained, and I am to request you to say what sum should be awarded to the applicants out of the £5 deposited by the objector.

I have, &c.,

HARRIE WOOD.

(10.)

Office Memorandum.

Charting Branch, 14 November, 1888.

A TRACING of a gold lease survey (particulars of which are given below) is herewith forwarded to the District Surveyor at Maitland, with a request that he will, at his earliest convenience, transmit to the Chief Mining Surveyor, Sydney, this tracing,* with portion marked "Land not available," or "Land available for mining purposes," according as the land is or is not the subject of any prior application under the Land Act. In the former case the nature and extent of the encroachment should be shown.

E. F. PITTMAN, C.M.S.

Particulars of survey referred to:—Portion No. 75, gold lease; parish, Teleraree; county, Gloucester; area, 8 acres. Urgent.

This report as to availability is urgently required, so that a lease may be prepared on Friday next. Consequently will the District Surveyor be good enough to wire to the Chief Mining Surveyor whether it is available or no, so that action may continue, pending return of this form in course of post.—E.F.P., 14/11/88.

(11.)

Telegram from The District Surveyor, East Maitland, to The Chief Mining Surveyor, Sydney.

15 November, 1888.

GOLD lease 75, parish of Teleraree, county of Gloucester, land available for mining purposes, as far as prior applications under the Land Act are concerned.

S. L. PEYTON

(pro District Surveyor).

Office Memorandum.

Department of Mines—Hunter and Macleay Mining District.

APPLICATION No. 190, Bullahdelah, for gold-mining lease, submitted herewith for the consideration of the Honorable the Minister for Mines. The plan and description have been checked. The Warden reports that the land does not belong to either of the classes exempted from the power of leasing. The applicants are the holders of miners' rights. The number of men proposed to be employed appears reasonable. The time for commencing work appears to be reasonable. Application No. 190, Bullahdelah (as modified), Hunter and Macleay Mining District, approved of.

Minute of the Executive Council.

Mr. T. A. Paulson to The Under Secretary for Mines.

Gold-mining Lease Regulations—Schedule 6—Notice of Application and Deposit.

Sir,

Bulladelah, 30 April, 1888.

I have the honor to inform you that I have this day deposited with the Warden's Clerk at Bulladelah the sum of £10, being the first year's rent in advance of 10 acres of land at Coolongolook for the purpose of gold-mining, and the sum of £2, being the fees for survey of the said land. The number of my application is 182.

I have, &c.,

TONNOS ANDREES PAULSON.

Gold-mining Lease Regulations, Schedule 2—Application for Gold-mining Leases.

To the Honorable the Secretary for Mines, Sydney,—

Bulladelah, 30 April, 1888.

We hereby make application for a gold-mining lease of that piece or parcel of land situated at Coolongolook, parish of Teleraree, county of Gloucester, containing 10 acres, of which we took possession on the 25th day of April, at the hour of 12:30 o'clock, for the purpose of mining thereon and therein for gold, for a period of fifteen years, by L trenches and posts at each angle thereof. The datum-tree is distant 1 foot in a northerly direction from north-east corner-peg.

Notice of our intention to make this application has been given in accordance with the Regulations in that behalf. We also hand herewith £10, being the first year's rent in advance of the said land, and £2 to cover the cost of survey. And we hereby request that survey may forthwith be made of the said piece or parcel of land.

We hereby acknowledge that this application is made upon the distinct understanding and condition that if we shall abandon or fail to proceed with it, or if it is refused, the Secretary for Mines for

the time being may deduct from the sum of £10 deposited as aforesaid any costs to which in his opinion the Crown may have been put in or about or in respect of this application; and this application shall thereupon become and be void, and the possession aforesaid shall cease and determine. And if the lease shall be granted we shall and will commence mining operations upon or in connection with the demised land within fourteen days from and after the granting thereof, and shall and will employ upon such land not less than five men during the first six months of the term thereby created, and not less than five men during the remainder of such term. And shall and will at any time when called upon in terms of the regulations relating to gold-mining leases to do so, execute and take delivery of such lease, or failing therein for a period of fourteen days after being so called upon, we shall and will forfeit the said sum of £10, and all right, title, or interest in and to the said land and the possession thereof, and the said lease shall be forthwith cancelled.

I have, &c.,
TONNOS ANDREES PAULSON,
 For self and party.

JAMES HASSALL, 21, Exchange, Pitt-street, Sydney.
TONNOS ANDREES PAULSON, Coolongolook.
THOMAS H. JONES, 53, Hunter-street, Sydney.
PAUL PAULSON, Coolongolook.
ALFRED S. PAULSON, Coolongolook.

This application was received by me this 30th day of April, 1888, at the hour of 10 o'clock in the forenoon, and is numbered 182.—**ROBERT QUAYLE**, Warden's Clerk.

Questions to be answered by Applicants to Lease.

WHEN receiving an application to lease land for mining purposes, the Warden, Warden's clerk, or an agent, as the case may be, shall require the applicant or applicants, or his or their agent, to answer the following questions, and shall take down such answers in writing. The statement, when complete, to be read over to, and signed by, the person furnishing the answers:—

1. Were you, or each of you (applicants), the holder of a miner's right, in force at the date of taking possession of the land referred to in application No. 182? Yes.
2. Do you produce them? Yes.
3. What was the date and hour of the day when you took possession of the land referred to in application No. 182? 12.30, 25th April, 1888.
4. Did you take possession by erecting posts and cutting trenches at each angle of the land? By erecting posts and cutting trenches.
 [If No. 4 be replied to in the affirmative, then 5, 6, and 7.]
5. What was the diameter of the posts? 4 inches.
6. How high did they project above the surface when fixed in the ground? 4 feet.
7. What was the length of each arm of each trench, and what was the depth of each trench? 6 feet long and 9 inches deep.
9. At which angle of the land is the datum-tree fixed? Northerly direction of north-east corner.
10. Did you affix a board or metal plate to the datum-post? Metal plate.
11. What was written or painted on each board or plate? Applied for gold-mining lease of 10 acres; T. A. Paulson and party.
12. Where did you post the notices, Schedule 1? Post Office, Coolongolook; Warden's office, Bulladelah.
13. When did you post such notices? 25th April, 1888.
14. Did anybody claim or appear to be in possession of the land applied for, or any portion of it? No.
15. Did you serve notice, in the form Schedule 1, upon every such person, and when? None to serve.

I, **TONNOS ANDREES PAULSON**, on behalf of self and party, declare that the foregoing questions have been answered by me truthfully in every particular, and the answers thereto have been read over to me and are correctly taken down in writing.

Witness to signature,—

ROBERT QUAYLE, Mining Registrar.

TONNOS ANDREES PAULSON.

Notice to make Survey.

Sir, Department of Mines, Sydney, 8 May, 1888.

Bulladelah; No. of application, 182; locality, Coolongolook, parish of Teleraree, county of Gloucester; area, 10 acres.

Names and addresses of applicants:—**James Hassall**, 21, Exchange, Pitt-street, Sydney; **Tonnos Andrees Paulson**, Coolongolook; **Thomas H. Jones**, 53, Hunter-street, Sydney; **Paul Paulson**, Coolongolook; **Alfred S. Paulson**.

An application for a gold lease (particulars as per margin) having been lodged in this office, I request you will be good enough to survey, in accordance with the regulations relating to gold leases, the area so applied for, and to furnish me at your earliest convenience with a plan and report.

Your attention is particularly directed to the regulations for mineral leases, numbered respectively 2, 3, 12, 13, and 14 (or to the regulations relating to gold-mining leases, numbered respectively 1, 2, 3, 4, 5, 14, and 15).

I have, &c.,

EDWD. F. PITTMAN,
 Chief Mining Surveyor.

J. H. McEwen, Esq., Mining Surveyor.

Copy of description of the land as given in the application:—10 acres, situated at Coolongolook, parish of Teleraree, county of Gloucester, portion 22; former number of lease, 650. The datum-tree is 1 foot in a northerly direction from north-east corner peg, and marked G.L. 22; possession taken, 25th April, 1888. Returned to the Chief Mining Surveyor, with my plan and letter, dated 13th November, 88/175.—**J. H. McEwen**,

Mr.

Mr. Mining-Surveyor M'Ewen to The Chief Mining Surveyor.

Sir,

Camp, 13 November, 1888.

I have the honor to transmit herewith* plan of portion G.L. 102, containing 10 acres of land * Appendix. in the parish of Teleraree, county of Gloucester, applied for as a gold-mining lease by J. Hassall & Co., under application No. 182, at Bulladelah, and surveyed by me on the 12th November, 1888, in accordance with your instructions dated 8th May, 1888.

The provisions of the Act have been complied with on the ground.
This survey cancels portion G.L. 22.

I have, &c.,
J. H. M'EWEN,
Mining Surveyor.

MEMORANDUM.

Copeland, 27 November, 1888.

DUPLICATE tracings of one survey (particulars of which are given below) are herewith forwarded to the District Surveyor at East Maitland, with a request that he will, at his earliest convenience, transmit to the Chief Mining Surveyor, Sydney, one tracing of each portion marked "Land not available," or "Land available for mining purposes," according as the land is or is not the subject of any prior application under the Land Act. In the former case, the nature and extent of the encroachment should be shown.

J. H. M'EWEN,
Mining Surveyor.

Particulars of surveys referred to:—Portion No. G.L. 102, parish of Teleraree, county of Gloucester; applicants, J. Hassall & Co.; area, 10 acres.

Forwarded for the information of the Chief Mining Surveyor.—S. PEYTON (*pro* D.S.), 3/12/88.

Application No. 187, at Bulladelah, for a Gold Lease.

1. By whom application was received? Robert Quayle, Warden's Clerk.
2. At what place? Bulladelah.
3. Date and hour when received? 24th July, at 12 a.m.
4. Receipt for first year's rent, No. 10? Date, 24th July, 1888.
5. To whom receipt was issued? Paul Paulson.
6. Date when notice to survey was sent to surveyor? Previously surveyed.
8. Names of objectors, and dates on which they lodged their objections? Nil.
10. Are the applicants holders of miners' rights? Yes.
11. Is the land applied for exempted from leasing under the 34th section of the Mining Act, 1874? No.
12. Is the time proposed for commencing work reasonable? Yes.
13. Is the number of men proposed to be employed reasonable? Yes.

CHARLES H. FAWCETT,
Warden, Stroud, 27/7/88.

Gold-mining Lease Regulations—Schedule 2—Application for Gold-mining Leases.

To the Honorable the Secretary for Mines, Sydney,—

Sir,

Bulladelah, 24 July, 1888.

We hereby make application for a gold-mining lease of that piece or parcel of land situated at Coolongolook, county of Gloucester, parish of Teleraree, and known as the Mountain Maid, containing 10 acres, of which we took possession on the 21st day of July, at the hour of 8 o'clock in the forenoon, for the purpose of mining thereon and therein for gold, for a period of fifteen years, by L trenches at each angle thereof. The datum-tree is distant 6 inches in a north-east direction from north-east corner peg.

Notice of our intention to make this application has been given in accordance with the regulations in that behalf, and we hand herewith the sum of £10, being the first year's rent in advance of the said land.

We hereby acknowledge that this application is made upon the distinct understanding and condition that if we shall abandon or fail to proceed with it, or if it is refused, the Secretary of Mines for the time being may deduct from the sum of £10 deposited as aforesaid any cost to which, in his opinion, the Crown may have been put in or about or in respect of this application; and this application shall thereupon become and be void, and the possession aforesaid shall cease and determine. And if the lease shall be granted we shall and will commence mining operations upon or in connection with the demised land within fourteen days from and after the granting thereof, and shall and will employ upon such land not less than five men during the first six months of the term thereby created, and not less than ten men during the remainder of such term. And shall and will at any time when called upon in terms of the regulations relating to gold-mining leases, to do so, execute, and take delivery of such lease, or failing therein for a period of fourteen days after being so called upon, we shall and will forfeit the said sum of £10, and all right, title, or interest in and to the said land and the possession thereof, and the said lease shall be forthwith cancelled.

We have, &c.,
PAUL PAULSON,
ALFRED PAULSON.

This land has been previously surveyed.

This application was received by me this 24th day of July, 1888, at the hour of 12 o'clock in the forenoon, and is numbered 187.—ROBERT QUAYLE, Warden's Clerk.

Questions to be answered by Applicants to Lease.

WHEN receiving an application to lease land for mining purposes, the Warden, Warden's Clerk, or an agent, as the case may be, shall require the applicant or applicants, or his or their agent, to answer the following questions, and shall take down such answers in writing. The statement, when complete, to be read over to, and signed by, the persons furnishing the answers:—

1. Were you or each of you (applicants) the holder of a miner's right in force at the date of taking possession of the land referred to in application No. 187?
2. Do you produce them? Yes.
3. What was the date and hour of the day when you took possession of the land referred to in application No. 187? 21st July, at 8 a.m.
4. Did you take possession by erecting posts and cutting trenches at each angle of the land? By erecting posts, with cut and stone trenches.
If No. 4 be replied to in the affirmative, then 5, 6, and 7.
5. What was the diameter of the posts? 4 inches.
6. How high did they project above the surface when fixed in the ground? 3 feet 6 inches.
7. What was the length of each arm of each trench; and what was the depth of each trench? 6 feet long, 9 inches deep.
8. If a substitute for post or trench was used, describe it? Half a stone trench, where ground could not be dug.
9. At which angle of the land is the datum-post fixed? North-east corner of land.
10. Did you affix a board or metal plate to the datum-post? Board.
11. What was written or painted on each board or plate? Applied for 10 acres of gold lease.—A. & P. Paulson.
12. Where did you post the notices, Schedule 1? Post Office, Coolongolook; Warden's Office, Bulladelah.
13. When did you post such notices? 9 a.m., on the 21st July, at Coolongolook; 12 a.m., on the 23rd July, at Bulladelah.
14. Did anybody claim or appear to be in possession of the land applied for, or any portion of it? No.

I, PAUL PAULSON on behalf of self and party declare that the foregoing questions have been answered by me truthfully in every particular, and the answers thereto have been read over to me and are correctly taken down in writing.

PAUL PAULSON.

Witness to signature,—

ROBERT QUAYLE, Warden's Clerk.

This land has been previously surveyed.

This application was received by me this 24th day of July, 1888, at the hour of a quarter to 3 o'clock in the afternoon, and is numbered 188.—ROBERT QUAYLE, Warden's Clerk.

Questions to be answered by Applicants to Lease.

WHEN receiving an application to lease land for Mining purposes, the Warden, Warden's Clerk, or an Agent, as the case may be, shall require the applicant or applicants, or his or their agent, to answer the following questions, and shall take down such answers in writing. The statement when complete, to be read over to, and signed by the person furnishing the answers:—

1. Were you or each of you (applicants) the holder of a miner's right in force at the date of taking possession of the land referred to in application No. 188?
2. Do you produce them? Yes.
3. What was the date and hour of the day when you took possession of the land referred to in application No. 188? 21st July, at 1 a.m.
4. Did you take possession by erecting posts and cutting trenches at each angle of the land? By cutting trenches and erecting posts.
If No. 4 be replied to in the affirmative, then 5, 6, and 7.
5. What was the diameter of the posts? $3\frac{1}{2}$ inches.
6. How high did they project above the surface when fixed in the ground? 4 feet.
7. What was the length of each arm of each trench? And what was the depth of each trench? 6 feet 9 inches deep.
8. At which angle of the land is the datum post fixed? Eastern corner.
9. Did you affix a board or metal plate to the datum post? Board.
10. What was written or painted on each board or plate? Applied for gold lease of 10 acres for gold-mining, John Perry and party.
11. Where did you post the notices Schedule 1? Post Office, Coolongolook, and Warden's Office, Bulladelah.
12. When did you post such notices? 21st at 11:30 at Coolongolook, and 24th at 8 a.m. at Bulladelah.
13. Did anybody claim or appear to be in possession of the land applied for, or any portion of it? No.

I, John Perry, on behalf of self and party, declare that the foregoing questions have been answered by me truthfully in every particular, and the answers thereto have been read over to me and are correctly taken down in writing.

JOHN PERRY.

Witness to signature—

ROBERT QUAYLE, Warden's Clerk.

This application may be refused, having been lodged before the expiration of three clear days, and as the applicants had priority of possession, they should receive beforehand notice.—H.W., 20/8/88. Submitted. Approved.—F.A., 20/8/88.

Minute for the Governor and Executive Council.

Subject :—Recommending the refusal of certain application for Gold-mining Lease.

Department of Mines, Sydney, 20 August, 1888.

It is recommended to His Excellency the Governor and the Executive Council that the applications for the Gold-mining Leases of Crown lands specified in the annexed schedule be refused, having been lodged before the expiration of the three days.

FRANCIS ABIGAIL.

The Executive Council approve of the course herein recommended, and advise that the necessary notices be issued.—ALEX. C. BUDGE, Clerk of the Council. Min. 28/8/88. Confirmed, 4/9/88. Approved.—CARRINGTON, 28/8/88.

Sirs,

Department of Mines, Sydney, 20 September, 1888.

I am directed by the Secretary for Mines to inform you that your application for the gold lease noted in the margin has been refused, having been lodged before the expiration of the three days.

I have, &c.,

G. E. HERRING

(For the Under Secretary for Mines).

The Under Secretary for Mines to J. Perry and another.

Sirs, Department of Mines, Sydney, 20 September, 1888. Bulladelah, No. 188.
I am directed by the Secretary for Mines to inform you that your application for the gold lease noted in the margin has been refused, having been lodged before the expiration of the three days.
I have, &c.,
G. E. HERRING
(For the Under Secretary for Mines).

Messrs. A. S. and P. Paulson to The Under Secretary for Mines.

Sir, Coolongolook, 24 September, 1888.
I received your note of the 20th September, stating that our application was refused for gold lease 661, portion 75, for not allowing three clear days to expire (No. at Bulladelah, 187). We hereby beg that the money paid in advance will be forwarded to the Warden's Clerk, Bulladelah.
We remain, &c.,
A. S. PAULSON.
P. PAULSON.

Refund any sum available.—G.E.H., for U.S., 11/10/88. Refund voucher forwarded to Treasury for payment on the 20th October, 1888.

Application No. 189, at Bulladelah, for a Gold Lease.

1. By whom application was received? Robert Quayle, Warden's Clerk.
2. At what place? Bulladelah.
3. Date and hour when received? 10th August, 1888, at 10 a.m.
4. Receipt for first year's rent, No. 189, date, 10th instant.
5. To whom receipt was issued? Tonnos Andrees Paulson.
8. Names of objectors, and dates on which they lodged their objections? Nil.
10. Are the applicants holders of miners' rights? Yes.
11. Is the land applied for exempted from leasing under the 34th section of the Mining Act, 1874? No.
12. Is the time proposed for commencing work reasonable? Yes.
13. Is the number of men proposed to be employed reasonable? Yes.

CHARLES H. FAWCETT.
Warden.

Gold-mining Lease Regulations—Schedule 6—Notice of Application and Deposit.

Sir, Bulladelah, 10 August, 1888.
I have the honor to inform you that I have this day deposited with the Warden's Clerk at Bulladelah the sum of £8, being the first year's rent in advance of 8 acres of land at Coolongolook for the purpose of gold-mining. The number of my application is 189.
This land has been previously surveyed. I have, &c.,

TONNOS ANDREES PAULSON.

The Under Secretary for Mines, Sydney.

Gold-mining Lease Regulations—Schedule 2—Application for Gold-mining Leases.

To the Honorable the Secretary for Mines, Sydney,—

Sir,

Bulladelah, 10 August, 1888.
We hereby make application for a gold-mining lease of that piece or parcel of land situated at Coolongolook, county of Gloucester, parish of Telalaree, and known as the Mountain Maid former lease, No. 661, containing 8 acres, of which we took possession on the 4th day of August, at the hour of 7 o'clock in the forenoon, for the purpose of mining thereon and therein for gold, for a period of fifteen years, by L trenches at each angle thereof. The datum-tree is distant 1 foot in a north-easterly direction from east corner-peg.

Notice of our intention to make this application has been given in accordance with the regulations in that behalf, and we also hand herewith the sum of £8, being the first year's rent in advance of the said land.

We hereby acknowledge that this application is made upon the distinct understanding and condition that if we shall abandon or fail to proceed with it, or if it is refused, the Secretary of Mines for the time being may deduct from the sum of £8 deposited as aforesaid any cost to which in his opinion the Crown may have been put in or about or in respect of this application; and this application shall thereupon become and be void, and the possession aforesaid shall cease and determine. And if the lease shall be granted we shall and will commence mining operations upon or in connection with the demised land within fourteen days from and after the granting thereof, and shall and will employ upon such land not less than four men during the first six months of the term thereby created, and not less than six men during the remainder of such term. And shall and will at any time when called upon, in terms of the Regulations relating to Gold-mining Leases, to do so, execute and take delivery of such lease, or failing therein for a period of fourteen days after being so called upon we shall and will forfeit the said sum of £8, and all right, title, or interest in and to the said land and the possession thereof, and the said lease shall be forthwith cancelled.

We have, &c.,
JAMES HASSALL, 21, Pitt-street, Sydney.
THOMAS A. JONES, 53, Hunter-street, Sydney.
TONNOS ANDREES PAULSON, Coolongolook.

This application was received by me this 10th day of August, 1888, at the hour of 10 o'clock in the forenoon, and is numbered 189.—ROBERT QUAYLE, Warden's Clerk.

This land has been previously surveyed.

Questions

Questions to be answered by Applicants to Lease.

WHEN receiving an application to lease land for mining purposes, the Warden, Warden's Clerk, or an agent, as the case may be, shall require the applicant or applicants, or his or their agent, to answer the following questions, and shall take down such answers in writing. The statement, when complete, to be read over to and signed by the person furnishing the answers :—

1. Were you or each of you (applicants) the holder of a miner's right in force at the date of taking possession of the land referred to in application No. 189? Yes.
2. Do you produce them? Yes.
3. What was the date and hour of the day when you took possession of the land referred to in application No. 189? 4 August, 1888, at 7 a.m.
4. Did you take possession by erecting posts and cutting trenches at each angle of the land? By erecting posts and cutting trenches.
5. What was the diameter of the posts? 4 inches.
6. How high did they project above the surface when fixed in the ground? 4 feet.
7. What was the length of each arm of each trench, and what was the depth of each trench? 6 feet long and 9 inches deep.
10. Did you affix a board or metal plate to the datum-post? Board.
11. What was written or painted on each board or plate? Applied for gold lease of 8 acres.—T. A. Paulson and party.
12. Where did you post the notices, Schedule 1? Post Office, Coolongolook; Warden's Office, Bulladelah.
13. When did you post such notices? 4th instant at Coolongolook, and 5th instant at Bulladelah.
14. Did anybody claim or appear to be in possession of the land applied for, or any portion of it? No.

I, Tonnos Andrees Paulson, on behalf of self and party, declare that the foregoing questions have been answered by me truthfully in every particular, and the answers thereto have been read over to me, and are correctly taken down in writing.

Witness to signature,—

ROBERT QUAYLE, Warden's Clerk.

TONNOS ANDREES PAULSON.

This application may be refused, the land not being available at date of taking possession.—H. W., 5/9/88. Submitted. Approved.—F.A., 6/9/88.

Minute for The Governor and Executive Council.

Subject :—Recommending the refusal of certain application for Gold-mining Lease.

Department of Mines, Sydney, 6 September, 1888.

It is recommended to His Excellency the Governor and the Executive Council that the application for the gold-mining lease of Crown lands specified in the annexed schedule be refused, the land not being available at date of taking possession.

FRANCIS ABIGAIL.

The Executive Council approve of the course herein recommended, and advise that the necessary notices be issued.—ALEX. C. BUDGE, Clerk of the Council. Min., 11/9/88. Approved.—CARRINGTON, 11/9/88. Confirmed, 19/9/88.

Extract from *Evening News*, 5th January, 1889.

AN IMPORTANT MINING CASE.

ON the 21st ultimo, just before the Legislative Assembly adjourned for the Christmas holidays, some correspondence of a very interesting character was tabled, having been asked for some time previously by an inquisitive honorable Member. What this honorable Member wanted to know was how and by what means two mining leases—known as the Curreki and Mountain Maid claims—came into the hands of their present holders. The correspondence on the subject has been printed, and is worth attentive examination. Like everything official, it is of a rather complex and involved character, and the difficulty of understanding it is not lessened by the fact that the properties mentioned in it are referred to in several different ways, and by the apparent omission of some rather important memoranda. However, to make the best of what materials there are, the facts of the case seem to be as follow. Perhaps it should first be stated that the understood rule of the Mines Department is that the person who gives information that the labour conditions imposed by gold-mining leases and regulations are not being complied with has—in the event of the leases being cancelled—right to prior notice of the cancellation, so that he may obtain the ground if he wishes to do so. Now, at Coolongolook, county Gloucester, there were two gold leases—No. 650, known as the Curreki claim, and 661, known as the Mountain Maid. A Mr. T. A. Paulson was part lessee of both, and had different partners in each. On 8th November, 1887, a Mr. Henry Tagg informed the Minister of Mines that the labour conditions were not being performed on No. 650, and this seems to have been the first notice received. Similar information was given on 11th November by E. Easterbrook, and on 5th December Mr. T. A. Paulson himself represented that 650 and 661 were open to the same objection, and he applied for the cancellation of each lease, stating that his partners would not assist in working the ground or paying the rental, and he was prepared to do both. Action was taken upon this, so far as 650 was concerned; but, for some unexplained reason, nothing was done for months as to 661. According to the documents, due notices were given to the lessees of the intention to cancel the lease in question, but no work was done; and the Warden, Mr. Charles H. Fawcett, having, on 8th March, 1888, reported accordingly, the leases were cancelled by the Governor-in-Council on 3rd April, and on the 19th information of the fact was given to Mr. Paulson, so that he might, if he chose, take possession of the ground after midnight on the 22nd. As for the prior informants, Mr. Easterbrook seems to have dropped out of the business altogether; and Mr. Tagg, who gave first information, was told in reply to his complaint that the matter was under consideration. This letter is dated 13th March, being just a week before the cancellation of the lease was decided upon by the Minister, and it does not appear that he ever received any other notice. Mr. Paulson seems to have obtained possession of the ground, and this ends the history of lease No. 650. Now as to No. 661, the Mountain Maid. The first mention of this, after Paulson's letter of 5th December, already mentioned, was on 23rd April, 1888, when Wm. Jennings and John Perry lodged a complaint as to the non-working of the ground by the lessees, and stating that they had applied for the ground, and were prepared to work it. This was referred to the Warden, who, on 13th May, reported that their statements as to having made application was untrue, and also that Paulson was arranging for the amalgamation of four claims, and for bringing up pumping and crushing machinery. On the 15th the Minister inquires what is being done about Perry's complaint, and on the same day Jennings and Perry again apply for cancellation of the lease. The Minister orders a careful inquiry and early report on the matter. At this stage Mr. Wood, the Under Secretary, orders a *précis* of the whole case to be made, which, it is to be supposed, was done, and the departmental memory refreshed. On 19th May, Jennings and Perry were written to, stating that the lessees, of whom Paulson was one, would have to show cause why the lease should not be cancelled, and actual notice, dated 21st May, to show cause, was given to Paulson and his partners on 28th May. On the latter date Jennings and Perry protested against Paulson having been allowed to take up lease 650 again, as it was forfeited owing to his non-fulfilment of the labour conditions, and it was urged that Mr. Perry had made a complaint in the first instance as well as Paulson. Perry's complaint does not, however, appear in the correspondence, and there is a minute of Mr. Wood's to this letter, saying that he had convinced Perry and Jennings that their demand was not reasonable. On 1st June the Minister notes that he does not "feel at all satisfied with the Warden's recommendation," whatever that may be. During the rest of June a Mr. Kirchner seems to have made some ineffectual efforts to get his supposed rights as a partner of Paulson's—although not an actual lessee—recognised. This brings us to 6th July, when the Warden telegraphs that no work is being done on the ground, and in view of this report the cancellation of lease 661 is approved by the Minister, and gazetted on the 20th. Now comes the most curious part of the affair. On 13th August the Warden's clerk reports to the Under Secretary that three applications for the land (now known as portion 75) had been received, viz., from A. S. Paulson, John Perry, and T. A. Paulson, since the lease 661 was cancelled; and then there is a complication which the papers do not clear up. Which was the first application, and who repegged the ground, is left in doubt. Information seems to have been asked for and not given; but it at last appears that on 29th September John Perry made application for the land, and paid the first year's rent in advance. This is known as application No. 190. On this same 29th September a new person appears on the scene in the form of Mr. James Abigail, who, with John Perry before mentioned, makes application for a lease of the property. This is probably the same application notified by the Warden's clerk as being made by Perry alone. However, they state in their letter that they took possession on 21st September. Paulson and his partners, Jones and Hassell, challenged their right to a lease, and on

27th October their objections were heard on oath before the Warden. It is then sworn to, and not disproved, that their application was numbered 189, and that they took possession of the ground on 4 August, and applied for a lease on the 10th; also, that no objections to their application had been lodged, nor had they received any notice that it was refused by the Minister of Mines. Paulson therefore was first both in application and possession. Prior to this, however, the Warden seems to have known that there was a refusal; for on the 20th he telegraphs to the Under Secretary that, "supposing all applications for application 190 had been refused," he advised the objectors (*i.e.*, Paulson and the others) to withdraw their objections, but was informed that Paulson refused. Well, after hearing the evidence in his Court, the Warden points out that no objections seem to have been lodged to Paulson's application 189, and asks for the Minister's decision. The decision of the Hon. F. Abigail, Minister of Mines, is that, as all applications prior to that of Messrs. James Abigail and John Perry (No. 190) have been refused—why or wherefore is nowhere stated—their application stands alone. It is approved by the Minister, and they receive their lease accordingly. This is the statement of the case as it is disclosed by the papers. We make no comment upon it at present, but unquestionably, and particularly as the successful applicant for the forfeited lease is a brother of the Minister for Mines, the case presents aspects upon which a little more light should be thrown without delay.

Extract from *Evening News*, 7 January, 1889.

AN IMPORTANT MINING CASE.

To the Editor.

Sir,

Referring to your leading article under the head of "An Important Mining Case," which appeared in your issue of Saturday last, we, the lessees of the Mountain Maid Mine, having nothing to conceal in respect of our connection therewith, and everything to gain by the utmost publicity being given thereto, hereby challenge the most searching investigation of the matter, we having the fullest reliance on the honesty of the transaction. Perhaps, in justice to ourselves, you will offer no objection to inserting this in your next issue.

Newtown, 6 January, 1889.

We are, &c.,

JAMES ABIGAIL.
JOHN PERRY.

To the Editor.

Sir,

I have read with much surprise your article in Saturday's issue headed "An Important Mining Case;" and while doing so I could not help thinking that it would have been much fairer if before publishing that which was evidently meant to create a suspicion in the minds of the public, you had done in this case what has been done in many others—namely, sent and made inquiries at the Mines Department as to the facts of the matter before writing about them. You would then have been satisfied that the case in question had been dealt with just as it would have been had the names of the parties concerned been Bennett and Hogue instead of Perry and Abigail, except indeed you are of the opinion that because one of the persons was named Abigail the case should have been refused rightly or wrongly. You would also have been supplied with the explanation as given to me on Friday afternoon by the Under Secretary for Mines, when reporting that in the extreme haste of preparing the papers at my wish to enable me to fulfil a promise given the day before in Parliament (and not, as your article says, for some time previously), the reasons for refusing the applications of those you name had been accidentally omitted; and you would also have learned that I had given instructions the day before your article appeared that a supplementary paper should be prepared to lay upon the Table of the Legislative Assembly next Tuesday afternoon containing the said reasons; and also that the confusion said to exist in the imperfect copy of the papers you had by some means obtained possession of before they had been correctly printed had been rectified, and would be in regular form by Wednesday evening, when it has been proclaimed all over the city that this case would be brought forward. Now, I venture to think that had you received these explanations you would not have allowed yourselves to be used into publishing a statement of anything but the real facts. These will be supplied to Parliament, when it will be seen that the whole matter is all fair and above-board, and contains not anything that will cause shame or discredit to

Yours, &c.,

FRANCIS ABIGAIL.

P.S.—May I ask that you will, in all fairness to me, give as much prominence to this explanation as you did to the leader above complained of.—F.A.
589 and 591, George-street, 5 January, 1889.

[Mr. Abigail professes to be "much surprised" at our article. If he is, he is easily taken that way. The means by which we obtained possession of the papers was the ordinary course of formally applying for them at the Government Printing Office. That they have, as Mr. Abigail says, been incorrectly printed, is news to us. That is a matter we could know nothing of, and with which we had nothing to do. That they were incorrectly compiled, a material portion being omitted, is also news to us; yet Mr. Abigail somehow seems to think that we should have known this fact. If the papers are incomplete, that is the fault, admittedly, of the Department over which Mr. Abigail presides. All we had to do was to deal with the papers as we found them printed at the Government Printing Office. We were neither "used," as the Minister gratuitously suggests, nor inspired by any one. We gave a plain unvarnished account of the transaction as disclosed in the correspondence, without one single word of comment to colour the narrative one way or the other, and it was no more our business to go to the Mines Department for an explanation of the transaction than to any or all of the parties whose names appear in the correspondence.—Ed. *E.N.*]

Minute by The Secretary for Mines.

I DIRECT the attention of the Under Secretary to the attached article, which appeared in Saturday's issue of the *Evening News*, and request him to report as to the correctness of the statements contained therein. He will see the article says there are important omissions in the papers, and what appears most important that the reasons for the refusal of Hassall and other applications were not among the papers. It would be as well to supply the editor with the same explanation the Under Secretary made to me on Friday last, when he reported that the said reasons had been accidentally omitted in the great hurry of preparing the papers for Parliament. He may also inform the editor that I had instructed him on Friday last to prepare a supplementary return of these reasons for presentation to Parliament, on Tuesday, the 8th inst. Copies of these may be supplied to the paper to prevent further misapprehension. I also wish to know if any special action was taken in this case, which would not have been taken if the names of the applicants had been different.

F.A., 7/1/89.

The instructions to prepare the papers to lay on the Table of the House was given on the morning of the day on which they were laid on the Table. The instructions were given in pursuance of a promise made by the Minister on the previous night, and as neither the promise nor the instructions were in writing they were understood to apply only to cancelled leases 650 and 661, and the application then pending for the land formerly comprised in lease 661. Hence the omission of the applications No. 182 for the land formerly comprised in G.L. 650, and applications 187, 188, and 189, for the land formerly comprised in G.L. 661, and owing to the hurry in preparing the Return the omission was not detected till too late. The only special action in connection with these cases is that beforehand notice was given to Mr. Paulson, although he was not the first person to complain of non-work on G.L. 650. This was due to representations made by the Warden and others in Paulson's favour. As far as I know, Mr. J. Abigail took the place of Wm. Jennings in these transactions, and the same course would, I think, have been taken had the names of Perry and Jennings been continued instead of Perry and Abigail.—H.W., 7/1/89.

MINING ACT FURTHER AMENDMENT ACT OF 1884.

(REGULATIONS RELATING TO MINING LEASES.)

Presented to Parliament, pursuant to Act 48 Vic. No. 10 sec. 4.

REGULATIONS RELATING TO MINING LEASES UNDER THE MINING ACT FURTHER AMENDMENT ACT OF 1884.

[Published in Government Gazette of 28th September, 1888.]

WHEREAS by the Mining Act Further Amendment Act of 1884, the Governor is empowered to make Regulations for certain purposes, to be dealt with as Regulations made by the Governor under the principal Act: Now, therefore, His Excellency the Governor, by and with the advice of the Executive Council, doth make the Regulations following, that is to say:—

1. The holder or holders of any Permit or Authority granted under the principal Act, and still in force, may make application in the form in the Schedule A hereto for the conversion of such Permit or Authority into a lease.

2. Upon receipt in the Department of Mines of such application, together with a sum of money equal to one year's rent of the land, and (if required) the fee for survey of the land, the Governor may, subject to the rents or royalties, or both, and to the covenants and conditions hereinafter prescribed, and to such special covenants and conditions as shall in certain cases appear to the Governor necessary, grant a lease of the land for the term applied for, or subject to such modifications as shall appear proper.

3. To obtain a lease of land referred to in section 2 of the said Act, not included in any Permit or Authority, the mode of taking possession, giving notice, and lodging application shall, where practicable, be the same as prescribed in the Regulations made under the principal Act, relating respectively to Gold-mining and Mineral Leases; and such Regulations shall, except as otherwise expressly provided in these Regulations, apply to all other matters relating to applications and objections thereto and to leases—but the restrictions in such Regulations as to the form and dimensions of the land and the position of the boundary lines in regard to any vein, reef, or lode, shall not apply. Where, by reason of the land being under water, or from any other sufficient cause, possession cannot be taken, the applicant shall attach to his application a plan or sketch of the land applied for, and shall in the notices and application give such description as will lead to the ready identification thereof.

4. The Regulations made under the principal Act relating to Gold-mining shall, except as regards the form of application, the area, and the dimensions of the land, and the position of the boundaries in relation to any vein, reef, or lode, or as otherwise provided in these Regulations, apply to any Special Lease for Gold-mining purposes. Every application for a Special Lease shall be in the form in the Schedule B hereto, and the extent of land demised by any such lease shall be in proportion to the number of men to be employed, and the capital to be expended in the purchase and erection of

machinery, or the construction of costly works for the purpose of working the land, not exceeding in respect of land worked or to be worked by any method or process other than that known as hydraulic sluicing, 2 acres for every man employed, and 1 acre additional for every £200 to be expended in machinery, dams, or races; in respect of land to be worked by means of hydraulic sluicing, 10 acres for every man employed, and 1 acre additional for every £50 expended, or to be expended in machinery, dams, races, or appliances, provided that the area demised by any one lease shall not exceed 100 acres; and no Special Lease for hydraulic sluicing shall be granted unless the Minister is satisfied that the land is specially adapted for working by that means.

5. Upon approval by the Governor of any application for a special lease, notice shall be published in the Gazette promising a lease of the land applied for, or so much thereof as may be available, upon condition that within a period to be named in such notice, such a sum of money as may be approved by the Governor shall be expended in the purchase and erection of machinery or in the construction of works said in the application to be necessary, and upon compliance within such period or such extension thereof as may upon cause shown, be approved by the Secretary for Mines, a special lease of the land aforesaid shall forthwith issue to the applicant; but upon the applicant failing to comply with the conditions aforesaid, the Governor may revoke the promise of lease and refuse the application, or may reduce the area of the land applied for to the dimensions proscribed for an ordinary lease.

6. Every lease granted under the Mining Act Further Amendment Act of 1884 shall be subject to the rents, or rents and royalties, and conditions following:—

7. Leases for mining for minerals, other than coal or gold, including the right to occupy the surface or some portion thereof, five shillings per acre per annum; (when no right to occupy any portion of the surface can be granted the Secretary for Mines may reduce the rent to two shillings and sixpence per acre per annum); for land wholly under water, one shilling and sixpence per acre per annum; leases for coal-mining including the right to occupy the surface or some portion thereof, two shillings per acre per annum; without the right to occupy any portion of the surface, one shilling and sixpence per acre per annum; for land wholly under water, one shilling per acre per annum. Leases for gold-mining, one pound per acre per annum. In respect of every ton of coal raised from the land demised, the sum of sixpence shall be paid as royalty; provided that if the royalty payable in respect of the coal raised during any one year exceeds the rent paid for such year, the amount paid as rent may be deducted from the sum payable as royalty, but if the royalty as aforesaid in any one year amounts to less than the rent paid for such year, the lessee shall not for such year be required to pay royalty.

8. Upon or in connection with the land demised by any such lease, work shall be commenced within such period, and be carried on by such a number of men, in such manner, within such limits, and subject to such supervision as the Governor may in each case direct: Provided that the Secretary for Mines may at any time and for any period authorize the suspension wholly or in part of work upon or in connection with any such lease.

9. The term of any such lease shall be that named in the application, or such shorter term as shall be approved by the Governor, not being less than one year, and such term shall commence upon and be computed from the date on which the Governor shall approve of the granting of the lease.

10. The rents reserved under any such lease shall be paid in advance to the Colonial Treasurer, on or before the first day of each year of the term.

11. The royalties reserved under any such lease shall, subject to the deduction of rent as aforesaid, be paid to the Colonial Treasurer at the expiration of each year, or within one month thereafter, and with each such payment a statement shall be furnished under the hand of the lessees, or some one of them, or of the manager of the mine, setting out the quantity and value of mineral raised from the land demised, and the accuracy of every such statement shall be verified by the statutory declaration of the person making it. The lessees or lessee shall keep a proper book, in which shall be entered the quantity of coal raised each day from the demised land, and such book shall at all times be open to the inspection of any officer of the Department of Mines.

12. If any lessee shall fail to execute his lease when called upon to do so, or shall fail to pay the rent or royalty reserved under his lease within the prescribed time, or shall fail to keep a proper record of the quantity and value of the coal raised, or shall refuse to allow such record to be inspected by any officer of the Department of Mines, or shall fail to observe and perform the other conditions or covenants of his lease, or in the case of a special lease shall fail to expend in the purchase and erection of machinery, or the construction of dams, races, or other costly works, the amount of money proposed in the application to be so expended, he shall forfeit his right to such lease, and the Governor may thereupon, or at any time thereafter, cancel such lease, and upon publication in the Gazette of such cancellation, the lease shall be absolutely void.

13. From and after the publication of these Regulations, the Regulations relating to Mining Leases, under the Mining Act Further Amendment Act, 1884, made by the Governor on the 16th day of March, 1886, and published in the Gazette, No. 164, on the 18th day of March, 1886, are hereby repealed, but such repeal shall not affect any proceeding, matter, or thing lawfully taken, done, commenced, or rights acquired before these Regulations came into operation; nevertheless, any application made under the repealed Regulations may be dealt with under these Regulations, and the holders of any lease granted under the repealed Regulations may surrender such lease with a view to obtain a lease of the same land under these Regulations, and upon such surrender being approved by the Governor, a lease in terms of these Regulations may forthwith issue to the holders of the surrendered lease.

SCHEDULE A.

To the Honorable the Minister for Mines.

being the holder of a granted under
 Section of the Mining Act, 1874, to mine for
 all that piece or parcel of land being
 and containing acres, more or less, do hereby apply
 for a lease of the said land for a period of years, with the
 right to occupy acres of the surface thereof in such position
 as may be approved of, and undertake if such
 lease be granted to execute the same when called upon to do
 so, and within days after the granting of such lease
 to commence work thereon [or upon adjoining land proposed
 to be worked in connection therewith, and to extend the under-
 ground works into such land with the utmost possible speed]
 and thereafter to employ in mining upon [or under] such land
 men, and to observe and perform all the covenants
 and conditions contained in such lease; and
 herewith tender the sum of being the first
 year's rent of such land, and the fee for survey of the land, and
 agree to forfeit such rent if
 fail to accept and execute such lease when called upon to
 do so.

Dated at this day of

Received at the Department of Mines, Sydney, this
 day of 188 , at o'clock in the
 noon.

Registrar.

SCHEDULE B.

To the Honorable the Secretary for Mines.

hereby make application for a Special Lease for
 years, of all that piece of land, being
 containing acres for the purpose of Gold-mining,
 possession of which was taken on the day of
 188 , at the hour of o'clock, m. The deposit proposed
 to be worked consists of
 and by reason of requires for its
 proper development the erection or construction of the follow-
 ing machinery or works:—

the estimated cost of which is £ , and propose to
 employ upon or in connection with such land men; and
 herewith tender the sum of , being
 the first year's rent of such land and the fee for the survey of
 the land, and agree upon notification of approval
 of this application to expend the sum of in the
 purchase and erection of the machinery, or the construction of
 the works aforesaid, within of notice of such
 approval, and to accept and execute the lease when ready, or
 failing therein to forfeit the rent deposited herewith.

Dated at this day of 188 .

Received this day of 188 , at the hour
 of in the noon.
 No. of Application

Mining Registrar.

1888.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

CLAIMS OF WILLIAM TOM, JUNIOR, AND J. H. A. LISTER, AS
THE FIRST DISCOVERERS OF GOLD IN THIS COLONY.

(PARTICULARS RESPECTING.)

Ordered by the Legislative Assembly to be printed, 28 November, 1888.

*RETURN (*in part*) to an Order made by the Honorable the Legislative Assembly of New South Wales, dated 16th December, 1887, That there be laid upon the Table of this House,—

“Copies of all claims, petitions, letters, and papers in connection with any claims for compensation made by William Tom, jun., and J. H. A. Lister, as the first discoverers of gold in this Colony.”

(*Mr. Dalton.*)

Mr. W. Tom, jun., to The Colonial Secretary.

Sir,

Will you please to look into the matter of the first gold discovery of 1851, of which the accompanying paper gives particulars, and see that justice is done to all parties concerned.

Sunrise, Guyong, 2 April, 1887.

I have, &c.,

WILLIAM TOM, JUN.

This is a true verbatim copy of the several original papers about first gold discovery in 1851, to which the magistrates' signatures are appended as witnesses to the declarations made by William Tom, jun., John H. A. Lister, James Tom, and Henry Tom.

FIRST GOLD DISCOVERY.

Sunrise, Guyong, August, 1884.

THE following evidence touching the first gold discovery in Australia was prepared by us in 1876, and will read accordingly. It was prepared to read to a Committee of the New South Wales Parliament, but having tried by all legitimate means for twenty years to obtain a hearing by that astute body without success, we now adopt the press (the only alternative left to us) in order that the public mind may be disabused of its error in supposing Mr. Hargraves to be the sole discoverer of the first payable gold, or in supposing that he ever did more to the discovery than introducing the tin dish system, and finding something less than a farthing's worth of gold, to which he was taken by John Lister and James Tom. We can assign no reason whatever for why the public mind should not receive the truth and be undeceived. Certainly, we not being able to obtain a hearing by Parliament, can be considered no proper reason. We wish readers of the following to consider well the letter No. 1, and the circumstances under which it was written. If this letter, under the circumstances it was written, does not show most clearly to the reader the unfair, wily, and deep designing character of Mr. Hargraves, whom we have had to contend with, we have no idea of anything that will show him. We think it will show the full extent of Mr. Hargraves' honor to the Government, to the public, and to us in 1851. It will show most clearly how he wished to hoodwink the Government, to deceive the public, and bamboozle us and Mr. James Tom—in all of which he has tolerably well succeeded. It may not be out of place to remark here that our Petition through the last twenty years has been presented to and received by various Parliaments of New South Wales, and on one occasion the members of a Select Committee for inquiry were named, but by a breaking up of Parliament the matter could not be proceeded with. The fact, however, shows clearly enough that various Parliaments have said that we ought to be reheard.

The following history has been most solemnly attested before a magistrate, and challenges contradiction.

WILLIAM TOM, JUNR.
J. H. A. LISTER.

A.D.

A.D. 1876.

Mr. Chairman, and honorable gentleman of your Committee,—With your permission we may perhaps be allowed to preface the remarks we have to make touching the first gold discovery, by stating that Mr. James Tom and we always acted up to the letter and spirit of every arrangement we made with Mr. Hargraves, which he did not do with us, and we feel confident the nearer we can come to the truth about such gold discovery the better our case will appear. We will first acquaint your honorable Committee with all Mr. Hargraves did towards the discovery, and afterwards, with permission, we will state the part we took in the matter. When Mr. Hargraves visited Bathurst, or rather the Guyong neighbourhood, he called on Mr. John Lister and told him he was on his way to Wellington in search of a gold-field, upon which Lister told him he had been in search of gold himself, and showed him some stones, which they both supposed were stones of an auriferous character. From this information they joined each other in the character of partners, accordingly Mr. Hargraves abandoned the idea, at least for the present, of going to Wellington, and instead of which he allowed Mr. Lister to take him to a spot near Ophir, where Mr. Hargraves washed four or five pans of earth, and attained a few very minute specks of gold. This was on the 12th February, 1851. They returned to Mr. Lister's in the evening and did not go prospecting any more till they were joined by Mr. James Tom. After being joined by him they started on a prospecting trip down the Macquarie, and were away some nine or ten days, and got nothing more than the colour of gold during the whole of that time. After this trip, Mr. Hargraves went to Wellington, where he originally intended to go, and was away some two or three weeks, and when he returned he could not show us a speck of gold, we suppose, for the simple reason he did not get one to show. Beyond suggesting how to make a cradle, everything Mr. Hargraves did towards the first gold discovery was now done, and all the gold that was got by James Tom, Mr. Hargraves, and Mr. John Lister, before Mr. Hargraves took his final departure from the Bathurst district, did not amount to more than one-eighth of a grain in weight. Were we to say Mr. Hargraves did more than we have already mentioned we should be guilty of the most positive falsehood. We believe the Rev. W. B. Clarke got nearly if not quite as much gold from a scientific experiment he made on some stones he got from the Vale of Clwydd in 1848 or 1849, as Mr. Hargraves got all the time he was prospecting in the Bathurst and Wellington districts. [See Clarke's "Southern Gold-fields."] We believe the Rev. W. B. Clarke found gold in this Colony as early as 1841, which was no accidental discovery, as Mr. Hargraves in his book has been pleased to term all discoveries made before his own, for, if we conceive aright, Mr. Clarke's discoveries were the result of scientific research, and if his discoveries did no other good (whether made by accident or otherwise) they established the fact that the quartz reefs of Australia were auriferous, and thereby in some probability induced many people over the various Colonies to search for gold till a payable gold-field was fully developed. Long before Mr. Hargraves went to California, in 1849, it was generally known, by report at least, that several small parcels of gold from M'Gregor's reef, at Wellington, had been sold in New South Wales. We think it was a knowledge of this fact, and what was proved by Mr. Clarke, that helped Mr. Hargraves, in California to come to a right conclusion, when in the fullness of his geological knowledge he instituted a comparison between the rocks of that place and the rocks of Australia. We only mention this particular that honorable members may see it is quite possible Mr. Hargraves spoke the truth when he first called at Guyong, in February, 1851, and told Lister's family he was on his way to Wellington in search of a gold-field. We believe he was on his way thither to test the soil about Macgregor's Reef, which, within a month after, he did test without the least success. We have, no doubt, from Mr. Hargraves' antecedents, he would now like to make the public believe he came from California on purpose to prospect the very rod of ground at Ophir which we first found to be payable. When Mr. Hargraves was on the eve of his last departure, before the discovery of a payable gold-field, he said he was sure no place he had seen would pay for working (we can bring one person, besides ourselves, who heard Mr. Hargraves say this, if necessary); and he himself proposed an arrangement to the following effect, namely, that he would return to his home, and after he had set his domestic matters in order he would go to Moreton Bay and make a prospecting trip through that country, and if he succeeded in finding any gold he would acquaint us with the fact at the earliest date. We were to remain at home and prospect the Bathurst district, and do precisely the same with him if we were successful. Well, not longer than three days after, Mr. Hargraves left Guyong for Sydney, James and William Tom took a cradle which had been made by William Tom for prospecting purposes, and went down a creek to where, at the end of a long sheet of water, they determined on making a trial to get some gold. The spot they decided on trying was partially under water, and to get the soil from between the rocks they found it necessary to pull their trousers off. This being done, they commenced washing, and in the course of a few hours they succeeded in procuring 16 grains in weight of gold over only a few yards of ground—they weighed the gold with small medicine scales which had formerly belonged to the late Captain Lister. With this gold in their possession they returned home the evening of the same day they got the gold, and on that very evening William Tom wrote to Mr. Hargraves acquainting him with every particular of the find. The letter acquainting him with this must have been in Sydney as soon as Mr. Hargraves himself was there, or not more than a day after. It had been sent away when Mr. John Lister, who saw Mr. Hargraves as far on his way to Sydney as the Fish River, returned, and he returned on the fifth day after he left with Mr. Hargraves. Not having mentioned anything about these 16 grains of gold when we were examined by a Select Committee of the Legislative Assembly, in 1853, proved fatal to our cause on that occasion, for we believe, in fact we have not the slightest doubt that it was on the information received from the letter respecting them that Mr. Hargraves based his proposition to the Government, which was made on the 3rd April, 1851. In that proposition, we believe, he told the Government he would show any officer sent with him a payable gold-field. It is quite clear to our minds that Mr. Hargraves never found any place he could say was a payable gold-field, never having discovered more than the bare colour of gold in any one place; but from his experience in California he knew very well that the place where James and William Tom had procured 16 grains in weight, on a few yards of ground, he might point out to the Government as a payable gold-field without running much risk of failure. However, we ourselves took very little notice of the 16 grains, as we did not think, at the time, that their discovery would establish the fact that Australian soil would pay for working—that is in a general way. Mr. Hargraves replied to the information about the 16 grains in weight, on the 5th April, 1851, and in his reply he signified his intention to return to Bathurst. We believe when he wrote his reply he thought if he came up he would be able to get as much gold

gold where James and William Tom got the 16 grains, or in that immediate neighbourhood, as would force the Government to notice his claim. However this may be, he did not come to Bathurst for some four or five weeks after he got our letter. The 16 grains of gold were got by James and William Tom, about the 23rd or 24th of March, 1851, and we could not make it convenient to start on another prospecting trip till the morning of the 7th April, when we started, and upon arriving at what is now called Ophir, William Tom proposed stopping in that neighbourhood to prospect the creek the remainder of that day, assigning as a reason for his proposal, that a shepherd of Mr. Lane had some years before that time picked up a piece of gold in that locality, which a Mr. Trappit (now of Orange) had sold for some £7 or £8. Mr. Lister falling in with the proposal, we hobbled out our horses, and after partaking of some refreshment, we went down upon the bed of the creek, and we were not there many minutes before William Tom picked up a bit of gold which was afterwards found to be worth £2 10s. This bit of gold having been discovered it was determined that we should that evening clear away a lot of heavy stones in the bed of the creek and commence washing in form on the following day. To this end we got the cradle from the mountains the next morning, where it was left for prospecting purposes when James and William Tom got the 16 grains of gold, and that day we succeeded in getting one lump the exact weight of a new sovereign, and some 20s. worth of gold-dust; we continued to wash and got about 30s. worth of gold a day for 2 or 3 days, when we arranged to go further down the creek, accordingly we started, and when we got about a mile and a half further down the creek than where we had been working, Lister picked up a bit of gold which weighed exactly 2 oz. This was the last gold we found, and it being late in the evening we formed our camp for the night. We were at this time quite out of provisions, but if honorable gentlemen will pardon a moments digression we will state that as William Tom was crossing the creek about sundown he heard a loud splash between some boulders which were partially immersed in water, and upon stooping he saw and caught two fishes, each of which would weigh between 3lb. or 4lb.; one of these fishes was swallowing the other—whether it was the larger swallowing the smaller, or the smaller swallowing the larger, William Tom could not tell, they were so nearly of one size, but he has many times since thought, that as far as the swallowing was concerned, it was typical of the unceremonious way in which Mr. Hargraves swallowed his partners. However, we cooked one of the fishes for tea that evening, and the other the next morning for breakfast, and then we started home. Upon arriving home, pursuant to an arrangement with Mr. Hargraves, we immediately acquainted him with the particulars of how we had discovered 4 oz. of gold, and we believe we requested him to come to Bathurst, and we would hand them over to him that he might convince the Government of the discovery of gold in payable quantities. However, Mr. Hargraves did not make his appearance, we waited week after week and did not know the cause of his long absence, but we now believe he was trying to work out his salvation with the Government, but whether he was or was not we will refer Honorable Members to the Honorable Sir E. Deas-Thomson, who was then Colonial Secretary, and by whose evidence, so far as that honorable gentleman was acquainted with facts, we are willing to stand or fall. The Honorable A. Lloyd, ex-Colonial Treasurer, is reported to have said in his place in the House, that he had seen Mr. Hargraves with many beautiful samples of gold in his possession—meaning of course Colonial gold—and that they were samples of gold got by Mr. Hargraves himself before we had found gold in payable quantities. If this is not what was meant we fail to see the force of that honorable gentleman's assertion. As it was Mr. Hargraves desire to convince the Government that a payable gold-field was discovered, we think it must appear clear to every man of the commonest sense that if he had any beautiful samples of gold in his possession he would have shown them to the Honorable Colonial Secretary (now Sir E. Deas-Thomson) when he showed him the few minute specks when he first visited Sydney; or again, if he had found the beautiful samples of gold in question when he was looking for the first payable gold-field it would be most wonderful indeed that no mention of the circumstance appears in his own book. We wish it to be remembered that Mr. Hargraves never returned to Bathurst after he showed the few specks to the Honorable Colonial Secretary till some four weeks after we got the 4 ounces of gold at Ophir. The beautiful samples of gold could not have been shown to the Honorable Mr. Lloyd earlier than the 6th of May, 1851, and we therefore believe that the honorable gentleman must have spoken from wrong impressions and not from any knowledge of dates. It is quite clear to our minds that, commercially speaking, Mr. Hargraves never had a penny's worth of colonial gold in his possession till we delivered him the 4 ounces on the night of the 6th of May, 1851, only a few days before the first general rush to Ophir set in. If we had not been the partners of Mr. Hargraves and under promise to him, it is not very likely we would have placed these 4 ounces of gold in his possession. We think we had intelligence enough ourselves to have satisfied the Government they had been found by us without troubling Mr. Hargraves. Any person now coming in from the country and saying he had found a payable gold-field and could show no more gold than Mr. Hargraves got the whole of the time he was prospecting would only be laughed at for his pains. We know many places from each of which more gold could be got from a pan of earth than Mr. Hargraves got all the time he was in the Bathurst and Wellington districts, and yet no one of these places is ever likely to become a payable gold-field. Many people think we made no claim on the Government till after Mr. Hargraves was rewarded, and therefore, in justice to ourselves, we believe it only right to say that on the 6th June, 1851, William Tom, junr., wrote to the Honorable Colonial Secretary (now Sir E. Deas-Thomson), and on the 22nd December, 1851, to the Governor-General (Sir Charles Fitzroy), giving an explanation of how matters stood between Mr. Hargraves and ourselves. We thought at the time, and we still think, that these two letters ought to have suggested the propriety of an inquiry before Mr. Hargraves was given to understand he would be allowed to extract from the Treasury as the first and sole discoverer of payable gold. We may state that Messrs. Lister and James Tom took Mr. Hargraves, when they were prospecting together, to what is now called Fitzroy Bar. This bar was found to be the richest part of Ophir. It is about 200 yards long, and is the place we first found payable gold (after the 16 grains were found). We have no doubt half a million pounds worth of gold has been taken from this bar since it was first worked on or about the 8th or 9th of May, 1851. Mr. Hargraves took several pans of earth from this place and could not obtain the colour of gold from any one of them. We believe a person of Mr. Hargraves' leviathan stature and Californian experience could have got gold in payable quantities at this place, as well as many other places he was taken to, if he had only dug and looked for it in a proper manner, but this we are of opinion he was too lazy to do. We have heard some people say that what Mr. Hargraves did on the 12th of February, 1851, led to the discovery of a payable gold-field. Admitting such to be the case, what led to the discovery and the discovery itself are two distinct

distinct things. It may also be said, and we think with almost equal propriety, that the first gold found in California led to the discovery in the same sense, only more remotely, as it was there Mr. Hargraves was first taught the use of the tin dish, which he simply taught us the use of after he came from that place. It may also be said that the bit of gold found at Ophir by Mr. Laue's shepherd led to the discovery; for it was because of that fact we stopped there to prospect, which resulted in the find of the 4 ounces of gold; or again, it may be said that Mr. John Lister having stopped Mr. Hargraves when going to Wellington, and taking him to Ophir, led to the discovery, for if it had not been for that circumstance Mr. Hargraves would have never seen Ophir. In short a hundred circumstances may be said to have led to the first discovery of a payable gold-field; but, after all, it is quite clear that no one of these circumstances, nor the whole of them put together, would be the discovery itself. Mr. Hargraves has denied ever having received as his own the fourth part of the 4 ounces of gold which we procured at Ophir while he was in Sydney, or 150 miles away from us. We have no doubt Mr. Hargraves denies having received this gold, because he sees that his acceptance of it as his own involves a proof of partnership with us. When Mr. Hargraves took these 4 ounces of gold from us he valued them at £3 10s. an ounce; and we now plainly and distinctly assert that Mr. Hargraves, according to this value, not only got his share, or one-fourth of the 4 ounces, but we also unhesitatingly affirm that it is quite impossible he can have forgotten the circumstance. We will explain why. Soon after the first rush to Ophir set in Mr. John Lister accompanied Mr. Hargraves to that place (Mr. Hargraves was going there to show the late Mr. Stutchbury, the Government Geologist, that a payable gold-field had been discovered), and on the road Mr. Hargraves told Lister that he did not think that William Tom was entitled to a part of the 4 ounces of gold, as he was not a partner with John Lister, James Tom, and himself in the discovery. This assertion of Mr. Hargraves' opinion somewhat annoyed Mr. Lister, and produced some angry words between them. When Lister got to Ophir he told William Tom about what had passed on the road, upon which William Tom asked Mr. Hargraves if such were the case, and he said that what Mr. Lister had told Mr. William Tom was quite true, but that, upon reflection, he was very sorry he should have spoken to Mr. Lister as he did, as William Tom, in his opinion, was as much entitled to a share of the gold as any of them, and he begged that William Tom would take no further notice of anything that had passed, upon which William Tom was satisfied, and, as Mr. Hargraves had expressed his sorrow for what had been said, he dismissed the matter from his mind. Well, after all this, Mr. Hargraves returned to the "Guyong Inn," pretended to be very ill, and took to his bed, saying he was "so very much grieved" that he and the son of his old friend (meaning the late Captain Lister) should have had any angry words. We are now aware that Mr. Hargraves was "so very much grieved" to think that the unpleasantness which had passed might lead to a full disclosure of all the particulars of how the first gold discovery was made, and, in his opinion, it was rather too soon for such disclosure to take place, as he had not as yet received from the Government his anticipated reward. We think what we have said on this part of the subject is sufficient. It may be said again, as it has often been said that Mr. Hargraves came from California on purpose to make the discovery of a payable gold-field in Australia. All we say, in answer to such a saying, is that having come to find a payable gold-field and finding one are two very different things. Mr. Hargraves, after he took his final departure from Bathurst, came to Sydney, and showed all the gold which James Tom, John Lister, and he himself had discovered, which, it will appear by the evidence the Honorable Colonial Secretary (Sir E. Deas-Thomson) gave before a Select Committee of the Legislative Assembly in July, 1853, amounted to only a few almost invisible specks. Mr. Hargraves on the 119th page of his own book says that Lister and James Tom brought some fine gold from the Turon—no doubt that gold was some of which was shown to the Honorable Colonial Secretary. Upon showing this gold he received no other encouragement from the Government than that the discovery of gold would be rewarded in proportion to its value. We wish honorable gentlemen to take particular notice of the part we are now describing, as it will show that the Government did not intend to reward Mr. Hargraves for what he had already done—on the 12th of February, for instance—nor for what he had done at any other time subsequently. In the opinion of the Government something all important had yet to be done to merit a reward. Well, now we unhesitatingly assert that after this assurance from the Government that the discovery would be rewarded in proportion to its value. Mr. Hargraves never prospected one moment on the western side of the Blue Mountains till he came to Guyong on the 6th of May, 1851 (he did not prospect then either), and received the 4 ounces of gold from us, which, upon being made known, resulted in the first rush to a gold-field which ever took place in New South Wales. We think it will be seen by this fact that Mr. Hargraves has been rewarded with £12,381 and an annuity of £250 for his natural life for our first procuring gold in payable quantities (the 16 grains and the 4 ounces) when he was 150 miles away from the scene of our operations—that is, when he was in Sydney and we at Ophir. We may, perhaps, be kindly allowed to say a word or two about the Mandurama diggings by way of making it obvious that the discovery of small quantities of gold is no proof of a payable gold-field. The Mandurama estate of Mr. Icely was opened on the 26th January last by Mr. Icely, and some 3 or 4,000 diggers, many scores of whom got several grains in weight of gold each, and yet it is well known that the Mandurama is not a payable diggings. It is also a well known fact that hundreds of other localities, which have yielded a little gold, have been well tried without any profitable results. We think these facts alone afford the very clearest evidence, and that too in the most practical way, that the discovery of even 6 or 7 grains in weight of gold (although fifty or sixty times more than Mr. Hargraves ever got) is not the discovery of a payable gold-field. Without hesitation we affirm it is our positive opinion that if Mr. Hargraves be the first and sole discoverer of the first payable gold in New South Wales, he is such without ever having found a farthing's worth of gold, for we are quite positive if a new sovereign were divided into 960 equal parts (the number of farthings in a pound) each part would be heavier than all the gold Mr. Hargraves got while he was in the Bathurst district. We believe one rub of an old file would take more gold off a sovereign than Mr. Hargraves got altogether, and we do not think 960 such rubs would reduce a new sovereign to gold dust. The Honorable Capt. Charles is reported in the *Sydney Morning Herald* of the 3rd of February last, as having said in the House that we only followed in the wake of Mr. Hargraves. Perhaps that honorable gentleman is not aware that at the very time Mr. Hargraves got the very little gold he did get that some of us were with him as *bonâ fide* partners in all profitable results. We think Mr. Icely, of Mandurama, would not be very much displeased if two or three individuals followed in the wake of his three or four thousand diggers with the same result as we followed in the wake of Mr. Hargraves at and about Ophir. Although what
Mr.

Mr. Hargraves did towards the first gold discovery was brought to a profitable issue by us and Mr. James Tom, we by no means wish to speak disparagingly of his introduction of the tin dish by showing us how to use it. We think that fact alone rendered him entitled to a handsome reward (keeping in view the vast issues and commercial importance of the discovery), for we do not think it will be denied that at the very time we discovered gold in payable quantities the whole of Australia was very little better than on the eve of bankruptcy, whereas now, by virtue of that discovery, she is one of the most prosperous and flourishing places in the world. It may be remarked, and we think with propriety as it involves a principle, that we bore Mr. Hargraves' expenses during the time of prospecting, and not he ours, which shows that we could not in any way be regarded as his subordinates (we believe he represented Messrs. Lister and James Tom to the Government as such), and in consequence subject to his orders. The fact of the whole matter is simply this (with due deference of course to whatever some people may say or think to the contrary), that if matters remained where Mr. Hargraves left them no payable gold-field would have been discovered till this day. It was by our perseverance after Mr. Hargraves took his final leave of the district, that the first gold in payable quantities was discovered, and which made us the first practical discoverers—producing as it did that practical result of digging which has now continued for something over twenty-five years, and resulted in all the Colonies to the enormous yield of something like three hundred million pounds worth of gold. Should any honorable members have any doubt about anything we have advanced in this paper, or anywhere else, we would request such honorable members to give Mr. Hargraves the full benefit of all such doubts, for we are most certainly of opinion that if Mr. Hargraves be the sole discoverer of the first payable gold (which he says he is) he cannot be dealt too liberally with; in fact, we believe if he be the sole cause of one million pounds worth of gold having been unearthed over the Colonies every month for the last twenty-five years, that he ought, so far as external appearances are concerned, be made a gentleman of while he lives. On the other hand, if what we have said be true and correct, we hope and believe your honorable committee will not withhold from us a simple and fair acknowledgment of the fact that we were the persons who first discovered gold in payable quantities which brought about a general digging over Australia. We admit others had found gold before us, but their discoveries, unlike ours, did not produce any public and payable gold-field. We hope our opinions are expressed in such a way that honorable members may see that we wish all parties concerned to base their conclusions on what they think is just and fair.

We have given the whole of the foregoing statement a well-matured and most candid consideration, and we have come to the unavoidable conclusion that we have either a strong claim for consideration, not only on the Parliament of New South Wales, but on the Parliament of each Colony of Australia, or that our minds have become most peculiarly infatuated. Which of the two we most respectfully leave to the judgment and justice of your honorable committee to decide.

WILLIAM TOM, JUNR.
J. H. A. LISTER.

THE foregoing history of the first gold discovery in Australia, to which our names are appended, we most solemnly declare to the best of our belief to be true and correct, and what refers to our individual knowledge we solemnly declare to be true.

WILLIAM TOM, JUNR.,
J. H. A. LISTER.

Witness to signatures,—

JAMES TORPEY, J.P.

Orange, 15 August, 1884.

After all we did in the matter of the gold discovery, which we have truthfully narrated in the foregoing history, Mr. Hargraves had the astounding impudence (using the mildest term which is at all appropriate) to write a letter, of which the following is a *verbatim* copy. This letter, which is a tissue of falsehood and exaggeration from beginning to end, Mr. Hargraves put John Lister's name to, and asked John Lister to send it to the *Sydney Morning Herald* for publication. We do not read it to your honorable committee to gratify any morbid feeling of animosity, for we hope we do not entertain any such feeling. We read it simply that Honorable Members may see that our word is, at least, as worthy of credence as that of Mr. Hargraves. The letter to which we refer, and Lister's reply thereto, are both subjoined. They appeared in the *Bathurst Free Press* newspaper of January in the year 1852.

WILLIAM TOM, JUNR.
J. H. A. LISTER.

[A true copy of the letter Mr. Hargraves wrote and asked John Lister to publish.]

(No. 1 Letter)

THE GOLD DISCOVERY.

(Editor *Sydney Morning Herald*.)

Ophir, 19 May, 1851.

GENTLEMEN,—A report having been spread abroad by some malicious person, who evidently is jealous of Mr. Hargraves' great discovery, to the effect that I was the party who made it and communicated it to him, I beg leave most unreservedly to contradict this false report, although having been upwards of two years searching for it—one time with two geologists and mineralogists, who told me there were indications, but could not find the gold. Mr. Hargraves, during his explorations, called on me as an old friend of my late respected father, and in course of conversation he told me this was a gold country, and if I would keep it quiet he would combine me. This I agreed to. He was as good as his word, and scarcely ever made a failure. Where he said gold was to be found, he found it. I neither understand geology or mineralogy, but I am convinced my friend Mr. Hargraves knows where and how to find gold, and all honor and reward in the late discovery belong to him alone. Indeed, few men would have done what he has—intersecting the country with blacks; sometimes alone, sometimes with my friend Mr. James Tom; and during his explorations had rain set in, from the imperfect manner in which we were equipped, starvation and death must have been the result. Trusting you will give this publicity in the columns of your valuable journal.

I am, &c.,

[Here Lister's name was written by Mr. Hargraves.]

P.S.—I have also heard it reported that Mr. Hargraves had not acted fairly towards me. I beg most distinctly to state that in all transactions with that gentleman he has acted strictly honorable with me, and friends in the secret of the great discovery. Mr. Hargraves is now no longer connected with me or my party at Ophir; and wherever he may be he has my best wishes, and I believe of all who have known him in the district of Bathurst.

[True

[True copy of Mr. Lister's reply to the above No. 1 Letter.]

(No. 2 Letter.)

(Editor Bathurst Free Press.)

THE foregoing is a copy of a document which Mr. Hargraves wrote and gave me, requesting I would send it to the *Sydney Morning Herald* for publication. I declined doing this because I could not subscribe my name to the untruths it contained, for I never knew him travel with a blackfellow in my life, neither am I aware of any extraordinary difficulties or dangers to which Mr. Hargraves was exposed. Furthermore, by my complying with his request, I should have betrayed Messrs. James and William Tom, who were the prospecting colleagues of Mr. Hargraves, and who, with myself, were at all the expense and most of the pains when actually searching for gold; and, further, Mr. Hargraves certainly sometimes found the horse he rode himself, but the other necessary horses and provisions were not one farthing expense to him. While living at my place, during the business of the gold search, he was entertained free of cost. I also assert, in plain words, that Mr. James Tom and I never travelled with Mr. Hargraves with any other understanding than that we were his prospecting colleagues, and concerned equally with himself in any favourable result that might accrue from our journey or journeys. I do not mean to assert that the Messrs. Tom and myself expected to get a share of what Mr. Hargraves might obtain from the Government, or even in the shape of public subscriptions, but only of the profitable results of our explorations. I expected Mr. Hargraves to make a truthful representation to the Government of how the first gold was obtained, that the Government might have had the opportunity of judging and rewarding each individual concerned according to his merits in the discovery. Messrs. James and William Tom can bear testimony to the truth of what I have now written.

J. H. A. LISTER.

P.S.—The early history of the discovery will appear in next Saturday's paper.

I HAVE most attentively perused the foregoing history of the gold discovery of 1851, which is signed by William Tom, junr., and J. H. A. Lister, and I believe the whole of it to be correct,—the parts that refer to my personal knowledge I know to be true. I could not say the exact day that I and my brothers got the 16 grains in weight of gold, but I know it was some days before I started to Adelaide, and I started (or I believe I did) on the 1st April, 1851. We got the 16 grs. of gold in the latter end of March, 1851, and I know it was before William Tom and John Lister got the 4 oz. of gold. With regard to No. 1 letter, which is a tissue of falsehood, Mr. Hargraves was out only twice prospecting while he was in the Bathurst District. The first time was on the 12th February, 1851, when John Lister was with him, and the other time was directly after, when John Lister and I were both with him. We went down the Macquarie on the second occasion, and we were away from seven to ten days. I never knew Mr. Hargraves experience more hardship or difficulty than he might have experienced at a picnic on the same rough ground. I do not believe he saw a native blackfellow, of Australian birth, while he was in the Bathurst District.

As witness my hand, at Melbourne, Victoria, this nineteenth day of October, in the year of our Lord one thousand eight hundred and seventy-six.

Signed and delivered in my presence,—

JAMES TOM.

RICH. GIBSON, J.P., for New South Wales.

WE will now acquaint your honorable committee with the fact that Mr. Henry Tom assisted in getting the 16 grains in weight of gold, which were discovered just after Mr. Hargraves left the Bathurst District. Our reasons for not having mentioned his name before now in connection with the first gold discovery are as follow:—In the first place, when we and James Tom published a pamphlet in 1870, William Tom, who wrote the pamphlet, had forgotten which brother it was who made the third individual of his party. He felt sure it was his brother Henry, but he did not know, and as Henry and Charles Tom were living in Queensland, he did not feel disposed to put off the publication of the pamphlet till he had made inquiry. In the second place, we were well aware that the brother of William Tom (whichever it was) had no intention of making a claim on the Government, for although he was at the getting of a hundred times more gold than Mr. Hargraves ever got, he did not think that so small a quantity as only 16 grains in weight would warrant an application to the public purse. In the third place, William Tom knew if he omitted the name of his brother (whichever it was) the omission would not in any way interfere with the truth and correctness of the pamphlet. We assign this latter reason for not having mentioned Henry Tom's name in the foregoing history. What Henry Tom says about the matter is as follows:—"I remember that at some time about the middle of March, 1851, that James Tom, William Tom, and myself started from Springfield about sundown, taking with us one horse named Dash, provisions sufficient for three days, pick, spade, and a cradle for washing gold, and that we travelled till nearly midnight, when we arrived at a point on Lewis' Ponds Creek, about 2½ miles above the junction of that creek with the Summerhill Creek, now known as Ophir, where we camped till morning, when we commenced to wash for gold. I dug the earth and filled the buckets; James Tom carried the earth to the cradle, and William Tom washed it. We continued at this work until some time in the afternoon, when we collected the gold from the cradle, hid the cradle on a mountain close by, and started for home, where we arrived about 9 o'clock p.m., when the gold we procured was weighed, and found to be a little over 16 grains."

I, Henry Tom, do solemnly declare the above to be true and correct to the best of my knowledge and belief.

HENRY TOM.

Declared before me at Waromgh, in Queensland, this third day of March, 1887,—

HENRY G. PISCOE, J.P.

Dear William,

17 August, 1876.

You wish me to let you know how much gold Mr. Hargraves brought to Guyong on the evening of the 12th February, 1851. Mr. Hargraves showed me the gold he brought there on that evening through a small magnifying glass, which was carried about by himself. There were three specks, and they were so very small I could not see them distinctly with the naked eye.

Yours, &c.,

E. BATE.

Submitted.—7/4/87.

A *précis* of these letters may be made.—H.P., 7/4/87. Herewith,

Précis.

Précis.

FIRST GOLD DISCOVERY OF 1851.

THESE papers are said to be true copies of the documents written by Mr. William Tom, junr., and Mr. J. H. A. Lister with the object of "undeceiving" Parliament and the public with regard to the first discovery of payable gold in New South Wales, and of showing that Mr. Hargraves, who claimed and obtained the reward offered by Government, had no real right to it.

The details of Mr. Hargraves connection with the matter are narrated at great length; but the circumstances, stated as briefly as possible, appear to have been as follows:—

When Mr. Hargraves visited Bathurst in February, 1851, he called on Mr. Lister, and said he was on his way to Wellington in search of a gold-field. Mr. Lister remarked that he also was in quest of gold, and produced some stones he had found, which resulted in the two becoming partners, Mr. Hargraves abandoning for the time his intention of proceeding to Wellington. Mr. Lister accordingly, on the 12th February, 1851, took Mr. Hargraves to a spot near Ophir where he said there was gold, and "allowed" him to wash four or five pans of earth, from which he obtained a few very minute specs of gold. After prospecting together unsuccessfully in the Macquarie, Mr. Hargraves went to Wellington, and returned after three weeks' absence without having found any gold whatever (as he produced none). Up to the time of his final departure from the district the combined efforts of the three had failed to produce more than $\frac{1}{3}$ th of a grain weight of gold. It is contended incidentally that as early as 1841, and certainly in 1848 or 1849, the Rev. W. B. Clarke had obtained gold in the Vale of Clwydd by scientific experiment; while it was known long before Mr. Hargraves visited California that parcels of gold had been obtained from Macgregor's reef near Wellington. It is distinctly asserted by the complainants that Mr. Hargraves, on taking his last departure from Ophir before the discovery of a payable gold-field, said "he was sure no place he had seen would pay for working." It was then agreed that Mr. Hargraves should go prospecting to Moreton Bay, whilst William and James Tom should continue their researches in the Bathurst District, and that each should apprise the other of any discovery of gold. Three days after Mr. Hargraves had taken his departure James and William Tom found 16 grains weight of gold, and duly acquainted him of the fact by letter; and they consider that it was their omission to mention this circumstance when examined in 1853 by a Select Committee that proved fatal to their cause on that occasion. It is asserted that Mr. Hargraves, on the information contained in this letter, made his proposal to the Government on April 3rd, 1851, viz., to point out a payable gold-field, on the basis of the 16 grains found on March 23rd or 24th. There is nothing to show how Mr. Hargraves came by these 16 grains, or whether he had them in his possession at all, since he did not visit Bathurst after finding the "few specks" until May 6th, when he was given the 4 oz. (to be referred to in the following pages) in order to convince the Government.

On April 7th James and William Tom set off to Ophir on another prospecting trip, and they give at great length their reasons for expecting to find gold there. Before many minutes William Tom picked up a piece worth £2 10s.; on the following day they obtained a nugget of the "exact" weight of a sovereign and 20s. worth of gold-dust. They continued washing, and for two or three days they obtained about 30s. worth of gold-dust per diem. A little further down the creek Mr. Lister picked up a piece weighing "exactly" 2 oz. These discoveries were also communicated to Mr. Hargraves, who was requested to return to Bathurst. After some four weeks unaccountable delay (during which it is assumed Mr. Hargraves was negotiating with the Government) he arrived; and it is asserted that until these 4 ozs. were delivered and shared, Mr. Hargraves had never a penny's worth of colonial gold in his possession (with the exception of the "few specks") until May 6th.

They took Mr. Hargraves to Fitzroy Bar on 9th May, 1851, but he could not obtain even the colour of gold, although £500,000 has since been obtained from that locality. They state emphatically that Mr. Hargraves accepted his fourth share of the 4 oz., which they regard as proof of his partnership with them, viz.—Mr. Lister and James and William Tom. Mr. Hargraves, however, has denied such partnership.

It is solemnly asserted that from the time Mr. Hargraves received the assurance of the Government (that he would be rewarded according to the value of the gold he discovered, and not for what had been done) until May 6th, he never prospected one moment on the western side of the Blue Mountains. It was the discovery of the 4 oz. that resulted in the first gold rush in New South Wales; and they claim that it was their perseverance alone, while Mr. Hargraves was 150 miles away, which has resulted during the twenty-five years in a total yield of about £300,000,000 throughout all the Colonies.

Next follows a copy of a letter (page 5 of MS.) worthy of notice. It was drafted for the press by Mr. Hargraves as from Mr. Lister, and sent the letter for approval prior to publication. Its purport was to make Mr. Lister entirely disclaim all credit in connection with the gold discovery, and to make Mr. Hargraves appear as the only person entitled to the reward. Mr. Lister declined to publish such a letter as his own, but he published in the *Bathurst Free Press* the draft with an exposure of Mr. Hargraves' attempt to force him into foregoing his own claims.

The affidavits of William and James Tom and Mr. J. H. A. Lister are appended, certifying the above facts to be correct. Henry Tom, on March 3rd, of the present year, also made an affidavit to the same effect; and the reason his name has not been already mentioned is accounted for by the statement, that when James and William Tom published their pamphlet in 1870, William, who wrote it, had forgotten which of his two absent brothers constituted the last member of the party. Mr. E. Bate, on August 17th, 1876, also made an affidavit, stating that the gold brought home by Mr. Hargraves on February 12/51, consisted of a few specks almost invisible to the naked eye, and could only be seen through a magnifying glass.

15 April, 1887.

C.W.

Mr. W. Tom, junr., to The Colonial Secretary.

Sir,

Sunrise, Guyong, 25 April, 1887.

Some two or three weeks ago I sent you, by direction of his Excellency the Governor, the history of the first gold discovery in Australia, with the hope that you would give the matter due consideration and bring it before Parliament. If you feel desirous of going on with the matter will you please to acquaint me with the circumstance?

I am, &c.,

WILLIAM TOM, JUNR.

1888.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

MINERAL CONDITIONAL PURCHASE OF JAMES KENNEDY
BROUGHAM, PARISH OF PICTON.

(CORRESPONDENCE, &c., IN REFERENCE TO.)

Ordered by the Legislative Assembly to be printed, 28 November, 1888.

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated 16th July, 1888, That there be laid upon the Table of this House,—

“Copies of all minutes, correspondence, papers, &c., relating to the mineral conditional purchase taken up by James Kennedy Brougham, in the parish of Picton, county of Yancowinna, Albert Gold-field.”

(Mr. Chanter.)

MINERAL CONDITIONAL PURCHASE OF JAMES KENNEDY BROUGHAM,
PARISH OF PICTON.

No. 1.

Application by James K. Brougham.

C. [Alienation Act, sections 13, 14, and 19.]
District of Mitchell. No. 56 of 1882.
Application by James Kennedy Brougham, minor, 17 years, 5th August, 1883, for the conditional purchase, without competition, of 40 acres, unimproved Crown land.
Received by me, with a deposit of £20, this 20th day of September, 1883, at 11.10 o'clock.
FYSON A. SLACK,
Agent for the sale of Crown lands at Wilcannia.

Sir, 20 September, 1883.

I am desirous of purchasing, without competition, under the Crown Lands Alienation Act of 1861, the portion of unimproved Crown land hereunder described, containing 40 acres; and I herewith tender the sum of £20, being a deposit at the rate of 10s. per acre on the area for which I apply.

I am, &c.,

JAMES KENNEDY BROUGHAM,

To the Agent for the sale of Crown lands, at Wilcannia.

Wilcannia.

Description.

County of Yancowinna, parish unnamed, 40 acres. Commencing at a post marked JN, about 22 chains southerly from south-west corner of Alexander Edwin Greel's mineral conditional purchase of 40 acres, No. 83-54, selected 20/9/83; thence south, thence west, thence north, thence east, to the point of commencement, to include the area in a square block.

Within the Albert Gold-field, proclaimed 25th February, 1881, open to conditional purchase under the 14th clause of the Act of 1861. Cat. No. Y 57-2,186, portion 3 of 40 acres, parish of Picton. Instructions on certified copy have this day been issued to Mr. Licensed-Surveyor Bray to measure, if unobjectionable.—J.W.M., 19/11/83. Chartered approximately (*per* mineral conditional purchase), 83-38. Mr. L.-S. Bray to measure, if unobjectionable.—M. A. M'LEAN (for Surveyor-General), 19/11/83. Transferred to Mr. Licensed-Surveyor W. Jamieson.—M. BARLOW, Surveyor, 19/3/84. Received, 19/3/84. Transmitted to the Surveyor-General, with plan, under cover of my letter, No. 84-177, 28/6/84.—WILLIAM JAMIESON, 30/6/84.

No. 2.

Transfer from J. K. Brougham to J. Nickel.

H.

[Alienation Act, sections 13, 14, 19, 21, and 22.]

Notification of alienation of conditional purchase by James Kennedy Brougham, minor, aged 17 years, 5th August, 1883, in the district of Mitchell.

I HEREBY notify to you, as the Agent for the sale of Crown lands for the district of Mitchell, that I have, in consideration of the sum of £20, this day alienated to Julius Nickel, of Mount Gipps, the 40 acres of land, situated in the county of Yancowinna, parish unnamed, which was selected at Wilcannia by myself as a conditional purchase, under the 19th section of the Crown Lands Alienation Act of 1861, on the 20th September, 1883.

JAMES KENNEDY BROUGHAM,

Wilcannia.

Witness—THOS. W. BARNES, J.P.

Dated, at Wilcannia, this 20th September, 1883.

To the Agent for the sale of Crown lands, at Wilcannia.

I have duly registered the above notification of alienation in the records of this office. Fee of 15s. paid, including 7s. 6d. for registration fee, and 5s. stamp duty.

FYSON A. SLACK,

Agent for the sale of Crown lands.

District of Mitchell, Land Office, Wilcannia, 20th September, 1883.

No. 3.

Transfer from F. A. Tewsley to J. Nickel.

II.

[Alienation Act, sections 13, 14, 19, 21, and 22.]

Notification of Alienation of Conditional Purchase by Frederick Augustus Tewsley, minor, aged 17 years, 24th February, 1883, in the district of Mitchell.

I HEREBY notify to you, as the Agent for the sale of Crown lands for the district of Mitchell, that I have, in consideration of the sum of £20, this day alienated to Julius Nickel, Henry Francis Hawson, Thomas Collins,

Collins, and Thomas Bond Hawson, of Mount Gipps, the 40 acres of land, situated in the county of Yancowinna, parish unnamed, which was selected at Wilcannia by myself as a conditional purchase, under the 19th section of the Crown Lands Alienation Act of 1861, on the 20th September, 1883.

Witness—THOS. W. BARNES, J.P.

FREDERICK AUGUSTUS TEWSLEY,
Wilcannia.

Dated at Wilcannia, this 20th September, 1883.

To the Agent for the sale of Crown Lands at Wilcannia.

I have duly registered the above notification of alienation in the records of this office. Fee of 15s. paid, including 7s. 6d. for registration fee, and 5s. stamp duty.

FYSON A. SLACK,
Agent for the sale of Crown lands.

District of Mitchell, Land Office, Wilcannia, 20th September, 1883.

As alienee is not of age, the transfers herewith cannot be recognized. Parties interested should be so advised, and papers returned to this Department.—J.R.Y. (for Chief Commissioner), B.C., 29th September, 1883. Crown Lands Agent, Wilcannia.

Parties advised, and papers returned herewith.—FYSON A. SLACK, Crown Lands Agent, Wilcannia, 8th October, 1883. The Chief Commissioner, Department of Lands, Sydney.

As alienee is a minor, it is submitted that the transfer herewith be cancelled, and fees paid thereon refunded.—J.R.Y., 15/10/83. Chief Commissioner.—J.W.B. The transfer of course cannot be acted upon. Inform with refund of fees, &c.—A.O.M., 17/10/83.

Treasury and Crown Lands Agent informed, 25/10/83, refund of fees, &c.—(P.)

Mr. Yorke.—W.B., 15/2/84. Action referred to already taken, *vide* within. Writers informed.—(P.), 19/2/84.

No. 10.

Mr. Licensed-Surveyor W. Jamieson to The Surveyor-General.

Sir,

Silvertown, 28 June, 1884.

I have the honor to transmit herewith the plan* of one portion of land, containing 40 acres, numbered 3 in the parish of Picton, county of Yancowinna, applied for by James Kennedy Brougham, minor, under the 19th section of the Crown Lands Alienation Act of 1861, and surveyed in accordance with instructions dated the 19th November, 1883, to Mr. Licensed-Surveyor Bray, No. 38; improvements nil. The land was originally taken up by James Kennedy Brougham (minor), but, I understand, has since been transferred to J. Nickel. The land is situated within the Albert Gold-field, and was surveyed on the 6th June, 1881. The present holder is a *bona fide* miner.

* Appendix A

I have, &c.,

WILLIAM JAMIESON,

Surveyor.

[Enclosure.]

Mineral conditional purchase, 83-56, Mitchell, within a gold-field—Description—Lot E. 40 acres. County of Yancowinna, parish of Picton, portion 3: Commencing at a point bearing about S. 46° 15' W., and distant 36 chains 39 links from the north-western corner of portion 10, of 40 acres, parish of Bolairo; and bounded thence on the north by a line bearing west 20 chains; on the west by a line bearing south 20 chains; on the south by a line bearing east 20 chains; and on the east by a line bearing north 20 chains, to the point of commencement.

C. P. No. 83-56 and plan herewith, Y 57-2,186. Secretary and Cashier, 26/7/84. Examined and charted.—F. GOODE, 29/10/84. Survey approved.—31/10/84. Tracing enclosed for inspector dealt with in Charting Branch.—J.W.M., 31/10/84. Description prepared.—J.S.M., 9/12/84.

No. 11.

Mr. J. K. Brougham to The Under Secretary for Lands.

Sir,

Wilcannia, 3 November, 1886.

I have the honor to apply for an extension of time with respect to the expenditure on mining improvements on my mineral conditional purchase, 83-56, of 40 acres, Wilcannia. £62 has been spent on the land in actual mining work, without counting expenses of material, &c. Owing to adverse occupation under mineral license application, No. 1,028, Silvertown, I have been unable to do any further work on the land.

I have, &c.,

JAS. K. BROUGHAM.

No. 11½.

Declaration by Mr. J. K. Brougham.

F.

[Alienation Act, 1861.]

Declaration of conditional purchaser for mining purposes.

I, JAMES KENNEDY BROUGHAM, of Wilcannia, do solemnly and sincerely declare that I am the lawful owner, by conditional purchase, of the land hereunder described, and that an expenditure equal to £1 10s. per acre for the area of land has been made on mining operations other than gold-mining on the land, and since the selection in Wilcannia, on the 20th September, 1883, and I make this solemn declaration, conscientiously believing the same to be true, and by virtue of the provisions of an Act made and passed in the ninth year of the reign of Her present Majesty, intituled "An Act for the more effectual abolition of oaths and affirmations taken and made in various departments of the Government of New South Wales, and to substitute declarations in lieu thereof, and for the suppression of voluntary and extrajudicial oaths and affidavits."

Description.

County of Yancowinna, parish of Picton, 40 acres, on , being (part of) conditional mining purchase, No. 56 of 1883, in the district of Wilcannia.

Taken and declared, at Wilcannia, this third } day of November, 1886, before me,—

JAS. K. BROUGHAM.

FRANK LEVY, Commissioner for Affidavits.

No. 15.

The Under Secretary for Lands to The Chairman of the Local Land Board,
Wilcannia.

District of Wilcannia; name of applicant, James K. Brougham; area, 40 acres; date, 20/9/83.

[Section 19 of the Alienation Act of 1861—25 Vic. No. 1.]

DECLARATION upon the above described mineral conditional purchase requires verification. All available papers in connection with it are therefore referred to the Chairman of the Local Land Board, Wilcannia, with a view to the necessary instructions being issued to the Inspector of Conditional Purchases at an early date.

If the report, when furnished by the Inspector, shows that the improvements are not sufficient to satisfy the requirements of the law, or that they have not been effected *bona fide* for mining operations, as contemplated by the 19th section of the Alienation Act of 1861, an investigation by the Local Land Board may be instituted, subject to the provisions of the 20th section of the Crown Lands Act of 1884.

W.H.C., 12/1/87.

The above recommendation approved by the Minister for Lands, *vide* 87-1,358 D.

F.H.W.

18th January, 1887.

No. 18.

Decision of The Local Land Board, Wilcannia.

[Crown Lands Act of 1884—(Part II, section 14, subsection 4).]

New South Wales, }
to wit.

C.P., 83-56—J. K. Brougham—Wilcannia.

WHEREAS, on the 12th day of May, 1887, it became a matter for investigation before us whether the conditions of improvement have been fulfilled, and, having taken evidence and inquired into the said matter, we find that over 24s. per acre had been expended in mining improvements at the time of making the first declaration.

Therefore so far satisfactory.

Given under our hands, at the Local Land Board, at Wilcannia, in the Colony of New South Wales, this 12th day of May, 1887.

FRED. TROLLOPE,
Chairman.
GEO. H. GOWER,
Member.

[Enclosures.]

[Crown Lands Act of 1884—(Part II, section 14, subsection 1.)]

C.P., 83-56—Wilcannia—J. K. Brougham.

New South Wales, to wit.

The examination of James Kennedy Brougham, of Outer Netallie, in the Colony of New South Wales, overseer, T. W. Barnes, of Wilcannia, in the said Colony.

WHEREAS, it hath been alleged that inquiry has been made as to the conditions of improvements, and it hath been found necessary to investigate the said matter on oath, the depositions of the several witnesses are appended hereto.

JAMES KENNEDY BROUGHAM sworn, saith :—I am an overseer on Netallie Station ; I am applicant for this land ; mining improvements, consisting of a shaft, have been sunk on this land ; the shaft is 28 or 30 feet, and is partly timbered ; that has cost now £60 ; it cost £2 per foot ; some months before I made my declaration this land was applied for as a mineral lease by two men, Renham and Harper ; legal proceedings had to be taken to get rid of these men ; this caused a suspension of the work ; a further application for a mineral lease of the same land was made by another man ; I had to go to Silverton to appear before the Warden in an objection to that claim ; the land being jumped has caused delay in proceeding with mining improvements.

C.P. 83-56,
Wilcannia,
Jas. K.
Brougham.

JAMES KENNEDY BROUGHAM.

Sworn before us, at Wilcannia, this 12th day of May, 1887,—

FRED. TROLLOPE, Chairman, Land Board.
GEO. H. GOWER, Member.

THOMAS WILLIAM BARNES sworn, saith :—I am a stock and station agent at Wilcannia ; I know this land ; I have superintended the effecting of the mining improvements ; in May, 1885, I made a contract with a party to sink a shaft ; the shaft was commenced and sunk to the depth of 8 feet ; on the 8th June, 1885, Renham and Harper jumped this claim ; that caused a suspension of the work of sinking the shaft ; Mr. Brougham lodged an objection to the claim of Renham and Harper ; this gave us a great deal of trouble ; in March, 1886, I took an opportunity of Renham being off the land to recommence sinking the shaft ; I was thereupon summoned for trespass ; there was some trouble, and this caused delay in going on with the mining improvements ; towards the end of last year Renham's application for a mineral lease was refused by the Mines Department ; immediately after a man named Martin put in another application for a mineral lease ; Mr. Brougham lodged an objection to that claim ; the work of sinking the shaft to the depth of 28 feet was completed in April, 1886 ; no work has been done since then owing to legal difficulties ; the first 8 feet sunk cost 30s. a foot, and the next 20 feet cost 50s. a foot, making the whole cost £62 ; there were also extra charges.

THOS. W. BARNES.

Sworn before us, at Wilcannia, this 12th day of May, 1887,—

FRED. TROLLOPE, Chairman,
GEO. H. GOWER, Member.

No. 19.

Mr. Capper.—S.F., 1/7/87.

No. 20.

Mr. W. J. Fergusson to The Secretary for Lands.

Portion 3, Picton, Yancowinna, Mineral Conditional Purchase, 83-56.

Sir,

Fitz-Evan Chambers, Castlereagh-street, Sydney, 21 July, 1887..

I beg to claim the above allotment on behalf of Mr. M. C. Renham, of Broken Hill, and to enter a protest against the same being dealt with in any way, or the title validated without notice to me.

Mr. Renham has been in possession since May, 1885, under his mineral license, and has duly fulfilled the conditions of the Act, and I cannot understand why his application for a lease was refused, mineral conditional purchases on proclaimed gold-fields having been declared void (*Wood v. Scott*, 1885, N.S.W., Rep. c. 83).

The claimant (James Brougham) has not taken the land *bona fide* for himself, and is acting as a mere dummy, nor has he fulfilled the requirements of the Act.

I shall be glad of a reply hereto at your early convenience.

I am, &c.,
W. J. FERGUSSON
(Per C. P. SOWTEE).
As

As mineral conditional purchase, 83-56, is within the Albert Gold-field, proclaimed 25th February, 1881, and open to conditional purchase under the 14th clause of the Act of 1861, it is submitted that the application be validated under the provisions of the 3rd section of the Crown Lands Titles and Reservations Validation Act of 1886.—W.H.C., 31/8/87.

Sir,

Wilcannia, 10 August, 1887.

With reference to the mineral conditional purchases noted in the margin, we have the honor to request that you will inform us if it is proposed to validate them shortly, and about what time.

As regards mineral conditional purchase 83-56, the Local Land Board held an inquiry into the mining improvements effected thereon, and, we understand, reported favourably on the case.

A declaration has been lodged, showing £7 per acre to have been expended on mineral conditional purchase 83-64.

The former portion is now in hostile occupation, and the mineral conditional purchaser is prevented from going on with the work in consequence. On the last named, work is suspended pending settlement of the title.

We have, &c.,

T. W. BARNES & CO.

In view of this letter the reference to the Mines should be made at once and urgent.—T.G., 6/9/87. The Under Secretary for Mines.—C.O., B.C., 7/9/87. Urgent. I have the honor to request that you will be good enough to inform me if the mineral conditional purchase of Mr. J. K. Brougham, of certain land at Wilcannia, on the 20th September, 1883, has been validated.

I have, &c,

GERARD E. HERRING

(For the Under Secretary).

Papers, S7-4,425, Cor., are noted. B.C., Mines Department, for report, 7/9/87.—J.P.M., 27/9/87. Mr. Wilkinson as to query of Mines Department.—J.P.M., 28/9/87. May be informed of reference of papers to Mines for report prior to validation submitted.—H.W., 28/9/87.

Mineral conditional purchases, 83-3, Wilcannia, parish Picton, county Yancowinna, Albert Goldfield, John Kennedy Brougham. Let me have the papers in the case.—T.G., 4/10/87. M. C. Renham claims this land under mineral license, through Mines. Mr. Capper.—S.F., 4/10/87. The papers, S7-4,425, Cor., are at Mines Office, but not complete, regarding any objection to the validation of the conditional purchase in question.—W.T.N., 4/10/87. The Assistant Under Secretary.—W.H.C., 4/10/87. Perhaps J. K. Brougham's mineral conditional purchase, 40 acres, portion 3, parish Picton, is that referred to plan Y 57, at Mines. Try papers C.S. 84-6,414, Survey.—J.T.K., 4/10/87.

No. 26.

Mr. W. J. Fergusson to The Secretary for Lands.

Mineral conditional purchase, 83-56, Brougham, 87-38,670.

Sir,

Fitz-Evan Chambers, Castlereagh-street, Sydney, 22 September, 1887.

May I ask you to expedite this matter as much as possible. My client, Mr. Renham, has already been put to much expense and delay, and as on the decision of the Lands Department the Mines will probably reconsider his application for a mineral lease, you will see how much depends on getting the matter through quickly.

Yours, &c.,

W. J. FERGUSSON

(Per C. P. SOWTER).

No. 27.

Mr. W. J. Fergusson to The Under Secretary for Lands.

Portion 3, parish Picton, county Yancowinna, mineral conditional purchase 83-56.

Sir,

Fitz-Evan Chambers, Castlereagh-street, Sydney, 29 September, 1887.

I shall be obliged if you will kindly inform me how this matter stands.

Has anything been done to validate the above?

Yours, &c.,

W. J. FERGUSSON

(Per C. P. SOWTER).

No. 28.

Mr. W. J. Fergusson to The Secretary for Lands.

Mineral conditional purchase, parish Picton, county Yancowinna.

Sir,

Fitz-Evan Chambers, Castlereagh-street, Sydney, 4 October, 1887.

Referring to my interview with the Minister for Lands this morning, I shall be obliged if you will expedite this matter as much as possible.

If I can do anything to assist you in pressing on the matter I shall be most happy.

Yours, &c.,

W. J. FERGUSSON

(Per C. P. SOWTER).

No. 29.

Telegram from F. Oliver, Esq., to The Under Secretary for Lands.

Wilcannia, 4 October, 1887.

When may validation of mineral conditional purchase, 83-56, Wilcannia, be expected to appear in *Gazette*?

FRANK OLIVER.

The papers in the case are now with Mr. Mayes, in the Mines Department, who will give his whole time to the matter, and hopes to return the papers to this Department by Friday next.—W.T.N., 5/10/87. The Under Secretary.—W.H.C., 5/10/87.

Reply that the Department of Mines has not yet reported, but has promised to do so to-morrow, when further intimation will be made to Mr. Oliver.—C.O., 5/10/87. Wire, 6/10/87. Return papers to me.—C.O. Have the papers been received from Mines?—C.O., 14/10/87. Mr. Capper.

No. 30.

Office Memorandum.

MINERAL conditional purchase, 83-3, Wilcannia, refers to a case in the name of T. W. Chambers; but mineral conditional purchase, 83-56, Wilcannia, is in the name of J. K. Brougham.

The papers, 87-4,425 Cor., were taken to the Mines Department on the 7th ultimo to ascertain whether there was any objection to validating the purchase, and personal application has since been made as to what had been done in regard to the case. On my application this afternoon I ascertained that the clerk who had the matter in hand has returned to his duties, having been ill for several days. There was also some difficulty in obtaining the plans, which he only received this morning, and will at once attend to the case, hoping within two or three days to return the papers to this Department.

The Assistant Under Secretary.

W.T.N., 4/10/87.

No. 31.

D. O'Connor and J. Hurley, Esquires, Ms.P., to The Secretary for Lands.

Dear Sir,

Norwich Chambers, Hunter-street, Sydney, 5 October, 1887.

We beg to draw your attention to our application, made some time since, for a portion of land in the parish of Picton, county of Yancowinna, within the Albert mining district and gold-field. The land applied for was a mineral conditional purchase, in the name of an infant, James Kennedy Brougham, by an agent, Charles Nicholls, which in itself was an illegal application.

We therefore urge the refusal of such application, and would further point out the injustice to the mining community for such mineral conditional purchase to be upheld, besides the fraud on the State.

1st. In the interest of the mining community, we desire to point out, if mineral conditional purchases are allowed or generally accepted, it is more than likely that large areas of land will fall into the hands of monopolists and become void of development, besides the mineral conditional purchaser becomes a permanent holder as against the mineral lease holder, who pays annually 5s. per acre for a term of years to the State, to whom hereafter the land may revert.

Again the application is illegal, inasmuch as an infant, even by an agent, cannot select mineral land in this way, and to do so is only to defraud the State.

In conclusion, we feel assured that an injustice will be done a mineral lease applicant (Mr. M. C. Renham) who has been in possession some considerable time, and expended, in working, watering, and prospecting the lease, somewhere about £500, besides being a *bona-fide* miner, whose only desire is to practically develop the property, and not dummy it through the agency of an infant.

We enclose the printed report of a case tried before His Honor the Chief Justice, last Friday week, 27th September, as showing the position Mr. Renham stands in in his occupying and determination to uphold his legal rights.

Your early attention to this case will oblige.

We are &c.,

D. O'CONNOR.
J. HURLEY.

[Enclosure.]

Hay Standard, 28th September, 1887.

HAY CIRCUIT COURT.

THIS Court opened on Monday, before His Honor the Chief Justice. The Hon. B. R. Wise, Attorney-General, prosecuted on behalf of the Crown, assisted by Mr. Merewether. The other legal gentlemen present were: Mr. Hanbury Davis, barrister. The solicitors present were: Mr. T. Robertson, Mr. Brough, Mr. Kensington, Mr. R. M. Comans, T. Jhonson, G. C. Gillott.

M. C. Renham and C. Harper v. Jas. Martin.—Trespass on land held as a mineral license at Silverton. Damages, £1,000.

Mr. Merewether, instructed by Mr. Brough, appeared for the plaintiffs.

The defendant did not appear.

Jury: R. Woodward, A. Brown, J. Fallon, R. Massie.

M. C. Renham gave evidence of the defendant entering upon the land and doing certain damage to it, knowing it to belong to plaintiff.

His Honor, in reviewing the evidence and directing the Jury, stated that the plaintiffs had unquestionably established their claim to the land in question, and that the only matter with which they needed concern themselves was the amount of damages which they thought the plaintiff has sustained by the wrongful action of the defendant. He added, in a case of this sort, although no actual damage had been proved, they would still be justified in awarding substantial damages, and cited a case in which the sum of £500 had been awarded as damages for trespass, which consisted only of the defendant persistently walking across the plaintiff's land in front of his windows.

The Jury gave a verdict for 1s., and costs.

No. 32.

D. O'Connor and J. Hurley, Esquires, Ms.P., to The Secretary for Lands.

Dear sir,

Norwich Chambers, Hunter and Bligh Streets, Sydney, 6 October, 1887.

Referring to our letter of yesterday's date, respecting a mineral conditional purchase in the parish of Picton, county of Yancowinna, will you please correct the following clerical error therein:—

Instead of the words "to our application made some time since" please substitute "to an application made some time since," and oblige,—

Yours faithfully,

D. O'CONNOR,
T. HURLEY.

Make this correction.—T.G., 7/10/87. See as to case, as to which Hurley and O'Connor wrote two letters last week, something about land at Silverton, I think.—T.G., 12/10/87. J. K. Brougham.—Mineral conditional purchase, parish Picton, county Yancowinna, Albert Gold-field. Has this case come back from Mines yet?—T.G. The papers have not been returned from Mines Department yet.—J.R.Y., 13/10/87. Send someone for them.—S.F. Papers not yet returned from Mines; in fact, they have not been finally dealt with in that Department.—W.H.C., 13/10/87. The Under Secretary. To await return of papers recently sent to Mines.—C.O., 31/10/87. Mr. Capper.

STEPHEN FREEMAN

(For the Under Secretary).

No. 34.

Mr. W. J. Fergusson to The Under Secretary for Lands.

Mineral Conditional Purchase, 83-56.

Sir, Fitz-Evan Chambers, Castlereagh-street, Sydney, 8 October, 1887.
 Has anything been done herein as to the above? My client is pressing me, so an early reply will oblige.

I have, &c.,

W. J. FERGUSSON

(Per C. P. SOWTER).

No. 35.

D. O'Connor and J. Hurley, Esquires, Ms.P., to The Secretary for Lands.

Dear sir, Norwich Chambers, Hunter and Bligh Streets, Sydney, 17 October, 1887.

In reply to your letter dated 13th instant, No. 87-5,671 Cor., we beg to inform you that the following are the particulars of the conditional purchase therein asked for:—

Portion No. 3; parish of Picton; county of Yancowinna; area, 40 acres; date, 20th September, 1883.

We are, &c.,

D. O'CONNOR,
J. HURLEY.

Put with other papers.—T.G., 18/10/87.

No. 36.

Office Memorandum.

PORTION 3 of 40 acres, parish of Picton, county of Yancowinna. Within Albert Gold-field, proclaimed. 25th February, 1881; reserved from conditional purchase, 29th September, 1884; cat. Y. 57-2,186.

James K. Brougham.

Referred to this Department for any objections to validation of mineral conditional purchase. Objection by M. C. Renham, who claims possession under mineral license since May, 1885, *vide* 87-12,148 enclosure. See 87-11,063, with 87-13,689. The Lands Department may be asked not to validate mineral conditional purchase, 83-56. Mineral conditional purchase 83-56, Wilcannia, 20th September, 1883.

M. C. Renham.

An objection was lodged by J. K. Brougham, who is the holder of the mineral conditional purchase 83-56, and is also one of applicants under mineral lease application 1,029, at Silverton, Application 1,028, at Silverton. Possession, 8th June, 1885, at 7 a.m.

An inquiry was held by Warden, and it was elicited in evidence that no work had been done on the mineral conditional purchase from date of application to purchase, 20th September, 1883, to date of inquiry, 2nd July, 1885, and that Renham (application 1,028) also took possession by virtue of his mineral license, on 5th May, 1885. See minute by Under Secretary on 86-8,588, *vide* 86-8,588. Letter from J. P. Abbott (on behalf of application 1,029), stating how Renham (application 1,028), obtained information given in confidence to another, which enabled him (Renham) to take prior possession. Application 1,029, Silverton. Possession, 8th June, 1885, at 9 a.m.

Application 1,028 and 1,029, at Silverton, refused 22nd October, 1886, 87-6,041 Cor., *vide* 87-11,786, statutory declaration by M. C. Renham (clause 1), that he has held land by virtue of mineral licence since 5th May, 1885, and (in clause 17), that he obtained from Warden suspension of labour conditions for three months from 4th December, 1886.—J.D. (*per* J.L.), 18/10/87. The Chief Mining Surveyor. The Under Secretary.—F.P., 18/10/87.

The Lands Department may be asked not to validate Brougham's mineral conditional purchase, as the land in question is claimed by Renham, in virtue of his mineral license, and he appears to have succeeded in an action of trespass in the Hay Circuit Court (Renham and Harper *v.* Martin), *vide* *Hay Standard* of the 28th September, 1887.—H.W., 18/10/87.

Submitted. Approved.—F.A., 18/10/87. The Under Secretary for Lands.—H.W., B.C., 19/10/87.

No. 37.

The Under Secretary for Mines to Mr. W. J. Fergusson.

Sir,

Department of Mines, Sydney, 19 October, 1887.

I have the honor to inform you that the Lands Department has been asked not to validate James K. Brougham's mineral conditional purchase No. 83-56, Wilcannia, as the land in question is claimed by Renham, in virtue of his mineral license.

I have, &c.,

HARRIE WOOD,

Under Secretary.

No. 38.

No. 38.
Office Memorandum.

Wilcannia—Mineral conditional purchase, 83-56, 40 acres, portion 3, parish Picton.

THE abovementioned mineral conditional purchase was selected by James K. Brougham on 20th September, 1883. He made his declaration on 3rd November, 1886, as to improvements to the value of 30s. per acre. An inquiry, subject to the provisions of the 20th section of the Crown Lands Act of 1884, was held on 12th May last by the Land Board, who found that an expenditure of over 24s. per acre had been made upon the land, and that the conditional purchase was so far satisfactory. The land however was situated within the Albert Gold-field, proclaimed 25th February, 1881, and it having been decided that mineral conditional purchases within gold-fields were illegal, steps were about to be taken to validate it under section 3 of the Act 50 Victoria, No. 21. Mr. Fergusson, solicitor, on behalf of M. C. Renham, protested against such validation, and alleged that he (Renham) had been in possession since May, 1885, under his mineral license, and had duly fulfilled the conditions of the Act. Reference was then made to the Mines Department, and that Department has now reported as follows, by B.C. of 19th instant:—
“The Lands Department may be asked not to validate Brougham’s mineral conditional purchase, as the land in question is claimed by Renham in virtue of his mineral license, and he appears to have succeeded in an action for trespass in the Hay Circuit Court—Renham and Harper v. Martin, *vide Hay Standard* of 28th September, 1887.”

W.H.C., 26/10/87.

Before determining this matter, I should like the Mines Department to inform me of the circumstances of Renham’s application, how it has been dealt with, and its present position as to fulfilment of conditions under which the area is alleged to be held under a mineral license. The representatives of Brougham should be informed of the action being taken by Renham with regard to the mineral conditional purchase.—T.G., 28/10/87.

W. J. Fergusson and J. K. Brougham, care of T. W. Barnes & Co., informed, 29/10/87. The Under Secretary, Department of Mines, in view of Mr. Secretary Garrett’s minute of the 28th instant.—S.F. (for the Under Secretary), B.C., 29/10/87. To be returned. Mr. Warden Wyman Brown for report in terms of minute of the Secretary for Lands herewith.—G.E.H. (for the Under Secretary), B.C., 31/10/87.

No 39.

The Under Secretary for Lands to Mr. J. K. Brougham.

Sir,

Department of Lands, Sydney, 29 October, 1887.

Mineral conditional purchase, 83-56; Wilcannia; 20th September, 1883; 40 acres; J. K. Brougham.

Referring to the proposed validation of the mineral conditional purchase, noted in the margin, I am to inform you that, before determining this matter, the Secretary for Lands awaits information from the Under Secretary for Mines as to the circumstances of Mr. M. C. Renham’s application, how it has been dealt with, and its present position as to fulfilment of conditions under which the area is alleged to be held under mineral license.

I have, &c.,

STEPHEN FREEMAN

(For the Under Secretary).

No. 39½.

The Under Secretary for Lands to Mr. W. J. Fergusson.

Sir,

Department of Lands, Sydney, 29 October, 1887.

Wilcannia; mineral conditional purchase, 83-56; 20th September, 1883; 40 acres; J. K. Brougham.

Referring to your letter of the 22nd September ultimo, respecting your protest on behalf of Mr. M. C. Renham against the validation of the mineral conditional purchase, noted in the margin, I am to inform you that, before determining this matter, the Secretary for Lands awaits information from the Under Secretary for Mines as to the circumstances of Mr. Renham’s application, how it has been dealt with, and its present position as to fulfilment of conditions under which the area is alleged to be held under mineral lease.

I have, &c.,

STEPHEN FREEMAN

(For the Under Secretary).

No. 40.

T. W. Barnes & Co. to The Under Secretary for Lands.

Sir,

Wilcannia, 5 November, 1887.

M. C. P. 83-56, Wilcannia; 20th September, 1883; 40 acres; J. K. Brougham.

We are instructed by Mr. J. K. Brougham to acknowledge receipt of your letter of the 29th ultimo, having reference to the proposed validation of the mineral conditional purchase noted in the margin.

We may, perhaps, be permitted to state, in connection with Renham’s claim to occupation under mineral license, that in his evidence before the Warden, at Silverton, when an objection to his occupation of the land, lodged by Mr. Brougham’s agent, was being heard, Renham admitted that he knew the portion (No. 3, parish Picton) was a mineral conditional purchase. In point of fact, the portion had been surveyed in accordance with Mr. Brougham’s application, and a shaft sunk 10 or 12 feet before Renham ever saw the ground.

Since early in 1885, the applicant has been unable to enter on the land without being exposed to legal proceedings, and had to defend two or three actions in endeavouring to fulfil the mineral conditional purchase conditions. These conditions must be completely fulfilled before long. Outside capital is offered to develop the mine properly, which offer may lapse through delay.

We therefore earnestly beg that the applicant may be put in legal possession of the land at the earliest possible period.

We have, &c.,

T. W. BARNES & CO.

May be informed of the position of the papers as stated upon 87-52,394.—W.H.C., 18/11/87. Inform.—T.G., 19/11/87. T. W. Barnes & Co., D. O’Connor and J. Hurley.—21/11/87.

No. 41.

No. 41.

D. O'Connor and J. Hurley, Esquires, Ms.P., to The Secretary for Lands.

Dear Sir, 32 and 33, Norwich Chambers, Hunter-street, Sydney, 11 November, 1887.

Having regard to our brief interview to-day, in company with Messrs. Renham and Haley, we would thank you to have all papers and documents in reference to the case of Renham before you on Monday, at 11:30 a.m., as suggested by yourself, in order that some definite decision or understanding may be arrived at. We desire to point out that the parties above-named are here in Sydney at considerable expense to themselves, and this, with the fact that Renham has already expended a large sum of money, to say nothing of the labour and time devoted to the lease, and in the defence of action at law, he naturally feels aggrieved at what appears unnecessary delay in being placed in possession of what is generally admitted to be his lawful property.

We have, &c.,

D. O'CONNOR.

J. HURLEY.

Submit previous papers, please.—S.F., 12/11/87. Mr. N.—Please obtain papers in the mineral conditional purchase case mentioned.—W.H.C., 14/11/87. Mineral conditional purchase, 83-54, Wilcannia; Papers, 87-6,041, Cor.; 87-50,102, Department Mines.—W.T.N., 29/10/87. The Assistant Under Secretary.—14/11/87.

No. 42.

Telegram from Mr. Warden Brown to The Under Secretary for Mines.

Silverton, 11 November, 1887.

Re papers in connection with portion 3, parish Bolairo, sent here for report as to whether Renham who claims the land under mineral license has complied with the regulations. Renham is in Sydney, therefore cannot get the required information from him. If I don't inspect the land, cannot distinguish between work done by him and mineral conditional purchase claimants. What is best to be done; shall I return the papers.

WYMAN BROWN,

Warden.

Inform that he should inspect the land, and if he required Renham to give evidence as to work done, we will advise Renham on receipt of telegram from the Warden to that effect.—H.W., 12/11/87. By telegram 156, 12/11/87. See Mr. Capper's memo. on C.S. 87-51,269 Dep.—J.P.M., 16/11/87.

The papers were sent to Mr. Warden Brown on the 1st instant under the No. 87-15,286 Mines. His report is expected in about a fortnight.—W.H.C., 18/11/87.

No. 43.

Telegram from The Under Secretary for Mines to Mr. Warden Brown.

12 November, 1887.

Re papers in connection with portion 3, parish of Bolairo, sent you for report. You should inspect the land, and if you require Renham to give evidence as to work done, he will be advised on receipt of a message from you to that effect.

HARRIE WOOD,

Under Secretary.

No. 47.

H. H. Cooke, Esq., M.P., to The Secretary for Lands.

Renham v. Brougham, Broken Hill.

Sir,

Legislative Assembly, New South Wales, 25 November, 1887.

In my letter to you this morning, *re* above case, I stated, upon information supplied, that at the time of taking the mineral conditional purchase Mr. Brougham was in the Government Service. This is now shown to be a mistake, and I hasten to rectify it. To make sure about this a telegram was sent to Silverton this afternoon, and the enclosed is the reply to same. You will see by the enclosed message that Brougham the day after the selection executed a transfer, and the transfer is annexed with the paper, presumably because it was out of order and could not be completed, as Brougham is now claiming the land and stoutly contending for it. I hope you will do all you can to bring this tedious case to a close, so that the rightful owner, whoever he may be, can go on with developing the mine.

Kindly have this letter, and enclosed telegram from Welsh to Renham, placed with the papers in the case.

I have, &c.,

HENRY H. COOKE.

[Enclosure.]

Telegram from Mr. W. Welsh to Mr. M. C. Renham.

Silverton, 25 November, 1887.

BROUGHAM executed a transfer to Nickel day after selection. Transfer is now annexed to papers in Land Office. Brougham, then clerk to Kirkpatrick, Barnes, & Company, Wilcannia.

W. WELSH.

No. 48.

H. H. Cooke, Esq., M.P., to The Secretary for Lands.

Sir,

Legislative Assembly, Sydney, 25 November, 1887.

I have the honor to bring under your notice the case of M. C. Renham and the mineral land mentioned in the margin.

It appears this land was applied for in the name of J. K. Brougham, an officer of the Government at Wilcannia, as a mineral conditional purchase, on the 20th day of September, 1883, at Wilcannia Land Office. Brougham being then only 17 years of age, and therefore a minor, the mineral conditional purchase was bad. M. C. Renham took possession of the said land by virtue of a mineral license on 5th May, 1885, and afterwards as a mineral lease.

On an occasion Brougham wished to make a transfer of his alleged right to some person at Wilcannia, when it was discovered that Brougham was a minor no transfer was made.

Will you please satisfy yourself by wire of the truth or otherwise of the above statements.

Yours, &c.,

HENRY H. COOKE.

Telegraph to Mr. Chairman Tompson, and inquire whether he could hold an inquiry at Wilcannia on his return to Bourke relative to J. K. Brougham's mineral conditional purchase. The papers are with Mr. Warden Brown, from whom they might be obtained. The question is as to the age of conditional purchaser when he applied for the land.—C.O., 25/11/87.

Wire, 25/11/87. Noted, 2,134.

No. 49.

H. H. Cooke, Esq., M.P., to The Secretary for Lands.

Renham v. Brougham, Broken Hill.

Sir

Legislative Assembly, New South Wales, 25 November, 1887.

Since writing this evening another telegram from Mr. Walsh, solicitor, Silverton, to Renham, has been handed to me, and I enclose same for your information. The Kirkpatrick & Co. herein include, I am informed, the Mr. Barnes who has been writing on Brougham's behalf.

Yours, &c.,

HENRY H. COOKE.

[Enclosure.]

Telegram from Mr. E. Welsh to M. C. Renham.

Silverton, 25 November, 1887.

BROUGHAM took up land as dummy for Nickel. It was Nickel's money that paid for it. If any one other than you entitled it is Nickel. Kirkpatrick & Co. acted as agents for Nickel, and now want to keep land for themselves. If necessary can prove this.

E. WELSH.

No. 50.

Telegram from The Chairman, Land Board, Wilcannia, to The Under Secretary for Lands.

Silverton, 26 November, 1887.

In consequence of Mr. Trollope's illness, Broken Hill Court to-day had to be adjourned until next Tuesday. Doctor says he must not be moved for several days; therefore, Silverton Court on Monday must be adjourned until Wednesday, and I will be unable to leave for Wilcannia until next Saturday's coach.

G. C. TOMPSON,

Chairman.

Seen.—C.O., 28/11/87. Telegraph to Mr. Chairman Tompson.

It was supposed that the allegations in Brougham's mineral conditional purchase case was, that he was under 16 years of age when he applied; but it is found now that it is generally admitted that he was 17, and was, therefore, eligible to select. No inquiry necessary on this point. Please return papers to Mr. Wyman Brown, in order that he may complete action thereon.—C.O., 29/11/87. Wire, 29/11/87.

PLEASE arrange to hold inquiry, *re* Brougham's case, as proposed.

STEPHEN FREEMAN
(For the Under Secretary).

No. 53.

The Under Secretary for Lands to H. H. Cooke, Esq., M.P.

Sir,

Department of Lands, Sydney, 28 November, 1887.

In reply to your letter of the 25th instant, respecting the conditional purchase noted in the margin, I have the honor to inform you that the Chairman of the Local Land Board, who is at present at Silverton, has been requested to hold an inquiry into the matter, and that officer has intimated that he will do so on the earliest possible date.

I have, &c.,

F. H. WILSON,
(For the Under Secretary).

Mineral conditional purchase, 83-56; Wilcannia; 20th September, 1883; 40 acres; J. K. Brougham.

No. 54.

Telegram from The Under Secretary for Lands to The Chairman, Local Land Board, Silverton.

Sydney, 29 November, 1887.

It was supposed that the allegations in Brougham's mineral conditional purchase case was that he was under 16 years of age when he applied, but it is found now that it is generally admitted that he was 17, and was therefore eligible to select. No inquiry necessary on the point. Please return papers to Mr. Wyman Brown in order that he may complete action thereon.

STEPHEN FREEMAN
(For the Under Secretary.)

No. 55.

T. W. Barnes & Co. to The Under Secretary for Lands.

Sir,

Wilcannia, 31 January, 1888.

Referring to your letter of 29th October last, advising the applicant for the mineral conditional purchase, noted in the margin, that an inquiry would be held by the Mines Department into the circumstances of Mr. M. C. Renham's claim to hold the same area under mineral license, we have recently been given to understand by Mr. Warden Wyman Brown that he has been unable to hold such inquiry owing to the continued absence from the Silverton district of Mr. Renham.

We had requested the Warden to give us notice of when the inquiry would be held, but have had only the above communication from him on the matter.

We may here state that, until the 7th June, 1885, it would appear that Mr. Renham had never been upon the land, as, on the evening of that day he made inquiries at the Broken Hill Mine as to the locality of the portion. On the following morning he pegged out the land and applied for a mineral lease in the names of Renham and Harper.

We had instructed an agent in Silverton, by letter dated 5th June, 1885, to apply for a mineral lease of the portion in the names of J. K. Brougham, A. Kirkpatrick, and T. W. Barnes. Our agent received this letter on the forenoon of the 7th, and incautiously communicated its contents to a Mr. Welsh (who has since had charge of all the legal proceedings as Renham and Harper's solicitor). Previous to Renham's mineral lease application a shaft had been sunk on the land some 9 feet, and arrangements made with a contractor for the further sinking; Renham and Harper's application, however, stopped the work, pending Departmental action. In March, 1886 (Renham being at the time not in occupation of the land), the applicant, Mr. Brougham, put on men to continue the sinking of the shaft. Some days afterwards Renham returned to the land and ordered the men off. On their refusal to move, Renham summoned them for trespass, but was non-suited by the Warden on April 16th, 1886. An appeal was then lodged by him, and heard at Minindie by Judge Backhouse, who decided in his favour.

As the period within which the applicant must fulfil the conditions of the mineral conditional purchase will shortly expire, and, as under the present circumstances, he is precluded from working on the land unless he renders himself liable to legal proceedings on the part of Mr. Renham, we have the honor to request that notices be served on both parties, and an inquiry into the matter held at an early date.

We have, &c.,

T. W. BARNES & CO.

No. 56.

M.C.P. 83-56; Wilcannia; 20/9/83; 40 acres; J. K. Brougham; portion 3, parish Picton, county Yancowinna.

No. 56.

Mr. P. F. Richardson to The Secretary for Lands.

Sir,

No. 1, Spring-street, 2 February, 1888.

I reference to Mr. M. C. Renham's application for a mineral lease at Silverton, about which I spoke to you yesterday, I have the honor to request your early attention to the case, and as the papers have been recalled from the Warden on Mr. Cooke's representation to you that there was sufficient evidence in the papers to prove my client's claim, I would respectfully submit that the matter be so dealt with by you on its merits. Mr. Renham is in Sydney, and is prepared to be examined on oath, if necessary, and to give any further information that may be required. Without going into the merits of the case *in extenso*, I desire to call your special attention to the following facts:—

Mr. Renham held the ground under mineral license in May, 1835, before the Supreme Court decision was given that the mineral conditional purchases were not legal on gold-fields, and he applied for a mineral lease, on 8th June, 1835.

He has already proved his claim in the District and Supreme Courts, and the defendants have never appealed against it.

Brougham applied for a refund of the deposit on his mineral conditional purchase which shows that he had no expectation of getting it, and it was only when the ground was likely to prove valuable that he revived his claim.

From the first Brougham was acting in the interest of Nickel (Mr. Renham's partner), as will be seen from the fact that he transferred it immediately to that person, but the transfer could not be ratified owing to Brougham being under age.

Since my interview with you, I find Mr. Barnes, who is acting as agent for Brougham, is in Sydney, and wishes to have the cases reopened before the Warden's Court, which I most strongly protest against, as it would be most unfair to put my client to further delay, trouble, and expense, when he has twice proved his title to the land in question. Mr. Salomon's opinion is that cases such as this cannot be affected by Mr. Copeland's Mineral Conditional Purchase Validating Bill.

I have, &c.,

PHILLIP F. RICHARDSON.

Register. Put with papers, and submit case as soon as possible.—T.G., 2/2/88. Mr. Capper. Papers, 88-422, Cor, sent to Under Secretary, 1/2/88.—J.P.M., 2/2/88. Papers herewith.

After carefully considering the conflicting statements made by the rival claimants in this case, I have arrived at the conclusion that the most satisfactory course to pursue will be to refer the case to the Local Land Board to be fully investigated, all the parties interested being summoned to appear and produce any evidence they may deem proper. The Board meets at Silverton early in April, and therefore there will be ample time for each claimant to collect the necessary information in support of their respective claims. It would not be in accordance with the law to hold an inquiry except within the Board district in which the land is situated.—C.O., 4/2/88.

It is pointed out that Mr. Renham is responsible for the delay which has occurred, as, had he attended before the Warden as desired, the case would no doubt have been long since disposed of.—C.O., 6/2/88.

Approved.—T.G., 6/2/88. Parties may have copies of papers on usual terms if applied for without delay.—T.G. P. F. Richardson and T. W. Barnes & Co. informed, 6/2/88.

No. 57.

The Under Secretary for Lands to T. W. Barnes & Co.

Gentlemen,

Department of Lands, Sydney, 6 February, 1888.

Wilcannia,
M.C.P., 83-56;

Memo. from Mr. W. J. Fergusson to The Secretary for Lands.

RENHAM's application for mineral lease, in opposition to Brougham's mineral conditional purchase, Wilcannia.—Will you keep these papers in your office till Friday next, when I would like the Minister to appoint a time I could interview him on the matter.

Yours, &c.,

Papers 88-443 Cor. now herewith, going to Local Land Board to-day.—J.P.M., 7/2/88. May the papers be retained in this office as desired by above memo.—W.H.C., 7/2/88. The Assistant Under Secretary. Are the papers still to be retained here?—W.H.C., 6/3/88. The Assistant Under Secretary.—S.F., 6/3/88.

The enclosed papers, referring to the mineral conditional purchase quoted in the margin are forwarded to the Chairman of the Local Land Board, whose attention is specially directed to Minister's minute of 6th ultimo as to a full investigation of the case, and all parties interested summoned to appear and produce any evidence they may deem proper.—F.H.W. (for the Under Secretary), B.C., 9/3/88. The Chairman, Local Land Board, Bourke.

See action on outside paper.—L.B.D., 88-927.

Decision of the Land Board, Silverton.

Crown Lands Act of 1884—(Part II, section 14, sub-section 4).

New South Wales, }
to wit. } Mineral Conditional Purchase, 83-56, James Kennedy Brougham.

WHEREAS on the 17th and 18th days of April, 1888, it became a matter for investigation before us as to the fulfilment of the conditions of the Act on mineral conditional purchase, 83-56, being portion 3 of 40 acres in the parish of Picton, county of Yancowinna, made by James Kennedy Brougham, at Wilcannia, on the 20th September, 1883, and having taken evidence and inquired into the said matter, we find that the conditional purchase was not made for the exclusive use and benefit of the applicant, and recommend that the conditional purchase be declared forfeited.

Given under our hand, at the Local Land Board, at Silverton, in the Colony of New South Wales, this 18th day of April, 1888,—

G. C. TOMPSON, Chairman.
FRED. TROLLOPE, Member.

[Enclosures.]

Crown Land Act of 1884—(Part II, section 14, sub-section 1).

New South Wales, }
to wit. } Caption to Deposition of Witnesses.

THE examination of Thomas William Barnes, of Wilcannia, in the Colony of New South Wales, commission agent; James Kennedy Brougham, of Broken Hill; Patrick May, of Broken Hill; James MacClure, of Broken Hill; Julius Nickel, of Silverton; Otto Fischer, of Broken Hill; and Hugh Patterson, of Broken Hill, in the said Colony.

WHEREAS it hath been necessary to inquire into the application of James Kennedy Brougham for mineral conditional purchase, 83-56, being portion 3, parish of Picton, county of Yancowinna, and it hath been found necessary to investigate the said matter on oath, the depositions of the several witnesses are appended hereto.

G. C. TOMPSON,
Chairman.

THIS deponent, *Thomas William Barnes*, of Wilcannia, in the Colony of New South Wales, commission agent, being duly sworn, maketh oath and saith as follows:—

By Mr. Thonson: I know land forming subject of this inquiry, portion 3, parish of Picton; in September, 1883, I paid some money on account of it; I paid James Kennedy Brougham the sum of £20; that was to apply for the land within boundaries of portion 3, parish of Picton, county of Yancowinna, as a mineral conditional purchase, that was to pay deposit; I saw this land first on 18th May, 1885; I was in company with Patrick May; prior to 18th May, 1885; Kirkpatrick, Barnes & Co. had made an arrangement with Brougham to acquire an interest in this land; as a party interested I gave directions on that day—18th May; after inspecting the ground I instructed Arthur Hawson to sink a shaft on the land; he was working in neighbourhood at time; I asked him to give me an estimate of cost; in pursuance of this no work was done when I next saw land; it was subsequently jumped; he did not make arrangement for work to be proceeded with owing to Renham and Harper claiming land; we started work afresh in March, 1886; Matherson and Arnheim, as our agents, employed MacClure and Mason; sank a shaft of 25 feet; they received £2 a foot; I am not clear about their doing anything further; there was £5 expended in addition to this.

By Board: The shaft had been sunk certain depth, and 25 feet was in addition to this.

By Mr. Thonson: Top of shaft was secured with Mulga timber; that timber has since been removed; do not know by whom; I was, or my men MacClure and Mason, were sued in April, 1886, by Renham in Warden's Court; complaint was dismissed; Renham, on appeal, got a verdict for ls. and costs; on that occasion we failed to produce proof of mineral conditional purchase application; since then no work has been done; we were afraid to go on the ground; a man named Martin, whom Renham afterwards sued, and against whom a verdict was passed, had no connection with us; I did not lodge an objection to Martin's application.

By Mr. Welsh: In September, 1883, I was carrying on business with Alfred Kirkpatrick, under names of Kirkpatrick, Barnes, & Co., of Wilcannia, commission agents; Mr. Kirkpatrick also claims interest in the land on arrangement between us and James Kennedy Brougham; on 20th September, 1883, Brougham was a clerk in the employ of Kirkpatrick, Barnes, & Co.; he was with us about a year after; am not quite sure; forget when he left; I was in Land Office when Brougham made application; I was requested, or my firm was requested, to apply for this land, as a mineral conditional purchase, by Frank Hawson, for himself; I presume he did not state for whom; my firm had not special instructions from Hawson to select land for Julius Nickel; I cannot recollect if I had instructions to select on behalf of any specific individual at all; received instructions

instructions from Mr. Hawson by letter; he was residing 150 miles from Wilcannia; Brougham did not, on my instructions, execute a transfer to Julius Nickel on date of selection; that is my signature; that is also my signature to affidavit of verification; the first signature is to papers 83-24,649 C. S. Department to Lands; these documents were prepared by my instructions; at the time this selection was taken up by Brougham I think ten other blocks were taken up—ten blocks now known as Round Hill property, under instructions from Hawson; I received instructions from Hawson; they were to be for certain persons in whose names they were to be transferred; I received the names subsequently to the instructions; it appears I received instructions previously to transfer, which was executed in pursuance of instructions received from Mr. Hawson; on 20th September, 1883, I had no interest in this land beyond Brougham taking it up; I first became personally interested in this land about August, 1884; my partner and myself at the same time, by arrangement, with Brougham; this land was not selected by Jas. K. Brougham on 20th September, 1883, on his own behalf, and not with his own money—with my firm's money; I acted as agent for Hawson in taking up the land, and Brougham acted for the firm; Mr. Brougham is present to-day; I got description from Hawson of the land; Brougham, Kirkpatrick, and myself certainly claim free from any agency or trusteeship.

By Mr. Jhonson: We were in first place told by Hawson to take it up, and were afterwards told by him to keep it; at that time knew of nobody beneficially interested in the land but Hawson.

By Mr. Welsh: I know transfer was executed to Julius Nickel, but know of no subsequent arrangements; received no legal document from Hawson with regard to transfer.

By Mr. Jhonson: Mr. Hawson told me by letter.

By Board: At time Brougham applied in September, 1883, do not know if there were any improvements on the land; Brougham sunk 25 feet in a hole, but do not know who sank that hole; saw land first time on 18th May, 1885, portion 3, parish Pictou, county Yancowinna; there was a hole, apparently commencement of a shaft silt in bottom; it might be 6, 8, or 9 feet deep; value it £1 10s. a foot, total value of £9 or £10; Brougham sunk 25 feet in same hole, cost of sinking the 25 feet, £50; the shaft was sunk with a view to fulfilling our conditions for mining purposes; portion was measured at the time this shaft was in the lode; there are several lodes there; it might be 250 feet from north-west corner of portion in south-east direction, on western side of hill; if hill is correctly shown on plan, it would be about centre of block; there might have been small trench, but I am not sure; no other improvements on there that I know of; I walked all over it; improvements to value of £50 and £5 expended, but cannot specify for what before expiry of three years from date of application; cannot speak about timber at head of shaft; no more improvements put on since, on account of decision given at Menindie by Judge Backhouse; Brougham has been prevented from completing improvement; final declaration not made; five years not expired.

THOS. W. BARNES.

G. C. TOMPSON, Chairman.
FRED. TROLLOPE, Member.

THIS deponent, *James Kennedy Brougham*, of Broken Hill, in the Colony of New South Wales, sharebroker, being duly sworn maketh oath, and saith as follows:—

By Mr. Jhonson: I was the applicant for mineral conditional purchase, 83-56, made at Wilcannia on 20th September, 1883; it was a personal application, by instructions from Mr. T. W. Barnes; he gave me the money to pay the deposit; I was 18 years of age then; on same date I signed transfer, produced, of this land to Julius Nickel; this was done by direction of Mr. Barnes.

By Mr. Welsh: I had received instructions from Mr. Barnes, who had been instructed by Hawson; I selected this land for myself, and for no one else that I was aware of at the time; I repudiate the allegation that I took it up as agent or trustee for anyone else or as the servant of anyone else; I took up this land, and it is mine; that is position I take up to-day; it was Mr. Barnes who gave me the money; I had no interest in the money; I first became interested in 1884 in the money by which the land was taken up; previous to this I had no interest in the moneys; I did not understand what the transfer was; Mr. Barnes asked me for my signature, and I gave it; I cannot remember if I understood from Mr. Barnes at the time of making application that it was for anyone else; was under the impression at time it was for myself; I did not know where land was when I selected; I got the description from Mr. Barnes; in the description it says, beginning a peg marked J N; I did not know what J N meant; I did not understand Mr. Barnes to make me a present of the money; I understood it to be a loan; the time of loan was not given; did not understand it was for any time; I cannot remember when my mind was first disabused of idea that it was a loan; I have seen Mr. Julius Nickel; would not know him if I saw him; I have met him; he has claimed this land from me within the last two months, and requested me to transfer it to him; I cannot remember what amount he offered to pay, but he offered me a bag of sovereigns; he may have offered to pay all expenses in connection with land in writing; I do not know what the document was he gave me; I said on that occasion I should have to consult my partners to see whether I should transfer it or not; I meant Kirkpatrick and Barnes by my partners; I now repudiate the right of Mr. Julius Nickels to this land; transfer was not registered, because I was a minor; I can't say if I have repudiated this transfer to Mr. Nickel; I never wrote to Mr. Nickel repudiating it; I am 23 on 5th August; I became of age in 1886; I have only seen Mr. Nickel once in my life; within last two months, when he offered me the sovereigns; I heard Mr. Barnes' evidence; I heard Mr. Barnes swear that I took it up as agent for firm who was agent for Hawson; it is not true.

By Mr. Jhonson: In making this application for mineral conditional purchase and signing transfer to Nickel I acted merely by direction of Mr. Barnes; in making application knew no one to be connected with it except Mr. Barnes; in signing transfer to Nickel did not know Nickel to be interested in any way in this claim; I never knew Nickel to be interested in this claim till he came to me about two months ago; previous to that occasion Nickel had never made any demand upon me in any shape with regard to this land; I merely accepted the money to make the application as directed by Mr. Barnes at time of making application; I was doing as Mr. Barnes told me, and using his money.

By Board: That is my application 83-56, and that is my signature; it is dated 20th September, 1883; land since measured and numbered portion 3, parish of Pictou, county of Yancowinna, shown by red edging on tracing marked exhibit A, after selecting the land; it was eighteen months ago I first saw it; I did not give any instructions to effect improvements on land; left it to Mr. Barnes; I know shaft is there as I have seen it; I know that shaft, 25 feet deep, was sunk on that land for mining purpose, value, £2 a foot; value, £50; have put no improvements on since then; at end of first term of three years I believe Mr. Barnes made declaration; I left everything to Mr. Barnes; that is my declaration produced, dated 3rd November, 1886; that is to the effect that mining operations to the extent of £1 10s. per acre, other than gold-mining, had been effected on land; declaration is No. 36,257 of 87, Department of Lands.

THIS deponent, *Patrick May*, of Broken Hill, in the Colony of New South Wales, miner, being duly sworn, maketh oath and saith as follows:

By Mr. Jhonson: I know portion 3, parish of Pictou; I visited the land about 18th May, 1885, in company with Mr. Barnes and two other gentlemen; there were two holes down, one 5 or 6 feet deep and one 4 or 5, and a little costeaning; I know a man named Maclure; I saw him working there afterwards; he was sinking a shaft; I think a continuation of one of the holes; depth was sunk to about 30 feet deep, I think.

By Board: I think Maclure put a shaft down for Mr. Barnes; I should say £2 to £2 5s. a foot for it; I never saw any other improvements beyond those mentioned; cannot state value of costeaning; there would be 9 or 10 feet of costeaning a foot deep.

THIS

THIS deponent, *James Maclure*, of Broken Hill, in the Colony of New South Wales, miner, being duly sworn, maketh oath and saith as follows:—

By Mr. Jhonson: I know portion 3, parish of Picton; I worked on it in early part of 1886, in March, I think; I was instructed to do the work by Matherson and Arnheim; work consisted of sinking a shaft 25 feet deep; I did not start from surface, but in a shaft sunk 5 feet before; it was near the middle of claim; I was paid £2 a foot for the work; I had a man named Mason assisting me; when I went on to the ground beyond these holes there was a little costeaning 8 or 10 feet, and 18 inches deep, perhaps; the costeaning was about a day's work for one man.

By Board: Have not seen ground lately; twelve months ago when I last saw land; only the shaft I put down on it; that shaft near the costeaning, about a chain south of it; I cannot say exact date I completed the improvements; cannot state date; I commenced some time in March or April; I was working part of March and April; commenced March and completed in April, 1886; I was paid £2 a foot; £50.

By Mr. Welsh: I am not sure of the date; I was working when sued in Warden's Court; I worked about a week after the proceedings in the Warden's Court; I was here when judgment was given in Warden's Court; I was working after that.

By Board: No other improvements beyond the one shaft and costeaning.

JAMES MACLURE.

THIS deponent, *Julius Nickel*, of Silverton, in the Colony of New South Wales, mine owner, being duly sworn, maketh oath, and saith as follows:—

By Mr. Welsh: I know the land now known as portion 3, parish of Picton, the subject of this inquiry; in 1883 I held a mineral license; I have looked for license and cannot find it; very early in the month of September, 1883, I was in possession of this land on my mineral license; in early part of September I discovered a silver lode on the land; I communicated having made discovery to Tom Hawson, Tom Purcell, and others; I became interested with other parties in ten adjoining blocks; Mr. Frank Hawson, of the Nine-mile, was instructed to get mineral conditional purchases of these eleven blocks made—as to ten blocks on behalf of myself and others, as to the eleventh, portion 3, on behalf of myself only; these ten blocks were to be paid by Frank Hawson in consideration of being let in as a partner; the ten blocks were duly selected and transferred to self and friends; I did not get a registered transfer of portion 3; got no transfer at all; during September and afterwards had a man working on this land for me—Otto Fischer, now sharebroker, Broken Hill; I never consented to Mr. Brougham obtaining a mineral conditional purchase of this land for himself; I never gave up my right under mineral license to anyone but Otto Fischer; I gave him half of it—a half share; some time before Christmas of 1883 I heard that transfer could not be executed from Brougham to me; I have lately applied to Mr. Brougham to transfer to me about two months ago; I offered to pay all moneys he had expended on the ground; tendered him 200 sovereigns; he said he could not accept, he would have to consult his partners; since September, 1883, Mr. Brougham has never sent me any document repudiating the transfer he signed on 20th September; I was not aware that Mr. Brougham has taken position that he had selected this land on his own account; I have filed a suit in Equity against Messrs. Kirkpatrick, Barnes, and Brougham to compel them to transfer to me.

By Mr. Jhonson: I never made any demand upon Brougham with regard to this land until about two months ago.

By Board: It was about 20th September it was taken up; improvements on the land—shaft, costeaning, 9 or 10 feet deep, an open trench running along the surface, value at about £50; I know of no shaft being put down by Brougham; I do not know of myself of a shaft being put down.

JULIUS NICKEL.

THIS deponent, *Otto Fischer*, of Broken Hill, in the Colony of New South Wales, sharebroker, being duly sworn, maketh oath, and saith as follows:—

By Mr. Welsh: I know portion 3, parish of Picton, subject of this inquiry; I knew it end of September, 1883—about the end of September, might have been first week in October; I was employed by Mr. Nickel to work there for him; he gave me a share; I worked there till first week in December; I dug the shaft between 9 or 10 feet; it would fill up by being let alone; have seen where shaft has been put down since; about 30 feet as near as I can tell.

By Board: I went to work about beginning of October, 1883; there were no improvements on land at that time; the shaft was put down an extra 20 feet; saw the land six or eight months ago; there were a couple of shafts about 6 or 8 feet on the land when I saw it last; I only looked at the one; I can't say as to value of two other shafts 6 or 8 feet deep; the costeaning I did must have been 20 feet long, and another trench 20 feet—40 feet altogether.

No. 87.

The Under Secretary for Mines to The Under Secretary for Lands.

Sir, Department of Mines, Sydney, 9 May, 1888.

With reference to Brougham's mineral conditional purchase, 83-56, recommended for forfeiture by the Local Land Board at Silverton, on the 17th ultimo, I have the honor to request that the papers (87-16,870, Mines), in connection with this matter, which were forwarded from this Department to the Department of Lands, on the 30th December last, may be returned to this Department if they can be spared.

I have, &c.,
GERARD. E. HERRING
(For the Under Secretary).

No. 88.

The Chairman, Local Land Board, Bourke, to The Under Secretary for Lands.

Sir, Local Land Board Office, Bourke, 10 May, 1888.

Appeal enclosed.

With reference to the enclosed appeal, lodged by Mr. James Kennedy Brougham against the decision of the Wilcannia Land Board, in finding that the conditional purchase, 83-56, of 40 acres, made by him at Wilcannia on the 20th September, 1883, was not made for the exclusive use and benefit of the applicant, and recommending that the conditional purchase be declared forfeited, I have the honor to inform you that section 37 of the Crown Lands Regulations of 1880, states that conditional purchases for mining purposes shall be subject to all the conditions set forth in the foregoing sections, 1 to 10. Section 2 states that conditional purchases must be for the exclusive use and benefit of the applicant, &c.

The evidence clearly showed that the land was not taken for the exclusive use and benefit of the applicant.

I have, &c.,
G. C. TOMPSON,
Chairman.

[Enclosure.]

Sir,

As agents for Mr. James Kennedy Brougham we enclose notice of appeal to the Minister from decision of the Local Land Board at Silverton on the 18th ultimo, with respect to mineral conditional purchase, 83-56, Wilcannia, 40 acres, 20th September, 1883.

A remittance of £10 will be forwarded to-morrow by telegraph to the Commercial Bank, Bourke, in your favour as security for costs of this appeal. The irregularity of the mails at present, as shown by the non-arrival of to-day's mail, renders this course advisable, as the next mail to Bourke might not reach you with a bank draft within the prescribed time.

The Chairman, Local Land Board, Bourke.

We have, &c.,
T. W. BARNES & CO.

Receipt forwarded to James Kennedy Brougham, care of T. W. Barnes & Co., 10/5/88.

Crown Lands Act of 1884—(Part II, section 17).

Notice of appeal to the Minister from decision of Local Land Board to be lodged with the Chairman.
New South Wales, }
to wit.

WHEREAS on the 17th day of April, 1888, a certain matter, wherein an inquiry as to the fulfilment of the conditions of the Act on mineral conditional purchase, 83-56, applied for by myself on the 20th September, 1883, at Wilcannia (40 acres), came before the Local Land Board at Silverton, in the Colony of New South Wales, for report, I being a party to such proceeding, and the said Board, after having inquired into the premises, decided that the forfeiture of said mineral conditional purchase be recommended, the land not having been taken up for the sole benefit of the applicant: And whereas I am dissatisfied with such decision, and intend to appeal therefrom to the Minister. These are, therefore, to give you notice of my intention to appeal as aforesaid, and I herewith tender the sum of £10 as security for the costs of such appeal. And the grounds of such appeal are annexed.

JAMES KENNEDY BROUGHAM.

To the Chairman of the Local Land Board at Bourke.

Received the sum of £10 referred to above by wire. Commercial Bank, Chairman, credit public moneys account.
8th May, 1888.

G. C. TOMPSON,
Chairman, 10 May, 1888.

Grounds of Appeal.

THAT I made a *bona fide* selection of the land, and expended the required amount in improvements within the first three years which mining improvements could have been proceeded with had I not been prevented by hostile occupation.

That in consequence of a mineral conditional purchase not being subject to the conditions of residence the Regulation No. 2, Chap. II. of Regulations published in the *Government Gazette* of 29th May, 1880, does not apply to this case.

No. 89.

Receipt.

New South Wales, 10 May, 1888.

RECEIVED from James Kennedy Brougham, care of T. W. Barnes & Co., the sum of ten pounds sterling, on account of Notice of Appeal to the Minister from decision of the Local Land Board.

G. C. TOMPSON,

Chairman, Local Land Board, Bourke.

£10.

Received by wire.

Receipt.

New South Wales, 14 May, 1888.

RECEIVED from James Kennedy Brougham, the sum of ten pounds sterling, on account of second Notice of Appeal to the Minister, from decision of Land Board, M.C.P. 83-56, Wilcannia.

G. C. TOMPSON,

Chairman, Land Board, Bourke.

£10.

Care of T. Jhonson, Esq., Solicitor, Silverton.

No. 91.

The Chairman, Local Land Board, Bourke, to The Under Secretary for Lands.

Sir,

Land Board Office, Bourke, 14 May, 1888.

I have the honor to forward herewith second appeal lodged by James Kennedy Brougham, against decision of the Silverton Land Board, and to refer you to my communication of 10th instant, enclosing first Appeal. M.C.P., 83-56
Wilcannia.

I have, &c.,

G. C. TOMPSON.

[Enclosure.]

Crown Lands Act of 1884—(Part II, Section 17.)

Notice of Appeal to the Minister from decision of Local Land Board, to be lodged with the Chairman.
New South Wales, }
to wit.

WHEREAS on the 18th day of April, 1888, a certain matter being an inquiry as to the fulfilment of the conditions of the Crown Lands Alienation Act of 1861, on mineral conditional purchase, 83-56, applied for by me on 20th September, 1883, at Wilcannia, came before the Local Land Board at Silverton, in the Colony of New South Wales, for decision, I, being a party to such proceeding, and the said Board, after having inquired into the premises, decided that they would recommend that the said mineral conditional purchase should be declared forfeited on the ground that it was not made for the exclusive use and benefit of the applicant: And whereas I am dissatisfied with such decision, and intend to appeal therefrom to the Minister. These are, therefore, to give you notice of my intention to appeal as aforesaid, and I herewith tender the sum of £10 as security for the costs of such appeal. And the grounds of such appeal are annexed.

JAMES KENNEDY BROUGHAM

(By his Attorney,—THOMAS EDWARD JHONSON,
Solicitor, Silverton).

To the Chairman of the Local Land Board, at Bourke.

Received the sum of £10 referred to above.

G. C. TOMPSON,
Chairman.

Bourke, 14 May, 1888.

Grounds of Appeal.

1. That the within mentioned decision was against the evidence.
2. That the within mentioned mineral conditional purchase was valid.
3. That on the evidence the said Board should have decided that the conditions of the Crown Lands Alienation Act of 1861, in respect of the said mineral conditional purchase had been complied with by the applicant.

JAMES KENNEDY BROUGHAM

(By his Attorney,—THOMAS EDWARD JHONSON,
Solicitor, Silverton).

Office Memorandum.

Wilcannia—Mineral Conditional Purchase, 83-56 ; 40 acres, portion 3 ; James K. Brougham.

21 May, 1888.

THE facts of this case up to 26th October last are set out in my *précis* of that date on papers 87-50,102, Department. In view of the facts then brought forward, Mr. Secretary Garrett desired to be informed by the Mines Department of the circumstances of Renham's application, how it had been dealt with, and the conditions under which the area was alleged to be held under a mineral license. The papers were thereupon transmitted to the Under Secretary for Mines, by whom they were forwarded to Mr. Warden Brown for report. On 22nd November last the Warden, by telegraph (87-59,285*d*) reported that he could get no one to point out the work done by the respective claimants, and in view of this report the papers were recalled by the Under Secretary for Mines and returned to this Department. Numerous letters for and against the conditional purchase application having been received from the interested parties, Mr. Secretary Garrett decided, on 2nd February last, to refer the case to the Land Board, with a view to a full investigation being held, and all the parties interested being summoned to appear and produce any evidence they might deem proper. In view of this decision the papers were transmitted to the chairman on 9th March last, and on 17th and 18th ultimo the case was fully investigated by the Board, who found that the mineral conditional purchase was not made for the exclusive use and benefit of the applicant, and they therefore recommended it for forfeiture. At this inquiry the following witnesses were examined:—T. W. Barnes, J. K. Brougham, Patrick May, James Maclure, Julius Nickel, Otto Fischer, and Hugh Patterson. With the view of showing the grounds upon which the Board have made their recommendation, the following digest from the evidence is given:—At page 1 of the deposition, T. W. Barnes states that he paid the selector (Brougham) the sum of £20 to apply for the land in question, and prior to 18th May, 1885, Kirkpatrick, Barnes, & Co. had made an arrangement with selector to acquire an interest in the land. At page 4, he states that he, or his firm, was requested to apply for the land, as a mineral conditional purchase, by Frank Hawson, who instructed him by letter; but he could not recollect if he had instructions to select on behalf of any specific individual. And with reference to the transfer, he states at page 5 that it was executed in pursuance of instructions received from Hawson, from whom he (Barnes) subsequently received the names of the persons to whom the mineral conditional purchase was to be transferred. At page 6 he states that the land was not selected by Brougham on his own behalf, and the money was supplied by the firm of Kirkpatrick, Barnes, & Co. He (Barnes) acted for Hawson in taking up the land, and Brougham acted for the firm of which Barnes was a member. The selector (Brougham) in his evidence, at page 9, states that he applied for the land by direction of Mr. Barnes, who supplied him with the money to pay the deposit, and on day of selection he signed a transfer of the land to Julius Nickel, also by direction of Mr. Barnes. This transfer was not passed, as Brougham was a minor. He also stated he selected the land for himself, and for no one else that he was aware of, and he repudiated the allegation that he took it up as agent or trustee for any other person, or was the servant of any one else. At page 10 he states he had no interest in the money given him by Barnes, and he did not know where the land was situated when he selected, but he got the description from Mr. Barnes. He did not understand what the transfer was, but when Mr. Barnes asked him for his signature he gave it. He could not remember if he understood from Mr. Barnes at the time of making the application that it was for any one else, but was under the impression at the time it was for himself (Brougham); and at page 11 he states he did not understand Mr. Barnes to make him a present of the money, but understood it to be a loan, although the time of loan was not given. He could not remember when his mind was first disabused of the idea that it was a loan. Nickel claimed the land, and offered him (Brougham) some money to pay the expenses, but Brougham would not accept it, and said he would have to consult his partners (meaning Kirkpatrick and Barnes). He afterwards repudiated the right of Nickel to the land. At page 13 he states that in selecting he was doing so by direction of Mr. Barnes, whose money he was using, and he did not give any instructions to effect improvements, but left it all to Mr. Barnes. The mining improvements made in connection with the conditional purchase he valued at £50, being a shaft 25 feet deep, at £2 per foot (page 14). James Maclure, in his evidence (page 17), states that he sunk a shaft under instructions from Matherson and Arnheim.

Julius Nickel, in his evidence (page 25), states that he has filed a suit in Equity against Kirkpatrick, Barnes, and Brougham to compel them to transfer to him. He (Nickel), at page 19, states that early in September, 1883, he discovered a silver lode and communicated his discovery to other parties with whom he became interested in eleven blocks. A person named Frank Hawson was instructed to get mineral conditional purchases for these eleven blocks, ten of which were on behalf of himself (Nickel) and others, and the other, being the portion in question, on behalf of himself (Nickel) alone. The ten blocks were to be paid for by Hawson in consideration of being taken in as a partner (page 20).

Two appeals by Brougham against the decision of the Board have now been received, and special attention is drawn to the chairman's letter of the 10th instant (88-19,018 Dep.).
The Under Secretary.

W.H.C., 21/5/88.

J. Hurley, Esq., M.P., to The Secretary for Lands.

Dear Sir,

Legislative Assembly, Sydney, 22 May, 1888.

I shall feel deeply obliged if you will cause me to be supplied with a copy of the evidence and decision of the Local Land Board, taken and delivered at Silverton, on the 18th April last, in the case of Brougham and party *versus* Renham and party.

In the cause of justice and equity I should like to have this at once, for Renham and party have been subjected to great loss of time and expense in regard to their property, and it is high time they were placed in full possession.

I am, &c.,

JOHN HURLEY.

The

The copies asked for may be supplied on the usual terms.—T.G., 23/5/88. Let me have the papers, please, to-day.—S.F., 23/5/88. Mr. De Low. Cannot trace in this Branch.—R.H.D., 23/5/88. The Assistant Under Secretary. A conditional purchase case.—R.H.D. Are the papers conditional sales?—S.F., 23/5/88. Yes. They are now attached.—W.H.C., 23/5/88. The Assistant Under Secretary. Mr. Smith to copy.—S.F., 23/5/88. Papers copied.—J.A.R., 25/5/88. A notice has been sent to Mr. Hurley informing him that the copies are ready and that he may obtain them upon forwarding 16s. 8d., the cost of the copying.—J.A.R., 26/5/88.

APPEALS (2) by James K. Brougham, against the proposed forfeiture of his mineral conditional purchase, 83-56, Wilcannia.

THE facts of the case are set forth in the accompanying *précis* by Mr. Capper.

F.H.W., 5/6/88.

J. K. Brougham (care of T. W. Barnes & Co., Wilcannia) informed that Court will be held on 26th instant.—F.H.W., 8/6/88.

Appellant, care of T. W. Barnes & Co., and respondent, care of W. J. Fergusson, Esq., informed in each case of decision.—7/7/88.

No. 95.

Mr. T. W. Barnes to The Under Secretary for Lands.

Sir,

Wilcannia, 6 June, 1888.

Referring to the decision of the Honorable the Minister for Lands, given on the 2nd instant, in the appeal against the proposed forfeiture of the mineral conditional purchase noted in the margin, we have the honor to request, as agents for the applicant, that you will inform us as to Mr. Brougham's present position in connection with this matter, that is to say—Is it the intention of the Minister to validate the mineral conditional purchase?

As the balance of the mining improvements, sufficient to comply with the conditions, must be completed by the 22nd of September next, and as Mr. Brougham is naturally desirous of knowing how he stands before incurring further expenditure, we must beg the favour of a reply as early as possible.

We have, &c.,

T. W. BARNES & CO.

No. 96.

Telegram from The Under Secretary for Lands to Mr. T. W. Barnes.

Sydney, 23 June, 1888.

In reply to your telegram, Appeal Court adjourned until Monday, 2nd proximo.

STEPHEN FREEMAN,

Minister's Decision.

Crown Lands Act of 1884—(Part II, section 18).

Decision of Minister on a Case of Appeal from Local Land Board.

New South Wales. }
to wit. }

WHEREAS, on the 18th day of April, 1888, a certain matter wherein the fulfilment of the conditions by J. K. Brougham upon his mineral conditional purchase 83-56, Wilcannia, came on for investigation and adjudication before the Local Land Board at Silverton, Colony of New South Wales, and the said Board decided that the said conditional purchase was not made for the exclusive use and benefit of the applicant, and recommended that it be declared forfeited, and J. K. Brougham, one of the parties thereto, appealed from such decision to the Minister, and the said matter having this 2nd day of July, 1888, come before me, Thomas Garrett, on appeal, I, being the Minister charged with the administration of the Crown Lands Act of 1884, having heard the said appeal in open Court, do hereby decide as follows:—That the 9th clause of the Crown Lands Acts Amendment Act of 1875 does not apply to mineral conditional purchases, and I therefore sustain the appeal, and order the deposit lodged therewith to be refunded.

Given under my hand, at the Department of Lands, Sydney, this 2nd day of July, 1888,—

THOMAS GARRETT,

Minister.

No. 99.

No. 99.

Minister's Decision.

Crown Lands Act of 1884—(Part II, section 18).

Decision of Minister in a Case of Appeal from Local Land Board.

New South Wales, }
to wit. }

WHEREAS, on the 18th day of April, 1888, a certain matter wherein the fulfilment of the conditions by J. K. Brougham, upon his mineral conditional purchase, 83-56, Wilcannia, came on for investigation and adjudication before the Local Land Board, at Silverton, Colony of New South Wales, and the said Board decided that the said conditional purchase was not made for the exclusive use and benefit of the applicant, and recommended that it be declared forfeited, and J. K. Brougham, one of the parties thereto, appealed from such decision to the Minister, and the said matter having this 2nd day of July, 1888, come before me, Thomas Garrett, on appeal, I, being the Minister charged with the administration of the Crown Lands Act of 1884, having heard the said appeal in open Court, do hereby decide as follows:—That the 9th clause of the Lands Acts Amendment Act, 1875, does not apply to mineral conditional purchases; and I therefore sustain the appeal, and order the deposit lodged therewith to be refunded.

Given under my hand, at the Department of Lands, Sydney, this 2nd day of July, 1888,—

THOMAS GARRETT,
Minister.

[Enclosure.]

J. K. Brougham.—Appeal against the proposed forfeiture of his mineral conditional purchase, 83-56, Wilcannia.—(Two Appeals).

AFTER due inquiry, the Board found that the said purchase was not made for the sole use and benefit of the applicant, and recommended that it be declared forfeited. Mr. Pring appeared for the appellant. Mr. W. J. Fergusson appeared to support the finding of the Board. The Minister decided that the 9th section of the Crown Lands Acts Amendment Act, 1875, did not apply to mineral conditional purchases, and therefore sustained both appeals. He also refused to submit the point to the Supreme Court, as requested by Mr. Fergusson. Deposit to be refunded.

B. J. ATTERBURY,
2nd July, 1888.

No. 100.

P. F. Richardson, Esq., to The Secretary for Lands.

Sir,

No. 1, Spring-street, Sydney, 4 July, 1888.

Wilcannia,
J. K. Brougham,
M.C.P. 83-56.

I have the honor to protest against the mineral conditional purchase of J. K. Brougham, noted in the margin, for the following reasons:—

1. A mineral conditional purchase, taken up on a proclaimed gold-field is, by the decision of the Supreme Court, illegal, and, therefore, null and void *ab initio*.
2. Sufficient improvements as prescribed by the Act, have not been effected during the first three years by the applicant on the land in question, and the amount stated by him is incorrect, as the work done could be carried out for nearly half the sum he claims to be allowed for.
3. The said J. K. Brougham being a minor, and having no status in the eyes of the law, could not take up the land as an agent, or in any interest but his own, as he was not in a position to transfer or otherwise deal with the property; and that this was attempted to be done is clearly shown by the papers, while his evidence before the Local Land Board at the recent inquiry is so unreliable and contradictory that he stands self-condemned of attempting to retain the land in question under false pretences, and to defraud those who are justly, legally, and equitably entitled thereto.

In conclusion, I have no hesitation in submitting these points to your most careful consideration, feeling certain that in the interests of justice you cannot uphold the mineral conditional purchase application in question.

I have, &c.,

PHILIP F. RICHARDSON.

Put with papers and submit case.—T.G., 5/7/88.

No. 101.

Final Declaration.

F.

[Alienation Act, 1861.]

Declaration of conditional purchaser for mining purposes.

I, JAMES KENNEDY BROUGHAM, of Broken Hill, do solemnly and sincerely declare that I am the lawful owner, by conditional purchase, of the land hereunder described, and that an expenditure equal to £2 5s. per acre for the area of the land has been made on mining operations other than gold-mining on the land, and since the selection in Wilcannia, on the 20th September, 1883, and I make this solemn declaration, conscientiously believing the same to be true, and by virtue of the provisions of an Act made and passed in the ninth year of the reign of Her present Majesty, intituled "An Act for the more effectual abolition of oaths and affirmations taken and made in various departments of the Government of New South Wales, and to substitute declarations in lieu thereof, and for the suppression of voluntary and extrajudicial oaths and affidavits."

Description.

County of Yancowinna, parish of Picton, 40 acres, being conditional mining purchase No. 56, of 1883, in the district of Wilcannia (late Mitchell).

Taken and declared, at Broken Hill, this 31st day }
of August, 1883, before me,— }

JAMES KENNEDY BROUGHAM.

JUSTIN M'CARTHY,

Commissioner for Affidavits.

Entered, &c.—H.R., 19/9/88. J.R.Y.

No. 103.

No. 102.

Office Memorandum.

Wilcannia—Mineral conditional purchase, 83-56, 40 acres, portion 3—James K. Brougham.

THE facts of this case are set out in my *précis* of 28th May last, since which date the appeal referred to therein was heard before Mr. Secretary Garrett, who decided that the 9th clause of the Lands Acts Amendment Act of 1875, did not apply to mineral conditional purchases. He therefore sustained the appeal, and ordered the deposit lodged therewith to be refunded.
The Under Secretary.

W.H.C., 31/10/88.

Has the conditional purchase been validated; I cannot trace the *précis* of 26th October, 1887, referred to in minute of 23th May.—S.F., 31/10/88. *Précis* of 26th October, 1887 (50,102 D.) now indicated by tab.

The mineral conditional purchase has not been validated; objections to validation have been raised, and the Mines Department have asked that it be not validated. See *précis*, 26th October, 1887.—W.H.C., 1/11/88. The Under Secretary.

No. 103.

Office Memorandum.

Conditional purchase, 83-56, 40 acres, portion 3, Section 19, Act of 1861—James K. Brougham. Claimed by M. C. Renham, under mineral lease.

THE main questions for consideration in this case apparently are:—

- 1st. Should the conditional purchaser, being the first applicant for the land, be upheld in his title, by the validation of same under section 3 of the Act 50 Vic. 21, provided he can satisfy the Minister that he has duly complied with the requirements of the law in regard to mining expenditure, and
- 2nd. Has Renham such a claim to consideration as would justify the establishment of his title in preference to Brougham's.

The papers do not disclose positive proof as to either Brougham's or Renham's mining expenditure, beyond a statement by the former in his evidence before the Local Land Board, on 17th April, 1888, that a shaft had been sunk at a cost of £50. Mr. Surveyor Tuxen in his report of 16th April, 1888—papers, 88-17,523 D.—states that mining expenditure to the extent of £124 19s, had been incurred. He does not mention by whom, so that in the absence of proof, as to date, value, and nature of such mining expenditure, and of the interest (*i.e.*, whether Brougham's or Renham's) in which it was incurred, it is hardly possible to fully determine in what direction the strongest claim exists.

Submitted therefore as to whether the case should be forwarded to the Local Board for an exhaustive inquiry in the direction indicated, and with directions to notify all persons interested of the date and nature of the investigation.

S.F., 3/11/88.

Mr. Secretary Bruncker will remember informing Mr. Fletcher, M.P., and Mr. Renham, that he would give no decision in this case until Mr. Fletcher had an opportunity of representing the case from Renham's point of view.—S.F.

The submission may be adopted. Important interests are involved. Consequently desirable that the fullest information should be elicited, and the circumstances connected with the holding, more explicitly stated before giving a final decision. A full and searching inquiry before the Local Land Board ought to be the most effective means of ascertaining the facts.—J.N.B., 9/11/88.

MINERAL LICENSE TAKEN UP BY MICHAEL CHARLES RENHAN, PARISH OF PICTON

No. 1.

Application by M. C. Renhan and C. Harper.

Mineral Lease Regulations.—Schedule 2.

To the Honorable the Secretary for Mines, Sydney,—

Silvertown, 8 June, 1885.

Sir,
We hereby make application for a mineral lease of that piece or parcel of land, situated about 20 miles south-east of Silvertown, in the parish of Picton, county of Yankowinni, and being surveyed portion No. 3, said parish and county, containing 40 acres, of which we took possession on the 8th day of June, at the hour of 7 o'clock in the forenoon, for the purpose of mining thereon and therein for silver and lead for a period of twenty years, erecting posts and digging trenches at each angle thereof. The datum point is situated at the north-west corner of said portion.

Notice of our intention to make this application will be given in accordance with the regulations in that behalf. We hand herewith £10, being the first year's rent in advance of the said land.

We hereby acknowledge that this application is made upon the distinct understanding and condition that if we shall abandon or fail to proceed with it, or if it is refused, the Secretary for Mines for the time being may deduct from the sum of £10 deposited as aforesaid any cost to which, in his opinion, the Crown may have been put in or about or in respect of this application; and this application shall thereupon become and be void, and the possession aforesaid shall cease and determine. And if the lease shall be granted we shall and will commence mining operations upon or in connection with the demised land within one month from and after the granting thereof, and shall and will employ upon such land not less than three men during the first six months of the term thereby created, and not less than four men during the remainder of such term. And shall and will at any time when called upon in terms of the regulations relating to mineral leases to do so, execute, and take delivery of such lease, or failing therein for a period of fourteen days, after being so called upon, we shall and will forfeit the said sum of £10, and all right, title, or interest in and to the said land and the possession thereof, and the said lease shall be forthwith cancelled.

We have, &c.,

MICHAEL CHARLES RENHAN,
Silvertown.CHARLES HARPER,
Silvertown.

The address of the applicants is care of William Welsh, solicitor, Silvertown. We are satisfied with the survey as marked on the ground.

This application was received by me this 8th day of June, 1885, at the hour of 4 o'clock in the afternoon, and is numbered 1,028.—JOHN SAUNDERS, Warden's Clerk.

[Enclosures.]

Application No. 1,028, at Silvertown, for a Mineral Lease.

1. By whom application was received? Warden's clerk.
2. At what place? Silvertown.
3. Date and hour when received? 8th June, 1885, at 4 p.m.
4. Receipt for first year's rent, No. 609? 8th June, 1885.
5. To whom receipt was issued? Michael Charles Renhan and another.
6. Date when notice to survey was sent to Surveyor? Land previously surveyed as portion No. 3, parish of Picton.
8. Names of objectors, and dates on which they lodged their objections? Thomas William Barnes, 22nd June, 1885.
9. Dates of inquiry? 2nd July, 1885.
11. Is the land applied for exempted from leasing under the 34th section of the Mining Act, 1874? Claimed by objectors as a mineral conditional purchase.
12. Is the time proposed for commencing work reasonable? Yes.
13. Is the number of men proposed to be employed reasonable? Yes.

WYMAN BROWN,
Warden.

Questions to be answered by Applicants to lease.

WHEN receiving an application to lease land for mining purposes, the warden, warden's clerk, or an agent, as the case may be, shall require the applicant or applicants, or his or their agent, to answer the following questions, and shall take down such answers in writing. The statement, when complete, to be read over to, and signed by, the person furnishing the answers:—

3. What was the date and hour of the day when you took possession of the land referred to in application No. 1,028? This land has been held by the applicant, Michael Charles Renhan, under mineral license, since the 5th of May, 1885. Possession for the purpose of application to lease was taken on the 8th June, 1885, at 7 a.m.
4. Did you take possession by erecting posts and cutting trenches at each angle of the land? Yes.
If No. 4 be replied to in the affirmative, then 5, 6, and 7.
5. What was the diameter of the posts? 3 inches.
6. How high did they project above the surface when fixed in the ground? 3 feet.
7. What was the length of each arm of each trench, and what was the depth of each trench? 6 feet long and 9 inches deep.
9. At which angle of the land was the datum post fixed? North-west.
10. Did you affix a board or metal plate to the datum post? Notice signed by warden's clerk.
11. What was written or painted on each notice? Mineral lease applied for by Michael Chas. Renhan and another—
Application 1,028.

12.

12. Where did you post the notices Schedule 1? Warden's office, Silverton, and post office, Mount Gipps.
 13. When did you post such notices? 9th June, 1885.
 14. Did anybody claim or appear to be in possession of the land applied for, or any portion of it? No.

I, Michael Charles Renhan, on behalf of self and partner, declare that the foregoing questions have been answered by me truthfully in every particular, and the answers thereto have been read over to me and are correctly taken down in writing.

Witness to signature,—

JOHN SAUNDERS,
 Warden's Clerk.

M. C. RENHAN.

In this case it is admitted the holder under mineral conditional purchase has done no work since the mineral conditional purchase was made, in September, 1883. It is also in evidence that, on the 5th May last, the applicant to lease pegged out this land under his mineral license, but there is no evidence that he did any work on the land. Unless it be decided to validate such mineral conditional purchases as this, it will probably be necessary to take further evidence, and the application might therefore stand over till the course to be pursued in regard to mineral conditional purchases has been decided.—H. W., 13/7/85. Submitted. Approved.—J. P. ABBOTT, 14/7/85.

No. 2.

Application by M. C. Renhan and C. Harper.

Mineral Lease Regulations.—Schedule 6.

Notice of Application and Deposit.

Sir,

Silverton, 8 June, 1885.

We have the honor to inform you that we have this day deposited with Warden's clerk, at Silverton, the sum of £10, being the first year's rent, in advance, of 40 acres of land, near Silverton, for the purpose of mining for silver and lead. The number of our application is 1,028.

We have, &c.,

M. C. RENHAN.
 CHAS. HARPER.

The Under Secretary for Mines, Sydney.

Land previously surveyed as portion No. 3, parish of Picton, county of Yancowinna.

[Enclosures.]

I, THE undersigned, on behalf of myself and partners (Alfred Kirkpatrick and James Kennedy Brougham), do hereby give notice that I object to the application, No. 1,028, of Renhan and Harper, for a mineral lease of survey portion No. 3, parish of Picton, being registered for the following reasons:—

That the land applied for has hitherto been held by us as a mineral conditional purchase in the name of James Kennedy Brougham.

That as soon as we became aware of the decision of the Supreme Court that the mineral conditional purchases on a gold-field are illegal, I instructed an agent to apply promptly for a mineral lease of the land in the names of my partners and myself.

That notwithstanding our agent's action in the matter, was as prompt as possible, the application in our behalf was lodged one quarter of an hour after that of Renhan and Harper.

That no means have been neglected by myself and partners to secure our title to the land in a legal manner when the illegality of our former title from the Crown Lands Department became apparent.

And I hereby require the Mining Registrar to withhold the registration of the application of the said Renhan and Harper, pending the hearing of this objection by the warden.

Dated this 17th day of June, 1885.

THOS. W. BARNES, Objector.

(By his attorney, T. JOHNSTON, Solicitor, Silverton).

Warden's Court, Silverton.

Before Mr. Warden Brown.

Objection of Thos. W. Barnes to granting of land comprised in mineral lease application No. 1,028 to M. C. Renhan and another. Mr. Johnson appears for objector. Mr. Welsh, applicant. Objector's deposit receipt produced.

Thomas William Barnes, being duly sworn, saith:—I am the objector in this case on behalf of self, Alfred Kirkpatrick, and James Kennedy Brougham; I know the land in dispute; it is surveyed portion No. 3, parish of Picton; this land was taken up as a mineral conditional purchase by Brougham, on 20th September, 1883; it has been held by us as a mineral conditional purchase until the 8th June last, and I still claim under that title; hearing that the mineral conditional purchase titles were illegal, I instructed my agent to apply for a mineral lease of this portion.

Examined by Mr. Welsh:—Mr. John Brougham is my agent; since this land was taken up in September, 1883, no work has been done by us.

Taken and sworn before me, at Silverton, }
 this 2nd July, 1885,—

THOS. W. BARNES.

WYMAN BROWN, Warden.

John Brougham, being duly sworn, saith:—I was agent on the 8th June last for Barnes, Kirkpatrick, and Brougham, and by instructions received from them applied for a mineral lease of the land in dispute; I complied with all the regulations; I took possession of it about 9 a.m. of 8th June, 1885, and made the application between 4 and 5 p.m. of the same day; on the 17th served the applicants with notice of this objection.

Examined by Mr. Welsh:—Before pegging off this land on the 8th I saw other pegs and trenches; before making application I was told that a previous one had been lodged for this land; I did not serve the other applicants with notice in the form of Schedule.

Taken and sworn before me, at Silverton, }
 this 2nd July, 1885,—

JOHN BROUGHAM.

WYMAN BROWN, Warden.

Michael

Michael Charles Renhan, being duly sworn, saith:—I am one of the applicant's for this land, and produce my mineral license; I know the land in dispute; on the 8th June I marked it off, in accordance with the regulations, about 7 a.m., and applied for a lease of it on the same day; I got a notice from the Warden's clerk to post on the land; I put it there on the 10th; about the 5th May last I marked off this land by virtue of my mineral license.

Taken and sworn before me, at Silverton, }
this 2nd July, 1885,—

M. C. RENHAN.

WYMAN BROWN, Warden.

Minute on foregoing.

I am of opinion, from taking all the surrounding circumstances connected with this case into consideration, that the objection should be upheld, and would recommend that mineral lease application No. 1,028 should be refused.—WYMAN BROWN, Warden.

No. 3.

Application by Mr. A. Kirkpatrick.

Mineral Lease Regulations.—Schedule 2.

To the Honorable the Secretary for Mines, Sydney,—

Sir,

Silverton, 8 June, 1885.

We hereby make application for a mineral lease for twenty years of that piece or parcel of land situated about 18 miles south-east of Silverton, containing 40 acres, of which we took possession on the 8th day of June, at the hour of 9 o'clock in the forenoon, for the purpose of mining thereon and therein for silver and lead; post and trench at each angle thereof. The datum point is the north-west angle of area applied for, and being mineral conditional purchase No. 3, parish of Picton.

Notice of our having made this application will be forthwith given in accordance with the regulations in that behalf, and we hand herewith a list of the persons who occupy or claim a right to the land aforesaid, or any part thereof, together with such consents as we have obtained. We also hand herewith the sum of £10, being the first year's rent in advance of the said land, to cover the cost of survey.

We hereby acknowledge that this application is made upon the distinct understanding and condition that if we shall abandon or fail to proceed with it, or if it is refused, the Secretary for Mines for the time being may deduct from the sum of £10 deposited as aforesaid any cost to which, in his opinion, the Crown may have been put in or about or in respect of this application; and this application shall thereupon become and be void, and the possession aforesaid shall cease and determine. And if the lease shall be granted we shall and will commence mining operations upon or in connection with the demised land within one month from and after the granting thereof, and shall and will employ upon such land not less than two men during the first three years of the term thereby created, and not less than four men during the remainder of such term. And shall and will at any time when called upon in terms of the regulations relating to mineral leases to do so, execute and take delivery of such lease, or failing therein for a period of fourteen days, after being so called upon, we shall and will forfeit the said sum of £10, and all right, title, or interest in and to the said land and the possession thereof, and the said lease shall be forthwith cancelled.

We are satisfied with the land as surveyed.

We have, &c.,

ALFRED KIRKPATRICK, Wilcannia.

THOMAS WM. BARNES, Wilcannia.

JAMES KENNEDY BROUGHAM, Wilcannia.

(By their Agent, JOHN BROUGHAM).

This application was received by me this 8th day of June, 1885, at the hour of 4.10 o'clock in the afternoon, and is numbered 1,029.—JOHN SAUNDERS, Warden's Clerk.

[Enclosures.]

Application No. 1,029, at Silverton, for a Mineral Lease.

1. By whom application was received? Warden's clerk.
2. At what place? Silverton.
3. Date and hour when received? 8th June, 1885, at 4.10 p.m.
4. Receipt for first year's rent, No. 610? 8th June, 1885.
5. To whom receipt was issued? Alfred Kirkpatrick and two others.
6. Date when notice to survey was sent to surveyor? Land previously surveyed as portion No. 3, parish of Picton.
11. Is the land applied for exempted from leasing under the 34th section of the Mining Act, 1874? This land was held by applicants as a mineral conditional purchase.
12. Is the time proposed for commencing work reasonable? Yes.
13. Is the number of men proposed to be employed reasonable? Yes.

WYMAN BROWN,
Warden.

Questions to be answered by Applicants to lease.

WHEN receiving an application to lease land for mining purposes, the Warden, Warden's clerk, or an agent, as the case may be, shall require the applicant or applicants, or his or their agent, to answer the following questions, and shall take down such answers in writing. The statement when complete, to be read over to, and signed by, the person furnishing the answers:—
In regard to an application for a gold lease:—

3. What was the date and hour of the day when you took possession of the land referred to in application No. 1,029? 8th June, 1885, at 9 a.m.
 4. Did you take possession by erecting posts and cutting trenches at each angle of the land? Yes.
- If No. 4 be replied to in the affirmative, then 5, 6, and 7.
5. What was the diameter of the posts? 3 inches.
 6. How high did they project above the surface when fixed in the ground? 3 feet.
 7. What was the length of each arm of each trench, and what was the depth of each trench? 6 feet long and 9 inches deep.
 9. At which angle of the land is the datum post fixed? North-west. 10.

10. Did you affix a board or metal plate to the datum post? Notice signed by Warden's clerk.
11. What was written or painted on such notice? Mineral lease applied for by Alfred Kirkpatrick and Thomas William Barnes, and another application, 1,029.
12. Where did you post the Notices Schedule 1? Warden's office, Silvertown, and post office, Mount Gipps.
13. Where did you post such notices? Silvertown, 8th June, 1885, and Mount Gipps, 9th June, 1885.
14. Did anybody claim or appear to be in possession of the land applied for, or any portion of it? The present applicants have held this land as a mineral conditional purchase.

I, John Brougham, on behalf of Alfred Kirkpatrick, Thomas William Barnes, and another, declare that the foregoing questions have been answered by me truthfully in every particular, and the answers thereto have been read over to me, and are correctly taken down in writing.

JOHN BROUGHAM.

Witness to signature,—

JOHN SAUNDERS,
Warden's Clerk.

Notice of Application and Deposit.

Sir,

Silvertown, 8 June, 1885.

We have the honor to inform you that we have this day deposited with Warden's clerk, at Silvertown, the sum of £10, being the first year's rent in advance of 40 acres of land near Silvertown for the purpose of mining for silver and lead, being the fees for survey of the said land. The number of my application is 1,029.

We have, &c.,

ALFRED KIRKPATRICK.

THOS. WM. BARNES.

JAMES KENNEDY BROUGHAM.

(By their Agent, JOHN BROUGHAM).

The Under Secretary for Mines, Sydney.

Land previously surveyed as mineral conditional purchase, No. 3, parish of Picton. Returned for signature of the applicants.—G.E.H. (for the Under Secretary). Warden's clerk, Silvertown.—G.E.H. (for the Under Secretary), B.C., 16/6/85. Notice, duly signed, is herewith returned to this Department.—JOHN SAUNDERS, Warden's clerk, 2/7/85.

No. 5.

Mr. W. Welsh to The Secretary for Mines.

Re Lease Application No. 1,028.

Sir,

Silvertown, 7 July, 1885.

I have the honor to request that, as attorney for the applicants, I may be furnished with a copy of Mr. Warden Brown's report in the matter of an inquiry held by him on the 2nd July instant, upon the application of Messrs. Michael Charles Renhan and Charles Harper for a mineral lease of portion 3, parish of Picton, county of Yancowinna, and the objections thereto of Messrs. Barnes and others. My reason for making this request to you is that I have already applied to Mr. Brown for such copy and he declines to furnish same, stating that his reports are confidential between him and yourself, and that he will not furnish copies thereof to anyone.

I think I need hardly point out that in this Mr. Brown holds an erroneous idea. I enclose a copy of the application made by me to Mr. Brown, and beg to request the favour of an early reply to this communication.

I have, &c.,

WM. WELSH.

[Enclosure.]

Sir,

Silvertown, 1 July, 1885.

I have the honor to request that you will be good enough to furnish me a copy of your report to the Secretary for Mines in the matter of the application, objections, evidence, and recommendation in the matter of the application of Michael Charles Renhan and Charles Harper for a mineral lease, No. 1,028, under the 47th section of the Mining Statute.

I shall be happy to pay any fees payable thereon.

I have, &c.,

WM. WELSH.

Wyman Brown, Esq., Warden, Silvertown.

The copy may be supplied. Forward through the Warden, who will collect and transmit the fee.—H.W., 22/7/85. Copy of decision sent to Warden, 27/7/85. Telegram to Mr. Welsh, No. 1,174, 27/8/85. Mr. Neate, 29/8/85.

No. 6.

The Under Secretary for Mines to Mr. Warden Brown.

Sir,

Department of Mines, Sydney, 27 July, 1885.

Mr. William Welsh, solicitor of Silvertown, having applied, on behalf of Messrs. Renhan and Harper, for a copy of your report in the matter of the inquiry held by you with reference to mineral lease application No. 1,028, Silvertown, and the objection by Messrs. Barnes and others to the granting of same, I have the honor to forward you a copy of your decision, which is to be supplied to Mr. Welsh on payment of 1s. 6d., which you will be good enough to cause to be collected, and to remit to this office.

I have, &c.,

HARRIE WOOD,

Under Secretary.

Postage stamps for 1s. 6d. herewith.—WYMAN BROWN, Warden, Silvertown, 28/8/85. Postage stamps, 1s. 6d.—G.E.H., 4/9/85. H.T.

No. 7.

No. 7.

Mr. W. Welsh to The Under Secretary for Mines.

Sir,

Silverton, 31 August, 1885.

I have the honor to acknowledge, with thanks, receipt of your telegram of the 27th instant, informing me that I could obtain copy of the Warden's decision in the case of the objections to Renhan's and Harper's application for lease, No. 1,028.

I have since obtained copy of the decision, by which I observe that the Warden reports as follows:—"I am of opinion, from taking all the surrounding circumstances connected with this case into consideration, that the objection should be upheld, and would recommend that mineral lease, No. 1,028, should be refused."

In the first place I am at a loss to understand what the expression, taking all the surrounding circumstances connected with this case into consideration, means. Again, there were four objections of Barnes & Co., to the application to the following purpose:—

1. That the land applied for had hitherto been held by objections as a mineral conditional purchase in the name of James Kennedy Brougham.
2. That as soon as objectors became aware of the decision of the Supreme Court the mineral conditional purchases on a gold-field were illegal, an agent was instructed to apply promptly for a mineral lease.
3. That, notwithstanding the prompt action of said agent, he was a quarter of an hour too late in lodging application.
4. That objectors had done their best to secure a title in a legal manner, when the illegality of the former title became apparent.

The Warden in his report says that he considers that the objection should be upheld without specifying which one. Is it because the land was presumed to be held as a mineral conditional purchase, or is it because the objectors were too late in taking possession of the ground legally, and that, therefore, the last ought to be first. If it is upon the first ground I must say that after the well considered judgment of the Supreme Court of this Colony, that there could be no such title as a mineral conditional purchase upon a gold-field, except for land originally demised under the Mining Statute.

I do not see how such an objection can be sustained; and as to the other objection, they are perfectly untenable. I may, however, observe that it was proved in evidence that my clients held the land in question under mineral license since the 5th day of May last, nearly a month before the Supreme Court gave their decision as to the illegality of mineral conditional purchases upon gold-fields, and such being the case, I cannot see how they can be deprived of their legal rights under the Mining Statute. Under the Mineral License Regulations, persons wishing to raise ore from land held thereunder, are obliged to apply for a lease under a penalty of forfeiting their mineral license title, and yet in the face of that provision it is attempted to say, "Yes, you are bound to apply for a lease, but it is of no avail your doing so, inasmuch as from surrounding circumstances we think we are entitled to decide as we like upon the matter."

I may also state that James Kennedy Brougham, in whose name the land was taken up as a mineral conditional purchase, was, and still is, an infant under age; I cannot, therefore, see how he could either transfer any rights to the other objectors or be himself an applicant for a lease under the Mining Statute, as he could not legally execute any lease if granted to him.

Hoping that the application of Messrs. Renhan and Harper will be dealt with upon its merits and those only.

I have, &c.,

WM. WELSH,

Attorney for Messrs Renhan and Harper.

P.S.—May I call attention to the facts admitted by objectors that although they held this land for nearly two years they never did any mining thereon whatever. Is it for such people that the so-called equitable discretion of the Crown is to be exercised.

WM. WELSH.

Mr. Welsh may be informed of the decision in this case on 85-7,573.—H.W. Submitted, 19/9/85. Approved.—J.P.A., 21/9/85. Informed, 24/9/85.

No. 8.

The Under Secretary for Mines to Mr. W. Welsh.

Sir,

Department of Mines, Sydney, 24 September, 1885.

Referring to your letter of the 31st ultimo, in which you take exception to the decision of the Warden in the case of the objections by Messrs. Barnes and others to mineral lease application, No. 1,028, at Silverton, by Messrs. Renhan and Harper, I am directed by the Secretary for Mines to inform you that the question of mineral conditional purchases on gold-fields has been under consideration, and it is thought that this case should be allowed to stand over until the course to be pursued in regard to such purchases has been decided on.

I have, &c.,

HARRIE WOOD,

Under Secretary.

No. 9.

Mr. T. W. Barnes to The Under Secretary for Mines.

Sir,

Wilcannia, 5 April, 1886.

I have the honor to apply for a refund of the sum of £5, lodged as a deposit, with my objection to mineral lease application, No. 1,028, Silverton, by Michael Charles Renhan and Charles Harper, on the 22nd June, 1885.

I have, &c.,

THOS. W. BARNES.

An

An objection was lodged by T. W. Barnes, for himself and others, to the granting of mineral lease application, 1,028, Silverton (Renhan and Harper). This application has not been refused (see 85-7,573), but the matter is to stand over till the course to be pursued in regard to mineral conditional purchases on gold-fields has been decided. Submitted as to whether the refund may be made until the objection has been finally dealt with.—W.R.C., 13/4/86.

No. Inform, 13/4/86. H.W., 14/4/86. Informed, 15/4/86.

No. 10.

The Under Secretary for Mines to Mr. T. W. Barnes.

Sir,

Department of Mines, Sydney, 15 April, 1886.

Referring to your letter of the 5th instant, in which you apply for a refund of the sum of £5 lodged as a deposit, with your objection to mineral lease application, No. 1,028, Silverton, by Michael Charles Renhan and Charles Harper, I have the honor to inform you that the question of the refund must stand over until the matter of mineral conditional purchases on gold-fields has been decided.

I have, &c.,

HARRIE WOOD,

Under Secretary.

No. 11.

J. P. Abbott, Esq., M.P., to The Secretary for Mines.

Sir,

Wentworth Court, Elizabeth-street, Sydney, 30 April, 1886.

On the 20th September, 1883, James Kennedy Brougham made an application at Wilcannia for 40 acres of land as a mineral conditional purchase, the number of such application being 83-56.

Subsequently the land so applied for was surveyed as portion 3, in the parish of Picton, county of Yancowinna.

It would appear that on the 25th February, 1881, a large area of land had been proclaimed as the Albert Gold-field, and within that gold-field the land applied for by Mr. Brougham is situated.

The title of Mr. Brougham to the 40 acres was assumed to be made under the provisions of the 19th section of the Crown Lands Alienation Act of 1861, and until the end of August, 1885, the Department of Lands allowed all applications similar to that of Mr. Brougham to be effective and valid, and in so acting the Department was guided by the opinion of Mr. Justice Faucett, who was Solicitor-General when he gave the opinion so far back as 1863, so that the practice of permitting the making of mineral conditional purchases on gold-fields has been sanctioned by the Department of Lands for twenty-two years.

In June, 1885, in the case of *Wood v. Scott*, reported in volume 6, New South Wales Law Reports, page 83, the Supreme Court held that a conditional purchase under the 19th section of the Crown Lands Alienation Act of 1861 could not be made within a gold-field.

Consequently, upon that decision, the titles of many persons to land held by them became involved, and, amongst others, that of Mr. Brougham.

However, to secure his title to the land so selected he, on the 8th June, 1885, authorized an application to be lodged, in due form, with the Warden, for a lease of the 40 acres, in the names of himself, Alfred Kirkpatrick, and John Brougham. This application was lodged at 10 minutes past 4 p.m., and, on inquiry, it was found that Michael Charles Renhan and Charles Harper had made a prior application for the same land, on the same day, at 4 p.m.

I would most respectfully point out that the application for the mineral conditional purchase was bad and invalid *ab initio*, and the applicant is now entitled to demand his money back from the Government, under any and all circumstances, and, failing the return of the same, he can sue for its recovery.

By the lease applications it would appear that Brougham took possession of the land at 9 a.m. on the 8th June, 1885, whilst Renhan and Harper took possession at 7 a.m. on the same day. This being so, there can be no doubt that Renhan and Harper's application, in point of time, is before that of Brougham; and as they were in possession when Brougham took possession, Brougham's application was bad.

But I would submit, as an act of justice, that Mr. Brougham's party should be sustained; and the land secured to them, as the holders of the mineral conditional purchase (which the Lands Department permitted and encouraged); or since that was a bad title, and never had any effect, I have the honor to request that it may be ignored so far as Mr. Brougham is concerned, and as an act of justice both applications for lease should be refused, and that Mr. Brougham should have the first notice of the refusal, so as to allow him to secure the land which, in all honesty, is his property.

I have, &c.,

J. P. ABBOTT.

At an inquiry held by the Warden into an objection lodged by T. W. Barnes against the application, No. 1,028, of Messrs. Renhan and Harper, it was elicited that no work had been done on the mineral conditional purchase by the person who claimed it from the date of application to purchase, 20th September, 1883, till the date of inquiry, 2nd July, 1885. It was in evidence at that inquiry that Renhan, about the 5th May, 1885, took possession of this same parcel of land in virtue of his mineral license, but no evidence was given as to whether he performed any work upon the land in virtue of such possession. The late Minister in his decision (on 85-7,573), approved of further evidence on this point being taken, unless it should be decided to validate such mineral conditional purchase, as the one herein referred to. So far it has never been proposed to validate such a mineral conditional purchase as this. Before complying with the request contained in this letter, it will be necessary to decide that no further inquiry need be made into, and no further notice need be taken of Renhan's alleged title in virtue of his mineral license.—H.W., 1/5/86. Submitted.

[Enclosure.]

[Enclosure.]

I, JOHN BROUGHAM, of Silvertown, agent, do hereby make oath that on the 7th day of June, 1885, I received a letter from Thomas William Barnes, of Wilcannia, informing me of a certain decision of the Supreme Court of New South Wales, affecting mineral conditional purchases on a gold-field, and instructing me to peg out and apply for mineral lease of surveyed portion 3, parish of Picton, county Yancowinna, which hitherto had been held as mineral conditional purchase 8,356, Mitchell, by James Kennedy Brougham in partnership with the said Thomas William Barnes and Alfred Kirkpatrick, and which still stands on the books of the Department of Lands in the name of the said James Kennedy Brougham. That subsequent to the receipt of letter of instructions aforesaid, I saw William Welsh, of Silvertown, attorney-at-law, and knowing that he was interested in certain mineral conditional purchases, I communicated to him the contents of said letter in strict confidence. That when I reached said portion 3, on the morning of the 8th June, 1885, at 9 o'clock, I found the claim had been freshly pegged, and on reaching the Warden's office, at Silvertown, the same afternoon, at 4.10, I found that mineral lease application 1,028 had been lodged by Michael Charles Renhan in the names of himself and Charles Harper, at 4 o'clock of the same day. The above facts were stated by me in evidence before Mr. District Court Judge Backhouse in the mining appeal case, Renhan and Harper v. M'Clure and Mason, for trespass, heard at Menindie on the 10th May, 1886.

Taken on oath, at Wilcannia, this 13th day of }
May, 1886, before me,—

JOHN BROUGHAM, SENR.

J. W. FORSTER, a Commissioner for Affidavits.

Has the appeal been decided, and how? If we have no information, ask Warden Brown.
Urgent.—H.W., 23/. Telegram 297 to Mr. Warden Brown, 23/6/86. Remind.—G.E.H. (for
Under Secretary), 13/7/86. Reminded, 15/7/86. Submitted, 24/7/86.

[Enclosure.]

Messrs. Abbott and Allen, Wentworth Court, Sydney,

Ardmore, Wilcannia, 13 May, 1886.

Dear Sirs,

I have delayed acknowledging receipt of your telegram of 29th ultimo from various causes, and have now to advise you that I have, within the last few days, ascertained how Renhan and Harper became possessed of the information which led them to jump our claim, portion 3, parish of Picton, on Monday, 8th June, 1886. Mr. John Brougham, the agent whom I instructed by letter on the 5th of that month, to peg the land and apply for a mineral lease, received my communication on Sunday afternoon, the 7th, and has now confessed that he saw a Mr. Welsh, solicitor, of Silvertown, shortly afterwards, and incautiously informed him (in confidence, knowing that Welsh was interested in certain mineral conditional purchases) of the decision of the Supreme Court, and even told him that he would apply next day for a mineral lease on behalf of his son, Kirkpatrick, and myself, of our mineral conditional purchase. It appears Welsh took advantage of this information, and started Renhan same evening to peg the land. Of course Brougham found next morning, when he arrived on the ground, that he had been frustrated in pegging; but he ran Renhan very close with the application at the Warden's office, being only 10 minutes behind him. In consequence of our having started work about the middle of last March, in order to fulfil the mineral conditional purchase conditions, the men were summoned by the jumpers for trespass, and the case was heard by Mr. Warden Brown, at Silvertown (Renhan and Harper v. M'Clure and Mason), on the 13th April. The jumpers then claimed to have held the land in the first place as a mineral prospecting area, and Renhan swore that he took possession according to regulations, on 5th May, 1885, and that he worked regularly until 8th June following, when he applied for a mineral lease. Harper has figured in several cases in connection with Renhan, in which Welsh has been mixed up, and Renhan was examined by our solicitor, and by the Warden, as to the actual existence of such a person. He stated that he had never seen Harper and did not know him, except through Welsh. He would not swear that Harper and Welsh were not identical. The jumpers failed to satisfy the Warden that the regulations had been complied with by them, either as regards the mineral license title or the mineral lease application, and were consequently nonsuited, with costs. They then gave notice of appeal, which was heard at Menindie, on Monday last, the 10th instant, before District Court Judge Backhouse. Renhan's evidence was substantially the same as at the Warden's Court. My own evidence proved that I was twice on the land on the 18th May, 1885, having gone there with Hawson and others to arrange about the sinking of a shaft. I visited the four corners of the portion on that day, in company with Hawson, and there were certainly no posts, trenches, nor notice-board at any of them; in fact, no marks but the survey pegs and trenches. I went all over the claim with Hawson and, except some old workings by the original prospector, through whom we had the information respecting the claim, there were no signs of work on the land, nor was anyone on the claim, or camped near it. Our agent (Brougham) then gave evidence as stated in the enclosed affidavit. Welsh was also put in the box, and admitted the conversation with Brougham on 7th June, and that he acted as Harper's agent, and stated that Charles Harper is a gentleman in the Melbourne Post Office. Judge Backhouse reserved judgment; but, from his remarks, I fear it will go against us. Our solicitor had instructed me to obtain a certified copy of the mineral conditional purchase application from the Crown Lands Agent here. The Judge pointed out, however, that proof of the mineral conditional purchase should be by a certified copy of the original application from the Department of Lands, Sydney. I never knew how Renhan and Harper (or Welsh) had got their information, until Brougham confessed, shortly before the Court sat, his stupid action in confiding in Welsh. I think if the circumstances of the case were brought to the knowledge of the Minister for Mines, and he became aware of how we have been served in this matter, he would feel justified in refusing the jumpers' mineral lease application. We have been prevented, of course, from working the claim advantageously, through our uncertain title, but we have sunk a shaft sufficient to fulfil the mineral conditional purchase condition of improvement, which has been the cause of the trespass action and the appeal, and now the claim must lie idle until something is settled. I am advised that our own application for mineral lease is informal, on the ground that our agent (Brougham) failed to give Renhan and Harper the required notice, but if we knew that both their and our application would be refused, we could put in a fresh one the moment the *Gazette* notice appeared, and thus have some security for any outlay we may incur in further opening up the mine.

Trusting you may be able to get us righted in this unfortunate affair.

Yours, &c.,
THOS. W. BARNES.

No. 12.

Telegram from Mr. Warden Brown to The Under Secretary for Mines.

Sydney, 23 June, 1886.

HAVE received no official information that Mr. District Court Judge Backhouse has given his reserved decision in appeal case Renhan and Harper v. M'Clure and another, but believe appeal allowed damages 1s.; each side pay their own costs in Warden's Court.

WYMAN BROWN,
Warden.

No. 13.

Mr. Warden Brown to The Under Secretary for Mines.

Sir,

Warden's Office, Silvertown, 23 July, 1886.

I have the honor to acknowledge the receipt of your letter, dated 15th instant (No. 85-7,573), inviting my attention to your communication of the 23rd ultimo, in which I was asked to report the result of an appeal heard at Menindie on the 10th May last, viz., Renhan and Harper v. M'Clure and Mason, in
respect

respect to a case of trespass on Mr. J. K. Brougham's mineral conditional purchase, being portion 3, parish of Picton. In reply, I have nothing further to add than the information I forwarded when replying to your communication of the 23rd ultimo, viz., that neither officially or otherwise has the Registrar of the Appeal Court at Menindie given me any information that the Judge's reserved decision has yet been given. I have casually heard that the appeal was allowed, with damages for 1s., each party to pay their own costs in the Warden's Court.

I have, &c.,

WYMAN BROWN.

In view of all the circumstances surrounding this case, I think, perhaps, the best course will be to refuse both applications, and not to give beforehand notice to either of the parties.—H.W., 11/8/86. Submitted.

Approved.—J.F., 19/8/86. Refused, *vide* Executive Council minute, 86-12,246.

No. 14.

The Under Secretary for Mines to The Under Secretary for Lands.

Sir,

Department of Mines, Sydney, 8 October, 1886.

I have the honor, by direction of the Secretary for Mines, to request that you will be good enough to move the Secretary for Lands not to validate the purchase of land, noted in the margin, as such land is claimed by one M. C. Renhan in virtue of his mineral license.

I have, &c.,

HARRIE WOOD,

Under Secretary.

M.C.P., No. 83-56, James K. Brougham, Wilcannia, 20th September, 1883.

No. 15.

Mr. T. W. Barnes to The Under Secretary for Mines.

Sir,

Wilcannia, 17 November, 1886.

I have the honor to apply for a refund of the deposit of £5, made by my agent when lodging my objections to Renhan and Harper's mineral lease application, No. 1,028, Silvertown, which objection was heard by the Warden on the 22nd June, 1885, at Silvertown. Mineral lease application, No. 1,025, was gazetted "as refused," I believe, on the 24th ultimo.

I have, &c.,

T. W. BARNES.

Submitted. As to whether, as the application, 1,028, Silvertown, has been refused, the objector's deposit may be refunded provided the Warden reports no order made against or any part of it. The Warden may perhaps be asked whether (if approved) the refund should be made to Barnes alone, and whether the whole of the money is available.—W.R.C., 24/11/86.

Mr. Warden Brown, Silvertown, with refund voucher.—G.E.H. (for the Under Secretary), B.C., 24/11/86. No order was made against this deposit, which, I think, may safely be refunded to Mr. Barnes.—W. BROWN, Warden, Silvertown, 4/12/86. The Under Secretary for Mines, Sydney. It is submitted as to whether, in view of this report, the objector's deposit may be refunded to T. W. Barnes.—W.R.C., 13/12/86. The deposit may be refunded.—G.E.H. (for the Under Secretary), 13/12/86. Voucher to Warden Gower for signature by Barnes, 13/12/86.

No. 16.

Renhan and Harper to The Secretary for Mines.

Sir,

Silvertown, 3 December, 1886.

We have the honor to inform you that we have been in possession, and held under our mineral license since 5th May, 1885, the claim known as No. 3 mineral conditional purchase, parish of Picton, county of Yancowinna, of the Albert Gold-fields, N.S.W., which is claimed by Brougham, Kirkpatrick, and Barnes as their mineral conditional purchase.

On 8th June, 1885, we applied for a mineral lease of the said claim, No. 3, mineral conditional purchase. Brougham, Kirkpatrick, and Barnes afterwards applied for a lease of said claim.

I, M. C. Renhan and C. Harper, brought a case before the District Court for damages for trespass. After the hearing of the evidence on both sides, the Judge ruled that Brougham, Kirkpatrick, and Barnes had no title to the said land; and that we, M. C. Renhan and C. Harper, had an indisputable title under our mineral license and mineral lease application, and gave us damages, with costs, against the said parties.

I was working on the said claim prospecting it when our application for lease No. 1,028 appeared in the *Gazette* as refused on the 22nd of October, 1886.

I wrote to ascertain on what grounds this application was refused, and whilst waiting a reply a man named James Martin applied for a mineral lease of said claim. I prevented him from pegging, stating at the same time that I held the ground under my mineral license; that I was working it every day; my pegs were up; my trenches kept clean; and a notice kept posted on the ground, as follows: Mineral prospecting area possession. 5th May, 1885.

M. C. RENHAN.

C. HARPER.

The said James Martin summoned me for an assault for shoving him off my ground. As a proof of my statement, I enclose your Honor scrap, cut from the *Broken Hill Times*, containing a report of my evidence heard before Warden Brown and another magistrate.

All this I humbly submit to your Honor as an objection to the granting of J. Martin's application for mineral lease. James Martin has since been served with a Supreme Court writ, also Brougham, Kirkpatrick, and Barnes, which will further prove our title to the said land.

We have, &c.,

M. C. RENHAN.

C. HARPER.

No. 17.

Memo. to Mr. Warden Gower.

Wilcannia—Refund voucher—T. W. Barnes—Objector's deposit to Mineral Lease Application, 1,028, Silverton.

Department of Mines, Sydney, 13 December, 1886.

THE attached refund voucher is forwarded for signature by Mr. Barnes. Please notify Mr. Barnes, and when completed return the voucher to this office.

GERARD E. HERRING,
(For the Under Secretary).

Herewith.—G. H. GOWER, Warden, Wilcannia, 17/12/86. The Under Secretary for Mines, Sydney. Refund voucher now herewith.—W.R.C., 29/12/86. Submitted. Refund voucher for objector's deposit sent to Treasury, 6/1/87.

No. 18.

Mr. W. J. Fergusson to The Secretary for Mines.

Claim 1,028, portion 3, parish of Picton, county of Yancowinna.

Sir, Fitz-Evan Chambers, Castlereagh-street, Sydney, 25 June, 1887.

I am instructed by Mr. M. C. Renhan, of Broken Hill, to apply to you for information as to the above claim under the following circumstances:—

On 1st May, 1885, Mr. Renhan pegged and took possession of the above mentioned 40-acre lot under his mineral license. On the 8th June, 1885, he repegged the land (the said block) and applied for a mineral lease of same in accordance with the regulations, paying the lease application money, which has not yet been returned.

In March, 1886, Mr. Renhan brought an action against Messrs. Brougham, Kirkpatrick, and Barnes for trespass on his claim, and it was decided therein that he had an indisputable title to the said portion 3 under his mineral license and mineral lease application, and damages and costs were recovered by the plaintiff against the defendant.

On the 22nd October, 1886, a notice appeared in the *Gazette* that the mineral lease application, No. 1,028, had been refused.

At the latter end of October, 1886, the said M. C. Renhan was summoned for assaulting James Martin by putting him off the said claim, but such summons was dismissed on the ground that the said James Martin was a trespasser, the said M. C. Renhan being the proprietor of the said land.

On 4th January, 1887, the said M. C. Renhan obtained a suspension of work from the Warden for three months, thus showing that the Warden considered him the rightful occupant.

The said M. C. Renhan has been in the possession of the claim since such suspension expired, and has duly fulfilled all rules and regulations.

The above statement contains shortly the facts of the case, and I shall be glad if you will kindly inform me,—

1. The grounds upon which the application for the lease was refused.
 2. If, under the circumstances, the application for the lease could not be reconsidered.
- Awaiting the favour of an early reply,—

I have, &c.,
W. J. FERGUSSON,
(*pro* C. P. SOWTER).

No. 19.

Mr. W. J. Fergusson to The Secretary for Mines.

Portion 3, parish Picton, Yancowinna—Mineral Conditional Purchase 83-56.

Sir, Fitz-Evan Chambers, Castlereagh-street, Sydney, 21 July, 1887.

I beg to claim the above allotment on behalf of Mr. M. C. Renhan, of Broken Hill, and to enter a protest against the same being dealt with in any way, or the title validated, without notice to me.

Mr. Renhan has been in possession since May, 1885, under his mineral license, and has fulfilled all the conditions required by the Act. Full particulars have already been given in my letter of the 25th instant, to which no answer has yet been received.

I cannot understand on what grounds the application for the lease was refused, as mineral conditional purchases within proclaimed gold-fields have been declared void (*Wood v. Scott*, New South Wales, report 1885, page 83), and the person, James Brougham, claiming in opposition, has not taken the land *bonâ fide* for himself, and is acting as a mere dummy; nor has he fulfilled the requirements of the Act.

A reply hereto will oblige,—

Yours, &c.,
W. J. FERGUSSON,
(*pro* C. P. SOWTER).

The writer may be informed that the voucher for refund of the deposit was forwarded to Treasury on the 6th January last. The application was refused because, upon the evidence submitted to the Warden, the merits did not appear to be on the side of the applicant, Renhan. The Lands Department deals with the question of validating mineral conditional purchases, and the writer might perhaps apply to that Department, or, if he would prefer to do so, he can submit facts relating to Renhan's title under mineral license, verified by declaration, and this Department might then consider what steps (if any) can be taken.—H.W., 22/7/87.

Mr. Fergusson, 30/7/87.

No. 20.

The Under Secretary for Mines to Mr. W. J. Fergusson.

Sir,

Department of Mines, Sydney, 30 July, 1887.

Referring to your letter of the 21st instant, in which you, on behalf of Mr. M. C. Renhan, claim the allotment of land, M.C.P. 83-56, portion 3, parish Picton, county Yancowinna; and later, a protest against the same being dealt with in any way without notice being given you, I have the honor to inform you that, in respect of Renhan's application to lease the same was refused because, upon the evidence submitted to the Warden, the merits did not appear to be on the side of the applicant. The Lands Department deals with the question of validating mineral conditional purchases, and you might apply to that Department, or, if you would prefer to do so, you can submit facts relating to Renhan's title under mineral license, verified by declaration, and this Department might then consider what steps (if any), can be taken in the matter.

I have, &c.,

HARRIE WOOD,

Under Secretary.

No. 21.

Mr. W. J. Fergusson to The Under Secretary for Mines.

Re Renhan, No. 3, parish of Picton—Mineral Conditional Purchase, 83-56.

Sir,

Fitz-Evan Chambers, Castlereagh-street, Sydney, 2 August, 1887.

I beg to acknowledge receipt of your favour of the 30th, herein, and in reply thereto will submit, Renhan's title verified by declaration, as proposed.

Yours, &c.,

W. J. FERGUSSON,

(pro C. P. SOWTER).

No. 22.

Mr. C. Renhan to The Secretary for Mines.

Sir,

Broken Hill, 6 August, 1887.

In reference to an interview I had with your Honor when at Broken Hill about a mineral lease, you instructed me to write you the particulars of the case, and when you got back to Sydney it would receive your immediate attention. The case is as follows:—

On 5th May, 1885, I pegged out and took possession of 40 acres of land, being measured portion 3, parish of Picton, county Yancowinna, of the Albert Gold-field, as a mineral prospecting area under my mineral license.

On 8th June, 1885, I repegged the said 40 acres, and applied for it as a mineral lease in accordance with the regulations. A party named Brougham, Kirkpatrick, and Barnes afterwards pegged and applied for the same 40-acre block, being portion 3, parish of Picton, county of Yancowinna, as a mineral lease, served me with a notice stating that when they found mineral conditional purchases were illegal on a gold-field, according to the decision of the Supreme Court, they applied for it as a mineral lease. This is the first intimation I had as to who claimed the said block, or that it had a claimant, as it had lain there for about two years without any work being done on the said block, not even a peg or a trench in it to show that it had been claimed or occupied by any person, and on inquiry I learned that a boy named J. K. Brougham, Wilcannia, applied for the said 40-acre block now in question in his own name, as a mineral conditional purchase for a miner on the Barrier, who sent the money to Wilcannia to defray all expenses in the taking of it up, which, according to the Act, is dummying Crown lands. The said J. K. Brougham not being of age could make no transfer of the said mineral conditional purchase to the miner for whom it was taken up.

The said mineral conditional purchase being afterwards claimed by Brougham, Kirkpatrick, and Barnes, which is shown by their mineral lease application.

In March, 1886, Brougham, Kirkpatrick, and Barnes put men on to work on the said portion 3, parish Picton, county of Yancowinna. I served them with notice that they were trespassing on my ground and brought an action against them for trespass and damages. The case was heard before the Warden's Court, and then appealed to the District Court, held in May, 1886, at Menindie, and after the Judge hearing all the evidence of both sides, he (the Judge) decided that Brougham, Kirkpatrick, and Barnes could show no title at all to the said portion 3, parish Picton, county Yancowinna, and decided that I, M. C. Renhan and party, had an indisputable title to the said portion 3, parish of Picton, county of Yancowinna, under my own mineral license and mineral lease application, therefore gave us costs and damages against the said Brougham and party.

This decision, your Honor, together with the decision of the Supreme Court, had a right to be sufficient to prove my title as being the rightful owner and in legal possession of said portion 3, parish of Picton, and that my lease should have been granted instead of not being, had not influence taken the place of justice.

I was working on the said portion 3 when a notice appeared in the *Gazette* of the 22nd October, 1886, of the refusal of my mineral lease application, No. 1,028, 8th June, 1885.

I wrote to the Mines Department to ascertain on what grounds my lease application was refused, and whilst waiting a reply, a man named James Martin came on the morning of the 11th November, 1886, to peg out the said portion 3 and take possession of it.

I put him off the said portion 3, and would not allow him to peg it, stating at the same time that I was in possession under my mineral license; that I was working on the said portion 3 every day, my pegs kept up, my trenches kept clean, and my notice kept posted on the said claim, as follows:—

Mineral prospecting area—Possession, 5th May, 1885—M. C. Renhan and C. Harper.

In the face of all this, he (J. Martin) applied for the said portion 3 as a mineral lease, and his application, No. 1,609, is still pending. I cannot understand why J. Martin's 1,609 lease application for said portion 3 is not refused, who has no right at all to the said portion 3.

He,

He, the said J. Martin, summoned me for an assault for putting him off my claim. The case was heard before the Warden and a J.P., who dismissed the case, on the ground that I was in possession of and working the said claim, and that he, J. Martin, was a trespasser and had no right there.

On 4th January, 1886, I got suspension of work from the Warden for three months for said portion 3. On 3rd March, 1886, my suspension was up, and I commenced work again, and have been working on the said portion 3 ever since, and intend to continue so until my lease is granted or approved of, after which I shall be able to start work with a good heart and to better advantage. Even getting suspension from the Warden shows that I am the acknowledged and rightful owner of said portion 3. The lease money that I paid when applying for the said portion 3, parish of Picton, county of Yancowinna, is still held by the Mines Department. Could not your Honor reconsider my application, No. 1,028, 8th June, 1885, and have it approved of, and my lease granted.

I think your Honor must see plainly that what I ask for is but justice, when taking into consideration that I have held the said portion 3 claim, for about two years and a half, and in that time it has been proved over and over again by law that I was the rightful owner, and according to the Judge's decision had an indisputable title.

What more proofs than this should be required, unless influence should take the place of justice, as I believe such had been the case when my application was refused. I therefore pray, hope, and trust to your Honor to do me justice, as I ask for nothing more.

I take the liberty of addressing the envelope thus to ensure direct communication, so as the case may receive your Honor's immediate consideration in accordance with your promise to me when at Broken Hill, Barrier Ranges.

I have, &c.,
M. C. RENHAN.

For report early.—F.A., 19/8/87.

Mineral lease application, M. C. Renhan and C. Harper refused, 22/10/86; mineral lease application, 1,609, J. Martin, awaiting action by Lands Department on mineral conditional purchase.—E.C.P., 31/8/86.

Although this matter has been before me on several occasions, I can give very little information respecting it. I think the appeal referred to was decided in Renhan's favour, on the ground that the other side were unable to prove that an application for a mineral conditional purchase had ever been made for this land, the respondent not having obtained to produce as evidence the application or a certified copy. I expect Renhan's mineral lease application was refused on the ground that the land was not available, this mineral conditional purchase standing in the way; in fact, the whole matter appears to me, hinges on the validity of Brougham's mineral conditional purchase.—WYMAN BROWN, Warden, Silverton, 14/9/87. The Under Secretary for Mines, Sydney.

Submitted.—E.P., 21/9/87.

Ask Lands Department if any steps are being, or are likely to be taken, to validate mineral conditional purchase No. 83-56, made by James Kennedy Brougham, at Wilcannia, on the 20th September, 1883, and request an urgent reply, as the land is held and being worked in virtue of a mineral license, and a lease application is pending. If the reply be in the negative submit Martin's application to be at once dealt with. See decision of the Circuit Court in Renhan v. Martin.—H.W., 29/9/87.

The Lands Department may be asked not to validate mineral conditional purchase 83-56, made by James Kennedy Brougham on 20th September, 1883, as the land in question is claimed by M. C. Renhan, in virtue of his mineral license.—H.W., 4/10/87. Submitted.

Approved.—F.A., 6/10/87. Lands, 8 October, 1887.

No. 23.

Mr. W. J. Fergusson to The Under Secretary for Mines.

Re Renhan, 87-8,130.

Sir, Fitz-Evan Chambers, Castlereagh-street, Sydney, 31 August, 1887.

Herewith I have the honor to forward you declaration made by Mr. M. C. Renhan, in accordance with your letter of 30th July, 1887.

I shall be happy to give you any further details or information you may require.

I have, &c.,
W. J. FERGUSSON,
(pro C. P. SOWTER).

Submitted, *vide* minute on letter of Mr. Fergusson, of 21/7/87.—E.C.P., 5/9/87. Submitted.—E.C.P., 21/9/87.

[Enclosure.]

I, MICHAEL CHARLES RENHAN, of Broken Hill, in the Colony of New South Wales, miner, do hereby solemnly and sincerely declare as follows:—

1. On the 5th day of May, 1885, under and by virtue of my mineral license, dated 6th September, 1884, I pegged out and took possession of 40 acres of land known as portion 3, parish of Picton, county of Yancowinna, in the said Colony, upon behalf of myself and one Charles Harper, who was the holder of a mineral license, dated 21st April, 1885.

2. On the 8th June, 1885, I repegged the said land, and I and the said Charles Harper applied for a mineral lease thereof, and duly complied with the regulations, as prescribed by the Mining Act of 1874.

3. Objections were lodged to the said application by Thomas William Barnes, of Wilcannia, upon behalf of himself and Alfred Kirkpatrick and James Kennedy Brougham, and a true copy of the said objections are hereunto annexed, and marked "A."

4. The said objections were inquired into by the warden at Silverton, who made a report thereon in the word and figures following:—"I am of opinion, from taking all the surrounding circumstances connected with this case into consideration that the objection should be upheld, and would recommend that mineral lease application No. 1,028 should be refused.—WYMAN BROWN, Warden."

5. Upon learning the nature of the said reports I, on the 31st August, 1885, instructed our solicitor, Mr. William Welsh, of Silverton, to write a letter to the Under Secretary for Mines protesting against such reports and recommendation, as not being warranted by the evidence adduced before the Warden.

6. A true copy of the said letter is hereunto annexed, and marked "B."

7. On the 1st day of November, 1885, our said solicitor received a reply to the said letter, a true copy of which is hereunto annexed, marked "C."

8. In the month of March, 1886, two men, named James M'Clure and James Mason, having commenced to sink a shaft upon the said land under contract with the said Thomas William Barnes, Alfred Kirkpatrick, and James Kennedy Brougham, I and the said Charles Harper brought an action in the Warden's Court, at Silverton, against the said James M'Clure and the said James Mason for trespass upon our said land, and the Warden, on the 13th April, 1886, nonsuited us, the complainants—a true copy of the summons in the said suit is hereunto annexed, marked "D."

9. I and the said Charles Harper appealed against the said decision of the Warden to the District Court sitting at Menindie, as a Mining Appeal Court, and the said appeal was heard by the said Court on the 10th May, 1886, and judgment thereon reserved.

10. The said Thomas William Barnes was examined as a witness upon the hearing of the said appeal upon behalf of the said James M'Clure and James Mason, and admitted that they had done the work complained of under instructions and on behalf of himself and the said James Kennedy Brougham and Alfred Kirkpatrick, and that he and his partner were the real defendants in the matter.

11. Judgment was given in the matter of the said appeal in June, 1886, and the decision of the Warden was reversed with costs, the Court finding that the defendants had trespassed upon our said land, and that we were entitled to the possession thereof.

12. A true copy of the said judgments is hereunto annexed, marked "E."

13. The costs and damages awarded by the said judgment were paid by the said Thomas William Barnes and his copartners.

14. On the 22nd October, 1886, a notice appeared in the *Gazette* that our application for a mineral lease had been refused; and, hereunto annexed and marked with the letter "F," is a true copy of a letter received by me from the Under Secretary for Mines, stating the reason of such refusal.

15. In November, 1886, a summons for assault was issued against me in the Court of Petty Sessions, holden at Broken Hill, at the instance of one James Martin, for assault, in putting him off the said land while he was attempting to peg some, prior to making an application for a mineral lease therefor; but such summons was dismissed, on the the ground that I was the proprietor of the said land and in possession thereof.

16. That the said summons was heard by Wyman Brown, Esquire, Warden, and Richard Dawes, Esquire, Justice of the Peace.

17. On the 4th December, 1886, I and the said Charles Harper obtained an order from Warden Brown for license to suspend work for three months, which would show that the Warden considered us *prima facie* owners of the said land.

18. The claimant, James Kennedy Brougham, claims the said land under a mineral conditional purchase merely as a dummy, and not in his own rights; moreover, as I am informed and believe such purchases on proclaimed gold-fields have been declared void and have not since been validated.

19. I have at all times duly taken out my mineral license and have performed all rules and regulations in respect of the said land, and am now and have been in possession of the same since the 5th May, 1885, and have expended a considerable sum of money in mining thereon.

20. In carrying on such mining operations I have discovered silver ore in large quantities; but I am advised if I attempt to raise same without having a mineral lease, I will forfeit my title under mineral license.

And I make this solemn declaration conscientiously believing the same to be true, and by virtue of the provisions of an Act made and passed in the Reign of Her Present Majesty, intituled "An Act for the more effectual abolition of Oaths and Affirmations taken and made in various Departments of the Government of New South Wales and to substitute declarations in lieu thereof, and for the suppression of voluntary and extra-judicial oaths and affidavits.

Subscribed and declared at Round Hill, this 23rd day of

M. C. RENHAN.

August, 1887, before me,—

RICHARD DAWES, J.P.

(A.)

I, THE undersigned, on behalf of myself and partners, Alfred Kirkpatrick and James Kennedy Brougham, do hereby give notice that I object to the application, No. 1,028, of Renhan and Harper, for a mineral lease of survey, portion 3, parish of Picton, being registered, for the following reasons:—

That the land applied for has hitherto been held by us as a mineral conditional purchase, in the name of James Kennedy Brougham.

That as soon as we became aware of the decision of the Supreme Court that the mineral conditional purchases on a gold-field are illegal, I instructed an agent to apply promptly for a mineral lease of the land in the names of my partners and myself.

That, notwithstanding our agent's action in the matter was as prompt as possible, the application on our behalf was lodged one quarter of an hour after that of Renhan and Harper.

That no means have been neglected by myself and partners to secure our title to the land in a legal manner, when the illegality of our former title from the Crown Lands Department became apparent.

And I hereby require the Mining Registrar to withhold the registration of the application of the said Renhan and Harper, pending the hearing of this objection by the Warden.

Dated this 22nd day of June, 1885.

THOS. W. BARNES,

Objector.

(By his Attorney, T. JOHNSON, Solicitor, Silverton).

These are the objections marked "A," referred to in the annexed declaration of Michael Charles Renhan, declared before me, this 23rd day of August, 1887.—RICHARD DAWES, J.P.

(B.)

The Under Secretary for Mines, Sydney,—

Sir,

Silverton, 31 August, 1885.

I have the honor to acknowledge with thanks receipt of your telegram of the 27th instant, informing me that I could obtain copy of the Warden's decision in the case of the objection to Renhan and Harper's application for lease, No. 1,028.

I have since obtained copy of the decision, by which I observe that the Warden reports as follows:—"I am of opinion, from taking all the surrounding circumstances connected with the case into consideration, that the objection should be upheld, and would recommend that mineral lease application, No. 1,028, should be refused."

In the first place, I am at a loss to understand what the expression, "taking all the surrounding circumstances connected with this case into consideration" means. Again, there were four objections of Barnes & Co. to the application, to the following purport:—

1. That the land applied for had hitherto been held by objectors as a mineral conditional purchase, in the name of James Kennedy Brougham.
2. That as soon as objectors became aware of the decision of the Supreme Court, that mineral conditional purchases on a gold-field were illegal, an agent was instructed to apply promptly for a mineral lease.
3. That, notwithstanding the prompt action of such agent, he was a quarter of an hour too late in lodging application.
4. That objectors had done their best to gain a title in a legal manner when the illegality of their former title became apparent.

The Warden, in his report, says that he considers that the objection should be upheld, without specifying which one. Is it because the land was presumed to be held as a mineral conditional purchase, or is it because the objectors were too late in taking possession of the ground legally, and that, therefore, the last ought to be first?

If it is upon the first ground, I must say, that after the well-considered judgment of the Supreme Court of this Colony, that there could be no such title as a mineral conditional purchase upon a gold-field, except for land originally demised under the Mining Statute, I do not see how such an objection can be sustained; and as to the other objections, they are perfectly untenable. I may, however, observe that it was proved in evidence that my clients had held the land in question under mineral

mineral license since the 5th day of May last, nearly a month before the Supreme Court gave their decision as to the illegality of mineral conditional purchases upon gold-fields, and such being the case, I cannot see how they can be deprived of their legal rights under the Mining Statute.

Under the Mineral License Regulations, persons wishing to raise ore from land held thereunder are obliged to apply for a lease under a penalty of forfeiting their mineral license title, and yet, in the face of that provision it is attempted to say, "Yes, you are bound to apply for a lease, but it is of no avail your doing so, inasmuch as from surrounding circumstances we think we are entitled to decide as we like upon the matter."

I may also state that James Kennedy Brougham, in whose name the land was taken up as a mineral conditional purchase, was and still is an infant under age. I cannot therefore see how he could either transfer any rights to the other objectors, or be himself an applicant for a lease under the Mining Statute, as he could not legally execute any lease if granted to him.

Hoping that the application of Messrs. Renhan and Harper will be dealt with upon its merits, and those only.

I have, &c.,

WM. WELSH.

P.S.—May I call attention to the facts, as admitted by objectors, that although they held the land for nearly two years, they never did any mining thereon whatever. Is it for such people that the so-called equitable discretion of the Crown is to be exercised.—W.W.

This is the letter marked "B" referred to in the annexed declaration of Michael Charles Renhan, taken before me this 23rd day of August, 1887.—RICHARD DAWES, J.P.

(C.)

Sir,

Department of Mines, Sydney, 24 September, 1885.

Referring to your letter of the 31st ultimo, in which you take exception to the decision of the Warden in the case of the objections by Messrs Barnes and others to mineral lease application No. 1,028 (at Silvertown), by Messrs. Renhan and Harper, I am directed by the Secretary for Mines to inform you that the question of mineral conditional purchases on gold-fields has been under consideration, and it is thought that this case should be allowed to stand over until the course to be pursued in regard to such purchases has been decided on.

I have, &c.,

HARRIE WOOD,

Under Secretary.

William Welsh Esq., Solicitor, Silvertown.

This is the letter marked "C," referred to in the annexed declaration of Michael Charles Renhan, taken before me this 22nd day of August, 1887.

(D.)

Mining Statute, 1874—Twentieth Schedule—Warden's summons to defendant.

To James M'Clure and James Mason, of Broken Hill,—

You are hereby summoned to appear before me, or some other Warden of the gold-fields, at Silvertown, on the 31st day of March, 1886, at 10 o'clock in the forenoon of the same day precisely, to answer the complaint of Michael Charles Renhan and Charles Harper, by which complaints they seek that it may be determined that you, at divers times between the 15th and 22nd days of March, 1886, trespassed upon certain lands situated in the parish of Picton, county of Yancowinna, and being portion No. 3, said parish, to the possession of which the complainants are entitled, under and by virtue of the mineral licenses, and for which land the complainants had, on the 8th day of June, 1885, applied for a mineral lease in accordance with the regulations in force, and applicable to such lease so far as such regulations were at the time of such trespass capable of being complied with, and that you may be ordered to cease from such trespass, and that the Court cause you to be removed from such land, and the complainants claim the sum of £100 damages.

If you desire the said complaint to be heard before assessors, you are entitled to have it so heard.

You may have a summons to compel the attendance of any witness, or for the production of any books or documents, on applying at my office.

Bring this summons with you when you come to my office.

Given under my hand this 22nd day of March, 1886.

WYMAN BROWN,

Warden.

The complainants' address is care of William Welsh, Solicitor, Silvertown.

This is the copy summons marked "D," referred to in the annexed declaration of Michael Charles Renhan, taken before me this 23rd day of August, 1887.—RICHARD DAWES, J.P.

(E.)

District Court at Menindie.

In the matter of appeal of Michael Charles Renhan and Charles Harper from a decision of the Warden's Court, Silvertown, given in a case, No. 7-86, in this Court, in which the said Michael Charles Renhan and Charles Harper were the complainants, and James M'Clure and James Mason were the defendants, of alleged trespass by the defendants to land, to occupy which the complainants claimed to be entitled by virtue of their having applied for a mineral lease of the same to the District Court held at Menindie sitting as a Mining Appeal Court.

THE appeal came on for hearing, and was heard, before me on the 10th day of May last, with consent of both parties. I reserved my decision, it being agreed that I should forward it to the Registrar as soon as I had come to a determination. My decision is as follows:—

With evidence before me which is evidently different from that before the Warden, the complainants have shown a right to the present possession of the land in question (whether a lease will be granted of course it is for His Excellency the Governor with the advice of the Executive Council to say), while the defendants and those who authorized them to do the acts complained of, have brought no legal evidence to show that they are, or any one of them, have any claim to the said land. Under the circumstances I must reverse the decision of the Warden and find a verdict for the complainants, and order that the defendants pay the complainants damages 1s., and that the defendants pay the costs of the appeal, and that the parties pay their own costs in the Court below.

ALFRD. P. BACKHOUSE,

D. C. J.

To the Registrar, District Court, Menindie.

This is a copy of the judgment "E" referred to in the annexed declaration of Michael Charles Renhan, taken before me this twenty-third day of August, 1887.—RICHARD DAWES, J.P.

(F.)

Gentlemen,

Department of Mines, Sydney, 22 October, 1886.

Silvertown, 1,028.

I am directed by the Secretary for Mines to inform you that your application for the mineral lease noted in the margin has been refused, it not being proved, upon inquiry, that the land was available at date of taking possession.

I have, &c.,

GERARD E. HERRING,

(For the Under Secretary for Mines).

Messrs. M. C. Renhan and another, Silvertown.

This is the copy of letter marked "F," referred to in annexed declaration of Michael Charles Renhan, taken before me this twenty-third day of August, 1887.—RICHARD DAWES, J.P.

No. 24.

Memo. from Mr. W. J. Fergusson to The Under Secretary for Mines.

Sydney, 19 September, 1887.

Re Renhan.—I beg to draw your attention to my letter of the 31st ultimo.

No. 25.

Extract from the *Hay Standard* of 28th September, 1887.

BEFORE HIS HONOR THE CHIEF JUSTICE.

M. C. Renhan and C. Harper *versus* James Martin—Trespass on land held as mineral license at Silverton. Damages, £1,000.

Mr. Merewether, instructed by Mr. Brough, appeared for the plaintiff. The defendant did not appear.

Jury:—R. Woodward, A. Brown, J. Fallon, and R. Massie.

M. C. Renhan gave evidence of the defendant's entering upon the land and doing certain damage to it, knowing it to belong to plaintiff.

His Honor, in reviewing the evidence and directing the jury, stated that the plaintiff's had unquestionably established their claim to the land in question, and that the only matter with which they needed to concern themselves was the amount of damages which they thought the plaintiff has sustained by the wrongful action of the defendant. He added, in a case of this sort, although no actual damage had been proved, they would still be justified in awarding substantial damages, and cited a case in which the sum of £500 had been awarded as damages for trespass, which consisted only of the defendant persistently walking across the plaintiff's land in front of his windows.

The jury gave a verdict for 1s. and costs.

No. 26.

Mr. W. J. Fergusson to The Secretary for Mines.

Mineral Conditional Purchase 83-56, parish Picton, county Yancowinna.

Sir,

Fitz-Evan Chambers, Castlereagh-street, Sydney, 4 October, 1887.

Referring to my interview with the Minister for Mines this morning, I beg to draw your attention to the 7th section of the Regulations of 1887, by which it appears compulsory that the owner of a mineral license should apply within thirty days for a mineral lease, and the regulations do not seem to even contemplate the possibility of a refusal of such lease.

I shall be glad, therefore (if Mr. Renhan's application is taken into consideration), if you will reconsider the decision of the 7th June, when the application was refused.

I shall be most happy if I can assist you in any way in expediting the matter.

Yours, &c.,

W. J. FERGUSSON,

(pro C. P. SOWTER).

Chief Draftsman.—E.F.P., 10/10/87. On 87-14,468 the Lands Department have now been asked not to validate mineral conditional purchase 83-56, Brougham. Chief Draftsman to note.—E.F.P., 18/10/87. Noted on plan Y 57-2,186.—E.P.M., 19/10/87. M.C., 19/10/87. Records—E.F.P., 20/10/87. Mines, 21/10/87.

No. 27.

Mr. W. J. Fergusson to The Secretary for Mines.

Re Renhan—Mineral Conditional Purchase 83-56.

Sir,

Fitz-Evan Chambers, Castlereagh-street, Sydney, 8 October, 1887.

Referring to my interview with you yesterday, I have seen my client hereon, and he is most anxious that his application for a lease should be reconsidered, and that he should not be put to any further expense or delay in the matter.

You will perhaps remember it is two years since the application was made, and that if the matter has to be started entirely afresh, it may again prolong the time. The Warden's report would seem to prove my client's case, except in the matter of surrounding circumstances, and this objection, I take it, does not exist at present.

As Mr. Renhan has already proved his title in two Courts, I shall be glad to hear that his application will be reconsidered.

Yours, &c.,

W. J. FERGUSSON,

(pro C. P. SOWTER).

No. 28.

Telegram from The Under Secretary for Mines to Mr. Warden Brown.

Sydney, 12 November, 1887.

Re Papers in connection with portion 3, parish Bolairo, sent you for report. You should inspect the land and if you require Renhan to give evidence as to work done, he will be advised on receipt of a message from you to that effect.

HARRIE WOOD,

Under Secretary for Mines.

No. 29.

No. 29.

Telegram from The Under Secretary for Mines to Mr. Warden Brown.

21 November, 1887.

CAN you report at once in regard to the mineral conditional purchase claimed by Brougham, and the holding under mineral license claimed by Renhan, as to what work has been done by the persons claiming under mineral conditional purchase and mineral license respectively.

If you cannot furnish this report without taking Renhan's evidence again, he shall be instructed to proceed to Silverton at once.

HARRIE WOOD,
Under Secretary.

No. 30.

Telegram from Mr. Warden Brown to The Under Secretary for Mines.

Silverton, 22 November, 1887.

Re your wire yesterday and portion 3, Bolairo, can get no one to point out the work done by respective claimants, therefore can do nothing in the matter until Renhan returns, which he should do as soon as possible. Please let me know when he is likely to return that I may advise other side of date of inquiry.

W. BROWN,
Warden.

As no report appears to have been received from the Warden, these papers may perhaps be returned to the Mines Department, in view of Mr. Secretary Garrett's minute of 28/10/87 on 87-50,102, Departmental.—W.H.C., 1/2/88.

ALL papers re Renhan and Brougham returned by this day's mail.

W. BROWN,
Warden.

No. 33.

Mr. P. F. Richardson to The Under Secretary for Mines.

Sir,

1, Spring-street, Sydney, 24 April, 1888.

87-15,286 Mines,
portion 3, parish
of Picton, county
of Yancowinna.

As the Land Board at Silverton have recommended Brougham's mineral conditional purchase, 83-56, for forfeiture, at their meeting on 17th instant, I have the honor to request that the lease application of Mr. M. C. Renhan may be proceeded with, as he has been already a very long time debarred from dealing with the property, owing to Brougham's claim being in abeyance; but as it is now quashed, there is no reason why the matter should be any further delayed.

I have, &c.,

PHILLIP F. RICHARDSON.

87-16,870. The papers in this matter were forwarded to the Lands Department on the 30th December last; perhaps they might be asked for.—G.W.N., 25/4/88. Ask the Under Secretary for Lands to return the papers if they can be spared.—G.E.H. (for Under Secretary), 28/4/88. Under Secretary for Lands asked, 9/5/88.

No. 34.

Messrs. T. W. Barnes & Co. to The Chairman, Local Land Board, Bourke.

Sir,

Wilcannia, 16 July, 1888.

M.C.P., 83-56,
Wilcannia; J. K.
Brougham;
40 acres.

We have received notice from the Honorable the Minister for Lands, dated the 7th instant, that the appeal lodged by the applicant for the mineral conditional purchase noted in the margin against the decision of the Local Land Board, given at Silverton on the 18th of April last, with respect to the fulfilment of the conditions of the Act, has been sustained, and that he has ordered a refund of the deposit of £10 which was lodged therewith.

As agents for the applicant, we have the honor to request that you will remit the above sum to us at your early convenience.

We have, &c.,

T. W. BARNES & CO.

Papers not to hand yet from the Appeal Court.—T.W.W., 27/7/88. The Under Secretary for Lands.—G. C. TOMPSON, 27/7/88.

1888.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

ANTHRAX (CUMBERLAND) DISEASE IN
SHEEP AND CATTLE.

(TEST OF EFFICACY OF PASTEUR'S VACCINE OF ANTHRAX AS A PREVENTIVE AGAINST—REPORT
OF EXPERIMENTS AT JUNEES, &c.)

Ordered by the Legislative Assembly to be printed, 13 December, 1888.

Department of Mines, Stock Branch, Sydney, 14 August, 1888.

HIS Excellency the Governor, with the advice of the Executive Council, has been pleased to approve of the appointment of the undermentioned gentlemen as a Board to watch and report upon the experiments to be made by the representatives of M. Pasteur, Paris (France), in demonstrating the efficacy of Pasteur's "Vaccine of Paris" as a preventive for Anthrax (Cumberland Disease) in Sheep and Cattle, viz:—

JOHN DE V. LAMB, Esquire, Chairman, Board of Sheep Directors, Sydney;
ARTHUR A. DEVLIN, Esquire, Chairman, Board of Sheep Directors, Narandera;
WILLIAM M. HAMLET, Esquire, F.I.C., F.C.S., Government Analyst;
ALEXANDER BRUCE, Esquire, Chief Inspector of Stock; and
EDWARD STANLEY, Esquire, F.R.C.V.S., Government Veterinarian.

FRANCIS ABIGAIL.

REPORT on experiments at Junees, during September and October, 1888, carried out by the representatives of M. Pasteur, Paris, under supervision of the members of the Anthrax Board, in demonstrating the efficacy of Pasteur's "Vaccine of Anthrax" as a preventive against Anthrax (Cumberland) Disease in sheep and cattle.

The Honorable Francis Abigail, M.P., &c., &c., Sydney,—

Sir,

We have the honor to submit our report upon the experiments recently carried out at Junees by Dr. Germont and M. Loir, the representatives of M. Pasteur, for the purpose of demonstrating the efficacy of his vaccine of anthrax as a preventive against anthrax, *i.e.*, Cumberland Disease; and we have to congratulate those gentlemen and the Colony on the unqualified success of their demonstration.

During the early part of August last, Mr. T. W. Hammond, of Junees, was asked if he would allow the experiments to be carried out on his run, when that gentleman at once placed some 30 acres of land adjoining the railway line, about a mile from Junees Junction, at the disposal of the Board. The site was inspected and found in every way suitable, and the necessary fencing and buildings were erected under Mr. Devlin's supervision.

First Vaccination.

Dr. Germont submitted a programme of the proposed demonstration (similar to that by M. Pasteur at Pouilly-le-Fort in 1881), which was approved by the Board, who proceeded to Junee on September 3rd to witness the first vaccination. In order to ensure that none of the stock were infected with the disease, thirty-nine sheep and six head of cattle had previously been purchased at Cootamundra, an uninfected district, and of these twenty sheep and four cattle were vaccinated by Dr. Germont, assisted by M. Loir, on September 4th, under the supervision of the Board.

The sheep were vaccinated on the inner side of the off thigh by the hypodermic injection of one-eighth part of a cubic centimetre (about two minims) of attenuated vaccine of anthrax—"First Vaccine of Pasteur." The cattle were similarly operated on behind the shoulder, each receiving one-fourth part of a cubic centimetre, *i.e.*, four minims. The temperature of each animal treated was taken immediately afterwards, and will be found recorded on page 3, the normal temperature being—sheep, 103 deg. to 104 deg.; cattle, 101 deg. to 102 deg. It was also taken on the 5th, when a general rise of the temperature of the sheep was discerned, and in the case of one of the sheep had risen to 106.2. On the following day the temperature had in most cases slightly fallen. This was also the case in regard to the sheep whose temperature had reached 106 deg. Another had gone up to 106, but was on the following day found to have gone down to 102.3. The sheep between this and the second vaccination continued to be closely watched, but exhibited no symptoms of being affected by the operation.

Second Vaccination.

The members of the Board (with the exception of Mr. Lamb, who was unavoidably absent) attended at Junee on September 18 to watch the second vaccination, when Dr. Germont and M. Loir re-vaccinated the twenty sheep and four cattle, this time with the same quantity of Pasteur's second vaccine of anthrax. The temperature of the animals was taken immediately afterwards, when it was found that it corresponded with that of the previous vaccination. On the following day a considerable rise of temperature was noticeable in those sheep which had shown no rise after the first vaccination, two of them going as high as 107 deg. On the following day there was a considerable fall in nearly all the sheep except one, which registered 105.2 deg. (See page 4.) The vaccinated and unvaccinated animals were allowed to run together, but no ill-effects were noticed.

On September 18, Dr. Germont also inoculated two sheep, in the presence of the Board, with a cultivation of the virulent virus of anthrax (Cumberland) disease. This virus had been originally procured by the Government Veterinarian (Mr. Stanley) in May last from Mr. A. A. Devlin's sheep at Uarah, and was handed by him to the Government Analyst (Mr. Hamlet), on September 13, for this inoculation, the object being to test its efficacy, and, if still effective, to obtain a supply of fresh virulent virus for the demonstration. The result showed that the virus had lost none of its vitality, the two inoculated sheep dying at 8 p.m. on the following day, being thirty-two hours after inoculation. Careful *post-mortem* examination of these sheep by Mr. Stanley and Mr. Devlin, in the presence of Mr. Hamlet and Dr. Germont, showed unmistakable indication of the disease anthrax, and the microscope revealed its characteristic bacilli. Blood was taken by Mr. Hamlet from one of these sheep for the purpose of preparing a cultivation for the final test, and the cultivation was carried out in the Government laboratory, Sydney, under his supervision by M. Loir.

Inoculation of Sheep with Virulent Virus for Demonstration.

The cultivation prepared under Mr. Hamlet's supervision was taken on September 29 to Junee, and on the 30th three sheep were inoculated with different quantities of this cultivation by Dr. Germont, in the presence of Mr. Devlin and Mr. Bruce, at the experimental station, with the view to have the deaths occurring at different times for the purpose of demonstration. Of these, the first sheep died at 6 a.m. on October 2, thirty-four hours after the inoculation; the second at 3.30 p.m. of the same day, forty-three and a half hours after inoculation; and the third sheep at 9 a.m. of the 3rd, fifty-nine hours after inoculation.

Final Experiments and Demonstration.

All the members of the Board attended at Junee on Tuesday, the 2nd instant, together with Dr. Thompson, of the Board of Health, the Chief Inspectors of Stock for Victoria, Queensland, and Tasmania, and the Government Veterinarians for Victoria and Tasmania. There were also present a considerable number of delegates from the Pasture and Stock Protection Boards, and a good many Inspectors of Stock and visitors from different parts of the Colony, in all about 200 people. At 3.30 p.m. one of the sheep inoculated on September 30 died, as anticipated. After *post-mortem* examination and inspection of the blood under the microscope, and the Board being satisfied that the death was caused by anthrax, Dr. Germont and M. Loir commenced the inoculation of the thirty-nine sheep with the blood of this sheep, at 4.45 p.m., doing the vaccinated and unvaccinated sheep alternately, using the same syringe and the same quantity of blood for each, *viz.*, one-eighth part of a cubic centimetre, equal to two minims. The six head of cattle were also inoculated with blood from the same sheep, and with the same syringe, receiving one-fourth part of a cubic centimetre. The whole of the inoculated sheep, both vaccinated and unvaccinated, were then placed in the same enclosure, fed upon the same food, and drank from the same trough. Green food was scattered about the floor upon which the unvaccinated sheep were dying, and sanious discharges contaminated the food. The vaccinated sheep, in addition to the inoculation, also had to undergo the risk of contracting the disease by taking up the blood or other excreta from the unvaccinated sheep which died in the same pen, where they were confined and fed for four days after the inoculation took place.

The first of the nineteen unvaccinated sheep succumbed to the disease at 8.15 p.m. on 3rd October, being about twenty-seven hours after inoculation, and the last of that number died at 5.30 a.m. on Friday, 5th October, sixty hours fifteen minutes after inoculation. Of the two unvaccinated cattle (Nos. 88 and 33) the former died at 10.30 p.m. on Saturday, 6th October, while the latter, though having been very ill, is likely to recover. All the protected sheep and cattle continued unaffected, and are in remarkably good health. Mr. Stanley made a *post-mortem* examination of all the sheep that died, and found the lesions of anthrax very decidedly

decidedly indicated in every instance. The diagnostic changes were the black semi-fluid blood, the enlarged, softened, blackened spleen, and the dark bloody colour of the urine. These conditions were well marked in each case. During the examination the changes produced by the disease, such as the bloodstains, patches of inflammation in various parts of the body, the gelatinous bloody effusion at the point of inoculation, and other points of interest, were explained to the visitors. A healthy sheep was killed for the purpose of comparison of the organs with those of a diseased sheep.

In order to remove any possibility of doubt as to the cause of death, the Board requested Mr. Hamlet (Government Analyst) to examine the blood of the sheep as the *post-mortem* examinations were made, and in every case the blood, when submitted to that test under the microscope, contained *bacilli anthracis*. The blood of the healthy sheep was also examined and exhibited for comparison.

At the request of one of the visitors present (Mr. R. G. Higgins), a sheep which had been protected by vaccination and afterwards inoculated on September 12 was killed, but did not show any trace whatever of the disease, neither was there any effect upon the wool. This was eighteen days after inoculation. Some additional experiments are being made by the Board to ascertain, if possible, why travelling sheep are more subject to the disease, and if there is any difference in the *post-mortem* appearances of inoculated and naturally-infected sheep, but as sufficient time has not yet elapsed it is premature to offer an opinion thereon. The results will form the subject of an additional report.

Opinion of the Board.

After carefully watching the whole series of experiments and giving the subject the fullest consideration, the Board are unanimously of opinion that Dr. Germont and M. Loir have conclusively demonstrated the efficacy of M. Pasteur's "Vaccine of Anthrax" as a preventive against that disease, and therefore recommend its adoption and use. In conclusion, the Board desire to express their appreciation of the untiring efforts of Dr. Germont and M. Loir, by whom the late demonstration was made most interesting and instructive to the large number of gentlemen attending. The Board also wish to express their appreciation of the able and efficient manner in which the duties of secretary have been discharged by Mr. E. C. Weller.

Cattle.

Of the two unprotected cattle, one died on 7th October; the other, though very ill, recovered.

SUPPLEMENTARY REPORT A.

The Honorable Francis Abigail, M.P., Minister for Mines, Sydney,—

Sir,

We have the honor to report the result of the supplementary experiments carried out at Junee, with some of the sheep generously furnished by Messrs. Robertson Brothers, of Mimosa and Goree, for the purpose of ascertaining as far as possible,—

- i. The cause of the comparatively sudden deaths which at times occur among travelling sheep from anthrax.
- ii. Whether there is any difference, as it was alleged there is, in the *post-mortem* appearances of the spleens of sheep which died from infection contained in their food or water and those presented by sheep which died from inoculation with virulent virus.

I.—THE CAUSE OF SUDDEN DEATHS AMONG TRAVELLING SHEEP FROM ANTHRAX.

To test this, four sheep were inoculated at 2 p.m., on the 5th October, with blood taken from the heart of a sheep which had died of anthrax.

The sheep were then kept moving for six or seven hours in the paddock, as if they were being driven on the road. In this way their temperature was raised considerably over what it would have been if the sheep had been left quietly in the paddock; and they suffered in some degree from exhaustion, but not to anything like the same extent as if they had been long on the road, and had been weakened from want of grass and water and over-driving.

On the following day (6th October), at 2 p.m., one of the inoculated sheep died; at 4 p.m. another of these sheep died; at 6.30 a.m. of the 7th October, another inoculated sheep died; and at 7.30 a.m. of that date the fourth and last-inoculated sheep died.

From this it will be seen that the first two deaths occurred within a shorter time than those of any of the other sheep which died of inoculation with virulent virus during the demonstration, and that the average period of inoculation of the whole four sheep—thirty-three hours—is considerably less than that of the other inoculated sheep; and the result, we think, indicates that our supposition is correct, and that given conditions favourable to a speedy development and termination of the disease—such as fever, starvation, and exhaustion—we need not be surprised if deaths occur among travelling sheep within twenty hours of their coming on infected ground. While, however, the somewhat imperfect experiment points in this direction, the Board would advise that the matter be put to a more severe and thorough test, with the view to finally settle the question.

II.—THE DIFFERENCE, IF ANY, IN THE POST-MORTEM APPEARANCES OF SHEEP DYING FROM INOCULATION AND FROM NATURAL INFECTION.

It was decided to carry out this test by drenching the sheep both with blood from a diseased sheep and also with a cultivation of virulent virus, so as to have the germs in a similar state to those naturally infecting the sheep.

1. *The Drench with Diseased Blood.*—At 12.45 p.m. of the 6th ultimo four sheep were drenched with some of the same blood as the other four sheep were inoculated with, the sheep receiving the following quantities:—

- No. 1, branded ↑ in red on top of shoulder; with a strong dose—about 2 ounces.
 No. 2, branded ↑ in red on near rump; with a less dose—about 1½ ounces.
 No. 3, branded ↑ in red on off ribs; with a smaller dose „ 1¼ ounces.
 No. 4, branded ↑ on near ribs; with a still smaller dose „ 1 ounce.

Of these four sheep, the one which had received a dose of 1 ounce died on the 7th October, at 4 a.m., *i.e.*, in about forty hours; another, which had received 2 ounces, died on the 9th, at 2 a.m., *i.e.*, in about eighty-six hours; and another, which received 1½ ounces, died on the 11th, at 12.15 a.m., *i.e.*, in about 144 hours. The last sheep, which was drenched with 1¼ ounces, was apparently unaffected by the dose, and is alive and well.

The three sheep which died exhibited, on *post-mortem* examination, the marked symptoms of anthrax, and the bacilli were found in the blood; but these were in no way different from the symptoms exhibited by the sheep which died from inoculation.

2. *The Drench with Cultivated Virulent Germs.*—After some delay in obtaining a supply of cultivated virulent germs, arising through the first cultivation having been kept too long before being used,—

One horned wether, branded ↑ (in red) on shoulder, and
 One wether, branded ↑ (in red) on loin,
 were drenched, at noon on the 24th ultimo, each with 8 drams of virulent cultivation.

The first (the horned) wether died at 3 p.m. on the 26th, in fifty-one hours, and the other wether at 6.10 p.m. of that day, in fifty-four hours ten minutes after the drench was administered.

On the *post-mortem* examination these two sheep exhibited the characteristic symptoms of anthrax, and the bacilli were found in the blood, but the symptoms differed in no respect from those observed in sheep which died from inoculation with the virulent virus.

From these experiments it would seem the supposed differences in the appearance of the spleen of sheep do not exist, or that the sheep in which a difference had been observed had been dead for some time, and putrefactive changes had set up in the spleen.

SUPPLEMENTARY REPORT B.

TEST OF EFFICACY OF MR. P. H. GEHRIG'S SPECIFIC FOR ANTHRAX.

To the Honorable Francis Abigail, M.P., Minister for Mines, Sydney,—

Sir,

We have the honor to report that, in accordance with your request, we made a close observation of the experiments made at Junee by Mr. P. H. Gehrig, of Albury, to prove the efficacy of his specific as a preventive and cure for the disease anthrax.

Six sheep from Cootamundra, an uninfested district, were provided, and numbered 20, 21, 22, 23, 24, and 25.

On the 2nd October, Mr. Gehrig, under supervision of the Board, administered his specific to three of the six sheep set apart for him to prove its efficacy as a preventive. These sheep were numbered 20, 22, and 25.

During the afternoon all six sheep were inoculated by Mr. Government Veterinarian Stanley, with two minims of blood taken from the same sheep as that taken for M. Pasteur's experiment.

To show that his specific was a cure as well as a preventive, Mr. Gehrig, at 11.10 a.m. on the following day, drenched the sheep numbered 23, 24, and 21 (which had been inoculated with virulent virus the day previously) to protect them from the effects of the inoculation.

At 7.30 p.m. these sheep commenced to die, and at 3 a.m. on Thursday morning, 4th October, all the six were dead. The deaths took place in the following order:—

| | | | | |
|--------|--------------------|------------|-----|--------------|
| No. 23 | died at 7.30 p.m., | Wednesday, | 3rd | October. |
| No. 22 | do at 8 p.m., | do | do | |
| No. 25 | do at 8.35 p.m., | do | do | |
| No. 20 | do at 11.25 p.m., | do | do | |
| No. 24 | do at 3 a.m., | Thursday, | 4th | October, and |
| No. 21 | do at 3.45 a.m., | do | do | |

Opinion of the Board.—That Mr. Gehrig's specific is ineffectual, both as a preventive and cure of the disease anthrax.

NEW SOUTH WALES.

IMPORTED STOCK ACTS OF 1871 AND 1884.
(REGULATIONS UNDER.)

Presented to Parliament, pursuant to Act 35 Vic. No. 6, sec. 13.

[Laid upon the Table of the Honorable the Legislative Assembly of New South Wales by the Secretary for Mines "A copy of an amended Regulation issued under the Imported Stock Acts of 1871 and 1884.]

Department of Mines, Stock Branch, Sydney, 2 October, 1888.

His Excellency the Governor, with the advice of the Executive Council, has been pleased to cancel so much of the Regulations of the 22nd May last, issued under the Imported Stock Acts of 1871 and 1884, as will admit of Foreign Cattle being imported into this Colony on a Quarantine of ninety days.

FRANCIS ABIGAIL.

1888.

NEW SOUTH WALES.

GLEBE ISLAND ABATTOIRS.
(REGULATIONS.)

Presented to Parliament by Command.

The Treasury, New South Wales,
13th November, 1888.

PUBLIC ABATTOIR, GLEBE ISLAND.

His Excellency the Governor having been pleased, with the advice of the Executive Council, further to amend the "Orders and Regulations" concerning the Public Abattoir at Glebe Island, as published in Government Gazette of 10th June, 1887, it is hereby notified that, in lieu thereof, the following shall be enforced, on and after the 1st day of January, 1889.

J. F. BURNS.

ORDERS AND REGULATIONS.

1. The Abattoir shall, during the period from 1st October to 31st March, be open daily (Sundays excepted) for the despatch of business, from the hours of 5 o'clock a.m. to 6 o'clock p.m. (except on Mondays, on which day the Abattoir will be open from 2 o'clock a.m. to 6 o'clock p.m., and on Saturdays from 2 o'clock a.m. to 3 o'clock p.m.), and during the period from the 1st of April to the 30th September, from 6 o'clock a.m. to 6 o'clock p.m. (excepting on Fridays, when the hours will be from 5 o'clock a.m. to 7 o'clock p.m., and on Saturdays, from 5 o'clock a.m. to 3 o'clock p.m.); and no slaughtering of cattle will be permitted during any other hour or day than the hours and days above mentioned, nor shall any person be allowed to come within or remain within the enclosures of the Abattoir except at such times as they are open for business. Pigs, lambs, and calves may, however, be slaughtered and dressed at the Abattoir during the nights of Friday, between the 1st of October and the 31st of March in each year.

2. The slaughter-houses shall, with the exception of six beef, six mutton, and two pig slaughter-houses, be retained in the hands of the Government for the use of the public.

3. Six beef, six mutton, and two pig slaughter-houses may be submitted to public competition, by lease, at an upset price to be announced at the time of sale should it be decided to submit the same to auction.

4. A fee of threepence for inspecting brands shall be charged upon every head of horned cattle slaughtered in the leased houses.

5. Parties desirous of using the slaughter-houses reserved by the Government shall be permitted to do so on payment of the following fees:—

| | |
|--|------|
| For every ox, cow, bull, or heifer, or steer (including s. d. inspection fee of 3d.) | 1 0 |
| For every calf not exceeding six months old (including an inspection fee) | 0 6 |
| For every sheep or lamb | 0 1½ |
| For every head of swine | 0 6 |

6. All fees shall be paid at the office of the Inspector of the Abattoir, on demand to such officer, or to his Assistant, and shall thereafter be paid into the Colonial Treasury under such directions as shall from time to time be given by the Secretary for Finance and Trade.

7. Printed receipts shall be given to all parties paying fees.

8. No person or persons shall yard or slaughter, or cause to be yarded or slaughtered, any animal without the sanction of the Inspector or Assistant Inspector.

9. The hours during which cattle may be driven in and yarded for slaughter shall be from 5 o'clock a.m. to 8 o'clock a.m., between the 1st October and the 31st March, and from 6 o'clock a.m. to 8 o'clock a.m., between the 1st April to the

30th September in each year, daily, including Sundays; and cattle shall in all cases be inspected before being slaughtered. Milch cows and stall-fed cattle may be driven in between the hours of 12 noon and 3 o'clock p.m. during week days only.

10. No person or persons shall slaughter, or cause to be slaughtered, any animal in any of the slaughtering-houses on Glebe Island, without the sanction of the Inspector or Assistant Inspector. And in all cases when carcasses are brought to the Abattoir dressed or to be dressed, notice shall be given to the Inspector or the Assistant Inspector on the arrival of the same; but no animal slaughtered outside the Abattoir and brought there with the head detached from the body will be allowed to be dressed there. In no case shall the body be brought into the slaughter-house until seen by the Inspector or Assistant Inspector. In all cases the owner thereof, the lessee, or the persons in privileged occupation of the slaughter-house, shall be held liable for any breach of this Regulation.

11. Any animal brought to the Abattoir for slaughter, which appears to the Inspector or Assistant Inspector to be diseased, shall be disposed of in such manner as the Inspector or Assistant Inspector may direct, to secure the slaughtering, examination, and final disposal of the same. If the owner, the lessee, or occupant of the slaughter-house shall object to the decision of the Inspector or Assistant Inspector with regard to the sanitary condition of the animal, the owner, lessee, or occupant may require the animal to be inspected by an officer of the Board of Health, whose decision shall be final. In all such cases the owner of the animal, the lessee, or person occupying the slaughter-house, shall be held liable for any breach of this Regulation.

12. The Inspector and Assistant Inspector are hereby empowered to control and direct the traffic, wheeled or otherwise, for the safety and convenience of business at the Abattoir.

13. Should any animal die while in the pens belonging to any slaughter-house, the owner of the animal, the lessee, or occupant of the same at the time, shall immediately remove the body entire from the Glebe Island; or should any animal die within the precincts of the Abattoir, the owner or person in charge of such animal shall be held liable for its immediate removal in its entire state from the Glebe Island.

14. All animals on which fees are charged shall be reported to the Inspector or Assistant Inspector without delay, and the fees paid forthwith; failing such payment either of the said officers may close and lock the doors leading from the pens to the pithing or slaughtering floors, until the said fees are paid.

15. Sheep and cattle will not be permitted to remain in the Abattoir pens for more than forty-eight hours from the time of being brought in.

16. No lessee or occupier of any slaughter-house connected with the Abattoir shall expose for sale any meat which has been condemned by the Inspector or Assistant Inspector; and any such lessee or occupier shall, when ordered to do so by the Inspectors aforesaid, immediately remove such meat from the Abattoir, and cause the same to be destroyed by fire or boiled down for the purpose only of extracting tallow. The Inspector or Assistant Inspector is hereby empowered, in the event of non-compliance with his order for the removal of the said meat, to destroy the same at the cost of such lessee or occupier.

17. The lessee or occupier of any slaughter-house shall thoroughly cleanse the same, to the satisfaction of the Inspector or Assistant Inspector, immediately after slaughtering has been carried on, and with respect to the offal and blood, may select and shall immediately remove, each day, at such time during the day as may be appointed by the Inspector or Assistant Inspector for the purpose, such portions, not being the whole of such offal and blood, as the said lessee or occupier may require for disposal for human food; and failing such removal at the time so appointed, the whole of such offal and blood may be removed by the Government.

18. No matter shall be allowed to remain overnight in any slaughter-house or premises, whether held under lease or privileged occupation, by which a nuisance may be created, and each slaughter-house shall be kept clean by the lessee or person occupying or using the same, to the satisfaction of the Inspector or Assistant Inspector of the Abattoir.

19. The lessees of sheep and pig slaughtering-houses shall severally furnish to the Inspector or Assistant Inspector, at their respective offices, on or before the 4th day of each month, a monthly return of all such animals as shall have been slaughtered at such houses.

20. No hide, carcase, or spleen of any horned cattle (not having been previously inspected) shall be removed from any slaughter-house until after the same has been inspected by the Inspector or Assistant Inspector of Abattoir.

21. Any meat found blown at the Abattoir may be condemned by the Inspector or Assistant Inspector, and the owner or person found blowing the same will be held liable.

22. The lessee or occupier of any slaughter-house shall cause the vessels and water used in dressing carcasses therein to be kept clean to the satisfaction of the Inspector or Assistant Inspector.

23. Cattle, as they are brought in for slaughter, shall be kept separate from those already in the yards, until the brands of those so brought in shall have been inspected.

24. All hides, skins, heads, feet, and offal shall be removed from the Abattoir only by way of the road at the rear of the buildings.

25. The hours fixed for driving animals into the pens of the reserved mutton slaughter-houses shall be from 6 o'clock a.m. to 6 o'clock p.m., between the 1st of October and the 31st of March in each year, and between the 1st of April and the 30th of September the hours shall be from 7 o'clock a.m. to 4 o'clock p.m. in each year.

26. It is strictly prohibited to place candles or lights of any description upon or against the walls, or upon or against any portion of the woodwork of the slaughter-house or stables, or any other building or buildings in connection therewith; and the lessee or person occupying the slaughter-house or stable where such prohibited candle or light is found will be held responsible for the same.

27. In cases where water is found running to waste in any slaughter-house, the lessee or occupant will be held responsible for such waste.

28. Gaming is prohibited at the Abattoir, also the tossing up or pitching of coin, throwing of dice, or playing of cards, under any pretext whatever.

29. Any person wilfully or negligently causing injury to any Government property of any description whatever at the Abattoir will be held responsible for the same.

30. The use of obscene or offensive language, the throwing of missiles, filth, or muck of any kind, or riotous conduct, or disorderly noise, is strictly prohibited within the enclosure of the Abattoir.

31. The lessee or occupier of any slaughter-house is prohibited from using, causing, or permitting to be used, any instrument for driving cattle from the pens to their respective houses other than such as may be approved by the Inspector or Assistant Inspector.

32. The Inspector or Assistant Inspector, or any other officer connected with the Glebe Island Abattoir, may at any time enter to view any of the slaughter-houses connected with the Abattoir, whether leased or otherwise; and no person or persons shall obstruct, molest, or assail with abusive, obscene, or offensive language, either the Inspector, Assistant Inspector, or any other person acting officially with or for the aforesaid officers.

33. It shall be competent for the Inspector of the Abattoir at any time, should any person or persons occupying any of the slaughter-houses reserved by the Government be found breaking or continuing to break any one or more of the Regulations made concerning the Public Abattoir at Glebe Island, to refuse to allow such person or persons to use any of the slaughter-houses reserved by the Government.

34. The lessees or occupiers of each slaughter-house shall keep any vehicle used for the transmission of meat from Glebe Island Abattoir, and the awnings and coverings used therewith, in clean and proper condition, to the satisfaction of the Inspector or Assistant Inspector.

35. It is also provided that no meat shall be loaded at the Abattoir into vehicles for transmission without the person while loading wearing a dark woollen jumper, and also a cap covering the head. In all cases the lessees of slaughter-houses, or the occupiers of unleased slaughter-houses, shall be held liable for any breach of this Regulation.

36. The contents of the paunches and intestines of the large animals slaughtered in the beef houses only will be allowed to be deposited on Glebe Island, in the manure pit at the rear of each slaughter-house; and the intestines of sheep, lambs, pigs, and calves shall have their contents discharged at such place as the Inspector or Assistant Inspector may direct.

37. The lessee of any beef slaughter-house or houses shall not slaughter, or cause to be slaughtered therein, any sheep, lambs, or pigs.

38. Persons are prohibited from bringing to and depositing at the Abattoir offal or other offensive matter.

39. Any person or persons offending against or failing to comply with any of the orders and regulations contained in paragraphs 1, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, and 38 shall for each and every offence forfeit and pay a sum not exceeding five pounds.

EXPLANATORY CLAUSE.

An occupant or occupier, as distinguished from a lessee in these "Orders and Regulations" is meant to apply to the persons or firm enjoying the privileged use of an unleased slaughter-house.

Commission.

VICTORIA, by the Grace of God, of the United Kingdom of Great Britain and Ireland, Queen, Defender
of the Faith, and so forth,—

To our trusty and well-beloved—

The Honorable GEORGE HENRY COX, M.L.C. ;
MAJOR COOPER PENROSE, R.E. ; and
JOHN CHADWICK WOORE, Esquire, Police Magistrate, Queanbeyan,—

Greeting :—

Know ye, that We, reposing great trust and confidence in your ability, zeal, industry, discretion, and integrity, do, by these presents, authorize and appoint you or any two of you, as hereinafter mentioned, to make a diligent and full inquiry into certain allegations which have been made respecting the construction of Public Tanks and Wells in Our Colony of New South Wales : And We do by these presents give and grant to you or any two of you, at any meeting or meetings to which all of you shall have been duly summoned to call before you all such persons as you may judge necessary, by whom you may be better informed of the truth in the premises, and to require the production of all such books, papers, writings, and all other documents as you may deem expedient, and to visit and inspect the same at the offices or places where the same or any of them may be deposited, and to inquire of the premises by all lawful way and means ; also to visit and inspect, if considered necessary, such Tanks and Wells : And Our further will and pleasure is, that you, or any two of you, after due examination of the premises, do and shall within the space of three months after the date of this Our Commission, or sooner, if the same can reasonably be, certify to Us, in the office of Our Secretary for Public Works, under your or any two of your hands and seals, what you shall find touching the premises ; and We hereby command all Government officers and all other persons whomsoever within Our said Colony, that they be assistant to you and each of you in the execution of these presents : And We appoint you the Honorable GEORGE HENRY COX, aforesaid, to be President of this Our Commission, which said Commission We declare to be a Commission for all purposes of the Act 44 Victoriae No. 1, intituled, “ An Act to regulate the taking of Evidence by Commissioners under the Great Seal.”

In testimony whereof, We have caused these Our Letters to be made Patent, and the Great Seal of Our said Colony of New South Wales to be hereunto affixed.

Witness our Right Trusty and Well-beloved Councillor, CHARLES ROBERT, BARON CARRINGTON, Knight Grand Cross of Our Most Distinguished Order of Saint Michael and Saint George, Our Governor and Commander-in-Chief of Our Colony of New South Wales and its Dependencies, at Government House, Sydney, in New South Wales aforesaid, this twenty-eighth day of December, in the fifty-first year of Our Reign, and in the year of Our Lord one thousand eight hundred and eighty-seven.

(L.S.) CARRINGTON.

By His Excellency's Command,
(L.S.) HENRY PARKES.

LIST OF WITNESSES

| Arthur William Stilwell (recalled) | 235 to 237 |
| William Christopher Bennett (recalled) | 237 to 238 |
| David William Gregory | 238 |
| Arthur Pepys Wood (recalled) | 238 |

REPORT.

To His Excellency the Right Honorable CHARLES ROBERT, BARON CAR-
RINGTON, Knight Grand Cross of the Most Distinguished Order of
Saint Michael and Saint George, Governor and Commander-in-Chief of
the Colony of New South Wales and its Dependencies, &c., &c., &c.

MAY IT PLEASE YOUR EXCELLENCY,—

We, Her Majesty's Commissioners, appointed by Letters Patent under the Great Seal of the Colony, dated the 28th day of December, 1887, to make a diligent and full inquiry into certain allegations which have been made respecting the construction of Public Tanks and Wells in the Colony, have the honor to submit to your Excellency the following Report:—

We have held seventy-five meetings, and examined thirty-six witnesses, minutes of whose evidence are appended hereto.

We have also inspected a number of the works and appliances at the public watering places in the Hay District, with respect to which some of the more serious allegations have been made.

In this Report we have dealt as fully as the circumstances appeared to demand with the numerous allegations submitted for our investigation, confining our attention chiefly to the more prominent and important cases affecting public interests, and avoiding unimportant and tedious details.

We have dealt with the allegations as nearly as possible in the order in which they are given in the Minute Paper by the Chief Inspector of Public Watering Places, covering the *précis* of cases submitted to us, under the following heads:—

1. Faults of judgment in the selection of sites for public tanks on stock routes.
2. Defective design and faulty construction; too steep batters in most cases without reference to the nature of the soil, and the adoption of a certain form of tank without reference to the formation of the ground.
3. Excessive cost of construction of public tanks on stock routes, and sub-letting of contracts for same.
4. Incapacity of officers of the Department of Public Works, and frauds by contractors in the construction and measurement of public tanks.
5. Defective construction of flumes and inlet pipes.
6. Carelessness in laying out drains, and excessive cost of construction.
7. Expensive forms of machinery for lifting water, necessitating greater cost of maintenance.
8. Excessive cost and faulty construction of fencing; sub-letting of a contract for fencing, and excessive cost of gates.
9. Interference with Mines caretakers and overseers by officers of the Department of Public Works.
10. "Greasing" of service tanks.
11. Faulty sites of wells.
12. Faulty construction of wells; sinking, timbering, and centering of shafts, and erection of head works—whim, service tank, and troughing—before testing for supply and quality of water.
13. Excessive cost of construction of wells, and supply and quality of water.
14. Costly hutting for caretakers.
15. Defective construction of troughing.
16. Unfortunate effects of dual control, and suggested remedies.

We

We have also ventured to touch upon subjects incidentally introduced in the course of our investigations, which, though not strictly within the authorized limits of our inquiry, are nevertheless so intimately connected with the matters submitted to us, and with the interests of the public, that we trust the brief expression of our views and suggestions with respect to them will not be considered out of place in this Report.

We have dealt with these subjects under the following heads:—

- (A) Cost of maintenance of public watering places.
- (B) Caretakers.
- (C) Condition of stock routes.

Although the witnesses have been allowed considerable latitude in giving their evidence, and in putting in documents which in some instances are inadmissible as evidence, we have endeavoured to base our conclusions upon evidence of facts within the personal knowledge of the witnesses, carefully disregarding all hearsay and extraneous statements.

We have also been guided by our personal inspection of the works and appliances at many of the public watering places, and by our personal knowledge and experience in connection with the several matters submitted to us.

NO. 1.—FAULTS OF JUDGMENT IN THE SELECTION OF SITES FOR PUBLIC TANKS ON STOCK ROUTES.

The construction of public watering places was commenced by the Department of Public Works in 1869, and originally, the selection of sites for, as well as the construction and maintenance of these works was entirely in the hands of that Department; but when, some years later, the Department of Mines was charged with the control and, to a limited extent, the maintenance of public watering places, it was arranged that that Department should indicate generally the position in which a watering place was required, and that the Department of Public Works should fix the exact site, which arrangement does not seem to have been adhered to in some cases. (See Q. 9, 16, 3042, 3304, 3306, and 4406.)

Mr. Gilliat states that when he was appointed Inspector of Public Watering Places, on the 6th October, 1879, there were only about twenty such places in the Colony. (See Q. 24, 25, and 121.) It appears that it was not always possible to obtain very good sites, as the selection was restricted within the limits of stock routes, and to approximately equal distances on those routes (See Q. 2934 and 3374.)

It is alleged that the Department of Public Works has committed faults of judgment in the selection of sites for tanks. Amongst the earlier works constructed by that Department are those named respectively—*Peri*, *Yentabangee*, *Warramutty*, and *Goomboolara*, on the Paroo stock route.

The chief objections advanced against these tanks are that they have been placed in close proximity to natural waters which, it is suggested, might have been improved and utilized as public watering places, in lieu of the tanks; therefore the tanks were not required, and that public money was unnecessarily expended in constructing them, particularly *Peri* tank. It is also stated with regard to the site of *Goomboolara* tank that the catchment is defective.

In order to form a correct opinion of the action of the Department of Public Works with regard to the selection of sites for these tanks, it is necessary to take into consideration the period of their selection—1879—and the surrounding circumstances.

The district in which these tanks are situated is subject to long periods of drought; the climate is intensely hot; and generally, the natural water supply is very precarious, and the rainfall very limited and uncertain. The pioneer Crown tenants of that part of the Colony may justly be regarded as the reclaimers of a region which, in its natural state, was not inaptly described by the early explorers as a desert unfit for the habitation of man.

The natural waters, excepting *Peri* Springs, near which the sites for these works were selected, were certainly not permanent; but their degree of permanence was greatly increased by earthworks constructed at the expense of the pioneer Crown tenants of the pastoral runs on which they were situated, and they were at that time of the utmost importance and value to them, and doubtless were used by them as bases of operations for the conservation of water upon, and occupation of, the adjacent waterless country.

Peri

Peri Springs are the only absolutely permanent waters in that locality yielding a large supply, and were used by the first occupants of the extensive pastoral holding on which they are situated (during whose tenure Peri tank was constructed) as a refuge for the whole of their stock during periods of protracted drought.

The improvement of these natural waters at the public expense, with the object of making public watering places of them, as suggested by Mr. Gilliat (see Q. 117), would have necessitated reservation from lease; and, at the time the sites were selected, reservation of these natural waters—especially those improved at the expense of the Crown tenants—would have been, in our opinion, an unjustifiable violation of vested rights, and a very serious obstruction to the improvement and profitable occupation of the adjacent waterless country.

With regard to the statement that the catchment at *Goomboolara* tank is defective, Mr. David Brown, of Kallara, a witness suggested by the Department of Mines, states in his evidence that if a tank was required there at all, he does not think that a better site could have been had within a reasonable distance from the road (Q. 951); that in 1875 and 1876 there was no water at all at Mungundie Lake within 4 miles of the tank (see Q. 946 and 949); that he has not seen the tank dry (Q. 960); that he leased it for about two years formerly, and had the general supervision of it for three or four years after that (Q. 961 and 962); and that it was not dry during the drought of 1884. (Q. 963.) Mr. Gilliat, also, states in his evidence in reference to the tanks in question that there is no fault that he knows of as regards catchment. (Q. 107.)

Considering these statements in connection with the evidence of Mr. Hanna (Q. 3767 to 3775), we find that the site of this tank, as regards catchment, is not open to any objection.

We also find that sound judgment, a proper regard for the improvement of the public estate by Crown tenants, and a just appreciation of private rights and enterprise, were exercised in the selection of the sites for all the tanks in question; and that proximity to natural waters must have considerably facilitated and diminished the cost of their construction.

In reference to these cases see evidence, Q. 75 to 77, 96 to 121, 682 to 743, 944 to 970, 984 to 986, 989 to 995, 1021, 1022, 1867 to 1908, 2399 to 2433, 2446 to 2459, 3689, 3690, 3767 to 3775.

Dry Lake Tank.—This tank is on the road from Wilcannia to Mount Brown, and has not yet been transferred to the Department of Mines. Notwithstanding that it has been submerged by an unprecedented rainfall, which could not have been foreseen, the site is admitted to be, and undoubtedly is, a very good one under ordinary circumstances, both as regards catchment and position on the road, and was reserved from sale specially for water supply many years ago by the local Commissioner of Crown lands. The Department of Mines did not recommend the site for a public watering place, which is alleged to be unnecessary on the ground that a Mr. Smith, a publican of Dry Lake, had made sufficient provision there for watering stock. The Department of Public Works on the other hand, recognizing the importance and urgency of providing *public* watering places on that road during the "rush" to Mount Brown, constructed the tank at Dry Lake, deeming it injudicious to leave the public entirely at the mercy of the publican Smith, who had the power in seasons of drought, not only to demand excessive rates for water, but to refuse it altogether, if he thought fit.

We find that in this instance the Department of Public Works acted judiciously and in accordance with the best interests of the travelling public; and that the Department can scarcely be blamed for the tank being submerged, seeing that the lake was never known to have been flooded before. It may here be noted that this is not a parallel case to Cobham Lake, inasmuch as that lake is much more liable to be flooded, being supplied by two of the largest creeks in that part of the country, and was known to have been flooded two or three times before the tank was made there. It is also very much larger than Dry Lake, where the tank is more sheltered than that at Cobham; and consequently less liable to be damaged by wave action.

In reference to this case, see evidence, Q. 122 to 128, 580 to 582, 3302.

Old

Old Copago Tank.—This was one of the earlier tanks constructed by the Department of Public Works. It was situated on the Paroo stock route, and consisted of a dam and excavation in the channel of a creek, at its entrance into Copago Lake. The dam has long since been washed away, and the excavation silted up, necessitating the construction of another tank a little higher up the creek.

We find that great want of judgment and foresight were displayed in selecting the site for this tank, as the result has amply proved; and that the officer who selected it is responsible for a great waste of public money.

In reference to this case see evidence, Q. 239, 734, 1957 to 1959, 1962.

Seaville's Tank.—This tank is on the road from Wilcannia to the Paroo; the site is objected to on the ground that it is only 7 miles from the river Darling.

We find that the tank is within about 7 miles of the nearest point of the river, which is about that distance off the Paroo stock route; that it is properly situated on the stock route about 12 miles from Wilcannia, and that there is no reasonable objection to the site.

In reference to this case see evidence, Q. 239, 2191 to 2211, 3688.

Tarella Tank.—This tank is on the road from Wilcannia to Mount Brown, and is alleged to be unnecessary on the ground that it is situated between Koonawatta and White Cliff dams, about eight miles apart, on Bunker or Teralla Creek. These dams were constructed at the expense of the Crown tenant on whose run they are situated; and we are of opinion that the water in them, conserved by his enterprise and the expenditure of his money, is as much his property during the currency of his lease as the grass upon his run; and that no person has a right to take the one or the other without his consent; and although Mr. Quin, the present occupant of the run, has generously allowed the public to use the water in his dams, there is no guarantee that he will always do so, or that his successor will be equally obliging, or that the dams will always be equal to all demands, especially as silting up is said to be inevitable. (See Q. 1960 and 3691.)

Therefore, to protect the public from inconvenience, and possible disaster in seasons of drought, when the Crown tenant would probably require all his water, the Department of Public Works chose this site as a convenient stage on the road for a public watering place; and in doing so in this and other similar instances, prior and subsequent to this, acted upon a principle laid down in a Minute by Mr. J. P. Abbot when he was Minister for Mines, referring to J. K. Well, dated 3/7/84, the justice and expediency of which we have no reason to doubt.*

We therefore find that in this instance the Department of Public Works did not commit any fault of judgment in the selection of the site, which we believe to be the best that could have been chosen, and that proximity to water must have considerably facilitated and diminished the cost of construction.

In reference to this case see evidence, Q. 132, 133, 404 to 410, 1909 to 1920, 1931 to 1939, 2219 to 2223, 2477 to 2491, 3305, 3306, 3691, 3692, 3698, 4848.

Cobham Lake Tank.—This tank is at Cobham Lake, on the road from Wilcannia to Mount Brown. The objections made to the site are that it is in the lake; that the tank has been submerged for about three years; that when the waters of the lake subside the tank will be nearly silted up; and that the expenditure on it was useless, especially as there is sometimes water in the lake.

This lake has no outlet and is capable of containing a great depth of water; it is known to have been filled—or partially filled—at least two or three times since 1865; and the water in it is known to have lasted for about seven years; it is also known to have been dry for several years in succession.

The tank is situated on the south-eastern side of the lake far above the level of its bed, but considerably below the level to which it is capable of being filled. The last time it was filled the embankments of the tank were some four feet under water, as admitted by Mr. Hanna (see Q. 3684), who acknowledges the responsibility of having selected the site. (See Q. 3672.) The water in the lake will, in all probability, be fit for general use for two or three years without further replenishing; consequently the tank will be useless as a public watering place for about six years from the time it was submerged. The

* See minute of Minister of Mines, dated 8/7/84 (quoted in Q. 3306, p. 159):—"I think tenders should be accepted for a well, as by this means a more permanent water supply is likely to be had, and entirely independent of the lessee."

The lake covers a large area and the wave action, as the water subsides, in our opinion, cannot fail to do considerable damage to the tank—which is in an exposed position—by washing away the embankments and partly silting it up.

We find that the tank, not being required for so long a period, in consequence of the temporary supply of water afforded by the filling of the lake—does not in itself render the site objectionable, but its liability to considerable damage by wave action every time it becomes submerged, or partly submerged, is in our opinion a serious objection, which shows want of judgment and forethought in the selection of the site; and it may be deemed advisable to abandon the tank rather than risk any further expenditure upon it.

As to the suggestions of the Mines Department for a tank 3 or 4 miles south-east of the lake (Q. 2439 and 2440) or a well a mile south of it (Q. 237), the former would be too near Murlippa tank, and would make the distances between that and Cooilly still more unequal. As to the latter, the saline nature of the country and the proximity of a very large salt lake—divided from Cobham by a sand ridge only about a mile in width—is much against the probability of obtaining suitable water in an ordinary well, though artesian water of fair quality might perhaps be obtainable by boring.

In reference to this case see evidence, Q. 149 to 154; 237; 583 to 589; 2212 to 2218; 2434 to 2444; 3296 to 3302; 3669 to 3685.

Ivanhoe Tank.—This tank is on the village reserve at Ivanhoe, on the road from Booligal to Wilcannia. The allegations against the site are that, being in the centre of the township at Ivanhoe, it is inconveniently situated for watering stock; that the drainage from the township past stables and piggeries flows into the tank; that the townspeople cannot get near it; that it has never been used for supplying the town; and that it does not hold water well, the soil being very porous.

It appears that a site for this tank was first chosen on the Ivanhoe to Balranald road, about 1 mile west of the town; and a tender was accepted for construction; but it is stated pressure was brought to bear against this site by the lessees of Kilfera run and some of the townspeople. Consequently it was abandoned; and a site was then chosen at Box Swamp, about 1 mile east of the town on Ticehurst run.

Trial holes were put down and contract for construction was let, but between the time of sinking the trial holes and the arrival of the contractor on the ground, the lessees of Ticehurst run selected—*i. e.*, conditionally purchased—the site and ordered the contractor off it, no precaution having been taken to have the land reserved from sale, which Mr. A. P. Wood frankly admits was an omission on the part of his Department. (See Q. 4844, 4845, and 4846.) The Department of Public Works was then apparently forced to adopt the alternative of placing the tank in its present position on the village reserve.

This site was approved of by Mr. Gilliat in his minute of the 18th March, 1885, quoted by Mr. A. P. Wood (see Q. 3350), and appears to have been the only one then available free from the drainage of the town. Mr. Stilwell, under whose supervision the tank was constructed, states that he consulted the residents of the locality as to the suitability of the site, and did not hear anything against it until some time after the work had been in progress. (See Q. 4417.)

We find that although this tank is on the village reserve, it is a short distance (about a hundred yards) apart from, and not in the centre of the town as alleged, which consists of only a few buildings.

That it is somewhat inconveniently situated for watering stock on account of being so near to the buildings.

That the drainage from the buildings does not flow into the tank by the drains, though it is *possible* that it might do so by an indirect course, and from the main road through the lower silt tank during heavy rains.

That the tank is accessible to the townspeople, and though there is no evidence showing whether it has been used for supplying the town or not, it could be used for that purpose, if the inhabitants wished to avail themselves of it, and were permitted to do so.

That the soil is porous and some of the water is now lost by absorption, but the deposition of silt will, no doubt, in time, render the tank sufficiently retentive, the holding powers of the tank having very much improved already.

That notwithstanding that the site is somewhat objectionable, mainly on account of its proximity to the buildings, the tank is a useful work and answers the purpose for which it was intended.

That the site chosen at Box Flat is, all things considered, preferable to that on the village reserve; and the Department of Public Works is responsible for omitting to have it reserved from sale.

In reference to this case see evidence, Q. 158 to 167; 656 to 674; 393 to 400; 1119; 2640 to 2646; 3347 to 3359; 4412 to 4420.

Walla Walla Tank.—This tank is on Petrie's Creek about 25 miles north of Albury. The site is objected to on the ground that it is in close proximity to natural water and that the tank was therefore unnecessary.

We find that the site was suggested by the Stock branch of the Mines Department; that the natural water near it is not permanent, and when it fails, the inhabitants of the locality are entirely dependent on the tank; and that the tank is not an unnecessary work, and the site is not in any way objectionable.

In reference to this case see evidence, Q. 177, 178; Mr. Low's report, paragraph 9, page 58; Q. 1141, 1142; 3417 to 3432; 4332 to 4337.

Gilgai Tank.—This tank is on the road from Nymagee to Nyngan. The site is objected to on the ground that there are some gilgai holes within half a mile of it which are not included in the tenants' lease.

We find that in this case the objection is of a frivolous nature, and that the site is not open to any objection whatever.

In reference to this case see evidence, Q. 181 to 183; 2940, 2941.

Gunaramby Tank.—This tank is on the road from Ivanhoe to Balranald. The allegations with regard to the site are that it is in a swamp, in rotten copai ground; and that it would have been better if it had been situated about 300 yards away on red ground, where the catchment would have been much quicker.

We find that the tank is placed on the edge of a swamp; that it has a good catchment from the swamp and the adjacent high ground; that it is capable, with proper care and management, of conserving a large quantity of water above the berm; and that the site is in every way satisfactory.

In reference to this case see evidence, Q. 838 to 840; 2636, 2637; 3362 to 3367; 4454, 4455, 4457; 4765, 4766.

Clare Tank.—This tank is on the road from Ivanhoe to Balranald. The allegations with regard to the site are that it is on low ground, in a boggy black-soil swamp, and that the works are liable to damage from being surrounded by water when the tank is full.

We find that the tank was placed on low ground in the swamp with the object of commanding as large a catchment area as possible by tapping a neighbouring swamp; that during an exceptionally wet season the water from this swamp—added to that in which the tank is situated—caused an excessive supply, which surrounded the works and made the ground about them boggy; that this state of things was prolonged by the valve being left open, allowing the water to escape from above the berm level of the tank into the swamp; that very little damage was done to the works by the excess of water in the swamp, which could easily have been prevented by cutting off the supply from the upper swamp, and preventing the water above berm level from flowing back into the swamp by closing the valve; that the site probably is the best that could have been chosen in the locality; and that there is no reasonable objection to it.

In reference to this case see evidence, Q. 1098 to 1112; 2625 to 2635; 4421 to 4432; 4765.

Box Creek Tank, and New Tank 16 miles from Balranald.—These tanks are on the road from Ivanhoe to Balranald, at the junction of stock routes. The sites are objected to on the ground that better sites could have been obtained.

We find that the sites are in every way satisfactory.

In reference to these cases see evidence; Mr. Low's report of 17th January, 1888, pp. 60 and 61; and Q. 4459 to 4466.

Tom's Lake Tank.—This tank is on the road from Booligal to Ivanhoe. The allegations with regard to the site are that it is in a rotten, boggy swamp; that there is much better holding ground three-quarters of a mile northerly; and that the tank is quite half silted up.

We

We find that the tank is partly in a swamp, in good holding ground, and where a larger catchment area is obtained, than if it had been placed in any other position; that the troughs are on the edge of the swamp, clear of the bad ground; that there is only about one foot of silt in the tank; and that the site is satisfactory.

In reference to this case see evidence; Mr. Low's report of 7th January, 1888, p. 59; and Q. 4417 to 4451, 4453, 4770 to 4774; and diagram in Appendix.

Kerrigundi and Mulya Tanks.—These tanks are on the road from Cobar to Louth. It appears to have been impossible to obtain good sites in suitable positions on the portion of the road on which they are situated; and we have no reason to doubt that the sites chosen are the best that could be obtained within the limits of the stock-route, and with due regard to approximate equal division of distance.

According to the return of the Department of Mines for the week ending 10th January, 1888,—produced by the Department at the request of the Commission—the first-named tank contained 14 feet of water; and there is no evidence showing that it has not answered the purposes for which it was intended. *Mulya tank* is said to have contained 12 feet of water at one time; and the catchment has been increased by extending the drains so as to make it fill more readily.

We find that any faultiness in the sites of these tanks is due to circumstances beyond the control of the Department of Public Works, and not to any want of judgment in their selection.

In reference to these cases see evidence, Q. 1075 to 1081; 1645 to 1653; 1671, 1672; 2777 to 2786; 3374; 3844 to 3847; 3855 to 3861; 3975 to 3984; 4140 to 4142.

Lowsdale Tank.—This tank is on the road from Corowa to Urana. The site is objected to on account of the sandy and unretentive nature of the soil, which at first resulted in loss of water by absorption; but it is admitted that the tank has been made retentive, and holds well now; and, from the weekly returns of the Department of Mines relating to public watering-places, it appears that the depth of water in this tank during nine months from the 1st January last has been from 16 to 18 feet.

We therefore find that there is now no objection to the site on the ground stated.

In reference to this case see evidence, Q. 200 and 1430.

Thirty-five Mile Tank.—This tank is on the road from Ivanhoe to Wilcannia. It is alleged that the site was badly selected, and that the tank never had any water in it to the knowledge of witness G. W. Townsend. On reference to the weekly returns of the Department of Mines relating to public watering-places—produced by the Department at the request of the Commission—it appears that the depth of water in this tank during nine months from the 1st January last has been from about 16 to 19 feet.

We therefore find that the site is satisfactory.

In reference to this case see evidence, Q. 1845 to 1847; 2174; 2175; 2984.

Booorooban Tank.—This tank is on the road from Deniliquin to Hay. This is a case of alleged faulty site mentioned in the *précis* of cases submitted to us—p. 220. The objections advanced against the site are that it is in a swamp, and that it is near a waterhole which is admitted not to be permanent.

There is no evidence supporting these allegations; or showing that the tank is an unnecessary work; or that it has not fulfilled the purposes for which it was intended.

Youhl Plains Tank.—This tank is on the road from Ivanhoe to Balranald. This, also, is a case of alleged faulty site, mentioned in the *précis* of cases submitted to us—p. 219. The objections advanced against the site are that the drains have had to be taken over porous ground, and that the watershed is very small.

There is no evidence supporting these allegations; and on reference to the weekly returns of the Department of Mines relating to public watering-places, it appears that the depth of water in this tank during nine months from the 1st January last has been from about 14 to 17 feet.

In

In concluding this portion of our report, we desire to point out that there are 113 public tanks on stock-routes in the Colony, including those in course of construction. With respect to twenty-two of these, it is alleged that the Department of Public Works has committed faults of judgment in selecting the sites. It will be seen from our report on the sites of these tanks that there is one case—namely, Old Copago—of total failure and loss of public money on account of injudicious selection of site; that there is one case—namely, Cobham—which may result in total failure and loss of public money on account of injudicious selection of site; and that there is one case—namely, Ivanhoe—in which the site, and the action of the Department of Public Works with respect to it, are, to a certain extent, unsatisfactory.

It is a well-known fact—and it is within the personal knowledge of two of your Commissioners—that in the selection of sites for the conservation of water the squatters themselves have made great mistakes, resulting in loss of money and disappointment; and Mr. Tully, of the Department of Mines, who has had considerable experience as a station manager, admits that in the early days “mistakes were made all round” (See Q. 2491.) Therefore, infallibility in this respect cannot reasonably be expected from a Government department; and taking into consideration the restrictions previously mentioned,—by which the Department of Public Works was limited in selecting sites for public tanks, and the novel nature of the duty to the Department,—the result is somewhat remarkable; and cannot fail to be regarded as highly satisfactory to the public and creditable to the Department.

NO. 2.—DEFECTIVE DESIGN AND FAULTY CONSTRUCTION; TOO STEEP BATTERS IN MOST CASES WITHOUT REFERENCE TO THE NATURE OF THE SOIL, AND THE ADOPTION OF A CERTAIN FORM OF TANK WITHOUT REFERENCE TO THE FORMATION OF THE GROUND.

A great deal of evidence was taken in reference to this comprehensive allegation, which may be resolved into the following more specific allegations.

- (a) That in most cases the batters are too steep, and will not stand.
- (b) That in some cases the tanks are too large.
- (c) That in many cases advantage has not been taken of the lie of the ground to conserve water over the natural surface by a proper disposition of the embankments.
- (d) That the steep batters have unnecessarily increased the cost of construction.

(a) The latest type of tank approved by the Department of Public Works and the specifications are shown in Appendices.

This type is the outcome of many years' experience of tank-construction in all parts of the Colony; and we are of opinion that it is admirably adapted to the requirements of a public watering-place on a large stock-route.

The form is square, the batters of the excavation 2 to 1, and the depth 18 feet. Assuming that experience has shown that this batter is the steepest advisable in most cases, this form of tank—putting aside one of circular plan—will conserve most water with the smallest evaporation and soakage areas; the mean depth will be greatest; the surface exposed to wind and sun will be least; and the probability of the tank holding water through a long drought will be a maximum.

In some of the earlier tanks batters of 1 to 1 and $1\frac{1}{2}$ to 1 were adopted, with a view of still further reducing the areas for soakage and evaporation in relation to the cubic contents. Much fault has been found with these earlier batters, and, we think, much exaggeration indulged in as to the evil effects said to have been produced by the crumbling away of these slopes under wave-action. We inspected two of the tanks specially referred to as instances of this falling-in of the batters, viz., Ivanhoe, a new tank, and Gunaramby. We are of opinion that the damage done by wave-action at these tanks is practically insignificant, and that it will probably cease as age and exposure consolidate the sides. In the older tanks, the growth of water-plants on the batters, which are undisturbed by stock, appeared to afford an excellent protection against wave-action.

We

We find that the charge of blindly adhering to one form of tank, irrespective of varying local conditions, has not been made out.

The Commissioner for Roads points out in his evidence that when he first started these works everything was necessarily of a tentative character, and that every latitude was given to his local officers to modify the type designs and specifications. This is borne out by the evidence of his officers. Long experience has caused a reduction of the slope of the batters from 1 and $1\frac{1}{2}$ to 1, to 2 to 1, and in some instances even to 3 to 1.

(b) As regards the statements that tanks are in many cases too large, we are of opinion that the evidence does not bear out the allegation, and that the Department of Works has, as a general rule, constructed the tanks of the cubic capacity requested by the Department of Mines. Some witnesses have said that the tanks in the Cobar district are about twice as large as required, owing to the quick and good catchments generally available there; but Mr. A. P. Wood, of the Department of Public Works, shows (in Q. 3416 and Appendix XII), that the size of many of these tanks (20,000 yards) was fixed by the Department of Mines. He also proves that the *Walla Walla* tank, the size of which is complained of by some of the Mines witnesses, was constructed of its present capacity in accordance with a minute by Mr. Bruce, Chief Inspector of Stock of the Department of Mines. (See Q. 3425 to 3431.)

(c) That in many cases advantage has not been taken of the lie of the ground to conserve water over the natural surface by a proper disposition of the embankments.

Although the formulated allegations of the Mines Department do not contain the above charge in so many words, yet the evidence given with regard to tanks generally—and those in the Cobar district especially—led us at first to suppose that much stupidity and ignorance had been displayed in the adaptation of the works to particular sites where natural advantages existed for conserving water over the surface of the ground.

We find, however, that such is not the case; and that the allegation has not been substantiated. We consider that considerable skill and judgment have been displayed in many instances in adapting the tanks to local circumstances, so as to catch water from different levels; on one side up to—or nearly up to—berm level; and on the other side above the natural surface—*e.g.*, *Tom's Lake*, *Mossgiel* and *Gunaramby* tanks,—which we personally inspected. At *Tom's Lake* and *Gunaramby* tanks the embankments are run out to the high ground to impound the water above the natural surface, and we find from the evidence that this has been done wherever practicable.

We find, also, that the shape, depth, and ratio of batters have been left very much to the discretion of the local officers, subject to approval at headquarters, and that an admirable code of instructions was issued by the Commissioner for Roads to these officers to guide them in this particular branch of their work. (See evidence, page 148.)

At *Tom's Lake* tank, which has been the subject of much adverse comment by officers of the Mines Department, there are two catchments as already explained, feeding the tank through silt-tanks at different levels. From the neighbourhood of the upper silt-tank a large deep drain has been led for about three-fourths of a mile to a shallow creek or swamp on a slightly higher level than the main tank; this creek has been dammed by a low embankment which was constructed to throw the water down this drain to the upper silt-tank and raise the water in the main tank some feet above the natural surface. When we inspected this tank we found that the water in the upper creek had been allowed to scour a channel round the dam; the intercepting drain choked up with vegetation and silt, and a cutting made through the lower side of the drain near the tank to prevent any water going into the upper silt-tank; so that the object of this drain has been completely defeated. We have no doubt that this drain has at one time brought water down to the tank as intended from the creek, partly because the upper silt-tank was quite full of silt; and from the evidence adduced, we believe the present state of the work to be due to want of proper maintenance and care on the part of those in charge of the tank. This appears to us a notable instance of the lamentable result of the divided control of these public works.

(d) That the steep batters have unnecessarily increased the cost of construction. There

There is no doubt that the steep batters have increased the cost of construction, but not, we think, to the extent supposed by some. To obtain any material reduction in the cost of excavation due to the batters alone (apart from depth and other conditions) would have involved very gentle slopes of 4 or 5 to 1; and we are of opinion that in view of the many undoubted advantages conferred by steep batters, the Department of Works have been wise in keeping them as steep as possible; and that the consideration of the permanence of the water so conserved far outweighs the slightly increased cost of first construction. Taking the increased cost of construction due to steep batters at 2d. per yard in an 18,000 yard tank the increased cost of excavation is £150; and this is but a small fraction of the total cost of such a work.

We are of opinion that the holding qualities of the tanks have not suffered to any appreciable extent owing to the steepness of the batters; and that although at first a tank with steep slopes possibly may not hold as well as one with gentle slopes, yet the published records produced by the Department of Mines of the depths of water in the public tanks during the past dry year afford no indication of any undue leakage. Some of the tanks appear to have leaked when first filled; but there is no evidence to show that any undue loss is now occurring from this cause.

It has also been alleged under the head of "faulty construction," that in some instances the embankments have not been completed to the full height,—notably at *Pulletop* and *Rathole* tanks,—and that as these tanks conserve water over the natural surface, the embankments have been in considerable danger in consequence. It has been explained by Messrs. Hanna and Stilwell, the Works officers in charge, that the contractors in each case failed to complete their embankments, and thereby forfeited some of their retention money; and that if any danger to the embankments has arisen, it has been the fault of the caretakers in not having diverted the water from the drains into the creeks and natural by-washes, and in not having made up the embankments themselves to the proper level. It is evident that unless care is observed in cutting off the supply of water to tanks conserving much above the natural surface, the best finished embankments are liable to be washed away in exceptionally heavy rains.

We took the opportunity when visiting the tanks of sounding some of them in order to test the amount of silt deposited. At *Tom's Lake* tank—which one of the Mines Department witnesses believed to be half silted up—we found only about 10 inches of silt. In an older tank, *Til Til*, we found about 2 feet of silt. This question of the silting up of tanks—which does not appear at present to be a very pressing one—and also that of pumping outlying water over the embankments, are, we think, deserving of careful consideration by the responsible authorities, as being intimately connected with the question of the permanency of the supply of water at these public tanks.

We do not consider it necessary to touch upon all the alleged instances of faulty construction and defective design cited by the Department of Mines, as it would unduly lengthen this report. We are of opinion that the design and construction of Government tanks is excellent, that the batters are not too steep in most cases, and that it is not the case that a certain form of tank has been adopted without reference to the formation of the ground.

For evidence *re* "defective design and faulty construction," see Q. 190 to 211; 265 to 269; 353 to 365; 418 to 426; 458; 593 to 624; 757 to 759; 819 to 821; 960 to 967; 998 to 1000; 1026 to 1027; 1096; 1130 to 1152; 1167 to 1200; 1382 to 1385; 1394 to 1418; 1460 to 1464; 1477 to 1522; 1525; 1586 to 1596; 1644 to 1646; 1665 to 1677; 1804 to 1816; 1824 to 1827; 1831 to 1836; 1964 to 1975; 2040 to 2049; 2078 to 2082; 2097 to 2118; 2147 to 2148; 2334 to 2347; 2363 to 2367; 2460 to 2470; 2490 to 2491; 2556 to 2562; 2573 to 2585; 2637 to 2639; 2646; 2652 to 2655; 2661 to 2666; 2790 to 2795; 2831 to 2836; 2848 to 2850; 2862 to 2886; 2946 to 2960; 3075 to 3125; 3154 to 3161; 3170 to 3176; 3375 to 3396; 3415 to 3434; 3619 to 3631; 3638; 3708 to 3711; 3776 to 3799; 3822 to 3825; 3835 to 3841; 3870 to 3875; 3999 to 4002; 4024 to 4037; 4160 to 4189; 4324 to 4345; 4394 to 4400; 4447 to 4483; 4688 to 4712; 4766 to 4770; 4774.

No. 3.—EXCESSIVE COST OF CONSTRUCTION OF PUBLIC TANKS ON STOCK ROUTES AND SUB-LETTING OF CONTRACTS.

It is alleged that the Department of Public Works has given very excessive prices for the construction of public tanks on stock routes, and that these prices are very much higher than those given by squatters for the construction of their tanks. (See Q. 246 to 252; Mr. Boulton's report, paragraphs 3 & 6, pp. 35 and 36; Q. 793 to 797; 1063 and 1064; 1387, 2073, 2109, 2494.)

The principal reasons given for the alleged excessive cost of construction are,—

- (1.) That the design is unnecessarily expensive, especially in respect to steepness of batters and formation of embankments round and at a given distance from the excavations. (See Q. 263, 344, 360; Mr. Boulton's report, paragraph 6, p. 36; Q. 1019, 1501, 1803, 1824, 1825, 1831, 1832, 1984, 2310, 2311, 2661, 2797, 2864.)
- (2.) That the specifications adopted by the Department of Public Works were framed for the purpose of consuming public money and contain a great many unnecessary provisions. (See Q. 459, and Appendices V and VI.)
- (3.) That unnecessary, absurd, and ridiculous precision and nicety of finish of the works has been insisted upon. (See Q. 264, 267, 454, 455, 462; Mr. Boulton's report, paragraph 6, p. 36; Mr. Chesney's letter, sub-paragraph 1, paragraph 2, p. 76; Q. 1513, 1802, 1803, 1983, 1984.)
- (4.) That delay in payment of contractors has induced them to tender at higher rates than they would have otherwise. (See Q. 264, 345; Mr. Boulton's report, paragraph 6, p. 36; Q. 440; Mr. Mackenzie's report, paragraph 18, p. 84; Q. 1385, 1976, 2312, 2313; 2348 to 2351; 2495, 2658, 2797, 2864; 2956 to 2958.)
- (5.) That contracts have in some instances been let at excessively high rates and sublet at much lower rates. (See Q. 240 to 245; 257, 446; 849 to 852; Mr. Boulton's report, paragraph 3, p. 35; Q. 1325; 1562 to 1565; 1796 to 1801; 1818 to 1822.)

A remarkable fact in connection with the allegation as to the excessive cost of public tanks—as compared with private tanks—is, that the witnesses of the Department of Mines on this question do not seem to have had any knowledge of the prices per cubic yard actually paid by the Department of Public Works for excavating tanks, excepting from hearsay statements, which do not appear to have any foundation in fact. Mr. Gilliat, for example, states that he has been unable to ascertain the cost of the public tanks, yet he says the cost is excessive, because it exceeds the prices given by squatters. (See Q. 245 and 246.)

The cost of squatters' tanks cannot reasonably be taken as a basis for the cost of public tanks, inasmuch as in each case the character of the works, the purposes for which they were intended, and the conditions under which they were constructed, are totally different. The squatters' tanks are often comparatively temporary and shallow works, intended to provide sufficient water for a limited number of stock depastured on their holdings; they are generally designed and constructed as cheaply as possible, and their cost is often considerably diminished by concessions to contractors—such as grass and water for their animals, meat and stores at moderate prices, and sometimes the use of bullocks, &c.—and by taking advantage of favourable seasons and positions, in which they are comparatively unrestricted.

On the other hand the public tanks are national works, suitably designed and constructed, much deeper as a rule than squatters' tanks, and intended to last for all time, and to provide a never-failing supply of water in all seasons for an unlimited number of usually thirsty travelling stock, and for the travelling public. Concessions to Government contractors—such as those mentioned—cannot possibly be made by a public department; but, nevertheless, their money value has to be paid to the contractors, who frequently have to cart water and forage long distances, and to pay high prices for meat and stores; and the works have sometimes to be carried out under pressing public necessity, regardless of bad seasons and other unfavourable conditions. So that if the value of the concessions referred to be added to the prices paid for squatters' tanks, the difference between the cost of them and public tanks cannot be so great as represented, and is, in our opinion, amply justified by the unquestionable superiority in every respect of the public tanks.

With

With regard to the reasons advanced for the alleged excessive cost of construction, we find—

1. That the design, especially as to steepness of batters and construction of embankments, is not unnecessarily expensive for the character of the works, and is fully justified for the attainment of the objects for which they were constructed, and which they appear, generally, to have satisfactorily fulfilled.
2. That the specifications adopted by the Department of Public Works were not, in our opinion, framed for the purpose of consuming public money, but for the purpose of binding contractors to carry out the construction of the works in such a manner as to secure to the public the full value of the money expended upon them, which they appear to have done, and that they do not, in our opinion, contain any unnecessary provisions.
3. That the works appear to have been carried out in a neat, business-like, and substantial manner, in accordance with the spirit of the specifications; and, so far as we have been able to ascertain, no unnecessary, absurd, or ridiculous precision and nicety of finish has been insisted upon.
4. That a system of progressive and prompt payment appears to have been carried out for some years for the convenience of contractors; and that since that system was adopted delay in payment has not taken place, excepting such delay as is inseparable from the necessary routine of large Government Departments, and in cases where contractors have made default in carrying out their contracts, or where disputes have arisen in reference to their claims.
5. That the allegations in respect to the letting of contracts for the excavation of tanks at excessively high rates, and the sub-letting of them at much lower rates, are based entirely upon hearsay, and do not appear to have any foundation in fact, as the sequel will show. And we would here remark that the apparent heedlessness with which this very serious allegation has been made has naturally created in our minds certain doubts and misgivings as to the correctness and *bonâ fides* of numerous other allegations made against the Department of Public Works by the Department of Mines.

Reverting to the evidence under this heading, it will be seen that Mr. Gilliat states that he has been informed that certain tanks at *12-Mile*, *35-Mile*, and *48-Mile*, on the Booligal road, and *Box Creek*, *Til Til*, and *Youhl Plains* tanks, on the road from Balranald to Ivanhoe, were let to Burton Brothers at contract price for 2s. 6d. per cubic yard; and relies principally upon Mr. Low, Mr. Boulton, and Mr. Townsend to prove it. But these gentlemen have utterly failed to prove it, as will be seen on reference to their evidence. (See Q. 242, 851, 852; 1796 to 1801; 1818 to 1822.)

And Mr. Abigail, in speaking of the cost of public tanks, states:—"There can be no doubt about it—there can be no question about it—that as much as 2s. 6d. has been paid away to contractors, who have sublet the work at much smaller rates." (See Q. 446). To prove beyond the possibility of doubt the incorrectness of these statements, Mr. Bennett, Engineer-in-Chief for Roads and Bridges, has exhibited to us copies of vouchers for the tanks in question, showing that they cost from 1s. 6d. to 1s. 9d. per cubic yard; and Mr. Gregory, of the Auditor-General's Office, produced the originals—see his evidence, p. 238. (See also Q. 4837.)

In reference to the evidence under this heading generally, see Q. 240 to 269; 277; 334 to 365; 373 to 378; Mr. Boulton's report, paragraph 3, p. 35, and paragraph 6, p. 36; Q. 440 to 463; 745 to 747; 793 to 799; 1002 to 1019; 1063, 1064; 1385 to 1428; 1500 to 1501; 1502 to 1512; 1562 to 1567; Mr. Mackenzie's report, paragraphs 7 to 10, p. 83, and 19 to 22, p. 84; Q. 1796 to 1810; 1818 to 1834; 1976 to 1984; 2073; 2109 to 2111; 2119 to 2133; 2258, 2259; 2263 to 2265; 2301 to 2359; 2494, 2495; 2658 to 2671; 2796 to 2812; 2873 to 2875; 2940 to 2974; 3108 to 3112; 3131 to 3155; 3383 to 3414; 3632 to 3636; 3663 to 3666; 3937 to 3941; 3946; 4003 to 4017; 4034 to 4037; 4390 to 4398; 4473 to 4500; 4764, 4765; 4829 to 4837.

We find that in letting contracts for the construction of public tanks it has been the practice of the Department of Public Works to invite public competition by tender, and to adopt other measures calculated to insure the construction of the works at fair and reasonable prices, with due regard for the urgency of public requirements :
That

That the cost of these works has ranged from 10½d to 1s. 9d. per cubic yard, excepting in four instances mentioned in Appendix III, in which prices exceeding 1s. 9d. per cubic yard were given for the removal of rock and hard cemented gravel met with in the excavations ;

That, considering the national and substantial character of the works, the purposes for which they were intended, the unfavourable conditions under which, doubtless, many of them have been constructed, and the fact that the contractors who constructed them have not, as a rule, made large profits, but in some instances have become insolvent, the prices paid for the construction of the works have not been excessive.

No. 4.—INCAPACITY OF OFFICERS OF THE DEPARTMENT OF PUBLIC WORKS AND FRAUDS BY CONTRACTORS IN THE CONSTRUCTION AND MEASUREMENT OF PUBLIC TANKS.

It is alleged that Mr. A. P. Wood has been terribly embarrassed by the incapacity of the officers under him, and that these officers have been repeatedly misled by contractors making up the soil round the tanks so as to make the excavations appear deeper than they really are, in some instances by 2 or 3 feet ; that they have been imposed upon by contractors in measuring the work ; and that in one instance cement was represented to the Road Superintendent as gravel, in consequence of which he told the contractor not to go any deeper. (Q. 2259 to 2262 ; 3018 to 3020.)

Mr. A. P. Wood emphatically denies the incapacity of the officers under him (see Q. 3290) ; and from what we have seen of these gentlemen under examination before us, and learned from the evidence in defence, we are of the opinion that it is extremely improbable that they have been misled or imposed upon by such very simple and perceptible artifices as those described, or that frauds to any appreciable extent have been perpetrated. (See Q. 3170 to 3176 ; 3290 ; 3528 to 3530 ; 3532 ; 3638 to 3646 ; 3915 to 3924 ; 4135 ; 4399.)

No. 5.—DEFECTIVE CONSTRUCTION OF FLUMES AND INLET PIPES.

Very little evidence has been elicited in support of this allegation, and what has been given is comparatively trivial and unimportant.

We are of opinion that as a rule the flumes and inlet pipes are of good construction ; and that, with ordinary attention from those in charge, will fulfil—and have fulfilled—the purpose for which they were designed. At Tom's Lake tank, which has been constructed some years, we noticed an open flume failing for want of a little ordinary care on the part of those in charge of the tank.

Great exception has been taken by some of the Mines Department Officers to the method in which the water is led into Gunaramby tank from one side. There are two silt-tanks at opposite sides of the main excavation ; the water from the upper silt-tank is led round both sides of the excavation in drains cut in the berm to the flume on the further side. It is said that this will endanger the edge of the excavation and carry it away into the tank. We fail to see why this should happen with ordinary care and attention, and the explanation offered by the Department of Works, viz., that it was done to save a second flume and apron, costing £100, appears to us reasonable and satisfactory.

At Box Creek tank we found a defective valve on the inlet shoot, which has probably been the cause of a great loss of water. The tank has had 19 feet 6 inches of water in it, which, if this non-return valve had been in repair, would have been impounded in the tank as the outside water fell. We cannot say whether this valve was out of repair before the water filled the tank ; but we do know that it was out of repair at the time of our inspection, long after it might have been repaired by those in charge of the tank. (See Q. 553 ; 838 to 848 ; 1096 ; 1644 to 1678 ; 2637 ; 3128 to 3130 ; 3706 to 3707 ; 4039 to 4044 ; 4455 ; 4781 to 4792.)

No. 6.—CARELESSNESS IN LAYING OUT DRAINS AND EXCESSIVE COST OF CONSTRUCTION.

A good deal of evidence has been received on this subject, chiefly in regard to tanks in the Hay District. Having carefully considered the evidence and visited many of the works complained of, we are of opinion that the Department of Public Works has successfully rebutted or explained away the allegations,

We consider it desirable to specify some cases—three of which came under our own notice :—

Tom's Lake Tank.—Mr. Low, Inspector of Public Watering Places, in a report read before the Commission (p. 59) states:—"Drains. These are badly constructed, especially one alongside of road, which for some distance from its commencement runs water from instead of to main tank, having a direct and sudden fall into same without the water, as is usual, passing through a silt tank. Owing to no silt tank being here and the drain being much cut up by traffic and nature of ground much silt must have been carried into main tank which I feel confident is quite half silted up. This drain could easily and practically have been led to opposite end of tank when water could have run through swamp and silt tank, thus allowing silt to settle and not be carried into main tank."

These statements are further corroborated in his sworn evidence (Q. 1161.) Mr. Stilwell, the Works officer in charge, in Q. 4452, says:—"That statement is directly at variance with the facts. There is a silt tank on this side of the creek through which all the flow must pass into the tank, &c."

Having carefully examined this watering place we found the upper silt tank full of silt, showing that the drain referred to by Mr. Low as running water away from the tank must at one period have run water into it. Moreover, had Mr. Low's proposal of running the water from this intercepting drain into the swamp been adopted, the whole object of the drain would have been defeated, as it was intended to run water in above the natural surface by means of this drain on the upper side, the embankments having been run out as wings for this express purpose. At the time of our inspection the lessee was clearing out the silt tank, which Mr. Low says does not exist; but the drain referred to had been blocked, and the water diverted into the swamp, thus defeating the object of the original design.

In the same report, referring to *Dowdigans*, or the *new tank 16 miles from Balranald*, which had not, by the way, been transferred to the care of the Mines Department, Mr. Low states:—"Drains.—There were 50 chains 6 ft. by 9 in. excavated here. Although there had been heavy rains shortly before my inspection, these had run no water into silt tank; in fact they never will as both drains in some places were full of water but quite dry near the tank, thus showing they would run water from instead of to main tank." In reply to this, Mr. Stilwell, the engineer in charge, states (see Q. 4467 to 4469), that the statement is at direct variance with the facts; that when he visited the place about November, 1887, he was unable to measure up the silt tank, as it was overflowing with water brought down by these drains; that there was no water standing in the drains themselves; and that the water had to be dammed back from the main tank which was not quite completed.

We examined this tank at the end of August, 1888, and found the silt tank two-thirds full of water after a long spell of dry weather. We are of opinion that Mr. Low's criticisms are not borne out by the evidence and the facts of the case.

Ivanhoe Tank.—The allegation in respect to these drains is that they have been carelessly laid out and badly graded; that one important drain (the northern drain) leading to the upper silt tank is ineffective for a good distance at the end furthest from the silt tank; and that another drain leading to the lower silt tank runs through the town and collects filth from stables and piggeries. The Road Superintendent in charge of the work, Mr. Stilwell, in his evidence states that after a portion of the northern drain referred to had been constructed, he found by levelling that an advantageous extension of this drain could be made by cutting through a small rise 3 feet 6 inches in height, and continuing the drain on the other side for some chains. This work he gave to the caretaker to do just before the tank was handed over; the cutting has never been continued or finished properly; and therefore that extension of the northern drain is still ineffective.

We see no reason to doubt that Mr. Stilwell's explanation is satisfactory as far as he is concerned. As regards the lower drain passing through the township allotments we found on inspection that this drain ran through the allotments above the stables and piggery referred to, and consequently did not carry the drainage from these places to the lower silt tank. We concur in the action taken by the authorities in closing this drain, which has been found unnecessary for the supply of water to the tank, as it cuts through many township allotments. We strongly recommend that the allotments near the tank should be resumed, and the catchment area of the tank be kept quite clear of human habitation. From

From the ample supply of water in the tank at the time of our inspection after a long period of drought, we see no reason to doubt that the drains, with the exception referred to—which has never been completed—efficiently fulfil the purpose for which they were constructed.

Hulong Tank.—Exception is taken to the state of some drains at this tank, which are said to run water away from instead of to the tank; and it is further alleged that the Department of Public Works was obliged to lower the level of the flume to get the water to run into the tank owing to carelessness in levelling the drains. (Q. 533, 879, 1096. *Précis* pp. 185–186.)

The engineer in charge replies (see Q. 4445, 4781, 4806), that the drains were not completed by the contractor, who also left the tank excavation unfinished; and the flume set at the wrong level, that the retention money was more than enough to cover the cost of completing the work by day and contract labour; that he had the flume put right by his own men as soon as possible, and not in consequence of seeing water lying in the drains; that in order to save expense he left the completion of the drains to be done by the caretaker; and that the ineffective drains complained of could easily be put right at small expense and trouble.

We are of opinion that the Department of Public Works acted in this manner from a desire to save undue expense and hand over the work to the Department of Mines for use by the public as soon as possible; but that it was unwise to so hand over the work to another Department in an incomplete state.

Excessive Cost of Construction of Drains.—Mr. Low in his report read before the Commission (p. 59 and Q. 1166) states that the cost of the drains at Ivanhoe tank was 15s. per chain—about three times what they should have cost—and this is corroborated by Mr. Yeo. (Q. 2673.) Mr. Stilwell, the engineer who constructed the tank, admits that the price paid for these drains was excessive. It would appear from his evidence (Q. 4508 to 4516) that the drains were offered for public tender, and that he was forced to let them at an excessive price to get the work done at once; and that by so doing he was able to catch the first fall of rain, which would otherwise have been lost.

It would appear that the drains were not included in the tank contract, and that had they been included they would probably have been done much cheaper.

We consider that under the circumstances the Department of Public Works acted judiciously and in the interests of the public in paying this excessive price, rather than run the risk of losing the first opportunity of filling the tank by leaving the drains unconstructed until more moderate tenders were obtained; but that an error of judgment was committed in not including the drains in the tank contract originally.

We have had no evidence to lead us to believe that drains as a rule have been constructed at excessive prices.

For evidence *re* drains, see Q. 553; 667 to 670; Mr. Low's report, p. 58; Q. 1157 to 1166; 1654 to 1658; 2673 to 2687; 3000 to 3001; 3126, 3127; 3350 to 3361; 3699 to 3705, 3762; 3899; 3975 to 3984; 4418 to 4420; 4434 to 4436; 4444 to 4453; 4466 to 4467; 4501 to 4502; 4508 to 4521; 4775; 4818.

No. 7.—EXPENSIVE FORMS OF MACHINERY FOR LIFTING WATER, NECESSITATING GREATER COST OF MAINTENANCE.

The Mines Department, some years ago, strongly urged the adoption of watering appliances at public tanks; and we are of opinion that the recommendation was a wise and proper one. Objection is, however, strongly urged to the alleged expensive nature of the water-lifting appliances adopted by the Department of Works in accordance with this recommendation. The M'Comas horse-gear lift was first tried by the Works, found wanting, and condemned, as it involved expensive timbered wells and staging, and was very difficult to put in order, if anything went wrong when the tank was full. The Mines Department strongly advocated a double whip to be worked by a horse, and sent in a sketch of proposal, which the Works Department found involved the same expensive and perishable timbering as the M'Comas horse-gear lift.

The

The Works Department then determined to adopt pumps, involving little or no woodwork in the tank itself, and selected some simple and effective forms of steam and horse-gear pumps for trial. The steam pumps are placed at tanks where wood is easily obtained, and horse-gear pumps where wood is not easily obtained.

Many witnesses of the Mines Department now state that neither horse nor steam-power is required for these tanks in many instances, and that the hand-power M'Comas lifts would amply suffice in these cases. We can find, however, no evidence that the Department of Mines recommended the adoption of hand-power lifts at the time the question of watering appliances was first taken in hand; and we do not consider that hand-power lifts would have been adequately powerful for these works, taking into consideration the possible maximum demand for water, the depth of the tanks, the severity of the climate, and the uncertainty as to the physical powers of the caretakers or lessees.

We are of opinion that the Department of Public Works has acted wisely in adopting the forms of machinery now in use; that the pumps—both steam and horse-gear—are simple and effective; not easily put out of order with ordinary precautions and care, and neither unnecessarily expensive in first cost nor in maintenance, considering the conditions which they are bound to fulfil at public watering places.

For evidence *re* machinery for lifting water, see Q. 324 to 327; 553 to 557; 854 to 858; 890 to 905; 470 to 471; 761 to 769; 1096; 1201 to 1219; 1527 to 1539; 1614; 1690 to 1706; 1851 to 1855; 1985 to 1996; 2134 to 2139; 2496 to 2516; 2672; 2688 to 2704; 2813 to 2830; 2890 to 2894; 2986 to 2993; 3177 to 3201; 3208 to 3227; 3324; 3372; 3435 to 3462; 3473 to 3475; 3712 to 3716; 3862 to 3869; 4051 to 4065; 4190 to 4208; 4316 to 4352; 4523 to 4536.

No. 8.—EXCESSIVE COST AND FAULTY CONSTRUCTION OF FENCING; SUB-LETTING OF A CONTRACT FOR FENCING; AND EXCESSIVE COST OF GATES.

It is alleged that the cost of fencing at public watering places has been excessive as compared with the cost of squatters fencing; that in some instances the construction is faulty; that in one instance a contract for fencing was sub-let with enormous profit to the original contractor; and that the cost of gates has been excessive.

We find that the prices paid by the Department of Public Works for fencing at Public Watering Places, consisting of fencing inclosing the tanks and caretakers' paddocks, have usually ranged from £58 15s. to £100 per mile; and that in one or two instances £112 and £120 have been paid.

The extent and description of fencing appears to have been decided upon by the Department of Mines (see Appendices X and XI) under departmental arrangements (see "Public Tanks and Wells—Departmental Arrangements;" Class A, No. 7; p. 175), no distinction having been made in the description of fencing for inclosing tanks, and that for lessees or caretakers' paddocks. But the Department of Public Works, finding the description of fencing decided upon very expensive for these paddocks, substituted a No. 4 wire for the top rail, or two No. 6. wires, decided upon by the Department of Mines; and placed the posts 10 ft., instead of 8 ft. 6 in., apart.

Notwithstanding that the posts were sunk 2 ft. 6 in. in the ground (which we consider unnecessary and costly), this is a somewhat less expensive description of fencing than that decided upon by the Department of Mines, and quite as effective. And in Wilcannia district a still less expensive description of fencing has been constructed.

We find that the description of fencing decided upon, and that constructed, is not too substantial or costly for inclosing the tanks, it being absolutely necessary that these valuable national works should be very substantially protected; but that the same description of fencing, and that constructed, is unnecessarily substantial and costly for tenants' leases or caretakers' paddocks; and that the Department of Mines having, under Departmental arrangements, decided upon a very expensive description of fencing for the purpose, is responsible for the somewhat extravagant expenditure that has taken place with respect to it.

The

The cost of these fences per mile cannot reasonably be compared with the cost of squatters' fences, inasmuch as they are—as a rule—immeasurably superior to squatters' fences in every respect; and the conditions under which they were constructed—as in the case of tank-sinking—were probably more favourable to squatters' contractors than Government contractors. Then the timber in some instances had to be procured under great difficulties and carted long distances—in some cases 60 miles—and the contracts were very small as compared with squatters' contracts, which also has materially increased the cost.

There is ample proof that public competition was invited for the erection of the fences—in some cases repeatedly—and that the lowest tenders were accepted.

We may fairly conclude from this and from our inspection of some of them that—as fences—they are, as a rule, worth the prices that have been paid for them.

The following statement is made by Mr. Abigail in evidence (see Q. 387 p. 24):—
“At one watering place a simple piece of fencing required renewing which at the most would have cost £3. The officer reported that the fence should be removed as suggested. This had to go to the Works Office, and ultimately the cost of reporting upon the removal of the fence was some £50.” (See also Q. 388.)

This statement is based entirely upon hearsay. Mr. Hanna states that the work referred to was not done, and that no expense was incurred in connection with it, and gives a full explanation which we consider perfectly satisfactory. (See Q. 3758 to 3761.)

The faulty construction complained of consists chiefly in erecting fences without straining posts, running the wire out to its full length, and straining and fastening to posts only 3 inches thick, which it is said will not stand the wiring plug being driven in; and are splitting and giving way, being unequal to the strain.

We find that this description of fencing has been erected in several instances, experimentally, to lessen the cost and to avoid splicing the wire; but it was discontinued on account of the objection raised by the Department of Mines.

We inspected some fencing of this description in the Hay district; it was in very good order, and seemed to be well and substantially constructed; and we did not observe any of the posts splitting or giving way; but we are of the opinion, nevertheless, that a fence constructed in the usual way with special straining posts is better.

With regard to sub-letting Mr. Abigail states (see Q. 477) “There was one case (Boonoona tank) which cost more than £120 per mile. It was sub-let by the contractor to another man, and the former pocketed about £40 per mile.” And referring to sub-letting fencing at Ivanhoe tank Mr. Yeo states (see Q. 2710):—“The first contractor must have made a profit of £60 per mile on the transaction;” and Mr. Low referring to this case (see his report, last paragraph, p. 59) puts down the profit from first contract price at “at least £33 11s. per mile.”

We find that no evidence excepting hearsay has been tendered in support of these statements.

With regard to excessive cost of gates constructed by the Department of Public Works at a cost of from £10 to £15 each (see Appendix XX), we are of the opinion that these gates are not too substantial for access of stock to public watering places, and that their cost is not excessive.

It is stated that at some of the paddocks to which travelling stock are not admitted these expensive gates are provided (we observed some of them at paddocks in the Hay district), but as no reason is given for this apparently extravagant expenditure, we have no alternative but to find that the Department of Public Works is responsible for it.

In reference to the evidence under this heading generally, see Mr. Boulton's report p. 36, paragraphs 2 and 3; and Q. 882 to 889; 473 to 487; 800 to 801; 821 to 825; 1031 to 1033; 1063; Mr. Low's report, page 58, paragraphs 2 and 3, p. 59, paragraph 13; and page 60, paragraphs 13, 17 and 18; Q. 1220 to 1261; 1437, 1541, to 1557; Mr. McKenzie's report, page 84, paragraphs 8 and 9; Q. 1707 to 1731; 1997 to 2007; 2149 to 2154; 2171; 2390; 2517 to 2521; 2589, 2590; 2705 to 2714; 2841 to 2847; 2895 to 2899; 3228 to 3238; 3476 to 3498; 3536 to 3541; 3719 to 3739; 3740 to 3761; 3876 to 3897; 4066 to 4099; 4209 to 4242; 4357 to 4365; and 4537 to 4582.

No. 9.—INTERFERENCE WITH MINES' CARETAKERS AND OVERSEERS BY OFFICERS OF THE DEPARTMENT OF PUBLIC WORKS.

It is alleged that caretakers and overseers of the Department of Mines, at public watering places, have been interfered with by officers of the Department of Public Works, and that the interference has taken place chiefly in the Hay district. (See Q. 502 to 510; Mr. Low's report, last paragraph on page 61; Q. 1289 to 1314; 2522 to 2524; 2715 to 2733; 3010 to 3014.)

We find that with the exception of the interference admitted by Mr. Coleman, which appears to have been justified (see Q. 4100 to 4107), there is no admissible evidence of direct interference with the caretakers and overseers of the Department of Mines by officers of the Department of Public Works; but that Mr. A. W. Stilwell, Road Superintendent of Hay district, Mr. A. P. Wood, Mr. W. J. Hanna, and Mr. J. Coleman have, we believe, in the execution of their duty, and in the interests of the public, indirectly interfered by reporting to the head of their Department cases of negligence and incompetence of caretakers of the Department of Mines, that have come under their notice. (See Q. 3240 to 3242; 3500 to 3510; 3523 to 3527; 3657 to 3662; 3785 to 3799; 4100 to 4107; 4584, 4593, 4594, 4624; Mr. Stilwell's letter of 9th February, 1887, p. 227.)

That such negligence and incompetence is amply proved by the evidence of Mr. Stilwell, Mr. Wood, and Mr. Adams (see Q. 4610 to 4614, Mr. Stilwell's reports, pp. 222 to 224, and Q. 4588, 3503 to 3505, 4716) and by the fact proved by the evidence of Mr. Abigail, Mr. Boulton, and Mr. Low, that several of the caretakers were reported and suspended for neglect of duty and dismissed on account of their unfitness for their positions. (See Q. 507, 876, 877, 1290, 1312, 1313.)

As far as we were able to observe, the caretakers on the Hay and Ivanhoe and Balranald roads were capable and attentive to their duties.

No. 10.—“GREASING” OF SERVICE TANKS.

It is alleged that service tanks were “greased” with a composition of tar, tallow, and pitch (Q. 907); that 7,000 sheep were lost on the borders of a tank because they would not drink the water owing to the mixture which the Department of Public Works has been in the habit of dressing the inside of service tanks with, causing a film to arise on the water and rendering it undrinkable by stock (See Q. 452 and 2769); that the Mines Department strongly objected to this being done, and has evidence to show that it was done after it was objected to. (See Q. 510.)

We find that a mixture, composed of tar, tallow, and pitch, was in three instances applied by the Department of Public Works to the inside of service tanks, a somewhat similar mixture having been reported by Mr. M'Kinney, C.E., of the Mines Department, to have been used with success in Victoria and having been recommended by him to Mr. A. P. Wood.

That the statement that 7,000 sheep were lost on the borders of a tank because they would not drink the water owing to its being rendered undrinkable by the use of the mixture is not substantiated.

That the mixture at first produced a film upon the water but its effects appear to have been only temporary.

That the Department of Mines objected to further use of the mixture on service tanks, and its use was at once discontinued by the Department of Works in deference to the objections of the Department of Mines.

That no evidence whatever has been offered showing that the mixture was used after it was objected to. (See Q. 3254 to 3259; 3511 to 3519; 913 to 915; 2770.)

No. 11.—FAULTY SITES OF WELLS.

J. K. Well and Menamurtie Well.—These wells are on the road from Wilcannia to Mount Brown. The objection advanced against them is that they are unnecessary, having been placed near permanent waterholes, which might have been used as public watering places. (See Q. 129 to 148; Mr. Boulton's report, p. 36, paragraph 4; Q. 411, 412; 1921 to 1931; 2527 to 2531; 3306, 3307; 4848; 3346.) The waterholes referred to are named respectively “J. K.” and “Menamurtee.”

Though they are fine waterholes they certainly did not afford a permanent supply of water in their natural state; but the supply was largely increased by dams constructed at the cost of the first occupants of the runs on which they are situated.

The

The fourth, sixth, and ninth paragraphs of our report upon the sites of Peri, Yentabangee, Warramutty, and Goomboolara tanks (see pages 6 and 7), and the second and third paragraphs on the site of Tarella tank (see page 8), apply generally to these wells, rendering repetition here unnecessary.

It will be seen that the action of the Department of Public Works in these cases is covered by Mr. Abbott's minute. (See note, foot of page 8.)

Willandra Well.—This well is on the road from Balranald to Ivanhoe. The site is objected to on the grounds that the Department of Mines did not ask for a well there; that one watering-place, namely, a tank, would have been sufficient between Clare and Ivanhoe; that the Department of Public Works constructed two watering-places there, namely, a tank and the well in question; and that the well is absolutely unnecessary on such a road. (See Q. 169 to 172; 3323, 3324; extract from Mr. Gilliat's report of 13th January, 1880, upon the road from Balranald to Ivanhoe, on page 27, Mines *précis* of cases; Q. 4766.)

We find that in constructing two public watering-places between Clare tank and Ivanhoe the Department of Public Works was guided by Mr. Gilliat's recommendations for 1884, for two works (see Appendix XII); and in our opinion one public watering-place between Clare tank and Ivanhoe would not be sufficient, and that a public watering-place at this site is necessary.

Roto Well.—This well is on the road from Hillston to Cobar. The site is objected to on the ground that it is almost alongside of a permanent waterhole in Willandra Creek. (See end of Q. 521, Q. 3295 and 3296.)

We find that the site, though now objected to, was approved of by the Department of Mines, and the Department of Public Works acted in accordance with that approval (see Q. 4848); that Willandra Creek at this point does not afford a permanent supply of water; that the well is a very necessary and useful work; and that there is no reasonable objection to the site.

Normanstone Well.—This well is on the road from Gunnedah to Coonabarabran. The site is objected to on the grounds that it is not identical with that fixed by Mr. Gilliat, and that it is in basalt country. (See Q. 179, 233; latter part of Q. 521; Q. 1739 to 1743; 1756 to 1758.)

It appears from the evidence of Mr. A. P. Wood that this well is in basalt, and was sunk within a few chains of the site fixed by Mr. Gilliat; that many wells sunk through basalt have proved very good water-yielding wells; and that wells sunk in the neighbourhood have given an abundant supply of water. (See Q. 3326 to 3340.)

We find that in this instance the arrangement between the Departments with respect to sites (see Q. 9) appears to have been adhered to by the Department of Public Works; that the fact of the site being in basalt country is not sufficient to justify us in condemning it, and that there is no evidence showing that a supply of water would have been more readily obtained by sinking the well in the exact position defined by Mr. Gilliat.

NO. 12—FAULTY CONSTRUCTION OF WELLS—SINKING, TIMBERING, AND CENTERING OF SHAFTS AND ERECTION OF HEAD-WORKS (TO LINE SERVICE TANK AND TROUGHING) BEFORE TESTING FOR SUPPLY AND QUALITY OF WATER.

There are about thirty wells at public watering-places, and the Department of Mines allege that many of these wells have been constructed, and great expense incurred, without a proper test being made of the supply and quality of the water.

Exception is taken to the sites of *Baloola* and *Normanstone* wells as not being in the exact sites prescribed by the Mines Department, and also that they have been sunk in basalt rock; that no water has been found; and that the whim and service tank were erected or commenced at one of these wells before any water was found.

No trial shafts were first put down in these cases, as the ground was basaltic and it was thought cheaper to sink the main shaft at once.

We are of opinion that it would have been wiser to have bored in these two cases; and that the Department of Works committed an error of judgment in not doing so, as admitted by Mr. Wood (see Q. 3549), although they appear to have had good grounds for their action, as wells in the same district through basalt are said to give a fair supply of good water.

We

We find that head-works were not put up at *Normanstone* well, as stated, and that at Baloola the contractor was stopped constructing the service tank, the whim having been put up most probably to help in the sinking of the shaft. It would appear that these wells are not yet done with, and further boring and driving operations are either in progress or contemplation, so that water may yet be obtained.

Old Gunbar, *Holy Box*, and *Dolmoreve wells* are cited as cases where the Department of Works have completed the shafts and head-works without testing the quality of water and that in each instance the money has been thrown away, owing to the water being quite unfit for stock.

In the case of *Old Gunbar Well* we find that the Department of Works received a sample of water which was good, which purported to come from the trial shaft; and that having sunk the main shaft some distance away from the trial shaft, bad water was obtained, and that the water has remained unfit for stock ever since.

We are of opinion that in this instance the Department of Works has not evinced enough care in testing the quality of water previous to erecting costly head-works and fencing.

In the case of the *Holy Box Well*, we are of opinion that the Department of Works were justified in proceeding with the erection of head-works; and that although the quality of the water is not so good as it might be, it has much improved, owing most probably to constant baling. We visited this work, and found that a large number of travelling and station stock were watering at it, and our own horses drank readily of the water. (Q. 4755 to 4760.)

Dolmoreve Well.—The water at this well is not at present fit for stock; and we find that in this instance also the Department of Works is responsible for having completed the head-works, &c., without properly testing the quality of the water. Seeing, however, that there is within a mile of this well a private well where the water is very good, and from which water is constantly being drawn, we recommend that the well should be leased, if possible, to the lessees of Til Til station, for, say, two years, with a view of its being given a thorough trial, and of testing the value of constant baling in improving the water. We have reason to believe that the manager of Til Til station would be ready to take the well over for a time.

Willandra Well is cited as an instance of faulty construction and excessive cost without any supply of water for stock having been obtained.

We find that this well has given great trouble to the Department of Works, which is still endeavouring to get the well completed and to obtain a supply of stock-water. It would appear that in sinking the main shaft the contractor failed to get the shaft to stand in soft drift at the bottom, and it had to be abandoned, and a new one sunk in close proximity, three contractors failing to complete the well. It appears that the whim, service tank, and troughing have been erected, and two shafts partly sunk, the sums paid to contractors amounting to £752, or considerably less than the first contract. As the operations in connection with this well have not yet been concluded, we are of opinion that the time has not yet arrived for criticising this work, which may, after all the difficulties that have been encountered, prove a useful public watering-place. (Q. 4819 to 4821.)

Wooloondool Well is cited as an instance of faulty construction, in that the Works Department omitted to put a floor and pipe at the bottom of the well; and that in consequence of this omission the bore at the bottom of the well became choked with silt. The Department of Works affirm that no floor or pipe is necessary, and that baling or the occasional probing of the bore is all that is required to keep the well in order. We believe a floor and pipe, as suggested—and, we understand, constructed—by the Mines Department to be unnecessary; and fail to see how it will get over the silting up of the bore, unless constant baling is kept up.

It appears to us doubtful whether wells are satisfactory as public-watering places where brackish water is known to exist, seeing the uncertainty that seems to obtain as to whether the water when struck will be fit for stock or not, and as to where the line is to be drawn between good and bad stock-water. Seeing, however, that wells are so much cheaper than tanks, and afford a more permanent supply of water, we are of opinion that both the Departments of Works and Mines have evinced a proper regard for the public purse in making every effort to put down wells as often as possible, and that the Department of Works is by no means singular in its failure to provide good stock-water in every instance. For

For evidence *re* "faulty construction and excessive cost of wells," see Q. 172 to 176; 179; 212 to 234; 272 to 279; 514 to 523; 553; 802 to 806; 924 to 934; 1035 to 1060; 1096; 1145 to 1149; 1326 to 1343; 1441 to 1448; 1644; 1733 to 1759; 1848 to 1849; 2011 to 2014; 2178 to 2180; 2744 to 2761; 3002, 3003; 3035; 3160 to 3169; 3260 to 3276; 3310 to 3345; 3543 to 3576; 3925 to 3936; 4265 to 4293; 4615; 4640 to 4650; 4819 to 4823.

No. 13.—EXCESSIVE COST OF CONSTRUCTION OF WELLS.

It is alleged by the Department of Mines that the cost of construction of wells has been excessive.

We are of opinion that no comparison can be made between the wells constructed by the Department of Works at public watering places, and those constructed by squatters as regards the material and workmanship. We find that the total cost of some of the wells has reached a sum of £1,000, but this includes the whim, service tank, and troughing, and frequently repairs and alterations. We believe the construction of these works to have been let by open tenders, and that the Department of Works has exercised due reluctance to accept high tenders. We do not consider the class of work at these wells unnecessarily good or expensive for such important national works. Our remarks as to the disadvantages under which tanks are often constructed, tending to raise the cost of construction, apply in some degree to wells.

No. 14.—COSTLY HUTTING FOR CARETAKERS.

The Department of Mines allege that the caretakers' huts designed by the Department of Works were too expensive, and that by undertaking the construction of these huts themselves they have effected a saving of something like 50 per cent. Having compared carefully the drawings and specifications of the huts designed by the Works Department with those constructed by the Mines Department, some of which we have inspected on the spot, we find that no comparison can fairly be instituted between the two classes of buildings. (See Appendices.) The designs of the Department of Works, which were estimated to cost about £100, provide for three rooms, with spouting, and a tank for rain water, while the constructive details are far stronger and better than those of the huts put up by the Department of Mines.

Having examined some of the huts erected by the Mines Department, we consider that they are of very inferior construction; that they will probably in their present condition, fail to withstand a strong gale of wind; and that they are scarcely fit habitations for human beings in the severe climate of the western district. In these huts only two rooms are provided; the gauge of iron and scantling of timber are of the lightest description; there are no braces to walls or roof; no painting of wood work is done; and no guttering or drinking tank is provided—even at brackish wells, such as Holy Box, where we found the caretaker carting his drinking water from Mossgiel, distant 16 miles.

We believe that it would have been a truer economy to erect the more expensive huts designed by the Department of Public Works.

For evidence *re* hutting, for caretakers, see Q. 282 to 295; 1071 to 1073; 1344 to 1354; 1574 to 1577; 1760 to 1764; 2015 and 2016; 2535 to 2537; 2602; 3277 to 3283; 3577 to 3579; 3800 to 3817; 3942 and 3943; 4294 to 4298; 4717 to 4726; and Appendices.

No. 15.—DEFECTIVE CONSTRUCTION OF TROUGHING.

Exception is taken by the Officers of the Mines Department to the original type of railing put round the watering troughs to prevent cattle and sheep from getting into them.

We find that this railing was at first experimental, and that the Department of Works submitted a sketch of the railing as used at some private troughing for the approval of the Department of Mines; that this form of railing was generally approved by the Inspector of Public Watering Places, but that it failed to give satisfaction to the public. We find that a superior design of troughing has been adopted

adopted by the Department of Works, and that a rail down the centre as proposed eventually by the Department of Mines, has also been adopted. We think the latest type of troughing and railing to be excellent. We find that the Department of Works adopted the form of railing which was the best they knew of at the time, and that the subsequent alterations are the outcome of experience. We noticed that the alterations now being carried out to existing troughing rails by the Mines Department are by no means uniform; and while those at Ivanhoe tank appear to be excellent, those at Mossgiel tank seem to us quite the reverse.

We do not find that the Department of Public Works has been to blame in this matter, which has been the subject of experiment for some years by the pastoral community.

For evidence *re* troughing, see Q. 427 and 428; 529 to 531; Mr. Boulton's report, pp. 36-7; Q. 807 and 808; 916 to 923; 1355 to 1366; 1372 to 1378; 1568 to 1572; 1578 to 1580; 1765 to 1773; 2017 and 2018; 2158 to 2165; 2391; 2538 to 2540; 2763 to 2770; 2900 to 2916; 3580 to 3582; 3944 to 3946; 4114 to 4116; 4299 to 4300; and Appendices.

No. 16.—UNFORTUNATE EFFECTS OF DUAL CONTROL, AND SUGGESTED REMEDIES.

We find that the evidence throughout discloses that the dual control exercised by the Department of Public Works and the Department of Mines over the public watering places, and the laxity in adherence to arrangements between them—doubtless framed with the best intentions, but in which the seeds of discord are sown broadcast (see p. 175)—has, as a natural consequence, for some years past, been productive of frequent unseemly differences and recriminations, and much unnecessary and irritating correspondence between the Departments, the tedious details of which we have deemed it unnecessary and unprofitable to enter into in this report.

This very objectionable state of things has no doubt for a corresponding length of time been highly prejudicial to public interests, and to the decorous and regular conduct of public business by the Departments in question. We therefore deem it incumbent upon us to suggest the adoption of the following remedies:—

- (1.) That the Department of Public Works, be charged with the construction of all public watering places, whether tanks, wells, or artesian borings, and with the entire supervision, maintenance, and control of them.
- (2.) That the necessity for constructing public watering places on any stock route, be in all cases reported to the Department of Public Works by the Stock Branch of the Department of Mines.
- (3.) That the sites for such watering places be fixed by the Department of Public Works, dividing the distances between them as equally as the circumstances may permit.
- (4.) That before entering upon the construction of such watering places a report be obtained by the Department of Public Works from the Government Geologist, or other competent authority, as to the advisability of sinking wells or boring for artesian water.

In concluding this portion of our report we desire to point out that for some time past three classes of officers have been employed in the supervision, control, and maintenance of public watering places, namely: Road Superintendents, under the Department of Public Works; Inspectors of Public Watering Places, and Overseers of Public Watering Places (who are also Inspectors of Stock), under the Department of Mines. (Q. 647 to 649.)

But in the event of the Department of Public Works being charged with the entire supervision, control, and maintenance of all public watering places in accordance with our suggestion, the services of the Inspectors and the Overseers of Public Watering Places would be unnecessary, and the duties now performed by them might conveniently (with necessary assistance) be undertaken by Road Superintendents resident in the several districts, who presumably being trained engineers, and having supervised the construction of these fine works, and the erection of all the appliances connected with them, must naturally have a better knowledge of their management, and a greater interest in them than could be expected from unprofessional officers of a foreign department.

SUBJECTS REFERRED TO AT PAGE 6.

(A.) COST OF MAINTENANCE OF PUBLIC WATERING PLACES.

It appears that the revenue derived from public watering places, provided at great cost for construction and maintenance, is so insignificant that the maintenance of them is a burden upon the community.

The principal reason for this appears to be that in good seasons—or after heavy rain—there is usually sufficient natural water along stock routes to enable stock to travel independent of public watering places, which—irrespective of such conditions—have to be continuously maintained up to the normal standard of efficiency, notwithstanding that they may sometimes remain unused for long periods.

We are of the opinion that these works should be at least self-supporting, and that they might with perfect justice be made so, by making owners or drovers of travelling stock pay for the water along the particular stock route they wish to travel, at the time they take out their travelling permit.

The revenue from public watering places would thus be collected by officers of higher responsibility than caretakers over whom, under the present system, there does not appear to us to be any sufficient or satisfactory check.

The proposed mode of payment would not be applicable in the case of teamsters' stock, the collection of charges for which, being comparatively a minor matter, would probably have to be entrusted to the caretakers as at present, if no better arrangement could be made.

(B.) CARETAKERS.

Intimately connected with the question of cost of maintenance is that of caretakers, who, under present arrangements, are employed at most of the public watering places, and we think are indispensable for the protection of the works.

In some cases public watering places are leased, but lessees appear to us not to be so much under control, and in case of any default, such as negligence or incompetence, cannot be so readily and promptly dealt with as caretakers.

Leasing, moreover, appears to involve the expense of erecting several miles of fencing which, where steam water-lifting appliances are used, is unnecessary for the efficacy of the works; and even where horse-power appliances are used, less fencing would perhaps suffice for caretakers than for lessees.

For these reasons we believe caretakers to be preferable to lessees, and in the event of our suggestions as to payment for water by travelling stock being carried out, caretakers might be allowed the use of existing paddocks in part payment for their services.

(C.) CONDITION OF STOCK ROUTES.

We desire to direct special attention to the fact that although a very large expenditure has been incurred in constructing public watering places on the stock routes of the Colony with the object of rendering them available for the passage of stock—especially during seasons of prolonged drought—that object is partially nullified by the usually bare condition of the stock routes, owing to their not as a rule being reserved from lease, and otherwise protected.

The holders of runs over which they pass—naturally desiring an equivalent for the rental they pay—usually divest the portion of their runs embraced by the stock route of every vestige of sustenance, thereby in dry seasons rendering the passage of stock in parts of the Colony not yet traversed by railways very hazardous—if not impossible—just perhaps at a critical time when it may be necessary to remove them to save their lives; the situation being that they must either perish miserably on drought-stricken country, or face the terrors of starvation on a stock route abundantly supplied with water, but utterly devoid of any other sustenance.

This appears to us to be a matter of considerable moment, and we have ventured to introduce it into our Report in the interest of the public and in the cause of humanity.

We

We observe that reference is made to the condition of reserves and driftways for travelling stock in the Annual Report of the Stock and Brands Branch of the Department of Mines for the year 1881 (page 9).

Understanding that the Department of Mines wished to reply to the evidence of the Department of Public Works, we expressed our willingness to receive oral evidence in reply, in denial of facts spoken to by the witnesses of that Department; but although ample opportunity was afforded, no such evidence was tendered.

In conclusion we deem it but just to record our opinion that, although the construction of public watering places and the works connected with them has not been altogether faultless, the large degree of success attained in so extensive, and to some extent experimental an undertaking, is very satisfactory, and highly creditable to the Department of Public Works.

Certified at Sydney under our hands and seals, this thirteenth day of December, 1888.

ROYAL COMMISSION OF INQUIRY INTO CONSTRUCTION OF PUBLIC
TANKS AND WELLS.

MINUTES OF EVIDENCE.

THURSDAY, 12 JANUARY, 1888.

The Commission met at 10 a.m.

Present:—

HON. G. H. COX, M.L.C., CHAIRMAN.
MAJOR PENROSE, R.E., | J. C. WOORE, Esq.

Harry Gilliat called in and examined:—

1. *Chairman.*] What position do you occupy in the public service? I am Chief Inspector of Public Watering-places.
2. You are aware that various charges have been made against the Works Department—that portion of the Works Department which has the construction of tanks and wells: You are aware that certain charges have been made against them? I desire to explain at once that I can hardly regard what has been said as charges, as these papers which I have placed on the table are communicated to me by my local officers in many cases, and submitted by me to my Minister. Of course it would be necessary for me to point out that according to these statements there appears to be considerable waste of public money in the construction of these works; and in the covering paper forwarded to you the other day you will find these cases set out. The full papers from which they were drawn will be submitted to you.
3. Of course you are aware that when I speak of making charges, I do not mean that they are criminal charges; but, rather, charges of carelessness and neglect? Exactly; this is the point which the Minister desires me to clearly explain to the Commission. As a matter of fact the charges are rather against this department than against the Works Department.
4. Well, in that light we can scarcely call them charges; but have not the Roads and Bridges Department charge of the public watering-places? I should say that the Roads and Bridges Department had not charge of the public watering-places.
5. But they have charge of the construction? Yes.
6. Have you yourself any knowledge of these defects or want of skill in construction? To a very large extent I have. I used, until lately, to spend nine or ten months out of every year in the interior. Up to 1885 I visited every part of the colony, but since then the duties have so increased that I could not make the inspections so frequently.
7. *Major Penrose.*] Do you not think it would be well to get a clear definition how far the duties of each department extend?
8. *Chairman.*] Yes; there is a sort of dual control. As soon as the work of one department is completed it is handed over to the other department.
9. *Witness.*] It is handed over to the Mines Department. We can recommend any number of sites for tanks, but it remains for the Works Department to decide which shall be selected. The arrangement arrived at between the two departments will be seen from the printed papers. It was a matter of some discussion, the final decision being that the Mines Department should indicate the position in which they wished the watering-place to be put, and that the Works Department should fix the exact site; so that, if in a report I recommend a certain site, the Works Department are supposed to fix it exactly. I objected to that arrangement at the time, but was overruled. This arrangement has been in force ever since; although, I may add, a number of watering-places have been constructed by the Roads and Bridges Department without reference to the Mines Department.
10. Are you aware upon whose recommendation these were made? The matter was never referred to us, and I knew nothing about them officially until we received an intimation that they were ready to be handed over.
11. *Major Penrose.*] Within what limits would the Works Department be allowed to vary the site of a tank? There was no actual rule established. It was merely that the Mines Department should indicate generally the position of the tank. The Works Department fixed the exact site.
12. *Chairman.*] Then I understand that the general site would be fixed by the Public Watering Places branch: the Works Department to construct it within a suitable distance therefrom? Yes; in two of the cases that are brought before you, of wells, I attached so much importance that I fixed the exact sites by mile-posts; in both of these cases the position was altered.
13. To what extent? In one case to about 4 miles, and in the other to about a third of a mile.
14. *Mr. Woore.*] Are there any papers to define the arrangements and relations between these two departments? Yes; and they will be submitted to you. They will be submitted with the printed papers; and that is the reason why I was anxious not to be examined until the printed papers were laid before you, so that I could be able to refer to them while under examination.
15. *Chairman.*] I think we ought to exhaust this subject now before we touch another. We can in that way make our inquiry as symmetrical as possible. We can proceed point by point, and there will be no confusion in referring back to anything we have dealt with. You say that in the first instance the Mines Department were not consulted as to the localities in which tanks and wells were to be sunk? The arrangement was that we should recommend; but cases have occurred in which watering-places have been constructed without reference to the Mines Department.

H. Gilliat.
12 Jan., 1888.

H. Gilliat.
12 Jan., 1888.

16. *Mr. Woore.*] The arrangement has not been strictly adhered to, then? No.

17. Was it adhered to at first? For the first few years I had great difficulty in getting works constructed; but, latterly, owing to the recognition of the importance of the works, the Works Department have proceeded with greater rapidity.

18. *Chairman.*] So that the Commission may understand, is it not a fact that when the Public Watering Places Act came into force it was then arranged that no tank or well should be constructed without reference having been previously made to the Mines Department, and the work recommended by it? That arrangement came into force previous to the inception of the Public Watering Places Act. This measure should have altered the whole affair, because it gave the whole power to the Secretary for Mines—that is, the whole power of construction. As a matter of fact this Act took the whole power out of the hands of the Works Department.

19. So I gather from you that the present construction of tanks and wells by the Works Department is in contravention of the Public Watering Places Act of 1881? Yes, it is. But I may further say that soon after Mr. Abigail took office he directed that certain of the papers showing the relations between the two departments should be put before him. These were submitted to the Cabinet, and by its direction a letter was subsequently addressed to the Mines Department, directing that for the future it should undertake the construction of these works. My first action was to place before the Minister a statement of what would be necessary before we gave practical effect to the Cabinet minute, and we wrote to the Roads and Bridges to know what arrangements they had entered into for the construction of the various works recommended by the Mines Department during the last few years. They were again reminded, but we have received no reply, and my hands are tied in regard to doing anything except with further works; because I cannot get the information as to what engagements have been entered into.

20. *Mr. Woore.*] I should think the letter referred to ought to be produced.

21. *Witness.*] I will have it put in.

22. *Chairman.*] When did the construction of tanks and wells first begin under the Government—do you remember? I took charge in 1879, but to the best of my belief the earliest tanks that I heard of were the three little tanks that had been completely destroyed, which were constructed by the Surveyor-General's Department. The first constructed by the Roads and Bridges branch was, I believe, the Boonoono tank, on the Booligal to Wilcannia road, about 92 miles from Wilcannia. The 48-Mile tank on the same road was constructed before I took charge. The 35-Mile tank, the Holybox well, the Jumping Sand Hill well, the Mossgiel well, the Mount Manara well, were also constructed prior to my appointment. Then, on the road from Balranald to Ivanhoe, the Box Creek, the Youhll Plain, and the Til Til tanks. These are all that I recollect at the present time, besides those on the road between Cobar and Bourke.

23. *Mr. Woore.*] Is there not another, the 25-Mile tank? That has been completed since. There are a number of others; one at the 26-Mile, and another at Ivanhoe. Those of which I speak are prior to 1879—to October of that year. On the road between Cobar and Bourke there were several. I would like to qualify that statement, as I am not quite certain that these latter were not constructed in that very year. Of course, I am merely giving an approximate idea of the dates.

24. I asked this question because I wanted to know how these tanks were taken over, and in whose charge they were previous to your taking charge of them? There was absolutely no one—no caretaker—in charge. There were some other tanks on the Cobar to Bourke road, and the Cobar to Nyngan road. I think I am approximately correct in stating that there were not more than twenty tanks and wells for public watering-places constructed in the colony at that time. Our present list of available works is 165.

25. You were first appointed overseer of public watering-places? I was appointed inspector. I was first appointed in the year 1879.

26. *Major Penrose.*] Is that position conferred under an Act of Parliament? I was appointed by the Governor and Executive Council, and in consequence of the rapid increase of public watering-places, the Act became necessary.

27. *Chairman.*] Previous to your appointment, who took care of the tanks and wells? They were without caretakers, and the principal objection—the original element of discord—is my having been obliged to point out to my Minister in a departmental communication that no care was being taken of the tanks and wells after construction, and that some of them were useless. That was the subject of a report, which I am sorry I cannot put in evidence, because the document was destroyed in the Garden Palace fire. Prior to the appointment of caretakers, the tanks and wells were mainly in the hands of the various road superintendents.

28. *Mr. Woore.*] Were not some of these public watering-places let to squatters? I think in one case this was done. The Waiko well was so let.

29. What about the tanks on the Booligal road? I think not. I can only speak from hearsay.

30. Was it not a general practice? I cannot say. Until we introduced the system of leasing I never heard of it.

31. *Chairman.*] Then we are to understand that prior to your appointment there was absolutely no control exercised over these tanks and wells after construction? To the best of my knowledge and information, none but that of the local road superintendent. I received authority from my Minister to take delivery of these works from the different local road superintendents.

32. So that they were really under the control of the road superintendents? Yes.

33. Then after your appointment did you take steps to have caretakers appointed on all these tanks? I called attention in a number of reports, showing the condition which these works were in; and I think it was early in 1880—I cannot be quite positive about it—it was decided to appoint caretakers. It was very soon after my appointment. I also, at an early date, pointed out that the appointment of caretakers would necessitate additional outlay by the Government, and urged the importance of leasing the works. This gave rise to the steps subsequently taken.

34. We are anxious to go through the whole process, so that we may find out who are responsible.

35. *Witness.*] The Department of Works were hardly aware of the importance of these works to the travelling stock at the time, and my recommendation was made that a certain area of land should be attached to each of these tanks and wells by which the lessees would benefit, and would add to their inducements to rent them.

36. *Mr. Woore.*] You are quoting now from the report? Yes, I am quoting roughly from it; but I cannot put it in, because the papers were, as I have already said, destroyed in the Garden Palace fire.

H. Gilliat.

12 Jan., 1888.

37. Is that the substance of them? Yes; so far as I can recollect.

38. *Chairman.*] What I am trying to lead up to is to ascertain who the parties are who had these tanks in charge from the earliest time to the present. I want to find out when they took charge, so that we may know who are responsible for the work from the beginning to the end? I may state that the general substance of these reports has been frequently re-stated in reports that will be placed before you.

39. No doubt the papers, when they come before us, will give more information, but any papers that are printed are of no value to us, except they are supported by oral testimony. We must get our information *viva voce*, and on oath, so that every statement made in the papers must be verified on oath. I may add that any statement made in the papers is useless to us, excepting so far as it will help us to elicit information for ourselves. Now in the year 1880, some few months after your appointment, you recommended that instead of giving the tanks over to the caretakers they should be leased, and that small portions of land should be attached to them—in fact, that a sort of common should be made around those tanks and wells for the use of travelling stock? Yes. In the original recommendation the arrangement was that 200 acres should be given around the tanks as a special lease. But my duties kept me constantly in the field at that time, the office duties being then performed by the Chief Inspector of Stock. He brought before the Minister for Mines my reports from time to time, and amongst these was a recommendation that we should give over 200 acres to the lessees under special lease.

40. Were these leases to be disposed of by tender? Yes; they were originally to be invariably let by tender.

41. Was that arrangement carried out? That was given effect to, but I cannot say exactly the date. It would be in the course of a year or two afterwards, and some of the public watering-places referred to would be in these reports.

42. Then, you say that your report was acted upon some time subsequently, and that these tanks and wells—or most of them—were leased, with small portions of land attached? Oh, no; only a few of them, because we had a very great difficulty in getting satisfactory surveys from the Lands Department. In some cases of special lease asked for at a work, 200 acres were prepared; but the surveyor, not understanding the requirements of public watering-places, placed the work in the centre; the consequence was that as a leasehold the land was of very little value, because so large a slice would be taken away to admit stock.

43. What was the object of this leasehold: was not the land to be a sort of common? No; it was intended as an additional inducement to a person to come forward and lease the works. The water would enable him to keep a little stock of his own and to have a garden; but the tank was supposed to be always on a reserve.

44. *Major Penrose.*] Having the water, these leases would be useful to the caretaker in the way you state? Yes.

45. *Chairman.*] Then, you had some difficulty in having the surveys made to enable you to issue those leases? Yes; that is the better way to put it, because what I have said before might be considered a reflection on the Lands Department. I certainly had no intention of making any such statement in this connection. I think it was really a difficulty to obtain suitable surveys. We had a difficulty also, inasmuch as there was some trouble in obtaining the services of men understanding the requirements of the watering-places. The lease of the 200 acres was intended for the use and convenience of the tenant, so as to give him a small property which he could cultivate in the neighbourhood of the work.

46. And unless this survey was made on one side of the tank, so that the tank should not be in the centre of the ground, the land would be valueless to the lessee; because it would be a mere common, for the use of travelling stock? Yes.

47. Were there any other causes of delay beyond the want of appreciation, and the difficulty in having surveys made? No; but there were other causes mentioned in my earlier reports. In these I pointed out that where the tanks had been constructed there was no continuity in the line of water; one tank might be placed here, and there might not be water for a great number of miles on either side. I called attention to the necessity of having these works at regular distances, to enable travelling stock to pass from one to the other without suffering from any risk of thirst.

48. Do you think that that could be the fault of the Department? I may point out that this was the view I took in my recommendations of the object to be attained for the future.

49. Well, suppose there was no water for 50 miles. The Government would put a tank midway or 25 miles from the nearest water—that would give temporary accommodation, but they could not put a tank at 12 miles, except after a long time. Yet, after putting the other tanks through, the route was made available at once? I recommended that tanks should be put down at points which would enable us to bridge over dry places; that subsequently they should be put down at intervening points. This has since been carried out, and some routes are magnificently watered now.

50. Then, for various reasons, the system of leasing the tanks was not followed? It is in force, but was not availed of to the full extent that I hoped it would, and which I think it will be in the near future.

51. But in the meantime you had caretakers? Yes.

52. When do you take charge of the tanks and wells, and by whom are they handed over to you—by the Works Department? We usually took over the tanks and wells from the local road superintendents; but in some cases arrangements were made by which we nominally took transfers. I, for a time, visited and took the transfers myself, and placed the men in charge, who were to be directed by overseers. I believe it was about 1881 that we took charge of the first new works.

53. So that they were absolutely placed in charge of the Mines Department as soon as they were handed over by the person in charge under the Works Department? Yes.

54. And you became responsible for them? Yes; but as a matter of fact one of the questions which arose at the time was as to who should undertake repairs. The maintenance of the tanks is vested in the Mines Department, but in case of accident or break-down, or a “wash-away,” or anything of that sort, it became necessary under the old arrangements to refer the matter to the Department of Works.

55. *Major Penrose.*] Then you had no constructive power? No, for there was a clause in one of the arrangements that we were not to spend more than £10 per annum for minor repairs at each tank. We looked, therefore, to the Works Department to repair any accident of a serious or disastrous character.

56. *Chairman.*] What were the duties of the caretaker? Exactly what is detailed here in these printed instructions. These are the instructions issued to the caretakers, which were prepared by me for the officers of the Department; and with them are the regulations and the Act. The pamphlet gives general instructions to inspectors, overseers, and caretakers.

H. Gilliat.
12 Jan., 1888.

57. In accordance with the regulations at the end of the Act? Yes; they were practically the same as those in the Act and Regulations. Of course, experience has shown us what was desirable and what was not, and we have altered the regulations; but they are fundamentally the same.
58. *Mr. Woore.*] What I understand is that, after the tanks were completed, they were handed over to the Mines Department?
59. *Chairman.*] Yes, unless some break-down occurred.
60. *Mr. Woore.*] Let us hear what this "break-down" means? It means that anything that requires the expenditure of money we are required to refer to the Works Department.
61. In case of silting up of the tank, would that be repaired by the caretaker? Yes.
62. Then, all you could do in the way of repairs was what the caretaker could do? Exactly so.
63. Beyond that, it was the duty of the Public Works Department? Yes; we were allowed the sum of £10 to be expended on each tank by our department; that was outside what the caretaker might be able to do. Substantially, these are all the instructions issued to caretakers.
64. *Chairman.*] Then, what you mentioned just now—that only substantial damages were made good by the Works Department; and that, where damages are of less cost, they are not referred back to that department—does not that show that the Works Department do not finally give up all charge of these tanks and wells, even when handed over to you; because, in any heavy breakages, you state that the matter might be referred back to them for repairs? Yes.
65. Is not that likely to be the cause of disagreement? It was the whole cause of the annoyance and friction which have arisen. When the printed papers come before you, they will show that.
66. We are not going into that now. We want to confine your remarks now to the fact that various tanks and wells were sunk in improper places. The other matter is only incidental? I think I may safely say, to the best of my belief, this was one of the fundamental causes of the disagreements between the two departments. I stated this substantially to the Minister in a draft which I gave to him, and which he took to the Cabinet meeting; but it was never seen afterwards. The document was not registered nor copied. My statement to him was this—that, when we called for certain repairs to be made, the Works Department said that the repairs were necessitated by the carelessness of the Mines officer, while we contended that it was through the works not having been properly carried out in the first instance.
67. *Mr. Woore.*] Was it optional with the Mines Department to take over these tanks or not? Were you obliged to take them over whether in good order or not? I am very glad indeed that you have asked that question. We did not desire to take works over unless in good order. On the contrary, on one occasion I refused distinctly to do so unless I received instructions from the Minister; but I was instructed to take over everything that Mr. Bennett handed to us.
68. *Chairman.*] You have no discretion in the matter? No; none whatever. I have a discretion now; because, since Mr. Abigail came into office, I raised the question with regard to certain works.
69. *Mr. Woore.*] You were obliged to take the tanks and wells over whether you approved of them or not? Yes; whether I thought they were properly carried out or not. As soon as the papers are placed before you, you can turn up all the points and the deductions to be derived from them.
70. When these tanks were completed, was the construction of them approved of by any person, either in the Mines or Works Departments, before they were handed over to you? In many cases they were not approved of by us; but I assume that they were approved of by the duly authorised officer of the Works Department.
71. Do you know who he is? Mr. A. P. Wood and the local officer, I believe, dealt with the contractor. I am very much afraid that until the case is properly before you, with all the papers, it will be difficult for me to make myself clear to the Commission. In many cases years have elapsed since the matters referred to in the papers were dealt with.
72. *Chairman.*] We met here on Tuesday, and had the *precis* of the papers handed to us. We then determined to examine witnesses first on the faults of judgment in the selection of sites for tanks and wells; second, on defective design and faulty construction; third, on expensive forms of machinery; fourth, on faulty construction and excessive cost of fencing; fifth, interference with contractors; sixth, subletting of contracts; seventh, faulty construction of wells, sinking and centring of shafts, erection of head-works, service tanks and troughing before testing supply and quality of water; eighth, excessive cost of construction; ninth, cost of hutting for caretakers; and tenth, defective construction of troughing? Well, I will deal with the first point, and I can state that some of these tanks have been under water since 1885.
73. Well, we will not go into that now. I merely wished to point out to you how we want to carry out this inquiry. We want to exhaust one subject before we go into the next.
[*A discussion ensued, with the result that it was arranged the Commissioners should not read the papers for the present, but go on with the points given in the précis.*]
74. *Chairman.*] Then all tanks were placed in the hands of caretakers? When I say that all were placed under the charge of caretakers, there may be one or two tanks where (being close to natural water) we did not think it necessary to employ men. We did not think that we were warranted in going to the expense of engaging caretakers for them.
75. What tanks were these? Peri Sand Hill, Yentabangee, Warramurtie; and, I think, Goomboolara.
76. These were the tanks that you declined to put caretakers on? We really found that no stock would come there to water, and on that account we did not think that the expense was warranted.
77. *Mr. Woore.*] You thought that, being close to natural water, the tanks would not be required? Yes; that the tanks would not be used, owing to the presence close by of natural water.
78. *Chairman.*] The number of tanks became so numerous, and the expense so large, that you considered it desirable to have legislation on the subject? Yes.
79. And you recommended that such should be done? Yes. I recommended it, but not in writing. It was more in the nature of a conversation with the Minister.
80. Well, we will put it in that way. There was a large expense incurred, and in view of the great importance and necessity of legislation you advised certain changes, which were made in the Act of 1884? Yes, that is a very fair way of stating it.
81. Now, did this Act lessen the difficulties that you were labouring under with regard to the unfortunate disagreements between the two departments? Oh, no; I don't think so in the least. I do not think that as the Act has been administered it would be likely to reduce departmental friction. The Act legalised the construction of public watering-places, and enabled their being placed under caretakers; but as administered,

administered, the Act did not in any way reduce the friction between the two departments—not in the least. 82. Are you in a position to point out how the Act could be remedied in this direction? Well, the fifth clause of the Act provides that the construction should be vested in the Minister who administered it, and there is another clause providing that the works should be leased by the Mines Department.

H. Gilliat.

12 Jan., 1888.

83. Then the Act was not carried out in its integrity, although the fifth clause said that the Minister for Mines shall have the construction and maintenance of the tanks? No.

84. And notwithstanding that this provision is in the Act of 1884, the law has not been carried out? No; it has not been carried out.

85. Can you give any reason why the Act was not carried out in its integrity? I can give no reason for it. I have pointed out from time to time to the Minister how urgent and desirable it was that the whole of the construction and maintenance of these tanks and wells should be placed under the control of one department.

86. What is the Minister's opinion on the subject? Well, he is the first Minister who has taken a very strong view of the matter. The other Ministers were very much pressed with other business, and have allowed this matter to stand.

87. *Major Penrose.*] I may point out to you what the Act says: "It shall be lawful" to make a change? According to my reading of the Act, I should say the Minister has the power at any time to take over the construction of the tanks.

88. *Chairman.*] Are you aware why the Minister of your department does not carry out the law in its integrity? Can you tell us why he does not take on himself the powers and duties conferred on him by this Act? That I cannot say; I have no evidence to show. I really do not think there is any reason to show why it has not been done.

89. But there is a Cabinet minute on the subject? Yes; it was written about September or October last.

90. Can you put it in evidence? I will do so at the next meeting.

91. *Mr. Woore.*] What is the substance of this Cabinet minute? That the construction of public watering-places and the maintenance shall in future rest with the Department of Mines.

92. But if there is an Act giving that power already to the Minister for Mines, is this minute needed? No; I don't think there is any necessity for it.

93. *Chairman.*] Can you tell us why that minute has not been acted on? Well, when the minute directing the construction of watering-places should be taken over by the Minister for Mines was received, the period of retrenchment came in. We asked the Works Department to make arrangements to enable us to carry out the construction. Before I could go on I had to ascertain how far the Works Department had gone with letting contracts. I therefore submitted to the Minister, that in accordance with the instructions from the Cabinet, it was necessary we should be informed to what extent the Works Department had made engagements with contractors for works, and also the names of those works. To that letter we have received no reply. I could do nothing further with regard to these works, and could not put down in the estimates for this year the sum of money which I thought would be necessary to carry them out until such information was supplied.

94. And having no money you could not go on with the works? Certainly not; because the money voted hitherto was for the Works Department, and it was impossible for me to make any provision or prepare estimates for the carrying out of the work, until we received the information as to how the other department stood with regard to contracts. We have been waiting for that reply ever since, and have not yet received it. We thought that an amicable arrangement could be made for the transfer of the vote, as was done with regard to the vote for hutting. When the Works Department submitted the tenders they had accepted, or had arranged to accept, they were sent on to us; but the average cost was thought too high. The vote was transferred to us, and we have since carried out these works.

95. *Major Penrose.*] We have got clearly now the position of affairs.

96. *Chairman.*] You tell us that the papers show that Peri Springs tank has been constructed within 500 yards of permanent springs, one of which gave 7,000 gallons per day. If this is proved, it is clear that the tank was constructed near permanent water? Upon this I can give you personal evidence, because I have inspected it several times.

97. Is it a fact that this tank was constructed within 500 yards of permanent water? I will not say that it is within 500 yards, but the spring is within the tenant's lease. As one method of recouping money that had been unnecessarily expended on the tank, I had a survey made to include the springs within the tenant's lease at the Peri Springs tank. A person said that if he were allowed to develop the Peri Springs himself he would make the Paroo run into the Darling. This tank has certainly been sunk within half a mile of permanent springs. One of these springs was opened by Mr. Hogarth, the manager of the Momba Pastoral Company, whose letter on the subject is attached to these papers.

98. *Major Penrose.*] Who asked that the tank should be made at that spot? From recollection I cannot now say.

99. You do not remember at whose instance this tank was sunk? No; it certainly was not sunk through any action taken by the Mines Department, as the papers will show.

100. *Mr. Woore.*] Where are those springs situated—are they not in the lake? They are on the edge of the lake.

101. Are they not right in it, or, at all events, right on the margin of the lake? Yes; on the margin. The lake itself is about 5 miles by 18, and when full lasts about three years with drinkable water. After that the water becomes brackish and finally salt. When completely full, the water in the lake will last five or six years.

102. *Chairman.*] It is filled now? Yes; it has been filled by an overflow.

103. *Mr. Woore.*] Have you ever known the supply of water for stock to fail in the Peri Springs during the driest season that you have known? I have been through the country during the severest drought that the colony has known, and there was then plenty of water there.

104. If the supply of water had failed in the spring, were there other springs that could have been opened, and would have given a further supply? Certainly; Mr. Hogarth's letter says that by an expenditure of £300 he could have supplied sufficient water there to water every hoof that came down the Paroo.

105. Are these springs on the travelling stock reserve, or are they on private property? If they are not available for travelling stock, it would necessitate a tank being put down, and there may be some reason why

H. Gilliat.
12 Jan., 1888.

why the Works Department put the tank there in this case? I am going to explain still further. In wet seasons the Paroo, by overflowing the country, forces teamsters and the travelling stock to go close to the shores of the lake. The tank has been put on the wet weather road, and in close proximity to the springs. This diagram shows the edge of the Peri Lake, and the tank on the east side of it; while here is the road in which the stock has to travel in time of flood. The tank, instead of being put on the dry weather road, and where it might have done some good, was put there 3 miles further back upon the wet-weather road, where there is always a supply of water. In this case, the route goes along the clay-pan and sand ridges, along the shores of the lake, and regains the main road further on.

106. Are these springs not known to be the most permanent water in that part of the country back from the river? I should say so unquestionably. I think they are the most permanent water on the Paroo, or even in the whole of this part of New South Wales, with the exception, perhaps, of certain springs on the other side of the Paroo between Yantabulla and the Paroo. They are the same line of springs, but on the Bourke to Hungerford road.

107. *Major Penrose.*] Are there any other faults with regard to the size of these tanks—is there any fault as regards catchment? No fault that I know of as regards catchment. Of course, there are places on this line where tanks would have been useful. My original report is against these particular ones. The Peri Springs tank was bottomed on cement, which is very difficult to take out.

108. *Mr. Woore.*] This tank was constructed after you took charge? Yes, after I was appointed inspector; but I think the selection of the site was made about the time of my appointment. I am not sure that I was not consulted myself about this tank.

109. You do not know at whose instance the site was selected? I know this by looking through the papers—that it was selected by the Works Department at the instance of two Sydney stock firms, who asked that water might be supplied *en route* between Hungerford and Wilcannia. I see by the papers the sites of both tanks were selected by Mr. Cambridge, who was the Works Department local road superintendent at Wilcannia.

110. *Chairman.*] This is a very important matter? Yes; and it will be shown fully in the papers.

111. Then the site of this Peri tank was selected by Mr. Cambridge of the Roads Department? Yes.

112. *Mr. Woore.*] I suppose you have his report on it? The Peri Springs tank papers give the whole history of the case. They show that letters were received calling for a tank at this place.

113. This man was quite a stranger in the district at the time? I believe he was.

114. Will you please read the report made by Mr. Cambridge on the matter? Yes.

Report by Mr. Road Superintendent Henry Cambridge.

Tanks, Paroo Road.

Hay, 30 June, 1879.

Sir,

In accordance with your instructions, I visited the Paroo respecting proposed tanks on that road. I found that the following would be about the stages from Wilcannia to—

1. Copago dam, 27 miles—dam and tank here already made by Department.
2. Momba dam, 50 miles—nothing required here.
3. Peri Sand-hills, 70 miles—tank required here.
4. Nipper's Creek, 83 miles, or Yentabangee Lake, 89 miles—good sites for tank at either.
5. Warramurtee, 106 miles—tank.
6. Goombalara, 131 miles—tank.

I think the £6,000 available will make four tanks, at £1,500 each. They need not be very large—say, 12,000 cubic yards each. I should recommend that tanks be put down at Peri Sand-hills, Nipper's Creek, or Yentabangee Lake, Warramurtee, and Goombalara. At this last place the Paroo channel becomes defined, and water is found in the water-holes. The places recommended are all cane-grass swamps, and have good drainage area. The sites recommended have been suggested by some of the oldest residents in the district, to whom I am indebted for a great deal of information respecting the road and sites suitable for tanks. I should have mentioned that we already have a tank and dam at Copago. At Momba there's a good billabong, which is very seldom dry, and has at present a good supply of water; so that the tanks I suggest will cover the portion of the track at present unwatered. My visit was very hurried, and consequently I had not such a good opportunity of thoroughly examining the country as I could have wished, especially as it rained the whole of the time I was away from Wilcannia; but I think that very little more can be said of these sites I propose than that they are suitable.

I should not think of recommending any tanks with pumping gear for this portion of the district, but similar ones to those that are being put down between Hay and Booligal. I am, &c.,
The Commissioner for Roads.

HENRY CAMBRIDGE.

I should suggest that these tanks be let as soon as possible, to enable contractors to take advantage of grass and water. This will save at least 20 per cent.

With respect to Major Penrose's question just now as to whether there were other objections, it appears to me, in the first place, that it was radically wrong to put a tank there on account of its close proximity to water which is much more permanent than the tank. There is also the fact that no trial shafts were sunk to ascertain the nature of the soil in which they were going to put those tanks down. Then Mr. Cambridge writes:—

PERI TANK.—On the 22nd January I received the enclosed letter from the contractor, advising me that he had got on to a hard sandstone in the drinking tank, and asking for extra remuneration on that account. I wrote him in reply herewith, and on my visit found matters as described by the contractor. I found powder was being used to blast out the stone. I brought a sample with me, which I send by post. I think some slight allowance might be made. Will you kindly inform me if the stone being in the tank, and not having shown in any of the trial shafts, will nullify the contract? I have never had such a case before, and shall be glad to know for future guidance. The main tank and also the silt tank were completed. A good deal of gritty material came out of the main tank. The banks round the tank were well consolidated and were well trimmed. I laid out a series of drains, shown on accompanying plan. They follow the water-courses, which at this tank are fairly plain and are well graded—in fact, the fall throughout is about 1 in 200 to 1 in 100. I laid out about 113 chains of drains, which will be quite sufficient here. The water at this tank will be good, as it all runs off sand hills and hard ground. I find a great deal of salt in all the ground about; but I do not think this will injure the water.

There are a good many clay-pans. These places are hollows that have been coated with clay from water lying in them. These will all be drained into the main drains.

Reduce the size of the tank. Arrange it so that the cattle will stand on the stone as far as possible when drinking. I find that it is objected to that they bog in these tanks.—W. C. B.

One would think Mr. Cambridge's common sense would guide him here. Of course the man must be paid extra; but I cannot conceive how Mr. Cambridge laid out a tank in a place where there was the slightest possibility of meeting rock. I hope such a thing will not occur again. If the printed specification was complied with, it could not. Will the tank be water-tight?—W. C. B.

I do not wish to put this in evidence; but I may remind the members of the Commission that in dealing with this gentleman's report a considerable amount of latitude must be allowed, because he was
subsequently

subsequently convicted of a serious crime. He was convicted of embezzlement, and was confined in gaol for a number of years. I believe the embezzlements took place in connection with supplies to these very contractors. Cambridge stated that tanks would be put down after consultation with a certain number of the oldest residents of the district. I wrote to Mr. Hogarth, the manager of the station on which this tank was placed, and told him the whole story. My letter is as follows:—

H. Gilliat.
12 Jan., 1888.

My dear Mr. Hogarth,

I wish to obtain an opinion from an independent observer with regard to the value of the Peri Sand-hill, the Yentabangee and Warramurtie Government tanks, on the Paroo, and whether they are or are not so close to other sources of water as to interfere with their being leased.

Any remarks you may have to make upon them will be sure of careful attention.

As I am preparing a paper on these works, I shall be glad if you will let me hear from you as early as possible.

I am sorry to say that the tracing you lent me, with the other papers connected with the wells of the Colony, were destroyed in the fire at the Garden Palace.

I expect to be on the Paroo in four or five months' time, when I hope to have the pleasure of meeting you.

W. Hogarth, Esq., Manager, Momba Pastoral Company.

HARRY GILLIAT.

The following is Mr. Hogarth's reply:—

My dear Mr. Gilliat,

Momba, 27 January, 1883.

Yours of the 18th to hand, *re* tanks in this district.

Peri Sand-hill tank I don't think you will ever be able to let, simply because it is within a quarter of a mile of the Peri Springs, therefore I think putting the tank down in the present site a great waste of public money. Had the Government and station-owners (M. P. Co.) combined and spent say £300 on the Springs, they would have watered all the stock that ever came down the Paroo, and all station stock that the country would carry.

Yentabangee is almost similarly situated, being within about 3 miles of the Tongo waterhole, which is almost permanent on the one side, and Olpoloko waterhole on the other side, also about 3 miles distant from tank. In my opinion this tank should have been put down at the Olpoloko waterhole, as it would have divided the distance between the Peri Springs and the Tongo waterhole, making about 10 miles from the former and 6 or 6½ from the latter.

Warramurtie tank I don't know anything about, as I have never seen it. I note the tracing, &c., I sent you, got burnt. Should it be of any further use to you, I could get you another, and also showing another well where I was fortunate in getting good stock water at 148 feet. The supply is not great, but I believe by going down 5 or 6 feet there will be an abundant supply. Hoping to see you in the course of a few months,

I am, &c.,

Mr. Gilliat, Inspector of Tanks and Wells.

W. HOGARTH.

115. *Mr. Woore.*] Well, we will go on to the next tank—Yentabangee—where is that situated? Yentabangee is the next tank to the Peri Springs. It is not so serious a case as the Peri Springs case, except that it is close to water, which would give a large supply at a less cost had the natural features been utilized.

116. Have you thought of the possibility of floods washing away dams? I know that some of the dams on the Paroo have been washed away, but far above Yentabangee and Olepoloko; but all danger could be avoided by increasing the earthworks, and allowing flood waters to go off by the natural by-washes. I am speaking now of what could be done at either of those places.

117. What is the next tank? The next tank is No. 118—Warramurtie. This is within half-a-mile of a waterhole that lasted during the whole drought. The point we raise is a twofold one: If the tank is excavated within reasonable distance of permanent water, it is absolutely impossible to lease it. The question is, then, whether it is not more desirable to improve permanent water where it exists, than to make new tanks and wells. The point I am raising is this: that the tank has been put down near a permanent waterhole. So permanent is it that I have never known this place to be dry, even during the last drought; and Mr. David Brown, of Kallara, on whose run this place is situated, can give you testimony to this effect.

118. *Major Penrose.*] Is this another tank recommended by Mr. Cambridge? Yes.

119. Did the Works Department know at this time that the tanks were going to be leased? I cannot say that.

120. Because your objection on that ground to leasing to squatters would fall through? I should say it was extremely likely that they did not know that the tanks were to be leased; but it is a point on which I cannot say whether they were informed or not.

121. *Mr. Woore.*] Were there any reports since the reports received from Mr. Cambridge? Mr. Cambridge's reports came in June, 1879. I was only appointed on the 6th of October of the same year, so that it would have been some months before my appointment. Consequently, these tanks were recommended before the Works officer knew anything about me, or about the proposal to lease the tanks.

122. So that no idea of leasing could have been brought forward? No. The Dry Lake tank has never been transferred to us, because it was under water the whole time.

123. In regard to this Dry Lake tank, you say there was no necessity for it? I was sent up at the time of the water famine at Milparinka. Sir John Robertson was Colonial Secretary at the time, and I had to report upon a scheme of water supply for this road. I made a full report, and it will be placed in evidence here. My recommendation concerning this place was that a tank was unnecessary. A man named Smith had put down two tanks and a well, and had made provision for the watering of travelling stock which I considered sufficient, and I called attention to that fact.

124. You thought a Government tank there unnecessary? Yes; and I drew attention to the fact that as Smith had gone to considerable expense to put down water, we should not enter into competition with him; and that so long as his charges were reasonable I did not think we should interfere. I considered it a legitimate enterprise and expenditure of private capital, and I believed we should not put a tank there. I also made a series of recommendations as to where in my opinion water should be provided, and as the watering of this road is one of the most serious errors that have been committed from our point of view, I should like to be examined upon it. The Works Department in this instance put a tank where we recommended there should not be one.

125. Was there not a public-house there? Yes; a very respectably-kept place, indeed.

126. *Major Penrose.*] If this Mr. Smith placed a tank and well there, and made them profitable, surely the Department were justified, in case they wanted to construct a tank there, in thinking that they could do the same? Quite justified, if they thought the tank necessary; but I thought that under the circumstances it was not necessary, because this man Smith had made arrangements to water stock, and did, as a matter of fact, water stock all through.

127. When you were there did you foresee that the place was likely to be flooded? No; and I did not object to the general site at all. I merely thought that a watering-place at that point was entirely unnecessary in view of the local provision that had been made. I recommended also that the whole of the lake should be reserved as a water reserve in case it might ever be required for that purpose.

H. Gilliat.
12 Jan., 1888.

128. *Mr. Woore.*] Was it not already a water reserve? I was informed there were frequent applications made for it. The reserve was in danger of being alienated. Applications were being made for it as a conditional purchase.

129. *Chairman.*] You know something about Meenamurtie? This is another case in which a well was constructed in the vicinity of permanent water. This well had been sunk within half a mile of permanent water on the Bunker Creek.

130. *Mr. Woore.*] When was that well sunk? Within the last year or two. I submitted a scheme for this road between Wilcannia and Wampah waterhole. I thought a work at this place was unnecessary, on account of the Meenamurtie waterhole.

131. Is there a well on the water reserve? I cannot say, but we objected to a well going down there on account of its being close to a permanent waterhole.

132. *Major Penrose.*] When did you object? As soon as we heard of it. Instead of adhering to our scheme they put a tank down at Dry Lake and a well at Meenamurtie, in contravention of our report. The Tarella tank is in close proximity to two dams yielding water. These belong to Mr. Quin. There was one on each side. I pointed out in 1883 that there was no necessity along the Bunker Creek for additional water.

133. *Mr. Woore.*] But you could not fairly take away the water that the lessees had conserved and use it for travelling stock? Mr. Quin told me that it was unnecessary, and that he never prevented the travelling stock from being watered at his place. The next work on that road to which we have to take exception is No. 75. There is a waterhole there—the J. K. waterhole; and I recommended that it should be dammed and fenced, and a small horse-pump put there. If this had been done it would have given us an ample supply to meet the necessities of the road. However, that was not acted upon, and they have sunk a well there, but have not got water.

134. What depth is this well? I have no information about it.

135. It is used? I presume so. This has been going on for two or three years or more. At least that period has elapsed since the work was commenced.

136. *Major Penrose.*] Have you written a report, saying that you wanted water in a certain place, and never afterwards heard anything about it from the Works Department? I will not say that they have not treated us with sufficient courtesy; but they have not complied with what we might say was departmental etiquette; and where they have departed from our recommendations they have not informed us, and gave no indication of desiring to do so.

137. Did you ever suggest that the officers engaged in the construction department should go around with your officers? Not exactly in the selection of sites, but for a short time an officer of the Works Department travelled with me while we were taking delivery from the Works Department.

138. But never in the selection of sites? No.

139. *Mr. Woore.*] Still these recommendations from your Department for the supply of water were simply ignored by the Works Department? Yes; and in those that they carried out they expended a great deal more money on the roads than was necessary.

140. And your recommendations as to sites? They were not adhered to; not closely. As a case in point: they put a tank in Dry Lake, where there was no necessity for one, and at Meenamurtie, where a well was not only unnecessary, but where we reported against it. Again, they put a well at considerable cost at the J. K. waterhole, where we considered all that was necessary was that the existing dam should be slightly added to.

141. And the well is useless in consequence? Well, we know nothing about it, because it has not been transferred, on account of the Works Department having failed to find water.

142. Is there now no other water there? There is a permanent waterhole; but if there was danger that that water might give out I would at once make provision to have that waterhole made effective. Since I have been Chief Inspector I have found it necessary on several occasions to take action of that kind.

143. *Major Penrose.*] Then the only watering-place on that road was taken over by you? Had it been open to me to decide, I should have recommended that we should not take over Meenamurtie, because I do not think there is the least chance of its being leased. However, it is near a public-house, and drovers may use it occasionally.

144. *Mr. Woore.*] Are you aware that a large expenditure on a dam has been made at the Meenamurtie waterhole? Yes; and it was an expensive one. As long as the water is made on the travelling stock reserve I think the public have a right to water their stock there; but I suppose that is a question which will have to be fought out.

145. If the public have no right to water at this place, where the water is conserved by a squatter, then the Works Department would be justified in constructing a tank—would they not? Well, I look for precedents to those countries where water conservation is dealt with as a national question, and where the water is retained as the property of the Crown. The water in every creek, stream, and river and lake is held as the property of the Crown, and the Crown has the right to adjudicate in respect to it without reference to private interests or private rights as opposed to public needs. At the time I was in that country I stayed at Meenamurtie and went very carefully over it with the manager of the place. I consulted him on the subject, and he said that there was ample water for travelling stock if they were confined to a certain point of entrance. My recommendations dealt with that point, as will be seen in my report. The view I took was that there was available local permanent water that had been used for years by everybody that passed that way.

146. But they might have been using it only on sufferance? Then they could have continued to use it on sufferance.

147. But might they have been prosecuted at any time? I think not. Well, that, I will admit, is a most important point; but there was ample water there for everybody that required it.

148. And this well was sunk close to a waterhole, where the public had a legal right to get water? That is my opinion.

149. Are there any other watering-places on this road? Yes; I called attention to Cobham Lake, No. 77. I recommended no watering-places there, to the best of my recollection. I thought that a well back from the lake would have been better. We knew the lake was frequently filled and to a large extent; but having no outlet, it became salt in time. The Works Department constructed a tank so far within the boundaries of the lake that it has been under water ever since January, 1885.

150. *Major Penrose.*] That might be a perfectly good tank in dry weather? Yes; but fancy the state the tank will be in when the water dries up! It will be very nearly silted up. You have yet to examine these tanks with high banks all round them.

H. Gilliat.
12 Jan., 1888.

151. But do you not think that this would be a perfectly good tank in dry weather? Yes; I think it would, provided it had not been under water for three years.

152. *Mr. Woore.*] When you recommended the well, was there no other probability of getting good water there? I had made a careful inquiry at Milparinka from a number of persons, and I learned that there was no prospect of doing it.

153. Were any other wells sunk there? Yes; I was informed other wells had been sunk about the country, and good water obtained.

154. Were you aware when you recommended this that there is a large salt lake close by? Yes, I was perfectly aware of it; but the Cobham Lake is just as salt as that when it stands for a few years.

155. *Major Penrose.*] When will you be able to take this place over? I can hardly say; but if you will permit me I will read Mr. Abbott's minute on the subject:—

The Minister for Mines with reference to an Extract from the *Sydney Morning Herald*.

Department of Mines, Sydney.

In an article published in the *Sydney Morning Herald* on the 10th instant I find the following:—"Tanks and wells have been repeatedly constructed where they were not wanted, and where no local authority would ever have placed them. For example, on Menamurtee station a Government well has been sunk within a mile or two of permanent waterholes, both on the stock road. A Government tank has been constructed on Tarella station, close to the Coonawatta dam, on the stock route. This dam has been used by travellers and drovers for a long time; and although a station work, it is available for the general public, there being abundance of water. A Government tank has been made on the Paroo Road, close to the Peri springs—a natural reservoir on the stock reserve, sufficient for all the stock that can ever travel that way. Now for a case of another kind. On Mount Manara an expensive well has been sunk, securing abundance of water good for stock. This well has been abandoned, and no one is looking after it. It is said that some years ago one of the slabs with which the well is lined got loose; the bucket stuck, and could not be brought up. No attempt was made to put it right, and there it remains. As the well is sunk in hard rock, there is not the least risk of its giving way, and it is believed that it could be put in working order for a few pounds; but no official has any instructions to deal with it, and though the public suffer by the want, nothing is done. This is certainly a burlesque on centralization and officialdom."

It is alleged that a Government tank has been sunk within 1 mile of two permanent waterholes, on a stock road on Menamurtee station. I shall be glad if Mr. Gilliat will inform me whether this allegation—first, is true; second, if true, why was the tank so constructed?

10 May, 1884.

J. P. ABBOTT.

Mr. H. Gilliat, Inspector of Public Tanks and Wells, in reply to the memo. of the Minister for Mines.

The Peri Springs and Public Tank.

20 May, 1884.

In reply to the minute of the Hon. the Secretary for Mines, T. and W. 542, with reference to the statement in the *Sydney Morning Herald* of the 10th instant, that a public tank has been made close to the Peri Springs, I have to say it is correct.

Early in 1881 I was directed by the Secretary for Mines to take delivery and report upon the tanks on the Paroo, between Wilcannia and Hungerford. My report was submitted in April of that year, and pointed out that it was improbable that tenants would ever be obtained for the Peri, the Nipper's Creek, or the Warramurtie, on account of their neighbourhood to good water supply.

The Peri Springs are within 500 yards of the Peri tank, and are practically inexhaustible.

The Nipper's Creek tank has the Olepoloko waterhole 5 miles on one side, and the Tongo waterhole 3 miles on the other side.

The Warramurtie tank is about half-a-mile distant from the Warramurtie waterhole, one of the finest in the Lower Paroo.

The attention of the Department has on various occasions been directed to these works. I may add that it is only within the past ten months that the Department of Mines has been admitted to have any voice in the selection of sites for works, and that I am not aware of any instance in which it has been consulted with regard to their construction.

HARRY GILLIAT.

156. Were the faults of judgment in the selection of sites a general thing? No; I do not say that. There are numerous other cases referred to in the papers; but those I have given you are the principal ones.

157. I presume they have traversed all these statements? Yes; and traversed this very report on the subject. They referred to Mr. Woore again about it. The following is the reply of Mr. Bennett on the subject, and I think it should be put in evidence along with the other papers. I am now merely stating my view of the case. All these papers afford information, although they traverse our opinions on the subject. The following is the letter:—

Minute by the Commissioner and Engineer for Roads and Bridges.

Roads, Sydney, 8 August 1884.

In compliance with instructions to report on the strictures contained in a paragraph by letter from in the *Herald* of 10th May, on the operations of this Department in the dry country, I think it necessary to deal with the paragraph in its entirety.

It begins by pointing out the desirability of a Local Government Act. As I have long advocated such a course, I append two paragraphs from reports of mine, dated 31st March, 1865, and 9th February, 1871, respectively.

It is generally represented that the Department is opposed to such a measure. The extracts appended show, on the contrary, that I have always advocated it, but from reasons different to those generally put forward, as I cannot admit that the works would be better done, as throughout the Colony where municipalities do exist it will almost without exception be found that the best roads and bridges therein have been made under this Department either prior or subsequent to the formation of the municipality.

As to not giving consideration to the wishes of those on the spot, Mr. Cambridge reports that the sites were recommended by the oldest residents, and Mr. Quin's letter of approval was an evidence that Mr. Wood gave satisfaction.

The first specific accusation in the paragraphs is with reference to the Peri tank. The Minister for Mines asks that the Minister for Works will ascertain who is responsible for this gross waste of public money, and the cost or amount so wasted.

The amount is £1,500. The tanks in this Paroo route were demanded in very strong terms by the local press, by a petition forwarded and urged on by the then Member for the district, Mr. Colin Simpson, and by letter from Mr. W. Brown, of Wilcannia. Mr. Cambridge, Road Superintendent at Hay, was directed to report.

I attach copy of his report with parts underlined; but, not satisfied with Mr. Cambridge's examination, as he was then new to the locality, and liable to be misled by interested persons, I requested that the opinion of the gentleman whom I considered, and had a right to be, the best and most disinterested authority—Mr. Woore, the then Commissioner for Crown Lands—should be obtained, and asked Mr. Cambridge to confer with him. His letter is attached.

The waterholes referred to by Mr. Gilliat either have been made since, or it was considered that they were private property, and not available for public purposes, as Mr. Brown distinctly states there was not a drop of water on the line in dry seasons, and that great losses of travelling stock had been sustained. I am not sufficiently informed on this point, but will endeavour to ascertain.

It is no doubt extremely easy to find fault, now that the country is known and of easy access, water conserved, and communication facilitated.

H. Gilliat.
12 Jan., 1888.

When the inquiry as to works was being made, the course of post was at least six weeks, and there was no railway nearer than Junece.

It should not be forgotten that tenders were invited for the construction of these works in *Gazette* and local papers for some weeks. No one during that time objected, and excessive pressure was put on the Department to get the work executed during the season when it was alone possible.

If there has been a gross waste of public money, which, notwithstanding Mr. Gilliat's assertions, I doubt very much, I alone am responsible, if it is considered I could have done more and laid the Department open to accusations of delay and accountable for loss of stock.

Mr. Wood had nothing whatever to do with these Paroo works; but that the springs were not overlooked is evident from the sketch plans sent by Mr. Cambridge.

I have not had time to get detailed information about the relative positions of other works and respecting adjacent waters; but Mr. Woore's approval applies to all on this line.

I need not further dwell on accusations made after seven years, when the whole circumstances of the case have changed; but, in the interests of the future, I think that Mr. Gilliat's recommendation as to further expenditure on these works should be considered in the light of Mr. Higman's recommendation of 26th November, 1878, as to the probability of this route being superseded when rail opens to Bourke. I will therefore not proceed with the alterations and additions suggested by Mr. Gilliat until further instructed—at most the Copago tank or well there, which I believe would be most advisable; and, as instructed at the Peri, Mr. Hanna reports that the slopes are easy and the ground firm, and stock can be watered with safety and despatch, thus avoiding expense which the erecting of pumping-gear would involve.

As regards Mount Brown road and Mr. Abbott's memo. on Mr. Gilliat's paper, requesting that searching inquiry be made into the matter, I append Mr. Wood's paper.

There were a number of communications from the district urging on the construction of some sort of water supply about the commencement of 1881, and at the urgent and pressing request of those interested, Mr. Wood was despatched to let such works and take such steps as seemed to him necessary for the permanent opening of a route to a large goldfield which was then pronounced to have been proved. Mr. Wood's mission gave great satisfaction at the time, and I might say an unparalleled letter was written by Mr. Quin, M.P., expressing approval of the action taken.

The Under Secretary for Public Works.

W. C. BENNETT.

[The Commission adjourned until the afternoon, when the sitting was resumed.]

158. *Mr. Woore.*] I want to ask you about Ivanhoe tank? Yes; that is one which I ought to have brought up this morning. It is a case that shows very clearly, in my opinion, the evils which a divided control between the two Departments has brought about. I am not sure whether the Ivanhoe tank papers are amongst the papers yet before you or not. Still I can give you a general account of it, reserving the point that the evidence I am giving is merely from recollection; and, as I am on my oath, I want to be particularly careful.

159. *Chairman.*] Can you remember at whose instance this tank was sunk? The general question of the construction of the Ivanhoe tank was at my instance—on my absolute instance that it was necessary the work should be done. It is situated at a central point between the Lachlan and the Darling—that is, on the road from Hay to Booligal, and at the junction of the Paddington and Balranald roads. The abandoned Waiko well had been sunk about half a mile or three quarters from it.

160. By whom? By the Works Department. It was done some years previously—(I cannot give the date; perhaps Mr. Woore could give it);—probably about 1874 or 1875, or perhaps before that time. I found that this Waiko well had been leased to the Kennedy's, of Ticehurst. It was in drift, and there was always a danger of such a bottom caving in. I had a careful examination of this well made, and I obtained information from all the neighbouring stations about it.

161. What was the depth? I think it was about 120 feet.

162. *Major Penrose.*] What do you call drift? I mean very fine sand. It is suspended in the water, it is so light. By the least disturbance it floats, but it will again settle on the bottom. Shafts in drifts frequently form cavities behind the slabbing, and then the whole thing collapses. After carefully considering the question, we found no proof that absolutely pure water had been discovered at any of the wells on the neighbouring stations. The water at all was more or less brackish. I therefore recommended, on account of the probable increase of population at a central point like Ivanhoe, that a tank should be made at a site which would necessitate the resumption of a portion of purchased land. Mr. Williamson, who was the owner, offered to exchange this for other land in the neighbourhood. Being a field officer at the time, and not in charge of the branch, there was a good deal of delay; but at length the Works Department was urged to construct the tank. Instead of carrying out my recommendation with respect to the site, another was selected. This was upon Ticehurst Run, and the excavation was commenced.

163. *Chairman.*] How far was this distant from the township? As to that, I can only speak from hearsay; but I believe it was about a mile or a little more from the township. After having commenced this tank (being at the time in Hay) I received information that the tank was being excavated on a conditional purchase or an improvement purchase. From subsequent information I obtained, it appeared that the officers of the Works Department then removed the site of the tank, and had sunk it directly in the township.

164. *Major Penrose.*] Why did they move it? Because it was on private ground. Of course we understood that they had to pay compensation to the contractor for shifting him from the place where he had commenced. It was simply a piece of carelessness in not obtaining a knowledge of where they had a right to put the tank down.

165. *Chairman.*] This is the way it is put in the memorandum:—"The Waiko or Ivanhoe well fallen in through neglect prior to 1879. Tank required for use of township and townspeople; and after much correspondence, the Works Department consented to construct it. A site was recommended by Mr. Gilliat, but not adopted. Another site chosen for tank upon Waiko private property. Tank site was altered to present position in main street of Ivanhoe. Compensation paid to contractor for moving. Tank sunk in sand-drift. Papers relating to prices paid for fencing and drains, also to character of drains and fencing in this case?" I have no personal knowledge myself that compensation has been paid to the contractor, but I understand that it was paid. Everything else is quite correct.

166. And this tank was first sunk in the sand? Oh, no; bottomed on sand-drift.

167. What is the meaning of the sentence, "sunk in the sand-drift"? I do not know that. It was probably reported on as leaky—that is, having sand-pipes in the sides or bottom, and after filling, the water sank away. The defective selection of site was caused by not putting down trial shafts.

168. There are also questions in regard to fencing, but we do not intend to touch them? That is an entirely distinct matter. Of course the present objection —

169. *Mr. Woore.*] Which is No. 10? No. 10 is the Willandra well. The *précis* states, in regard to that well: "The construction of this well not asked for by the Mines Department. Site selected by Works Department."

Department. When nearly completed, a supply-tank, troughs, and whim erected, it was found that a portion of the headworks were upon Kilfera private property. Chief Inspector recommended one tank between Clare and Ivanhoe. Works Department constructed the tank and the well. He also pointed out that from experience gained in district, wells were not suitable. Construction so defective that although only 102 feet deep, the cost has exceeded £1,050."

H. Gillist.
12 Jan., 1888.

170. How did it happen that the well was being sunk on private property? The papers will show that.

171. You have no personal knowledge? None; except that all the papers came through me. I dealt with the matter fully, and here are my minutes on the subject. They first commenced sinking a shaft on the edge of a reserve. After they got the headworks erected, they found that the service-tank and the troughing were encroaching upon an improvement purchase.

172. *Chairman.*] This states that the sites that were fixed by the Mines Department were not adhered to in the Willandra case? As a matter of fact they were not. In reference to the Clare tank, I wrote a report in 1882 or 1883 as to the want of watering places on this road. I thought one would be sufficient (as it was not a first-class road) between Clare and Ivanhoe. Instead of this the Works Department put down a well and a tank where one would have been quite sufficient. My whole experience in this district showed me that wells were undesirable, because when sunk the water was found to be very salty. This is also shown in the papers. Without consulting the Mines Department, or in any way referring to my report on the matter, they proceeded and put down this tank, No. 58, No. 57 being Willandra well. The water in this is absolutely salt. The well is between 98 and 102ft. deep. I considered it absolutely unnecessary upon such a road. The case is a very long one, and the papers will be given *in extenso*. In regard to the Holy Box well, I find a statement in these papers which shows that evidence as to salty condition was submitted, and that it was quite unfit for the travelling public; but it is not shown that the well is salty just now. Another question comes in, in No. 18—Mount Manara. It appears that this well was sunk on the shoulder of a hill, the tank being some 5 miles away.

173. Are you aware of the circumstances in connection with this well at Mount Manara? This is not one of the very salt wells, but of insufficient supply. It was constructed about the same date as Waiko.

174. Before the Mines Department had anything to do with it, I suppose? Yes; but still these reports show that we reported against it. We showed that the supply was so small that it was practically useless for a road supply. We recommended the construction of a tank, which has since been carried out; and the well has been abandoned.

175. The chief charge here is that the whim and tank were constructed without testing the value of the water? It was generally the case. Mount Manara well is not a good one, and No. 10, Willandra well, shows it more completely. There was no proper test of the quality of the water in this case.

176. Now, in regard to Roto well—this too has been constructed, I believe, in the vicinity of permanent water? In a recent case against the lessee, the Bench declined to find against him, on the ground that the well had been constructed near permanent water. They forgot that he was proceeded against for a breach of contract, and a breach of the Regulations under the Act.

177. Have you dealt with the Walla tank? This is one of those minor cases which are of lesser importance. It was constructed on a road where it was used by a few selectors. I reported in 1883 that it was absolutely unnecessary at the time; still the Works Department constructed it.

178. This is what the *précis* says on the subject:—"Walla Walla tank. Papers indicate that this tank is in close proximity to large swamp, although this site was reported upon adversely by the Chief Inspector, Public Watering Places. Even if required at its present site, the rainfall is sufficiently great to have rendered a very much smaller tank sufficient?" The statement there is substantially correct. I reported against it altogether.

179. What about the Balloola and Normanstone well? This is a case where three wells were recommended, and in each I defined on a tracing the exact points. I was very short-handed at the time, and sent the original papers to the Works Department with the tracings. I have not since been able to recover the tracings. The Works Department sank two wells at points that do not correspond with those fixed in my report. The Normanstone well is one of these I have referred to in the papers, in which I give general deductions. The headworks were put down before testing for the supply and quality of the water. The whim and a skeleton of service tank remained there for years, but the money spent on them was thrown away. The work has since been abandoned. The Willandra well is another case.

180. What about the tanks on the road between Bourke and Wanaaring? It is said that these tanks have been sunk in close proximity to artesian bores, without reference to this Department.

181. *Mr. Woore.*] With regard to these tanks and wells being put near permanent water, are they not still useful for the purpose of watering travelling stock? Well, speaking generally, I should say that they are not useful. The Peri Springs tank is not useful, generally speaking; it is not often used. We have a number of cases to be submitted to you to confirm this. The Gilgai tank was leased to a tenant for £60 per year. The gilgai holes are within half a mile of it, but are not included in the tenant's lease, and the poor fellow who has leased the tank has been absolutely left out in the cold.

182. But those gilgai holes dry up? Always in dry seasons; but this is not a dry season.

183. But you say the tank is not used at all? Not in good seasons. Roto well is another case. I think this well has not collected anything at all since it was leased. It was rented by Mr. Evan Evans, of Roto, who is said to have taken it because he wanted to control the well himself.

184. Take the Peri Springs, which are the most permanent water in that part of the country, and can you say that the supply of water in these springs is sufficient for all demands upon them in all seasons? I cannot give evidence that this is the case; but Mr. Hogarth, the manager of the station on which the springs are situated, will distinctly state that they are; and my own impression, so far as my knowledge goes, is that they are quite sufficient. In all seasons, so far as my experience goes, there has been quite sufficient water there.

185. You were not there in 1865? No, I was not.

186. *Chairman.*] We now want to settle the matter of the selection of sites? I think a great want of judgment has been shown in placing the tanks and selecting the sites at places that are too low. I should prefer intercepting the water before it reaches the lower ground, and get it into the tank before reaching the swamp.

187. *Mr. Woore.*] For what reason? For various reasons. If you can get the tanks on the side of a slope, with the same amount of excavation, you can conserve a great deal more water.

188. *Major Penrose.*] What are the contents of these tanks? From 12,000 to 18,000 cubic yards; and I think there are two or three of about 20,000 cubic yards.

- H. Gilliat. 189. Then the catchment area is very small? Not necessarily. In some cases it is very large. One thing I am of opinion should be specially watched: Instead of putting tanks down where the drains run over black soil they should be put down where the drains collect from red soil or clay pans. The clay pans are always firm, whether covered by water or not. I do not think that sufficient care has been exercised in the selection of these sites. In most cases the tanks have been put down in the flats. I should prefer putting them at a little above, on the fall of the ridge, so as to intercept the water before it gets to the flooded lands. Wherever practicable the tanks should be so situated as to drain from red land.
190. *Chairman.*] The next thing to consider is "the defective design and faulty construction, with but little concern of the formation of ground or selection of catchment area so as to avoid collection of silt; of too steep batters in most cases, and apparently the adoption of a certain form of tank without reference to formation of ground or nature of soil; the defective construction of flumes and erection of inlet pipes, with carelessness in laying out drains and excessive cost in construction." Now, this is what we want you to show, and unless you are an expert, you can only speak as a practical man. I assume that you do not say that Mr. Bennett is not a man competent to undertake the theoretical part of his duties. No hard and fast rule for construction could be made to apply to all localities. I have seen a great many tanks in my time, and I know that some localities will stand a very much steeper batter than others? You have made my answer for me. The character of the soil in various parts must be taken into account; some will allow almost perpendicular sides;—for instance, the Peri tank was in cement; and practically might at a certain depth have been put down with vertical sides.
191. One in I would be quite ample in such a place for embankments? Yes, wherever the embankments could be so placed as to protect the tanks from prevailing winds it would be a great advantage. This was one of the points that I took, and I believe that unnecessary expense has been gone to on the embankments. I think a hard and fast rule in the construction of tanks is certainly objectionable.
192. Have you ever known an instance where the batter has not been sufficient to retain the bank and it has slipped under? I am sorry to say that this is the case in nearly every instance.
193. And has the attention of the Works Department been drawn by you to this subject? I believe so. I have called their attention lately to it, and I think we have often done so before. I can refer you to the papers, which will be placed before you, dealing with those works in the Walgett district—Boro, and Bung Hill tanks—and in each the trouble with the batters is shown. The batters on several other tanks caved in and fell into the tank.
194. Do you know of your own knowledge that a large portion of these tanks have slipped in;—are you aware that a large number of these steep embankments have fallen in on account of the want of batter? Yes.
195. *Major Penrose.*] But does it do much harm? Yes, it reduces the depth of water and increases the evaporation.
196. *Mr. Woore.*] Are any of these tanks made so that the water can be pumped over the embankments? They are now usually made that way.
197. But I think you stated there was an opening in the embankments? Yes, to allow the flood water to get in.
198. Is the opening right down through? Yes. The only advantage of putting down the four-sided tank is protection from wind, and to enable the water to be pumped above surface level. As a matter of fact, it is not a practice that has been generally followed. In any case, it has always been my desire to pump the tanks full during good seasons; and I did it quite recently in one case—in that of the Kulkine tank.
199. *Chairman.*] Are you aware that it is very desirable to put down steep sides in these excavations? Yes, wherever the nature of the soil will admit of it. I am quite well aware of the desirability of confining the water to the smallest possible surface, and having as steep batters as the soil will admit of.
200. It is for that reason, probably, that the Works Department have had these works carried out in that way. Have you ever known tanks sunk where the soil has been so porous as to allow the water to run out? Well, no; I have not. The only tank which I know of, and which I can recollect now, is the Lowesdale tank; but it was handed over to us in good order some time ago. It was sunk in a sandy, porous bottom. No; we have not, as a rule found a great many leaky tanks. The Ford's Bridge tank is also a leaky tank. We have not had Lowesdale tank long enough yet in our hands to show whether it is a leaky tank or not. I was down in the district with the local superintendent, and saw it with him; and I heard that he carried out certain repairs. When I saw this tank it had not a drop of water in it.
201. *Mr. Woore.*] Is it not usual for tanks to leak at first? Certainly not. I have known one tank that did leak at first to be made afterwards to retain water; but when I speak of leaky tanks, I refer to the exceptional leakage; I was not referring to ordinary leakage.
202. *Chairman.*] Sometimes a tank may leak, without any fault of selection of site, after the trial shafts have got to a good bottom? Yes; you may find sand pipes.
203. And no fault must be found, because every precaution has been taken, and trial shafts have got on to retentive soil? Oh, no.
204. *Major Penrose.*] This is one of the hazards of engineering? I would never dream of constructing a tank without at first putting down trial shafts.
205. Has it been the practice of the Works Department to do this? I cannot say.
206. Or did they go and sink a tank without making any examination of the ground? I have not the slightest idea what they did. We are not able to give any evidence of that sort, because we are not in a position to know what they have really done.
207. If there was any case in which the Works Department did adhere to the ordinary batter—the $1\frac{1}{2}$ in 1—and got into hard ground, they might have had a steeper batter than that? In the Peri Springs sand-hills they clearly got into cement after they got a little way down. The batter might have been very much steeper there; but they should not have constructed a tank at all. As a rule, the batters have been made too steep.
208. *Chairman.*] Of course, you are aware that the Government have specifications for all these works, and that these specifications are insisted on, and have to be adhered to strictly? Yes.
209. Now, in the case of a squatter getting a tank made, he would occasionally visit the tank himself, and modify the conditions and specifications in case the tank-sinker had got on to rock. In that case he would not insist on having a batter? Yes.
210. I suppose that that is not the rule with the Government? Well, I do not know what the rule really is. I should not like to state objections unless I am asked about particular cases. My reply is general that

that the fault was not having sufficiently close supervision. In the Peri Springs case, when they reached cement the batters should have been changed.

211. *Major Penrose.*] What do you mean by "cement"? It is not the proper term to use, as it is not cement in the ordinary sense, but a hard indurated clay.

212. *Chairman.*] It is a kind of clay with a mixture of coarse gravel, and is excessively difficult to work. In some instances it has been blown up with powder, but it is really harder than rock. Sometimes the men who get into this kind of stuff could not earn rations upon it. Now, we will go into the matter of wells. Do you know any fault in the construction of wells? We know of serious faults that have occurred in the construction of a number of wells that are alluded to in these papers. The Willandra well presents some of the faults.

213. Then there is the Wooloondool well. You state that "this well has been bored from the bottom of shaft; neither pipe nor floor placed in well; bore liable to, and is constantly, choked from silt; constant baling, even when water is not required, necessitating great wear and tear and useless labour, insisted on by Works Department as necessary to keep bore from silting; bore choked on many occasions, and has caused much needless labour and correspondence; the Works Department endeavouring to show that it is the fault of the Mines' caretaker or lessee"? A floor to well and pipe in bore would not be very expensive, and would prevent choking from silt, and allow the well to be worked much more cheaply than now.

214. *Mr. Woore.*] Is it a usual thing to put a pipe and floor in wells; and if so, why was it neglected in this case? I believe it is the general practice. I should always do so.

215. Do you know why it was not done in this case? No, I do not. They have not given us their reasons. The papers show that our request has been refused by the Works Department, and we are requested to bale the well constantly. This necessitates the labour of man and horse unnecessarily. We propose to relieve the Department of Works of all repairs in future.

216. That is the action to be taken in the future? Yes.

217. A number of wells having been proved to be unfit for drinking purposes, was machinery erected? Yes; we have had such cases as these. I am only venturing as an opinion, from what I have seen of their method of construction, that they leased the contract for the sinking of wells and at the same time the construction of the head works—the whim, service tank, and so forth. The objection I take to this proceeding is that these costly head-works and main shaft should not be erected before a trial shaft had been put down to test the quantity and quality of the water. One of the cases I have referred to was the Willandra well. I question very much, although it has cost an enormous sum of money, whether it will not be necessary to put a new work down there. If the construction was transferred to the Mines Department I should not put a well there at all, because I am quite certain I could never get any but salt water. Then, again, there is the Holy Box well, from which I do not think 5s. has ever been taken for the sale of water.

218. *Major Penrose.*] Is it a usual practice to make trial borings? It ought to be. It is done in the colonies I have heard of; but I do not say a bore is absolutely necessary. If not a bore, a trial shaft should of course be put down, as is done on a goldfield.

219. *Mr. Woore.*] Has the watering of stock been tried at Old Gunbar? Yes; when I inspected it on the date of completion with the officer of the Works Department, I telegraphed down: "Re Old Gunbar well. Have accepted transfer, subject to Minister's approval, but require analysis of water. Report to follow." That analysis was made, and the following is what was said by Mr. Watt, the Government Analyst:—

REPORT respecting sample of water received from the Honorable the Minister for Mines. Sample received 21st March, 1885, Old Gunbar Well, near Carathool.

| | 25th March, 1885. |
|-----------------------------------|-------------------|
| Total solids, grains per gallon | 932·00 |
| Soluble solids | 826·20 |
| Insoluble solids | 68·00 |
| Volatile at red heat | 87·80 |
| | 982·00 |
| Chlorine | 313·25 |
| Saline ammonia, parts per 100,000 | 0·029 |
| Organic ammonia | Not determined. |

This water has been found to contain a very large quantity of organic impurity, derived partly from animal and partly from vegetable origin. This alone is quite sufficient to condemn it for domestic use.

There is also an excessive amount of saline matter, consisting chiefly of common salt, carbonate, and sulphate of lime. The water may be used for cattle if no other is to be obtained in the neighbourhood, but it should never be used for domestic purposes without first being boiled or properly filtered. However, no amount of boiling or filtration will remove the extraordinary quantity of soluble matter present. Distillation would be the only method of properly purifying such a water, and as I am not acquainted with the history of the water and its surroundings I am unable to indicate the sources of pollution.

CHAS. WATT,
Government Analyst.

The Honorable the Minister for Mines.

Upon this report reaching me (17/4/85), I wrote as follows:—

THE report of the Government Analyst upon the water of the Old Gunbar well cannot be regarded as satisfactory, but I would point out that the organic impurities, especially those derived from animal origin, in water from a well shaft recently sunk 100 feet deep, lead to a suspicion that the water may not have been taken from the source intended. I would recommend that a gallon jar be packed and forwarded to Mr. Keighran, with a request that he should draw the water himself and forward for analysis.

On the 23rd April, 1885, I also wrote in reference to a newspaper extract, which stated that there was not an animal in Riverina that would drink the water from this well unless actually starving from thirst:

WATER was sent down from this well, and condemned by the Government Analyst; but as there appeared some reason to suspect that the sample procured was not a pure one from the well, a fresh sample has been sent for. In any case, I have no hesitation in saying that in its present state horses will not drink it, and I am doubtful if sheep or cattle will. I have withheld making a recommendation to the Works Department upon the subject until the analysis of the water could accompany the paper.

This

H. Gilliat.
12 Jan., 1888.

H. Gilliat. This was followed by a second analysis by Mr. Watt, who writes:—

12 Jan., 1888. MEMO.—The sample of water was found to contain 1,094·4 grains of solid matter per gallon. The water is quite unfit for use. The remarks made in the report dated 25 March apply to this sample even more strongly than to the previous one. It is possible that the organic matter may arise, at any rate, in part from the well not having been thoroughly cleaned out after the workmen left it. Nevertheless, the saline matter alone condemns the water.

Government Laboratory, 12 May, 1885.

CHAS. WATT,
Government Analyst.

The Under Secretary for Mines.

220. *Major Penrose.*] That was certainly a very extraordinary thing to find? Yes; and, as you will see, a second analysis showed that the water was worse than ever. Mr. Keighran, who obtained the water on the 4th May, 1885, wrote:—

Sir,

Referring to instructions contained in No. 83-613 Tanks, of the 15th ultimo, I do myself the honor of informing you that I visited Old Gunbar well, and drew a jar of water from the well, which I am forwarding you by rail to-morrow per Messrs. Wright, Heaton, & Co.

I have, &c.,

JOHN KEIGHRAN,
Inspector of Stock.

The Chief Inspector of Stock.

A copy of these papers, with a report of the analysis, was forwarded to the Works Department before the fencing of the special lease was proceeded with.

221. *Chairman.*] Then it has been fenced? Yes; but we submitted that they should delay it. I recommended then that the papers might be forwarded to the Engineer-in-Chief for Roads and Bridges. The object of doing this was that we might ascertain whether measures could not be taken to improve the quality by boring.

222. *Mr. Woore.*] Has this water been used by stock? No; no stock ever drank it.

223. Well, where did the stock water while travelling along that road? They went to the next well, or wherever else they could get water.

224. And this has gone on for two years? Yes; and a caretaker kept to protect all these expensive works, which would have been otherwise destroyed.

225. *Chairman.*] You have come to the conclusion that the Department of Works went to unnecessary expense in making the head works until the quality of the water had been proved; and the water has now been proved to be so bad that it is utterly undrinkable? Yes.

226. But the caretaker has been placed there at much expense? Yes; because, if we had left the place unprotected, these works would have been destroyed. The Works Department were always urging us to bale the well in the hopes of improving the quality of the water. We have kept this man baling for some years; but I have maintained that this baling arrangement is an absurd one. My request was for the Works to bore until we got drinkable water, or else abandon the well altogether.

227. *Major Penrose.*] Have you ever known the quality of the water to be improved by baling? Personally, I never have. I have heard it said that water is improved by baling, but I never had an instance of it coming under my own personal knowledge, and I do not think that a very salt-water well would improve. There is another case about which you will probably be asking me questions. I refer to the Holy Box well. A very remarkable change in the water took place; but, in my opinion, this was simply owing to overground drainage.

228. *Chairman.*] You came to the conclusion it was a mistake to erect all these head works until the quantity and quality of water was ascertained by boring? Unquestionably.

229. This well is now stated to be useless;—is that so? Utterly useless; and it will have to be abandoned.

230. We now come to the Holy Box well. You state that the well has cost over £1,000. Also, in the *précis*, “that this well was sunk, and small supply of fresh water tapped, followed by a great flow of salt water, which when twice analysed was declared unfit for use. Evidence as to saltiness was submitted. Well was abandoned, and tank commenced. Works Office stopped work at tank when about 3 feet deep, declaring well-water good. Well again handed to Mines, and constant baling insisted on to improve quality of water. This done without result. Depth of well and price referred to, 94 feet deep, cost over £1,000. Mines has to bear cost of maintenance, and employ caretaker to bale and protect head works. There is no prospect of leasing salt wells. Caretaker has carted drinking water 17 miles. Whim, service tank, and troughs erected before quality of water proved suitable. Iron in troughs destroyed by action of salt. Well almost useless for stock; quite unfit for travelling public?” I would like to mention what I have done at this well. I have seen as much as 40 or 50 pounds of crystals of salt under the troughs and around the service tanks. Of course, it is not a pure salt. There is sulphate of lime and sulphate of magnesia in it. When the troughs were filled with water you would find a quantity of crystallised salt after evaporation in the stock troughs.

231. You also came to the conclusion that this well should not have been sunk without previous testing? Yes. The papers in this case are very voluminous; and many gentlemen in the district wrote to me protesting against this well. The Works Department then commenced a tank, and subsequently abandoned it. This is the present position of affairs.

232. We now come to the Mount Manara well. I suppose that in all these works the same contractor apparently contracts to sink and supply the well with all the head works? That I am not in a position to say.

233. Well, it looks like it; because if the well is sunk, and it proves a failure, this expensive work goes on notwithstanding? I do not know about that at a well which has never been completed. I have seen the contractors sinking and timbering main shafts before discovering any water at all. The case I refer to is that of Normanstone, on the road from Gunnedah to Coonabarabran. I visited the well on two occasions, and found that the contractor was down about 80 feet in basalt without water, and putting up the same time the whim and service-tank. The average capacity of Mount Manara was about 3,000 gallons a day. They tried to increase it by driving, but unsuccessfully.

234. *Mr. Woore.*] The supply was never considered very large, but the quality of the water was good? The Government, by advertising, guaranteed that a certain supply of water would be forthcoming; but the water obtained here was not sufficient for the requirements of this road.

[The Commission adjourned.]

FRIDAY,

FRIDAY, 13 JANUARY, 1888.

The Commission met at 10 a.m.

Present:—

HON. G. H. COX, M.L.C., CHAIRMAN.

MAJOR PENROSE, R.E.

J. C. WOORE, Esq.

Harry Gilliat called in and further examined:—

235. *Chairman.*] You mentioned that in one instance tanks had been sunk on the sites of dry lakes and were now under water;—do you refer to Dry Lake and Cobham Lake? I know that both are under water now. I have not been there since they have been submerged, but I have reports from my officers on the subject, showing that they are still under water. H. Gilliat.
13 Jan., 1888.

236. At whose instance were these sites selected? As I stated yesterday, in making my recommendations for water along the road from Wilcannia to Milparinka, there was water supply provided by this man Smith, at the Dry Lake, which was amply sufficient for the time. Mr. Smith is a very respectable man, who had a licensed public-house there. He had sunk one or two tanks and a well for the use of travelling stock. As stated yesterday, he having gone to this expense, I thought it was very undesirable for the Government to interfere and put a tank there.

237. Did not you give your support to the sinking of tanks at Dry Lake and at Cobham? My report, which will be submitted to you, distinctly states that I objected to the construction of a watering-place at the Dry Lake, and that I recommended a well to be sunk about a mile south from Cobham Lake.

238. Then you did not support sites selected for the construction of tanks at Dry Lake and Cobham Lake? Most certainly not.

239. There are also tanks at Seaville's and Copago;—were not these also chosen by the Works Department, and also supported by the Mines Department, or by officers of yours? My report on this subject will also be submitted to you. It will show that I selected a site, to the best of my recollection, about 4 miles northerly from Seaville's. I passed over the road at the time when the cane grass had been cut from the site of the tank. I rode down to look at it, and found that no further work had been done. I wrote an urgent minute, asking that the tank should be stopped at Seaville's, and that a site 4 miles further on, which I had previously recommended, should be taken. With this minute you will have a letter from Mr. Hogarth, showing that the site which I selected was a much better one. The old Copago tank was constructed long before I entered the service. It was a dam and excavation at the entrance to the Copago Lake, and I always anticipated the first heavy flood that came down would sweep it into the Copago Lake and cover the excavation. I then recommended that as the Copago Lake became salt in time that a new watering-place should be made on higher ground. The old tank was made before I entered the service, and the new tank I had had nothing to do with further than recommending its construction at some suitable spot in the neighbourhood.

240. A memorandum has been handed to us, showing the cost of the various tanks sunk under the Works Department, and I see that the prices run from 10 $\frac{3}{4}$ d. up to 1s. 9d. Now, I believe the assertion has been made that tanks have cost up to 2s. 6d. per cubic yard? Of that I have no knowledge. It is a matter about which I have never spoken to contractors. The statement was made to me, recently, by Mr. Townsend, Civil Engineer, who stated that he was camped upon the Booligal to Wilcannia road at the time Burton Brothers received their contracts in that district at 2s. 6d. per cubic yard, and immediately afterwards sublet to Ford Brothers at 1s. 3d. He volunteered that statement to me, and said that he would give evidence, if desired, before the Commission.

241. What tank was that price given for? I am not quite certain; but you will find it in the papers. Mr. George Williamson, of Ivanhoe, has recently stated the same. Of this I am informed by letter from one of my inspectors, which is as follows:—

Department of Mines, Public Watering Places,

Sir,

Ivanhoe, 12th November, 1887.
I have the honor to report that Mr. G. Williamson, Ivanhoe, informs me that a contract for excavating 12-Mile tank was, by Works Department, let to Burton Brothers, Balranald, at 2s. 6d. per cubic yard, who afterwards sub-let to Ford, tank siukers in this district, at 1s. 3d. per yard, who performed contract and made money at it.

I have, &c.,

JOHN LOW,

Inspector Public Watering Places.

The Chief Inspector, Public Watering Places, Sydney.

242. That is the 12-Mile tank you are referring to? I think so. I have been informed that certain tanks at 12-mile, 35-mile, and 48-mile on the Booligal road; and Box Creek, Til Til, and Youhll Plains tanks, on the road from Balranald to Ivanhoe, were let to Burton Brothers at contract price for 2s. 6d. per yard. I may add that my other officers are prepared to make more positive statements about this matter. Mr. Inspector Low can give you direct information on the subject, and so can Mr. Inspector Boulton.

243. *Mr. Woore.*] But in what manner do you intend to substantiate those statements? Other officers attached to the Mines Department will give you evidence upon them. I am speaking from the reports which have been sent to me, and from what I have heard from Townsend and others, who are prepared to give evidence here.

244. *Chairman.*] You are head of the Public Watering Places Branch of the Mines Department, and therefore we wish to get all the evidence in connection with these charges? The papers contain the statements that have been made by our officers, which can, I have no reason to doubt, be proved by them when they are called on.

245. We want such information as you can give us on the matters stated in the *précis*? I may say that these reports are departmental reports, made to me by my field officers, and of course I have been obliged to place them by departmental rule before the Minister of Mines. I have reports from Mr. Inspector Low, in one or two cases in connection with this very matter—*i.e.*, the cost of excavation. In one case he reports to me that the contracts were let at 2s. 6d. per cubic yard; and Mr. Townsend informs me personally that he was on the ground when the contract was let. The Minister for Mines, six months ago, called upon me for a report. This report embraced the cost of each of the public watering-places in the Colony, the revenue from each of them, and the cost of their maintenance. I could

H. Gilliat.
13 Jan, 1888.

could only prepare the latter clauses, and pointed out to him that the replies to the first questions must be obtained from the Works Department. We have asked the Works Department repeatedly for this information, but have not yet received it.

246. Now, why do you consider that the cost of tanks is excessive;—is it because they exceed the prices given by private individuals? Certainly; because, to a large extent, they exceed the prices given by the squatters. From my experience, I am confident that I could obtain the performance of the work at much less cost.

247. *Mr. Woore.*] And could you have done it at less cost at the time when the tanks were sunk? The present is an exceptionally good season; but even at any time I think it could be done more cheaply. The prices given for work during the last two good seasons have been very high in many cases.

248. *Chairman.*] Were the rates excessive when these contracts were let? [No answer.]

249. *Mr. Woore.*] Perhaps they were let in the middle of the drought? I am confident that the work could have been done at much lower cost at any time.

250. Do you know of any tanks that have been sunk by private individuals at very much reduced rates? Yes; I know many tanks that have been sunk at less rates.

251. At that time? To the best of my belief, at that time.

252. Can you remember any instance of tanks in the same locality constructed at the same time at a less price? I can hardly commit myself to such a statement as that, because I do not think I could give personal evidence with regard to it. I am judging by the rates I have ascertained in travelling through the Colony, as to the average prices—and I may say that I was travelling during the greater part of the drought; and at all times the amounts given by private individuals for sinking tanks were much less than the amounts given by the Government.

253. It is most important that we should see these contracts, so that we may know what the contractors bound themselves to do.

254. *Chairman.*] The forms of tender are included in the papers submitted by the Works Department.

255. *Mr. Woore.*] Are you aware whether these contracts are let by public tender or otherwise? I always understood they were let by tender.

256. Then it seems rather odd that the Government should pay so much more than private individuals;—how do you account for that? You will find amongst the papers submitted to you (with the field officers reports to me) that if it is known that material is to be purchased by the Government, it will cost from 25 to 30 per cent. more than if it was purchased by private individuals.

257. For what reason? Well, I believe for this reason—that Government contracts have been let at much higher rates than they should have been.

258. Are you aware that in most instances the Government tanks are sunk very much deeper than tanks put down by private persons? Usually; but I believe the largest of ours do not exceed 18 feet deep.

259. Are you aware that the prices increase as the depth increases? Certainly.

260. And these tanks are deeper than private ones? We have some tanks that are deeper than private tanks; our larger tanks (those of 18,000 cubic yards) are certainly deeper than the average. They range up to 18 feet, while private tanks range in depth from 12 to 15 feet.

261. Then that alone should account for the increased prices which the Government have had to pay? I do not think so. I do not think it would account for the large price to any great extent, and it certainly would not account for some of the prices that have been paid.

262. You are also aware that the cost of excavation is increased by tanks having steep sides, or steep batters, rather than sloping batters? Well, that raises the question of construction, which I would point out can only —

263. I am only now speaking as to the cost;—would the steep batter not cost more than a sloping one? Unquestionably it would, unless it were constructed on improved principles. The practice is to leave a roadway along the batters, so that the drays could be taken out by this roadway. Unless this is done it adds very much to the expense; but in a tank, as I consider it should be constructed, I would leave in all cases a permanent roadway going out. Then the batter and the bank can be dressed down and the soil removed by drays.

264. *Chairman.*] Would you like to make any comments on the remarks that I made with regard to contracts let by the Works Department? I think the points you have mentioned very fairly indicate the errors that have been made in letting contracts. There is a good deal of unnecessary work and finish about the tanks. I think that the same amount of water might be conserved at a very much less cost. There is unnecessary work in the dressing and general construction, and I believe that suitable works for storage of water at public watering-places can be constructed at very much reduced prices. I believe that more prompt payment to the contractor and closer supervision, so that the contractor will have no claim for any mistake or error, will enable these works to be constructed probably as much as 25 per cent. less than at the present time.

265. Have you gone into the question with regard to the relative merits and cost of construction of tanks with steep batters and very considerable sloping batters—the cost of construction as against the loss of water caused by having a larger surface exposed to evaporation? Exactly, and my firm conviction is that the steep batter, when obtainable, in certain characters of soil is preferable to the sloping batter. The steep batter is preferable for any watering-places where stock are not allowed to enter, because it is always necessary that these watering-places should be used to a greater or less extent for domestic purposes. They are intended not only for travelling stock, but for the use of carriers, teamsters, and travellers. My general opinion is that the tanks can be constructed to the same depth and in the same soil, and at much more moderate prices than the Government have paid.

266. You have based your information on this matter, on the contracts that have been taken from the Government, and, as alleged, sub-let to other contractors at very much reduced rates? Yes, in many instances; and from the fact that in other works I have by careful measurement convinced myself of the high prices given.

267. *Major Penrose.*] Then you complain of the form of specification? I am not acquainted with the form of specification adopted by the Works Department; but I know what their works are when completed; and I know there is very much about those completed works that is entirely unnecessary. I take the ground that to accept a standard form of tank to be put down in all places, is wrong. I think a tank should be constructed in accordance with the nature of the ground in which it is sunk.

268. And are all specifications for tanks of the same character and nature? Yes, as a rule, as you will be able to see for yourself.

269. *Chairman.*] The specifications seem very full and very stringent? I understand they are.

270. *Major Penrose.*] There is another question—that of fencing—in respect of which there is a large amount of correspondence.

H. Gilliat.
13 Jan., 1888.

271. *Chairman.*] We will come to that directly.

272. *Major Penrose.*] About the excavation of wells—what was the cost per foot? In regard to wells, I may say we are not aware what the cost is per foot. We know in some cases the total sum; but I am prepared to put down wells from 150 to 180 feet deep, substantially the same as those put down by the Works Department, for from £450 to £750. You will see that the cost of some wells reaches to £1,100 and £1,200.

273. *Chairman.*] Yes; for yesterday we read of a case of a well 90 feet deep which cost over £1,000? We have numbers of cases of the same kind. One well, I think, has cost £1,400, and is under 200 feet in depth. I may add, in explanation, that, with respect to obtaining tenders, when the vote for building cottages was handed over to us I found great difficulty indeed in obtaining tenders at anything like suitable prices. Many of the contractors refused to reduce the prices that they had been asking under the Works Department, and I gave instructions to the local officers to entertain none of those high prices at all, with the result that after a few months I was able to let the contracts at reduced rates.

274. *Major Penrose.*] What is your estimate based on? It includes everything.

275. What would you have done in a case of urgency? Well, I question whether any such case has arisen. In the midst of severe droughts very few stock travel, and it would be undesirable to commence the construction of a tank at such a time. There are very few instances, if any, in which an emergency of that kind has occurred.

276. You cannot conceive of a pressure being put on? Oh, yes, I can; but not in such cases as these. It would be in some case of a remote mining township; but for ordinary watering-places and the ordinary requirements of travelling stock, I think it would be unnecessary. Mining townships often spring up very rapidly. A large population collects, and there is always a danger of suffering from want of water. Then, if the Government desire to supply the water to that township, it becomes an entirely different question, and one which has very little resemblance to the supply of water at public watering-places.

277. *Chairman.*] The same remark which applies to the excessive cost of wells applies also to the excessive cost of tanks. Yes; I think the tanks, too, can be constructed at very much reduced rates.

278. We have here remarks about faulty construction of wells and timbering of shafts before testing the supply and quality of the water? Yes; we went into that yesterday. I believe a rule should be absolutely and universally carried out that bores or trial shafts should always be made in order to test the supply and quality of the water.

279. You mean that a trial shaft or bore should be put down before constructing the head works? Yes; but even if they put down the shaft before timbering and centring, it would reduce the expense very much. I have here reports from my field-officers, showing the faulty construction of drains, and also the high cost per chain of fencing. Contracts have been taken from the Government at 4s. 6d., and immediately sublet at 3s. 6d. This is a fair price for the class of drains that are used. They are 6 feet by 9 inches in depth. I put these reports in, as I cannot verify them from personal knowledge.

280. Now, with regard to fencing? The same thing applies here. These papers, handed in by my field-officers, show the facts. The officers themselves will be before you for examination, if necessary.

281. *Major Penrose.*] But you can give no personal evidence on this matter? No, except to indicate that certain works, which are noted in the paper, have been constructed. For the last three years my departmental duties have kept me at headquarters, and I have been unable to make a personal inspection.

282. *Chairman.*] Now, we have heard of the cost of hutting. I have some documents here in connection with this matter, and the estimate of the Mines Department for a two-roomed cottage was £100. This was in 1883? I never heard of that before. I expect that that was when Mr. Bruce was attending to the departmental business. We have refused tenders of £60, and since then we have got them done for about £40. We refused many of the first tenders received.

283. Did the contractors find all material? Yes, all material. These papers show our case exactly. At Cobar we have completed sixteen cottages at £50 each. The Works Department approved tenders for the same buildings at £82 6s. At Corowa we have completed three cottages at £40 7s. The price approved by the Works Department was £68. At Silverton we have completed five cottages at £50. These are all of iron. Another was completed for £47 10s.; while the tender received by the Works Department was £69 10s. Others were completed for £44; and at Forbes we built some for £30 11s. 2d.

284. *Major Penrose.*] Did you really get this done for £30? Yes; we merely insisted on the Government getting the work done at the same rates as were paid by private persons.

285. *Chairman.*] Information has been furnished to us alleging that where the Mines Department purported to have a cottage at Deniliquin built for £44 3s. 6d., the materials alone have cost £50? I have no hesitation in saying that that information is untrue.

286. Of course these cottages consisted only of two rooms? Yes.

287. *Major Penrose.*] Can you produce the accounts? Yes; and the specifications and the vouchers, in all cases. I shall be very glad if you direct that they shall be called for.

288. I see in one case at Forbes that a hut has been built for £26 1s. 6d.? The explanation is this: This man guaranteed to put up a hut, the cost of which was £21 1s. 6d. This was irrespective of iron for roofing, which cost £4 10s., bringing the total cost up to the amount stated.

289. Do you line the roofing of the cottages? No; we let the caretakers do that for themselves. We merely put up an ordinary bush hut. You rarely see lining, except in the head stations. The occupants themselves often put bark or boughs over the roof.

290. *Chairman.*] It has been said somewhere that some of these huts have been very badly placed. Is it a fact that some of the huts are now submerged by water? Certainly not; not to my knowledge. The strictest instructions have been given to the inspectors, and in nearly every case the site has been selected by the inspector. We have never had a report that a hut was submerged, nor even that a hut had water near it.

291. We have had it in one of these papers received here from the Works Department that one of the huts which were built by you is now up to the eaves in water? I would like to see the case, because I will then be in a position to get a report from the caretaker. If it has occurred, it has been most carefully kept back from me.

292. *Major Penrose.*] You say that the hutting work has been passed over from the Works Department

H. Gilliat.
13 Jan., 1888.

to the Mines? The papers, which will be submitted to you, show the whole history of the case. Briefly, it was this: Tenders received by the Works Department were sent to the Mines after they had been approved of. We disapproved of the cost, and pointed out that the work could be done for one-half the money. The Ministers for Mines and Works agreed that if this were the case the works should be transferred to us. We have been constructing huts ever since for something like one-half the price approved by the Works Department. Our average now for thirty-three to thirty-six huts is about £46 10s. The huts I refer to are two-roomed huts.

293. Why were the plans for huts sent to you for approval, if it had not been done in the case of the tanks? I cannot account for it. It was certainly a most unusual thing. My answer to the question is, that I am not aware why they were sent; but the papers in the case will show all the action.

294. *Mr. Woore.*] Was it not in consequence of your making a statement that the huts could be put up for less money than the Works Department were paying? No; that statement was only made after we received the papers.

295. *Major Penrose.*] It seems a very curious thing that this should be done in one case and not in another. Arguing from the case of the huts, the same economy might be practised in all other cases? Yes, in all other cases. I may add that upon the question of fencing we have distinctly guaranteed to the Minister for Mines that fencing throughout the Colony can be done for an average of £48 to £50 per mile.

296. *Chairman.*] I notice in the *précis*, in Dry Lake it is stated that a hut built at a slight elevation over the tank was submerged to the eaves? Well, that was Smith's house, built by a private individual. We have nothing whatever to do with that.

297. From the statement made in the papers it would appear that several of these huts had been erected by the Mines Department? Well, that is not so. This particular hut of Smith's was put up by a private person.

298. When you took over the tanks and wells and placed your caretakers in them, were they then solely under the charge of the Mines Department? I consider that they should be, except when we were asking for repairs to be made, which were inevitable under the vicious system of double control. The caretakers in that case are told to lend every assistance to the man making repairs.

299. When you or your officers think that repairs should be made, and that the caretaker is not capable of making them, you send a letter to the Works Department requesting their assistance? I at once place the matter before the Minister for Mines and give him my opinion, recommending that the Works Department may be requested to carry these repairs out. If the matter is approved of, a letter is sent to the Works Department, asking that the repairs should be made; but I hold that until the Minister for Mines approves of the proposed repairs the Works Department have no right whatever to interfere.

300. As a matter of fact, you have already stated that all repairs involving a sum of more than £10 would be referred to the Works Department? As a matter of fact, we have referred almost everything to them.

301. Why do you do that;—why do you refer all these trifling matters? Well, we have to refer everything to them which the caretaker is unable to do. In the case of a break-down or a smash, it is usually so referred; but in some cases of urgency we have had repairs effected ourselves, without reference to the Works Department.

302. *Major Penrose.*] Have the Works Department officers continued to inspect the works? [No answer.]

303. *Chairman.*] I am coming to that. Do you apply to the Works Department to carry out any necessary repairs that might be required;—what made you apply to them if you thought that you had the works under your own charge? We have tried to adhere to the original arrangement that was proposed. I certainly think it was an error to have done so, and I frequently moved to have the whole thing taken over by the Mines Department under the Public Watering Places Act.

304. For instance, suppose the simple matter of a pump getting out of gear, owing to the want of new leathers, would you apply to the Works Department to put that right? Certainly not.

305. Are you aware that it has been done? No, not to the best of my belief. At the Boonoon tank something radically wrong with the pump was reported. Mr. Boulton made a very full inquiry, a report of which appears in the papers. We never intentionally referred a small matter of repair that could be attended to by the caretaker, to the Works Department.

306. Is it a fact that many men are placed in charge of tanks and wells who are utterly incompetent to take charge of them? Not many men—I should say certainly not. As a rule our caretakers are fairly good average men. I might point out that these appointments do not rest entirely with the head of the Department, but have been made at times by Ministers over the heads of their officers. Immediately a caretaker is found to be, or is reported to be, unfit or incompetent to discharge his duties, he is subjected to a strict inquiry, and if the report proves true he is dismissed.

307. Are you aware that on one occasion the pump at One-tree tank was stated to be out of repair by the caretaker, owing to disconnection of the piston-rod between the piston and the plunger, and that application was made to the Works Department to put it right? I am not quite certain about this case. I should certainly like to make inquiries about it. I may state that this man Kelly was not appointed by me at all, but was put on by the late Minister for Mines, Mr. Fletcher.

308. Is it the duty of the officers of the Roads Department to send reports if they see anything wrong with regard to tanks, to headquarters? I should think that we might be notified about it if they see anything wrong.

309. Then you think it is right, for instance, for a road superintendent, or a roads officer, in the event of anything being wrong, to interfere? No, not to interfere. I think a road superintendent should communicate with the local Mines officers, and avoid all unnecessary correspondence. A simple memorandum to the local Mines officer would often cure the whole thing.

310. Do you know who Mr. Stilwell is? Yes; he is a road superintendent at Hay, I think.

311. He made a complaint in July last that breaches in the bank at Pulletop tank had never been repaired; that the silt tank had been neglected; and that the troughing was not clean. This was reported to the Commissioner for Roads, and hence we can understand how the friction arose? This case is not the case of a caretaker. The whole of it is very fully dealt with in these papers. Pulletop was leased to a very unsuitable man, who commenced by giving a great deal of trouble to the Mines officers by violating the conditions of his lease. At the very time those letters were being written, arrangements were being carried out for the cancelling of this man's lease, and removing him from his position. This has since

been

been done, and immediately a man was sent up to put the tank in good order. Mr. Boulton inspected H. Gilliat and made a careful report of what occurred.

312. We have here a letter dated 1st July, 1887, referring to the Hulong tank. It is addressed to the Commissioner for Roads, and is as follows:—

Sir,

On the 24th ultimo, I found 17 feet of water in this tank, and the appurtenances in fair order; but the caretaker and his family were residing in the pump weathershed, and keeping up a fire under the boiler for domestic purposes. The defects in the construction of the weathershed—R. Duncan, contractor—had not been rectified, the framing being imperfect, and some of the iron used, 26 instead of 24 gauge. The contractor has been notified by me of this.

I have, &c.,

A. W. STILWELL.

Upon this Mr. Wood wrote:—

I think it might be advisable to refer this to the Mines. I could not have credited such practices being allowed, were the report not signed by one of our own officers.—A. P. W., 4/7/87.

I have never heard of it, and I do not think the papers were ever referred to the Mines Department. There are plenty more papers in connection with Hulong and Mr. Stilwell.

313. *Major Penrose*.] Does this friction of which you speak (and which purports to exist between the various officers)—is it confined to the head office in Sydney, or does it extend to the officers in the country districts? I think the greater part of the friction arises in the district of which Mr. Stilwell has charge.

314. *Mr. Woore*.] What district is that? The district of Hay. In the other districts the officers get on pretty well together. The trouble arises chiefly in this one district.

315. *Chairman*.] Are you aware that Mr. Hanna, the road superintendent, has frequently complained to Mr. Crommelin, overseer of Public Watering Places, that the Wilson reservoir had been neglected by the caretaker, and subsequently found that his remarks with regard to the want of repairs had not been attended to? I have no special recollection of this particular case.

316. Well, now, do you think Mr. Hanna had any right in his public capacity to write, drawing attention to this neglect? No doubt he had a right to draw attention to it; but I think that the management of these public watering places, having been transferred to the Mines Department, should be left with that Department. I think Mr. Hanna, as a zealous officer, might fairly have called attention to any neglect that came under his observation. That is the way I think I should act myself.

317. But was Mr. Hanna justified first in making these complaints, and then, finding that they were not attended to, in communicating in an official manner with the head of his Department in Sydney? [No answer.]

318. I think the answer is one which we ought to have. Was Mr. Hanna justified in making these complaints; and then, finding that the matter was not being attended to, was he right in communicating, in his public capacity, with the head of his Department in Sydney? I think that Mr. Hanna had no right as an officer of the Works Department in interfering at all; but I think that he would have been quite justified if he noticed any neglect to call attention to it—to call the attention of the local officer to it, who was in charge of the works at that place. Then if he found that the matter was not being attended to, as an extremely zealous officer, I do not know that he would not be justified in reporting it to Sydney, in order that attention might be called to it there. If an officer of mine neglected his duty, I cannot find it out unless it is reported to me in some such way; and I think that the officer of another Department would be justified in reporting it to me; but to hinge a complaint against a whole Department on such a ground is not fair.

319. In the abstract of reports on tanks and wells in the Hay district, I notice the following having reference to the Til Til tank:—

Report of 21st January, 1885: That Mine's caretaker was without a horse to work the McComas lift, and without oil for bearings; that the public worked the pump with their own horses, when requiring water, and it had thus sustained considerable damage. Report of 3rd April, 1885: Found caretaker absent on leave—only a lad in charge; sheep and cattle had been admitted inside tank enclosure to water at silt tank, and the embankment was thus being damaged; fence rails were missing, apparently used for fuel by travellers. Report of 1st May, 1886: As to pump (Holman, horse-power) being reported by caretaker as out of order and quite ineffective; that there was no defect, except that bucket leathers required renewal, and this should have been done by caretaker instead of requiring mechanic to be sent for from Hay—100 miles; also that much negligence was evinced in keeping drains and fence in repair, and that sheep have been allowed inside tank fence, damaging the embankment. McLeod, Mines' overseer, reported, in reply to this, that caretaker had been told by travelling mechanic never to open the pump for repairs, and that the sheep had been removed from tank enclosure as soon as observed. Report of 6th August, 1886: That statement of caretaker, as to repairs of pump, was incorrect; had not been directed not to touch it by mechanic; did not know how to overhaul the pump; and that there was no other defect than as to leathers being worn; that Mr. Nicholson reports that sheep had remained inside fence by caretaker's admission for some days until they were too weak to walk out.

—? You will find that we will have rebutting evidence on all these points as soon as the papers are placed before you.

320. Then we have the following statements in reference to the Lignum Hut well and the Mossgiel tank:—

Report of 22nd October, 1886: Connecting-rod of pump broken; pump does not receive due attention from caretaker; am having a ladder put in well, so that the caretaker should have no excuse as to want of access to pump. Report of 8th November, 1886: Breakage of plunger-rod. Report of 5th December, 1886: Breakage of windmill connections; it is evident that there is much want of attention on part of caretaker, &c.

Then in regard to Mossgiel we have—

Report of 30th July, 1887: Embankment batters scoured by rainflow; negligence in keeping in repair; horse has been admitted inside fence and on the embankment, destroying the vegetation, which it is so desirable to protect; that caretaker had taken up the dwarf fence from troughing, leaving the post-holes open; had evidently been so for a long time; were full of rain water, impairing stability of trough sleepers; the fence was being used to construct a rail laid on the posts as bearers along the middle of the trough.

Now I would like to have a little more information from you in reference to this friction between the two Departments. How do you propose to remedy or remove this friction? Of course it has been proved in various letters and papers that considerable friction does exist between the Works and the Mines Departments;—how do you propose to remedy this very undesirable friction? I have submitted recommendations to the Minister for Mines on this subject. My recommendation was that the whole construction and maintenance and administration of the Public Watering Places Act should be transferred to one Department. I would have one Department responsible for the whole work. Under present circumstances the responsibility is divided, and both Departments decline to assume it.

H. Gilliat. 321. *Major Penrose.*] But duality of control still has a good effect where the officers of one Department happen to be inefficient? I do not want to be understood in that way. I was asked whether Mr. Hanna had any right in his public capacity to make a report concerning the neglect of an officer of another Department. I said that a very zealous officer might have been justified in calling attention to the neglect of an officer of another Department.

13 Jan., 1888.

322. You said that in this far-away district one officer is a check upon another? I might certainly have conveyed that impression. But Mr. Hanna might merely have said that there was an inefficient officer there. But this is picking out a trivial case. I have no doubt but that the caretaker and inspectors will deny a good deal that is contained in these papers. That is why I can say nothing about them just now. We simply have to deal with these matters from the reports which come in from the officers who are in charge.

323. *Chairman.*] Now, these papers come from Mr. Stilwell, who is, I understand, the road superintendent at Hay. Then, in these various reports which have been read from Mr. Stilwell, do you think he exceeded his duty in bringing those matters before his chief? I am not aware what his instructions are. He is, of course, a subordinate officer, acting under instructions from the Engineer-in-Chief and Commissioner for Roads and Bridges. I think it very undesirable that Mr. Stilwell should make such reports; but if it is admitted that there is dual control I do not see how he can avoid making reports to his own Department. Whether it is desirable that it should be so, is another matter. That is for the Commission themselves to say.

324. *Major Penrose.*] What are the expensive forms of machinery that you object to? I think the use of steam-pumps necessitates the employment of skilled workmen, and increases the cost of maintenance. I am quite certain that, in view of the allegations of the Works Department as to the character of the caretakers employed, we get the best men available, so that the simplest forms of machinery may be used.

325. Are there many steam-pumps? I should say that to the best of my recollection there are between thirty and forty. I strongly objected to them for public watering places. They may be very desirable and useful at or near a township, and occasionally some of our watering places are in the immediate neighbourhood of townships. At other places I would recommend the very simplest sort of appliances.

326. *Chairman.*] Your objection to the steam-pump is that it necessitates the employment of more expensive labour as caretakers? Yes; and it raises the average cost of the work.

327. *Mr. Woore.*] What would you substitute for them—windmills? No; I would not.

[The Commission adjourned until the afternoon, when the sitting was resumed.]

William Sawers called in and examined:—

W. Sawers. 328. *Chairman.*] Where do you reside, Mr. Sawers? I am living down in the country at present; but for many years I have been a resident of the Western Division of this Colony. I have lived for some time west of the Barwon or Darling River.

13 Jan., 1888.

329. You formerly represented the electorate of Bourke in the Legislative Assembly? Yes.

330. Are you aware that a Commission has been appointed to take into consideration the difficulties that exist in working this particular branch of the Public Works Department having reference to tanks and wells, and also to consider the difficulties and differences that have arisen between the two Departments—the Works and Mines;—you know that some difficulties have arisen? I was aware of the difficulties you refer to, and have noticed through the press that a Royal Commission had been appointed on the subject.

331. Will you kindly state what has been your experience in connection with the district you have represented in procuring the initiation of tanks and wells. Be good enough to state how this matter worked, and the difficulties you experienced in getting your applications for necessary works replied to and dealt with? I may mention that, as representative of the Bourke district, I had occasion to apply for the construction of several tanks during the time that I held that position. The usual procedure was to apply by letter to the Minister for Mines, stating the necessity for these works, and putting forward the reasons why such tanks should be excavated. That letter would be simply acknowledged, and I would have to follow the matter up by several interviews with the Minister, and also with the officer-in-charge (Mr. Gilliat), with whom I would have various conversations on the subject. Mr. Gilliat would submit a report to the Minister for Mines; and, as I have said, I would also make representations myself to the Minister during the course of an interview. In every case I believe there has been attached to my applications a satisfactory report from Mr. Gilliat in favour of my contention that the work should be done. In every case the Minister approved of the tanks being excavated and constructed; and, in my innocence, I thought that that had ended the matter. But I afterwards found that the papers had to be sent on to the Department of Works. Anxious to serve my constituents, I followed the matter up to the Works Department, and was in the habit of reviewing the matter with the Minister on various occasions. I also interviewed the Commissioner and the Engineer-in-Chief for Roads and Bridges (Mr. Bennett), who has charge of this Department. I represented to him that the construction of the works for which I had applied had been sanctioned and authorized by the Minister for Mines, and should be carried out. Mr. Bennett, in effect, said that he must wait and act upon the report of his own officers, and that he had nothing whatever to do with the Mines Department. His contention was that he had to rely upon his own officers, to whom he referred the matter. I believe Mr. Bennett received favourable reports from his own officers in each case, and when I pressed him to carry out the works he said that he had no money for the purpose. I desire to point out to this Commission the absurdity of a Member of Parliament having to carry his application to one Department, and having received the sanction of the Minister of that Department to the work, having afterwards to go and get the approval carried through another Department. And I would like, further, to point out the absurdity of one Minister sanctioning work—not only one Minister, but two Ministers in this case—and afterwards in the Cabinet so cutting down his Estimates that the work could not possibly be performed, because there was no money to pay for it. In my opinion, the construction and management of the tanks of the Colony should be placed altogether in the hands of one Department; but as to the Department to which it should be given, I express no opinion.

332. Have you found, from your own personal experience, that it is more satisfactory, and that less friction would take place than otherwise, if this dual control by Departments were abolished? I cannot say from actual

actual personal knowledge. From the fact that my residence has not been in the immediate neighbourhood of tanks, I have it only from hearsay.

W. Sawers.

333. *Major Penrose.*] Might I ask if the witness considers that the tanks that have been so constructed were constructed in an economical manner; the witness may have seen some of the tanks? I have represented a large portion of the Colony; but my own station is on a watered portion, and I have not much knowledge on the subject.

13 Jan., 1888.

334. You have nothing to say as regards construction or cost of works? Well, I am not in a position to give a reliable opinion on the matter. I have sunk many tanks myself, but of course private tanks are different from the Government tanks. There is no similarity whatever between the tanks constructed by private individuals and those constructed by the Government. The Government tanks that I have seen have a larger earth excavation, and embankments are invariably made round the tank, which I have never done at all.

335. *Mr. Woore.*] Were these Government tanks which you have seen more expensively constructed than private ones? Yes; but the excavation is quite the same. The only difference is, that the earth is built around the tank with the object of holding the greater quantity of water.

336. *Chairman.*] Necessarily, then, the Government tanks are the more expensive? Yes.

337. *Mr. Woore.*] Are not the Government tanks generally deeper than other tanks, and have they not steeper sides? I cannot say. I can, of course, give you particulars regarding the batters that I have made myself, and what their expense has been. My firm conviction is that, had I the batters steeper I would have had to pay very much more money. I have excavated in tanks, I suppose, about 200,000 cubic yards. In various tanks (with one exception) the slope of the batter was 3 in 1. I have in every case excavated with bullocks, with ploughs and scoops, and have dressed the sides afterwards. The average price which I have paid for such work as this is 1s. per cubic yard, and I am convinced that I could not have got this work done at the price had I the batter 2 in 1.

338. What was the depth of these tanks that you refer to? The average depth was, I think, from 15, but nothing over 16½ feet. I may state that the greater part of the trouble and difficulty I have had was in the last 2 or 3 feet of the excavation. The contractors would sink down to 15 feet at a trifle less than they would be willing to receive for taking out 18 feet. I think I may amend my evidence by saying that the average depth of these tanks was about 16 feet. The contractors have very great objections to go beyond 14 feet. In one instance or two I believe they have gone down to 18 feet, or, rather, I wished them to go down to that depth; but in spite of all persuasion I was unable to get them to go down that far. The bullocks cannot possibly draw the stuff up at that depth. The time I refer to was in a fair season.

339. Supposing you made your tanks 18 feet deep, would you not have had to pay a considerable sum more than you paid for the tanks sunk to 15 feet? Yes; I would probably have had to pay 1s. 3d. per cubic yard instead of 1s.

340. *Chairman.*] And if you had steeper banks what would be the result? I could not get the work done with ploughs and scoops. In going down the extra 2 feet I would have had to pay a-third or a-half more for the excavation below 15 feet.

341. *Mr. Woore.*] Then you say that tanks cannot be sunk to that depth with scoops? I cannot say that it could not be done, but I have had always the greatest difficulty in getting the contractors to go beyond 15 feet.

342. *Chairman.*] Can you give us the reason why the Government have had to pay very much more for their tanks than private individuals;—Is it for this reason or any other that has come to your knowledge? The reason I have mentioned is probably one of them.

343. Are you aware of any other reasons that would necessitate the Government paying more for their tanks than other persons? I am not positively aware of other reasons; but I believe it is because the Government are needlessly particular. The Government require that their tanks should be mathematically correct.

344. *Mr. Woore.*] Where a professional man is employed to pass the tanks, would he not be bound to see that they were properly made, and to insist upon their being carried out in the strict spirit of the contract? In the case of a squatter, if a man has worked well, and has not made money out of the work, the squatter is apt to take the whole of the circumstances into account. Of course a tank not well finished would not do an inspector so much credit as one nicely finished. Another most important consideration in the matter of expense is the distance that the contractor has to deposit the earth from the edge of the tank.

345. *Chairman.*] Is there any other reason that ever came to your knowledge. Does not a squatter pay cash down on completion of the tank, after measuring it up, while the Government go through a good deal of red-tapeism before the money can be paid. The accounts must first go to the Department, then to the Auditor-General, and then to the Treasury before the money can be paid? I have heard very serious complaints on that point.

346. *Mr. Woore.*] Now what is the usual distance that squatters in your experience have had the earth which has been taken out of the tank removed from the edge of the tank? I cannot say from memory.

347. In the case of Government tanks it is, I believe, about 30 feet. In your own case how far do you remove the earth? Speaking from memory, I should say we put the earth away from the bank from 12 to 13 feet. I may point out that there has been serious trouble with the contractors in order to get them to put the earth far away, even in our locality. If we always insisted on moving the earth twice the distance I have named I would not like to say what we would have had to pay for the tank.

348. There is another matter you do not always insist upon having—this earth put up in a bank with uniform sides? No.

349. That would entail a greater expense, would it not? Certainly; considerably more expense. I have no knowledge of what the expense would be to do that. We simply ask that the earth should be shovelled out beyond a certain point.

350. *Chairman.*] All the squatters care for is that the earth taken out does not go back again? Yes.

351. *Mr. Woore.*] This bank that you say is erected around the Government tanks is made with the object of conserving more water by pumping over the bank from outside when there is surplus water? That is the object, I believe.

352. From your observation of the Government tanks, do you believe that they are made in an unnecessarily expensive way for public works. Further than that there is a good deal of neatness and finish;—

do

- W, Sawers. do you think that the tanks are made in an extravagant way? I do; I think that they are made in some cases extravagantly.
- 13 Jan., 1888. 353. Will you explain? Where there is an excellent catchment—a hard ridge like the roof of a house—I think in any season almost sufficient water would come into an ordinary tank without having these additional expensive embankments built all round. Of course, I refer now to a case where there is good catchment area.
354. Of course, you will admit this—the greater the depth of water, and the more water the tank contains, the more permanent and valuable it is likely to become to the public? Yes; I quite admit that.
355. Then, suppose you conserve 25 feet of water instead of 15 feet, is it not all the better? I admit that it is; but I think that it would be better still, where there is a good catchment area, to make two tanks instead of one.
356. Then you think the quantity of water conserved is unnecessarily large? I do, where the catchment is good.
357. But the catchment is no good without rain? What I mean is, that an inch of rain falling into a tank from a good catchment will put plenty of water into it; but in some parts of the country two inches of rain will not make so much water as one inch will elsewhere—that is, where the soil is porous.
358. But you will admit that as a rule the general design of these tanks, and utilising the earth that comes out of them, is an economical way of constructing these public watering places? I think it is business-like and substantial, but expensive. I think a hard and fast rule as to the size of the tanks must be absurd, so much depends upon local circumstances and the quantity of water required from these tanks.
359. Is it not more economical to utilise the earth taken out of the tank, by building it around the tank, to conserve more water than by not using it in any way at all? In answer to that I would say that it may be so in some cases, but circumstances must determine in each.
360. But, generally speaking, is it not a more economical system? Only where the catchment area is not good. My opinion is founded upon a proof that additionally heavy expenditure is caused by these embankments.
361. Are you sure that it is not by the steepness of the batter? No; not by steepness of batter. Steep batters are unnecessary where the catchment is good, and the money expended upon one tank would probably have excavated two;—but on the simple merits of whether, *per se*, a tank with embankments round it is not better than one differently situated, there can be no question.
362. *Major Penrose.*] Will not a tank of this kind hold just double the amount of water by putting up embankments, especially where there is a caretaker in charge? Certainly, there can be no question about that; and especially where the expenditure is of no moment. The same caretaker might be looking after two tanks, provided they were not more than 8 miles apart.
363. *Mr. Woore.*] You admit, then, that these tanks with banks around them are better than squatters' tanks;—do you admit that? Certainly, in some cases; just as I admit that a new fence is better than an old one.
364. Then, if that is so, why do not the squatters make their tanks in this way;—is it because the engineering skill is not available? No; because it would not pay us to do so.
365. *Major Penrose.*] But your tanks have not to fulfil the same conditions as Government tanks? Though the conditions are entirely different, we would find it much better to make two tanks for the same money.
366. *Mr. Woore.*] Now, if you wanted to augment your water supply at a certain place, and had six months' supply at that place in a waterhole, and the banks were not suitable to a very much increased depth of water, would you think it better to sink a tank near that place, if you had good catching ground, than to make banks around this waterhole, which would be liable to be washed away by a flood;—would you bank the whole all round, or would you prefer, if you had a good place for a tank, to make a tank apart altogether from the creek? It would entirely depend upon the features of the case.
367. The reason I ask this question is because we have evidence here as to the making of tanks near natural waterholes? As a practical squatter I should be guided entirely by the circumstances.
368. But I have given you the circumstances? If the waterhole was not a permanent one, I should think it would be a waste of money to bank it; and my experience brings me to the belief that in the far western flat country of New South Wales tanks are much more satisfactory than anything in the way of dams.
369. They are not so liable to wash away? That opinion which I have given you only refers to the western country.
370. Do you know the Paroo? No; but I can speak of those creeks—the Narran River, the Bokkara, the Birie, and the Culgoa Creeks—on which dams have been a very doubtful success indeed. Unless you have a first-class place for a dam it is no good.
371. *Chairman.*] In Riverina they are the commonest things you can have? I regard this hitherto dry back country as the most permanently-watered country we have now. I know the country on the Bokkara, and the dams in that creek. They are expensive dams; but I now regard our back-country (previously dry owing to the want of tanks) as the most permanently-watered country we have got. But the circumstances of each case must guide a practical man.
372. *Mr. Woore.*] Have you had any experience of springs? No, not much.
373. Is it within your knowledge that to try and do anything with springs—that is, to try and open them up—sometimes results in a decreased water-supply instead of an increased supply? Yes, I have heard of that being the case out in the Irrara district—in the country west of the Warrego. The opening up of springs is not always followed by an increased supply of water; indeed it is sometimes the reverse. In speaking of the prices we have given for tanks, I may say that the country where we have sunk, and where we gave 1s. per cubic yard, was very good sinking. There was no difficulty in ploughing off a layer of soil with a plough and bullocks, and then scooping off the soil.
374. Is there no provision in contracts for hard ground or cement? No; we always sink a shaft.
375. *Major Penrose.*] Has there been water near where the contractor was working? Yes, there was water not very far away.
376. *Mr. Woore.*] But if, owing to unforeseen circumstances, a contractor had taken a contract to make a tank, and the price had proved to be too low, is it usual with squatters to make any concessions? It would be usual with nine squatters out of ten—that is, if they wanted the work finished.

377. Are you aware that it is not usual for the Government to make any concession of that kind? I was going to point out that I have seen Government tanks which it was impossible to complete beyond a depth of 7 or 8 feet. The contractors worked at it, and left it. Around Byrock I should not be surprised if a man had to pay from 2s. 6d. to 3s. 6d. for the excavation of such soil. W. Sawers.
13 Jan., 1888.

378. And have you known contractors on some of these Government works not to make even wages? Yes; they could not make wages on that kind of stuff. I found it necessary in many cases to make tanks oblong instead of square. I have one 180 yards long and 40 wide, or something of that kind. We took the stuff out the way that was shortest. An oblong tank is much easier to construct than a square one.

James William Boulton called in and examined:—

379. *Chairman.*] What is your position in the Public Service? I am an inspector of public watering places. J. W.
Boulton.
13 Jan., 1888.

380. Are you aware of the objects of this Commission? Yes, I am.

381. You are aware that there has been—to use the mildest term—considerable friction between the Departments of Mines and Works with regard to the construction and maintenance of tanks and wells? Yes; there has been a considerable amount of—I would not like to call it friction.

382. I use this term as being the least disagreeable? Well, I think there has been what it is safe to call friction between the two Departments.

383. To what cause do you attribute this feeling? To a certain extent, the feeling has been engendered by the tone of the minutes adopted by the Works Department. The tone of their correspondence with us is not calculated to engender good feeling between the officers of the two Departments. Besides this, I think it is attributable to the system of dual control—to having two sets of officers over the same work. The feeling is only the natural consequence of this.

384. *Mr. Woore.*] I suppose it was this dual control that caused this correspondence? Just so. [*Witness then read a document entitled, "Abstract of Reports on Tanks and Wells in Hay District," signed A. W. Stilwell, 20/8/87, a copy of which will be found in Appendix.*]

385. *Witness.*] As to the complaints as to the caretakers, we employ the best men we can obtain; and when a complaint was made against the caretakers, each case was investigated, and the man dismissed if he was found guilty.

[The Commission adjourned.]

THURSDAY, 19 JANUARY, 1888.

The Commission met at 10 a.m.

Present:—

HON. G. H. COX, M.L.C., CHAIRMAN.

MAJOR PENROSE, R.E., | J. C. WOORE, Esq.

Francis Abigail called in and examined:—

386. *Chairman.*] You are a member of the Legislative Assembly, and Secretary for Mines? Yes. F. Abigail.
19 Jan., 1888.

387. In the inquiry we are now making, we are going through the charges *seriatim*, so far as we can, in order that in our summary of evidence we shall have all these matters in regular order, which will be more conducive to the end that we have in view. It will save trouble if we go through the same system with you, asking you at the end your opinion with regard to the friction that has arisen between the two Departments, its probable cause, and any suggestions which you may wish to make with a view to a remedy? Perhaps you will permit me to start by describing the circumstances which led me to take up this matter. That will explain very fully the position I have taken up, because I look upon this inquiry and the appointment of this Commission as the result of my action. I will state what I have to say as briefly as possible. When I took charge of the Department of Mines I immediately became aware of the fact that great loss of time and public inconvenience arose from the division between two Departments of the work in connection with the construction and maintenance of tanks and wells. What I had learned in this way led me to inquire from the officers of my Department the causes of this loss of time, and I then ascertained that some portion of the work was done by the Mines Department, but that the constructive part of it was under the charge of the officers of the Department of Public Works. About that time also a large number of complaints came in to me, as Minister for Mines, about the faulty manner in which the works were carried out. Complaints were made as to the bad selection of sites, and in some cases I was told that tanks were constructed where there was no necessity for them. I was so impressed by all these circumstances that I made a representation to the Cabinet by minute on the 21st of March last. The following is the minute:—

Minute by the Secretary for Mines.

Department of Mines, 21st March, 1887.
The administration of the Public Watering Places Act, 48 Vic. No. 16, which gives statutory authority for the construction, control, and maintenance of works for storing or providing water, adjacent to any public road, is charged to the Department of Mines.

The administrative arrangements of 1880, which are still in force, also allot to that Department the charge of works for the storage of water in the pastoral districts. In addition to the control, maintenance, and leasing, the surveys of watering places and the construction of huts have more recently been undertaken, and it is now found necessary to assume the charge of fencing, and provision has been asked for that purpose on this year's Estimates.

The construction and repairs still remain with the Department of Public Works; but this division of authority is accompanied by drawbacks, such as much unnecessary correspondence, great loss of time, and a resulting want of economy, which, it is thought, will be obviated if the service is placed under one Department.

The Secretary for Public Works will perhaps agree with me that, under the circumstances, it might be desirable, in the public interest, that the whole of the business connected with these works, including construction and repairs, be handed over to this Department.

FRANCIS ABIGAIL.

That minute went in due course to the Cabinet, and they virtually decided to carry out the suggestions I had made. About that time, also, I was informed by Mr. Quin, who was at one time a Member of the Legislative

F. Abigail.
19 Jan., 1888.

Legislative Assembly, of circumstances which strengthened me in the conviction that, in connection with the construction of public watering places, there was a great deal of abuse and defects which required alteration. At one watering place a simple piece of fencing required renewing, which at the most would have cost £3. The officer reported that the fence should be removed as suggested. This had to go to the Works Office, and ultimately the cost of reporting upon the removal of the fence was some £50. I considered, as a business man, that any arrangement of that kind, which resulted as it did, was simply a waste of public money, and on that account I urged the matter on the Cabinet so that the thing should be stopped. At that time there was upon the Estimates a sum of £30,000 for the construction of new works. The Roads Department immediately called for a lot of tenders for works for tanks and wells in various parts of the Colony, which absorbed the whole of this money. This was done, as I believe, for the purpose of preventing the Mines Department from having the spending of the money.

388. *Mr. Woore.*] In reference to this expenditure on the repairing of the fence, might I ask how it was incurred—was it incurred on the repairs which were necessary? I believe some officers of the Works Department had to make very long journeys, travelling some hundreds of miles to report on the matter. That is the way, I understand, the expenditure was incurred. The officer had to make two or three journeys backwards and forwards to see that the work was done.

389. *Chairman.*] Is it not a fact that the Public Works Department have now road superintendents in all parts of the Colony? I believe that is so.

390. And do you know the reason why the services of these men were not obtained for this thing? I have the impression that most of these men have not the necessary knowledge; and my authority for that statement is the opinions of men possessing large station experiences—such men as Mr. Quin, Mr. Russell Barton, Mr. Chesney, and a number of others. These gentlemen have made to me very strong reports in reference to the selection of sites and the manner generally in which the work was carried out.

391. *Major Penrose.*] Were those tenders that you have mentioned called for by the Works Department before the proclamation of the Cabinet minute? I think they were called for about that time; if not, immediately afterwards. It was immediately prior to the issuing of the minute.

392. Because they would hardly have done it after the minute was issued? [No answer].

393. *Chairman.*] I made one or two notes as to what you have mentioned to the Commission. Has not the selection of sites been made by some of your own officers? These papers will prove the contrary; and in proof of what I say I will just turn to one—a most extraordinary one—that giving the history of the Ivanhoe tank. I can speak with authority on this matter, because during my western trip some months ago I inspected the tank and saw the absurdity of it. The site was selected in direct opposition to the wishes of the Department of Mines. It is the 16th case in these papers.

394. Yes; it is alluded to in the *précis* as follows:—

Ivanhoe Tank.—The Waiko (or Ivanhoe) well fallen in through neglect prior to 1879. Tank required for use of township and travelling stock, and, after much correspondence, the Works consented to construct it. A site was recommended by Mr. Gilliat, but not adopted—another site chosen for tank upon Waiko private property. Tank site was altered to present position in main street of Ivanhoe. Compensation paid to contractor for moving. Tank sunk in bad holding ground. Papers relating to prices paid for fencing and drains, also to character of drains and fencing in this case.

—? Well, now, the site of this Ivanhoe tank is in the centre of the town. As a matter of fact, I have now under consideration a proposal to open a new stock route at the back of the township, because stock will not travel through it. The site selected for the tank is such that the townspeople cannot get near it. I saw it was silted up and leaky; and altogether in the district it is looked upon as a huge joke that a tank should be constructed in that locality.

395. Can you give us any reasons for the alteration in the selection of the site from that originally chosen? I cannot tell; except that the Works officers saw a difficulty, and our officers found it necessary to go in the opposite direction.

396. Might it not have been the case that upon putting down a trial shaft the site chosen was found to be ineligible? I think a close scrutiny of the papers will show that that was not the case. It was clearly pointed out to the Works Department before they undertook the work. It was merely a difference of opinion between the officers of two Departments, and the result shows that the officers of the Mines Department were sounder in their judgments than the officers of the Works Department.

397. But this tank was supposed to supply the town as well as travelling stock? Yes.

398. And it is found to be useful for one purpose, but not for the other? Well, the site recommended by Mr. Gilliat would have been very much more suitable for both purposes. It would have been very much cheaper and very much better.

399. But this tank is necessary to supply water to the town? Well, it has never been used for that purpose.

400. I suppose that in the present season it is not required? During my trip no deputation waited on me, as was done in other places, to ask that the tank water should be allowed to be used by the townspeople.

401. Then, as a matter of fact, the selection of sites which was supposed to have been made by the Mines Department, has not always been carried out, and you think to the detriment of the public? There can be no doubt of that. Now I will read, if you please, a portion of report received from Mr. Inspector Low upon this very tank. It is dated 12th December, 1887:—

The drains here have evidently been constructed with no respect as to what a drain is for. One drain, for a good half mile, running water from tank. Another is brought along road to Mossgiel, and cut up very badly by both stock and teams. The water from this drain overflows silt tank, which is very small, and partly upon main road, and runs into Elliott's tank on opposite side of road, which water Elliott afterwards sells to the public. Another long drain runs through township allotments which have been sold, and is now being blocked up.

JOHN LOW.

402. *Mr. Woore.*] Was that work done by the Works Department or by the Mines? Well, I cannot tell you now. I have also in another report, referring to the fencing of the same tank, a statement which shows that a tender was let for this fencing at from £116 to £120 per mile. It was sublet to Elliott, and afterwards to a man named Anderson, whose price for doing the work was £32 per mile; showing that the first contractor, without doing anything at all, had cleared a profit of £33 11s. per mile. When these facts came under my notice I came to the conclusion that it was about time I did something to put a stop to the practice.

403. *Chairman.*] Have any of these sites selected for tanks besides that of Ivanhoe come under your notice? Yes; Mr. Quin pointed out to me that the dam at Tarella tank had been constructed on his run, and quite close to good permanent water, in direct opposition to his recommendations and to the recommendations

recommendations of the Department. The tank had been under the charge of a keeper for some years without bringing in the slightest revenue to the State.

404. I have it here, "Tarella and Meenamurtie"? Yes; these are the places.

405. *Mr. Woore.*] Was this place close to which the tank had been erected permanent natural water, or was it made by the lessee? Partly natural, and partly made by Mr. Quin; but in my opinion the Government had a perfect right to use the place without any charge.

406. *Chairman.*] In what way? By Mr. Quin's offer in writing to that effect.

407. *Mr. Woore.*] Are you aware of a minute, written by Mr. Farnell when he was Minister for Lands (I cannot tell you the year), stating that the foreshores of all waters artificially conserved by lessees of runs would be protected, and that a number of the lessees took advantage of this inducement, and made some very expensive works for the conservation of water? I am not aware of that. All I know is that if Mr. Farnell did so, he had not the authority of law in his favour.

408. But he did actually issue this minute, and I, myself, acted upon it? Well, I am not aware of it; but even if what you say occurred, it could have no reference to the Tarella tank, because Mr. Quin freely offered the use of it to the Government.

409. I merely point this out to you that you may see that it would not have been fair for the Government to take these waters, artificially conserved by lessees, away from them? The papers show no reason for the non-acceptance of Mr. Quin's offer; but they do show that the work was proceeded with in spite of his protest against this wrongful expenditure of money.

410. *Chairman.*] The Tarella tank and Meenamurtie well minutes are referred to in these papers? I would like to say in reference to this matter that Mr. Quin lately came to me and spoke to me about it again. I at once called for a return of the cost of maintaining these two wells, and also the revenue that had been derived from them since they had been constructed. Mr. Quin, on this occasion, reiterated all that he had previously said to me, and I showed him a minute from Mr. Bennett, the Commissioner for Roads, who stated that the work had been carried out at Mr. Quin's request. On this Mr. Quin immediately wrote me a letter, denying the statement in the most indignant terms, and protesting against being placed in such a false position. He concluded by again denying in the most emphatic way the statement that had been made by Mr. Bennett.

411. Are there any other cases besides this that you are personally aware of? There was the Meenamurtie well, which is also in close proximity to waterholes. This well is only a very short distance away, and although a man has been put in charge of it, it has never been used, and has not brought in any revenue. In fact, at the present moment I am thinking of having the well battened down, and the man removed from it.

412. Do you know how many years this well has been sunk? It has been sunk now for a good many years, but I cannot state exactly. It was not during a wet season, but I believe it was during Mr. Quin's term in Parliament, six or seven years ago. Had the well been opened in a good position it would undoubtedly have been used.

413. Have there been any other cases brought before you in which faulty judgment has been displayed? No; these are the most prominent ones that have been brought under my notice.

414. We have evidence rather fully from Mr. Gilliat on this matter. He had remarks to make upon them all; but it is only in regard to special ones that we require your evidence? Certainly.

415. *Mr. Woore.*] Did you see in all cases the sites of those tanks that were chosen by the Works Department? No; not in all cases, but I saw some of them. In some cases that were referred to the Works the Mines recommendations were approved of.

416. In some cases I understand you to say the recommendations of the Mines Department with regard to sites were approved of and adopted by the Works Department? Yes; and I have not heard of any of these being afterwards complained of as unsuitable, because in selecting the sites they had the experience of the stock inspectors, as well as their own, in connection with these public watering-places.

417. Do you know anything about the tanks on the Nyngan to Cobar Road? No; I do not know by whom the sites of these tanks were selected.

418. *Chairman.*] Now, in regard to defective design and construction, and excessive cost? In connection with these matters, of course, I can only state to you that which I have learned myself. I cannot, of course, give you anything like professional testimony or information gained by practical knowledge. I can only say this, that during my Western trip, which occupied close on a month, travelling in the country for close on 600 miles, it was subject of complaint by nearly everyone that I met with that had any knowledge on the subject, that these designs were faulty.

419. In what way? It was said by nearly everyone that the sides of the tank were too steep—that the batter was too steep. I believe that in most cases it was 1 in 1.

420. *Mr. Woore.*] How does this affect the tanks? Well, I will merely say what I was informed. The batter is made so steep that when the cattle are driven on to the ground they go straight into the water and down go the sides of your tanks.

421. Is there no troughing at the tanks? Not always; in many cases there is not.

422. But is there not a place made specially for the cattle to water at? There is still a part of the tank they can get at, and the result is what I have stated to you. Steep sides are very nice to look at if you can keep them in that position and keep out the cattle.

423. Is there not a fence round the banks to protect them? There are cases where this has been done, and others where it has not been done. Where you have a mob of cattle you cannot confine them except by a strong fence, and this does not exist in many places.

424. *Chairman.*] Is it a reasonable supposition that when the tanks were constructed with steep sides it was not intended to water cattle at all in the tanks, but to pump the water into troughs? I think that is very probable indeed.

425. Consequently, stock getting into tanks shows no defect of design in constructing the tanks? Well, I take it that there is still a want of knowledge; and in support of what I say in this respect, I point to the fact that no squatter constructs on his run tanks with the same steep sides.

426. Mr. Sawers has already given us valuable information to the effect that pumping the water into troughs would be too expensive for squatters? Well, I think there is a lot of expensive machinery on many of these tanks for which there is no necessity. I think this is a question to be dealt with by skilled inspectors, who would have more practical knowledge of this particular subject than I could possibly have.

F. Abigail.
19 Jan., 1888.

F. Abigail.
19 Jan., 1888.

427. *Mr. Woore.*] With regard to troughing, has faultiness of design come to your knowledge? Our Department is now altering all the troughing. The alteration was pointed out to the Works Department times without number, and it was shown that the first construction was so unsuitable that cattle could not drink at the troughs; and we are now proceeding to alter the thing by taking down the top rail.

428. But you are speaking now generally? Yes; I am referring to a general rule, and the Department of Works has since admitted that the alterations which we have carried out are wise and good ones.

429. *Chairman.*] Are you aware that one of the reasons for the construction of these steep batters was for the purpose of lessening evaporation; because you must allow that the greater the surface of water exposed to the sun the greater will be the evaporation, and that in a long batter there is a greater amount of water exposed to the surface than in a steep batter. It is for that reason apparently these steep batters were designed by the Department of Works. In two places, the fact of these steep batters being adopted was for this reason: Tanks necessarily cost considerably more than they would otherwise have done if there had been a very long slope, because, in constructing a steep batter, it is impossible to get bullocks to draw ploughs up the sides. The next reason for the apparent excessive cost is that so far as we have learned yet the Government tanks are much deeper on an average than the squatters tanks. This adds, as you must know, very materially to the cost of the works? I do not think the reasons stated by you can be sound. If they were sound the squatters would adopt the Government system of tank-making, because they are more intimately concerned than the Government can be in the storage and saving of water.

430. But if the squatter could make a tank for 1s. per cubic yard of excavation, would he not rather prefer to make two tanks for that price than to make one which would cost him 2s. per cubic yard? My opinion is that the squatter would construct his tanks in the deepest and most effective manner, having all the knowledge which men gain by living out in that part of the country.

431. Then there would be some apparent antagonism between cheapness and effectiveness. The Government would, perhaps, adopt this plan, not thinking it necessary to save a few pounds; but the squatter, wishing to get as much water as he could, and as cheaply as he could—would it not be reasonable to suppose that he would prefer to have two tanks at 1s. per cubic yard than one tank at 2s.? Well, all I can say is, that gentlemen with professional knowledge outside the Department of Public Works, say no. Mr. Chesney is an engineer as well as a squatter, and you will find in the papers valuable information from him on the subject. It is generally admitted that his conclusions are correct, and his judgment sound on the question.

432. But I am now speaking presumably from the squatters' point of view. The Government make tanks, say, every 10 miles, but the squatter wants his tanks nearer than that. In consequence of having to make more tanks he cannot afford to pay so much as the Government, who have one over every 10 miles? But the Government do not have one every 10 miles.

433. But that only bears out the argument which I am adducing. A squatter having to make more tanks than the Government cannot afford to go to the expense that the Government (whose tanks are further apart) can afford to undergo? That may be so.

434. *Mr. Woore.*] Are not the demands made on the Government tanks much larger than the demands made on the tanks of the squatters? Well, the revenue obtainable from them does not show that. There are a number of these places which return no revenue whatever. I called for a return recently on the subject, and was simply astounded at the fact that men are being paid £3 per week to take care of places which are not used at all, and which bring in no revenue whatever.

435. Does that occur in a great many instances? In several—in numbers of instances. I think I shall be able to supply the Commission with a copy of that return. I shall have it prepared and sent down.

436. No doubt some of these tanks seem unnecessary, especially in good seasons; but a caretaker has to be appointed there, so that in time of severe drought the tank which is now considered unnecessary, and which is not used at all by the public, may prove of good service. It is not in good seasons at all, of course, that tanks are required. People can do without them altogether then? Certainly, and I have no doubt that some of these tanks were constructed in some of the seasons when they were wanted by the public; but what I have said shows that they were either put in the wrong place

437. *Chairman.*] Can you enumerate one or two cases where this occurred, so that the other side may have an opportunity of replying to them? I would rather that this information was given directly by one of the officers, who can speak with authority, and give the whole of the surrounding circumstances, which I cannot do.

438. With regard to excessive cost, there is one other matter I should like to ask you about

439. *Witness.*] In speaking about the last question, I would like to refer to the Jumping Sand-hill well case, the report of which showed that the tank need not have been made, as there was good water a mile away. I have a list of cases here with respect to Low, but he will be here himself. This report is written by an officer, and comes with authority; but at the same time it would be much better to have it from the officer himself.

440. Now, one other matter. As a rule, when a squatter has a tank excavated he of course gives every facility to the contractors to carry out the work, and advances money to pay wages; so that when the tank is finished he goes there, measures it, and pays the money at once. I believe this is not the case with regard to the Government. In the first place only 50 per cent. of the whole amount to be paid for construction is given, and inspectors are sent up to see that the work is being carried out properly, and sometimes several months' delay occurs before the contractor is paid. Necessarily, therefore, the contractor has to ask a higher price from the Government, because it means that no one can take a Government contract unless he has a considerable sum of ready money available to pay off his workmen. Do you not think that this delay that occurs between the inspection and the survey, and the final passing of the work and final payment, therefore necessitates larger prices being asked? I think there can be no doubt that the delay which takes place in paying the contractors by the Works Department has led to excessive prices being charged, and I gave instructions seven or eight months ago that the contractors were to be promptly paid. I believe that it is for this reason the Mines Department have been able to obtain the erection of huts and other works at very much reduced prices.

441. *Major Penrose.*] Might not the excessive cost be due in some instances to the works having to be constructed in very bad seasons—in seasons when there is a great drought, scarcity of provisions, scarcity of grass and water, and under great pressure from outside—a great want for the works having been pointed out, and a tank having to be constructed whether the Department wished it or not? That would no doubt be

be the case in some of these works ; but it could not affect the cost per cubic yard. For instance, if a squatter were to carry out an excavation of a similar character in the same district at 9d. to 1s. per cubic yard, there would be no reason whatever for the Government allowing their works to cost them 1s. 9d.

F. Abigail.
19 Jan., 1888.

442. But suppose the conditions were not the same? Well, there would still be a great disparity in the cost.

443. But the Government tank might be much further from water than the squatter's tank? Yes.

444. And the facilities given by the squatters? I think in most cases the Government give better and greater facilities to the contractors than the squatters.

445. *Chairman.*] There is yet one other matter? I would like to say now in reference to the cost of excavation that seven months ago I made a request to the Department of Public Works through the Minister that I should be supplied with a return, showing the cost of excavations. I have received no reply, and have addressed some ten or twelve other communications to the Department, every time being put off with one excuse or another; and this led me to the conclusion that the Works Department did not desire to furnish me with this information, as it might prove too much. I at once wrote to Mr. Sutherland (you will see in the papers some very strong minutes on the subject), but up to the present moment we have not received the information that we asked for.

446. We have here a list, but it is not a complete one, in which we find that the cost of excavation has varied from 10½d. to 1s. 9d. per cubic yard. In the evidence given by Mr. Gilliat, the Chief Inspector of Public Watering Places, he stated he heard as a fact that as much had been given as 2s. 6d. per cubic yard for this work? There can be no doubt about it. There can be no question about it, that as much as 2s. 6d. has been paid away to contractors, who have sublet the work at much smaller rates.

447. Well, the Commission have made a minute that the cost of the other tanks should be sent in to us, so that we may know each case thoroughly. There is another matter in connection with this. In some cases where the population was rapidly growing, such as Broken Hill and Silverton, great pressure is brought to bear on the Government that roadside wells and tanks should be constructed at any cost? But no such representations have been made to the Government with regard to Broken Hill; and, as a matter of fact, before the Government knew anything whatever about the accumulation of a great population there, the Works Department had authorized the construction of a tank near the town. This tank I saw when I was up there, and it is only since my visit that communications were sent to me urging greater speed.

448. *Mr. Woore.*] I think the place about which Mr. Gilliat gave evidence was not Broken Hill but Milparinka? Yes; Milparinka and out that way were referred to in Parliament on one or two occasions, and I gave a promise that the works would be proceeded with, with all the speed that we could command. These works cannot apply to the question, because they are only just recently started.

449. Still it is possible that similar costs may have been incurred in years past, where the requirements of the population were urgent and where the Government were compelled to carry out the works at any cost? No doubt. I think that that was the case with regard to the Paroo Road tanks.

450. *Chairman.*] The facts stated would necessitate an apparent excessive cost of Government tanks over those constructed by private individuals; but is it the duty of the Government to construct expensive tanks where there is no certainty of getting water and no public necessity, and is that a proper action of Government officers who are paid to select proper sites and to carry out the works with all the skill and professional knowledge that they can command? I think not. I may be strange in my conclusions; but, as a business man, I would not care to have an officer with me who would not make an endeavour to do his duty properly.

451. The public will agree with you there; but, in the case of loss of life occurring, the Government would have to do almost anything, and to incur almost any expense, rather than that lives should be lost? Certainly, if it were to supply the population I should not consider the expense at all, or if life could be saved; but in most cases there is no population to be supplied, and that is what I complain of.

452. *Mr. Woore.*] But then as to stock. I know one man who lost 12,000 sheep through there being no drinkable water in Copago Lake? And I know a case where a man lost 7,000 sheep on the borders of a tank, because the sheep would not drink the water. It was owing to this mixture which the Works Department have been in the habit of dressing the inside of service tanks with, causing a film to arise on the water, and rendering it undrinkable by stock.

453. But the making of tanks was a new thing at that time; and if the work had been in charge of any other Department inexperienced in such matters, it would have been liable to make the same mistakes? There is no doubt about it; but, then, the Works Department ought to admit that they have made a mistake, and not stick to the contention that they have done the correct thing. When their mistakes have been pointed out to them, the usual thing for the Works Department to do was to return offensive replies. Mr. Abbott, when he was Minister for Mines, received the same replies that I have received; and these papers will show that I considered their replies so offensive that I appealed to the Minister for Works.

454. *Chairman.*] There is one other matter still in connection with the charge of excessive rates of payment to contractors for Government tanks. It is this, that where a squatter is quite content to have earth excavated at a certain distance from the tank, the Government insist by very strict regulations and specifications that the earth must be placed a certain number of yards from the excavation, and they also insist that the banks shall be nicely trimmed, merely making them look well, but doing no real good? There is no doubt that that is so; and if you go to expense in having the banks nicely trimmed, it may be very agreeable to the eye, but it will be of no practical benefit. This is one of the things which involve unnecessary expense.

455. *Major Penrose.*] Then you think that the embankments round the tanks are of no practical utility? No, there is no practical benefit in making the tank as level as a billiard table, because it cannot remain so if the tank is to be used.

456. *Mr. Woore.*] The Government employ professional men to look after these matters, to plan these tanks, and to see that they are constructed in accordance with the plans? I suppose that is so; but I think in many cases if they got a good bushman he would do the work very much better than a professional officer.

457. That is your opinion; but is it likely if an engineer were employed that the work would be completed in any but a proper and workmanlike manner? They might be completed in the manner in which he would consider proper and workmanlike; but it would not follow that the work would be done properly.

458.

F. Abigail.
19 Jan., 1888.

458. A private owner would, perhaps, be content at having the work done less nicely? Perhaps it would be just as well. I do not say anything about that, or if I did I might say something that would not be very flattering to the Works Department. I do not believe that at the present time the works in connection with tanks and wells are carried out well or neatly or cheaply, and that is the cause of the country calling out so loudly for a Local Government Bill.

459. *Chairman.*] What do you think about the specifications adopted by the Works Department? I can see that they were framed for the purpose of consuming public money, and contain a great many unnecessary provisions.

460. *Mr. Woore.*] But specifications of any kind are necessarily precise? Exactly.

461. And, of course, the Government would be more particular in carrying the works out through their officers (who are responsible for their proper completion) than would be a private individual? The officers are responsible for carrying out the works strictly in accordance with the spirit of these specifications? Yes, of course; a business man would have his specifications exact, but he would not overload them with a number of provisions which are entirely unnecessary.

462. *Chairman.*] Now, no squatter ever dreams of cutting down stumps, but he would take care that no trees were left standing in the vicinity of the tank, because the boughs might keep falling in? I see here that one of these specifications states that the bottom of the tank shall be perfectly level. Now, that alone is really an absurd thing. It is ridiculous to so construct a tank as to put a spirit level on it.

463. *Mr. Woore.*] But it is the spirit and not the letter of these specifications that it is intended should be carried out by the contractors? No; the terms of the specifications have to be carried out exactly. Your Chairman here has had practical experience of this question, and if he goes through these specifications carefully he will simply laugh at many of the conditions, and would never think of spending his own money in having them carried out.

464. The tendency of your argument is in favour of non-professional men being employed to carry out these works? I did not say that. I said men —

465. You said good bushmen would do as well as professional men? Yes; because a good bushman would have practical knowledge of what was necessary for the work. An engineer sent from Sydney without having any practical knowledge of the country, and the necessities of the works to be constructed, has not the local knowledge which is necessary.

466. Then, is your argument not in favour of having a non-professional man to take charge—to plan and to carry out these works? I would have good men, whether they possessed professional training or not. In connection with our Department we have inspectors who have had years of service on large stations, and who have acquired a knowledge of stock, and how best they may be encouraged to drink. They know what form the work should take, the kind of fences to be erected, and troughing to be supplied. We have a number of men of that kind; and men having this practical knowledge are better than engineers who have not the same experience. Not that I would select men off the streets of Sydney and send them up there; but we have practical men who are able to construct the works better and cheaper than the Works Department have done them.

467. *Chairman.*] The next matter on our list is that dealing with expensive forms of machinery. We would like to have your opinion on this? In many cases the Works Department have put on engines, necessitating the employment of engineers. Our officers have repeatedly reported to me that this expensive machinery is not required, and that the work might be done by a very much simpler process.

468. In many instances, we understand, steam-pumps have been erected? Yes; here is what is said about this:

Polygonum Hut Well.—No better site for a tank could be desired than this, which, in my opinion, would have been much more suitable for traffic. The mode of lifting the water here, which is by a windmill, condemns itself, as the windmill is continually getting out of repair and breaking. Sufficient water for requirements could easily be drawn by a single whip, the cost of which would not exceed £5. The water here is unfit for use, and is, consequently, unfit for travellers.

469. *Mr. Woore.*] Is it not the case in some instances that it is not possible to obtain water fit for human use from wells used for stock? No doubt; but it opens up the question whether it is a wise thing to open up expensive wells until you have acquired the knowledge by boring whether you can get fair water or not.

470. *Chairman.*] We are still on this question of the excessive cost of machinery and the greater cost of maintenance. Of course we are aware that a caretaker who could merely take care of a common pump or whim would not be competent to take care of a steam pump? Certainly not.

471. You think that these steam pumps are necessary at some places and that at other places they are not necessary? I do; and we are compelled to keep an engineer in charge of machinery at these places where there is no water whatever. A more simple form of machinery which would require the services of a man at 7s. a day, would be quite sufficient; but at the present time we would have to pay an engineer at the rate of £4 per week.

472. *Major Penrose.*] I suppose you can specify instances of this, given by your own officers? Yes; but I should prefer that it should come from the officers themselves, as they can speak with greater authority.

473. *Chairman.*] The next point of inquiry is as to the excessive cost of fencing? In reference to the fencing, the excessive cost will be found to be in this way: A very expensive style of fence was adopted, and one which I conceived to be altogether unnecessary. During my trip in the west I actually came across some fencing paid for by the Government at the rate of something like £100 a mile.

474. *Mr. Woore.*] Was not that fence put around the tank to protect it? Yes; but there are very extensive fences, sometimes including land, to the extent of 400 or 500 acres.

475. It is not around the tanks, then? No; the fence is around the caretaker's paddock. We have evidence that men working in the district have offered to put it up for from £40 to £45 per mile.

476. Then these fences around the caretaker's paddocks are put up in just the same manner as fences around the tank? They must be.

477. Are these fences wire fences? No; I understand that a good many of them must be of sawn timber. The gates erected at many of these places were something like those which might be seen at the entrances to some gentlemen's residences in Sydney. I asked where those gates led to—in my simplicity and ignorance thinking that they led to some palatial residence near at hand—and was told to my astonishment that they were the entrance to the caretaker's paddock. There was one case (Boonoona tank) which cost more than £120 per mile. It was sublet by the contractor to another man, and the former pocketed about £40 per mile.

mile. The cost of each gate was about £15; when any form of the simple fence that I had seen in my 600 miles journey round the country would have done just as well.

478. *Chairman.*] Will you describe the fence—how many wires had it? It was of sawn timber.

479. *Mr. Woore.*] You mean sawn rails and posts? Yes.

480. Were they painted? Yes; the gates were splendidly painted. They had a beautiful white paint coating, and I supposed I was reasonably correct in imagining that the gates led up to some gentleman's residence.

481. *Major Penrose.*] Then it was the gates that you referred to as being made of sawn timber? No; it was the fences. At the Ivanhoe tank there was a six-wire fence of a description which was new to the inspector, and it cost £35 per mile.

482. *Chairman.*] Are you aware of any instance in which straining posts were dispensed with at the instance of one of your own officers? No; I am not aware of that.

483. *Major Penrose.*] The specifications are very clear with regard to straining posts.

484. *Chairman.*] I have a memorandum here to the effect that in one instance straining posts were dispensed with by one of the officers of the Mines Department? Has that been confirmed by Mr. Gilliat?

485. No; I do not think that Mr. Gilliat knew anything about it. I suppose you do not complain that the fence around the tank is unnecessarily strong? No; but I think it unnecessarily good.

486. Of course you are aware that a mob of 1,000 cattle, almost dying with thirst, require a very strong fence to restrain them, else they would break it down? The trouble is that the fence is expensive without being strong. I am quite sure that if a mob of cattle ran up against most of these fences they would have to give way. I have a list here which I will read:—

Forty-eight-mile Tank.—Fencing not yet completed; this of split belar, none of it being carted more than 5 miles. Contractor would not tell price, but told me it was between £90 and £100 per mile.

Mount Manara Tank.—Fencing in good order; not yet transferred. This has lately been erected by Works Department at £120 per mile. Is of pine, half split, and the balance round young pine, with no straining posts. The round pine will last only a few years.

Boonoonoo Tank.—Fencing in fair order; not yet transferred; lately erected by Works Department at £120 per mile. Gates in good order; lately erected by Works Department at £15 per gate; not yet transferred.

Thirty-five-mile Tank.—Fencing in good order; not yet transferred. This has been erected at £95 per mile; none of the timber was carted over 4 miles.

487. I think we have gone sufficiently into that unless you want to supplement your evidence in some way? No; I have nothing further.

488. Then we will go into the next; but first of all I would like to read to you a report from Mr. W. J. Hanna, on the Wilson reservoir. He writes from Menindie on the 13th June, 1887:—

MEMO.—*Wilson Reservoir.*—On last inspection the caretaker was absent, and very little work appeared to have been done since my last visit. Mr. Crommelin informed me the pump is now in working order. I would again suggest that the caretaker be instructed to keep the various parts clean, and to lubricate more frequently. The ruts in the embankment could be filled up by shovelling up the material washed down instead of breaking in the sides, which tends to weaken the embankment. This evil of rutting can be reduced to a minimum by drawing off the top water at one or both ends of the embankment, as recommended in previous report. If small drains were cut round excavation and kept in proper order the storm water would be collected, and would run into the creek instead of flowing down the excavation slopes and causing deep ruts. It should also be part of the caretaker's duty to remove the sand from the bed of the creek, especially near the weir, as opportunity offers. This report has been unavoidably delayed.

The Engineer-in-Chief for Roads, Sydney.

W. J. HANNA,
Road Superintendent.

—? I may say, with reference to Mr. Hanna, that he is a very efficient and careful officer, and I should be happy to give great attention to any report coming from him, although he is an officer in another Department.

489. Now, when these works are completed and handed over to the Mines Department, what right has Mr. Hanna, or anybody else, to report on them or to interfere? I think he was encouraged to do so by his chief.

490. But is it recognized at all that the Roads officers have the right to report on works that have passed out of their hands? Well, I should resent any interference by any officer of the Works Department of anything that happened to be under my control. I should resent it as a very improper interference.

491. But suppose an officer of the Works Department saw works that had cost the country large sums of money going to destruction, would he not be right in reporting that fact to the head of his Department? Yes; I should say so under these extraordinary circumstances. If that had been done the officer would deserve to be commended for it; but what you say does not contain the case as it occurred.

492. Well, it seems clear that Mr. Hanna reported on the want of Mr. Crommelin's attention, and the next time he visited the reservoir he found that the caretaker had not attended to the instructions, and that Mr. Crommelin did not compel him to do so; and he not only found fault with the caretaker, but with Mr. Crommelin as well, both persons being officers of the Mines Department? Was the document which you have read sent to the Mines Department? I ask that question because I have dismissed several caretakers for neglect of duty.

493. The document is endorsed—"I think a copy might be sent to the Mines Departments"? If a copy had been sent the matter would have been at once inquired into; and if the statement therein contained was found to be correct, then the caretaker would be dismissed.

494. And Crommelin would have got a reprimand? Certainly.

495. But do you think that Mr. Hanna stepped out of his way in reporting this matter to his Department? In a case of this kind, I would not think that Mr. Hanna would be guilty of doing such a thing.

496. We have some documents here which I would like to read to you. They relate to the One-tree tank:—

Sir,

I have the honor to inform you that Caretaker Kelly, at the One-tree tank, has reported that the plunging-rod belonging to the pump has become disconnected. I have reported the matter to the assistant-engineer, Mr. Stilwell.

I have, &c.,

JOHN A. KEIGHRAN,
Overseer of P.W.

The Chief Inspector of Public Watering Places, Sydney.

This is a matter which should have been attended to by the caretaker, and this appeal to this Department is scarcely consistent with the claims made by the Mines as to the maintenance of these works being in their hands. I would point out that this system of routine causes unnecessary delay—in this case three weeks—and to deal with a matter which should be attended to at once by the caretaker.—A.P.W., 24-6-87.

19 Jan., 1888.

Telegram from Sydney to A. W. Stilwell, Roads Office, Hay

Keighran reports piston-rod, One-tree pump, disconnected. Presume it has been attended to?

A. P. WOOD,
Assistant-Engineer.

The Commissioner and Engineer for Roads.

One-tree Tank.

Roads Office, Hay, 26th June, 1887.

Sir,
Mr. Wood's telegram attached. I visited One-tree tank on the 24th instant, and found that the piston-rod had become disconnected with the plunger-rod, owing to the key which fastens the two together having fallen out. This I attribute to negligence on the part of the caretaker. I repaired it, and the pump is now in working-order. This might have been remedied by the caretaker himself.
I have, &c.,
A. W. Stilwell, A.E. W. B. NICHOLSON.

This is another proof of the absurd nature of many of the complaints forwarded to us by the Mines. Long correspondence, and an official set in motion to rectify carelessness that could have been dealt with by the most stupid of labouring men.

Sir,

Roads Office, Hay, 2nd July, 1887.

As instructed by you, I visited the One-tree tank on the 24th June, and found that the piston-rod had become disconnected with the plunger-rod, owing to the key which fastens the two together having fallen out. This I attribute to negligence on the part of the caretaker. I repaired it in five minutes, and left the pump in working-order. This repair might have been effected by caretaker, who, when I asked him the reason, replied that he did not know anything about the pump, but reported the break-down, and was waiting till some one was sent to repair it. To do this five minutes' work I had to ride 50 miles over country almost impassable. This man is evidently unfit for the post of caretaker, as he has no knowledge of any portion of his work.
I am, &c.,
A. W. Stilwell, A.E. W. B. NICHOLSON.

An unnecessary journey of 50 miles across flooded country, equal to 150 miles in a dry season, has been caused by the carelessness and incompetence of this caretaker of the Mines Department.—A.W.S., 1/7/87.

—? Well, I should want that confirmed before I believed it.

497. This man says that he rode 50 miles in order to attend to what might easily have been put right in five minutes? Well, I have a case in which Mr. Stilwell countermanded the instructions of the officers of our Department, and caused a great amount of public inconvenience.

498. *Major Penrose.*] Was he within his rights in doing that? No; certainly not.

499. Who moved Mr. Stilwell to do this? It is necessary to explain that there has been a continual desire for the last five years to discredit the officers of the Mines Department in connection with this work. Four or five years ago Mr. Abbott (who was then Minister for Mines) wrote a strong minute, expressing disapprobation at the terms used by some of the officers of the Works Department in writing to the Mines' officers in connection with these works; so that this friction and irritation has existed for a long time, and I insisted upon having the whole of the work, or I said I would have none of it. You will find that all these statements are couched in the most offensive terms.

500. *Chairman.*] Now, this is the gist of our inquiry. It is as to the nature of the present interference of the officers of one Department with those of another. Here, a caretaker applied to the Inspector of Public Watering Places, who, instead of attending to it, refers it to the Works Department in Sydney, and that Department was obliged to compel its officer to ride 50 miles to do five minutes' work. Now this of itself (as anyone can see) must have led to a good deal of friction. Here is a trifling complaint by a man who should have been sent about his business there and then; who waits for three whole weeks, allowing the public to suffer for want of water, until he has communicated with his superior, and his superior communicated with the Works Department, who have to communicate with their officer up country. Now, it is easy to understand what annoyance this must give to a public officer, who must necessarily feel very angry that, through the stupidity of one man, he should be made to ride 50 miles; and hence the friction between these two Departments? You will understand at the same time that we are not allowed to do anything, no matter how small the cost might be. We are not allowed to do anything by way of alteration or repair, although the Act gives the Mines the power of alteration, and even of construction. We could not do anything before the matter was brought before the Cabinet.

501. Mr. Gilliat stated in evidence that it was not the privilege of the Department to spend more than £10 on any necessary repairs? Yes, that is as a matter of course; but we had not the right to do it. We had not ministerial or executive authority to spend a shilling until I obtained from the Cabinet the minute giving us the power.

502. *Major Penrose.*] I suppose you had no vote to work on? No; the statement which has just been read is a bare statement from the Works' officers, and it will be necessary to have a reply from the Mines' officers on this particular case before you will be able to see the exact facts. One is an *ex parte* statement, and may be very good until you get the other. Mr. Gilliat is more conversant with individual cases than I could possibly be; and he will be able to deal with this at once. I have two cases here of Mr. Stilwell interfering with our officers at Pulletop and Hulong.

503. *Chairman.*] We should like to hear about them? The first is dated from Hay, on the 6th December, 1886, and is in these terms:—

Sir,

On visiting this tank on 3rd instant, the water was 2 feet above level of berm—20 feet depth in the tank. John O'Neil is lessee. He has been in possession six weeks, and was in charge when I visited. The embankment was in very bad repair, and no effort had been made by lessee to remedy it. Water had been allowed to accumulate on top (which is dished), and break over at two corners, carrying down some 30 cubic yards of earth. The batters throughout were also corrugated by neglected rain-scour. The wires of enclosing fence were very slack, and should be attended to.

The service tank was not full, and the lessee appeared to know little about the care or working of the steam-pump. I got it to work, and he said he would employ a man to take charge of it. It worked satisfactorily, but the boiler needed cleaning. The troughing was in good repair; it also needed cleaning.
I have, &c.,

The Commissioner and Engineer for Roads.

A. W. STILWELL.

Make copy to send Mines; re-submit on Mr. Wood's return.—W.C.B., 8/12/86. The Mines should certainly be informed and requested to insist on lessees keeping works in proper order.—A.P.W., 10/12/86. (Mr. Overseer Elworthy for report.) If these statements are correct, Mr. Elworthy will please say why reports of neglect at wateringplaces in his district should be so frequently received through another Department before being reported on by him.—HARRY GILLIAT, B.C., 20/12/86. Mr. Overseer Elworthy.

These statements by Mr. Stilwell are very annoying. I visit these tanks regularly, and report you fully after each inspection. The last time I reported on this tank was when I handed it over to O'Neil in October. At two ends of the embankment the earth was washing away, and I gave O'Neil instructions to mend this up, and have sent him iron to make the V shaped gutter at corners. When passing the tank subsequently I noticed my instructions had not been carried out, mainly owing to Mr. Stilwell, who, the lessee said, had countermanded my orders, and told O'Neil not to touch the embankments without instructions from him. Why does Mr. Stilwell do this? I have personally complained of this interference to Mr.

Boulton,

Boulton, who can tell Mr. Gilliat all about it, and I am sending Mr. Boulton copies of several letters on the subject. I also refer you to my letter of 10th instant, wherein I complained about Mr. Stilwell. I will write O'Neil, and insist on the work being carried out at once; and if not done by the time I pay my next periodical visit of inspection in January, I will report to you. I opposed O'Neil's tender for this tank, but he got it after all.—W. J. ELWORTHY, 22/12/86. F. Abigail.
19 Jan., 1888.

The next is dated from Whitton, 21st December, 1886 :—

Sir,

Referring to my instructions to visit the Hulong tank, I have now the honor to inform you that I did so, and found that Mr. Road Superintendent Stilwell—after Mr. Overseer Elworthy had instructed the caretaker to coal-tar the boiler, &c., in accordance with your circular, 3rd September last—had issued fresh orders to the caretaker to paint it red, and to apply to Mr. Elworthy for paint. Mr. Elworthy instructed to prepare the newly-dished top of the embankment for the reception of a shoot for carrying off the storm water, and material for which Mr. Elworthy was applying. These instructions were also countermanded, and a length of india-rubber hose 2½ inches in diameter was supplied by Mr. Stilwell to carry off all the storm water from the four embankments. I need hardly say how totally inadequate this is, and must at the same time protest against such a useless waste of money, and such a childish innovation, that in the eyes of the travelling public so reflects upon the Public Watering Places officer. I wish to bring this immediately and urgently before you, as I understand Mr. Stilwell is about supplying other tanks in his district with the same. A shoot of less than one foot across is perfectly useless and is required at each angle. Actual experience, both at Hulong and Pulletop, has proved the folly of the 2½ in. hose, and caretakers have now definite instructions to proceed with shoots so soon as material arrives.

The interference on the part of Mr. Stilwell and his assistant, in regard to the control of public watering places transferred to us, is highly objectionable. The overseers do not appear to have the interest in their work they should have while dictated to and snubbed by an officer who has no control over them. The caretakers cannot understand what appears to them a divided and antagonistic authority (antagonistic, however, only on the part of the Works' officer), and between the two the public watering places suffer.

After the transfer of public watering places to us in good order, I would urge that the responsibility of the Works officers should cease. We have capable men as overseers, who, if they understood it to be their duty, could see all repairs executed, and, I think, with less expense; and thus avoid a correspondence and interference that, I venture to think, is hardly creditable to Mr. Stilwell and his endless and groundless complaints.

It is only from Mr. Stilwell's districts that these endless, frivolous charges come.

The accompanying copies of letters are, I think, a substantiation of my remarks.

I have, &c.,

JAMES W. BOULTBEE,
Inspector of Public Watering Places.

The Chief Inspector of Public Watering Places.

Now, you will observe there that Mr. Stilwell complains of the work not having been done; but he does not say anything about the countermanding of the orders given by the Mines officers and the non-fulfilment of repairs, which is the result of his own action and not of our officers.

504. It might be advisable if I read over *seriatim* to you the complaints that were made by Mr. Stilwell? I have another one here.

505. This is the series of reports sent in by Stilwell himself, and some of the officers under him. It goes to show, apparently, that the caretakers over these works are careless, and that several incidents such as that where the key fell out and the plunger-rod became disconnected, have happened. This matter was read over to Mr. Gilliat, but he stopped me in reading in order to make some reply. This would appear to show good reason why the Works Department were continually interfering with the Mines. Take the report with reference to Til Til tank, for instance. It is as follows :—

Til Til Tank.—Report of 21st January, 1885 (85-118): That caretaker was without a horse to work the McComas lift, and without oil for bearings; that the public worked the pumps with own horses when requiring water, and it had thus sustained considerable damage.

Report of 3rd April, 1885 (85-578): Found caretaker absent on leave—only a lad in charge; sheep and cattle had been admitted inside tank enclosure to water at silt tank, and the embankment was thus being damaged; fence rails were missing, apparently used for fuel by travellers.

Report of 1st May, 1886 (86-643) as to pumps, Holman horse-power, being reported by caretaker as out of repair and quite ineffective: That there was no defect, except that bucket-leathers required renewal, and this could have been done by caretaker instead of requiring mechanic to be sent from Hay—100 miles; also, that much negligence was evinced in keeping drains and fence in repair, and that sheep had been allowed inside tank fence, damaging the embankment; Mr. M'Leod, Mines' Overseer, reported, in reply to this, that caretaker had been told by travelling mechanic never to open the pump for repairs, and that the sheep had been removed from tank enclosure soon as observed.

Report of 6th August, 1886 (86-1,165): That statement of caretaker as to repair of pump was incorrect; had not been directed not to touch it by mechanic, but that mechanic had found that caretaker did not know how to overhaul the pump, and that there was no other defect than as to leathers being worn; that Mr. Nicholson reports that sheep had remained inside fence by caretaker's admission for some days until they were too weak to walk out.

—? I have a letter here from the lessee on the subject, and he states that whatever blame there is in the matter lies with Mr. Stilwell himself.

506. There is no reply from Mr. Stilwell to that? It is dated on the 9th, and is headed, "As to alleged interference with Mines' overseer at Pulletop tank." The letter is as follows :—

Sir,

Referring to the attached papers, it is to be observed that Mr. Elworthy does not state that I countermanded his orders to the tenant, but that the tenant, O'Neil, informed him so. An obvious preliminary on Mr. Elworthy's part would have been to ascertain whether such were the facts. For your information I may state that it is about the reverse of the facts; but as this was not elicited by Mr. Elworthy, it may perhaps be neglected as irrelevant, and now apparently the points to be considered are that this man's unsupported statement is taken by his overseer (as he intended it should be) as an excuse for gross neglect, for some two months, of a most obvious and urgent duty; and then his hand is unwittingly played further to by Mr. Elworthy's report, and Mr. Gilliat's consequent minute being based upon it.

It would really appear that up to the present Mr. O'Neil has been master of the situation. I do not see how any responsibility regarding it rests with this Department.

In fact, the matter should be one, as Mr. Gilliat somewhat elaborates in his minute—so obviously and solely between the Mines officers and their tenant—that unless it had been forced upon me I should have had some delicacy or reluctance in dealing with it.

I can, however, heartily concur in what Mr. Gilliat says respecting the interference of officers with the men under another Department—the more especially as this has been at times somewhat realised for me by actions of his overseers at works still under my jurisdiction; but I confess that I have failed to draw from it the somewhat anomalous conclusion that it is impossible an officer can successfully accomplish his work if his orders are countermanded by an officer of another Department, possessed of no authority to interfere.

On the contrary, I have found little difficulty in maintaining my authority, and little harm has resulted, and I have taken it all in good part as evincing only mistaken zeal on the part of his officers.

I have, &c.,

The Commissioner and Engineer for Roads.

A. W. STILWELL.

507. The object of reading this letter of Mr. Stilwell's is to bring out such incidents as show where the Roads officers were justified in making charges against the men who were placed in charge of valuable public works? There can be no doubt that at times improper men are appointed to the position of

F. Abigail. of caretakers. This is proved by the fact that I have dismissed, during the last few months, several of them who were reported to me for neglect of duty. In every case where the neglect was proved I have never hesitated to dismiss the man.

19 Jan., 1888.

508. *Major Penrose.*] Of course, caretakers might prove inefficient, no matter what Department appointed them? Yes. Here are the instructions to the caretakers. (*See Appendix.*)

509. That appears to cover the whole thing? No doubt.

510. Perhaps the Works officers have had similar instructions? But there are times when under the most strict regulations men will be guilty of disobedience; and as soon as it is shown that there has been disobedience they are punished. The tone of Mr. Stilwell's communication would lead to the inference that we not only appointed incompetent men, but that we countenanced their incompetency by keeping them in their positions. That is what I regard as a ridiculous conclusion. Now, the greasing of the tanks is a matter to which we objected most strongly; but we have evidence to show that it was done after we objected to it.

511. What about the subletting of contracts? I have heard of contracts that have been sublet so often that the public have had to pay to the tune of £30 to £35 per mile more for fencing than they should; and the same with regard to excavation.

512. *Chairman.*] We should like to get a contractor to give evidence about this matter. It may be that a contractor, having a large sum of money on hand, will go in and take Government contracts where men of small means are shut out. The consequence of that would be that these men would get a very large margin of profit by subletting the contracts to other men possessing less capital? That may be the case; but do not the facts in connection with the caretakers' cottages destroy a conclusion of that kind? While the cottages were under the control of the Works Department, the average cost of their erection was £85.

513. Unless we can get something specific, the matter is hardly worth going into? I know cases where the first contractors for fencing have bagged from £35 to £50 per mile.

514. Now, with regard to the faulty construction of wells and the expense of constructing headworks before the water was tested—that would involve a large expenditure of public money, and apparently in a very improper manner? In reference to the faulty construction of wells, I think I had better begin by referring to the Wooloondool well:—"This well has been bored from bottom of shaft without any pipe or flooring being placed in the well. The bore is liable to, and is constantly choked from, silt—constant baling, even when water is not required, necessitating great wear and tear and useless labour, insisted on by Works Department as necessary to keep bore from silting. Bore choked on many occasions, and has caused much delay and useless correspondence. The Works Department endeavoured to show that it was the fault of the Mines caretaker or lessee." Now, here is a very case in point. Here is a certain work insisted on by the Works Department, showing that they were interfering with the management of the works by the Mines Department. We shall show that they insisted upon much needless work which was entirely unnecessary. Then there is the case of the Dry Lake well, the circumstances of which are similar to those of Wooloondool well, in which all the requests for repairs and alterations were referred to the Commissioner for Roads. We come next to the Willandra well, the construction of which was not asked for by the Mines Department, the site having been selected by the Works officials. When the well was nearly completed and the supply troughs and whim erected, it was found that a portion of the headworks was upon private property. The Chief Inspector of Public Watering Places recommended one watering place between Clare and Ivanhoe; but the Works Department constructed both a tank and a well, although Mr. Gilliat pointed out that, from experience he had gained in the district, wells were not suitable. The construction of the well was so defective that, although it only went 102 feet, the cost exceeded £1,050. Then for the resumed land where the headworks were erected they had to pay £30 compensation, being £7 10s. per acre for 4 acres, to the owner.

515. Was there no reason given for that? The papers show that there was no reason whatever, but that they had ample room for the troughing without encroaching on this land.

516. Why did they go in, then, on what was private property? I cannot say; but I should think it was their duty to acquire information whether the land was private property or not before they trenched upon it. As you all know, you can, under the most difficult circumstances, put down a well from 100 to 175 feet deep at a cost of about £700, and that is a very good figure; but here there was no need for a well at all. There was only need for a tank, but we get both a tank and a well at excessive cost. It is noticeable, also, that this was done in direct opposition to the report of the Mines officers.

517. Here is another matter about which we want your opinion—the erection of headworks before a water supply is found at all? My view of that is this—and I will carry it out while I have the privilege of presiding over the Mines Department—that where a well is necessary to water stock, and as soon as a suitable site is selected, I shall insist on boring being carried on or a trial shaft being sunk, to test whether we can get fairly good water or not before the expenditure of any public money is incurred by the erection of those costly headworks.

518. Has that system of which you speak not been already carried out by the Works Department? Evidently not; otherwise we should not have had a number of wells where the water is of such a character that stock will not use it.

519. *Major Penrose.*] Is boring for artesian water carried out by your Department? Yes; and very successfully carried out by our Department of late.

520. *Chairman.*] In many cases these headworks are let all in the one contract with the excavation? Yes.

521. Consequently, the contractor takes care to put the headworks down, and then gets paid for them whether he gets a supply of water or not? Yes; here is another case I refer to—the Holy Box well—which was sunk, and a small supply of fresh water tapped, followed by a great flow of salt water that, when twice analysed, was declared to be unfit for use. Evidence as to saltiness was submitted, and the well abandoned and the tank commenced. When the work at the tank had proceeded to about 3 feet, the Works officer suspended operations, declaring that the water in the well was good. The well was again handed over to the Mines Department, and constant baling was insisted upon to improve the quality of the water, which was done without result. The Mines has had to bear the cost of maintenance, and employ a caretaker to bale and protect the headworks. There is no prospect of leasing salt wells, and the caretaker has had to cart water 17 miles. The whim, service tank and trough were all erected before the quality of

of

of the water was found to be suitable; and the iron in the troughs was destroyed by the action of the salt. The well is now useless for travelling stock and the public. Then, here is another case—that of the Mount Manara well—which was sunk on the shoulder of a hill. The supply of water was too limited, and the depth too great to be of use. The Works Department erected whims, tanks, and troughs before testing supply. Endeavours were made to increase the supply by driving, but without success, and the well was abandoned, and a tank sunk 4 miles away. Then there is the Old Gunbar well, which, when completed and transferred to this Department, was proved by analysis too salt for any purpose. Although the Works Department admit that this water is too salt, yet they endeavour to show that it is fit for use, and urge that constant baling will improve the quality. This constant baling was carried on for two years without any improvement. The Works Department then consented to bore a well, but this has apparently been abandoned. The Mines Department have had in the meantime to employ a caretaker to bale and protect the headworks. The well was completed, supply tanks, whims, and trough completed, although Works Department were requested to defer the latter work till the water was proved. No stock was ever watered there, and the well is useless as a public watering place. A small tank has been recommended to be constructed in the vicinity. Then there is the case of the Dolmoreve well, which is an instance of what is considered stock water by the Department of Works. At the time of the transfer the local officer called attention to the quality of the water, and advised that a tank be made. Constant baling was again urged by the Works Department to improve the quality, but without success. The possibility of leasing this well is small, and the caretaker has had to take his horse 4 miles to fresh water. A case of breakage of wire-rope is submitted as an instance of the action of saline matter in water. I would like to add that this is a case where we several times sent the water to the Government Analyst; and, in the face of the fact that he reported it was unfit for cattle, or for any stock whatever, the Works Department went on and completed the well in the same way that they would have done had the water been good. Then there is the Baloola and Normanstone well, which have been for a long period in course of construction. The usual head-works in this case were erected before the supply of water was assured. There appears to be a reasonable doubt that the sites recommended by the Chief Inspector were not adhered to by the Department. Normanstone well has since been reported as having been abandoned. The Roto well is another which deserves mention. This well has been sunk almost alongside a permanent waterhole in the Willandra Creek. The lessee of the well was prosecuted by the local overseer for a breach of the regulations under the Public Watering Places Act.

F. Abigail.
19 Jan., 1888.

522. With what result? The case was dismissed.

523. Are you aware that wells are ordinarily sunk as adjuncts to what is called permanent water, because sometimes the so-called permanent water gives out? Yes, I am aware of that; but the quality of what is coming should be tested before you put down expensive wells. Of course I should want evidence to show that it was necessary to have a well close to a tank for the purposes which you have enumerated, before I would feel justified in going into an expenditure which might prove unnecessary.

524. The next question is, excessive cost in the construction of these wells? I think I have very fully elaborated that part of the question.

525. Well, can you give us some information about the huts? I can only give you the fact that we are now having the huts constructed at an average of £42 15s. each. We have now in course of construction thirty-four of these cottages. The average price paid by the Works Department was £85. They paid from £114 to £46; but the average was what I state.

526. Is the same accommodation given in both? I think so; but the work is meted out on the principle that I have before referred to—of not having everything so particular and nice. Ornament is altogether unnecessary under the circumstances.

527. But the accommodation is not more limited? I do not think so. The papers will show it, so that it is not necessary to go into it.

528. *Major Penrose.*] Perhaps the Mines Department will furnish the drawings by which these huts are made? Certainly; the papers are now being prepared for Parliament. The Assembly carried a resolution during last session that all these papers should be placed upon the table of the House, and we will supply you with plans and everything else.

529. *Chairman.*] The next question is the defective construction of troughing? Well, the defectiveness is proved beyond all doubt, because we are altering all the troughs; and the Works Department have agreed in the wisdom of the change.

530. What is the chief difference? They were altogether defective, and the top rail was so fixed that it was impossible for the cattle to get at the water. We are now taking the top rail off.

531. *Major Penrose.*] Is it difficult to arrange to meet the requirements of all classes of stock? I think not. Our plan is working very well. One general rule will apply.

532. *Chairman.*] Now, I want to ask you about the remedy. There are one or two matters noted down here in this discussion that has taken place.* In the Public Watering Places Act, the fifth clause of that measure provides that it shall be lawful for the Minister for Mines to take over the construction of these places. Now, this Act was passed in 1884, authorizing the Mines Department to do all these things;—has that provision in the law ever been carried out? No.

533. Why? Because there was always a very strong opposition offered to it on the part of the Works Department. We have not had a Minister for Works who would consent to hand the matter over to the Mines Department, until I brought it (as I said) before the Cabinet myself; and I told the Cabinet simply this, that they would have to make the change, and if they did not, I would take a step of a most extraordinary character. I felt the matter to be of such urgent public importance, that I would have given up my position in the Government rather than allow things go on as I found them going on.

534. *Mr. Woore.*] Has your Department the whole of the construction under its charge now? Well, very nearly. Occasionally we have some interference; but on this year's Estimates we, and not the Works Department, have placed sums down for the construction of tanks, dams, and wells. I have insisted on that step being taken.

535. *Chairman.*] Now here is an important matter. In handing over this Department from the Works to the Mines, does it not necessitate a new set of officers to carry on the construction of tanks and wells? No; our Inspectors of Public Watering Places, and Mr. Gilliat are, I think, admirably suited to carry out the work in an economical and satisfactory manner.

536.

* Reference is here made to evidence of Harry Gilliat, Esq.

F. Abigail.
19 Jan., 1888

536. I think you have already stated that you do not think it necessary to have specially trained men to carry out these works—that you prefer good, practical, sensible men, possessing a good knowledge of the country? Certainly. Here is a man appointed at £6 per week to tar the tanks, when we could get a man to do it equally well for 45s. ; and he would be very well paid.

537. We find now that the Works Department have to draw out specifications and plans of those works which they construct, necessarily employing their own skilled officers to do it ;—I understand from you that you deem it unnecessary in your Department to take their place? The officers we have there are in every way capable of carrying out these works without any of the skilled officers from the Works Department.

538. Then it would not actually increase the expenditure on the part of the Government to hand over these works from the Works to the Mines? On the contrary, I believe it would be a great public saving ; and I do not make that statement without thought, or from any personal or interested feeling. It is a matter which has given me very grave concern for the last nine months, and what I have done is the result of very careful consideration.

539. In saving money, do you mean that you would save money in the construction of these works or in the salaries of officers? I mean a saving of money in the cost of construction ; a benefit to the public in doing away with unnecessary delay ; and altogether putting an end to that friction—that unseemly friction—which has been going on between the officers of the two Departments.

540. Then, from your experience you think it is impossible to carry on this dual control with any satisfaction? I think it is just absolutely impossible. In fact, I would not be a party to anything whatever of the kind ; and, in connection with this work, I have found, as in some other things, the same division of labour bring about the same result. When I took charge of the Mines Department, I found the same public inconvenience in consequence of the division of labour in connection with the minor roads. I had a conference with the Minister for Lands on the subject, and allowed him to take the whole of these over, with the result that there is much saving of time and public convenience. I look upon the matter as a man having a large business experience, and it seems to me thoroughly ridiculous to divide the work in the way it has been done here. No man who was spending his own money would do it.

541. *Major Penrose.*] I suppose these officers of yours have some engineering qualifications? Yes ; I think sufficient engineering qualifications for the work.

542. *Chairman.*] You are aware that lately, at some considerable expense to the Government, a Commission on Water Conservation was appointed—that it took a very considerable amount of evidence, and brought up a report which, if carried out, would necessitate a large expenditure of public money? Yes ; that is so. The Mines Department is the Department in which the officers of the Commission are now engaged ; and when I was appointed to the position I now occupy, I found that the Commission had spent from £12,000 to £13,000. I found, also, that it had collected very valuable information ; and they applied to me for a renewal or further extension of time. I thought, however, that they had gone far enough, and, with the concurrence of the Cabinet, I refused the extension asked for. The officers of that Commission are now under my control, and we are now carrying out some experimental works at Lake Urana, towards one of the first steps of a large scheme of irrigation.

543. The carrying out of a scheme of irrigation is one of the recommendations of this Commission? Yes ; one of its first features.

544. Would your officers be competent to carry out such a very elaborate and costly scheme of irrigation, presuming that this water conservation business is entirely taken over from the Works Department? Yes ; we have a man there now (Mr. McKinney, the engineer in charge of the Lake Urana works), who is admitted to be one of the most capable men in the Colonies. He has had a large experience in water conservation works in India ; and all authorities agree in stating that he is a man capable of carrying to a satisfactory issue any works of this kind, no matter what their magnitude may be. He is the engineer under Mr. Gilliat.

545. So that in carrying out the recommendations of this Water Conservation Commission, entailing many thousands of pounds expenditure, you think you have officers in your Department competent to deal with these expensive and elaborate works? I am thoroughly satisfied of it ; and I may say that Mr. McKinney's reports to the Water Conservation Commission have been commented on in Victoria in the highest terms.

546. *Mr. Woore.*] Is Mr. Gilliat a professional man? He has had experience of the water question in California, and has had eight or nine years' experience in connection with the same matter in the Colonies.

547. But he is not a trained man? No ; he is not a trained man.

548. *Chairman.*] Would you be at all surprised to find that Mr. Bennett, now at the head of this Water Conservation Branch, would feel very much disappointed and perhaps hurt at finding that the system which he had advocated and encouraged for years was to be taken out of his hands because a little friction had taken place between the subordinate officers of two Departments? That question is put in such a manner that I scarcely know how to reply to it. I do not think, where public convenience is in question and the public interest is at stake, that any individuals should be considered. The works should be carried out in the manner which would best serve the people's interest and obtain for them the best return for the money they have expended. I think it is very likely that Mr. Bennett or any other man would feel very much hurt at the work being taken out of his hands under the circumstances.

549. Especially when he has brought it to fruition? There is a great deal to do yet before it comes to fruition ; and when it comes to that I do not think that Mr. Bennett will be amongst the living.

550. Do the Government not contemplate any immediate large expenditure in accordance with the report of the Water Conservation Commission? The state of the matter is this : The Government have not yet decided which Department is to be charged with the work of water conservation. This is a matter which cannot be taken up till Parliament is invited to deal with this question, and it is impossible for me to say at this stage what will be the decision of the Cabinet. Certainly the question will not be dealt with in any large measure during the present session of Parliament. We have at present sufficient measures to occupy our time.

551. *Major Penrose.*] This question, I presume, is largely mixed up with that of Local Government? Yes ; and the passage of a Local Government Bill will settle the question altogether ; although, of course, the central Government will have to retain the supreme control.

[The Commission adjourned until the afternoon, when the sitting was resumed].

James William Boulton called in and further examined:—

552. *Chairman.*] We are trying, Mr. Boulton, to make our evidence as symmetrical as possible; and to do that we intend to adhere as strictly as we can to the items you have given here, which we will go into *seriatim*. The first question to consider is the faulty judgment alleged to have been shown in the selection of sites for tanks and wells. I notice that your Department has issued the following circular to your officers:—

J. W.
Boulton.
19 Jan., 1888.

(88-408)

Sir,

Department of Mines, Public Watering Places Branch,
Sydney, 1st December, 1887.

In compliance with a direction of the Hon. the Minister for Mines, you will be good enough to furnish me, as soon as possible, with replies to the following questions. It is to be understood that the information afforded shall be based on your own experience or observation:—

1. At the public tanks, whether it is preferable that stock should have admission to the excavation, or be supplied from troughing? State reasons for your preference.
2. What are the general rates paid per cubic yard for excavation by private persons and by the Government.
3. What are the general rates for sinking wells per lineal foot paid by private persons and by the Government.
4. What are the relative cost of headworks paid by private persons and by the Government.
5. Are the costly appliances at the Government tanks more effective than simpler methods of raising water? State which are the most liable to get out of repair and present greater difficulties in restoring them to order.
6. Are there any substantial reasons why the Government works should not be constructed at the same relative prices as those given for works undertaken by private enterprise? If so, state them.
7. State the most serious errors in construction you have noticed of public tanks and wells.

I have, &c.,

HARRY GILLIAT,
Chief Inspector of Public Watering Places.

Of course you are aware that although these documents are very instructive and give us very useful information, still we can only be guided by *viva voce* sworn evidence. We will take the documents for what they are worth, and merely ask questions upon them? I have written a rather lengthy report myself on the subject and I would like to hand it in.

553. I think you had better read it? I will.

Public Watering Places, Mines Department,

1st January, 1888.

Sir,

Referring to your letter of the 1st inst., I now have the honor to reply to it, dealing with each question raised in the order indicated.

From actual experience, I am strongly in favour of water being supplied to stock at tanks from troughing, in preference to allowing them to water from the excavations or open drinking tanks; and the following reasons for it will, I think, uphold my views:—The water in a tank, if supplied to stock by troughs, can be used to the last drop—if from open tanks, it cannot. Stock can water with greater comfort and ease, there is little or no waste, and weak sheep cannot get bogged. No water is carried out in the fleeces. There is no pollution of the water from droppings or drainings from long-woolled sheep, and the water is always good and pure and available for human beings. At the open tank the slopes get trodden in, dung and urine is carried into the water, and the tanks in time get putrid so that nothing, as experience has shown, can drink when the water is stirred up. There is the cost of cleaning out the open drinking tank, a nasty and expensive job; and, in addition, the cost of an open drinking tank is, I think, greater than that of service tank and troughing. The service of water by troughing is far more economical in every way, since water supplied by this means will last fully one-third as long again as compared with open tanks. This is a question that has had some prominence of late years among the large Western squatters, and the more advanced have adopted it with success.

So far as I have been able to ascertain, the rates paid by Government for tank-work have been largely in excess of those paid by private individuals. I lived for twelve years in the dry country beyond the Darling, and I have no remembrance of a case, not even in the early days, where more than 1s. per cubic yard was paid for tank-work. This rate I have myself paid during the dry seasons of 1882, 1883, 1884, and where the contractors had to cart their water 6 and 9 miles respectively. The general rate, however, was 9d. to 10d. per cubic yard; and I have ascertained that this rate is the general one throughout the Colony. In cases where plant and cattle were found, from 4d. to 5d. was deemed a fair rate, and one at which contractors could make money. The price at which Mr. Kennedy offered to construct a dam at the J. K. Waterhole for the Works Department, viz., 6d. per yard, and which appears in the papers, gives independent testimony on what was evidently considered a fair price.* I have no absolutely reliable information as to prices paid for tank-work by the Government; but I think I can safely say it has ranged from 1s. 1d. to 2s. per cubic yard. E. Ford, lately a Government contractor, excavated over 20,000 yards for me at Tarella at 10d. and 1s. for dam-work. Well-sinking in the same district was paid for at the following rates:—Trial shafts, 2s. 6d. per foot to 100 feet, 4s. 6d. to 200 feet. Main shafts in alluvial, 15s. to 20s. per foot of 100 feet, 25s. per foot to 200 feet, 30s. per foot to 300 feet, which price included timbering, centering, and fixing runners, and is exclusive of the cost of sawn timber, which was delivered on the station for 42s. per 100 feet. Where contractors found their own timber, *i.e.*, pine or mulga, the price was 5s. per foot in excess of that quoted; and anywhere where alluvial sinking exists these prices, so far as I have been able to ascertain, are not exceeded by private individuals. £5 10s. per foot has been paid by Government for well-sinking, and this has in cases, I think, been exceeded.

The cost of headworks, as paid by the Government, exceeds fully 50 per cent. the price paid by private persons. For whims I paid—

| | £ | s. | d. |
|---|------------|----------|----------|
| Getting timber and erection | 30 | 0 | 0 |
| Sawn timber, tar, &c. | 10 | 0 | 0 |
| Mountings (best and heaviest) | 12 | 0 | 0 |
| Carriage, &c. | 10 | 0 | 0 |
| Total cost | £62 | 0 | 0 |

This included poppet legs, &c. The whims erected by the Government are elaborately finished, all materials used in most cases being sawn red gum, even to king posts, and, so far as I can ascertain, at a cost of from £120 to £150. The whims erected for the sum I quote will compare very favourably in point of workmanship, design, and durability with the best of those erected for the Government, the design of which is open to serious objections. £90 was, if I remember rightly, the cost of a 20,000 gallon wood and iron service tank erected by me, including 200 feet of troughing, the timber for which was landed on the station at a cost of 42s. per 100 feet from Echuca. This sum is rarely or ever exceeded, since a cheaper form of tank is in general use. £200 has been in nearly every instance paid for service tanks by the Government, and this does not include troughing, which has cost from 15s. to 18s. per foot, while that erected by private persons costs from 4s. 6d. to 8s. per foot, according to design.

The appliances used for raising water, notably the steam pump, are no doubt effective; but its cost and elaborate adjuncts do not compensate for any advantage gained. They necessitate far greater care and cost in maintenance, and skilled and reliable persons, at high wages, have to be employed as caretakers; and erected as they are without shelter sheds, exposed to all weathers, have been most difficult to keep in order, and have been the subject of considerable correspondence between the Departments. They appear also to have been erected at places where least required, and horse-power supplied where the traffic is apparently greater. Except at tanks which are used for both stock and town supply, I think steam pumps entirely unnecessary. Failing simpler appliances, the horse-power pump, if properly erected, can do all that is required; and at other places, where the traffic is small, the hand M'Comas' or Floods' lift is ample; one man, single-handed, can lift sufficient water daily for 7,000 sheep. This is within my own experience. The steam pumps are far more liable to get out of order—the multiplicity of parts, their exposure to all weathers, wear and tear, all conduce to it—and the ordinary caretaker is not equal

* See papers re J. K. Well

J. W.
Boulton.

19 Jan., 1888.

equal to the repairs, although, by instructions, we are endeavouring to replace them as opportunity offers by men who can undertake repairs of all kinds. It is, however, desirable that simpler appliances of a less elaborate and costly nature should be used, and which an average caretaker can repair without reference being made to the constructing Department, which has so frequently led to frivolous and unpleasant minutes from that Department *re* "neglect of Mines caretakers."

It is a well-known fact, and one much commented upon in the country districts, that rates paid for Government tank-work are largely in excess of those paid by private persons; and this is, I think, mainly due to the delays that ensue in making payments. Small men, or contractors without money, are consequently unable to tender. Could they do so, the works would not be left in the hands of a few men who have followed up work of this kind, and who, by charging a higher rate, can afford to wait for payment. Mr. Quin told me of a case of a man who owed his merchant £60, and although the Government owed him £600 on a contract, he was sold up and ruined. In addition, too much polish is required to the work, the batters pick-dressed, and the floor of excavation as level as a table. The extreme steepness of the batter, viz., 1½ and 1 to 1, precludes the use of the scoop and bullocks (the most economical way devised as yet). The tank has consequently to be finished, and, in fact, mostly excavated by shovels and drays, necessitating extra men and extra cost. Drays and horses cannot climb the batters; roadways are consequently necessary, and the labour and power cannot be used to the best advantage. The embankments are invariably placed all round the tank, and unless used for conserving water over the excavation, are a very considerable item in the increase of cost. In their present state, they are practically useless. The nicety of the work enforced serves no practical end, and largely increases cost.

The fencing at all the Government tanks is far heavier than is required, and the cost of it, so far as I can ascertain, out of all proportion, and the disparity between station and Government rates very marked. The style of fencing latterly adopted by the Works Department is as follows:—Posts, 9 x 3, 9 feet apart, 2 feet 6 inches in ground, every twelfth post a straining post, and wired with Nos. 4, 6, and 8 gauge. This is all unnecessarily heavy. What suits for a station horse paddock or a police paddock should suit for a Government tank. Posts 6 inches or 8 inches x 4 inches, 22 inches in ground, and 12 feet apart, every twentieth post a strainer, and wired solely with No. 8 Rylands, Whitecross brands, are ample for all requirements, and will cost from £35 to £48 per mile, according to carriage and proximity of timber; and the average rate throughout the Colony should come well within £50 per mile. No station pays more than this for the fences I have described, while, so far as I can ascertain, the Government rate varies from £58 to £120 per mile, and then the contracts are sub-let. In addition, a concession has lately been made in the Ivanhoe district, by which the contractors have been allowed to disregard straining posts. The wire is run out and fastened to the post where it ends (this no practical man would ever dream of), and within a few days of the transfer from the contractors to the Works Department the Mines caretaker is reported for having the wires all slack. The charring of pine posts helps to increase the cost, while it draws the resin—the wood's best preservative—from it. The heavy wires, Nos. 4 and 6, are objectionable, since a caretaker singlehanded cannot re-strain them properly, and from the extra weight required and cost per mile.

In regard to the gates provided at the Government tanks, I think they are far too elaborate and expensive for the requirements. The general run of them are single gates, 12 feet swing, some well made, others badly. A pair of 6 feet gates, lighter in construction, would be far more serviceable, and cost one-third the price paid. I understand as much as £20 has been paid for a gate. At some of the paddocks, and to which travelling stock are *not* admitted, a 12 feet gate and two 12 feet slip-panels are provided, and are quite unnecessary; and at other places (in Albury district) a large expensive 12 feet gate is erected to admit to the tank enclosure into which nothing is allowed except the caretaker's horse to work the pump. A wicket gate appears to me to be all that is required in a case of this sort.

In regard to the last paragraph of your letter, there are many instances of injudicious selections of sites, faulty work, a disregard of the requirements of travelling stock, especially in the matter of the railing at the troughing; a disregard of the rainfall in a district in determining the size of the tank required; in sinking wells in districts where the salt water is invariably met with, and where excellent and ample catchment area exists for tanks; in placing drains where they run from the tank and where they can be but of small use; the adoption of a standard form of tank, irrespective of the ground formation, with 1½ and 1 to 1 batters in ground that will not stand; and of the inconvenient way in which the water is admitted to the troughing, and without due reference to the requirements of the road or the probability of tenants being found. In corroboration of which, reference may perhaps be made to the following, and which are within my personal knowledge:—Cobham Lake tank: In the bed of Cobham Lake, now under water for two years; J.K. well: Close proximity to an almost permanent waterhole. Tarella tank: Almost midway between two large dams that are on reserves and open to the public; neither of these dams have to my knowledge been dry since 1875. Meenamurtic well: Close proximity to permanent waterhole in 1875 before the dam was made; this waterhole was not dry. Dry Lake tank: In bed of Dry Lake; now under water two years. Ivanhoe tank is directly in the centre of township, upon measured portion of V.R., and is most inconveniently situated for bringing stock to it. Willandra well: This well is salt, and has cost £1,087, although only 102 feet deep; there is a good catch for a tank close to, but owing to defective work a new well has been commenced, I understand; the experience of the whole district has been that wells are invariably salt. The Dolmoreve and the Holy Box wells are the same, and this Department has to maintain them at great expense, since it was urged by the Works Department that constant baling would improve the quality; at the latter place a tank was commenced and abandoned by the Works, since they insisted the water was suitable for travelling stock. At both the Lignum Hut and Jumping Sand-hill wells the water is not good, while good catchments are close to for tanks. At the Old Gunbar the case is the same, only that the water is perfectly undrinkable by either man or beast; yet it is urged that improvement might ensue with constant baling. The expense of maintenance is the same as at a fresh water public watering place, and there is no possibility of leasing a public watering place of this description. All the wells enumerated are sunk in country that shows, from wells sunk by private enterprise, that brackish water alone is obtainable. The requirements of the travelling public have not met with due consideration in considering the suitability of the water, and from having to maintain caretakers at them. Some odium is attached to this Department. Reference may be made to the construction of the Woolloondool, Dry Lake and Crow's-nest wells. These are sunk and slabbed to a certain depth, and a bore to increase the supply has been sunk from the bottom. No flooring slabs, however, have been put in the well, and no pipes in the bore holes. This is, and has been, a source of trouble. The bore-holes choke and silt in, and the supply gets checked, and it becomes necessary to probe the hole to release the supply. It is urged imperatively by the Works Department that constant baling, whether water is required or not, is necessary to keep the hole clear. This is imposed upon the Mines Department, and I am sure that no practical person would attempt to defend the absence of floor or pipe. There is a consequent waste of water, wear and tear of gear and ropes, with no practical advantage, and the matter has been the source of numerous reports from overseer and lessee, and has been referred to the Works Department for action, with the result that when the bore gets choked it is attributed to the negligence of the Mines caretaker.

In the matter of drains, I have reported that at Tom's Lake, Hulong, and Ivanhoe the levels are in some cases imperfect, and water expected to run up hill. At Mount Elliott a long drain is brought straight down a hill, and is practically useless. In many cases the wheel traffic crosses them. They are consequently very much cut, silted, and damaged. If it was absolutely necessary that the drains should cross the track, provision should I think have been made, either by logging or pitching. Ivanhoe, Pulletop, Hemitage, Muriel, Tom's Lake, are cases in which this defect is very apparent.

The railing at the troughs at Government tanks has also been the subject of several memorandums by me. It is in nearly all cases too high to allow large stock to water with ease, and did not prevent sheep from getting into trough. Alterations were made by this Department, which were commented upon by the Works Department, but that Department has, in the Cobar district, now adopted the form of railing as altered by us. The complaints made to me personally in reference to this defect have been frequent, and I am sure the Department has lost hundreds of pounds from it alone. At the Hovell's dam, in the Albury district, there is an example of great waste of money. The dam (a very fine one) is constructed across the creek, and on the one side abuts on to a rocky spur; on the other is a fine wide open flat—an ample and a fine natural by-wash. This (for a reason I cannot explain) was disregarded, and a cutting taken right through the spur to form a by-wash. This by-wash is cut through the solid rock to a depth of about 15 feet, and is about 70 yards long, &c. The reason for this it is hard to understand, seeing the natural by-wash already made. At the Muriel tank and dam it became necessary, upon the adoption of pumping gear, to erect a horse-walk, and this was done on the upper or inside of the dam, at a time when the water was over the excavation. The distance from edge of excavation to edge of dam necessitated the formation of the horse-walk partly in the tank. Load after load of loamy spoil that melted like sugar, to the extent of I believe something like 3,000 yards, was tipped into the tank. This is now much filled with silt, &c., from this source. The necessity for placing the horse-walk in its present position, and in which it has settled considerably, I never could understand, nor could I understand any practical man allowing the same to be done.

The

The size of the tanks in the Albury district, and in fact through the whole of the southern portion of the Colony, are, I think, larger than required in many cases. The embankments surround the tank, and no provision is made for filling over the excavation. Had this been done, a much smaller excavation would have sufficed. Tanks are, in cases, most admirably suited for this, and steam pumps erected; but no effort has been made to utilise them by pumping within the embankments—The Hulong tank, where the tank is on the edge of a large swamp; the Ledknappa and others. The same form of tank has in most of the later tanks been adopted, with batters $1\frac{1}{2}$ and 1 to 1, irrespective of the soil. The Gunaramby tank is an instance of this. The soil is what is known as copai ground, very friable and loose, and the batters are caved in excessively. On one side the face is now about 3 feet high, and here one silt tank discharges by means of drains following right round the tank into the lower flume. The ground has been badly cut, and has been protected by the caretaker to a certain extent by a pitching of copai stones.

In some cases the troughing does not run at right angles to the supply tank, the valve from which is in cases 2 feet 6 inches from the troughs; and the consequence is that when the water is turned on it misses the troughs. This has to be remedied by the caretaker. At Goonery the valve is exactly opposite the centre rail of troughs, and when the water was turned on it scattered all over the place. A bent pipe should I think deliver from supply tank to the trough, since the noisy and rapid flow of the water alarms and disturbs wild stock, and a long length of troughing becomes practically useless. Sufficient room has not in some cases been left for stock on one side of the troughing, as at Gunbar, Ivanhoe, Roto, &c., and the access to the Ivanhoe tank is down the main street. The placing of tanks near good waterholes and the salt wells are very much against the chance of obtaining tenants for these works. In some cases two works are placed on a line of road where one would have sufficed—Clare to Ivanhoe. Wells have been sunk, timbered, centred, &c., and whim, service tank, and troughing erected, before the supply or quality of the water was decided sufficient or suitable; notably at Willandra, Old Gunbar, Holy Box, and Dolmoreve. No practical man or squatter would do this before he had tested the ground either by trial shafts or bores.

I have, &c.,

JAMES W. BOULTBEE,

Inspector of Public Watering Places.

554. *Chairman.*] Then these elaborate embankments are of no use? No, there are not many cases of that sort; but there are cases where the embankments are all made after the same form—that is, open inlets are used.

555. *Mr. Woore.*] Are they not made in that way, so that the water supply may be increased, if required? That may be; but it has not been done. My argument is, that if smaller tanks had been constructed, and the embankment utilised for conserving water, smaller excavations, and consequently less expense, would have sufficed.

556. *Chairman.*] But they would hold a lesser quantity of water? They would hold a greater quantity of water than they do now.

557. The first matter is between open watering and troughs. You are, of course, aware that the matter is very much after all a matter of pounds, shillings, and pence. Open watering is infinitely cheaper than pumping and troughing, and the question then arises which is the better plan—the cheap one, or the conserving all this water and keeping it intact from the contamination of animals, which always makes their droppings in the tanks. Then there is the corresponding costs of keeping a caretaker at these tanks, and pumping the water from them for the watering of animals;—I would like to ask you this question from the Government point of view (where money is not so much an object), and from the squatters' point of view (from which money is an object)? Well, speaking from the view of an ex-station manager, I most certainly would never allow stock into the tanks. In the first place, away up in that dry country, a tank will last fully a third as long and more by keeping the stock out. Then, as regards the cost of supplying the tank with a caretaker and troughing, I may point out that boundary-riders on a station do the work. You save the money on the whole, and you do not lose any sheep through bogging, and the wool is not perished; so that altogether, I think, there is no comparison between the two methods. If sheep are allowed into a tank they will carry out a very large amount of water with them. A boundary-rider ought to be able to look after his paddock and attend to the watering of 7,000 sheep in a day. With the McComas' pump, which is an endless chain, a man can lift water 20 feet. He can also water 7,000 sheep in the day. I never myself had to do it at that depth, but I have seen it done at Meenamurtie. It was a perpendicular lift of 20 feet. They had a well sunk on the edge of the berm, and lifted it. The great object in keeping water pure in the Government tanks is that it may be kept available for human beings as well as stock; but that, of course, does not apply so much to squatters. Another plan that was adopted on some stations was to fence in three sides of the tank, and have moveable hurdles on the fourth. The approach to the tank would be along one slope.

558. *Mr. Woore.*] But that does not get over the fouling of the tanks? No; but it prevents the waste of water. I admit that it does not keep the water entirely pure.

559. *Chairman.*] You mentioned about the J. K. well. The cost of that well has been very considerable;—we would like more information on that point? I referred to the J. K. well. It was placed in close proximity to a fine waterhole. Mr. R. H. Kennedy, of Wonominta, offered to construct a dam there, and to do it for 6d. per yard. He offered to construct a dam on the J. K. waterhole.

560. Are you aware that it is scarcely possible to have permanent water by means of tanks and dams; and, that being admitted, do you not think it desirable to have an adjacent well on which you can rely in a case of drought? Then the question comes in, that we have to maintain them. They do not return a penny, although they are a very big expense to us.

561. In what way are they a big expense? We have to employ a caretaker, there being no possibility of leasing them.

562. But the caretaker looks after the tank and dam, and the well does not want him? I understand now what you mean.

563. But you see that complaint has been made that wells have been sunk in close proximity to tanks, and you can see that no water is permanent, strictly speaking. The tanks are always liable to dry up; and is it, therefore, not desirable to have wells, even in close proximity to tanks, which will always give you water? If it can be done under these conditions I should think it would be an advantage; but the expense would be double, and it would be a very long drought that would dry up these tanks. I do not think the J. K. waterhole will ever dry up.

564. But I am speaking generally. In some instances the Works Department have thought it desirable to have tanks and wells in close proximity to one another? [No answer.]

565. *Major Penrose.*] I do not fancy that they were very close together; but where one was asked for in a gap they put down two? That was the case in the Ivanhoe, and also in the Willandra and Gunaramby, where two public watering places were constructed when one was asked for.

566. *Chairman.*] To carry out what I wish to ask you,—are you not aware that squatters, to provide against contingencies, have sometimes thought it desirable to sink wells, perhaps immediately adjoining the tanks,

J. W.
Boulton.
19 Jan., 1888.

tanks, so that in case a tank fails they can pump the water from the well into the tank, and in that way carry themselves over a long drought? I cannot call to mind where that has been done. I have known a tank at one end of a paddock and a well at the other, so that in case of stock travelling to a tank, the grass around the tank would be all eaten when the water was exhausted. Then the sheep and stock go to the other end of the paddock, where the well is, and eat the grass down there.

567. Do you not think it a wise precaution on the part of the Government, knowing the terrible droughts we are subject to, to put down a well in the same neighbourhood as a tank, so that one caretaker can look after both; and then, in the event of a tank going dry, it would be a very desirable thing to have the well? I can hardly say that, because the tanks now constructed are so large that they can well stand any drought, and there is not the double expense. Practically, they are as permanent as a well. I guarantee that some of the Government tanks will last for three or four years without rain.

568. I do not think you quite understood my question about the J.K. waterhole. You said that a Mr. Kennedy proposed to construct it at 6d. per yard? Yes; he was to find all plant and do the whole of the work at 6d. per yard.

569. What did the work actually cost? I really cannot say what the cost was in this case.

570. *Major Penrose.*] Did Kennedy get the work? No; I don't think so. A dam was never made, but a well was put down close to there.

571. *Chairman.*] What are these service tanks made of? The bulk of them are of wood, lined with galvanized iron, and the balance buckle-plate iron.

572. In your experience, which are the most effective and desirable? There can be no question as to which are the best. Buckle-plate iron is the best, but a cheaper form of tank was used by the squatters, and seemed to last very well.

573. You must remember that the position of the squatter and that of the Government is not quite the same. A squatter is a man planted upon the ground for the time being; but the Government have to make their works much more durable, and do make them so. You think it is desirable in this hot climate to have really good service tanks instead of wooden affairs? Certainly I do; but squatters improvements are, as a rule, permanent.

574. So that you do not find fault with the expense that the Government have gone to in having these more expensive service tanks? I never ascertained exactly what their cost was; but there is no doubt that they are very much more durable and better than the wooden ones.

575. *Major Penrose.*] These buckle-plate tanks would last for years? For very many years, if they are taken care of.

576. In fifty years time the cost of the buckle-plate service tanks will be less than the wooden ones? I should think so, if they last so long. I do not say that it would be so at a place where there is salt in the water. I do not think that in such cases they should be used. If so, the iron should be galvanized, as the salt water would eat the plain iron through.

577. *Chairman.*] Now, with regard to Cobham Lake and Dry Lake, you spoke about the injudicious action of the Government in making tanks in these two places. Are you aware that the sites of these tanks were approved of by the officers of your Department? No; I never heard that they were, and I do not think that they were so approved. It was before my time; but I have seen Mr. Gilliat's report on the Mount Brown road.

578. It is asserted that Mr. Gilliat himself approved of these two sites? Mr. Gilliat has submitted his report to show that he did not do so. He left out Dry Lake altogether in his report on the Mount Brown road as a public watering place. He specially mentioned Dry Lake as having been supplied with water by a publican, and he said that so long as the publican supplied the water at reasonable rates to the public he thought further expense by the Government was unnecessary.

579. Of course you are aware that the publican had the privilege of denying the water to anyone who might offend him, and he could charge what he thought proper. Therefore, it was undesirable that a private individual should have the control of a place of this kind and be able to make very heavy charges for the watering of travelling stock? The plan that Mr. Gilliat laid down might have been easily carried out without reference to the publican, Smith, at all, and the public would not be literally forced to go to Smith for water.

580. As a matter of fact, Dry Lake is merely a depression in the ground; and, therefore, was not a tank justified in this place? Yes; it is simply a depression between sand-hills, fed by two considerable creeks.

581. Then the fact of sinking a tank in this depression in Dry Lake was not a faulty one? As an actual site for a tank there is no question about its being a good one; but as a public watering place it would have been better had it been further away from the lake.

582. *Mr. Woore.*] But presuming that the lake had not been filled—I knew it twenty-five years ago, and there was no water in it then, and it had apparently been dry for many years? Still I think if Mr. Gilliat's plan of watering the road had been brought about the necessity of sinking a tank there would have been avoided.

583. Would the same apply to Cobham Lake? Yes, more so; because this lake was only dry once.

584. But there is evidence that it had been dry for twenty-four years? That was before my time.

585. *Chairman.*] Then you think that the Works Department were to blame for selecting these sites? I do think so; because they must have known that at some time there was bound to be plenty of water there for long periods. A tank at a place where there was no water at all would be far more useful. About 8 miles from Cobham's there is a good place for a tank—Slight's Camp. Besides, the probability of leasing a tank ought to be taken into account.

586. At a time like the present I suppose it is absurd to keep a caretaker looking after these places? Yes; when under water.

587. *Mr. Woore.*] There is no doubt about it that Cobham Lake, although one of the finest lakes in the back country, is liable to be dry for many years together? I never knew it dry, although I heard it was dry for a short time in 1875.

588. It was dry in 1863, and is liable to be dry for a number of years at a time. The filling of this lake depends upon two creeks running at one time; if one creek only runs it may merely put a little water into the lake. Now, is it not a reasonable thing to put a tank there to catch and conserve what little water that may run into the lake when it is empty, instead of allowing it to spread over the whole surface of

of the lake bed, where it would soon evaporate and soak away? The porous bed of a lake is never a good catching surface, and there is generally a substratum of drift. Mr. Gilliat's recommendation dealt fully with this lake.

J. W.
Boulbee.

19 Jan., 1888.

589. *Chairman.*] For the reasons that you have stated, you think that there is no blame attaching to the Works Department for putting a watering place there? I certainly think they are to blame.

590. You made some remarks about Meenamurtie;—can you give us any further information about that? Meenamurtie well is put down in close proximity to a permanent waterhole. This hole was not dry in 1875 before the dam was made.

591. *Mr. Woore.*] This was not a travelling stock route then? No; although considerable numbers of travelling stock used this road.

592. *Chairman.*] You seem to be under the impression that the Works Department had caused unnecessary expense in putting a well down where there was an abundance of fine water;—did you ever know that this water failed? Never; and I knew it for over twelve years. It had then and still has the reputation of being the most permanent water in the back country. Since the dam was placed there I do not think the hole can ever dry. In 1884, when the drought broke up, there was an abundance of water there.

593. Now, about Hovell's dam—you do not know why the water was sent through the rocky ridge? I heard that an error had been made in taking levels. Overseer Mackay, I think, refers to it.

594. However, it struck you that an unnecessary expense had been gone to in making a by-wash through this rocky ridge? Yes.

595. You do not think that there was any danger of erosion? No, I do not think so; because there was a wide flat on the other side for the water to flow-over.

596. *Major Penrose.*] Has water ever flowed through the by-wash? Yes; in flood seasons I think the water would run through the by-wash before it would run over the flats; but no water has been through it yet.

597. *Chairman.*] Is it not possible that the rock taken from the by-wash might have been utilised in protecting the embankments abutting on the flat? I do not think so, because the amount of stuff taken out of the excavation in front was really much in excess of what was required. The spoil from the by-wash has not been used at all. I would like to refer to Overseer Mackay's report. It says, respecting Hovell's tank and dam:—"This watering-place is on a by-road. It was constructed, in the first instance, on the petition of the local selectors, who used to suffer greatly for want of water every year. A great deal of unnecessary expense was incurred in cutting the by-wash, owing to the levels being incorrectly taken in the first instance."

598. *Mr. Woore.*] Where is this place—Hovell's dam? It is on the road from Wallbundry to Howlong.

599. About Meenamurtie waterhole being permanent, do you mean permanent in its natural state, or that it was permanent after Mr. Middleton built the stone dam? Well, my experience only goes back to the time the dam was built. The dam was washed away; but there was abundance of water there after that.

600. Then, when you speak of the waterhole being permanent, you mean that it was permanent after the dam was put up? Yes, within my experience; and before, by report.

601. *Chairman.*] The next matter is the Muriel tank, in which you say the tank was interfered with by a horse-walk having been made; and to give sufficient space, they encroached upon and filled up a portion of the tank. This would appear to be a most extraordinary proceeding, and I should like to know more about it? [*The witness proceeded to show by diagram the extent of the excavation, the position of the drinking-tank for stock, and of the horse-walk.*]

602. *Mr. Woore.*] Was there any reason why the horse-walk should not have been put on the other side of the bank? I should have put it on the other side myself.

603. Is there any reason why it should not have been put there? None that I know of.

604. *Major Penrose.*] I see in the correspondence here that Muriel tank was nearly filled up? That is possibly an exaggeration. There is a great amount of spoil in the tank, and the overseer of the district puts it down at from 1,000 to 2,000 yards; but mine is merely an approximate statement. The bottom of embankment is, so near as I remember, about 30 feet from edge of tank.

605. *Mr. Woore.*] So that you think it was a waste of public money to throw this stuff into the tank, besides damaging the tank itself? Quite so.

606. But did it damage the tank? At the time it was being done the stock were getting bogged in it, and the lessee wrote to the overseer of the tank (Mr. Cotton), in order to try and get it stopped.

607. *Chairman.*] If this pump was attached for the purpose of raising water there, how comes it that the stock were allowed there at all? The horse-walk was being erected to supply water to the trough. The overseer will be able to give a far better explanation of it than I can, since he saw it at the time it was being made.

608. *Mr. Woore.*] Has the partial filling up of this tank had such a serious effect as to reduce the water-supply to such an extent that it was not sufficient? I hardly think so. There is still plenty of water there for all the stock passing.

609. *Major Penrose.*] You state that the batter of most of these tanks is from $1\frac{1}{2}$ and 1 to 1? $1\frac{1}{2}$ and 1 to 1.

610. How do you know that;—by measurement? No; by the eye. I never put the clinometer on them.

611. Are you aware that all the specifications given to us show that the batters have to be excavated at a batter of 2 to 1? I never saw any of these specifications at all. Of course that statement of mine that they were $1\frac{1}{2}$ and 1 to 1 is only based on the judgment of my eye.

[The Commission adjourned.]

FRIDAY, 20 JANUARY, 1888.

The Commission met at 10 a.m.

Present:—

HON. G. H. COX, M.L.C., CHAIRMAN.

MAJOR PENROSE, R.E., | J. C. WOORE, Esq.

James William Boulton called in and further examined:—

J. W.
Boulton.
20 Jan., 1888.

612. *Witness.*] I was asked yesterday whether the silt put in the Muriel tank by making the horse-walk would impair the efficiency of the tank. I wish now to qualify my statement by stating that I think that when the tank gets low it will impair its efficiency. It will certainly reduce its holding capacity to some extent, although perhaps it does not impair the tank at the present time, while full and overflowing. Another matter that I would like to refer to is the probable ulterior use of the embankments that are put round the tanks. When the Works Department handed these works over to us I do not think that they had any ulterior idea in utilizing these embankments round the tanks for the storage of water, because no provision is made for pumping or anything else. The water is in some cases over the excavation, and when it gets lower you will not have the full benefit of the size of the excavation in consequence of its silting up.

613. *Major Penrose.*] What do you think the embankments are for? I cannot say at all. In their present state there is no attempt made to use them.

614. *Mr. Woore.*] Is it not reasonable to suppose that they were constructed with the idea that they would be used if required? Yes, that is a reasonable supposition; but the engines have not been fixed in any way for that purpose.

615. *Chairman.*] All the engines that are now used are for pumping water away from the tank and not for putting it into the tank? Yes.

616. *Mr. Woore.*] Have any of these tanks gone dry to your knowledge? Not to my knowledge; and I do not think it likely that they ever will.

617. That being the case, does it not clearly prove that the sites have been well selected with regard to catchment area? Some of them have.

618. And that the supply is sufficient without utilizing the embankment? Yes; but then my argument is that the smaller tanks, utilized as pump-up tanks, would have done as well, if not better.

619. *Chairman.*] Is it not a fact that those embankments, as placed round the tanks, have helped to prevent evaporation? There is no doubt about that.

620. You are aware, then, that one of the objects of these embankments is to prevent evaporation by the wind? Yes; it is one of the results.

621. Do you know any instance where tanks have been sunk previous to the last wet season, and did not get water? The Mulya tank, near Louth, was a long time in getting full, and I do not think it is full now.

622. Is that tank on the north side of the river? No; it is on the south side, near the township of Louth.

623. I would like to get a definite answer in regard to this question;—I have heard indirectly that sites of tanks have been badly chosen, and that even during this last wet season some of the tanks have not been full? I have no personal knowledge of that matter.

624. You can understand that if that had been the case it would be positive proof that the site chosen was a bad one? Yes.

625. *Major Penrose.*] How many tanks have you in your district? Somewhere about seventy-five. I think there are about thirty-five in the Narrandera part of the district, and forty-one in the Cobar part of the district. I can furnish the information exactly if it is required.

626. *Chairman.*] Now, I would like to know exactly what your duties are? I am Inspector of Public Watering Places, and as such I have to visit and inspect those tanks, and see that the work is all kept in proper and good order. I have to lay out the work for the caretaker, and in case any improvement is necessary I furnish a plan of it, and an estimate as required. I have also to examine the books and certify that they are correct. I have to inspect the books kept by the caretaker, and see that the amounts received for watering stock are acknowledged. I have to examine everything at the tank as fully as possible. The work then has to be laid out for the caretaker, and when I return I have to see that the work so laid out has been properly done. I have also to make special reports on any requisitions that may be made for new tanks, and furnish whatever evidence I can get as to the probable cost thereof, and whether the work is required in the district.*

627. Have you anything to do with the selection of sites? No; I merely recommend a site which I believe to be a good one. The actual selection of the site rests with the Works Department.

628. What are the plans that you refer to? If any alterations are required at the tank, I have to make a plan of the alterations in order to show what has to be done. I have also to supply, sometimes, explanatory plans.

629. *Mr. Woore.*] Who are these plans sent to—are they sent to the Works Department? No; they are sent to the Chief Inspector of Public Watering Places.

630. Have you had any special training in the matter of drawing up plans and specifications? No; only my own knowledge of the work, which I gained on a station. I am not an engineer.

631. Now, all these particular works having been handed over to the Mines Department, are you aware whether there are sufficient trained men in the Department to carry on the works that are now done by the Roads Branch? With regard to the construction of tanks, I do say that our officers are quite capable. I hardly think that it requires a trained engineer to lay out a tank, or to put it down. A practical knowledge gained on a station comes in there.

632. *Major Penrose.*] Can you make a contour survey? I believe I can. I understand the theory of it.

633. *Chairman.*] Do you understand levelling? Yes; a station manager has to understand that.

634. Now, in the face of such large works as those recommended in the final report of the Water Conservation Commission being taken in hand by the Mines Department, are you aware whether there is a sufficient staff of men in that office competent to undertake these expensive works? I have not the slightest doubt about it. I think our men are quite capable of doing it. We have an engineer there—Mr. M'Kinney—who is second to none in the Colony. I believe that Mr. M'Kinney has made the question of the conservation of water the study of his lifetime.

635.

* For duties, see Regulations attached to the Act

J. W.
Boultonbee.

20 Jan., 1888.

635. What are his special duties now? His duties are the duties of an engineer in connection with this water conservation scheme.
636. Has he anything to do with watering places? Not so far as I know, except that should Mr. Gilliat require information on any special matter Mr. M'Kinney would possibly be referred to.
637. *Major Penrose.*] What check is kept on the moneys taken by the caretakers? They are obliged to keep a receipt book, a cash book, and a journal. Beyond this there is little or no check on their accounts.
638. I suppose there is a check in this way: A caretaker waters 9,000 sheep, and he might return the number as 7,000 or even 6,000? Of course, there will be discrepancies. If, in a dry time, a mob of sheep travelling a long length of road misses a tank here and there, we ask the caretaker for an explanation.
639. Otherwise there is no check on him? No; and it would be quite impossible.
640. *Mr. Woore.*] I think each drover ought to be called upon to sign a receipt-book? Well, something like that is done. The caretaker signs the receipt and hands it to the drover, so there is always the counterfoil for us to look at.
641. So that the drover's signature does not appear at all? No.
642. Well, I think it ought to appear? The counterfoil or butt of the check is kept, and although it is not signed by the drover the corresponding entry is made in the butt.
643. *Major Penrose.*] Perhaps this is a little outside the scope of our inquiry.
644. *Chairman.*] It might be the legitimate subject of an inquiry if the public were being plundered. If we can suggest a remedy we ought to do it. Do you not think it would be desirable that the drover should sign the book, certifying the number of stock that he had watered;—would that not be a very considerable check on the caretaker? I can hardly see why it would be a greater check than to have the caretaker receipt the book. It would not be a very simple matter to get the drovers to do it, because many of them are intractable fellows, and sometimes they even object to receive receipts. These receipts, of course, show the amount that the caretaker has received.
645. But what does the drover care about that;—have you full control over these caretakers? We have full control. If in any case we have ground for suspicion, a report is at once sent to the Chief Inspector, the caretaker is suspended, and another man is put in his place.
646. *Major Penrose.*] On an average, how many times per year do you visit the tanks in your district? I cannot give an answer to that, as it is only since last July that additional inspectors were appointed, and the districts apportioned. Before that, I was the only inspector—travelled all over the Colony—and I had no chance at all to pay regular visits. The inspectors of stock act as overseers of these caretakers, and are supposed to visit and report on the tanks regularly every two months.
647. *Mr. Woore.*] Then there are three classes of overseers over these tanks—the inspectors of watering places, the inspectors of stock, and the road superintendents? There are only three inspectors of watering places in the whole Colony, and they have to exert a general supervision. Originally there were only three overseers; but they were dispensed with, and the duties thrown on the inspectors for stock.
648. *Chairman.*] You say there are three inspectors of public watering places? Yes;—Mr. Low, Mr. Mackenzie, and myself.
649. And how many stock inspectors act as overseers? About twenty-three or twenty-four. They get no salary for the work. It is a duty which they have to perform.
650. Is there a caretaker at each tank and well? Yes; but there are some open dams in my district where one caretaker is in charge of four places. I refer to Hurley's, Old Junee, Wallacetown, and Illabo.
651. What are the wages received by these caretakers? Where they have a horse to keep they get 8s. per day; and where steam pumps are used they get only 7s. 6d. a day, and in some cases only 6s. 6d. The lessees where the tanks are leased have to keep a caretaker, who resides there.
652. Now, will you state the duties of these caretakers? The duties are very carefully laid down in the regulations with the Act, and also the duties of overseers and inspectors. Our instructions to the caretakers are very full.
653. Has it come to your knowledge that any tank excavated has not been filled during this wet season? I do not know of any, except Mulya tank, by report.
654. Then where is the alleged mistake made with regard to the selection of sites? I think we went into that yesterday. I refer you to Cobham, Meenamurtee, and Tarella.
655. *Mr. Woore.*] But these, you say, are bad sites, in regard to being too near to permanent water. What we want now is about their being in wrong places as regards catchment? [No answer.]
656. *Major Penrose.*] Do you consider that the Ivanhoe tank is on a badly selected site? I think it is most inconveniently situated. It is right in the middle of the township, excavated on what are village reserves and allotments, and stock have to go down the middle of the main street to get to it.
657. *Mr. Woore.*] But there is not much of a main street there? Well, they have to go between the houses to get to the water. Ivanhoe is now a big place.
658. *Major Penrose.*] But, from an engineer's point of view, the site selected for catchment was a fair one? Yes; the catchment was a very fair one.
659. *Mr. Woore.*] Were you there when the tank was first constructed and laid out? No.
660. Then you cannot say what Ivanhoe was then? No; I did not see the tank till it was nearly finished.
661. Even then, how many houses were there? All the houses that are there now, with the exception of the stock office.
662. *Major Penrose.*] You say in your report that the townspeople are dependent on a tank of Mr. Williamson's? Yes.
663. *Mr. Woore.*] You spoke of this tank being in the main street;—do you know whether the township had been surveyed before the houses were built? I fancy the township had been surveyed, but I can ascertain directly.
664. *Major Penrose.*] A tank has around it a square mile of land, I believe? The land is not all around it. The reserve is not square.
665. What constitutes the tenant's lease, then? The tenant's lease is a long narrow strip, following the road, in this case.
666. *Mr. Woore.*] Is it not better to have this portion of land, which is to be leased to the caretaker, situated in that way than to have it all around the tank? Just so. It is always the endeavour to get the tank as near one corner as possible. When the tank is in the middle of the tenant's lease, the stock go in there and destroy all the feed, unless the troughing is fenced off.

J. W.
Boulthbee.
20 Jan., 1888.

667. *Major Penrose.*] Now, can the whole of this 640 acres be utilized for catchment? Oh no; the catchment is the bad part of it, and the drainage comes through the town in several places in to the tank. One drain runs right past Cobb & Co.'s stables and then past a piggery, thence into the tank. Other drains run through allotments that were sold the other day.
668. *Mr. Woore.*] Is there no other water accessible? None, except from private tanks. Mr. Elliot and Mr. Williamson supplied the people.
669. Then this tank is almost a cesspool for the town? It is not so bad as that; but it is certainly not a nice thing to have these drains coming into it.
670. If this tank is on lower land than the buildings, of course all the village drainage runs into it? Certainly, besides the drain crosses the road in two places, and all the traffic goes over them.
671. *Chairman.*] Do you know of your own knowledge that there was a better site than that recommended? The site recommended by Mr. Gilliat on purchased land of Mr. Williamson's was much better. It could have been exchanged for other land.
672. Would that be on the stock route? Yes; on the Balranald road. It is about half-a-mile from the town.
673. *Mr. Woore.*] On Government land? No, on private land; but Williamson offered to exchange.
674. Was this site chosen by the Works Department while there was an available site on Crown Lands? Yes; that I know to be true. The site was moved and a place chosen where it would be close to the township. They then found that the land was selected.
675. *Chairman.*] Now with regard to defective design and too steep batter. We cannot give an answer at the present time to your question whether the earlier specifications were the same as the present ones. I think, in the paper you read yesterday, you went fully into the matter of defective design, and that paper will of course be printed with your evidence? [No answer.]
676. *Mr. Woore.*] You say "that tanks are of defective design and faulty construction; and but little concern is taken of the formation of the ground or of the selection of catchment area so as to avoid collection of silt." You state also "that too steep batters were adopted in most cases, and that sites were adopted without reference to formation or nature of soil"; also, that "the construction of flumes and inlet pipes has been defective; that carelessness has been manifest in the laying out of drains, the cost of which is excessive"? Tanks have invariably been placed on the lower portion of the catchment instead of on a sidling, so that there would be a good fall to the tanks by gravitation.
677. But the lower the tank is situated the better the chance of carrying overhead fluming over the embankments if required, and the better the chance of filling the tank? In some cases you can do without overhead fluming. You can intercept the water on a higher level, and bring it down to fill the tanks to the top of the embankment. I have seen one good example of this, which is on a station of Mr. Evans' at Babooba.
678. Of course, in a wet season it does not matter where the tank is placed so long as there is a fairly good catchment, but the object is to catch water in dry seasons, and therefore it is only reasonable to suppose that these tanks were placed on the lower ground in order that, however little water fell, some of it would go into the tank? But you might be able to get a place giving ample catchment area at a higher level.
679. *Chairman.*] Then the chief fault you find in laying out these tanks is the fact that you cannot get water to run over the embankment unless it is built on the side of a ridge with fluming running down a gradual slope? Quite so; in some cases the tanks will hold water a little over the excavation, but the embankments will not fill up.
680. The length of fluming would depend upon the levels of the ground? Yes; and the distance from the silt tank to the main tank.
681. But the water from the silt tank could only fill up round the side of the embankment? It would fill a main tank to its own level.

William Sly called in and examined:—

- W. Sly.
20 Jan., 1888.
682. *Mr. Woore.*] Where do you reside? In Toowoomba, Queensland.
683. You are a grazier? Yes?
684. You formerly owned Ardoo Station? I own it now.
685. Where is it situated? On the Booloo River, in Queensland.
686. How long have you owned that station? I have owned it for about ten years.
687. Do you know the road down by the Paroo to the Darling? Yes.
688. How long have you known it? Ever since it has been opened—twenty-seven or twenty-eight years.
689. Is that the main stock route from the south-west part of Queensland to Melbourne? Yes, it is.
690. How many years has it been used as a stock route? Well, I travelled it with stock twenty-two years ago.
691. Stock were travelled also from the neighbouring stations? Yes.
692. What kind of stock—cattle or sheep? Principally cattle.
693. I believe there is a great difference in the number of cattle travelling now and twenty-two years ago? I suppose there is 2,400 per cent. more—no comparison.
694. What is the greatest number of cattle that you have known to travel by that route within a given time? The greatest number that I know of was about 78,000, which travelled there last year, made up from three books where stock was reported.
695. Within how many months? Within nine months.
696. Do any sheep go down? Not from my part. They may go from some places further down near the Border.
697. What quantity of water would each beast drink at each watering place after making a fair stage? Each beast would drink from 8 to 10 gallons.
698. I am speaking now of a dry season? Well, they would drink 10 gallons after doing an ordinary day's journey, if they had to depend on tanks.
699. Are the cattle now confined to this stock route? Yes.
700. Were they not formerly confined to it? No, they could go anywhere formerly; but now the route is fenced in.
- 701.

W. Sly,
20 Jan., 1888.

701. Do you know Warramurtee waterhole—the last waterhole on the Paroo? Yes.
702. Is that a permanent waterhole? No.
703. Not even with the dam on it? There is a dam on it, but the water is not permanent.
704. Do you think that that waterhole would be sufficient to supply travelling stock without water being conserved there? No; I do not.
705. Then, an additional supply cannot be unnecessary at that place? No; I think not.
706. You know the Warramurtee tank; it is situated near the waterhole? Yes.
707. Is the water in the tank with that in the waterhole sufficient for the stock that travel down there? No; it is not sufficient in a drought.
708. And it is in a time of drought that it is most wanted? Yes.
709. And that being the case, are you prepared to say that the Warramurtee tank is an unnecessary public work, and that public money has been thrown away by making a tank there? No; I do not think it was unnecessary. On the contrary, I think it is very necessary. If three times the amount of money had been spent there in water conservation it would have been very necessary.
710. Another place on that road is the Yentabangee tank? Yes.
711. Do you consider that an unnecessary public work? No; I do not.
712. Does that tank supply the demands of travelling stock in all seasons? No; it does not supply the demands of travelling stock—nothing near it.
713. *Major Penrose.*] Then it sometimes runs dry? Yes.
714. *Mr. Woore.*] Is there no natural water there at the Yentabangee tank? Yes; a spring.
715. Would that spring have been sufficient to supply all demands of travelling stock? No; it was a weak spring.
716. But the springs are the only permanent water there? Yes.
717. There are waterholes as well—are they not permanent? No; and the lake is a mere shallow depression in the ground. It is a mere swamp, not a lake.
718. The next case is the tank at the Peri Sand-hills;—do you know it? Yes.
719. Do you know the Peri Springs? Yes.
720. Are the springs the most permanent supply in that part of the district? Yes; the springs are the most permanent water that I know of away back from the river.
721. Do you think that if the waters of these springs were opened up there would be sufficient water to supply the demand of travelling stock during drought? I do not think so.
722. The springs would not give the quantity of water required? No; they would fail at any time when a sudden demand was made on them.
723. Have these springs, to your knowledge, been opened up in any way? I cannot say.
724. Do you know if the Peri tank is situated near the springs? Yes.
725. Do you consider that tank an unnecessary public work? No; it is very necessary, but not large enough.
726. Well, from this I gather that your opinion is that the water of this tank and these springs combined is not sufficient for travelling stock in dry seasons? No.
727. Have you ever known either of the other tanks that I have mentioned to be dry? Yes.
728. In what year? In 1885.
729. Were they all dry then? Yes.
730. That being the case, was not the traffic in travelling stock suspended? Yes, we had to stop sending stock from the south-west part of Queensland, in consequence of these tanks being dry.
731. What remedy would you suggest for the state of things you describe? I would suggest that the stock routes should be better supplied with water. I would recommend more tanks and deeper tanks. The tanks should be made deeper if the ground would allow of it.
732. Then, are the distances between these tanks too great? Yes; too great by half. There ought to be a tank between Peri Springs and Yentabangee, and between that and Warramurtee.
733. Do you know Copago tank? Yes; I know that one.
734. Do you know anything about the tank that is made there? There was, first of all, a dam at Copago, near where the creek enters into it. This dam was washed away, and was then replaced further up the channel.
735. How far? About a quarter of a mile from where the dam was.
736. In dry seasons was the tank supply sufficient to water all the travelling stock? No.
737. It was not large enough? No.
738. What do you think of the first three sites mentioned? I think they were all placed in an excellent catchment area.
739. Do you think that the Peri tank is well situated with regard to the stock route? I do think so.
740. Is the stock route the best that could be chosen? Yes; it was the road chosen by the stock-owners at a time when they could go where they liked.
741. *Major Penrose.*] Do you think that the Peri Springs could be improved in any way by the addition of large service tanks and troughing? I do not think so.
742. *Mr. Woore.*] The springs are situated in the lake—are they not? Yes; but the springs out there won't stand much meddling.
743. You do not think that they would be benefitted by being opened up? No, I do not. More stock travel in twelve months now than were in the whole district originally.
744. *Chairman.*] Have you any experience in tank excavations? Yes.
745. To what depth have you had these excavations made? Usually from 10 to 15 feet. We would put them down to 25 feet if it could be done.
746. How much more have you to pay for these deep tanks than the shallower ones? About 30 per cent. That is after you go to a certain depth.
747. *Major Penrose.*] Do you mean when you get beyond 15 feet? Yes.
748. *Mr. Woore.*] Can you get as deep as 25 feet with ploughs and scoops? Yes, you can; but you must make the tank in a different shape altogether from the way Government tanks are made. They must be longer than the others.
749. Why a long tank;—how does that lessen the expense? You can make them both ways; but by making them long you can take out the earth lengthways, and not sideways.

- W. Sly.
20 Jan., 1888.
750. That would increase the expense? Yes.
751. Then the earth that you would take out of these deep and oblong tanks—where do you deposit it? There is some ground that will not allow you to use the earth. You have to be guided by the construction of the ground. Coming down from Adelaide I noticed tanks over half-a-mile long excavated by ploughs and scoops.
752. But for the expense attached to it, would it not be much better to have steeper batters, so as to have less exposure of surface to wind and sun, causing less evaporation? Yes; we do not give as much batter as the Government do.
753. You mean that you give a great deal more? No; not as much as the Government.
754. *Major Penrose.*] Do you mean that you have steeper sides still than the Government? [No answer.]
755. *Chairman.*] What batter do you allow? If it is good ground we allow 1 in 3.
756. *Major Penrose.*] You mean 1 down to 3 long? Yes; but this is a new thing altogether. Formerly we used to allow stock to go into the tanks; but now the arrangement is to pump the water out.
757. *Chairman.*] It has been complained that the Government tanks are faulty in construction, because the batters are too steep. You appear to think that they are not steep enough? Yes; I have not seen any of them but what a man could ride in and give his horse a drink, and stock will go in wherever a horse will go. If this were done a less portion of the surface would be exposed to atmospheric influence and to the wind, which causes a great deal more evaporation than the sun.
758. Then would it not be desirable to surround these tanks with earth excavations, so as to protect them from the influence of wind and sun? Yes; but you have to keep it a good distance away. I do not think that the earth does protect the water from the sun.
759. *Mr. Woore.*] It must afford a certain amount of shelter. High embankments round a tank must surely protect the water from the wind? It is barely discernible, I think. There is great danger in floodtime of the floods washing the earth back again.
760. Do you allow stock to water in your tanks? Not generally.
761. You pump the water into troughs? Yes.
762. What lifting apparatus have you? A common Californian pump.
763. Worked by hand? Yes.
764. And what troughing do you use? Iron troughing.
765. You mean troughing made specially of galvanized iron? No; made of sheet iron.
766. *Major Penrose.*] Do you think that steam-pumps on Government tanks involve unnecessary expenditure of public money? Well, in employing steam-pumps you have to depend upon one man. You must have an engineer if you have a steam-pump; whereas if you have a windmill almost anyone can work it or repair it.
767. *Mr. Woore.*] But the demands made upon the water of a Government tank are much greater than those made upon a squatter's tank? Of course there is a great difference between a squatter's tank and a road tank. The stock go to a squatter's tank in small numbers, but to the other tanks the stock come all together, in hundreds or thousands.
768. Then there is no comparison of the works required? None at all.
769. So you think it quite possible that a steam pump may be required on some tanks? Yes; because the quantity of water required in Government tanks is much greater than that which is required in tanks on a run.
770. *Chairman.*] It has also been complained that the Public Works Department have sunk wells in close proximity to tanks and waterholes. Do you think that this was a useless expenditure? No.
771. *Mr. Woore.*] Do you know the J.K. waterhole, and the well that has been sunk there? Yes.
772. Would you say that that was unnecessary? No, I would not say that it was unnecessary. I have often sunk wells close to waterholes.
773. Because in the event of the tank running dry you have a supply in the well as a stand-by? Yes; it is said that wells when sunk drain the water off from the tanks—that is the usual complaint of those who do complain about it.
774. But you do not think where tanks or waterholes are not permanent it is a useless expenditure in sinking wells? No; I do not think it is either useless or unnecessary.
775. And it is no unusual thing for the squatters to do it? Not at all unusual. The water on my run is all conserved water. There is no permanent natural water on it.
776. With regard to the J.K. waterhole, do you think that the expenditure was unnecessary? No.
777. The J.K. waterhole is not a permanent waterhole—is it? No.
778. *Chairman.*] You mentioned just now that you make a very steep batter if the soil is suitable; consequently you think a hard and fast rule for the construction of tanks is not desirable? No; I do not think that it would be desirable.
779. *Mr. Woore.*] Do you make your batter according to the ground? Yes.
780. Have you ever utilised the earth from the tanks to increase their depth by building a bank all round? Yes.
781. Then how did you fill the tank,—by pumping or conveying the water by flumes? By flumes from a higher level.
782. How do you fill them? I fill mine by flood-gates put in the flume through the bank.
783. But that will fill the tank only up to the level of the berm? Yes.
784. You never utilise the earthwork above that? No, we have not arrived at that yet.
785. Then why do you use the flood-gate,—what value is attached to that? It keeps the bank right. It is no good putting earth around a dam unless you can keep the water which is inside it.
786. But that would fill as well without a flood-gate as with it? Yes; but the water would run away again.
787. If the water rises to a higher level than the berm by the use of a flood-gate, you save an extra 2 or 3 feet of water? Yes.
788. *Chairman.*] Then you have never pumped the water into these tanks? No, I have never done that; and I never knew it to be done except on Fisher's station on the Balonne.
789. In your travels, have you ever seen a want of care and attention on the part of the caretakers who have charge of tanks and wells? No, I do not think I ever noticed anything that way.

790. Have you ever known any of these tank caretakers to be in any way neglectful of their duties? No; and as a rule I think the caretakers are good servants. It is an unhappy position, you know, that of a caretaker. W. Sly.
20 Jan., 1888.
791. Have you ever had any experience of the difficulty of dealing with the officers of two Departments. You are aware, of course, that the construction of tanks in this Colony is under the charge of the Works Department, and that when the tanks are constructed they are handed over to the Mines? No; I have never had anything to do with the Public Departments of New South Wales. All my difficulties are in Queensland.
792. Have you ever observed any unnecessary expenditure on these works—where the Government have gone to needless expense on tanks and wells—or in the construction of fences? No.
793. Do you know as a fact that the Government pay more per cubic yard for the excavations of tanks than the squatters do? Yes, generally.
794. Why? Because a squatter generally looks after his own work, and he knows the value of it.
795. But then these works are all done by tender, and everyone is open to contract for them under the Government as well as under the squatters. If it pays a man to do work for one it ought to pay him to do work for the other? The general idea is that men are better paid by the Government, and a man will work for me 20 per cent. less than for the Government. The reason is that the Government always accept tenders, and by a combination the tank-sinkers take care that they get a higher rate than they will attempt to ask from a squatter. They never tried that on with me. Months ago I was giving 10d. a yard for tank sinking, but the Government of Queensland, for exactly the same class of country, were giving 1s. 2d. per cubic yard.
796. *Major Penrose.*] Were the conditions just the same? Yes.
797. The same depth of tank? Yes.
798. *Chairman.*] Other reasons still have been advanced. Do you know that while the squatter measures the tank and pays off his men at once, there is considerable delay with the Government before they will pay over the money to the men? Yes, I have known delays.
799. Do you not think that this has a good deal to do with it? I do not think it enters into consideration very much when the work is taken.
800. Has it come to your knowledge that the caretakers' paddocks which are given them to keep their horses—that the cost of fencing in these paddocks is much in excess of what is paid by squatters for the same class of work? I do not know what the Government have paid, but it cannot be much more than £20 per paddock at the most.
801. Would you be surprised to find that these fences cost on an average some £95 per mile? Yes, I should be very much surprised to hear it.
802. *Major Penrose.*] Have you ever watered stock at Mossgiel or Holy Box wells? No, I have never done it, but I have had stock watered there.
803. Lately? No, not for the last five or six years.
804. It is a salt well? Well, I think it is brackish, or has acquired a mineral taste.
805. But it is perfectly good for stock, as far as you know? Perfectly good.
806. *Mr. Woore.*] Have you ever heard any complaints about the water at Holy Box Well? No.
807. *Chairman.*] Have you found a difficulty in watering stock at this place by reason of the faulty construction of the fence guards? Yes, the fences are generally too high, especially up Bourke and Cobar way. Owing to the stock trampling on the ground the ground wears away and the guard rails become too high. The guard rails are first put up to prevent the stock getting through, but the soil gets torn away, and then the fences become too high, and the cattle standing on ground which was six or nine inches higher originally, cannot reach over.
808. *Major Penrose.*] But that is merely a question of making up the ground, is it not? Yes.
809. Have you ever had reason to find fault with anything else in regard to these tanks and wells; or have you heard any complaints with regard to their construction and management? Yes; the drovers have repeatedly complained.
810. What was the nature of their complaints? The caretakers are in the habit of keeping dogs which disturb the stock, and cattle that have never seen dogs before are very much terrified at the sight of them. Travelling cattle, when once they are frightened, cannot be got back to the water again, and in dry hot weather this is a very serious matter.
811. *Chairman.*] Any other complaints? No.
812. Have your drovers never had to tackle to and water their stock in consequence of the absence of the caretaker? I have never heard of it, but as a rule a drover would water his own stock if he was any good.
813. *Major Penrose.*] And in that case he would not pay anything? No.
814. I suppose if there were no caretaker there, there would be nobody to take the money? What I meant was that if the drover was any good he would naturally go and assist in getting the stock watered.
815. Have you ever known tanks going dry on other stock routes? Yes; on the road to Mossgiel, which was closed to travelling stock for several months.
816. Was that in the same year? Yes; in 1885. The road across to Mossgiel has been stopped several times owing to the tanks failing. We take all our stock along the routes I have mentioned. I do not believe that I have taken 500 head out of Queensland in any other way.
817. Do you know any other tanks that have gone dry on other routes? Yes; on the Cobar road.
818. In your large experience do you know of any unnecessary tank or well;—of any well that could have been dispensed with? No; I do not know of one.
819. Has your attention ever been drawn to the fact that tanks have been sunk in improper places, and bad sites chosen? Of course there are people who will fault anything. Of my own knowledge I do not know of any.
820. They are all required? Yes; and as a rule, we reckon that tank-work in New South Wales is very superior to tank work in Queensland.
821. *Mr. Woore.*] You mean the Government tank work? Yes; that is what I mean. All the people who work on New South Wales tanks says that the works are very superior; they are more thought of than those of Queensland, and better sites. The only thing is the fences—£95 per mile for fencing simply astonishes me. My fences cost only £40 per mile.

W. Sly.
20 Jan., 188

822. But then you have only four wires? We have six wires; we have sheep on one side and cattle on the other.

823. *Major Penrose.*] You have not a top rail with these fences? Oh, no. That is a piece of extravagance which we cannot afford in our part of the country.

824. *Chairman.*] Have you ever noticed any expensive fencing around these caretakers' paddocks? No.

825. And in fact you have seen no reason why the fences round these paddocks should cost more than those around ordinary squatters' paddocks? No.

[The Commission adjourned until the afternoon, when the sitting was resumed.]

James William Boulton called in and further examined:—

[*The witness handed in a plan of the township of Ivanhoe, showing the position of the Ivanhoe tank, drains, &c., and also that the survey of village reserve was made before tank was commenced.*]

J. W.
Boulton.
20 Jan., 1888.

826. *Chairman.*] This plan shows that it is exceedingly undesirable to have a watering-place, as is this? Yes.

827. Where cattle would have to pass through the only street with houses on either side to get to the tank? Yes.

828. A suggestion was made to the Department to alter the approach for travelling stock? Yes.

829. But that would necessitate the altering of the caretaker's fences? Yes.

830. And the only question would be the cutting off of the water from the caretaker's paddock? Yes; there is a series of papers here which show that, and the action of the inspector of the district (Mr. Low).

831. *Mr. Woore.*] Was this the only available Crown Land? The only Crown Land available that I know of, though I believe another site could have been obtained.

832. Some ground will slip no matter what the grade is? I think if the batters were less steep they would not slip in that way.

833. *Chairman.*] This is black soil, is it not? Yes, copai ground. The water has washed a ledge higher than that table, straight down.

834. *Major Penrose.*] The action of the water would be merely to reduce the slope in the batter to what the soil would stand at? Yes; but all the stuff going into the tank reduces the capacity of it.

835. It gives way at the top? The top surface gives in. In ground of this nature it is utterly impossible to allow the stock access to the excavation. If anything went wrong, and stock were allowed access to the tank, they would certainly perish, the ground is so excessively boggy.

836. *Chairman.*] We presume the stock are not allowed to go into the tank? Certainly not.

837. What you deprecate is that there should be any hard and fast rule for the construction of tanks—that the slope in friable soil should not be so steep as in solid ground? Yes; that is what I mean—that the specifications should be varied with the kind of soil in which the tanks are put down.

838. Now in regard to this tank (Gunaramby), was there not another locality where it could have been put down? Yes; about 300 yards away, where there was a fine run of water in red soil. The tank is placed on the edge of a black soil swamp. This place is about 20 miles from Ivanhoe—between Clare and Ivanhoe.

839. Do you not think it was because there was a swamp there—was not that the reason why the ground was chosen? The place did not seem to have ever had any water in it. Swamps are not always the best catchments.

840. Do you know at whose suggestion this site was selected? I think it was selected at the suggestion of some officer of the Works Department. I believe that Mr. Gilliat recommended one tank between Clare and Ivanhoe, and two were made—this being one of them. [*Witness then explained by diagram the position of the tank and the manner in which the water was led into tank from upper silt tank.*]

841. What was the object in carrying the water all round the tank? I have not the least idea.

842. What was the meaning of the silt tank being placed in the lower position? I suppose there was a good catchment from the swamp. The catchment that I spoke of was a low ridge on the other or higher side, and beyond which was the formation of a watercourse. It certainly is a very curious form of tank. There is a drawing attached to the papers recommending that an open box flume should be made towards the tank from the upper silt tank, and that the drains round the excavation should be closed.

843. *Mr. Woore.*] Why were these drains cut around the tank? I have no idea.

844. *Major Penrose.*] Did not the Works Department in the papers, give any explanation of their reasons for carrying the drains between the excavation and the embankment? I do not know.

845. *Chairman.*] Is there any other information with regard to the flumes? The flumes that I saw along the Bourke and Cobar road are really very defective; they are all too small. I have referred to them in the papers. I do not think that as a rule there is any facing put to the flume. In making the mouth of a flume on a station, we put a narrow cutting in the ground, and a sheet of galvanized iron is let into it, disturbing the ground as little as possible. Wings are put on either side, and this literally gives the water no chance of getting in behind or underneath. The putting in of a flume to a tank requires very great attention indeed.

846. I know it is a very difficult matter to deal with; the ground washes away so in that country. The chief difficulty is when the tank is first constructed. There is generally some fall, and this carries a large amount of soil into the tank. If the silt tank is full, it catches the silt, and the water flows out and runs into the main tank. Unless this is carefully done it causes a big gutter to form, and this is all washed into the tank. Then to avoid this a flume is put in, so that the water will not gutter the channel? The great danger is that the water gets behind the flume, and if it does it simply bursts it out. At another place that I would like to mention on the Bourke and Cobar road, the construction of the fluming is to a four-sided embankment. The silt tank is some distance away, and the fluming only starts within the embankment, and all the rush of water from between the silt tank into the end of the fluming has to pass through two embankments where there is no protection. The consequence is that the loose soil of the embankments gives way.

847. In fact the sides of the embankments should be secured? Yes; with logs.

848. Is it impossible in most cases to get stone to floor the flume to these tanks. It is exceedingly difficult for the wood and soil to amalgamate together? Stone should be obtained wherever it can be had. If the thing is properly stopped and rammed and the iron is put in as I describe without disturbing the ground, I think it will stand, and would be preferable to stone.

849. The next thing we have to enquire about is the excessive cost of construction. We want you to give us a few instances which have come within your knowledge in regard to what you conceive to be excessive cost of these works? Of my own personal knowledge I can say nothing whatever of the prices paid by the Works Department. All I know is that I have heard of a number of cases where excessive prices have been paid.

850. Unless it can be borne out in the papers I do not see how we can receive that evidence? What I know of my own knowledge is very small indeed.

851. Well, give us what you have heard on the subject and your own information, too? I have heard that the 12-mile tank was let to Burton Brothers at 2s. 6d. per cubic yard, and sublet to Ford Brothers at 1s. 3d. per cubic yard. Then again I have heard that statement qualified, and that only 1s. 9d. was given. The fact that 1s. 9d. only was given came to my knowledge a few days ago.

852. Are there any other tanks that you have heard of where the same prices were given? I cannot say just now. In the report that I handed in I made mention of the fact that I had no absolute personal knowledge on the subject. Mr. Low is the man who will be able to give you valuable information on the question.

853. Can you account for this excessive price—how do you account for it that when prices were let by tender they were so large? I gave the reasons in my report. I submitted very few statements to Mr. Gilliat as regards price. The only one I reported was, I think, the cost of the fence at the Ivanhoe tank.

854. The next matter is about machinery. It is stated here that it is of a very expensive character, entailing unnecessary expense in having skilled caretakers to look after the tanks? I believe that a simpler form of appliance would better meet the purposes required. The ordinary caretaker is not able, if anything goes wrong, to make repairs which require some knowledge of mechanical engineering. We endeavour to get the best men as caretakers to take charge of these works, and we are doing it by degrees. We are replacing some of the caretakers by more competent men. We have definite instructions on that matter from the Chief Inspector, and we are carrying them out as fast as we can.

855. Are you aware that some of these caretakers cannot manipulate the simplest form of pumps? I have had no such complaints made to me, and if I had I should have remembered it.

856. Are a large number of these tanks supplied with steam-power pumps? Yes.

857. Are these often out of repair? No; very seldom.

858. When they are out of repair whose duty is it to repair them? It is the duty of the travelling mechanic of the Works Department. Of course, what I say only refers to my own districts, and my districts are Condobolin and Narrandera.

859. How many square miles are there under your control—how many miles are your districts in length and width? I go from Albury to Cobar, and from Deniliquin to Wagga.

860. Now, with regard to the alleged incapacity of these caretakers. Here we have in the papers submitted by the Works Department, a letter sent to the Chief Inspector of Watering Places by Mr. Keighran, who says, under date June 5, 1887, with reference to the One-tree tank:—"I have the honor to inform you that caretaker Kelly, of the One-tree tank, has reported that the plunging-rod belonging to the pump has become disconnected. I have reported the matter to the Assistant Engineer, Mr. Stilwell." Then Mr. Stilwell was telegraphed to by the officials in Sydney, and he sends an officer some 50 miles to remedy this small defect. This is his report on the subject:—

[*Report of W. B. Nicholson, dated Hay, 2nd July, 1887, as printed at p. 30, read.*]

Now, here is a statement made by an officer of the Works Department of the utter incompetence of the caretaker. It would seem from this that he is not a man of much intelligence, seeing that he does not understand how to look after a common pump. This entails a great amount of correspondence and trouble? I have no knowledge of this case at all. I think Mr. Gilliat has sent a paper to you about this very case.

861. Mr. Gilliat was examined in reference to the same matter, but I wanted to allow you to know of the complaints made of the incompetence of this man. Now, in the event of such a case occurring within your own knowledge, what would you have done? Were I satisfied that the caretaker was unable to repair the pump (or that the key had been lost), I should have suspended him, because this is really a thing which a man ought to be able to do.

862. You would have taken it upon yourself to suspend such an incompetent man? I certainly should, if I were satisfied of his neglect.

863. Now, we have other evidence here with respect to other caretakers who had been found drinking at a public-house some distance from their tanks, and when the drovers came up there was no water for their stock, and the slip-rails were burned to make a fire? I have never had any experience of such a case; but had I had such a case, I should have taken it upon myself to dismiss the caretaker at once. This is one of the things that we are most particular about. Any caretaker getting drunk is dismissed at once. We get the very best class of men we can, and we employ none without the best testimonials.

864. It is also on record here that reports have been sent in by the road superintendents, who found fault with the caretakers for absolute neglect of duty;—do you conceive it to be the duty of road superintendents to make such reports? I do not see that any disadvantage can arise through their doing so to their own Department—no disadvantage or detriment. I can see no objection to a road superintendent sending down a report if he sees any case of glaring neglect. I think it is only right that a man who sees a case of glaring neglect should call the attention of the Department in charge and have the matter attended to. I know that if I saw anything wrong I should call attention to it, or perhaps write to that officer of the branch of the service having charge of the work, so that the matter might be remedied.

865. But the action of this man belonging to the Roads Department led to what has been called friction between the two Departments? Yes; but I do not want to impute anything wrong to the Works' officers, who, in some cases, have not been quite justified in their reports.

866. We have a large number of allegations here regarding the carelessness, negligence, and absence from work of caretakers. This is all done by the roads superintendents. If the road superintendents are to look

J. W.
Boulton.
20 Jan., 1888.

J. W.
Boulton.
20 Jan., 1888.

look after these caretakers, then the question arises what is the good of having overseers and inspectors? I think the overseers have done their duty well.

867. If these allegations are correct then they have certainly not done their duty? Well, unless a particular case is mentioned I cannot say.

868. Well, perhaps there is a case here that you might like to say something about. Take the case of the One-tree tank. Is that in your district?—Here is what is said about it:—

One-tree Tank.—Report of 25th November, 1885 (85-1863) : Fence wires around tank slack ; caretaker might easily have remedied this but appeared to think it no part of his duty ; found him at the inn instead of being in charge of the tank. Report of 25th November, 1886 ; Caretaker said he was quite ignorant of, and appeared to be equally indifferent, as to the working or the keeping in repair of the pumps ; the plunger gland had been fractured through carelessness in screwing it down, but he said he knew nothing about it ; the pump, consequently disabled, service tank not half full, and the troughing contained only some liquid mud ; the pump was in addition in a most dirty and neglected state, the bearings being almost dry ; sent out the following day and put pump in repair. Mr. Nicholson's report, of 2nd July, 1887 (87-519) ; in consequence of Mines reporting pump disabled, he was sent out to inspect ; that nothing was amiss, except that the piston-rod had become disconnected, owing to pin falling out ; put it right in five minutes, and pump then worked well ; caretaker's incompetence had occasioned an unnecessary journey of 50 miles in wet weather."

—? I cannot remember anything about this particular case ; it was never referred to me ; but I reported on a former case.

869. We want to know whether the inspectors, who were appointed to look after these places, or the roads superintendents, whose duty it is not to look after them, should find out these mistakes ; we want to know why the roads superintendents do the work for which the others were appointed? I would like to have all the papers before me before replying to that question. The dates are grouped up so that I do not quite understand them. In one of these cases the caretaker made a statutory declaration, which is included in these papers, that a certain report was not correct.

870. *Mr. Woore.*] Is this the tank where the caretaker was found living in the engine-shed ; and, if so, is he still a caretaker? No, he resigned.

871. Immediately after that? Yes ; immediately after.

872. Was no attempt made to dismiss him? No, he had some words with Mr. Nicholson ; and in the declaration referred to he states that Mr. Nicholson threatened to punch his head. The bulk of the complaints that come into our Department come from Mr. Stilwell's district.

873. *Chairman.*] That may be because Mr. Stilwell is a very careful officer, and is trying to preserve the property of the Government, in which he takes an interest? Well, I think the Mines' officers are just as anxious to do that as Mr. Stilwell.

874. Is the Pulletop tank in your district? Yes.

875. This is what is said about it:—

Pulletop tank.—Report of 6th December, 1886 (86-1,601) : Embankment in bad repair generally and damaged by scour at two corners, some 30 cubic yards of earth being displaced, wires in surrounding fence very slack, service tank not full, and the lessee in charge appeared to know little about care or working of the steam pump. Memo. of 9th February, 1887 (87-119) : In reply to statement by Mines' overseer that I had forbidden their lessee to repair embankment in accordance with his instructions, and also to minute of Mr. Gilliat's complaining of interference with officers of his Department—that the lessee's statement was not true, made to screen his gross negligence in performing a most urgent work, and apparently accepted by the Mines' officers as a sufficient excuse for him, and also for throwing the onus on this Department. Report of 7th March, 1887 (87-199) : Embankment still remains unrepaired, fence wires slack, troughing foul, drains neglected.

—? [No answer.]

876. Do you know anything about the caretaker at Pulletop? This man was the lessee and caretaker ; and I must say that he was not a desirable person to have in that position.

877. You had no control over him? Oh, yes, we had ; and he has lost his lease since.

878. Is Hulong in your district? Yes.

879. I find that this is what is said about Hulong:—

Hulong Tank.—Report of 13th September, 1886 (86-1,293) : When there, on 8th instant, found caretaker at his camp reading his newspaper, although his drains were much in need of attention.

Report of 9th November, 1886 (86-1,223 & 1,511). The drains, for want of attention during rainfall, had allowed a considerable quantity of water to escape into the swamp.

Report of 9th December, 1886 (86-1,616). The drains require much more attention during wet weather than the old man stationed here as caretaker gives them ; the wires in fence around tank were slack.

Report of 7th March, 1887 (87-201). The tank batter had been damaged, by caretaker discharging water from the berm down it.

Report of 1st July, 1887 (87-530). Caretaker and family residing in pump weather-shed ; use boiler fire for domestic purposes.

A. W. STILWELL, 20/8/87.

—? That matter about reading the newspaper was referred to me. I called on the caretaker for an explanation, and he told me he had been reading the *Government Gazette* during the dinner hour, and it was at this time that Mr. Stilwell saw him. He is an old man, who has paid great attention to the tank ; and if we had not had him there, we would not have had the same amount of water in the tank that it contains now.

880. Was your attention drawn to the fact that the steam-boiler was being used for domestic purposes? I do not think that that can be a fact. I never heard of it. I believe that the caretaker had camped over near where the tank was erected. He might have been in the shed in wet weather ; and, if so, he would have been justified in going in there.

881. But the using of the boiler for domestic purposes—what about that? I hardly think that that was done. I never saw it. I notice that the other road superintendents do not seem to be able to find the same number of faults in the management as Mr. Stilwell does.

882. Are you aware of any excessive prices having been given for fencing? Not from personal knowledge. I had it reported to me, by Mr. Yeo, that £112 per mile had been paid for fencing at Ivanhoe tank, and that the contract had been sublet three times.

883. *Major Penrose.*] What was the matter with the fence at Ivanhoe? This is where there are no straining-posts at the end for the straining of the wires. Whichever post the wire ends at, it is strained there.

884. Were there no struts put up? Not that I saw,

J. W.
Boulton.
20 Jan., 1888.

885. Do you know any other instance where straining-posts have been dispensed with? Yes; I think they have been dispensed with at Boonoonoona, and around the One-tree tank. The wire there is strained the full length of the fence round the tank.

886. What is the distance? About 160 yards; I cannot be sure as to the exact length of it.

887. Do you think that that is excessive? Yes; I think from 80 to 90 yards is a very good strain.

888. Has the fence suffered in consequence of the absence of straining-posts? I think it has. However, I have not seen it since.

889. *Chairman.*] Are you aware of any instances where straining-posts were dispensed with by the action of the Mines Department? No.

890. *Major Penrose.*] I should like to know on what facts Mr. Boulton bases his conclusion that steam pumps were unnecessary as a rule? I think that, as a rule, there is not sufficient work for steam pumps, and that horse-power can do everything at a much lesser cost. On some roads I do not think that horse-power is necessary, and that a man can do the work. Along the Cobar road, where there is a considerable amount of traffic, steam pumps are erected, and on the Booligal road, where the traffic is apparently heavier, there are horse-pumps. The railway to Bourke has stopped the traffic immensely. At all events, I cannot help thinking that the simpler you have these appliances the better.

891. *Chairman.*] If you have a steam pump you must have a man of more than ordinary intelligence to work it? Yes.

892. *Major Penrose.*] Have you made any calculations as to the relative cost of pumping water by steam pumps and horse-pumps? I have made no actual estimate; but I think the horse-pump is the cheaper. It would be a very nice calculation.

893. *Mr. Woore.*] Is it not expensive to keep horses? Yes, and when the places were not fenced in it was very hard on the caretakers to feed their horses during the last drought.

894. They would have to buy forage? Yes.

895. *Chairman.*] Then the steam pumps would be preferable under these circumstances? I hardly think so.

896. Then who has to bear the cost of forage in dry times? The caretakers have to do it. They have to take the good times with the bad; and as they are now provided with a paddock in most cases they are independent of forage.

897. They provide horses on their own account? Yes; and they get from 8s. 6d. per day; and formerly, where they had no paddock, it was 10s. per day.

898. And do these men who have to work without horses get the same amount of land? Yes; but they are only allowed to put one horse into it. The paddock is kept with good grass in it in order that someone may be induced to lease it.

899. The average price paid to a caretaker is 8s. 6d. a day—to a man who keeps his own horses? Yes.

900. And how much is paid to the man who works the steam pumps? 7s. 6d.

901. So that the man who works the steam pumps gets less than the man who works with a horse? [No answer.]

902. *Major Penrose.*] And this results in a saving to the Government of £18 a year? [No answer.]

903. Who finds the firewood? The Government supplies it; but where the wood is plentiful the caretaker supplies his own.

904. Then, in that case, the steam pump would be the cheaper? Yes.

905. Do you know what is the cost of these steam pumps? No, I do not. I think the cost would now be about £75; but they were higher some time ago—I think about £125. For myself, I believe that the hand-pump would be cheaper than either, and a man would be well able to keep it going. Of course he would not be able to do this on some of the larger stock routes and town tanks, such as those at Cobar, Nymagee, Nyngan, and other places.

906. *Chairman.*] You think that the Government have been put to useless expense in putting down large tanks where the traffic was small? Yes; the size being in excess of requirements.

907. Now, with regard to the "greasing" of these service tanks, it has been said that the composition with which these service tanks are "smeared" contaminates the purity of the water? Yes; it was a composition of tar and tallow and pitch, the result of which was that a greasy scum formed on the top of the water. A drover named M'Donald, who was fined for removing the rails at Boonoonoona, told me that this scum had as much to do with his cattle not drinking as the height of the rails. We simply use boiled tar and pitch, and let it harden before the water is allowed to go in. The tallow had the effect of keeping the pitch moist.

908. Did you ever try a composition of tar and lime? No; I hardly think a composition is necessary on these troughs. They are galvanized iron, and there is no action of the water on them.

909. You think this coating was quite unnecessary, then, on galvanized iron tanks? Yes; but not in the places where troughs are attached to wells that have salty water, which would even corrode galvanized iron.

910. Then you have never tried a composition of tar and lime? No.

911. It lasts almost for ever? I have heard of tar and cement being put on the inside of stone tanks, and it is a very good dressing for them.

912. I can understand the objection to grease and tallow; they are exceedingly objectionable to animals? [No answer.]

913. *Major Penrose.*] Was this objected to by the Mines Department? Yes.

914. And was it pointed out that the stock would not drink the water? It was.

915. And was that matter attended to? Yes.

916. *Chairman.*] We have heard that considerable complaints have been made with regard to the faulty construction of wells, and also in the construction of troughing and appliances;—can you give us any information in respect to these matters? With regard to troughing, I brought the matter before the Chief Inspector, and he has dealt with it himself. It is in the troughing that there has been so much inconvenience.

917. In what way? There is a dwarf rail on one side, and a high fence on the other, and the troughing comes in between. Sheep drink under the rail, and cattle have to drink over it. In some instances this rail is so far from the ground that the cattle cannot possibly drink over it.

J. W.
Boulton.
20 Jan., 1888.

918. Was this at the same height when originally built, or was it caused by the wearing away of the ground? No; it was originally the same height.

919. Are you sure that the stock did not wear away the ground by trampling on it? No; only in a very few cases. Latterly we put a rail down the centre of the troughs. This high rail acted as a sort of block to the cattle. Bush cattle do not like to approach a fence, and do not understand it.

920. Did you not find wild cattle jump over a fence which sheep can get under? No, it is a good height. Before these alterations of ours had been made there was a great deal of dissatisfaction.

921. Have the Works Department made any objection to this? No; and they are now adopting the system of making rails along the centre of the troughs, instead of the high fences hitherto adopted. Several gentlemen in the country spoke to me about this. Mr. Miller, a very large drover, spoke to me very strongly about it, and told me that he had come down from Bourke and had used only one Government tank. Mr. Allison also mentioned to me, at the Hermitage tank, that if his sheep would not drink he would order the rails to be chopped down.

922. We had it this morning that it was not so much the fault of the Department as that the ground had been washed away? In some cases that would be true, but in many it would not be. The caretakers have in every case had our instructions to make up the ground where required.

923. *Major Penrose.*] Where do the Mines Department get the money to make these alterations? The caretakers make the alterations in their spare time. For the expenditure on bolts, screws, and other things that are necessary, authority has been given by the Minister for Mines. In one case the alterations were effected by some men who were building cottages in the Corowa district, and if I think aright the alterations were made for about £3.

924. *Chairman.*] Have you any knowledge of the construction of wells in your district? Yes; in my district there are only two fair wells—Berrigan and Murray Hut. Oh, yes; there are more.

925. Do these contain good water? Yes; Berrigan and Murray Hut contains very fair water; but the old Gunbar well is very bad, the water being utterly undrinkable either by man or beast.

926. Have you any well in your district where, by constant use, the water has become drinkable? No.

927. Are there any abortive wells sunk in your district and abandoned? None; except the old Gunbar well, which is quite useless.

928. Were all the headworks put up in that well before the water was touched? I cannot say when the water was touched, but the headworks were put up before the quality of the water was tested and deemed suitable.

929. And you think that if the water had been tested it is unlikely that the headworks would have been constructed? Yes; when Mr. Gilliat took them over he did so subject to the approval of the Minister for Mines, and said that he would require an analysis of the water.

930. That well is still useless for stock-drinking purposes? Quite useless. I do not think that a hoof of stock has ever been watered there.

931. Was a caretaker put there? Yes.

932. What for? To protect the headworks and to bale the well, as the Public Works Department urged that constant baling would improve the quality of the water. The baling has been kept up, but it has not improved the quality of the water in the least.

933. Are you aware that constant baling has improved the wells in Riverina? No; I am not aware that the water in any Riverina wells has been improved by baling; but I have heard that it has done so in some slight way in wells along the Darling.

934. *Mr. Woore.*] Baling cannot alter the character of the water when it contains minerals? The idea is that constant baling would wash the salt out. A great deal of the water, besides being salt, is evidently charged with magnesia. Those witnesses who come after me will be able to give more information on the subject. I have knowledge of other works like this, owing to my having travelled at different times through the Colony. I made a special report on the Dolmoreve and Holy Box wells.

935. *Chairman.*] Is there anything wrong with the troughing arrangements or with the construction of troughing? I think the objection made by us only refers to the rails.

936. Can you give us any information about hutting? I know what some of the huts erected in my district by the Mines Department have cost.

937. *Mr. Woore.*] Do you know what has been the cause of the disagreement between the officers of the Departments? Well, I think it is due chiefly to misapprehension. I think the friction exists only in one district—that it is confined to a certain extent to the district of which Mr. Stilwell has charge. It is only from his district that complaints have come largely. Every repair required passes from us to the Works Department; and in a great many cases these repairs that the Mines Department have deemed necessary have been referred by Mr. Gilliat to the Commissioner for Roads, and by him treated as complaints.

938. *Chairman.*] Of course, you can understand that if the officers in the Roads Department are put to considerable trouble and annoyance, and heavy duties imposed upon them through the apparent carelessness of caretakers, they naturally feel angry and are apt to use strong language? Yes; it would be justified if these things can be borne out. Nobody sympathises with these gentlemen more than I do. I know if I saw a man neglect his duty and I reported it, and no notice was taken of it, I would be annoyed very much.

939. Particularly if the work you saw going to destruction was the work of your own hands? Decidedly. Mr. Stilwell I have never met, but by those officers whom I have met I have been treated with the greatest courtesy, and I have always treated them in the same way. There is no personal friction whatever between us.

[The Commission adjourned.]

THURSDAY,

THURSDAY, 2 FEBRUARY, 1888.

The Commission met at 10 a.m.

Present:—

HON. G. H. COX, M.L.C., CHAIRMAN.
MAJOR PENROSE, R.E., | J. C. WOORE, Esq.

David Brown called in and examined:—

940. *Chairman.*] You are a joint lessee of Kallara station? Yes.

941. Are you aware that a Commission has been appointed for the purpose of inquiring fully into what has been called the strained relations between the Department of Works and the Department of Mines? I² Feb., 1888. D. Brown.

942. You are not aware that we were appointed to inquire into the matters I have mentioned, and also into the allegations that have been made by officers of the Mines Department as to tanks constructed by the Works Department, and entrusted to the Mines? I have heard something about a dispute between the two Departments, but as to the nature of it I have no knowledge.

943. Then I might briefly state to you the heads under which we propose to examine the witnesses. They are—

1. Faults of judgment in the selection of sites for tanks.
2. Of defective design and faulty construction, with but little concern to take advantage of formation of ground or selection of catchment area, so as to avoid collection of silt; of too steep batters in most cases, and apparently the adoption of a certain form of tank, without reference to formation of ground or nature of soil; the defective construction of flumes and erection of inlet pipes, with carelessness in laying out drains, and excessive cost in construction.
3. Expensive forms of machinery for lifting water, necessitating greater cost of maintenance.
4. Faulty construction and excessive cost of fencing.
5. Interference with caretakers and overseers; greasing of service-tanks.
6. Sub-letting of contracts.
7. Faulty construction of wells, sinking, timbering, and centering of shafts; erection of headworks, whim, service tanks, and troughing before testing for supply and quality of water.
8. Excessive cost of construction.
9. Costly hutting for caretakers.
10. Defective construction of troughing.

And finally, the evidence throughout confirming the unfortunate effects of a divided control, under which each Department denies responsibility? [No answer.]

944. The principal matter which we will dwell on to obtain information from Mr. Brown is as to the faulty selection of sites, which means that if the soil is not good for holding water, it was useless to make a tank in that place. We want first to ascertain if the sites are faulty as to the selection, and we will then inquire who was responsible. Now, what are the tanks which you are more immediately connected with, and which have come under your observation? There are two Government tanks on our run; they are both situated on the course of the Paroo River. One of them—Goomboolara tank—is about 7 miles from the northern boundary; the other is 24 miles further down the river. They are both on the flow of the Paroo. The name of the other is the Warramurtee tank. The first was sunk by a man named Doyle.

945. Have the sites of these tanks not been well chosen? I think not. I think the site of the Goomboolara tank is particularly badly chosen. The reason why I make this statement is that within 4 miles of Goomboolara tank there is a lake which contains water nearly always, and is seldom dry. When the lake is dry the tank is also dry, because the lake is filled by the flow of the Paroo River, and it requires the Paroo also to flow to fill the tank.

946. *Major Penrose.*] What lake is this? The lake known as Mungundie.

947. What run is that on? It is the Goorimpa, which is a back station of Kallara.

948. *Mr. Woore.*] How far is it from the Paroo? It is on the Paroo, or, rather, just off of it. There is a cutting running down. It is a natural lake, and it has only been dry on one or two occasions during the last ten years.

949. Is there a cutting made into this? Yes; the cutting was made in 1877, and improved somewhat since then. In 1875 and in 1876 there was no water there at all.

950. *Chairman.*] Would not a fall of rain fill the tank irrespective of the flowing of the river? A very heavy fall of rain might fill the tank. There is a dam above this, and the principal watershed is above the dam. The effect of the dam is to send the water towards the lake rather than towards the tank, so that in most cases the lake should begin to fill before the tank. Of course the filling of the tank by rain would depend upon whether the rain was heavy or not. It is just possible that a moderate rain might fill the tank without sufficient falling to fill the lake.

951. Could a better site have been found in that locality? No; I do not think a better site could have been found; that is to say if a tank were required there at all. I do not think that a better site could have been had within a reasonable distance from the road.

952. Would it have been more satisfactory to have made a well there rather than a tank? I think not.

953. Is well water obtainable there at all times? I have tried to get well water in several places along the run of the Paroo and have invariably found that there was a very considerable quantity of salt water within a few feet of the surface; I mean from 7 to 14 feet of the surface. The expense of sinking wells increases very much, if you have a large quantity of salt water to deal with near the surface. My own opinion is that to get really fresh water it is necessary to sink or bore from 700 to 1,400 feet.

954. I do not know if you have yet gathered the force of the question which I desire to ask. I want to know whether, when the water in a tank is precarious, and it is necessary to have a stock route supplied with water, do you think it is desirable to have anything beyond tanks to depend on in severe droughts? Do you want to go back to the time when these tanks were put down—that is, do you refer to the present or to the past?

955. I mean that where the rainfall is precarious, would it not, in your opinion, be desirable to have permanent water alongside the tanks? Are you referring to the Goomboolara tanks or is your question a general one?

D. Brown. 956. I refer to tanks in general? Clearly, if water is necessary at all no expense should be spared in providing it by sinking wells to any depth. Of course, I mean if the catchment area for tanks is not sufficient to render tank water practically permanent.

2 Feb., 1888.

957. Was there any water in the lake when this tank was sunk? Probably there was, but I cannot say from memory. When the contract was let there probably was water there.

958. *Mr. Woore.*] In what year was the tank sunk? In 1880 or 1881.

959. But there have been considerable droughts since then? Yes, the drought came on in 1883. From memory I believe I can say that the lake had water in it at the time, because the tank was sunk in April, 1880; and in March, 1881, there was a very big rain that filled the lake.

960. *Major Penrose.*] Have you ever seen this tank dry? I have seen it useless, but not dry. I have seen it useless for stock.

961. Was this tank much used? I leased it for about two years formerly, and have had the general supervision of it for three or four years after that. During that time I had the right to collect all dues, but I was only able to collect the sum of (I think) £4 10s., because in nearly every case when travelling sheep passed up or down the river there was a sufficient supply of water on some part of the route, which prevented the necessity of drovers using this particular tank.

962. *Chairman.*] Then under these circumstances you think that the expenditure on the tank was a useless one? I am not quite prepared to say that.

963. Were not these leased tanks dry during the drought of 1884? No, not dry. The drought was in 1883 and in 1884.

964. *Mr. Woore.*] When the tank was useless for watering stock was there plenty of water available in the lake? Generally there was; the tank was not required as a watering place when the lake was dry. I remember it having been dry for two or three months, and during that time no travelling stock came down that road. Our stock was dying in thousands, and other stock could not possibly travel.

965. Do you not think it was possible to make this tank—I do not know what the size of it is—but do you not think it possible to have made the tank very much more permanent than the lake? I think not, except on one condition—that these small rains might fall and fill the tank while being insufficient to fill the lake; and I think that in the lake there is very much less absorption than there is in the tank. In other cases that I know of the evaporation is not nearly as great as the absorption. The whole of the ground along the Paroo is of such a nature that tanks should never be put down more than 9 feet. I myself have put down tanks 12 and 13 feet deep in similar ground, and in one case I returned the clay to the bottom of the tank to cover the porous stratum, which contains salt, and which was opened up at that depth.

966. At the time this tank was made by the Government, was it then generally known that it was not advisable to go down more than 9 feet in the Paroo River country? Some people might not agree with me in what I say. It is an exceedingly difficult matter, even with trial shafts, to tell whether the ground will hold water or not. I know of one tank 12 feet in depth with a bank around it, arranged in such a manner that the capacity of the tank is about 60,000 yards. That tank seemed to me to be better capable of holding water than any other I saw on the course of the Paroo.

967. How deep was it? Over 12 feet, and 19 feet when filled to top of embankment. I found, however, that I was wrong, and that this tank, which looked the best of any that I had seen, turned out to be the very worst along the river.

968. Putting out of the question altogether the facilities for getting a supply of water at this particular spot near the lake, do you think the position of the place is a good one as the site of a public watering place for travelling stock? I think not. I do not think it was a good position for a large expenditure of money. If water could be got at a reasonable cost, and maintained and distributed, it might be good enough; but, under the circumstances, and from what I know since the tank was made and the revenue which it has brought in, I think that it was not a good place. My own opinion is that no public watering place was required there at all.

969. Why? Principally on account of the lake being there.

970. But the lake is liable to be dry for years? That is not my experience.

971. *Chairman.*] Are you aware of the enormous evaporation in that climate? What do you call enormous evaporation?

972. Something very abnormal as compared with the evaporation in the coast districts? How has the evaporation been tested?

973. Government have had various registers kept from year to year, and proved the existence of what I call enormous evaporation? Could you give me any idea of how much that is?

974. Well, I understand a certain amount of water is put into a vessel, which is placed under the surface of the ground, to prevent the sun from acting on the sides of the apparatus; and this, measured carefully by scales and measurement, shows that there has taken place what I call enormous evaporation. I have been given to understand that water will evaporate at the rate of 1 inch per day? That is 30 inches per month?

975. Yes, but not all the year round? It is an exceedingly difficult matter to prove. I am aware of what are said to be facts in connection with evaporation, but I am of opinion that they are not all facts. I kept one of Mr. Russell's evaporators myself at his own request, and after using it for a time, I suggested to Mr. Russell that a better evaporator should be obtained before any definite result was made known.

976. Well, you are aware that a great amount of evaporation goes on during the hot summer months in that country? I have heard of it.

977. You state that you have kept a register? Yes, I have. The register was one of Mr. Russell's small evaporators, and by the results obtained from it one might have imagined that the evaporation was considerably over a foot per month; but from practical observation I am satisfied that evaporation (apart from absorption) is not nearly so great as that. If the evaporation pure and simple could be estimated, my own opinion is that it would not be more than 2 feet 6 inches per year in deep water.

978. You stated just now that you did not think any tank along the Paroo could be sunk more than 9 feet? No.

979. Now take a three years' drought—and they are not unusual—this would mean between evaporation and absorption the escape of 12 feet of water, leaving scarcely any water at all for the stock. You do not think that it would all go in evaporation? No; twice as much would disappear by absorption; and in many cases much more.

980. Then, if that is the case, what is the use of sinking a tank at all. There is no good in a tank unless it can be relied on in a drought? If absolutely permanent water was absolutely necessary, I should say certainly not.

981. Of course, you know that a squatter would conserve water on his own run even if it only remained twelve months, because it would give him an opportunity of supplying his stock for that period. But that is not the way the Government should act. The Government have to supply travelling stock routes with water, and none of these smaller tanks put down by squatters would be of any value; so that the cases are not quite the same? Quite true.

982. So that one of these tanks of 9 feet, which you would sink on your own run, would be of no use to the Government? Excuse me, but I think that the Commission ought to go back to the time the tanks were sunk and ask my opinion as to the desirability in having sunk tanks in preference to wells, at the time wells were put down. If you did so, my answer to this would be that at that time so little was known as to the possibility of getting fresh water under salt water, that the majority of people would very much have preferred a tank to a well. All over that Paroo country salt water exists. Its presence was known; but it was not known that possibly at greater depths fresh water might be got by boring. These depths are not yet ascertained. I have put some bores down 800 feet, and the supply of water at such a depth was not sufficient for a Government watering place.

983. *Mr. Woore.*] Well, then, perhaps you may think that the Public Works Department in sinking tanks there did only what was reasonable under the circumstances? So far as the question is between tanks and wells, they acted rightly at that time.

984. *Major Penrose.*] Are you aware under what conditions these tanks were constructed. Were they urgently demanded by the people in that district? I think not. The Goomboolara tank was made about the same time as the Warramurtee.

985. *Mr. Woore.*] But do you not know that considerable pressure was brought to bear on the Government to have these tanks made? I am not quite certain about that.

986. Do you not remember that there was considerable agitation for the construction of tanks on the Paroo river? Yes; but not in respect to these two places, Warramurtee and Goomboolara.

987. Then where are the tanks which the Government were pressed to construct? They were lower down the river. I think Copago was one of them. I was never concerned in any such agitation myself.

988. *Chairman.*] Are there any other tanks that you know of, the sites of which were badly chosen? I only know that the tanks on the Cobar road,—the Kerrigundi and the Matthews's Flat tanks; and, I believe, the first tank out of Louth, were badly placed.

989. Have you anything to say about Warramurtee? Only this, that if a tank were required there at all the site selected was certainly the best one. But here again I think that the Warramurtee waterhole was quite sufficient for all public requirements.

990. How far is that distant from the tank? Quite close to the tank. My reason for making this statement is this, that since the tank has been constructed it has been required only once for the use of travelling stock. And only once has there been any water in the tank when there was none in the waterhole.

991. *Mr. Woore.*] Is it not a fact that this road has been closed for months owing to the want of water? No, not to my knowledge, except in the droughts of 1883 and 1884; and I think it was closed then, not so much because there was an absolute absence of water as that there was no grass for the travelling stock. There was then a greater want of grass than water. There have been, of course, exceptional cases, where stock have got through owing to the presence of this tank when they would not have got through otherwise.

992. Then in that case if the natural supply dried up, is this tank sufficient to take the stock over a severe drought; and is it not possible that if it were sunk deeper there would be a better supply of water? There never have been any travelling stock on that road that were not supplied with water. No stock have ever applied for water there and failed to get it. I do not say that some stock have not been prevented from going, but during my occupation of this lease no travelling stock have applied for water and failed to get it.

993. Have the tanks never been empty? I do not say that. The tanks may not have been empty, but they were so near it as to be useless for travelling stock.

994. What I want to get at is this,—is it not absolutely necessary to have permanent water on a stock route, because it is during great droughts that water is required? Quite so.

995. Permanent water is not supplied on that route in these tanks? No; and cannot be supplied anywhere after a three years' drought that Mr. Cox spoke of.

996. Then the only way to supply permanent water is by these expensive deep borings? That is the only way.

997. And little was known about boring when these tanks were constructed? I believe I was one of the few individuals who tried boring at that time.

998. *Chairman.*] Now, as to the faulty designs. Besides these two tanks, are there any others that came under your observation that you have any cause to find fault with? Well, I will take the question of batters. In most of that country the batter given to Government tanks is too steep, because the soil is not sufficiently retentive for the case of poor holding ground. Very much depends upon whether you allow the stock to go into the tank or not. If you do not allow stock to go into the tank it does not very much matter whether the batter is one in three or one in six. Where the soil is not sufficiently retentive I think it advisable that the stock should be allowed to go into the main tank, and in that case the batter must be an easy one. I can give you an instance of that, if you like.

999. I have come to the conclusion that all stock at Government tanks ought to be watered by troughs? In that case I should not put down tanks at all in bad holding ground. I should take other means of watering stock, because unless stock watered on the slopes the tanks would never get puddled. The ground along the Paroo would scarcely hold. The water there has a tremendous amount of clay in suspension. That clay settles perpendicularly. I think it desirable in most cases that the tank should be open, so that sheep on a shallow batter might be allowed to puddle the soil, which without their puddling, is not sufficiently retentive.

1000. *Major Penrose.*] Do you consider that a batter of one in two is too steep as a general rule where the stock are watered at troughs? That entirely depends upon the soil. If it is good retentive clay, a perpendicular bank would stand, and will hold water, on condition that you log it. I have on the Paroo

D. Brown.
2 Feb., 1888.

D. Brown.
2 Feb., 1888.

a logged tank with perpendicular sides, and you can pour into that tank a considerable amount of water, and the longer you pour the longer you will have to pour, because the tank will never fill. The sides of the tank are so porous that the water goes away as fast as you can put it in. If you make a shallow slope the clay in suspension in the water falls on the side and tends to fill up the porous sides and bottom.

1001. Now with regard to the cost of construction, have you many tanks on your own run? I began in 1878 to make tanks on the Paroo.

1002. And what was the highest price that you gave per cubic yard? Before I went up there the lowest price at which excavation was done was 1s. 6d. per cubic yard. The highest price that I have ever paid is 1s. 2d.

1003. Is that the highest price that any of your neighbours have paid? As I have said, previous to my going up there, the lowest price was 1s. 6d. per cubic yard, contractors finding everything.

1004. Yes; but I want to know what is the highest price? Well, that depends upon the work.

1005. But what is the highest price that you have known to have been given by private individuals in that locality? Well, I have known as much as 1s. 8d. to be given for excavation; but the tank was a small one, and probably had steeper sides. The highest price, and the usual price given up there before my time, was 1s. 6d. per cubic yard.

1006. Now, why was this high price given;—what caused it? You mean this excessive price of 1s. 6d? 1007. You say it is excessive? The people up there did not consider it excessive at that time.

1008. The size of a tank makes no serious difference in the cost of construction? Oh! but it must.

1009. In what way? Because if you have a moderate-sized tank with a steep slope you must take out much of the stuff by dray work, and dray work is less economical than scoop work. Then all the bank cannot be used as a roadway, necessitating greater haulage of earth. These things make a difference, and the chief difference lies in the application of dray work rather than scoops.

1010. And this is caused by the steep batter? Yes; but cost depends much upon the soil. You may get a soil in which you cannot work scoops at all, or at great disadvantage.

1011. What was the highest price that you have known the Government to give for their tanks? I can answer that only from hearsay—only from report.

1012. Do you know what these tanks—the Warramurtee and the Goomboolara—cost per cubic yard? No, I do not.

1013. *Chairman.*] Are you not aware that when a squatter's tank is finished he measures up the work and pays the money at once? Certainly.

1014. Are you aware that this is not the rule in the Government Departments? I have heard that there has been some delay.

1015. And if there has been a considerable delay, you can understand why the contractor would allow a margin for having his money so long outstanding? Yes; I can well understand that. The squatters make progress payments.

1016. Government do also, according to their contracts. Are there not circumstances where the Government find it necessary to sink a tank and have to give excessive prices, owing to the distance of the contractor's camp from the nearest water? Certainly; there may be.

1017. A squatter will scarcely go to the expense of making a tank 20 miles from water, but Government may be compelled to do so, which would enormously increase the cost of the work? I should say that to put a tank 20 miles from water would be to nearly double the cost of the tank.

1018. *Major Penrose.*] What price per cubic yard were you paying for excavation at the time these tanks were made? From 10d. to 1s. per cubic yard.

1019. And what depth were these tanks of yours? From 9 to 12 feet 6 inches. In the construction of a tank it makes an immense amount of difference where you put the stuff. If you carry the stuff a long distance from the batter, it may make a difference of 2d. or 3d. in the price of the tank. A high embankment, and other things, also make a vast amount of difference.

1020. *Chairman.*] Is there any lifting machinery at these two tanks with which you are acquainted? No.

1021. *Mr. Woore.*] With regard to these two tanks on the Paroo, which you have referred to, would it not cost a great deal more to make them at some considerable distance from water instead of at their present positions? I do not know any better position that they could be in. They are right on the road.

1022. And but for this water beside them they would have cost a great deal more money? Yes; and they were constructed each close to a public-house. Everything else being equal that was the place to put them at the time.

1023. Do you know of your own knowledge that there was a great amount of absorption from these tanks? Yes, I know that from my own knowledge.

1024. *Chairman.*] Are you not aware that in very dry weather sheep will go and drink in these tanks and swim about in them, carrying away an immense amount of water? Yes, they will do that.

1025. *Mr. Woore.*] Therefore, when mobs of sheep enter the water they will carry away large quantities of it in their fleeces? [No answer.]

1026. This system, which you think suitable in your own case and in the case of other squatters, of having open tanks, so that sheep can go into the water, could not be applied to public watering places, for the reason that sheep would carry out a large quantity of water in their wool, besides fouling the tank? I would answer the question in this way: If you must have tanks for public watering places, the proper way is to treat them in very much the same way as people of local experience manage their tanks—make sloping batters, and allow the stock, if necessary, to puddle the ground until it is sufficiently puddled. Then close the tank, and save as much water as possible.

1027. Of course, this has all been learned by experience, and could not have been known at the time the tanks were sunk? In all these tanks there has been a considerable amount of clay sediment; that is owing to the fact already stated,—that the Paroo water contains a large amount of clay in suspension, which, when the batters are steep, is more apt to settle on the small bottom of the tank, at the foot of the batters. I suppose that in each of these tanks there is about 3 or 4 feet of silt. This silting up must continue to occur, although more slowly, as the tank widens upwards; and I think that the loss at the bottom can be more than gained at the top by an arrangement to apply an engine and centrifugal pump to give more water at the top than is lost at the bottom; that is, in heavy rainfalls.

1028. *Major Penrose.*] Is there any machinery at these tanks? No; but no machinery, except such as I have stated, would be of use for this purpose. I do not think there is any machinery at any Government tanks that could fill the tanks above the gravitation level in reasonable time. 1029.

1029. *Chairman.*] You have just mentioned something about the stock not having watered at the main tank but at a smaller one;—how was that filled? From the main tank by a pipe. The two tanks are always kept at the same level.

D. Brown.
2 Feb., 1888.

1030. *Major Penrose.*] Then you think that the machinery at the Government tanks is not powerful enough? That depends entirely on what the machinery is required for. The ordinary machine is not powerful enough to pump into the tank the large quantity of water which is required to fill the tank above gravitation level, but quite powerful enough to supply water to stock outside.

1031. *Chairman.*] Are you aware that the Government have now given most of the tanks over in charge of caretakers, and that these caretakers have paddocks fenced in for their horses which they employ in lifting the water? There are also very strong fences put around the watering place to prevent stock breaking into the main tanks. None of these fences have come under my notice as having been badly constructed or constructed at an excessive cost. The two tanks on the Paroo are fenced with as good a fence as can be had in that part of the country where the timber is very small. At them there is no paddock fenced in for the caretaker; the only fence is that which is put around the tank itself.

1032. Are you aware that the cost of these fences erected by Government was very much in excess of the cost of similar fences put up by private individuals? I do not know what the cost is, but the length of fencing is so very small that I should say the cost should not amount to very much in any case.

1033. Being a small contract people would ask rather more for it than for a large one? Yes.

1034. Have you ever found that the superintendents of roads who looked after these tanks had made complaints of the caretakers? No; but while I was lessee of these tanks I used to have letters from the overseer or stock inspector, who drew my attention to anything that required to be done. So far as I was concerned there was never any undue interference.

1035. Have any wells been constructed on the Paroo by the Government in later years? No; but I know that wells have been put down at Mossgiel and Holy Box.

1036. What is your impression generally with regard to these wells,—were they properly put down? Some of them were; the Jumping Sand-hill well certainly was; and there is a Government well some seven or eight miles out from Mossgiel. I think they call it the Polygonum well; it was also properly put down. This is a capitally-made well, and was certainly very much required. The water, unfortunately, was very bad. In reference to the Holy Box well, I was there when a trial-shaft was put down in the first instance under the supervision of a man named Higman, or some name like that. This trial-shaft was supposed to have struck really good fresh water. Between the time when the trial-shaft was finished and the time when the main shaft was undertaken, I was at the well, and I saw the water at the bottom of the shaft. There was only a small quantity of water in it, and I was exceedingly anxious to know whether it was good or not, because at that time I was sinking a number of wells myself at the Mossgiel station, of which I was manager. I let down a billy or a tin and brought up some of the water to try it. Although the water was said to be very good in the trial-shaft, this water which was at the bottom of the shaft, seemed to me to be only good stock water. The supply was evidently very small, as there was only 6 inches at the bottom of the trial-shaft.

1037. *Mr. Woore.*] What was the depth then? I should say about 100 feet. It might have been anything to 110 feet. My impression at the time was that the trial-shaft had given a very unreliable result. The quantity appeared to be small, and the quality, so far as I could judge, good enough for sheep to live on; but not good enough to take on a first trial. I should have been inclined to have had another trial. From my knowledge of that country more than one trial-shaft is always necessary if you do not get a good result at the first; because only a few yards away from one shaft you may get a different result in another. My impression at the time was that this water was not good enough. I understood that the well was proceeded with and finished, but I have never had an opportunity of testing the water or the supply afterwards.

1038. Do you know anything about the matter by common report? I have had bad reports of it, and judging by these reports the water seems to be very much what I expected it would be by the tests that I made at the time that I took the sample from the trial-shaft.

1039. *Major Penrose.*] Have you any experience as to baling out wells to improve the quality of the water? Oh, yes. Do you mean continual baling? Under certain circumstances continual baling may improve the quality of the water. I can give you one or two instances in that neighbourhood.

1040. Then it is within your experience in that neighbourhood that continual baling has improved the quality of the water? Yes; water has improved when a well was in use; but I do not know that I am justified in stating it was continued baling that did it. Indeed, I am not sure that the effect was owing to the baling. In two instances water had improved after a good deal of baling; but I have reason for thinking that the effect was due to another cause. The position of the well was covered with a large amount of flood-water, and that flood-water in going down the shaft had some effect in throwing back the salt which causes the well to be salty. That is my opinion. The very effect that I speak of was apparently produced at the Mossgiel (south) well.

1041. *Mr. Woore.*] The water there was improved by baling? Well; that is the question. It was improved.

1042. *Major Penrose.*] Then the improvement that you speak of would not be a permanent one? Possibly it might. In this south well at Mossgiel the improvement was permanent. Previous to 1870, the south well at Mossgiel gave a full supply of water, but it was of very poor quality, and was all but useless to the stock. The well was covered with water by the overflow from the Willandra during the 1870 floods, and for a considerable time after the flood-water had receded the well-water was distinctly improved in quality, and has remained useful for stock ever since. I believe that it is also possible, by constant baling of a well, to exhaust the salt in the salt-bearing stratum which makes the water salt.

1043. *Chairman.*] Are you aware of the cost of this Holy Box well? I am not.

1044. What was the sinking? It was easy, and so far as the shaft was concerned, I could have had a similar well put down for 8s. or 10s. per foot. It depends on the depth.

1045. I am told the depth was 94 feet? I could have got it sunk and timbered for £1 per foot, and perhaps for less than that. The trial shaft should not have cost more than 10s. per foot. In this instance, timber would have cost a large sum in consequence of the great scarcity of wood in that neighbourhood.

1046. Do you think, even taking that into consideration, the well should have cost £12 per foot? No, I think it is an excessive price, unless the specifications were absurdly heavy and strong.

- D. Brown.
2 Feb., 1888.
1047. Do you think it was wise to have erected a whim and trough, and so forth, before it was proved that the water was sufficiently good to be useful for stock? No, I think it was exceedingly unwise.
1048. Are you aware that the iron troughs have been destroyed by the action of the salt? I believe it quite possible, but I am not aware of it. If the iron troughs have been destroyed, from the salt water in that well, it must have been very much worse than the water in the Government Mossgiel well, which is too bad for travelling stock to use, although station sheep do so.
1049. *Major Penrose.*] Do you know whether this well is now in use or not? No, but I have heard drovers complain during the last few years that they could not get water there. I have heard that drovers have had to get water from the private tanks.
1050. *Mr. Woore.*] Have you been there since the well was completed? No, but I will say this, that if the water is more salty than the water in the Mossgiel well, machinery should not have been put down there.
1051. *Major Penrose.*] But here I find that in 1883 good water was obtained there? Well, I will give some information about that matter. With these salty wells, it is quite possible that in the shaft there may be some stratum which bears a small quantity of fresh water. That fresh water will float on the top of the salt water, and if you let down a bottle into the well, the bottle will fill from the thin layer of fresh water on the top, and consequently the water will appear to be very much better than it really is. And it is possible this may account for the fact that the first water struck in the trial-shaft, which, according to my judgment, was a very small quantity, was better than the water ultimately obtained in the main shaft.
1052. *Chairman.*] Have you ever known an instance where wells have been sunk and all the head gear supplied before the water was found? If a trial-shaft is sunk, the plan is to erect a whim to expedite the work of sinking the main shaft, the supposition being that the trial-shaft has proved the water to be sufficiently good in quality and sufficient in quantity for all the purposes desired.
1053. The whim would, of course, be put up by the contractors at the cost of the Government to carry on the contractor's work more expeditiously and cheaply? Exactly; as part of the contract.
1054. But have you ever known an instance where a well has been sunk and all the head gear erected without water having been found at all? He would be a very foolish man who would do such a thing in a country like that. No one who knew what he was about would do such a thing in that country, because of the great doubt as to the finding of water good enough.
1055. Now, it is a somewhat expensive system—that of trial-shafts—as compared with boring? A trial-shaft is better in my opinion where you only require to go down 90 or 100 feet; and for that depth is probably nearly as cheap as boring when no timber is required; because it can be done from 5s. to 7s. 6d. per foot. You see that the expense of bringing boring machines on the ground is very considerable.
1056. This is certainly a very material question, bearing as it does on the relative expense of the two methods. On the other hand, from your knowledge of the country you know you have to go a considerable depth before you can obtain water? Then boring is infinitely the cheapest plan.
1057. Are you aware that the Government have paid very much higher prices for sinking wells than private individuals? Their specifications are different from private specifications; and, therefore, I know that they must have given higher prices.
1058. Just tell us the reason why? Well, I think that their prices ought to be somewhat higher, because in most cases, particularly in the Mossgiel district, the timber they use (if I am not mistaken) is red gum, while private wells are put down with the local pine timber, which is lighter to carry, more easily worked, and sufficiently durable for all practical purposes.
1059. Is there any other reason? Well, the pine timber is brought from 30 to 40 miles distant, while the red gum timber has to be conveyed from Echuca, on the Murray river, a distance of 300 to 500 miles.
1060. But pine timber would not be good enough to use in a public work? I think it would; pine is practically everlasting underground.
1061. Do you know anything about the erection of huts for caretakers? No; nothing at all.
1062. *Major Penrose.*] Do you think there has been a waste of public money to any great extent on these watering places? Do you mean with regard to construction, supervision, or maintenance?
1063. Principally with regard to construction, but I would put it under all three heads? It has always been my impression that, considering the difference in quality, the prices which the Government have paid are excessive; and, if I may say so, not for this work alone, but for other public works—fencing, for instance.
1064. *Chairman.*] You have already given some reasons—do you think these are sufficient to warrant the high prices paid? I think there is one reason which has not been given, but which is still very important. I know that contractors tendering for Government work put their prices on a distinctly higher scale than for private work; and, as in that far-out country, the contractors who are able to undertake such a work are few, they know that they have a good thing in their own hands; and I have very little doubt they have sense enough to arrange that whichever man gets the contract gets a very good thing.
1065. *Mr. Woore.*] Is some sort of a "ring" formed between them? No doubt; there may be. There are only a few men who can take this work, and they may keep matters in their own hands.
1066. *Chairman.*] Now, I am going to ask you a general question. You have already learned from what I have stated that there is a good deal of friction between the two Departments—the Mines and the Works—and that charges and counter-charges have been made against the officers of both Departments. For instance, a superintendent of roads, under whom the tanks are during construction, reports what he believes to be a great want of care on the part of the caretakers. He finds fault, sends down reports to his chief that works constructed by the country at great cost, are being destroyed by want of care. The caretakers, on the other hand (who are appointed by the Mines Department), resent this interference; and hence friction arises. Now, do you not think it is very desirable that the whole maintenance of wells and their construction should remain in the hands of one Department? Will you tell me, does maintenance include repairs?
1067. As far as we know, maintenance should include minor and trifling repairs? There could be no objection to one Department constructing the works if, on their completion, the works were wholly handed over to another Department. But if, while the works were under the control of one Department in the matter of supervision, the matter of maintenance is handed over to another Department, there must be friction. It seems to me clear that all three—construction, supervision, and maintenance—should

should be under one Department; or if that is too much for one Department, then that one should have the construction, while the other should have everything else—supervision and maintenance—handed over to it.

D. Brown.
2 Feb., 1888.

1068. Now, do you not think that this also would lead to friction. The parties taking over these works might say that they were badly constructed, and insist that they were put to extra expense in keeping them;—would not that occur? Well, I am not sure that that would be altogether a disadvantage, because it might be so, and the parties constructing might not care to acknowledge an error of construction.

1069. Do you not think that it would lead to a further expenditure of public money? I am looking at it from the point of public utility. If it made it too cumbrous for one Department to have the construction with the supervision and maintenance, then the construction could be given to one Department and the supervision and maintenance to another.

1070. At the present time small repairs to the extent of £10 may be entered into by the Mines, but if any more serious repairs are required they have to go back again to the Works Department. The consequence is, that one finds fault with the work of the other and reports unfavourably of the repairs? That is an absurd system, undoubtedly.

1071. *Major Penrose.*] What can you build a small hut for—such as caretakers live in? That varies very much according to the specifications. If you are going to put an iron roof on the hut, it will probably cost you from £35 to £60, and then it depends upon a variety of other circumstances.

1072. *Mr. Woore.*] What would be the cost of such huts as are put up for caretakers? Well, I can get them put up, apart from material, for about £16 to £20.

1073. What is the cost—material and all? From £40 to £65—that is, for a hut such as men generally live in in that part of the country. Now with regard to these two tanks, I do not know of my own knowledge the manner in which they were leased. Before I was asked to take over the leases a man got so much a year for leasing them. There was no revenue from them at all till I took them over. It could not have been more than a few pounds during two or three years; so, to save the Government expense, I offered to lease the tanks for £1 per year. At the end of that time another arrangement was made, and since then I have been generally looking after the tanks.

1074. But do you not think the tanks of sufficient importance to warrant a caretaker being kept there? Well, I am sure that, so far as revenue is concerned, it would not pay.

1075. Do you know anything about the tanks around Cobar? I have been along the Cobar road, and I know the tank near Matherson's place. They seem to be all useful tanks, with the exception of Kerrigundi. There is not a sufficiently good catchment there. That was the impression I carried away after having seen it during very good years. I have not seen it since 1875. It is near Mulya. One of these tanks struck me as being of very doubtful character.

1076. Was there a better catchment somewhere else? No; I do not say that. I do not know the road sufficiently, nor whether a tank is required in that place or not.

1077. Have you any knowledge concerning the soil about there;—is it better than that on the Paroo? I should rather think it was better, and that it would stand a much steeper slope.

1078. Have you seen much of these tanks generally? I have passed there about ten or twelve times.

1079. Did it ever strike you that there was a waste of public money there? No; because I do not know how much money was spent there.

1080. But you would not place all the tanks where they are? Certainly not.

1081. Yet all the tanks that you observed you considered necessary? Yes, I think so; if the positions are good.

1082. *Chairman.*] Do you know anything about the tanks on the road from Bourke to Wanaaring? I know that the Kulmine tank was a good one. That road requires watering very badly, and it has required it for a very long time. An immense amount of money has been spent on boring, with little result. The machines that they are boring with there are absurd. These people will not take the result of private experience; but they go on, and make all the mistakes that I and others did. They bore with tools utterly inefficient for great depths—such as Wright & Edward's auger and the Tiffin. These are the two instruments that they have been boring with. For considerable depth, in my opinion, neither Wright & Edward's auger or the Tiffin auger are sufficiently good instruments. They are both admirable for shallow depths, up to (say) 300 feet; but when you get beyond that, something in the shape of the Pennsylvania oil drill is absolutely necessary. In any case where I had to go down 400 or 500 feet or more, I should use one of these instruments.

1083. Has the diamond drill been tried up there? No; not in our immediate neighbourhood.

1084. But has it been successful where it has been tried? Yes; where it is applied to boring through dense stuff or rock. Boring up in that country seems to be nearly a matter of certainty. Almost invariably, after going through a certain amount of alluvial, you reach a blue-coloured clay, and in or under that clay you are certain to get fresh water, if you only go deep enough. The shallowest water got in this stratum that I know of, was obtained at 500 feet, while the deepest was close on 1,200 feet.

1085. How high does this water flow through the bore? In some cases the water rises near the surface, and in other cases it flows in a fairly strong stream. I know of no case where a sufficient supply of water has not been got where the water is struck in the stratum, if it can be pumped from a depth of 100 to 200 feet. The weakest bore that I know of gives about 10,000 gallons per day in that manner, raised from 100 feet.

1086. Is it always good water? Always good for stock, but not always quite fresh. Most of it that I know would be useless for irrigation. Now, I believe that blue clay to be all over the country, and anyone who sinks in or under that clay will get good water.

1087. *Mr. Woore.*] That would apparently be the best means of providing water for that particular country. Of course you were only speaking of that part of the country of which you have acquaintance—that along the Paroo? Well, this formation appears to extend from Kallara to Thurlgoona, and from Kallara up to Queensland. At Barcaldine it appears to be similar, and with some slight exceptions, you have apparently the same conditions over a very large area.

1088. Have you any experience of these borings south of the Darling? No; although I know the blue clay exists between the Darling and Willandra, and that good water is always obtainable, and sometimes without going into the clay at all. At Mossgiel we used to get a large supply of very good water after about 40 to 80 feet sinking through the blue clay.

D. Brown. 1089. Now, as far as your experience goes with these borings, do you think that the expense of maintenance (provided that you get a supply of good water by boring) would be very much less than the expense of getting it in these tanks? Infinitely less.

2 Feb., 1888. 1090. So that it would be cheaper in the end to supply these stock routes along the Paroo and south of the Darling by bores? It certainly would, on condition that you expect to get the same invariable result down there that has been got further north. I think it would be worth trying.

1091. And also there would be no reason to doubt the permanency of the water? No reason at all. There is not one tank in the north-western country that is permanent—no mere surface water can be considered permanent for a three years' drought. The only objection that I see to boring is the length of time that would elapse before you could get the machinery, which would have to be worked by steam, and which is rather expensive. Of course, as the country becomes stocked the demands on the routes will be increased, and this is a question which might be fairly considered, as to whether some better system of supply to stock routes might not be adopted. If, by means of these bores, a permanent supply can be obtained, and the expense of maintaining the places made very much less, then the system is assuredly worth a trial.

1092. Do you know of any person who has had any experience in putting down bores? Yes; I have always done the work myself, and always tried to get information from those who had similar work in hand.

1093. But do you know anyone who has had a great experience in this particular kind of work? I do not know one who has put down as many bores as I have myself.

1094. Yes; I know you sunk some immediately after you went up there? Yes; but I then bored with Wright & Edward's tools. I have now, for the last two years, used the Pennsylvania rock drill, and have been trying to work it on the rope system. The other arrangement was unsatisfactory, because the drill sometimes lost its perpendicularity; and I am now going to adopt what is known as the Canadian system of (I think) wooden rods in place of rope.

[The Commission adjourned until the afternoon, when the sitting was resumed.]

John Low called in and examined :—

J. Low. 1095. *Chairman.*] What are you, Mr. Low? I am an inspector of public watering places. I have a report here concerning the works which I have personally inspected as an inspector of the Mines Department.

2 Feb., 1888. 1096. Well, we will receive the report and make notes as you go along? This report is written in reply to Mr. Gilliat's memorandum :—

Sir,

Broken Hill, 7 January, 1888.

Referring to B.C. documents, 21/11/87, as to what matters, *re* objections to works by Mines Department herewith returned, I have the honor to report that the following have been personally inspected by me :—

NARRANDERA DISTRICT.

Fencing here was let by Works Department at the time of my inspection, pine 9 inches x 3 inches, 2 feet 6 inches in ground, which gauge appears to me to be absurd. In this opinion I am borne out by Mr. Cowper, station manager, Coonapaira, who also inspected posts which at the time were being split. I read specifications and contract, which was £700 for 1,140 chains. Contractor Hackett also showed me a contract where he sublet splitting, erecting, boring, and wiring, at £16 10s. per mile.

This style of fencing will not bear comparison with the fence on Bingagong reserve in same district, erected by Mr. Angus Robertson, Yarrabu Park, for which he claimed for material and erection at the rate of £34 per mile. See Public Watering Places, 87-1,957, 6/5/87.

Pulletop Tank.

Drains.—These here have a much too sudden fall, causing water to run too rapidly, cut up drain, thereby carrying silt into silt tank. A drain here with a much more gradual fall could easily have been excavated, embracing the present catchment area.

Water-lifting appliances.—These are placed in the most unsuitable site—dangerous position—being in the lowest ground, and liable in heavy rains to be damaged by water running on and around them, and undermining foundations. No by-wash has been excavated here, and no provision made to protect these appliances, &c.

Embankments.—These have been erected with no regard to being level; in fact are at the corner opposite water-lifting appliances, lowest being 2 feet 7 inches lower than middle of embankments, thus further endangering water-lifting appliances.

Mount Elliot Tank.

Drains.—These have been constructed evidently with little or no idea of what is required of a drain. Three drains have been excavated down face of hill, and, although my inspection was immediately after heavy rains, I could discover no trace of water having run in these—nor water-wash. Had one of these drains been extended about half a mile, it would have caught the water in a good natural watercourse, which in any ordinary season would be quite equal to filling this tank, thereby saving the outlay incurred for what is and will remain useless.

Hulong Tank.

Drains.—One is here so constructed as to run water from instead of to main tank. This showed plainly at the time of my inspection, owing to water lying in different parts of drain, which had been banked up to prevent water running from main tank. Were this drain opened up and main tank full, I feel confident it would run quite 1 foot of water out.

ALBURY DISTRICT.

Walla Walla Tank.

Main tank.—This is reported to be over 12,000 cubic yards, which, in my opinion, in a district with a rainfall such as this, is about twice the required size. I made every possible inquiry while in this district, and although I met Mr. Douglas (Walla Walla Station) and Mr. Simpson (Burrumbuttock Station), two large landholders, who have excavations never known to be dry, I could hear of no excavation equal or approaching in size to this. There is here a large natural basin, which at my inspection was full, and will be equal to all the requirements of this road and district for the next two years. In this opinion I am borne out by Mr. Douglas, of Walla Walla Station.

Water-lifting appliances.—These are so situated as to be liable to be washed away. At my inspection I could see traces of heavy streams of water having run round these and underneath troughing.

Embankments.—These are so erected as to allow overflow of water to run upon troughing and water-lifting appliances, hereby endangering foundations. This could have been easily avoided.

Hovell's Dam.

By-wash.—103 yards long, 43 feet wide, 10 feet to 6 deep, cut through solid rock, when a good natural by-wash was available at opposite side of creek, and which natural by-wash is of sufficient width to allow water to spread, thus minimising the possibility of its cutting away; but even assuming it had cut into ground, which I consider most unlikely, this

this could have been logged or pitched if considered requisite, I feel certain, at a quarter the cost of present by-wash. At the time of my inspection of this, stock were allowed access to water; but I have good reason to believe water-lifting appliances were proposed to be erected by Works Department, at a cost of £375 7s. 4d., to which must be added cost of 2 Feb., 1888. J. Low.

HAY DISTRICT.

Tom's Lake Tank.

Main tank is here excavated in a rotten, boggy swamp, a place which was well-known to all travellers on that road as a spot to be avoided after rain, owing to its boggy nature. Had this tank been excavated about three-quarters of a mile northerly of its present site, it would have been on much better holding ground, and on ground naturally less liable to cut up, which, in fact, is an old natural watercourse into swamp, which has cut up little if any. Mr. Overseer Keighran, of Hay, has for many years known this place, and fully bears me out in my remarks.

Drains.—These are badly constructed, especially one alongside of road, which, for some distance from its commencement, runs water from instead of to main tank. This drain crosses main road almost in front of main tank, having a direct and sudden fall into same, without the waters, as is usual, passing through a silt-tank. Owing to no silt-tank being here and the drain being much cut up both by traffic and nature of ground, much silt must have been carried into main tank, which I feel confident is quite half silted up. This drain could easily and practically have been led to opposite end of tank when water could have run through swamp and silt-tank, thus allowing silt to settle and not be carried into main tank.

Jumping Sandhill Well.

Water.—This water is, in my opinion, not even good stock water. I have on several occasions seen horses taken to it, which, although thirsty, would not drink. It is undoubtedly unfit for human consumption. About a mile northerly of this a good site for a tank could easily have been obtained, which, in my opinion, would have been much more suitable for the traffic; and in this opinion I am borne out by old settlers in this district, such as Mr. Laird, Mossgiel.

Polygonum Hut Well.

Water.—This water is quite unfit for human consumption. No better site for a tank could be desired than what is close to this, which, in my opinion, would have been much more suitable for the traffic, and less expensive either in cost of erection or keeping in repair. The fact that during this summer this swamp has held sufficient water to water all stock travelling, is sufficient evidence of its natural qualities and holding capacity of ground.

Water-lifting appliances.—The mode of lifting water here by windmills is expensive in the first instance, and condemns itself so far as use is concerned, as it is continually getting out of repair, and has not, since August—although it is allowed by Mr. Overseer Keighran to have worked more regularly since that date than it had done previously—done more than fill and keep full supply tank. No water during that period has been sold. Sufficient water for requirements could easily be drawn by a single whip, erection of which would not exceed £5.

IVANHOE DISTRICT.

Mossgiel Tank.

Fencing.—I have been unable to discover cost of fencing this tenant's lease. Mr. Laird, who knows fence well, values it at £55 per mile, comparing it with the prices he has been and is now paying for fencing. Lawrence Farrell, late contractor, now caretaker, Mossgiel tank, knows country well, and would be at any time, if contracting, willing to erect fence equal to this at £35 per mile, were wire put on line.

Excavation.—Original contract reported to be 1s. 3d. per cubic yard. Mr. Laird, Mossgiel, is now and has been getting tanks 13 feet deep excavated at 8d. per cubic yard, and strongly advocates 3 or 4 to 1 slopes.

Holy Box Well.

Water.—The water here cannot be reckoned even stock water, and is perfectly useless for human consumption, thus unsuitable for the traffic. The troughing here has been renewed owing to being worn out or corroded by the water. Much salt can at any time be gathered about this troughing. Mr. Webb, Kilfera, knows this public watering place well. He would not water stock at it, owing to quality of water. He considers it quite unsuitable for the requirements of the traffic. He has lost sheep at it, and has repeatedly advised drovers not to water their stock at this well, as they would certainly lose some. Mr. Laird, Mossgiel, knows this public watering place well; would not water stock at it, owing to quality of water; has heard drovers often say they would not water stock at it, owing to quality of water. A good site for a tank could easily have been got within a short distance of this, which, in my opinion, as also in the opinion of Messrs. Webb, Kilfera; Laird, Mossgiel, and any adjacent station-owners I have met, have been equal to all requirements, and much more suitable for traffic.

Runners.—The runners in this well are fixed in a manner new to me, although I have had considerable experience in this style of work, being fastened by screws, and in most cases only a shell of runner left after piece is cut out sufficient to allow head of screw being turned round. This shell has in many cases worn out, leaving a face for the bucket to catch on, which is most dangerous, and liable to cause an accident. Some of the well at bottom has, so far as I could discover, never had runners, thereby allowing buckets to get off and being blocked under water, as has already been done to my knowledge.

Ivanhoe Tank.

Main tank.—The batters here are so steep that ground from underneath shoot to a depth of 2 feet has been washed away, thereby endangering shoot. Excavation here is reported to have cost in first instance 1s. 4d. or 1s. 5d. per cubic yard. Mr. Brougham, Ticehurst, had tank excavated by Lawrence Farrell at same time, 15 feet deep, at 11d. per cubic yard, embankments 36 feet from and on four sides of excavation. Contractor, it is reported, and I have reason to believe, claimed and received a large amount over his contract price.

Batters.—These are much too steep, water-washed, and cut away, causing ground to sink to bottom of tank, thus bringing it quite as shallow as Ticehurst tank.

Drains.—These are badly constructed, evidently with no intention of leading water to main tank, much of them running from instead of to main tank. Two of these drain water from the township, the other runs parallel to main road, overflows silt tank and fills a private tank belonging to Elliott, which water is afterwards sold to the public. This could easily have been avoided by taking drain to opposite end of main tank, as is now being done by caretaker. These were excavated by Lawrence Farrell at 15s. per chain, dimensions being 9 feet x 1 foot. At same time he was excavating drains for Mr. Brougham, Ticehurst, 9 feet x 6 inches, at 3s. 6d. per chain, and which, in my opinion, owing to nature of ground, would serve the purpose equally well. Mr. Road Superintendent Hanna is now getting drains excavated at Broken Hill, where labour is much dearer than at Ivanhoe, quite equal to Ivanhoe drains, at 4s. 5d. per chain. In the Albert district I have had plenty of drains of this size—9 feet x 1 foot—excavated at 4s. and 4s. 6d. per chain.

Fencing.—This was originally let to one Bevan; I am informed by Mr. George Williamson, J.P., Ivanhoe, and Mr. Brougham, Ticehurst, at £116 or £120 per mile, who sublet it to Elliott, who afterwards sublet to Anderson (my informant) at the following:—30s. per 100 posts splitting; 100s. per 100 posts carting; £18 per mile erecting and wiring. The panels are supposed to be 10 feet, which would allow of the following:—

| | £ | s. | d. |
|------------------------------------|-----|----|----|
| 530 posts, splitting, at 30s. | 7 | 19 | 0 |
| 530 posts carting, at 100s. | 26 | 10 | 0 |
| Erecting, per mile | 18 | 0 | 0 |
| Wire | 30 | 0 | 0 |
| | £82 | 9 | 0 |

The allowance for wire is ample, thus leaving a profit from first contract price of at least £33 11s. per mile. This has no straining-posts, the wire being strained as it runs out. The posts are of split pine, unequal to the strain; in many cases are splitting and drawn over. This description of fencing is new to me, and I unhesitatingly condemn same. In this opinion I am borne out by Messrs. Webb, Kilfera, Brougham, Ticehurst, and Laird, Mossgiel, all of whom have had much experience in fencing-timber in this particular district, and neither of whom would erect a fence without straining-posts. I have now a tender for erecting at Ivanhoe a fence of same gauge and style of wire with proper straining-posts, at £70 per mile, although it is a small job, in which case a much higher rate is always allowed.

Inlet

J. Low.

2 Feb., 1888.

Inlet or flume.—The covering of inlet or flume consists of leopard wood—a timber notably known to rot quickly, and which no one having the slightest knowledge of would use for such purpose.

Gates.—12-foot swing, have recently been erected by Bevan, who originally contracted for erection of fence, whose men state he is getting £15 per gate.

Engine-shed.—This was erected by C. Anderson, resident in Ivanhoe, in four days, for which he got from Works Department £10 for labour alone, material being prepared and put on ground by Works Department.

Clare Tank.

Main tank.—This is in middle of a swamp, and at my inspection was surrounded by water.

Embankments.—Are here, owing to being surrounded by water, much cut away, and before many years will be level with the ground, judging from how they have washed since erection, and are so erected as to bank water across 5-chains road, which water has supplied the public free of cost until lately.

Water-lifting appliances.—These are so situated that at the time of my inspection the troughing was at least 9 inches under water, and the pillars carrying supply-tank were also under water, thereby endangering foundations of same. This could easily have been avoided by having supply tank about 3 chains north of present site, which is above water-mark.

Fencing.—This, for over a year, has been in course of erection by Mr. F. Casey, under contract with Works Department, and is still unfinished.

Gunaramby Tank.

Main tank.—This has been excavated in rotten copai ground, which, owing to steepness of batters, has fallen in to a very large extent. A good site for a tank could easily have been secured near to this.

Drains.—These are here badly laid out, and the system of leading water round excavation inside of embankments, in ground such as this, must lead to damage and washing in of batters.

Willandra Well.

Shaft.—For some years well-sinkers have been at work trying to sink this well. It has now been abandoned and a new shaft commenced.

Water.—Well-water in this locality is not even good stock water, and certainly none fit for human consumption. Mr. Webb, of Kilfera, upon whose property this proposed well is, informs me he has abandoned most of his wells—in fact all where he could get suitable sites for tanks; and near to this proposed well a splendid site for a tank could be got. A tank of 12,000 yards would be quite equal to the requirements of this road, and would perhaps have cost much less than what has already been expended upon what is looked upon by every practical man in the district, even were a good supply of water got, as being a useless piece of work, and at which stock are very unlikely to drink.

Well-sinking.—Well-sinking in this locality is paid for by station owners at the following—20s. per foot for the first 100 feet, 40s. per foot afterwards, owners finding material. Red gum could be delivered at this well at 40s. per 100 superficial feet.

Head Works.—

| | £ | s. | d. |
|-----------------------------------|----|----|----|
| Whim, round timber, and labour .. | 30 | 0 | 0 |
| Sawn timber .. | 10 | 0 | 0 |
| Mountings .. | 12 | 0 | 0 |
| Carriage and tar .. | 10 | 0 | 0 |

£62 0 0

Boonoona Tank.

Fencing.—None of this required to be carted more than 4 miles, as there is plenty ballah within that distance. Was erected by Bevan at £120 per mile. The erection of this fence, in comparison with prices paid by station owners in this district, I consider to be worth not more than £26 per mile exclusive of wire; and in this opinion I am borne out by Mr. Webb, Kilfera, who has had much fencing done in this locality, and who, after inspecting this fence, values it at £26 per mile exclusive of wire. Mr. Webb, Kilfera, in 1882, when feed was scarce and water had to be carted at least 5 miles, had tank-sinking done of the following description and rates:—Excavation 15 feet 6 inches deep, embankments four sides of and 22 yards from excavation, at 11½d. per cubic yard, and these tanks have never during the late dry season been dry, although stock have been regularly watering at them. Mr. Webb has all his tanks excavated with 3 and 4 to 1 slopes, considering them preferable to steeper slopes and less liable to water-wash. He approves of water being pumped out and stock watered at troughing, but considers the present water-lifting appliances extravagant in the extreme, and feels certain that a 2½-inch McComas water-lifter, worked by hand power, would meet all requirements, would cost less for erection, would be less liable to get out of order, consequently would cost less to keep in repair.

Gates.—These are here being erected by Bevan (originally contractor for fence), 12 feet swing, at £15 per gate, as reported by his employes.

Mount Manara Tank.

Main Tank.—This was in the first instance contracted for by Mr. John Hay, station owner, Mount Manara, at 1s. 4½d. per cubic yard, who afterwards sublet to Fred. Hardie, who did work at 1s. per cubic yard. This, Hardie informed me himself.

Engine-shed.—This was erected by C. Anderson, who was working in the neighbourhood, in four days, for which he got from Works Department £10 for labour alone, material being put on ground by Works Department.

Fencing.—This was erected by Bevan at £120 per mile; has no straining posts, which cannot be too strongly condemned; is about half split, the balance being round saplings (pine), the latter being in my opinion most objectionable and not lasting. None of this timber required to be carted more than 4 miles, which must have left a profit of over £40 per mile.

Gates.—These are being erected by Bevan, original contractor for fencing of tenant's lease, being 10 feet and 12 feet swing, at £15 per gate, as reported by Bevan's employes.

BALRANALD DISTRICT.

Dolmoreve Well.

Water.—This is bad stock water, and quite unfit for human consumption, consequently unsuitable for the traffic. A good site for a tank could have been got here, and an excavation of 12,000 yards would have been quite equal to the requirements of this road, which I venture to say would have been much more suitable. The station holders in this district, after years of experience, are abandoning wells and excavating tanks as being more suitable for stock. Messrs. Waugh, of Clare, and Webb, Kilfera, who are large land holders, strongly condemn wells in this district. Few if any stock will ever water at this well, and teamsters complain to me about the quality of the water, and state their stock will not take a good drink of it, even although very thirsty.

Shaft.—This I was unable to examine. A bucket was lost in shaft on 22nd May, and some of the runners broken, although the Works Department mechanic had been there on 20th June to repair same. Up to date of my inspections, 6th September and 3rd October, the bucket had not been repaired nor rope put on whim, and it was only on 30th October caretaker notified me he had received rope a few days before writing, thus taking five months to execute repairs any ordinary man could have done in a fortnight at most.

Box Creek Tank and Dam.

Main Tank.—One embankment here forming a dam would have been quite sufficient for requirements, instead of the large outlay for tank and dam. In this opinion I am borne out by Mr. Lindsay, Manager Til Til Station.

Embankments.—The embankments around excavation are of no practical use, and must have increased cost of tank considerably.

Site.—The site would have been a more favourable one and more water conserved had a simple dam been constructed down the creek about three-quarters of a mile—near to "Thompson's Hotel."

New

New Works 16 miles from Balranald.

Main tank.—This excavation, at my inspection, was almost completed.

Site.—The site is certainly not a good one. A much better one could have been procured within half-a-mile. The present excavation will require a large outlay for drains, if even by these it can be filled with a fair rain.

Drains.—There were 50 chains, 6 feet x 9 inches, excavated here. Although there had been heavy rains shortly before my inspection, these had run no water into silt tank—in fact, they never will, as both drains, in some places, were full of water, but quite dry near the tank, thus showing they would run water from instead of to main tank. Contractor informed me that he was getting 6s. 6d. per chain for these drains, which is quite 2s. per chain more than the work is worth, more especially as the contractor was doing the work when he was, from rain, unable to work in tank, and not as if he was losing time going to and from a small job.

WILCANNIA DISTRICT.

12-Mile Tank.

Main tank.—This excavation, Mr. George Williamson, Ivanhoe, informs me, was in first instance contracted for by Burton Brothers at 2s. 6d. per cubic yard, who afterwards sublet to Ford Brothers at 1s. 3d. per cubic yard, who performed work and made money at it. I have since seen Mr. Burton, who says 1s. 9d. was the original price, but admits 1s. 3d. was the rate they sublet at.

26-Mile Tank.

Fencing.—This is of good ballah posts. Works' caretaker informed me cost £95 per mile. No timber had to be carted 5 miles, and contractor averaged two loads per day. He sublet at the following rates: 20s. per 100 posts, splitting; 20s. per 100 posts, erecting; 20s. per 100 posts, boring—which rates would allow of a large profit. This contractor contracted for 12-Mile, 26-Mile, and 48-Mile tenant's lease fencing.

35-Mile Tank.

Fencing.—This is of mulga. Caretaker informed was contracted for at £95 per mile. No timber had to be carted for more than 4 miles. Contractor averaged three loads in two days.

Engine-shed.—This is of corrugated iron, 12 x 12 x 8. Caretaker informs me Davidson was contractor at £50 for material and labour. This is in low ground, and floor of same has been under water.

48-Mile Tank.

Fencing.—This is of split ballah. Contractor informs me he is getting £95 per mile for this, and had not to cart any posts 5 miles.

SILVERTON DISTRICT.

Rathole Tank.

Main tank.—I have been unable to discover price paid for this excavation; but contractor was fined a heavy penalty for non-completion, it is publicly reported.

Embankments.—These have never been level. One on lowest ground, and which banks backwater, shows signs of water-wash within 3 inches of top, which, in a district liable to sudden heavy rains like this, I consider too low, and ought to have been at least 2 feet 6 inches higher to insure safety.

Thackeringa Tank.

Main tank.—Mr. Davidson, Manager, Thackeringa Station, informed me contractor got 1s. 6d. per cubic yard for excavating this.

Day Dream Tank.

Main tank.—Mr. C. Webster, "Day Dream Hotel," informed me contractor told him excavation averaged 11 feet in depth, was stony in bottom, and that he (contractor) got 1s. 6d. per cubic yard for excavation.

Fencing.—The fence enclosing tank does not extend sufficiently far along creek to protect water from pollution, of which the residents loudly complain.

Purnamoota Tank.

Main tank.—Messrs. Davidson & Gibson, Purnamoota, informed me that they measured this excavation before water got in; that it did not average more than 9 feet 10 inches in depth; that contractor informed them he was paid at the rate of 1s. 1d. per cubic yard.

Broken Hill Tank.

Main tank.—This, at time of my inspection, was unfinished. Contractor informed the area of excavation was to be 76 yards x 70 yards x 6 yards, 2 to 1 slopes, and that his contract price was at the rate of 1s. 1d. per cubic yard.

Silt-tank.—Contractor informed was 30 yards x 30 yards x 3 yards, and that his contract price was at the rate of 1s. 1d. per cubic yard. Mr. Armstrong, of Burta Station, informed me that he has had several tanks excavated to a depth of 12 feet at 8d. per cubic yard. Mr. Binnie, Manager of Mundi Mundi Station, informed me he is now getting tanks excavated to a depth of 16 feet at 8d. per cubic yard. Both these properties are in this district—in fact, the stations nearest to most of the public watering places. I may here add, both these gentlemen are much averse to batters such as 1½ to 1, and prefer 3 or 4 to 1 slopes.

I have had considerable experience in tank-sinking in the Albert district, and had tanks excavated at 10d. per cubic yard for 12 feet in depth; had the embankments finished much better than any Government work I have seen. This was done at a time when labour was much dearer than it is now, or has been lately—when water had to be carted in some instances 8 miles, and where feed was scarce, so much so, that bullocks had to travel 5 miles to feed and water.

Slopes of excavations of Government tanks—1½ to 1—are in all cases much too steep. All batters of excavations that I have seen are much water-washed, which, of course, must sink to bottom, and tend to silt up tank. I am of opinion that anything steeper than 3 to 1 is too steep—in fact, many of the station-holders that I have met and conversed with on this subject prefer to have the slopes 4 to 1.

The uprights of fluming down batters in Ivanhoe tank have had quite 2 feet of ground water-washed from them, owing to batters being so steep.

I have never seen station tanks with a 3 to 1 slope, or more water-wash, nor so cut up in batters as I have seen in tanks at public watering places; so that if any extra price is allowed for excavating owing to steep batters, beyond first appearance it is a great disadvantage, and all practical men I have met with agree with me.

Embankments have in no case I have seen been erected with a view to conserving water inside and by them, as is usually done with amphitheatre tanks, not one of them being finished with the slightest pretension to being level on top—in fact, any that I have levelled are lowest on the low ground, where, were they filled with water, the great weight would be, and consequently most danger of breaking away.

I cannot too strongly express my opinion in favour of watering stock by troughing when the troughing is so placed that all stock can conveniently drink at it. I have had years of experience in a dry climate, and can confidently assert stock do much better when not allowed to get into water; the water lasts much longer—a most desirable object to keep in view; is saved from pollution—a matter to be studied where the water is much required for human consumption, as it is at all public watering places; but I do consider the appliances for raising water from tanks, either by steam or horse power, are much too expensive in first instance, and entail a much too large outlay for working and keeping in repair. One man, with a 2½ inch McComas water-lifter, can easily draw sufficient water for 10,000 sheep daily, which is much in excess of the average quantity consumed at any public watering place. Mr. Waugh, of Clare Station, has several of these water-lifters, worked by one man, watering that number of sheep all summer, drawing water for 15 feet, and without having the large supply tanks that are at all public watering places.

I have also to bring under your notice the fact that caretakers at Mossgiel, Boonoon, and Mount Manara tanks have reported to me, when asked why they had not performed certain duties, that Mr. Road-Superintendent Stilwell had interfered with them in the performance of their duties as caretakers—in the former case, ordering caretaker not to tar or interfere with slip-rails of tenant's lease fence, in the two latter cases ordering caretakers not to clean out silt tanks; and I have further to report that station owners in public watering place district of Ivanhoe complain to me much of the high prices paid for Government work, such as fencing and tank-sinking; that contractors taking work from them quote Government prices in comparison to the prices offered and paid by station-holders for similar work.

J. Low.

2 Feb., 1888.

J. Low.
2 Feb., 1888.

I beg to enclose letter, dated 29/1/88, from Mr. Parsons, Mossgiel Station, *re* public watering places, which, on perusal, will be found to compare favourably with my report, and with which I entirely agree, with the exception that caretaker's time can be fully occupied if works under his charge are kept in proper order; also, that no case of caretaker's selling grog has been heard of by or reported to me in district under my charge.

I have heard of one caretaker having been reported for such, but he was instantly discharged, and matter placed in hands of police.

I would beg to refer to Messrs. Lindsay, Till Till Station and Waugh, Clare, *re* prices for fencing and tank-sinking, Balranald district.

I have, &c.,

JOHN LOW,

Inspector, Public Watering Places.

The Chief Inspector, Public Watering Places, Sydney.

In addition, I would add that in the Albert district I had the following works performed as per rates and dates:—1881—3 October: Tank-sinking, 18 feet deep, at 1s. 1d. per cubic yard. 1882—2 December: Drains, 6 feet on top, 4 feet 6 inches in bottom, 1 foot deep, at 3s. per chain. 1883—10 January: Tank deepened from 7 feet 8 inches to 13 feet, at 1s. 3d. 3 May: Tank-sinking, 12 feet 2 inches deep, at 9d. per cubic yard. 7 August: Tank-sinking, 12 feet deep, at 10d. per cubic yard. 1886—26 August: Tank-sinking, 12 feet 6 inches deep, at 10d. per cubic yard. Drains, 6 x 1 foot, at 3s. per chain. And I have further to state that I have known, in 1875, of wells being sunk, timbered, guides fixed, and whim erected for £100 for labour alone, depth of well being from 90 to 95 feet.—JOHN LOW, Inspector, Public Watering Places, 1/2/88.

1097. *Chairman.*] What is your district? My district extends from Tom's Lake tank around to Ivanhoe; thence to Balranald; thence to Wilcannia; thence to Silverton; and thence to Lower Darling. I also take in Mount Brown and the Paroo.

1098. We will begin with the selection of improper sites for tanks;—you state in your report that the Clare tank was excavated in a swamp? Yes.

1099. Of course it was dry land when it was excavated? I cannot say that.

1100. What objection is there to a tank in a swamp? Because, if the swamp is rotten it will let the water run away before it gets near the tank; and in the second place, it is so boggy that stock cannot get near it.

1101. You also mention that being in a swamp the supply tank is liable to have all the foundations flooded? In this particular instance the supply tank was liable to have all its foundations destroyed.

1102. Would the person who chose such a site do so had he any means of knowing that it was a swamp? Well, common sense should have told him that it was.

1103. *Mr. Woore.*] What sort of a swamp is this;—has it a hard bottom? It was all covered with water, and I cannot say. I tried to get into it on horseback, and then made an attempt to get into it on foot, and could not. It was too boggy.

1104. Was it a black-soil swamp? Yes.

1105. *Chairman.*] You say that there is another site about half a mile away that would have been a better place for the Tom's Lake tank? Yes; and Tom's Lake tank was in a spot that any one could have seen was a bad place.

1106. *Mr. Woore.*] Is there a better place for this tank near the swamp where the tank is situated? Yes; there is a better site within 300 yards of it. It is good, hard, holding ground.

1107. But still it would be in the swamp? On the side of the swamp. Now no one who knows anything about tank-sinking would think of putting a tank in a swamp. The better site for the tank that I refer to is near the swamp—on the side of it.

1108. *Chairman.*] And that would have been firm ground? Good hard ground.

1109. *Mr. Woore.*] What sort of ground is it? Good strong clay, with plenty of clay-pans about.

1110. You said something about the water-lifting appliances at this Clare tank? Yes; they are now under water.

1111. *Chairman.*] You complain of the site of this tank for three reasons. The first is that it is boggy; next, that it is not such good holding ground as this hard clay-pan soil; and thirdly, that when the swamp is full all the works are under water, tending to damage the pumps, service tanks, and troughing? Yes.

1112. Could a tank have been filled on this site that you spoke of;—could the water have been conducted in just as readily as in the present tank? Yes.

1113. One question I would like to ask about the site of this tank;—did you ever hear that any wells had been sunk in that swamp before the tank was made, because you know numbers of these swamps are seldom filled? No; this is a district that I do not know much about. I have a hazy idea that Mr. Waugh, of Clare station, spoke to me about water being in it.

1114. There is no caretaker, of course, attached to this tank? Oh! yes, there is. There is a caretaker put there to protect the embankments and banks from being washed away.

1115. And yet the swamp is all under water? It is.

1116. And the fences all around, which were erected to protect the tank, are also under water? There is no fence around the water at all.

1117. I suppose the water came down and filled the tank before it was thoroughly completed. It is not usual, I suppose, to give up a tank until all the upper works are completed and fenced? I do not know whether it is usual or not. There is no fence around the tank; but then there is no fence even when there is no water; so that it is not the water that prevented the tank from being fenced.

1118. *Major Penrose.*] I suppose there are other tanks unfenced also? In reference to this particular tank, there is dry ground where the fencing should be put, but there is no fence there, although one has been in course of erection for twelve months.

1119. *Chairman.*] The next one is the Ivanhoe tank. You stated that it was not in a very bad position, for the reasons given in your letter? I do not object very much to the site, but I do not approve of it.

1120. What is your objection to Tom's Lake tank? The Tom's Lake tank is supposed to be very faulty, on account of the boggy nature of the soil. Everyone knew it, yet the tank was placed right on the swamp.

1121. *Major Penrose.*] When was it constructed? I have no idea; but it was some years ago.

1122. *Chairman.*] How long have you been in the Public Service? I entered the service on the 27th June, 1887.

1123. The last two or three years have been good seasons, have they not? Yes.

1124. What previous engineering training had you? I was a station manager for some time in the Albert district.

1125. What part of it? I was managing Gnalta and other stations. I went to Gnalta in 1879. In reference to Gunaramby tank, I objected also to it. It is on the Balranald to Ivanhoe road, and was sunk in a rotten copai swamp.

J. Low.
2 Feb., 1888.

1126. What is the meaning of copai? It is a term applied to bad-holding ground. It purifies the water, but makes it very unpleasant to drink.
1127. Then it is not only the nature of the swamp, but the nature of the soil, also, that makes the water bad? Well, it does not improve it.
1128. *Mr. Woore.*] And do you say that at Tom's Lake and at Gunnaramby better sites could have been selected? Most undoubtedly—especially in regard to Tom's Lake. There is a better situation three-quarters of a mile northerly from Mossgiel, alongside the road.
1129. Do you know any reason why these tanks were so placed? No; I cannot account for it.
1130. *Chairman.*] You have stated as your opinion that the designs in many of these cases were faulty, and the slopes too steep; are you aware why the slopes are made rather steep by the Department of Public Works? No; I am not.
1131. Do you not think it is desirable (where it can be done) to confine the water in the smallest possible space, and have the water deep rather than have it flowing over a considerable distance of shallow ground, exposing so much of the water to evaporation, which is very great in that dry climate? I do not think the Government tanks confine the water any better than private tanks after they have been once or twice filled.
1132. You mean by that that the steep banks give way and form their own natural level? Yes; they form their own natural level and silt up the tank. This applies to all tanks I have seen.
1133. Is there any soil in that country able to stand a steep slope? Not in my district—not to stand the $1\frac{1}{2}$ to 1 slope.
1134. *Major Penrose.*] How do you know it is a $1\frac{1}{2}$ to 1 slope? Any practical man can see that with his eye.
1135. But all the contracts are made out 1 in 2? I would be very much astonished if they were. I would not be positive that they are $1\frac{1}{2}$ to 1; but any man can tell if they are 1 in 2 or 1 in 3. 1 in 2 means a 2-foot slope to 1 foot in depth.
1136. *Chairman.*] You have already stated why you thought the slope was too steep. The other points are that the embankments have not been carried out in a proper manner, and have not been finished off and made level? None of them are level.
1137. And in one instance—the Rat-hole tank, near Silverton—you stated that water had come up within a short distance of the top of the embankment? Within 3 inches of the top of the embankment; but this happened in a tank and not in a dam. The lower embankment acts as a dam, and was so low that all the water came within 3 inches of the top during the last season, and the caretaker had to get drains cut to save the embankments.
1138. Now, here we come to another case of what you call faulty construction—the Walla Walla tank. You say it is altogether too large? Yes; it is situated in the Albury district. I consider it to be too large.
1139. Why do you say that? Because I inquired from everybody about, and found that was the general opinion in the district where it was placed. There is a heavy rainfall in that district, and a tank of that size is not required.
1140. *Mr. Woore.*] But is the rainfall a regular one? I cannot say whether it is regular or not, but it is heavy.
1141. *Chairman.*] Do you not think it is necessary for the Government, when making these large permanent tanks for the benefit and advantage of a future time, to go to considerably more expense than private individuals. A squatter has only a limited quantity of stock; but if there is a large stock traffic on the road, larger tanks than the squatters use are necessarily required? I do not think that the Government are justified in spending a large sum of money in such a place as that in which this Walla Walla tank is constructed, where, at the time of my inspection, there was natural water enough to last for two years.
1142. Where is this natural water? It is in a large basin or swamp, and there is enough there to last for at least two years—enough to water all the stock that may come for that period. It is not a big travelling-stock route, and only a few sheep come up and down there. I do not think that the Government have sold one shilling's worth of water from that tank except to the farmers about. No tank was required there for travelling stock, and it should not have been put down.
1143. What is the capacity of this tank? Its capacity was reported to me as being 12,000 yards.
1144. You mentioned here that, from your observation and from what you gathered, tanks are preferred to wells? Yes; in this particular district, and places such as on the Mossgiel and Balranald roads.
1145. Do you think that tanks are better than wells; and, if so, why? I say that they are better than wells in such a district as that between Booligal and Ivanhoe and Balranald and Ivanhoe.
1146. I am only speaking now of the two methods of supplying water? But you cannot compare them till you know the characters of the different waters. You cannot compare them unless you take into consideration the qualities of the water.
1147. Is it really the case that in that country there are no wells which are capable of giving good water? No; so true is it that the best men in the district, and those best acquainted with it, are abandoning wells and constructing tanks.
1148. But this knowledge had to be gained by experience? Yes; but the Government do not appear to be gaining in that way. The Dolmoreve well has only just been put down, and the new Willandra well was only undertaken within the last two months, in spite of the failure of the existing one.
1149. Then you think it is undesirable to expend further money on wells where wells have been found to be of no use? Certainly.
1150. Now, you mentioned in your notes something about the relative merits of tanks and dams? In one particular case—that of the Box Creek, on the Balranald Road.
1151. But do you really think that dams are better than tanks? That all depends upon the country where they are situated. If you can get a dam on a creek where there has been no ground cut up by a heavy rush of water, then the dams are just as good as tanks. In this particular case, a dam would have suited the requirements of the route without the excavation of a tank.
1152. Dams, of course, retain very much larger quantities of water than tanks, and at very much less expense, if suitable sites can be obtained, and if they were not liable to be silted up? Well, there is a way of

J. Low. of preventing the silt from getting into the dams as well as into the tanks. It is a very inexpensive way, too, and can be done by throwing logs across. If it is a flat creek, and not a fast running one, you can do that.

2 Feb., 1888.

1153. Now, with regard to the cost in the case of the Ivanhoe tank, a statement has been made of an excessive demand having been put forward, which you believe was obtained;—what was the nature of this claim? It was said to me by the man who made the claim, that Mr. Stilwell remarked to him, "You know too much, Casey, and we will have to pay your claim."

1154. But what was the nature of the claim? He did not say that, and I cannot tell you. I asked him whether he had got more than his contract price, and he said that he had.

1155. What was the contract price? It is reported to be from 1s 4d. to 1s. 5d. per cubic yard; but I cannot find that out.

1156. Are you aware that the price was 1s. 7d.? No; I am not.

1157. You have mentioned in the paper which you have handed in that many of these drains, instead of running the water towards the tank, tend to run the water from the tank? I do say that unhesitatingly.

1158. You think the levels were badly constructed? Some of them were not constructed at all.

1159. *Mr. Woore.*] You say that some of the drains at the Ivanhoe tank did not run into it? Yes; they ran in a direction from the tank.

1160. *Chairman.*] Then I think you said that in one instance as high as 15s. had been paid for these drains, when they were let to others as low as 4s. 6d.? Yes; a man named L. Farrel (who is now one of my caretakers) contracted for this work. At the same time he was excavating drains on Ticehurst station, which is within 10 miles of the tank. These drains were 9 feet 6 inches deep, and he was excavating them at 3s. 6d. per chain. One drain was as good as the other, because they are both the same after the first rain.

1161. *Mr. Woore.*] You say that at Tom's Lake tank some of the drains were running from the tank? Yes; the fall is away from the tank.

1162. *Chairman.*] How can that be when the whole work is in the swamp? The whole work is at the side of the swamp, and it ought never to have been put there at all.

1163. *Major Penrose.*] I think you said you thought that these drains had never been laid out on this route? The Ivanhoe drains, I should say, were never properly levelled. If so, the man who levelled them was a very poor hand at it.

1164. *Chairman.*] Then you say that the drains are too deep? No, they are not too deep; but a 6-inch drain would be just as good as a 12-inch drain after the first wet weather in that soil.

1165. *Major Penrose.*] What do you consider the maximum slope should be? My idea is to get drains nearly as level as you can. If you can get them on to a dead level it will be all the better.

1166. *Mr. Woore.*] The object being to avoid carrying in silt, I suppose? Yes; you cannot get them too level; that is my opinion about drains. About the prices, I would like to explain that Mr. Road Superintendent Hanna has got drains done at Broken Hill—equal in every respect to the drains at Ivanhoe tank—for 4s. 5d. per chain. They were done just as well as Mr. Stilwell's drains, which cost 15s.

[The Commission adjourned.]

FRIDAY, 3 FEBRUARY, 1888.

The Commission met at 10 a.m.

Present:—

HON. G. H. COX, M.L.C., CHAIRMAN.

MAJOR PENROSE, R.E.,

J. C. WOORE, Esq.

John Low called in and further examined:—

J. Low. 1167. *Chairman.*] In continuation of your evidence given yesterday we proceeded as far as the Purnamoota tank;—I think you said that was only 9 feet deep? I think it is 9 feet 10 inches deep. It may be more in places, but that is the average.

2 Feb., 1888.

1168. Was any reason given why the tank was sunk so shallow? None whatever.

1169. I presume it was full of water when you saw it first? Yes; full of water.

1170. And you had no idea whether it was full of water or not till the contractor had finished it? I have no information whatever on the subject.

1171. *Major Penrose.*] Do you know anything about Hovell's dam? I inspected it some time ago.

1172. Have you any fault to find with the construction of that dam? Yes; I have fault to find with the extravagant expenditure in the construction of the by-wash.

1173. This was cut through solid rock? Yes; through solid rock.

1174. You think that the natural by-wash on the other side of the dam would have sufficed? would have been quite sufficient. The course of the creek was very flat at that particular spot.

1175. You are not aware of the levels of what you propose as the natural by-wash (above the by-wash on the other side) which has been cut through the rock? I am not aware of the difference of the two—between the natural by-wash and the deeper one which has been cut; but I know that the natural by-wash is sufficiently low for the present embankment.

1176. You do not think that it would have been necessary to make the embankment much higher if the natural by-wash had been used? I do not think that it would have been necessary to raise the embankment to utilize the natural by-wash.

1177. You do not think that there would have been any danger to the embankment by using the natural by-wash? I do not.

1178. *Chairman.*] The object of the last question is this: that if the water is allowed to run around the end of the dam, must not the end of that dam be protected? It could be protected by putting timber all round, and this at very small expense. A couple of men would do all the logging that was wanted in three days.

1179. Have you not known instances where the water running over the by-wash gullies out into a creek;—must not the water flowing around the dam eventually find its way in again in some place, where it will form a new creek? I have known instances of that; but in this case it could have been avoided at very little expense.

1180.

J. Low.
 3 Feb., 1888.

1180. In what way? By logging it, as we do all station by-washes, where the ground is cutting up.
1181. Would logging such as you mention be sufficient to carry off the water in a large creek and prevent this? I consider that logging in this particular instance, owing to the flatness of the ground, would be equal to all requirements.
1182. Then you are of opinion that although the safe plan was to go through this rocky hill, the cost was not justified in this case? I cannot answer that question.
1183. Well, you know this is what the parties who are complaining about it say was the case? I may not have understood your question.
1184. What I mean is this—with the perfect safety of carrying the by-wash through the rock, would that perfect safety warrant the Department in making this by-wash when there was a chance of forming a new creek by using the natural outlet over the flat? Certainly not. The idea is a perfectly new one to me, although I have a great deal of experience in tank-sinking.
1185. But this is not tank-sinking; it is dam-making? [No answer.]
1186. *Major Penrose.*] You are not aware, perhaps, that engineers, as a rule, take the by-wash through the solid rock if they can? I have never seen a case like that in Australia.
1187. *Mr. Woore.*] What is the character of the ground on the course of the natural by-wash? It is all clay ground and unlikely to water-wash.
1188. What is the fall? It is very flat at this particular spot; it is a very slow running creek.
1189. Has no water flowed that way? No; I do not think the water has ever gone that way so far as I could see at the time. I do not think the water has ever gone through that by-wash.
1190. Has the rock that was cut out been used in making the dam? No; not to protect the sides.
1191. What was done with the rock that was taken out? It is lying about and has not been used. Of course there may be some of it on the inside of the embankment, and I should be very sorry if there was.
1192. Have you ever known a natural by-wash in good clay such as you describe to scour away? Yes; I have known such a case of its scouring away.
1193. And such by-washes have always a tendency to wash away. Is there not some danger attached to that? There is danger in many cases of the natural by-wash scouring away, but in this case there was plenty of timber about close to the dam, and there would have been no expense in protecting it.
1194. I do not think you understand me. No amount of timber placed around the dam would prevent the by-wash from scouring away? Why not log or corderoy the by-wash, as we have done on stations?
1195. But is there a very large volume of water flowing into Hovell's dam? No; I do not think there is ever any water that goes through that by-wash. I made inquiry, and no one could tell me that the water ever went through there.
1196. *Major Penrose.*] How far is the water backed up? A very short distance, indeed. I did not measure it, but I do not think it is more than 150 or 200 yards. I refer, of course, to the time I inspected it.
1197. But if it rose to the level of the by-wash how far do you think it would back up? A long way further than it was.
1198. Practically, this dam has never been filled? So far as I could discover—no.
1199. *Mr. Woore.*] You think this dam has never been filled, do you? I do not think any water has ever run through the by-wash.
1200. But you have had good seasons? Yes; but there has been no great rain to fill the dams, and not much has been caught in this one. I would like to say that I was informed when down there that the water had never run through that by-wash.
1201. *Chairman.*] Now we come to the next question, with regard to the machinery used by the Department in lifting water into the service tanks and then into the troughs. What is the usual form of machinery on all the larger tanks? Well, there are special steam Tangye pumps, with horse-works, and Amos & Smith's pump and horse-works.
1202. You also have M'Comas's? No; none that I have inspected.
1203. In your experience what kind of power have you found the best—steam or horse-power? Well, I should say horse-power.
1204. Now, I want to ask you this question, supposing in a long drought that feed fails, then would not the better mode of raising water be by steam pumps rather than by horse-power? No; horse-power would still be the best.
1205. But then if you use horse-power you will have to carry forage? I do not think it would be necessary to carry forage seeing that the paddocks of the caretakers are fenced; but even if steam pumps were used forage would still be required for the horse that was employed carting firewood.
1206. Does what you say apply to every district? It applies to every district where forage has to be carted a long distance.
1207. Are Tangye pumps put where there is no firewood? They are put in such places that we have to supply caretakers with firewood.
1208. What is the greatest distance that you have to carry timber? I think at Rathole Tank; the timber there has been destroyed for mining purposes.
1209. That is not a case in point. Are there any pumps put in places where there is no timber? No; there are no engines placed where timber cannot be got within a mile, except as before mentioned. As the results of my inspection, I do not think that there any engines put up where firewood cannot be got within a mile.
1210. Then have you any special reasons for objecting to these machines? Is it one of your reasons that they require more expensive caretakers, because the caretaker must be skilled in his work? Yes; my reasons are that these machines are too expensive. From the first erection they are too expensive in keeping in repair, and they require a more skilled attendant. These are my reasons for preferring horse-power, and my experience is that water can be lifted in a much less expensive manner.
1211. Now, one more question. Do you think that hand-power would be sufficient in most of these cases where ordinary whims and Tangye pumps are used? Not as regards whims at wells.
1212. Do you not think that in some districts where the traffic is not large that the work could be done by hand-power? On tanks, yes, I do, most undoubtedly; because I have done it myself with my own hands.
1213. This would not necessitate the erection of these expensive works, and would not require skilled men to keep them in repair? No.

J. Low.
3 Feb., 1888

1214. *Major Penrose.*] What is the usual lifting distance from the tanks into the service-tanks? Well, it would be from 12 to 18, or say an average of about 15 feet.
1215. How many gallons could a man raise in a fair day's work with hand-power? He could water 10,000 sheep by raising water by hand 15 feet—that is, sheep fed on saltbush plains.
1216. That would be something like 10,000 gallons per day? It would be more. A gallon of water is not sufficient for a sheep. I should say it would be from 12,000 to 14,000 gallons per day.
1217. *Mr. Woore.*] You are in favour generally of horse-power for lifting water at public watering places? I am in favour of horse-power where it is necessary, but on such public watering places where the water could be lifted by hand-power I am in favour of it, seeing that it is very much cheaper.
1218. Are you aware that there have been droughts in the Albert District, where 640 acres would not keep a horse in condition to do any work at all? I am not aware that 640 acres, if fenced and preserved in ordinarily good seasons, would not support a horse in any season. Certainly, I have seen 640 acres in the Albert District that would not keep a horse.
1219. I mean average country? No; I have never known such a thing in the Albert District. If the country has been used and not abused I should say that 640 acres would keep a horse in any season.
1220. *Chairman.*] Now in regard to fences, you have laid considerable stress in the report which you have handed over to the Commission on the quality of the fencing used. We would like to get some definite statement with regard to this. We want to know first whether the costly fencing provided by the specifications could have been done without, and then something regarding the very expensive manner in which it is alleged these fences and gates have been put up. Are you aware of any instance where expensive post and rail fences have been put round tanks? No, sir; I do not know of any instance where expensive post and rail fences have been put up. I know of no fences except the wire ones.
1221. You have not found any fencing round the tanks too elaborate or strong? No; not round the excavations.
1222. And you do not complain that the fences round these caretakers' paddocks are too costly in most instances? Yes, I do complain about them; and the style of gates that are put up.
1223. Just give us a specimen of the cost—the exclusive cost—according to the specifications? Well, I will take the Ivanhoe tank as a specimen one, with your permission; and I will also deal with the specification of Mount Manara.
1224. *Major Penrose.*] I would like before you go any further to read you the specification *re* special lease fencing—"The fencing to be erected on lines laid out by the road superintendent or other authorized officer; the posts to be 7 feet long x 9 inches x 3 inches, sunk 10 feet apart from centre to centre, and to a depth of 2 feet 6 inches; corner posts to be 12 inches in diameter securely strutted with 8-inch diameter struts notched into posts sunk 2 feet in the ground, and footed against a dwarf post 8 inches in diameter—sunk 2 feet 6 inches. Six wires to be run through each post and the top one No. 4 gauge, and the rest No. 6 gauge. To be spaced as shown in drawings, and each wire to be strained to the nearest post to the end of coil. No wires to be spliced."
1225. *Chairman.*] Do you think that that wire was unnecessarily strong? Yes, I do; I think it was unnecessarily strong and involved unnecessary delay in re-straining, because one man could not strain a No. 4 wire single handed.
1226. On a sheep run this heavy wire fence is unnecessary? I think this wire fence is necessary to keep stock out of the paddock.
1227. And these posts 9 x 3? Pine posts 9 x 3 I consider simply useless, and unheard of in station fences. You cannot split them.
1228. *Mr. Woore.*] Pine is not the proper timber for that, I suppose? It is the pine posts of that size that I take special objection to.
1229. *Chairman.*] I suppose it is difficult to get the proper timber? 9 x 3 post are simply slabs.
1230. And in some cases you have to go long distances to get the pine timber? Where I saw that 9 x 3 pine being split was on a proposed line of fence or within half-a-mile of it.
1231. *Major Penrose.*] Is it generally used? Yes, in this district.
1232. *Chairman.*] Are these specifications carried out in all instances 9 x 3? They are allowed to have round posts.
1233. So that these specifications must have been modified in some instances? I should be very sorry to have anything to do with them.
1234. This is the only fence you knew of that came up to the specification? Yes; this is the only one. When I inquired about the straining-posts I was astonished at the size, and asked the man for his specifications, and he showed them to me as 9 x 3. There is one objection that I have to 9 x 3 straining-posts, and I think I will be able to explain it to you. The timber being only 3 inches thick will not stand the wiring or plug being put in, as it opens the posts up. One wire is turned half-way round the post one way, and the other half the other way, the result being that the post is sometimes split.
1235. In how many instances were these pine posts used? There are pine posts in the Whitton district and at Mount Manara—tank pine posts and pine saplings; and at Mount Elliott, Hulong, and Pulletop there are all pine fences.
1236. Do you think it quite unnecessary to have these posts only 10 feet apart. Squatters, as a rule, do not put their posts 10 feet apart? Well, there is a great deal of difference in the style of squatters' fences. Alongside a main road a squatter likes a good fence if he can get the timber. Ten-foot panels are often used on a main road.
1237. But, except on main roads, people will not go to the expense of putting posts at every 10 feet? No; I think 12 feet is about the average.
1238. *Mr. Woore.*] I suppose travelling stock sometimes crowd around the fences attached to the caretaker's paddocks? Yes; and I think it necessary that there should be a good fence alongside a main road.
1239. *Chairman.*] Seeing the very expensive construction of these fences, would you be surprised to learn that the cost of erecting them has been from £116 to £120 per mile? I certainly would be surprised.
1240. Even with that very expensive style of fencing? Yes.
1241. What would you consider a fair value for such a fence—9 x 3 posts 10 feet apart? I consider that the Ivanhoe fence could have been very well erected at £82 9s. per mile, according to the specifications.

1242. *Mr. Woore.*] This has No. 4 and No. 6 wire? Yes.
1243. *Chairman.*] Was £82 9s. per mile the total cost of erection? Yes; the total cost of erection.
1244. Have you ever found fault with anything else, except these pine posts, as being excessive in cost? 3 Feb., 1888.
Yes; at Mount Manara tank.
1245. What timber could have been used at that tank in place of this? There is any amount of pine sapling there; but split pine posts could have been got there.
1246. As to other fences that you have seen, in what way do you consider them too expensive? I consider the Boonoono tank fence (which is constructed of pine and belar) a very expensive one.
1247. What size were these posts? I think they ran to an average of 9 x 3.
1248. And were they of belar? Yes, and pine. They might have been 8 by 4, which are as good as 9 x 3 posts; and, in fact, I consider 8 x 4 very much better posts.
1249. Are there any other fences made of other wood, such as mulga? Yes; but not in Mr. Stilwell's district.
1250. *Major Penrose.*] Have you any complaint to make against these fences as regards the straining of the wires? Yes; I complain strongly of the absence of straining-posts in the Ivanhoe tank (tenant's lease) fence. And, in support of my complaint, I may mention that the posts are already splitting, although the fence has not been long erected.
1251. You do not consider the provision of straining-posts at corners as enough? I do not—not for a mile.
1252. In these old specifications, straining-posts were to be at every twelfth panel? It is just as great a mistake to have a too short strain as a too long one. I do not think that the Boonoono fence should have cost more than £60 per mile.
1253. *Chairman.*] Now about these gates. We have had some complaints sent into us about these gates, and in your evidence yesterday you made the statement, that very expensive gates were put up in the caretaker's paddock, of which no possible use could be made, except to allow the caretaker's horse to go in and out; and yet they have cost a large sum of money? The contractors say that these gates have cost £15 each.
1254. What are they made of? Sawn timber.
1255. Morticed uprights? Yes, and iron hinges.
1256. And you have been told by the contractors that the gates have cost £15 each? Yes, sir.
1257. What ought gates that would do for the purpose cost,—what would you put up in a paddock for a boundary rider? In this particular case something more than a wicket gate is required. I believe gates should be 12 feet, as they are at present. Men may have to go in and take their drays into the tanks, and it would be a great pity to make the gates too small. I think that 6 feet double gates, costing about £3, would be quite equal to all the requirements.
1258. I presume the caretakers live in their paddocks? Yes; and all the cottages are erected there.
1259. Therefore, there is very little traffic? Yes, except occasionally; when men have to go in to make repairs. Of course, at Holy Box and other places they can go in and cart drinking water from the swamp.
1260. And a gate would necessarily be required at one of the Tangye steam pumps to allow firewood to be carted in? Yes, I think a gate is necessary for that and other purposes.
1261. Then that gate would require to be stronger, because it might have to bear the strain of these travelling stock? That would be a gateway from the paddock not liable to be interfered with by travelling stock.
1262. We now come to the question of interference by the officers of the Roads Department with the officers of the Mines Department. This very question that you mentioned yesterday about the bucket being lost will bring it up. You said the bucket was lost in the Dolmoreve well, and that it was there from the 20th June to 30th October? From the 22nd May. On the 20th June the roads mechanic went to repair it. The well was out of repair all that time, although the bucket had been taken out.
1263. Now, I want to know what charge these caretakers have over the wells, and whether they are responsible from beginning to end. A caretaker has charge we will say of a well and of the buckets and ropes;—now, if the rope breaks, whose duty is it to repair it? I consider that the caretaker's duties are to protect the works, and to do all the work in connection with them that one man can do unless skilled labour is required.
1264. You do not call that skilled labour—to attach a bucket to a rope? There is no one man who can go down a well and fetch a bucket up by himself.
1265. Would the traffic on these roads be so small that the caretaker could not get the assistance of a traveller to do this, necessitating sending for a man many miles to get the work done? I would not go down a well with any ordinary man that could be picked up, on top.
1266. So that you do not think that it was the duty of the caretaker to make this repair by himself without calling in the assistance of an officer of the Roads Department? I do not know whether he called him in or not; he certainly could not have done it himself.
1267. So that the public might have been inconvenienced all these months because a bucket had fallen down a well and there was no one to attach it to the rope? The bucket could not have been got up even if it had been attached to the rope. The bucket was smashed before it was brought up.
1268. This is a new phase of the matter? The bucket had to be repaired after it came up.
1269. *Mr. Woore.*] Was the bucket stuck in the well? Yes; and it could not be got up. You cannot pull up these buckets when they get stuck; you must drive them down with a weight.
1270. Now, would all that delay have occurred had one Department only control of the maintenance and necessary repairs of these works? It would appear that this long delay was incurred by the transferring of this particular repair from one Department to another. Had these repairs not been under the charge of the Works Department at the time I inspected I should have had the well in working order within a fortnight.
1271. Now give us the reasons for that long delay, so far as you know? The bucket was sent to Hay and there was no rope sent. It was taken away by the Works Department.
1272. What distance is Hay from this Dolmoreve well? I should say it was about a three days' drive in a trap.
1273. What then took place? The bucket was sent to Hay and there was no rope sent back with it. There was no bucket at the time of my inspection. It was sent back about the middle of September.

J. Low.
3 Feb., 1888

1274. And when the bucket came back a new rope was required? There was no suitable rope there; the rope had become rusted, and was unsafe for me to inspect the well with.
1275. This was a wire rope? Yes.
1276. Then to whom should a requisition be sent for a new rope—to the Works or the Mines Department? At the time of my inspection I heard that a new wire rope was on the way up. I telegraphed to Mr. Gilliat, protesting against the wire rope being sent because I would not go down a well to inspect it with that kind of rope.
1277. *Major Penrose.*] Was the water salty? Yes; salty and brackish.
1278. *Chairman.*] After your expostulation was a wire rope sent up? I believe so; but I have not been there since. In fact, an officer in the Works Department told me that it was a wire rope; but I have not since inspected the place, and cannot say of my own knowledge.
1279. To whom was the requisition sent for a new rope—who wrote for it? I do not know.
1280. But you had heard that a new rope was wired for, and you said it was unsuitable on account of the brackish water? Yes; and that I would not go down a well of that description to inspect it with a wire rope.
1281. The Mines Department, having taken charge of these works after being handed over, is it not within your authority to order such things as new ropes and buckets? That I do not know; because one department is continually running against the other. We cannot put a man on to repair a well without another man coming and running against him.
1282. You do not know who orders new material in the event of old material wearing out and breaking? I do not. I really wish that I did know, as it would simplify my duties very much.
1283. *Mr. Woore.*] What caused the bucket to stick in the well? It stuck in the well through the rope breaking.
1284. Was the bucket full when the rope broke? All I know is that the caretaker was drawing water at the time that it broke.
1285. Do you know how long that rope was in use? I believe it had been in use about twelve or eighteen months.
1286. How long does a rope of that kind last in good water? I have known one of them to last eight years in good water, on such a station as Burrabogie, on the Murrumbidgee River.
1287. These ropes are made of iron? Yes; they are galvanized iron or steel, I am not sure which. I do not know much about them, and I do not want to.
1288. *Chairman.*] They are the grandest ropes ever made? Not in that kind of water, with all respect to you, Mr. Cox.
1289. Now we have had it in evidence that sometimes these caretakers are very neglectful of their duty; that they allow the works under their charge to get out of repair and the embankments to be broken down, and that they are guilty of other pieces of neglect;—do you pay periodical visits to your various tanks and wells? My district is so large that there are some tanks in it that I have seen only once; some of them I have seen two or three times.
1290. Have you had occasion to find fault with any of your caretakers with regard to their apparent neglect of duty? Yes, I have; and I have tried to keep them up to the mark as well as I can.
1291. Have you ever known an instance of a caretaker living in an engine-shed and using the boiler to cook his meals? I have never heard of such a thing, and I have no hesitation in saying that no such thing has occurred in my district.
1292. Do you know any instance where caretakers have left their tanks and gone to a public-house and remained there for days drinking and leaving the tanks to the mercy of travellers? No, sir.
1293. What would you consider your duty in regard to a matter of that kind? I would suspend the caretaker and report the matter immediately to the chief inspector of public watering places.
1294. Now supposing a road superintendent, having visited one of these tanks, found anything going wrong, would it not be his duty to report it? To whom?
1295. Well, I presume he would find fault with the caretaker, and would you take it as his duty to report it to you or to his own Department? I would have no objection to any road superintendent inspecting the works under my charge. I would have no objection to his reporting any complaint to his own Department so long as I was made aware of it; that is to say, so long as the same report that was sent to his Department was also sent to me.
1296. In fact you would deem it to be his duty as a good public officer to make a report on any work that he saw was going to the bad? I think so; I would have no objection to it.
1297. In fact anyone else ought to have done the same? Yes, any Government official.
1298. Are you aware that any friction has been caused by these road superintendents making complaints after the works have been handed over to the Mines Department? I know this, that at the Boonoonoon and Mount Manara tanks, before they were filled, I asked the caretaker why he did not clean them out, as I considered that it was a part of his duties. The caretaker then informed me that Mr. Road Superintendent Stilwell told him to leave the work alone, and that he would see about having the tanks cleaned out. I also know that I ordered the caretaker at Mossgiel to tar some rails and slip-panels which were very veiny and were cracking. The caretaker complained to me that Mr. Stilwell told him not to interfere with them.
1299. *Major Penrose.*] Were all these works handed over? I do not know. If I saw the timber going to ruin with cracking and veins running through it, I would have it tarred, no matter in whose Department the work was.
1300. Are these tanks not in your district? They are.
1301. Then these very tanks that you speak of were handed over to you? Oh! yes; they were handed over.
1302. *Mr. Woore.*] And they were under your control at the time? Yes; and in the charge of a Mines caretaker.
1303. *Chairman.*] It was not a part of Mr. Stilwell's duty, then, as a road superintendent, to interfere with you and the caretaker? I consider it was no part of his duty to interfere with servants under me and officials of the Mines Department.
1304. Was any reason given why the caretaker should not clean out these tanks? The caretaker reported to me that Mr. Stilwell said it was too much for one man to do. Mr. Stilwell said to him to leave the work alone and he would get it done for him.

J. Low.
3 Feb., 1888.

1305. *Mr. Woore.*] Was that work too much for one man to do, in your opinion? No, not if the works had been kept in proper order. But if you allow silt to accumulate, certainly there would be too much for one man to do—to clean out a silt tank with a barrow and attend to other duties.
1306. Is that particular caretaker a good man? Not a better man in the Department.
1307. *Chairman.*] Then you feel sure that he did not tell this story to cover his own lapses? I am quite sure that he would not be guilty of such a thing. I have known this man for many years, and I do not think there is a better man in the Department; but if I thought he would be guilty of such a thing I would have recommended his suspension in a minute.
1308. *Major Penrose.*] You have a very large district? Yes.
1309. So that you would not be able to visit one tank at a less interval than one year? Oh! yes; I can inspect some works every four months.
1310. But suppose anything happened just after your inspection, who would attend to that? The Local inspector of stock is overseer of public watering places.
1311. So that the tanks are constantly being inspected by officers of the Mines Department? Yes; there is one thing I should like to add here. I should like to say that on all occasions where employees of the Works Department have been employed at these works I have given instructions to the Mines caretakers to render them every assistance, and I have entered that fact in the journals.
1312. *Chairman.*] Have you had occasion to suspend any caretakers in your district for gross neglect of duty? Yes; I have had occasion to suspend caretakers.
1313. Will you tell us what has been the ultimate result. Have the men been dismissed or were they reinstated? Every one of them was dismissed.
1314. *Major Penrose.*] Do you think that, as a rule, the caretakers are good men, who are anxious to forward the public interest? I think so, taking them generally. Certainly every man at present under me is a good man.
1315. Do you think that they are all capable of attending to their duties? I think that in all cases they are quite capable of attending to their duties as caretakers.
1316. Except in regard to making repairs in the machinery and other apparatus? Except where skilled labour is required. I do not mean to say that these men can go and repair a shaft, but they are good men to the extent of their duties.
1317. Skilled labour is required in most cases to erect pumps and engines? Yes.
1318. *Chairman.*] I suppose it is very difficult to draw the line if the caretaker is compelled to look after the machinery under his charge, or whether he shall apply to a skilled mechanic to help him? Well, I do not think so.
1319. Well, I will put a case in point. It is in evidence that a caretaker had a plunger disconnected from the rod of the pump by the pin falling out. That man applied to the Works Department for a skilled mechanic to mend this thing, causing a journey of some 50 miles to put a thing together which was done in five minutes. Do you not think that it was part of the caretaker's duty to attend to this? If such a thing occurred under my supervision, I should have suspended the caretaker straight away.
1320. Well, that brings in the point that it is difficult to say where a caretaker's duties begin and end? Well, I consider that a caretaker ought to be able to put in a valve, to look after the engine, and in fact, to do everything else about it, except to repair a breakage. At the same time I consider that a skilled mechanic ought occasionally to visit these places, to see that the appliances are in proper working order. Although you may get men to look after things, and keep them right, the visit of a practical mechanic is also required, because there are many things which a practical man would see that would pass the eye of an ordinary man.
1321. Then should not the skilled mechanic belong to the same Department as the caretaker? Certainly he ought to belong to the same Department, or how could we put things right? If not we would have to apply to another Department.
1322. This causes not only considerable delay and inconvenience to the public, but loss of money and loss of time to the Government? Yes; loss of time and money, and inconvenience to the public.
1323. Now do you know of any contracts let at exorbitant prices by the Government, and afterwards sublet at lesser rates? I think I had better confine myself to information from the contractors. The Ivanhoe tank fencing, which I have already referred to as having been let at £116 per mile, was first sublet at £82 9s. per mile, and afterwards at £52 9s. per mile, exclusive of wire.
1324. Which wire you would put down as costing £30 per mile? Yes; and the great objection to this wire is that one man cannot strain a four-gauge wire fence, and in case of a break he cannot repair it.
1325. You have also mentioned the subletting of contracts taken for excavation? Yes; and I referred to the Twelve-mile tank, which Burton informed me he got at 1s. 9d., and sublet afterwards at 1s. 2d. to Ford, who told me the same.
1326. It is sufficient evidence for us to go on. Of course we cannot prove the fact unless we have the contractor here. Now, we will go into the matter of wells. You made various allusions with regard to the faulty construction of wells, and the excessive cost of machinery—an engine in one instance costing £750? Not in wells. This was in connection with the proposed works at Hovell's dam, and the cost was to be £705. The only well that I have any objection to the outlay for water-lifting appliances, is the Polygonum Hut well.
1327. Have you any fault to find with the construction of wells in your own district? None, except those which I have stated.
1328. What do you deem to be faulty in the construction of the Polygonum Hut well? No; I think I will withdraw that, and say that I have no fault to find with the construction of wells. The Polygonum well is only a small shaft, and is useless as a well.
1329. Are you aware that expensive head-works have been put up in some cases before water was ever found; or, when discovered, was found to be useless? Yes; I have.
1330. Will you state the cases that have come within your own knowledge? I know of the Willandra well. There all the watering appliances—troughs, service tank, whim, &c., were put up before the water was found. No supply of good water has been got there, and the well has since been abandoned and a new shaft commenced. That must be pretty fair evidence that there is no water there.
1331. And all these head-works were put up before it was known whether the well was any good or not? Yes; and it has since been proved to be useless.
1332. The trial-shaft did not get any water, then? It was a main shaft they put down.

- J. Low.
3 Feb., 1888.
1333. Is there any other instance but this Willandra well where the head-works were erected before water was obtained? [No answer.]
1334. *Major Penrose.*] Would not these works come in for a new well? Yes, if water is found; but every time you take a whim down and remove it, it takes three years off of it. I have had a few whims erected.
1335. *Chairman.*] And the erection of these head-works before the water was found, was a very unnecessary outlay? Yes; unnecessary and unusual. It is a thing that a squatter would never have done in the back country.
1336. No squatter would be guilty of such extravagance? No.
1337. Are you aware of the excessive cost in the construction of wells? No; I have no knowledge of what is paid for sinking. I go by what I had the work done for myself, but I have no knowledge of the price the Government have paid.
1338. *Major Penrose.*] Have you any wells in your district that require constant baling, in order to improve the quality of the water? No; constant baling in my experience does not improve the quality of the water.
1339. *Chairman.*] Is it a regular thing to keep the pumps going at these wells, whether the water is required or not? It is not in the regulations, but I always insisted upon its being done, at least once a fortnight.
1340. And very properly so, I should think. Regarding the Polygonum Hut well, there is a windmill used for raising the water, and this is said to be so ineffective that it cannot do more than keep the service tank full. In fact, in that country windmills appear to be very uncertain? I would not like to object to windmills as a method of lifting water, but I should object to them where there is only one man stationed, because if anything goes wrong, a man cannot put it right without assistance.
1341. That remark would apply to the horse gear and steam pumps? Yes.
1342. *Mr. Woore.*] What height does this windmill lift? About 100 feet, I think. I could have erected a simple whip for £5 which would have drawn more water than this windmill.
1343. *Major Penrose.*] I believe this is the only windmill attached to public watering places? Yes; and it is to be hoped it will be the last one.
1344. *Chairman.*] Do you know anything about the hutting of caretakers? Yes; five huts were erected at Silverton since I was appointed.
1345. Just state what you know about these? They were 25 x 12 x 10. I am speaking now from memory; they are two-roomed huts.
1346. Are they all constructed of the same material? Yes; corrugated iron sides and roof; that is the usual way in my district.
1347. No covering on the outside to keep out the heat of the sun? No.
1348. *Mr. Woore.*] No refrigerating composition on them? No.
1349. *Chairman.*] What has been the cost of these? £50 per hut.
1350. Were they put up by the Works Department, or by the Mines? They were put up by the Mines Department.
1351. Were they floored? Yes, with T. & G. sawn timber.
1352. Are there chimneys? Yes, iron chimneys lined with brick, and ledge doors. They contain two glass windows and three doors, which is the usual style in that locality.
1353. Have you heard of huts being built at a cost very much exceeding that? In the Public Service?
1354. Yes? No; I cannot give any information about that.
1355. Have you ever had any reason to find fault with the troughing at the tanks and wells, or with the way in which it was put up and protected from the inroads of stock? Yes; I have a good deal of fault to find.
1356. Just state what your complaints are with regard to that? Well, in the first place I object to the fencing and troughing, with two rails on one side and one on the other. One side is for cattle, and both sides for sheep. Had a single rail been bolted on the inside upright instead of being laid on to the top, it would be much better for both stock.
1357. Why? Because by moving the rail from the top to the inside, it would give the stock better access to the water. I believe that a single rail is infinitely preferable; but I consider that if a rail is necessary at all to protect the troughing there should be only one rail up the centre. I think steel troughing is the best.
1358. How does this steel troughing work? Well; I saw the salt on it at the Holy Box well, and it has only been down for a couple of months.
1359. *Mr. Woore.*] Do you think that where the troughing is sufficiently substantial a rail might be dispensed with altogether? Yes; providing the troughing is sufficiently substantial.
1360. *Major Penrose.*] Is not your troughing set in concrete? Yes; in certain cases they are set on blocks about 14 inches square.
1361. *Mr. Woore.*] Is it your opinion that these rails frighten the cattle away from water? Yes.
1362. *Major Penrose.*] You do not approve of a rail down the centre? I have no serious objection to it, but if I were a drover I would sooner have it away altogether. I think that old cows are more easily frightened than any other stock.
1363. These troughs being only in 9-foot lengths would it not be dangerous to allow a mob of thirsty cattle to get at them without the protection of a fence? When the troughs are full I think they will be found too heavy for the cattle to displace them.
1364. *Chairman.*] I suppose you think the steel troughs are better? Yes, I think they will be a great improvement.
1365. But there has not been time to say how the brackish water would affect the steel troughing? No.
1366. *Major Penrose.*] How is this troughing preserved? I am tarring it.
1367. *Chairman.*] Are you aware whether there is much friction between the two Departments? I have no departmental knowledge whatever. I have never heard anything more about it than what I heard before I was a Government official. I then heard more about the matter than I have since.
1368. Now is there anything that you would like to add that we have not questioned you on? There is one matter—the prices given for tank sinking. I quoted one price as 1s. 3d., paid in January, 1883, in the Albert district by me. I would like to add that the rate of 1s. 3d. paid by me for tank sinking was paid for deepening a tank that had been sunk to a depth of 7 or 8 feet. 1369.

1369. *Major Penrose.*] What is your opinion as to the relative merits of watering stock from troughs and allowing them to go into the tanks? There can be no two opinions about that.
1370. You are in favour of watering the stock from the troughs? Yes.
1371. Do you think it likely that any large quantity of stock would die through their being frightened away from the troughs? I have had a large experience in taking stock to troughs. I have taken stock to troughs that could never possibly have seen troughs before, and I have never lost a sheep by their not drinking at the troughs, if the troughs were kept full and the appliances right.
1372. *Mr. Woore.*] It has been said that these rails placed along the troughing to protect it are too high for cattle to drink over? Yes; for the reasons I have explained.
1373. Are these rails placed too high in the first instance? Yes.
1374. Was it not due to the ground being worn away by the cattle watering? No; the rails were too high in the first instance. In some places the ground has had the effect of enlarging the difficulty; but in the first instance the rails were placed too high and not in the proper style.
1375. And where the ground is worked away by cattle, is it not the caretaker's duty to make it up? Yes; and it has been done by them, and made up to the original level.
1376. So that you think this is faulty construction? Yes.
1377. Have you ever known cattle to be unable to water in consequence of this faulty construction? Yes; I have had drovers complain to me about it; that cattle would not water owing to the rails being too high; and I have always instructed the caretakers to knock off the rail rather than allow the stock to perish for want of water.
1378. Then these rails are not always kept in their original position? I only had them taken down to allow the stock to water. They had to be shifted only in a few instances.
- [The Commission adjourned until the afternoon, when the sitting was resumed.]

J. Low.
3 Feb., 1888.

Percy Rollo Brett called in an examined:—

1379. *Chairman.*] What position do you hold under the Department? I am an inspector of stock and overseer of public watering places for the district of Urana.
1380. How long have you been a public officer? Since 1882.
1381. In the same district? Yes; in the same district.
1382. You consequently have observed a good deal that has been going on with regard to tanks and wells during that time? Yes; I have had a very large experience in the construction of tanks and wells as a contractor previous to my joining the Department.
1383. Now, this is a matter about which we are particularly anxious to examine you—whether you, as a contractor, know anything about the way these tenders have been called for and contracts have been carried out between individuals and the Government? I have not been a contractor for the Government and I do not know how they manage their business. I have been a contractor for work belonging to private individuals and on stations, but I have never in any way been concerned in Government contracts.
1384. I presume you know something about the specifications for Government work? Yes; I believe they are something similar to the specifications governing station work.
1385. Now, is there any distinct difference between the specification of contracts called for by squatters and the specifications of contracts called for by the Government? I do not think there is much difference. A squatter requires his work to be done equally as well as the Government. The only thing is that contractors ask more money from Government on account of the system of deferred payments.
1386. Then are you aware that the Government, as a rule, have to pay higher prices for the construction of tanks and wells than private individuals? I am really not aware of it, but I have frequently heard contractors say that they have done remarkably well out of Government contracts.
1387. Is it a matter of general notoriety? Yes; that the Government have to pay a great deal more than private individuals.
1388. Now we shall be glad to hear of any reasons why this should be the case. Of course every one is aware that Government money is good money, and there is no danger of a man not being paid if he does his work? The reason I have heard is this—the contractors say that the Government is fair game to work on. In working for a squatter if you want a cheque for £30 or £40 you can get it, so long as a certain amount of the work has been done.
1389. Are you aware that in the specifications for these Government contracts, it is provided that contractors may receive 50 per cent. of their money as the work goes on? I am not positively aware of it; I believe it is the case; but even then there is a great deal of delay.
1390. Are you aware of any combinations among contractors to obtain high prices from the Government—is there not an arrangement amongst them to send in tenders considerably in excess of what other people would give for the work? No; I have never heard of that.
1391. You have no knowledge of any conspiracy of that kind? I have no knowledge of any conspiracy at all.
1392. You have said just now that you believed the specifications for work to be performed for the squatter and on behalf of the Government are pretty much the same? Yes; I think they are very much the same.
1393. Are the specifications with regard to the batter different in the Government tanks to the specifications with regard to batter used by private individuals? That would depend greatly as regards the district.
1394. Are you aware that the Government, as a rule, make very steep batters? Yes; rather too steep.
1395. Would that tend to increase the cost? Not at all. It would not matter in regard to the cost, and should not increase it in the least. If I were a contractor, it would not cause me to ask a higher rate. If a tank is sunk and the whole four batters are steep, say, $2\frac{1}{2}$ to 1, then it would be a different affair.
1396. The reason being that on a very steep batter it would not be possible to get up the incline with ploughs and scoops? Some of our tanks were made steep on both sides, but that would not increase the cost.
1397. If you have to deposit the soil equally round the tank, would not that make a difference? Very little difference—no more than a mere fraction. Some of the tanks that I have sunk for Mr. Samuel M'Caughey, of Coonong, had the soil which was excavated placed all round the embankments, so as to increase the depth of water that might be filled in by baling machines or by pumping.

P. R. Brett.
3 Feb., 1888.

P. R. Brett
3 Feb., 1888.

1398. Do you say that if two sides had a considerable batter it would not matter very much about the other two sides; but if you had to place the soil equally all round the tank, would not that make a difference? Yes; because you could not get out anywhere round the tank. But it could make no difference so long as we were allowed to place the stuff wherever we liked. Of course, if we had placed the soil equally all round these embankments, it would increase the cost because we would have only two ways of coming out.

1399. Are you aware that in some instances Government tanks are somewhat deeper than private tanks? I believe they are.

1400. How deep are private tanks? From 10 to 16 feet.

1401. And Government tanks go down to 18 feet? I believe they do.

1402. And do you not think that this would increase the cost of Government tanks as compared with private tanks? Yes; I suppose it would very slightly; but I do not think it would make very much difference under the old system of carting. A large tank would cost less in proportion than a small one; because in a large tank you would have a large face to work upon. But working by the scoop under the present system would make a difference; for the deeper you go the more pulling you have.

1403. Are you aware that the Government are in the habit of insisting on the soil being taken a further distance away from the excavation than the squatters are in the habit of asking shall be done? I am aware of that.

1404. What distance have you taken the soil out? About 25 feet from the toe of the batter. This was in a tank where we intended the water should be pumped in afterwards, raising it above the surface. These tanks were on the edge of swamps, but not in the swamps. We never made a tank in a swamp.

1405. Do you think it would tend to increase the cost of these tanks if the soil had to be taken, say 30 feet from the excavation, instead of having it only 10 feet away? Would it not increase the cost of the work if the toe of the embankment were 30 instead of 10 feet from the edge of the excavation? It would make a difference; but we never thought of leaving the stuff 10 feet away, because the sheep would bring it in. It would make a certain difference, but I think a very limited one. In contracting for a tank I would not think it anything important if the stuff had to be shifted, say 30 feet; and if the squatter or Government insisted on having it taken 5 feet further, it would not make any difference to me. But, of course, I would try and get a little more for it.

1406. Is it a fact that the squatters insist on having the stuff taken 25 feet away? No; it is not usual. Mr. M'Caughey is the only man who has made tanks in that way. A few others may have done the same thing, but not many.

1407. Is it usual for the squatters to insist on the embankments being made all round the tank at an equal level? No, but they like them fairly even. The embankments are levelled with the pick and shovel afterwards. They would not be dressed down only so far as they could be dressed with scoops.

1408. If they were dressed down afterwards it would cost more money? Yes, a little more.

1409. Are you aware that the batter, too, in Government contracts is required to be dressed down to a nicety? Yes.

1410. More so than the batters of the squatters' tanks? I don't know but that some of the squatters want it done, too, because if you only leave a little mound here and there they will think you are getting at them.

1411. Are you aware that the Government insist upon the bottom of their tanks being perfectly level? Yes, and in private we would have to do that, too.

1412. Do the squatters insist on that being done? Yes; they want their tanks as level as you can make them.

1413. But do the squatters insist upon the same absolute evenness of the bottom of the tanks as the Government insist upon? Some squatters would insist upon it; they want their work done just as well as the Government get their's done.

1414. Well, now having gone so far, have you any other valid reason why the Government should pay so much more than the squatters? I cannot account for it.

1415. But you know it is the case? Yes; men have told me that they got good jobs from the Government. In fact, I know one man who took the excavation of 20,000 yards for 7d. per yard, and under a man who knew what the work was, and would insist upon its being done properly. Had the Government wanted the same work done the probability is that they would have had to pay 1s. per cubic yard.

1416. *Major Penrose.*] Is it usual for squatters to have the tops of their embankments dished? No; they would rather have the tops convex. You will never see the embankments on squatters' tanks widen out as the Government tanks do.

1417. Would dishing the embankments increase the cost of formation? I do not think so. Of course, the formation of drains would increase the cost, but I think it would be a great mistake to have water lying on the top. The water would soon percolate through.

1418. Not if properly drained? Oh! no; but I have never seen anything like that.

1419. *Chairman.*] The contractor, when he wants money to pay his men, can go to the squatter and obtain it—can he not? Yes; he gets the money so long as he has a certain portion of the work completed. The squatter is not bound to pay any percentage, although I have, in fact, seen some of the contractors overdrawn. In some cases these men have a right to buy rations at the station, but there is generally a township close by where they can be supplied.

1420. Then men who contract for Government work must be men of means? Yes; or they would not be able to go fairly into it. Large contracts like these necessitate a large plant. I am not in a position to say what percentage the contractor gets from the Government.

1421. The contractor receives 50 per cent. from the Government. When the work is finally completed the squatter goes to the contractor, measures the work, and pays him off,—does he not? Yes; the squatter either goes himself or gets somebody to measure the tank for him. The contractor is paid off, and leaves for another part of the country.

1422. Do the Government do the same thing? I do not think so.

1423. Are you aware that the Government send out inspectors? I know that I have had to take over some of the works.

1424. And that the inspector has to report to the head office before the money is paid. Are you aware that sometimes months elapse before the contractor is paid off? I am not actually aware of it, but I believe that it is quite possible.

1425. That would tend to induce men to demand larger prices from the Government? Yes; and that is why the larger prices are asked—because there is so much red-tapeism.
1426. So that, knowing all these facts, you are quite prepared to believe that the Government has to pay for the same work much larger prices than the squatters? I do not know that they pay much larger prices, but I know that men being out of their money so long would expect a little more. It should not be very much, however.
1427. You stated that you knew of one instance where a man took a contract from a private individual at 7d. per yard, and that if he were doing the same work for the Government he would have asked 1s. ? Yes; but he might not have got it. I have taken out large quantities of earth in 1880 and 1881 at much less than 7d. per yard—at 6d.—and I must say that it paid remarkably well. I was working with patent scoops. I got 4d. per cubic yard from Mr. M'Caughey. He provided the scoops, and I supplied everything else, and was very well satisfied with the work. The only thing I had to buy from him was horse-feed—chaff, bran, and oats.
1428. Now, knowing this to have been done, you think it very extravagant for the Government to have paid 1s., 1s. 2d., and 1s. 9d. per yard, where they might have saved a considerable amount by using these patent scoops? I should say that it is very extravagant to pay these high rates when the work might have been done for so much less; in fact, I had no idea that they paid so much. Twenty-five years ago, when the work used to be done with wheelbarrows, it used to be performed for 2s. per cubic yard. This is the highest price I have ever known; and in this case the work was not tanks, but dams across a creek.
1429. Is there anything else that strikes you as being different in Government contracts and in the contracts of private individuals? I have seen great mistakes made in the ground selected for the sinking of tanks and wells. I have seen a tank sunk in sand, which no one but a lunatic would have gone on with. Before we sunk a tank at a place we always put down trial shafts—one at each corner. If, for instance, any one of these shafts struck a little sand, we would send another down to see whether the bed of sand was a large or a small one. I have seen other tank-sinkers do the same thing, and if the trial shafts put down were not satisfactory, we generally shifted somewhere else. In most cases, if sand was struck the place was abandoned at once.
1430. Are you aware what policy the Government pursued in carrying out these works, in the event of trial shafts not having proved satisfactory? I know of one case—that of the Lowesdale tank; but I do not know that a trial shaft was sunk there. I know this tank was sunk several feet into the sand. I saw it fill once, and in three days afterwards it was nearly empty. It now retains water, because it has had clay carted into it. A great deal of silt became deposited over it, and the traffic of stock has now made it hold.
1431. Have you ever had any contracts for fencing? Yes, for wire fencing; but never where I had to supply the wire. I only supplied the posts, and erected the fences. The station supplied the wire.
1432. What was the highest price you received from the Government? I never had a contract from the Government.
1433. What was the highest price, then, you got for the fences that you put up for private individuals? About twenty years ago I fenced a run of 80 miles, and I got £26 per mile for it.
1434. Did the proprietor of the run find the wire? Yes; I sublet almost the whole of the work—the putting in of the posts and the wiring—and made a very fair profit out of it.
1435. Making allowance for the cost of the wire and the carriage up to the station, what would this fence have cost the squatter? I suppose that in those days the wire must have cost him from £22 to £23 per ton. I really would not like to answer that question. I am speaking now of twenty years ago, when wire cost much more than it does to-day. I suppose that the fence which I erected then might be valued at £60 per mile. It was a wire fence of 10 feet panels; the posts were 10 × 5; they were split posts, and were placed 20 inches in the ground. There was a straining post every twenty-fifth post—say, from 10 to 12 inches through, about 3 feet in the ground. These were stayed with two stays; but these were only left there while the fence was being put up.
1436. What kind of timber was in the fence? Murray pine.
1437. Have you heard of a similar fence to that which you put up having been erected by the Government at £120 per mile? I would say that it was ridiculous and absurd. It was madness to pay such a price, unless the timber had to be carted a great distance. In regard to the fence that I spoke of, a couple of miles would be the furthest that we would have to cart timber. We might occasionally have to go further for straining posts, but we went through the country, and got the timber as near as possible to the line of fence. As a practical tank-sinker, I would never think of sinking a tank in a swamp, because before the tank can be filled the swamp would have to be flooded, which would take a long time and a great rainfall. I would prefer to sink a tank on the edge of swamps, where the ground is hard. In all our Riverina country there is good hard land on the edge of the swamps. Put a tank on the edge, and run back a high-level drain to intercept the water as it comes into the swamp, and then the tank would fill before the water went into the swamp. If the water fell into the swamp first it would be swallowed up by the cracks that occur in the soil. Mr. M'Caughey never put a tank in a swamp.
1438. So that you think that a tank put in a swamp would be a very great mistake indeed? Yes; and we found that out very quickly in Riverina, where it is very hard to fill the tanks except in wet winters.
1439. *Major Penrose.*] Do you know of any Government tanks that have been made in swamps? I know two cases of that kind. I know them simply by seeing them as I drive by. Some of our swamps extend for miles, and contain from 100 to 3,000 or 4,000 acres of land.
1440. *Chairman.*] Have you had any experience in dam-making besides this one many years ago? I have dammed creeks since.
1441. Have you ever sunk any wells? Yes, I have; but never by contract. I have sunk wells for myself, and I have let the sinking of others.
1442. What was the usual price for sinking wells, say 100 feet? What we had to do there was this—we let the work at so much for the first 100 feet, or until water was struck. If we did not get water until 120 or 125 feet was reached, it meant an extra charge. Most of the wells that I had to do with were single shafts; this would be 3 × 3 or 4 × 4. The cost of this, again, would depend upon the carriage of timber. We very seldom used sawn timber, and I do not believe in it; because I have seen several accidents with it in the old days in Victoria. We got it dressed and split into about 10-inch slabs.

- P. R. Brett. 1443. What was the usual cost of sinking and timbering? A 4 x 4 shaft would be about 12s. per foot. For the sinking of a double shaft the cost would be 20s. to 25s.; but it would depend entirely upon the distance the timber was away.
- 3 Feb., 1888. 1444. *Mr. Woore.*] And the nature of the ground? No; that would not make much difference, unless we got into rock; but we never got any rock there.
1445. *Chairman.*] Then, in putting up what they call head works—whim, and so forth—how much would they cost? You ought to get a very good whim for £50.
1446. That would be about 10s. per foot? Yes; you ought to get a remarkably good one for that.
1447. Then the total cost would be 30s. per foot? Yes; and perhaps more if the timber were far away.
1448. Have you ever heard of a Government well, say 100 feet deep, costing £10 per foot;—if you did hear of it, I suppose you would wish to know where the money went to? I would be only sorry that I did not have the contract.
1449. *Mr. Woore.*] You know nothing about the subletting? No, nothing at all; except that I frequently sublet work myself.
1450. But you do not know anything about the subletting of Government contracts? No; nothing. There is one good well in my district, but I do not know what the cost of it has been.
1451. *Chairman.*] These matters are beyond you? Yes; I think that the troughing put up at the tanks should be an inexpensive work. The Government work with which I have to do is remarkably substantial; in fact, too much so.
1452. As a matter of fact, squatters make their tanks so that stock will water themselves? Yes.
1453. And in Government tanks the water must be supplied by pumps? Yes; even where the squatter has 5 or 6 feet above the surface, the sheep will go over the embankment, and are not fenced out anywhere. If the tanks were used for cattle they would not allow it.
1454. Then, again, you must be aware that there is another difference between the Government and private tanks;—private tanks are used merely for stock, and Government tanks are for human beings well as stock? And the private tanks are used by human beings, too.
1455. Have you had any experience in boring for water? No, except to the depth of 15 to 20 feet.
1456. You know nothing about going down hundreds of feet? No; I have seen many good springs struck by going down a few feet in the bottom of a well.
1457. How long have you been a Government officer? Since 1882.
1458. Are you aware that there is some little friction between the two Departments—the Mines and the Works? I have heard so.
1459. Have you ever found that there has been any ill-feeling between the two Departments? Not that I am aware of. In fact, I did not know that I was to be called until to-day. I happened to be in town, and Mr. Gilliat asked me to come up here.
1460. *Major Penrose.*] Do you know Hovell's dam? No. What district is it in?
1461. Albury? I know that there is a large tank at Jindera.
1462. Is it not a matter of importance in dam-making to get a thoroughly safe by-wash? It is. I knew a dam 32 feet to be carried away because there was not a proper by-wash. At one tank 28 miles from my place—Coreen or Daysdale—I was rather amused to see a by-wash cut out of the creek. If at any time there came a heavy winter, the whole of the embankment must have gone. I thought it a very ridiculous thing when I saw it.
1463. *Mr. Woore.*] Was that a Government tank? Yes; I was present when the tank was taken over by Mr. Gilliat.
1464. *Major Penrose.*] A by-wash cut through the solid rock would be the best? Yes, if you can get it; but as we cannot get solid rock we try to get it as far away from the head of the dam as possible.

[The Commission adjourned.]

THURSDAY, 9 FEBRUARY, 1888.

The Commission met at 10 a.m.

Present:—

HON. G. H. COX, M.L.C., CHAIRMAN.

MAJOR PENROSE, R.E., | J. C. WOORE, Esq.

Charles Alfred Chesney called in and examined:—

- C. A. Chesney. 1465. *Chairman.*] What is your occupation? I am a pastoralist.
- 9 Feb., 1888. 1466. Where do you reside? At Tindarey station, near Cobar.
1467. Are you at all aware of the objects of this inquiry? Yes; I have some idea of it. It is with reference to a so-called friction between two public Departments—the Works Department and the Department of Mines.
1468. Are you aware that certain allegations have been made by officers of the Mines Department in connection with works handed over to them by the Roads Branch of the Public Works Department? I know it merely by newspaper reports. I know nothing of my own knowledge.
1469. You have made some communication with reference to this subject to the Mines Department? No; not directly to the Mines Department. My communication came directly through the public press. I published some letters in the *Daily Telegraph* some short time ago.
1470. How far back does your experience with pastoral affairs in the interior of this Colony go? My experience goes back over eleven years.
1471. And what extent of country have you known personally during that time? I know all the country from the Yanko and Colombo Creeks up to the Darling.
1472. *Major Penrose.*] You are a civil engineer? Yes; I am a graduate of the Queen's University in Ireland, and also of the Melbourne University, in engineering.
1473. *Chairman.*] I will briefly read for you the points upon which we desire you to give evidence. We will first go into the matter of selection of sites for tanks. Have any of these tanks, constructed
by

by the Works Department, been, in your opinion, sunk or excavated upon bad sites; and, if so, where? I do not think there are any in the Cobar district. I think around the immediate district the sites have been fairly well chosen. No doubt in many cases better sites could have been obtained; but I do not think that it would have been desirable to put down tanks on these better sites, because they would not have watered the road so well.

C. A. Chesney.
9 Feb., 1888.

1474. Of course, the great object in view is to give every facility for the passage of travelling stock and for public convenience along these proclaimed stock routes? That is my idea; and if you put the tanks at the best places you would have to put them too close together, and that would not be desirable.

1475. In any other parts of the country have you had reason to find fault with the sites chosen? No; I have not given much attention to tanks elsewhere.

1476. *Major Penrose.*] Do you know the Peri Springs tank? No; I do not.

1477. *Chairman.*] Now we will go on to defective design and faulty construction of tanks: Are you aware of the form of specification for the construction of these tanks? Yes; I have seen some of them with contractors.

1478. Have you any reason to find fault with the manner of construction? Yes; I think the sides of the excavation are made too steep.

1479. Why do you think so? I think that a slope of $1\frac{1}{2}$ to 1 or above 2 to 1 is too steep, if you allow stock to drink out of the excavation; that is to say, if the sheep are at all weak.

1480. Would your objection to the slopes being too steep apply if the water was pumped into troughs? No, certainly not. The embankments as well (which in many cases are completely around the tanks) are made with very steep slopes to them, so that it would be a matter of impossibility for weak stock to get over them if the pumping gear were broken down. These embankments being four-sided ones, the stock could not get to the tank if the pumping machinery broke down.

1481. Now, do you think it at all desirable that stock should be allowed into the tanks to water? I certainly think so, especially in the back country; because, as a matter of fact, stock not accustomed to water at troughs will not water at them until they are thoroughly broken into it; and, of course, the mere fact of having to pump the water implies that you must have troughs for the water to be used in.

1482. Have you never found that a large quantity of water is wasted by the stock being allowed to go into the tanks, and that the quality of the water deteriorates thereby? I think that if the tanks were properly fixed there would not be the least waste. But to get out of the difficulty of this waste I should propose to put a set of iron hurdles across one side of the tank, to prevent the sheep from going into the water. I would allow them to water at one side of the excavation.

1483. You are aware that in very hot weather sheep will plunge into the tank, and swim about in it like dogs? Yes; and I have seen them do the very same thing in troughs, too, in hot weather.

1484. In coming out they would carry away with them a large quantity of water? Yes; but by putting the hurdles as I propose they would not be able to get into the water.

1485. Then, irrespective of that, are you not aware that stock, continually watering at public watering places in this way, keep slipping in and breaking in the ground? Yes; but I think that improves the ground, and makes it hold the water better. I think it is a great thing at these places that sheep should puddle a tank.

1486. But that would apply only to particular soils? Yes; I was going to make that remark. What I say now has particular reference to the Cobar district; but all through that back country tanks do not get silted up as they might in the Wilcannia district.

1487. Then you are aware also that the water in these tanks is required for human use as well as for the use of stock? Oh! yes.

1488. Then would it not be very objectionable to allow large mobs of cattle to water there, especially as you know that cattle drop their excrement wherever they may happen to water? I do not think so. I think that tanks, such as are constructed along these roads by Government, are not liable to pollution in the least. They are in no worse position than station tanks, the water of which is used for human consumption. I admit that cattle drop their excrement where they water; but, in these large tanks, I do not think it does the water any practical harm. A large mob of cattle would not, perhaps, water at one of these tanks at intervals of less than one or two months.

1489. Then you do not wish your remark to apply generally. You say that in some parts of the country it is desirable to have stock water in the tanks; but you do not wish that remark to apply to every part of the country? I say that in any part of the country, where the silting up of tanks is possible, it might be desirable that the stock there should be watered at troughs; because, out of two evils I would choose the lesser.

1490. The matter of pumping would not be an extra expense, because a caretaker would have to be stationed at these tanks? I do not think there is any necessity for caretakers.

1491. So that it would be a saving of expenditure to have tanks without caretakers to pump the water out? It would be a great saving.

1492. *Major Penrose.*] Would it not be necessary to have a caretaker to alter the position of this iron hurdling which you propose, as the water rose and fell? I do not think so. I should have travelling inspectors with a couple of assistants always on the road, who would have charge of and inspect the various tanks. I would make these men working overseers, with an assistant to help, and they would be kept travelling from one tank to another.

1493. But would it not be necessary to alter the position of these hurdles, and put them straight? Yes; but only necessary once in three months. It all depends upon the season.

1494. And you think that these hurdles would keep a mob of thirsty cattle from breaking through into the main tank? I am certain of that.

1495. *Mr. Woore.*] But in the event of hurdles being fixed at the lowest point where the water is low, would not a sudden rush of water coming into the tank cover them up? Yes; but it would be very easy to shift them.

1496. Yes; but there would be no one there, and the stock might get in over the hurdles? It would be very easy to have a series of floating logs that would rise and fall with the water, the same as they have with fences across creeks. A small boom could be made that would rise and fall as the water went up or down.

1497. You think that cattle would not get over that? No; not if a fence were put on top of it. This is merely the idea that I want to get at without going into details.

1498.

- C.A. Chesney. 1498. This would require that the fence should move laterally? Yes.
1499. *Chairman.*] Then you do not think that a batter of $1\frac{1}{2}$ to 1 is too much where the water is pumped? It is not so objectionable, except that it costs more in the making of the tank.
1500. Because ploughs and scoops cannot be used? You can use them, but you cannot get the stuff out. I never gave more in the back country than 1s. per cubic yard, although the Government have given a very much larger price.
1501. Is the cost of making the steep batter the only reason for the excessive prices paid by the Government? That is one great reason, but other reasons are given in my letter to the *Daily Telegraph*, which I will read to you.
1502. We must have everything verified on oath, but you are quite at liberty to read the article? This is what I said:—

Government Tanks—Their Management.

To the Editor of the *Daily Telegraph*,—
Sir,

“The Problem of the West” articles have had in me an earnest and appreciative reader; but I am sorry that the writer of these did not, during his trip, journey as far as Cobar, as, having only mentioned his mission, he would have been supplied with such facts as on publication would have opened the eyes of your readers to the grievous waste of public moneys, exclusive of the rabbit business, which is now, and has been for years, taking place throughout the length and breadth of this arid district. Recent events, more especially the action of Mr. John E. Kelly, M.P. for the Bogan Electorate, in making inquiries of the Government in the House, on 27th September last, about the public watering places of the Colony, have induced me to institute inquiries locally concerning these, so that I might be in a position to put facts—not theories—before your readers to enable them to judge whether my conclusions are correct or not. I propose also to show how the Watering Places Branch of the Department of Mines may be made, instead of being a serious financial drag on the country, to add considerably to the State coffers. According to an answer given in our Legislative Assembly to Mr. Kelly, M.P., by the Minister for Mines, it appears that the total expenditure during the past two years upon the public watering places for travelling stock was £70,259 5s. 9d. sterling. Well, to my mind, this way of stating the expenditure is very misleading, as I will show later on. It does not let the public understand whether this amount is for new works constructed during these two years or whether it is the total loss the Consolidated Revenue suffers from the way these public works are at present managed. If it represents the former, why not give the latter also, so that the public may have an insight into the amount spent on new works, and the loss on the working per year of existing works? If the £70,000 odd represents new works, then the total expenditure during the past two years has been understated by £70,000 or £80,000. This, of course, is taking into consideration a low rate of interest on the money invested, the caretakers’ wages, less their takings from stock watered, to say nothing of the cost of supervision, engineers, and travelling expenses of the various heads of Departments.

To many people who have not thoroughly considered the matter in its different bearings it might appear that these watering places are self-supporting; but when it is found that, during the year preceding the issuing of the Report of the Royal Commission on Water Conservation, only £400 was raised as revenue from the various watering places of the Colony—seven wells, four dams, ten springs, and thirty-five tanks—it is self-evident that both cost of construction and maintenance are wholly defrayed from the public revenue. But to details: In the first place, the Government tanks pass through the hands of two Departments. The Works Branch construct them, and when finished, they are taken charge of by the Mines Department; and while in both hands they are equally mismanaged. In the first place I shall deal with them while in charge of the Works. Presuming that the best and most convenient sites have been chosen for the tanks; that the plans have been properly prepared; that the trial shafts have been sunk to ascertain the nature of the strata; and that, in fact, everything has been made ready for commencing the work, and that tenders have been called for and accepted, the first thing that strikes me on reading the amount of the accepted tender, is the high, in fact exorbitant prices, ruling for this class of work, compared with what work of a similar nature can be done for by private individuals. My business since the discussion has taken place is to find out the reasons for the difference shown, and which I conclude are as follows:—

1. The Government contractor requires to employ so much hand labour after the main work has been finished—in pick-dressing the sides of the excavations and making the bottom level enough for a bowling-green or tennis-court, while the embankments require such unnecessary levelling, filling up, and grading—that the contractor calculates a large loss in this item, and consequently adds a considerable margin to his tender to cover it, although this extra labour is mostly done for show.
2. There are too many Superintendents of various grades to supervise the work. If a superior inspector desires to make himself officious or disagreeable to another who may be under him, he may not pass the work when completed through some trivial reason, though the superintending overseer may have been perfectly satisfied with the way the contract has been carried out. The result is that the contractor suffers. His camp in the meanwhile may have been broken up, his men and plant may have gone away, as these contractors, as a general rule, cannot allow their plant to remain idle for even a short time. The contractor has then, in a case of this sort, to complete the contract to the satisfaction of this superior officer, and consequently, in justice to himself, to allow a considerable factor of safety in the computation of his tender price to cover this risk.
3. After the work has been completed and passed as satisfactory by all concerned, through some red-tape arrangement, the contractor cannot get paid his due for six or perhaps twelve months. What is the result, unless he be a man of means? He cannot pay his labourers, his storekeeper, or his produce dealer. Thus the contractor (firstly) has to pay a higher rate for labour on the Government contracts than on private ones, as the workmen know they have to run the risk of not getting their money for a considerable time after having been earned; and (secondly) the contractor has to pay exorbitant prices for his stores and produce, because storekeepers as a general rule do not care about waiting too long for the payment of their accounts of this class without a corresponding advantage to themselves; and further, he has also to pay a high rate of interest on the renewed bills to these storekeepers, as it was expected that when the bills matured his contract money would have been in hand to meet them; and (thirdly) the contractor may be forced into the most undesirable position of having to shelter himself in the Insolvent Court, and having at the same time the satisfaction of knowing that, could he only get his due, he is a solvent member of the community; so we see that a further factor of safety is required to cover this risk.
4. The change of plan that so very frequently takes place during the progress of the work requires also consideration for the trouble and anxiety that the contractor has to endure.
5. The division of what ought to be naturally one contract into a number of smaller ones leads to higher rates. For example, the Department, instead of calling for tenders for everything required about any particular tank, divide the whole up into a number of smaller contracts, somewhat as follows:—
 1. Excavating main tank.
 2. Enclosing embankment with fence.
 3. Fencing in 200 acres round excavation.
 4. Erecting troughing and service tank.
 5. Erecting pump and engine or horse-works.
 6. Erecting caretakers’ cottages.
6. What one Inspector orders to-day another countermands to-morrow, and refuses to pass often after the work has been completed, alleging as a reason that the one who ordered such work exceeded his authority. A friend of mine, a Sydney gentleman, was in this predicament, and only obtained his contract money after a long delay and much trouble. What is a contractor to do under the circumstances? He has to do his work by order, and, after completion, is refused payment. He can’t fight the Government, or if he does he is sure to come off second best, although he may get a verdict—for instance, the late arbitration case of Messrs. O’Rourke & M’Sharry; but one thing certain is, that when he next tenders he allows a further margin for this risk.
7. The extraordinarily steep slopes that the Government insist on having on every side of their tank excavations, viz., $1\frac{1}{2}$ to 1, raises the price of work to a great degree. No horse could haul a load of earth up such a slope, and,

and, as the Government will not allow roadways, it stands to reason it must be a troublesome and expensive job to get the bottom clay out of a cutting 18 feet deep with such slopes. However, the Government contractor sees an easy way out of the difficulty, and his method is worth public notice. In sinking the tank he leaves a roadway with a slope of 5 or 6 to 1 on one side of the excavation, as he proceeds with his work. Up this slope a horse can haul the excavated earth. When he arrives at the contract depth he does not then knock off sinking, but continues several feet deeper, according to circumstances. Into this extra depth he puts all his road material, and levels the bottom up to contract depth, so that, as a matter of fact, in a number of Government tanks with these steep slopes there are several feet of loose earth left, which, as soon as the tank gets filled with water for the first time, turns into sludge.

C. A. Chesney.
9 Feb., 1888.

These are some of the reasons for the high prices ruling for Government work of all descriptions in the back country, as compared with that of a similar nature required in the same locality by private individuals. The latter want their tanks for use, not show, and so long as they know that a certain work being done for them is carried out in the true spirit of the contract they are satisfied, and the money is waiting the completion of the job. I have been told by several of the most successful Government contractors in the Bourke and Cobar districts, that they would much rather excavate earth-work for a squatter at 9d. per cubic yard than for the Government at 1s. 6d. Their principal reasons for this preference I have pointed out above, and the fact remains that earthwork can be done for pastoralists from 9d. to 1s. 2d. per cubic yard whilst the Government have to pay 1s. 6d. to 2s., the contractors making more money at the former price than at the latter. The works are equally good, and the embankments are as level after the first rains, for, although the Government dams and cuttings look better just at first, still this niceness at the outset is a snare and a delusion, as holes are filled up temporarily to pass the inspector, and after the first heavy rains this filling up either washes away or sinks, leaving the last state of the dam as bad as the first. I have actually seen a contractor carting earth that had been already taken out into the excavation again to fill up and level the bottom so that it might pass the inspection; and furthermore, it is reported, with good foundation too, I believe, that in one of the Government tanks on the Nyngan and Cobar road 1,000 or 2,000 cubic yards of earth were filled into the centre of the excavation when full of water to make a horse-walk so that the pump might be worked. To my mind all this shows the absurdity of the pick dressing and levelling. I do not see the reason of this absolute precision, as I fancy the great object in constructing a tank is that it may hold so many gallons of water, and be of a certain average depth, with provision being made to hold as much water as possible over the surface.

The first remedy I would suggest to obviate the difficulties enumerated would be to design the tanks so that they could be constructed by scoops or other machinery, and do away with the great amount of hard labour required to dress them up unnecessarily. So long as a proper hole is made, with slopes fairly near that mentioned in specification, the bottom of cutting fairly level, and the embankments of the proper height fairly and honestly made, I would be quite satisfied. This item would reduce the prime cost considerably.

The second remedy would be to place one competent man in charge of the various works of a district, and let him reside in the district. He, and he only, would be responsible to the local board or trust, either nominative or elective, or a combination of both systems, for the proper construction and maintenance of the work. If found to be untrustworthy or incompetent, let him be replaced by a more reliable man. It is all very well in theory to have flying visits to the various works of the Colony from Sydney inspectors every year or two; but I hold that a man to be properly in charge of works ought to have the right of determining whether a contract is being properly carried out or not. He must also have the authority to pass the work for payment when finished, and he must not be placed in the disagreeable and unsatisfactory position of having some superior official who may happen to be in the district on one of his flying visits condemn the works when everthing has been completed.

The third and most important remedy is, when the work has been passed let it be paid for at once.

1503. *Chairman.*] Then the practice of the Government necessitates the employment of large capital; so that whereas half a dozen men of small means might be prepared to go into these contracts, it is only men with large means that can go into them under the present system? Yes; the number of men who can contract is limited. They have the matter all in their own hands.

1504. So that if there are only two men tendering for the contract they can arrange between themselves to put up the price to a certain amount? Yes; and as a matter of fact they do do so. It has been done repeatedly, and I have frequently had letters from contractors, asking me to draw the attention of the Government to it; but these being vague reports I refused to act upon them. There is another matter, too, which I would like to mention—the practice of carrying out Government works without calling for tenders.

1505. Is that really done? It is; but, of course, I do not want to say anything about individuals. I go on the general principle that whoever does it, it is a wrong thing to do.

1506. What works can you specify as having been carried out without calling for tenders? Such things as sinking trial shafts over a certain area to discover the best place for tanks. There are many other works—repairs, &c., that have been carried out, and for which I hold that the Government should have called for tenders.

1507. *Major Penrose.*] Would it not lead to a great waste of time to call for tenders in small matters? I do not think so.

1508. Might not contracts for repairs of that nature be allowed under some system other than calling for tenders? In what way?

1509. By entering into a small contract for small repairs for two or three years? These works extend over hundreds of miles of country.

1510. But the calling for tenders for small repairs is absurd? [No answer.]

1511. *Chairman.*] In referring to the steep batter, you spoke of the increased cost of construction;—now, do you think that this extra cost of construction is made up for by the very much less exposed surface of water to the sun? I do not think so.

1512. You know that in this very hot and dry country a very large amount of evaporation takes place;—is it not, then, desirable to confine the water as far as possible to the smallest possible surface, to guard against evaporation? It would be desirable.

1513. And do you not think that the extra cost of making these steep batters is compensated for by the lessened amount of evaporation that takes place? No, I do not think so. In my own tanks, I make three sides 2 to 1 and the fourth side 5 to 1. This allows the contractor to get the stuff out, which cannot be done by other means. Another cause of expense is the extraordinarily nice work which the Government require in finishing.

1514. Now, what I want to ask you is—Do not these steep batters—by the fact that they offer less surface of water to evaporation—in this way compensate for the extra expense in making them? No; I do not think so.

1515. *Major Penrose.*] You do not consider a batter of 2 to 1 too steep to provide against the washing down of the banks by wind action? Oh! no.

1516. Because it has been said that the banks are too steep and get washed away by caving in? That has not happened in my experience. I could understand an embankment washing down, but not an excavation.

1517. *Chairman.*] You think there is no good reason for the Government having embankments all round their tanks? I do not think so at all.

- C. A. Chesney. 1518. Does it not tend to lessen the action of the wind on the surface of the water by having embankments all round the tanks? It no doubt does—a little.
- 9 Feb., 1888. 1519. And of course you are aware that wind is a much greater evaporator than the sun? Yes.
1520. *Major Penrose.*] Do you not think it a wise provision for the Government, in case they wish to store more water, to have these embankments all round? Yes; but in this place they could not possibly store more water by having a fourth side. A three-sided tank will hold as much water as a four-sided one; and in the Cobar district four embankments are quite unnecessary, because there is no water available to fill them if it is thought desirable to retain the water above the natural surface. We generally put our tanks on the edge of a siding, leaving the fourth side open towards the slope of the country.
1521. *Chairman.*] I gather from what you say, that you think one specification for tanks for all parts of the country is clearly wrong? Yes.
1522. Each part of the country should have its own specification, and a tank made accordingly? Yes; that is my idea. One specification will not answer all parts of the country.
1523. Now, in the laying out of drains to take the water to these tanks, have you had any reason to find fault? No; I have never found the levels to be defective. I never checked the levels at all.
1524. We have had it stated here that, with some of these drains, the water, instead of running into the tank, runs away from it? I do not know that. Was any particular tank mentioned?
1525. Yes, the Ivanhoe tank? I am not aware of it; but there is one thing that has come under my observation in connection with a tank between Nyngan and Cobar—I am not sure if it is 20 or 21 on the map shown; I fancy it is Muriel tank, because it is worked by horse-power. In this tank, after it was excavated, about 2,000 yards of stuff were returned into the water to form a horse-walk—that is to say, out of a 10,000-yard tank 2,000 yards were put in again; while, at the same time, this horse-walk might have been put at the side, and the pump out on clear ground.
1526. Is there anything further about drains? No; I have no complaint to make about the drains.
1527. With regard to expensive forms of machinery, I think you said that you did not want machinery at all? I say that, if it is necessary to have machinery, it should be of the simplest possible kind that can be obtained. A common chain lift—one of the M'Comas pattern—ought to be sufficient.
1528. What about steam machinery? I think it is a great mistake.
1529. I presume it is liable to get out of order? Yes; and besides, it requires a skilled man to work it.
1530. Now with regard to the horse machinery, what is your chief objection to it? I think that horse machinery works very well, but I object to any machinery. If you must have machinery, horse machinery is better than steam; still they are all too expensive, and liable to get out of order.
1531. Of course you are aware that we are subject to very long droughts in this country? Yes.
1532. Then, in that case the question would come up, which is the most economical—horse or steam machinery? I do not think, as a matter of fact, that a drought will ever effect these Government tanks in the back country. Many of them are practically unused, and there is nothing, except evaporation, to take away the water.
1533. *Major Penrose.*] You think that a hand-pump would in most cases be equal to the work demanded of it? I think so.
1534. How many gallons a day could a man lift with a M'Comas pump say 20 feet? I made a calculation some time ago, but I forget now. My idea is that every drover should be made to pump his own water. This is a part of my scheme.
1535. *Mr. Woore.*] He might not have hands enough? Every drover going with stock along the stock routes has sufficient hands.
1536. But the caretaker is always at the tank, and a man might come along with 20,000 sheep? A man with 20,000 sheep will always have plenty of hands.
1537. If drovers were obliged to lift their own water, a service tank would not be necessary? A service tank might not be necessary.
1538. And if every drover had to lift his own water there would be no use in having service tanks, because he would have to lift the water for the next one that came along? I object to these service tanks altogether. My idea is to do away with them, and also with the caretakers.
1539. *Chairman.*] Now, supposing that there are tanks—and you have admitted that there are such—in which it would be very undesirable for stock to water, in the event of there being no caretaker stationed there, would there not be a risk of the banks being injured? Yes, there would be a risk; but every station manager is open to the risk of having his sheep stolen. Any one breaking the regulations by breaking down fences could be followed up by the inspectors and duly punished. Of course, I am a thorough believer in local self-government in that respect; and my idea would be to have a Board of five or six members, residing along the different routes, who would keep their eyes on these works—the same as our Sheep Boards are managed now.
1540. And this would do away with a large staff of Government officials? Yes; both in Sydney and in the country.
1541. Our attention has been called to faulty construction and cost of fencing. This means the fencing off of the paddocks of caretakers from travelling stock; have you any reason to censure the Government for this? I certainly do. So far as I can make out, from what the contractors told me, the Government have given ridiculous prices for fencing, ranging from £140 to £240 per mile; while, at the same time, a fence which could be put up for £35 per mile was good enough for all purposes.
1542. Are you aware of this extreme price having been given? No, not of my own knowledge; but it is very easy to get accurate information. The contractors told me about it.
1543. What tanks do you refer to? All those on the road that I have mentioned. There is the Booroondarra tank, and the Nullamut tank, and several others. In fact, nearly all the tanks out there have been expensively fenced.
1544. Just describe the kind of fencing? It is a top-rail fence, with 5 wires—I think the wire is No. 4 gauge—the posts are 3 feet in the ground; whereas a fence made with No. 8 or 10 wires, without a top-rail, and the posts 22 inches in the ground, with strainers about 3 chains apart, would be quite sufficient, and would not cost more than £35 per mile.
1545. *Major Penrose.*] You are speaking now of the fence immediately round the tank? Yes; and round the caretaker's paddock.
1546. *Chairman.*] As well as the tanks? Yes; there are some tanks that might be less expensively fenced; but I am speaking particularly in regard to the fences round the caretaker's paddocks.

1547. Would not an extra strong fence be required around the tanks, to prevent cattle from bursting in that were very thirsty? I do not think so. Cattle that have been on the road for some time are not very wild. They are timid, but not wild. C. A. Chesney,
9 Feb., 1888.

1548. Are you quite sure that this top-rail fence is put round the caretaker's paddock as well as round the tank? Yes; and there is a large amount of money squandered on them. In several cases, also, the entrance to what I may call the watering lane is very badly designed.

1549. *Major Penrose.*] In what way? It is inconvenient. In one case that I know of, stock had to pass the tank about half or three quarters of a mile before they could get into the gate, and then had to come right back to the tank. It was badly designed and laid out in every way.

1550. *Chairman.*] Which particular tank do you refer to? I refer to the Matthews' Flat tank on the Louth road. It is called Cuttygullyaroo. There is another tank called Helman's tank on the Bourke road. The troughing of this tank is open to the public, and has not been closed at all. At the same time, the caretaker's paddock is closed with a costly style of fence.

1551. Have you observed that any needless expenditure has been incurred on the gates to these paddocks? Yes; there are many too expensive altogether. I do not know the price of them, but they are very good gates, and I think were brought from Sydney.

1552. You think that they are unnecessarily expensive? I do.

1553. Would it surprise you to learn that they cost £15 each? If they got them for that I should say they were very cheap. There is a lot of ironwork about them, and they must be very expensive gates.

1554. What do you think an ordinary gate could be put up for? For about 20s. or 30s.; and it would answer the purpose quite as well. The fence I must say is a good fence, but it is altogether too costly.

1555. And quite unnecessary round the caretakers' paddocks? Yes. Referring to this matter of fencing, the Government have surveyed round the tanks, and have given the caretakers 640 acres, and fenced it in for them. In fact, by making these places for them, they have turned the caretakers and lessees into small squatters.

1556. *Mr. Woore.*] When you say that these fences are too costly, do you mean that a larger amount has been paid for them than they are worth, or do you mean that the class of fencing is too good? Yes; for the class of work that is required of them, and too good for the purpose for which they are intended; and they cost more than they are worth as well.

1557. *Major Penrose.*] Of course, you have no actual knowledge of what they cost? No; I cannot say what they have cost, but I have no doubt in my mind at all.

1558. *Chairman.*] The next question is interference with caretakers and overseers;—have you found any interference between the two Departments? Not between the two Departments.

1559. Well, between the caretakers and the roads superintendents? Well, I will tell you the case that I refer to. Some time ago, after the Public Watering Places Act was passed, it was provided that any persons trespassing on stock tank reserves should be prosecuted. With a lot of other holders of property in the Cobar district, I got a notice from the local stock inspector, cautioning me, as a pastoralist, not to allow my stock to go on these reserves, although at the same time these very reserves were under lease to us. I wrote down to my agents in Sydney, and others did the same thing. The agent interviewed Mr. Gilliat, and that gentleman wrote up, snubbing the inspector for doing that which he had actually done under instructions from his own Department. I think there is something wrong about that.

1560. Now, have you found any friction or interference between the road superintendents and the caretakers? No, not of my knowledge; but it is well known throughout that part of the country that there is a large amount of friction. I will not specify an instance.

1561. *Major Penrose.*] Have you known any case where this friction has prejudiced the public interest? No; I cannot say of my own knowledge. Of course there are many reports going about, but I take no notice of them.

1562. *Chairman.*] Now, in the matter of subletting contracts, you said just now that had heard from contractors that they had obtained contracts at one price and then sublet them to others at a lower rate? I know that contracts have been sublet, but I would rather not mention names. It might look as if I were picking out some one specially; but I know as a matter of fact that what I state has taken place.

1563. Well, just state the facts without mentioning names? One of the tanks on the Wilcannia to Cobar road—I cannot remember the name of it just now—was sublet, and the original contractor did not carry out the work. I do not mention the name of the contractor, because it is a very difficult thing to prove that subletting has taken place, although in one's own mind he may be certain of it.

1564. Then, something like collusion goes on, does it? Yes; I know as a matter of fact that this was a sub-contract.

1565. And do you know the difference between the two prices? No. I cannot state the exact prices; but I know that the sub-contractor made a considerable amount of money out of the work.

1566. We have had extreme difficulty in getting information on this matter; hearsay evidence is not sufficient? To get out of the difficulty, I would suggest to the Commission to take a trip to Cobar, and you will get dozens of persons to give information. One of the men to whom I refer was down in Sydney last week, and I telegraphed to him; but he had left town before the message reached him.

1567. Can you name any person who is likely to be able to give us reliable information on the subletting of these contracts? I think that Mr. James Budd, contractor, of Cobar, can do so. I may mention that in some cases these contracts are taken by storekeepers and publicans, and are sublet to their men, in order to get the contract money into their own hands.

1568. You have stated that there is considerable difficulty in watering sheep at Government troughs? I can give my reasons for making this statement, because, as chairman of the local board for some years, drovers used to come to me regularly (I have three Government tanks on my run), offering me double the Government rates if I allowed the stock to water at my tanks, although there was a Government tank only 3 miles away from one of my tanks.

1569. *Major Penrose.*] Can you give us the reason for this? In every instance the reason was that the sheep would not water at the troughs. They would not face the tanks to water at the troughing.

1570. Do you think that this was due to the faulty construction of the troughing as at present laid down, or to the fact that the sheep, not being accustomed to the troughing, would not water there? I attribute it to both causes.

1571. *Mr. Woore.*] Can you suggest any way of constructing these troughs so that any sheep will water from

- C. A. Chesney. from them? Not that any sheep will water from them. What I meant was, that sheep not accustomed to water from troughs require a considerable time to be broken into the habit of watering at them.
- 9 Feb., 1888. 1572. One reason given to us is that the sheep will not water at the troughs because of the way in which they are constructed;—can you suggest any other way? Yes, another way can be suggested. In the first place, the rails are not properly put up. At one side, where the sheep have to drink, the rails are so low that large sheep cannot get to water. Thus, these sheep have to lean over the fences before drinking, but the trough is then too far away. What I propose to do is just what we do with the wells in Riverina, and is about the simplest arrangement that I know of. This is simply to have a rail up the centre of the troughs and a fence on top of it. You cannot have a simpler arrangement than this. The rail is sufficiently elevated to allow the sheep to get their heads in, and the fence to prevent them from going across. At present small cattle cannot reach over in one place, and cannot get in in another. I have seen places where the troughs were actually covered with sheep. This would have been obviated by having a single rail, as I stated in these papers. Those who constructed the troughing knew nothing of the requirements of stock.
1573. Now, we will go into the matter of wells? I do not know anything about them. There are no Government wells in our neighbourhood at all.
1574. Do you know anything about the hutting of caretakers? The Department are erecting huts at all the Government tanks in my district at the present time.
1575. Are these huts suitable residences? Yes; I do not object now to the huts so much. My objection was to the original plans, as first called for.
1576. You objected to them as being unnecessarily costly? Yes; but now, as the plan only provides for two-roomed houses, I do not think the cost is out of the way.
1577. The original plan was too costly? Yes; but at the same time I hold that as there is no necessity for caretakers at these tanks, so there can be no necessity to put up huts for them.
1578. *Major Penrose.*] Do you think that with improved troughs your objection to the troughing would be done away with? Not quite. There is always the same objection, as sheep not accustomed to water will not do so at these troughs.
1579. I presume you will allow this—that where there are wells it is necessary to have troughs? Yes.
1580. Then if there are a great number of wells in the country the travelling stock will have to become accustomed to drink at the troughs sooner or later? Yes; but they run the risk of dying before they will drink. Of course we cannot help it in that case, as there are no tanks. I believe tanks to be the proper means of watering the back country instead of watering it by wells—that is to say, where you can get a proper catchment area.
1581. *Chairman.*] You have heard occasionally that some artesian wells have been made and good water obtained? Yes.
1582. Do you not think that they would be preferable to tanks in certain parts of the country? Certainly; if you can get artesian water. This comes out especially in the country north of the Darling, and always comes over the surface. At Dunlop station it does not come over the surface, but within 10 feet of it. This was, I think, the first well put down in the Colony by boring.
1583. Then you have come to the conclusion that, apart from artesian wells, the system of watering by tanks is better than the system of watering by wells? Yes, if you can get a fair catchment area.
1584. Now, would that apply in all parts of the country, where the rainfall is very slight,—on the Barrier Ranges, for instance? I think that on the Barrier Ranges, if the tanks were properly made and a good catchment area secured, tanks will answer all purposes. The Barrier Ranges is a much drier country than that around Cobar.
1585. What is the average rainfall there? About 13 inches; but we sometimes have heavy thunderstorms, which will bring up the average. Last year we had 19 inches of rain, and there is plenty of water in the tanks, which always appear to go to the same level. It was a wonderfully steady rain. Of course the filling of the tank all depends upon how the rain falls.
1586. Now, where there is a clear catchment area, do you think that these tanks which you speak of would be fairly reliable in a long continued drought? Well, I was never short of water, although in one year I had only $7\frac{1}{2}$ inches, and in another $9\frac{1}{2}$ inches. Whenever I lost any stock it was for want of grass and not for want of water. Another thing about these tanks is this—they are made far too large in this country. I think a 10,000-yard tank, if properly made and a good catchment area selected, is sufficient for all purposes.
1587. To what depth do you usually sink your own tanks? About 15 feet. This is the average depth; but there are some over and some under.
1588. Are you aware that the Government sink their tanks 18 feet deep? I am.
1589. Do you not think that the sinking of the extra 3 feet makes a great difference in the cost? No; because if you calculate the extra amount of excavation required to take out these 3 feet it will be found to be very small in proportion to the size of the tank. When you are down about 6 feet in a tank you have taken out about half the stuff of an 18-foot cutting.
1590. *Mr. Woore.*] Of course that all depends upon the slope? I am speaking roughly. There is really not much material taken out when you get towards the bottom. A good deal depends upon the slope, and if it were a complete pyramid, about half the tank would be excavated at a depth of 6 feet.
1591. Then you think a 10,000-yard tank, 15 feet deep, is quite sufficient for a Government tank on any stock route during droughty seasons? Yes, I think so; during any drought.
1592. *Chairman.*] Have you ever lived to the north-west of the Darling? No, never.
1593. *Major Penrose.*] Properly speaking, the size of a tank would be regulated by the rainfall, the catchment area, &c.? Yes, the size would depend upon the drains, the catchment area, and the character of the rainfall.
1594. *Chairman.*] Then, I gather from what you say, that where there is only a very slight rainfall you would have only a small tank? It is more the character of the rainfall than the amount of it. Half an inch of rain might fill your tank, whilst perhaps on a neighbouring run there is a drizzle which does no good. If the country is subject to thunderstorms a smaller tank will do. During my eight years' experience in the back country I have put down twenty-five 10,000 yards tanks, and I was never short of water.
1595. *Mr. Woore.*] What is the longest drought you have known? We had only 7 inches of rain in one year.
1596. But the number of months without any rain? I cannot tell exactly now, but the whole year we had practically no rain. A few points came now and again, but that rain did no good. 1597.

1597. *Chairman.*] Are there any other points that you have not touched upon? Not in connection with tanks, but if you have no objection I will read a few items here which I have proposed to remedy this unsatisfactory state of affairs, more particularly the annual loss the Mines Department incurs through the Watering Places Branch:—

C.A. Chesney.
9 Feb., 1888.

1. That they discharge all caretakers of Government tanks, as they are expensive and unnecessary luxuries.
2. That all the tanks be left free to water at, after fencing in the embankment alone and enclosing with a good six-wire fence about 50 acres around each tank. I propose to erect this merely for the purpose of protecting the water from the pastoral lessees' stock which might water at the Government tank if not fenced off. Erect two pairs of gates, one set for ingress of travelling stock to water, the other set for their egress.
3. That a travelling working tank superintendent with two assistants be employed for each district. His duty would be to travel round the various tanks in his charge with his assistants—working men—in a suitable conveyance, and make any repairs to dams, drains, or fences requisite. A strong box could be put at each tank, under lock and key, to hold tools, such as picks, shovels, axes, straining tools, &c.
4. That all pastoral, conditional, and homestead lessees and others be liable to a heavy penalty for wilfully watering their stock at these tanks unless under permit, as hereinafter described, and appoint some person, such as the inspector of stock or the Chairman of the Sheep Board, or of a Water Trust, if formed, in whose name, and by whose authority persons infringing regulations may be sued.
5. That a watering charge be put on all travelling stock in the Colony, including sheep, cattle, and horses, with certain provisos in favour of teamsters, &c., and those who, under the present Diseases in Sheep Act and its amendments, are not required to take out permits. This charge would be *pro rata*, according to the distance to their destination by the specified route for which a permit had been granted.
6. That all travelling stock, horses and cattle, as well as sheep be made to obtain, before starting on their journey, a permit from the nearest inspector, and be made to pay him the authorized charges, said charges to be handed into a separate account at the Treasury.
7. That all stock travelling without a permit be liable to a heavy penalty.
8. That every person damaging the tanks or their works, or wilfully or negligently leaving the gates open, be also liable to a heavy penalty.
9. That where troughing has been erected, let the present expensive pumps be changed for hand-pumps, of the M'Comas or other pattern, and let those who use the water raise it into troughs. I am sure no drover would object to pump the water if he would only get it free.
10. Where no troughing has been placed let the stock water direct at the excavation.
11. Put the management and control of the tanks in the hands of a local Board or Trust.

The above suggestions, if carried out properly, would do away with a lot of grumbling among drovers. By the present regulations a man has to pay for water according to the number of stock entered on his permit, or travelling statement, as the case may be, even if he only waters a small portion of his flock. So that under the present system it is impossible for a drover to water only a portion of the mob, unless he is prepared to pay for watering the whole lot. On the other hand, rain may come when a drover with stock is near a tank, so that there is no necessity for him to use the Government water. Still, as the country has made the tanks for his benefit, I think as a matter of fairness he ought to contribute something towards their revenue and maintenance. No doubt the Department will take exception to my saying that the tanks were made for the benefit of the man who travels stock. I have at present in my hands a minute paper signed by the Chief Inspector of Public Watering Places, in which he says, in reply to some strictures of mine *re* the tank question, that "the public watering places are not for the convenience of squatters or pastoral tenants alone, and while the action of the Government in watering the main stock roads of the Colony enables them to move their sheep and cattle with a minimum of loss in most seasons, they are also for the use and convenience of the travelling public." I quite agree with him that tanks and troughs are not for the convenience of squatters or those who have to travel sheep. I am endeavouring to prove that the Department through the incompetency and bungling of its officials, has made the tanks as inconvenient to the travelling public as it is possible for the official mind to devise. They have succeeded admirably. The suggestions thrown out by me as above are only equitable and show one method whereby these expensive works may be made to pay. Drovers would then have the same inducement to steal in the dead of night down to a private tank and surreptitiously water the stock in their charge. This is often done to save the cost of watering at the public watering places by those drovers who, driving their stock under a specific contract, endeavour to reduce their expenses to the lowest limit. Who can blame them?

In conclusion, I must reiterate that the Government have no right to supplement this cost of the tanks as originally constructed by the addition of steam or horse-pumps, expensive receiving-tanks or troughs, all of which require a certain amount of skilled labour to repair and work, when, as originally constructed, they answered their purpose admirably. I must now close, as I fear I have trespassed too far already on your valuable space; but the importance of the subject demands proper ventilation, and as I know your sympathies are with those who have sunk their fortunes in the west, I ask you, on behalf of the stockowners and drovers in this arid district, to publish the result of my inquiries. I feel certain that when once the matter is ventilated good will come out of it. The public do not at present know the amount of loss the revenue suffers from the departmental bungling and incompetency that exists in this particular branch, not only when the works are in progress, but while in operation. The subject is far from being exhausted, and I have no doubt now that the ball has been set rolling, but that the travelling public will keep agitating till a superior system of management supersedes the present one. The more constant the agitation the sooner the remedy will appear.

1598. Now I do not quite see what check you would have over people using the water if the caretakers were taken away? My plan would be this: As drovers have to pay now for a permit to go 100 miles, I would make them pay for the water over that route whether they went to the Government tanks or not. The Government have made the tanks for the public accommodation, and whether the drovers required the water or not, I do not see why they should be allowed to go along without paying their share of the cost. I speak as a person who has travelled a good deal of stock through the Colony.

1599. *Major Penrose.*] I understand that you would collect the money for the water when the permit was being issued? Yes.

1600. *Mr. Woore.*] Who is to look after the entrance to the enclosure? I would put a heavy penalty on any lessee who wilfully watered his stock there.

1601. *Major Penrose.*] You consider that the present system is very expensive? Yes; expensive and unsatisfactory.

1602. And that great economy would result from the adoption of this plan? I am certain of it, if the work was administered under the Local Board. I believe it would save the country a large amount of money yearly.

1603. Have you made any calculation to show what saving would be effected? I have done so, but I am not prepared to produce it just now. Another great objection to the present system is that when a drover with a permit goes to one of these tanks, he has to pay for the number of stock mentioned in his permit, whether they water or whether they do not. A drover goes with, say 10,000 sheep, and although perhaps only 100 may drink, he has to pay for the whole 10,000. He may have lost or sold some on the way, but he will have to pay the full amount just the same.

1604. That would apply to every case of permits? Yes; but a drover would have to get a change of permit in any case.

1605. *Chairman.*] I presume you would insist, then, that these local boards should be appointed in all the districts? Yes, all over the country.

- C. A. Chesney. 1606. Do you think there would be any difficulty in working that arrangement? None whatever; no more than there is in working the Noxious Animals Act. Under that Act we have to tax ourselves, and in the Cobar district we have taxed ourselves to the full amount required, with the result that we have destroyed nearly all the noxious animals up there.
- 9 Feb., 1888. 1607. *Major Penrose.*] Do you think that these local trusts would be fully able to undertake the work of erecting tanks where necessary? Oh! yes; they are all practical men. Not only would we see to that, but we would see that the work was properly carried out.
1608. Do you think they would get the work done at a cheaper rate? Yes; much cheaper.
1609. *Mr. Woore.*] What you propose is that the matter should be taken out of the hands of both Departments and put into the hands of Local Boards? Yes.
1610. You would give the construction, maintenance, and supervision to these Boards? Yes.
1611. *Major Penrose.*] But suppose that that were impossible for the present, would you recommend that the present state of things should continue? No; the present state of things cannot continue; it is too unsatisfactory.
1612. Then which Department should take charge of construction and maintenance—that is, if one must do so? It is very hard to say. In my opinion, one Department is quite as bad as the other. I do not see any difference between them. We could do the work very well locally.
1613. *Chairman.*] I notice here in your letter, with regard to the difficulty of getting sheep to water at troughs, you say that if the drover actually tries to break them in, he is then liable for not travelling the usual distance in twenty-four hours? Yes; because he must travel the 6 miles in twenty-four hours. It takes a full day to water 10,000 sheep separately at troughing, and yet the drover is supposed to travel 6 miles in twenty-four hours; and if he does not do so he is liable to be fined.
1614. He is really then, between two fires—the sheep must go away without drinking or he will be fined? Yes; that is rather awkward. If he goes away his sheep die; if he stays he is fined.
1615. *Mr. Woore.*] In the third paragraph of your letter to the *Daily Telegraph* of the 11th November, 1887, there is a statement which you would perhaps like to explain. It refers to caretakers. You state concerning them “that when the works are completed by the Department of Works, they are taken over by the Department of Mines and worked by it. Caretakers are appointed at wages ranging from 6s. per day upwards, and if they are required to supply a horse to work the horse-pump, they get an extra allowance from 10s. to 15s. per week; and for all this wage they have absolutely nothing to do”? Neither have they, practically, anything to do.
1616. But they are supposed to keep the embankments and drains in repair, and you say that this is a nominal matter? So it is.
1617. Have they not to raise water for the stock? For all the stock that water at these places in twelve months, they could raise sufficient water certainly within a week. This is what I consider having practically nothing to do.
1618. *Major Penrose.*] That is, in a good season? In any season. Look at the returns from all Government tanks with caretakers, and it is very small. The report of the Water Conservation Commission states that in the preceding year to the issue of this report, there were only £400 taken at the various watering places of the Colony in fees; so that practically the whole cost of construction and supervision was defrayed from the public revenue. In the returns presented to the House in September last, it was stated that out of forty tanks constructed during the previous two years, the cost of maintenance was £6,500, and the revenue only £1,300, showing a practical dead loss to the country, independent of the interest on the money, which the tanks cost originally. At the same time one-half the money raised as revenue was received from lessees of eight of these tanks.
1619. So that out of the total of £1,300, £650 was paid as rent? Yes; this was from eight tanks, which no doubt were in favourable positions, where it suited the men who leased them, to give the Department the minimum price.
1620. I gather from this, that you think the charges for water are too low? I think the charges are quite high enough; it is the expensive way in which the tanks are constructed and managed.
1621. Is there sufficient check over the money taken by these caretakers? I cannot say. I know that there is no check whatever as far as I can see, except the declaration which the caretakers are obliged to make every three months. These declarations are often made before me.
1622. So that if a man chooses to make a false declaration there is nothing to prevent him from doing so, and from keeping some of the fees which he receives from the drovers? Nothing whatever. Of course he runs the risk of being bowled out occasionally, but the arrangement is not at all a satisfactory one.
1623. *Mr. Woore.*] Have you considered that during good seasons there can be no return at all from any of these tanks? Good or bad there should be a return, because out in that country there is no natural water at all; so far as I can see there are no clay pans there. There is no natural water, as I have said; but, in a good season, water might be lying on the road. I have 350,000 acres on my run, and there is not a drop of natural water on it. It may rain very heavily now, but go out in twenty-four hours after the rain has ceased and you will not see a drop of surface water about.
1624. *Major Penrose.*] Therefore, the return ought to be the same in both seasons? Yes; so far as Cobar is concerned.
1625. Do you think that the returns under your system would be much greater? Certainly; because I would make Riverina, and Victoria, and Queensland stock that come along these roads contribute to the revenue. Perhaps the rain may come as one of these mobs come along from Riverina; they may then get to the Bogan, and run it up to Bourke without paying anything at all for water.
1626. *Mr. Woore.*] Then you propose to make the drovers come to these tanks whether they like it or not? I propose to make them pay for the water whether they use it or not, because these tanks were made by the public principally for the use of pastoralists.
1627. *Major Penrose.*] Do you think that public tanks are necessary at all? On that dry road I think they are; but if they are necessary, it seems to me that it is very desirable they should be made to pay expenses.
1628. And that the payments should be made by those most concerned? Yes; and not by the country at large. In fact, in this way it would be the men who travel stock who would bear the expenses.
1629. *Chairman.*] You say that you would give the local boards full control over these works. Where is the money to come from? I propose that the Government spend the same amount of money in the district as now; with this difference, that the money is controlled by local men. 1630.

1630. Do you think that you can get competent men in all these districts who will see that the work is carried out in a proper manner? I think so. Of course they would have to have a professional man employed who would measure the tanks, and see that they were carried out in accordance with specifications. C. A. Chesney.
9 Feb., 1888.

1631. *Major Penrose.*] In the same way that public works are carried out in Ireland? Yes; the grand jury system in Ireland is decidedly the best way. They do not let much go to waste there, because they tax themselves.

1632. *Chairman.*] Do you not think that this system would be liable to abuse if the Government had to find the money for the work? That might be a matter of policy for the Government to consider.

1633. What control would you have over the expenditure? I should certainly give the Government control. The plans ought to be submitted to Government for approval. Not as to whether the works were being properly constructed, but as to whether the works should be done at all or not.

1634. Of course no Government would give unlimited control to local boards? I do not propose that.

1635. Parliament would never put up with that, you know? If it did the Treasury would soon be empty, I am afraid.

1636. But you think that this might be all provided for by regulation? Yes; this is the general idea which I have given you without going into details. There is another matter which I would like to mention. It is a very unsatisfactory arrangement that although the squatters have to pay rent for these travelling stock reserves around public watering places and along travelling stock routes, they are not allowed to use them. I think all the travelling stock reserves ought to be resumed by Government and fenced off from the run, and the squatters called on to pay half the cost of fencing. I would urge this especially on the main line of road from Murrumbidgee up to Bourke; by this means those who travel stock would have plenty of grass always, and it would save the lessees, through whose run the routes go, a good deal of trouble and annoyance. As far as I am personally concerned, I should be very happy to pay half the cost of fencing and give the Government the land.

1637. And this would prevent the necessity of sending notices forward to the squatters? Yes; because there would always be plenty of grass on the roads. I think this matter might be taken up in connection with public watering places.

1638. *Major Penrose.*] Does the squatter pay rent for these reserves? Yes; he does. They are a mile wide, and round the Government tanks there is a reserve of 3,000 acres. The public have the right to use this, and the squatter who has to pay for it has not the right to use it. There are a lot of people who never had a run at all; they are simply stock holders, who buy sheep and "loaf" all around the country with them. They steal the squatter's water and eat his grass, and pay nothing to the revenue. A water charge would get at these men.

[The Commission adjourned until the afternoon, when the sitting was resumed.]

Farquahar M'Kenzie called in and examined:—

1639. *Mr. Woore.*] What position do you hold in the public service? I am an inspector of public watering places for the Bourke and Narrabri districts. F. M'Kenzie.
9 Feb., 1888.

1640. How long have you been acting in that capacity? I was appointed on the 27th June, 1887.

1641. *Major Penrose.*] Have you been in the public service before? No.

1642. What was your experience before? I was a station manager for many years.

1643. *Mr. Woore.*] In what part of the country? In the Albert district.

1644. I understand you have a paper which you wish to read to the Commission? Yes; it is as follows:—

Sir,

Public Watering Places, Mines Department, 6th February, 1888.

I have the honor to acknowledge your letter of 1st January, and to reply to it dealing with each question in the order indicated.

From my personal experience I am strongly in favour of supplying water to stock from tanks by means of troughing in preference to allowing them to water from the excavation. Stock, if allowed into an excavation, carry out large quantities of water, and in the case of full-fleeced sheep they waste considerably more than they drink, and the water becomes so much polluted through the droppings and washing out of the yolk being carried in that it becomes unfit for any stock to drink, and poisonous for domestic purposes.

I have no hesitation in stating that I consider the troughing much preferable to allowing stock into the excavation, and at many of the Government tanks it would be impossible for them to drink owing to the steepness of the batters, viz., 1½ to 1.

In the case of open drinking-tanks the objections are much the same, only that being smaller they become polluted much sooner.

These tanks are in use at Bughill and Boro, in the Walgett District, and after one lot of stock have watered, the water, from being stirred up, becomes quite thick and green, and nothing will drink it until it again becomes settled.

I have had many years experience in the West Darling country among stock and tanks, and I found that no tank would last through a severe drought when stock were admitted. I then adopted the plan of fencing them in and supplying water by means of M'Comas pumps, and troughing, and the saving of water quite justified the extra expense. One man could water 3,000 sheep in a day.

The cost of excavation by private enterprise varies at from 9d. to 1s., and I have had many thousand yards excavated at the former price, where contractor had to drive his cattle some miles to water and cart the same for domestic use. Where plant is found the work can be done at from 5d. to 6d. per cubic yard.

On Corella Station, Mr. Featherstonhaugh has had tanks excavated to a depth of 16 and 18 feet, at 11d. and 1s. per cubic yard.

I am informed that 2s. 6d. was paid for excavation of Government tank Kerrigundi, Helman's tank 1s. 8d., Bendemere 1s. 9d. Well-sinking within my knowledge has been done in alluvial at 25s. per foot for first 100 feet, including timbering and centering, 30s. per foot for second 100 feet, and 35s. per foot for third 100 feet.

I believe that much higher rates than the above have been paid at Balooloo, Normanstone and Mannum wells, in the Gunnedah District.

The Balooloo well has been sunk in basaltic country to a depth of 145 feet, and is now abandoned. A whim has been erected, and the wooden frame-work of supply tank, both of which are rotting from neglect. Normanstone well, also in basaltic country, has been sunk to a depth of 180 feet, at which depth a small quantity of brackish water was struck, and a fresh contract has now been let to bore 50 feet. I can state positively that the sinking cost £5 10s. per foot.

Trial-shafts I have had sunk at 2s. 6d and 3s. per foot for first 100 feet and 5s. for second.

The cost of whim complete should not exceed £75, and I know an instance where a substantial whim with best mountings was completed for the sum of £62.

Wood and iron supply-tanks, 22,000 gallons, can be erected, inclusive of material, at from £60 to £70, and troughing about 4s. 6d. per foot.

The

F. M'Kenzie.

9 Feb., 1888.

The appliances used for raising water, notably steam pumps, are probably more effective than simpler methods, but far more difficult and costly to keep in repair, besides the extra cost of fuel, which in some cases has to be carted long distances.

The expense of steam pump and shed, as erected, is enormous. Horse works and pumps are quite sufficient to answer all requirements, and where the traffic is small a M'Comas pump is all that is required. One man can with ease lift water from 18 to 20 feet.

At Girilambone and Bullagreen tanks, where there is little or no traffic, costly steam pumps and engine-sheds have been erected, and although the former tank has been completed over two years there has never yet been a flock of sheep or a mob of cattle watered.

There should be no cause why Government works should be paid for at higher rates than private. The reasons that can be brought forward are that there is inefficient supervision, too much fancy work, and too great delay in payments. These avoided, the work should be done at current station rates or under in works of magnitude.

It is only contractors who have money at their disposal who can afford to take a Government contract. A poor man, who might be equally efficient and as well provided with plant, could not carry out the work through being unprovided for until his contract is completed.

Consequently, the few men who work for Government can make their own prices, where, under different circumstances, the work could be done at station rates.

The extreme steepness of the batters, viz., $1\frac{1}{2}$ to 1, precludes the use of bullocks, and the more expensive plan of tip-drays and shovels is resorted to, when it becomes necessary to make roadways to enable the horses to climb the batters; and, although embankments are placed on four sides of the tank, they serve no purpose, as the water is admitted by means of open fluming, whereas, if pipe and valve were used, the water could be pumped in and many feet of water saved which now goes to waste. The engines are now so fixed that the pumping of surplus water cannot be resorted to.

The fencing at all Government tanks is heavier and more costly than necessary, and the rates paid are much in excess of private work. At Goonery Bore, the fence enclosing T.L. cost £86 per mile, and at Mulga No. 5, £75. The same description of fence has been erected in the district, with no better facilities for obtaining timber or carriage, at from £35 to £39 per mile.

The fencing at Baradine well, I am informed, cost £100 per mile. It is 5 feet high, split iron-bark posts, and top rail and five wires. I think No. 4 wire is ridiculously strong and out of all proportion to requirements. I have written several letters on the subject of railing at the troughing, which is in nearly every case much too high, and at some places as much as 2 feet 10 inches from ground-level, viz., Booroondarra tank, Baradine well, and other places. Consequently, sheep crawl in underneath and fall into the troughing, stirring up and fouling the water; on the other hand, cattle cannot reach over the top, and, unless some of the railing is removed, it is impossible for them to drink. An alteration was suggested by this Department which has been adopted by the Works Department in the Cobar district, and at a nominal cost, has proved a great success.

In conclusion, I wish to bring under your notice the state of inlet from silt to main at some of the tanks in my district, which in many cases is a narrow cutting through the earthwork of embankments, which, in time of flood, keeps cutting away and filling in, and consequently all loose earth is carried into main tank. This could be remedied by having the sides of embankments logged or stoned to prevent cutting the tanks. Where this is most required are Helman's tank, Booroondarra, and Mulga No. 5.

I have, &c.,

F. MACKENZIE,

Inspector, Public Watering Places.

The Chief Inspector, Public Watering Places.

1645. Do you know of any faults in the selection of sites? Yes; there is the Mulga tank on the road from Louth to Cobar.

1646. *Major Penrose.*] Is it quoted in these papers? [referring to Blue Book.] I do not think so; at least it is not quoted by me. I only just inspected it before I came down here. That tank has been put down over twelve months, and has never had more than 5 feet 2 inches or 5 feet 3 inches of water in it.

1647. Has there been sufficient rain to fill it? Yes.

1648. What is the reason, then? It has been put on rising ground. The drains have been so formed that the water will not run in. It is on considerably higher ground than that surrounding, and the drains are so constructed that the water runs back.

1649. How does the water get in, then? There has been an alteration made lately in the drains for that purpose, and the water will, I believe, run into the tank; but we have had no rain since.

1650. Was there any necessity for a tank at this particular spot? Not actually at this spot, but a tank is required in the vicinity somewhere.

1651. *Mr. Woore.*] Is there any other place that would have been a better site? Yes; within a quarter or half-a-mile of this place there is good, hard, red ground.

1652. Who proposed the site for this tank? I really do not know; it was constructed before my time.

1653. Then you think a tank is required somewhere in the vicinity? Yes.

1654. *Major Penrose.*] Do you know who it was that recommended the alteration in the drainage? I believe it was the overseer of public watering places for the district of Cobar. He is also stock inspector for the same district, and his name is Mr. Cotton.

1655. This tank was constructed some time before you became a public officer? Yes.

1656. Was there any water in it when you first saw the tank? The first time that I saw it was about ten days ago, and there was then about 5 feet 10 inches of water in it.

1657. *Mr. Woore.*] How do you know that the original drains would not run into the tank? I heard that from the caretaker, who had the thing recorded in his book.

1658. Then you do not say this of your own personal knowledge? No; but from information received, and I am confident from the rainfall that the tank would fill if the drains were properly made.

1659. Is there any other tank in your district the site of which you have reason to find fault with? There is the Ledknappa tank, on the road from Brewarrina to Enngonia.

1660. What fault have you to find with the site of this tank? Not so much with the site of the tank as the site of the troughing. The tank is right enough, but the troughing has been submerged. The site of the tank is a suitable one enough, if the troughing with it had been properly constructed on the opposite side on high ground.

1661. The troughing ought to have been made on the opposite side to where it is at present? Yes; there is a sand hill there, and there could not have been a better place for it. The consequence of putting it where it is, is that it has been submerged, so that the stock cannot get into it.

1662. But then the tank has not been required lately? No, because there is plenty of other water about; but in the time of a drought it would be required. In the meantime these works have been very much injured by the water being on them. All the works in fact are being damaged by the water.

1663. *Major Penrose.*] How many tanks, more or less, have you in your district? I think I have about sixty-five altogether—that is including tanks and wells.

1664. You have no fault to find with the sites chosen for the remainder of these tanks? No; I wish it to be understood that I do not find fault with the site of this Ledknappa tank, but only with respect to the troughing and so-forth.

1665.

1665. *Mr. Woore.*] Have you anything to say with regard to defective design and faulty construction of tanks in your district? No; with the exception of these two. I think in some cases the design is bad in having the embankments all round the tank so that they cannot be utilized for the storage of more water. This is owing to the tank not being closed up, so that the water rises only to the level of the excavation, and in some cases a few inches over it. F. M'Kenzie.
9 Feb., 1888.
1666. If they were constructed so that the embankments could be utilized, about double the amount of water would be conserved? Yes, if they were properly embanked all round perhaps 6 or 8 feet more water could be put into them.
1667. *Major Penrose.*] That would entail special arrangements in regard to pumping? We have at present no engines for pumping water over the bank that can be utilized; they are so constructed that they cannot be utilized for anything except to pump water into the supply tank.
1668. Very little change would be necessary in them? A very little alteration would make them suitable for both purposes.
1669. In that case, pumping water would be done from the silt-tank? Yes, and from the water lying outside. Of course, in many cases—in the Ledknappa case, for instance—there is over a mile of water outside, and if the water was pumped from the silt-tank, as proposed, we could conserve 8 or 9 feet of it inside the embankment.
1670. *Mr. Woore.*] Is there any other fault you have to find with the construction and design of tanks and generally with regard to batters? I think the batters, being $1\frac{1}{2}$ to 1, are too steep. In these big tanks the wind blowing against the sides often causes the bank to break down, and in many cases the batter is increased to 4 to 1. This is caused by the bank being washed in. This takes so much more off and decreases the holding capacity of the tank. I should say, perhaps, that the batter is 3 to 1 instead of 4 to 1, if I may be allowed to amend it.
1671. Has there been any carelessness shown in not taking advantage of the formation of the ground and utilizing catchment area so as to avoid collection of silt? This is what I have mentioned before. There is the Kerrigundi tank which is placed in a depression in undulating country, and the drains go into it from a very steep slope. Consequently, everything is washed down into it from the hills. It is most difficult to keep the silt tank clean, and at the present time I believe the water is only 3 feet deep.
1672. Is there a better site there where this collection of silt could have been avoided? Yes; about a mile nearer to Louth there is a much more suitable site; the ground is more level and there is plenty of catchment.
1673. Had a tank been placed there this collection of silt would have been avoided? Yes, considerably avoided. I consider it a great mistake in every case to have falling ground into a tank.
1674. *Major Penrose.*] I suppose you mean steeply falling ground? Yes; my experience is that if you can get your drains nearly level you will get less silt into your tank.
1675. *Mr. Woore.*] Do you object to the particular form of tank for that place? No.
1676. Are these tanks made by the Government all made to the same plan and design? Yes, all but the older ones. The old ones are made on a different plan; all the new ones are made in one way. The character of the country up there is so similar in all respects that I consider one form and design of tank is suitable for all places, where they have been already constructed in my district.
1677. You also consider the square tanks very suitable for that country? Yes.
1678. That is if the embankments are made use of? Yes, but they are useless in every case now. As to the fluming at Helman's, on the road from Cobar to Bourke, it is only carried from the inside of the embankment to the bottom of the tank. I consider that some provision should be made to prevent the banks from washing in. I regard fluming 2 feet high as being of very little use, because in high floods the water gets behind the fluming, which, with the great rush of water at particular places, will not be sufficient to protect the embankment.
1679. You have said something about the careless laying out of drains in one instance; do you know of any other? No; that is the only case I am acquainted with.
1680. Do you know anything about the excessive cost of constructing these tanks? Yes; there are cases I mentioned in the matter of fencing.
1681. Has the cost of construction increased in consequence of these steep batters? Yes, undoubtedly; because men cannot work in a tank like that without a long roadway; it has to be taken out afterwards; he cannot work up the slopes at $1\frac{1}{2}$ to 1 with any stuff.
1682. How do they get the earth out, then? They form a roadway all the way down, which is taken out after the excavation is completed.
1683. That increases the cost of construction? Yes, it is all extra cost.
1684. The object of making these steep batters is to expose as little surface of water as possible to evaporation, and, according to your account, this is to a great extent counteracted by the banks being broken down by the water washing against them? Yes; I consider that it is more than counteracted. The batter is the same or greater afterwards through the washing-in of the banks. They do not remain at $1\frac{1}{2}$ to 1.
1685. But where the ground is suitable and the banks would stand that batter, would it not be an advantage in the way of protection from evaporation to have a less surface exposed? It might be a very small advantage, but if stock were allowed into the excavation I should say it would be a very great disadvantage.
1686. *Major Penrose.*] You are in favour of stock watering from the troughs? Yes.
1687. Do you think it would be possible or even advisable to water the stock from the main tank itself if a small portion of it were railed off with iron hurdles? No, I do not think it would be any advantage. The stock certainly could not get into the tank and swim in it, but the water would still be polluted by their going in a short distance. I have seen that tried, but not successfully.
1688. It would do away with the expense of pumping gear and caretakers? It certainly would do away with them, but I do not consider that any ordinary tank would last through the drought if treated in that way, because if the water went down to 3 or 4 feet the stock would not drink it. I have seen stock turn away from green water.
1689. You do not think that plan would answer at all? No, not for public watering places. I think the best way of dealing with water is by using troughs, especially when full-fleeced sheep are watering. If a sheep drinks 1 gallon of water he carries out 3 with him if he is allowed to go and swim in the tank; and of course, with these Government tanks, it would be quite impossible for sheep to water without their going in and swimming in hundreds.
- 1690.

- F. M'Kenzie. 1690. *Mr. Woore.*] The next subject is expensive forms of machinery for lifting water, necessitating greater cost of maintenance;—do you consider the forms of machinery for lifting water at these tanks are of a too expensive nature? I think a steam pump is both expensive and unnecessary.
- 9 Feb., 1888. 1691. What would you suggest to raise water as quite as effective and not so expensive? I think that a horse-pump on roads where there is a lot of traffic is a suitable machine. On roads where there is not much traffic a M'Comas pump would, I think, do; that would cost very little in alteration, and I have had a lot of experience in watering sheep with a M'Comas pump.
1692. What number of sheep would a man water in a day with a hand-pump? I consider that one man would water 8,000 sheep in a day. I have had it done myself.
1693. *Major Penrose.*] This would be a good day's work for a man? Yes, a fair day's work.
1694. Then if drovers had to water their own sheep, and had four or five horses with them, they could water the sheep a great deal quicker by horse-power than by hand? Undoubtedly.
1695. All I want to know is, is there any limit to the number of sheep that a man can water? Of course a dozen men taking shifts might water 13,000 or 14,000 in a day, and I have watered 18,000 with four shifts, one man to each shift, in twenty-four hours. I have done this every day for a month till the rain came. This was done with a 3-inch M'Comas pump.
1696. What lift had you? About 16 feet, I think.
1697. Can you make any estimate as to the number of gallons raised per sheep at that time? I consider that each sheep drank a gallon and a-half within the twenty-four hours. I have known sheep to drink 3 gallons each during the drought, and perhaps in saltbush country they would drink more.
1698. *Mr. Woore.*] Is it not hard work to raise water 16 feet with a 3-inch M'Comas pump? Yes; but we used to rig a buggy or dray wheel, and by means of this fly-wheel the work would be very much lighter. It answered the purpose of two men working.
1699. Are steam-engines for raising water at Government tanks unnecessary in all cases? Except they are utilized as pumping-up engines as well, they are. In that case they would be a great advantage.
1700. But you think that they would be necessary for pumping over an embankment? Not altogether necessary, because a portable engine might be able to do it—similar to what is used on many stations.
1701. But cannot a M'Comas pump be used for pumping over the bank? Not without removing it. If you had two M'Comas pumps you might use them in that way.
1702. What is the cost of a 3-inch M'Comas pump? I do not know positively, but I think about £15.
1703. Then you think that a M'Comas pump would be quite sufficient to raise water for the supply of stock? Yes.
1704. And that a portable engine might be used to pump the water over embankments? If the tanks were made suitable a portable engine might answer. One for each district might be used to pump the water over the embankments.
1705. *Major Penrose.*] Do the pumps in your district necessitate great cost in maintenance? Yes; I think they are more costly than horse-pumps, and in many cases we have to cart firewood for them; a caretaker has to leave his work and go and cart firewood, perhaps for several miles.
1706. Are the caretakers as a rule capable of maintaining these engines in proper order? No, not ordinary caretakers.
1707. *Mr. Woore.*] The next matter is the faulty construction of fences;—do you know anything about the fencing of caretakers' paddocks? I could mention cases of excessive cost, but I cannot find fault with the fences in my district, except with the fence at Baradine well.
1708. What have you to say with regard to the fence there? That it is unnecessarily strong.
1709. You are speaking now of the fence around the tanks? No; of the fence around the tenant's lease, or what is known as the caretaker's paddock. The fence is 5 feet high; the posts average about 10 x 6 or 8. They are split ironbark posts, and the rails average about 8 inches.
1710. How many wires? I believe there are five wires and a top rail.
1711. What is the number of the wire? I think it is No. 4, but it is a strong heavy wire.
1712. Have you any idea what this fence cost? I am informed that it cost £100 per mile.
1713. You think that it is too expensive, and altogether too strong? Yes, far too strong.
1714. How many miles of this fence are there? I cannot say; I think about 2 miles. It enclosed some 204 acres of land.
1715. Do you know any reason why this fence should be stronger than any other fence? I have no idea. I think that it must have cost well within £80 per mile, if it did not cost considerably more.
1716. What would such a fence as you propose cost? I could have got a six-wire fence erected suitable for all purposes, for £35 to £36 per mile. These heavy wires are a great mistake, as it is impossible for one man to strain them.
1717. Are these gates to the caretaker's paddocks? Yes, 12-foot gates.
1718. Are they expensive gates? Yes, very expensive. They are constructed of sawn timber, and very heavily mounted with iron. I do not know the cost, but some of them on these Government tanks must have cost as much as £15.
1719. This is the only instance that you know of excessive cost of fencing? Yes, I know of two other places; one of them was at Goonery bore, on the road from Bourke to Wanaaring. This fence cost £86 per mile, although it was only an ordinary six-wire fence.
1720. What number wire is used in this fence? There are five wires No. 8, and the top wire is No. 6. It is a suitable fence for the place.
1721. What kind of posts were used? Split pine posts.
1722. What do you consider the value of such a fence? I could have a fence of similar character put up in the same district for from £34 to £39 per mile.
1723. *Major Penrose.*] Have you seen the Government specifications for fencing at tanks? No, I have not seen the specifications, but I know the measurements. The posts are 9 x 4; I believe they are 10 feet apart, and 2 feet 6 inches in the ground. It is very unnecessary to have them 2 feet 6 inches in the ground. I believe that in many cases they have made no difference with the strainers, and have no stays at all.
1724. *Mr. Woore.*] Do you know why this particular fence at Goonery bore cost so much? Well, I do not think that it has cost more than Government fences generally, but this is not the only case that I know of. There is the Mulga tank, on the road from Brewarrina to Gongolgan and Byrock. Although there is plenty of timber in the vicinity, this fence, which has lately been erected, has cost £75 per mile.

1725. *Major Penrose.*] Describe that fence? It is a six-wire fence, five of the wires being No. 8 gauge and the top No. 6. The posts are 10 feet apart, but I cannot say what depth they are in the ground. There was no caretaker there when I visited the place. F. M'Kenzie.
9 Feb., 1888.
1726. Are the posts of split pine? Principally of split pine, but there are a few of mulga and belar.
1727. Have you noticed any bad effects due to straining wire to any posts? You mean without making provision for regular straining-posts?
1728. Yes? Yes, undoubtedly. In many cases the straining of the wire will drag the posts out of the ground.
1729. You have actually noticed this in connection with Government fences? Yes.
1730. *Mr. Woore.*] Have you known that the contracts for these fences have been sublet? I have heard of a great many cases, but know of none of my own knowledge.
1731. Do you know of any reason why the fences generally should cost so much? No; I know of no reason why they should cost more than station or private work.
1732. Has anything come under your notice with regard to interference with caretakers and overseers at these watering places by officers of the Works Department? No.
1733. Do you know anything of the construction of wells in your district? Yes, there is the Baloola well. In this well they have not obtained any water at all. It is on the road between Gunnedah and Coonabarabran. It has been sunk 145 feet, and has cost £5 10s. per foot.
1734. *Major Penrose.*] Then there is the Normanstone well? They are both almost the same.
1735. *Mr. Woore.*] Does the sum you mention include the whole cost of timbering, and so forth? Yes, it includes the timbering. A whim has been erected there which is not included in cost of well.
1736. *Major Penrose.*] I see that it has since been abandoned? Yes; a whim had been erected, and the woodwork of a supply tank, but it has never had the iron put in. This tank has been partially erected.
1737. And this was done before ascertaining whether the well would yield water or not? Yes; before they proved that there was any water there.
1738. Is there no water there? Well, there is rain water, but they never succeed in getting any other.
1739. And the Normanstone well—is it as bad as the other? Yes; I considered it a mistake from the first to sink for water in the basaltic country, because water is never obtained there, so far as my experience goes. All the headworks have been erected for a considerable time, and they are now rotting.
1740. *Mr. Woore.*] And do these remarks apply to the Normanstone well? No; not in the same way. Normanstone well is 180 feet deep, and a small quantity of brackish water was got at that depth; a contract has been let to go 50 feet further. No headworks have been erected at that well.
1741. *Major Penrose.*] Is water much required at that place? Yes; especially in dry seasons. A great deal of stock travel backwards and forwards.
1742. *Mr. Woore.*] How are the stock supplied now? Water is now obtained by travelling stock from private tanks and wells.
1743. *Major Penrose.*] Then there are wells in the vicinity which hold water? Not in close proximity, but in the neighbourhood there are some.
1744. *Mr. Woore.*] How near to the Baloola well is there any private tank or well? There is a natural spring at Garrawilla station, about 8 miles from Baloola well.
1745. Has any well been sunk in the neighbourhood of Garrawilla? I think the Baradine well is nearest. We spoke of that well just now.
1746. Was a well sunk near Normanstone well before Normanstone was put down? I do not know of any; still there might have been one on the neighbouring station.
1747. *Major Penrose.*] Have you any idea why wells were put there instead of tanks? As I understand it, watering places were required in this neighbourhood, and they were put down where they were required without considering the probability of obtaining water.
1748. But surely something must have determined them to sink a well instead of a tank? Well, I believe it is a difficult matter to excavate in that part of the country, but there is a very good catchment close to Normanstone well; the ground is suitable, and Cobb and Co. have a tank close by. At Baloola there is no suitable place for a tank in the vicinity.
1749. *Mr. Woore.*] Is the water obtained from Normanstone well unfit for stock? No; it is good stock water.
1750. What did this Normanstone well cost? I believe it cost £5 10s. per foot.
1751. Do you know this of your own knowledge? No.
1752. Do you believe it? No; I do not say that I do. I know that it has cost that, but only from hearsay.
1753. Do you consider that too great a price? I consider it very excessive indeed.
1754. What do you think a well ought to be sunk for in that neighbourhood, up to that depth? I think it could be done down to 180 feet for £2 per foot. Of course that is not in rock.
1755. Is powder required in getting through this rock? I believe that lately powder was used. The rock got harder and harder as they went down.
1756. Was it generally known in the neighbourhood that the formation of the ground was very unfavourable for procuring water? Yes; all the squatters were very much opposed to the sinking of a well anywhere about there. In fact, no one would sink a well.
1757. But before this well was commenced? Yes, undoubtedly; it was well-known that it was basaltic country, and unfavourable to wells.
1758. Was this basaltic rock struck down far under the surface? It is visible in places on the surface, and it would not have been easy to mistake it for slate; it crops up in different places.
1759. *Major Penrose.*] Do you think that the head works to wells in your district are, as a rule, constructed in too expensive a manner? There are very few in my district—only about five altogether. I cannot say what they cost, although they are, I think, unnecessarily costly. There is sawn timber put where round timber would have done as well; but I really cannot say what is the cost of any of these head works to wells in my district. They have all been erected for many years.
1760. *Mr. Woore.*] Do you know anything about the caretakers' huts? Yes, the huts erected by the Works Department were built upon a very expensive plan altogether.
1761. What did they cost each? From £100 to £120 and £130. We have had similar huts built, not exactly the same, for from £40 to £50; there is an additional room in the huts erected by the Works Department.

- F. M'Kenzie. Department. I think the average cost of our huts has been considerably less than £50 each.
- 9 Feb., 1888. 1762. Have these huts erected by you had less accommodation than the huts erected by the Works Department? There is a room less, but the accommodation is quite sufficient. The Works Department had an additional small room at the back.
1763. Were the huts constructed by the Works Department better huts than those put up by the Mines? Yes, so far as material was concerned.
1764. And they were unnecessarily good? Yes; but I should say that our huts were quite sufficient as caretakers' cottages.
1765. *Major Penrose.*] Do you know anything about faults in construction of troughing? Yes, I know a good many cases.
1766. In what way is the troughing defective? Well, it is really so high that in nine cases out of ten the cattle cannot reach the water unless the rails are removed.
1767. But this has been altered? No; only in the Cobar district, and there only within the last few days.
1768. You only find fault with the protection rails, and not with the troughing itself? Yes; these rails are in many cases 3 feet 10 inches above the ground level.
1769. Were they placed that way originally, or is the ground worn away by the continual traffic of stock? Some of the cases that I speak of are new works, and the ground is as it was at first; but in others the ground has worn away, although originally constructed in this way.
1770. This troughing must be protected in some way. What way do you suggest? The troughing that I find best is steel troughing, with centre rail. This rail is secured to struts bolted to the sleepers, which prevent the sheep or cattle from getting into the troughing. I consider that this form of troughing is the best that I have seen used.
1771. Have you ever experienced any difficulty, or have you any knowledge of any difficulty having been felt, in watering sheep or cattle at troughs? I have heard of such with the old form of railing.
1772. But with the form of railing proposed? No, it seems to answer admirably. One disadvantage with the old railing was that sheep would get into the trough, blocking it up and polluting the water.
1773. But there is no difficulty to get stock to water at any troughing that has a rail down the centre? None whatever.
1774. Do you consider the present system of public watering places to be effective and economical? No; I do not consider the present system to be an economical one.
1775. I mean apart from the question of construction? No, I think the machinery is too expensive, and that the watering places could be worked much more cheaply if the machinery employed was of a less costly character.
1776. But apart from all that, is the system of maintenance an economical one? I do not see that tanks can be maintained any cheaper; at least not with the existing form of construction and machinery.
1777. You think, then, that to maintain them more cheaply, it would be necessary to do away with the present machinery? Yes, with the costly machinery.
1778. Do you think, from your experience, that it would be possible to do without caretakers at all, supposing the machinery was absent? No; I certainly think it would be a great mistake to do away with the caretakers.
1779. Do you not think that the drovers would help themselves to water? Yes, but they would not pay for it.
1780. *Mr. Woore.*] Do you know that there has been considerable misunderstanding or friction between the officers of the Department of Mines and Works with regard to the maintenance of these public watering places? Yes, I have heard at different times of little troubles.
1781. Can you mention any instance where this has come under your notice? Well, of course where two Departments are working together there is always some trouble. I am sure that if we had the works independent of the Works Department, we would get on more satisfactorily.
1782. You think, then, that this friction is only the natural result of a divided control? Yes, and I think it must always be the case where two Departments are working in this way.
1783. *Major Penrose.*] How do you get your repairs done now? There is always a travelling mechanic obtainable from the Works Department to effect those repairs which the caretakers themselves cannot do.
1784. And do you ever find any difficulty in your district in having the repairs attended to at once? Yes, I have found considerable difficulty, because there is only one man for that large district, and he may be at one end of it when you want him to carry out some repairs at the other. In this way the works may have to wait for weeks.
1785. But would that not occur in any case, even if the whole of the works were transferred to the Mines Department? It might happen certainly, if we did not have men who could do these repairs themselves; but at present there is only one man on each road, and one man is not competent to travel around and keep the machinery in repair. The work requires more than one man to do it.
1786. You mean that if the work were under the Mines Department, you would make better arrangements? Yes.
1787. And you think that this divided control is very objectionable? Undoubtedly yes; and a great deal of expense would be saved if the whole arrangement were under our Department.
1788. You think that the maintenance of these watering places could be more economically managed by one Department than by two? I think so undoubtedly. If all were under one Department it would mean a great saving of public money.

FRIDAY, 10 FEBRUARY, 1888.

The Commission met at 10 a.m.

Present:—

HON. G. H. COX, M.L.C., CHAIRMAN.

MAJOR PENROSE, R.E., | J. C. WOORE, Esq.

George William Townsend called in and examined :—

1789. *Chairman.*] Where do you reside? At Burwood. I belong to the Railway Department.

1790. You are, I presume, aware of the object of this inquiry? I have some knowledge of it.

1791. You are aware that what has been called friction has arisen between the Mines and the Works Departments with regard to the management of tanks and wells? Yes; having been on the Water Conservation Commission I necessarily acquired some knowledge regarding what had arisen between the two Departments.

1792. You were engineer to the Water Commission? No; I was merely one of the Commission. I was a member of the body itself.

1793. And in your various tours through the country you became aware of this thing? No; it was previous to that, and before I became a member of the Commission at all that I became aware of the facts which I am likely to be questioned about.

1794. There are many points that we have been going through with regard to fences, selection of sites of tanks and wells, excessive cost, and various other items, and we wish to obtain such information from you on those points as come within your own knowledge? Well, I am not personally aware of any of the facts which you speak of. I have heard of them, and I have noticed in my travels that some of the tanks were badly situated.

1795. Our object in asking you to give evidence is that as your name has been used in communications from the officers of the Mines Department to headquarters we wished to test the truth of the matters stated to us;—we thought you would have been able to give us information on certain matters? I remember a certain conversation perfectly. It was a conversation between Mr. Gilliat and myself, and I think Mr. M'Kinney was present.

1796. Will you kindly state the substance of this conversation, and where it took place? It was some months ago. I cannot give you the exact date, but it was about the time that the Minister for Mines was going to give Mr. Gilliat the entire charge of the tanks and wells. I then said to Mr. Gilliat and Mr. M'Kinney that I knew of one instance (not from official knowledge, but from hearing the matter talked about between contractors while I was engaged on the Forbes-Wilcannia survey) where Burton Brothers, who had a large contract under the Roads Department, were paid, I believe, 2s. 6d. per yard for earthworks. They sublet a very large portion of this contract to a party named Ford Brothers for from 1s. 2d. to 1s. 4d. per cubic yard. This was for the excavation of several large tanks and a considerable amount of earthworks.

1797. Will you name these tanks? I think the 37-Mile tank is one of them, and the 48-Mile tank is certainly one. I was camped at the 48-Mile tank at the time.

1798. Was the 12-Mile tank one of them? I do not think it was in that contract, though I believe Burton Bros. had it. There was a 7-Mile road between Stony Rises and Wilcannia, and I don't think any of that was sublet. The work was done with ploughs and scoops, and I should say that it was performed for about 1s. per cubic yard—most probably less than that. This is what I said to Mr. Gilliat—and what I heard so frequently from these men (Burton Bros. and Ford), and also in Wilcannia. There was another tank being made for a station close by. I knew the man intimately, and was frequently at his camp, and had dealings with him. I know that he had a large tank for about 1s. 2d. which he was excavating within a mile of the 48-Mile tank, and for about half the cost that was being charged for the 48-Mile tank. I think the amount he was getting for that work was 1s. 2d. It was the common talk of the district at the time—the prices paid by the Roads Department for the earthwork of these tanks and roads. I did not volunteer this information, but having said it to Mr. Gilliat and Mr. M'Kinney I will not go back on it now.

1799. You do not know of your own knowledge that this money was paid? No; I was merely told by Burton Bros. and others.

1800. Could they have any object in misleading you? I have no idea what their object could be in misleading me.

1801. And would you be surprised to learn that this tank only cost the Government 1s. 9d. per cubic yard, instead of 2s. 6d.? Yes, I would.

1802. Can you give us any idea, from your residence in the interior, why the Government have to pay this excessive price, as compared with the prices given by private individuals—squatters and others—for similar work? Yes; I believe I can.

1803. Well, we would like to hear you on that matter? One reason is that the Government are too particular in dressing the slopes of the tanks.

1804. Would that apply to embankments as well as to the cuttings? Yes; there is no object to be gained by it, because it is all washed down by the rain shortly after being made. Another reason is, that the very steep slopes adopted in Government tanks necessitates the giving of an extra price for the work, because of the amount of difficulty in getting the stuff up the sides.

1805. Precluding, I presume, the use of ploughs and scoops? To a certain extent. I do not know that I can state this from my own knowledge, but I believe the contractors suffer great delay from the orders and counter-orders they receive. This necessitates charging an extra price, so as to allow for the vexatious style carried on by certain of the overseers.

1806. Are these alterations from the specifications? I can't say.

1807. No other reason? No, I do not know of anything else; but I think those facts form the cause why the Government work costs a great deal more than other work. I know that Mr. Wilson, of Trida Station, told me he gets his work done for about 6d. per cubic yard—at least so he informed me. He finds the plant and bullocks to work the thing, and he reckons to pay 4½d. per cubic yard, the interest on the cost of plant, &c., bringing it up to 6d.

34—M

1808.

G. W.
Townsend.
10 Feb., 1888.

G. W.
Townsend.
10 Feb., 1888.

1808. Are his tanks the same depth as the Government tanks? No; but within a few feet of the same depth. All the tanks that I know of are about the same depth. The depth of the squatters' tanks is usually governed by the layers of gravel. If a tank-sinker finds gravel in putting down a tank for a squatter he does not go on; but I am told the Government specifications call upon the contractors to go through the gravel, and in more than one instance they have gone down through it.

1809. Is it usual to sink trial shafts for excavating large works? I do not know; but it certainly ought to be.

1810. I presume you are aware that the extra 2 to 3 feet which the Government tanks are sunk lower than private tanks, very materially increases the cost of the excavation to the Government? Well, I have had a great deal to do with earthworks, and all I can say is that it ought not to materially increase the cost. There is no doubt that the last few feet of excavation will cost more than the first few feet; but this will not largely increase the average cost of the work, because where the last 2 or 3 feet are taken out the tank is narrowed down very much, so that the extra depth increases the local cost per yard, but not the average cost. Between 17 and 20 feet the increased cost will be about 1½d. per yard.

1811. Now, being an expert, do you think it very desirable in that hot country to confine the surface of the water as much as possible? I am of that opinion.

1812. Do you think that the extra cost of these steep slopes would be made up by the lessening surface of water exposed to evaporation? I am rather doubtful about that. It is a matter that I have studied carefully, and there can be no doubt that flattened slopes do increase evaporation; but whether the difference in the cost between 1 to 1 and 1½ to 1 would be made up for by the lessening evaporation is a matter upon which I cannot definitely give an opinion. I have observed the matter very carefully; but I am hardly prepared to say whether the difference between 1 to 1 and 1½ to 1 would cause such an increased evaporation as would warrant a difference of expenditure for making a very steep-sided tank. But if you get slopes of 3 or 4 to 1, then I am certainly of opinion that the evaporation would be very largely increased, and that it would pay to make steeper sides.

1813. *Major Penrose.*] Of course, the ratio of increase depends upon the size of the tank? Yes; of course it does.

1814. Now, if your tank was a mile wide? Oh, we deal with tanks of a certain size. We are not supposing lakes, but tanks such as we are accustomed to see constructed. I am speaking now of ordinary squatters' tanks, and they run from 15,000 to 25,000 yards. The water, shallowing much by the flattening of the sides, causes a thin film of water round the edges of the tank, from which there is a much greater amount of evaporation than there is from the surface of the water in the bed of the tank itself, where the water is deeper. Besides this, in the shallow flat-sided tanks with easy slopes there seems to be a greater amount of capillary attraction by which action the water creeps up from the edges into the dry earth round the sides of the tank causing a greater amount of evaporation than in the steep-sided tanks. Why there should be less effect from capillary attraction in the steep-sided tanks than in flat-sided tanks I am not prepared to say, except that in the flat-sided tanks there is a greater surface exposed in proportion to cubic contents than there is in steep-sided tanks.

1815. *Chairman.*] Are you aware that as a rule squatters make long slopes for the purpose of allowing stock to water in the tanks? In some instances I know they allow the stock into the tanks to water; but in others I know that the stock get the water from the troughs. I do not think that on stations you will find so steep a slope as 1 to 1 or 1½ to 1, which would be a steeper slope than would be allowed where stock could go in. In tanks into which stock are allowed, you will find that the slope is about 4 to 1.

1816. *Major Penrose.*] Do you consider that a slope of 2 to 1 would be a fair average slope for a Government tank? Yes, I should say so, if it were found that the work would be much cheaper by having it done that way. I think if tenders were let, leaving it to the contractor to arrange the slopes, you would find a material difference in the prices tendered for.

1817. Are you aware that the Government tanks are made with slopes of 2 to 1? No, I believe they are made with a slope of 1 to 1. I have never measured any of the slopes; but looking at them with my eye, I should say that they are 1 to 1. However, looking at the plans that you have shown me, I see that the tanks are made with a slope of 2 to 1. This makes me more surprised at the extraordinary price given by the Government, as compared with the price given by the squatters.

1818. *Mr. Woore.*] Have you ever heard any contractor say his contract price was 2s. 6d. per cubic yard for sinking a Government tank? Well, I cannot swear to that; but I was under the impression that one of Burton Brothers told me he was getting 2s. 6d. per cubic yard. It is now more than nine years ago since this occurred; and after that length of time I am not prepared to say whether I heard it from Burton Brothers or one of the Fords; but I was certainly told that this was the price that Burton Brothers got for doing the work.

1819. And was that generally believed in the district at that time? Yes; that was the general belief in the district.

1820. You said, at the commencement of your evidence, that you learned this from conversation which you had heard between contractors? No; I said I learned it while associating with the people who did the work.

1821. You heard them talking about it between themselves? No; I was not in the position of overhearing anything that was said. I was present at the conversation. I am quite positive of that.

1822. And those persons whom you referred to are Messrs. Ford Brothers and Messrs. Burton Brothers? Yes; and other people in Wilcannia.

1823. *Chairman.*] Where do these people—Burton Brothers—live? I fancy they came from Hay, or some place on the Murrumbidgee. I know that they had mail contracts between Menindie and Bourke.

1824. Are you aware that the Government, as a rule, insist upon the earth being taken a greater distance from the excavation than the squatters? Yes; they insist on leaving a greater berm. I have often noticed that.

1825. Would not that tend to increase the cost of construction? Yes; I think it would.

1826. Have you heard that there is sometimes considerable delay in obtaining payment from the Government after the tanks are completed? Yes, I have heard that; but I do not know it of my own knowledge.

1827. Do you think that there is another reason why an excessive charge is made? No.

1828. There is another reason that has been given us. Have you ever heard of such a thing as an arrangement or a conspiracy between the contractors to send in tenders very much in excess of what they would expect

10 Feb., 1888.

expect to get from private individuals, and taking care between themselves that they will not go below a certain price? No; I have never heard of that.

1829. Then, the effect of this long delay in paying the contractors would probably lessen the number of tenderers, because only men of means would go into such contracts? Yes.

1830. If many months elapsed, a contractor (who would have to pay his men somehow or other) would be put to serious inconvenience, and, unless he were a man of means, he might be ruined? Yes; the small men are invariably shut out of these contracts. There is no doubt whatever about that.

1831. You are aware, also, that the Government insist on the earth being spread out evenly all around the tank? Yes; and the slopes just the same as the tank.

1832. Would the effect of having the earth so distributed be to increase the cost of the whole work? Yes; I should say that it would materially add to the cost.

1833. Do you know why this is done? No; except it is done to secure uniformity of appearance.

1834. Well, in your opinion, is it desirable to have the embankments around the tank for the purpose of lessening the action of the wind upon the water—the wind causing more evaporation than the sun? The embankments would always be put around the tank for the sake of decreasing the lead; but there is no necessity for the earth being so regularly distributed around the tank. I admit, of course, that it looks better. I know that this is another thing which increases the cost of these works, because I have heard it from men who “chucked up” such works on this account. I have heard this matter discussed on many stations, because tank-sinking is one of the principal topics discussed in the back country, where it is talked about at almost every table you go to.

1835. Now, is there anything else that strikes you? No; I cannot say there is anything else.

1836. *Major Penrose.*] Do you consider the construction of any of the tanks faulty from an engineering point of view? No, I think not; excepting that, in my opinion, they ought to have been done at a less price; and flatter-sloped tanks could be constructed at a less price; but if, as I see by the plans, the tanks are made with a slope of 2 to 1, I would not be in favour of making them much flatter.

1837. *Chairman.*] But in case the stock were admitted to the water? I would not consider that because I would not allow it. I believe that sheep if allowed into the water will carry away more in their fleeces than they will drink.

1838. You have made some statement about contractors being obliged to go through gravel? Yes; but on reading the specifications I see that it is provided that the depth shall be varied in accordance with the quality of the earth met with; but I do know one tank where the contractor had to go through a stratum of gravel. This tank is close to the 35-Mile tank on the 70-Mile track; it is near the 37-Mile. This is the tank that I alluded to as having been sunk through gravel.

1839. *Major Penrose.*] The terms of this specification, as regards earthworks, appear to you to be good? Yes, except this one matter, which is evidently a clerical error.

1840. *Chairman.*] Have you seen anything in connection with wells in the back country which calls for comment? Not in Government wells.

1841. Do you think that instead of making tanks and dams and wells, it is desirable that attention should be given to artesian boring? No, I do not; because, although when only a few wells are put down the supply appears inexhaustible, when a number of wells are sunk in the same locality it will be found here, as it has been found elsewhere, that the supply will materially decrease, and that instead of the water coming over the surface as at present, it will have to be pumped up.

1842. You are aware of a wonderful artesian bore which has recently been put down at Barcaldine? Yes; I read of it.

1843. You saw that it gives many hundred thousands of gallons per day? Yes.

1844. Do you think that boring alone will decrease the supply? I think so; I noticed that the supply from a large 22-inch well near Paris decreased, although it had a larger flow than Barcaldine well.

1845. Have you ever had reason to find fault with the selection of the sites of those tanks that you happened to come across? Yes; I think the 35-Mile tank is badly selected as to site.

1846. For what reason? Had it been situated on a slope, instead of on rising ground, it would have caught more water.

1847. Was there equally good soil there where it could have been sunk? That I cannot say. Of course I never looked attentively to see whether there was anything wrong with these things. I merely say that it would have been better situated for catching water lower down; but there may be good reasons for putting it where it was.

1848. Have you seen any wells sunk in improper places? No.

1849. You think the specifications which have been shown you are fairly good ones? Yes.

1850. Have you observed the machinery which is attached to these tanks and used for raising water to supply it to the troughs? No; because I think that most of the machinery at present in use was put down subsequent to my having been down in that part of the country. All the machinery that I can recollect was the M'Comas pump.

1851. There are now Tangye steam pumps? Yes; but I have not seen any of them.

1852. With your knowledge of the country, do you think that the use of one of these pumps entails unnecessary expenditure of money? I think I should be inclined to be guided by what the squatters in the district do. It is really hard to say, where there is a big mob of sheep or cattle that have to be watered in a hurry.

1853. You are aware that at all these works there are service tanks that can be kept full? Yes; I know that. The service tank and the troughs are supposed to be kept full. I really do not see that a steam pump is needed.

1854. Besides, it requires a better educated man as caretaker? No doubt about that; and there must be so much idle time that it would do a man good to work the ordinary pump. It often struck me as wonderful that they did not put windmills on the tanks.

1855. They would be the cheapest? Yes; and in case the water was not wanted, it might be allowed to run back into the tank again.

1856. Have you observed the fences around the caretaker's paddocks and around these tanks? No; I have not.

1857. *Major Penrose.*] Have you had much experience in wells? No, very little. I have seen a great many wells, but had nothing to do with the sinking of any. I have a good knowledge of putting down mining-shafts, but not of wells, in this country.

1858.

G. W.
Townsend.
10 Feb., 1888.

1858. A good many of these are supposed to be salty? I know some of them are.

1859. There are the Mossiel, Holy Box, and Dolmoreve wells? Yes; that is common to private wells also.

No one can tell whether the water will be salty or fresh until he gets down.

1860. Do you think that the constant baling of water will freshen it? I believe not. I know men who started at it and gave it up.

1861. Did it improve the quality of the water? Unless I had some evidence to prove that it did improve the quality of the water, I should not care to incur the expense. Both the Government and private individuals throw away money in sinking wells instead of boring. They go and sink wells before they know whether they are going to get fresh or salty water; whereas, were they to get a boring-rod or water-auger, and bore preliminary to making wells, they could have satisfied themselves as to the existence or non-existence of water, and could know whether the quality of the water was good or bad for as many shillings as it now costs them pounds.

[The Commission adjourned.]

THURSDAY, 16 FEBRUARY, 1888.

The Commission met at 10 a.m.

Present:—

HON. G. H. COX, M.L.C., CHAIRMAN.

MAJOR PENROSE, R.E., | J. C. WOORE, Esq.

Edward Quin called in and examined:—

E. Quin.
16 Feb., 1888.

1862. *Chairman.*] Where do you reside? At Tarella, near Wilcannia, on the Darling River.

1863. You were formerly a Member of the Legislative Assembly for the district of Wentworth? Yes, I was member for the district embraced in that country.

1864. From your long residence in that neighbourhood, have you any personal knowledge of the wells and tanks put down by the Government? Yes; I have a knowledge of a number of them.

1865. Can you give us any evidence showing glaring faults in the selection of sites for tanks and dams? Yes; I know of three very glaring cases: the Peri tank, the Tarella tank, and the Victoria or Meenamurtie tank.

1866. *Major Penrose.*] Was the public watering place at Tarella a tank or a dam? It was a tank. These are the most glaring cases that I know of.

1867. *Chairman.*] Well, we will take the first one—the Peri tank;—what fault have you to find with that? Well, I have frequently seen a large body of water there. The station sheep watered there for years. It is very near, or right on, to the stock route, and the tank is close by to the springs, which are really on a Government reserve. The consequence of being so close to the springs is that the tank is never used. The springs are flowing over the surface, and a large body of water flows away. I consider the putting of a tank there a serious mistake.

1868. Was the spring on the travelling-stock route at the time that the tank was constructed? It was on, or very near, the route, and was used then. It was only recently that many of these stock routes were proclaimed; and proclaimed, I may say, through my exertions in Parliament. I thought it desirable that it should be done to prohibit selection and the alienation of water frontages.

1869. If the Peri Springs were not open to the public, was it not desirable that a tank should be sunk at that place for the supply of travelling stock? But it was on a reserve years ago—before the tank was ever sunk at all.

1870. *Mr. Woore.*] Was this a reserve from sale or lease? It was a reserve for public purposes. You know the people in the country districts merely know that a place is a reserve for one purpose or another; but what the purpose is, they sometimes are hardly aware. The stationholders never refuse admission to the tanks, and the manager of the station mentioned how absurd it was to construct a tank so close to the springs. I had a conversation with Mr. Fred. Bonney and others on the subject, and this was the effect of it.

1871. Had the springs been open before the tank was put down? Yes; the springs had been open years before. I saw large bodies of sheep watered there fifteen or sixteen years ago. I was driving round the country then with Mr. Bonney.

1872. Are you not aware that Mr. Bonney himself was very much against interfering with the springs, and very much in favour of a tank? I am not aware of that, because Mr. Bonney pointed out the absurdity of the thing to me later on.

1873. Oh! he did that later on; but not at that time? I am speaking now of Mr. Fred. Bonney.

1874. And I was referring to Mr. Edward Bonney? [No answer].

1875. *Chairman.*] Then, considering the abundance of water at the Peri Springs, and believing that they were on a travelling-stock reserve, you think it was a great waste of public money to excavate this tank? I do certainly think so.

1876. But would your objection apply in the event of springs being on the leasehold area of the run? No; not if the lessee had power over the springs, and refused to allow travelling stock to water there. It might not apply under these circumstances; but the present manager of the station, Mr. Hogarth, who would have no objection to stock watering there, often drew my attention to the absurdity of putting down a tank there.

1877. *Mr. Woore.*] But do you not know that the springs were within the squatter's lease? I was not aware of that. Mr. Hogarth told me that the object of closing the springs was to prohibit stock from watering there, and to compel them to go to the tank. I cannot, of course, say this authoritatively; but I believe it was done so that the stock might be made to pay for watering at the tank. In pointing out to me the absurdity of the thing, Mr. Hogarth stated that there is so much water in the springs there that it was simply ridiculous to sink a tank; and, as a matter of fact, the tank has never been used, and the springs are watering the stock still.

1878. Is it not within your knowledge that the springs and the tank together were insufficient to supply travelling stock with water during the last drought? No; such a thing as that is not within my knowledge.

1879.

1879. *Major Penrose.*] Apparently this tank was constructed on the recommendation of Road Superintendent Cambridge, who stated that the site had been approved of by some of the oldest residents in the district, to whom he was indebted for much assistance and information. He referred to this and to the Peri Sand-hills tank;—do you think that this is a fair statement? I can only say that Mr. Fred. Bonney complained very much to me of Mr. Cambridge fixing this place as the site of a tank, and also again complained of the tank being placed there. He also complained of a tank being placed at Copago, where he was sure it would quickly fill up with silt. E. Quin.
16 Feb., 1888.
1880. Then, in the minute by Mr. A. P. Wood, of the Roads Branch, Public Works Department, it is stated:—"The Peri Springs tank: This work was constructed before I had any connection with this Branch, and I have never seen the site; but I know that it was approved by the Crown Lands Commissioner, and by those who petitioned for the works on the Paroo Road"? I merely tell you what Mr. Fred. Bonney said to me in reference to these tanks.
1881. You do not know whether the sites of these tanks were generally approved of by the other residents of the district? No; I do not know that. I am aware that the general policy of placing tanks on the road was approved of; but as to whether the particular sites selected met with approval I cannot say.
1882. Do you think that this particular spring is capable of watering all the stock that may go down that road? I would not like to say definitely that it was capable of doing this, but whenever I saw the springs there was a large body of water flowing out; and both managers—Mr. Hogarth and Mr. Bonney—told me that they did not see any necessity for a tank. Indeed, Mr. Hogarth came to me when I was a public man and complained of it as a waste of public money.
1883. Supposing that the yield from this place was only 7,000 gallons per day, would it not be necessary to construct other works, in conjunction with these springs, in case mobs of 10,000 sheep, which might drink 20,000 gallons of water, came along. The public might have had access to this particular water; but if the land were under lease they would have no control over it, and though a lessee might have no objection to stock watering at these springs, still he might object to the springs being meddled with? As to that I cannot speak; all I can say is that the managers of the station who controlled the springs said that it was absurd putting a tank there.
1884. But meddling with a spring often stops the supply—does it not? In some cases it does; not often, but in some cases.
1885. *Mr. Woore.*] These springs being situated in the lake, do you not think that the cost of opening the springs and erecting works for supplying water to the large numbers of stock that pass that way would have been equal to the cost of making a tank? Well, I have not taken the levels, but I should hardly think so.
1886. You are aware that the springs are in the lake? Yes; but whenever the springs are not accessible the lake is full of water. The works would always be submerged when the lake was full.
1887. Have you any idea of the number of travelling stock that have gone down the Paroo along the stock route within a given time? I cannot say, but certainly very large numbers have gone down there.
1888. And do you think from what you know of the springs that they would yield sufficient water to supply a very large number of stock travelling that way through a severe drought? I would not like to say that the springs would yield an unlimited supply of water per day, but I have no doubt that they would give sufficient water to water a very large number of stock if the stock were distributed over several days. Of course, if 50,000 or 60,000 head of sheep came in one day, I do not think the springs would be sufficient to meet their requirements; but if the stock were distributed over several days, I think the supply of water there would be ample, if proper appliances were put down for conserving water. I mean by proper appliances, buckle-plated iron tanks, such as are now being constructed; and if these were put down I think it would enable the number of stock I have mentioned to be watered.
1889. *Major Penrose.*] That would necessitate pumping water from the springs, would it not? Yes.
1890. *Mr. Woore.*] You say that this spring was opened—in what way do you mean? I mean that it was opened for watering purposes, and that the water was flowing out of it.
1891. But had anything been done to the spring? Only that a fence was put round it to protect it from the stock.
1892. Except for that the spring was in its natural state when the tank was made? Yes; with this additional exception—that there was a drain and a small dam made there to catch the overflow.
1893. And since the tank was made has not something further been done to the spring? Yes, I believe so.
1894. Do you know of your own knowledge? No; I cannot say that. I do not know what has actually been done, because I have not seen the spring for some time.
1895. But something has been done in the way of opening up the spring with a view of increasing the supply of water? Yes; I believe that Mr. Hogarth has done it.
1896. Are you not aware that the lessee's stock, grazing over a very large area of country adjacent to this spring, were entirely dependent on this spring for water? Yes, I am aware of that. I am aware that they were dependent for water on the spring in time of drought.
1897. And do you know that the spring was in fact a sort of refuge for the stock of the Momba station in time of drought? Yes; that is so.
1898. *Chairman.*] That being the case, Mr. Quin, do you not wish to qualify to some extent your previous statement, that it was undesirable to sink this tank in close proximity to the spring; because, in the event of the squatter requiring a very large quantity of water from this spring for the use of his own stock, is it not probable that none would be left to supply the requirements of travelling stock? Well, I think that if the spring were reduced to such a state as that, there would be no large body of stock travelling. When this place becomes a refuge for the station stock, very few travelling stock will pass, because it is only when the country is passable that a large amount of stock will travel.
1899. *Major Penrose.*] But the object of putting down public watering places is to make these routes passable? Yes, but a route may become impassable as much from want of grass as from want of water.
1900. *Mr. Woore.*] Is it not a fact that the lessees of Momba station during droughts watered as many sheep at the Peri Springs as they consider the springs capable of watering? Yes; I believe they did.
1901. The springs being the only permanent water on that large station? Yes; the only permanent water during drought time—it and the other spring that has since been opened.
1902. It is the only permanent water, then, for a large number of stock? The only permanent water for the country in its natural state was the Peri Springs; but if they depended entirely on permanent natural water,

- E. Quin.
16 Feb., 1888.
- water, and no works had been constructed, no stock could travel at all, because the gaps between one watering place and another were so tremendous.
1903. Are you not aware that the lessees of the Momba station were strongly averse to the springs being interfered with? No; I never heard them say anything with regard to that. I know that Mr. Fred. Bonney was one of the first to complain to me of a tank having been put there.
1904. *Major Penrose.*] Did they collect rates for the water from the travelling stock? No.
1905. *Mr. Woore.*] Do you think that the site chosen for the tank is a good one for catchment? Yes, it is a good catching place; but I do not think that it was a judicious selection, seeing that a large number of station sheep were watered at the springs within half or three-quarters of a mile of the tank, where there was every likelihood of the sheep boxing. Putting the tank there was very likely to lead to a great confusion; and if the springs got so dry that the station sheep only could be watered, there would be no use in sending stock to travel, because there would be no grass anywhere.
1906. Did the manager of the station himself suggest the site of the tank to Mr. Cambridge, the Road Superintendent? No; I am not aware of that.
1907. Is not the road by Peri Springs the road chosen by the public to travel their stock at the time when the country was opened to them to go anywhere they liked? Yes; that is so.
1908. It was in these days the most convenient road? Yes.
1909. *Chairman.*] Now, you mention two other sites for tanks that you took great objection to? Yes; the Tarella tank is one of them. My reason for objecting to the Tarella tank is that it is not required. When the excavation had proceeded some 7 or 8 feet, I communicated to Mr. Bennett personally my opinion that the tank was being placed in an unsuitable position. I objected to it, not because the catchment was not good, but because it was not necessary there at all. It was placed at a spot about 4 miles above Tarella station, and I had large dams near it, one of them being 3 miles beyond it. Both these dams were on the roadside, and available to the public for ten years before. The name of one of these dams was the Koonawatta, which was on land made a reserve by the Crown Lands Commissioner; and the other place was called White Cliffs, which was about 3 miles above the tank. The two dams were only 8 miles apart, and the public had access to them at all times. I certainly did not deem it necessary for a tank to be put down there, on account of these dams being within the boundaries of a stock route.
1910. *Mr. Woore.*] Were the stock routes proclaimed then? No; the stock routes were not proclaimed until quite recently, but the public road was there.
1911. *Chairman.*] Then the proximity of these dams to the public road made you think it was a waste of public money to proceed with the Tarella tank? It did. When I went to see Mr. Bennett, he told me in reply that the contract had proceeded so far that the compensation which would have to be paid to the contractor would equal the cost of making the tank to the original depth. The reason why I did not communicate with Mr. Bennett sooner was that I was then partially a resident of Sydney, and did not know the exact site of the tank. Mr. Bennett was always very anxious to get correct information, and to do what he considered best in the public interest, and paid every attention to the communications which I, as a public man, addressed to him. It was on that account that I at once communicated with him as to the site of the tank.
1912. Are you aware who it was that chose the site of this tank? I am under the impression that it was Mr. A. P. Wood, of the Roads Branch; but I cannot say positively.
1913. Do you believe that Mr. Wood is personally responsible for choosing the site of this tank? Yes, I think so. While there remains a drop of water in my dams I do not think the Government will be able to sell any water from this tank, because my dams are on the road side.
1914. *Mr. Woore.*] But before the stock route was proclaimed, did the public possess any right to water at these dams, or did they water their stock there merely on sufferance;—I think Koonawatta was reserved by you? Yes; to prevent it from being selected.
1915. *Major Penrose.*] Did you think that travelling stock had a right to water there? I never thought that I had any power to stop them. The stock always had power to go half a mile each side of the road.
1916. *Mr. Woore.*] At the time you speak of, very little stock travelled that road? Yes; a considerable quantity of cattle from Queensland.
1917. Very seldom, I think? Large numbers came even then. Mobs of 300 and 400 cattle used to come from the Bulla Downs, from Thargomindah, and Cooper's Creek.
1918. You consider, then, that, notwithstanding the lessee had conserved this water by dams, the public had a right to water their travelling stock there? Well, I never thought that I had any power to stop them, the dams being within half a mile of the travelling stock road and within the stock reserve.
1919. *Major Penrose.*] Which means that the travelling stock had a right to water there? Yes; I always assumed that they had such a right, and unless travelling stock were interfered with by the lessee I think that tanks should not have been put down. It is only when found absolutely necessary that they should be constructed.
1920. *Chairman.*] Was this Tarella tank excavated on a travelling stock route? Yes; right along the side of a road.
1921. In the case of the Meenamurtee well, do you also think there is reason to find fault with the site? Yes; it is certainly within a mile or a mile and a-half of a waterhole that I have seen dry only once during the past 20 years.
1922. Was this waterhole accessible to travelling stock? Yes; and there is a 3 or 5 chain road right down to the water.
1923. But when this well was made there was no travelling stock road? No; but we always used a road. The Land Act defended travelling stock going by the road. I never looked at the proclamation of these routes as altering the conditions at all.
1924. *Mr. Woore.*] Do you think that if the lessee chose to fence in water, conserved at his expense, people travelling with stock would have any right to pull down his fences and take the water? No, I do not; because if they did the owners of stock would not have enough water.
1925. Then the water was used merely on sufferance? There was access to a large body of water, apart from the purchased land.
1926. But, under the circumstances I have stated, would not the water be used merely on sufferance? Yes; on the purchased land; but there was a great deal of water which was off purchased land.

1927. If the lessee chose to fence in the water conserved by him in dams made at his own expense, would the public have any right to pull his fence down and water their stock there? The lessee could only fence in a certain portion of the frontage, and there would be a large portion of the balance accessible to the public.

1928. *Chairman.*] In carrying out these works, I presume that Mr. Bennett, the Commissioner for Roads, can act only on the advice of his subordinates? Yes; certainly.

1929. In this instance you said that it was Mr. Wood who had selected the site? Yes.

1930. And if any mistake is made, it is Mr. Wood who is to blame? Yes; whoever selected the site.

1931. *Major Penrose.*] Mr. Wood says, at the conclusion of his letter of 3rd June, 1884, that "I may add that I gave Mr. Quin, M.L.A., a list of the works let during that visit, and that the people in that district, through that gentleman, expressed their satisfaction at the course adopted by me at the time?" Yes; that is quite right; but in giving the list, I may explain that I was then the representative of the district, and Mr. Wood dropped me a note, I suppose in consequence of my representative capacity. On the back of this note he had a list of names of various works, including an item—tank at Tarella. Well, as Tarella is 40 miles through, I had no idea of the particular spot to be selected. Meenamurtie is 35 miles through, and the site there also was not specified. As the people of the district had been very eager for the construction of these works, and as Mr. Wood said that that would be a convenient opportunity to get them done, I wrote to Mr. Bennett, saying that Mr. Wood's action was very generally approved of; but I must say that I did not know where all the sites of the tanks were, nor did I think it my province to interfere. When an officer wrote to me about a matter of that kind, I did not consider it my duty to bother my head about the exact sites to be selected.

1932. This letter was prior to the time you found that the tank at Tarella had been sunk 9 feet deep? Yes; I did not know where the tank was to be put until it was down 9 or 10 feet.

1933. *Mr. Woore.*] Where else would you have put a tank at Tarella? I do not know that I would have put a tank there at all.

1934. Is it not a fact that the position chosen for this tank was the best position, as a catching place, on the road? I would not say that, because the road is full of good positions. The tank was certainly put at a place where it would fill very readily.

1935. *Chairman.*] Then, you qualify your previous statement that you were at first quite content that the tank should be put there, and that afterwards you found reason to find fault with it? I do not think that any necessity had arisen for a tank there. Tanks were wanted in other places much more.

1936. On the same run? Yes; a tank could have been put 5 or 6 miles above the tin hut to greater advantage. When the upper portion of the creek was dry the lower portion had large dams which held out. I never interfered with travelling stock for ten years previously.

1937. Therefore, although you gave your approval to the construction of works on this particular run, you were not aware that this unfortunate site would have been selected, and that a place would have also been selected in such close proximity to permanent water? No; certainly not. I do not know what revenue has been received from these tanks for the last three years; but I should imagine that it would be very small.

1938. In good seasons like the present, many of these tanks are not required at all, and, therefore, no possible return could come in from their use? Yes.

1939. *Mr. Woore.*] If station improvements were sufficient for the use of travelling stock, what necessity was there for making any public watering places at all where there were such improvements? I only mentioned one or two cases as being unnecessary. The bulk of the other watering places are, I think, of great use, and are properly situated. I am merely finding fault with the expenditure on these sites, which I think might have been better chosen. To show that I was not selfish in the matter, I urged that stock routes should be put through my run, and I had a very great fight with the Department to get them proclaimed. Mr. Lewis and others had a notion that reserves every 7 or 8 miles, and several miles square, would suit better than stock routes.

1940. *Chairman.*] Do you think that it would be desirable that travelling stock routes should be wholly cut off from the leasehold area? No; I think it would be decidedly in the interests of most of the properties to allow things to remain as they are. In many cases stock routes follow creeks or rivers, and if they were taken from the runs the lessee would not have access to the water. It is a far better plan to have a give-and-take policy, by which the lessee may use the land and allow the public to use it when they require it.

1941. But where there are no permanent rivers and creeks, then do you not think it would be desirable that the stock routes should be fenced off from the leaseholds? I do not think so, because it is only very rarely that stock are annoyed or bothered on these routes. The cost of fencing would be very great, and no one would have control over these large areas of country. Now the stock have a large area to travel over, and are not confined; so that, in the interests of travelling stock, I do not think that this should be done.

1942. Of course you are aware that the lessees have to pay rent for these routes, although the land is used by travelling stock;—do you think that is fair? No; I think some allowance should be made in the rent for the fact that a stock route passes through a run.

1943. But you do not think that it would be desirable to fence off travelling stock reserves, because then the lessees would have no necessity to urge on the travelling stock the regular number of miles per day? I think all round that it is better the stock routes should be within the runs. Some few squatters may abuse their rights in connection with the stock route, by overstocking it, but generally this is not the case.

1944. Do you not think that these reserves, if taken off and fenced in, would retain very much more grass than at present for the use of travelling stock? No; I do not think so. In some places in South Australia, where the stock routes are fenced off, they are as bare as the floor of this room. I think the present arrangement works very well, if only some consideration is given to the holder; in fact, I think it would be disastrous to some runs if the stock routes were to be fenced off. Some of the stock would hang fire on the road, instead of travelling the requisite number of miles in a day. I think it would be better if some sort of partnership between lessees and the travelling public were established; let the lessees pay reduced rents. The conditions in Lower Riverina are different from those further back. I think the lessees in the back country deserve different treatment and consideration, more particularly where there are no large areas of purchased lands.

1945. *Mr. Woore.*] As a rule, does not the squatter get the lion's share of the grass on the stock route? Well, I would not say that; but they certainly get a large share. I have a stock route on my own run, and I get a good deal out of it.

E. Quin.
16 Feb., 1888.

1946 {

- E. Quin. 1946. In some cases, do not the owners take care that no grass is left on these reserves? Yes, in some cases,—sufficiently so for me to say so; but generally it is not the case. There may be an odd squatter who keeps a lot of dogs to drive travellers away, but very few of them do it. It would be difficult in a 7 or 8 mile paddock to keep stock on the line of route. I have one paddock 10 miles square, and I should like to know how I could keep stock on that stock route and eat the grass off of it to a greater extent than off the adjoining land. The country is too poor to be subdivided in this way into small paddocks.
- 16 Feb., 1888. 1947. *Chairman.*] Do you think it desirable, in the event of the Government excavating a tank on a public road, that the lessee should have the power to water his stock there? Yes; in the event of the place being one where a caretaker is not required. The lessee should be the caretaker, with the privilege of watering his own stock and looking after the watering of the travelling stock; but where the receipts from the tank will pay a caretaker's salary, I should certainly advise that the tank be kept in the hands of the Government. If only to avoid loss on the part of the Government, I would recommend such a course.
1948. In that case, the lessee would have no right to water his travelling stock? Certainly not. If a tank will pay a man ought to be kept there, and the work kept under the permanent charge of the Department. That is my opinion. No doubt I personally would like to avail myself of the Government tanks, and would use them if allowed to do so; but if the general public used it sufficiently to pay a caretaker's salary, I think the Department would be wrong to allow me to use it at all—that is, if the tank has been put down on a stock route for a specific purpose.
1949. Would not this system be possibly open to abuse—would not squatters have tanks put down for their own use rather than for the use of the public in the event of their becoming the caretakers themselves;—do you not think that it would lead to abuse of this kind, and that tanks would be made presumably for the use of the travelling public, but really for the squatters' own benefit? I do not think so; because I do not imagine for one moment that the Government would construct a tank merely on the recommendation of a squatter, and without the work having been examined and reported on by some responsible officer of their own, who certainly would not be fit to hold his position if he could not be trusted to report fairly on the necessity of a tank or not. I think that it is an absurdity to imagine that the Government would carry out works on a squatter's run on the squatter's recommendation. I know that there is a first-class officer in my district now who would not recommend a tank where it was not wanted. I would like to mention the name of Mr. Hanna, who is a first-class man. I can hardly think that the Government would construct a tank on my recommendation unless it were confirmed by some responsible officer.
1950. *Major Penrose.*] You speak of Mr. Hanna, an officer of the Roads Department;—would not the question of selection of sites of tanks be one for the Mines Department? I am speaking now of the competency of Mr. Hanna. Some of the officers of the Mines Department have not been so good.
1951. You quote Mr. Hanna as being a man who would report the advisability, or otherwise, of a tank being placed in a particular position? If works were reported on by such a man as Mr. Hanna, who, I am quite certain, is fully competent to make such reports when called upon, there would be no danger of the squatter's recommendation being carried out unless it were a good one. To illustrate my meaning, the tank at Tarella is now finished excepting the supply tank, which is under the charge of the Works Department. A well 10 miles away is in charge of the Mines Department; but if any report is called for in regard to either it is possible that the two officers will make separate journeys to both works. For instance, Mr. Tully, the stock inspector for Wilcannia, may find it necessary to inspect the Meenamurtie well; but no matter what little alteration the Tarella tank requires he has no control over it, although he is only 10 miles away.
1952. The Tarella tank, not being finished, has not been handed over to the Mines Department? Yes; and although there is a caretaker under the Works Department who has been in charge of it for two years.
1953. *Chairman.*] For what reason has this tank not been transferred to the Mines Department? Because the troughing is not completed. The tank is there, and the water also; but until the whole thing is finished the Mines Department will not take charge of it.
1954. Do you seem to think that there is a superabundance of officers in the Mines Department. Mr. Tully, being overseer, is quite competent to undertake all the duties of inspector of public watering places, as well as inspector of stock;—and if that be the case, why pay two highly salaried officers to do the work of one? I cannot understand it. I cannot understand why an inspector of public watering places should be appointed when there is another officer in the Mines Department—it may be said he is a stock inspector—whose business it is to travel from station to station and inspect these works. I think that with a small additional sum as salary he might undertake the duty of inspector of tanks and wells.
1955. Then you think the office of inspector of public watering places is a sinecure? I think it is unnecessary, and I believe that Mr. Tully could do the work without any serious difficulty. I think that Mr. Tully is quite as competent to go and report upon these works as any of the men they have.
1956. *Major Penrose.*] To report upon everything from start to finish—construction, maintenance, and supervision? I would not say that. He has put down tanks for me of 20,000 yards, and did the work well. He did it to my satisfaction, and to the satisfaction of many others at Momba. He is quite as competent a man as Low, or any other man that you could choose.
1957. *Chairman.*] Do you know anything about the Copago tank? A tank and dam was constructed at what is called Copago Lake, and it was generally thought that it would fill up with silt, and it has filled up.
1958. The works there are now utterly useless? Yes; the dam has been washed away, and the excavation is silted up.
1959. *Major Penrose.*] Do you know who selected that site? I think it was Mr. Cambridge; but I would not like to say for certain.
1960. *Chairman.*] Do you not think that it is exceedingly undesirable to put dams in this loose soil? Yes; from my experience I would say that it was. I should be very sorry now to put dams on Tarella Creek, now that I know the silting up is inevitable. We would have been very much better without dams. I found the waterholes in which no dams have been made have silted up too. The waterholes on my run have filled up as well as the dams.
1961. And during strong floods these dams were washed away? Yes; the creeks are too rapid and too savage. They come down with too great a rush. They rush up to their highest point and go down again within half an hour.

1962. The officer who selected this site might have only have done what the squatters themselves have done—put down dams which have proved a mistake? Yes; and they might not have calculated on a large body of water coming down there; but I think the officer might have known that the place would fill up, and should have observed that a great body of water would come down there. It is a badly chosen site, and unsuited to this particular class of country. I do not think that a squatter would have chosen such a site.

E. Quin.
16 Feb., 1888.

1963. *Major Penrose.*] Do you think that, as a rule, the tanks constructed by the Works Department are as well chosen and as well constructed as those made by the squatters? I would like to say a word or two on that. In many cases they are well selected, but not so well constructed. They are as carefully built tanks; but in some cases I consider that the slope of the tank is too steep. I may add that I think generally the sites are well chosen.

1964. *Chairman.*] The next question we have to consider is the faulty construction of these tanks. You have already stated your complaint that the batter is too steep? Yes; decidedly too steep.

1965. Do you mean that they are too steep to stand the action of the water, without reference to the watering of stock? Yes; there are some of them too steep for stock, and the wash of the water is so great that the banks wash away, although stock are not allowed into the tank at all. The wash of the water, when it is down 2 or 3 feet from the top, causes the sides to tumble in. The soil crumbles, and the water percolates through the friable ground, causing it to tumble in.

1966. Do you know what the usual batter is to Government tanks? No; I do not. I have never read the specifications for tanks; but I know that from having seen them, they are too steep.

1967. But, as a matter of fact, the batter of Government tanks is 2 to 1? Well, that is too steep.

1968. So that, if the specifications provide for a batter of 2 to 1, it is a mistake? Quite a mistake, I think. I do not know whether it would be in this particular country, or in particularly hard soil; although I am inclined to think that in all cases 2 to 1 is too steep a batter. Of course, we always make ours 3 to 1 and sometimes 4 to 1; and, even if the water was pumped out, we would do the same.

1969. *Chairman.*] Of course, in that dry country the amount of evaporation is very great, and the more you confine the water the less evaporation takes place? Yes; I am aware of that.

1970. Consequently, a long batter will lead to much more evaporation than a steep one? Yes, I know that is the case; but I think the disadvantages are greater than the advantages. Besides which, the Government are put to greater expense by having steep sides to their tanks. In the other tanks the stuff can be taken out anywhere with ploughs and scoops; but in a 2 to 1 tank this cannot be done, and consequently the cost of excavation would be increased. In some instances, where the soil is very hard, I think the batter could be made steeper—say 2 to 1—that is, if it were intended to pump out the water into troughs.

1971. Do you think it more desirable to pump the water out or to allow the stock to drink from the tank itself? I should say to pump the water out.

1972. In all cases? Yes; in all cases.

1973. Are you aware of more than one instance where the soil is very porous, and the effect of treading in the tanks makes it more firm, and improves it? I think all tanks would be improved if the stock were allowed to go in. I should let sheep in for two or three fillings, and then pump the water out afterwards, when the sides are solid. When the bank becomes retentive and will not allow the water to percolate, it is then preferable to pump the water out.

1974. *Major Penrose.*] Do you think that it would be detrimental to health to allow stock into a tank the water of which is used for human consumption? No; I have lived out there in that country for twenty years, and used the water all that time, more or less. In fact, we had no other water to use, and we felt no ill effects from it; but in some cases perhaps ill effects might arise. But I think if it had any such effects we would have heard of them.

1975. *Chairman.*] In certain localities, where the rainfall is fairly ample, you do not think there is the same necessity to conserve water or to use pumping machinery? Yes; and in illustration of what I say I may mention a tank in Lower Riverina which is not 10 feet deep, and this tank has never been dry for many years, although the stock have always been allowed into it.

1976. Now, are you aware that the Government pay very much more for the excavation of tanks than squatters? Yes; I am aware of that. In most cases the Government tanks are deeper than the squatter's tanks, and in other cases the specifications are much more severe than those under which squatters carry out their contracts. In some cases, indeed, the Government specifications are unnecessarily severe; they are too precise as to the batter and the distance as to which the earth has to be carted from the excavation. Then, I think, the system of progress payments is at fault; and it is very hard to get money from the Government, which deters a great many men from undertaking Government contracts. Contractors find very great difficulty sometimes in obtaining the concluding payment, having to wait for two or three months sometimes before they can get away. I know one working-man, having a large plant on his hands, who was anxious to go away and obtain another contract, and yet was unable to do so on account of the danger of disputes arising. I wrote about this to Mr. Bennett, and he at once made provision that Mr. Hanna, or some of his officers should make arrangements for examining the work, and after it was examined he telegraphed the money up to the contractor, which saved a great deal of delay; but even then the contractors had a long time to wait before the officers who examine the work can come round—perhaps once in three months. A man cannot run and get £10 or £20, as he could when doing station work. It would not pay him to go to Wilcannia or Hay to obtain such small sums.

1977. Consequently, it is only men with some means who can afford to tender for these works? Yes.

1978. And that necessarily lessens competition, then? Yes; I know some contractors who would not dream of tendering for Government work at all. I know some men who have done work for me at 1s. per cubic yard, and who, if they were tendering for the Government work, would charge 1s. 4d., for the reasons that I have stated; and even higher rates have been paid in some cases to my own knowledge.

1979. We have had it here in evidence that as much as 1s. 9d. per cubic yard has been paid? Yes; I have known 1s. 9d. to have been paid; and, owing to the severe conditions imposed upon him, I think the man was really entitled to demand a larger sum.

1980. Would not the distance from water increase the cost of the work? Yes; and in very many cases the contractors are bound to time, which, I think, also increases the cost. Very often, however, when the matter is fairly represented to the Commissioner for Roads, the contractor gets an extension of time.

- E. Quin. But in taking a contract a man always has this point in view—that he may be compelled to complete the work within a certain time.
- 16 Feb., 1888. 1981. One other matter. Sometimes, as you are aware, very hard strata is met with in sinking a tank that could not have been discovered by a trial shaft? Yes; I have known several shafts having been put down and still rock and cement were met with afterwards. I knew one case where an excavation was being carried out, and a rock like a pinnacle, or a column, was met with.
1982. The contractor, under the specifications adopted by the Government, would be compelled to excavate this at the same cost per yard as he would excavate earth? Yes.
1983. Had such a thing taken place on a squatter's station the squatter would make allowances—would he not? Yes; at Muntherungie—the station next to mine—Mr. Kennedy has paid 2s. 6d. for excavation of rock. This is a very stony part of the country, and rock is to be met with near the surface, so that unless he paid this high price he could not have got the work done at all. The squatter or his representative is always on the station, watching the work as it progresses, while the Government only send an officer at long intervals, so that some slight delay must of necessity take place; and then the severe conditions of the specifications rather frighten the men who are up there. In most cases, as I have said already, the Government tanks are much deeper than private tanks, and the finishing work required by them is very much nicer than the squatter exacts.
1984. Are there any other reasons for this increased cost? No; I think I might say that squatters, as a rule, allow their men to put the dirt around the slope, allowing it to form itself by the fall from the scoop; but the Government cause it to be battered and sloped, and the earth taken further away from the excavation; the top levelled, both inside and outside. The dirt must be perfectly sloped—which all means money, as in many cases it has to be finished with a tip dray. The squatter never exacts this. I must say that many of the Government works out there are splendidly done, though probably at a very much increased cost. Of course there are faults here and there in some of them; but many of them, as I have said, are splendidly executed.
1985. Now, as regards the expensive forms of machinery;—have you observed the kind of pumps used in lifting the water from these tanks? Yes; I have seen some of the pumps, both steam and horse power, used on several of these tanks. I think that unless they are used in raising the water over the embankments to pump water in, the steam pumps are unnecessary; but if the tank is in a good catching place, and the water has to be pumped out for the use of travelling stock only, I think hand pumps would meet all the requirements—say, with one or two men, when they were very busy, to help the caretaker. More particularly is this the case if there was a small reserve tank on top, of 10,000 or 20,000 gallons, to which the water could be pumped up in the caretaker's spare time.
1986. *Major Penrose.*] Is there not a service tank to be kept full? Sometimes the caretaker is there for weeks doing nothing.
1987. Then you think that steam pumps are not necessary? Yes; except where they can be used as a double pump, and in that case they are very necessary.
1988. *Chairman.*] Would the same objection apply to horse-power as to steam-power? The objection to horse-power is that in very bad times there is very little grass, and the feed has to be purchased, which in that dry country is very costly.
1989. But do not steam pumps involve the employment of a more intelligent and costly caretaker? Well, not always so. I know some very ordinary men who can work these pumps. The pumps are now so simple that with a few lessons any ordinary man can manage them.
1990. Then you would recommend that in all cases, except this you have mentioned, hand lifts should be used? Yes; I found the M'Comas pump a most useful machine, and I think it would be most useful for the purpose. Sometimes, if you had a sudden call upon it, it might be that it would take three or four men to get up a supply; but in such a case as that there would be a large number of men with the stock, and they could be made to help. Besides, the caretaker has sufficient time to keep his tanks full. I think, if necessary, it would be cheaper to have two men there if one man was not enough and sufficient men did not come with the cattle, than to have a steam pump.
1991. *Major Penrose.*] Did you ever make any representation to Mr. Bennett to that effect? No; but I told him that the machinery, unless there was a proper demand for it, would prove too costly. He said not; that he had some very simple pumps, which would be quite cheap. I remarked that what might suit the Government might not suit the squatters. Of course, in a very dry country, where a large number of stock had to be watered, an engine might be better than any other form of machinery; but where the thing is used only occasionally, and where a man is stationed as caretaker, I think that the hand pump would be ample, as in South Australia, where they use the tanks and wells ten months in the year. In that case steam pumps would be the cheapest, because of the large amount of work that had to be done.
1992. In using steam pumps you must have wood? Yes.
1993. Then the cost of supplying wood would be very considerable? We would try and collect a large amount of wood in good seasons; but, as a whole, I think that at the bulk of the watering places hand-power would be ample.
1994. For all requirements that are likely to arise for several years? I will not say that.
1995. These works are intended to be permanent, are they not? Yes; but hand pumps are very cheap, and might be replaced by-and-by, if another kind of machinery were required. What I mean to say is that it is not necessary in many cases to employ steam pumps.
1996. *Mr. Woore.*] But having steam pumps on these watering places now, you can see no object in removing them? No; except where fresh tanks have been sunk I should not employ them. In all cases, in wells steam machinery would be the best.
1997. *Chairman.*] We will now go on to the matter of fencing;—do you know of any fences that have been erected at too great a cost? No; I have never seen the specifications of the fences, but I have seen the fences themselves, and noticed them particularly.
1998. Do you think the fences round these tanks are unnecessarily expensive? Well, seeing that they are Government works, and that they have to last for a great number of years, I do not think so. They are very much dearer than the squatters' fences; but then they have a greater number of years to live. The posts are closer together than ours on runs, and in some cases they use more wires than we do; but then the pressure of travelling stock necessitates the erection of a strong fence.

1999. Would that apply to the fences round the caretaker's paddock, as well as to the fence which is put up as a protection round the tank? I think the fences round the caretaker's paddocks would do very well if they were lighter; but, as the tanks are there for all time, I think it is well that they should be protected by a good and substantial fence. A squatter has only a fifteen years' lease of his run; but the Government are there for all time. E. Quin.
16 Feb., 1888.

2000. Do you not think that the gauge of the wire is unnecessarily large? Well, we have found that No. 8 is ample, and that it lasts a great number of years.

2001. You think then that the larger gauge is unnecessary? Yes; except for the top wire. I think that No. 6 is not too large for a top wire. There is a difference between the squatters' fence and the fence round the tank. Large mobs of cattle come down from Queensland to these tanks, and they would probably rush about a good deal and knock the fence about, whereas a stronger wire would offer them more resistance. It could not be knocked about so much, and it would resist the pressure better under such circumstances.

2002. You are also aware that if No. 4 wire happens to be broken, it is impossible for one man to mend it? Yes; No 4 wire is like bar iron, but I think No. 6 might be mended by one man.

2003. So that in every case you think that No. 4 wire was unnecessary? Yes.

2004. Are you aware that some of these fences have cost at the rate of £120 per mile? No; I was not aware of that.

2005. So that under no circumstances should the fencing round the caretakers' paddocks have cost so much per mile? I certainly think it was unnecessarily costly. I think that fencing up to £70 or £80 per mile may be made quite ample for all purposes. The majority of fences that I have seen round public watering places are very good ones.

2006. Now, have you observed the gates that have been put up by the Government on entering these caretakers' paddocks? I do not think I noticed them particularly.

2007. *Major Penrose.*] Have you ever noticed any defect in the construction of this fencing, with regard to having no straining posts? No; I cannot say that I noticed any fences without straining posts. On the 70-mile track there is some fencing which has fewer straining posts than I would have put down.

2008. We have had it in evidence here that sometimes there is considerable interference with caretakers and others. For instance, a road superintendent may see some work which he thinks should be done by the caretaker. He can, of course, only report to his own superior officer, and then the matter has to be referred to the Mines Department and so on? Yes; I know a tank on the Paroo where Mr. Tully, the stock inspector, recommended that the place should be moved. He wrote down to his Department, and his recommendation had to be forwarded to the Works before the officer of the Works Department could report on the matter; and he had to proceed to this tank some considerable distance out of Wilcannia—some 170 or 180 miles—in order to report upon the alteration. He reported on it, and the alteration was carried out and cost £3. I am speaking now from hearsay. I am of opinion that the expense and salary of an inspector could have been saved if Mr. Tully, who is quite competent, had been allowed to alter the fence. I think the expenses of the man who went to report on the fence must have been very considerable, because he had to pay two visits, which must have been rather expensive, apart from the time lost. When I heard this I went and told the Minister for Mines, and said to him that I wished he would inquire into the matter in the public interest. Afterwards he told me he had done so. I had no interest in the matter beyond seeing that this wasteful expenditure was stopped. I think that these stock inspectors should be allowed to see to any little repairs that might be required after the tanks are handed over.

2009. *Chairman.*] Then, not only does this cause a large and useless expenditure of public money, but it produced friction between the two Departments? Yes; I should imagine that it would produce great friction.

2010. Are you aware of any excessive prices having been given by the Government for work, and that afterwards it was being sublet to other contractors? I have no positive knowledge on the subject; I only heard it.

2011. Are you aware of any faulty construction of wells, and particularly do you know of wells where all the head gear—the whim, and so forth—had been erected before any proof was obtained that water was there, or that it was of any value? No; I cannot say that, except under certain conditions, when the head gear would be required to haul up stuff, and when it could not be got up in any other way. There are no cheap ways of getting up the stuff without erecting a whim, and if you do not erect a whim, it will cost a great deal of money.

2012. Then you think that in all cases a water auger should be used to test whether there is any water there or not? Yes; if you can get the augers that are reliable. My experience in many cases is that where water augers have been used you cannot proceed any further if a choke occurs in the bore and a fault occurs with the tools. I certainly think that if you can get a shaft down it is better than boring.

2013. That can be done at a very small cost; but we have heard here that it costs £1,000 to sink a well? I think that is altogether too expensive.

2014. Are you aware, again, why the Government pay extra rates for sinking wells, as compared with the rates paid by private individuals? No; except that they exact very careful work, and are very particular about the kind of timber used. They excise any timber showing gum veins, although a squatter would accept it, and the conditions generally are very much more stringent than the squatters'. I have seen very good timber rejected, which might have been used with advantage.

2015. Have the huts for caretakers ever come under your observation? Yes; I have seen them in many instances. I think the wood is unnecessarily heavy, and in many cases the increased cost must be very considerable, because they are some distance from water. The erection of these cottages must have been a considerable item. I have seen some of the huts, which were 10 feet square, made of enormous blocks of wood which had to be carted 80 or 90 miles.

2016. *Major Penrose.*] I will read for you the specifications for huts. [*Specifications read.—See Appendix.*]? In the huts I put up I never used any timber stronger than 4 x 2, excepting in the ground-plates, which we would make 4 x 3. The uprights were mortised into these plates.

2017. *Chairman.*] Have tanks with troughing come under your notice? No; all the troughing that I saw I thought was very good generally. The early troughing was faulty, but the later troughing was very good; but I do not think that there was any fault to be attached to the officers for the early troughing, because

E. Quin. because it was the usual troughing adopted by squatters at that time. Latterly, the troughing has been very good, as I have said. It is of plated iron, which I consider very good indeed; so much so, that if I were putting it down again, I would try and get the same thing.

16 Feb., 1888.

2018. Is not composition sometimes put on this troughing? I think they paint it; but if it were galvanized I should think it would be better.

2019. Can you give us any reasons, except those already mentioned, why the apparent cost has been so great, and where the work has given so much dissatisfaction, although nothing is attributable to the officers of the Department who selected these sites. You know some of the gentlemen on the Works Department who have had the control of works in the interior? Yes.

2020. Was Mr. Wood one of them? No, he never had control; he was simply sent to select the site, and did it.

2021. Do you think that Mr. Wood is a competent person to undertake this duty? I would not like to say that. As to his competency, I think he is a professional man; but still I believe he has made mistakes.

2022. You think that a practical man would be very much preferable to select sites to a professional man? I should hardly like to say that, because a professional man should be very competent to select sites, take levels, and so forth; but I think that sufficient consideration has not been given to the opinions of local men. I think it would have been very much better had the officers asked the opinion of local men, and obtained a consensus of local information on the subject of sites for tanks. I really think it would have been better if the work were done, aided by two local men—no man to be consulted about work on his own run. With regard to progress payments, I think the managers of the runs adjacent to the work might be asked to measure it up, and I think that the Government might be fairly asked to pay it on their certificate. A great saving would thus be effected in the coach fares and salaries of inspectors, and so forth. Had I been asked to report whether a tank was 8 or 10 feet deep anywhere near my run, I could have sent down the information for a two-penny stamp. Outsiders there can help the Government considerably in the matter.

2023. *Major Penrose.*] Then, you think the fault is more in the system than in the individuals administering it? I certainly think so. An officer sent out there into that country by the head of his Department must do as he is instructed to do.

2024. *Chairman.*] Are there any other suggestions that you would wish to make, and which, in your opinion, might, if adopted, lessen the cost of these works to the country, and lessen the friction that has arisen between these two Departments? Well, I think one Department, if it could be done, ought to have control over these works. I do not mean to say that one should have the construction and maintenance; but in that case a good deal of expense might be saved, as in the instance I mentioned before, where the tanks and wells were in the same locality, and where two different officers were required to inspect and report on them before they were handed over to the Mines Department. Here was an instance of two officers having to go out and spend their time in examining watering places which were within 10 miles of each other.

2025. Consequently, in the event of one Department having the whole management of these works in its hands, no friction could arise in future? No; no friction at all. It could not happen. I know a case where a site selected by the officer of one Department was condemned by the officer of the other Department; and yet the tank was constructed. One said that the tank was not in a suitable site—that the water would not flow into it—and hence this great delay has occurred.

2026. Then I presume this had to be referred to some one else? Yes; to another Department. One Department recommends and constructs, and the other takes it over and maintains the works.

2027. Then, in the event of a disagreement, to whom is the matter referred? It is settled in Sydney in some way—how, I cannot say; but such a thing necessarily produces a great deal of friction, because each Department naturally defends its own officer.

2028. Have you any other suggestions to make? Only this: that a large number of cattle come down from Queensland, and these cattle, in conjunction with our own, use tanks which have been made at great cost. I think they might very fairly be called on to pay something for the advantages thus afforded to them when they get their permit to travel, whether they use the water or not. Stock-owners in this Colony have no such advantages in the other Colonies; they have to pay a stock tax. We have made this water for the stock, and even if the seasons are good we should not be asked to lose the interest on the money that has been expended on making these works. Cattle from the other Colonies use our grass for two or three months during the year, and drink our water, for which they do not pay a farthing. In fact, they get their grass and water for nothing, while residents of the Colony have to pay rent for the stock routes which these cattle graze over for nothing.

2029. *Major Penrose.*] Besides being taxed indirectly for the works themselves? Yes; I think it would be a very fair charge to make for stock coming in. In addition to that a small charge might be necessary on the runs of the Colony.

2030. *Chairman.*] Have you any other suggestions to make, or any information to give, especially in regard to excessive cost and what has been called red-tapeism? Well, I don't think that I have anything to add. I fancy that more use might be made of local help in the selection of sites. In Queensland, where I have a station, my manager is a member of the Divisional Board, and all such works are done by that body. There is no costly engineering skill needed at all. Four or five of these men construct all the tanks, the cost of which comes partly out of the Consolidated Revenue and partly out of taxation imposed on the station-owners themselves by the Divisional Board Act; so that care is taken that there is no wasteful expenditure of public money, and that tanks are only constructed where they are immediately required. As soon as new tanks are required they are constructed.

2031. So that you would hand the whole thing, the control, supervision, and construction, over to the local boards? Certainly, if we had a Local Government Bill. That is our experience in Queensland, and it has been found to work very well. Victoria can hardly be compared to this Colony, because it is much smaller in area; but New South Wales is capable of a very fair comparison with Queensland. All local works, such as tanks and wells for the passage of stock, a local body has to construct. In doing this work they are subsidised by the Government, and the arrangement has been found to work splendidly. I have to find my share in the taxation, under the Divisional Board system; but then I get a *quid pro quo* in the benefits received.

2032. *Major Penrose.*] Supposing the construction and maintenance of these public watering places were all vested in one Department, the change would not necessarily have any effect in decreasing the excessive cost of construction in the first instance? I think it would. You must, I think, take into consideration in each case what it costs the various officers to travel about to these tanks. I think a very considerable saving might be effected if you had one officer doing this work instead of two or three.

2033. Yes; but the road superintendents would be wanted there whether tanks were made or not, and a stock inspector would be required just the same? Yes; but my arrangement would reduce the travelling expenses. All payments to contractors might be very much expedited and progress payments made on the certificate of certain persons named for that purpose, instead of waiting for months for some person to come and inspect the works. This would reduce the cost very much. The contractors are sometimes reduced to destitution in waiting for their money, and the practice begets a feeling among the men that they will not be readily settled up with.

[The Commission adjourned until the afternoon, when the sitting was resumed.]

Hugh Giffen M'Kinney called in and examined:—

2034. *Mr. Woore.*] What are you? I am a civil engineer.

2035. Are you at present employed by the Mines Department? Yes.

2036. In connection with tanks and wells? No; I have nothing to do with tanks and wells. I am engaged in work connected with water conservation.

2037. Can you give us any information as to the faulty judgment in the selection of sites for tanks and wells: Are you aware of any tanks which are not properly situated? No; I am not. I have never seen one of the Government tanks at all, but I have seen plenty of those belonging to the squatters.

2038. Then the only thing you can give us evidence about is the question of divided control? Yes; that is about the only thing I can give evidence on.

2039. *Major Penrose.*] I would like to ask you some general questions in connection with the engineering part of tanks and wells, the specifications, and plans, before we proceed any further? I wish you would allow me to state at the outset that I have not given any special attention to the construction of tanks and wells. I have been employed all my lifetime in connection with works for water conservation and supply, but they have been all of a different kind.

2040. Complaint has been made with regard to the design of the Government tanks. In regard to the steepness of the batters and sizes of the tanks, it has been stated that the batters are a great deal too steep, and that they wash away through the action of the waves. The batter I am telling you of seems to be 2 to 1? With regard to that matter, the best way I should think would be to decide each case on its individual merits. I should not be disposed to lay down any general rule in dealing with such a matter.

2041. *Mr. Woore.*] You think that a hard and fast rule would not be advisable? No; I do not think so.

2042. And that each tank ought to be constructed in accordance with the nature of the ground in which it is to be put down? Yes; I think that in many cases a batter of $1\frac{1}{2}$ to 1 would be amply sufficient. However, that is a matter which varies in every part of the country.

2043. *Major Penrose.*] Do you think that generally a slope of 2 to 1 would be sufficient for a batter to a tank where it is intended to pump the water out into troughs for the stock? Yes; in all parts of the country where I have been I think a 2 to 1 batter would stand very well—that is where stock are not allowed in the water; but I understand that the practice has been nearly, if not quite, given up—I mean the practice of watering the stock direct from the tank.

2044. Now, it has been said that the waves will wash away the banks;—would that not be likely to occur, even if the batter were 3 to 1? It would occur undoubtedly, though not to the same extent with a flat slope as with a steep one.

2045. Another point has struck me that, in any case, even supposing the batter is too steep, and that the height of water is at the average level, this washing away can make no practical difference, because the amount that falls into the bottom is gained at the top? That is quite correct to a certain extent; but a shallow tank loses more by evaporation than a deep one.

2046. But would the amount of stuff that would fall in from this cause materially reduce the depth of water in a tank in which there was a large excavation of, say, 20,000 yards? There are some cases in which it would. It is astonishing how quickly a tank silts up. I have heard of a tank filling up partly from silt and partly from the falling in of the banks so rapidly that when an experienced pastoralist expected to find 11 or 12 feet of water, he found only six.

2047. *Mr. Woore.*] Do you approve of the principle of making the batters of tanks as steep as the ground will allow, with the object of exposing as little of the surface of the water as possible to evaporation? In the main, that is a sound principle to go upon.

2048. And you think that generally a batter of 2 to 1 is not too much for most soils? Well, it would stand in most places that I have seen; but of course that is a thing which varies very greatly. I know that there is ground near Urana that would stand a batter of 1 in 1 very well; but this is stuff which the people in that locality call cement.

2049. Would making embankments round a tank so shelter it as to reduce the amount of evaporation to an appreciable extent;—would it not shelter the water from wind? I think on the whole that it would, if the banks were any considerable height, and the water was three or four feet beneath the surface of the ground. The banks being 10 feet high, that certainly would have some effect in diminishing the amount of evaporation.

2050. What have you to say with regard to the evil effects of this dual control and the friction which goes on, and how it may be obviated? I think it is a very objectionable thing on all grounds to have the matter of water conservation divided as it is at present. At present this question is more or less in charge of three Departments—the Harbours and Rivers Department, the Roads and Bridges Department, and the Mines Department. You will find in Mr. Bennett's evidence before the late Commission for the Conservation of Water that he said he had no control over water conservation except in regard to tanks and wells, while another Department had charge of the rivers and creeks, and a third Department—the Mines—had the management of the tanks and wells after they were constructed.

E. Quin.
16 Feb., 1888.

H. G.
M'Kinney.
16 Feb., 1888.

H. G.
M'Kinney.
16 Feb., 1888.

2051. In what way has this misunderstanding or friction occurred;—from your observation, can you mention any instance of it? No; personally I have not been brought into contact with any friction at all, but I think it very objectionable to have this work divided.

2052. Can you suggest a remedy? Yes; I think such an arrangement as that in vogue in Victoria would be a better one than that which exists here. In the Government of this Colony we have no Department of Water Supply at all. As I have already pointed out, the matter is divided between three Departments in this Colony; and the subject is not considered as anything but a minor one in any of them. In Victoria they have not only got a separate Department of Water Supply, but they also have a Minister for Water Supply; and in addition to that they have elaborately divided the country into Water Trusts.

2053. *Major Penrose.*] Under a system of local government? Yes; they have local government there.

2054. Have you had any experience of that? Yes; I visited these Water Trusts in Victoria, and know the Engineer for Water Supply personally.

2055. How does the system work? It works very well indeed. The question of water supply and of water conservation is looked upon in Victoria as one of the greatest questions before the Colony, although Victoria requires the conservation of water less than we do here. Besides that, they have a very much smaller territory, having only 86,000 square miles, as compared with our 311,000 square miles.

2056. *Mr. Woore.*] And their rainfall is greater than ours? Taken on the whole, it is.

2057. Therefore, do you think that such a system of water conservation is even more necessary in New South Wales than in Victoria? Yes, it is.

2058. Can you explain the working of this system? In Victoria they have a small central staff which makes up what is called the Water Supply Department. That staff has chiefly to do with examining projects proposed by the different Water Trusts. When these projects are prepared, the Government Engineer for Water Supply decides upon whether they can be recommended to the Government or not. There is only one engineer, and if he decides in favour of the works proposed by the Water Trusts, the Government either lend the money or guarantees a loan to the Trusts for the construction of the works. In the case of large works, such as the weir on the Goulburn River, the Government take it up and deal with it, as what is considered a national work—a work which is beyond the scope of the Trusts. There is another project now being started, and that is the irrigation and water supply to the Western Wimmera district. The Engineer-in-charge sent me over a copy of his report recently, and from that I perceive that one portion of the work is to be dealt with as a national work, and the remainder is to be done by the Trust.

2059. *Major Penrose.*] Then, does each Trust employ civil engineers of its own? Yes; but the Government Engineer has supervision over them.

2060. And are these works in any way similar to the works carried out in this Colony? They go very much beyond our works. I think it is no exaggeration to say that Victoria is at least ten years ahead of us in the matter of water conservation and water supply. They have a very elaborate piece of legislation, which was passed in 1886, and which they admitted was to some extent founded on our Bill which appeared in the first report of the Water Conservation Commission, which was drafted by myself.

2061. *Mr. Woore.*] What is the title of that Act? So far as I can recollect, it is called the Water Supply and Irrigation Act of 1886. I am not sure that this is the exact title; but I believe it is.

2062. And from your experience you can say that this system works well in Victoria? Yes; it has worked very well, and has proved to be very satisfactory.

2063. And is economical—no waste of money? Economical, yes; and no chance of waste of public money; because the people for whose benefit the work is constructed have to pay rates on the money advanced to them.

2064. I presume these works bring in a revenue which covers the cost of construction and maintenance? Precisely.

2065. *Major Penrose.*] These Local Trusts see that the works pay? Yes, they do. In the case of that new work started in the Wimmera, I think the result shows very well how successful the previous works have been. Before the matter was brought forward, works had been carried out to the north of the Wimmera to the extent of £160,000 or £170,000, and the people to the south of the river have been so satisfied with what they saw done there that they guaranteed interest on about £340,000 to carry out works in their district.

2066. Are any non-professional men employed in the construction or supervision of these works, or are they entirely constructed by skilled engineers? They are planned and constructed by qualified engineers. In fact, they are not only designed by qualified engineers to the Trusts, but they have to be passed by the Government Engineer, who has the power to recommend any amendment, and the power to refuse to pass them at all if he considers that they are not suitable.

2067. *Mr. Woore.*] What sort of works have they constructed in Victoria for the supply of water to travelling stock;—are there any wells or tanks there? I know they have a number of tanks.

2068. Have you seen any of these tanks? No; but I have seen the designs. I went to inspect a number of their weirs on the Wimmera and other rivers, and also the channels for the distribution of the water. I was looking at the matter from a wider point of view, and did not go to see the tanks. Besides, some of them were in out-of-the-way places.

2069. Do you think the system adopted in Victoria would be a very proper one to adopt in this Colony generally? Generally speaking, it would be. I am not referring now to the supply of water to the travelling stock routes of this Colony. I doubt whether it would do to place our tanks and wells in charge of local bodies, because it is often to the interest of local authorities not to have water in their district for travelling stock. There may be a few men who do not wish to see travelling stock pass through their district.

2070. Can you suggest any system that you think would work better than the present one for watering our stock routes, and for the construction and control of these works;—do you think the Victorian system the best? The system would not work in that respect so well. The system they have in Victoria is to a large extent different, so that it is difficult to compare the two in detail. In the case of these works in the Wimmera district, they expect to be able to irrigate many thousands of acres of land. With them the watering of stock is merely a secondary matter; but with regard to the construction of tanks on our travelling stock routes, I really do not think that any professional skill is required in constructing them sufficiently well for all purposes. For instance, the manager of a pastoral station is always supposed to be quite

quite skilled in the construction of tanks, and must be able to arrange for the construction of such improvements for the station. I fancy, therefore, that similar men should be well able to do the work here, and in a satisfactory manner. I know that in the Mines Department they have at least two such men who have had large station experience.

H. G.
M'Kinney.
16 Feb., 1888.

2071. Do you think that station watering places can be compared with Government work required for the watering of stock along these stock routes? Yes; I think so. The requirements in both cases are nearly the same; but, of course, in the matter of tanks and wells, I must speak with a certain amount of reservation, because I have no actual experience of them, and I have had nothing to do with their construction and maintenance.

2072. *Major Penrose.*] Are you aware that those who construct private tanks and wells very often make great mistakes as regards the sinking of wells unnecessarily? I believe they sometimes do.

2073. Do not their dams sometimes wash away? Yes; but on the other hand I know that I have frequently found the squatters could beat the Government in the matter of economical construction.

2074. It has been said to us here that correct knowledge in well-sinking has only been gained by bitter experience in some cases, and at the cost of large sums of money? No doubt mistakes have been made by private individuals as well as by the Government officers.

2075. And do you not think that non-professional men would be likely to make greater mistakes than professional men with local experience? Well, yes, that is true; but very often work in out-of-the-way districts has had to be entrusted to men who have had little experience in such matters, and who know very little about the requirements of the pastoralists and of people who have travelling stock passing. The men who are most likely to understand such matters best are the men who have been on stations themselves. With regard to that matter, I should say that non-professional men are more likely to make mistakes than professional men with experience; but in reality, I think, in reference to the construction of such tanks and wells as are required, there is very little professional knowledge wanted beyond what good station managers would necessarily possess.

2076. *Mr. Woore.*] Are there any other points on which you can give us information? I am really not aware that there are any others.

2077. *Major Penrose.*] Do you know anything about the Queensland Water Trusts? I have had no experience of those bodies; but I have seen the different Acts that have been passed relating to water supply there. Victoria is the only Colony besides this that I have inquired into fully, and the working of whose Department of Water Supply I have seen.

2078. We have been told that a great waste of money has taken place in connection with the construction of Hovell's dam by some officers of the Works Department. The dam was placed across a creek, and a by-wash cut through the solid rock. It has been said that this was quite unnecessary, as there was a natural by-wash that would have been sufficient? Well, if the statement given is correct that there is a good natural by-wash, I cannot understand why one should have been cut through the rock.

2079. Is not that a matter that could be determined only by carefully taking the levels on the spot? It could be determined only by careful levelling, and by an examination of the nature of the ground. It might be possible for somebody (if he had seen the site in high flood time) to have got a very good idea of the levels by the extent of water and the rate of flow. It certainly would endanger the dam unless the ground was very hard if there be a rapid fall in the natural by-wash of a large flow of water.

2080. Then you think that there might have been very good reasons for cutting that by-wash through the natural rock? If there was a fall of 6 feet in 20 chains, and the nature of the ground was not satisfactory, I can quite understand that there was reason for it.

2081. *Mr. Woore.*] Allowing the ground to be good, would not a large body of water coming down there be liable to scour away the end of this dam? A good deal depends upon whether the end of the dam is upon low or high ground. If the surface of the water just touched the end of the dam it might be quite safe. Unless the ground were rocky or something approaching to it, the water would scour it away if any large quantity of water passed out,—that is, assuming a fall of 6 feet in 20 chains. If only a small quantity passed it would not effect it in the same way.

2082. *Major Penrose.*] We have had it in evidence that the ground on one side is very flat, and if that be so, would not a great body of water be likely to get away? Yes; if that were the case; but these plans appear to be rather incomplete, as they do not give a cross-section of the natural by-wash, nor afford any information as to the nature of the ground or the discharge of the creek.

FRIDAY, 17 FEBRUARY, 1888.

The Commission met at 10 a.m.

Present:—

HON. G. H. COX, M.L.C., CHAIRMAN.

MAJOR PENROSE, R.E.,

J. C. WOORE, Esq.

John Edward Kelly called in and examined:—

2083. *Chairman.*] Where do you reside? I live at Trangie, on the western line of railway.

2084. What are you? I am a grazier, miner, and employed at other things.

J. E. Kelly,

2085. You are a Member of Parliament? Yes; I represent the Electorate of the Bogan in the Legislative Assembly.

17 Feb., 1888.

2086. You are aware of the objects of this Commission? I am aware that you are inquiring into the management and working of the public watering places of the Colony.

2087. You know that the construction and management of public watering places are not under the control of the same Department of Government? I have heard recently that they are not; but of my own knowledge I do not know it. I have simply heard of it.

2088. Has it ever come under your notice that tanks have been sunk in improper positions as regards catchment, and so forth? Yes; I should certainly say so

2089.

J. E. Kelly. 2089. Can you name one or two of these tanks? Yes; the Nevertire tank, which was recently constructed, and which could, I think, have been put in a much better position. There are also one or two tanks between Nyngan and Cobar which are not properly situated, but I cannot remember their names at the present moment.

17 Feb., 1888.

2090. *Major Penrose.*] Was one of them called Muriel? I would not know it by that name. I merely know by travelling along the road between Cobar and Nyngan that there are tanks not in their proper places.

2091. *Chairman.*] Just state your reasons for thinking so? Well, they are not put upon clay-pans, which are the best catchment grounds existing in that neighbourhood, and some of the tanks are sunk in alluvial formation. There are large clay-pans, as Mr. Woore knows, in that locality, which would form an excellent catching ground, whereas I have seen these tanks put down in alluvial flats, where it requires very heavy rain to fill them. Besides, the soil does not hold so well, and they are more apt to silt up, and generally to be more perishable than tanks put in other places. Catchment on the clay-pans is infinitely better than on these sloping alluvial places. I cannot remember any exact place at the present moment.

2092. *Mr. Woore.*] But you particularised one tank? Yes; the Nevertire tank; and every one who sees that will admit that it could be infinitely better placed nearer the clay-pan than it is?

2093. *Chairman.*] If it were so placed, would it have been on the stock route? Yes, it would, and near the railway. I am going greatly by the opinions of others who have seen the place when it was under water.

2094. Have you any wells in that neighbourhood? Yes, I have one.

2095. Does the same remark apply to wells? Yes; there was a well at Nevertire, sunk by the Railway Department.

2096. But no wells for stock? There are no wells in the neighbourhood of Nevertire or Trangie that come under this heading.

2097. Have you any fault to find with the construction of tanks and with the specifications? Yes; so far as I have seen in my whole life, the works constructed by the Government for the watering of stock are, in my opinion, all mistakes—in many instances I believe them to be a waste of public money.

2098. In what way? Speaking of the most recent job—I must term it that—which has come under my notice—the Nevertire tank—has cost an enormous sum of money.

2099. We will go into the matter of cost presently; we are now speaking of the formation? The batters are too steep, and will not hold water as well as a tank with a proper slope. I will explain my experience in these things. The batters of tanks which have been made by the Government are all too steep, and hence the water will escape from them. It will percolate through the soil; whereas, if the batter had a slope of 1 in 4, or 1 in $3\frac{1}{2}$, the sediment from the water would choke the porous ground, and make these tanks hold like tanks with cemented bottoms. This is my experience and the experience of everybody who has done much tank sinking.

2100. Do you know what the specifications require with regard to the batter? I really do not; but I have seen all the tanks, and I can say that their batters are too steep.

2101. Would 2 to 1 be too steep? Most undoubtedly it would, for the simple reason that water that settled in a tank of 2 to 1 would allow its sediment to fall to the bottom instead of allowing it to go on to the sides, and fill up the porous soil in that part of the tank. It is a well known fact that the sediment in the muddy water will choke the porous ground. I am certain of this, because I tried the experiment last week in soil almost purely sand.

2102. That would apply in particular cases. Of course tanks are sometimes sunk in good retentive soil, and in that case would a sloping batter be required? Yes; even in good retentive soil. There is gypsum even in clay-pans, which runs in veins or seams through the soil below, and allows the water to pass through the sides. The sediment does not fall direct on these passages in steep slopes and choke it up, and any soil requires the sediment in the water to choke up the porous portions of it. Even clay will take in a certain amount of water if it is left in its natural state. It is very fine sediment (which falls from the water when the water is in a muddy condition) which makes them hold. This chokes almost any kind of ground if there is enough muddy water flowing into the tank—that is, if the batters are sufficiently sloping to catch the sediment. The very best tank and the soundest ground I ever saw leaked because there were a few roots of trees in the wall; but since they have been cut out and the ground puddled, the tank has been all right.

2103. This Nevertire tank—is it a tank from which the water is pumped into troughs, or is it one of these tanks into which the stock is allowed to go in and drink? I just now heard a gentleman who took some stock there that badly required watering, and which were going to be trucked to market, say that the stock went to the troughs and would not drink from them; so that, from the information I have gathered, I should say that the tank is one where there are troughs.

2104. You are not aware of your own knowledge whether stock go into this tank to drink or not? No; but I believe the water is pumped into troughs.

2105. From what you have just stated, do you think that where tanks are constructed for watering stock directly, or for pumping, that they require a sloping batter? Yes; a tank with a sloping batter will hold much better—of that I am positive—and admit also of stock watering in the natural way.

2106. *Major Penrose.*] Do you know of your own knowledge that any of these Government tanks do not hold water from the cause you have just specified? Of course I do. I know that they lose their water more quickly than another tank, and I attribute that loss to the cause I have stated. The tank which lasts longest, in my opinion, is a tank with a sloping batter, and not a steep one.

2107. But would not puddling by the stock have something to do with the holding power of the tank? Puddling may be a very good thing; but sediment is the secret of it. I have some small tanks myself in porous soil which have been rendered retentive by tailings from a battery, which choked the drift.

2108. Are you quite certain that sediment will not lie on a batter of 2 to 1? I am quite certain of it. I tried it only last week in a small way.

2109. *Chairman.*] Now, it is stated here in evidence that the cost of the construction of these tanks has been excessive. Are you aware that the cost of these Government tanks has been more than the cost of tanks put down by private individuals? For me to say that of my own knowledge is impossible; but I have seen figures proving that the cost is greater. I cannot; but if the prices which are notorious, and which the contractors say they have received for putting down these tanks, are the true prices, then I say that at least

least twice the value of these tanks is paid away for their construction. I will undertake myself to put down a similar tank to this one at Nevertire for one-half the money, and to make a better tank for all practical purposes.

J. E. Kelly.
17 Feb., 1888.

2110. What rate could you get the Nevertire tank done for? Sixpence per yard. I am getting tanks sunk within 10 or 12 miles of this place for 6d. per yard.

2111. *Mr. Woore.*] Do you know what the cost of the Nevertire tank was? No, I do not; only from hearsay; all I know is that I am getting tanks put down for much less money.

2112. *Chairman.*] In stating that Government tanks are too steep in their slope of 2 to 1, do you not think the slope would be ample in the case of troughing being employed? I think the fall is too much. I have known of one case where, in consequence of the sides being too steep, they fell in.

2113. Do you think the slope here in these plans is sufficient to allow the working of ploughs and scoops? Yes, I think so.

2114. *Major Penrose.*] And you think the slope here shown is sufficiently flat? Yes; even to allow ploughs and scoops to take the soil out; the plans, too, show too gentle a slope, in my opinion. I am positive that the tanks which I have seen have much steeper sides than are shown on the plan.

2115. *Chairman.*] I understand you to say that in your own tanks you always insisted on a slope of 1 to 3½? Yes; but the people who sink the Government tanks either do it wrongly or the plans before us are wrong.

2116. What do you mean by a slope of 1 in 3? I mean a 3 feet slope to 1 in depth; you descend 3 feet by slope to 1 foot perpendicularly. That plan shows too much slope for me, or else I do not understand it. I know what is termed 1 in 4 by practical men is a lesser slope than what is shown on that plan.

2117. Do you think that a slope of 2 to 1 or 1 in 2 mean the same thing? No, I do not think so; 2 to 1 does not mean the same thing as 1 in 2.

2118. Here is the specification of the Nevertire tank of which we are speaking, from which it appears that the slope is 2 to 1? I do know that if these works were carried out according to the sketch before us, which is said to be a slope of 2 to 1, it would be possible for sheep to water on a fall like that. But sheep cannot stand, nor can anything else, on the slope of the tanks made by the Government.

2119. You were speaking of the excessive cost of construction, and you stated that you could get work similar to that which was done at the Nevertire and other tanks performed for 6d. per yard. I see here that the excavation of this Nevertire tank cost 1s. 1½d. per cubic yard? Well, I am getting tanks sunk within 15 miles of Nevertire for 6d. per cubic yard. I am finding the men scoops and ploughs, and lend them a team of working bullocks, and this tank will answer all the purposes better than the Government tank at Nevertire.

2120. *Mr. Woore.*] But in this case you are supplying ploughs, and scoops, and cattle? Yes; but that is nothing at all to me.

2121. Nothing to you; but a good deal to the contractor? No; not much to him. It might be about 2d. per cubic yard more. Having the things, it is no loss to me to allow the contractor to use them; but they would bring the cost up to about 8d. per yard if they had to be found.

2122. *Chairman.*] Can you in any way account for the fact why the Government have to pay so much more than you? The thing is to be accounted for by the way in which the earth is removed, and from the fact that the stuff has to be taken out by one roadway and brought all round the tank. This, in my opinion, costs 2d. or 3d. per yard more than if the earth were removed from all sides of the tank, and were the whole batter a roadway. Any one can see that a horse can go up a batter such as is described, if driven sideways along the batter. I think a batter should be as steep as possible, so long as it allowed sheep to water on it.

2123. Are you aware whether Government tanks are, as a rule, deeper than private tanks? I believe they are.

2124. Would that add to the cost? It would.

2125. Then from the nice manner in which the trimming is required to be done in Government tanks do you not think the cost is increased? Yes; but to a very small extent. Of course all these little things make up.

2126. Would carrying earth 30 feet away from the top of the excavation increase the cost of the work? Well, very few people have their muck thrown less than 30 feet away. It would be taken down again by the sheep in going to water. I always make my people put the stuff from 30 to 40 feet away from the tank.

2127. Are there any other reasons why the Government should pay more money for their work than private individuals? Well, in most cases the contractors have, I believe, to supply themselves with water. They are asked to put down tanks in dry and isolated country, where, perhaps, there is no water with which they can make a start, and they have to go to considerable expense in putting down supply tanks for their own use before they can commence to work. Then they must wait until these supply tanks are full; when we know that the practice of the lessee, or squatter, or private individual is not to go to this cost, but have some preparation made for those who go to put down the tank. But the Government would have nothing to do with these preliminaries, which I think might reasonably be put down as being worth 1d. or 2d. per yard to be added to the cost. This would not occur at a place like Nevertire, where there is water in the immediate neighbourhood.

2128. When a squatter has a tank finished;—I presume when he measures it he pays his men right away? Yes.

2129. Was that done in the case of the Government tanks? No; I have often heard of men having to wait a considerable time for their money.

2130. Weeks or months? I have heard that they had to wait a long time, on account of the Department not having an officer to send to measure up the tank. I do not like to exaggerate anything, but I have heard that men have had to wait several months for their money. Then there is the possibility of disagreements taking place about the carrying out of the work, and in taking work from the Government men have to calculate this as a big item, and it is regarded as such by the contractors. The interference of inspectors, and the delays occasioned by the Government in making payments, is also regarded as another big item in taking Government contracts. Then, again, alterations have frequently to be made, so that contractors necessarily allow a margin for all these reasons. This is what I have heard from all sides; and this is what I complain mostly of, and not that the contractor is paid too much.

J. E. Kelly. 2131. Consequently, it necessitates that men who undertake Government contracts shall be men of some capital? Yes, it takes men with some means, and also men who can find security for the proper performance of the work. Whereas with private individuals, who require excavations made, the doing of the work is regarded as being a sufficient security. They pay about 75 per cent. of their money before the work has been completed.

17 Feb., 1888.

2132. Are you aware what the Government pay as progress payments? I am not aware of it.

2133. As a matter of fact it is 50 per cent. Then, as a necessary consequence, contractors for Government work being necessarily men of means, the number of tenders becomes reduced? Yes; the number of men who are able to do the work. It is only special men who have friends who can undertake Government contracts. Men who have friends who will guarantee the work shall be properly performed are the only men who can get contracts, and I have known instances where these contracts have been sublet—I am going outside the question of tanks now—for one-half the money which the original contractors have received from the Government. The men who actually do the work are the men who receive the reduced rates of pay.

2134. Have you ever noticed the kind of machinery used at these tanks for pumping water into the troughs? Yes.

2135. What kind of machinery have you seen there—horse-power or steam? I have not particularly examined the machinery, but I think they are the Tangye and Blake pumps. These are the two that I saw.

2136. Do you think they are desirable machines for their purpose? Certainly not. I have no fault to find with the pumps, but I find fault with the principle. In my opinion they are not necessary; but, on the contrary, a waste of public money.

2137. Would the same remark apply to horse whims? To everything.

2138. How, then, would you have the water raised? I would not have it raised at all.

2139. You are aware that these tanks are used, not only for the purpose of watering stock, but that they are also intended for the use of human beings who may be travelling along these stock routes? Yes.

2140. Would not allowing stock to water at these tanks pollute the water very much in periods of drought, and so make it unfit for human use? Well, it was never considered so in my time. We always got our water out of the tank that the stock watered at. It might be injurious to health, though.

2141. It never hurt you? Oh, no; it never hurt me; I have been drinking water of that sort nearly all my life. But it is possible to filter enough water for human use, or have it in a little drainage tank, and allow it to percolate through charcoal, to filter it or in some other way fit it for human use, if that point arises.

2142. Would not the continual treading of stock round these tanks tend to fill them up? No, not at all; especially not with the Government tanks.

2143. Are you aware that sometimes in hot weather sheep will plunge into the tank and swim about, carrying a great deal of the water away? I am aware that sheep are accused of doing that, but it is not true. I know that where a big flock of sheep are allowed to go of a rush to water at one time, one will shove the other into the water, and thus cause it to carry away a large quantity of water in its fleece, thus spoiling the wool and wasting the water. But if a proper number of sheep were allowed to water at one time, no sheep would do more than wet its ankles in taking a drink. That is to say—on only a surface of 400 feet no more than 500 sheep should be allowed to go to water at one time. No sheep will go into the water of its own accord; but when a thirsty flock is allowed to go to water at one time, the pressure of those behind will shove the leaders forward, and they will then be forced into the water; but sheep are very timid, and will not go into the water if they can help it. They will wet no more than their toes, keeping clear of the water if they can.

2144. Then, you think the tanks should all be open to the public, and that consequently they would not require caretakers? No; I do not say that; I think it would be well to have caretakers on these tanks who might be paid a small amount for looking after them, and be allowed to supplement their incomes by keeping a small store or a refreshment-room or something of that sort. But I certainly would not like to see these tanks placed at the mercy of a run-holder in a dry country. I would have a caretaker employed wherever there was sufficient income from a tank to pay the cost, whose income, as I have said, might be supplemented by a little store or refreshment room.

2145. Do you think the people specially appointed for that purpose—say, road-inspectors, travelling continuously—would be sufficient to prevent any damage to these particular works, and so save the expense of keeping a caretaker at every tank? I think the cure would be as bad as the disease. I think these ride-about gentlemen would cost as much as a caretaker, and we might want two after all. A good deal would depend upon the circumstances and the sort of men we would have. The safest thing to do would be to leave the caretakers where they are, make the water available, and charge a reasonable sum for it.

2146. What is the probable cost to the Government of keeping caretakers at each tank? Circumstances, I believe, alter cases; there are tanks which employ caretakers at salaries ranging from £60 a year, and I think that is all that is required myself. I know one man who pays £60 per year for the privilege of keeping a store at one of these Government tanks, so that it costs the Government sometimes £60 per year to get done what a private person pays £60 a year to be allowed to do. So that under such circumstances it is impossible to draw the line.

2147. *Major Penrose.*] When these tanks were originally made, was the system the same as at present;—were there not two separate tanks, one for drinking out of, the other being the main reservoir? Oh, I see now what you mean. If the level was the same in both tanks, which were connected by a pipe, the water in the tank in which the stock drank might be replenished from time to time from the other tank. That, no doubt, is the proper way; but you cannot water stock in the first instance out of troughs. Stock which never saw troughs before will not drink out of them. They must be taught to do it. It would be possible I think, to make very much better provision to water stock in the manner suggested by a second tank than out of troughs. I see now what you mean; of course it would be infinitely better than to have troughs.

2148. Well, it was deliberately given up, after experience, in favour of troughs? Well, but we do not know who gave it up; I have been through the country for the last 30 years, and have had tanks and wells myself, and I say that second tanks must be an improvement upon troughs; but even this is not needed.

2149. *Chairman.*] Do you know anything about the fences round the tanks and round the caretakers paddocks? Yes; there are fences round the paddocks.

J. E. Kelly.
17 Feb., 1888.

2150. And do you think that these fences round the tanks to protect them from the travelling stock, and the fences round the caretakers' paddocks, are too costly or otherwise? Yes; like all other Government work they cost twice the money which should have been paid for them.

2151. Why do they cost too much? The work is too good, for one thing.

2152. Do you mean that the posts are too close together? Well, it is no more a lasting fence than a lighter fence. A lighter wire fence would do just as well, and would cost no more than a third of the money. The posts are too heavy and too close together, and the wire is too heavy. The whole thing seems to me to have cost double what fencing that would answer all purposes should have cost.

2153. Would that apply to fences round the caretakers' paddocks as well? Of course you would recommend a substantial fence round the tanks to protect them from stock? No; the fences are too costly. In every instance the fences are far too costly in their character, and are no more permanent than a lighter fence. Speaking of these fences round paddocks and tanks, I really think they answer one good purpose; that is, they help materially to keep the tank from silting up. Around station tanks the ground is cut up in the immediate neighbourhood into fine dust, and the first fall of rain carries the dust in the shape of mud into the tank. This leaves a great deal of sediment at the bottom of the tank. Of course I am now speaking of squatters' tanks.

2154. Is that not remedied by having a silt-tank? I do not think so, because the water comes in in a muddy condition, and brings in the sediment with it; besides some people have no silt-tank at all. I was pointing to the good done by the fencing round the caretakers' paddocks, because it does not allow the catchment to be cut up. This is a very great advantage, and saves the tank from silting up. So far as the injury done by stock walking on the batter, if they make a hill they make a hole which fills up again; thus they do not fill up any of the water space.

2155. Have you ever heard of any interference with caretakers and of overseers by officers of another Department? Have you ever had any interference reported to you of roads superintendents with caretakers? No; I did not know of it till recently. I did not know until then that the whole thing was not under one Department. I never heard of any squabbles between the officers of the two Departments until recently.

2156. Are there any Government wells in the neighbourhood that you have seen? I do not know one Government well that is used for the purpose of watering stock. I know of them, but not from personal knowledge.

2157. Has the hutting put up for caretakers ever come within your observation? No, I have seen nothing too costly in that. All the huts that I have seen left me under the impression that they were built by the caretakers themselves. They seem to me to be bark "humpys." I have not been in the back country for five or six years, but between Coonamble and Warren I noticed one man when I was there who appeared to be living in a bark "humpy."

2158. I heard you state just now that you did not approve of troughing. Will you give us some further reasons why you do not approve of troughing. Is there anything defective in the way the troughing was put down, or is the system, in your opinion, inherently wrong? My objection to the thing is that no troughing can be suitable for the watering of travelling stock, for the reason that travelling stock, in seventy-five cases out of one hundred, have been accustomed to water only at creeks and waterholes, and open tanks, in the natural way, and have never been accustomed to water at anything that is calculated to frighten them, or at anything that is unusual. In many cases the stock come up to these troughs in a maddened condition from want of water. They smell the thing they actually want, but are afraid to touch it. It is more difficult to get stock to go near troughs when they are in that half-maddened condition, than it would when they are not so thirsty. Hence sheep have often perished from want of water while water was in the troughs. Of course, where troughs exist on a station, the matter is different altogether. There sheep have become accustomed to drink out of the troughs, and they will of course go up and drink from these Government troughs when they are thirsty. But no sheep or cattle that have not been accustomed to drink at these troughs will go up at once and drink at them when they come to them. I have never yet heard of an instance where cattle from Queensland, for example, or stock that were not taught to water at troughs, went up and drunk from them the first time. And I have known many sheep of my own knowledge to perish from want of water before they would drink it out of these troughs. I have known sheep smothered by being rounded-up before they would drink at troughs, and the water had to be poured out on the ground.

2159. These cattle from Queensland, having travelled for weeks and weeks, would surely learn to drink from the troughs in a few days? Yes, but while they were learning they would be dying. Going across, say the Cobar road, there are troughs, also on the other side of the Warrego; and there are troughs, I believe, between Warrego and Bourke; certainly no stock will water out of these troughs if they can get natural water on the road. If you wish to get stock to drink out of troughs, you will have to put them in stock yards, with stock to teach them which have been accustomed to drink in this way.

2160. *Major Penrose.*] Are not many of the squatters adopting this system of troughing? Yes, and that is what they ought to do to economise their water; but it is an expensive method.

2161. Then, if that is the case, will there not be a great many sheep educated into drinking out of these troughs? Yes, and in time all sheep will do it, if stockowners adopt troughing. But at the instance of some gentlemen who live in the Cobar and Bourke districts, I not long ago offered to the Department of Mines £1,000 if they would make a flock of sheep, that had been four days without water, drink out of troughs for the first time. Several gentlemen subscribed the money, and told me I was quite safe in offering the money to the officer who designed these troughs, and I offered the challenge in a letter to the Mines Department. When the sheep go at these troughs in a large body, they force some of their number that are in front into the troughs, spoiling the water by the yolk of the wool. They jump on one another, and in some cases sheep are smothered. I have heard of accidents of this kind from good authority.

2162. Would not the same remark apply to sheep going to a tank? No; and for this reason;—if tanks are properly managed, a mob of 20,000 sheep, which is more than is likely to be put into a yard, may be watered in batches of 400 to 500. This number might be allowed to run through into a watering place, and as soon as they were watered, another batch could be brought out of the yard, and the same thing repeated till all have watered. In this way the sheep can be satisfactorily watered, and will do no damage to themselves or to the tanks.

2163. *Mr. Woore.*] Cannot the same thing be done at the troughs? No, for the reason that sheep which have never drunk at troughs will never do it—that is, unless they previously had an idea of drinking out of the troughs. If they were allowed to go into too large a body they would smother. 2164.

J. E. Kelly. 2164. Have you ever known sheep to die for want of water alongside of these troughs? Yes; some of Mr. Allison's sheep died near Cobar. He lost 6,000 sheep between a well of mine and the Darling. Complaints have frequently reached me as a member of Parliament, particularly from people who know that I have some knowledge of the back country, to the effect that the caretakers have in some cases allowed greasy or hot water to remain in their troughs—water which sheep had been into and discoloured, and poisoned with yolk. They have allowed this water to become hot in the sun, and the sheep would not drink it. Numbers of sheep went to these troughs, but the water was actually stinking, and the sheep would not drink it. The caretakers refused money, as I am informed, to throw the hot and polluted water away, in order that the perishing sheep that had arrived might have an opportunity of drinking freshly-pumped water. And the sheep suffered because they had not had fair opportunity even of drinking, and the troughs in such cases have not had fair play. In some cases the sheep went to the troughs, but as they were filled with hot, polluted, and stinking water, they went past it. In other cases people have told me that their stock would have drank from the troughs even the first time had the water in the troughs been good—not as the troughs are now, but as they were built some time ago. These are written complaints which I have received, and told the names of the persons from whom I received them. I state them now in evidence, believing them to be true myself.

2165. *Chairman.*] Have you yourself made complaints at headquarters? Yes.

2166. What was the result? None at all, except that this Commission is the outcome of them. I have been complaining for some time, and I inquired and obtained papers in respect to these troughs, and told both the Minister for Mines and the Minister for Lands. I called for a committee, when the latter said he would do something better.

2167. Are you aware that there is an officer known as the Inspector of Public Watering Places, whose duty it is to go about and see that the caretakers attend to their work? Yes; I believe there is an officer of that kind.

2168. Did you ever complain to him? No; not to my knowledge. I may have done so, but it was at the instance of other people. But I cannot remember now. I don't know any such officer personally.

2169. Who is the Inspector of Public Watering Places in your district? I really do not know. I know none of the inspectors in the colony.

2170. Do you not ever see any of them going around your district? No; Mr. Wood, I think, is the only inspector, judging by the letters that I have received. I think he had something to do with the matter. I really do not know, but I thought this work fell upon the inspectors of stock. The only person I ever complained of was the overseer at Cobar, because a drain at that place was left unclosed. I made no complaint of my own to anybody, but only for others on information received. I have written a good deal to the Department.

2171. Have you any views to offer in regard to the future management of tanks and wells? Nothing further than what I have said. I never see any of these fences, tanks, engines, &c., without my blood boiling to see the waste of public money that has taken place on them, so that I prefer to keep out of sight of them.

2172. *Major Penrose.*] Do you speak now of the construction or of the maintenance of these works? I speak in regard to both. I have sworn evidence to bear out what I have said. People require water, and although there is water at these places they cannot get it, but have to go and pay the squatter for it. I refer you to Mr. Smith, who has a station somewhere near Carcoar, who can give valuable information.

2173. Was this due to the troughing, or to what? Due to the troughing, which was badly constructed, and to the machinery, which was calculated to scare away the stock, and to the fact that the stock could not get down the batters to the water, even if they were allowed inside the fences.

[The Commission adjourned until the afternoon, when the sitting was resumed.]

George William Townsend called in and further examined:—

G. W. Townsend. 2174. *Chairman.*] I received a note from you, in which you express a desire to give some further evidence? Yes; there were several things I recollected since I was here the last time. I was in doubt when I gave my evidence about the 12-Mile tank as to whether it was in Burton Brothers' contract or not. Since then I have remembered that it was. I am not sure whether in my evidence I stated anything about the 26-Mile tank. Since I was here before I have remembered that the 26-Mile tank was not commenced when I was there, but the 26-Mile had long been known as a stock camp on account of water having generally been found there. The 35-Mile tank never to my knowledge had any water in it, although there was a tank within a mile of it, called 37-Mile, which was always to be depended on for a supply of water.

2175. What reason was there, do you think, for there being no water in the 35-Mile tank? I could not give any reason. I never examined the place sufficiently to be able to give a reason.

2176. *Major Penrose.*] What year was that in? I think it was in 1878 or 1879. I wish to ask when the blue print diagrams shown to me, were prepared, as the slopes shown do not correspond with the slopes of the tank that I remember, which I am confident were much steeper than 2 to 1, for you can stand easily on a 2 to 1 slope; and I am confident (for I have tried) that I could not stand on one of these slopes. I still believe that the slopes of all tanks on the 70-Mile track were 1 to 1, or nearly so. That is my belief.

2177. *Chairman.*] Is there any other evidence that you think it desirable to lay before the Commission? I cannot think of anything else. There was something passed in conversation about wells.

2178. *Major Penrose.*] I asked you what effect the baling of wells had on the water? I remember having written something about this some years ago. I brought a pamphlet with me, and have addressed it to the Commission, and will read an extract bearing on this point:—

It is frequently asserted in letters in the papers that we may reasonably hope for an unlimited supply of water in artesian wells through the Riverina country because of the great soakage from some of the rivers, and from swamps that are fed by the rivers. I greatly fear that we can in no way count on recovering any of this water in a state fit for use, even by stock, for the country that receives this soakage is full of water-bearing strata, the water in which is as salt as brine, and I think this occurrence is to be accounted for in this way: There can be no reasonable doubt that the whole of the lower portion of the watershed of the great Murray tributaries has been at one time an estuary or landlocked arm of the sea which has gradually become filled up and raised above present sea level in the manner already described. While through long ages this silting up process has been going on, many extensive, shallow, salt water lagoons would be formed; as these gradually silted up the water in them by evaporation, becoming intensely salt, would completely saturate the soil with brine. As the raising and silting up process continued the coast line would be forced further back, and these once open

open, stagnant salt lakes would become covered with a greater or less depth of soil, and would give rise to the apparently strange phenomenon of runs of salt water high above sea level, while, wherever in sinking or boring we tap an old river bed that has retained unobstructed its drainage to the sea, we obtain fresh water by reason of all the saline matter being washed out by the constant run of fresh water draining along the sand or gravel forming the bed of such ancient water course.

G. W.
Townsend.

17 Feb., 1888.

The original bed of the estuary, on the other hand, will probably be found to contain fresh water throughout its whole area, for it would in every part retain along the sand and gravel forming the ancient bottom, uninterrupted drainage to the sea, by means of which the constant run of fresh water soaking in along the outcrop and draining through the porous layer to the sea, would dissolve out and carry with it all saline matter. This opinion of the origin of the many salt water accumulations that are found by wells being sunk, to exist throughout so large a portion of the Murray basin is in a measure borne out by the fact that by long continued baling or pumping (provided that the water raised is carried clear off, and not allowed to drain back into the well) the water generally becomes less salt, showing, I think, that the original accumulation, becoming exhausted, is replenished by drainage of fresh water from the surface, which doubtless in time, would dissolve out from the water-bearing layer or stratum, all saline matter; but this would be a very costly experiment, in that the immense volume of water that would need to be disposed of before the desired result could be attained on a scale sufficiently large to be of any practical value, would swamp miles upon miles of flat country, and destroy much valuable pasturage. I fear that once the water is allowed to run from the high ground, we must regard it as lost. So that, although we are perfectly justified in trying to get all the water we can from this source of supply, it will not, even when proved available over a large area (which it by no means is so far), in any way relieve the country of the responsibility of providing a water supply by the only reliable means, viz., that now advocated by means of open reservoirs formed by dams or weirs.

I have seen many acres flooded by attempts to bale water, without any practical result. Of course I believe that fresh water can be obtained, but then no use can be made of it. The expense involved in baling would be far greater than the expense attending an effort to get water in other ways. I know that boring has in many cases saved thousands of pounds.

2179. *Major Penrose.*] Is boring cheaper than sinking trial-shafts? Yes, very much cheaper.

2180. Have you any idea why there is so little boring done up to the present? It was not generally done, but there is no reason why it should not have been.

George Earngey called in and examined:—

2181. *Chairman.*] What is your present occupation? I am, at present, a contractor.

G. Earngey.

2182. You have had some experience in the construction of tanks and wells? I was road superintendent in the Roads and Bridges Department for six months in charge of tanks and wells in the Wilcannia district. 17 Feb., 1888.

2183. Are you aware of the objects of this inquiry? Yes; so that the control of public watering places should be under one Department.

2184. Not altogether that; we have a number of allegations to inquire into to the effect that tanks have been sunk in a useless manner and in bad situations. Do you know anything about wrong sites having been chosen for tanks? Yes; when I took charge it was to replace a road superintendent named Henry Cambridge.

2185. And when you took his place, did you find that he had made mistakes in selecting sites for tanks? Yes; and I found that he had been guilty of large embezzlements.

2186. Did you find that he had been faulty in his judgment? Yes; he merely travelled by the coach and never left the road in looking for sites.

2187. What guided him in selecting these sites? The advice of publicans and drivers of coaches.

2188. This, of course, took place before you arrived there, and is only hearsay? Yes; but the sites of the tanks proved that hearsay was correct.

2189. Then I gather from you that the sites having been improperly placed would only have occurred to a man who was not conversant with the country? Yes.

2190. And probably took information from interested parties? Exactly so.

2191. Now, will you take one or two of these tanks that fairly represent what you state—take the most glaring cases that have come under your observation? Yes; I will take Seaville's tank, which is 9 miles north of Wilcannia, and the Cobham Lake tank, which is some 200 miles north-west of Wilcannia.

2192. Any other particularly glaring case, according to your opinion? These were the only two.

2193. Why do you find fault with Seaville's tank? It is within 7 miles of the river Darling, opposite a public-house kept by a man named Seaville.

2194. Was the ground at this point unsuitable, or was it merely that the distance from the Darling to the tank was too short? Yes; too short to warrant the expenditure of the money on a tank.

2195. What distance apart are watering places usually situated? They are constructed from 12 to 15 miles apart.

2196. Was that done only in the first instance to be afterwards subdivided, or was that considered a fair distance for travelling stock? Yes; these distances were regarded as rests.

2197. But sheep could never travel such a long distance as that in a day? No, I do not think so; but they do not construct tanks every 7 miles, which would be a fair distance for sheep. Sheep can travel through a dry country.

2198. Is there any other reason why you complain of the site of this tank at Seaville's, except that it is too near the river Darling? Yes; that is just the reason. The Darling affords permanent water, and this tank yields only a precarious supply.

2199. Why speak of it as a precarious supply—is it not a well constructed tank? The ground is so very flat and sandy there that it takes a very much larger rainfall than is usual about Wilcannia to keep up the supply.

2200. Is there a better site as regards catchment area further on? There is a better catchment area, but the ground would not be so retentive. This tank at Seaville's is placed where there is a cane grass swamp.

2201. You refer to clay pans? No; I refer to a cane-grass swamp. The grass that grows there is like large weeds.

2202. *Mr. Woore.*] Does not that cane-grass usually grow on clay pan ground? I do not think so. In dried up lakes and lagoons I have seen similar cane growing.

2203. Then, if this tank had not been sunk at Seaville's, where else could it have been placed? Further along the Paroo road, about 15 miles from Wilcannia. There is a good site there.

2204. Although you say that this tank is within 7 miles of the river, is it not fully 9 miles from Wilcannia by the travelling stock route? Yes; 9 miles from the town, but only 7 miles from the river.

2205.

- G. Earngey. 2205. Is not the river off the travelling stock route from Wilcannia to the Paroo? Yes; but cattle would take the nearest water.
- 17 Feb., 1888. 2206. Then the stock watering at Wilcannia would have to travel 3 miles before reaching Seaville's tank? Yes; but they could make the distance shorter.
2207. Is there a road to the river from Seaville's tank? Yes, there is a road.
2208. I mean from Seaville's tank to the nearest point to the river? I think the country is open, although there are runs along there.
2209. Is the country not fenced in? There is some of it fenced in up the river; but between the two places that I speak of, it is not fenced in.
2210. Must not travelling stock going up the Paroo go past Seaville's tank? Yes.
2211. If Seaville's tank were not constructed and stock had to travel up the river from Wilcannia on their way to the Paroo, and then to tanks constructed further on, would not that be a longer route from Wilcannia than that via Seaville's tank? Yes, it would.
2212. Now, about Cobham Lake tank, what do you know about that? This has a frontage to Cobham Lake. The fault here is in the watershed. Of course, in constructing a tank on the lake, the best watershed must be the deepest part of the lake. This is the place that will give the largest watershed.
2213. Is the tank then sunk on the edge of the lake, where there is a sandy belt, and is it deficient in catchment area? Yes; I do not think a reasonable rain could ever fill it.
2214. Is there a light coating of sand? No; there is a thick belt of sand there.
2215. I am speaking of the spot where the tank is sunk. Is there not a thin layer of sand on the top of the clay? I should think there are 2 or 3 feet of sand there.
2216. And below that, is it fair holding ground? Yes, it is fair holding ground—not pure clay, but loam.
2217. *Major Penrose.*] Was that tank finished when you got there? No; it was under construction then. The contractor could not get the men to work at that time.
2218. Are you aware that if this tank were placed in the bed of the lake, in what you call the deepest part when the lake is full, it would probably have some 40 feet of water over it? Yes; the water in the tank would then be the last to leave the lake.
2219. *Chairman.*] Are there any other cases of faulty judgment in the selection of sites that you met with in that part of the country? Yes; there was another tank at Tarella put down quite close to Mr. Quin's large dam, while I believe he told the officer of the Roads Department that he would allow the travelling stock to water at his tanks.
2220. And that was the reason why you think the expenditure was an unjustifiable one? Yes.
2221. But the public were only watering at these dams and tanks on sufferance? Yes.
2222. Consequently if Mr. Quin sold his station, and somebody else, who might not be so obliging, came there, he might prevent persons from watering their travelling stock? Yes.
2223. Would a tank then be necessary? Yes, and it could be constructed.
2224. You were in the Roads Department, and consequently had charge of the construction of tanks? Yes.
2225. Have you found by experience that when these tanks were constructed there was something faulty in the design? I was only there six months, and none of the tanks were completed while I was there.
2226. Would anything that you saw lead you to believe that the design was faulty? My own opinion was that wells would be preferable to tanks on account of the small rainfall in that district.
2227. Are you not aware that many wells are sunk, and that the result is salty water? Yes; but then the Mines Department test the wells practically, which the Roads Department does not. The Mines Department put down bores with the diamond drill, while the Roads Department put down shafts, and they cannot staunch back the salt water when sinking these shafts.
2228. So that in no instance should a well be sunk until it has been tested by an auger or a bore? Yes.
2229. To prove whether the water is there, and whether it is fit for use? Yes.
2230. Have you had reason to find fault with any of the plans or specifications of the Roads Department as being faulty, and not answering the purposes of construction? No.
2231. Have you ever found that the batter was too steep? None of the tanks were completed while I was there. The contractors used to complain of the batter embankments as being too steep.
2232. You knew what the batter was? Yes, 1 to 3. 1 to 3 on the outside, and 1 to 2 on the inside. Generally they were supposed to make their bullocks draw up their stuff along this 1 to 3.
2233. Are you aware of the Roads Department ever having made their batters steeper than they do now? No.
2234. How long were you in the Roads Department? Seventeen years; but only six months in charge of tanks and wells.
2235. And you do not remember any alteration in the specifications? I never had anything to do with these tanks and wells except for six months, and on account of an officer having committed an embezzlement I had to remain the greater part of that time at Wilcannia collecting evidence.
2236. You said that the contractors complained of the batters being too steep because they could not use their ploughs and scoops? Yes; on the back of the embankments.
2237. Did you write a letter to Mr. Gilliat, Inspector of Public Watering Places during the latter part of last year? I did.
2238. And in that letter you make some very hard statements. You state here in one place that the most criminal management existed? Yes, the Road Superintendent, Mr. Cambridge, used to be in partnership with some of the contractors.
2239. Are you aware of this of your own knowledge? I reported it to the Commissioner.
2240. Was it proved? They did not attempt to collect evidence in the matter; they only took evidence in three cases. The charge was so large that the Roads Department did not attempt to deal with it.
2241. Do you think you are justified in making such statements as these unless you can prove them? I can prove them.
2242. But this only applies to one individual officer? That is all.
2243. It only applies to one individual officer; but in this letter you use the word in the plural sense—you say officers? It only alludes to Mr. Cambridge.

G. Earney,

17 Feb., 1888.

2244. Then this word "officers" was a mistake? It only applies to one.

2245. Now, another very serious charge which you make is this;—you say that the head of the Department (Mr. Bennett) tries to hush up these things when they are brought under his notice. Why do you make this statement? Because he always found fault with me for complaining.

2246. But did he find fault with you for complaining about the mismanagement of this man Cambridge? I believe he did. I do not know personally; but Mr. Stevenson, the member for the Wollombi, who is my father-in-law, whom I met when I arrived in Sydney to come here, said that Mr. Bennett was very wroth with me.

2247. I will draw your attention to another matter. You state that there have been dozens of officers guilty of fraud, and not one (with the exception of one only) has been prosecuted? Yes; that is true.

2248. Have you any grounds for making such a statement as this;—do you know of your own knowledge that such a thing has occurred, as it is a very serious statement to make? I know that dozens of officers have been guilty of fraud, and no action has been taken against any of them except against Cambridge.

2249. Has it come within your own knowledge that they have been guilty of fraud; and, if not, how do you know it? By dismissals from the service, and by the reasons why they were dismissed.

2250. But are not officers sometimes dismissed from the Department without being guilty of fraud? Yes.

2251. Then this is another very broad statement—made, perhaps, without due consideration. The fact of an officer being dismissed does not show that he has been guilty of fraud? Some are dismissed for fraud, some for insubordination, some for negligence, and some for incompetence.

2252. Yes; but you say that many dismissals take place because of fraud. An officer may be dismissed, as you say, because he is incompetent or insubordinate; but it is a serious thing to say that numbers of men have been dismissed for fraud. You make the first part of your letter apply only to Cambridge? Yes.

2253. Have you ever had any reason for feeling angry with Mr. Bennett when you were leaving his office? I never did agree with him during the whole 17 years that I was in the service.

2254. And do you entertain rather antagonistic feelings towards him on account of your dismissal? Yes.

2255. I presume you were not dismissed for fraud? No.

2256. You know that what you have said would lead us to think that there was something of that kind. You say that you can give any amount of such mismanagement, and we want to know what this is, because it is our duty to see that it is put a stop to in future;—can you mention any particular case? The greatest mismanagement takes place in exploring for sites.

2257. You say that you can give any amount of such mismanagement if it is desired? Yes; but that would be in connection with roads and bridges.

2258. Are you aware why it is that in many instances the Government have to pay very much larger sums for the work than private individuals? During the time I was up there they were paying 1s. 6d. per cubic yard; that was then considered a reasonable price.

2259. Were the squatters in the neighbourhood giving that price? No; they were giving something less, about 1s. 3d.; but still I think that at that time 1s. 6d. did not pay very well. There was very little grass and no water at that time. Another instance of mismanagement which I may mention is this, that the levels were not taken at the tank side, and the contractors, notwithstanding their arrangement to sink 18 feet, would fill up the surface of the ground; that would of course give depth. The sites were chosen without any survey or levels having been taken, and the filling up of the ground would naturally give depth. The tanks were not 18 feet deep from the natural surface of the ground.

2260. But surely such an attempt at fraud as this could not possibly pass the inspection of officers sent to examine the work? But it did; the ground and the surroundings being somewhat similar, it would be very difficult to discover the fraud, and seeing that levels were not taken, it would not be easy to prove that such a thing took place.

2261. *Major Penrose.*] You mean that it was difficult to discern between the made ground and the other portion? Yes; when the bullocks worked over the place for some time you could hardly tell the difference between the virgin soil and the other portion.

2262. *Chairman.*] But any competent officer who was sent up there to measure the tanks could surely find out and detect such an attempt as this at fraud? Any officer that could level would find it out on inspection; but the made portion of the ground was so far apart from the other that no fraud could be detected unless previous levels had been taken. In my experience in that country I learned that Mr. Cambridge never used his own vehicle to travel in; he used to travel on the coach, which could only stop for a moment or two to allow him to choose the sites. In some instances I heard from the contractors that they could have defrauded the Government by raising the natural surface of the ground so as to make the excavation deeper than it really was. This has been done to the extent of 2 or 3 feet, and can be done everywhere, provided the sections are not taken. It is exceedingly difficult of detection unless a previous survey and sections have been taken.

2263. You think the apparent excessive price the Government gave was necessary for the carrying out of these works in that exceedingly dry country? Yes; I think the price was reasonable at the time.

2264. I presume a squatter would never have attempted to sink a tank under such circumstances as the Government put down some of their's? I should think not.

2265. The Government were compelled to do it under pressure brought to bear on them—as, for instance, the construction of works out on the Barrier Ranges? Yes; and at Mount Browne. There was a very small population on the Barrier Ranges at that time.

2266. Are there any other reasons by which you can account for this apparent excessive price given by the Government? No; not concerning tanks and wells.

2267. These tanks were not finished when you left, and therefore you were not aware what kind of machinery was there? No.

2268. Have you seen any of the different forms of machinery used for pumping water from these tanks? No; there was an order sent down from Melbourne for some valves when I was up there. That is all the machinery I saw.

2269. Have you had anything to do with the fencing while you were up there? Do you mean the fencing of tanks or the caretakers' paddocks?

2270. Of either? No.

2271. Have you found during your experience up there any interference by the officers of one Department with those of another? Did you ever come into collision with any of them? I only know that Mr. A. P. Wood was unfriendly to Mr. Gilliat.

2272.

- G. Earngey. 2272. How did they come into collision? In what way could they interfere if their work was entirely different? I expect it was on account of Mr. Gilliat's dissatisfaction with the construction of tanks by the Roads Department?
17 Feb., 1888.
2273. Do you know whether Mr. Gilliat really complained of the faulty construction of the tanks under Mr. Wood's care? No; but I heard —
2274. That is not the question; that is not evidence. Are you aware whether contracts let at large prices were sublet at very much reduced rates to sub-contractors? No, I am not aware of that.
2275. Have you had anything to do with the construction of wells? No; although there was one well being sunk in the district when I was there. This well is between Wilcannia and Dry Lake.
2276. Do you think the site was a fairly good one? It was about 12 miles out of Wilcannia.
2277. But was it a fairly good site? It was a necessary site. I was at that well when it was being sunk, and when they met with the salty water.
2278. What expenditure has been incurred on that well approximately? A large expenditure has been gone to which might have been saved had they used the water auger. The name of this place is Mulga Valley.
2279. Do you think that this dual control, and the handing over of these tanks when completed, has been the cause of considerable friction? Yes; if an officer is dissatisfied with the site he would not take the same interest in the tank as if the site had been selected by himself.
2280. One Department would, I presume, say that the works were not in accordance with what was agreed upon, and another would say that whatever was wrong arose from the fault of the caretaker? Mr. Gilliat generally went over the route with the squatters, who were better acquainted with the country than the coach driver; the Roads officers, on the other hand, stuck to the roads, while Mr. Gilliat saw the country about.
2281. What officer do you speak of? Mr. A. P. Wood has generally been the officer who undertook this work.
2282. But the road superintendent is the only officer out there? Yes; Mr. Cambridge always travelled by coach, and so did Mr. A. P. Wood, who generally measured the tanks and wells in the district. His knowledge of the district was always confined to the road. As you know the physical features of the country may alter very much half a mile away from the road.
2283. Would any person travelling have to depend upon local knowledge? Yes; but it would be better to get local knowledge and see for yourself, and have a good look around.
2284. You can understand that in an enormous tract of country it would be impossible to know the best sites without getting local knowledge? Yes; but the local knowledge some of these men gained was from the publican and the coach drivers; they never used their own observation, because they did not like to leave the line of road.
2285. Then you think that the inspectors of public watering places have reason to complain that the best sites have not been chosen because the road superintendent was not acquainted with the country? Yes; and the road superintendents do not give time to explore the best sites.
2286. Would that be remedied if the sites so chosen were chosen by the inspectors, and the construction given to the roads superintendent, supposing the inspector of public watering places chose the sites? I think they should not only have the choosing of the sites, but the construction of the tanks.
2287. You think the whole work ought to go into the Mines Department, and not to be divided as it is now? I should think so.
2288. Would it not be the means of creating another Department and so adding to the charge upon the revenue? Would it not entail a new arrangement in the superintending and construction of these works? Yes; but then the present roads officers would not be required. If additional officers were appointed by the Mines Department the roads officers would not be wanted.
2289. But the roads officers would have to be retained in their present position irrespective of the duty which they have to do in looking after tanks and wells;—would it not be unnecessary, therefore, to create a new Department necessitating another set of officers? It would not create a new Department.
2290. But it would mean the employment of a large number of additional officers? Yes; it would require more officers.
2291. And unnecessarily entail considerable expense to the country? Slightly; and the work would be well done. The men who would be employed on the work by the Mines Department would have a knowledge of geology, which would assist them in the selection of sites; because the man who has a knowledge of geology is much more likely to pick out a good site for a watering place than a man without that knowledge.
2292. *Major Penrose.*] Do you think that because the Department is called the Mines Department that therefore its officers must have a knowledge of geology? Yes; because the men employed by it would have greater advantages in studying the subject, inasmuch as they would have an opportunity of seeing the minerals from all parts of the colony.
2293. *Chairman.*] Are you aware that many of these officers of the Mines Department live hundreds of miles from Sydney and perhaps would not see the Geological Museum once in twelve months; and if that were the case how could they study geology? It would evolve, nevertheless, an interest in it; while in the Roads Department the subject is never given a thought.
2294. But supposing, as was the case, that one of these gentlemen lived at Hay, another at Bourke, and others elsewhere, how could they study geology? Well, the Mines Department to a man will have some knowledge of mining.
2295. But it does not follow at all? All officers in the Mines Department would be supposed to have a knowledge of geology.
2296. You are aware that the Forest Department is under the Mines; what has that to do with geology? Well, it has something to do with botany and soil, and that even bears relation to the subject.

[The Commission adjourned.]

THURSDAY,

THURSDAY, 23 FEBRUARY, 1888.

The Commission met at 10 a.m.

Present:—

HON. G. H. COX, M.L.C., CHAIRMAN.

MAJOR PENROSE, R.E.,

J. C. WOORE, Esq.

James Budd called in and examined:—

2297. *Chairman.*] What are you? I am a contractor. I have been a contractor in the vicinity of Cobar for the last twelve years. I have done considerable work for the squatters round there. I have been a contractor for twenty years altogether.

J. Budd.
23 Feb., 1888.

2298. For private individuals or for the Government? For both the Government and for private individuals.

2299. *Mr. Woore.*] For tanks? Yes.

2300. *Chairman.*] You have not been a contractor for fencing, then? No, not under the Government. I have done tanks only for the Government. In fact, I have done very little work lately except for the Government.

2301. What tanks have you excavated for the Government? The Hermitage tank, the Booroondarra tank, the Burra tank on the Hilston Road, Helman's tank, Kerrigundi and Nullamut tanks. I also constructed two supply tanks on the Wilcannia road; one of these is at Springfield, and the other at Barnato. I had to do the main tank at Springfield; it was transferred to me by another party, and was not done in my name.

2302. By whom was the work transferred? By Coates and Holly. They were the successful tenderers for two tanks; but they only wished to excavate one; and I, being very little above them in price, got the work from them.

2303. At what rate? At 1s. 2½d. per cubic yard. I was only a trifle above them in my tender, so I took up the work at their price. They had the preference of three tanks, and gave me the one they did not want themselves.

2304. You agreed to take the work and construct it for the Government at the same price fixed by them? Yes; but the contract stood in their name. I had to do the work at the same price, and in addition gave them a bonus of £10 to hand over the contract to me. They were entailed in a certain amount of expense in obtaining the contract; and, of course, I had to pay a certain sum to them to recoup them for their trouble.

2305. Have you ever sublet Government contracts that you have taken? No.

2306. And is this the only instance where you have taken a contract from another person? No; I had one transferred to me before. This was the Kerrigundi tank; but it was transferred to me, and carried out in my own name. That was first taken by a man named Webb; but he did not sign the bond for it, and the work was transferred to me.

2307. Were you also a tenderer for the Kerrigundi tank? Yes; but I did not get the work originally.

2308. What rate of pay did you receive for that work? I think it was 1s. 5½d. I am not certain about it just now; but it was somewhere about that sum.

2309. What price did you take it for? I remember that there was only a very little difference between myself and Webb; he was only a little higher. I think there was only a difference of 1d. or ½d. between us.

2310. Is it a fact that the Government have to pay higher rates for excavation and construction of tanks generally than private individuals? Yes.

2311. Can you give us any reasons why this should be so? The principal reason, in my opinion, is on account of the slopes being so steep that it is not possible to have a roadway to take the stuff out. We are not able to plough or to use scoops. Besides that, there is a great deal of delay in getting our money as the work progresses.

2312. This is owing, I presume, to the want of inspection of the work by some officer? Yes; sometimes months elapse without any reports having been made; and in one case I had four months to wait, and had to pay an agent £50 to collect the money. I had to employ an agent named Cummings to get this money for me.

2313. Did this delay take place after the work had been completed? Yes; and in another case I was six months waiting before I got the balance of my money. This occurred in connection with the work done at the Nullamut tank.

2314. Now, are there any other reasons besides these two why the work done in constructing Government watering places should be more expensive than those of private individuals? Yes; because the Government tanks are carried to a much greater depth than the squatters' tanks.

2315. And after tanks have got down to a depth of from 12 to 14 feet the expense of sinking, I presume, increases considerably? Yes; the stuff, too, generally gets harder after you get down 10 or 12 feet in fair ground, and then it is very much harder. I have tendered now for work on the Wilcannia road, and have increased the prices as the depths vary and as the ground becomes harder. I am also prepared to submit a tender at a very much reduced price if a concession be made that the slopes shall be 6 to 1. [*Witness hands in a tender for the excavation of a tank, 14 feet deep, for 1s. 1½d. per cubic yard; for a 16 feet tank, 1s. 3d. per cubic yard; and for an 18 feet tank, 1s. 5½d. per cubic yard.*]

2316. *Major Penrose.*] Does that cover the whole? Yes; that is the average price. It is the price charged per cubic yard for sinking a tank to the depths stated.

2317. *Chairman.*] If you go 18 feet deep, you charge for the whole excavation 1s. 5½d. per cubic yard? Yes.

2318. So that going the extra depth you have to charge 1s. 5½d. for the whole? Yes; on account of the rock that we had to go through.

2319. Do you not always put in a separate tender for rock? No; it is nearly always an average price for a tank at the different depths. I have always had one price in every tank that I have taken from the Government.

2320. Have you ever come across rock in sinking a tank that had not been shown by the trial shaft? Yes.

- J. Budd. 2321. Did you ever receive any allowance from the Government for that? No; but I have often come across more rock than was shown by the trial shaft.
- 23 Feb., 1888. 2322. And the Government gave you no compensation? No; I never applied for anything.
2323. You asked an extra price from the Government on that account? Whenever rock showed in the trial hole I got rather bigger prices on that account; but still I lost money on account of some of the tanks.
2324. Do you remember what price you received when you lost money? Yes; I received 1s. 9d. per cubic yard, and I was out of pocket even at that price.
2325. *Major Penrose.*] Did you really lose money at the price stated by you? Yes; and I made money on excavations at 11d. per yard.
2326. *Chairman.*] Now, have you ever come upon rock in sinking a tank for private individuals;—would they not allow you something in the event of your striking rock? Yes; but it would depend greatly on the conditions of the contract. Squatters, as a rule, do not care in sinking for water to go through rock, and do not care to pay the increased prices which that would involve. They have never paid for it in my experience, and I have put down hundreds of tanks for them.
2327. Are there any other reasons why Government work is more expensive than private work? Well, the squatter always provides water and grass for his workmen. If a tank is to be placed in a spot where there is no grass he will take off his sheep and allow the ground to stand till the grass does come; whereas, in the case of the Government tank you have to buy feed for the horses, and the work is let without any consideration as to where grass and water are to be obtained. The contractor has to buy feed at whatever price he can get it.
2328. *Mr. Woore.*] In fact, in doing Government work you have to take your chance as regards contingencies? Yes; and another thing is this, that the squatters generally crowd in more sheep in the vicinity of the tank than they would otherwise do, because they are opposed to these Government watering places.
2329. Why are the squatters opposed to the Government watering places? The fact of a public watering place being made by the Government increases the liability of the squatter to trespass from travelling stock. Another thing which increases the expense is, that there is a great deal more stuff to be taken from the bottom of the Government tank than from private tanks. Steep batters necessitate a much greater amount of stuff being taken out on account of the greater depth required to make up the total number of cubic yards. The squatter always allows a roadway sloping into the tank, which enables the contractor to get the soil up without trouble. The weight of the soil lies near the top; in fact, when you get half way down in a squatter's tank you have a great deal more than half the excavation work done. The difference is very great when compared with the Government tanks.
2330. *Chairman.*] As a rule, tanks constructed by the Government are intended not to water stock directly, but to water them by means of troughing? Exactly.
2331. But this is not the rule with squatters? No; they prefer to allow the stock to water themselves. I know that, because I have sunk hundreds of tanks in the Cobar district for squatters about there.
2332. The Government are generally more particular in the finish of their tanks than are squatters? Yes, certainly; and especially in the finish of the banks. A squatter does not care much about the shape of the banks, provided they hold the water satisfactorily. The Government tanks, on the other hand, have their banks all dressed down to a certain slope, which entails a considerable amount of extra expense. Again, the trimming work, and so forth, all have to be done more particularly than the same work in connection with the squatter's tanks. There is a great deal of trouble with the embankments round the excavation, as compared with those made by the squatters.
2333. Then, again, in the Government tanks I understand that the bottom must be absolutely level? The specifications say so; but in actual practice they are not very particular. Sometimes the inequalities in the bottom are made up with loose earth, and no objection is taken if portions of the tank are a little deeper than others.
2334. In those Government tanks that you have constructed, do you recollect what the slope has been? In the last tank that I constructed the slope was 2 to 1; but all the others have been $1\frac{1}{2}$ to 1. I really forget what the slope in the Nullamut tank is. It is a 10,000-yard excavation, and was constructed for the purpose of allowing stock to water without troughing.
2335. Consequently, the slopes are more gentle than in the case of the other tanks? Yes; the slopes were flatter than $1\frac{1}{2}$ to 1, and roadways were allowed in it to cart the stuff out.
2336. Is it only quite recently that the Government officers have changed these slopes? It was only about Christmas, when I completed the last tank, that I heard of that alteration.
2337. What is the usual slope of the tanks that you have seen throughout the country? I should say about $1\frac{1}{2}$ to 1. I am speaking now of the Government tanks. With the exception of two places that are being put down on the Wilcannia road, the slopes are all 2 to 1. One of these tanks is complete, and the other is in course of construction. One of the tanks that I have just mentioned will be useless. This is the Barnato tank. The water soaks out of the supply tank, undermines the sides, and goes away. There is good holding ground at the bottom; but, owing to the sides being made with a slope of 2 to 1, the water runs through them as it might run through a sieve. I proposed to construct that tank 3d. per yard less if the Government made a concession of making the slope less steep; but they would not do it.
2338. I find here in one of these specifications the following provisions:—"Should the road superintendent consider that the surface, or any other stratum passing through in the excavation is too porous, the contractor must adopt such steps to puddle the porous ground as the superintendent may direct; the cost of such work to be provided for by a price per cubic yard for puddle being quoted in the schedule of prices?" Yes; but that would not affect the surface in any way. Even if we got gravel we would have to fill it up; but that would not meet the case. It is like a bed of ashes; it washes away with the water and goes down. The soil where Barnato tank is sunk is so exceedingly porous and ash-like that it will not stand up, and the water disappears. As a matter of fact, the contractors had to cart the water the whole time during construction. The supply tank had been filled time after time.
2339. Now, do you not think that this very porous soil could have been observed from the surface, even by one who was not a great expert; and that it would then be discovered it was not a proper place to sink a tank? No; I have often been deceived in the matter myself, and I am considered a pretty good authority.
2340. So that you do not think any blame can be attached to the person who selected the site of the tank? No; because the tank would have been all right if the slopes had been made flatter.

2341. But I imagine anyone would have seen that the holding ground was not good? No; I do not think so. Had it been a squatter who was putting a tank down he would have made a flatter slope.

2342. I presume that you are of opinion no hard and fast rule should be adopted in respect to the putting down of tanks? No; it should not. In fact, the depth of tanks should also be considered. Where you get a flat locality you will most likely get good ground, so that I think a hard and fast rule should not be adopted at all. Of course there ought to be a great change in the specifications. They should be made to suit the localities for which they are framed. In hilly country, where there is a good catch, a shallow tank would be more advisable than a deep one, because very likely you will meet with a bad bottom. In that case, too, the slopes might be made fairly steep, and you could conserve more water on account of this steep formation. You can have a much steeper batter, but not so great a depth as in other parts of country. Then in open country and flat ground, where great depth is desirable for a tank, the batter should be more sloping; but everything depends upon the nature of the ground.

2343. Consequently, all tanks should be sunk in accordance with the nature of the soil and the locality? Yes, exactly.

2344. And variations might be made both in the slope of the batter and in the depth of the tank? Yes; because a hard and fast rule is not at all suitable.

2345. Have local engineers, in your opinion, sufficient discretion and ability that they might be allowed to make variations from the specifications? I do not think that a man requires to be an engineer at all to do this. Of course I can only speak of the men with whom I have had actually to do; and if I am asked about any particular one I can answer the question.

2346. But are they allowed to alter the specifications? No; certainly not. They have their plans drawn out for them and are obliged to work up to them. I have often suggested things to them, and they agreed with me that the alterations were advisable; but stated that they were unable to carry them out. When I tendered for the last tanks that were constructed on the Wilcannia road I offered to do these tanks for 3d. per cubic yard less if I were allowed a 6 to 1 roadway on one side. That would have meant a reduction in the price of the tank to about 1s. 5d. per cubic yard; but I do not think that the matter was ever considered in Sydney. I could easily have done this if I had been allowed the concession. I do not know that my proposal was ever submitted to the authorities in Sydney, but I am not sure.

2347. Did you receive no reply? No; no other reply, except that the work must be done on the old lines—which, of course, I did.

2348. *Major Penrose.*] Have you ever been inconvenienced by delay in receiving payments for your work? Yes; I was compelled by this delay to borrow money at very high rates, and on one occasion I was obliged by it to go insolvent. This was in the case of the Nullamut tank. Fully six months elapsed before I was able to get the balance of my money, and I was obliged to go insolvent. As soon as I got my money I paid all my creditors.

2349. Can you state to whom all this delay is to be attributed? On that occasion I think the great delay was attributable to a mistake in making out the quantities. There is always a delay more or less; but in this case the delay was owing to a mistake.

2350. Is it due in any part to the want of prompt inspection of the work by Government officers? Yes; in a great measure it is, because sometimes they do not come out for three months.

2351. *Chairman.*] So that unless you happen to have money of your own you cannot well afford to compete for the construction of these tanks? Unless one has some money of his own, or that he is given credit. Fortunately for me, I had unlimited credit, and that was what stood to me; but I have to pay more for my goods to the people from whom I purchase than I would otherwise, on account of the long time that I am obliged to keep them out of their money. They know that they will have to wait a considerable time for their money, and consequently they charge me more for my supplies.

2352. And the result of this is, I presume, to lessen the number of contractors? Certainly; men have not the means or the credit to go into these works.

2353. *Major Penrose.*] Can you give us any idea of the difference which the supply of grass and water to contractors makes in the construction of a tank? I think on an average it would make at least 1d. per cubic yard difference if you had the water and the grass on the ground.

2354. But it might make a great deal more? Yes; in some instances it cost me what was equal to about 3d. per yard to feed my horses. If I started a tank on the presumption that I would have to buy-feed all the time, I should put on 2d. or 2½d. per cubic yard extra to remunerate me for the extra expense involved. Cartage is very expensive, and the extra charge would depend greatly on the distance of the place from the railway.

2355. In excavating for private persons, what implements do you use? In some cases I used ploughs and scoops, and in others I employed drays. In shallow, small tanks, scoops are most suitable; and especially where there is a dam to be made. If you have a long tank to make, the best way to do it is by drays.

2356. What do you call shallow tanks? Tanks from 6 to 9 feet deep. After you take out with scoops, then it is cheaper to take the stuff out with drays.

2357. *Mr. Woore.*] Well, then, ploughs and scoops are of very little use in Government tanks? Very little. Even on the top they are of very little use. As a rule squatters' tanks are rather long and narrow, which makes it much more easy to use ploughs and scoops than if the tanks were of a different shape. I have found that as a rule squatters' tanks are not more than half the width on top of Government tanks.

2358. *Chairman.*] Have you made any calculation as to the difference in cost between work done with ploughs and scoops, and work done with picks, shovels, and carts? Yes; but I have not got that calculation here. I think, where the ground is suitable, and the tank is being made long and narrow, the difference would be about 2d. per cubic yard under the cost if the work were done by carts, because so many more men have to be employed in shovelling, driving, and so forth; while it only requires two men and a team of bullocks to work ploughs and scoops. On the other hand, it requires double that number of men to work the drays. Besides, in sinking tanks for the squatters, we generally make an arrangement with the squatter to obtain meat at a very cheap rate, while to the contractors for Government tanks the squatter charges an excessive price for the meat.

2359. And, of course, the squatter also takes into consideration the fact that he will not be paid for a very long time? Yes; that is a fact. I could not have paid them in many cases until I got my money, unless they put me "up a tree" again; and I do not think they would care to do that.

2360.

J. Budd.
23 Feb., 1888.

- J. Budd.
23 Feb., 1888.
2360. Now, in your experience, with regard to the selection of sites, do you think that sites have generally been well selected as regards catchment area? No; I do not; though I cannot say that I have any fault to find with that. In every case I have seen the tanks filled.
2361. Do you know anything about those tanks out on the Wilcannia to Milparinka road, on the Darling? Nothing further than that I have heard from the contractors, who have been there, that the ground is much better for tank-sinking than the ground out our way. Of course I have not seen this country myself.
2362. You have never erected any fences for the Government? I think I have done some, but it was so very trifling that I do not remember any particulars about it.
2363. *Major Penrose.*] As a rule, are the batters of the tanks which you have constructed for the Government standing well? As a rule they are.
2364. Even at $1\frac{1}{2}$ to 1? Yes; as far as I have seen they are standing pretty well. Yet they would be much better if they were flatter, although they would expose a larger surface to the wind.
2365. Do you think these tanks, if constructed as you state, would hold water better than now? I do believe they would.
2366. Do you think that a batter of 2 to 1 will be sufficient in most cases? Yes; but it would depend altogether on the nature of the ground. What would do for one case would not do for another. In some cases, if they were constructed 3 to 1 they would be better, but as a rule 2 to 1 is sufficient. In some cases, where the soil is firm, even 1 to 1 would be better, because there would be a less surface exposed to evaporation; but in other cases, where the soil is very friable, a batter of 3 or 4 to 1 would be advisable. As regards construction, in all cases there should be at least one roadway of 5 to 1. This would admit of a great reduction in the price. It is something extraordinary the difference it would make if this concession were granted.
- [At this stage, the witness submitted a calculation, with the view of showing the very considerable saving that might be made in the construction of tanks. As near as he could estimate the amount of excavation to be 3,000 yards less. At the top side of the excavation of 200 feet there should be one batter of 5 to 1, and on the opposite side one of 2 to 1, to admit of ploughing. On the other sides the batter might be 2 to 1, or steeper, if necessary, if the soil would admit of it. This would reduce the cost of the excavation by about 3d. per yard, being a saving on 15,000 yards of £187 10s. There would also be 3,000 yards less of excavation at 1s. 6d., which would amount to £125, or a total saving of £412 10s. on the tank, the contents of the tank, as shown on the Government drawings, being 18,000 yards. This statement was merely approximate. He did not think that the extra 3,000 yards was worth £412 10s. In the event of the head-gear for pumping water into the troughs getting out of order, then the long slope would be advantageous in allowing the stock to water in the tank until the head gear was repaired. If this were done it might save the lives of stock and thousands of pounds of money.]
2367. Have you put these suggestions before the Department of Public Works? Yes; I mentioned it to Mr. Adams, our road superintendent, but he did not seem to embrace it. I think it would be very desirable, before the construction of a tank was commenced, that the paddock which now accompanies these tanks should be first of all fenced in, so that the grass might have time to grow for the use of the contractor's horses and bullocks, as the case might be. When the supply tank is put down, the fence should also be made, and by the time there was grass and water, the contractor would be there to construct the main tank. This would mean a great reduction, and would materially lessen the cost of construction, making, in some cases, fully 3d. per yard difference.
2368. *Chairman.*] Do you think that the contractors for these Government tanks, even at the apparently high rates charged, make more money out of them than they do out of the squatters' tanks? Well, for my part, I have made more money out of the squatters' tanks at reduced rates. The squatters give every facility for the carrying on of the works by the contractors, and the prices have varied from 9d. to 1s. 9d. The cheapest dry work that I have ever done was done for 11d. per cubic yard, and the cheapest with ploughs and scoops was 9d.; but I have received as much as 1s. 9d. per cubic yard.
2369. What special reason was there for this high charge? Well, we had further to cart water, and the tank was being sunk in cemented ground. I had to cart water in one case some 18 miles. This was to supply the tank in Sussex Station, about 30 miles from Cobar. I had to get a supply of water to sink the big tank there, and for this I got the extra price of 2s. 6d. per cubic yard.
2370. So that you think there may be circumstances under which Government would necessarily have to pay large prices for tank sinking, such as for tanks constructed a long distance from water? Yes.
2371. And there would be nothing unusual or out of the way in the Government doing it? No; the conveyance of water for long distances is a very big item in the construction.
2372. And, as a rule, a squatter does not put down his tanks in adverse seasons, when there is neither grass nor water? No; he does not generally do so, though in some extraordinary cases he might.
2373. But if the public insist upon a tank being put down, the Government are obliged to do it? Yes; and no excuse is admitted for their not doing it.
2374. Do you know of any instance where contractors have sublet their work at very much reduced rates? No; I cannot say that I do.
2375. Now, will you state to us what course you think would be most desirable to carry out these works more satisfactorily in the future? I think it is very undesirable indeed that all these works should be constructed and managed by different Departments. I think the whole thing should be placed under the control of one Department. I also think it would be very desirable that there should be some person who will give proper supervision to the construction of the work, and who will possess at the same time discretion to vary the specifications in accordance with the nature of the soil to be excavated. Even the sizes of tanks should be taken into consideration, because in many cases they are made larger than the requirements warrant.
2376. Do you not think that if these works were managed by some local body the arrangement would be a better one? I think if the matter was left in the hands of the local superintendent—if he is a really good and capable man—that you cannot do any better. In fact, I am certain that it does not require a civil engineer to be a practical conservator of water in that country. What is wanted is a man who has a practical knowledge of the interior.
2377. Do you think the road superintendents would be suitable persons to have the management and control of these works? So long as he is a thoroughly good and practical man it would not matter what he

was

was called. We require really good practical men, with local knowledge. He does not require to be a civil engineer ; but his being a civil engineer is not in his way, if he has local knowledge. J. Budd.

2378. Have you any further suggestions to make whereby water might be better conserved? As regards contract work, I think all tenders should be opened before a Board rather than before one man in the country. I do not want to give any particular reasons for what I say on this point. 23 Feb., 1888.

2379. You need not give the names, but you can surely give the reasons ;—do you think there is collusion between the Government officers and the contractors? Yes ; in some instances. In one case I myself was told that I need not tender for the excavation of tanks on the Wilcannia road. I asked the party who said this at the time, if he was not inviting tenders? He said yes ; but that I need not put in a tender, as he thought there were plenty tendering already. I said to him, "You evidently do not want me to tender?" and he said "No." The person I refer to is a Government official in that part of the country. After this conversation I went to Mr. Barton, a storekeeper and a local Justice of the Peace, and told him what took place. He advised me to wire my prices down to head-quarters in Sydney, which I immediately did, and I ultimately obtained the contract. I had to go a good deal lower in order to get the work than I would otherwise have done. I lost money by the same thing ; but then I got an insight into the construction of the big tanks. 2380. Are you aware that some of these Government officials have lost their situations by improperly dealing with contractors? I was not aware of it before. There is one case, however, which has come under my own experience lately ; but I would rather not refer to it.

2381. All that is necessary is that the facts should be stated? Well, there are numbers of other contractors as well as I who hardly care to go and inspect work at the present time for which tenders have been called. They do not think it advisable to do so, especially if the work is any distance away. Unless it is somewhere convenient to us, we do not think it worth our while to go and look at it.

2382. Why? Well, of course, there is always some little hitch or other by which we are deprived of the work. Our tenders are always informal, or something happens by which other parties get the work. One instance that happened to myself I might as well relate. When contracts were called for the tanks on the Wilcannia road, about June or July last year, I tendered three times—in fact, we all had tenders in for this particular work.

2383. Why did you tender three times? Well, in the first place one of the conditions proposed was that we should engage a certain number of the Sydney unemployed, which, of course, caused high rates to be put in. Then tenders were called, leaving out that condition ; and then we were told that the tenders were still too high, and that the work would not be done at all unless we cut down the prices finer.

2384. What was your tender at that time? I did not reduce mine but very little. The prices were given for different depths of tanks, so that I cannot exactly remember the prices. No one tank is a guide as to what another is worth, as you have to be guided altogether by the trial holes. My third tender was reduced just a mere fraction, but on that occasion we gave in open prices, the tenders not being enclosed in envelopes. Although I was told before that I need not tender for the work, I was then sent for to put one in, and I did put in my tender. Afterwards, when I saw other parties, I concluded that I would not get the work, and I offered to make a wager to that effect. I said that it would be found my tender was just a little over the estimate of the others. I told Mr. Barton about it when I put in the tender for the work, and when I went back I said I was sure I would not get it—that I would be a half-penny or a farthing too high, or something of that sort.

2385. And did the result justify your anticipations? Yes, very nearly. My prices were just slightly over those of another contractor, at whose prices I carried out the work some time ago.

2386. These people were the lowest tenderers? Yes ; the rates were sent into the office at Cobar, and Coats and Holly got the work. As they were not prepared to do both tanks, I offered to take one of them at their price ; but the officer-in-charge refused to transfer it from Coats and Holly to me, telling me that he had wired to the Department in Sydney to know whether the next highest tenderer should not receive the contract. Eventually, after getting Mr. Barton's assistance, one of the tanks was transferred to me ; but it was made out in the name of Coates and Holly, although I carried out the work. No answer was received from Sydney as to whether the second tenderer should receive the work or not. I finished my tank two months ago, but it will be some time before it is fenced in.

2387. You think that in this instance favoritism was shown by the Government officials? Decidedly it was. I should think that in future tenders should never be left to be opened by one official. I don't think that tenders should be opened up there at all. The local officer, after having received my open prices, went down to M'Donald, who had also put in a tender for Coates and Holly, and it was after that that I found out that my tender was a trifle too high. That is why I would like to see tenders opened down here in Sydney.

2388. Now, could not this be done—could not a board be appointed in the country districts to receive and open tenders for such work? That would be very much better, I think.

2389. And you think that what is now done by the local officer it would be desirable to hand over to some local body? Yes ; the only object would be in regard to the tenders. The people up there all know each other, and I got into their bad graces by being pressed for money. In one case I had completed my contract some two or three months before I was able to get the road superintendent to measure up and pass it. When he came up to measure the work, he staked his horse accidentally, and he had to get another from Mr. Leslie, whose place we had to pass. Owing to this, we had to camp out, and in the morning we had some difficulty in catching the horse. The superintendent then said that if he knew he was going to be humbugged in this way, he would not have come up to measure the work at all ; but I did not see that I was in any way to blame for his staking his horse.

2390. Do you know anything about fencing at Government tanks? Yes ; I think that a less expensive fence would answer all the purposes of these watering places. They are too particular in this matter, and altogether the fencing is too expensive.

2391. Have you ever found any difficulty in watering stock at the troughs? I never watered any stock at the troughs myself, but I have heard a great many complaints ; but from my own experience I can say nothing. Every horse that I drove to the troughs watered at them right enough.

[The Commission adjourned until the afternoon, when the sitting was resumed.]

Mark James Curry Tully called in and examined:—

- M. J. C. Tully. 2392. *Chairman.*] What are you, Mr. Tully? I am an inspector of stock and overseer of public watering places.
- 23 Feb., 1888. 2393. Which is your district? My district is the Wilcannia sheep district.
2394. How long have you been a resident of that neighbourhood? Twenty-one years.
2395. How long have you been an overseer, under the Mines Department, of public watering places? Nearly three years.
2396. Of course you are aware of the objects of this Commission? Yes, I know some of them.
2397. I may state briefly that it is an endeavour to find out the causes of the friction which has been shown to exist between the two Departments—the Works and the Mines—and also to examine into the allegations made by the Mines Department with regard to the excessive cost of public works carried out by the Government. Who is the inspector of public watering places for your district? Mr. John Low.
2398. The evidence that we desire to obtain we have arranged in a certain form, and we will take the points *seriatim*. The first thing we wish to take into consideration is the faults of judgment which have been made in the selection of sites for tanks and wells;—can you of your own knowledge say that the sites of any of the tanks that have been excavated are not suitable ones, or are improper and undesirable, and not selected with due consideration? Yes; I know of some cases of that kind. I know that the tank at the Peri Springs and the tank at Cobham Lake, and the Goomboolara tank on the Paroo are badly situated. These are some of the principal cases that I know of.
2399. Why do you consider the site of the Peri tank badly chosen? Because it is in close proximity to the springs.
2400. Do you think that the springs give sufficient water to meet all the requirements of travelling stock? I do.
2401. Are not the springs situated on the travelling stock reserve which is within the leasehold? Yes; but the travelling stock reserve has not been reserved or defined on that portion of the Paroo. I do not think the reserves have been defined lower down than Goomboolara.
2402. Has not this stock road since been surveyed? No; it has never been surveyed or defined.
2403. How far are the Peri Springs from the usual stock tracks? There are two tracks.
2404. But from the track most used? About 2 miles.
2405. Are you aware that this is beyond the usual width of travelling stock reserves? Yes.
2406. Then, any stock watering at the Peri Springs must have been trespassing on the leasehold of the squatter's run? I do not know whether it would be trespassing or not, seeing that there is a road up to the springs that is used for months and months every year. There is a road past the springs that has been used frequently by stock for years.
2407. But you have told us that the usual road is 2 miles away? Yes.
2408. Under these circumstances, do you not think that it would be a very proper thing to excavate a tank at a place where water could only be obtained on sufferance, and by applying to the lessee of the run? Yes; but the tank is in the very same position as the springs.
2409. How far away is the tank from the springs? A little more than 400 yards—I mean only about 400 yards further from the main road than the springs are. The springs are really nearer the main travelling stock road than the tank.
2410. *Mr. Woore.*] Were you in the district when the tank was made? No; I do not think I was in that district at the time. From the year 1880, up to 1881 and 1882, I was not in the district.
2411. Are you not aware that before the tank was made these Peri Springs were on a pastoral lease held by the lessees of Momba run? Yes; I believe they were.
2412. And were not the springs used as a place of refuge by the main body of stock belonging to that station during droughts? It was.
2413. And the lessees of the station—did not they make some little improvements, such as drains running from the springs, and dam up the water for their stock? Of my own knowledge I cannot say, but I believe that improvements had been made before the tank had been put down.
2414. If the Government had resumed these springs for a public watering place, would it not have been a very serious loss to the lessees of the run? I think it would have interfered with the run.
2415. You know that it was a refuge for the whole of the stock of the station in times of drought? That could not be disputed.
2416. *Chairman.*] Then you think that the tank in any event is in an improper position because it is still further from the main track than the springs? Yes; the tank is further away from the main track than the springs.
2417. *Mr. Woore.*] Which was the main road for travelling stock at the time the tank was made? Stock in those times took what is called the right-hand track. The main track did not originally go along by the springs, but stock were always allowed to go up to the springs to water.
2418. *Chairman.*] Then, that is the only objection to the Peri Springs tank—that it was unnecessary, because the springs themselves gave plenty of water for travelling stock? Yes.
2419. *Mr. Woore.*] Is it a good site otherwise—a good site as to catchment area? Yes; it is a good catchment.
2420. Do you of your own knowledge know what number of sheep the lessees of the Momba run used to water at the Peri Springs during times of drought? I do not know the number of my own knowledge; but the present general manager, Mr. Hogarth, told me that he watered from 12,000 to 14,000 sheep there.
2421. Then, if the owners of the station watered from 12,000 to 14,000 sheep in times of drought at the springs, would there be any water left for travelling stock? That I cannot say.
2422. *Chairman.*] Have you any idea what is the average daily supply from these springs? I am not aware what the daily supply is, but I would gather from the fact of so many sheep having been watered there in a day that the supply would have been about 18,000 gallons per day.
2423. Then, in times of drought travelling stock might at any time go to the springs and find them dry? Very probably.
2424. Then, under these circumstances, do you still think that a tank was improperly sunk in the locality? Yes; because the springs and all were proclaimed a public watering place.
2425. Not at this time, I imagine? The tank was excavated on water reserve No. 630.

2426. *Mr. Woore.*] But at the time this tank was made there was no such thing as a public watering place, because the Act had not then come into force creating such places? Yes; but there were reserves set apart for the purpose—water reserves. M. J. C. Tully,
23 Feb., 1888.
2427. Do you know what these reserves were really made for? Yes; to prevent alienation of the land.
2428. They were reserves for water supply? Yes.
2429. To prevent the eyes of the country from being picked out by selectors? Yes.
2430. They were not made as reserves for public watering places? No; because the Act had not then come into force; but notwithstanding, I understood that they were for the purpose of conserving water for the use of travelling stock.
2431. I think you will find you are mistaken. Do you believe that all water reserves reserved from sale were made to conserve water for the travelling public? I mean that these spots were reserved so that they might be available for the purpose.
2432. But many of these reserves are off the stock routes altogether? Yes, that is so. [*Witness then explained on a chart the routes referred to, and pointed out the position of the tank and springs.*]
2433. Was not the only road chosen by the public before the tank was made along the eastern bank of the lake, past the springs, and then *via* Olepoloco Lake? Yes; for travelling stock, but not for the general traffic.
2434. *Chairman.*] The next tank that you mentioned as having taken objection to is that at Cobham Lake? Yes; all that class of ground is of a more friable nature, and not such good catching ground as the clay-pan country. All these lakes are liable to be filled up during heavy rains, although some of them have been dry for a very long time.
2435. Is there any objection to a tank being sunk in a lake which is dry? I think it is a useless expenditure, especially as there is sometimes natural water there; and I think that if these tanks were put in dry country they would be much better and more calculated to do good. If a tank is put where there is natural water it is not calculated to be very valuable.
2436. *Mr. Woore.*] Are you assuming that this lake affords a permanent supply of water? No; I am aware that it does not supply permanent water.
2437. Can you say how long the lake has been without water? I believe it has been for many years without water.
2438. Do you not know that the lake is subject to be dry for several years? Yes.
2439. *Chairman.*] Could you put a tank at Cobham Lake in a better position than that chosen? Yes; within 3 or 4 miles of that site there is a much better position.
2440. *Mr. Woore.*] Is that in clay-pan country? Yes; it is some 3 or 4 miles south-east of the lake.
2441. Is the soil in the lake loose, friable soil? Yes; until after going some distance down.
2442. Underneath the sand and drift there is clay? Yes.
2443. *Chairman.*] I presume that in loose soil the water would soak through the ground before reaching the tank; whereas, if a tank were excavated in clay-pan country, every shower would help to fill it? Yes.
2444. *Mr. Woore.*] Are there any good clay-pans in the place that you mention? Yes, excellent clay-pans, about 4 miles away among the sand-hills. It is perhaps less than 4 miles from the tank. I examined that spot recently.
2445. *Chairman.*] Are you aware who chose the site of these tanks at Peri Springs and Cobham Lake? No; I do not know the name of the officer who chose the sites.
2446. What is the name of the next tank you object to? This is Goomboolara, on the Paroo, just about 12 miles beyond Courimpe.
2447. What is your objection to the site of this tank? The tank is put on a neck of water running into the lagoon, which holds about 5 or 6 feet of water more than the site of the tank. The water to go into the lagoon must pass the tank. I have frequently seen water going into the lagoon without filling the tank.
2448. But is there not a drain intended to intercept the water which otherwise would spread out into the swamp and fill it? It may be intended for that, but it does not fulfil the purpose.
2449. Is there no local catchment for this tank? No, beyond what might be collected in the bed of the Paroo. It may be 200 yards wide at this place and is very much like a series of clay-pans.
2450. And then the tank cannot be filled unless the Paroo is running? No, not without.
2451. *Mr. Woore.*] Is there not a natural channel from the Paroo into the swamp by which this water passes? Yes.
2452. And this natural channel has been deepened, has it not? Yes.
2453. *Chairman.*] You say that this tank is in such a position that unless the Paroo runs it cannot be filled? Yes; the tank cannot fill unless the Paroo is running, and unless it runs pretty high it will fill the swamp, but will not fill the tank.
2454. *Mr. Woore.*] Then there is no local catchment? No; there might be local rains that would run the Paroo for some distance.
2455. Cannot this tank be made to fill by means of a local catchment? No; not without a dam is put right across the channel of the Paroo.
2456. I mean independent of the Paroo flood water—cannot the tank be made to fill from local catchment? No; I do not think it could. The tank might have been situated in the swamp or closer to the lagoon.
2457. *Chairman.*] You are not aware by whom the site of this tank was chosen? No; it was chosen before I entered into charge of that district.
2458. Do you know that this lagoon has been filled without any water being put into the tank? Yes; I have seen it full.
2459. *Major Penrose.*] Is there any water in the tank now? Yes; the Paroo has been running almost continuously for the last two years.
2460. *Chairman.*] Have you any fault to find with the construction of tanks—with faulty designs and so forth? No, with the exceptions of the steepness of the batters; otherwise the designs of the tanks appear to be correct.
2461. What do you find the batters to be in those tanks that have come under your own observation? The slope of the batters appears to me to be like 1 in 1 and 1 in 1½.
2462. And at that slope the bank sometimes falls in? Yes; but I would like to say that you could scarcely lay down a hard and fast rule as to the kind of batter to be used.

- M. J. C. Tully. 2463. You would have the slope of the batter fixed in accordance with the nature of the soil? Yes.
2464. Are you aware that the steep batters increase the cost of excavation? Yes, greatly.
- 23 Feb., 1888. 2465. Are you aware that in that hot dry country it is very desirable to expose as little water as possible to the sun and to the wind? Yes; I am quite aware of that.
2466. Then, do you not think it is quite right that the batter of the tank should be as steep as possible? Yes; I believe the batter should be as steep as the nature of the soil will allow.
2467. Have any tanks been constructed with a more gentle slope than $1\frac{1}{2}$ to 1? I think none of the older ones, constructed before the Mines Department took charge, had a greater slope than $1\frac{1}{2}$ to 1.
2468. Do you know what that slope was? No; I do not know.
2469. Of course, in all these steep-slope tanks the intention is that the stock shall water at troughs? Yes.
2470. And if stock were to water direct from the tanks they would require a more gentle slope? Yes.
2471. Do you think it desirable or otherwise that stock should water direct from the tanks? Not usually; but in certain cases they should be allowed to water at the tanks.
2472. Where should these places be at which you think stock should not be watered by machinery? Wherever there is a large traffic I would have appliances for the watering of stock, but not on that sort of roads where the tanks are seldom used. On these latter places I would be inclined to admit stock to the tanks.
2473. Would that save the expenses of keeping a caretaker there? Yes, it would. I would deprecate any hard-and-fast rule in these specifications in regard to the slope. In every case the question of batter should be considered on its merits, and a greater or less slope adopted if the ground will admit.
2474. Are you aware whether the road superintendents who had the selection of sites and the control of the construction had any discretion in this matter? I was not aware that the road superintendents had any discretion in the construction of any of the works that are referred to here.
2475. Of course, a trial shaft is sunk in every case? Yes.
2476. Well, then, a road superintendent, in seeing these trial shafts put down, ought to be able to form an opinion as to the proper slope to be given to that particular tank? Yes; I think so.
2477. And if he recommends a slope that the nature of the soil will not bear he is to a certain extent reprehensible and guilty of a waste of public money? Yes, assuredly. There are several other places that I might refer to that have faulty sites. Another one is the Tarella tank, to which I would like to draw attention. With respect to this tank at Tarella, after the contractor had commenced the work he found that the plans did not agree, and that the inlet was placed down stream. In connection with the Tarella tank, when the contractor undertook the work he found that the opening was down instead of up. He came to me and asked me what he was to do, and I recommended him to see the superintendent before he went further with the work. Having understood matters, the superintendent altered the inlet to the tank.
2478. Who was the officer who selected this site? I believe the site was selected by the Assistant Engineer for Roads, Mr. A. P. Wood. I am not quite sure, but it was either Mr. Wood or Mr. Earngey. I cannot speak positively. The site of the tank was not a good one, because it was placed very near a watering-place on the Bunker Creek.
2479. *Mr. Woore.*] Then it is placed in the water-course? Yes.
2480. And in the creek? No, not in the main creek, but in the Billabong, and the first flood that went by washed around the end of the tank. This is 3 feet deeper than the inlet to the tank.
2481. *Chairman.*] In any event, being situated on a billabong or creek, the tank was liable to be silted up? Yes, or the banks washed away, or both.
2482. Was this a natural waterhole, or had the supply been increased by expenditure? It was dammed by lessees.
2483. In the event of the lessee refusing water to travelling stock, how would they obtain water? The stock could not have travelled.
2484. And do you still say that the tank was improperly placed, in the face of that fact? Yes.
2485. *Major Penrose.*] What state is that tank in now? It is just about to be completed and handed over to the Department of Mines.
2486. *Chairman.*] Could a better site have been selected in that neighbourhood? Yes; within a very short distance from the tank.
2487. In your opinion, do the road superintendents out there take any trouble to obtain local information as to the best position to put down these tanks in? I have heard it frequently stated that they do not inquire sufficiently or get the advice of the older residents there.
2488. *Mr. Woore.*] You have only heard that? That is all. All I know is that they did not come to me for information. Had they done so I would have given them every information in my power.
2489. And are you aware of any local people in the neighbourhood having been asked their opinions? No; I am not aware of it.
2490. Are you aware that in the early days mistakes were made by the squatters in constructing excavations for tanks, and in putting up dams that were washed away? Many mistakes were made in the early days. I know that some dams on Bunker Creek and other places were washed away.
2491. So that it could scarcely be expected that the Government officers should be infallible. If other men made mistakes, they were liable to do the same? Yes; mistakes were made all round.
2492. *Chairman.*] Are you aware that in some instances drains leading water into these tanks were improperly constructed, and that instead of leading the water in, had a contrary effect? No, not in my district, and it contains altogether twenty-two watering places—three of these being on the Booligal to Wilcannia road. My district runs 150 miles up the Paroo. Previous to the beginning of this year it ran out to Tibbooburra.
2493. Is it your duty as overseer to visit these tanks? Yes; I have to visit these tanks once every two months; and unless there is some reason why, I do so. I am supposed to inspect and report on the tanks every two months.
2494. Now, with regard to excessive cost of construction, are you aware that the Government pay higher prices for excavation work than squatters and others? That has been well known.
2495. Can you give any reasons why that should be the case? I do not know all the reasons why. The only reason that I am aware of is the delay which the contractors have to contend with in obtaining payment for their work. That I take to be the principal reason, because it necessitates a man with a large plant and with considerable capital to enter into these Government contracts.

2496. What machinery have you in your district? We have got four steam pumps, three of which are under my control. M.J.C. Tally.
2497. Do you think that steam pumps are needlessly expensive? Except where the traffic is very heavy I think a steam pump is a needless expense. 23 Feb., 1888.
2498. But you think that in some instances it is desirable to have steam power? Yes; where the traffic is heavy, and where other kinds of machinery might cause delay.
2499. How do you regard steam power as compared with horse-power? From what I have seen of the two I would prefer horse-power for the public watering places.
2500. For what reason? Because an ordinary man can deal with horse-pumps, and you must have a man of more than ordinary intelligence to make repairs if the steam machinery gets out of order.
2501. Of your own knowledge what is the greatest amount of water required in one day at one of these public watering places? I do not know what quantity would be required, though I say about 70,000 gallons. The public watering places in my district have had very few demands made on them lately on account of the seasons being wet.
2502. Do you think it is possible that with a hand-pump a caretaker could always keep the service tank full and available for traffic? I do not think he could. Wherever the traffic is at all heavy I do not think it is possible; but where, on the other hand, the traffic is light, I think he might keep the tank full and attend to his other work at the same time.
2503. *Mr. Woore.*] What is the greatest number of stock that you have known to water at the public watering places during one day? There might be a case of 40,000 sheep watering in one day.
2504. But what is the greatest number that you have known? I think about 26,000 sheep. That number watered at the 35-Mile tank in one day.
2505. And how much water would they each consume? I should say at the rate of a gallon and a-half each. I am under the impression that in this case the sheep were allowed to drink at the silt-tank, as it was about being cleaned out at that time.
2506. I want to find out whether it is possible for any one man with a hand pump to water the greatest number of sheep or cattle that would travel in one day? No; not on a regular road. I think a horse-power pump might do it, but a M'Comas hand pump could not.
2507. *Major Penrose.*] In the event of 40,000 sheep calling for water in one day, would not the water required be 100,000 gallons? Yes; 100,000 gallons might be wanted, but 80,000 gallons would be more like their real requirements.
2508. That would mean four times the water in the service tank? Yes.
2509. And in that case steam power would be required? Yes; but it would not be necessary to water such a number of sheep as that altogether.
2510. *Chairman.*] Then you think that discretion should be exercised in putting up machinery? Yes; wherever several roads converge and the traffic is heavy, steam pumps might be necessary. Expensive forms of machinery might be wanted in such case, but in every other instance I think a horse-pump would be sufficient.
2511. *Major Penrose.*] Have you made any calculation showing the cost of erection and maintenance of horse-power and of steam power? No; I have not.
2512. *Chairman.*] You are aware that the Government fence off paddocks in connection with these tanks for caretakers and their horses? Yes; at many places the caretakers are provided with paddocks. At others the land is set apart but is not fenced in in all cases. In some cases where the traffic is not large, I think the caretaker's services might be dispensed with; that is, if the tanks were constructed with slight slopes allowing the stock to water in them. What I say now only refers to outlying roads.
2513. *Major Penrose.*] Do you find that steam pumps are easily put in repair by your caretakers? No; although I find that they are very liable to get out of order. One of the first things that I have to do is to see to the repair of one of these when I get back to my district.
2514. In the event of accident what provision is made for travelling stock? At one place the stock can water at the tank, because it is on the side of rising ground and is constructed for that purpose. This is the 48-mile tank on the Booligal road.
2515. Do you think that this inability to make repairs arises from the incapacity of the caretaker or from the complicated character of the machinery? Any man who has to deal with the Tangye steam pump must possess something above the average information.
2516. And do not the caretakers know something about these steam pumps? Yes; in some cases, but in this instance the tank was let to Robinson & Wagner and they employed the caretaker. There is great risk to the travelling public in cases where incompetent men are employed. In that case the Department was not responsible because the man was employed by the lessees of the watering place.
2517. *Chairman.*] Now with regard to the fencing: are you aware of any faulty or expensive construction of the fencing of the caretakers' paddocks? I know that a great deal of expensive fencing has taken place, but I would not call it faulty, because its greatest fault is that it is too good.
2518. You mean that the posts are too close together, the wire too heavy, and so forth? Yes; and too many wires. Altogether the fencing is too expensive for the purpose.
2519. Do you know what some of these wire fences have cost per mile? I know that they have cost over £90 per mile in my district.
2520. What is the usual cost of squatters' fences? Fences of the same nature that would be required for a horse paddock would cost about £40 to £45 per mile at the present rate of wire.
2521. *Mr. Woore.*] What is the size of these paddocks? 640 acres usually, but some of them have 5 miles of fencing, according to the shape of the paddock. They are 2 miles long by $\frac{1}{2}$ a mile wide; so that, to fence them, it takes more than is usually required.
2522. *Chairman.*] Now, have you found any trouble with regard to the dual control of these works. The Public Works Department, as you know, has charge of the construction, and then the works are handed over to the Mines? I have not had much trouble nor interference in my district because the local road superintendent has more discretionary power than are given to other superintendents in the Colony. He is not obliged to refer to head-quarters for every little thing that is wanted. In one case the Assistant Engineer laid a very strong complaint against one of the caretakers in my district. This was Mr. A. P. Wood; and the caretaker against whom the strong complaint was made was the man at the 48-Mile tank. The caretaker of the tank complained that the works that had been found fault with were not under

- M. J. C. Tully.** under our control; that they were in the hands of the Department of Work; but Mr. Woods, notwithstanding, blamed the caretaker of the Mines Department for the whole condition of the works.
 23 Feb., 1888. 2523. But I thought you said that that tank was in the hands of lessees? So it is at the present time, but it was not then in their hands. It was still under the control of the Works Department. It was only the watering appliances that were then being erected. The Works Department had made these improvements, but had not handed them over to us; and it was for not looking after them while under the Works that Mr. Wood found fault with the caretaker.
2524. *Major Penrose.*] I suppose that caretaker was an employee of the Mines Department? Yes; and he was in charge of the tank, but he was not in charge of the appliances. My instructions to the caretaker were to see to the watering of stock, but not to interfere with the appliances until the whole thing was handed over to the Department of Mines.
2525. *Chairman.*] Have you any knowledge of the letting of works by the original contractors to sub-contractors? Nothing that I can speak positively about; I have heard of these things, but none of them have come under my notice.
2526. Have you any wells in your district? Yes.
2527. Have you any fault to find with the sites chosen for the construction of these wells? Only one well has been handed over to the Department of Mines. This is Meenamurtee well, which I always considered unnecessary, and the site of which I considered badly chosen.
2528. For what reason? Because the natural water of the creek might have been utilized at the Meenamurtee waterhole.
2529. Was it a very expensive well? No; I do not think it was very expensive, and the water obtained was very fair stock water.
2530. Do you not think it is desirable to have well-water as a stand-by in extreme droughts, during which tanks have been known to fail? Yes; but I would not put a well close to permanent water. As far as possible I would try to have it put down in dry country.
2531. Yes, but the water is not permanent sometimes, although it is thought to be so, and therefore is it not desirable to have a well close by? It is certainly a difficult matter to define what water is permanent in the western country.
2532. Do you think it is sometimes desirable to sink wells as a stand-by in a very long continuous drought? I do not think it would be advisable to do that until the country is better supplied with water in the unwatered portions of it.
2533. Have you had anything to do with the hutting of caretakers in your district? Yes.
2534. There has been some considerable discussion between the two Departments in regard to this matter? I believe there has been, but none of it has come under my notice.
2535. Have you any huts in your district that have cost a large sum of money? No; the Department of Works have not put up any huts in my district lately. One has been put up by the Mines Department. The material was found by the Department, and the caretaker put up the hut, but not by contract. There were some engine-sheds put up in my district that were unnecessarily costly.
2536. In what way? They were very much too heavy. This was the principal item. It was contract work, and the contractor got £50 for putting them up.
2537. What do you think would have been a fair price for work equal to this? My estimate, which was sent in to the Department, was £19, and I think I could get them made for that.
2538. Have you any reason to find fault with the troughing that has been laid down at public watering places? Nearly all the troughing that has been laid down is the new steel troughing, and there is not much fault to be found with it. Of course, the top rail is too high. It shuts the cattle out, and allows the sheep to come in. The road superintendent in my district has tried the troughing without any top rail.
2539. Have you ever found that sheep got into the water? Yes.
2540. And do you not think, then, that it will be necessary to have a rail down the centre? It might. I have recommended the superintendent to try several kinds of rail, and see which will answer the best. I believe there is less fault to be found with the watering places in my district than with those in any other part of the Colony, because most of them have only recently been constructed.
2541. Now, can you give us any idea how best to meet the exigencies of the case—to lessen this unnecessary expenditure, and remove the friction that has arisen between the two Departments. Do you not think that if the whole matter were put into the hands of a local body it would be advantageous to the public, seeing that the men would have local knowledge and experience? If they were placed under local bodies it would be an immense advantage in saving expenses, and in securing efficiency. I think that the construction and maintenance of these works should all be in the hands of one Department.
2542. From your knowledge generally of this locality you think that Local Boards could be appointed, in whom the public would have confidence, to carry out these works in an economical manner? I am sure of it.
2543. And you do not think there would be any risk of favoritism? None, if the parties concerned would take sufficient interest in, and attend the meetings.

[The Commission adjourned.]

FRIDAY, 24 FEBRUARY, 1888.

The Commission met at 10 a.m.

Present:—

HON. G. H. COX, M.L.C., CHAIRMAN.

MAJOR PENROSE, R.E.,

J. C. WOORE, Esq.

Thomas Waddell called in and examined:—

- T. Waddell.** 2544. *Chairman.*] You are a Member of the Legislative Assembly? Yes.
 24 Feb., 1888. 2545. I think you reside at Bourke? No; I live at Croydon, near Sydney.
 2546. You are one of the Members for the Bourke Electorate? I am.
 2547. I think it was at your instance that the papers in connection with this disagreement between the Mines and Works Departments were produced and printed? Yes; I first asked a question about the matter in the House, and afterwards I moved for the papers. 2548.

2548. These papers have been presented to Parliament? Yes.

2549. What induced you to ask for these papers—had you heard anything that induced you to do so? Yes; it was owing to something that I had heard in my capacity as a representative of the district in Parliament.

T. Waddell.
24 Feb., 1888.

2550. What were these matters that you refer to? Well, in urging the Mines Department on two or three different occasions to get tanks constructed in different parts of the interior where they are required, it appeared to me there was considerable difficulty in getting anything done, owing to the work being divided between two Departments. This came to my notice on several different occasions, and I had my attention repeatedly called to the delay caused by this dual control. I may also mention that I have been told by different persons who ought to know, that there has been considerable loss owing to this work being divided between two Departments.

2551. In what way was there a loss? I believe that large sums of money had been paid away for the making of inspections of work, and that these expenses were far greater than the work itself actually cost.

2552. I suppose the difficulty was caused by what is usually designated "red-tape"? Yes; that is it exactly. I may say, however, that I have had nothing to do personally with getting tanks constructed by the Government, and therefore I cannot say much more.

2553. Do you know any particular tank or well or piece of fencing with which fault might be found, and if so we will be glad to hear of it? I may mention to you now before going any further, that one of the strongest reasons that induced me to take action was—knowledge that any business-man would not have—that work divided between two Departments, as is the case here, could not be carried out in a proper manner. That was one of the things that induced me to bring the matter forward, and it seemed to me plain enough that the Works Department could in some cases get their works constructed if there had not been some antagonism between them and the Mines. The latter would find fault with the way that things were done, and demand that a certain alteration be made, which entailed cost and much loss of time; and, besides that, kept the public from having the advantage of the works.

2554. Now, have you any particular case that you can mention which would exemplify what you say? I think you will find that everything is contained in the papers which have been laid before Parliament. I do not know that there is any case that has come within my personal knowledge, but my reason for doing this was my own feeling that work carried on in this way could not be satisfactory. Representations were made to me by other persons to the same effect since I have been a member for the district.

2555. Having perused these papers, what conclusion did you arrive at with regard to the most desirable way of getting rid of this dual control? The conclusion that I have come to is that the wisest plan would be to put these works entirely into the hands of the Mines Department. I think that Mr. Bennett, the Commissioner for Roads, has so much to do that it is impossible for him to look after his work. I have the highest opinion of Mr. Bennett's ability, but I do not think that he has the time, nor have his officers the time either, to give proper supervision to his work, and that it could be better attended to by men who have more time and larger experience. I know Mr. Gilliat personally, and I know that he is a thoroughly practical man.

2556. I gather from what you state now that a good practical man would be more desirable than a trained engineer? Yes; I have had very large experience in the construction of tanks and dams, and the conservation of water generally in the interior of this country, having had stations out there covering extensive areas; and I have noticed by personal observation that large sums of money were thrown away even by private persons in doing work planned by those possessing no knowledge of the country.

2557. But would not a trained engineer possess the requisite knowledge? It is only by local personal experience of the nature of the ground in the interior that any man can say whether a certain spot will hold water or not. I have known tanks of from 15,000 to 20,000 yards constructed by men who had no knowledge of the nature of the soil, and when they were made they would not hold water. The works were consequently useless and the money expended upon them was thrown away.

2558. I presume this occurred not through faulty design, but through want of local knowledge of the nature of the soil in which the tanks were being put down? Exactly. I may also mention one great fault that many men fall into in carrying out tanks in the interior;—engineers and others who have no personal knowledge of the locality often make what is called the batter of the tank very much too steep. The consequence of this is that the waves of water when disturbed by the wind undermine the banks and large quantities of earth fall in and fill it up, so that the tanks are now much shallower than they ought to be. This I have noticed particularly myself in tanks made under the Works Department.

2559. Do you know what the batter is of which you were speaking? Yes; I should say it was about 1 in 1, while it should be about 1 in 4.

2560. *Major Penrose.*] You mean for that particular soil? Yes, for the particular soil it was excavated in.

2561. *Chairman.*] I presume that some soils would stand a batter of 1 in 1? Yes, some soil would do that, but it is very seldom you will meet with ground of that nature.

2562. Consequently you think that any hard and fast rule in regard to specifications for tanks is altogether wrong? Yes, it is impracticable.

2563. Has it never occurred to you that the handing over of the control of these matters to local bodies would be very desirable, and be likely to result in cheaper construction and arrangement than under the present system? Yes, that would be the case if we had a proper system of local self-government. I believe the work could then be done very much cheaper than by having it looked after by some of the Departments in Sydney.

2564. You think the system of centralization involves the unnecessary expenditure of a great deal of money and the waste of a great deal of time? Yes; I believe this is one of the greatest difficulties that the people of this colony have to contend with. That is the centralization of everything in connection with the carrying out of public works.

2565. Do you know much about Queensland? I do not.

2566. Do you know anything about the system in vogue there? No, not the system in vogue by the Government; but I have a very good knowledge of what is done by private individuals in the way of water conservation. I have no knowledge of works carried out by the Government.

2567. Are you aware that the Government of Queensland have created local bodies to carry out public works in that Colony? Yes, I think so. I believe they call them Divisional Boards.

2568.

- T. Waddell. 2568. You do not know of your own knowledge how these local bodies work? So far as I have seen, having travelled round to Normanton, and also travelled a good deal in south-western Queensland, and so far as I have heard, I think the arrangement in Queensland is a more satisfactory one than any I have yet heard of.
2569. *Major Penrose.*] Because, I presume, the people in constructing public works spend their own money? Yes; I think the rates collected on town and suburban properties are applied partly to these works, and that the Government also gives further assistance.
2570. In any big works the Government give assistance? Yes; in large public works I think they assist; but the local people, I believe, are obliged to assist as well.
2571. *Chairman.*] And you think it would be very desirable if such a system were established in New South Wales? Yes, or some similar system by which the people locally would have supervision over the work. I might mention that the present system of watering stock at tanks does not seem to work very well. Wild cattle do not like to drink out of the troughs. At the same time, I am not prepared to offer any opinion or to suggest anything better.
2572. *Mr. Woore.*] You cannot say anything about the manner in which these works are constructed in Queensland? No; I do not recollect how they are constructed.
2573. *Major Penrose.*] What particular tank do you refer to as having its batter too steep? I think it is called Mulga tank No. 5. I drove past the tank, I think, in January, 1887, and it was then almost completed. In fact I believe it was completed. Since then, I have learned on good authority—I have seen it in the local papers—that the tank has become available for use only a few weeks ago; so that it appears to be standing unused all this time owing to something of which I have no knowledge. The delay must have been caused by the bad management of some of the Departments. At all events, the consequence has been that the public who use this road very largely have been deprived of the water for their stock.
2574. Was the machinery up when you were there? No, not at that time, but the tank appeared to be ready then to have the water let in to fill it up. The silt-tank and shoots, &c., were then ready. The distance between Byrock and Gungolgan is about 40 miles, so that every one will see the hardships which stock, and even human beings, must have suffered in travelling that distance without water.
2575. Is that tank full now? I believe it is.
2576. *Chairman.*] Have you made any inquiry about this long delay? No; the matter was not brought under my notice until I saw it mentioned in one of the papers, which showed me plainly that the tank had only recently been completed.
2577. *Major Penrose.*] You could not have noticed the cutting away of the banks in that particular tank? I owned the country once, and have a good deal of knowledge of the nature of the soil, and from my acquaintance with it I should say it will happen that a good deal of the banks will be washed down into the tank and fill it up. Out in that hot, dry district what we always like to have in our tanks is depth.
2578. Have you any reason to find fault with the sites selected for these tanks? Well, in some cases I do. For instance, the tank I mentioned between Bourke and the Warrego river, was not put in anything like the best place that could have been selected. It could have been put in a much better place. I think the gentleman who put this tank down, although a trained engineer, had no local knowledge, and could not be said to be a practical man.
2579. What was the objection to the site? There was not sufficient drainage to fill the tank quickly—not sufficient catchment area. It often happens that if a tank were made in one particular place half an inch of rain would fill the tank, while if it were placed a little further away, it would take 2 or 3 inches to fill it.
2580. Everything would depend upon the nature of the soil? Yes, and upon the catchment area.
2581. *Mr. Woore.*] Has this tank failed in consequence of the insufficient amount of water flowing? No, it has been very useful; but still a large amount of money has been spent on making drains into it when if it had been made a little further away it would have got the hard clay-pans, and about one-half of the drainage would have sufficed.
2582. *Chairman.*] Do you know the name of the road superintendent who selected that site? I think it was Mr. Postle who was at one time in the Works.
2583. Do you know of any tanks the construction of which you have reason to find fault with? Yes, I know tanks that have been constructed with too steep batters.
2584. *Major Penrose.*] A site of the nature such as that you have just spoken of, requires a great deal of drainage to collect the water. Would it collect more silt than a quicker catchment? I don't think it would. In this particular case, the tank was made close up under the hills; and in consequence of this, the drains would take a good deal of dirt into it, whereas if made with broad shallow drains, the water would run so slowly that it would not carry in much earth with it.
2585. Then this particular tank would collect a great deal of silt? Yes, I should think so.
2586. *Chairman.*] Are you aware that the works constructed by the Government have as a rule cost very much more than those constructed by private individuals? I think they generally do.
2587. Do you know any reasons for that? I think the principal cause of it is that the work is looked after by the Department in Sydney. I believe if the work could be done locally and that the people concerned had to pay part of the cost, work would be done very much cheaper than it is at present.
2588. Have you ever taken notice of the machinery in use in these places for lifting water? No, I have no knowledge of the machinery at all.
2589. Do you know anything about the fences that are constructed round these tanks and round the caretakers' paddocks? Yes; in connection with that I may mention that I know of one or two cases where £8 have been paid for making gates for which £3 would have been full value.
2590. *Mr. Woore.*] Can you name these places? Well, I would sooner not do so, as the information in both cases came to me in confidence. I know that tenders were accepted at £8 for the construction of gates that I reckon ought not to have cost more than £3 or at the most more than £4. I think £12 was given in one case where £4 or £5 would have been quite sufficient. The gates were put where slip-panels were used.
2591. *Chairman.*] Do you think any favoritism was shown in giving contracts to these parties? The work was generally done by tender, but complaints were made to me—I do not know on what grounds—that the system of letting contracts by tender is not a satisfactory one.

2592. From what you say, I imagine that you deprecate the opening of tenders by these local officers as being subject to comment? Yes, I think some other arrangement than the present one would be advisable. T. Waddell.
24 Feb., 1888.

2593. It is possible, of course, that these local officers may act in collusion with contractors, and that other undesirable things may happen? Yes, I think that is quite possible. I might suggest as a way that would be much more satisfactory, that the tenders should be opened before a bench of magistrates, consisting of at least two magistrates of the town where the tenders were received.

2594. Of course a local board would be still better as a substitute for the present system of opening tenders? Yes; some local body composed say of three persons.

2595. Have you ever observed any unnecessarily costly fencing to caretakers' paddocks in your journey through your electorate? No; I do not know that I have.

2596. *Mr. Woore.*] Do you think that in an outside district there would be any difficulty in local bodies having charge of the matter of water conservation. When people live a long distance apart, it might be difficult to get them together, in the same way as there is now sometimes a difficulty in getting meetings of the Stock Board? I do not think it would add to the difficulty. At present, I think the arrangement is this way—the Bourke road superintendent has tenders sent him for work say 100 miles away. He opens them there, and I do not see that it would add to the inconvenience if the Local Land Board were to open the tenders instead.

2597. *Chairman.*] The next matter is the alleged interference by the officers of one Department with those of another in the maintenance of these public watering places? No; I know nothing special about that.

2598. There is another important matter concerning which we would like information—that is, the subletting of contracts. Are you aware of contracts having been sublet at very much reduced prices? No; I have no knowledge of that. I have no personal knowledge of anything of that kind having been done.

2599. Can you give us any information with respect to alleged misconduct of Government officers in connection with any public works in your district? No; I have no personal knowledge of any misconduct, and I may also add that I have not heard anything to warrant me in supposing that there was any misconduct. I cannot speak with anything like certainty about this. I have only heard rumours that things have not been done in a satisfactory manner by the officers of the Works Department. But I have no reason whatever to come to the conclusion that these rumours are correct.

2600. Do you know that some officers have been discharged for misconduct? Yes; I believe that there have been some cases of that kind.

2601. Have you any knowledge of the public wells of your district? No; no knowledge about them.

2602. Have you heard anything about the erection of huts for caretakers? Nothing except what is disclosed in the papers. I may mention that I do not think that one of these huts should cost more than £50—not any this side of the Darling, at any rate.

2603. I think you mentioned something about troughing. Now do you think that the construction of the troughing has been defective? No; I cannot speak from personal knowledge, because I have not taken sufficient notice of it.

2604. Is there anything else that you would like to state? I do not think there is anything else except with regard to boring operations.

2605. Well, we shall be glad to hear it. Hitherto we have understood large expense had been incurred by the Government in connection with the sinking of trial-shafts, prior to the sinking of wells. Would not the boring, if properly carried out, very much lessen the expense and trouble involved in the putting down of trial-shafts? I think the best plan would be to bore in every instance, and not to sink a trial-shaft at all. The way in which boring operations have been carried out in the interior is I think a very unsatisfactory way, tending to very serious loss to the Government, and very great delay in carrying out the works.

2606. Which of the Departments has control of the boring? I think it is the Mines Department. During the last five years there have been boring operations going on on the road between Bourke and Wanaaring, on the Paroo. And I believe I am quite correct in saying that there must have been several thousands of pounds of public money thrown away, owing to the bad management of that branch.

2607. What bores have been used? I believe the Wright and Edwards, and the Tiffen bores have been used. What I would suggest in place of the present system of carrying out boring operations by the Government, would be that in all cases the work should be let by tender, at so much per foot, binding the successful tenderer to do the work within a given time.

2608. *Mr. Woore.*] And provide him with the plant? No, I would have nothing to do with plant or machinery in any way. There is a gentleman named Loughead in Queensland who often visits Sydney, and who is carrying on boring operations for the Government of that colony. He informed me on several occasions that if our Government wished it he would take contracts for boring for them, and charge so much per foot, guaranteeing to do the work within a few weeks. The works on the Wanaaring road, which have taken the Mines Department some two years to do, Mr. Loughead would undertake to do in a few weeks.

2609. *Major Penrose.*] At how much per foot? I think it would be £1 a foot up to 1,000 feet.

2610. And what did you say the boring under the Mines Department cost? I should imagine that most of the boring between Bourke and Wanaaring has cost—I think I am quite within the limit when I say it has cost—several hundred per cent. more than Mr. Loughead would require to do the work for.

2611. *Chairman.*] How many of these bores have turned out satisfactorily between Bourke and Wanaaring? Three of them have turned out satisfactorily, and I am of opinion that they will be an immense benefit to the public.

2612. And how many have turned out unsatisfactorily? Well, I think several have turned out useless. But the loss has been in the great delay which has taken place, and the money wasted in doing the work.

2613. *Mr. Woore.*] You do not mean to say that the boring carried out by the Mines Department has cost several hundred per cent. too much, but that the contingent expenses and delays have run it up to that? Yes; the loss incidental to the delays and the expenses in connection with the work, have run it up far above what it should have cost. It is only fair to the officers who are carrying out this work to say that

- T. Waddell. that I believe one of the causes of the loss has been the bad machinery that was used. I think the machine of the new kind such as that which Mr. Loughead is using would be much better, and the work could be done at a fraction of the cost.
- 24 Feb., 1888. 2614. What kind of machinery is this gentleman in Queensland using? I do not remember the name of it just now.
2615. *Chairman.*] Then in any estimate of cost it would be necessary to include all incidental expenses? Yes. I do not think the Government could give the exact cost of the work.
2616. If the Government said that one of these bores cost over £2 or £3 per foot, would that include all the expenses and the delay in putting this work down? I do not think so.
2617. That could only be obtained by actually getting returns of the whole cost from the commencement to the completion of the particular work? Yes, the present system is involved in great difficulty; the machinery is bad and there is a difficulty in getting competent men. If the Government officers were allowed to pick out sites, and then let out work by tender, I am satisfied that it could be done at one-third of the present cost.

James Yeo called in and examined:—

- J. Yeo. 2618. *Chairman.*] You are an overseer under the Mines Department? I am late overseer of public watering places for the Ivanhoe District.
- 24 Feb., 1888. 2619. What is your present employment? I am inspector of stock.
2620. We have understood up to the present that these terms are synonymous? Yes, so they are in some districts; but in my district now there are no public watering places, and consequently no overseer.
2621. For what district are you an inspector of stock? For Picton, Berrima, and Kiama districts.
2622. You are now then in the Metropolitan district? No.
2623. How many years were you living in the Ivanhoe district? About two years and six months.
2624. How long since? I left at the beginning of October last.
2625. Have you had any reason to find fault with the selection of sites for tanks? Yes, there are several places where tanks were put down in unsuitable situations.
2626. What is the reason of this? One was put in a swamp, and one is surrounded with water, and should have been put on the ground higher up.
2627. What is the name of that tank? That is the Clare tank.
2628. What objection is there to that tank being placed in low ground? Well, the service tank is endangered, and the water is all round the foundation. The troughing is under water, and it is impossible for any stock to get to the troughing. The embankments are affected a great deal by the continual whirl of the water all round.
2629. Could a better site have been selected in the neighbourhood? Yes, about 300 yards away.
2630. Has this swamp or lake often been filled? I do not think it has been filled for some years till eight or nine months ago.
2631. Then you think that the site was a fairly good one? Yes, it was a fair catch.
2632. If the lake had not been filled with water you would have no reason for objecting to the site? Well, I would not have put the tank into the swamp in any case.
2633. Why? Because the red ground is preferable, and does not take so much water to fill it as a tank put in swampy ground, where the water soaks away before it can get to the tank. One is hard soil, and the other porous.
2634. *Major Penrose.*] I suppose most of the catchment is on the hard ground outside the tank? Yes.
2635. So that you would have chosen the site nearer the hard ground, where the water would have run direct into the tank, filling it with a less rainfall? Yes.
2636. *Chairman.*] Are there any other tanks that you think fault may be found with? Yes, Gunaramby tank, on the Clare run.
2637. What is the situation of that tank? It is in a swamp. There is no water around it just now, but it would have been better if it had been placed on the red ground, because it would catch much quicker. I would also wish to point out the great difficulty in the way the water is carried into that tank. It is by the silt-tank on one side, and there is a lead from that silt-tank around on top of the excavation to the other side, to be carried into the flume. Consequently, with the very loose open soil, the earth between the top of the excavation and drain is liable to be washed into the main tank. There was no protection to the sides or bottom until I had it made. I had a lot of gypsum stones collected, and made a gypsum flume all the way. I pointed out this at the time I was taking delivery from Mr. Wood and Mr. Stilwell. Mr. Wood snubbed me, and said I was not there to criticise the work, but to take delivery of it in the condition in which it stood.
2638. Was any reason given for the exceptional way of taking the water into the tank? No; no reason was given to me.
2639. I presume that is the only instance you know of where this extraordinary way of taking the water was adopted? That is all.
2640. Any other tanks? I think a better site could easily have been selected for the Ivanhoe tank. It is right in the centre of the township, and the drains to it run right alongside piggeries and Cobb & Co.'s stables; whereas the tank might have been put in another place on Government ground, where the stock, in order to get to the tank, would not have to pass through the township.
2641. Were not these stables and piggeries erected since the tank was put down there? No, before.
2642. Who chose the site of this tank that you have just been speaking about? I cannot say, because that work was started before I took charge of the district.
2643. But the Mines Department, as a rule, chose the sites for tanks? Yes, but they generally send an officer of the Works Department with them. I do not know that it was done in any of these cases. There was a site chosen and a lot of work done to it, but they only went down about 2 feet when it was given up.
2644. For what reason? I was informed that the station people, having found out where the tank was to be put down, went and selected the land, and since then they have put down a tank there, although the selection has been forfeited.
2645. Was the ground found to be suitable? Yes; it was very good holding ground.

J. Yeo.
24 Feb., 1888.

2646. And you do not know any reason why the site of the tank was shifted, except that it was selected by the lessees of the run? No; no other reason. The Ivanhoe tank, I may say, does not hold water well; the soil is very porous, and, in fact, for some time the water left it at the rate of 3 inches a day. When I left the district of Ivanhoe the water was leaving at the rate of an inch per day. There is a drain to the Ivanhoe tank that carries the water in an opposite direction instead of allowing it to run into the tank.

2647. *Major Penrose.*] Do you know who laid out that drain? I cannot say whether it was Mr. Stilwell or his assistant. A very excessive price was paid for it, too.

2648. With regard to the Ivanhoe tank, you have already written letters to your Department setting forth your objections to it? Yes.

2649. *Chairman.*] Do you know any other tanks that show great faults in selection of sites? Well, these are the chief ones in my district.

2650. And have you any fault to find with the construction and excavation of these tanks? Yes; in the first place the batters are all too steep.

2651. What are the batters? They are $1\frac{1}{2}$ to 1 and 2 to 1. Of course, being so steep, in loose, open soil and the continual swelling of the water, the soil caves in, and large quantities go into the tank.

2652. Are there any other reasons for finding fault with the construction of these works? Well, the embankments are much too steep. They scour a great deal, and great complaint was made about the water getting off the embankment at Ivanhoe. A great amount of the embankment washed into the silt-tank.

2653. Could that happen if there was a drain all round the tank between the edge of the tank and the embankment? This that I am speaking about was on the top of the embankment. A syphon was sent up to take this water off, but it was not sufficiently large; consequently, I had to make application to have the angle-shoots put in to carry it off.

2654. *Major Penrose.*] Is this water off the dished top of the embankment? Yes.

2655. But the area of that would be very small? The top of the embankment is, I think, 30 feet wide.

2656. *Chairman.*] You have already mentioned that carelessness has been exhibited in laying out the drains of the Ivanhoe tank? Yes; any one can see that instead of bringing the water to the tank it leads the water in an opposite direction.

2657. I presume you think that no levels could have been taken? No; there could have been no levels taken.

2658. Now, about the excessive cost; how comes it? As a rule it has been alleged that the Government pay very much higher prices for the construction of their works than private individuals? Well, there is only one reason that I can give and that is the great length of time that contractors have to wait for their money. On that account the contractors insist on getting good prices for their work.

2659. Do you think that was sufficient reason to warrant the extra charges in every case? I think there is no reason why the Government should give more for their work than station owners. If contractors for the Government only received their money directly they finished their work, I see no reason why the work should not be done as cheaply.

2660. Is there no other reason you know of besides that? No.

2661. Would not a much steeper batter be more expensive? Of course it would; but I thought you were speaking of the drains just then. The batters are much too steep, and the making of them necessitates extra labour and a larger sum of money. Particularly steep batters necessarily cause great expense.

2662. And as a rule the Government sink their tanks some 2 or 3 feet deeper than squatters? Yes; as a rule they do.

2663. That would entail extra expense? Yes; and of course the deeper you go the more the tank will cost.

2664. Is there not sometimes considerable difficulty in inducing the officers to measure and pass the work while it is in progress? Yes; I think there is; in fact I am certain there is.

2665. Do you think that the very elaborate manner in which the Government insist upon all the earth being placed evenly around the tank, would add to the expense? Yes; undoubtedly; I think a great many of these things are not necessary.

2666. Then, taking all these matters into consideration, do you think that the alleged excessive finish required by the Government in their tanks warrants the tenderer in asking more money? Yes; but I should like to add something else to that. The tanks are made in an unnecessarily expensive manner. I think it is quite unnecessary to lay down a hard and fast rule as to what kind of tank should be constructed in these places. There should be no such rule, but a tank should be made so as to suit a locality in which it is placed.

2667. *Mr. Woore.*] You think there is no necessity for the delay in the payments? I think not; and if a competent man were appointed to look after the work, there should be no delay.

2668. *Major Penrose.*] To what do you attribute this delay in payment for work? In some instances I think it arises on account of not having the work passed immediately, but there is a great deal of delay apart from this for which I cannot account.

2669. Some of the delays, I presume, are due to the local officers, and others are departmental? I should imagine so, but I am not in a position to say.

2670. Are you quite sure that a delay has occurred? Yes; I know it has occurred in some cases.

2671. A delay in inspecting and measuring up the work? Yes.

2672. What forms of machinery are used for lifting water in your district? Some of them are horse-power pumps and others are steam pumps.

2673. *Chairman.*] You said something about the excessive cost of making the leading drains? Yes; 15s. per chain was paid at Ivanhoe.

2674. *Mr. Woore.*] What was the size of the drain? About 6 feet wide by 1 foot deep.

2675. *Major Penrose.*] What is the usual price for such work? From 3s. 6d. to 5s. per chain.

2676. *Chairman.*] And can you account for the excessive price paid in this instance? In this case no tenders were called for the drain.

2677. And was the party who made the contract the local road superintendent? Yes, the men who did the work I know perfectly well. They made an arrangement to ask 7s. 6d. per chain for it; and then one of them said: "No, it's Government work; we'll ask 15s. for it, and possibly we will get 12s. 6d." They asked the 15s.; there was no question about it, and they got the work.

2678. *Mr. Woore.*] Did you see these drains being constructed? Yes.

2679. And can you tell how much of that kind of drain a man can do in a day? The work was done with ploughs and scoops, and I should say that a tremendous lot of it might be done in a day. 2680.

- J. Yeo.
24 Feb., 1888.
2680. Do you believe that these men made a good profit on the work? Yes, an enormous profit; I am quite sure of that. The same men made drains in the same paddock, and the same kind of drain, for 3s. 6d. per chain.
2681. And how do you account for this excessive price having been given to them? I cannot say; all I know is, that it is a fact. I remember the incident perfectly well, because there was a row about it. Two of the men wanted to turn out the third man and they had a fight which I saw myself.
2682. *Chairman.*] It was then that you became aware of the fact? Yes.
2683. Do you think that any intended favoritism was shown in giving the contract to these men? I am not aware of it. I would like to read an extract from a letter which will confirm my statement.
2684. *Mr. Woore.*] Do you know who let this other work for 3s. 6d.? Yes, Mr. Brougham, of Ticehurst. The road crosses the drain of this tank in four places that have been stoned at a cost of £16 10s. or £17 each.
2685. What would have been a fair price for this work? I should think if they got £5 each it would have been sufficient.
2686. Is stone available in that neighbourhood? No, it is not very plentiful, but there is a good deal of stone there suitable for the purpose.
2687. Was this work also done without tendering? I cannot say; I have been informed by Mr. Williamson that he had drains almost similar put down for 5s. 6d. per chain.
2688. *Chairman.*] Now, do you think that the machinery that you have seen working at the tanks is of a more expensive character than is necessary? Well, I am not aware of the cost of the machinery. I have never had a chance to find out what the cost of it was.
2689. Do you think that hand pumps would be sufficient to keep the service tanks supplied without these expensive forms of machinery? I do not think so.
2690. Of course it would depend upon the particular road on which the particular watering place was situated? It would. I do not think a hand or M'Comas pump would be sufficient.
2691. Do you know how many gallons in a day could be pumped with one of these M'Comas pumps? I think one man would pump enough water with one of these pumps to water 8,000 sheep. This would be 8,000 or 10,000 gallons, or perhaps more.
2692. Could the caretaker do this? Yes; but he has other work to attend to as well.
2693. What is his other work? Cleaning the drains, and keeping the tank in proper order, and looking after his fencing.
2694. As a rule stock are not continuously on the roads? No; there might be two or three or four mobs of sheep along in one day, and sometimes none at all.
2695. *Mr. Woore.*] What is the greatest number of travelling sheep that you have known to water in one day? About 20,000 sheep.
2696. That would take about 40,000 gallons of water, including wash? They drink a lot of water.
2697. Would they empty a service tank containing 20,000 gallons twice? Yes.
2698. *Chairman.*] Consequently, one man could not provide for that large number? No.
2699. *Major Penrose.*] Is there a steam pump at Ivanhoe? Yes; and I think it is working well.
2700. You say that from practical experience you have found that a steam pump is dearer than a horse pump? Yes. The caretaker has given him 640 acres, which provides enough feed for his horse.
2701. And, therefore, as one man could not do the work, you do not think the machinery put up on these roads is unnecessary? No; I do not think so.
2702. Do you think the drovers in charge of travelling stock would be able, with the assistance of the caretaker, to raise enough water to supply the stock? Yes; but it would be very difficult to make them do it. They would not feel inclined to do that. They would be more inclined to rush the tank, and allow the stock to get into it.
2703. Do you know any particular tank where machinery is used, and where the traffic does not warrant the expenditure on the machinery? Since I have been in the Ivanhoe district the traffic on some of the stock routes certainly does not.
2704. *Chairman.*] So that in this matter, as in others, a great deal of discretion should be exercised by the Department? Yes.
2705. You know something about the fences round these caretakers' paddocks? Yes.
2706. Has it come under your observation that they have cost an excessive amount? Yes; very excessive.
2707. For what reason are the specifications unnecessarily strict? I have never seen the specifications, but I have no doubt that they are. For instance, the posts are too big and the wire is too heavy. It is almost impossible for a man, single-handed, to strain No. 4 wire. The posts of the fence round the Ivanhoe tank are splitting already on account of the way the wire is strained on them. There is no straining-posts put in—and in a great many places the posts are made of split pine.
2708. Could more durable timber for the work be found in the neighbourhood? Yes; they could have got plenty of belar; it is quite large enough.
2709. Are you aware what this fencing has cost per mile? The contractor for the Ivanhoe tank told me that he got £112 per mile for it, and that afterwards he sublet it to a man named Elliott.
2710. *Mr. Woore.*] Do you know this of your own knowledge? Yes; but I could not find the price that Elliott got from Bevan. Elliott sublet the erection of the fence to one Chas. Anderson, and the carting of the posts to Pat Gallagher at £5 per 100. Anderson was to get £18 per mile from Bevan—the latter to find the wire himself. I think you will find all this in the papers. The first contractor must have made a profit of £60 per mile on the transaction.
2711. Now, can you give me any reason why this enormous price was paid for the fence in the first instance? No; I cannot say.
2712. Do you know that it was let by tender? This particular fence was not let by tender.
2713. By whom was this contract made? By Mr. Stilwell.
2714. With this man Bevan? Yes; this information I got from Bevan himself. Bevan told me further that he had had several other works along the road; and Mr. Stilwell said to him that, seeing he had all these works, he (Mr. Stilwell) might as well give him this one, too.
2715. Have you had any difficulty in regard to interference by the road superintendents? Yes.
2716. In what way—will you mention any particular case that has come under your notice? In connection with my duties, do you mean?

2717. Yes; the officers of one Department interfering with the officers of another? Yes; something occurred in connection with the Merri-Merriwa tank—with regard to the cleaning out of the silt-tank at that place. It is a part of the maintenance; and since I have been in charge of the district I know, from my own personal knowledge, the silt-tank has been cleaned out twice. The caretaker in this case was waiting until the tank was dry before he attempted to clean it out, because the work could not be done while the tank was full of water. In spite of this, a contract was let to clean out the tank by the Works Department.

J. Yeo.
24 Feb., 1888.

2718. Was this before the tank became dry? Yes; before it became dry they let the contract to clean it out; but they had to wait until it was dry.

2719. Who was the road superintendent in this case? Mr. Adams, of Cobar.

2720. What business had he to interfere with the maintenance, so long as it was under the charge of the Mines Department? He had no right to interfere in the matter at all.

2721. Did he state as his reason that the tank was being neglected? No; I did not know that he had let the work until I got round on my usual inspection, and found that it was done.

2722. If the road superintendent found the caretaker neglecting his duties, would he have been justified in attending to the matter? Well, I think he should have reported it first, and then I could have called on the caretaker for an explanation as to why he did not attend to his duties.

2723. What was the result? The contract was let and the tank cleaned out by the contractor to whom the work had been let by the officer of the Works Department.

2724. *Chairman.*] At what cost? I cannot tell you.

2725. You think that in any case it was unnecessary, because it was the caretaker's duty to do the work? Yes; and he had done it twice before.

2726. Is there any other glaring instance where the caretakers have been interfered with by the officers of the Roads Department? In one case Mr. Stilwell reported negligence on the part of the Mines officer. It might have been myself, or the caretaker, as he merely said Mines officer, and did not mention names. It was the caretaker of the Mount Manara watering place, to whom Mr. Stilwell spoke of the state of the pump. The work was completed, and I received instructions to go and take delivery of it. On my arrival I found there was no water in the tank, and of course I would not take delivery of the works on that account, because I could not test them. It remained then for four or five months until rain fell, when there was about 3 feet of water in the tank. I met by appointment, to take delivery from Mr. A. P. Wood, the Assistant Engineer, and Mr. Stilwell, but the machinery had not been transferred to the Works Department previous to this by the contractor, who was to meet us there also in order to transfer the machinery. These works had been exposed to the weather during the whole time of their construction; consequently they were quite rusty and could not be started when steam was got up. The contractor did not arrive; so Mr. Wood and Mr. Stilwell set to work the whole of the day, and in the evening about five o'clock the pump commenced to work, but not in a satisfactory manner. Mr. Stilwell then said to me, "If you will take delivery of these works as they are, I will send my travelling mechanic at once to put them in thorough repair for you." I said to him that if he would do this I would have no objection, in order to save trouble and to save us from travelling the same distance over again for the same object, to accept the transfer from him on these conditions; but Mr. Stilwell did not visit the tank again until the following October (this was in June), and in the meantime no travelling mechanic had arrived. In spite of this, Mr. Stilwell reported the caretaker and myself for negligence, but I referred to what happened between Mr. Wood and myself, who was present to transfer the work. Mr. Stilwell alluded to the fact that the state which the machinery was in at that time was owing to the negligence of the Mines officer, although it got into that state before it was transferred. I am referring now to the Mount Manara tank, and it only shows Mr. Stilwell's own neglect in not sending up the travelling mechanic which he promised to do. He also told the caretaker not to interfere with the arrangements; that he would send up a travelling mechanic to put the works in order. Mr. Stilwell then did something to the work himself, and the machinery worked better after that.

2727. You say you refused to take charge of this work till the rain came? Yes.

2728. Now, supposing that the rain did not come for a year or two, who is to look after this work;—if it is completed and you refuse to take it over, what arrangements are made in regard to taking delivery? We take delivery of nothing until we can test it.

2729. Then, if rain did not come for two years you would not have taken delivery until the end of that time? No; the Works Department would have to keep some one there between the completion of the work and its being handed over to us. In this particular instance, I put on a caretaker after the work was finished, but we could do nothing with it until Mr. Stilwell came again, when he complained of my want of attention.

2730. *Major Penrose.*] Do the Mines Department, when taking over the works, take over with them the caretaker appointed by the Works Department? In some instances they do. If the man is a good reliable man he is taken over.

2731. *Chairman.*] Is there any other case where the caretakers have been glaringly interfered with? Yes; at Boonoonna tank.

2732. What was the nature of this? The pump did not throw the water fast enough; the horses had to go at a jog trot to draw the water to fill the pipe. I complained to Mr. Wood and Mr. Stilwell that it did not throw the water sufficiently fast to water stock. They appeared to think that it would be right to test it, and from Mr. Wood's test the service tank should have been filled in about six hours; whereas it takes most men about two days to fill it with the horse pump. On one of my own inspections I examined it and found that the leathers in the caretaker's pump had quite perished. I could not get out the plunger, although the caretaker and I pulled with all our might. The bearings were taken to pieces and covered over, and I reported the matter at once to Mr. Stilwell, saying that the work was out of order, and asking him to send a practical mechanic at once.

2733. *Major Penrose.*] Was the tank under your charge at this time? Yes. In connection with the machinery the Works Department took it upon themselves to put it into repair. They always kept a travelling mechanic going about for this purpose, and it appeared from what Mr. Stilwell said that the travelling mechanic was away at Deniliquin and could not come. I therefore directed the caretaker to put the works in order if he could do so; but he could not do it. Mr. Stilwell, the next time he came along, fixed it up and then reported the matter again.

- J. Yeo. 2734. But if this work could have been done by a travelling mechanic alone, how comes it that you require three men? Well, we could not get the plunger out otherwise. It was stuck very tight.
- 24 Feb., 1888. 2735. Would you send many miles for a travelling mechanic to put in a piece of leather? No, I would not; but we were impressed not to interfere with the machinery internally, and on that account we expected the Works officers to come and make such repairs as were required.
2736. So that this little thing would necessitate the travelling mechanic coming several miles to attend to;—now, could it not be done by an ordinary man? Yes; but we are not allowed to interfere with the internal arrangements of the machinery at all.
2737. *Mr. Woore.*] If, with the assistance of the caretaker, you could have got the plunger out, would you not have set the pump in working order without troubling the Works Department at all? Yes, decidedly.
2738. Although it would not be your duty, or the caretaker's duty either? Yes; but Mr. Stilwell told some of our caretakers distinctly not to interfere with the machinery internally.
2739. But, notwithstanding this instruction, you would have made the repair if you could, in order to save trouble? Yes.
2740. And you spent the whole day in trying to do it? Yes.
2741. *Major Penrose.*] Were the public debarred from getting water all this time? No; it so happened that there was a lot of water in the swamp close by, otherwise it might have been very serious.
2742. There are no hand pumps to fall back upon in case of accident? No.
2743. *Chairman.*] Then this interference between the two Departments caused unnecessary delay, and leads up to what has been called friction? Yes; but I am sure I was never anxious to have this at all. I was always anxious to have things put in proper repair, which I think will be seen from the way in which I took delivery of the Mount Manara steam pump.
2744. Are there any wells in your district? Yes; there are two.
2745. Have you any reason to find fault with the construction of these wells or the sites selected for them? I consider that the Holy Box well should never have been put in that position. There was a splendid site there for a tank; in fact, a tank was sunk there down to about 3 feet and then abandoned.
2746. Do you know for what reason? It was put down before I took charge of the district. The only reason that I know of was that wells were thought more suitable at the time.
2747. Is this a good well? No; the water is very salt and brackish, and travellers who pass by will allow their stock to perish almost rather than allow them to drink there. The oldest drover on that road, John Clancy, who has been on the road for 25 years, would not think of letting his stock drink there. At the time Cobb & Co. leased it they had had to take their horses away or they would have died.
2748. *Major Penrose.*] Was that the well where the baling was going on? Yes.
2749. Did not the baling improve the water? Only very slightly. The caretaker does not use it even now, but carts his water from elsewhere.
2750. Then he is still baling the well? Yes, still baling.
2751. *Chairman.*] Will the public use the water? Very few. Any one who knows the road at all does not use it.
2752. *Major Penrose.*] Is it not true that a flock of 10,000 sheep watered there at one time? Not since I have had charge of the district.
2753. You think that it would have been much more satisfactory to have continued this tank than to have sunk a well? Decidedly it would.
2754. Are you aware that brackish or salt water is found in many of the wells sunk in that country? Yes; in a great many of them. And they have been abandoned and tanks substituted in their place.
2755. You do not complain that wells should be sunk in suitable localities if you can ensure fresh water being obtained? No; there would be no objection to it at all.
2756. For this reason, I presume that the tanks might go dry—while you can always rely on wells? Well, I think it will be a very long drought that will send some of these tanks dry.
2757. *Chairman.*] Have any wells been constructed in your district during your term of office? The Willandra well was in course of construction. They sunk a shaft and it caved in at the bottom. They got into sand drift.
2758. What about this Willandra well? It is put down in a place that would be very good for a tank. It has been abandoned by three or four different parties—some of them experienced men, too. They could not get through the drift.
2759. *Major Penrose.*] That could not have been foreseen when the site was chosen? I do not know whether they put down a trial shaft or not, but they could have seen a good site for a tank close by.
2760. *Chairman.*] Do you think that if they had put down a boring or a trial shaft that they would have found this out? Yes. I may say that I am informed that they are putting down a shaft alongside of the well now, which is ridiculous. A portion of the work was on the private property of the Kilfera Pastoral Company.
2761. *Major Penrose.*] Is the Willandra well also in Mr. Stilwell's district? Yes.
2762. *Chairman.*] Have you had anything to do with the erection of huts for caretakers? Very little; but I have seen some of the specifications.
2763. Have you any fault to find with the troughing supplied to these tanks and wells? Yes; the draught rail is too high. It prevents the cattle reaching the water.
2764. Is that now being obviated? Yes; it is in some cases.
2765. Could not the difficulty of animals reaching over the rails have arisen by the wearing away of the soil from underneath? No; because the troughs put down were generally too high from the first. In fact at the Ivanhoe tank the ground had to be raised directly the trough was erected.
2766. But the troughing is good as a rule? Yes; as a rule it is good; but it is the position of some of it which I object to.
2767. What do they use for the construction of the troughing? Galvanized iron for some of them.
2768. What protection would they require in your opinion? From fresh water I do not think galvanized iron requires any protection.
2769. Now, with well water, what do they use? They use tar and tallow. In hot weather it melts, forming a scum over the water, and the stock won't touch it. In one case the rails were taken down by a drover and he rushed the tank. I had him summoned and fined £10.
- 2770.

2770. Since complaint has been made of this composition, has not the use of it been given up? Yes; in my district it has.

2771. Now, do you not think that if these works were given over to local bodies—to people living in the localities—that it would be greatly to the benefit of the community generally, and that it would lessen the cost of these works? Well, it is a difficult matter to get local men to attend to anything of this sort. As a stock inspector, I have had great difficulty in getting meetings of the Stock Board together to do business. They generally have other meetings which take up a great deal of their time; and besides most of them have a long distance to come to town.

2772. Do you think the Divisional Board system of Queensland would be a success here? Yes; but in any case they would have to rely upon the opinions of their stock inspectors.

2773. Do you not think it would get rid of the difficulty in regard to the payment of money? No; I think not. It would be just as well if the Inspectors under the Works Department were kept up to their work. The overseers should be bound to visit the tank once a month and measure it, so that the contractors could be able to obtain a certain percentage of their money. This would, I think, meet the difficulty.

2774. Then you think there would be difficulty in making this local system work? I think there would.

[The Commission adjourned until the afternoon, when the sitting was resumed.]

James Cotton called in and examined:—

2775. *Chairman.*] What are you? I am an inspector of stock and overseer of watering places for the district of Cobar.

2776. How long have you been in office? I have been in office for nearly six years.

2777. Have any of the tanks that have come under your observation been constructed in wrong positions, in your judgment? As a rule, in the Cobar district, the sites of the tanks have been fairly well selected. The sites have answered the purpose very well. I daresay sometimes a better site might have been found for one of these tanks a mile or two further on, but it would not have answered the purpose of a public watering place; because it would not have been at the proper distance between two other places. I have no particular fault to find, therefore, with the sites of public tanks.

2778. Do you know of any faulty sites in other districts than your own? Yes, there is one; but I can hardly say that it is within my district, although it is under my control. It has been handed over to me. I consider that the catchment area at this place is too small.

2779. What is the name of that tank? The Mulya tank. As a proof of what I say, I may mention that it has now only about 9 feet 3 inches of water in it, or it had that on my last inspection. It has been constructed for over two years, and on one occasion there was a rainfall of 8 inches within a week over that portion of the country, and yet this tank did not fill. I am opinion, therefore, that the catchment area of this tank is too small.

2780. Who chose that site? So far as I know it was chosen by the road superintendent at Bourke, Mr. Coleman.

2781. Is it not a fact that the road superintendent, in fixing the sites for tanks, has to act in conjunction with the overseer of public watering places? Well, this is what we are told by the Watering Places Branch; but, as a rule, the road superintendents never do consult us.

2782. Is this tank that you speak of near Gungolgan? No; I think it is about 14 miles from Louth, on the Louth to Cobar road.

2783. Could that faulty catchment area have been observed, in your opinion, by a man of ordinary intelligence? I think so, because it has been handed over now to another road superintendent, who has been to a great deal of trouble indeed in getting a mile more of drains into the tank. He told me that he had very great difficulty in getting ground and utilizing the catchment area, running his levels very low that they would be able to run the water in. By this means he said that he hoped to be able to get another mile of drains.

2784. And the fact remains that in this unusually wet season the tank would not fill? Just so.

2785. Then this very injudicious selection of the site has caused a large expenditure of money with very little good result? Yes.

2786. *Mr. Woore.*] Is there a better site in the immediate vicinity? I think a far better site might have been found. It is out of my district, but I was instructed a little while ago to go there and effect a transfer of the works from the Public Works Department to the Mines. I did so, but while there I had not sufficient time to go round and examine the country to see whether there was a better site. Yes; I am of opinion that a better site could have been chosen.

2787. Is the usual machinery erected at this place? Yes; a steam-pump.

2788. *Chairman.*] Are there any other cases of faulty sites? No; none that I have special knowledge of.

2789. The next question is as to the faulty catchment areas;—but, with respect to the construction of these tanks, do you notice anything faulty in the specifications? Yes; I think the specifications are for the most part wrong. I wrote a letter on this subject some time ago, which I would like to read.

2790. We would prefer taking your own statement? Well, in the first place, I consider that the construction of these watering places should be under the supervision of officers that are thoroughly acquainted with stock and all the requirements of stock, and who have had experience in conserving water in dry country for stock purposes. For these reasons it seems to me that one set form of tank to be constructed at each place should not be adopted; while these specifications have hardly ever been departed from, notwithstanding the variations in the nature of the soil.

2791. You mean that the Roads Department have applied a hard-and-fast rule? Yes; and this hard-and-fast rule will not answer for every place. Their slopes or batters are in every instance too steep; their watering appliances are expensive, and I think unnecessary. I may mention that in my opinion there are many places where the ground would stand a 2 to 1 batter or less, but there are other places where it would require as much as a 3 to 1 batter on account of the porous nature of the soil. In this friable soil the top of the tank has a tendency to fall in. Another fault in the construction of these tanks is that there is no roadway left to take the stuff out. Now, in my opinion, there ought to be a roadway left in each one of these tanks, and a roadway sufficiently wide and sufficiently

J. Yeo.
24 Feb., 1888.

J. Cotton.
24 Feb., 1888.

- J. Cotton. sufficiently complete to allow the stock to water if necessary at the tanks, in the event of the machinery getting out of order. It is always possible for these steam pumps and horse-gear pumps to get out of order altogether. My district is a very dry country, and if it should happen to occur when the thermometer was at 118° in the shade, as it often is up there, stock would never reach the next tank alive. At these steep tanks of 1½ to 1 it is utterly impossible to water the stock. Certainly, you might get them in, but you would never get them out again; and this I consider a very great mistake indeed in the construction of the tanks. No practical man could have made such a mistake in the construction.
- 24 Feb., 1888. 2792. Do you not think it desirable to have batters as steep as possible, so as to prevent the evaporation of the water? Well, I really think that the evaporation that takes place is not worth considering. I know for a fact that we had only some 7 inches of rain in 1884, and that year every tank was then full to the brim; so that I think that matter of evaporation is not worthy of a second thought. The Cobar district is an undulating country; and, as I say, in other districts a steeper slope might be possible—that is, where the catchment area was very slow, and where the storage of a large amount of water is required.
2793. The soil in your district is of a good, firm character? Yes; it is hard, and makes a good catchment.
2794. I presume 7 inches of rain per annum would never fill a tank in the black soil plains in the interior? No; it never would, indeed. That is why I say that no hard-and-fast rule can be applied in such matters.
2795. *Major Penrose.*] Was there much demand upon your tanks lately? No. In 1884 the stock were not able to travel. There was no grass whatever, and the stock could not get along. While all the sheep were dying throughout the district for want of feed, there was on the other hand, any amount of water.
2796. *Chairman.*] Are you aware that it has been alleged that the Government have to pay very much more for the construction of their works than private individuals? Yes.
2797. Can you give us the reason why? Well, one reason why is in the specifications which the contractors have to work under, compelling very steep slopes, and allowing no roadway to cart the last 4 or 5 feet of stuff out of the tank; this causes it to be very expensive to get out the bottom of the tanks. Another reason is the delay which ensues in the matter of payments. I have heard contractors complain very bitterly about the delay that they have experienced in getting their money.
2798. Is there not a Mr. Budd in your district, a contractor? Yes; he has put down a good many of the Government tanks.
2799. Are you aware that on one occasion he actually became insolvent by reason of the delay of the Government in paying him for his work? I am not aware of that, but I have heard that he and others complained about delayed payments. I know a man named Ryan, who put down the Mulya tank, who complained to me very bitterly two or three times about not getting paid. He appealed to me to assist him if I could, but I was unable to do anything in the matter. He said to me that he had finished his work, but he was unable to get it inspected by the Government officer. He was delayed for months and months; and although his creditors were pushing he could do nothing.
2800. *Major Penrose.*] To what do you attribute this delay? The delay was in the inspection of the work. Had it been inspected there is no doubt the contractor would have received his voucher.
2801. *Chairman.*] I presume the proper officer to do this is the local road superintendent? Yes.
2802. And was he not available? No; of course I do not know if he has much to do elsewhere or not. The superintendent, Mr. Coleman, has a very large district.
2803. Then you think generally the specifications for these Government tanks are altogether too strict, and that their strictness is the cause of the extra price which the Government are obliged to pay? Yes; and the delayed payments.
2804. You think that under these circumstances the prices asked for by the contractors are excessive? Not under the circumstances. Considering all these matters, I should say that the prices asked by the contractors are not excessive. Having to conform to all these requirements, I do not think that they asked too much.
2805. Then these alleged excessive prices are not really excessive? Under the existing circumstances, no; but if the circumstances were altered I should think that the contractors would then be able to do the work much more cheaply. I know, as a fact, that a fair price for squatters' tanks is 11d. per cubic yard.
2806. And what is the highest price that you have known to be given in your district? Well, I really know very little about the prices which have been paid for these Government tanks.
2807. But surely you must know something about it? I have only heard about them; I have had nothing actually to do with them.
2808. *Major Penrose.*] It is commonly reported, I presume, that the prices for Government work are very much higher? Yes; everybody knows that; but I can hardly say from memory what the Government pay.
2809. What was the highest price you have known to be given by squatters? I know one case where the squatter paid 2s. 6d. per cubic yard; but that was for going through solid rock. The usual price given by the squatters for ordinary work is from 11d. to 1s. 2d. per cubic yard.
2810. I suppose you have never heard of 1s. 9d. having been given? Oh, yes; I have already said that I have known squatters to give 2s. 6d. for the excavation of certain ground, but in the ordinary way the price is from 11d. to 1s. 2d.
2811. But, as a rule, the squatter has more choice in the selection of a site than the Government can possibly have? Yes; there is no doubt whatever about that.
2812. Then it might easily occur that the Government tanks cost a good deal more than private tanks, because the Government, in their choice of a site, are much more restricted than private individuals? Quite so.
2813. *Chairman.*] In your district, I presume, machinery is used for raising water? Yes.
2814. Do you think that this machinery is of too expensive a character? Yes. If I had been allowed to read the letter which I spoke of, I could easily show that. I feel very strong on that point, and have been writing about it for the last three years. I am of opinion that this machinery is not only too costly but is actually unnecessary.
2815. What is the largest number of stock that have been driven over a road at one time in your experience; how many sheep have you known to require water in one day? I think the maximum would be about 20,000; but as a rule not so many.

2816. How much water would these 20,000 sheep require? They would require 20,000 gallons. One gallon per sheep is perhaps slightly above the quantity that is drunk. I know that by personal experience, because I have been watering stock for many years in South Australia. A gallon per sheep is slightly over the amount required. I got my living for over twelve years as a drover on the roads. J. Cotton.
24 Feb., 1889.
2817. *Mr. Woore.*] By what means have you arrived at the conclusion that a travelling sheep will not drink more than a gallon of water in a day—by measurement or otherwise? By watering the sheep myself, and counting the number of buckets that were emptied. I have done this not only once but scores of times.
2818. *Chairman.*] Are you not also aware that thirsty sheep, by being allowed to go into the tank, not only consume a large quantity of water, but also take away a great deal? Yes.
2819. Would one gallon per sheep be sufficient for all that waste? No; not for the waste.
2820. Then, suppose the 20,000 sheep consume to-day all the water in the service tank and another 20,000 come along to-morrow, how is the second 20,000 to get water? What I suggest will pump the water every bit as quickly as the steam pump, and it would require an extreme case like this to upset the arrangement. By the Public Watering Places Act the caretakers should be empowered to call upon the drovers for one or two men if required. What I would suggest is Flood's lift of $1\frac{3}{4}$ inches, by which one man is supposed to raise 40 gallons per minute from a depth of 24 feet. I take 40 gallons as the maximum, but I will divide that by two, and say that by this means a man can raise 20 gallons per minute. I reckon, therefore, that with this machine one man would be able to water 10,000 sheep per day without taking the service tank or troughs into consideration at all. The service tank and trough hold 20,000 gallons. The Flood's lift costs about £16, and there is nothing in it to break except a chain which can be mended by a piece of fencing wire; that can be done at any time. The depth a man can lift from is 24 feet; but as these tanks are nearly always full he would not have to raise the water more than 6 feet under ordinary circumstances. I am now speaking of circumstances when there would be only a little water in the tank, but even then he would be able to raise the amount of water I state from the bottom. In most cases these tanks are full to the brim; but no matter what happened, Flood's lift is quite ample. In fact, a 3-inch pipe through the embankment would, in some cases, fill the tanks in my district without the use of a pump at all.
2821. *Major Penrose.*] Is water conserved above the natural level of the ground in your district? Yes; in some cases it is; but it might be better if, instead of making these square embankments in a set form, wings had been carried out, which would in some cases have conserved water fully 6 feet above the natural surface of the earth.
2822. Then you do not conserve water inside the embankments by pumping it over? No.
2823. Of course, now you are only speaking of what is done in your own district. Are you not aware that in some outside districts, where they travel enormous mobs of sheep, it is possible to have 40,000 sheep watered at a tank in one day. Would it not be impossible to water these 40,000 sheep merely by the aid of human labour? Upon my word, I do not think that these steam pumps are at all required. I have thirteen of them in my district and five horse pumps out of a total of twenty two, and my impression is that, with Flood's lift, you can get the water up as fast as with a steam pump.
2824. And if one man was not able to do it I presume you would employ two pumps? Yes; two pumps or two men, if you like. It would be better than bringing these expensive things there that are of no use at present, and require skilled labour to keep in order.
2825. So that you think there is no necessity for these steam pumps? None whatever.
2826. Do you know what these steam pumps cost? I think I have heard that they cost £120 without carriage; but I really do not know the amount. It is only just hearsay.
2827. This includes the boiler? Yes.
2828. *Chairman.*] And you state that this Flood's pump only costs £16? Yes; it will scarcely ever get out of order, and may be worked if necessary by a blackfellow.
2829. You think that it is very desirable in every instance to have one sloping batter to allow the stock to water at the tanks in the event of the machinery meeting with an accident? That is just what I mean. If 40,000 sheep came along they could water at the tank itself, which would be available for any emergency, although such emergency might not occur once in five years. Still, it wants to be provided for.
2830. Do you know of any case where the public have suffered materially through the pumps going wrong? No, I do not. They have not had sufficient time yet; they have not been up long enough yet. Ever since stock have been able to travel since the drought there has not been very much demand on the Government tanks, as you can see from the returns.
2831. *Major Penrose.*] From what you state, I presume you think that many of the tanks are too large? Yes; in my letter I showed that in my district, a tank from 9,000 to 12,000 yards, according to the catchment, would be amply sufficient. There are more Government tanks in mine than in any other district in the Colony. Some of them have been made as large as 30,000 yards, which I consider entirely unnecessary.
2832. So that your testimony bears out what has been shown here already—that tanks should be sunk with reference to the special conditions of each locality? Yes.
2833. In a very dry country, and with a bad catchment area, you want a very large tank? Yes.
2834. And in your district, where the catchment is good, small tanks are ample? Yes.
2835. *Mr. Woore.*] Have you had any experience of a severe drought in your district? Yes, I have had. In the early part of 1884 I was obliged to pay 20s. a bushel for oats and 42s. per cwt. for chaff to keep my horses alive.
2836. And at the same time there was an abundance of water? Yes, any amount of water. It is hard ironstone country, and will run water like the roof of a house. And in these droughts, the drier the soil gets the more water it will run, because in getting bare it also gets very hard. I may say that I have no personal complaint to make of the officers of the Roads Department. Any differences that have occurred have been simply differences of opinion; and, in many instances, in little details as to the position of a gate or anything of that sort, the suggestions that I have made have often been acted upon; but it is this great principle of construction that I differ with them about. Our differences, therefore, have only been differences of opinion.
2837. *Chairman.*] Have you had any interference from the road superintendents? No; no trouble at all. As I have already said, all our differences are merely differences of opinion.
2838. Do you know anything about the subletting of contracts? No.
2839. Have you ever been aware of any favoritism having been shown to people in the Cobar district with regard to contracts? No; I cannot say that I know of any favoritism having been shown. 2840.

- J. Cotton. 2840. There are no wells in your district? No; no wells.
2841. Do you know anything about the fences round the caretaker's paddocks? Yes.
- 24 Feb., 1888. 2842. Do you think that money has been spent unnecessarily on them? I think they have been too costly. In the first instance, the posts are 2 feet 6 inches in the ground, which is a most absurd thing. No practical man would ever expect posts to be put down to that depth, especially with 10-foot panels.
2843. And the wire is of too large a gauge, is it not? No; I do not object to the wire—indeed, I believe in a strong wire at the top. They have No. 4 wire at the top, which I thoroughly believe in. I believe this wire is better than any rail which you can put on a fence. Nothing, almost, can break it in the ordinary way; and if it is broken, in five minutes you can make the fence as good as ever it was.
2844. We have heard here that in case a No. 4 gauge wire is broken one man cannot mend it? I do not know that. I think the gauge of the remaining wire might be considerably reduced, but I believe in having a strong wire at the top.
2845. Have the fences in your district a top rail? Yes, a few; and I object to it for this reason—that if there is a rail broken at any time—I do not care how you repair it, or how nicely you put in a new rail—it is always a slip-rail from that time out. In one case that I have just been reporting upon, I notice that at some of the tanks in my district the fencing has cost as much as £70 per mile, while I am of opinion that a very good fence, and sufficient to meet all purposes, can be put up for £42 per mile.
2846. But, under the circumstances, do you think that the £70 per mile was an excessive price for the fence in this particular case? Well, I am not in a position to say; I never saw such a fence before.
2847. We want to find out whether the cost is greater than it should be, or whether the fence is of a better character than was required? Well, I really cannot say.
2848. We would now like to get your opinion on any other matter that we have not questioned you about; we shall be glad to hear anything further that you may have to say? I do not think there is anything else. Anything that I could tell would be in relation to some particular case, and would only bear out what I said before, that a hard-and-fast rule cannot be followed. I know a place where there is a tank going down now. This is the first lot of tanks that have been put down in my district of a slope of 2 to 1; all the rest are 1½ to 1, which is the regular slope of all tanks in my district. A little while ago there were three new tanks started on the Wilcannia road, with a slope of 2 to 1. The gentler-sloped tanks were only adopted in the Cobar district in July last.
2849. *Mr. Woore.*] Are you not of opinion that even a 2 to 1 is not a sufficient batter in some cases? Yes; in some cases. One of these tanks which is now being sunk has a 2 to 1 batter. The tank I refer to is the one at the 55-Mile post, on the Cobar to Wilcannia road—I think it is called Barneto. This is being put down in very loose soil, which melts like sugar as soon as the water goes on to it. I am of opinion that 2 to 1 is not a sufficient slope for this tank. If I were making it I should construct it with a batter of 3 to 1 on three sides, and 5 to 1 on the remaining side, to allow the silt to deposit itself on the batter, and then I would allow the sheep to go in and puddle it all round. My reason for saying this is that I have seen a supply tank which was put down there, and which was filled with rain-water three or four times, allow the water to get out through the sides, and then the sides fell in.
2850. *Major Penrose.*] Does not the engineer-in-charge see to this? Well, I suppose he does.
2851. *Chairman.*] When the contract is once entered into I suppose it must go on? Yes; I expect the road superintendent is like myself in many cases—he must do what he is told. We have to do a great many things that go against the grain.
2852. You think that great discretion should be exercised by these local officers? Yes; and I think these officers should be men who have a thorough knowledge of stock and the requirements of stock; for just a very slight mistake will render a watering place utterly useless. In one of the tanks that I have taken over I found an entrance gate for stock right on the point of a fence. Now, how could a man get a lot of wild Queensland cattle into a gate like that? Of course they would run down both sides of the fence. There can be no doubt that the gate was placed there owing to the want of practical knowledge on the part of the man who did it. I saw Mr. Adams about it, got him to shift the gate, and now the thing works very well.
2853. *Major Penrose*] Do you think that the stock routes ought be fenced off? Well, that is a very difficult question to deal with. I have thought over this question as much as anybody, and still I cannot see how this is to be done. If you fence off, you must reserve the land from lease; and if you do that, the Government must destroy the rabbits on it.
2854. And it would be nobody's business to compel stock to travel a certain number of miles every day? Oh; yes, the stock inspector would see to that. I have talked to Mr. Bruce about it, and have asked him to make as few reserves from lease as possible in my district on account of the rabbits. Of course, if the river frontage were taken away by the stock routes being reserved from lease, it would ruin the squatter. It might be done in the Cobar district, or any place where there was water on the road. It would be a little awkward for the squatter to cut them off their tanks, but they could make provision if compelled to do so. The difficulty is in the rabbit question, and it is going to be a very big difficulty indeed.
- [The Commission adjourned.]

THURSDAY, 1 MARCH, 1888.

The Commission met at 10 a.m.

Present:—

HON. G. H. COX, M.L.C., CHAIRMAN.

MAJOR PENROSE, R.E., | J. C. WOORE, Esq.

Peter Leslie called in and examined:—

- P. Leslie. 2855. *Chairman.*] You are a resident on the Parramatta river? Yes; I reside there just now, but I live at Amphitheatre station, near Cobar.
- 1 Mar., 1888. 2856. Have you long resided in that neighbourhood? I have resided in that neighbourhood since 1881.
2857. What are you? I am a squatter; I am one of the lessees of Amphitheatre station
2858. Have you had much experience in the excavation of tanks upon runs? Yes; I have had a great deal of it. 2859.

2859. There are a considerable number of Government tanks in your neighbourhood, I presume? Yes, P. Leslie.
there are.
2860. Are you aware of the objects of this Commission—that this Commission is appointed to find out¹ whether, in some instances, improper sites have been chosen for the excavation of tanks and wells? Yes; I believe that to be the object of the Commission. ¹ Mar., 1888.
2861. And to ascertain what truth there is in the allegations that construction of such works have been faulty and unnecessarily expensive? Yes; I believe that to be the case.
2862. Have you any fault to find with the sites for public tanks chosen in your district? Not with the sites, because I have never taken much notice of them; but I noticed that the construction of them was very expensively carried out. I never looked to see whether the sites could have been better or not.
2863. Then it is the construction that you find fault with? Yes; I believe that the majority of the tanks have been constructed on far too expensive a scale.
2864. Just state shortly your reasons for making that statement? Well, I believe that the tanks could be excavated for far less money if the batters had been lower, and if the contractors could have got a portion of their money while carrying out their contract. No contractor can work his team to advantage on the batter of Government tanks.
2865. Do you know what that batter is? It is $1\frac{1}{2}$ to 1 and 2 to 1—that is the latest. I think there is only one in the district of 2 to 1 that I know of.
2866. Have you observed that these batters slip in with the action of the water? Yes; I have noticed it.
2867. In all cases? Not in all cases, but in most; unless in exceptionally hard ground.
2868. You therefore think that any hard-and-fast rule for excavation of tanks is undesirable? Most certainly.
2869. And every tank should have its particular batter, in accordance with the stability of the ground? Most certainly. I do not think any tanks should be excavated with a batter of $1\frac{1}{2}$ to 1, no matter what the ground may be. It costs too much to take the stuff out, and all the extra water you can conserve on that account is of no great benefit. I have gone through two seasons—through the years 1883 and 1884—on my run with less than 16 inches of rain, and yet I was never short of water. All my large tanks are 3 to 1 on two sides, and 6 to 1 on the other sides; all my small tanks are 3 to 1 on three sides, and 6 to 1 on the other side. I allowed this batter that the contractors could get at their stuff from both sides of the large tanks and one side of the small. I have been short of grass, but never of water.
2870. Are you aware that with a sloping batter much more water is exposed to the wind and sun, causing a greater amount of evaporation? Yes, there is a little more exposure; but when the embankments are all round these tanks I do not think they can be more exposed than a tank with a $1\frac{1}{2}$ to 1 batter. I really do not think they will suffer any more by evaporation than a tank with a shallow batter. If they were open they might, but with the banks that the Government put round their tanks I do not see that they can. The embankments break the wind.
2871. Do you think the tanks in your district are constructed on too large a scale? I think 10,000 cubic yards is sufficient for any tank. It all depends upon the catchment; and if you have a slow or porous catchment, of course you want a large tank; but it is a foolish thing to put down tanks in slow, porous soil.
2872. Then a good deal depends on the rainfall. You say you had under 16 inches and yet had plenty of water? Yes, under 16 inches for two years; that was in the years 1883-84.
2873. Are not the Government tanks of greater depth than tanks constructed by private individuals? I believe they are.
2874. If so, would not that add to the expense? No, I don't think it would. The depth does not make so much difference if the contractors can work their teams along the banks. Nearly all my tanks have been put down to a depth of 15 feet—they narrow at the bottom and become very small—and this stuff I had taken out at 11d. per cubic yard. In the last tanks I had made, the contractor offered to do the same work at 10d. per cubic yard if I gave him ten weeks to complete the work in. I wanted these two tanks cut out quickly so that they would be ready for the rain, and I bound him to do the work in six weeks, and got the work done for 11d.
2875. If you had these tanks put down in accordance with the specifications of the Government as to batter what would they probably have cost? Well, I hardly know. I think the tanks would have cost at least 3d. or 4d. per yard more—perhaps even more than that. A tank of 5,000 cubic yards would narrow very much as it gets to the bottom and be more difficult to excavate.
2876. *Major Penrose.*] With this very gentle batter to the Government tanks, you probably could not put the earth all round the tanks, because the areas would have so much increased? Yes, with a 10,000 cubic yards tank I could put it all round. I am sure it could be done. I put the earth round three sides of my tank, leaving the inlet open. I have one tank which will hold 12 feet above the natural surface of the ground, and in all my tanks I conserve water above the surface, more or less.
2877. Are the catchments there favourable to holding water over the surface? Yes, in most places.
2878. Well, in that case, embankments all the way round would seem not to be suitable for that district? I think so; but with an embankment all round the water could come into the tank by a pipe, and it would still remain behind the tank if wings were carried out to stop it.
2879. *Chairman.*] Are you aware as to what the ultimate object of the Government is in making embankments all round a tank? The ultimate object I take it is to utilize the embankments for the conservation of water. I concluded it was for that purpose the banks were made. All the Government tanks in the Cobar district have not had embankments put round them.
2880. Some of them were used for watering stock at the tanks without troughs? I do not know of any accessible in this way, except the one at the Cobar township. There were others at one time, but I think the tank at Cobar is the only one open now. At least it was open when I last watered stock there.
2881. Do you allow stock to water at all the tanks excavated on your run? Yes.
2882. If you intended to put pumps there you would have done the same? I would, and made the batters to my tanks 3 to 1 on three sides and the remaining side 6 to 1; but if I were going to pump the water out, and had to improve the country for that purpose, I would make all the embankments round my tanks square. I would stop all the water I could behind the banks by wings, and pump it into the main tank. If you run wings out you can stop a great body of water in most places.
2883. *Major Penrose.*] How would you pump the water over? With a movable engine—one that could be taken about.

P. Leslie.
1 Mar., 1888

2884. But would that suit the Government? I do not think so.

2885. *Chairman.*] Do you think it is desirable for the Government to allow stock to water at the tanks direct, instead of having machinery to pump the water into troughs? Certainly not; the Government have the travelling public to consider, and stock will spoil the water for human use. I do not see how water could be used for human purposes if stock were allowed continual access to the tanks.

2886. Of course you are aware, from your experience of your own tanks, that if stock are allowed invariably into the tank the water would be spoiled? Yes; the sheep will go in and swim in the water and spoil it. I have seen the water in some tanks turn quite green on this account. It may be right enough for stock to drink, but they should not be allowed in, except in extreme cases, where human beings have to use the tanks.

2887. Have you any reason to find fault with the flumes or drains for taking the water into the tanks in your district? No; they are all right, so far as I know.

2888. They could not make a mistake in your district on account of the hills? Not very well.

2889. Do you think that the machinery used by the Government for pumping is unnecessarily expensive? I do think so.

2890. What kind of machinery is this which is being used? Tangye's steam pumps.

2891. What would you suggest in lieu of these steam pumps? Well, I think the M'Comas lift would be better, or a double whip would answer admirably, as the water has to be lifted only a short distance.

2892. Would the caretaker be able with one of these pumps to supply all the demands made by travelling stock? I think so. It is done on stations where there are more stock than generally come to a Government tank in one day. It is done with double whips. The water is drawn straight up with a horse by means of two buckets, one coming up and the other going down. The horse travels outwards in drawing the bucket up. A whip is, I think, too slow, although it may be a very good thing for deep wells. I have seen a horse with a single bucket water 8,000 sheep in one afternoon. This was done with a single whip, the horse pulling right around with a wheel. The horse goes round and round, and when he gets straight out from the post the bucket is up. I have seen 8,000 sheep watered in this way without very much delay.

2893. Do you think it would be beyond the caretaker's capacity to keep the service tank filled with a M'Comas pump? I think it would be easy enough. That would not necessitate carting wood to burn or buying horse-feed. I think the M'Comas pump would be the best for the tanks, and would do away with a great deal of expense.

2894. I presume a M'Comas pump is so simple that any man could repair it in case anything went wrong? Yes, I think so.

2895. Have you observed that any very expensive fences have been put up around the caretaker's paddocks adjoining the tanks within your district? No; I did not notice particularly, but I fancy they are more expensive than I would think of putting up. I think a good fence could be put up for less money, and would answer the purpose just as well.

2896. Do you refer to the fences around the tanks? Yes, and around the paddocks, too. I think a top rail to a fence round a tank is a mistake, and besides that the wire is too strong. No. 8 wire is quite strong enough, and will go much further in a fence than the wire that is now being used. No. 8 wire will outlast the posts.

2897. Are you now referring to sheep or to cattle—in speaking of the fence? Both to cattle and sheep.

2898. Do you not think that a mob of Queensland cattle that have never seen a fence before in their lives would be likely to break this down after a long journey? They are just as likely to break a fence down with a strong wire as with a weak one.

2899. But I mean with a top rail? No; I don't think there is any danger. Cattle outside are not so apt to try to rush into a small enclosure as they would be to rush out of the enclosure if they were in it. There is one thing I would like to say—that in watering sheep at these troughs it is sometimes difficult to get them to drink, and some of them will not drink at all. I think the caretakers should be instructed to allow such sheep to water in the tank—that is, whenever they will not water from the troughs. I had a drover coming over from Nyngan to Cobar with some eight-tooth ewes, and the first tank belonging to the Government that they came to he was unable to get more than one-third of them to drink. A good deal of that was probably owing to the rail along the front of the troughs.

2900. Have you ever lost any sheep by reason of their refusal to drink at the troughs? No, not by refusing to drink at troughs; but I have lost sheep by their refusing to drink at an open tank on the Bourke road, where there was only one end open to drink at. I took 14,500 sheep there one day. The first flock puddled the water so much that the rest would not drink it. The caretaker would not allow me to let the sheep into the large tank, so that they could not get a good drink. He told me that I would have to water the stock at this narrow opening. It was a double tank, and the big tank was fenced off all round. The tank looked like a large supply or silt tank. The first lot of sheep got water, but puddled it so much that the others would not drink it.

2901. Your remark would not apply to one of the present tanks? No; if they had allowed me to get at the big tank my sheep would have had a good drink.

2902. That is not an answer to my question;—have you ever lost any sheep through their refusing to water at these troughs? No, never.

2903. *Major Penrose.*] That was not one of the later style of tanks? No; this was before the Department put down the troughing.

2904. Then you think the caretaker should have discretionary power to allow or not allow sheep in to drink at the tank? Certainly. Where the sheep will not drink at troughing, they will perhaps not live to reach another watering place. On stations, I have had sheep for three days trying to make them drink at troughs, but to no purpose. A lot of them would not drink after being kept there for three days.

2905. *Chairman.*] You said something about the rail? Yes; I think it is the rail alongside the troughing that prevents stock in some places from drinking. I believe they are doing away with that now, and putting a rail down the centre.

2906. That is a better plan? Yes; I suggested it two or three years ago.

2907. *Mr. Woore.*] Do you think that any sheep would drink at a trough with a rail down the centre? No; there are some sheep that will not drink the first time they are brought to troughs, and it is a very difficult thing to get weaners to drink. As I have said, I have kept sheep for three days and a lot of them would not drink then.

2908. But you speak of sheep on a station; I am referring to travelling sheep—would they drink out of the troughs? The first time weaners come to the troughs, even when they are travelling, they will not always drink; and you cannot get them all to drink the first time they are brought to troughs. P. Leslie.
1 Mar., 1888.
2909. *Chairman.*] The best way would be to get them to water at the troughs before they are weaned? Yes; but there are plenty of weaners travelling as well as other sheep during the year that could not be broken in to drink at troughs before they were weaned. It is not on every station that you have a chance of breaking in weaners alongside their mothers, because it is not on every station that you have to water at troughs.
2910. In the event of the pump going wrong it would, of course, be a terrible loss if the sheep could not get to the water? Yes; and in a case like that they should be allowed to water at the tank.
2911. *Major Penrose.*] Do you think it would be safe to allow sheep into a tank constructed with a batter of $1\frac{1}{2}$ to 1? No; it would not be at all safe. The tanks at present in existence are very bad for watering sheep.
2912. But you said just now that tanks are for the benefit of the travelling public, and that sheep should not be allowed into them? It would not hurt the tanks if the sheep were only allowed in in extreme cases, but if they were always left open for stock it would certainly spoil the water.
2913. But if the caretaker were allowed to do this at all would there not be the danger of his allowing it in every case? Yes; there is something in that. There is no doubt there would be danger if the caretaker were allowed to let the sheep water at the tank; he might do so in every case in order to save himself the trouble of pumping.
2914. *Mr. Woore.*] Can you suggest any method of watering stock other than by troughing or allowing the stock into the tanks? Well, there are other ways, but I do not approve of them. I have known of people to cut out a long, narrow tank in the earth and pump the water into it.
2915. *Chairman.*] That would soon get destroyed? Yes. You cannot get any better way of watering stock than by troughing, and it must be stuck to at the Government tanks.
2916. *Major Penrose.*] Has it not also been largely introduced on stations? Yes; many stations have nothing else.
2917. *Chairman.*] Of course where stations are watered by wells troughing must be used? Yes; it is inevitable. Over a large part of Liverpool Plains the stock are watered from wells.
2918. You cannot make tanks there as a rule? No; it is a deep black soil, 10 or 12 feet deep, and silts up quickly.
2919. Do you know anything about the subletting of contracts. I may explain to you that it is stated contracts have been taken at very high prices and sublet at very much reduced prices? No; I do not know anything about that.
2920. There are no wells in your district? No; none near me.
2921. Do you know anything about the wells far out in the plain country? No; nothing about Government wells.
2922. Have you had particularly brought under your notice the huts lately erected for the caretakers? No; but I have seen some of them. I know nothing specially about them, but I think that under the circumstances they are necessary.
2923. Now, you are aware that a good deal of trouble has arisen in the construction and maintenance of these public works by their being under a sort of dual control. The Works Department construct the works and then hand them over to the Mines, which Department is charged with the maintenance. Are you not aware that friction has arisen in consequence of this dual control? No; I am not aware of it. In what way do you mean?
2924. Do not the road superintendents select the sites, and then, when the work is finished, hand it over to the Mines, complaint being sometimes made that things are not done properly? No; nothing of that sort has come under my notice. I have heard of such things, but I know nothing positively.
2925. Now, there is another matter. Are you aware that these Government works cost a good deal more to construct than the works put up by private individuals? Yes.
2926. Do you think that if this alleged faulty construction and delay in getting paid were done away with, that the expense of these works might be lessened. Do you not think that if these works were in the hands of local bodies, who have much more knowledge as to the best sites than the people who now have the management—do you not think that then they could be constructed more cheaply? I do think so.
2927. Do you think it would be quite possible to get a sufficient number of independent men in the various districts to give their attention to these works and see that they are properly carried out? Yes, I think so. I think it is possible to get a sufficient number of men to make specifications for the work to be done, and to have it done by the overseer of watering places, or whoever was in charge of the tanks in the locality. But I think that, unless they were paid, you could not expect them to do this work.
2928. But you know that in Queensland there are Divisional Boards who take these works into their own hands without any remuneration? Yes, I know they have boards there, but I think they must pay them. You can get plenty of men up-country to do the work if they are only paid for it.
2929. What I mean is this: we have now such bodies as municipalities, where gentlemen take upon themselves great public duties without any payment. Of course they have officials under them to carry out the works, but all control of public matters is in their hands. Now, do you think it would be possible for these works, which cost large sums of money, and which are surrounded by a great deal of red-tapeism and delay, to be better constructed and managed, were they placed in the hands of local bodies? Yes, I am sure of it. The work would be done far better and far cheaper.
2930. *Mr. Woore.*] Do you think the Stock Boards could undertake the construction and supervision of these works? Yes, I think it is quite possible. I am a member of one of the Boards, and I am always willing to do all that I can for the benefit of the district.
2931. Would it not have this good effect, that the Boards would take very good care that tanks were so constructed so as to suit the conditions of the locality? Yes.
2932. They would have the batters formed in such a way that they would not cave in? Certainly; I do not believe in steep batters at all.
2933. You think that on occasions sheep should be allowed to water at the tank themselves? No; only in extreme cases.

- P. Leslie.
1 Mar., 1888.
2934. *Chairman.*] I suppose it is inevitable that there should be bad catchment areas selected in some cases on stock routes? Well, I have not taken much notice when going along the roads, and I cannot say, but it is certainly more difficult to pick a good catchment area on a stock route than on a run. A Government tank must be very close to the road, while a half mile or even a couple of miles do not matter to the squatter so long as he can get a good hard catch. On the Nyngan road I think the tanks have very good catchment.
2935. Have you any further information to give? No, I do not think there is anything else.
[The Commission adjourned until the afternoon, when the sitting was resumed.]

Arthur Hastings Doudney called in and examined:—

- A. H. Doudney.
1 Mar., 1888.
2936. *Chairman.*] Where do you reside? I am living in Sydney at the present time.
2937. You were formerly a contractor? Yes; a tank contractor.
2938. *Mr. Woore.*] For the Government? Yes.
2939. *Chairman.*] And I presume for private individuals as well? No; I never did any tanks for private individuals. I did some ploughing and that sort of thing for them.
2940. Have you constructed many tanks? Three.
2941. What are their names? Tinda, near Condobolin, Babinda, 15 miles from Nymagee, and Gilguys, 40 miles from Nyngan. They were 15,000, 16,000, and 20,000 yard tanks.
2942. And their depths? The first one was 18 feet, the second 16 feet; and the third 15 feet.
2943. What were the relative prices? I got 1s. 9d. per yard for the 18-foot tank, 1s. 4d. for the 16-foot tank, and 1s. 2d. for the 15-foot tank.
2944. What methods of excavation did you use? I used Fowler's steam scoop.
2945. Was the plant your own or did it belong to the Government? It was our own. I was then a partner with William Sloane and Co., now the Union Mortgage and Agency Co., Limited. I gave a good deal of time to these tanks, and spent about ten years in the back country.
2946. Now did you find it very difficult to work your plant under the Government specifications? Yes. I had very great difficulty indeed; the specifications were all dead against us.
2947. Just state why you had this difficulty? Well it was the high banks and the steep batters, and generally the tank conformity and the distance we had to place the dirt away from the tank. We got our plant to work but it was at a great loss. These are the only reasons.
2948. Of course the rate of excavations varies with the depth of the tank? Yes; just as I have already shown.
2949. So that if, as a rule, Government tanks were sunk 18 feet in depth they would necessarily cost more than the squatters' tanks? Yes; the difference in the price of Tinda and Gilguys was caused through allowing me to spread the dirt round roughly instead of exactly. I could do it even deeper than I did, and yet make good money where that was allowed. We did that tank in the quickest time on record. Eighteen weeks was the quickest time a tank had ever been done before, but we finished it in nine and a half weeks. We lost a great deal of money over the tank which we excavated at 1s. 9d.
2950. If the Government had allowed you to make the batter 1 in 5, would that have made any difference in the matter of cost? If that had been allowed we would have taken the work willingly at 1s., that is, if the slopes had been 5 in 1 on each batter all round, or even 4 in 1.
2951. What was the batter of those tanks that you constructed? The batter of the first one was 1½ to 1, the batter of the second tank, the Babinda, was 2½ to 1, and, I think, the batter of the last was 2 to 1. I cannot recollect exactly now whether the batter was 3 to 1 on the second or not, but it is either 2½ or 3.
2952. Did you observe many of those Government tanks sunk by other contractors in that neighbourhood? Yes; I have seen them all over the country round at Wilcannia and other places.
2953. What was the usual batter? 1½ to 1, and sometimes 2 to 1.
2954. Was the batter increased lately? It might have been. My knowledge only goes back to those that were 3 to 1.
2955. How did you come to have this modification made in your favour? Because we represented to the Department that we had bought a very expensive plant, and that it was utterly useless to us. We showed that we worked out a tank at such a loss of money and time that we had to have a greater slope, and we kept at Mr. Bennett until he had to allow us to alter the batter. As it was we lost four months in trying to get him to do it.
2956. We have heard a great deal about the delay which it is alleged exists in getting work measured and paid for? Yes, contractors have a lot of trouble in this matter.
2957. And in such cases as when the work is progressing and is not finally finished? Yes, that is true. In fact if I had not had a good firm to fall back on I would have been closed up before I finished the first contract—before I got half through with it.
2958. Then it consequently means that when these steep batters are insisted upon by Government, combined with the difficulty which contractors are said to have in obtaining their money, that no one but a man of considerable means can tender for these Government works? No; he always loses.
2959. And consequently poor men are shut out from tendering? Yes; and I should say that these contracts have ruined them, one after another. The only man that seemed to get along at all was Budd; but he made a lot of money from the squatters and lost it on the Government works. I do not think he made money, certainly; but the other contractors were shut up all round and lost their money.
2960. You are not aware that any other contractors have had this modification made in their favour? I think there is a tank called the Limestone tank, near Nymagee, which was also made with a batter of 3 to 1. The contractors made it to a depth of 15 feet instead of 18 feet, which was allowed on account of the rock they met with.
2961. Did you ever meet with rock in your excavations? Yes, in the Babinda tank we reckoned on 1,500 yards of rock or sandstone. It was not cemented gravel which we got at the Gilguys, but with the steam ploughs it does not matter. This was all the rock that we found.
2962. Did you make any application for compensation for this rock? No; I never made any written application, because the matter did not worry me much, and I was anxious to see how we would get on with the Government. I did ask Mr. Adams about it, but he said we would not get anything.

A. H.
Doudney.
1 Mar., 1888.

2963. *Major Penrose.*] Did you put down any trial-shafts in that case? No; the rock comes right up to the centre. I would have made application for compensation for the rock but I was anxious to get more contracts from the Government, and I did not push them for it. I thought by taking out the rock in this way I would have got more work from them.

2964. Have you lately made any contracts with the Government? No; I knocked off contracting three years ago, and the plant was sold for a mere song.

2965. Taking into consideration the first cost of the plant, did you find it more efficacious than the use of bullocks? I would sooner have the bullocks and scoops in a good season, such as the present one, because there is no worry, and there is not the continual strain of breakages which may occur with the other appliances. But if I were tank-sinking again, I would have two small engines and a plough with the bullocks and scoops to follow, and drays to finish. One steam plough would keep a hundred drays going easily.

2966. Did you never see any of these patent earth excavators? I have seen them all at work, and brought some from Melbourne some years ago, having taken the contract for the Ivanhoe and other tanks, which I afterwards threw up, and which were let to others. I then bought ploughs and scoops.

2967. Were you the contractor for the Mount Manara and Ivanhoe tanks? Yes; but the Department let me throw up the contracts, so that I did not start the work.

2968. I suppose that when you had a contract at 1s. 9d. per yard you expected to make money out of it? Yes; we expected to make a great deal of money indeed.

2969. It is considered a large price? Yes, a very large price; but when you come to do the trimming, and all that sort of thing, you will find that no man can make it pay and go to the bottom.

2970. What was the cause of your tendering at so high a figure? Because we showed that we had bought this very expensive plant, and that similar plants had done good work for Sir Thomas Elder, and that if this tank was a success for the Government we could put down tanks very quickly. This was before the drought, and when the Government could not get the contractors to leave the squatters at the ordinary rate of 1s. per yard.

2971. *Chairman.*] Give us the reason for that? Because it is much better to work for a squatter than to work for the Government at any price.

2972. For the reasons you have stated? Yes; and for other reasons. If you are working for a squatter your water is secure, and he will arrange to give you meat, provisions, &c. Besides that, you know that your money is safe and easily obtained; you also know that the squatter is himself always watching the work, and that if you do a fair thing for him he will be satisfied. That is to say, you are not left for a month or six weeks doing work in a certain way, and then finding out that it is condemned when the inspector comes round.

2973. *Major Penrose.*] In that particular case were there difficulties in the supply of water and feed? Yes; there was no grass within 6 miles of the place, and we had to carry water from the tank, about 5 miles away; and nobody could do that except by steam, the engines required so much. The tank next to this one was let for 1s. 9d. A man named Bull did the work. I think it is the Moonbil tank, on the Wangeribone Creek. That was done at 1s. 9d. per cubic yard, and the contractor "went broke" over it.

2974. *Chairman.*] For what reasons did they make it 1s. 9d.? They had a horse plant, and there was no grass. They had to pay large prices for water and for provisions and horse-feed. For instance, they paid 1s. 3d. for a sheep that would not make a meal for ten men. The sheep had been fed on scrub, and had not seen grass for two years. The leg of one of these sheep would not make a fair-sized chop, and then there was no nourishment in it. This was in 1883; about the middle of the drought.

2975. Were many squatter's tanks being sunk during that year? Very few, and afterwards they stopped altogether.

2976. *Major Penrose.*] I suppose it was absolutely necessary that some Government tank should be put down there? Well, no. I think that all these tanks were too late. Had they been put down there ten or fifteen years before they would have been most useful. It seems to me that the Government do not look far enough ahead. Stock go upon a road, and reports are sent down to Sydney that tanks must be constructed, and while all this red-tapeism is being gone through, the real push and the real necessity for the tank passes away, and the road is no longer used, because trucking is so much better than droving that the squatter always goes straight for the railway.

2977. Now, from your experience in working for the Government, do you think that it would facilitate and cheapen these works if they were handed over to local bodies? Yes, certainly; and that is the only way they can be made to pay or to be put upon a proper commercial basis. The only way that this can be done is by fencing in the travelling stock routes, and then by making the drovers pay a certain amount for the sheep whether they used the public watering places or not. The routes could be divided into sections, the drover to pay for each section of 50 miles a certain sum. One ranger could be appointed for a section, and it would be his duty to ride up and down, and stop at the tank at night. That would do away with the expense of a caretaker.

2978. *Chairman.*] And would do away with the objection to the stock remaining longer on the road than they had a right to remain? Yes; and the ranger could also keep the squatter's sheep from the water. At present if there is a sign of grass on the travelling stock route the squatter sends all the stock on to it and eats it down.

2979. Now would you not like to modify your remarks applying to the river frontages in the dry country? Yes; that would never do in certain cases.

2980. So that you now say each case would have to be dealt with according to the circumstances? Quite so. It would not do even to have lanes leading through.

2981. All these matters require so much local knowledge and local experience that they should be dealt with by local bodies who have a good knowledge of the country? Yes, certainly; but besides these you want a man such as Mr. A. P. Wood to be in charge of the construction. Everything should go through his hands. He is the most practical man that I know of.

2982. Have you ever been in Queensland? Yes; all over Queensland.

2983. Do you know how those things have been managed in that Colony? No; I have been mostly along the coast, and have no experience of their system of water conservation. The country is sufficiently well watered up there.

A. H.
Doudney.
1 Mar., 1888.

2984. Do you consider that a fairly correct judgment has been exercised in the selection of sites for public tanks—that is, considering the distances along the roads at which these tanks had to be placed, and the catchment area? Yes; I think so. I think that every where the sites of the tanks have been chosen well. It is a thing that many people are often greatly deceived in. In regard to one tank which I constructed I was under the impression that we were working on the top of a hill, but notwithstanding this impression, the tank became full when the rain came. There is one tank on the 70-Mile track to Wilcannia which, I admit, was put in a bad place and never filled, but that is the only one that I know of.
2985. Do you know of a tank on the road between Louth and Cobar which has never yet filled? I have never been on that road at all.
2986. Has machinery been put up on those tanks that you are acquainted with? Yes.
2987. What kind of machinery? Tangye's steam pumps. I forget the names of the others.
2988. Do you think that this form of machinery is desirable or necessary? If you want to have good, clear water in the troughs, this machinery is better than horse-power.
2989. Do you think that the caretaker himself would be well able to keep the service tank full with the M'Comas pump? A great deal would depend on the road, and upon the number of stock that were travelling.
2990. But in that part of the country you are most acquainted with, do you think the number of travelling stock is so great that the men could not meet the requirements? I think any man might have met the requirements on any road that I have been on, except the Booligal to Wilcannia road.
2991. So that you think it was an unnecessary expense to put up these Tangye pumps in every instance? Yes; except on very large stock routes.
2992. Do you know the capacity of a M'Comas pump when worked by hand labour? I cannot say that I know it exactly, but you can do a tremendous lot of work with a M'Comas pump. I think there has been a great amount of dissatisfaction with it, simply on account of the want of labour in the back country. If there is any hard work to be done you cannot get people to do it.
2993. But these caretakers have nothing else to do? Then that is all they are good for; a ranger could attend to all their duties; and could, when required, go ahead of the stock and pump all the water that was wanted.
2994. *Major Penrose.*] It has been suggested that the drovers should be compelled to render some assistance? They will not do it for you.
2995. *Chairman.*] Another thing I would like to ask you;—do you think it necessary that caretakers should be placed at these tanks, because the number is now quite alarming;—do you think that every tank should have a caretaker? There is this difficulty in doing away with them: A caretaker might not be the slightest advantage at a tank for twelve months, and yet in one day, in consequence of a flood, his presence there might result in a saving of much property from destruction; so that the Government would be amply compensated by keeping these men there. But if you had the roads properly fenced in, of course you would not require a caretaker.
2996. *Major Penrose.*] Under present circumstances I suppose the caretakers are necessary to prevent squatters from watering their sheep at the tanks? Yes; it is in bad seasons that these tanks are unprofitable. In bad seasons the squatter trucks his sheep, if there is a railway handy.
2997. And yet you consider that these tanks are necessary? Yes; there is no doubt about that.
2998. To carry out your ideas fully every man would have to pay a certain water tax? Yes; and I think they would be only too glad to do it. The advantage of having a road fenced in is, that you have grass and water all the way. At present there is no certainty that you will have grass. As soon as there is any grass on the stock routes, the squatter himself puts his sheep on it and eats it down. The squatter does not wish sheep to travel through his run, because it necessitates his sending his men with them to shepherd them through his property, making them travel the specified number of miles per day. If the road gets bad, from want of grass or any other cause, the travelling stock will not use it, and will have to travel by some other route. I do not blame the squatters. I have seen as many as ten men belonging to one station shepherding travelling stock over the Kilfera run, and were kept at it for three or four days. This is a very large stock route, and it gives any amount of trouble to the station owners. I think it is some 97 miles through the run. Large numbers of cattle and sheep go along that road.
2999. *Mr. Woore.*] I suppose there are nearly always travelling stock on the run? Yes.
3000. *Chairman.*] Have you taken contracts and sublet them? Only drains; and in one case only.
3001. As regards drains, what price did you get from the Government, and what sum did you sublet them for? I think I got from the Government about £1 per chain for 12-foot drains, 9 inches deep, and with 3 to 1 batter. I sublet the work for 17s. 6d. per chain. I then got, I think it was 10s. per chain, for the 10-foot drains. I cannot be at all certain, because it is a long time since I did the work. The only reason I sublet this was that I had done with the tank. At Tinda tank there was a tremendous catchment, and I dare not put drains in for fear of destroying the engines. I had great trouble with labour, and it was on that account that I sublet the drains to a man who was living close by.
3002. Do you know of any wells? No; I only know of old wells. They were all sunk before I went there.
3003. What is the nature of the well water generally? The water in the Jumping Sand-hill is occasionally rather brackish for human consumption. Then the Holy Box well was abandoned, and Mr. Wood put a man on to bale the water out, and they got good water at the last report. The well at Mount Manara was abandoned before they had gone to a very great depth. One well further away from the Mount Manara—one about half a mile away—supplies magnificent water, but it is private property.
3004. Have you ever put up any fencing? No; I would never touch woodwork.
3005. *Major Penrose.*] Are any of these tanks constructed so that they will conserve water above the natural level of the ground? No; unless the water is pumped over the embankments from the silt-tank. The only advantage of the banks is that they act as a break-wind.
3006. *Mr. Woore.*] A violent wind blowing would drive the water against the sides of the tank, and bring the earth down? Yes; and I do not believe that any batter of $1\frac{1}{2}$ to 1 gives much resistance.
3007. These banks which are put round the tanks, although they may not conserve water above the natural level, tend to conserve the water within the excavation by sheltering it from the wind? Yes; they do that, but all that means money. You can shelter a tank with a brushwood fence which would cost only about 2s. per cubic yard, or less. I have noticed in these banks with a steep batter that the waves will cut not only the earth, but will cause it to fall in. I have a letter here that I would like to read. It is addressed to a member of the late Water Conservation Commission, Mr. Franklin. [*See Appendix.*]

3008. *Chairman.*] You said you had fault to find with the management of the tanks under the Mines Department? No; I did not exactly say that because I have no particular case to bring forward, and no particular fault to find; but it seems to me that the whole thing is mismanaged. I have seen for years back good tanks unattended to; the drains were not cleaned out and then the tanks silted up and became utterly useless. There was the Boonoono tank, for instance. It was more than half full of sludge; and although I admit it was very bad country, still they ought to have kept their drains clean, which is the chief thing.

3009. Is there a silt-tank there? Yes; but it disappeared long ago.

3010. *Major Penrose.*] Is there a caretaker there? I do not remember that there is any caretaker there now. There was a caretaker there at one time, but he never did anything. I think he did more in shifting the horses for Cobb & Co., than ever he did for the Government.

3011. *Chairman.*] So through the negligence of this caretaker this valuable work was allowed to fill up and become useless? Yes; and not only that, but the tank was in such a position that a tremendous fall of rain would fill the swamp all round it. I do not know what Department it was under at the time, but nothing whatever was done. They quietly stood by and took no notice while the squatter who leased the Kilfera run, and who had a tank in the same swamp, filled his tank brimming full, while the Government tank remained empty. Not only did they take no steps to fill the Government tank, but they did nothing towards blocking the station owner from doing this.

3012. *Mr. Woore.*] Do you know under whose charge this tank was at the time? I cannot say.

3013. You do not know whether there was a caretaker there or not, or whether the tank had been leased? I have no knowledge whatever of that.

3014. Do you remember in what year this incident occurred? I think it was in 1882 or 1883. But that is only one instance. Of course I look upon it in this way—that these tanks ought to be made to return something, just as well as the railways and the roads return something. The railways of this Colony are most expensive, and our tanks, which are magnificent tanks, are also the most expensive in the world; but if you adopted this system of tollage, there can be no doubt that they would bring in a large revenue.

3015. *Chairman.*] Now I want to get this further information. Is it a fact that the case of this Boonoono tank is pretty generally the case of all the tanks that are under caretakers? Yes; all the tanks that I have any knowledge of. I do not wish to cast any reflections on the Department.

3016. You will only state facts? I mean to say that the whole affair is so gigantic and is spread over so enormous an area of country, that there is a great difficulty in getting reliable men. In any case until the thing is put upon a proper basis, it never can be satisfactorily worked.

3017. You think that local bodies should have the management and control? Yes; the only way is by local bodies with an inspecting engineer over them all.

3018. *Major Penrose.*] You state in the letter which you have read to us that in measuring up the tank the contractor can get round the Government officer. I should think that the measurement would be a very simple affair? Yes; it would be, no doubt, if the Government officer had a staff with him; but when he comes alone into the enemy's camp—as it were—he is bound to be “got at” in all directions. If he is at the top of the bank with a rope in his hand, the man at the bottom gets at him in the depth; and if he goes to the bottom the man at the top is getting at him with the level, because he makes the inspecting officer push up. If the Government officer measures round the side with the tape, the man at the other end grasps 18 inches or 2 feet of it in his hand, and the inspector, unless he is very sharp-sighted, cannot possibly tell. Indeed, I know of one short-sighted officer who has been imposed on in this way by the man at the other side taking 2 feet of the tape in his hands.

3019. *Chairman.*] Is there not another way of misleading the Government officer by making up the soil so that you cannot tell the new ground from the old? Yes; I believe that has been done repeatedly.

3020. *Major Penrose.*] And could not the contractors cheat the squatter in a similar manner? No; because the squatter is continually on the ground, and besides that the squatters are too practical in their knowledge, and know too much to be cheated by the contractors. In one instance, in sinking a tank, I, myself, came upon what is usually called cement. The road superintendent happened to visit the tank at the time, and told me not to go any deeper, as I should probably lose the water, as the water would pass through what he thought was gravel, which exactly suited me. Although Mr. Wood has been very hard indeed upon me, I believe him to be a good man, but he is terribly embarrassed by the incapacity of the men under him. I know a great number of tank contractors, but not one who has made money. There never has been a rush for the Government tanks, and had the squatters continued their improvements a few years ago the Government would not have one-half their tanks down now, because men would not dream of looking at them. Had it not been for the continual drought and the passing of the present law, which prevents squatters from going on with their improvements, the Government would have had extraordinary difficulty in getting tenders for their tanks at all. I know that at the beginning of the drought, when I tendered for Ivanhoe and Mount Manara, they kept on advertising, but nobody would have the work, and Mr. Wood himself was sent up to offer all sorts of inducements to men to take the work. Years ago I believe that Burton Brothers made a lot of money out of tank-sinking, but it was in the days when everybody was making money, and when there was an abundance of grass and water.

[The Commission adjourned.]

THURSDAY, 15 MARCH, 1888.

The Commission met at 10 a.m.

Present:—

HON. G. H. COX, M.L.C., CHAIRMAN.

MAJOR PENROSE, R.E.,

J. C. WOORE, Esq.

William Christopher Bennett called in and examined:—

3021. *Chairman.*] What is your position, Mr. Bennett? I am Commissioner and Engineer-in-Chief for W.C. Bennett. Roads and Bridges.

3022. Of course, Mr. Bennett, you have read over these printed documents that have been printed and placed before Parliament, containing various letters and complaints from the Mines Department as to works performed under your management? Yes,

A. H.
Doudney.
1 Mar., 1888.

15 Mar., 1888.
3023,

- W.C. Benhott. 3023. And the various allegations that are made in these papers? Yes; and I have written a letter protesting against the question being put before the House and the Commission in this one-sided way.
- 15 Mar., 1888. 3024. As soon as these printed documents reached you? Yes; and I requested that the paper should be forwarded to the Commission. If you have not received it I will provide the Commission with another copy.
3025. The Mines Department have formulated their allegations under ten different headings, but of course you have seen all this? Yes; I am conversant with the documents.
3026. To enable us to refer to these matters more conveniently, we have asked each witness questions under these headings, *seriatim*. You have been supplied hitherto with a copy of the evidence taken? Yes; I have.
3027. You think it would be preferable if you would give us your evidence without going through the form of asking questions. First of all, you might speak in connection with the selection of sites for tanks and wells, referring in your statement to the most salient points—those cases which have been said to be the most glaring ones? I was preparing my statement in the form of a paper, but I was not able to complete it by the time of meeting of the Commission. The evidence is very voluminous, but I have gone through it and marked everything to which I wish to refer to particularly. But I wished to have the views of the Commission before I present a document of that sort to them, because it would be equivalent to a speech of counsel on evidence; and I thought the Commission might consider the position I was in, and allow me to justify myself by a formal defence in reference to the evidence.
3028. I am quite prepared to admit such a statement, having already done so in the case of other witnesses. (*Witness then said that he would hand to the Commission a written statement replying fully to the various allegations that had been made, with a view to lessen the labours of the Commission, and would give his views in defence.*)
3029. How many years have you been in the Public Service? I have been 34 years in the Public Service in New South Wales, and 10 years before that in the Imperial Service—on a service of a collateral character—which my connection with the Imperial Service led to.
3030. In what capacity? In the capacity of engineer-in-charge of works or surveys.
3031. When did you commence to take charge of tanks and wells in New South Wales—when did you first commence constructing them? In 1869.
3032. And, speaking approximately, how many tanks have you excavated, and how many wells have you sunk since then? Well I think that altogether there are 165 public tanks, wells and dams in the colony.
3033. Since when have complaints been made in regard to faults of construction and with respect to badly chosen sites for tanks and wells? Ever since the Mines Department got charge.
3034. Were no complaints made by private individuals prior to that time? I have no recollection of complaints having been made. There were criticisms and suggestions by private individuals, but no complaints.
3035. Before you selected a site for a tank or well, as the case may be—by whom where you moved? In the first instance—in the earlier stages—a sum of money was generally placed on the estimates at the instance of a member of the House; and I was directed to inquire where tanks were necessary on a certain road, and provide them. The first thing I did was to send Mr. Wood, the assistant engineer, up to bore in the country between Hay and the Darling. Mr. Wood provided a full boring plant at the expense of the Government. He was an old officer of the Department and then made a great many borings between Hay and the Darling. Some time during that period Mr. Wood reported that he found it cheaper to sink prospecting holes or trial-shafts than to bore. Sums of money were placed on the estimates occasionally, on the motion of members of the House, in an arbitrary way; and sometimes on our advice. We constructed a number of wells between the Lachlan and the Darling as well as tanks, as Mr. Wood reported most advisable.
3036. Was Mr. Wood instructed to avail himself of local knowledge where possible? Yes; we have been in the habit of consulting local people in every work we have undertaken. Of course it is not for us to follow exactly the dictum of local people, because they may be swayed by motives opposed to those which we are told to act on. After these works were completed the question of occupancy and revenue arises. We found that we, as a Department, had no local powers whatever to lease the works or compel payment of tollage; and we were told that these powers rested with the Crown Lands Occupation Branch; and the wells and tanks were then handed over to the Lands Department.
3037. *Major Penrose.*] About what time was this? It commenced in 1869 and went on to about 1872 or 1873. Then we were from time to time ordered to make repairs, which in some cases amounted to restoration, the works having in the meantime fallen into decay from want of superintendence and care. After the repairs were completed the works would be again handed over to the Lands Department. This restoration of some of the works occurred more than twice.
3038. Do you mean that the works were handed back to you for repair? Yes; the works were allowed to get into disrepair by one Department, and then taken over by us and reconstructed, after which they were again handed over to the Lands Department. During this period the M'Comas pump was used; but in one or two instances open tanks were made which the stock might drink from.
3039. *Chairman.*] Who used these M'Comas pumps? They were used on our works. Some of these works were leased by the Lands Department and the pumps were used by the lessees. We leased some of them, also, but we found that we had no power—or at least no power to compel the lessees to pay anything.
3040. *Mr. Woore.*] Some of these places were leased to the lessees of the runs on which they were situated? Yes; when the lessees tendered for the work. At that time it was held to be very objectionable to allow the lessees to lease the works, because it was said the lessees would use the tanks to suit their own purposes.
3041. *Chairman.*] We would like if you would detail the whole history of this matter in your own way? At different times sums of money were placed on the estimates to water other roads. There were some tanks made between Hay and Deniliquin.
3042. These were chiefly stock routes? Yes; stock routes. And on the opening of the Western line of railway to Nyngan there was great pressure put upon the Department to get the road to Cobar, and then the road from Cobar to Bourke, watered. On the road from Cobar to Bourke, the tanks at that time were all small open tanks. Between Cobar and Nyngan a larger and better style of tank had to be constructed. About the time of the completion of these tanks—my memory is rather vague on the matter—the Mines Department got charge. For some time there was no Chief Inspector, and Mr. A. Bruce,

Bruce, the Chief Inspector of Stock, recommended generally where tanks should be put down, and we fixed the sites locally—that is, within a mile or two of the place indicated by Mr. Bruce. Mr. Bruce wished to carry out a number of innovations, and suggested a great number of improvements. So far as was practicable I adopted some of Mr. Bruce's suggestions; but there were others which I did not think it desirable to adopt. There was a good deal of discussion about drinking tanks, and generally Mr. Bruce wanted more accommodation for stock, fences, &c., than were hitherto thought necessary. Then Mr. Gilliat got charge and made some tours of inspection; and, in many cases, in a rather arbitrary way, directed that alterations should be made by the caretakers without reference to the Roads Department at all. He condemned several works—notably wells, the water of which he condemned. I should say that Mr. Bruce recommended that the Mines Department should have a hydraulic engineer of their own, do their own work, and have a separate Department of their own. Then some years afterwards Mr. Harrie Wood, the Under Secretary for Mines, recommended Mr. Abbott, the then Minister, to have a hydraulic engineer. Mr. Abbott thought it was unnecessary, and said that he knew me very well, and knew what experience I had had, &c. Then from that day—for the last five or six years—there has been nothing but a continual fire of letters and complaints.

W.C.Bennett.
15 Mar., 1888.

3043. *Mr. Woore.*] By whom? From the Mines people, through their Minister, to the Works Department. The complaints were in most cases about trivial things, but the reiteration of these trivial things must have made an impression.

3044. *Chairman.*] Carrying on this line of statement, how does the friction arise between the two Departments;—had you any control over these works after giving them up to the Mines Department, or had your road superintendents any control over them? Yes; there was a minute giving us charge of repairs, and I always objected to hand over the works, as previously, when they had been handed over to the Lands Department; they had been allowed to get into disrepair. I have always feared that a similar state of things would ensue if the works were left entirely to the mercy of the Mines officers.

3045. *Major Penrose.*] You mean to say that you objected to giving up control over these works altogether? Yes; they were my children, as it were; and I wanted to see that they got fair play.

3046. *Chairman.*] Had your officers directions to see to the works after they had left your hands? Yes; that was a perfectly understood thing.

3047. Will you state what was the nature of these directions? That they were to do all repairs and report to me every time they went round to inspect the works. Besides that, they were to do the urgent repairs, as it would not do to wait on their report to the office. They were given the fullest freedom of action in reference to repairs, because in most of the men, particularly at this epoch, I had very great confidence.

3048. Did the repairs you speak of include minor repairs? There was a limit of £10, but it was a very hard thing to draw the line.

3049. *Mr. Woore.*] Who suggested the limit? The Mines Department. A valve or something else in a pump, the cost of which would not be more than 6d., was frequently a cause of complaint and of delay in giving water. Necessarily our officers, when they saw this, made reports.

3050. *Chairman.*] Did these caretakers receive any instructions not to meddle with the pumps? No; no general instructions. I believe that in some cases when the officers found the men in charge so unfit for any duty of the sort, they have told the caretakers verbally, "If anything goes wrong do not touch the pump, but let me know."

3051. We have it in evidence that they would not do the smallest job, because they had received instructions not to touch the works? In some cases they did not receive instructions, but of course no officer would complain of a man not doing work which he himself had instructed him not to do.

3052. *Major Penrose.*] You had no power to lease these works or to take them over after construction? No.

3053. And do you think it was a good thing that these two Departments should have something to do with the works? I thought it was a mistake then. I think instead of giving over to a new Department this power, it would have been much better to have conferred the power on the Works Department by a short act.

3054. Did you suggest that? No, I did not.

3055. *Mr. Woore.*] Who was it that first suggested this handing over of your works to the Mines Department? It arose entirely out of our inability to lease.

3056. And were you unwilling to hand over these works to any other Department? I saw that the law positively did not allow us to lease—that it was a privilege or a duty of the Lands Department, and then it was not so easy to get the law altered as it is now. And I never thought of waiting for the alteration of the law, but quietly handed over the works as I was told.

3057. *Chairman.*] Did you foresee any complications from this dual control of the works? No, I did not. The whole thing was in a rather embryo state at the time, and had not assumed the very large proportions which it has assumed since. These works were merely made as aids to the travelling public without any idea of getting revenue from them. The matter of revenue was an afterthought altogether.

3058. Did you ever anticipate that these works would be taken over by some responsible body outside the Government? In the year 1865 I recommended the decentralization of the Department so far as the roads and bridges were concerned; and in every report I have written since I have most strongly urged that matter. There is a paper of mine in the blue book (produced) which contains some minutes that I have written. But I must confess that I never anticipated local government in these localities, because the material for local government did not exist there in these days. It is only very lately that it can be said to have existed at all, and if such machinery can be found I would strongly advocate that the control of these works should be placed in the hands of properly constituted bodies.

3059. You think it would tend to satisfy public requirements and also, I presume, secure economy in the construction and administration of these works? I think so.

3060. Local bodies must necessarily know better the requirements of the district than an officer coming from Sydney? Yes, and they would sympathise with the contractors and other persons employed on the work, and it is now said that the contrary is the case.

3061. We have it in evidence that it is so? I would wish to add something with reference to what I have said with regard to handing these works over to local bodies. There should be some control over the local bodies in order that they might not be allowed to stop a road, because a local body from motives of injudicious

W.C. Bennett. injudicious economy or for some other reason might neglect works which would inconvenience the travelling stock. That has to be considered, so that rather more supervision would be required over these tanks and wells than over the ordinary road and bridge works of the colony, which it is so desirable to decentralize.

15 Mar., 1888.

3062. You mean this, that local bodies must not be too local, and that they must not be allowed to take a too narrow view of their responsibilities? Yes, and particularly if the Government should agree to any scheme to subsidise them. There should then be a central authority to see that the subsidy was properly disposed of.

3063. *Mr. Woore.*] You mean that they ought not to be entirely free from the supervision of a Government Department? No.

3064. *Chairman.*] You know that there are Divisional Boards in Queensland that have control over works in that Colony? Yes, I know that they have control of the roads; but I do not know that they have charge of tanks and wells. Persons who know both frontiers perfectly are best satisfied with the result under the roads and bridges system of New South Wales. They are better; but, notwithstanding the evils of centralization are so great that it would be better to put up with inferior roads and bridges, if it were a consequence necessary to the control by local bodies—though I do not think it would be—than to keep up this system of centralization. In the year 1865 I recommended this, and I have never since then had reason to change my opinions. I said then that it might be that the works would not be so well done, but that the general results would be more satisfactory.

3065. *Mr. Woore.*] It appears from the evidence given before us that some tanks and wells constructed by your Department have been placed near waters conserved by the lessees of runs—was that done with your knowledge? Not with my knowledge at the time.

3066. But what I want to know is, were not these waters, adjacent to which works were constructed, conserved by the lessees at their own expense? Yes; but the works were not put there at the time with my knowledge. Mr. Wood was sent up there owing to the great rush to Mount Brown. The papers teemed with extracts relating the sufferings of persons who had perished with thirst.

3067. You say that these works were not put down with your knowledge? No, but I endorsed everything that Mr. Wood did.

3068. It was done by Mr. Wood, who had great power vested in him? Yes, he had plenary powers to construct such works as were necessary to save life.

3069. But do you think it was a good principle to go upon,—to put these works for watering stock upon stock routes near squatters' improvements, or do you think that the squatters' improvements might have been availed of for the purpose of meeting the public requirements? Well, we were told to prepare for a great rush to a new gold-field.

3070. I am now speaking generally? In that particular case I have stated we were told to prepare for a great rush, and, as has occurred during the previous rushes, we know how very valuable these private waters of the squatters would become. A squatter might refuse to allow the people to enter, and then we ran the risk of having suffering, because there was no tank at a certain place. Or, on the other hand, we must have been compelled to purchase the squatters' works at a very large price, or again, the waters conserved by the squatters might have given out. If it had not been for the great rush, the works would have been designed and carried out with more deliberation.

3071. But do you think it was a proper principle to go upon—not to depend upon squatters' improvements for watering these roads? In that case, certainly.

3072. And also in fairness to the squatters—not to throw the public upon them for water? I think so.

3073. The waters having been conserved at their own expense? Yes, we are obliged to pay great deference to private rights in this country,—much more so than I found necessary at home.

3074. Therefore if a public watering place were required in a position on a stock route where water had been already conserved at the expense of the lessee, you think it is necessary for the Government to construct their works, notwithstanding that the squatter had already conserved water for his own use? Yes, I do.

3075. *Chairman.*] This is one of your specifications for tanks? Yes. (*See Appendix.*)

3076. Is this the same specification you have always adopted? No; this is the most recent one.

3077. You did not always adopt this specification? No; in the previous one a blank was left for the slopes, which blank was to be filled in by the officers.

3078. In the earlier specifications were the slopes usually steeper than the slopes in the later specifications? Yes.

3079. What was the steepest slope you have put in a tank? 1 to 1; but this was in the beginning.

3080. Was that slope universally adopted at that particular time? No. Many works then done had that slope, but few of them came under my own immediate attention. That was a good many years ago—nearly twenty years—and we had then only a very slight knowledge either of the rainfall or of the demands likely to be made upon these tanks. There were no squatters' tanks at all like them, and we were anxious to make our works most durable, so that they would hold out in any drought. And we then considered a 1 to 1 slope as the most economical.

3081. You must secure by this slope less evaporation than by a gentler slope? Yes. I have had a table made out showing the per centage. I hand this in as showing how I arrived at this conclusion. I came to that conclusion by practical experience, and this table has since been formulated. We knew that the local evaporation was very great, but we did not know what duration of drought we would have to provide for. In fact the whole thing was tentative. This is the table I referred to:—

Comparison of tanks 18 feet deep with varying slopes.

| | 1 to 1. | 1½ to 1. | 2 to 1. | 3 to 1. | 4 to 1. |
|------------------------------------|--------------|--------------|----------------|----------------|----------------|
| Capacity | 22·153 c. y. | 22·486 c. y. | 22·614 c. y. | 23·712 c. y. | 22·275 c. y. |
| Mean depth..... | 14·95 ft. | 13·77 ft. | 12·73 ft. | 11·1 ft. | 9·6 ft. |
| Evaporative surface | 40·000 s. f. | 44·100 s. f. | 49·284 s. f. | 57·600 s. f. | 62·500 s. f. |
| Decrease in mean depth | | 8 per cent. | 14·8 per cent. | 21·6 per cent. | 33·7 per cent. |
| Increase in evaporation area | | 10 „ | 23·2 „ | 44 „ | 55·5 „ |

3082. You never went into this question of evaporation closely? For years I have been endeavouring to arrive at a conclusion regarding evaporation, and my opinion now is that evaporation causes a loss of between 4 and 5 feet of water per annum. I consulted friends of mine in India and other places during the time the late Sydney Water Commission sat, and this was the result. W.C. Bennett,
15 Mar., 1888.

3083. It was in consequence of trying to get depth of water with as little surface exposure as possible that you adopted this 1 to 1 slope in the batter? Yes.

3084. Did you never find in these days the necessity of making provision as to the nature of the soil? Well, yes; there was provision made, and each case was considered by itself. Mr. Wood was the man on the ground at the time.

3085. Of course you are aware that in some grounds a 1 to 1 batter would stand very well? I have considered that subject very carefully.

3086. But in other places where there is loose soil a batter of 1 to 1 would not possibly stand? It would slip in the first time anything touched it? Yes.

3087. Then were you sufficiently careful to consider the nature of the soil when sinking these tanks, and so modify the specifications to make a gentler slope where the soil was loose and friable; or did you have a hard and fast rule? It was left to Mr. Wood to a great extent, he being then the officer in charge. The officer who had the laying out of these works used his own discretion with regard to what the slopes should be. The officers I refer to are the road superintendents under Mr. Wood. They filled in the specifications in accordance with what they saw of the soil in the trial shafts.

3088. So that in the event of any batter being found to be too steep it was an error of judgment on the part of the officer who filled in the specifications? Yes; but at the same time I do not shrink from the responsibility myself, because there were the plans which the officers had to follow. They were drawn $1\frac{1}{2}$ to 1, and that was the lead which was to guide the local officer.

3089. *Mr. Woore.*] But subject to modification by the local officer if he thought desirable? Yes.

3090. *Chairman.*] As a matter of fact, I suppose most of the early tanks were sunk with these very steep slopes? Yes, most of these on the Wilcannia road.

3091. *Mr. Woore.*] And do you and your Department know now from experience that that was a mistake. Of course everything was new then, and experience had to be gained? We found that the droughts, which were the principal causes in making us construct steep slopes, were not so great in their operation as we had anticipated; and we also found that the slopes did not stand so well, and we modified them accordingly.

3092. *Major Penrose.*] Practically have these banks fallen in very much? No, not very much. Most of the slopes stand very well; but Mr. Wood will be able to give you evidence on that point.

3093. *Chairman.*] Are you aware in some instances that these steep slopes that you have insisted upon for public tanks have cost more money for excavation than they would were the slope a gentler one—would the excavation have not cost less had there been a long slope say of 4 to 1 on one side of the tank? I think it is quite impossible that a tank of 1 to 1 could have fallen in to that extent. But if any particular case is cited I will take the trouble to have cross-sections made, if the gentleman making such a statement will name the tank or tanks he refers to. I will have these cross-sections made and laid before the Commission to show you to what extent this slope takes place. There are two other reasons that I want recorded, justifying these steep slopes. One reason is that the same area of bottom would not be given in the flatter-sloped tanks. A flat-sloped tank would give much larger excavation on top, which would cost more money, being of greater cubic contents. I imagine that a great deal of this harm is caused by the small waves washing against the sides, but if there was a larger surface necessarily you would have larger waves.

3094. Have you found in practice that the original steep slopes were too great, and have you modified them by a more recent specification of two to one? Yes; $1\frac{1}{2}$ to 1 first, and then 2 to 1.

3095. Have you found that the present specification of slope of 2 to 1 is sufficient? We think so.

3096. And has not your attention been drawn to the fact that this has slipped in? No; but we have had complaints, and I believe we should still have complaints if we made the batter 6 to 1.

3097. *Major Penrose.*] I see that some of them have 3 to 1 slopes? Yes; this was done merely to allow the use of Mr. Doudney's excavating plant. We tried to meet them in every way, so that the prices for the work might be reduced.

3098. *Chairman.*] You have not had any valid complaints that these batters are still too steep? No.

3099. Of course these tanks with these steep batters were never intended to allow stock to water directly at them? Never. Some tanks were intended to allow stock to water at them, but in these cases there is a batter of 1 in 6 to allow the stock to go down on one side.

3100. But latterly all tanks have been excavated with the idea of putting machinery down to lift the water into troughs? Yes; and not to allow the stock into the troughs. That was done on the Hay and Wilcannia road, and in some of the tanks first put down.

3101. You mentioned just now one tank which had been damaged by the water lapping and so forth on the sides? Yes.

3102. In excavating you have to put the soil from the tank all round some distance from the excavation—we presume for the purpose of protecting it from the winds? That was one reason. The other reason was that which was acted upon in one of the earliest tanks, Boonoo Boonoo, for the purpose of making the excavation hold water above the natural surface of the soil. We made staging and flumes to carry water from the high land across the flat, so that the storage might be utilized to the fullest extent above the natural surface of the ground. That staging was allowed to get into disrepair and it became useless.

3103. Have you ever used machinery to pump water outside the tank into these embankments and increase the capacity of the tank? We never had machinery powerful enough to do so to any extent, and we never required it.

3104. *Mr. Woore.*] In many cases the embankments are now left open? Where there is any possibility of accumulating water above the level of the ground we have closed the embankments and put a flap sluice in to prevent the egress of the water after the tank is filled up with heavy rains.

3105. *Major Penrose.*] How much water can you conserve above the natural level of the ground in that way? It depends upon the slope of the ground.

3106. *Mr. Woore.*] But in most of these instances where the embankments are put around it would be quite possible to pump outside water into the tanks? Yes; if you had machinery powerful enough.

- W.C. Bennett. 3107. *Chairman.*] You make these embankments solely for the purpose of protecting the water from the winds? Not wholly; many of them impound the water above the surface.
- 15 Mar., 1888. 3108. *Major Penrose.*] Have any of the contractors ever represented to you that they could make tanks much more cheaply if they were allowed certain concessions in regard to one or two batters of the tanks? No proposition of that sort was ever made to me. The only proposition made to me was one from Mr. Greig, of Fowler & Co., the proprietors of the steam excavating plant; and he wanted me to modify the batters to meet his views, but he did not modify his price. We thought he could do the work at a lower price if he were given this concession, but he did not make the price a bit lower. Therefore there was no reason for modifying the batters in the ordinary tanks unless they could be done cheaper. We called for tenders in every possible way, giving the contractors the advantage of this alteration, but we got no reduction in price.
3109. You tried to see whether the price could not be lessened by introducing a gentler slope where possible? Yes; and Mr. Doudney, who managed the plant, and Mr. Kilgour, could not afford to tender any less than they did under the other circumstances.
3110. Was the 3 to 1 batter your limit? Had they asked for more we should have given it.
3111. Would you be prepared to give it now to any other contractor? Decidedly; if we could get from them a reduction corresponding to the advantage which we give them.
3112. Would you accept a contract at 3d. per yard less on that account? No; because if you go into the question of evaporation and mean depth you will find that the loss would be greater than the saving.
3113. It has been stated in evidence that the steep batters are not such a gain as would appear, and that the loss from evaporation is not to be compared with the loss by soakage through the sides? Well, the loss through the sides is an additional argument for the steep batters.
3114. No; because on the gentler batters a fine suspended clay falls, and this is said to lie very well and stanch the tank? Well, that is a minor matter; because we find in the very worst tanks, such as that at Ivanhoe, if they are filled once or twice the steep banks become quite retentive. I have evidently misunderstood your question. There is a greater surface exposed to evaporation by capillary attraction with the gentler-sloped tanks than with the steep tanks.
3115. There is a much greater area of warm water? Yes; the main depth gives evidence of that, though not to its full intensity.
3116. *Chairman.*] The tanks that you are in the habit of constructing are about 18 feet in depth? Yes.
3117. Are you aware that this is a much greater depth than squatters are in the habit of sinking their tanks? Yes, it is.
3118. But you adopted that because it was considered very desirable to have great depth, and to have so much absolute capacity in the tank, which makes the water so much cooler? Yes; and it is an element in the evaporation. We wanted to have the duration of our tanks to continue to the very utmost period of the drought, because the drying up of one tank might neutralize the others. If a squatter's tank dries up he can send his stock to any other part of his run; but if our tanks were to give out travelling stock are deprived of all resource.
3119. Now we have also had it before us that the Government have gone to unnecessary expense in sinking wells in the neighbourhood of tanks? That is entirely a misapprehension. I do not know a single instance of it.
3120. We have had it in evidence here—and you must have read it—of wells having been sunk in close proximity to tanks in one or two instances? Yes; wells have been sunk in close proximity to water-holes, but not to tanks.
3121. Were the officers who had charge of these works told in every case that they must judge of the nature and formation of the soil in laying out the work? In the first instance we had to trust to the officers altogether, because the whole thing was tentative. It was impossible to make regulations, but the officers were told to do the best they could, and they had the benefit of many years of experience. It was a question I took the greatest interest in, and I gave them fully all the knowledge that I possessed. I told them to be most careful, and that the permanence of water in these public watering places was a most important thing; so that if we have erred at all in reference to the slopes it has been on the side of caution.
3122. And of course it may now happen that faults can be found, because since these works have been constructed you have been profiting by experience? Yes; and I think it would be very hard if the complaints about these faults came from persons whose experience has been acquired on our works. When our officers first went out there that country was a perfect *terra incognita*.
3123. And you admit freely that there exist things in connection with some of the works which have been constructed which your present knowledge might have obviated? Yes; I have stated in writing before that the whole thing was tentative, and that we were improving as fast as we could.
3124. *Major Penrose.*] The complaint is that with all this experience which has been gained, you are still going on constructing tanks in an expensive manner, and without taking advantage of the experience gained by squatters and other practical men? I think not.
3125. I am merely stating that that is the charge? Well, we will be able to disprove it. We will be able to prove that we have utilized all *bona fide* good experience. You no doubt have seen that a variety of opinions were put before the Commission.
3126. *Chairman.*] We have also heard that drains have been carelessly constructed, and that, in one instance, the water, instead of running into the tank, runs away from it? That was explained to me by Mr. Stilwell. In one place the drains crossed a flat or depression in the ground where there was a bank made for confining the water. A big flood came and washed away the bank. It was not replaced, and consequently the water runs back from the tank solely through the neglect of the caretaker.
3127. You say that a fluming was made to carry the water over the depression and on to higher ground, so as to utilize the full capacity of the tank, and that this fluming was allowed to get out of order? Yes; it was destroyed. I think it occurred in more than one case, but I am certain of this one.
3128. What has been called the defective system of fluming has been spoken of? That has reference to the fluming leading into the tank and within the tank itself.
3129. Of course the inlet pipes should be of stone rather than of wood, it being exceedingly difficult to get wood and soil to work together? Yes; but then we have to bring the stone 300 miles. If these works were continued in my hands and more money had been voted for them, I would have substituted concrete; and if there was no stone or wood about we would make the fluming of concrete, of cement, and of burnt clay.

W.C. Bennett.
15 Mar., 1888.

3130. Is not this soil exceedingly friable? Yes; it melts away like sugar. There is one other thing that strikes me. In making the original tanks we were rather limited in the matter of money. A certain sum was voted for watering a particular road, and we wished that that money should go as far as possible; and that was another reason for having steep slopes. Economy was more imperative then than now, though whether that economy was judicious or not is open to question; but at that time it appeared to us that economy was imperative.

3131. You have sent us the list showing us the cost of the whole of these works that have been handed over? Yes; a large number.

3132. Showing the cost of excavation as ranging from 10½d. to 1s. 9d. per cubic yard? Yes.

3133. In no instance did the cost of excavation exceed 1s. 9d. per cubic yard, except where rock or cement was met with? No.

3134. When the Government were giving 1s. 9d. per cubic yard for excavation, were you aware that the squatters were getting their tanks sunk for a very much less sum? Yes.

3135. Are you aware that as much as 2s. 6d. per cubic yard was given in some cases for excavation? I am aware that it is said that somebody said that somebody had told somebody else that another person had got the contract at 2s. 6d. per cubic yard and had sub-let it to somebody else for a less sum.

3136. *Mr. Woore.*] That is not true in any case? It is not, because we have the receipted vouchers and can produce them.

3137. Are you aware that at the time the Government were paying 1s. 9d. per cubic yard for excavating tanks squatters were getting their tanks sunk in some localities as low as 1s? That may have been the case.

3138. *Chairman.*] That being so can you account for the difference? Yes.

3139. Then we will ask you to go fully into that point? In the first place, the depth of our Government tanks is considerably greater than that of private tanks. That is valued at 2d. Then the increased finish—though I do not admit it—I say it is equal to 2d. Then the squatters give the contractors water, which I find is valued at 1d. Then there is the question of feed for the bullocks, which is equal to 3d.; that makes 8d.; and then there is the meat, and all the other accommodations that squatters can give their own men, and which we are unable to give them. I notice that great stress has been laid on alleged delays in payments. Well, no other Government Department has ever done what we have done in the prompt payment of money. This applies to within the last five or six years, since the pressure began. When an officer goes on to the ground and measures the work, he is instructed to give a cheque to the contractor for one-half the amount of the work measured. At the nearest telegraph office, he telegraphs the amount of the cheque, which is at once placed to his credit in the office in Sydney. Then he sends a voucher for 30 per cent. of the work, so that 80 per cent. of the value of the work done is paid for. The officer pays one-half of that 80 per cent. on the spot, and a voucher is sent down for the remainder. The only amount kept back is 20 per cent.; and the only delays that take place in payment are those delays which are necessary in checking the accounts of the contractor and the officer.

3140. When is the original 50 per cent. paid? Immediately when the officer measures. It is a payment on account for the amount of work done then.

3141. *Mr. Woore.*] Is there not sometimes unavoidable delay in inspection by the officers? Yes; but the officers cannot be ubiquitous; and had we more officers than we at present have, there is no doubt that that too would be made a charge against us.

3142. *Major Penrose.*] Do you think that the estimate of 8d. per cubic yard, which is said to be the advantage to be gained by dealing with squatters, on account of their supplying grass, water, meat, and so forth, can be justified? I think these particular items should be taken *cum grano*; but there are other reasons besides those furnished by the contractors, which may account for the difference between the prices the Government pay and those the squatters pay.

3143. *Chairman.*] Will you kindly state those reasons? One great reason is that these tanks have to be pushed on regardless of the nature of the season, while in all probability the squatter selects his own time.

3144. The distance from water would also add to the cost? It would.

3145. *Mr. Woore.*] And besides that, the number of persons who would tender for these works is rather limited? Yes; but there is no reason why the number should be limited. There were times when we had the most extraordinary difficulty to get contractors to take the work up at all.

3146. What I mean is that, as these contractors are thrown largely on their own resources, those who take Government contracts must have considerable means to carry the work on? Yes, that is so. That fact limits the number of contractors.

3147. *Chairman.*] There is another reason given also, and it is this, that the contractors are quite certain that the Government will always accept the lowest tender; however high the tenders generally may be? I am prepared to show that in many instances we have declined to accept the lowest tender; and in one very hard case brought against us here, we absolutely declined to do so. We called for fresh tenders, and ultimately we were obliged to accept some of those prices which are now objected to.

3148. On account of the pressure brought to bear on the Department to have the works constructed? Yes; pressure was brought to bear on us to construct works to save life, and to allow the country to be opened up so that stock from other colonies might pass through. All these arguments were adduced.

3149. As a rule you are aware that the Government are looked upon in a certain sense by people as an institution which may be fleeced? Yes; unfortunately.

3150. And a contractor invariably asks a higher price from the Government—other things being equal—than he would ask from the squatter? The condition of other things being equal is in this case almost an impossibility.

3151. But I am only putting a suppositious case—do not contractors think that the Government is fair game to be fleeced? A contractor will get as much as he can from everybody, and he is only restrained from asking a high price because he fears that he will not get the job; and that if he did ask a very high price he would get no more work. I think it is all a matter of freetrade. There is a great deal more made of this than there should be. Contractors have a great desire to get the work.

3152. It is said that there is a sort of conspiracy amongst these people to keep up the prices for work? I do not think so. We frequently rejected tenders, and we did so in the very case complained of in the evidence given by Mr. Budd. Delays often arose from our calling for fresh tenders, but this man attributes all sorts of improprieties to the local officer. I should like to refer to one statement which is given in the evidence of Mr. Budd. The statement was to the effect that favoritism was shown.

3153. Do you think it is possible that favoritism could be shown in the acceptance of tenders? No.

Instructions

W.C. Bennett. Instructions to the local officers are issued to open all tenders in the presence of the Police Magistrate, or in case he is absent, in the presence of the Clerk of Petty Sessions, or the senior magistrate on the Bench, or the highest-ranked officer of the Mines Department in the district. The amounts of the tenders are put in schedule form with the officer's recommendations and sent to Sydney for approval, and are submitted to the Minister.

15 Mar., 1888.

3154. Not only contractors but squatters have stated as their opinion that the cost of constructing all these tanks with the steep batters is not compensated for by the lessening of the soakage and evaporation. They state that the extra cost which these batters necessitate is not compensated for. I suppose that is a matter of calculation. You know what the increased cost is, and we will take that as a basis to go upon? It will entail 3d. per cubic yard more, which is 25 per cent. more, taking the normal price as 1s. per cubic yard. This list is made up from the past to some extent. It deals with the dearest work we did, but I think 1s. per yard is not too high a price to put down now as the normal cost of a tank.

3155. It is said that the Government pay 1s. 9d. per cubic yard, and out of this 3d. is paid on account of the steep slopes. If a squatter's tank had a slope of 1 in 3 or 1 in 4 could it be done at 1s. per cubic yard, or would not the extra 3d. be fairly spent by lessening the evaporation which a steeper batter would effect? I think so. Threepence is 25 per cent. on 1s., and I suppose evaporation is in proportion to the surface exposed. That will, I think, be granted. Now the surface evaporation in a 3 to 1 tank—

3156. It would not be 3 to 1 all round? Well, then, we will go roughly to work and say a-half, as I have calculated here. Everything being the same with a 3 to 1 tank, the evaporative surface, and, of course, the evaporation, would be 44 per cent. more, the half of which would be 22 per cent. And, in addition, the mean depth of the tank would be 3 feet 9 inches less, or 21½ per cent., adding to the evaporation and decreasing the duration of the tank.

3157. The question is whether a tank of such a character would withstand lengthened drought such as we know has occurred in this country? Yes.

3158. We have had droughts for say three years, during which very little rain has fallen? Yes; but I think that the tanks as they are constructed, with careful administration of the water by pumping it into troughs, would enable the water to last over a three years' drought; but if, as suggested, they would not do so, then if 3 feet 9 inches were taken off the depth (together with the greater amount of exposure) the tank would not last three years.

3159. *Major Penrose.*] Then you do not consider that in certain districts, where the catchment is very quick, the size of the tanks might be reduced? Well, if there was an elaborate engineering survey made all over the catchment, and the whole thing gone into as thoroughly as it is possible with a full knowledge of the rainfall, it is possible that a smaller-sized tank might be found advantageous. But we had no opportunity of doing all these things. The whole thing was a rough-and-ready arrangement. We had to do the work first, and what I told the officers was that they were to get the water first and we would defend the matter afterwards. My instructions were, first get the water and I will fight it out afterwards. If we had time to obtain reports and surveys of each catchment, there is no doubt that a variation of the size of the tank might be made.

3160. We have had it in evidence here that in the Cobar district the size of the tanks might have been reduced to 10,000 yards, as the catchment in that locality is very hard and quick? I do not think so. As an instance of this, I may state that there was great suffering in Cobar because the tank there very nearly gave out. I will grant that what is said was true, if we had had time to examine the catchment in each case. But I would point out that this assertion neutralizes the statement that the sites of the tanks have been badly selected. At the initiation of these works, we had had no experience of what the rainfall was in these localities, and even now it is a very capricious element. You may have a thunderstorm in one place and for years you will have no rain in the same locality, while the rainfall may extend over ten months or ten hours.

[The Commission adjourned until the afternoon, when the sitting was resumed.]

The witness handed in, and read the following documents:—

DEPARTMENT OF ROADS AND BRIDGES, NEW SOUTH WALES,
Supplementary General Instructions—Wells and Tanks.

THE works that have up to the present time been carried out by this Department, in providing for water supply on the different stock routes, have necessarily been of a desultory and intermittent character, on account of the smallness and irregularity of the votes granted for such works; but the large expenditure now proposed, together with the rapidly increasing importance of this question, necessitate a more uniform system and course of action on the part of those officers who will be charged with the construction of tanks and wells.

In dealing with these works they will in future be guided in their *general* action by the following instructions:—

1. The sites for proposed works, and the nature of the work to be carried out—whether tank or well—is to be decided by the officers of the Mining Department; but, should it be considered that a more advantageous site than that chosen can be obtained in the same locality, or that a well would be preferable to a tank, or the contrary, the facts of the case must be at once reported to this office with sufficient data to enable a definite conclusion to be arrived at, and if necessary, a recommendation made to have the nature of the work altered.

2. In forming an opinion as to the sites suitable for tanks, great attention must be paid to the following leading points:—

1. Area of watershed.
2. Nature of surface, whether porous and absorbent, or the reverse.
3. Fall of ground, which if considerable, will to a great extent counteract its absorbent nature, and *vice versa*.
4. Nature of ground in which excavation is to be carried out. On this point great judgment must be exercised, as many strata which, when first opened, appear too porous puddle themselves under the action of the water. Originally porous ground is often made perfectly water-tight by the deposit of silt from the waters collected off the shed, and the nature of the throwing surface must, therefore, be considered. Strict scrutiny will be necessary to detect the existence of drift veins should any be cut in the course of excavation, and great care taken to puddle the exposed faces of such veins, as an otherwise water-tight tank might be rendered valueless by neglect of this precaution.
3. In forming an opinion as to the sites for wells, the only safe guide is positive information. Any opinion likely to be formed from the geological features of the locality, is at the present time not to be relied on. Actual test of the underlying strata, or careful comparisons of the results attained by the Crown lessees in any wells sunk under similar conditions in the locality, offer the best guides. Of these two courses, the former is decidedly preferable as giving an absolute knowledge of the depth and nature of the supply. The latter course is not always to be relied on with the imperfect data obtainable.

4. In practically testing any locality for underground water it will be found that sinking trial-shafts is preferable to boring at any depth from which water can be economically raised. In such shallow, or comparatively shallow works, the cost of transporting boring plant, and the cost of the preliminary arrangements on the site, are so great that sinking proves more economical than boring. In addition to this, a trial-shaft has the further great advantage of enabling a reliable opinion to be formed as to the quantity and quality of the supply. W.C. Bennett.
15 Mar., 1888.

5. Type drawings and specifications, for two classes of tanks, and for top-works for wells, have been prepared; but it must be noted that in selecting the character of the works to be constructed for conserving surface water, it is not intended to insist on a slavish adherence to the standard plans. Cases will arise where, both from a constructive and economical point of view, a departure from the type will be advisable.

When such a course appears to be necessary, plans and sections of the site should be forwarded to this office with the necessary data and suggestions to enable a definite opinion to be arrived at. It must, however, be borne in mind that, as far as is practically possible, under such altered conditions, the general principles shown in the type drawings must be adhered to.

The conserving tank, as shown in drawings, is suitable for sites where there is an open shed, and where the water will have to be drawn to the tank by feed drains; but where the rainfall is concentrated in a well-defined channel it will probably be better to widen and deepen the bed, and construct an embankment at one or both ends according to circumstances.

In cases where there is a considerable fall, it might be found advisable to carry the dam some feet above the level of the banks of the creek, and extend the embankment on each side of the channel until, carried on a level, it cuts the natural surface.

In all cases where creek works are carried out great care must be taken to provide a sufficient by-wash to carry off all surplus or flood waters.

Whenever embankments are necessary, the greatest attention must be paid to the proper grafting of the new material with the old surface of the ground, and if necessary, on account of the too porous character of the surface soil, to the construction of an efficient puddle wall.

In situations where a rising bank offers the necessary conditions as to level and drainage, attention should be given to the advisability of feeding the tank from two levels—from the natural surface through the inlet pipe, and over the top of the embankment by fluming brought from the rising ground so as to utilize the area contained within the embankments for the storage of water.

When underground water of good quality is obtainable at a depth of 18 feet, or less, the type of tank shown in "A" drawing should be adopted.

It is, however, impossible to lay down instructions to suit every case, and the officer in charge of the works must use his own judgment, and when he thinks alterations advisable, forward a full report accompanied with plans and sections.

6. As soon as sites have been finally determined for either tanks or wells, the local officer will furnish a tracing showing the positions of same, so that they may be charted on the maps in this office, and steps taken to ascertain if the necessary reserves have been proclaimed.

7. From time to time, as other duties permit, information on the following points should be collected and forwarded to this office:—

1. Approximate positions of wells sunk by the Crown lessees, giving level of surface, depth of shaft, and the rise, quality, and the probable quantity of water.
2. Information as to any change that may have taken place in the quantity or quality of water since well was first sunk.
3. Information as to any change that has taken, or may take place, in the level of water in wells during long-continued periods of wet or dry weather.
4. Evaporation of water in tanks, noting depth of water, general shape of tank, conditions as to exposure to prevailing winds, and the general character of the surrounding features.
5. Approximate flood contour lines of rivers, and of waters spreading from outflows of rivers, such as the Willandra, &c.

Roads Department, Sydney, 19 June, 1882.

3161. *Chairman.*] Now this is something so utterly opposed to the evidence which we have had here that it is desirable we should have a little more information on the subject? Well, our first essay in this matter was to send Mr. Wood down to bore between the Lachlan and the Darling. He had a full equipment, and after putting down a great many holes he found that between smith's work and also the delays which occurred, that prospecting shafts were infinitely better for the depths that we had to deal with than boring.

3162. What were these depths? Up to 200 feet.

3163. *Mr. Woore.*] What drill did you use? The ordinary instrument used by boring parties—this is before the Wright and Edwards' borer came into use. It was the ordinary boring apparatus in use in engineering works, but there was no particular name for it.

3164. Would the experience obtained by Mr. Wood apply if more modern instruments were used? Not if you went systematically to work to do a great many bores in the same locality. But in these days transport was very expensive, and one of the chief difficulties a party would have to contend with was the transport of the water.

3165. Could not these augers be used without water? No; water was required for the men and the cattle. I would not hold this objection as applying in the case of the Pennsylvania boring apparatus, but it applied then, and that was our experience. We gave the matter a very good trial and this was the result.

3166. You are not sure that that objection would apply now? I am not certain that it would apply at the present time.

3167. Because that quite upsets my notion? The country is now opened up and there are facilities for transport which did not exist then.

3168. We would like to obtain the figures as to what the work cost? Mr. Wood will supply the figures. I have not the slightest idea of them, because it is fifteen or sixteen or more years ago, and one cannot recollect figures. I can have the figures supplied as an addendum to the evidence. Mr. Wood will give you full particulars of them. Sometimes deception is practised, and in one instance I know of, there was a bottle of water produced as from a certain shaft to deceive the officer. This occurred in the case of a man named Gordon, who was for a short time in the service at Hay.

3169. *Major Penrose.*] Do you know what well that was? Gunbar was one, but I do not remember the other case.

3170. *Chairman.*] Well, on that subject we might inquire further. We have been told here by one witness that the Government are always liable to be swindled. For instance, a road surveyor goes to measure a tank. He has no help, and must get one of the tank-sinker's men to assist him in measuring, and whether the officer is at the top or the bottom of the tank he is liable to be swindled and deceived? If the officer is worth anything he can prevent that. That is a worn-out trick of the contractors, and an officer with the slightest sharpness will prevent its being carried out. It is an old story, but as you

are

W.C. Bennett. are on that particular point I may mention it is stated that they sometimes bank up 2 or 3 feet of earth from the point where the 18 feet is measured. Here is a circular which I sent out to the surveyors, to enable them to detect that:—

Circular, copied from Tanks and Wells Letter Book, page 172, book from June, 1882, to June, 1883.

MEMO.

Roads Office, Sydney, 19 April, 1883.

When laying out tank works you must in all cases fix the levels of the four corner pegs of the excavation in reference to a BM situated near the site; and the levels of the corners must be checked when the final measurement is made.

In the case of works now in hand you must, when making the final measurement, carefully examine the cess between the excavation and the embankment, and satisfy yourself that the then level is that of the original surface of the ground.

ARTHUR P. WOOD,

(For Commissioner).

3171. You see how an inexperienced man could be taken in. When a tank is sunk with bullocks the original surface of the ground is worn away, and we have been given to understand that some of the more clever hands among the contractors would take care to throw on the top soil in the immediate vicinity new soil, which would give the appearance desired, and so bring up the levels? If the instructions given in my circular are adhered to that cannot be done.

3172. Can they not remove the bench marks? A man will have a separate mark outside the nearest fence, or on a stump or something else, and these four things would show the original level, so that the contractor would be "bowled out". Supposing that there was a bench mark it is impossible that a rude navy could put the pegs down to the exact level of the tank. I do not mean to say that such a thing has not been done, but it has not been done since this circular was issued in 1883.

3173. Now here is a curious thing told us of one of your officers who had been sent up to measure the tank:—We have been told that he asked, "Where is this 20,000-gallon tank," when, as a matter of fact, the tank was a 20,000-yard tank. Apparently he was not aware of the difference. Now this is what was told us as a fact of a young fellow who was sent up to measure the tank? I do not think that any officer of mine ever could have done that.

3174. Do you nominate all your own officers? No, but I would nominate any man who was sent out there to measure tanks. If such a thing occurred at all the man must have been very inexperienced; and you will see all the officers here.

3175. Another matter which we heard was this:—A contractor had sunk four trial-shafts in four corners, with a view of putting down a tank, but in getting into the centre he came upon cement; you know what cement is? Yes.

3176. Then this contractor says, that having sunk the four trial-shafts he had given himself no protection in the event of his coming on cement. He said he should lose money if he went on with his work; but luckily for him, the road superintendent came up to the camp. The contractor told the road superintendent that he had come to sandy bottom,—to drift, that would not hold water. He said that he had gone down about another foot and got into a seam of drift, but instead of that it was this exceedingly hard soil. The road superintendent said it was a very bad case, and allowed the contractor to desist. They covered the bottom all over with clay, and thus the contractor was saved the heavy loss of sinking in hard ground;—now will you tell us is this a fact? Well, if this place were named I could have the matter investigated. I can very easily see if any of the tanks constructed were stopped after sinking the trial-shaft.

3177. Now, with regard to the expensive forms of machinery for lifting water, we have had a great deal of evidence, and we would now wish to obtain your reasons for adopting this expensive form of machinery? Well, the two forms of machinery that have been used are pumps. One is a horse-pump and the other a steam-pump. Originally we had the M'Comas lift, and the Mines Department proposed what was called a double whip. At first, from the description, I gave approval to this double whip, but I said I would not give a final decision until we had the drawing (which I now produce). In the M'Comas lift we had something similar to this, and it was continually getting out of order. The worst of this was that, when the thing was most required, and when there was plenty of water in the tank, we could not get it, and there was no end of trouble and expense. The whole thing was silted up, so I determined that our tanks should be perfectly square without any projections or hollows on the sides. This enables us to make repairs at any time, but under other circumstances we could not make repairs without emptying the tank or making a coffer dam. There is nothing now in the tanks that cannot be removed when required. That is my great objection to this machinery. There was a tunnel in the tank, and the sides were fixed up with slabs. Our experience was that, just at the very time the water was most required and there was plenty of it in the tank, the whole thing might be upset by something going wrong. Then I found it was most desirable to avoid anything in the shape of corners in the tank, because a great amount of silt always collect round them. Besides that we wished to keep our tanks in such a way that there would be no impediment to the working of the scraper or scoop to clear the silt out at any future time.

3178. Have you found out the extent of this deposit that remains floating in the water—the water you know retains a large amount of clay? No; I do not know the amount of clay which the water holds in suspension, but I know it is very large.

3179. Do you think that the steam pump and the horse-whim are necessary in a very large number of instances;—would not the M'Comas lift answer all purposes at very much less expense to the country? I think that the steam or horse-pump is necessary in most cases. The Department has tried the M'Comas lift, and it was condemned. It got out of order, and was neglected in several cases where it was tried—on the Hay to Wilcannia road. But the most objectionable part of the M'Comas lift is the position in which you have to put it, and the leads necessary to bring the water to it. You have to make an excavation in the side of the tank and line it with slabs and piles, so that the thing is continually getting out of order.

3180. *Major Penrose.*] Could you not pump the water from the top? We have never tried; we consider the other much simpler. I do not think you could do this advantageously; you would want a lead for the main pipes, which would come as expensive as the steam-pump or the horse-pump. The M'Comas pump was tried, found wanting, and condemned. I pointed out that the most objectionable feature was the amount of woodwork necessary to make the lead to the water below.

3181. *Chairman.*] What is the expense of the Tangye pumps? The following gives the information required:—

Memoranda—Cost of pumps, &c.

| | |
|--|-------------|
| Tangye "Special," 4 in. x 3 in. complete in Sydney, capacity about 2,500 gallons an hour | ...£87 10s. |
| "Holman," 4 in., with horse-gear complete, capacity about 2,500 gallons an hour | ...£49 0s. |
| "Amos," steam complete in Sydney, capacity about 2,500 gallons an hour | ...£124 0s. |
| "Amos," horse-gear complete in Sydney, capacity about 2,500 gallons an hour | ...£54 0s. |
| "Appleby," steam complete in Sydney, capacity about 4,000 gallons an hour... | ...£128 0s. |
| "Hot air" engine, complete in Sydney, capacity about 1,200 gallons an hour... | ...£75 0s. |

3182.

3182. Now, you mentioned that in dry seasons it is difficult to get horse-power to do the necessary work; W.C. Bennett. would not the same thing apply to firewood for the steam-engine? The caretakers ought to have a stock of firewood on hand to anticipate any such thing. 15 Mar., 1888.

3183. Then the cost of this blocking and so forth for the M'Comas lift was really something enormous;— why should it be so expensive? Because a great amount of timber is required below the water, and you have a long distance to bring the timber.

3184. Could not iron be substituted, and the expense in that way very materially reduced? Iron would be still more expensive than timber, and be quite as perishable below water. If you had iron piles to support the staging it would be very expensive.

3185. I should imagine that something in the nature of telegraph posts would be quite sufficient? Quite so; but four telegraph posts would be rather expensive. I think that four telegraph posts, delivered up at one of these distant places, would cost a considerable sum of money.

3186. We have had a number of witnesses who say that these steam pumps are needless, except where there is a large amount of traffic, or in the event of their being situated near some inland town? To show that we have been anxious to economise I may mention this: On some of these roads—for instance the road from Cobar to Bourke—we objected to put any appliances up, but to allow the stock to water at the double tanks that were there. The Mines Department insisted on our putting water appliances up, and they are put up now. We then provided, as in all other cases, these steam pumps; because we considered that it was impossible to predict in this country when a road may or may not be extensively used, and we felt ourselves obliged to provide for the maximum wants of the future traffic.

3187. But when the seasons become so very bad that stock cannot travel, owing to the absence of grass, this traffic ceases? Well, we were told to provide for any possible drought. This is what we were instructed to do. We were not told that at any time traffic was to cease; and even in the case of the Mount Browne gold-field that would not apply. We had to provide for the maximum traffic.

3188. *Major Penrose.*] You also had to provide for human beings in all weathers? Yes.

3189. *Chairman.*] Are you aware that since the opening of the railway there is not the same demand for water on certain stock routes as was originally the case? I think—and I have found it to be true in similar cases—that the railway necessitates greater accommodation being provided, except on lines parallel to the railway itself. But, on lines running at right angles to the railway, water is still as necessary as ever. For instance, if a man beyond Cobar wanted to truck his cattle, and there was no water between Cobar and Nyngan, he would not be able to get his stock through to the railway. What I have said applies to this road, because we have had a great cry out for watering places on routes running at right angles to the railway.

3190. But is not the road between Cobar and Bourke nearly parallel to the railway? Yes.

3191. And are you not aware that since the railway has been opened, traffic has to a certain extent ceased on certain stock routes? That shows that our proposal to economise in the matter of pumping appliances on the Cobar to Bourke road was correct, but it was overruled by the Mines Department, and we were peremptorily ordered to put down the tank appliances and pumps.

3192. Now another question with regard to the machinery, which is the most vexed question we have had to inquire into. Has your attention been drawn to the necessity in some cases of allowing stock to water at tanks rather than compelling them to go to the troughs, at which some of them have not been accustomed to water? If you want tanks to withstand the extreme droughts to which this country is subjected they must be fenced in, and I have already given the reasons for the steep slopes, which are incompatible with the stock being allowed to go down into the tanks. But I will meet the case of the "weaners" that you put, and which was never put before. It is possible that a silt-tank or some similar tank might be utilized, having been filled with water by the pump, and "weaners" might drink in this way. The number of "weaners" travelling cannot be very large. In any case they could be divided into small flocks and taken a few at a time. But there is plenty of evidence that allowing them to go into the tanks pollutes the water and renders it unfit for any purpose. Not only do they waste and take away a great deal of water, but they pollute that which remains.

3193. Do you think it would be advisable to give discretionary power to these caretakers to afford in certain cases to stock perishing from thirst access to the tanks. It is giving as you know very great powers to the caretakers? I fear that this privilege would be very much abused.

3194. Then we have had some gentlemen here who assert that the whole system of caretakers is a complete mistake. They think that the care necessary for the due attention to these works might be given by travelling superintendents who would be continually going backwards and forwards along these routes. Such a superintendent would know when certain stock were passing, and would see that they passed without undue delay. This would not necessitate the employment of caretakers, and would save a large amount of money? That opens up a very large subject. The first subject it opens up is the propriety of charging for water at tanks at all, or whether it would not be advisable to adopt a mode of collection which was suggested years ago by our Department, and by one or two witnesses in this case. That question is whether it would not be better to make the travelling stock, when they got their permit or register to travel, pay for the water whether they used it or not. The reason that these works were constructed is that there should be water for the stock in dry times. But so long as the present traffic arrangements are in existence you probably will require caretakers. The question is whether the office of caretaker might not be amalgamated with some other office. I know it was a very objectionable thing, and Mr. Fosbery, the Inspector of Police, objected to it very much; but it was once proposed to have the maintenance men along the roads amalgamated with the police force, as is done in Prussia. It might be possible to concentrate the duties of a stock inspector and a policeman, and a number of offices of that sort, and those of a caretaker might be added to it. He would know when large flocks of sheep were coming to his tank, and he could be there to give them water. There is no doubt about it, it is a very great expense to the country to keep these men, and this expense ought to be reduced as much as possible.

3195. *Mr. Woore.*] How could a man attend to his police duties and attend to his tank at the same time, supposing he had a warrant to execute 20 miles away? An officer in my Department discussed this question eight or nine years ago and foresaw more clearly than I did the possible extent of this watering of stock in the interior. The name of that officer was Higman, and he suggested that the drovers should be made to pay for the water whether the stock used it or not.

[The Commission adjourned.]

FRIDAY,

FRIDAY, 16 MARCH, 1888.

The Commission met at 10 a.m.

Present:—

HON. G. H. COX, M.L.C., CHAIRMAN.

J. C. WOORE, Esq.

William Christopher Bennett called in and further examined:—

W. C. Bennett 3196. *Chairman.*] Have you anything further to say with regard to the expensive forms of machinery?
 16 Mar., 1888. No; except what I intend to say in remarks on the evidence and the general question, which I intend to put before the Commission. I wish to add that these horse and steam pumps, if not required at the place where they are originally put up, can be removed to another place. No such thing as that can be done in the case of the appurtenances of the M'Comas lift.

3197. Consequently on routes that have now been somewhat interfered with by the railway, these pumps can be removed from these localities and taken to others where there are more stock passing? Precisely. All the appliances of the M'Comas pump—the leads, and so forth, except the iron staging—would be irremovable and would add to the loss if they were required elsewhere.

3198. To carry on that matter further, will you say that the M'Comas pump, although costing originally a very small sum, becomes rather expensive on account of the fittings and appliances, and so forth? Yes; a large amount of money is sunk in a particular place. A great part of this staging is below the water and is impossible of access when the tank is full, so that when anything gets out of order the repairs are very expensive. Our experience of that was (particularly after the Mines came to manage the works) what I have stated, and we determined to have something that was impregnable. We determined to have tanks in which the silt could not accumulate, and which could be cleaned out with the scoop. With water in the tanks and the steam pumps on the surface they would be accessible at any time, and would be easily removed in case of being more required elsewhere.

3199. How much do these M'Comas pumps cost? About £15 or £16.

3200. And all the appliances to put them in position—the staging and retaining walls—would need about how much? Mr. Wood's paper gave the cost at from £150 to £300.

3201. Consequently, although the M'Comas pump costs comparatively little at first, by the time it is up it will cost more than a steam pump? Yes, and be less effective and more liable to get out of order.

3202. You have seen all the papers which have been printed and presented to Parliament by the Mines Department? Yes.

3203. Do they contain all the evidence and correspondence in connection with the two Departments? No.

3204. What letters are chiefly left out of the printed reports? Papers recorded in the Roads Department, which consist to a great extent of reports of our officers bearing out the views of the Roads Department.

3205. And to a large extent these would rebut many of the allegations contained in the published papers? Yes.

3206. *Mr. Woore.*] Do I understand you to mean that those papers, which have been printed by the Mines Department, are papers which have been drafted out by them, presenting their own view of the question? I would not say that, but the papers in the Mines Department and issued by them contain a large number of papers conveying their own views.

3207. These papers according to your account present in fact only one view of the question? Yes, one view.

3208. *Chairman.*] Then hearing from you that a large amount of correspondence that has not been made public is contained in your Department, I will request you to produce it and such portions of it as you may think relevant to be placed in the appendix to the report of the Commission? Very well. I have the papers all here, but it might be injudicious of me to make a hurried selection. Now I have a report here on this subject of machinery for tanks and wells which I would like to put in evidence. It is as follows:—

M'Comas and Flood Lifts and Douglas Pumps.

Department of Public Works, Sydney, 2 December, 1884.

I most willingly comply with the request of the Hon. Secretary for Mines.

The M'Comas lift referred to herein and stated to be nearly identical with the Flood lift, also referred to, is the appliance which was supplied in the first instance with several of the tanks constructed by this Department before the Mines had anything to say to them.

It was in common with most other of the arrangements of this Department then in existence condemned—as it was called in the printed reports—and disused. It is satisfactory to note that the officers of the Mines Department now see they were wrong in such condemnation, and I hope that after a little more experience they will find that the horse and steam pumps supplied to the works—now being handed over and being supplied to the others as rapidly as time will admit—will not with proper care break down so often as they anticipate; and that it will be unnecessary to revert to the simple and primitive appliances supplied in the first instance by this Department with a view to economy, and then condemned by the Mines officers in favour of the double whip, which was not adopted as involving, according to the plan supplied, complex and perishable timber work.

The Douglas-pump is the ordinary hand-pump in use in every house; the steam and horse-pumps supplied are equally simple and as little liable to get out of order if properly taken care of.

Under Secretary, Mines.

W.C.B.

3209. Is it a fact that the Mines Department have at any time given approval to the new form of machinery for lifting water rather than the old and now disused forms? Yes; Mr. Gilliat in a letter on page 174 of the printed papers (the Mines Blue-book) has done so. This is the paragraph:—

BUT as I have stated in my minute to Mr. Overseer Jones' report, *re* fencing (minute and sketch herewith), I consider the present fencing a very good one, if proper attention is paid to the height of the rails in proportion to the position of the troughing upon the ground; and I think a little energy, combined with a desire to make the best of what I think are substantially good, although not perhaps perfect improvements, yet certainly far in advance of anything done for the convenience and comfort of travelling stock, as far as my experience goes, in any part of the world I have visited, would enable the overseer, with the labour of the caretaker, to remedy the defects that exist in the height of the rail. This depends to a great extent upon the formation of the ground, and may not be the same along the length of the troughing. The sketch submitted will show the plan I think may preferably be adopted.

There

There is another opinion of Mr. Gilliat's given before the Water Conservation Commission, in which he expresses unqualified approval of the tanks and everything else. He says at page 137 and 139 of the first report of the Commission referred to:—

W.C. Bennett.
16 Mar., 1883.

Chairman.] The other form of batter could be given by the steam appliances in use? There I agree with Mr. Bennett, so far as steam-power has yet been used. We got very low slopes, and there is consequently an increased tendency for the water to splash up round the edges of the bank, and this especially in hot and windy weather.

Is that pump (the Tangye pump) effective? Yes; it is an excellent pump. With occasional repacking it will stand very well, and is sufficiently strong to bear the rough treatment of the men we employ.

Here are the papers going back to 1875, in which Mr. Bruce advocates the same thing that is advocated now—that a man could work these pumps, which we have disproved by experience.

3210. A considerable amount of correspondence appears to have taken place between Mr. Gilliat and your Department with reference to the double whips? Yes.

3211. The double whip was very strongly advocated by Mr. Gilliat? Yes; very strongly advocated.

3212. Did he give you the cost; because I do not see it in this paper? He may have done so, but from the drawing the cost would have been more than the M'Comas pump, it necessitated such a large amount of wood work.

3213. And is more liable to get out of order? Yes; more liable to get out of order than any contrivance I have ever seen.

3214. And was condemned wholly by your Department? Yes.

3215. Have any such whips been erected? Not by our Department.

3216. Are you aware that any have been erected by the Mines Department? Not to my knowledge. It is simply an application of the ordinary gold-fields whip.

3217. And for drawing water up out of a well is a good idea? Yes; a shallow well. I would now like to hand in the opinion of Mr. Hanna, in reference to the M'Comas pump.

Sir,

Having when in Sydney recommended M'Comas lifts (hand power) for some of the tanks in this district, I took an opportunity recently to inspect one, and am satisfied from what I have seen that they would not be suitable for supplying the service tanks from main reservoirs.

Tallywalka, 10 September, 1885.

The one referred to was lifting the water about 15 feet, and the work at this height was quite enough for one man.

It might be necessary at times to raise the water almost from bottom of tank to at least 6 feet above the surface, in which case I do not think two men would be equal to the task.

I have not before had any practical experience in the working of these water-lifts, and was led to believe from reports, &c., that they were much more easily worked.

I would therefore recommend that horse-gear pumps of the design, now being used, be ordered for the following tanks:—Tarella, Maxwell's, The Peak, Waratta, and Coalley Dam.

Maxwell's and Tarella are good positions for wind mills if considered reliable.

Shall advise as to transit after making inquiry. Have heard there is a light draught steamer at Bourke waiting for rise; if so, and not fully loaded, that will be the quickest and best route.

I have, &c.

Engineer-in-Chief for Roads, Sydney.

W. J. HANNA.

3218. Have you ever had any conversation with Mr. Hanna as to the relative merits of horse gear and steam-pumps? Yes; I think I have had some conversation with Mr. Hanna on the subject; but he will be here himself.

3219. I was going to ask whether he had not changed his mind in reference to the horse gear? Yes; even where there is timber to be had, my experience of the pump was sufficient to condemn it—not the lift *per se*, but rather the mode of appliances attached to it. The Tangye steam-pump cost only £87 in Sydney.

3220. But would not the weathershed and the cost of transmission and erection so raise the price as to make the cost greater than the cost of the M'Comas pump in the first instance? Yes; it would, very nearly so. I would be very glad to show you the Tangye pump, which is at work at the Centennial Park. I wish also to state that all the appliances of the Tangye pump—piping, connections, &c.—are all made of iron, and are far less perishable than the wooden appliances of the M'Comas.

3221. *Mr. Woore.*] A great portion of the woodwork of the M'Comas pump would be continually under water? Yes; except when the tank was dry.

3222. But we have been assuming that the tanks are never dry? Sometimes they would be nearly dry; but then the woodwork is exposed to the sun, and it is in the worst possible position for the duration of the appliances.

3223. Would you recommend an expensive Tangye steam-pump at all tanks, or that some simple form of hand pump should be substituted on stock routes which are not very much frequented? Well, where the importance of a stock route justifies so large an expenditure as is necessary on the normal style of tank, I think the difference in cost between the pumps and working them is inconsiderable—not worthy of consideration—having regard to the large outlay on the tank. If certain stock routes were selected, and we were told that they were only of second-rate importance, then we might have second-rate tanks and second-rate appliances; but our orders from the Mines Department were always of a most peremptory character, and whenever we suggested that there might be a saving, as in the case of Cobar to Bourke road, we were overruled.

3224. *Chairman.*] In some localities where tanks are required to be only very small, would not a simpler form of machinery—like the Californian pump—be suitable? It possibly might meet the requirements of the public, but it would be incompatible with a large expenditure on the tank. If there were any small or less used stock routes that it is necessary to supply with water, as I have said, second-rate accommodation ought to be provided for them.

3225. And in this case very inexpensive pumps might be used? Yes.

3226. *Mr. Woore.*] Are not these Californian pumps very apt to get out of order? These forms that have been suggested would scarcely be effective if the water in the tanks was very low. The most important thing is that they should be able to raise water when the tanks were low, and the country dry.

3227. Have you seen any simpler appliances for raising the water where the water has not to be raised to any great height? Yes; there is a number of simple appliances for raising water used in India and in Egypt.

3228. *Chairman.*] The next matter is the excessive cost of fencing. We have been given to understand that

W.C. Bennett. that the fences round the caretakers' paddocks are altogether too expensive; that very much heavier timber than is necessary was used, and also a much stronger gauge of wire? Well, in the one case brought against us—Bevan's case—we called for tenders three times over.

16 Mar., 1888.

3229. I am speaking now as to the specifications generally? Of course fencing is not a matter with which I am intimately acquainted, but it appears to me that the general fault-finding with the heaviness of our fences is caused by contrasting them with the fencing on sheep runs which are only intended to keep sheep apart, while our fences are intended to resist wild cattle. And we have amongst our papers the approval of Mr. Bruce as to the character of the fencing generally, and insisting on the use of a top rail, which we have omitted in some cases.

3230. Upon whom do you rely to give you information about the fencing? Mr. Wood and the local officers, who necessarily must have acquired considerable local knowledge. Mr. Wood has had 28 years' experience out of doors in the Department, and must have acquired a good knowledge of pastoral appliances; and then we have had Mr. Bruce's general approval to this style of fencing.

3231. Are you aware of the cost of some of this fencing per mile? Yes; but I think the most expensive fence was that of Bevan's, which cost £112 per mile.

3232. A fence of a similar kind put up by a squatter would, you think, cost as much? I am not aware what the cost of fencing such as ours would be, but I know that the squatters' fences cost from £30 to £60 and £70 per mile.

3233. Then, admitting that it was very desirable to put up a strong fence to protect the tanks from the inroads of wild cattle, was it necessary to put up the same expensive kind of fencing round the caretaker's paddocks—these paddocks which were a mile square and which necessitated 4 miles of fencing? Well, I am not prepared to answer that.

3234. Taking it for granted that it requires very strong and expensive fencing to protect the tank, is it necessary to put up the same expensive fences round the caretaker's paddocks, involving some 4 miles of fencing? I should say that the usual style of fences for roadways only would be necessary.

3235. Has your attention been drawn to the fact that these useless expenses have not been incurred by squatters and others who hold country in the vicinity of these tanks? I do not think so.

3236. Your attention has never been directed to the unnecessary cost of this fencing? Not directed to the difference between the two styles of fencing.

3237. I suppose you are aware that much has been made of these charges by the Mines Department? Yes. I would wish to say here that there is one gentleman to whom I am greatly indebted for all sorts of valuable information about the interior—that is Mr. Edward Quin, who always gave us sensible and practical information.

3238. We have also had complaints that the fencing is unnecessarily expensive because the posts are put into the ground much too deep for the ordinary wire fence? Well, that is a matter of detail that I can hardly speak of. It strikes me, though, that the posts of a road fence in that part of the country are not too deep at 2 feet 6 inches. However, that is a matter of practice.

3239. Now, as to the reported interference with the caretakers by the officers of your Department, what have you to say? Well, the chief man that has been complained of as interfering with the caretaker is Mr. Stilwell, and he will appear before the Commission himself. I wish to say that Mr. Stilwell is one of our best officers, and whatever he has done comes not from any defect, but may be attributed to his very great anxiety for the protection of the works.

3240. Are the road superintendents, who have had the construction of these works under their supervision, instructed to report to you if they see anything going wrong with the works after they have been handed over to the Mines Department? Yes; not only to report, but to remedy it at once. That has always been an understood thing.

3241. To whom are the officers to report? To me.

3242. They would not report to the Mines officer who had charge of the work? No; each officer reports to his own Department. It is utterly impossible to have officers, especially technical officers, reporting to any other Department than their own.

3243. This matter has evidently caused a great deal of friction, because it has been said that needless reports have been sent down to the head office in Sydney, when they might have been made to the overseers of watering places, who would have attended to them at once? That very action on the part of the Mines Department has formed a large source of complaint in the Works Department. It seems to me that needless and frivolous reports were sent in by the Mines officers with a view of disparaging the works and the officers of the Roads Department, and to create an impression that it was absolutely necessary to take the works out of our hands.

3244. We have been informed by a minute of the Minister that the officers of the Mines Department have a right to make any repairs in cases where these repairs will not cost more than £10? Yes.

3245. Have you been informed of that minute? Yes.

3246. But the limit of £10 might be a very arbitrary amount, and difficult to ascertain;—did it not cause a good deal of friction between the two Departments? It ought not. Friction has chiefly arisen concerning matters which could be attended to by the caretakers themselves without any expenditure whatever; so that the £10 limit could hardly be said to have operated in this matter.

3247. Of course, in respect to this friction you only know it from your own officers? Yes.

3248. It has been said that you are so anxious to uphold the action of your own officers that, in some instances, very unworthy men in your Department have abused the trust that you have reposed in them, and that you have not taken sufficient steps to secure the public interest? Only one case of this sort can be brought up. I am wrong; there is a second. But there is only one case of absolute robbery, and the man concerned in that was imprisoned for the offence. With regard to the second part of your question, as to his going about fixing sites, the chief ground for that assertion, or opinion, seems to be in the statement of Mr. Earngey, an officer of our Department, whose services were dispensed with, because he became so impracticable as really to be unfit to be trusted. My own opinion of him is stated in the papers, wherein I recommended his retirement on a pension. These papers, together with an absurd pamphlet, which proves the state of this man's mind, were I think forwarded to the Commission. As to the statement that Cambridge selected certain sites, I may state that the sites of the works referred to by Mr. Earngey were selected by Mr. Wood himself with Mr. Cambridge, and the surveyor of the district, who now lives at Tumul. They had two buggies and they drove round to select the sites of most of these works.

works. Mr. Wood will be in a position to give full particulars so far as Mr. Earngey's random statements have gone. With regard to another statement made by Earngey that Mr. Stevenson, the member for the Wollombi, had told him that I was very angry with him (Earngey) when he came back from that expedition because he had exposed Cambridge's improprieties, I have spoken to Mr. Stevenson on the matter. Mr. Stevenson said that not alone did he never make such a statement, but he proved that it was impossible, because I had not seen him for several years before, and not for three or four years after this time.

W.C. Bennett.
16 Mar., 1888.

3249. I do not think it is necessary for you to make any elaborate statement concerning Earngey's evidence, because he has been here? Mr. Higman, Cambridge's predecessor in the same district, was removed from the service for having dealings with Mr. Burton, a contractor. There was nothing to justify a prosecution; he was dismissed, and has since died. I think that Burton built him a house, or something of that sort.

3250. Referring to this same matter further, I may tell you that some curious instances have come before us in these papers. This is the case of proposed alteration, the cost of which would be exactly £3, but which through a system of red tape has cost nearly £50? That is an exaggeration. It assumes that the officers went for no other purpose but this, whereas they travelled not only to inspect this work, but for general purposes. This may have been the motive of going up, but they inspected generally both when going up and coming back; so that this is really one of those statements that contain a small grain of truth and a large amount of embellishment.

3251. Instead of your wishing to keep up this system of red tapeism, you have always been an advocate of local government? Yes, and I would have been very happy at any time to have handed these works over to the Mines Department. I got no fee or reward for my work in connection with them, but when the Mines Department took charge it evidently was with a fixed determination to get all these works out of my hands not merely because they wished to relieve me of the duty, but because they wished to make it appear that we were unequal to the proper carrying out of the works.

3252. It has been complained also that you have departed from the proper departmental rules not to write to the newspapers in justification of your conduct? Well, I have the approval not only of my own Minister—the Minister for Works—but of the Premier as well, to whom I showed the letter before it went into the paper. I think it is much less harm to write in a paper over one's own name than to attack people in paragraphs which are evidently inspired. I have always made it a rule of my life to be in a position to go into Court and swear that I never directly or indirectly was the cause of any paragraph appearing in the newspapers except I signed my own name to it; and I have done this on only two or three occasions.

3253. I would like to draw your attention to a statement made in the *précis* furnished to us. It is No. 4, and has reference to a document dealing with the dual control question, which document has since been lost. Can you give us any information about it? I have written a reply to that statement which was sent to the Minister and mislaid, but it was returned to me a few days since. I shall obtain it and forward it to the Commission.

3254. Complaint has been made also that you have used improper composition for the coating of supply tanks rendering the water undrinkable by stock? This composition was put on in three cases, in only one of which was any complaint made about it. The mixture is one not new to the Department; but it was suggested in a report by Mr. M'Kinney, Engineer to the Mines Department, as having been used with the greatest success in Victoria. This is what Mr. M'Kinney says at page 26 of the second report of the Water Conservation Commission:—

While the works are, as a rule, of well known types, the flume shown in the accompanying plan presents some unusual features. This work consists of a trapezoidal flume of sheet iron of No. 12 gauge, that is of the thickness of less than one-ninth of an inch, supported in a framework of timber. It has been seven years in use, and has given entire satisfaction. It is laid with a fall of 8 feet per mile, or 1 in 60; its length is 920 feet, and its total cost was £1,500. The ironwork is cleaned annually, and coated with a mixture, prepared in the proportion of 2 lb. of tallow and 2 lb. of resin to 1 gallon of tar. This is put on in hot weather, and at a time when the channel is not in use. It is found that the mixture applied assumes a glossy surface, and does not affect the taste of the water. The erection of this flume was simply and expeditiously done, by making it in sections above its bed, lowering the sections by screws, and rivetting them together in position. The Ballarat Water Commission owns 2,300 acres of land outside the limits of the catchment area of the present works.

3255. We understand that you relinquished the use of this composition when you found it was bad? No; we stopped using it because the Mines Department complained; but it has realized the end required, and it is now like a sort of varnish on the ironwork, just the same as it has become in Victoria.

3256. We were given to understand that you had abandoned this composition on discovering that it was improper stuff to use? We only gave it up because we desired to give the Mines Department as little reason for complaint as possible.

3257. Although it was recommended by their own officer? Yes. I do not say that it was used entirely on his recommendation, because the mixture was known to our Department long before.

3258. *Mr. Woore.*] Was the mixture removed from this tank when it was complained of? No; it is now on the tank and does not affect the water in any way. It affected the water a little at the first when it was put on, a slight scum having arisen.

3259. But it is now a success? Yes; and the man who used it will be here to give evidence before the Commission.

3260. *Chairman.*] I must ask you to look at the 15th charge in the *précis*, the clearing out of the silt tank at Merri Merriwa. The report says:—"This work is one of the Mines caretaker's duties. Papers show this had not been neglected; but at the time, owing to rain and water in silt-tank, caretaker could not perform the work. The Works Department officer conceives this to be a case of neglect by Mines caretaker, and lets a contract for this work; but the contractor also has to wait till silt tank dries before commencing work. A case of unnecessary expenditure. *Re* also paper *re* caretaker by Mr. Bennett." We do not want to go into the case of any particular well; but it was stated here generally that in the sinking of wells you have made contracts for the erection of head works, which the contractor, as a rule, has put up before sinking the well, helping him in the excavation, without knowing whether there was any water underneath or not, or whether the water will be fit for use if it is got? No contract for well sinking has ever been made without a prospecting shaft, where possible, having been put down, and, in some instances, boring. In two cases we had reason to doubt the genuineness of the samples of water produced; in all other cases fair stock water was obtained in the trial holes that we put down. The two cases where it was not possible

W.C. Bennett, possible to put down trial holes were the Normanstone and Baloola wells, which are in basalt. With respect to the lifting appliances, frequently the contractors have been allowed to put up the head gear; in fact, we were obliged to make them do so where the wells were beyond the ordinary depth.

16 Mar., 1888.

3261. Why go to the expense of putting this well in basalt without knowing what the result would be, whether good water could be had, or any water at all? Mr. Gilliat himself selected the site, and yet he now states that the wells are not on the sites he selected; but we have been assured by a gentleman who was with Mr. Gilliat at the time the sites were selected—Mr. Kelly, manager for Sir Patrick Jennings—that the wells are practically on the sites chosen by Mr. Gilliat.

3262. Why did you go to the enormous expense of sinking a well through basaltic rock merely on the *ipse dixit* of Mr. Gilliat, and against your own better judgment? The matter was not practically brought before me in detail. Perhaps, if I had been fully aware of it, I would not have allowed it to be done. It was one of those things that Mr. Wood was in charge of, and I think he did all the necessary work relating to it.

3263. Mr. Woore.] Was your Department aware when these wells were being sunk that they were going through basalt? I was not aware of it.

3264. There were two instances, you said, in which you doubted the genuineness of the samples of water. Can you give us any information in regard to them? The Old Gunbar was one; but I cannot tell you the name of the other just now.

3265. Is basaltic formation as promising for obtaining water as other formations? Yes; it is, if you can get through it.

3266. Chairman.] In what way were you doubtful about the water that came from the Old Gunbar well? We doubted whether the water came from the well at all or not, because the water produced was good, as reported by the superintendent, Mr. Gordon, a man who was only a short time there; but, since then, we have found that it is not so.

3267. The water in the Old Gunbar well was so salt as to be unfit for use? Yes.

3268. Although in the trial shaft you were under the impression that it was good? We were under the impression that it was good water; but then, I think, this was a false sample. The sample produced to me was good water; but I now believe that it could not have been genuine. This water came from the bore.

3269. We have also heard that there has been an enormous expenditure on these wells—over £10 per foot? I think that is an exaggeration. In many of these cases the cost includes the whole works, and embraces restoration and repairs.

3270. I would like you to turn to No. 17 of the *précis*—the case of the Holy Box well—concerning which it is stated:—“This well was sunk, and a small supply of fresh water tapped, followed by a great flow of salt water, which, when twice analysed, was declared unfit for use. Evidence as to the saltiness was submitted. Well was abandoned and tank commenced. Works officer stopped work at tank when about 3 feet deep, declaring well water good. Well again handed to Mines, and constant baling insisted upon to improve quality of water. This done without result. Cost of well and price referred to—94 feet deep—cost over £1,000. Mines has to bear cost of maintenance and employ caretaker to bail and protect headworks. There is no prospect of leasing salt wells. Caretaker has carried drinking water 17 miles. Whim, service tank, and troughs erected before quality of water decided suitable. Iron in troughs destroyed by action of salt. Well almost useless for stock, and quite unfit for travelling public.” Do you see that the sinking of 94 feet costs over £1,000? Yes, that is possible.

3271. Mr. Woore.] Does that include the cost of erecting headworks and troughings, &c.? Yes; it includes fencing and everything connected with the well. Besides, the well was sunk in dear times. It very likely includes also some additional repairs; but we can produce the original vouchers. I will reply to this in the evidence I am about to furnish.

3272. Chairman.] Now are not you aware that in most instances wells at this depth have turned out to be salty? The results of boring, exploring for water in these countries, particularly in the country between the Murrumbidgee and the Darling, are so very fluctuating that it is almost impossible to say where water was to be obtained; whether the water would be salty or fresh, or whether there would be any water at all. The difference in the cost between a well and a tank was so great that the inducement to sink a well was considerable. Of late years I think most of the well sites have been decided on by the Mines officers. This is my impression.

3273. With the appliances which we now have for sinking, and the knowledge that we can get artesian water, would you now sink wells? No; I wish to explain to the Commission that when this thing was first started there was but £1,000 put on the Estimates, at the instance of Mr. W. H. Suttor, for artesian water boring in the country. And I myself pointed out that it was a duty which the geological knowledge in the Mines Department best fitted that Department to undertake.

3274. And under that Department boring is now being carried on? Yes; artesian boring is being carried on entirely by them.

3275. In connection with this, of course all tanks may become dry during a long drought? Well, if there was a drought for a long period, I think that it is likely some of our tanks would become dry; but certainly they would not go dry during any drought known to the present inhabitants of this country.

3276. But to make proper provision for such a catastrophe it would be advisable to sink wells occasionally? Yes; artesian wells. Objection is now made to the large cost of these works, but I hardly think Government would be justified in adding this additional cost to meet contingencies which might not occur during the existence of a tank or a well either. Of the superiority of wells over tanks, if you can get good water, I am firmly convinced. The best proof of this is that the first steps taken by the Department to provide water for the country between the Murrumbidgee and the Darling were to send out a boring party in the year 1869, under Mr. Wood.

3277. Can you give us any information about this costly hutting for caretakers? We were told to provide huts for the caretakers, and I all along thought that the adjuncts to these works were too expensive. The first works were simply water-holes; then we were urged from one thing to another. A sum of money was put on the Estimates, at the instance of the Mines Department, for cottages for caretakers, Mr. Bruce's estimate being £100 for each. Mr. Gilliat's figures were the same. We made out a drawing and called for tenders.

3278. Will you state what the accommodation was? I have the specification here, which I will hand in. [See Appendix.] One room was to be 8 feet by 12 feet, and one 12 feet by 12 feet, and one

8 feet 6 inches by 8 feet, to be built of timber, with galvanized iron roof. Iron chimney and iron tank with pipes to provide for fresh water. We received tenders from £80 to £100. Our plans were suited to the amount which was voted by Parliament. Before we incurred such a large outlay I thought it was necessary to have the approval of the Mines Department before I accepted any tender. The papers were sent on to the Mines Office, and the reply we got was that they could get the work done very much cheaper.

W.C. Bennett.
16 Mar., 1888.

3279. *Mr. Woore.*] Was it the same class of hutting? They said they would supply the material and get the caretaker to work up the building himself—to make a number of piecemeal arrangements which we were not in a position to do, even if we considered it advantageous. So far as I can learn the houses built by them have not the accommodation which we proposed, and are not of equivalent stability or duration. I considered the difference between the two in quality is much more than equivalent to the difference in the price. Still, I am not fully informed of what the Mines Department have paid for the work.

3280. Then the Mines Department stated that they could get caretakers' huts put up for one-half of the price, without stating what the accommodation was? Yes; and I think that this was calculated to mislead both the Minister and the public.

3281. *Chairman.*] No doubt, a hut built altogether of iron would be very inexpensive? Very.

3282. But would it be at all suitable for people to live in? It would be uninhabitable.

3283. And it would be cruelty to the people to ask them to live in such a place? Yes; and no man in his senses would live in it. If I were asked I know that I should prefer to live outside. The tenders for these houses were forwarded to the Mines Department merely for the purpose of ascertaining whether they thought it desirable to go to such an expense, which, in the aggregate, would be very considerable. The policy of putting up these huts was not an engineering question at all, and before it was decided finally I wished to give them an opportunity of expressing an opinion on the subject, and that was why the tenders were forwarded to the Mines Department.

3284. What steps would you take to avoid this dual control in the future? Pending the establishment of Local Boards, I think the maintenance of public watering places should remain with the Works Department, and that the collection of rates, inspection, and so forth, should be with the stock inspectors. If the Mines Department were given clearly to understand that under no circumstances would they get the control or construction of these works, much of the friction would disappear. I have already stated what is equivalent to this in the report to the Minister for Works.

[The Commission adjourned until the afternoon, when the sitting was resumed.]

Arthur Pepys Wood called in and examined:—

3285. *Chairman.*] What is your position in the Public Service? Assistant Engineer in the Roads Department. A. P. Wood.

3286. You have had considerable experience in the construction of tanks and wells under this Department? Yes. 16 Mar., 1888.

3287. How many years have you been engaged in this particular work? It is about 20 years since I first started; but then there was an interregnum of about ten years.

3288. What was the cause of it? I was engaged on other work in the Department—not engaged on this work specially.

3289. *Mr. Woore.*] So that I suppose altogether you have had about ten years' experience of tanks and wells? Yes; about ten years' experience.

3290. *Chairman.*] A large portion of the duty of selecting sites for tanks and wells has fallen to your share? No; not entirely. I have selected the sites for a good many tanks on certain lines, but to a great extent the duty has been carried out by the local officers. My duty has been more particularly to inspect the various works during construction, and see that they are properly completed before being finally passed. I might perhaps be allowed to make a remark just here, as it is only due to those officers who have been acting under me. I see that Mr. Doudney, one of the witnesses who has given evidence, has stated that I have been handicapped by the inefficiency of the officers under me; and I wish to give a most decided and emphatic denial to that statement. I consider some of the officers under me to be the most efficient in the Department that I belong to.

3291. It has been said that some of your officers who were charged with the duty of selecting sites for tanks and wells have merely sat on the box of one of Cobb & Co.'s coaches, and selected the sites from that position, consulting no one but the driver and occasionally the publican at whose house they stopped, forming their conclusions from the very limited amount of knowledge gained in this way? The statement was made in regard to myself as well as in regard to others, and I now wish to give it my most emphatic denial.

3292. Has it been your object to obtain all the local information possible in order to guide you in the selection of sites for these works? Yes; it has been my object. I do not mean to say, however, that in obtaining this local information I consulted all the residents who were scattered sparsely over the different districts, but I examined each locality to get the best position within reasonable distance for a tank for the benefit of the travelling public.

3293. And you can answer for it, as far as you know, that your officers have been actuated by the same sense of public duty and have not been swayed by the opinions of other parties—I mean by the opinions of drivers and publicans? I am as certain of it—with one exception—as that I am answering your question. The officers have not been swayed by any person in the selection of sites. I admit that there is one unfortunate case that came within our knowledge; but there is no necessity to touch upon it.

3294. That officer has since been dismissed? Yes.

3295. We thought it advisable that you might give such rebutting evidence as in your opinion it was necessary to tender without going through the whole case, about which you may or may not know very much. You might give us whatever information you possess with regard to the allegations that have been made by the officers of the Mines Department. We shall be very glad to get such evidence from you, and your evidence can be taken down without the necessity of our putting questions. Perhaps it will be as well to take what may be regarded as one of the most material cases first, that of the Roto well, which

is

A. P. Wood is first on the list? It has been said of the Roto Well that "it is in close proximity to a water-hole in the Willandra Creek." In reference to that I may state that the site was selected by me when I made an inspection of the line. A report on the matter was submitted to the Commissioner, and by him forwarded to the Mines Department, and the sites mentioned by me in the report referred to were approved of by that Department, this site of Roto Well being one of them. It is now objected that this well has entailed a great waste of money, on account of its proximity to permanent water in the creek. In the statement made in this book (the *précis*) over Mr. Gilliat's signature—I do not remember the fact of having seen the statement anywhere in Mr. Gilliat's handwriting—

16 Mar., 1888.
