Traces of silver have been discovered at Mooney Mooney, but as yet nothing of a payable character has been discovered.

#### Junee.

The principal mines in this division are at Wantiool, Eurongilly, and Mitta Mitta, and for the most part are on private land or land that was private land, but now resumed for mining purposes. A fair amount of work has been done at Wantiool by the Prospecting Company on Crown lands, and by Fincher and Co. on land resumed by the Government for miners. At Eurongilly Lynch and party and Holland and party obtained 105 oz. of gold from 47 tons of stone, and the general prospects of the district are promising. At Mitta Mitta little or no work has been done, albeit the prospects of the place are of  
a most

a most encouraging character. The mines here are rich in gold, but the ore containing it is what is known as refractory. The ordinary mode of treating auriferous quartz will not answer for the stone in this neighbourhood. Expensive machinery is required for the special treatment of the stone. Here the Government has resumed a portion of land for mining purposes, and Messrs. Piercy and Dobbins have secured a large slice of the resumed land, but are unable to profitably work it in the absence of suitable machinery for treating the refractory ores, and as they have had this mine several years, first under permit to dig and search, and since under lease from the Crown for nearly two years, the ground is practically locked up from mining, nor do the prospects of it being unlocked look very promising; and to make matters worse Mr. Piercy has obtained permission to dig and search for gold in the adjoining portion, and having done so, worked about a week, then suspended work, and applied to have this portion resumed, on the plea that he has discovered payable ground. The payable ground—if it be so, and it is very probable—was discovered years before he touched it, and the week's work done by him on this portion, for all practical purposes, discovered nothing which was not known before; but having the permit, and having reported payable gold, &c., he claims that it should remain unworked until the land shall have been resumed. On the ground that expensive machinery is required to treat the refractory ores, which machinery it is not possible to get for want of capital until the land shall have been resumed, because until then he cannot get a safe title, this plea would be, perhaps, accepted, but for the fact that within a few hundred yards from where the discovery has been made in this portion he has, as before mentioned, a large area of land containing ores of a similar nature, and has had a good title for some two years, and yet has no machinery there. Besides, if he had machinery on portion 205 it would answer as well for the working of portion 207, the land he desires to get, as for that he already has. These lands, if properly worked, would, I think, profitably employ a large number of men—probably 100, and be a source of wealth to the district, but through what appears to me very like over speculative greed, these rich promising lands are lying idle and unproductive.

In writing thus plainly, and perhaps severely, I do not underrate the difficulty of those persons who, after years of hard, struggling work, have discovered payable country, and find themselves in difficulties to properly work it for want of the necessary capital. To a very large extent that has been the case with Messrs. Piercy and Dobbins. They have been very enterprising and energetic men, have expended large sums of money in putting up a crushing battery at Wantiool, and another at Mitta Mitta, and in other important mining works, without getting anything like payable results at present, and such men should have very liberal treatment, but it is not a wise policy, even for themselves, to grasp more land than they can profitably use; better let the land next them be open to others, so that a greater number may tackle the difficulties of the position, and by the force of numbers overcome them. I should, however, say that Mr. Dobbins has no interest in portion 207. I should also mention here that, acting upon a report furnished by me some time ago, Mr. Piercy and Mr. Hogan, both holders of permits to dig and search for gold (Hogan being the owner of the land), were called upon to show cause why their permits should not be cancelled, and probably by this time the necessary action will have been taken to free the land for whomsoever may desire to work it.

The output of gold for the whole of the Junee Division, as far as can be ascertained, was about 230 oz., or money value, say, £890. Of this gold, about 200 oz. was from quartz and 30 from alluvium.

I should say that a considerable amount of auriferous country in this division is in freehold land, and outside the gold-fields, and as a consequence is locked up from mining. This is an instance strongly showing the necessity, as I think, of proclaiming the whole Colony a gold-field—of course taking reasonable care to protect industries and interests other than mining. But this is one of the subjects I purpose reporting at length, and cannot now stay to do so in this report. I will, however, try to do so in time for my paper to be added as an appendix.

#### LACHLAN DISTRICT—BARMEDMAN DIVISION.

(*Thomas Love, Mining Registrar.*)

I HAVE the honor to forward herewith my annual report of the mining industry in the Barmedman Division of the Lachlan Mining District for the year ending 31st December, 1889.

The mining industry in this division has remained in a depressed state throughout the year owing to the inability of the miners to work the reefs below water-level for want of the necessary pumping machinery. This has caused a considerable falling off in the quantity of stone raised, the number of miners employed, and the amount of gold won, as compared with the previous years 1887 and 1888.

An effort is now being made to make arrangements with a Melbourne firm for the erection of a pumping plant on Gold Lease No. 37, adjoining the Fiery Cross Lease, from which a large amount of gold (about 5,000 oz.) has been obtained. Should the parties come to terms and erect the necessary plant, there is every reason to believe that the output of gold from these two leases will be very considerable and give a great impetus to the mining industry in this division, as the machinery would drain all the gold-bearing lines of reef with the exception of the Hard-to-Find and Jackson's reefs, which are already supplied with pumping plants. Owing to the insufficient depth of the Barmedman Company's shaft and the inefficient pumping appliances, the Fiery Cross Company have been unable to work their ground to a greater depth than 135 feet, leaving a body of stone under foot at this level varying from 1 to 9 feet wide, the yields of gold from this level to the surface varying from 5 dwt. to over 3 oz. per ton. The rock is soft diorite; the quartz is for the most part of a soft easily-broken, sugary nature, of a reddish colour, and different to any other line of reef on the field.

At the Hard-to-find Reefs,  $1\frac{1}{2}$  miles south-east of the Barmedman Reefs, a private Company, Messrs. Hardy, Merton, and Cassin, who hold a 10-acre lease, on which they have a pumping plant erected, have increased the depth of their main shaft about 50 feet during the year, making a total depth of about 196 feet (this is the greatest depth attained on the field), and are now raising stone from the 140-foot level, estimated to yield about 3 oz. to the ton. This party have had to discontinue sinking, in consequence of their supply of fresh water for the engine running short, and will probably have to discontinue work altogether in a few days when the water rises in the shaft. The reef in this property is unfortunately small, varying from 1 in. and 2 in. to 12 in. in width.

The

The quantity of stone raised and crushed from all sources for the year amounts to only 845½ tons, and this includes one lot of 360 tons raised as seconds, and crushed on halves by the Fiery Cross Company. In the year 1888 the total crushings amounted to 2,265½ tons.

Quantity of stone crushed for year 1889, 845½ tons.

Quantity of gold won for year, 449 oz. 19 dwt. 1 gr.

Value of gold at average value of 77s. 6d., £1,743 11s. 3½d.

Number of reefs from which stone was raised, 6.

„ miners' rights issued, 62.

„ business licenses issued, 7.

„ miners employed about, 30.

Total value of mining plant in division, including one 25-head stamp battery, with 75 horse steam-power, one 10-horse power steam pumping and winding plant, and one 10-horse power steam pumping plant—total, £9,950.

No payable alluvial has as yet been discovered in this division. With the exception of one gardener there are no Chinese on the field.

*Summary.*—Notwithstanding the general depression of the mining industry during the year just ended, the prospects of the field, taken on the whole, appear favourable, only requiring a small amount of capital judiciously expended, and the rigid enforcement of the labour conditions on the leases granted, to ensure the profitable employment of a large number of miners on the field for many years to come.

#### LACHLAN DISTRICT—TEMORA DIVISION.

(*James Davoren, Mining Registrar.*)

I HAVE the honor to submit the following report for the Temora Division of the Lachlan Mining District for the year ending 31st December, 1889.

I issued during the year 242 miners' rights, being a decrease of 72 from the number issued in 1888; 64 business licenses, being 16 over the number issued in 1888; and 11 mineral licenses, being 11 less than was issued in 1888.

#### *Gold.*

I received during the year one application for a gold-mining lease of 5 acres 1 rood 14 perches.

On the 3rd of April, Frederick Heansler reported that he discovered payable gold in his prospecting quartz claim at Gundabendyal, about 15 miles south of Temora, and 1½ miles south of his selection No. 26. The reef is perpendicular, is from 2 inches to 7 inches thick, increasing in width as it goes down; the walls are of slate, well defined. The country is very hard.

It is very difficult to get anything like reliable information as to the quantity of washdirt put through during the year, as many of the miners and puddlers have left the field, taking any gold obtained with them, and depriving this field of the credit of all gold thus taken away; but from the best information I could obtain there were about 5,600 loads of washdirt puddled, which gave a yield of about 690 oz. of gold, or about 2½ dwt. to the load, which, at £3 17s. 6d. per oz., would be worth £2,673 15s.

After most careful inquiry, I find the only lease or registered quartz claim at work in this division is the Mother Shipton claim at Upper Temora and Heansler's prospecting claim.

I made application for returns to all lease and claimholders, but obtained none. The mining manager of the Mother Shipton informed me that he applied to the legal manager for the information required, but received no reply up to the present.

#### *Tin.*

I have received three applications for tin-mining leases—80, 60, and 40 acres, making together 180 acres.

The parties have given over working the ground, and the prospectors state that the manager of the mine treated the ore in a long ton of a very inferior description, and, after an expenditure of about £400, advertised the ground for sale.

The Company has still about 200 loads of washdirt on the ground, which for want of water they cannot at present treat, and which the prospectors estimate would go about 20 lb. of tin to the ton.

Messrs. Roberts (the prospectors) say they have no doubt if a supply of water could be obtained the district would carry a large population.

The sinking is from 6 to 16 feet, and the wash from 1 foot to 6 feet thick.

The high grounds in the neighbourhood consist of a chain of conical hills, and in the breaks between those chains of hills are the places the heaviest deposits of tin have been discovered. Shafts have been sunk on some of the hills which have not been bottomed. These shafts went through a heavy water-worn wash, and the prospectors think heavy deposits of tin will be found on the bottom, and from the description of granite boulders discovered they think it probable rich lodes may be found in the vicinity.

The only machinery in this division is the Company's machine near Temora, estimated to be worth about £600, and Mr. W. R. Groves' machine, at the Homeward Bound, estimated to be worth £2,000.

#### LACHLAN DISTRICT—MURRUMBURRAH DIVISION.

(*C. Cutcliffe, Mining Registrar.*)

THE Mining Registrar at Murrumburrah reports that the gold-mining interest in his Division is not in a flourishing state.

The number of miners' rights issued has been 86 against 118 in 1888, and business licenses have been 5 against 10 in 1888.

The Warden at Young, from information sent to him by me, has supplied a full report of this division embodied in his own.

#### LACHLAN DISTRICT—CUDAL DIVISION.

(*A. Minslow, Mining Registrar.*)

I HAVE the honor to forward my annual report on mining interest for the Cudal Division of the Lachlan District for the year 1889. Twenty-nine miners' rights and two mineral licenses have been issued, and four applications for gold leases have been received during the year. There are two five-stamp batteries in this division, though only about 10 tons of stone have been crushed at such batteries during the year, as it is asserted that they waste three parts of the gold, and the bulk of the stone has been crushed out of

the district, viz. :—At the Clyde Chlorination Works and at Harden where the stone was sent at great expense to the parties interested with a view of getting it properly tested, there is no doubt some of the claims or leases at Boney's Rock would give good returns if proper machinery was erected on the ground. At Paling's Yard Courts and party have raised about 100 tons of lodestuff which has not been crushed, but which is supposed to be payable.

LACHLAN DISTRICT—PARKES DIVISION.

(James Millar, Mining Registrar.)

In forwarding the report for 1889 I have the honor to notice an increase in miners' rights issued, and gold bought by the banks at Parkes.

Miners' rights issued for 1888, 523; for 1889, 958. Business licenses issued for 1888, 18; for 1889, 56. Gold bought by all the banks for 1888, 3,975·08 oz.; and for 1889, 8,247·525 oz.

Within an area of 28 miles north and south, and 20 miles east and west, seven different lines of reef have been prospected at numerous points. Abundant employment could be found if more perfect gold-saving machinery were placed convenient to these reefs.

The total number of applications for gold-mining leases in the Parkes Division has been 348, comprising 1,006 acres, leaving hundreds of thousands of acres still open for speculators.

The average yield of gold per ton of quartz this year has been from 5 dwt. to 114 dwt., and Hazelhurst's Proprietary Company tops the list with 5 oz. 14 dwt. per ton.

The miners here were unsettled by Alexander Cameron, Alexander Whitelaw, and Alexander Patton reporting payable gold at their prospecting area at Bachelors, about 16 miles north of Parkes. About 2,000 miners came upon the field. Mr. Warden Sharpe and District Surveyor Sheaffe laid out a village naming it Alicktown in honor of the three Alex. named above. The population kept surging to and fro between the Peak Diggings, sheep shearing, harvesting, and Alicktown, until now there is a population of over 300, working steadily upon hope-sustaining patchy ground.

Moore's new engine at Mingelo, Ten-mile Creek, has been fitted, and is now ready for stone from reefs at the northern part of this division.

James Mulalley has opened a reef about 1 mile east of Alicktown showing stone similar to the Peak.

Burt and party's Golden Quarry, adjoining gold lease, portions 89, 90, 100, 101, 102, seems the largest reef in the division and gives promise of good returns.

Mount Morgan Gold Lease, portions 103, 104, 105, and 106, and M'Donald and Gillispie's give an assay of about 5 oz. of gold and 1 oz. of silver to the ton.

Bushman's comprising gold lease, portions 47, 48, 49, 50, and 86, are about to be amalgamated.

Kohinoor Gold Lease, portions 27 and 28, and adjoining claims, are about to amalgamate, and afterwards to be floated. Their last crushing gave an average of 1 oz. 11 dwt. per ton.

The Tichborne caused some excitement by the discovery of a portion of stone held together by a network of gold, and all the ground immediately around them has been taken up.

M'Gregor's old line of reef has been taken up with a view to placing machinery on the ground. This being a soft reef, easily crushed, should return a good profit on the outlay.

The Billabong Ore Crushing Company have erected the most complete plant, two Huntingdon mills, with the necessary gold-saving appliances, near the Bushman's.

The Parkes Quartz-crushing Company are moving their battery, with a view of adding more extensive machinery.

Hazelhurst Proprietary Company intend erecting crushing-mills for their mines.

As the supply of water affects the mining industry, an extensive system of dams and races should be encouraged so as to increase the produce of this gold-field.

The total number of miners:—Gold miners—Alluvial, 400; quartz, 500.

From alluviums.		From quartz.		GOLD.		Total.		Value.	
oz.	dwt.	oz.	dwt.	oz.	dwt.	oz.	dwt.	£	s. d.
3,230	9	5,016	6	8,247	523	30,381	16	6	

Number of square miles of auriferous ground which is being, or may have been, actually worked upon, 90 miles; number of distinct quartz reefs which have actually proved to be auriferous to the present time, 60.

The price of gold during the year in this division has been from £3 12s. 6d. to £3 15s. 6d., the lower price being for retorted gold and the higher price being for alluvial gold. Some samples from the Peak brought a higher price.

There are no coal, tin, or copper-mines in this division.

The total value of mining plant in the division is £14,000.

## LACHLAN DISTRICT—FORBES DIVISION.

(E. A. T. Pery, Mining Registrar.)

I HAVE the honor to submit my report and statistics for the Forbes Division of the Lachlan Mining District for 1889. The amount of gold won in this division (as per escort returns) for the year is 1,960 oz. 13 dwt. 9 gr., showing an increase of 998 oz. 5 dwt. 18 gr. on the amount won in 1888, to which must be added a considerable amount at present in the hands of the banks, together with parcels forwarded privately. The increase thus shown, as compared with the statistics, may be accounted for by amounts held by the banks from the preceeding year, as well as by small parcels derived from claims not possessed of machinery.

*Britannia Co-operative Gold-mining Company (Limited).*—This Company has sunk the main shaft to a depth of 165 feet, has opened drives to lower levels, and has sunk and put in drives from two other shafts on line of reef. The mine is now being worked very systematically, and the main drives are being opened ready for stopping. A new battery with the latest gold-saving appliances will shortly be erected. During

the

the year they have crushed at the old battery 248 tons of stone for a yield of 330 oz. of gold. A new vein of from 6 inches to 2 feet in width has lately been discovered on the surface, about 100 feet east of the present workings, showing rough gold.

*Pinnacle Reef Quartz-mining Company.*—This Company has during the past year done a great deal of prospecting, testing the property on the various reefs, and has two shafts down to water-level (which is 145 feet from surface) besides several others at varying depths. The reef has been proved to vary from 2 feet to 14 feet in width, and has yielded a fair average of half an ounce to the ton. This Company is greatly retarded by want of a more powerful battery and appliances for saving fine gold.

*El Dorado Gold-mining Company.*—Only prospecting work has been carried out by this Company, and several payable veins of quartz have been struck. The main shaft has been sunk to a depth of 150 feet, proving the vein to vary from 6 inches to 4 feet. Work is at present suspended pending the erection of a crushing plant, for which arrangements are being made.

*Bald Hills Extended Gold-mining Company.*—Work has been carried out at this claim pretty regularly throughout the year. With the aid of an ordinary whim and horse-puddling machine, upwards of 2,000 loads of wash-dirt have been put through for a yield of 650 oz. of gold. This Company has lately erected a steam-winding plant and sunk a main-engine shaft to the depth of 180 feet from which the workings will be extended on a far larger scale. The satisfactory position of this Company is chiefly due to the energy of one of the principal shareholders (Mr. Eugene Vanzetti) who has always displayed great enthusiasm in advancing the mining industries of the district.

*The Phoenix Gold-mining Association (Victoria Lead).*—This party has met with considerable difficulty through influx of water from old workings, though they have succeeded in winning over 200 oz. of gold, with only a small party of men, working a whim by horse-power. A very good vein of coarse gold was struck lately, some of the nuggets weighing over 5 oz., but, on account of the water being too heavy for horse-power, operations have been suspended for the present.

*Forbes Alluvial Gold-mining Company (Limited).*—This Company has had again to suspend work, owing to an influx of water from old workings on the south lead. A prospecting drive was put in on the out-skirts of the old lead and several payable tributaries discovered, which, owing to the excess of water, could not be profitably worked with their present appliances.

The Crinoline Gold-mining Company and Try Again (late Nil Desperandum) are still idle. The Metropolitan Gold-mining Company (Strickland's Reef) has been wound-up, and the machinery sold and sent to Cobar.

Two prospecting claims are working on the old Eureka Lead, about six miles north-east of Forbes, although nothing payable has been yet reported, other prospecting parties, in the neighbourhood of Forbes, are still in hopes of striking something good, and a revival of the mining industry may be confidently anticipated for the ensuing year.

During the past year I have issued 248 miners' rights, 4 mineral licenses, 10 business licenses, and have received 9 applications for gold-mining leases.

#### LACHLAN DISTRICT—MOLONG DIVISION.

(*J. Atkinson, Mining Registrar.*)

I HAVE the honor to report that during the year 1889 no increase has taken place in mining within this division, but rather a decrease, owing, no doubt, to a number of the miners in this district leaving for Alickton and Peak Hill gold-fields.

The only place where gold-mining is being carried on is at Gumble, about 14 miles distant from Molong. The Delaney's Dyke Gold-mining Company have there an 8-acre lease; three shafts have been sunk on this property to a depth of about 120 feet; there is 148 feet of drives and 98 feet of stopes; 1,727 tons of stone have been raised during the year, giving a return of 978 oz. 11 dwt. of gold; there is a battery of five stampers at work, and a new battery of twenty head revolving stampers is in course of erection. The new plant, which is valued at £6,000, will no doubt be a great improvement on the old machinery.

There are two large dams of water on the property which will, no doubt, last through the summer.

During the year 119 miners' rights, 5 mineral licenses, and 3 business licenses were issued, and 2 applications received for gold-mining leases.

#### LACHLAN DISTRICT—GRENFELL DIVISION.

(*W. H. Hazleton, Mining Registrar.*)

I HAVE the honor to submit my report, on the Grenfell Division of the Lachlan Mining District, for the year 1889. The principal event of the year was that of Maher and party, on the 23rd July last, reported the discovery of 7 grains of gold to two dishes of dirt, which they considered payable. This was obtained from an alluvial prospecting protection area, at a depth of 215 feet from the surface; the width of the lead is supposed to be 15 feet. The area in which the gold was found is situated on a selection at Eureka Flat, distance from Grenfell about 8 miles, in a south-westerly direction. As soon as the report became known several parties marked out tenements, and obtained permission from the owners of the land to sink on either end of the prospectors, and two shafts were sunk and bottomed on the south end, and three on the north-west end on the lead, and a few loads raised and washed, which only yielded from 3 to 4 dwt. to the load; and the prospector's washing gave about the same result. Eureka Flat was at once declared not payable, and was abandoned. At the Quondong during the first part of the year there were a few parties working. I am unable to give any particulars, as they have left this field. At the Seven-mile, one party have been at work under permit, but did not discover anything payable, and have abandoned the area. At One-mile, O'Brien and party worked a tenement for a month, and obtained gold quartz. Lawson's Reef (Hinchcliffe and party) mining tenement, two men's ground, during the year they have raised and crushed 112 tons; yield, half an ounce of gold to the ton.

Lucknow Reef, 4-acre lease, owner Miss E. J. Spence, of Melbourne, at present repairing shaft. This lady has only recently taken this lease. She has also applied for 3 acres adjoining the 4 acres. I am of an opinion, from what is known of this lady in Victoria, that she has faith in gold-mining, and that she has been a successful speculator, and that she will give the Grenfell Reefs a fair trial. She has purchased the Victoria crushing plant, and is about to erect all the most modern gold-saving appliances.

*Welcome Reef*, 3-acre lease, Wallace and party.—This party raised and crushed during the year 114 tons, which yielded about 8 dwt. to the ton.

*Enterprise*

*Enterprise Reef*, 3-acre lease, Pettit & Co.—This party raised and crushed during the year 56 tons, and obtained a yield of 16 dwt. to the ton.

Following is a return of the crushings from Sandy Creek.

Name of Party.	Amount crushed.			Total yield.		
	tons	cwt.	lb.	oz.	dwt.	gr.
Crouch and party .....	36	17	0	8	1	10
Neagle and party .....	18	14	0	2	3	5
Russell and party .....	10	8	0	1	18	20
Brenner and party .....	198	0	0	90	0	0
Bowman and party .....	70	10	0	60	9	0
Butler and party .....	16	0	0	2	7	0
Buckman and party .....	31	10	0	19	10	9
Bristow and party .....	50	0	0	8	0	0
Ryal and party .....	16	0	0	2	0	0
Kelly and party .....	9	0	0	1	0	0

At present there are only a few persons working at Sandy Creek, but I am of opinion that during the present year some of the reefs will get another trial.

*Denny and Watson's pans for treating the quartz tailings.*—The gentleman in charge is not very communicative as to results. He informs me that he has some machinery coming from England, which will, when erected, complete his plant.

*Silver.*—In this line I have very little to report. The Arramagong is the only mine known of in this division at present, and owing, I think, to some misunderstanding among the shareholders, nothing has been done during the year, but I am now informed that matters have righted again, and that the owners have disposed of part of the mine, and that work will at once be resumed. During the year I have issued 295 miners' rights and 5 business licenses.

#### LACHLAN DISTRICT—CARGO DIVISION.

(*E. Lord, Mining Registrar.*)

I HAVE the honor to forward my report relative to the mining interests in this division:—The Ironclad Mine, owned by an English Company, during the year work has been much delayed owing to the want of water, necessitating a suspension of labour during part of the year. New machinery has been erected for treating the refractory ore, part of which turned out unsuitable, and proved most prejudicial to the fortunes of the mine. Fresh capital has been obtained to further develop the mine; the main shaft has attained a depth of 163 feet; a large body of fair grade ore is in sight, and strong hopes are entertained of success. The mine is managed by Mr. Walter Morgh, who was sent out by the Company from India.

The Dalcouth Mine, owned and worked by Mr. James Powers, of Cargo. No crushings have been obtained from this mine during the year, but some splendid stone has been raised, assaying 2 oz. to the ton. Mr. Powers is at present trying to float the mine into a Company.

The Golden Clad Mine, situated at Cargo, has lately been floated into a Company for £30,000. A large dam has been made, and machinery will shortly be erected. Some splendid stone has been raised during the year;—3½ tons sent to the Clyde Works, Sydney, yielded 2 oz. 1 dwt. 19 gr. This mine adjoins the Ironclad Mine.

The mining around Cargo is looking very well at present, the only drawback being the want of a crushing plant, but two will shortly be erected. There are several leases that would pay well if a battery was on the ground, but having to send the stone away to get crushed it will not pay. There are three men prospecting under the Prospecting Vote, but up to the present have had no success. A warden's office has been established at Cargo since October.

#### SOUTHERN DIVISION—BOMBALA, BEGA, EDEN, AND NIMITYBELLE DISTRICT.

(*Jas. Giles, Warden.*)

I HAVE the honor to submit my report for the year 1889 upon the Bombala and Cooma Divisions of the Southern and, Tumut, and Adelong districts over which I exercise supervision as Warden, and which embrace the following gold-fields, viz.:—Delegate, Towomba, Nimitybelle, Collinton, Snowy River, Crackenback, and Kiandra.

I presume the wardens clerks and mining registrars at Bombala, Bega, Eden, Candelo, Cooma, Kiandra, and Nimitybelle have, as previously instructed, furnished their reports for the past year, giving detailed accounts of the various workings, proceeds, &c., also the number of miners' rights and business and mineral licenses issued within their respective divisions to the 31st ultimo.

At Kiandra, the gold won during the past year did not exceed 400 oz., being a considerable falling off from the yield for 1888.

The mining population of Kiandra, Snowy River, and Crackenback gold-fields may be estimated at 300, consisting of Europeans and Chinese.

*Collinton*

*Collinton Gold-field.*—Several gold-mining and mineral leases have been applied for; there is marked improvement in all matters connected with mining within this gold-field.

*Nimitybelle Gold-field.*—I regret to say that mining has fallen off very much within this field during the past year.

*Towomba Gold-field.*—Several prospecting parties have been searching for gold and silver reefs on this gold-field, and some gold-mining and mineral leases have been applied for.

*Delegate Gold-field.*—Several permits, gold-mining and mineral leases have been applied for; there is a decided improvement in all matters connected with mining upon this gold-field.

#### SOUTHERN DISTRICT—MORUYA DIVISION.

(G. Maunsell, Warden.)

I HAVE the honor to report as follows on the subject of gold and silver mining within the Moruya Division of the Southern gold-fields.

The reports of the several wardens' clerks will be found to contain all the detailed information relating to mining in their respective localities.

From replies to letters addressed to twenty-nine leaseholders, I find the total depth of their sinkings to be 2,970 feet; drivings, 4,955 feet; number of men employed, 131; quantity of gold won during last year, 1,207 oz.

With a view to nursing the industry within the division, I have perhaps been generous in giving suspension and partial suspension to some of the leases on which *bona fide* and substantial work has been done, but for this the quantity of gold won and the number of men employed would be much greater than is shown by the above return.

During last year a Melbourne syndicate has become possessed of several gold leases at Nerrigundah; from the energy and experience shown by its manager, Mr. Capes, I expect a thorough prospecting of a large area there.

The aid recently granted by the Prospecting Board to miners at Nerrigundah must have a similar effect, as they are all sinking to greater depths in their respective localities than have hitherto been obtained.

I also look forward to good results from Brunberamala, a tributary of the Clyde, as the owners of the leases and prospecting claims are men of means, possessed with a determination to test this auriferous-looking country.

At the Moruya silver mines ore is being raised and exported for treatment. This Company has 300 tons of ore at grass.

#### SOUTHERN DISTRICT—BERRIMA DIVISION.

(F. R. Wilshire, Warden.)

I HAVE the honor to report for your information that the operation in mining matters has been very slack in the division assigned to my charge during the past year. In fact, nothing new in the way of mining worth recording has transpired since making my report of last year.

A good many mining leases have certainly been applied for, but more in connection with coal and shale, and, as usual, more of a speculative character than otherwise. In this respect Burragorag has been one of the principal centres of operation. It is considered that a line of railway will, sooner or later, be constructed through that district, thus bringing the known coal and shale seams in that locality into probable value.

The Coal Company of Mittagong has nearly stopped work, and, like some others in the district, is engaged in a nominal output. A contract for the supply of the mineral on the Government Railway has, however, I believe been obtained for the present year by this Company, and work will consequently be extended for a time.

No fresh discoveries of the precious metals during the year have been reported to me, and many of the mineral leases—gold and otherwise—taken up during the mining "boom" of 1887 have either been abandoned or become voided for non-fulfilment of conditions, &c., and a number are held under the "suspension" provision of the Act, to be eventually abandoned, I fear.

On the whole, it is unsatisfactory to note that little advancement of *bona fide* mining in this division seems to have arisen through the great mining excitement of the last few years, though a great deal of prospecting has undoubtedly taken place.

The Carrington Mine, near Marulan, is still undeveloped, though work is still proceeding slowly.

A little stir has taken place at the Mittagong Diamond Mine, resulting in a few more of the gems having been obtained; but sluicing has again ceased for want of water. The few diamonds already alleged to have been recovered there have been obtained from an old drift-bed, apparently overlying the Wianamatta shale series of the neighbourhood; but some persons are of the opinion that the precious stones have a local origin, viz., a volcanic pipe (of which there are several in the locality), and would, if this idea be well founded, prove them to be of similar origin to those found at Kimberley, in South Africa. The fact remains, however, that all the stones yet found there are obtained by washing the drift above mentioned, which also contains gold in small quantity, very fine and scaly, showing a distant origin, I think. In my opinion this drift is the real source of the diamonds also. Should further investigation prove them to be of local "volcanic pipe" origin, the matter would at once assume a far more interesting and important aspect, and would justify an advance from the Prospecting Vote to finally decide the question as to the real origin of these Mittagong gems; and I desire to commend the subject to your favourable attention. If a diamond-field exist there, it is worth a little money spent in investigating, private enterprise having so far failed to settle the question. I would undertake to see the money judiciously expended in the direction indicated, if sanctioned.

A Government diamond-drill is employed near Joadja, testing for shale, &c., as yet without success, though some seams of an inferior mineral have been explored, but none so far of any marketable value, except, of course, the well-known one on the Joadja Company's property, which is still being worked with very satisfactory results.

An attempt with successful results was recently made at Mittagong by Mr. W. Brozenall, iron founder, &c., to make gas pipes, &c., from the crude iron ore, smelted and taken to the mould direct from the furnace (cupola), *i.e.*, without first making into pig-iron, and hopes are entertained that the success of the experiment (by which method an immense deal of labour and expense would be saved) will lead to further important results in the way of prosecuting the principle on a large scale.

I have visited the neighbourhood of Windelama and Nerrimunya lately, where quartz-mining is being carried on by a few parties, but as the crushers have only lately been started the results are not yet obtainable. Some years ago the reef there known as Manton's yielded excellent results for a considerable time, but eventually became less remunerative and was abandoned. It is thought, however, that the mine will yet be reopened and worked with profit, and a syndicate is now in possession endeavouring to further develop it.

The number of miners' rights issued at this office (Berrima) during the year was 22, and mineral licenses 8; mineral leases 12, and gold leases 3.

At Goulburn—Miners' rights, 95; mineral licenses, 12; gold leases, 11; mineral lease, 1.

At Taralga—Miners' rights, 16; mineral licenses, 4.

At Picton—Mineral license, 1.

Totals—Mineral leases, 13; mineral licenses, 25; miners' rights, 133; gold leases, 14.

#### SOUTHERN MINING DISTRICT—BRAIDWOOD, ARALUEN, LITTLE RIVER, MAJOR'S CREEK, NOWRA, AND NERRIGA DIVISIONS.

(James Aldcorn, Warden.)

In some of the above portions of the Southern District mining matters during the year 1889 have had a good deal of attention. Considerable areas of ground have been taken up under lease and otherwise almost entirely for gold. As yet, however, there is not much to report as to satisfactory results from the operations.

In the Braidwood Division not a little labour has been expended in some old and abandoned ground, with, I fear, considerable loss to the workers. The exception to this has been at Jembaicumbene Creek, where alluvial workings had been carried on successfully for many years, and almost abandoned except by a few Chinamen. During the year, however, a local Company secured the right to work some leads known to exist in private land, near the Creek, and the results, I understand, have so far been satisfactory to the parties interested. This may probably continue for some time to be a profitable venture.

At a point on the Shoalhaven River known as the Horse-shoe Bend, a party were engaged during the year in diving operations, to test whether payable gold existed in the river-bed. The result was such as to induce them to take steps for diverting the water by cutting across the bend. For this purpose a tunnel is necessary, besides open cutting. This work is now being proceeded with.

In this division, also, a few portions were taken up, with the idea that payable silver lodes existed. After a considerable amount of prospecting, however, the parties engaged therein gave up the work, the results not having been encouraging.

In the Araluen Division matters have continued much as usual. The old claims in the river-bed have been worked pretty constantly except one (the largest, which employed about sixty men and boys), work on which was stopped some months, the lead having become very poor. The holder of this claim has, however, resolved to open up in a fresh part of the river-bed, where he is sanguine that there exists still a payable lead. He has put on a few men to make preparations. The quantity of gold obtained has been considerably less than in the previous year, which is accounted for by the cessation of work referred to.

In the Little River Division very little has been done in alluvial mining, the water supply having been very limited. Several parties have been prospecting the quartz reefs, which are numerous in this division, but want of capital has, in most cases, necessitated the abandonment of these operations. Two or three parties are, however, still persevering in sinking on formerly abandoned reefs.

The Day Dawn Company have prosecuted their operations during the year, and have added to their machinery. They have had not a little difficulty to encounter from water and the broken nature of the country, and although they have raised and treated a fair quantity of stone during the time they have been at work, I understand that they will have to get increased capital by reorganizing the Company to enable them to proceed further to test the reef at which they have been working, as well as to develop the ground held by them under other leases. There is a slight decrease in the gold from this division.

In the Major's Creek Division the principal operations have been on the private land referred to in my report for 1888 as having been purchased by a Company for the purpose of working the mundic lodes which it was thought could be profitably mined and treated by the chlorination process. Crushing and concentrating works have been erected, and the completion of the chlorination portion of the works is expected in a few weeks. A large quantity of concentrates are stacked up ready for treatment. Should these operations prove successful a great impetus will be given to mining in this division, as there is an extent of Crown land containing similar lodes. There has been little done in alluvial mining here for want of water, and the return of gold is less than last year.

In the Nerriga Division a number of additional leases have been applied for quartz-mining, and some also for hydraulic operations. The only instances in which anything beyond prospecting has been done are at what is known as the Welcome Reefs, Ningi Nimble, and a place known as "Mountainy," both near the Shoalhaven River. At the Welcome Reefs a battery, &c., has been erected and operations were carried on for a few months. The stone did not, however, turn out to be payable and the work was discontinued. I understand however that the plant has been purchased by another party, who intend further to prosecute the search for payable stone in the reef already tried as well as in several other leases taken up by them. At Mountainy several leases are held by the South Carrington Company (in the names of several individuals). They have commenced operations on ground which was tried and abandoned many years ago. They are getting out stone from an open cutting at present. There is a quartz dyke showing gold and also a quantity of conglomerate which is auriferous. A small battery has been erected at a distance of a mile and a half from the lease, being the nearest practicable site at which  
water

water could be obtained except by incurring a very large expense. It is intended, however, should the lode prove to be permanent and payable, to erect extensive crushing plant where abundant supply of water can be got from the river, on the opposite side of which the Company hold ground which contains a wide quartz reef, not yet much tested. The battery had only been two days at work when I visited the locality, so it is too soon to venture an opinion as to the result. The manager was, however, very sanguine as to a favourable crushing.

As regards hydraulic operations, several long and expensive races have been cut, or are being cut, in this division, to carry water to the drift beds near the Shoalhaven River. The results, so far as trials have been made of sluicing, have not yet been very satisfactory, but it is confidently expected by the promoters of the works now proceeding, that the extensive drift deposits in the neighbourhood will yet be profitably operated on by hydraulic power.

In the Nowra division, mining operations are almost limited to Yalwal, on a tributary of the Shoalhaven River. During the year an impetus has been given to the development of the reefs and lodes, by the locality having come under the notice of capitalists from Sydney and Melbourne. The original holders of the leases were for the most part, unable, from want of funds, to do more than struggle along to fulfil the labour conditions. It has been quite well known that the machinery hitherto on the ground failed to save a large proportion of the gold, and although most of the lodes are of a low grade, it is confidently believed that more extensive machinery and improved appliances for gold saving will prove Yalwal to be a payable field.

The lease known as the Homeward Bound has all along produced the best results. I gave some particulars as to the work and results at this mine in my last report. It has been worked as a quarry by the original holders, Messrs. Thorburn, Faulks, and Misons up till August last, when it was sold for a large sum to a party of Melbourne gentlemen. The original holders have won altogether from the mine, and having only an ordinary and not very effective 10-stamp battery, over £30,000 worth of gold, and they believe they lost 50 per cent. of the free gold. Since the change in the ownership, a number of extra men have been set to work. The proprietors intend to erect at once a 20-stamp Californian battery, with rock-breaker, &c., &c. A change in the method of working is also contemplated. Tramways are to be laid, &c., &c. It is expected that by the new machinery about 350 tons of stone can be treated per week, whereas the original holders only managed about 50 tons. It is said that a new shoot of stone has been struck in the quarry, which will prove to be rich in gold.

With regard to the claim or lease known as the Pinnacle, there has been some disputes and correspondence between the owners, the men employed, and the Mines Department, so that very little work has been done. At present Mr. A. H. McCulloch, of Sydney, has obtained suspension of labour conditions.

The lease No. 2, known as the Eclipse, has been worked during the year with fair results. The battery at this lease has been utilized for trial crushings from other leases held in conjunction with it. The results of these crushings have been from 6 dwt. to 22 dwt. per ton.

The lease known as the Caledonian No. 20 has been regularly worked. Some good stone has been got from several veins or leaders, the aggregate width of which is about 7 feet. The first 10 tons taken from this gave a return of over 2 oz. per ton. Seventy-seven tons subsequently crushed at the Homeward Bound battery gave 17 dwt. to the ton. Since then the quality of the stone has improved. I am informed by one of the proprietors that having tried 50 tons (out of 130 tons at grass), at the Homeward Bound battery, with a result of 150 oz. of retorted gold, they were not satisfied with the result, and having forwarded an average ton to the Mint, the result was 9 oz. 17½ dwt., and 2 oz. of silver. The Mint assayer added that there was also a large proportion of the gold remaining in the tailings. This stone was got near the surface. A tunnel is being driven on the lease.

At the Pioneer, No. 11, adjoining the Homeward Bound, some apparently rich stone has been raised and stacked. There is an old battery in connection with this lease, but it was found that a great loss of gold resulted from using it, and in the meantime the stone has been stacked. One ton sent from it to the Mint gave 2 oz. of gold.

There are a number of other leases on which prospecting work is being carried on, and in some cases the indications are considered satisfactory.

The Yalwal field has recently been visited by a number of parties seeking for mining properties, and it is probable that a thorough trial will now be made in the locality for gold and silver. As regards the latter, only some small amount of prospecting has been done as yet on the leases taken up.

A tolerably good road has now been made by the Roads Department from Nowra to Yalwal, although it would be possible to improve some steep grades, which would lessen the cost of carriage of machinery, &c., from Nowra. A small inn has been erected and recently opened. This was much needed for the accommodation of visitors.

The foregoing is a general sketch of operations in the several divisions, leaving matters of detail to the Mining Registrars, whom I know pretty well furnish these.

#### TUMUT AND ADELONG DISTRICT—QUEANBEYAN, CAPTAIN'S FLAT, AND GUNDAROO DIVISIONS.

(*James Aldcorn, Warden.*)

THERE is not much about which to report in regard to mining operations in the above-mentioned divisions for the year 1889.

At Captain's Flat, where alone any extensive work has been carried on, the two companies—the Commodore Vanderbilt and the Kohinoor—have continued to work their respective holdings, by raising and treating the ores, and by adding somewhat extensively to their machinery, &c. The former Company have erected enlarged and improved smelting works, which have been in use for some months, while the latter Company have put up a twenty-stamp battery and Huntingdon mill for working the gold lodes in their leased ground. The battery has been at work for only a short time, but the results so far are payable. The mill is not yet quite finished. Smelting operations have been carried on intermittently, but considerable difficulties have been encountered on account of the refractory character of the ores. It has been necessary to incur a large expenditure in roasting these. The present manager is having a calcining furnace erected, by which he hopes a saving of expense may be effected. On the whole neither of the Companies have as yet had payable results in the treatment of their silver lodes.

The

The only other works, with the exception of a little prospecting by individuals, which have been undertaken, have been carried out by the North Vanderbilt Company. They have prosecuted the search for a payable lode on two of their leases, but nothing very encouraging has yet been found.

The appliances for working the two first-mentioned Companies' holdings are now very complete, and the present year's operations will probably determine the question whether the ores can at all be profitably treated.

In the Queanbeyan Division, several small parties have been engaged prospecting for both gold and silver, but there is nothing of a definite nature to report concerning these.

At Brindabella, the operations of the Goodrabigbee Sluicing Company have been prosecuted during the year. They completed their extensive head race, and got to work, but as yet have not had remunerative returns. They have not, however, been able to do more than work to a small depth of their wash stuff, and they are making arrangements for the construction of an extensive tail-race, &c., by which much deeper wash can be treated by their hydraulic works. The value of the Company's plant, including races, is about £5,000, and they are sanguine as to ultimate favourable results from their operations.

At Mac's Reef, Gundaroo gold-field, lease 231, work has been abandoned. The lessees have concluded that the reef cannot be worked with payable results, at least so far as they have been able to prove it. On two leases at the same place, held by another party, the work of tunnelling has been continuously prosecuted, but they have not yet cut the main reef.

At what has been known as the New Mac's Reef on the conditional lease of James Cartwright, the only work done has been by Mr. Cartwright, by virtue of a permit held by him. He has sunk a shaft and found a narrow reef showing gold. He intends to continue this shaft and has commenced timbering it.

In the early part of the year a party took up some claims in old ground, near Brooke's Creek, with the idea of sluicing the ground by water from Lake George. They have, however, done nothing to carry out their purposes.

#### SOUTHERN DISTRICT—YASS DIVISION.

(*H. J. Chisholm, Warden.*)

IN forwarding this, my annual report, I regret to say my anticipations for a busy year in all parts of my district have not been realized.

In the Yass portion of my district, a lease No. 5,487 taken up by Messrs. Wilson, Jones, and Clifton, is being worked, and a considerable quantity of umber has been obtained. Over a ton has been forwarded home to England, but at the present prices obtainable, it is thought it would not pay. Consequently the work is not being pushed on.

#### *Gunning.*

In this portion of my district, matters look more hopeful, and it will be seen from the Mining Registrar's report that there is a hope of mining matters looking up.

#### *Burrowa.*

The report of the Mining Registrar, I am given to understand, has been forwarded on to your Department.

In the Burrowa District I find there is a Company known as the Wallot Wallot Silver-mining Company which embraces four leases, and approval has been given to amalgamate these leases, hence the formation of this Company. A. E. Middleton, Esq., who is a shareholder has kindly furnished me with the following particulars:—"During the past year we have had eight to ten men at work prospecting. Two shafts have been struck, one down about 100 feet, and while sinking, went through galena ore; in some places the lode was 7 to 8 feet wide. The other shaft is about 77 feet; the ore in this shaft consists of carbonate of lead and galena. Our assays from time to time have on a whole been very good, giving from 30 oz. of silver to 325 to the ton, and as high as 78 per cent. of lead," &c.

Many persons in the district who have seen this mine speak in high terms of it, and it is hoped the Company will be well rewarded for the trouble and money expended.

#### SOUTHERN DISTRICT—COBARGO DIVISION.

(*L. J. Clifford, Mining Registrar.*)

I HAVE the honor to state that no mining of any consequence is carried on in this part of the Southern Mining District. During the year four men were engaged fossicking at Montreal, but found nothing payable.

Riley and party have a prospecting protection area at Coolagolite Creek in quartz, but will not give any information as to the amount of stone raised, crushed, or the gold won.

Hibel and Gins, of Coolagolite Creek, have a lease of 4 acres. The shaft is down about 30 feet. They forwarded some stone to Sydney to be crushed, which yielded 1 oz. 8 dwt. They refused to state the amount of stone sent, but from the return they got they seem confident that the claim will pay good wages.

I received £19 15s. for miners' rights and business licenses during the year, as against £35 for the preceding year.

#### SOUTHERN DISTRICT—WAGONGA DIVISION.

(*W. J. Foster, Mining Registrar.*)

#### *Mount Dromedary.*

IN the several claims, work has been regularly and steadily carried on—the vein-stone is very narrow, ranging from 1 inch to 12 inches, but reaching a greater thickness as depth is attained. 2,040 feet of driving has been done, and 191 oz. of gold won.

#### *Wagonga North Head.*

In the Bodalla Gold-mining Company's property, which comprises five leases—in the aggregate 40 acres, 130 feet of driving has been done; 210 tons of stone crushed for 95 oz. of gold.

On the Lady Carrington, comprising six leases with a total of 17 acres, for various causes little work has been done, and no gold won.

In one private holding there are 50 tons at grass awaiting crushing. In the other private holdings the reef has not yet been found.

*Montreal.*

*Montreal.*

The locality and the reefs in the neighbourhood are now abandoned.

*Parish Oudjangary.*

Near the head of Coolagilite Creek is a prospecting protection area in quartz. Two leases of 4 acres each have been taken up; in one 100 feet of sinking and 20 feet of driving have been done, and there is about 40 tons of stone at grass. In the other, 8 shafts have been sunk, but no payable reef has been found.

*Alluvial.*

On the 27th July, 1889, payable gold was reported to this office as having been found in a gully between the eastern bank of the Wagonga River and the Pacific Ocean, in the parish of Moorooma, about  $1\frac{1}{2}$  miles from Wagonga South Head. A small rush set in, and about 25 to 30 (more or less) men were employed up to the close of the year. The amount of gold won, so far as I can learn, is approximately about 45 oz. There are three or four men still working, but as a discovery of new ground it must be regarded as a failure.

No rain has fallen for some months, and crushing will have to remain in abeyance until it comes.

## SOUTHERN DISTRICT—MORUYA DIVISION.

(*H. Bragg, Mining Registrar.*)

I HAVE the honor to report in reference to the gold mines in Moruya Division that the quartz-mining has not made such progress in this division as I anticipated it would in my report for the year 1888. The cause has been principally the want of capital to carry on the work. The Little Gem Gold-mining Company has raised about 800 tons of quartz, and the quantity of gold won during the year has been 600 oz. The quality of the gold in this mine is good, the value being £4 per ounce. This mine, if properly developed, should pay well. The Caledonian Mine during the year has crushed 30 tons of quartz, yielding 68 oz. of gold.

The Crown Gold Mine, on the same line of reef, has crushed about 15 tons of quartz, and obtained  $18\frac{1}{2}$  oz. of gold.

The Italia Mine at Turlingah, near Moruya:—The main shaft in this mine is now down nearly 100 feet, and the stone looks well. The lessee of this mine has been granted aid from the Prospecting Board to carry on the sinking to 170 feet.

*Alluvium.*

Only one alluvial claim has been at work at Mogo during the year, that of Messrs. Aunett's and party, from which 110 oz. of gold have been obtained.

Messrs. Blackburn & Co. have done no work in their alluvium claim for the year, pending the granting of a 20-acre lease for which they have applied.

Michael Dinan and party were granted aid from the Prospecting Vote to cut a tail-race to drain a deposit of tertiary alluvial drift at Yankee Point, near Mogo, but owing to litigation over the race, which is still in abeyance, they have not done any work on it.

*Silver.*

There is one mine about 4 miles from Moruya. Work is now being pushed on in this mine, and they have about 300 tons of ore at grass; from an assay made of the ore the return was £18 per ton. It has not yet been decided whether machinery will be erected on this mine to treat the ore, or whether it will be sent elsewhere for treatment. During the year 4 applications were received for gold-mining leases, and 1 mineral lease of 40 acres was applied for; 51 miners' rights and 1 business license were issued for the year.

Miners' rights for this division are also issued at Bateman's Bay.

## SOUTHERN DISTRICT—GUNNING DIVISION.

(*S. Pembroke, Mining Registrar.*)

I HAVE the honor to report that during the year 1889 I issued 4 miners' rights, 2 mineral licenses, and 1 business license. Some prospecting has been done in various parts of this division, but I have not received any reliable information as to the results. During the year 1888 a number of mineral leases were applied for, and I anticipated that a large amount of work would have been done during last year; but as the applicants for these leases failed to execute and take delivery of them, I presume that the prospects were not of an encouraging character.

With reference to gold-mining leases No. 88-1, 88-2, and 88-3, situate in the parish of Bunton, I have to report that the original lessees transferred their interest to a Company known as the Dalton Gold-mining Proprietary, and this Company has erected quartz-crushing machinery on the ground, and done a great deal of work in sinking and raising stone, but have been unable to carry on crushing operations in consequence of a scarcity of water. The value of the machinery erected in connection with the gold-mining leases referred to, is about £1,600. The Company have constructed a large reservoir for the storage of water, for the working of the machinery, but little or no rain has fallen since the work was completed.

## SOUTHERN DISTRICT—ARALUEN DIVISION.

(*E. F. Carlile, Mining Registrar.*)

REPORT for 1889.—Some of the claims mentioned in my last report as having been filled with sand by the flood at the end of 1888, have not been reopened, consequently the yield of gold during the early part of the year fell off considerably; but after two or three months the claims that were at work got into full swing again, with the result that, as far as I can ascertain, gold to the amount of 3,020 oz., valued at £11,627, has been won during the year, which is a very fair return for the time actually occupied in washing (2,860 oz. 15 dwt. from alluvium, and 159 oz. 5 dwt. from quartz). The largest claim

claim has ceased work for two or three months, having come upon a bad patch, but has reopened in a different part of the ground with the new year. If successful, this will mean an addition of fifty or sixty men to the number employed. Two or three of the other claims have opened out more extensively, and during the last few months a Sydney syndicate has been engaged in a new venture of laying stone-ware pipes for a drainage race, with the intention of working a large scope of ground supposed to be payable, which, if according to expectation, will also give employment to a large number of men. Very fair progress has been made with this work, and a considerable patch of drift in the line of race has been washed with good results.

In explanation of the discrepancy which occurs in the quantity of gold reported as being won in Araluen and that credited by escort, I may state that the gold purchased by the bank here is taken to Braidwood, and enters into the returns from that town to our apparent detriment.

Rather more quartz-mining has been done at Bell's Creek than in the previous year, and with better results; the quantity of quartz raised and crushed being 205½ tons, with an out-turn of 159¼ oz. gold, showing an average of 15½ dwt. to the ton, as against 11½ dwt. before.

With the proverbial hope of gold diggers, anticipation of a fairly successful year is indulged in.

#### SOUTHERN DISTRICT—LITTLE RIVER DIVISION.

(*J. P. Galway, Mining Registrar.*)

I HAVE the honor to forward report and returns for past year 1889.

Alluvial-mining has been retarded from the limited supply of rain during the year, which was not sufficient to give the race owners a chance to make up for previous droughts, and the supply, though large enough for agricultural purposes, gave only a few weeks work to the sluicing parties.

Quartz-mining has advanced, and is now the chief source of employment here, and from all appearance will be permanent.

The Day Dawn Gold-mining Company have completed the erection of their extensive plant, and having got over a large amount of dead work are now in a position to fully develop their valuable property.

A new shaft, 12 feet in length by 472 feet, is being sunk, and will be continued to the depth of 250 feet, this will give 120 feet of backs, the present workings being 130 feet in depth. During the year, they have raised and crushed 1,820 tons of stone, yielding 910 oz. of free gold and 45 tons pyrites, assaying 6 oz. per ton.

The reef shows for over 300 feet on the floor of the lowest level, in width averaging 36 inches, and gold visible in the stone.

The Day Dawn Reef clearly proves that the Little River Reef only requires to be sunk below the present water-level (which is generally 50 feet) to become permanent, and I have no doubt that during the present year a great impetus will be given to quartz-mining in this division.

On several leases taken up in 1887, 1888, and 1889 no work has been or is being done.

11 gold leases have been applied for during the year, 156 miners' rights, and 3 business licenses issued.

#### SOUTHERN DISTRICT—NERRIGA DIVISION.

(*P. J. Galway, Mining Registrar.*)

THIS division has become a large mining centre, both for alluvial and quartz during the past year, and several mining investors from Sydney and Melbourne have visited the division. After careful prospecting many were convinced that this field only requires capital judiciously expended under skilled management to make it one of the premier gold-fields in the Colony.

Messrs. Farmer and party, after careful prospecting of the Shoalhaven River, at the Horse Shoe Bend, with the assistance of a professional diver, have secured 40 acres for alluvial mining, and are cutting a tunnel through a neck of land for the purpose of diverting the river, thus partly draining some 4 miles of the river-bed, and protecting their workings from freshes coming down the river. A water-race to convey 24 heads, is being formed from the Bewlay or Endrick River to alluvial workings, at Peggy's Hill.

The formation of the ground necessitates a dam at the head, 50 feet high, and a further embankment of 10 feet will be raised to act as a reservoir for surplus water so as to keep a constant supply in the race, which will be 14 miles long.

Some distance down the river, and taking in a branch creek, a Victorian Company are preparing to cut another race, 6 miles in length, to White's 50-acre lease at Primrose. A dam, 40 feet high, will be required.

Turnbull & Co.'s alluvial lease, near the Dalton Crossing, gives most encouraging prospects and the Company are making preparation for efficiently working the ground. Steam-pumping machinery will be required for working the claim.

Some extensive work in forming dams and fixing pumps, worked by steam, has been done on portions of the Shoalhaven River with the intent of working the bed of the stream, but an unexpected rise in the river swept away the work of months.

The Gorang Sluicing Company have extended their race to the Shoalhaven River, near Ningi Nimble Creek, and have been sluicing for some time, the water is beginning to slacken. The Company will have to erect a reservoir before a constant water supply will be obtained.

With the exception of some additional surveying and marking course of proposed race no work has been done on the Shoalhaven Hydraulic Company's leases, and the same remarks apply to the different alluvial leases on the west bank of the river.

The Nerriga Freehold Company have a shaft 130 feet in depth, through the basalt belt which runs along the foot of the Buddawang ranges and crosses the Shoalhaven River, all alluvial work, from 5 feet to 7 feet thick underlies the basalt, and for a length of 250 feet of driving gives 3 dwt. to the load. The lead has not yet been crossed, but the prospects to the east are improving. The Company are also putting down a second shaft to further test the ground. The water is very heavy. This venture, if successful, will open up a large extent of ground for deep sinking, as the basalt belt can be traced for miles on both sides of the river.

Very

Very little work has been done on any of the quartz leases taken up. A 10-head battery and 20-horse-power engine have been erected at the reefs known as the Welcome, but after the treating of some 300 tons of surface stone the Company have parted with their interest to a new Company who are commencing work in earnest.

At Mountainy another 10-head battery is erected. As this is a Victorian Company, and having secured interest in the different leases in the vicinity of their own property, work will be commencing generally at once. A second battery of thirty head of stamps, to be driven by water power, and to be erected on the western side of the river is daily expected. 15 quartz, 5 alluvial, and 3 special alluvial leases were applied for during the year, and 77 miners' rights issued.

#### SOUTHERN DISTRICT—MAJOR'S CREEK DIVISION.

(*J. Heazlett, Mining Registrar.*)

DURING the year 1889 very little progress has been made in the alluvial working, and with one exception the same may be said of quartz-mining. No new finds having been discovered, the claimholders are depending entirely on rainy seasons to help them along. And strange as it may appear, last year, although a wet season in some parts, has been no better than previous years, there not having been enough water at any time to do more than fill dams, and very often not sufficient to do this. At Long Flat, where the ground is more suitable for the storage of water, the puddling machines have not been at work constantly (see tabular form herewith); the owners were not, however, at any great disadvantage, they having obtained employment from the Company, and the same may be said of the miners on the main creek.

I have sold 41 miners' rights, as against 45 during 1888, being a decrease of 4, but is even with the year 1887, when I sold only 41. I have sold 2 mineral licenses as against 18 during 1888, and such a falling off may be attributed to the apparent partial failure of the Wyambene Silver Mines, I have used the words (partial failure) believing with many others that the said mines will be worked to advantage in the near future.

By comparing the yield of gold from alluvium with that of 1888, I find an increase of 18 oz. 1 dwt. 21 gr. which goes a little way towards proving that this field is not yet exhausted, provided the means of working the ground could be got at, viz., the Shoalhaven water, and this being impracticable, miners must rest satisfied with what moisture nature sends them.

Quartz-mining.—Nothing outside of the Company has been done in this line. The Snobs Reef, on Big Hill, is still unworked, and has been so for nearly nine years, true that on two occasions a small quantity of stone has been taken from it, with a view of testing its quality. I have heard much grumbling by the diggers, who say that men should be compelled to work their claims or leaseholds, otherwise giving up the ground so that others could try it.

There are a few other reefs or veins showing good gold, but, being narrow, it is thought they would not pay for the taking out where hard rock and water has to be contended with; but the time may come when a further trial will be made, more especially when it has been proved beyond a doubt that the gold can be extracted from the pyrites, and that too on the ground, which will soon be the case—at any rate, there is a probability of it, *i.e.*, judging by the show the Major's Creek Proprietary Gold-mining Company has made by the erection of chlorination works, which are on the verge of completion. This Company has erected extensive crushing and grinding machinery, consisting of stone-breaker, two grinding-mills, with Duncan concentrators, Frue vanners, &c., capable of putting through about 350 tons per week (for further details see tabular form herewith). One of the mines being worked is situate on the Old Commissioner's Hill, but now known as the United Miners, and from which a truck line has been laid down to the mills, so that wet or dry stone can be conveyed to the mill—not so when it had to be carted thither—the distance between the claim or mine and the mill is about 400 yards. The main shaft is over 200 feet deep, and levels cast and west have been driven at a depth of 120 feet. At present a winze or air-shaft is being sunk to meet the western level at a distance of about 260 feet from the main shaft. As yet this mine is being worked by horse-power machinery (for particulars as to width of vein or lode, see tabular forms). Dargues Reef is distant from mills in an easterly direction about 800 yards, and from which a truck line is being laid down with all speed, and when completed it is expected there will be no stopping of mill for lack of stone, as has been the case with the horse and cart arrangement.

The chlorination works are placed near Dargues Reef, but it is thought this will not cause much, if any, inconvenience, as when trucks leave their loads of stone at the mills they can take a return cargo of pyrites to the furnaces. (Details as to width of reef, depth of shafts being sunk, winding gear, &c., will be found in another form herewith.)

As regards a supply of water the situation of the mill is a good one, and taking all things as a whole, a good start has been made by this Company, and it is the wish of the creekites that the venture may turn out a success, by finding plenty of the precious metal to recoup for such a heavy outlay, and should it fall to my lot to make another report, I hope it will be in my power to speak as I wish it to be, viz, a successful business.

#### NUMBER of days on which rain fell during 1889 :—

Total .....		109	Total .....	70

During the year 1888, we had rain on 57 days, and 106 frosty nights. Very often the rain amounted to a few drops only.

SOUTHERN

## SOUTHERN DISTRICT—BRAIDWOOD DIVISION.

*(C. E. Oslear, Mining Registrar.)*

I HAVE the honor to inform you that, as far as I can ascertain, there has been little or no progress in mining in my portion of the district during the past year, with the exception of some alluvial diggings on private land at Jembaicumbene, and which so far has shown good results, but being of a patchy nature it is very doubtful if they will be of a permanent character.

## SOUTHERN DISTRICT—GOULBURN DIVISION.

*(O. A. Willans, Mining Registrar.)*

I HAVE the honor to forward my annual report for year 1889.

Mining in this district (from what information I can gather) is more of a prospecting nature. There is a falling off in gold and mineral lease applications, also of miners' rights and licenses, as compared with 1888.

Gold lease applications for 1889, 15; for 1888, 19. Mineral lease applications for 1889, 1; for 1888, 20. Miners' rights for 1889, 95; for 1888, 217. Mineral licenses for 1889, 12; for 1888, 79. Business licenses for 1889, nil; for 1888, 4.

With reference to your circular of 1st July, 1889, I beg to state that I sent circulars to Mr. Gegg and Mr. Armstrong; their replies I now enclose.

## SOUTHERN DISTRICT—BOMBALA DIVISION.

*(W. A. Dovers, Mining Registrar.)*

I HAVE the honor to tender my report as Mining Registrar, &c., for the Bombala Division for the past year, and in doing so am glad to be able to say that the mining industry is showing every sign of a prosperous future in the coming year.

I have long regretted the perfunctory way in which the mining has been conducted in the past, and the many rich places either merely worked in a desultory manner or left untouched for want of enterprise and capital. This last year, however, the miners have worked fairly steadily at the claims which were in existence in 1888, but the heavy rains of the winter and spring practically suspended work for some months.

The Delegate River Gold-mining Proprietary will start work on their new claims at Nelbothery in about four months; they are now busy getting machinery and preparing the ground.

There were 36 registered claims and 5 leases applied for during the past year, and water-races of sufficient volume to work them.

Miners as yet hardly recognize the facilities now existing for mining on private property, but some have already taken advantage of them.

Fifteen business licenses, 5 mineral licenses, and 33 miners' rights have been issued for the year 1889, and the amount of gold bought by the local banks was 216 oz. 10 dwt. 13 gr., at a price of from £3 15s. to £3 17s. 6d. per oz.

A rich find of tin has occurred on the Tantowanglo Mountain. Messrs. F. and C. Wiles having found a swamp richly charged with fine stream tin, this and the twelve extended alluvial claims at Nelbothery are only just starting into existence, but a rich return is expected.

## SOUTHERN DISTRICT—NERRIGUNDAH DIVISION.

*(D. T. Stinson, Mining Registrar.)*

I HAVE the honor to submit my report for the year 1889 upon the Nerrigundah Division of the Southern Mining District. Quartz-mining has made very little progress during the past year; the cause may be attributable to the majority of the mines being in the possession of persons not possessed of the capital to develop them.

The Christmas Box, Ocean View, and Golden Crown Quartz Mines have been disposed of to a wealthy Melbourne Company, who are about to erect a 10-head stamper battery, to be driven by a 25-h.-p. portable steam engine.

The Wandella Gold Mining Company are erecting a small 5-head battery on their mine at Tin Pot. There has been no crushing from this mine during the year, as the nearest battery (11 miles) was too far to cart the stone, however, they have over 200 tons of stone at grass, which will be put through when the erection of the machinery is completed, and I have been informed on good authority that the stone will average from 1½ to 2 oz. to the ton.

The Nil Desperandum and Eureka Mines are sinking two shafts with aid from the Prospecting Vote; so far they have not struck anything of importance.

The Mount Coman Mine has been idle the greater part of the year, the manager informed me that one of the Company is in England endeavouring to float the mine in the English market, and from late accounts he has great hopes of being successful.

*Alluvial.*

A considerable revival in alluvial-mining has taken place during the past year, principally in ground which had hitherto been deemed unworkable, on account of the quantity of water. On North's Creek Chas. Daviage and party, Thos. Daviage and party, and M'Vitty and party are all getting payable gold—the last named party spent three months cutting a tail-race, in parts the race is cut through rock 6 feet in depth, by this race a large flat has been completely drained and is now being worked. Several other claims on Gulph Creek, and Deep Creek are getting payable gold.

During the year I issued 141 miner's rights, and 20 business licenses, 11 applications for gold mining leases were received representing an area of 55 acres.

Total amount collected for the year, £159 2s. 6d.

Total value of mining plant in division £18,500.

SOUTHERN

## SOUTHERN DISTRICT—BEGA DIVISION.

*(R. Frappell, Mining Registrar.)*

MINING for the first part of the year was very dull owing to the funds of the miners having been exhausted but the advent of the Prospecting Board infused new life into the district, and the participation in the grant has enabled several of the Companies to resume work and send prospectors out. A discovery of quartz reef near Pambula has been made by miners from this place, but being out of my division I cannot report on it. The Standard Company at Coen's Lake have their shaft down 24 feet and timbered, and are again sinking; width of reef, 3 feet 6 inches. The Black Range Silver Company's shaft is down 47 feet, still sinking, a cutting has been put in the hill some 50 feet granite rock. 20 tons of ore at grass which is untried, small assays from this mine have given from 50 to 100 oz. of silver to the ton, no lead. The Bega Prospecting Association have been reformed and tenders are called for sinking a shaft 150 feet deep at the Nelson, it being intended to give this old field a thorough trial, nearly all the alluvial miners have left this place for the new find, near Pambula. I trust with the aid given by the Prospecting Board to furnish a better account for the ensuing year.

Since forwarding my annual report to you on the 9th instant, I have learnt of some parcels of gold that have been sold, and I wish to add the same to my report.

Gold 16 oz., bought at £3 17s. 6d. per oz., this was a good sample of coarse gold, some of the pieces weighing from 6 to 12 dwt., it was obtained from the old workings in and around Tanja.

## SOUTHERN DISTRICT—YASS DIVISION.

*(G. Addison, Mining Registrar.)*

I HAVE the honor to forward my report for the past year, and regret to say that very little has been done with regard to mining in this district.

Messrs. Jones, Wilson, and Clifton have sunk four shafts on their mineral lease, No. 3, of 1888, portion 288, and succeeded in getting up a quantity of umber, of which they sent to England about a ton; but as the prices were so low in the home market (there being little demand at the time), the amount realized was very small, and the holders of the lease have applied, I believe, for permission to suspend work for six months.

During the year I have issued 25 miners' rights, and 5 mineral licenses.

## SOUTHERN DISTRICT—BERRIMA DIVISION.

*(P. E. B. Barnett, Mining Registrar.)*

DURING the past year the only gold-mining carried on in this district appears to have been by Dunstain and party (*vide* Mr. Dunstain's letter enclosed). I have been reliably informed that during the past three months three men have been employed, and have done a considerable amount of work on this lease.

In coal-mining the A. K. O. and H. Co. appear to have been actively employed, while very little work has been done by the Mittagong Coal Company (Limited) and the Great Southern Colliery. No work has been carried on by the Wingello Coal Company (Limited), *vide* enclosed return.

During the year some advance in the iron industry appears to have been made by Mr. Brazenall of Mittagong. The report of a successful attempt to cast an iron pipe from the crude ore is enclosed with the other return, which may be of value to the Department.

## SOUTHERN DISTRICT—EDEN DIVISION.

*(Stephen Woods, Mining Registrar.)*

I HAVE the honor to forward my second annual report upon the Eden Division of the Southern District, which shows that about twenty-eight miners are engaged principally prospecting for gold and silver, although up to the present scarcely anything has been won; still of late the prospects have improved, so as to attract attention from outside the district.

Two mineral leases are held, one by Alexander, at Lett's Mountain, working silver, is being opened up to prove the lode.

At Yowaka, near Pambula, four gold-mining leases have been applied for; shafts and trenches have been put into the ridges, disclosing a quartz pipeclay substance; a ton of the stone was sent by the applicants to Sydney; the result, however, is not known, the parties seeming unwilling to part with any information. During the year I have issued 40 miners' rights, and 4 mineral licenses, which is considerably beyond the number ever before issued in the district.

There are really no practical miners in the district, all being residents who took out rights to prospect.

## SOUTHERN DISTRICT—BURROWA DIVISION.

*(W. E. Wotton, Mining Registrar.)*

I HAVE the honor to forward herewith my annual report upon the mining industry of the Burrowa District. The most important work of the year has been in prospecting for silver at the Walla Walla Silver Mine, and about that locality. The ore raised has proved to be very rich, and assayers say it cannot be told from the ore from Broken Hill. Assays range from 150 to 325 oz. to the ton of silver, and about from 50 to 75 per cent. of lead. The Frogmore Copper Mine has just started again, and will continue if the price of copper keeps up. The main shaft is about 270 feet deep, and at the depth of 300 feet the largest lode which was ever seen at Frogmore is expected to be struck upon. The number of mineral leases taken up this year is 22; number of miners' rights sold, 12; mineral licenses, 33.

## SOUTHERN DISTRICT—CANDELO DIVISION.

*(P. Smythe, Mining Registrar.)*

I HAVE the honor to state for your information that there is no mining carried on in this part of the Southern Mining District. A little prospecting has been done, principally on private lands; but up to the present, so far as I am aware of, nothing was found worth your notice.

SOUTHERN

## SOUTHERN DISTRICT—MILTON DIVISION.

*(J. Rainsford, Mining Registrar.)*

I HAVE the honor to report that mining matters in the Milton District are very quiet at present, and, with the exception of prospecting for gold, no other quartz or alluvial workings have been started. I issued fifty-four miners' right during 1889; no business or mineral licenses were issued during the same period

## SOUTHERN DISTRICT—NOWRA DIVISION.

*(F. H. Galbraith, Mining Registrar.)*

TWENTY-SEVEN applications for mineral leases for coal and shale were lodged at this office during 1889 for an area of 13,103 a. 0 r. 32 p.; 1 application of a mineral lease for silver area, 70 acres; 26 applications for gold leases area, 186 acres; 89 miners' rights; 6 business, and 16 mineral licenses were issued during the same period.

## TUMUT AND ADELONG DISTRICT—GUNDAGAI DIVISION.

*(C. W. Weekes, Warden and Mining Registrar.)*

THE past year has not been marked by any unusual results in mining matters. Many of the leases applied for during the year 1888 have been already abandoned, after a fair amount of prospecting, principally for want of capital necessary for deep-sinking. Some alluvial leases were being worked on Hillas Creek, but the parties were obliged to desist from the heavy flow of water, caused principally by the excessive fall of rain in that district last winter. I anticipated good returns from these leases if the parties were able to successfully contend with the underground water. These leases have been obliged to suspend work until the dry season (now on) shall have decreased the water. This ground was tried more than twenty years ago and abandoned on account of the water. Unless the present parties can bring very good machinery to contend with the water they will come to the same result. These companies deserve every encouragement, as it is quite impossible for the "working miner" to command the necessary capital.

Quartz-mining, except in one or two small mines, has been almost at a standstill. It is very evident that the working prospector alone will never develop the lower levels in this district; it requires capital to sink through the supposed barren interval. I can see no reason why the reefs in this district should not carry a second and third run of gold, the same as occurs in other parts of the continent. There are scores of reefs in this district that gave handsome returns down to a depth of 100 to 200 feet, and were then abandoned, as the quartz would not pay any longer to mine at those depths. These should be all worth testing for a second run of gold. A reef known as the "Great Southern," on Johnston's Hill, Kimo Range, has been recently taken up after laying idle for more than twenty years. The lessees intend to drive a tunnel along the line of reef at a depth of more than 200 feet from the surface. As this mine was abandoned for financial reasons before the reef was tested, and just as the shaft was almost in sight of the reef, the present holders may be rewarded for their enterprise. The prospects all point to a rich pyritous reef at a depth.

The two parties who obtained assistance from the Prospecting Vote, viz., James Higgins, at Mount Parnassus, and Jesse Harford, at Kimo, have both abandoned the work after expending only a portion of the vote. The prospects after sinking a portion of the proposed depth not justifying them in proceeding. This proves the wisdom of the policy of allotting only one-half of the estimated cost of the proposed work, as the recipients will not continue to work on half-wages, unless the prospect gives some justification. I have not had an opportunity of officially visiting the more distant parts of the district now under my supervision, but I hope in the view of the proposed new departmental arrangements to be enabled to do so at an early date. The large area taken up for silver in the Tumut District remains undeveloped for want of capital at present. Several mineral licenses have been taken out in this district with a view to develop the large deposits of magnesian limestone, commonly termed "marble," that exist in several places around Gundagai. The lime produced is of a superior quality, and this industry is worth fostering. I regret to say the slate quarries at South Gundagai are still idle. The material is there in unlimited quantity, and excellent machinery has been erected. Here again the old cry of "more capital" is heard, and the property lies undeveloped. For more detailed information respecting the Tumut and Adelong portions of my district, I would refer to the reports of the local Registrars—that from Adelong being especially full and interesting.

## TUMUT AND ADELONG DISTRICT—TUMBARUMBA DIVISION.

*(T. F. Makinson, Warden.)*

THE principal mining event of the past year has been the opening up of the deep lead under the basalt by R. D. Mathews and party at the reserve set apart for them on Tumbarumba Creek, about a mile below the town. This party has had aid from the Prospecting Vote to the extent of £650, and has expended a much larger sum of its own. At a depth of 98 feet the granite bottom was struck, having over it about 3 feet of wash, in which a little fine gold was found. This last was overlaid with about 2 feet sandy drift, which, in turn, was covered by a layer of lignite some 15 inches thick. The wash was cemented together by pyrites, and came out in blocks. About 300 feet of drives have been put in, mostly in the wash, but no payable gold is reported yet. The south-west drive has not yet been put in as far as the slate country, as recommended by Mr. David, of the Geological Survey, and later by Mr. Anderson of the same branch, and the wash eastward of the shaft has yet to be explored. If this lead should at Mathews and party's shaft be proved payable, and everything points to such a result, about 20 miles of the same ancient stream-bed is available for working from Bago to below Tumbarumba, and a very large mining population would be profitably employed. It is to be hoped that the lately published valuable report of Mr. Geological-Surveyor Anderson will receive the fullest publicity, especially at Ballarat, so that mining enterprise may be directed to this locality. It is thought, and perhaps with reason, that the Prospecting Board would be justified in going to a very considerable expense in having this deep lead thoroughly tested. So far, it is evident, intelligent and experienced direction has been wanting, and it is to be hoped that in future frequent inspection of the workings will be made by Government Mining Inspectors.

The

The silver-lead deposits at Coppabella still remain unworked. The show there is good, and a much less promising outcrop existing in the Broken Hill country would immediately attract plenty of capital and enterprise for its development.

Butler's tin lease at Jingellic has been worked, and some ore raised, which proved highly payable. I am informed that operations on an extended scale are about to be commenced.

The only gold reef at which work has been carried on is that of Storey and party, at Paddy's River. A long race has been cut to the machine site, where a five-head battery is in course of erection. This reef is known to be payable.

Sluicing for gold has been carried on with fair success, Watson Bros., on the Tarcutta, Krauss at Bago, the Burra Co. at Burra, and Heinecke at Upper Tumarumba having been notably successful.

At Bald Hill, Messrs. Rolfe and Moorhouse are still driving under the basalt for a deep lead, and it is just reported that they have struck a sandy drift and expect to have wash soon.

As nearly as can be ascertained the yield of gold in this division for 1889 has been 1,210 oz. A small quantity of stream tin has been raised.

Issued at Tumarumba:—Miners' rights, 316; mineral licenses, 6; business license, 1.

#### TUMUT AND ADELONG DISTRICT—ALBURY DIVISION.

(*T. A. Brown, Warden.*)

I HAVE the honor to furnish my annual report upon the state and prospects of mining in the Albury District, and, in doing so, feel compelled to regret that the success of mining operations has not been in accordance with the expectations with which the year 1889 opened.

Not that, as will be seen by the proportion of gold to the stone crushed, the yield can in all cases be considered poor; but, either from difficulty in raising, the want of first-class machinery, or other reasons, the gross proceeds have not kept pace with the expenses.

With regard to the Albury Gold-mining Company, which commenced with the purchase of Messrs. Pye and Wealand's claim at Mayday Hill, Black Range, no expense has been spared by the management to make the concern a paying one. Shafts have been sunk to a depth of 130 feet, and a large amount of driving executed. Nearly £10,000 have been spent upon developing the mine; but, at present, though work is still being carried on, the return must be held to have been so far inadequate.

With respect to the mine in the same locality, known as that of Meredith and party, the same comments may apply. The gold secured in the first "shoot" was extraordinarily rich. Sinking has been carried on for more than 100 feet. A portion of the subsidy granted for prospecting purposes has been received, but the present position of the mine cannot be considered as satisfactory.

The Bungowannah Mine, after being relinquished by the original Company, has again made a commencement on terms, under the management of Mr. A. Joubert. The percentage, so far, has been small, 450 tons having yielded 35 oz.; but, as the conglomerate in which the gold is found is abundant, it may yet become a paying concern.

At Hawksview, on private ground, Mr. Pollinghome has crushed 35 tons for a yield of 42 oz., and on Mr. Smith's property 44 tons have yielded 53 oz. The yield in this locality is invariably good; it is not, therefore, unlikely to develop into an important centre.

At Germanton, 40 miles from Albury, prospecting operations are being carried on, but no find of any importance has been reported.

On the Nine-mile Reserve Messrs. M'Arthur and party have crushed 2 tons for 3 oz.; Wilson and party, 10 tons for 29 oz.; Hanson, 8 tons for 31 oz. At Yarara little or nothing has been doing.

The number of business licenses is the same as that of last year, while in miners' rights there is a falling off, viz., 97 as against 119 in 1888.

It is perhaps an encouraging fact that nearly all the crushings show a high percentage to the ton; but the desideratum in the mines of the district generally is a large body of stone, which, if not quite so rich, may be easily raised and treated. Until such deposits are demonstrated, the mining interests around Albury and throughout the district cannot be considered to be in a permanently payable condition.

#### TUMUT AND ADELONG DISTRICT—NARRANDERA DIVISION.

(*L. S. Donaldson, Warden.*)

NOTWITHSTANDING the plentiful rains of the autumn and winter of this year, the great expectations referred to in my report for 1888 have not been realized; clearly showing, either that the old stories of fabulous finds had no real foundation in fact, or, which is equally probable, that the gold found was merely a patch.

##### *Leases.*

The several leases applied for in 1887 at Temora, and issued in the early part of 1889, were all returned unexecuted, except three on a piece of ground spoken of as the old Belmore. In these cases very little real work has been done. Immediately the leases were executed overtures were made for a speculative sale. A deposit was paid, and the purchasers undertook to work the ground, but have not done so, although an application for suspension of labour conditions was refused.

##### *Miners' Rights.*

The number of miners' rights taken out in 1889 was the same as in 1888, namely, 49, but the number already taken out for 1890 is only 3.

##### *The Year's Results.*

The gold yield for the year is as follows: From Ferrier, Evans, and party's claim at Cowabbie, and from Aulezark's claim at the 4-mile, 200 tons, averaging only  $2\frac{1}{2}$  dwt.; and from Ferrier and Flood's permit at Berembed (known as the old Gladstone), 9 tons averaging half an ounce. Neither of these results is payable, in the latter case, owing to the distance the quartz has to be carted to the machine, and the quantity of work that had to be done to get the 9 tons of stone. If it had not been for the energy and perseverance of Mr. Ferrier, the whole mining enterprise in my division would have collapsed; and I fear he is not likely to recover his large outlay. The gold found is extremely light, and is not in sufficient quantity to justify the expense of special treatment. Mr. Ferrier has tried two or three methods without satisfactory result.

The

*Prospecting Vote.*

The work at Cowabbie, at Anlezark's, and also some new work by Grennell and party at the Seven-mile, beyond Cowabbie, has been assisted from the Prospecting Vote; but I do not regard this outlay as in any degree whatever advancing mining enterprise. No doubt it relieves the pockets of those who get the aid, but it cannot be said to have developed mining, as none of the work done can fairly be called prospecting. A far better use of the Prospecting Vote would be its expenditure (to the extent of half the cost) in putting down bores in localities not previously worked, approved of by the Government Geologist. If by this means new finds of gold were made, the country at large would benefit by the outlay. As it is at present, the money spent is simply a benevolence to a few individuals.

*Royalty on Gold.*

The royalty for the year is nil. No lease has been worked, and consequently no gold has been raised.

## TUMUT AND ADELONG MINING DISTRICT—ADELONG DIVISION.

(J. James, Mining Registrar.)

I HAVE the honor to transmit to you my annual report for the information of the Honorable the Minister for Mines.

Seven applications for gold-mining leases were recorded. Other business is as follows:—Issues of 145 miners' rights, and 4 business licenses. Registrations—4 conditional, 11 unsurveyed and 1 surveyed.

Quantity of gold forwarded by escort:—

	Oz.	dwt.	gr.
Commercial Banking Company .....	2,259	18	1
Bank of New South Wales .....	635	15	2
Total .....	2,895	13	3

In the above quantity 480 oz. from outlying divisions are included, hence the correct total for the Adelong division is 2,415 oz. 13 dwt. 3 gr., distinguished as follows:—

	Oz.	dwt.	gr.
Alluvial gold .....	1,771	13	3
Quartz gold .....	644	0	0
Total .....	2,415	13	3

The following crushing returns for the year 1889 have been kindly furnished:—

	Tons cwt.	oz.	dwt.
Reefer battery .....	432	0	324
Perseverance battery .....	380	0	320
Total .....	812	0	644

Gold-mining has been chiefly confined to old ground, and the year has closed without any records of prospecting under the Mining Board Regulations usually so full of interest and expectation. The yield from alluvial takes precedence, the bulk coming from Mr. A. D. Shepard's lease. The proprietor is now beginning to realize the success he predicted, and as more powerful machinery and apparatus are contemplated and in course of erection, better hopes of larger returns are entertained next year. The workings of this lease were described in the report of 1888.

*Quartz-mining.*

The Lady Mary Company, Gap Reefs, Adelong, have the vote of assistance from Government of £1 per foot for 300 feet.

The Company have sunk 61 feet, for which assistance at above rate was granted. The present depth of the shaft is 214 feet. This mine is in good working order, having a winding and pumping engine valued at £500. Nine men are employed. The quantity of ore raised during the year was 155 tons, which yielded 124 oz. 5 dwt. 2 gr., value, £461 16s. 8d.

The Company were compelled to drive through to Crown claim for air, and put in level at 185 feet from main shaft to the south, and at a distance of 251 feet holed through to winze in Crown claim. There is now abundance of air, and sinking will be resumed in the main shaft.

Mr. A. W. Molineaux, mining manager of the Perseverance and Great Victoria Companies, reports that during the year 380 tons of quartz were crushed at the Perseverance battery, for a yield of 320 oz. smelted gold.

The following crushings were from the Great Victoria Company's mines:—

	Oz.	dwt.	gr.
29 tons, yield .....	40	13	0
17½ " " .....	33	2	12
8 " " .....	21	5	0
15 " " .....	14	10	0
50 " " .....	34	5	0
14 " " .....	18	19	0
21 " " .....	29	14	0
44½ " " .....	46	0	0

Being a total yield of 238 oz. 8½ dwt. from 199 tons. The remainder of the crushings came from various mines on the hill.

During the early portion of the year, the Perseverance Company confined their operations to the old line of reef, prospecting in the Adelong mine and in the ground known as Our Own. No good resulted from either of these places, and the manager is convinced that the only probability of meeting payable stone in these leases lies in sinking, as the shoot of white stone in which the workings are at present confined, must be pierced.

About the middle of September, the Company determined upon resuming work in the north shaft in the Little Victoria lease which was accordingly baled out. A drive was put in 50 feet to an old shaft to the north for the purpose of ventilation, and work was then started in the south drive at the 130-ft. level which had been previously 84 feet. Good stone was met with almost immediately, but it has continued small though driven on for about 50 feet. A couple of stopes were also started above the drives. The manager anticipates having some payable stone to work on to enable him to sink the shaft and prospect at a deeper level.

At the Great Victoria Company's Mine work during the year has been exclusively confined to the tributors, of whom there have been fifteen employed with results satisfactory to themselves.

Mr. K. A. M'Kenzie Clarke, mining manager for the Proprietary and Currajong Gold-mining Companies reports that for the former Company, 101 tons of quartz were crushed, yielding 195 oz. 3 dwt. The last parcel treated yielding 3 oz. 5 dwt. per ton. The shaft is 280 feet in depth, and the deepest level 258 feet. The Company employs fifteen men. The vein is situated in a diorite dyke and is heavily charged with pyrites. The quartz is reduced by the ordinary battery process, and the only method of saving the pyrites is with a buddle. The mine was only worked six months for the year, and during four months of that period six men were employed.

The latter Company have employed six men. The work done has been cutting down and timbering engine shaft to the depth of 160 feet, and baling 60 feet of water out of the mine.

In conclusion it may be remarked that active mining operations are anticipated from all the companies noticed in this report, and should other additional ventures transpire in 1890, a better record may be looked for.

The machinery at work and idle in alluvial and quartz mining during the year is estimated to be the same as 1888.

#### TUMUT AND ADELONG DISTRICT—JUNEE DIVISION.

(A. Elliott, Mining Registrar).

##### *Eurogilly.*

In February last a slight rush took place in a gully adjoining M'Donald's Wantabadgery Station. A number of shafts varying from 50 to 125 feet were sunk in the alluvial, and a little coarse gold obtained, but not sufficient to pay working expenses. Consequently the ground was abandoned. Although the results obtained were not up to expectations, I am of opinion that far more satisfactory results would be obtained by sinking farther up the gully in M'Donald's conditional purchase land.

During the past few months Lynch and party obtained from the Pioneer Claim 21 tons of quartz, which yielded 53 oz. 7 dwt. 13 gr. Other parties have also obtained and crushed quartz from this claim, but I have been unable to ascertain the quantity, although I wrote to the manager some time ago in reference to the matter.

William Holland reports having obtained from his lease of 10 acres 26 tons quartz, which yielded 52½ oz., 15 oz. of which were sold at £3 10s. 6d., and 47½ oz. at £3 17s. 6d. per oz. Depth of shaft, 40 feet; width of vein, 8 to 10 inches.

##### *Wantiocl.*

W. Garland (Fincher and party), aided by the Government, after prospecting for some time in the quartz and found and reported payable gold, have applied for a lease of 25 acres. A shaft has been sunk to a depth of 141½ feet.

Hawthorne and party report having raised and crushed from their gold lease 99 tons of quartz, which yielded 35 oz. 14 of which were sold at £3 12s., and 21 at £3 17s. 6d. per oz.; total value, £131 15s. 6d. Depth of shaft, 90 feet; width of vein, 6 to 18 inches.

A number of other reefs are being worked in this locality, which bear a low percentage of gold, and when found in any quantity it is contained in leaders or veins which pinch out. I am of opinion that good results would be obtained by deeper sinking.

##### *Junee Reefs.*

M'Grath and party having received aid from the Prospecting Vote, have been prospecting in the alluvial at Specimen Hill. A number of shafts have been put down, and a little coarse gold obtained, but not in payable quantities.

During the year I issued 102 miners' rights and received 6 applications for gold-mining leases, representing 71½ acres. I have also received a number of applications for extended quartz claims.

The gold returns kindly supplied by the managers of the Bank of New South Wales and the Union Bank show that during the year they purchased 31 oz. 17 dwt. 23 gr. from alluviums and 196 oz. 13 dwt. 15 gr. from quartz. Total value, £838 1s. 7d.

The alluvial gold brought £3 18s. 9d. per oz., and the quartz from £3 12s. 6d. to £3 13s. 3d.

#### TUMUT AND ADELONG DISTRICT—COOMA DIVISION.

(J. B. Spence, Mining Registrar.)

I HAVE the honor to furnish you with my annual report of the Cooma Division of the Tumut and Adelong Mining District for the year 1889.

258 Miners' rights, 2 business licenses, and 11 mineral licenses have been issued.

12 gold leases have been applied for, comprising in the aggregate an area of 80 acres; and 5 mineral leases, totalling 160 acres.

##### *Gold.*

No fresh discoveries have been made during the year, but work has been diligently proceeded with at most of the diggings.

At Colinton a 5-head stamper battery has been erected by the different claim holders. The several crushings made yielding from ½ oz. to 5 oz. per ton. The original prospector, N. W. Quigg, and No. 1 North are still the only ones who have struck the reef, and about £1,000 worth of gold has been won by these two parties. Messrs. Welch and party, who have spent a lot of money in prospecting this place, are now sinking on the east side of No. 1 North, and expect to catch the reef at about a depth of 100 feet. At present they are down 45 feet in very hard ground. No. 1 South (R. Swan) are sinking a shaft on the hill, and are down 170 feet, but have not yet struck the reef. The

The Fiery Creek diggers have kept Mr. Hart's 4-head stamper battery busy. The yields averaging from 18 dwt. to  $1\frac{1}{2}$  oz. to the ton, but the miners all say if their stone received better treatment the returns would be much larger, as the gold is very fine. At present most of the claims are under suspension of the labour conditions, pending the result of work being done by Messrs. Goodwin and party, who are aided to prospect by the Government to a depth of 200 feet. They are now down 60 feet from the surface.

At Cowra Creek, which is about 3 to 4 miles north of Fiery Creek, Messrs. Maxwell and party erected a 5-head stamper battery, and, I am informed, have made several small crushings, yielding from about 12 dwt. to 1 oz. to the ton, but owing to the battery having recently changed hands, I have not as yet received correct returns. Several gold leases have lately been executed at this place, and the several lessees are negotiating with a Ballarat expert with the object of amalgamating and forming a big Company, suspension of work having been granted to them for that purpose.

*Michelago.*—The gold leases of Messrs. O'Leary and Lyons are now under suspension pending the floating of a Company, which, I am informed, is near completion. Two shafts have been sunk to 100 and 96 feet respectively, from which a sample crushing of 6 tons yielded 4 oz. 16 dwt.

Silver-mining has been very quiet. At Bredbo, Messrs. Grant and Duddle have sunk several shafts with fairly encouraging results from assays. Mr. R. Goode has received aid from the Prospecting Vote to further test his 50-foot shaft, and is about to recommence work. At Little Plain, Messrs. Foster and party have sunk several shafts, and are about commencing to further test one of them under Government aid. The Big Badja Company have also been aided to prospect, but have not yet commenced work.

The total value of mining plant in this division is £2,300.

#### TUMUT AND ADELONG DISTRICT—REEDY FLAT DIVISION.

(*J. T. Hely, Mining Registrar.*)

I HAVE the honor to submit my annual report for the year 1889, as under:—

Miners' rights, 82; business licenses, 5.

I am very sorry to state, mining has been very dull since the middle of the year, and seems to be getting worse.

A 5-head battery has been erected here at considerable expense by a Company of local residents to test the reefs. Some four or five were tried, and about 105 tons put through, but, none of them coming up to expectations, have been abandoned, and the battery is now lying idle.

The amount of gold won during the year has been 440 oz., valued at £1,690.

The great drawback to this place is want of capital to sink the reefs and test them at a greater depth.

#### TUMUT AND ADELONG DISTRICT—CAPTAIN'S FLAT DIVISION.

(*T. Canning, Mining Registrar.*)

I MAY state a great amount of work has been done here and capital expended by the erection of machinery at the Commodore, Vanderbilt, and Kohinoor Company's mines.

At the Commodore Mine work has been carried on most successfully; 700 feet of drives have been put in tunnels, developing a large amount of oxidized ore, which is being delivered at furnaces for treatment. A main shaft has been sunk to a depth of 100 feet below levels of tunnel, at which point a cross-cut was driven to lode a width of 34 feet, composed of dense iron pyrites. A drive was put along its course for a distance of 82 feet south, and rise put up 40 feet, when decomposed cuprififerous pyrites of a payable character was struck. Drives have been extended along this ore 80 feet north and 90 feet south; cross-cuts have been put in from each drive to hanging-wall, proving width of decomposed ore 13 feet. There is now in sight 6,000 tons, which can be easily mined. Furnaces for treatment of said ore will shortly be erected, when a more prosperous future is predicted.

At the Vanderbilt Mine work has been chiefly developing a chute of ore below tunnel levels by sinking blind shaft to a depth of 116 feet. The water being too strong, was compelled to discontinue and connect blind shaft with surface, a height of 80 feet. This work has been performed and whim erected; further development will commence next year.

The stability of the mines is marked by the erection of two 60-ton furnaces, 30-horse-power engine, and 2 boilers, 1 multitubular and 1 cornish.

The above furnaces are capable of treating 500 tons of ore per week, and the consumption is being kept good from the different mines. During the holidays the works were closed down; everything seemed in first-rate order, and a most extensive supply of coke, fluxes, and ore on hand.

The mines and general management are under the supervision of Mr. Joseph V. Thompson; smelting department under the supervision of Mr. Levine, assisted by Mr. Grono.

Quantity of ore smelted, 4,704 tons, for 62,452 oz. of silver, 740 oz. of gold, 162 tons 9 cwt. of lead, value £15,805; ore at grass, 2,000 tons, value (estimated) £9,000. Total quantity of ore raised during the year, 6,704 tons, £24,000 total value.

#### *Kohinoor Gold and Silver Mining Company (Limited), Captain's Flat.*

During the past year smelting has been carried on more or less continuously. An extra water-jacket smelting furnace (30-ton) has been erected, making the total smelting capacity 50 tons per day. A reverberatory calcium furnace is being erected to treat the sulphide ores. The mine has been opened up, and a new main shaft sunk to a depth of 100 feet. A large body of silver ore is now in sight. In connection with the large body of gold-bearing ore formerly opened up, a mill, containing twenty head of stampers and a 5-foot Huntingdon mill has been erected, and the stampers are now at work with payable results. The Huntingdon mill is expected to start early in the new year, and the ore in sight is calculated to keep this plant in work for over two years. The silver ore is very refractory, and the high price of coke makes smelting very expensive, but it is hoped that the new furnace will enable a profit to be made. When in full work this mine employs about 250 men. Quantity of ore smelted during the year, 4,732 tons 8 cwt.; obtained, 54,511 oz. of silver, 70 tons of copper, 660 oz. of gold, and 215 tons 3 cwt. of lead, valued at £13,700. Ore still at grass, 200 tons; estimated value, £100. Total of ore raised during the year, 4,932 tons 8 cwt.; total value, £13,800.

Mr.

Mr. Edgar Hall, F.C.S., has full charge of the mine and smelting department; Mr. G. Rodda as underground manager, and Mr. S. Cullingworth as assayer. Great changes have been made at this mine lately for the better, and everything seems to work systematically.

*North Vanderbilt Gold and Silver Mining Company, Captain's Flat.*

I am unable to give a full account of the work done on the Company's leases, including 79½ acres rented by the Company from Mr. George Osborne, of Foxlow, owing to a Mr. C. Collens, mining manager employed by the above Company, leaving here some time during the month of August, 1889, leaving behind no record of work done during his (Collens') time in charge. Since August, 1889, a great amount of trenching has been done on portion of Mr. Osborne's 79½ acres. Nothing discovered. Shaft No. 2 at 110 level cross-cut extended east 2 feet, and 24 feet driven west in hard country. No. 3 shaft, 39 feet of sinking in hard dense country. Water very troublesome. Cross-cut driven east at 107-foot level a further distance of 15 feet, and level driven on course of lode 35 feet, which has not proved, so far, to be of a payable character. Also a new shaft has been sunk (No. 4) to a depth of 51 feet, cross-cut driven 60 feet, and blind shaft sunk on lode track 25 feet. Lease 126—tunnel driven 122 feet across the lode, showing decomposed diorites, carrying a quantity of pyrites containing silver and gold, and level driven of western wall of lode 69 feet, and shaft sunk 50 feet. Lease 116 and leases adjoining a great amount of trenching has been done. So far nothing payable has been discovered. Mr. John Hewett, late of Sandhurst, Victoria, is now in charge of this mine, and employs 15 men.

Constant prospecting going on, searching for payable mineral on the undermentioned leases:— Nos. 40 and 86, good indications of payable copper. Nos. 60 and 110, good indications of silver and lead ores.

Area of land applied for, 40 acres; miner's rights sold, 104; business licenses, 41; mineral licenses, 6; population, including juveniles, of Captain's Flat proper, 650.

TUMUT AND ADELONG DISTRICT—COOTAMUNDRA DIVISION.

*(A. J. M'Carthy, Mining Registrar.)*

I HAVE the honor to submit my report for the year 1889. During the past year I have issued 31 miners' rights and 2 mineral licenses. Two gold-mining leases have been applied for, one for 15 acres and one for 10 acres. I regret to have to report that the mining industry in this division is not at all in a progressive state, the Excelsior Reefing Company, at Muttama, and the Mount Morgan Reef, at Mooney Mooney, being the only parties actively engaged in quartz-mining. The former, for the year, has raised 154½ tons of quartz, yielding 128 oz. of gold. The latter party, consisting of 3 men, have raised 179 tons of stone, yielding 75 oz. of gold. The Excelsior employs 8 men. This party own a battery of 5 head, and an engine of 20 horse-power. Total value of machinery, £700. There are about 15 alluvial miners scattered through various parts of the division.

TUMUT AND ADELONG DISTRICT—NIMITYBELLE DIVISION.

*(H. J. Lea, Mining Registrar.)*

I HAVE the honor to furnish you with my annual report of the Nimitybelle Division of the Tumut and Adelong Mining District for the year 1889.

46 miners' rights and 2 mineral licenses have been issued in this office during 1889.

Mining in this division is very quiet, but it may improve during the year.

*Gold.*

David Kiss & Co., who were working a mine on the reefs at Kydra, have abandoned it.

Samuel M'Donald & Co.'s claim at Kydra has been idle for the last six months; they were granted a suspension of labour to enable them to float a Company to work the claim, but they were unable to do so. They have started work again, and they are of the opinion that they may come upon a good reef. They have received aid from the Prospecting Board to enable them to sink their shaft a further depth of 110 feet.

*Bismuth.*

Samuel Maxwell & Co.'s claim is situated a few miles from Nimitybelle, on the Colombo Road, which has been idle a long time; they have recently obtained aid from the Prospecting Board to enable them to sink their shaft a further depth of 80 feet, which they are at present at work on.

There are no alluvial diggings in this district.

Two gold leases were applied for during the year of 1889, amounting in the aggregate to 35 acres.

TUMUT AND ADELONG DISTRICT—NARRANDERA DIVISION.

*(J. W. Lees, Mining Registrar.)*

As requested by your circular letter of the 13th ultimo, I do myself the honor to forward herewith the returns asked for, showing the result of mining in this district; as regards silver, copper, and tin, to be nil.

The operations carried with respect to quartz-mining have been on a very meagre scale, the gross quantity of gold obtained being only 29½ oz., of the value of £103 5s.

The total number of miners' rights issued was 49, but of that number not more than a dozen were actually working upon the claims.

TUMUT AND ADELONG DISTRICT—ALBURY DIVISION.

*(C. A. Conley, Mining Registrar.)*

I HAVE the honor to report that mining matters have not been so brisk during past year as anticipated, but still there are several quartz claims at work and all getting gold.

Mining operations are being carried on at Hawkswiew (private property), Bungowannah, and Splitters Creek (also private lands), besides at Black Range, Nine-mile Reserve, near Albury, Four-mile Creek, Yarrara, and Germanton. Several

Several prospectors are scattered about the district, and in all some 53 men have found employment either in shows already opened up or prospecting.

I have nothing to report in alluvial mining.

The following is the number of miners' rights, &c., issued during 1889—miners' rights, 97; business licenses, 10; mineral license, 1.

#### TUMUT AND ADELONG DISTRICT—TUMBARUMBA DIVISION.

(*J. F. Mackinson, Mining Registrar.*)

THERE should be, in my opinion, a large forest reserve made about Coppabella, Ournie, and Jingelic, to provide firewood for the smelting works in connection with the silver-lead and tin-mining which in the future is sure to be carried on in the locality. The timber is being rapidly cleared off by ringbarking.

#### TUMUT AND ADELONG DISTRICT—KIANDRA DIVISION.

(*H. Redriff, Mining Registrar.*)

GENERAL report upon the state and progress of the mines in the district or division:—Dull in alluvial on account of want of water. Quartz waiting for assistance from Prospecting Vote, and consider splendid prospects here, but want of capital.

#### TUMUT AND ADELONG DISTRICT—QUEANBEYAN DIVISION.

(*C. J. B. Helm, Mining Registrar.*)

I HAVE to report a quiet year as regards prospecting, no new discoveries of importance have been made, but a large amount of work has been done in those mines that may be looked on as permanently established, in the way of developing them, and considerable sums of money have been expended for that purpose. At Brindabella the Goodradigbee Gold-mining and Sluicing Company have expended a sum of £5,000 in the construction of races and tunnels for sluicing purposes. Some sluicing has been done on the surface, and 50,000 cubic yards of earth has been washed giving 64 oz. of gold. Better results are expected at a lower depth. The extent of the alluvial ground is  $\frac{3}{4}$  mile in length, 600 feet wide, and 90 feet deep. At Mac's Reef the Goulburn syndicate are constructing a drive of 400 feet into the hill on their property. They are now in 380 feet, and have pierced through one reef 12 feet wide carrying some gold; 4 men are engaged on this property. At Michelago Lyons has a shaft down 104 feet on to a quartz reef 7 feet wide and has got gold. Cleary is down 96 feet on the same reef.

Some alluvial mining is being done on the Molonglo River, about 6 miles from Queanbeyan, by a party of three. A race has been cut through very hard ground and a dam constructed. The wash varies from 3 to 12 feet in depth, and shows gold freely, but sluicing has not yet been started. The expected visit of the Prospecting Board to this district was looked forward to by those who had made applications for a share of the Prospecting Vote to help in the development of their properties, as considerable sums have been expended in legitimate work, and great disappointment was felt when it was found that the Board had passed Queanbeyan by, although they stopped at places on each side of Queanbeyan, and granted aid to one party at least.

#### PEEL AND URALLA DISTRICT—BINGERA DIVISION.

(*Corbet Lawson, Warden.*)

I HAVE the honor to forward my annual report of mining operations in the portion of the Peel and Uralla Mining District under my observation.

##### *Bingera Diamond-fields.*

Some old hands have persistently worked on, with limited capital, obtaining very encouraging results in diamonds, and in some instances enough gold to pay working expenses.

The Adelaide Gold and Diamond Mining Company sunk a trial shaft some 130 feet, striking the wash under the basalt. The proprietors are so satisfied with results, that they have sunk and timbered a new shaft, now down 120 feet, and expect to strike the gravel at 150 feet. There is some prospect of a second company starting work on known diamondiferous deposits in adjoining blocks.

##### *Gold.*

The alluvial flat adjoining the town has twice been tested by the Gwydir Gold-mining Company, who erected pumping machinery, that successfully kept the water under; but the returns were so very small, that they abandoned the ground.

The Bingera Gold-mining Company (Limited) have purchased and reopened the All Nations' Reef, by sinking a new shaft 130 feet, striking the reef in several places; at the bottom of the shaft it is 7 feet wide. They have commenced stopping down, and have 60 or 70 tons at surface, of stone, showing a very fair yield of gold.

About 5 miles from the town a small alluvial flat has furnished employment to some 100 men for many months past, who obtained about 1,000 oz. Eighty men still continue there, many obtaining more than wages.

*Bobby Whitlow.*—A few miners still make a living, but the place looks deserted.

*Gympie Flat.*—Little or nothing.

*Spring Creek.*—Almost abandoned; some three or four claims working.

*Upper Bingera.*—Many of the old claims idle, but one or two good ones were opened with satisfactory results. Mr. J. Carnie has opened a reef in limestone formation. Several tons were forwarded and tested in Brisbane and Sydney, yielding an average of 4 oz. to the ton.

*Barraba, Ironbarks.*—In the early part of the year there was a stir in mining transactions, resulting in the formation of some companies, that have steadily continued operations. The Euroyra Gold Hydraulic-sluicing Company, have erected a powerful pumping plant to raise the water to the top of the ridges, to wash the adjoining lands by hydraulic-power. The Mount Moore Company have enlarged the old battery, erected improved ripples, known as Alve's patent concentrator and amalgamator; thus endeavouring

endeavouring to save more gold. They have about 300 tons of quartz at the surface waiting machinery, and have expended some £3,000 on the reefs. Several new reefs have been opened, in some cases yielding 3 oz. to the ton; another lot of 22 tons yielded 30 oz. of gold.

*Crow Mountain.*—Some Sydney syndicate has commenced work here.

*Tea-tree.*—Hughes' party are down on a reef known as the Black Mountain, 140 feet, on payable stone. The adjoining claim, Black Mountain North, have sunk a shaft, now down 112 feet. Reading's Old Reef again has changed hands, the new men are already at work.

During the past year a large number of leases were forfeited for non-fulfilment of labour conditions, in many instances these were retaken by fresh hands.

So far as I am able to discover, some 1,200 oz. of gold were forwarded from Bingera proper, besides other unknown quantities from various sources in this district.

#### PEEL AND URALLA DISTRICT—TAMWORTH, NUNDLE, AND BENDEMEER DIVISIONS.

(*John L. King, Warden.*)

*Tamworth Division.*—The year past has not seen any marked improvement in the mining industry in this division.

The tunnel which was being driven by Aitken and party at the beginning of the year (with aid from the Prospecting Vote), was abandoned on the 5th January, owing to a disagreement arising between the parties; only 82 feet of the 250 feet authorized having been driven. One line of reef was cut, but apparently a barren one. Two gold leases, of 25 acres and 12 acres each, have since been taken up in the locality. Some sinking has been done with encouraging prospects.

A prospecting party has discovered gold about  $4\frac{1}{2}$  miles in a north-east direction from Tamworth, and on the same line as Aitken's tunnel, but no defined reef, the gold being found in a decomposed ironstone lode, intermixed with broken quartz, varying from 1 foot to 3 feet wide.

Prospecting aid has been offered to King and party at Swamp Oak, also to J. K. Doyle, at Dunganwan, and work is to be commenced.

106 miners' rights, and 5 mineral licenses have been issued. Revenue, £144 1s. 3d.

*Nundle Division.*—Mining is still active. The reefs under the Hanging Rock have been producing good stone, Thompson's Reef and the Christmas Reef in particular. The former stone went nearly 7 oz. per ton from 12 tons, and the latter is expected to go  $2\frac{1}{2}$  oz., if not more. The former is worked by a tunnel 65 feet in, and a drive 25 feet; the latter by a tunnel 350 feet in. Many other reefs are showing good prospects. The Golden Chance, at the top of the hill, is down with a shaft 70 feet, and a drive of 40 feet at the 50-foot level; but nothing payable has been found. Dangars's Gully tunnel is in 415 feet, with a depth of 210 feet from surface; no cement yet. Mount Sheba sluicing claims are working well. The water supply is still sufficient, and the first cleaning up has commenced. It is the intention of the Company to extend their grants to Red Hill, where a trial shaft has been sunk 40 feet, showing gold freely.

The Peel River Gold-mining Company, lately formed to work Foley's Reef and John Bull Reef at Bowling Alley Point, are about to commence crushing, having completed their new crushing plant, consisting of one horizontal 30-h.-p. engine, Tangye; Cornish boiler, 27 x 6; and a 10-stamper battery. The Foley's tunnel is in 1,150 feet, and the reef has a mean thickness of about 15 inches. A winze is down 94 feet, from which the quartz is supposed to go from 14 dwt. to 17 dwt. per ton. A lower tunnel is being driven, which is in 80 feet, the entrance being an opening cutting over 100 feet in length. When far enough it is intended to tip the quartz obtained from the upper tunnel into the lower, and conveying it to the battery by trucks. This will save all cartage; 750 tons are now ready for crushing.

At the John Bull, the new air-shaft is down 80 feet, and the old level has been driven 58 feet, making a total of 209 feet; 60 tons are ready for crushing. Both these reefs have carried good gold, so the prospects of the new Company are very good.

The Carrington Reef and Anderson's Flat Alluvial are both being worked by Adelaide syndicates. The water in the latter being very troublesome.

Mr. Norris, the present owner of the cement works at Mount Pleasant, has sunk a shaft on lease 386,  $8\frac{1}{2}$  x 3, 245 feet, and several drives which are worked with a horse whim. The old tunnel is in 2,600 feet, with several drives. Mr. Norris is now following the gold wherever it occurs, instead of driving straight ahead, which was both expensive and unremunerative.

The prospectors at Nimble Nook and Swamp Creek, who were receiving aid from the Prospecting Vote, have knocked off without finding the supposed cement lead, and what cement was tested was not payable.

*Mount Ephraim.*—The manager has knocked off following the cement in the sandstone, and is now sluicing the top, as was done in the old days, with good results; but without a greater water power than at present, their execution is bound to be of little avail, the process being too slow.

In this division I have found that a great many leases are held without the labour conditions being fulfilled, and I attach a list of them. I believe, if they were forfeited, the land would be applied for in smaller areas, or as claims. It is impossible to arrive at the correct quantity of gold won in this division, as much of what used to be bought by the local banks and storekeepers, is now taken direct to Sydney.

227 miners' rights, 1 mineral license, and 8 business licenses have been issued. Revenue, £467.

*Bendemeer Division.*—Tin-mining is all that has been done in this locality. The large areas under lease are not efficiently worked, and the only tin raised during the year has been by holders of mineral licenses.

5 miners' rights and 16 mineral licenses have been issued.

#### PEEL AND URALLA DISTRICT—SCONE DIVISION.

(*W. F. Parker, P.M., Warden.*)

SINCE furnishing my annual report for the year 1888, I have the honor to state that a change for the better has taken place in gold-mining prospects in the division under my charge. Two new powerful crushing-machines have been erected—one at Stewart's Brook and the other at the Denison (Moonan Brook). At

At Stewart's Brook the lease held by Adams, Goodwin, and party has been formed into a Company, to be called the Ethel May Gold-mining Company, and a large amount of work has been done in sinking shafts and driving tunnels and levels, with very satisfactory results, the reef being large and in very easy country. A road has been cut to it from the main track at considerable expense. The Company are starting to erect a powerful battery on the main creek, half a mile away. A trial crushing of 100 tons of stone was put through the Royal Standard battery, with the yield of a little under 1 oz. per ton.

*The Royal Standard Mine.*—A large amount of work has been done in this mine, with very satisfactory returns, until the heavy rains suspended shaft work, rendering it necessary to erect machinery or else bring in a long cross-cut tunnel (some 700 feet). It was decided to proceed with the latter, as it would prove other lines of reef going through this ground. They are now in nearly 300 feet. The reef, in deepest workings, when overcome by influx of water, was larger and of more permanent appearance, and carried gold fully equal to anything hitherto obtained out of this mine. I consider that if the necessary dead work of putting in this low-level cross-cut had been started twelve months ago, and while the mine was returning such good dividends, that this mine at the present time would be showing better results than at any previous period.

*Imperial Standard Company.*—This mine has also been doing a lot of work with payable results before it, but was suspended for a considerable period during the wet season. Several shafts, tunnels, and levels have been put in, showing a well-defined reef in fairly easy country, and being so close to the main creek and battery, should be a thoroughly payable one. The crushings have averaged over 1 oz. to the ton.

The Royal Standard North have recommenced operations.

The Lady Maudc Company have done a good deal of work in their ground, but the wet weather suspended operations for a considerable period. A crushing from the claim went about 1 oz. 8 dwt. to the ton.

*The Wet Claim.*—Giro and party have done a lot of work driving a cross-cut over 250 feet and in sinking on the Dixon line of reef, it opening out to 2 feet wide, with excellent prospects, but the water has overcome them.

Bezzant and party are busy sinking and driving on the Standard line, but have also had much water to contend with.

The Maitland Syndicate (Wall, Harris, and party) have been carrying out some extensive operations in their leases, viz., in putting in two cross-cutting tunnels at the lowest levels in their leases to cross-cut the different lines of reef running its north and south boundary, and have already cut two reefs carrying gold, and are continuing these cross-cuts with increasing depth as each foot is driven to the east. They intend to put these tunnels through their ground, and thus be enabled to work the line of reef known as the Mountaineer, and which is expected to be in full working order in about two months' time.

At the Denison there are three crushing machines, and a fourth (a water power) in course of erection for J. M. Harle. Of these, one is newly erected, and ready for work, by the Newcastle Gold-mining Company (Limited), and is a powerful Huntingdon battery, with engine of 16-horse power. The second is the old water-power battery, a 10-stamper. This is the only machine that has done any crushing at the Denison during the past year, viz.:—211 tons of stone, yielding 270 oz. of gold, of the value of £600. The proprietors of this machine are about to have it repaired, and intend to erect a new water-wheel, and when completed it will be a great convenience to the Denison miners. The third machine is a small Marcolini Patent, used only for the trial crushings.

"Great Britain," Mountain Maid, and Giro's big reef at one level, show many hundreds of feet of backs.

The Grosvenor leases have changed hands, and work is to be resumed immediately.

Several other claims about this part of the field, viz., Dunn and party, A'Hearn, Fishers, and Mills have also done a considerable amount of work with varying results, but on the whole favourable. These claims are on the south field.

#### *The Upper Field.*

*Bluey Line of Reef.*—The claims on this reef, viz., the Maitland, Rose, Shamrock and Thistle, Collison's Horse-shoe, &c., have been formed into a Company under the name of the "United Bluey Gold-mining Company." They have erected a 10-head stamp battery (driven by steam) on the main creek, about 1½ mile from the mine, from which a good road has been cut and formed at considerable cost.

The large amount of work that has been done in this mine further proves the permanency, quality, and size of the reef, which shows an average of 3 to 5 feet of quartz, and with the advantage this Company have of putting in levels (600 feet of backs) in very easy country should prove a thoroughly good thing for its owners' crushings.

*Maid O'Galla.*—This claim adjoins the Bluey Reef Company on the south. They have two shafts down. Reef looks very satisfactory, and improves in size and gold as depth is attained.

*O'Neill's Reef.*—This reef shows very well, and the more work done goes to prove its permanence and gold-bearing qualities. The prospectors have a couple of shafts down, one 60 feet and the other 20 feet; reef showing 18 inches to 2 feet wide. They have a good body of stone at grass. The adjoining claims on this line, held by Cooper and party and Fisher and party, have also very encouraging prospects before them.

*Garry Owen or Wyndham Reef.*—Davis, Cook, Young, and party have a large well-defined reef in their ground at 50 feet in depth; it is 4 to 5 feet thick. The water is very troublesome, and has caused them loss of time. Adjoining them is Sparke, Carter, and party's claim and lease, which is being worked by tunnels. Some very rich stone has been obtained in this ground and good crushings made, the reef varying from 1 to 3 feet thick.

*Terry Gold-mining Company.*—Adjoining the last-named on the south is the Terry Gold-mining Company, operations in which commenced about two months ago. They have sunk a shaft 50 feet (besides a lot of surface operations) and driven north and south. At that depth, on the reef, which averages from 1 to 2 feet thick, some very rich patches were struck just before Christmas, and the bulk stone looks very well.

*Morning Star Reef.*—This claim, and adjoining ground, has been sold to an Adelaide Company, who are busily engaged proving the rich specimen shoot of gold. Numerous parties are busily engaged prospecting and proving other reefs and gold-bearing veins in the upper field with hopeful prospects.

#### *The Denison (en route from Stewart's Brook).*

*Cook's Patch Reef.*—A considerable amount more sinking and driving has been done on this line of reef, and a large amount of quartz raised; but the wet season has delayed operations here, similar to all others where sinking is the mode of work.

*Mount*

*Mount Pleasant or Farthing's Reef (Wall, Harris, Gillies, and Party).*—A good deal of labour has been expended in opening up the different reefs and veins in this lease (25 acres), all of which carry gold. These lessees are now busily engaged sinking a shaft to cut reef on underlay, which gave good results in trial crushings, and towards which the numerous veins adjacent to this reef (which prospects so well at outcrop) all trend. With the advantages this property has of putting in tunnels at a great depth, it only requires capital to develop, what, from surface and proved indications, should be large and rich reefs, at a greater depth and in more settled country.

*Red, White and Blue Reef.*—Next to Farthing's Reef, and adjoining it, comes the above claim, worked by Messrs. Wall and Harris. They have a fine well-defined reef (blue quartz heavily charged with pyrites); they are driving a tunnel on the line of reef to get under at a depth where a good shoot of gold has been prospected on the surface, but which underlays too much to work conveniently by shaft.

*Fuller's Reef (owned by Donnelly, Driscoll, A. Watt, Walter Sidney, Russell, Buchanan, and Party).*—Next on the track from Stewart's Brook to the Denison comes the well known Fuller's Reef, out of which such good returns have been obtained in past years, and which, under new management during the past few months, has shown such good prospects. The main low-level tunnel (1,250 long), which has been lying idle so long has been restarted, and at only a few feet further in rich stone was struck, which has continued in to the face, a further distance of nearly 150 feet. The reef averages from 2 to 4 feet wide, and some very rich specimens have been picked out, and the Company have a good body of stone at grass which should go many ounces to the ton. The Company have nearly completed the erection of a large-sized Huntingdon battery driven by steam. At the main tunnel mouth have excavated a large dam, and have everything very conveniently and thoroughly arranged for the future development of this mine. The results from the next few months crushings from this claim will probably cause strong attention to be drawn to this part of the gold-fields.

*Fuller's Reef, North.*—A 15-acre lease held by A. A. Wall. Since the proving of the rich gold going north in Fuller's Reef Company this ground has been taken up again, and the old workings known as "Blue Mountain Reef," have been cleaned out and put in thorough working order, viz., tunnel 350 feet cleaned out, necessitating a lot of work, owing to stull timber having given way, and several shafts having fallen in. A large quantity of quartz was crushed from this reef with very good results in past years, it being a good size and in easy country to work. The lessees have very good hopes by continuing this tunnel to strike a rich shoot of gold again, and if this Blue Mountain Reef should prove to be independent of "Fuller's," then the latter can be cut by a cross-cut tunnel driven east within 250 feet. The lessee has a very good prospect before him. To the north of this a 5-acre lease, held by B. D. Williams and party, is being rapidly proved by a tunnel on the line of reef from creek level, with very good prospects.

*Welchmen's Reef.*—Since last report this lease, held by A. A. Wall, has been continuously worked. A shaft, 8 x 3 feet (divided into up and down ladder ways), has been sunk a depth of 100 feet, and trial crushings taken from it at 60 odd feet. The reef was cross-cut (being between 10 and 11 feet thick) and some tons sent to Sydney for treatment, which gave the return of 1 oz. 8 dwt. per ton. This shaft would have been continued to a much greater depth, but the water was too heavy unless machinery were erected, and, after repeated trials, Mr. Wall had to give up the sinking and continue a tunnel on the line of reef, which was in some 300 feet, and prove the reef by driving some 350 feet further to reach shaft and drain the reef, which, by the amount of surface work done, catches so much surface water. The tunnel has been driven about 150 feet further, and the lessee expects very shortly to strike good stone, as he is nearly under where the old shoot of gold was worked in past years. Reef has carried a little gold all the way, but country has been hard.

*Simpson's Reef.*—Harle and party have been busily engaged at work on this reef, and are raising good stone.

*Collett's Reef.*—Harle and party have done a lot of work on this line, and have had some good stone out of it. It is their intention, after Christmas, to open out a fresh tunnel, as they have splendid facility to get depth, the mountain close to reef being nearly vertical.

*Jeweller's Shop Reef.*—There are great complaints amongst the miners here that this reef should be locked up in leases for past eighteen months to two years, and the labour conditions have not been fulfilled, in fact, not a pick put in the ground since corner pegs and trench marks were cut. Applications have been made to the Department to have same cancelled. Numerous other reefs are receiving attention at, and close to, the Denison, and a good deal of prospecting is being carried on by Clifford and party, Tilse and party, Taylor and party, Urquhart, Simpson, Johnson, Barber and party. I estimate the number of miners working at Stewart's Brook at between 350 and 400, and at the Denison (Moonan Brook) between 50 and 60; and from the fields about 3,500 tons of quartz have been raised during the year, and from about 2,500 tons crushed gold, to the value of £11,200, was obtained out of this. £7,700 worth of gold from total crushings of 1,309 tons of stone was obtained from the Royal Standard Gold-mining Company's mine. The value of the machinery erected at Stewart's Brook and the Denison is £4,700. At Stewart's Brook there are two large quartz-crushing machines, viz., the Royal Standard, a 10-stamper, with engine of 12 horse-power and water-power in addition, worked in combination, and the United Bluey Gold-mining Company (only lately completed and commenced crushing), a 10-stamper, with engine of 20 horse-power. A third machine is now in course of erection for the Ethel May Gold-mining Company (Limited), to be driven by steam-power by the proprietor, Mr. J. M. Harle. Number of miners' rights issued during the year at Scone, 179. In conclusion, I beg to state that I have great hopes of better times coming, and that there will be a marked improvement in the yield of gold during the next twelve months.

#### PEEL AND URALLA DISTRICT—INVERELL DIVISION.

(W. W. Fraser, Warden.)

I HAVE the honor herewith to forward my return for the year 1889 of the Tingha and Inverell Divisions of the Peel and Uralla Mining District under my charge.

The effects of the late severe drought retarded mining operations on alluvial claims during the early part of the year. Prospecting has, however, been carried on, and, although no new finds of alluvial deposits have been discovered, several reefs were found, and are being tested. I have no doubt that the future prosperity of this field will mainly depend upon the many reefs which are known to exist all over the

the field, and which prospectors are from time to time discovering. Then, when capital, with its means of supplying the most approved appliances for working the reefs, is brought to bear on them, I anticipate a permanent source of profitable industry for this field. An alleged discovery of a silver lode has quite recently been made near Elsmore; but the result of assays of samples sent to Sydney has not yet been received. The reef is said to be 42 feet wide.

The diamond industry is at present at a low ebb, chiefly, I think, owing to want of means of lessees to procure the necessary appliances for further developing their lands.

I am indebted to the managers of the Union Tin-mining Company at Elsmore and Tingha, the manager of the Malacca Tin and Diamond Company, and Messrs. Litchfield and Hills, tin buyers, Tingha, for the following returns, viz. :—

<i>Tin.</i>						
	Tons.	cwt.	qr.	lb.	£	s. d.
Union, Elsmore.....	113	18	1	2	=	5,928 0 0
„ Tingha .....	102	0	0	0	=	5,304 0 0
Malacca .....	6	16	1	21	=	351 3 0
Mr. Litchfield .....	700	0	0	0	=	36,400 0 0
Mr. Hills.....	430	0	0	0	=	22,360 0 0
	1,352	14	2	23	=	70,343 3 0

<i>Diamonds.</i>			
	Carats.	£	s. d.
Malacca .....	2,195½	=	878 5 0

Making the total value of output £71,221 8s.

#### PEEL AND URALLA DISTRICT—ARMIDALE, HILLGROVE, AND WALCHA DIVISIONS.

(*C. E. Smith, Warden.*)

IN submitting my annual report of minerals obtained in the Armidale Division of the Peel and Uralla Mining District for the year 1889, it is extremely satisfactory to notice the large increase in the yield of gold, which is nearly 200 per cent. more than the quantity returned for 1888, estimated at 11,500 oz., as the total return for last year is calculated at 30,550 oz.

The search for silver has been almost discontinued, and the approximate quantity won is about 300 oz.

Antimony having advanced considerably in market value, there is every probability of a large supply being obtained and forwarded from the district during the current year. During the past year 195 tons was obtained.

The total number of gold leases applied for was 282; mineral leases, 36; and mineral licenses issued, 153.

There were 2,329 miners' rights and 167 business licenses taken out. The number of quartz-crushing machines is estimated at 11, some of which have been only recently provided, and are not yet at work.

The population attracted by the Baker's Creek mines is about 3,000, and eight public-houses have been licensed—six for East Hillgrove, where there are a Public School, two Churches, two Banks, a Cottage Hospital, and a Post and Telegraph Office; the other two hotels are at West Hillgrove. Three constables are stationed at East Hillgrove, where a Warden's Court and Petty Sessions are held when necessary.

Postman's Creek Mines, situated about 12 miles southerly from Hillgrove West, and which were only discovered six months ago, are attracting considerable attention, and now that the quartz-crushing machinery recently provided by the energetic Enmore Consolidated Gold-mining Company is likely to be at work shortly, the first extensive crushing is looked forward to with considerable interest, as the trial crushing of 4 tons is alleged to have returned 11 oz. to the ton. The population of the mining settlement of Melrose, which is over a mile from the reefs, is nearly 500. A Post Office is established there, and postal communication has been allowed twice a week, by coach, with Uralla. Two hotels have been licensed, and a third is in course of erection, and a Public School is expected to be opened soon. About a mile of the main street, which is 99 feet wide, is reported to have been cleared of timber by directions of the Roads Superintendent, who is also having a shorter track to Melrose opened up for several miles. A constable, who is acting as Warden's Bailiff, is stationed in the township.

#### PEEL AND URALLA DISTRICT—GUNNEDAH DIVISION.

(*P. Brougham, Warden.*)

I HAVE the honor to submit my report for the year 1889 upon the Gunnedah Division of the Peel and Uralla Mining District over which I exercise supervision as Warden.

The only mineral which has been worked during the year is coal, and the following quantities have been raised from Black Jack and Curlewis Mines, viz. :—James Pryor, 1,861 tons; Mary Melvil, 1,227 tons; M'Cosker, 703 tons 12 cwt. 1 qr.; Centennial (Curlewis), 100 tons—total, 3,891 tons 12 cwt. 1 qr. The Centennial has only recently commenced work, and although at present the coal is not equal to M'Cosker's, yet as the work proceeds the quality may improve.

#### PEEL AND URALLA DISTRICT—TINGHA DIVISION.

(*W. A. Fraser, Acting Mining Registrar.*)

I HAVE the honor to herewith forward my report for the Tingha division of the Peel and Uralla Mining District for the year 1889.

Owing to the severe illness of the Mining Registrar, and my having quite recently taken charge of the office, I am unable to give you a detailed report of the business transacted in this division during the year.

I understand that Mr. Warden Fraser, in his report of the Inverell division, has as well given full particulars of this part of his district.

The number of applications during the year to lease land is 63, and the area thus applied for amounts to 1,623½ acres, and the rentals received amounted to £341.

There were 208 mineral licenses, and 30 miners' rights issued for the value of £217; 20 business licenses for the sum of £20.

The output of tin in this division amounts to 1,100 tons, the local value for which is £52 per ton.

PEEL AND URALLA DISTRICT—URALLA DIVISION.

(K. T. Garland, Mining Registrar.)

I HAVE the honor to submit my annual report for the Uralla Division of the Peel and Uralla Mining District for the year 1889.

Owing to the severe drought, continuing until late in the year, little washing could be done.

*The Rocky River Diggings.*

The Old Rocky Gold-mining Company finished driving to the boundary of the Tug-of-War Gold-mining Company without striking anything payable. French has finished driving at Mount Jones with no better results. The Jubilee Gold-mining Company have struck gold, but not yet payable. Rice and party are on good payable gold, 6 feet of wash, averaging 15 dwt. per ton.

*Postman's Creek.*

In July last a reef was discovered at Postman's Creek, a distance of 27 miles from Uralla, by prospectors named George M'Crossin, G. H. Robson, and James D. M'Lennan. The claim, which is called the Enmore Consolidated Gold-mining Company, has been recently floated in Adelaide for a capital of £170,000, and they are now erecting a large crushing plant at a cost of £10,000. At a trial crushing from 5 tons the average was 11 oz. 4 dwt. per ton. The Enmore Consolidated Gold-mining Company struck a reef on a spur leading to Postman's Creek, County Sandon, Parish Merrigalah, which assayed on the surface as much as 30 oz. to the ton. This reef has also been struck in two places lower down the spur on the Company's ground, the lowest being 380 feet from the surface. Trial crushings from James Houghton's claim (on Postman's Creek) of 5 tons averaged 2 oz. 5 dwt. Hanlon's, the Lord Hopetoun, Browning and party, Grenville, Leamon and party, and Walsh and party, all reported to be on reefs, averaging from 1 to 10 oz. to the ton.

A township has sprung up on this field, and has been called Melrose, having a population of between 400 and 500 inhabitants, about 120 residence and business areas having been applied for. There have been 117 gold-mining leases applied for for land at Postman's Creek, 114 applications of which were applied for since the 13th July last. During the year the number of licenses issued were:—Miners' rights, 478; business licenses, 38; and mineral licenses, 2;—the miners' rights sold during 1889 exceeding the number sold during the year 1888 by 151, the excess being on account of the new rush to Postman's Creek.

PEEL AND URALLA DISTRICT—WALCHA DIVISION.

(E. Marriott, Mining Registrar.)

I HAVE the honor to submit herewith my annual report for the Walcha Division of the Peel and Uralla Mining District for the year ending 1889, and I have much pleasure in being able to note considerable activity and improvement in the mining industry during that period as compared with previous years.

*Glen Morrison.*

1. The Glen Morrison Gold Prospecting Company did a large amount of work and expended a large sum of money on labour and putting the crushing machine in working order, which had been previously idle for some years. Suspension of work for three months has recently been granted for the reconstruction of the Company.

Mr. John Maule Hill, the legal manager, reports as follows:—The Company's claim consists of 14 acres of leases, through which run four lines of reef, all of which are gold-bearing.

2. *Golden Star.*—This line of reef is on the western side of the leases, and runs north and south underlaying west. It has been worked to a depth of 127 feet, the width of the reef being from 8 inches to 2 feet, the stone yielding good returns, crushings having reached as high as 70 oz. per ton of quartz. At the 127-foot level the reef has been split by a "horse" of slate. A main shaft has been sunk to a depth of 195 feet cutting the western leg at 170 feet. The eastern leg has taken a sharp turn east, on which a drive has been commenced, and it is highly probable that this leg will make gold when it returns to the proper course. It is estimated that within 30 feet the proper course will be made. Work for the present is suspended on this line. Ground hard and wet.

3. *Golden Bar.*—This line of reef lies about 300 feet east of the Star line, and runs north and south underlaying west. It has been worked to a depth of 80 feet; width of reef from 2 feet to 3 feet, stone yielding from 25 dwt. to 3½ oz. gold per ton. A drive is being carried on north at the 80-foot level. The reef is broken up into several veins of quartz carrying gold. There is every appearance of the reef making again in this drive. The main shaft has been sunk from the 80-foot level to a depth of 131 feet, cutting the reef at about 120 feet. Reef broken up and not defined, but gold-bearing. Ground hard and wet.

4. *Root Hog.*—This reef lies east of the Bar line, runs north and south. No work done on this reef during the past year.

*Temperance.*—This line lies north and east of the Star and Bar lines of reef, and runs diagonally nearly east and west across those lines underlaying to the north. Work on this line during the past year has been "stopping" out from 70-foot level and sinking underlay shaft on the reef from 70-foot level to a depth of 50 feet; reef running from 20 inches to 2 feet wide, showing fair gold. The stone crushed has averaged 9 dwt. to the ton and that ready for raising appears of a better quality. Work going on at present time raising stone from underlay shaft and preparing to sink main shaft to cut reef at 180 feet. Ground not over hard and little water.

Quantity of stone raised, 279 tons; quantity of gold won, 131 oz. 2 dwt.; value of gold won, £482 6s. 4d.

The Company have now the control of a 15-stamper battery, which originally cost, including erection, £3,584; and with repairs and additions a further expenditure of £350, making a total expenditure on the machine of £3,934.

*Centennial*

*Centennial Gold-mining Company.*

Mr. J. N. Watts, honorary secretary reports:—"This mine has not been working for the last three months, but it has now started work with two shifts, and the Company are determined to push on the work vigorously. During the present year we have driven over 100 feet on the reef, put down a shaft 40 feet, and have opened up the reef some distance. The prospects in the south are very encouraging, gold being freely seen in the stone, and, as it is all new country ahead, there is every reason to believe that a good shoot of gold is before us. We have about 500 tons of stone at grass, but, owing to the\* exorbitant rate charged for crushing and carting by the local battery and carriers, we have decided to let it stand over for treatment at some future time. Quantity of stone raised, 500 tons; none treated."

*Homeward Bound Gold-mining Company.*

Mr. J. N. Watts, legal manager, reports:—"We have been steadily raising stone, and have crushed 82 tons for a total of 122 oz. A trial crushing of about half a ton gave us a return of 26 oz. to the ton, and at the local battery we get  $1\frac{1}{2}$  oz. to 3 oz. per ton.

We have a main shaft down 60 feet, all timbered and secured; this we intend to sink another 60 feet to intersect the reef at about 100 feet. There is every prospect of this mine being a permanent and dividend-paying one.

Quantity of stone raised, 82 tons; quantity of gold won, 122 oz., value of gold won, £461 15s. 4d. net.

*Three-mile Creek.*—A new find near Glen Morrison. A number of leases have been taken up in this locality and a considerable amount of prospecting has been done.

The *Golden Crown Gold-mining Company*, Three-mile Creek, have sunk a shaft 60 feet, and propose driving on to the reef. Expended about £80 in labour and plant; no returns as yet.

*M'Intyre and party* have also done a considerable amount of work in sinking and trenching. Have sunk a shaft nearly 60 feet. From 30 to 40 tons of stone at grass. Prospects improving.

*Tia River Reefs.*

*Tia Gold-mining Company.*—Mr. J. N. Watts, part proprietor and legal manager reports:—"We started to sink the main shaft and succeeded in carrying it down to a distance of 40 feet below the level of the tunnel, but the water got too heavy for hand-power and we were obliged to let it stand over until machinery could be placed to keep the water down. We expect to cut the reef in about 30 feet, and should it be equal to where it was left under foot it should prove nearly 1 oz. stone and 4 feet wide. The Company are arranging for the introduction of more capital to work the mine efficiently."

"We stoped out 130 tons of stone from the top levels and treated a portion of it, but, on finding that a large percentage of gold went with the tailings, we decided to leave the bulk of the stone raised until we could procure better gold-saving appliances. The Company intend to push on the work vigorously this year, and are sanguine as to the prospects of the mine."

Quantity of stone raised, 130 tons, only a portion treated averaging about 10 dwt. to the ton; value of gold won, £35.

*Mountain Maid Reef (E. Oxenbridge and Party).*—*Prospecting Claim, Tia River.*—This claim is still being worked with assistance from the Prospecting Vote, and the holders of the claim have shown considerable energy in developing the mine. The main shaft has been sunk to a depth of over 150 feet, and a drive will now be constructed along the line of reef in a northerly direction to a distance of 50 feet.

Quantity of stone raised, 30 tons; still at grass,  $25\frac{1}{2}$  tons; quantity of gold won, from 3 tons crushed,  $4\frac{1}{2}$  oz.; value of gold won, £15 8s. 9d.

*Sleeping Beauty Reef, Tia River (David George).*—Work has been carried on in this mine under assistance from Prospecting Vote until the amount granted was exhausted, when work was suspended principally owing to the want of means, old age and infirmity of the owner, the claim has, however, recently changed hands and work may be resumed shortly.

*Cell's Creek.*—Situating nearly 60 miles from Walcha, south of the Port Macquarie Road. Several leases have been taken up in this locality, the principal holders being Messrs. Nathan Davis and party, of Port Macquarie; but little work by way of mining has as yet been done, the proprietors time having been devoted to the construction of a road to the machine site, and preparing for the erection of machinery now on its way to the mine.

*Mumble Creek.*—Three leases for Silver-mining have been taken up in this locality (two of which are held by Messrs. M. W. Walsh and E. C. Norton), but little work done as yet.

*Nowendoc.*

*Mount Carrington Mine, Nuggetty Valley.*—Henry Whittam owner, reports:—"Still driving from present length of No. 2 tunnel, between 500 and 600 feet to a further distance of about 70 feet northerly, at which spot it is expected the "conglomerate" will be met. Mr. Whittam has been working in this ground for the past six years by himself, and without any aid from the Prospecting Vote, he deserves every success.

From 15 to 20 men are engaged in "ground sluicing" at Nowendoc, and are said to be earning about £2 per week.

Miners' rights issued, 212; mineral licenses issued, 4; business licenses issued, 3; leases applied for gold, 33; for silver, 3.

Quantity of gold purchased locally, 394 oz. 4 dwt.—Value (Sydney Mint) £1,408 10s. 3d., which is a considerable advance on last years returns.

## PEEL AND URALLA DISTRICT—BARRABA DIVISION.

(P. Sinclair, Mining Registrar.)

In submitting to you my report of the Barraba Division of Peel and Uralla Gold-mining District, I have the honor to inform you that I have issued 91 miners' rights, 25 gold, and 1 mineral license.

The

\* The Glen Morrison Gold Prospecting Company charge the public 15s. per ton for crushing, and the same Company paid 4s. per ton for carting tone from their claim to the machine, a distance of over 3 miles.

The mines for the last year have been slowly improving, especially as regards population. There are, I think, at present in my division over 130 or more, including women and children; and old Woodsreef is developing once more into a township, and I think this year will see men of capital here—just what we require. Things are slack at present here, but I think there will be reaction shortly.

Under separate cover you will find my returns for the year 1889, to the best of my knowledge. I think they are pretty correct. Diggers and fossickers are spread about—so much so that it is hard to come at a correct estimate of the quantity of gold won.

PEEL AND URALLA DISTRICT—BINGERA DIVISION.

(*T. Connolly, Mining Registrar.*)

I HAVE the honor to submit to you my report for the year 1889, which, as far as I can ascertain, has been fairly prosperous. I have issued 216 miners' rights, 14 mineral licenses, and 1 business license. I have received 15 mineral and 14 gold-mining lease applications. The principal part of the gold has been found about 5 miles from Bingera, on the Tamworth Road. Shallow alluvial sinking; the ground is poor, but most of the miners are getting a little. The best claim has given a return of £5 a week to four men for the last six months. I feel certain that more gold has been won, but it has gone through private hands and cannot be traced. On the whole the prospects are very good.

PEEL AND URALLA DISTRICT—HILLGROVE DIVISION.

(*S. Matthews, Mining Registrar.*)

I HAVE the honor to forward herewith my annual report on the Hillgrove Division of the Peel and Uralla Mining District, up to date. I have not been able to visit the eastern portion of the division, on account of the incessant rain which has fallen during the last eight days, no less a quantity than 770 points being recorded during that time. I shall inspect the different mines in the above-mentioned locality, as soon as the weather will permit, and forward a supplementary report on same.

The past year has shown a decided improvement on previous years, mining matters generally having made great progress in this division, and from the appearance of the majority of the working claims I am of opinion that the year 1890 will tend to show a still further improvement.

During the year ended 31st December, 1889, there have been 88 applications for gold leases, covering an aggregate of 751 acres, and 23 applications for mineral leases, covering an aggregate of 700 acres. I have also issued for the year 659 miners' rights, 135 business licenses, and 10 mineral licenses.

Total revenue for the year from all sources, £1,984.

*Baker's Creek Gold-mining Company.*—This Company are working on two distinct reefs. No. 1, which is known as Smith's reef, being about 1 foot wide, and the second about 2 feet wide. The number of tons crushed during the year being 3,137, giving a yield of 24,825 oz. of gold, valued at £82,361 15s. 11d. They employ 120 men; value of machinery, £6,000, which consists of a 20-head stamper battery and Berdan pans, driven by 40-horse-power engine. They are at present laying down ten head more stampers to crush for the public.

*Ellenora Gold and Antimony Mining Company.*—No. 2 shaft, 120 feet deep, on lode composed of quartz and antimony, 8 feet wide, intersected by a sandstone dyke,  $4\frac{1}{2}$  feet wide. The quartz in this shaft averages 8 dwt. to the ton. They have also driven 70 feet on the lode, which averages the same right through. Next in order is what is known as Brakin's shaft, which is about 600 feet N.W. of No. 2 shaft, this is down 312 feet on the same lode as found in No. 2 shaft, with an average width of 5 feet. Next in order is the Isabella shaft, 400 feet to the N.W. of Brakin's shaft, which is down 86 feet, with a drive of 212 feet to meet a similar drive from Brakin's shaft. These drives are on the same lode all the way; strike of lode, N.W. by S.E.; underlay, 1 foot in 4 to the N.E.; the greater part of the lode is treated by being put through a smelting furnace, which extracts the antimony, the remaining part being then crushed in a 25-head stamper battery. The antimony thus saved goes about 63 per cent. of pure metal per ton. A parcel of 38 tons, which has just been shipped to London, is expected to bring from £45 to £50 per ton. The refuse from the smelted ore is then put through the battery, and afterwards through Berdan pans, the result being a return of 1 oz. gold to the ton. A trial parcel of 32 tons of burnt concentrates have just been forwarded to the Clyde Works, Sydney, for treatment, from which they expect to get from 4 to 5 oz. of gold per ton. This Company have just finished a trial of the electro-dynamo process, but it was a complete failure, and has been discarded. Value of machinery and plant, £15,000; number of men employed, 80.

*Sunlight Gold-mining Company, Block 110, M.C.P.*—No. 1 tunnel driven 70 feet to strike lode, and continued 418 feet on lode, which averages 6 feet wide, strike N.W. underlay to the N.E. about 1 in 10; the reef is gold-bearing, and gives an average of 2 oz. to the ton. No. 2 tunnel, which is about 110 feet easterly of No. 1, is driven 20 feet to strike lode, and driven 120 feet on lode, which is the same as is met with in No. 1 shaft, are also driving a third tunnel 112 feet further east, which is in about 50 feet, and expect shortly to strike the lode. There are also three other lodes showing on the surface to the N.E. of the main lode and two lodes to the S.W., all of which have been proved to contain gold; but as no thorough test has yet been made, and no work done on them, I cannot say whether payable or not. The Company have just purchased a 20-head battery, with complete concentrating machinery, valued at £1,700, the greater part of which is now on the land. The manager expects to have a first crushing-out with the new machinery about the end of June next. Value of old plant, £900; number of men employed, 42.

Block 109 M.C.P., which adjoins the Sunlight Company's land on the western boundary, have just found a nice looking reef about 2 feet wide, running parallel to the Sunlight lode, assays from which give a return of 11 oz. 8 dwt. of gold per ton, have only lately commenced operations, and are employing five men.

*Baker's*

*Baker's Creek North Gold-mining Company.*—No. 1 main shaft is down 150 feet, and expect to strike lode at 350 feet. A winze has been sunk 75 feet, on a lode about 12 inches wide, showing a little gold. Have driven in main shaft and cut two lodes, one 2 feet wide, supposed to be the big reef that runs through the Baker's Creek Company's land. The other reef is about  $2\frac{1}{2}$  feet wide. Average yield from the two reefs, 1 oz. 15 dwt. per ton. The former runs south-east and the latter north and south. They have driven 65 feet on the latter, showing the reef all the way; have also driven 68 feet on the first-named, showing the reef the whole distance. Both reefs underlay about 1 in 4 easterly. The only machinery at present on this Company's land is a winding machine, valued at £150. Number of men employed, 70.

*Primrose Gold-mining Company.*—Shaft 60 feet deep, on which a brace has been erected 32 feet high, on a lode averaging 1 foot wide; strike north-west, underlay west, about 1 in 15. This is a continuation of what is known as Smith's Reef, in the Baker's Creek Company's ground. They have had several trial crushings, one from the 32-foot level of 15 tons, yielding about 6 oz. to the ton, and a second crushing of 15 tons, yielding about 7 oz. to the ton, also a crushing of 2 tons of picked stone, crushed at Sydney gave a return of 35 oz. to the ton. No stone has been crushed for the past six months; are sinking a further depth of 60 feet, after which intend to open out and raise stone, of which there are about 16 tons at grass estimated to yield from 6 to 8 oz. per ton; 32 tons quartz yielded 222 oz. of gold. Value of plant, £606; number of men employed, 15.

*Enterprise Gold-mining Company.*—Tunnel driven 150 feet on lode averaging 1 foot wide, strike north-west, underlaying east 1 in 12. A trial crushing from this reef gave a return of 2 oz. per ton; a parcel of 20 tons has lately been forwarded to Sydney for treatment, which is estimated to go about 4 oz. per ton; have also sank a shaft on reef for a depth of 35 feet, showing lode from 6 inches to 2 feet wide; have also driven from bottom of shaft 60 feet, showing same lode all the way; expect to be in full working order in about six months, when they expect to employ about 25 hands. Number of hands at present employed, 5.

*Cosmopolitan Gold-mining Company.*—No. 1 tunnel driven 100 feet on lode 2 to 6 feet wide, consisting of antimony and quartz. Quartz shows a little of gold, and the antimony averages about 50 per cent.; strike of lode, north and south; underlay east about 1 in 10; also, two other tunnels started to the south of No. 1, both on the same lode, which is traceable in this Company's ground for a distance of 45 chains. I may mention that the Company hold 54 acres in all, have also sank a winze 90 feet on the lode which varies from 2 to 4 feet. This Company have done a considerable amount of work, such as cutting a dray tract from the top of the falls to their workings, a distance of 400 feet; they are also laying a tramway for a distance of 9 chains to a battery right at the bottom of the falls, which they expect to shortly start erecting, some of the machinery being already on the ground. This battery is intended to be driven by water-power, the water to be obtained from two large reservoirs at the top of the gorge, which are estimated to hold 1,800,000 gallons of water; it is to be conveyed to the works by iron pipes, "which are already in position for a greater part of the distance" down the side of the gorge, a distance of about 2,000 feet. About 400 tons of stone at grass awaiting erection of machinery. They have also shipped a considerable quantity of antimony to England, which, at the high prices now ruling, should go a long way towards paying expenses. Number of men employed, 32.

*Lady Carrington Gold-mining Company.*—Tunnel driven 150 feet on a lode averaging about 2 feet wide; gold bearing, giving a return of about  $1\frac{1}{2}$  oz. of gold per ton; have also driven a cross-cut about 80 feet lower, to strike the lode, for 72 feet, in which have crossed three lodes; have driven 13 feet on one, 44 feet on the second, and 33 feet on the third; traces of gold found in each; underlay, N.E.; strike, N.W. Have also sunk grass shaft to strike the main lode at the 33-foot level; on the lode all the way. Are at present cutting tramway from top of the falls, and excavating site for battery; number of men employed being 32. 16 tons of quartz crushed in Sydney gave a return of nearly 2 oz. per ton.

*Mount Carrington Gold-mining Company (No. 1 Tunnel, 25 feet).*—No. 2 tunnel, 110 feet, showing small leader, gold bearing. No. 3 tunnel, about 220 feet, showing lode 3 feet wide, showing 1 foot of solid quartz, which on testing by dolly, gives a return of 1 oz. of gold per ton, are driving along this reef about 100 feet to the south on the lode all the way; strike about N.W. S.E.; underlying easterly about 1 in 10. Number of men employed, 8.

*Ellenora North Gold-mining Company.*—No. 1 shaft sunk 60 feet on a reef 2 feet wide, carrying a little gold; reef is composed of quartz marked with pyrites; strike, N. and S; underlay, easterly 1 in 6. No. 2 shaft, 50 feet, showing two reefs, one on the hanging wall being 1 foot wide, and the other on the foot wall  $1\frac{1}{2}$  feet wide, both showing trace of gold, which they expect will junction at a depth. This shaft is about 2 chains east of No. 1 shaft, and the reefs are distinct from that found in No. 1 shaft; the strike of both reefs is N. and S., underlaying about 1 in 5 E. There are three other reefs further E. not yet opened. They are starting a tunnel at the western boundary to drive 300 feet, on which they expect to cut all the above-named reefs, and thus test the whole of the ground. Number of men employed, 6.

*Garibaldi Gold-mining Company.*—Main shaft 110 feet deep, on lode, 3 feet wide, of quartz and little antimony. The lode is intersected by a sandstone dyke, averaging 1 oz. to the ton; strike of reef, N.E. and S.W.; underlay nearly perpendicular. No. 2 shaft, 100 feet, on reef, which is split into three parts by sandstone dyke; strike, N.E. and S.W.; underlay same as in No. 1 shaft. A trial crushing of 6 tons gave a return of  $5\frac{1}{2}$  oz. retorted gold, and 10 per cent. concentrates, assaying 31 oz. One  $\frac{1}{2}$  ton of concentrates, taken from the above and treated in Sydney, gave a return of 14 oz. for the  $\frac{1}{2}$  ton. The Company are now preparing site for battery and concentrating plant. Number of men employed, 30.

*Lord Hopetown Gold-mining Company (late Root Hog).*—Shaft 39 feet deep. Are now sinking a winze 54 feet on lode, which is rather broken; also three tunnels, about 66 feet apart. The reef in Nos. 1 and 2 tunnels average 10 inches wide; and in the third or lowest tunnel, from 12 to 24 inches wide. Underlay almost perpendicular; strike not proved at present. Have crushed about 3 tons of stone, which averaged about 5 oz. to the ton. Number of hands employed, 10.

*Centennial Gold-mining Company.*—No. 1 shaft, 40 feet deep, on reef 2 feet wide, showing little gold. No. 2 shaft, 12 feet; also 3 tunnels, of which No. 1 is 90 feet; No. 2, 40 feet; and No. 3, 20 feet. Reef averaging from 15 inches to 24 inches; strike of reef, N.W. and S.E.; underlaying, E. Have crushed 3 tons of stone for a return of 7 oz. for the 3 tons. Number of hands employed, 5.

*Baker's Creek South Gold-mining Company.*—Shaft sunk 172 feet on reef, about 1 foot wide, showing a trace of gold. Have opened a level at that depth, alongside of reef. Have also driven a tunnel below the 152-foot level in the shaft, for a distance of 500 feet through the same reef, which is about the same. Number of men employed being 21.

*Princess Midas Gold-mining Company.*—No. 1 shaft, 60 feet drive, N.W. 15 from bottom of shaft, working in this shaft for antimony only, with prospect of cutting lode containing quartz; antimony lode from 6 to 8 feet wide mixed with slate.

No. 2 shaft, 38 feet deep, and about 300 feet easterly of No. 1, sinking on a quartz lode about 18 inches wide, containing a trace of gold, strike N.W. by S.E. Perpendicular, the lode is mixed with a little slate and antimony, and seems to improve with depth. Six men employed.

*Golden Gate Gold-mining Company.*—One tunnel 150 feet, showing reef at 90-foot level, averaging 1 foot wide; reef mixed with slate and antimony. A trial crushing gave 13 dwt. per ton; winze sunk 94 feet, in tunnel, to a depth of 64 feet on same reef, which improves with depth; also air-shaft, 65 feet, the reef, strike E. and W., underlay to N. 1 in 6; also a second reef, about 43 feet S. of the above, 2 to 3 feet wide. Just opened, intend driving from main tunnel to cut this reef at a depth. Stone in this reef looks well and shows gold, strike N. and S.; also several small leaders on the same ground, which have not yet been tested. Number of men employed, 10.

*Gleeson's Block, Gold Lease 178.*—No. 1 tunnel, 80 feet, and cross-cut to east 30 feet, reef in tunnel 4 to 6 inches wide, showing little gold, strike E. and W. No. 2 tunnel 90 feet on small vein of quartz; trial crushing gave 11 dwt. per ton; have about 20 tons of stone at grass. Number of men employed, 5.

*Moore and Party's Gold Lease, 287,* which joins the eastern boundary of the Garibaldi Gold-mining Company's land.—Reef on surface 1 foot wide, showing little gold; strike of reef, N.E. Are sinking on reef. Number of men employed, 4.

*P. Ryan & Co.'s Lease,* joining the above on their eastern boundary, have three reefs showing on surface, averaging from 6 to 12 inches; strike, N.E. They all contain a little gold. Are now sinking shaft to prove same. Number of men employed, 5.

*Moore and Party's Gold Lease.*—East of the above, showing a reef 2 feet wide; no gold in it as yet; have done no work up to date, but intend to commence shortly and prove reef.

*Little Nellie Reef (Monk and Party).*—This reef is situated on the Woolomombi River, about 10 miles north of Hillgrove. The reef is opened in several places; No. 1 shaft 16 feet deep, and No. 2 9 feet on lode 14 inches wide, strike E. and W.; the stone is of a bluish grey colour with granite hanging-wall, and porphy foot-wall the stone shows a little gold. The lode is traceable for about 8 chains; country, granite formation, gently rounded hills with abundant supply of wood and water. The district round has been worked for alluvial some twenty years ago, and I have heard that some very good patches were obtained. Four men employed.

*Little Beauty Reef (Chilton and Party).*—This reef is about half a mile west of the Little Nellie line of reef. A shaft has been sunk 6 feet showing a reef about 8 inches wide, with trace of gold and silver, are sinking to prove reef.

*Union Jack Reef (Kemp and Finlayson).*—About half a mile west of the Little Nellie line of reef. A shaft has been sunk 56 feet on lode 4 feet wide, showing gold-bearing vein of from 2 to 20 inches wide. Assays from this vein give a return of from 6 dwt. to 5 oz. gold per ton. The lode is composed of ferruginous quartz and fellstone. This reef is traced for a quarter of a mile, strike E. and W.; are not working at present, as trying to amalgamate with some private property adjoining; there are also several veins of quartz running through this land.

*Comet Reef (Rodgers and Party).*—About 2 miles north of the Union Jack, at the junction of the Boundary Creek and Woolomombi River. This reef is on private property. It is in slate country, strike S.E. There are several shafts sunk, one about 15 feet, showing a lode 5 feet wide of quartz, carrying a little gold. This reef was worked about twenty years ago and abandoned, but the present party have great faith in the result. They are commencing to erect machinery to properly develop the mine. There are at present six men employed.

About half a mile to the east of the Union Jack reef there is a large lode about 300 feet wide, of felspathic rock formation, intersected with ferruginous quartz veins, containing silver and a little gold, strike N. and S., assays from which have given from 15 oz. to 7,400 oz. of silver per ton, and from walls of lode 15 dwt. to 7 oz. of silver, and 3 to 17½ dwt. of gold per ton. The lode is traceable for about half a mile, about 20 chains only of which are on Crown lands, the remainder being on private property. Messrs. Kemp and party, the discoverers of this lode, are sinking on it to prove the depth, and if satisfactory, will form into a Company and put on more hands to open it out.

Up to the end of the year 1889 there has been about 8,300 tons of stone crushed for a return of about 29,300 oz. of gold, valued at about £99,320; total number of hands employed, about 600.

#### SUPPLEMENTARY REPORT ON THE HILLGROVE DIVISION OF THE PEEL AND URALLA MINING DISTRICT.

*Mount Ophir Gold-mining Company (J. Walsh and Party).*—No. 1 tunnel driven 60 feet on lode about 8 feet wide, divided by dyke about 6 feet wide, strike N.W., underlaying E. about 1 in 6. Trace of gold has been found in this reef, but nothing payable at present. The quartz is mixed with antimony. Have also sank a winze in tunnel for a depth of 12 feet on the hanging-wall. Have not cut the lode as yet. No. 2 tunnel, which is about 300 feet lower down the gorge, has been driven 100 feet on a lode, about 2 feet wide, of a bluish quartz mixed with antimony, with a trace of gold. A trial crushing of 5 tons from this reef has been forwarded to Sydney; result not yet known. There are several antimony leaders running through this property which have not yet been opened. Six men employed. This property is about 2½ miles east of the Ellenora property.

About a mile further east there is the new Ellenora reef (Becke and party). No. 1 tunnel, 21 feet, showing a lode about 6 feet wide, intersected with veins of quartz and antimony varying from 2 to 5 inches wide; strike of lode N.W., underlaying E.; trace of gold in quartz. There are also two lodes to the east of No. 1, which are about the same width and formation as No. 1. Have driven a cross-cut on No. 2 lode to intersect No. 1 lode, so as to work the two from the one level. They expect to junction in about 18 feet. The antimony in these lodes is of very good quality, and they are bagging about 25 tons to send away. It is fully expected that the antimony itself will more than pay working expenses. Have tested this lode for gold—result, 3 to 15 dwt. to the ton. Have also three lodes to the east of the above which

which have not yet been opened. Have also opened No. 1 lode about 30 feet higher up the gorge, in which the lode is shown about the same size as in No. 1 tunnel. A considerable amount of work has been done on this property, viz., No. 1, platt, 117 feet long by 13 feet wide, on which is erected a blacksmith's shop. It is intended to cover the whole of the platt, so that it can be used as a shed for dressing and storing antimony. No. 2 platt, about 15 feet higher up the gorge, is 15 feet x 23. They have also cut a road from the top of the gorge for a distance of about 20 chains, to enable them to reach all the workings with safety. Number of men employed, 11.

Verge and Richardson's lease, about  $\frac{1}{2}$  mile to the west of the New Ellenora.—No. 1 shaft about 10 feet deep, showing lode formation 3 feet wide, containing antimony veins of from 1 to 6 inches wide, strike N.W. No. 2 shaft, just opened, showing a small reef of quartz in which a trace of gold is found, are commencing to develop the land. There are four other lodes running through this property, varying in size from 1 foot to 3 feet, all of which contain antimony and quartz. Have not done any work on them to date. Three men employed.

Mining lease portion 47, which lies westerly of the New Ellenora, contains several lodes of antimony varying from 1 foot to 2 feet wide. Also one lode of quartz and antimony, 3 to 5 feet wide. No work has been done on this property as yet.

About 200 yards easterly of the New Ellenora property the country changes from felspathic granite to a slate formation, which continues for about 3 miles easterly, in which there are numerous small veins of quartz and antimony visible, also the whole of the country between this and the village of Hillgrove is intersected with antimony lodes mixed with quartz, varying in size from a few inches to 1 foot.

#### PEEL AND URALLA DISTRICT—GLEN INNES DIVISION.

(G. Stevenson, Mining Registrar.)

OWING to a rich find of gold by Messrs. Meehan Brothers at a place known as "Bear Hill," in the parish of Mitchell, county of Clarke, about 39 miles by road in a southerly direction from Glen Innes, a very strong impetus was experienced in gold-mining. Powerful and influential companies have been formed, and the development of this industry during succeeding years promises to be extensive and successful. Further prospecting at Kookabookra, which is situated at the junction of the Mitchell and Oban Rivers, and which is distant about 34 miles, by road, south-easterly from Glen Innes, has confirmed the stability and value of the reefs in that locality.

The following table gives the business transacted at this office:—

Miners' rights issued .....	416
Mineral licenses.....	94
Business licenses .....	97
Applications received—	
Machine sites.....	9
Mining tenements (quartz).....	12
Business and residence sites registered .....	129
Gold lease applications for a total area of 2,183 acres, 3 roods, 9 perches.....	198
Mining lease applications for 938 acres.....	31
Total amount collected .....	£3,242 2s. 6d.

The business and residence areas registered are almost wholly at Kookabookra and Bear Hill, where residence sites were laid out by Mr. Warden Martin, under the Mining Act and Regulations thereunder.

*Kookabookra.*—In this township there are two hotels, four stores, two butchers, one baker, besides produce stores, and places of residence. A police station has been established with a senior-constable in charge; the mail accommodation is provided by a four-horse coach plying to and from Glen Innes twice a week, and a Warden's Court is about to be established, so that the necessary conveniences will be provided for all mining and other purposes. The Welcome Stranger reefs, principally owned by Messrs. Simpson, Drew, and Brereton, are contiguous to the township, and several crushings from the battery proved the richness and stability of the reefs. Another reef, said to be rich, and known as "The Germans," traverses the main street of the town, but has not been worked owing to a dispute between two parties who are applicants. Given that this be speedily settled the town must progress, as a large number of men will be employed on these valuable properties.

*Bear Hill* as a township is of less pretensions than Kookabookra, and is about 4 miles easterly of the latter place, a mountainous road intervening. It contains one public-house, two stores, one butcher, one baker, and the other necessary adjuncts of a mining centre. The Bear Hill Proprietary, formerly known as Meehan's, was the first company formed, being quickly followed by the Butcher's and the Butcher's North. It is stated that other rich finds have been discovered, especially that of Shakespeare and party, adjoining the Butcher's on the south.

It is reported that valuable reefs have been discovered at Glen Elgin, where alluvial gold was obtained in past years; eight leases have been applied for, and the work of thoroughly prospecting the ground is going forward rapidly under the direction of our townsman, Mr. F. J. Thomas. These reefs are situated on the Rocky or Glen Elgin River, about 40 miles north-east from Glen Innes.

The large increase and activity displayed in mining operations, during the year, led to a corresponding increase in the duties performed by Mr. Warden Martin, who, besides giving advice and counsel to every person engaged in the pursuit, repeatedly visited the several "finds" in a precipitous and mountainous country. Fifty Warden's Courts were held, as against ten in 1888, and two each in the two preceding years. The principal business arose from complaints as to the non-fulfilment of the labour conditions imposed under the Act and Regulations, his decisions giving entire satisfaction to the miners, and his recommendations being very generally acted upon by the Department. His long experiences and intimate knowledge of the law and district enabled him to perform his arduous and oftentimes irksome duties with great success, and with the very satisfactory results that the different fields are in a very fair way of being fully tested and worked.

## PEEL AND URALLA DISTRICT—ARMIDALE DIVISION.

(J. M. Sheaham, Mining Registrar.)

I HAVE the honor to submit to you my report for the past year of the Armidale Division of the Peel and Uralla District. Owing to the Hillgrove District being formed into a separate division, and the newly discovered field at Enmore, being transferred from the Armidale Division to that of Uralla, I have no workings of any importance to report upon.

The Clarendon Company, whose operations were carried on on the freehold land of Mr. George Cross at Tilbuster, have suspended work for some months past.

On the Tilbuster Creek during the past year several parties have been prospecting; up to the present, however, no report of anything payable has been reported to me. The number of miners' rights, business and mineral licenses issued during 1889, exceeds the number issued during the previous year, as will be seen from the following statement:—

	1889.	1888.
Miners' rights.....	980	853
Business licenses.....	42	29
Mineral licenses.....	137	24

The applications for gold-mining and mineral leases, for the present year, however, show a considerable falling off. This is altogether owing, as I have already stated, to the Hillgrove District having been formed into a separate division.

During the year 1888 I received 265 applications for gold-mining leases, embracing an area of 3,180 acres. Applications for mineral leases during the same period were 29, embracing an area of 1,160 acres.

During the present year the number of applications received were:—For gold-mining leases, 45, embracing an area of 488 acres; mineral lease applications, 10, embracing an area of 240 acres.

In conclusion, I regret to say that, as far as the Armidale Division is concerned, mining *per se* is at a very low ebb.

It is to be hoped, however, that things will take a turn for the better during the ensuing year, which doubtless will be the case, owing to privileges conferred on prospectors by the Mining Act of 1889.

## PEEL AND URALLA DISTRICT.—DEEPWATER DIVISION.

(J. W. S. Isaacs, Mining Registrar.)

I HAVE the honor herewith to submit my report for 1889 of mining operations in my division.

Deepwater was proclaimed a mining district from 1st August, 1889. Since then I have issued, up to 31st December, 18 mineral licenses, 1 miner's right, and have had 68 applications for mineral leases, all for purposes of mining for tin or silver.

Referring to silver-mining, a large amount of land has been applied for, and great activity prevails at and around Castle Rag. Numerous companies have been floated, and sinking has been vigorously carried on. A township has been formed. As a large number of men are employed the Castle Rag find gives every evidence of permanency and richness.

*Castle Rag Proprietary Silver-mining Company.*—Men employed, 97; machinery, 3 boilers, one 10-horse-power engine, one 6-horse-power engine, one 4-horse-power engine, ore-breakers; roller-mill, jiggers, revolving buddles, separators, revolving sieves, steam pump, and other appliances. Total value, £7,000. Houses, horses, smithy, engineer's shop, assay office, mine, plant, &c. Value, £2,500. Ore raised, about 4,000 tons; value, £30,000; ore despatched, 200 tons; value, £1,600. A parcel of 50 tons sent to Dry Creek Works, Adelaide, from this mine, left a profit of about £7 per ton after paying expenses. Deepest shaft, 140 feet; five shafts and tunnel, 500 feet.

*Castle King Company.*—Men employed, 12; value of plant, &c., £300; ore raised, 250 tons—value, £1,750.

*Castle Queen Company.*—Men employed, 16; plant, &c., value, £500; not yet opened out for raising ore.

*Castle Prince.*—Men employed, 6; value of plant, £150; no ore raised.

*Castle Chief.*—Men employed, 12; plant, &c., £400; ore raised, 50 tons.

*Castle King No. 2.*—Men employed, 6; value of plant, £120.

*Central Castle Rag.*—Men employed, 6; value of plant, £50.

*Castle Rag Extended.*—Men employed, 10; value of plant, £200.

*Castle Moat.*—Men employed, 10; value of plant, £80.

*Tin*

At the Nine-mile great activity prevailed towards the end of this year, several shafts being bottomed on first-rate tin. This caused numerous applications for land during December, 1889, and January of this year.

A Newcastle syndicate purchased a 20-acre block, known as Peter Jerney's, at a cost of about £3,000, and work will soon be in full swing. The sinking on this ground is about 30 feet, giving between 18 inches and 3 feet of first-class wash, the tin being of very high quality.

On Berkley and Palmer's ground a party of tributors also struck a lead of splendid tin towards the end of the year, and it will take a little time to develop. On this ground there is a splendid dam, engine, pumping gear, workshops, &c., &c.; value, about £1,250.

The M. and P. mine (lately Wright's) ground, is being vigorously worked. The claim has a really good reef, as well as good alluvial. The ground is being systematically worked under good management, and gives every promise of developing into a first-class property.

Mr. Cowan's ground has also been sold to a Newcastle syndicate at a high figure, and no doubt will soon give employment to a large number of men.

The Torington mines are employing about the usual number of men, &c., but I have not been able to obtain much information regarding that part of my division as yet.

I find it very difficult to obtain any reliable statistics of tin ore raised and despatched during the year. Very few of the working parties keeping any account.

At Pye's Creek the only mine working is the Pye's Creek Silver-mining Company. The main shaft is down about 350 feet, and fair amount of ore has been raised. There are eight or ten men employed on this mine.

The

The New England Proprietary Silver-mining Company at Nine-mile has done a large amount of work for the year. The ore in this mine is totally different from any other ore in this district, carrying, as it does, a large percentage of bismuth. Assays have given as high as 700 oz. of silver, and 60 per cent. bismuth to the ton.

In concluding my report I may state that the outlook for the year 1890 is very encouraging indeed. A very large amount of capital has been lately invested around here in both tin and silver land, and no doubt a beneficial result will ensue.

The Nine-mile has for years been very highly thought of, but has never had the capital expended, as will now be the case. The Castle Rag Silver-field gives every promise of developing into one of the best in the Colony.

PEEL AND URALLA MINING DISTRICT—BENDEMEER DIVISION.

(*L. S. Stumbles, Mining Registrar.*)

I HAVE the honor to forward my report for the past year of the Bendemeer Division of the Peel and Uralla District. During the year ending 31st December, 1889, there have been three applications for mineral leases received at this office for the purpose of mining for tin—that being the only mineral at present worked in the district. There have been 16 mineral licenses issued at this office, and 5 miners' rights. There has been 26 tons of tin raised on Watson's Creek by parties holding mineral licenses, which was sold at £60 per ton.

PEEL AND URALLA DISTRICT—TAMWORTH DIVISION.

(*H. A. Ledger, Mining Registrar.*)

THE mining in my division consists of prospecting two lines of reef situated to the N. and E. of the town of Tamworth. There are about ten miners actually working.

PEEL AND URALLA DISTRICT—CASSILIS DIVISION.

(*H. S. Hawkins, Mining Registrar.*)

No mining of any description has been done in this division during year ending 31st December, 1889.

PEEL AND URALLA DISTRICT—GUNNEDAH DIVISION.

(*J. J. Kingsmill, Mining Registrar.*)

THE only mining in the Gunnedah portion of the Peel and Uralla Mining District is coal-mining. The Springfield Colliery and the Gladstone Colliery have been in existence between three and four years, and the Centennial Coke and Coal Company (Limited) has only been in existence a few months. The amount of coal raised, and the value of same, &c., is as under, for year 1889:—

No. of miners employed—(All Europeans.)	Colliery.	Output.			Value.		
		Tons.	cwt.	qr.	£	s.	d.
One above ground ; five below .....	Springfield .....	1,861	0	0	907	4	9
” ” two ” .....	Gladstone.....	703	12	1	342	1	4
Four miners employed .....	Centl. Coal and Coke Co. ..	100	0	0	50	0	0
		2,664	12	1	1,299	6	1

The coal industry in this district promises to be very successful.

Being a new comer to this district, I cannot enlarge on mining industry generally.

PEEL AND URALLA DISTRICT—GLEN INNES DIVISION.

(*G. Martin, Warden.*)

*Tin.*

NOTWITHSTANDING that the search for the precious metals in my division drew off much of the enterpris and labour formerly devoted to mining for tin, the output for the year was 1,695 ton 15 cwt.—being 414 tons in excess of the production of the previous year.

This increase was not owing in any way to the discovery of fresh sources of supply, but simply to the facilities available at all points for washing, in consequence of the ample and continued rainfall, extending over the twelve months.

At the average price of £50 per ton at the Tent Hill smelting works, the total value of the ore raised would be £84,812. The bulk of the ore was purchased and reduced at the smelting works, and the manager reports a production of 942 ton 13 cwt. 0 qr. 16 lb. of refined metal for the year. Mining in the lode has made but slight advance since my last report, and of the ore won only 98 ton 17 cwt. came from this source.

The Basaltic-lead-prospecting Company, extended the main tunnel on their reserve for a total distance of 1,000 feet from the entrance, without as yet having found any payable wash. By the last report of the manager it appears from the continuous flow of water and the rough boulders encountered, that the drive is in the course of the old river bed, and it is expected that a deposit of value may be struck at any moment as the work proceeds.

This is the only work of exploration under the basalt now being carried on west of Emmaville, but in the opposite direction at the Nine-mile, surfacing on the Red Hill has been followed downwards into deep ground, where the deposit of stream tin is of sufficient value to induce the formation of a Company to mine for it in the freehold land adjoining.

The number of miners engaged in mining for this metal has very much decreased of late, and there does not appear to be any probability of an immediate increase, unless the deep lead at the Nine-mile should be found to extend in a defined run under the basalt in that locality.

*Silver.*

The four mines being operated on the last year for this metal, *i.e.*, Webb's, Webb's Consols, Pye's Creek, and Castle Rag, are still the most important in the division, but their relative importance has undergone a change.

The mine that was least opened out at the close of 1888, has, by careful and judicious management, combined with energy, been brought rapidly to the front, and holds at the present the most favoured position in the eyes of investors. Step by step, in the face of much adverse criticism and depreciation at the hands of so-called experts, this position has been won, and, judging by the appearance of the lode and the analysis of the ore obtained from it, there does not seem any reason why the estimate formed of its value should not be realized.

I the more dwell upon the prospects of this mine, as I wish to put it forward as an instance of the success to be attained by right management in legitimate mining, as opposed to the too prevalent desire to open a mine on the Stock Exchange instead of on the ground.

Castle Rag was thoroughly tested and well opened up before the general public was asked to join in forming a Company to work it, and the capital subscribed in shares was so moderate as to give a fair expectation of a dividend on the investment. Since the formation of the Company a concentrating plant has been erected at the mine, through which it is intended to pass all the ore preparatory to its transmission to reduction works at Adelaide or elsewhere. During the year 80 tons hand-picked ore, yielding 58 oz. silver, and 24 per cent. lead to the ton, have been forwarded for treatment to Dry Creek Works; and it is estimated that there are at grass 4,000 tons ore, averaging 40 oz. of silver, and 20 per cent. of lead per ton. It is not, I understand, the present intention of the Company to erect reduction works on the property.

In consequence of the apparent prospects of the mine and the opening of other mines in the locality, a township site has been laid out on freehold land in the vicinity of the mines, and all the lots disposed of to business people and others intending to settle there.

The distance from Deepwater Railway Station is 6 miles.

Veins of argentiferous galena are very numerous on Castle Rag Creek, and several of them are being opened up, with more or less energy, by companies and syndicates. The principal mine next to Castle Rag, is Castle King, where 30 tons of ore at grass is said to have given an average assay of 60 oz. of silver, and 60 per cent. of lead per ton. This ore, I believe, has been hand-picked.

*Webb's.*

After the failure of the attempts to treat the ore locally at this mine, all raised has been carefully hand-picked, and forwarded to Dry Creek, South Australia, for reduction. The manager reports 450 tons shipped during the year to those works—the first half-year returns giving an average of 80 oz. to the ton, and the last six months 95 oz. The total yield of silver for the year was about 36,000 oz., and the number of hands solely employed in extracting the ore, 50 men and boys. No use appears to have been made of the reduction plant at the mine, which is valued at £11,000.

It is estimated that 5,000 tons of low grade ores, averaging from 8 to 10 oz. of silver, are stacked on the ground awaiting the advent of some cheaper process of concentration than at present in use to make its manipulation profitable.

I forward a plan of the two working shafts of this mine, courteously furnished with other information by the manager, Mr. Adams, by which it will be seen that the deepest shaft is 360, and the lesser one 210 feet deep.

*Webb's Consols.*

I have not been able to obtain as ample information concerning the working of this mine as was so readily and courteously supplied by the managers of Castle Rag and Webb's concerning the working of the mines under their control, but from the data furnished, I gather that fourteen men have been employed throughout the year, and 40 tons of concentrated argentiferous galena sold, averaging 70 oz. of silver and 68 per cent. of lead. The deepest shaft on this mine is 135 feet. There is not any machinery on the ground.

*Pye's Creek.*

The expectations entertained of this mine, from surface indications, have not been realized as sinking proceeded, and at 329 feet in the main shaft the lode is reported to be small and not very rich in silver. There is not, however, any sign of the lode pinching out, as a smooth and clearly defined hanging-wall has been followed to the very bottom. There are about 800 tons of ore to grass, which, according to assay, should yield between 40 and 50 oz. of silver to the ton, but 20 tons sent to Dry Creek for treatment is reported to have given an average return of only 34 oz.

South-east of Glen Innes, in the Paddy's Land range, the silver lode referred to in my previous report, has been taken up by a Sydney syndicate, who propose spending £500 in testing the property. The lode is a wide one, and assays of surface gossan at the Mines Department, two years ago, gave 22 oz. of silver to the ton.

North-west of Glen Innes, and within 13 miles of the town, a well-defined vein of argentiferous galena has recently been discovered in a belt of hard slate and other metamorphosed rock, which displaces the granite over a considerable extent of country in that direction. A shaft put down on the lode by a party of miners to a depth of 70 feet disclosed a highly mineralized formation of not less than 8 feet in width, with a smooth hanging-wall dipping slightly to the south. A sample of the ore sent by me to the Government Assayer for analysis gave massive galena with a trace of blende and a few specks of copper pyrites, yielding 14 ounces 14 dwt. of silver to the ton—agreeing very nearly with a previous assay of lode stuff from near the surface. As the ore is evidently easy to smelt, it ought, apart from its value in silver, to be in demand to mix with more refractory ores at Dry Creek or elsewhere, where silver ores are sent for reduction. The lode can be traced without any difficulty on a westerly course for about a mile and a half, and indications point to its continuance over a much greater extent of country. Another argentiferous lode has been opened in the granite 20 miles east of Glen Innes, on the Newton Boyd Road, and assays of some small samples of the ore have gone as high as 60 oz. to the ton. The lode is said to be a wide one, and in a position easy of access.

*Gold.*

*Gold.*

Prospecting for this metal on the eastern fall of the table-land was unusually active during the year, and in consequence many promising discoveries of auriferous reefs were made both in old and new ground. The chief of these were at Bear Hill, near Kookabookra, at which place a Kangaroo shooter named Meehan was attracted by the glitter of gold in an exposed piece of quartz as he was crossing the crest of the range in pursuit of his game. Further investigation revealed gold in the underlying reef, and in a short time some hundreds of people had rushed to the locality and pegged out claims for miles around the central attraction. Unfortunately for the development of the field most of these people were mere speculators who desired to act as middle men between the miner and the capitalist, and from the first were a hindrance and a stumbling block to both.

The usual means were resorted to by the exhibition of specimens, and the concoction of telegrams of glowing import to cause a boom in mining circles, while the actual testing of the claims where all this wealth was asserted to lie was very generally neglected as being of quite secondary importance.

To afford the *bona fide* miner and capitalist an opportunity of combining their energies in the development of the field, it was necessary by enforcement of the labour conditions under the Regulations to clear off the dummies who were strangling the industry, and in the face of much clamour and abuse, and with the support of the Department this was eventually done. The result of this clearance justifies the action taken to effect it, as already capital is slowly but surely flowing in support of recent discoveries by the working miner, and the steady advancement of an apparently rich field is assured under the altered and more favorable conditions afforded the prospector.

The population of Kookabookra reefing-field had fallen to about 300 at the close of the year, but since then the tide has turned in its favour, and the class of experienced miners settling there are apparently well satisfied with the prospects opening out to them. The Welcome Stranger was the first mine opened on this field, and it is still the only one on which machinery has been erected for reduction of the ore. After the usual difficulties incidental to pioneer enterprise of this nature in a mountainous and sparsely peopled country without roads, a 10-head battery with engine and appliances complete was at last placed in position, at a cost of £1,500, and a trial crushing of 64 tons gave a return of 80 oz.—being 1 oz. 3 dwt. per ton. This was much less than was anticipated, but successive crushings under more careful manipulation of the machinery have brought the yield up to 2 oz. per ton; and this, I believe, to be the average of the mine as far as the lode has been explored. In all 119 tons 10 cwt. of stone were passed through the battery during the year for a total yield of 148 oz. of gold—value £573 10s, at the rate of £3 17s. 6d. per oz. The reef being worked is on the face of a steep declivity into which a tunnel has been driven for 340 feet on the course of the lode, which has an average width of 18 inches between walls of slate and granite. The bearing is about W.N.W. and E.S.E., and the dip 1 in 20 northerly. Up to the end of December, £3,100 had been expended on development of the mine by the present proprietary.

The Bear Hill Proprietary Company's mine, 4 miles easterly from the Welcome Stranger, is on the top of a sharp spur of the Paddy's Land Range, at an elevation of about 1,500 feet above the beds of Nowland's and Cedar Creeks, and into which it falls with steep declivities at every point. The country is wholly of indurated slate, and the lode of an average width of 18 inches, crosses the ridge on a N.E. and S.W., bearing with a dip of 65 degrees to the S.W. Three shafts have been sunk on the lode to depths respectively of 56 feet, 74 feet, and 115 feet, and 180 tons of stone stacked ready for crushing; but as yet there is not any machinery on the ground. A sample of the quartz taken by myself from the surface when the reef was discovered some months ago gave an analysis by the assayer to the Department of 18½ oz. to the ton.

The Butcher's Reef Company is the only other incorporated Company at work on this field, but I have not been able to obtain any return of operations from the manager of the mine. Lower down the hill Drew and Vitnell have a claim showing a vein 9 inches wide, from which a sample taken by me gave a return of 10½ oz. of gold to the ton. It is surprising that capital has not been drawn for investment in this ground, as the indications of richness are most promising, and the position of the reef affords unusual facilities for working and draining the mine. At the foot of Bear Hill Shakespeare and party are 50 feet down on a wide reef said to be a continuation of the Butcher's Reef, which shows gold freely, and which they intend to float into a Company as soon as possible.

Fourteen miles northerly from Kookabookra, at the Gulf, Oakwood, the Starlight Reef has been at last taken in hand by a syndicate who evidently intend to lay out money in proving its supposed richness. The reef is 2 feet 8 inches wide, running an easterly and westerly course, with a dip of about 65 degrees to the south. It lies about 500 feet below the edge of the table-land, and 1,500 above the bottom of the East Gulf, through which the Mitchell River runs over a boulder-stream bed on its way to the Clarence. A 10-head battery, with engine and gold-saving appliances complete, has been purchased, and will be erected below the mine on the Mitchell, but before the plant can be placed in position it will be necessary to construct a tramway for about 2 miles from the table-land to the river to carry the machinery to its site near the water. This work will shortly be taken in hand, and it is estimated to cost £1,000. The line will eventually be used for the conveyance of stone to the battery. The country is wholly of slate formation, and it is thought that there will not be any great difficulty in cutting and keeping open the tramroad at an easy incline on the steep face of the mountain.

Half way down the mountain and inclined to the north at an angle of about 20 degrees with the horizon the Golden Gate reef follows the course of Nuggetty Gully for a considerable distance on the east, and disappearing under the abrupt rise at its head it appears to make again on the western side, where Francis and party are driving in a tunnel in a claim called the Golden Key. The reef is very narrow wherever exposed, not exceeding 4 inches, but the outcrop was rich enough to pay the men who years ago broke it up with crowbars and gads to obtain by hand crushing the nuggetty gold which it enclosed. The gully severing the reef obtained its name from the payable quantities of coarse gold won from the rocky bed, where no doubt in past ages it had been deposited from the decomposition and erosion of the reef through which its narrow course had been cut by the waters falling from the table-land. Judging by the experience of Francis and party at the Golden Key the lode will widen and carry gold as it is driven on and incline more to the perpendicular the further the mountain is pierced, until eventually the dip will be found to follow the rule which appears to hold good everywhere else in this country, and trend permanently

permanently to the south. From the peculiar overthrown position and apparent richness of the reef, it would seem to be especially adapted for testing operations with the diamond drill, instead of by the slow and laborious method of tunnelling now being followed.

There are other auriferous reefs in this gulf, but beyond gathering surface specimens, nothing has been done to test their value. Thirty miles north of Oakwood and about the same distance north-east of Glen Innes, in the centre of the alluvial diggings at Glen Elgin, some gold-bearing reefs have lately been opened by F. J. Thomas and party, which are attracting some attention from capitalists. The find is not a new one, but although the main reef was sunk upon and cross-cut over a distance of half-a-mile, some years ago, for some not apparent reason the ground was abandoned as being of little value until Mr. Thomas, an experienced reefer, lately prospected the westerly continuation of the lode, and proved it to contain payable gold. Having been requested by the Department to specially report on the auriferous character of the reef, I visited the locality in November last, and took specimens at random from the old shafts and cuttings, which on analysis by the Government assayer, gave respectively :—

6	4	2
1	8	6
1	7	4
13	7	20
3	16	5
3	0	22

per ton. The lode is of quartz, and a compact quartzite 3 ft. 6 in. wide between smooth granite walls, and is said to bear gold through the quartzite as well as in the quartz, which is 15 inches in thickness on the hanging-wall. The country generally is of granitic formation, but a mountain range of felstone and slate, with veins of quartz, breaks the continuity of the formation in the immediate vicinity, and appears to divide the watershed whereon gold has been chiefly mined for from that where tin has been principally found.

The Glen Elgin River, cutting a course between the two formations, here falls a considerable distance to the valley below, affording splendid sites for the utilization of water in driving machinery, of which the lease applicants intend to take full advantage when erecting their crushing plant.

A mile and a half higher up the river is the great chasm worked out by the Glen Elgin Sluicing Company when endeavouring to turn the river, but operations were stayed and the design abandoned on reaching the solid core of rock, as it was thought the expense of its removal would be too great, and the chance of profit too uncertain to justify any further prosecution of the enterprise. Gold is very generally diffused over this valley down to the falls, the colour being found everywhere, but the richest accessible deposits have long since been exhausted, and the ten or twelve old diggers who have become attached to the soil have for years found it a veritable poor man's country.

Reports of promising finds came in occasionally from Newton Boyd, on the Grafton Road, and it is very likely that rich reefs will be discovered in that neighbourhood, as waterworn pebbles of quartz showing gold freely are not infrequently picked up in the bed of Bruiser's Creek, which must have been detached from sources at the head of that Creek south of Newton Boyd township.

#### Bismuth.

Sixty men and boys were actively employed during the year at the Kingsgate Mine, in mining for this metal, but as the production, combined with the supply from other sources, appeared to be in excess of European requirements, all hands were discharged at the close of the year, and the mine shut up and left in charge of a caretaker.

At the Glen Innes Mine adjoining, four men were at work for an output of 3 tons. This mine was also closed at the end of the year for the reasons stated above.

The railway returns show that 40 tons bismuth ore were forwarded by train to Sydney during the twelve months, being the output from these two mines.

I append a summary of the amount and value of metals won during the year, and the average number of miners employed in the division.

RETURN showing the average number of Miners employed in the Glen Innes Division during the year 1889.

Silver Ore—625 tons averaging 70 oz. silver; 43,750 oz. at per oz., 3s. 8d. ....	8,020	16	8

Grand total .....£102,902 10 8

## HUNTER AND MACLEAY DISTRICT—KEMPSEY DIVISION.

*(J. Ducat, Warden.)*

ON submitting my report of the mining prospects, and of work done in my division for the year 1889, I have the honor to report:—

*Gold.*

There are no alluvial diggings in the division. Reports of a find were made casually, but as no field was ever found payable, I, therefore, did not report such as Warden.

Gold leases are only situate at Deep Creek, and only on the prospectors' lease, No. 196, has stone been struck. They have a shaft down 105 feet, with drives bearing east and also west. A very large dyke of mispickel quartz has been exposed. Various assays from this stone have been obtained from most of the reliable sources, all of which have given very favourable results, ranging at the rate of from 5 to 17 oz. per ton; and one reported to have been 33 oz. Notwithstanding this, the proprietors do not seek to realize in bulk from their property. They sent some 10 tons of stone to Swansea for treatment, but have not yet had intimation of the result. About 20 tons more stone is laying bagged up at the wharf ready for shipment, if the return from the first lot proves satisfactory. Steady work is being done, and a considerable outlay has been made on the lease. Lessees, No. 227, south of the prospectors, are down 61 feet, but the water has come in so strong upon them they will require to have machinery erected to enable them to keep it under. They are not yet on stone. There is no machinery whatever on the ground. All the raising and baling done with windlass and bucket.

*Silver.*

The remaining mineral leases in the same locality that are being worked, on none of them has stone been struck. Shafts are down from 40 to 50 feet, but without any satisfactory results.

*Antimony.*

A. J. Powell and party's lease. They are driving a tunnel on the reef, which ranges from 18 inches to 30 inches wide. The ore is of good quality, and will no doubt give a good percentage when treated. Anderson and party are overflowed with water. The late rains have flooded them altogether.

At Taylor's Arm and Buckrabandini Mines the leaseholders had only got on to work fairly at their leases at the end of the year. I cannot yet say what their prospects may be.

The Corrangula Antimony-mining Company have been at a standstill for over two years, not having done any work. The manager reported the works were to be started again; however, nothing has been done, all the machinery is laid up idle.

The Kullatyne mines have been abandoned, the prospects not giving sufficient encouragement for the expenditure of capital on them.

Twenty-two applications for mineral leases were lodged during the year, and one application for a gold lease.

There being no alluvial diggings in this division my duties as Mining Registrar have been confined to the sale of miners' rights, business licenses, and mineral licenses. The registration of claims or tenements were nil. Miners' rights sold during the year, 41; business licenses sold, 1; mineral licenses sold, 12.

## HUNTER AND MACLEAY DISTRICT—DUNGOG DIVISION.

*(C. G. Smith, Warden.)*

I HAVE the honor to report respecting the gold-mining in this division of the Hunter and Macleay District.

At Lower Wangat, 20 miles hence, the Wonga Claim is worked by a tunnel about 300 feet in length, having a shaft 50 feet deep, the deepest level being about 200 feet, and average width of vein, 12 inches. The underlay, 50° north, strike east and west. The holder of this claim of 5½ acres has expended £1,500, and during last year crushed 172 tons for 130 oz., realizing £400. He thinks that, by driving a tunnel at a lower level, the prospects of the mine will improve, and suspension of work has been granted to him until the 16th March to enable him to obtain more capital for that purpose. The number of men employed in this claim averages five. The value of the plant about £800, with a lease of a 10-stamper battery, at £80 per annum.

Adjoining the Wonga claim on the west is that of W. Vanderkolk of 1½ acres. He is now driving a tunnel to cut the vein, and has reached 150 feet. He has obtained a grant from the Prospecting Vote to enable him to go 60 feet further, and to drive along the line of reef for 100 feet. The prospects of the whole workings will very much depend on the result of Mr. Vanderkolk's operations.

Messrs. Boyle and Box hold an extended claim of about 3½ acres east of the Wonga. They have not yet had much encouragement, but intend to persevere.

At Upper Wangat some work of a desultory character is going on, but without capital no progress can be made; and persons who have obtained good prospects and have applied for leases have failed to execute them from want of means to carry on the work. Although some money has been expended on this field there has never been enough, and consequently an unwarranted expectation of speedy and satisfactory returns.

There are two batteries of 5 and 10 stampers driven by water-wheels, present value from £1,200 to £1,500; and, although now comparatively idle, they afford facilities for developing the field of much consequence both to claim holders and prospectors.

Good prospects have recently been obtained at Cherry-tree Creek, 6 miles from Dungog, on church and school lands, and the holders of the ground are erecting a 10-stamper battery.

HUNTER

## HUNTER AND MACLEAY DISTRICT—BULLADELAH DIVISION.

(R. Quayle, Mining Registrar.)

I DO myself the honor to report as follows respecting the Bulladelah and Coolongolook portions of the Hunter and Macleay Mining District, for the year ending 31st December, 1889. Very little progress has been made since my last report. Messrs. Stuart and party crushed 20 tons which yielded 1 oz. per ton. This mine was cancelled and retaken up. The Mountain Maid have erected a 6-head battery, and expect good results. This is the only mine working at Coolongolook, and employs five men, suspension of labour having been granted on several claims. The Australian Alum Company at Bulladelah, have suspension of labour granted, and little progress has been made owing to insufficient machinery. The manager being away for some time I am unable to furnish any further particulars. Messrs. Partridge and Co. have raised 1,700 tons of limestone from their quarry, situated on the Myall Lakes, near Bungwall, and forwarded it to Sydney.

59 acres have been taken up at Coolongolook under gold lease; 23 miners' rights have been issued for the year.

## HUNTER AND MACLEAY DISTRICT—MAITLAND EAST DIVISION.

(F. S. Isaac, Mining Registrar.)

I BEG to report that during the year 1889 coal was the only mineral operated upon in my division of the Maitland District. In compliance with request contained in your circular of 1st July, 1889, I forwarded a form of the circular mentioned therein, to the holders of mineral leases in this district, full particulars of the replies to these circulars will be found in the return enclosed. The only coal-pits now at work in this district are four in number, viz. :—

1. South Greta Colliery Company (Limited), situate at Farley, near West Maitland; Edward S. Wright, Manager. From this lease during the year 1889, the quantity of coal drawn has been 10,560 tons, gross value, £5,280; cannel drawn, 428 tons, value, £428. The colliery has now been idle over two months, and only three men are at present employed, but for the remainder of the year when the mine was in full work an average of 62 men was employed.

2. Thornley Colliery, near East Maitland, G. Fishburn and Company.—Quantity of coal raised during 1889, 8,000 tons; value of coal at the pit, 5s. a ton; and the average number of men employed was 15.

3. Bloomfield Colliery, near East Maitland, Austin Fitzpatrick.—Quantity of coal raised during 1889, 10,000 tons; value, £2,500; number of men employed, 8.

4. Tulip's Pitt, near East Maitland, Matthew Tulip.—Output of coal for 1889, 1,050 tons large coal, valued at £262 10s.; small coal, 200 tons, valued at £20; this includes 345 tons raised from the mineral lease, No. 6 (see return attached hereto) during the last four months of 1889.

The coal from the before-mentioned pits is of highly excellent quality.

There have been 9 mineral leases applied for during 1889, covering an area of 5,440 acres. The number of mineral licenses issued during the year 1889 was 10, and miners' rights, 22.

## RETURN REFERRED TO IN ANNUAL REPORT.

Number of Lease.	Name of Lessee.	Replies to Circular.
1	R. T. Smith .....	The only coal raised on this lease was that taken from a small shaft sunk from the field.
2	Arthur L. Hayes .....	No coal has been raised on this lease.
3	J. T. Mance .....	do do.
4	R. T. Smith .....	do do.
6	M. Tulip .....	Since the granting of the lease in May, 1889, two men have been employed; output 345 tons; value, 5s. a ton at pit.
13	D. Shaw and others .....	No coal has been raised on this lease.
14	D. Shaw and another .....	do do.
17	A. L. Hough .....	do do.
19	Robert Beeston .....	Boring operations started in February last, but no coal has been won as yet. Two bores have been put down, one to a depth of 804 feet, and the other to 770 feet, and still proceeding.
20	Do .....	
21	Do .....

36	Do .....	
44	H. J. Adams and another .....	No answers received to my circulars; leases delivered on 7th October last.
45	Do .....	
46	Do .....	
48	John Scholey .....	No coal as yet obtained; lease delivered November last.

## HUNTER AND MACLEAY MINING DISTRICT—COPELAND DIVISION.

(Alfred Stone, Mining Registrar.)

I HAVE the honor to forward my report for the past year of the Copeland Division of the Hunter and Macleay District.

During the year ending 31st December, 1889, there has been eighteen applications for gold-mining leases, making a total area applied for 105 acres. There were 87 miners' rights and 27 business licenses issued at this office during the year.

I am glad to be able to state that a considerable improvement has taken place in mining matters in this division during the latter part of the year.

The Hidden Treasure Mine, which had been abandoned, has been taken up by a party of gentlemen residing in Newcastle. They had considerable trouble in baling out the water, and are now driving in a southerly direction in the 500-foot level. The manager appears very reticent, therefore I am unable to say with what result.

The United Reefs Gold-mining Company, which was floated a few months ago with a capital of £8,000, is busy erecting a 15-head battery, and expect to have it ready for operations in a few weeks. They have several tons of stone at grass. The work of raising stone is very much retarded in consequence of the quantity of water in the workings.

The Granville Gold-mining Company have had several men working during the latter part of the year. This Company is not quite formed yet; suspension has been granted to enable them to complete the Company.

There are two reefs on this property, viz.: The Sydney Flag, and the Rose and Thistle. Two tons of stone were sent to Sydney as a test with the following results—The Sydney Flag, 1 ton, realized 1½ oz. The Rose and Thistle, 1 ton, realized 6 oz. This Company has made arrangements with the United Reefs Gold-mining Company to crush their stone, which formerly cost £2 per ton cartage.

The Lady Belmore Mine, which had been abandoned for some years, has been taken up by a Sydney syndicate, and, after an unsuccessful attempt to bale out the water, went into a tunnel and drove 80 feet and struck the reef, which varies from 8 to 14 inches showing good gold. Towards the end of the year 2 tons of stone from the above was sent to Clyde Chlorination Works, Sydney, but the result is not yet made known.

The Centennial Gold-mining Company has been idle during the last half-year. Their tunnel is now in 1,050 feet. This Company has obtained assistance from the Prospecting Vote, and will again commence operations after the holidays. Messrs. Kelly and Hudson have made three attempts to get the water out of this shaft on the Mountain Maid line of reef, but were defeated each time and were forced to abandon it. They got 6 tons of stone from the 100-foot level which went 2½ oz. to the ton.

Kelly, Hudson, and Fallon have amalgamated their several claims on the Mountain Maid line of reef, and are engaged driving a tunnel which, when the reef is reached, will drain the whole line. This Company is in receipt of aid from the Prospecting Vote.

The Prince Charlie Company has done nothing since obtaining the land in the early part of 1887.

No. 2 Prince Charlie Company is engaged driving a tunnel, which is now in about 48 feet. This Company only started two months before Christmas, so that very little can be said as to its intentions.

From careful inquiries made from most reliable persons, I find that the gold won upon this division from quartz is 50 oz., and alluvial 44 oz. The total value of machinery on the field is estimated at £4,500. On the whole, there is a brighter look-out for Copeland during the year 1890 than there has been for many years past.

#### NEW ENGLAND DISTRICT—THE TENTERFIELD, FAIRFIELD, DALMORTON, LOUISVILLE, AND WILSON'S DOWNFALL DIVISIONS.

(*J. B. Graham, Warden.*)

I do myself the honor to submit my report on the northern division of the New England Mining District for the year ending the 31st December, 1889.

Great depression in mining still exists in this district. During the year prospecting has been carried on, the result of which for the most part has not been satisfactory. Extensive mining plant has been erected at the White Rock, and a large plant is in course of erection by the Great Northern Gold-mining Company.

The Fairfield, or Drake, division comprises the east and north-east portion of my district. In this division the principal mining is carried on.

The White Rock Proprietary Mine, situated about 3 miles west from Fairfield, has so fully been reported on by me on previous occasions (especially in my yearly reports) that I have now little to add, except as to the progress made in the erection of machinery, plant, &c. The mine itself still looks well, showing numerous seams of rich galena and pyrites. About 150 tons of picked ore has been sent away from the mine during the year for treatment at different reducing works, the average value of which has been about £13 per ton. Two lots were sent to the Clive works, and the result, I am informed, was satisfactory. The mine has been considerably opened up since the commencement of the year. Rock drills, driven by compressed air, are used, and are doing excellent work. About 25,000 tons of ore is now ready to put through the battery.

The reduction plant is said by competent authorities to be one of the best and largest in the Colony. The mill, when at full work, will run sixty head of stamps, which, with the aid of the stone-breakers, will put through about 1,500 tons of ore per week. The battery is a Californian one, which will do considerably more and better work than the ordinary battery. A tram runs from the face of the mine to the works, the greater portion of which is self-acting, the full trucks descending pulling the empty trucks up. The ore is discharged from the trucks on a floor, at an elevation above the battery, where it is broken up with giant stonebreakers. One of the stonebreakers was made especially for this mine in America, and it is said to be the largest one yet made. It is capable of putting through 400 tons per day. The ore is then conveyed to the battery on a tram, and the battery is kept fed with automatic feeders. From thence it goes over tables and through concentrators, and eventually the slimes are treated with Frew vanners and Triumph vanners. The engines are sufficiently powerful to work the whole sixty head of stamps and all the concentrating plant. For the present the ore will be concentrated, bagged, and sent away to other reducing works for further treatment. I believe it is the intention of the Company to eventually treat the concentrates at the works.

Water

Water will be supplied to this plant by pumping from Plumbago Creek, and by catchment of flood waters in two dams built in the gully in which the works are situated. Crushing has now commenced with twenty head of stamps, and the problem as to whether the low-grade ores of the White Rock are payable or not will soon be solved. The fate of the mine, to a great extent, depends on this, although the rich seams (some of which are in places 1 ft. to 18 in. thick) could be worked separately; the great wealth of the mine is the low-grade ore, if it can be worked at a profit.

The Great Northern Company's mine is situated in Sawpit Gully, about 1 mile north-west from Fairfield. A large area of land is held by this Company under gold-mining and mineral leases. Reduction works are in course of erection, and now nearly completed; the ore is of a low grade, yielding probably not more than 4 or 5 dwt. gold to the ton; 1,500 tons of ore has been crushed with an old plant which did not satisfactorily save the gold—the result was 270 oz. gold. The new plant consists of a Californian battery of twenty head of stamps, each stamp weighing 900 lb. which will be driven at the rate of 90 drops to the minute. The amalgamation will be an improved method, by which it is expected nearly all the fine gold will be saved; there is a Giant stone-breaker and automatic feeders in connection with the mill, and a large quantity of ore can be put through at a minimum cost, by which means the Proprietary expect to obtain profitable returns. It is estimated that the plant can treat 360 tons a week. A number of reefs and dykes intersect this country, and the quantity of ore is practically unlimited. If the result of the treatment is profitable, it will probably be the means of opening up a large field abounding in low-grade ores.

The Mascotte Mine is situated about 3 miles south-east from Drake. This mine has attracted a great deal of attention. It is considered one of the richest mines in this district. A considerable amount of work has been done in opening up the mine, but no machinery erected as yet. Parcels of ore have been sent away to various places for test trials, the results of which have been most satisfactory. The following lots have been sent away, and treated during the year:—No. 1, 20 tons; yield per ton, 57 oz. silver and 1 oz. 6 dwt. gold. No. 2, 4 tons; yield, 125 oz. silver, 1 oz. 2 dwt. gold per ton. No. 3, 6 tons; yield, 37 oz. silver, 1 oz. 2 dwt. gold per ton. The ore is a sulphide, and will probably have to be treated by dry crushing and amalgamation. Arrangements will shortly be made for the erection of the necessary plant for the treatment of the ore.

The Adeline Mine at Drake is still working on a good well-defined reef, about 5 feet thick. The ore is of a refractory nature, containing a considerable percentage of copper; the assay value is about £3 per ton. The present manager, Mr. B. Bryant, is a miner of great experience, and he is very sanguine that it will prove a payable mine.

Wann's mine, situated on Sawpit Gully, near the Great Northern G.M. Company's ground, promises to be payable. The lode or dyke is about 25 feet wide. To a depth of 15 feet the ore yielded bullion to the value of £2 per ton; below that level sulphides were met, and the free gold could not be separated by the ordinary process. The ore still shows good assays, and the necessary machinery for its reduction will, in all probability, shortly be erected. 300 tons of this ore has been treated during the year at the Adeline battery, resulting in the saving of 325 oz. free gold, and 26 tons of concentrates, valued at £17 per ton. The total value of bullion and pyrites was £824. The mine is now purchased by a Company or syndicate for development.

Rivers' lease at Long Gully is situated about 7 miles southerly from Fairfield. A rich find of gold was made in this lease in 1888. The first reef discovered was very narrow, and soon ran out; 353 oz. of gold was obtained from it in a rich patch. Induced by the aid of the Prospecting Vote the holders continued prospecting, and discovered a larger and more likely looking reef. They have sunk 50 feet on it, and put in a drive 40 feet. The reef averages 8 inches wide. The ore is a gossan, containing zinc blende, copper, and visible free gold; 56 tons have been crushed, which yielded 278 oz. of gold. The reef still looks well. It is situated in an almost inaccessible gully. The stone has to be packed out and carted under great difficulties to Fairfield, as there is no machinery nearer than that place. This mine would probably have been abandoned if it had not been for the aid of the Prospecting Vote.

At the Red Rock very little work has been done during the year; in fact, that portion of the field is at present almost abandoned.

*Poverty Point.*—The Surface Hill Gold-mining Company has again been floated, and machinery will be put on to treat the mass of ore in this locality. The gold is contained in granite, and dykes of soft granite and felspar. The quantity is inexhaustible, but of a low grade, containing about 4 to 6 dwt. to the ton.

At Tooloom and Pretty Gully a number of miners are still engaged both on alluvial and quartz. The yield is about the same as 1888. Prospecting under basalt ranges is being carried out in this locality, aided by the Prospecting Vote. The surrounding country is auriferous, and it is expected that rich and extensive beds of wash, containing gold, exist under the basaltic flow.

At Lionsville and Solferino little alteration has taken place in the mining. About forty miners are employed, and the yield of gold has been about 200 oz.

At Dalmorton a slight revival has taken place. There are about fifty miners employed in alluvial and about 120 in quartz-mining; 150 tons of stone was crushed at the Mann River, yielding 62½ oz. gold. About 100 tons crushed at Dalmorton yielded about 79½ oz. gold. The yield from the alluvial during the year has been about 150 oz. gold. A number of leases have been applied for during the year.

*Wilson's Downfall Division.*—The alluvial tin on Wylie Creek and its neighbourhood is still being worked. A few new finds have been made. The mines are principally worked by Chinese. The yield for the year has been 254 tons, value £13,716. No lodes have as yet been worked. The Wylie Creek Tin-mining Company have two pumping engines at work, and they are on good payable wash.

A graphite mine near Undercliff is now working. Good ore is being obtained, and it promises to be a payable mine. It is distant 18 or 20 miles from the railway at Stanthorpe.

The Rivertree silver mines are situated about 18 miles east from Wilson's Downfall. This promises to be a rich and extensive field. Prospecting has been carried on during the year, which has resulted in the discovery of extensive and rich lodes.

The Wongabah Silver-mining Company own 13 40-acre blocks; two shafts have been sunk to a depth of 100 feet; numerous other shafts, tunnels, and open cuttings have been made for the purpose of prospecting the various blocks. This Company have erected a 30-ton water-jacket furnace, and smelting is now in full swing. In connection with the furnace there is a No. 9 patent pressure blower, drawn by a 14-H. P. engine; this smelter is erected on the leases, and is central to the various mines the lodes are at and near the junction of granite and slate country. The ore consists of gossan carbonate of lead and galena; iron stone and lime for fluxing are found in the vicinity. As there is abundance of timber, charcoal will be used in the furnace instead of coke. This Company purchases ores from the surrounding mines. The Rivertree Prospecting Company own several leases on the east bank of the Clarence River; work has been continuously carried on during the year, and the prospects are most satisfactory. Several parcels of ore have been sent away for treatment, with the following results:—No. 1—3 tons yielded 182 oz. silver per ton; No. 2—1 ton, 39 oz. of silver per ton; No. 3—3 tons 16 cwt., 80 oz. silver per ton; No. 4—1 ton 2 cwt., 146 oz. silver per ton. 3 miles further down the river Messrs. Parker and Hynes are on lead ore, rich in silver; they are raising ore for sale to the Wongabah Company. 6 miles north from Wongabah the Mount Hope Company are sinking a shaft and raising sulphide ores of fair quality. The lodes in this vicinity are large and well defined; the geological formation of the country is slate, with intrusive granite. I confidently expect a large output of silver from this field as soon as the necessary reduction works are erected. If the present furnace is successful the Wongabah Company intend to greatly extend their operations.

In the Tenterfield Division the only mines are at Boonoo Boonoo and the Eight-mile. Little work has been done during the year, but now several of the mines are being prospected under the aid of the Prospecting Vote. A few small finds of bismuth have been made in the neighbourhood, but no systematic work has been done.

The number of leases applied for, miners' rights, &c., issued in my district during the year is as follows:—

Division.	Miners' Rights.	Business Licenses.	Mineral Licenses.	Gold-mining Lease Applications.	Mineral Lease Applications.
Tenterfield .....	121	4	14	4	6
Fairfield .....	385	32	14	22	12
Dalmorton.....	87	4	6	35	.....

#### NEW ENGLAND DISTRICT—WILSON'S DOWNFALL DIVISION.

(Thomas Olva, Mining Registrar.)

I HAVE the honor to transmit my annual report of the mining industry of this division for the year ending 31st December, 1889.

The mining industry is in a very quiet state at present, owing to the exodus from our district of a large number of Chinese to Queensland, who are attracted there by the tobacco industry, although at the same time the returns of ore raised and sold here show an increase from last year.

Warren & Co.'s tin leases, three 20-acre blocks, are being worked in a very satisfactory manner, they having brought on a large head-race fully 3 miles, making a dam for the same, and cutting a tail-race about 400 yards, so that they have everything in such good working order that they can go on working for a good length of time. Their first cleaning-up was just before Christmas holidays, with a very good result, the average depth of wash-dirt being about 17 feet.

The Wylie Creek Tin-mining Company (John Carmichael and party), about 5 miles below Warren and Co., are at present at a standstill owing to the depth of the stripping, but as there was very good wash-dirt raised I do not doubt but that the Company will see their way clear to introduce earth-schoops, &c. There are two engines and a complete plant for working the claim at present on the ground.

The lease of Mr. Seaman and the private land of Messrs. Amos Brothers are still kept at work.

Mr. M'Alister's lease, No. 49 is still being worked with four or five men.

The lodes are not being worked, although the dividing range between Queensland and this Colony, from 4 to 5 miles in extent, is known and acknowledged to be full of tin-bearing lodes, and only waiting development.

#### Graphite.

Barrowdale Graphite Mine is situated about 3 or 4 miles from Undercliff head station, and the proprietary company are at present erecting buildings, &c., for stacking their ore, which they intend to raise shortly. Shaft No. 1 is down 15 feet, showing splendid lode of graphite, 6 feet wide; there are also several cross-cuts and cuttings along the lode showing the same richness. As it is a new industry, and one from the several satisfactory tests and assays received, it promises to develop into a valuable addition to this district of one of the means for the employment of labour.

*Silver.*

The Rivertree silver mines are situated about 18 miles in an easterly direction from Wilson's Downfall. One branch of the Clarence River flows through the district, the various silver lodes in some instances being situated on either side of the river. Prospecting was started about two years ago by one or two parties, but the prospecting activity which my predecessor mentions in his last year's report, has been still maintained and with almost greater vigour.

The Wongabah Silver-mining Company, who held several leases, are the first in erecting a smelting furnace, and with which they hope to start smelting about 12th January, 1890. It is one of Mort & Co.'s 30-ton water jackets, with a 12-horse-power engine to work the blower, and as there is a large supply of ore at grass on their own claim, also on the various claims in the vicinity, and which, I understand from the manager, they are agreeable to smelt, for the purpose of testing the value of the same, and, should it be successful, they will at once erect more smelting furnaces. There is a large number of people employed on the various claims.

The other claims are sinking and prospecting with various results, according to assays, although one party, Messrs. J. P. Thomas and party, have forwarded either two or three parcels of 4 or 5 tons each to Dry Creek Smelting Works, Adelaide, and the returns according, to my informant, have been handsome, so that should the smelting corroborate the various assays, the success of the Rivertree silver mines may class this as one of the silver producing districts of New South Wales.

During the year ending 31st December, 1889, the following business has been done at this office:— 83 mineral licenses issued, 13 miners' rights issued, 10 business licenses issued, 10 mineral leases applied for, as follows: 2 silver leases, 7 tin ore, 1 plumbago. (2 silver and 1 tin ore applications for lease are reapplications.) The quantity of tin ore obtained during the year ending 31st December, 1889, is 254 tons valued on the ground at £13,716.

The mining population is about 340 persons, there being an increase on the silver mines at Rivertree.

## NEW ENGLAND DISTRICT—FAIRFIELD DIVISION.

(*J. P. Curran, Mining Registrar.*)

I HAVE the honor to forward my annual report, for the year just ending the 31st day of December, 1889, of the progress and future prospect of the mining industry in my division. I regret to say that the mining industry is not in a very flourishing state at present, as during the past year the results of development have not reached the expectations of many, and the future of this, as a mining district depends very much on the White Rock Proprietary Silver-mining Company, the Great Northern Gold-mining Company, Rivers & Company, at Long Gully, and the Mascotte Gold and Silver Mining Company, as these are the principal mines in full operation at present.

A number of mines, on which a great deal of work has been performed, and a large amount of money has been expended in the erection of machinery, have suspended operations, in consequence of the unremunerative character of the ore. The Strauss Gold-mining Company at Sawpit Gully have suspended work, and have sold their valuable milling machinery, which is now being taken down, for the purpose of removal to Hillgrove. This Company's mine gave promise, in the early days of the fields, of being one of the best mines in the district.

The British Red Rock Gold-mining Company have also wound up after expending about £2,200 in prospecting their property at Red Rock. The Great Red Rock Gold-mining Company appears to be in a languishing state, and only eight men are employed on the whole of their property. A considerable amount of money has been expended by this Company, during the past two years, and the plant, including the winding engine on the mine, is valued at £2,500.

The Great Northern Gold-mining Company, which was formed in the latter part of last year, has been carrying on mining operations during the year with partial success. They have with the ordinary 10-stamp battery and mercury tables, treated about 1,500 tons of ore, which has yielded 270 oz. of gold. In consequence of the gold being fine, and this class of machinery unsuitable for saving it, work has been temporarily suspended on the mine, and the hands are at present engaged in the erection of a Californian stamp mill. This mill is being erected in close proximity to their principal mine. The ore will be trucked from the face of the mine, to the ore floor, about 22 feet above the battery, and is dumped on to a set of inclined screens, which separate the fine from the coarse ore. The fine ore passes through the ore bin direct, whilst the rough ore passes through the jaws of a rock-breaker, into the same bin, it then passes through adjusted grates, and shoots to four automatic feeders, which are regulated by a rod, shod with rubber, which is struck by the centre stamp as more feed is required for the battery. The motion of each feeder is conveyed through a lever-friction clutch, and bevel-wheels to a circular table, which revolves, and carries the ore into the mortar of the battery. The battery consists of twenty head of stamps, each weighing 900 lb. The mortars are designed for rapid crushing, and inside amalgamation, a plate being fitted for the latter purpose, inside the recess cast in the mortar. The discharge will be through No. 10 slotted screens extending the full width of the mortar without a break. The cam-shaft makes 45 revolutions per minute, giving the stamp 90 drops per minute. The whole of this machinery is driven by a 20-horse-power engine of the Scotian type. The quantity of ore treated by this kind of machinery is 60 tons in twenty-four hours.

At the beginning of the year I was in hopes that the White Rock Proprietary Silver-mining Company would have had very large returns before this, as they had then about 12,000 tons of ore ready to operate upon, and it was expected that the whole of the concentrating machinery would be completed and ready for work in about three months from that date. The services of an experienced American mining expert were engaged about that time to inspect the mine and works, and to advise, as to the proper kind of machinery to use for the profitable treatment of the ore then in hand. After a careful inspection by this gentleman, it was decided that a different system of treatment, to that intended should be adopted, which necessitated a suspension of work, pending the arrival of machinery from America. The machinery is now in position, and the treatment of the immense pile of ore will be proceeded with at once. They have over 12,000 tons

to

to start on, and about 25,000 ready to break down. I have given a description of this mine in a previous report, so it will not be necessary for me to give any particulars further than to say, that a cut has been put into the face of the cliff for a distance of 60 feet, exposing numerous veins of very rich ore. The average number of men, per week, employed during the year, is thirty-five, and 150 tons of ore have been sent away valued at £15 per ton.

The reduction works consist of a 20-stamp mill, with arrangements made for the erection of forty additional stamps when necessary. The ore is conveyed by trucks from the mine to a large hopper midway between the mine and the reduction works, and is discharged from this into other trucks, which run along an elevated tramway to the mill, a distance of 1,000 feet, the full truck in its descent drawing up the empty one. The ore is dumped on to a floor, from which it is delivered to two giant rock breakers, capable of breaking 400 tons per day. From these the broken or crushed ore drops into side-tipping waggons underneath, and is conveyed along a line of rails to the different batteries, where it is delivered into self-feeding hoppers, which are regulated by a bar which is struck by the disc of the centre stamp of each battery. The crushed ore as it leaves the stamper-boxes, passes over an electro-plated mercury table 7 feet long, and is delivered to four oscillating pans, to which motion is given by a shaft of 1-inch stroke. The ore falls from these pans into sizers or boxes, of which there are two sets, one set being placed above the other, the stuff passing from the upper to the lower one. All heavy concentrates remain in a false bottom beneath the sizers, and is drawn off by taps, the lighter material being fed off by pipes to the "Frew" and "Triumph" vanners, of which there are four of each. The tailings or refuse is then conveyed by launders to settling pits, from whence, after settling, the water returns to the dam to be again ready for use.

The water supply for these extensive works has not been neglected. Besides the three large dams described in a previous report, which are estimated to hold 1,000,000 gallons of water, a race has been cut from Plumbago Creek, a distance of 1 mile, and the water is delivered into a dam. The water is lifted from this dam to a height of 260 feet, and is then conveyed by a race 1 mile in length to the mill. By this means a constant supply of water for all purposes may be depended upon.

The Mascotte Mine is considered one of the most promising in this division. From tests made of small parcels of ore sent to the Clyde Works in Sydney, and to the Dry Creek Works in Adelaide, very satisfactory results have been obtained, and it is probable that in a very short time the proprietors of this mine will erect reduction works, and treat the ore on the ground. About 1,000 tons of payable ore is now at grass, and the parcels tested gave the following results:—No. 1, of 20 tons, yielded 1 oz. 6 dwt. gold, and 57 oz. silver per ton; No. 2, of 4 tons, gave 1 oz. 2 dwt. gold, and 125 oz. of silver per ton; No. 3, of 6 tons, yielded 1 oz. 2 dwt. of gold, and 37 oz. of silver per ton. The ore is a sulphide, very closely resembling the ore in the Golden Age Mine at Boorook, and must, I think, be treated in the same manner, viz., dry crushing, and Wheeler's pan amalgamation, as it is not a smelting ore.

Wann's Claim is the newest development in mining on the field. This is a large lode or dyke about 25 feet wide. From the surface to a depth of 15 feet all the stuff crushed yielded 1 oz. per ton of metal, worth £2 per oz. Below this level, however, the free gold became less, and, though high assays were obtained, the metal could not be saved by the ordinary method of treatment, and necessitated the erection of new and improved machinery. A trial parcel of 300 tons was treated at the Adeline Reduction Works in the following manner:—The stone was crushed in the ordinary way, and allowed to pass over the mercury tables for the purpose of saving any fine gold that there might be in the stone. The tailings then, instead of being allowed to run into the slime pits, were conveyed by launders to three of Duncan's concentrators. By this means 325 oz. of bullion, worth 26s. per oz., were collected on the tables, and 26 tons of concentrates from the pans, worth £17 per ton. Total value of bullion and concentrates, £864 10s.

Rivers' Claim at Long Gully is a gold lease of 5 acres, which was applied for in July, 1888, and is within the boundary of a mineral lease, applied for by the same person. The mine was worked for gold, from the time of taking possession until March of the same year, and 353 oz. of gold was obtained therefrom. At 40 feet the vein of ore pinched out, and Rivers was about to abandon the land; but before so doing, thought it advisable to make application to the Prospecting Board, who were at that time visiting this district, for assistance to further prospect the land. Whilst waiting for a reply, they thought it advisable to search in other likely looking parts of the land, and were fortunate in discovering a small leader carrying gold, which they sank on, and which increased in width and quality as the sinking was proceeded with. After sinking to a depth of 50 feet, a drive was put in, north and south, for a distance of 20 feet each way, showing a well-defined lode about 8 inches wide and composed of gossan, zinc blende, and copper, a good deal of free gold being visible in the stone. A crushing of 56 tons of ore from this mine has yielded 278 oz. of gold. Had not the Prospecting Board recommended that aid be given to Rivers and party to further prospect this land, I am of opinion that it would now be abandoned, and the valuable discovery just mentioned would not have been made.

Tooloom and Pretty Gully maintains a population of about 60 miners, and the gold won is about the same as last year.

I estimate the population of Fairfield at 500.

There has been only one fatal accident in the mines this year. A man, named Henry Franklin, lost his life, through falling down a shaft of the Adeline Mine. The matter was duly reported to the Inspector of Mines.

I am indebted to the courtesy of the managers of the two local banks and the storekeeper at Pretty Gully, for the quantity of gold that has passed through their hands during the past year. The returns are as follows:—

Australian Joint Stock Bank.....	1,583	oz.	5	dwt.
London Chartered Bank.....	496	"	9	"
Mr. John Farley .....	356	"	0	"

Total ..... 2,435 oz. 14 dwt.

Average value, £3 10s. per oz.

844 oz. of this was obtained from quartz, 1,591 oz. from alluvial.

During the past year I have received 12 applications for mineral leases, 22 for gold leases, and I have issued 385 miners' rights, 14 mineral licenses, and 32 business licenses.

NEW

## NEW ENGLAND DISTRICT—LIONSVILLE DIVISION.

(R. Wilkinson, Mining Registrar.)

I HAVE the honor to herewith submit my report on the Solferino Division, New England Mining District, for the year 1889.

*Quartz.*

The Lion Mine, of which I reported in my last report as being worked by a syndicate, who had two men on driving a tunnel in on the course of the reef, and had, up to the end of the year 1888, put the drive in a distance of 225 feet, ceased operations on the 1st July last, having driven a further distance of 60 feet, making a total length of drive 285 feet; and should they have been able to continue on till the close of the year, they would have completed the task of putting the tunnel through to the main shaft; but unfortunately some of the paying shareholders got into arrears and the managing director was compelled to suspend work, and nothing has been done in the mine this last six months awaiting a reconstruction of the syndicate.

*Garibaldi Prospecting Claim.*—Bassetti, Uduesich, and party have kept from two to four men constantly at work, but have not met with that success anticipated, this mine being very patchy they have not come across anything like a good dab, although they have had a small patch or two. Want of machinery is a serious drawback, all the stone that they cannot see gold plainly in, has to be sent out to the tip, as it would not pay to cart it away from the district to be treated, but would no doubt pay well if machinery was on the ground to reduce it.

This Company have during the last six months realized on 1 cwt. of specimens in London for a net value of £68. This stone was sent home with a gentleman some eighteen months ago, for the purpose of trying the London market to raise a Company, but unfortunately it got into the wrong hands, and nothing in the way of floating was ever attempted, and the shareholders were therefore compelled to realize upon the specimens rather than go to any further expense.

They have also despatched during the last month of the year 14 cwt. of specimens and 15 cwt. of mineralized stone for treatment in Melbourne, by the chlorination process, result of which is not to hand to date.

There is no doubt, but that this mine is valuable property, if it was only in the hands of a good Company with a manager who would economically work it, and put machinery on the ground for the proper treatment of the stone, which is so much impregnated with mineral. The owners are very anxious to get capital to develop it, and are trying to raise a Melbourne Company to take it in hand, as the mine is in thorough working order, being all well secured and well opened out for at least fifty hands to be readily employed underground.

*No. 1. North Garibaldi.*—C. Harkin has constantly kept pushing on with opening up this claim, and has had, by his own story, very satisfactory results.

*Shallamelia.*—A. Tamini and others continued their main tunnel on for a further distance of 50 feet, making a total of 240 feet. Ground was very hard, and reef was quite pinched for last 40 feet, driven on, they therefore gave it up as too expensive; during the last four months they have sunk a winze in the 40-foot level drive to a depth of 25 feet and drove from that depth to a distance of 20 feet, but with no success.

*Band of Hope.*—J. F. Adam and party have kept two men at work all through the year, but unfortunately have not met with any gold to speak of.

At Cangie there has been a little stir in mining, caused through a small crushing or two for a total of 8 tons treated in Sydney, from the Sir Walter Scott Reef, for a return of 3 oz. per ton.

In alluvial mining, this district still holds its own, with nothing occurring to produce excitement. Mr. P. Marcolino, who, as I reported in my last annual report, had made a new discovery near the Old Scrub Diggings, worked out his claim, which turned out very well, considering the small area of ground the gold was found in, which unfortunately did not extend beyond that of any ordinary prospecting claim, and at that very narrow. Mr. Marcolino with three or four other men worked the best of it out in six months, having obtained from 60 to 70 oz. of very nice nuggetty gold up to a 22-dwt. piece, and valued at £3 14s. to £3 10s. per oz. all of which was lodged at the head of a bar.

A good deal of prospecting was done in the neighbourhood of the find, but with no success, as there must have been some twenty men at work for a month at the beginning of the year, but all retired disappointed, with the exception of three men who have made a little all through the year.

In the Ewingar Creek, Bulldog and Old Scrub, there are still located the old hands who appear to make a fair living and quite contented with their lot.

During the latter part of the year, Mr. Marcolino obtained a grant from the Prospecting Vote of half wages for himself and four others to go out and prospect the country lying between Lionsville and the Rocky River. His party commenced operations during latter part of November, and, after putting in five weeks, left for the holidays, and will probably resume early in January, when it is to be hoped they will show up something worthy of their labours.

I have issued during the year 54 miner's rights, one each business and mineral license, and received 4 applications to lease a total of 22 acres for gold-mining purposes.

As far as I can gather the amount of gold won in my division is—from quartz, 280 oz.; from alluvial, 200 oz., valued at from £3 5s. to £3 10s. per oz. Numbers of miners at work—quartz, 16; alluvial, 24; total 40.

Have just got the returns authenticated for the 14 cwt. specimens from Garibaldi Company Claim, which were sent to Melbourne for treatment, and which gave the very good yield of 280 oz. 6 dwt. of smelted gold.

## NEW ENGLAND DISTRICT—TENTERFIELD DIVISION.

(P. Burne, Mining Registrar.)

I HAVE the honor to submit my report for the Tenterfield Mining Division for the year 1889.

Since my report for the year 1888 mining in this division has been rapidly on the decrease, and the work done has been merely prospecting.

*Gold.*

All the machinery has been removed from off the Lady Mary Reef in consequence of the non-payable character of the stone. That on the Golden Crown Reef, though still on the ground, has been idle for some time. From one of the leases the prospectors have crushed about 7 tons of stone, yielding about 14 oz. of gold. There are a few men working the alluvial with very poor results.

*Silver.*

*Silver.*

Nothing beyond prospecting has been done in this line.

*Tin.*

There are a few men prospecting on the Brassington Creek, situate about 12 miles south of Tenterfield, with every indication of success. Kennedy and Bateman still at work on their leases on Tenterfield Creek, but have had no return for their outlay and labour as yet.

Applications for gold and mineral leases for the year 1889 are as follows, namely:—4 applications for gold leases and 6 for mineral leases.

The number of miners' rights, business licenses, and mineral licenses, issued for the year 1889, is as follows:—121 miners' rights, 4 business licenses, and 14 mineral licenses.

## CLARENCE AND RICHMOND DISTRICT—GRAFTON DIVISION.

(*A. L. McDougall, Warden.*)

I HAVE the honor to forward you my annual report as Warden for the Clarence and Richmond Mining District for the year 1889.

Within the last few months, both at Dalmorton and Nana Creek, mining matters have assumed a more lively aspect. At the former place 35 gold-mining lease applications, embracing an area of 372½ acres, have been made during the year; and at Nana Creek 13 gold-mining leases have been applied for, containing in all 66 acres; and at Grafton 4 gold-mining lease applications, containing an area of 26 acres; and a much larger number of men have been engaged in mining pursuits than for several years past, and there is every prospect of a revival of the mining industry during the present year in this district.

I beg to forward you herewith the returns received by me from the Mining Registrars at Dalmorton, Nana Creek, and Grafton, giving details of the mining proceeding at their offices during the past year, from which you will ascertain the advance made in this mining district during the last year compared with the previous one.

The coal-mine at Coaldale, taken up by Messrs. See & Co., is in a fair way of being worked during this year, as arrangements are now being made to commence operations on a large scale.

The further search for coal at Maclean and the Coldstream, near Ulmarra, and at Chatsworth have been abandoned since the visit of the Prospecting Board to this district.

Return of mining business for the year 1889:—Miners' rights issued, 80; mineral leases lodged, none; mineral licenses issued, 29; business licenses issued, 1; 2 gold-mining leases were received for 10 acres, situated at Chambigue; 2 gold-mining leases were received for 16 acres at Cangai.

## CLARENCE AND RICHMOND DISTRICT—MURWILLUMBAH DIVISION.

(*Joshua Bray, Warden.*)

I do myself the honor to report that no payable gold has yet been discovered in the district under my charge.

In the early part of the year (1889) a few people were prospecting in the parish of Terranora, and nine miners' rights were issued. Several shafts were sunk, and a few specks of gold got, but nothing payable. Work in the locality was discontinued about four months ago.

I do not know of anyone prospecting in this district at present.

## CLARENCE AND RICHMOND DISTRICT—LISMORE DIVISION.

(*E. Jones, Warden.*)

I DO myself the honor to forward you the annual report upon mining in that portion of the Clarence and Richmond Mining District assigned to my charge.

I commenced my duties here in June, 1889, and found at that time 15 gold-mining leases had been granted and 6 mineral leases refused. The gold-mining leases are situated near Black Head, in the Ballina District, and were taken up during 1888. No leases were applied for during the past year.

I am informed that no mining operations have been carried on upon any of the leases during my residence in the district, and that but little work at any time to fairly test them. Upon gold-mining lease, 88-1, gold was found, but evidently not up to the expectations of the party, or some further labour would have been expended towards developing what may yet turn out to be a valuable property. Upon the small amount of capital and labour expended upon the several leases referred to, I infer they were mainly taken up for selling and floating speculations.

I have heard of two parties prospecting. No reports of a successful find has reached any of the Mining Registrars, and no claims under the Gold-mining Regulations were registered during the past year at any of their offices.

I am informed that extensive coal-measures exist near Wardell and Casino, and that nothing has been done towards proving their value.

I sincerely hope that my next report will be of a more favourable character.

CLARENCE

## CLARENCE AND RICHMOND DISTRICT—LISMORE DIVISION.

*(C. Coghlan, Mining Registrar.)*

I do myself the honor to report, for the information of the Department of Mines, that gold-mining operations on the Lower Richmond have gradually declined during the past year, and, as far as can be judged from the information filed at this office, is regarded as having almost ceased.

The Black Head, which in 1888 attracted a good deal of speculation, has been abandoned as a gold-field. A few parties are still fossicking along the beach, between the Little River (Evans R.) and Brunswick Heads, but nothing is definitely known as to the success or otherwise of their operations.

Nothing is known at this office regarding any efforts to mine for other mineral.

## CLARENCE AND RICHMOND DISTRICT—DALMORTON DIVISION.

*(W. F. Poole, Mining Registrar.)*

IN compliance with the request contained in your letter of 9th instant, I take the very earliest opportunity of supplying you with the following information respecting my division for the year ending 31st December, 1889.

I have received 35 applications for gold-mining leases, comprising an area of 372½ acres, issued 87 miners' rights, 4 business licenses, 6 mineral licenses, registered 1 alluvial protection area, 1 prospecting claim, 3 ordinary claims, 1 sluicing claim, and 1 amalgamation; also 7 quartz prospecting protection areas, 3 prospecting claims, 2 ordinary claims, 2 extended claims, 3 machinery areas, 6 stream-water rights, 7 dam sites, 1 tunnel site, 1 tail-race, and 2 residence areas.

About fifty men are employed at alluvial mining, and about 120 in quartz-mining.

148 tons of quartz crushed at Mann River yielded 62 oz. 11 dwt. gold, and 97 tons crushed at Dalmorton yielded about 79 oz. 10 dwt. gold.

Several other trial parcels have been crushed, but the lessees have not yet responded to my circular letter, asking them to furnish me with the return of gold won. About 150 oz. have been won from alluvial, making a total of 292 oz. 1 dwt.

Considerable excitement was caused in July by the reported find of alluvial gold at Marengo, about 20 miles south of Dalmorton; but after some weeks the place was deserted by all but the prospectors. But on 26th October Messrs. Ryan and Miller and party reported payable gold. A few miners are again on the ground, waiting for the prospectors to bottom their new shaft, when it is anticipated a rush will set in.

Messrs. Sellen and party took up a sluicing claim at Black Hole Creek, and erected an engine and centrifugal pump, sawbench, &c.; but after working a few days they abandoned it, and the plant is now for sale.

Several new reefs have been reported, amongst which the Magpie, Isabella, Black Slate, Cadell and party, Excelsior, Black Jack, and Florida may be expected to be heard of before long, as machinery is going to be placed on several of them if reports are true.

The Magpie is a small vein 2 or 3 inches thick, but if it gets no worse it must be considered payable.

A shaft has been sunk 47 feet, and the quartz, amounting to about 4 tons, yielded about 45 oz. of gold.

This claim was worked by Messrs. Green and Butler, under the backing system, until the backers got tired of it and threw it up, they then started to crush with a dolly, and, from 6 or 7 cwt. of stone, obtained about 14 oz. of gold. Green then transferred his share to Butler, and for a few weeks Butler hired a man, and was able by hard crushing to obtain sufficient gold to give £3 a week after paying expenses. Butler then sold to a Mr. Foster in Sydney for £400. Local people were jubilant, thinking if a man solely depending on his labour could work the claim with profit, that now capital was introduced, work would be carried on in a systematic manner, and large returns obtained, thus giving an impetus to mining in the district, but after securing a 10-acre block on one end and a 12-acre block on the other end of the claim the owner applied for and got suspension. As no notice was given of this suspension, it gave general dissatisfaction, and petitions to annul it were spoken of, but it ended in the usual way. The cause for suspension was, that "time was required to erect machinery", yet no machinery has been erected.

The Isabella Reef, owned by Greenaway, Ducker, and party, reported payable gold on the 9th October. They were receiving Government aid, but owing to the discovery the aid was stopped. It has, however, been renewed, I think wisely so, as they were really in no better position than the day they started work, as they were confident of the existence of this shoot of gold, but they required aid to prove its extent before they could reasonably hope to induce capitalists to erect machinery to enable them to get returns from the gold won.

No doubt they deserve success, as they have expended a large amount of labour apart from the requirements of the Prospecting Vote. Aid was granted for driving (on the vein they are now working on) 25 feet south and 100 feet north. The 25 feet south was driven, but it was found that a further distance of 36 feet drive and open cutting would have to be done before a barrow or truck-way could be brought in; this work was performed, and the driving north then commenced. After driving 43 feet, payable gold was reported with a width of reef 16 inches. I was shown about 3 dwt. gold obtained from the casing, and some very rich specimens. The best gold appears to be in a soft ferruginous quartz, and I am afraid will be very patchy.

There is another larger reef in the claim, from which a little gold can be obtained from the casing; and Government aid has been granted to sink to a depth of 60 feet in this reef. The shaft at present being 30 feet. The claim is situate about 4 miles south west of Dalmorton.

The Liberator Reef, distant about ¾ mile, east of the Isabella has also got a Government aid to sink 103 feet. This will be a good test for the ground, as it will deepen the present shaft to 150 feet, and as very rich stone was got in the early days, I believe as high as 7 oz. per ton, the owners have a reasonable chance of being recouped for their outlay. The contract for sinking has been accepted, and 7 feet already sunk. The time allowed for the work to be completed is four months from the 7th instant.

The

The Calliope Reef, about  $\frac{1}{2}$  mile in a north-west direction from the Liberator, also receiving Government aid, is a well defined reef, 3 feet wide, with a little gold in the casing. A drive has been put in 20 feet.

In September Messrs. Swain and party reported payable gold at Mount Swain, Black Slate Creek, about 10 miles south of Dalmorton, and took up a 20-acre lease. Arrangements were entered into with Mr. A. Cadell, of Vegetable Creek, a gentleman of large mining experience, and well known in mining circles, by which he acquired one half of the property with the option of purchasing the whole, and in the early part of last month the property passed into his hands. During the whole of the time the labour conditions have been strictly observed. Two shafts, respectively 50 feet and 30 feet, have been sunk, and a tunnel driven about 70 feet. This tunnel is expected to cut some of the reef at a depth of from 250 to 300 feet.

Mr. Cadell has two or three other leases working, but, up to the present, without any favourable results.

I believe there are some twenty or thirty gold-bearing veins on the 20-acre block, averaging from 1 or 2 inches to 4 feet. The prospectors informed me the assays were all satisfactory. A good deal of prospecting has been carried on in the vicinity, but up to the present without satisfactory results.

In November two new reefs were discovered by Messrs. Orr and party, viz., the Excelsior and Black Jack. Arrangements were entered into with Messrs. Jenkin and party, of Armidale, and a large amount of ground has been taken up on both reefs. About 9 or 10 tons have been sent to Sydney for a trial crushing, and the owners appear very sanguine as to the result.

The Florida, another new reef owned by Orr and party, is also expected to be heard of in the near future.

The old reefs appear to be blotted out for a time. The Mountain Maid Prospecting Claim, with a reef from 2 to 5 feet, crushed 64 tons for about 1 oz. per ton, and only 10s. cartage to pay, yet the owners applied for and obtained suspension for six months, ostensibly to float and erect machinery, but I think capitalists are arriving at the conclusion that it is scarcely good enough to erect machinery for a suspended claim that has no stone at grass worth speaking of.

The Garden Hill Protection Area has been hung up for nine months under suspension; the crushing of 30 tons I alluded to in my last report only yielded about half an ounce per ton, which was considered very unsatisfactory, as it was expected to yield at least  $1\frac{1}{2}$  oz.

The Alice Cornwall Prospectors has also been hung up under suspension, and has since been applied for as a lease.

The Old Sir Hercules has been taken up as an extended claim, and a shaft started.

The Scottish Chief has been hung up for the last nine months under suspension.

All or nearly all of the claims and leases at Mann River have obtained suspension, Cangi the same. In fact, there appears to be a mania to get protection in some form or other.

However, the prospects are brighter than at any previous time during the last sixteen years, and if the labour conditions were enforced, employment would be given to 400 or 500 men, whereas under present arrangements only one-fourth of that number (or even less) manage to find precarious employment.

Prospecting is being vigorously carried on between Dalmorton and Marengo, and if a road was cleared between the two places, it would be a great boon to the miners generally, as a great many get lost in the ranges trying to make their way through. It would also act as a means of communication with Wullamunbi, Baker's Creek, Hillgrove, Armidale, and all parts of the table-land from the Guy Fawkes to Glen Innes.

#### CLARENCE AND RICHMOND DISTRICT—NANA CREEK DIVISION.

(George Geddes, Mining Registrar.)

I AM in receipt of your advice of the 9th instant, and have the honor now to furnish the particulars therein asked for, as follows:—

Number of miners (quartz), 24; number of miners' rights issued, 28.

Mining tenements have been applied for thus:—Ordinary claim, 1; tunnel sites 2; residence site, 1; machine site, 1.

Thirteen gold-mining lease applications, showing an area of 66 acres, have been received at this office during the current year.

The undermentioned claims, viz., Nana Queen, Lady Carrington, Jubilee, Lady Bella, and Nana's Daughter, have been worked, yielding from eleven crushings, the stone weighing  $239\frac{3}{4}$  tons, 289 oz. 12 dwt. 8 gr.

Three other claims, the Waratah, Day Dawn, and Advance Australia, have been worked, but I do not think the owners will give returns of the gold won—certainly not in time for your report.

I have the honor to remit my report upon the state of mining in the Nana Creek Division of the Clarence and Richmond District, for the year 1889.

*Jubilee.*—This, a prospecting claim, is the property of Mr. Alexander Nicholson, and is situated on the Matilda Hill, at Nana Creek. It has been continuously worked by him since 23rd April, 1887, the gold won from it averaging to the present time, 1 oz. 2 dwt. per ton. The reef which averages 2 feet 6 inches in width is found in granite sandstone and clay slate, and its bearing is east and west. On the south side of the hill is a tunnel 200 feet in length entering a chamber 27 feet by 30 feet, and at the 60-foot level there is another chamber 60 feet by 30 feet, in which most excellent stone is to be obtained. For the removal of the quartz, a road from the mouth of the said tunnel, extending about 4 chains, has been constructed, and will be continued a farther distance of 6 chains. There is a 1-acre lease adjacent to the above claim, in which a considerable quantity of work has been done by the lessee, Mr. A. Nicholson. A shaft was sunk to a depth of 37 feet, but failing to find the reef it was left, and another sunk to a depth of 37 feet, in which are two drives at 24-foot level, one to the east 14 feet in length, and the other to the west, 12 feet in length. The cost of the whole of the work is said to be nearly £1,100.

On

On the north side of the hill is a tunnel worked under a grant from the Prospecting Vote, made on the 25th April last, to Alexander Nicholson and party, of £200, to drive a distance of about 175 feet, in order to cut the reefs at a depth of 200 feet from the surface. My advice of the 30th November last, indicates that up to the 27th idem, the extent of the drive was 100 feet. The formation is, I am informed, quartzite, and very difficult to be worked.

*Lady Bella.*—This claim is held by Messrs. Forbes and Wood, and is situated about  $1\frac{1}{2}$  miles in a south-westerly direction from the Warden's office. It is an 8-acre block, for which a lease has been applied, and therein are found two well-defined reefs—one, north and south, the other, east and west; the former for a distance of about 6 chains, and the latter about 11 chains. As traced the ground has been opened in several places, the stone tested, and the whole of it yielded well, so much so, that the owners determined to work the ground systematically. There are three shafts; Nos. 1 and 2 are down 25 feet and 33 feet; these are on the east and west line of reef, and at a distance from the former of about 1 chain, a tunnel is in about 20 feet, with the view to enter the shaft at the 60-foot level. In the tunnel, the reef runs its length, about 15 inches in width. In the latter shaft is a drive at the 14-foot level of 30 feet. The No. 3 shaft, reef north and south about 2 feet 6 inches wide, is sunk to a depth of 12 feet. Stone aggregating 83 tons has been crushed, yielding of retorted gold, 128 oz. 2 dwt. 21 gr. or 1 oz. 10 dwt. 21 gr. per ton. This cannot be considered, as far as the field is concerned, other than a highly satisfactory result, still, the gold being very fine, the proprietors are strongly of the opinion, and from the general appearance of the quartz I consider they are justified in forming that opinion, that were better gold-saving appliances available, the returns would have been largely in excess of that noted. There were two crushings, the last for 96 oz. 15 dwt. from 58 tons, the average being 1 oz. 13 dwt. 8 gr. It looks all out 3 oz. stone, and is taken from ground which has not hitherto been worked.

*Nana's Daughter.*—This claim, originally owned by Messrs. O'Grady and Nordberg, is a 4-acre block, adjoining the eastern boundary of Messrs. Forbes and Wood's claim. A lease of it has been applied for, and it is being worked. The reef is supposed to be the continuation of the Lady Bella reef on its easterly course through a soft blue slate country. A shaft has been sunk on it about 25 feet in depth, from which in the sinking only 21 tons of quartz was taken; this was crushed for the satisfactory average of, Mr. O'Grady informs me, 1 oz. 3 dwt. per ton. The reef is from 3 to 4 feet wide in the shaft, and also in a tunnel further west, it shows good gold. The Lady Bella line of reef is generally admitted to be the best yet opened on Nana. Mr. O'Grady is now sole owner of the claim, he having bought his partner's interest in it. He intends to, without delay, let a contract for further sinking and driving.

*Unnamed.*—This is a 4-acre block situated on the western boundary of Messrs. Forbes' and Wood's 8-acre block, and originally applied for as a lease by Messrs. Nordberg and O'Grady, but the latter's interest therein has now been transferred to his former partner.

*Illabo.*—This abandoned claim, about 2 miles from the Warden's office, on the main Nana Creek Road, has been taken up as a lease of 4 acres by Mr. O'Grady, the present owner of the battery, hitherto known as the Dargue battery, at Nana, with the view of having a trial crushing from what is known as the big "Blow," which is stated to be about 40 feet wide, with, in places, visible gold.

*Victor.*—This is very old abandoned ground in the vicinity of the battery, formerly the Benson. It has been applied for as a 2-acre lease by Mr. O'Grady. The reef runs right under the mill site, and a fair body of  $\frac{1}{2}$ -oz. stone ought to pay. Some cutting has been done already.

*Lady Carrington.*—This is a 2-acre lease, the property of Messrs. M'Vicar and Fauvel. It is distant from Nana Creek in a north-west direction about 2 miles. The main shaft is about 50 feet in depth, and at that level a tunnel has been driven a distance of 141 feet piercing it. The reef, a north-north-east and south-south-east one, averages in width about 10 inches, and is found in a formation of slate and sandstone. At a supposed distance of about 200 feet, and an altitude of 92 feet, from the mouth of the foregoing tunnel, another tunnel is being constructed under a grant made to the claim-holders from the Prospecting Vote, upon the recommendation of the Prospecting Board who visited this field on the 4th April last, by the Secretary for Mines of £200, to assist them to drive a tunnel 200 feet in a north-east direction. When last remitting vouchers for work done, my advice of the 21st December gave the extent of the drive as 50 feet 6 inches on the 20th idem, and the formation black slate, very hard. In addition to the foregoing works, a roadway, in length about  $\frac{1}{2}$  mile, has been made at considerable expense, to facilitate the getting the quartz from the mine. Two crushings have taken place from this claim, the average returns being slightly in excess of 1 oz. per ton. A detailed list of them will be found below.

*Day Dawn.*—This, an ordinary claim No. 50 on the register, was applied for, on the last occasion by E. F. Sharpe, on the 2nd January last. It has not been surveyed, consequently it is unregistered, nor has any work, I think, been done in the claim. Messrs. Sharpe and Morrow have been engaged at their battery crushing some 16 tons of stone which was at grass on the Nicholson claim. Having abandoned the claim, they, on the 2nd January last, registered the stone for twelve months. No particulars, however, can be got from them as to the quantity of gold won from the crushings. This, with the Nicholson claim, I reported upon last year, likewise the battery they have in use.

*Caledonian.*—This abandoned claim was, on the 21st December, applied for by Messrs. Nelson and Thomas as a 10-acre lease, and I am told by them, that a party from Hillgrove will shortly join them to work the claim.

*Homeward Bound.*—The lease was, for this, I am informed by Mr. L. R. Rudder, granted, and the lessees called upon to execute it, but no notice, even of its approval, reached this office.

*Unnamed.*—A notice of intention to apply for an 8-acre lease was, on the 30th December, posted at this office by Messrs. Nelson and Thomas, and will, for a certainty, be applied for by them on the 9th proximo. It is outside of, and on the southern boundary of the lease applied for by Messrs. L. R. and F. J. Rudder on the 27th April, 1888.

*Nymboi.*—This gold-mining lease No. 131 was transferred by E. F. Rudder and two others, to S. H. Jones, but since his ownership, no labour has been done upon it. A grant, on the 25th April last, was made from the Prospecting Vote, upon the recommendation of the Prospecting Board, by the Secretary of Mines to this person of £75, to assist him to continue the shaft then down 50 feet, a further depth of 50 feet; yet, no further sinking has been done, nor has work of any kind been carried on in connection with the claim under his lease.

*Eureka.*—This old abandoned claim was applied for as a 2-acre lease on the 15th May, 1888, by W. B. Lewis and E. F. Rudder. A transfer has, I understand, been given by them to S. H. Jones of their interest in the claim, and, as in the foregoing case, a sum of £75 was granted to him, to aid him in driving a tunnel from a point (not stated) from main shaft in a south 35° east direction for a distance of 150 feet, and this work, although the aid was, by the Minister for Mines, most generously accorded him, has never been proceeded with.

*New Hidden Treasure.*—A 9-acre lease of the old abandoned Hiddden Treasure has been applied for and renamed by Messrs. H. Feldheim and two others; this was on the 4th November last; and on the 26th December last, Mr. Feldheim with two miners, started for the claim. A new shaft within 30 feet of the old main shaft has been commenced, and is now down about 20 feet. He, on behalf of the Company, intends despatching to Sydney for treatment, 3 tons of quartz, and should the trial prove satisfactory and a sufficient body of stone be found to work upon, machinery will be placed upon the ground.

*New Year's Gift.*—This is a 4-acre lease numbered on the register 132. The principal work done upon this claim, Mr. Anderson informs me, has been in connection with the grant made to him from the Prospecting Vote, on the 25th April last, of £97 10s. to continue his main shaft, then down some 70 feet, a farther depth of 30 feet, and to continue his drive, then in 95 feet, a farther distance of 100 feet. I last measured the work done in the tunnel on the 23rd November last, and when remitting the vouchers, I, on the 25th idem, reported the distance driven under the grant as 87 feet, thus making the length of the tunnel 182 feet. The formation is black slate. The work that Mr. Anderson was engaged in, in the earlier portion of the year was procuring timber for supports, slabbing, &c. He estimates the quantity of quartz he has at grass as 125 tons. Shaft, 66 feet in depth, measured 7th instant.

*The Challenge.*—This is a 4-acre lease numbered on the register 128, the property of Mr. O. Anderson. No work during the year has been done in this claim, he having been engaged, under his grant, in pushing on the work of the tunnel in the New Year's Gift claim.

*Advance Australia.*—This is a 6-acre lease owned by James Wilson and party, and numbered on the register 134. Prior to a grant being made them, they were engaged in sinking a shaft No. 3. They sank it to a depth of 24 feet, then followed the reef on the underlay to a farther depth of 34 feet. On being visited by the Prospecting Board, 4th April last, they were instructed to continue the shaft perpendicularly a farther depth of 125 feet, and crosscut from the bottom of said shaft for a distance of 100 feet. On the 28th August, the shaft had, under the grant, been sunk 47 feet 6 inches. A further grant was made to assist them to continue No. 1 shaft, now standing on the most westerly or "Mundic" reef at a depth of about 70 feet, a farther depth of 30 feet. It has since been sunk a distance of 13 feet. The sum granted is £256 for the entire work. On the 12th July, when Messrs. Wilson and Forbes were engaged drilling out, as they supposed, a miss fire charge, after waiting an hour and a half, the hole 2 feet 4 inches in depth, having been charged at noon, an explosion took place whereby they were so seriously injured, that they had to be conveyed to the Grafton Hospital, and the work of the mine was brought to a stand-still. Forbes, with an eye permanently injured, almost sightless, is able to again resume work, whereas Wilson is so much knocked about internally, as well as externally, that he contemplates entering one of the Benevolent Asylums of the Colony. A crushing of 26½ tons was put through the battery by S. H. Jones at the Little Nymboi River, the yield being, I am informed by him, 16 oz. 5 dwt. 8 gr., and the value £58 19s. 2d.

*Jessie Smith.*—This, a prospecting claim, is situated about 20 miles from Nana Creek. Nothing further than opening a drive to the extent of 45 feet appears to have been done in the early part of the year. On the 30th April, a grant was made to the owners of the claim to extend the said tunnel a farther distance of 100 feet at the rate of £1 per foot. In my advice of the 19th November last, I mentioned that, up to the 6th idem, the extent of the work done under the grant in the drive, was 82 feet 6 inches, that the reef was then on the east side of the tunnel 1 foot 6 inches in width, showing galena, iron pyrites, and manganese in a country of blue diorite.

*Unnamed.*—A gold-mining lease of 6 acres was applied for by George Kelly and four others on the 17th September. The land is situated near the Bosterbrick old station, Blick's River and some 40 miles hence. I cannot report upon the working of the ground by the applicants, as I have no particulars, anent it to hand.

*Unnamed.*—A gold-mining lease of 10 acres situated on the Upper Orara, distant from Coff's Harbour about 7 miles, was, on the 18th November last, applied for by Messrs. J. M'Leod and six others. The distance from the Warden's Office is about 16 miles. Concerning the working of this ground I cannot supply any information. I am, however, informed by Mr. John M'Leod that samples of the stone got from the claim had been sent to Sydney for treatment, and the returns were deemed satisfactory, but no further information was given me.

*O'Grady's Battery.*—This formerly was owned by a Company and was styled the "Dargue Battery." It has now become the property of Mr. T. R. O'Grady, who, now that the recent crushings comprising good and indifferent stone amounting to 137 tons 10 cwt. are over, is making extensive alterations in and about the battery. It is his intention to set up a concentrator. He values his plant at £1,200.

*Jones' Battery.*—This plant, until very recently, was the property of Mr. P. Marcolino and has, already, been fully described in my report for the year 1886. It is distant from the Nymboi about ¼ of a mile and close to the Little Nymboi River.

*Sharpe and Morrow's Battery.*—This has been worked by them solely on their own account, and no information can be got from them, as to what quantity of gold they have realized from any crushings they may have had. Value of plant about £70.

The average of the crushings is, for 1889, 1 oz. 2 dwt. 23 gr. per ton, and it is anything but a bad one. For the years following, the averages were:—1886, 1 oz. 12 dwt. 12 gr. per ton; 1887, 1 oz. 1 dwt. 15 gr. per ton, and 1888, 1 oz. 3 dwt. 18 gr. per ton. From these statements it will be seen that, although a small quantity of stone only is crushed from year to year, still the average is good, and might be much better but for the fact of some parties putting through the battery more than doubtful stone, thus lowering the average of the gold won, irrespective of the loss they entail thereby upon themselves.

Stone will, after the holidays, be raised from a few of the claims with all convenient speed, and the battery (O'Grady's), when the requisite repairs, alterations, and additions have been made, will again be ready to start on any stone that may be brought in for the purpose of being crushed. The alterations now being made will be a decided improvement upon the old plan of working the battery. The weather during the past few months has been most uncertain, and like unto last year, constant thunderstorms have taken place, causing the creeks and rivers to rise. This has been, or rather was, a serious hindrance to some of the miners getting on with their usual work. The lightning was at times too near to be pleasant. Trees were hurled in all directions, many across the roads. The District Superintendent of Roads, &c., has placed two men here to repair the main road cutting to this place, and none too early, for the road has, for some time past, been almost impassable. It is no exaggeration when I state a wheelbarrow could be buried in some of the ruts, made to a depth of 2½ feet by the extreme force of descending waters from several gorges down the wheel tracks. Some teamsters have ventured down, but at very great risk, and not altogether free from accident.

Capitalists from afar, I am aware, are becoming much interested in the working of this field, some of them having applied for leases recently, with the expressed intention of shortly taking up more ground, machinery to be placed thereon should circumstances warrant their so doing.

Value of machinery in the division, £1,520.

#### CLARENCE AND RICHMOND DISTRICT—BALLINA DIVISION.

(*Wm. J. Tippett, Mining Registrar.*)

THERE is very little mining going on in this division, only some alluvial mining at Evans River, and a few scattered parties fossicking on the beaches. The lease of the Black Rock Gold-mining Company has been allowed to lapse.

#### CLARENCE AND RICHMOND DISTRICT—CASINO DIVISION.

(*J. T. Hobbes, Mining Registrar.*)

WITH reference to your reminder of the 16th instant, I have the honor to explain that I have been quite prevented from communicating with you on the subject of information asked for in connection with the compilation of the annual report, owing to the very large amount of work attached to this office, and especially at this season of the year.

I have to state that I am unable to furnish you with any information, there is no mining of any kind going on in this vicinity, the principal workings being at Fairfield, Drake, where there is a resident Mining Registrar, although, in the Land District of Casino scarcely even licenses are applied for, two only being issued last year, and one this year, so far.

I would also mention that having arrived in this district in August last, I have had but little opportunity to go about to make inquiry into the products of the district.

#### CLARENCE AND RICHMOND DISTRICT—GRAFTON DIVISION.

(*William Clarke, Mining Registrar.*)

SINCE my last report the boundaries of my division have been altered, cutting out of it all the portions where any mining was being carried on.

See and party have done a good deal of work on their mineral prospecting area at Coaldale, and are confident of procuring payable coal.

I issued 80 miner's rights, 29 mineral licenses, and 1 business license, and received 4 applications for gold-mining leases.

#### ALBERT DISTRICT—BROKEN HILL, SILVERTON, EURIOWIE, AND MOUNT GIPPS DIVISIONS.

(*A. N. Barnett, Warden.*)

I do myself the honor to forward, for the information of the Honorable the Minister for Mines, my annual report on the Broken Hill and Silvertion Divisions of the Albert Mining District for the year 1889.

The rainfall for the past year was 16.43 inches. This has been one of the best seasons, as far as water supply is concerned, that has been known for many years.

Prospecting, which in this waterless country is only carried on in dry seasons with great hardships and disadvantages, has been of late appreciably stimulated throughout the whole district.

#### *Broken Hill Division.*

In this division the mines on the Broken Hill lode have been worked to immense advantage.

The Proprietary Mine has, during the past twelve months, erected two additional furnaces, which, with eight already in existence, have a reducing power of 3,200 tons of ore per week, averaging about 650 tons of lead and 145,000 oz. of silver, the output being thus double that reached in 1888.

This enormous increase is mainly due to the large reserves of very rich ore which have recently been found to exist in that portion of the Company's ground known as Block 11.

It is expected that the output of this great mine for 1890 will be materially increased when the additional smelting plant now in course of erection is completed.

The

The quantity of ore raised last year was 161,500 tons. Of this, 145,041 tons have been smelted, containing 6,236,006 oz. of silver, 25,170 tons of lead, valued in all at £1,317,831 sterling.

This mine now employs 2,140 men, and up to the present time has paid £1,160,000 in dividends, and £5,760,000 in bonuses, to which have to be added the nominal value of shares received from Block 14, British Broken Hill, and Block 10, totalizing in all about £3,840,000.

The Junction, British, Block 14, Central, and Block 10 mines have all discovered large amounts of payable ore during the past year, and the work of development is being rapidly carried on. Block 14 has been dividend paying since April last, and it is expected that the others will shortly be in the same position.

The work in the South Mine has been less fruitful of results during the past twelve months, but a new and systematic method of development, by deep sinking, has been decided upon by the management with every reason to anticipate success.

A large number of prospecting mines are being opened up in the vicinity of the Broken Hill lode, with varying results. In this respect the increased rainfall has been of incalculable benefit.

#### Silverton.

During the past year mining operations have been carried on with greater vigour than ever, owing to the cessation of the drought.

The Umberumberka Mine, which was the first of any consequence on the Barrier, is still employing a large number of men, and although not a dividend-paying concern, is still working to advantage.

A very large amount of prospecting continues to be done all over this district, and mineral leases are being taken up in every direction, the whole of the country being undoubtedly metalliferous in a greater or less degree.

At the Pinnacles, situated about 12 miles from Silverton, the new concentrating plant has been working very successfully since its erection in July last, reducing about 500 tons of ore per week, and employing some 200 men.

The Corona blocks, which have been abandoned for two or three years, are now attracting the attention of the mining community, and an English Company has been formed to work six blocks in the Corona lode, with a capital of £150,000.

A considerable number of abandoned leases in this neighbourhood are being reapplied for and floated into companies for the purpose of more thorough development.

At the Acacia dam a new industry is springing up in the quarrying of limestone, which is being extensively used as flux for the furnaces of the large mines in the Broken Hill lode.

The following figures show the quantities and values of minerals exported from the district during the year ending 27th December, 1889 :—

	Tons.	cwt.	qr.	lb.	Value.
Silver ore.....	42,253	5	2	20	£ 291,534
Argentiferous lead.....	31,544	4	2	18	1,433,679
Tin ore.....	8	19	1	0	86
Copper ore.....	106	8	0	8	1,081
Gold quartz.....	1	14	2	0	17
	73,914	12	0	18	£1,726,397

The above figures show an increase of nearly three-quarters of a million on the exports for 1888.

The amount of work done, and revenue received at the Warden's offices at Broken Hill and Silverton, will be gathered from the following figures :—

	Broken Hill.			Silverton.		
	£	s.	d.	£	s.	d.
January.....	338	7	6	349	2	6
February.....	154	0	0	157	2	6
March.....	172	17	6	164	15	0
April.....	162	0	0	252	15	0
May.....	207	12	6	153	5	0
June.....	223	12	6	217	10	0
July.....	350	0	0	297	10	0
August.....	524	2	6	312	7	6
September.....	316	15	0	290	10	0
October.....	555	17	6	130	5	0
November.....	433	7	6	366	12	6
December.....	556	17	6	372	17	6
	£3,995	10	0	£3,064	12	6

125 cases were dealt with at the Warden's Court, Broken Hill, and sixty at the Warden's Court, Silverton.

#### Miners' Rights, &c., issued.

	Broken Hill.	Silverton.
Miners' rights.....	1,084	65
Mineral licenses.....	152	159
Business licenses.....	3,149	193
Deed fees on mineral leases.....	£50	£198
Stamp duty on transfers, mining tenements.....	200	10

The

The value of the machinery at present in use on this field is estimated at fully £220,000.

Several of the reports from the various managers have not yet been received, but will be forwarded in due course.

The work in the Warden's offices at Broken Hill and Silverton is very heavy, and, as will be seen by the above figures, rapidly increasing.

The population of Broken Hill alone being now estimated at fully 17,000 inhabitants.

In conclusion, I may add that, having only been acting as Warden at Broken Hill since the end of August last, I have not been able to report as fully and exhaustively as so large and important a district deserves, but I trust that the information herein afforded will convey a fair impression of the importance of this portion of the Albert Mining District.

#### ALBERT DISTRICT—WILCANNIA DIVISION.

(*Walterus Brown, Warden.*)

I do myself the honor to submit my annual report for the Wilcannia Division of the Albert Mining District.

As I only took charge of this division last month my report must necessarily be brief.

During the past year more interest has been taken in mining in this division than heretofore, and more prospecting has been carried on.

Prospecting has been vigorously carried on, with the result that some very promising prospects have been discovered, notably that at Cawker's Well, where there have been several gold-bearing reefs found, 5 tons of stone from which, crushed in Melbourne, yielded 1 oz. 2 dwt. per ton; and assays have gone as high as 19 oz. per ton; this, of course was from picked stone.

These reefs are situated about 37 miles from Wilcannia and about 12 miles from the River Darling, on the Wienterriga Run.

There is every probability of these reefs turning out sufficiently rich to pay handsomely for working.

The only other locality in this division where any extent of work has been carried on is at Kanoie Peak, on the Mount Browne Road, about 80 miles from Wilcannia. Prospecting has been carried on here for some considerable time, and though some very nice alluvial gold has been found, and some fairly good reefing prospects have been obtained, nothing as yet has been found to return any adequate remuneration; but there is no doubt there are both alluvial gold and gold-bearing reefs in the locality which will ultimately be proved payable. There has only been one lease taken up here, which is known as "The Mystery," on which some really good work has been done, and I am told their prospects have recently very much improved. I expect to hear of payable gold being found in this locality before any great length of time.

During the latter end of last month the discovery of opal was reported about 70 miles from Wilcannia, on the Yungnalgra Plains Run. There is a large extent of country showing it to be opal-bearing, and a good deal of work has been carried on prospecting. Some very nice specimens of opal have been found, but as there is very little commercial value attached to it I attach little importance to the find, as it is not likely to maintain anything of a population.

Many years ago—long before Broken Hill broke out—I expressed the opinion, which I have ever since maintained, that the Albert Mining District was one of the wealthiest in the Colonies, and I am still of the same opinion, irrespective of Broken Hill.

The want of water is a great drawback to this field, and the want of capital for the proper development of it.

Gold and silver is to be found in every portion of the Albert Mining District.

The large amount of gold got in the surfacing, and the great extent of gold-bearing cement and conglomerate formations at Tibooburra, the extensive gold-bearing reefs at Warratta, the payable ground in the deep sinking at Mount Browne and Stringer's Hill, and the gold and silver-bearing reefs at Kooningberry, clearly show the large extent and great variety of the gold-bearing country, and large scope for labour and capital, in those portions of the district which only require development by the securing of plenty of water and the expenditure of capital to prove it one of the wealthiest districts in the Colony. Gold and silver can be obtained in any portion of it, and payable gold has been proved to exist at all depths from the surface down to nearly 300 feet, which probably will continue much deeper.

#### ALBERT DISTRICT.—MILPARINKA DIVISION.

(*E. L. Maitland, Warden.*)

THE past year opened with fair prospects which, unfortunately, have not been realized, the want of water again seriously retarding the success of the field and an appreciable decrease in the population has resulted.

With the exception of 1½ inches in January last, no rain has fallen in sufficient quantity to make surface water, and consequently many of the smaller mining localities are deserted.

At Stringer's Hill but little work has been done, water for puddling being available only during the first few weeks of the year, while that for domestic purpose has been carted either from Mount Browne or Milparinka. The principal returns to hand are Kilgour and party 208 oz. from 109 loads; Crammond and party 36 oz. from 60 loads; Swain and Conway 14½ oz. from 22 loads. For the latter part of the year work in deep ground was abandoned for the time being, as the miners have been obliged to adopt the primitive method of dry-blowing to obtain a livelihood.

A similar state of affairs exists at Mount Browne, and, until a supply of water is available, there is little hope of an improvement. The Mount Browne Prospecting Company, finding their capital insufficient to carry on the work of their claim and purchase more powerful machinery, amalgamated with a Melbourne syndicate. The machinery necessary has been purchased and is now on the ground, the greater portion being erected. The manager expects to have everything in full working order by the end of January. This Company have purchased an adjoining claim, All Nations, for the sum of £500, which they purpose to work by means of a drive from their main shaft. Should this venture prove successful it will give a great impetus to deep sinking in this part of the division.

A little work has been done at Mount Poole payable wash-dirt being found at a depth of from 6 to 12 feet, but, from appearance, is of limited extent.

So far as the rainfall is concerned, Tibooburra and neighbourhood has fared worse than many others of the mining localities in this division, latterly the miners have been obliged to remove their stock, all surface having dried up, and except for a little puddling with soakage water and dry-blowing the last nine months have been almost a blank. As an example of the extreme richness of the auriferous deposits in this part of the field, I may state that recently one miner obtained more than 8 oz. of gold, the result of one week's dry-blowing.

Applications to lease 100 acres at Nuggetty have been made lately. Nuggetty is a low hill situate some 7 miles to the westward of Tibooburra, and appears to be composed of a mass of water-worn gravel and quartz, which, from returns to hand, contains free gold throughout from 3 to 15 dwt. to the load. As the supply of this cement is almost inexhaustible, the lessees have a firm belief that their property is one of the most valuable yet discovered in New South Wales—such is also the opinion of many practical men who have lately examined it, and steps are now being taken to float a Company to thoroughly test its value.

The gold-saving appliances at Warratta having proved wholly inadequate, even so far as the free gold is concerned, nearly all work ceased for a time, but efforts are now being made to bring further capital into the field with a view of purchasing improved machinery. Several parcels of stone forwarded for assay have returned from 3 to 7 oz. to the ton, while from the primitive machinery on the field the return from similar stone has never exceeded 1 oz. On the Elizabeth line of reef Hassall and party are down 60 feet, the reef at that depth being 3 feet wide, showing a little gold on the Warratta line, House and party have sunk 50 feet, and have 100 tons at grass, and are now sinking another shaft to cut the underlay. 2 tons of stone from this claim will shortly be forwarded for treatment in bulk. In the Gladstone, Kissley and party are down 100 feet, but have come upon very unsettled country, so intend sinking another 50 feet.

Some 4 miles to the eastward of Warratta the discovery of a seam of carboniferous shale is reported, but I have not as yet had an opportunity of inspecting the locality. In the event of quartz crushing being carried on to any great extent in this division the want of fuel will be a serious consideration, the value of a discovery of a seam of coal or shale cannot therefore be over-estimated.

The Koorningberry Reefs are a discovery of the past twelve months. A township has been laid out, and at the present time some forty miners are located there. Many leases, both gold and mineral (silver) have been applied for, but so far nothing definite as to the value of this discovery has been proved. The Koorningberry syndicate has sunk their shaft 70 feet, and forwarded 30 cwt. of stone from that level for treatment. The result is being anxiously looked forward to, and will have a great influence on the future of this portion of the field. The Grey Range Syndicate have sunk a similar depth, and are now driving on the reef. In the Alliance lease three shafts, each about 50 feet, have been sunk. The lessees are very sanguine, and are now endeavouring to float a Company to enable them to purchase the requisite machinery.

So far as I have been able to ascertain the quantity of gold won during the past twelve months is, as could only be expected under the circumstances, very much less than that obtained during 1888—probably about one-half; but now that a general rain has fallen throughout the district, ensuring a supply of grass and water during the remainder of the summer, the year 1890 commences with bright auspices for all classes.

#### ALBERT DISTRICT—WILCANNIA DIVISION.

(*A. W. Pratt, Mining Registrar.*)

I HAVE the honor to report that the mining industry of the district suffered considerably from the effects of the drought during the early part of year 1889; the collections at this office during that period only amounting to the sum of £129.

Four leases for gold-mining purposes were applied for, but no mineral leases at all.

#### ALBERT DISTRICT—TIBOOBURRA DIVISION.

(*J. W. Day, Mining Registrar.*)

I HAVE the honor to submit the Mining Registrar's returns for 1890, and this my report for same.

The Tibooburra Division of the Albert Gold-mining District is about 30 miles in extent, 10 miles of which are worked payable for alluvial, one reef only in work, the Gladstone. There are several rich quartz mines in the Milparinka Division immediately on the boundary of this division.

The alluvial hitherto worked is generally shallow, varying from the surface to a depth of 20 feet, though rarely exceeding 3 feet. There are 200 diggers on the field, comprising puddlers, wagesmen, and fossickers.

The revenue from the field for past year was £158, as collected by me from the sale of miners' rights and business licenses. Warden's Court fees and fines were very slight, as the separation of this division from the Milparinka only took place on the 10th of September last, several gold-mining leases taken up at Nuggetty, 6 miles from here, the fees for same were paid to the Warden at Milparinka, making an item of £150 or £200.

Owing to the fact of most of the puddlers and miners being in debt to the business people, it is a matter of great difficulty to ascertain the aggregate result of their working, or the quantity of gold produced. They are mostly reticent about their savings, while some forward their gold direct to the Mint, and will not give any satisfaction when questioned. After considerable trouble I am enabled to submit the returns as shown on attached form as facts, with the presumption of a far greater amount of gold obtained and not accounted for.

Tibooburra

*Silver.*

The only silver won in the district came from the Mount Billagoe Company's claim, as above stated. The other mineral claims have for a considerable time suspended operations.

*Copper.*

Cobar Mine, which has been in operation for the past fifteen years, closed in August last, in consequence of the low price of copper then ruling, but when railway communication is established with this town there is every probability of this important mine resuming work, as fuel will then be procured at a reasonable rate, and copper procured and delivered in Sydney at a much lower rate than hitherto, thus enabling the Company to work at a profit.

C.S.A. has suspended work through the Cobar Mine closing.

Nymagee Mine has been working during the year, but, through the low price of copper, only 250 men were employed and 8,755 tons of ore raised and smelted at the mine, realizing 843 tons of copper, valued at £39,500, as against 12,600 tons raised the previous year containing 1,300 tons of copper, valued at £93,276. The depth of this mine is 634 feet, and the width of the lode from 8 to 22 feet.

New Burra Burra is situated at Hermitage Plains, between Cobar and Nyngan. The owners of this mine have expended a large sum in erecting a furnace, and a quantity of ore was smelted but not yet refined.

*Machinery.*

The Chesney Cobar Company has its own machinery, consisting of a 15-head stamper, Huntingdon mill, Watson and Denny pan, Blake pump, and Knowles pump, valued at £2,978 9s. 5d., and a private company, called the Cobar Quartz-crushing Company, has a 5-foot Huntingdon mill, with crusher and engines complete, also a 4,000-yard tank, valued at £2,500. The former Company crushes for itself and the latter for the public, and 902 tons of quartz passed through this mill, realizing 758 oz. 16 dwt. 19 gr. of gold.

The business transacted in this office was not so heavy as the preceding year. Seventeen wages cases and a number of applications occupied my attention in the Warden's Court. Miners' rights issued, 162; mineral licenses issued, 35; business licenses issued, 14; water rights issued, 10; business sites issued, 1; gold lease applications issued, 19, for 131 acres; mineral lease applications issued, 27, for 890 acres.

In conclusion, I would venture to assert that, when the long-promised railway communication is established, the Great Cobar Copper-mining Company in full swing, and the public become better acquainted with the mining capabilities of this district, new mines will not only be opened up but thoroughly tested, and Cobar become one of the principal mining centres in the Colony.

Rainfall for the year, 19 inches 55 points.

## COBAR DISTRICT.—HILLSTON DIVISION.

(*N. C. O'Neill, Warden.*)

I HAVE the honor to state, for the information of the Honorable the Secretary for Mines, that during last year little progress has been made in mining pursuits in this district. Several gold leases are in existence in the neighbourhood of Mount Hope, but up to the present no gold has been won, and I am informed that altogether there are only eight or nine men employed in connection with the leases in question. In fact, I doubt very much the bona fides of some of the leases, and I think that where work is not being carried on the leases should be promptly cancelled. The Government prospecting party is working on flat ground. Three shafts have been bottomed at a depth of 61, 105, and 122 feet, respectively, the colour of gold having been got in the last-named shaft.

No sort of mining whatever is carried on at Lake Cudgellico, although the surrounding country is decidedly auriferous. People in that locality prefer taking up land for sheep-raising and for agricultural purposes; but, with the development of the district, capital may, by-and-by, be invested in testing the mineral capacity of that portion of the country.

On Yallock run, about 55 miles from the village of Ivanhoe, eight men are prospecting. Fourteen shafts have been sunk at a depth of from 14 to 65 feet. Some of the stuff dug from these shafts was sent to Melbourne, and, on analysis, it yielded 4 oz. of gold, and 57 oz. of silver per ton.

The copper mines at Mount Hope and South Mount Hope have been working during the year. The New Mount Hope Company employed fifty-six men and six boys. The quantity of ore raised was 1,870 tons, producing 260 tons of copper, of the value of £10,400. The value of the plant at this mine is £7,000. The Great Central Company employed ninety men. The quantity of ore raised was 2,000 tons, producing 394 tons of copper, of the value of £15,740. The value of the plant at this mine is £3,000. I understand that this Company is putting on additional hands, and otherwise extending its operations in view of the present satisfactory price of copper.

I notice that during my absence in Sydney in the early part of the year four applications for silver leases were made by persons about Mount Hope. The land embraced in these leases, so I am told, is not being worked, and I have not the slightest doubt that the leasing has been resorted to in order to acquire a monopoly of land in connection with adjacent auriferous land.

I regret that I am a little late in sending in this report, but I have had to contend with some difficulty in obtaining information. For instance, the policeman at Mount Hope, when asked for a confidential report as to mining operations out there, declined to assist me without the express sanction of the Police Department. I did not press the matter, as I was doubtful as to how far my power extended in a matter of this sort.

---

INSPECTOR

INSPECTOR OF MINES' REPORT.

In submitting my Annual Report for the year 1889, I have the honor to inform you that the following is a list of the accidents reported on by the Wardens, Coroners, or Mining Registrars, as having occurred during the year in the Metallic Mines of New South Wales :—

No. of Accidents.	Date.	Name of Mine or Company.	Locality.	Persons killed.	Persons seriously injured.	Occupation.	Cause of death or injury.	Fatal.		Non-Fatal.

Table No. 2 gives in addition to the value of mining machinery the number of persons employed and the percentage of persons killed or injured in the metallic mines of New South Wales during the year 1889.

Out of a total of fifteen persons killed during the year five lost their lives in auriferous quartz-mining, three in alluvial gold-mining, five in silver, one in tin, and one in copper mining,—being an increase in the number of accidents during the year, as compared with 1888, of three killed and seven injured, or a total of ten.

During the year the following mining centres have been inspected by me in my capacities of Inspector of Mines and member of the Prospecting Board, exclusive of the diamond drill work:—In the south—Mittagong, Shoalhaven, Goulburn, and Yalwal; in the north—Boonoo Boonoo, Drake, Tooloom, Solferino, Glen Innes, Dalmorton, Inverell, Tingha, Emmaville, Hillgrove, Armidale, Uralla, Moonbi, Bendemeer, Tamworth, Stewart's Brook, Denison Diggings, Copeland, and Dungog; north coast—Casino, Lismore, Ballina, Maclean, Grafton, Nana Creek, Bellinger, Nambucca, and Upper Macleay; western—Locksley, Blayney, Orange, Molong, Cudal, Cargo, Parkes, Canowindra, Alick's Flat and Peak Hill, Tarana, Oberon, and Wiseman's Creek.

#### PROSPECTING VOTE.

In my last annual report I wrote fully on the constitution of the Prospecting Board and mode of distribution, as set forth in the Prospecting Vote Regulations, which regulations have not been altered owing to the fact that it is thought that the system adopted is the fairest and safest in the interest of the general public, and I may add that during the year the results of the Prospecting Vote have been fairly successful.

#### GOLD.

*Boonoo Boonoo.*—This gold-field has in former years employed a large number of miners, but owing to the patchy nature of the reefs, the hard country (granite) in which these reefs occur, and the baser minerals generally associated with the gold, makes the ore refractory and unfit for successful treatment with the ordinary crushing appliances, hence companies have failed, and the miner left the field. In my opinion the patchy nature of the gold deposits in the Boonoo Boonoo quartz-veins will not return large payable results to those who will work and further develop them, but they will in time nevertheless prove payable to a number of miners.

*Drake.*—Owing to discoveries of different minerals, principally gold, silver, and copper, having been made in this district during the year 1888, a large population gathered around, and a flourishing township sprung up; but this year the excitement diminished, and several mines were abandoned.

The auriferous quartz-veins generally occur in lenticular blocks; the gold as a rule is very fine, and associated with iron and arsenical pyrites, and difficult to treat by the ordinary crushing-machine. This may be said of the Adeline, Strauss, and other mines. The Red Rock contains, in addition to pyrites, gold, silver, copper, and zinc blende. It will therefore be seen that the future prosperity of this field must greatly depend on gold-saving and other appliances, which will successfully overcome the difficulty in treating refractory ores.

In alluvial, the basaltic range near Pretty Gully, Tooloom, is well worth prospecting, as coarse gold has been obtained in the gullies draining from said range.

*Solferino*, which has been rich in gold deposits, is now almost deserted, as during the time of my inspection only a few miners were at work at the Garibaldi, Lions, and the Band of Hope reefs; but I have no doubt that if the Garibaldi and other reefs were systematically worked, they would again return payable results for capital judiciously invested. The geological formation is very favourable for heavy gold deposits to occur in them, as they consist of diorite, granite, and altered Devonian slates, but owing to the disturbed nature of the rock formation the gold is likely to occur in patches, hence provision should be made for progressive works ahead, both in sinking and driving.

In the alluvial a new rush took place at a place known as the Malara Scrub, of which Mr. Paul Marcolino was the discoverer. This well-known, energetic, and persevering old miner was also the discoverer of the Solferino Gold-field. Although Mr. Marcolino's party of five made about £9 per week per man, the gold could not be traced to any great extent; the gold, which was coarse, and in the

the sample shown, contained pieces about 8 dwt. The formation consists of pyritous diorite, granite, and conglomerates, with crystalized quartz-veins. The denudations of the pyritous rock and quartz-veins traversing it is probably the source from which the gold was derived.

*Dalmorton.*—Very little mining is at present carried on at this field, although an impetus has been given through aid being afforded to the miners' out of the Prospecting Vote, and one of the parties, Greenway & Co., at the Isabella Reef, have during the year obtained payable gold.

*Hillgrove (Armidale District).*—The following are the names of mines held under lease or on freehold property in the district:—The Ellenora, Garabaldi, Baker's Creek, Baker's Creek South, Baker's Creek North, Primrose, Sunlight, Enterprise, Baker's Creek Extended, Baal Gammon, Golden Gate, Golden Gate Extended, Sunnyside, Carrington, South Baker's Creek, Block 215, Duncan Wade, Key's Block, De Bau's Block, Gleeson's Block, Queen Adelaide, Mount Carrington, Ellenora North, Scholes Block, Lady Carrington, Cosmopolitan, Root Hog, St. Patrick, Centennial, Starlight, Diadem, Never-can-Tell, Flora Bell, Eclipse, and others.

The Ellenora Mine has been fully described by me in former reports, suffice it to say that a new Company has bought the mine and machinery for £30,000 in cash. A whim has been erected since my last inspection, and the main or whim shaft is now somewhat over 300 feet in depth. The quartz-veins in this mine contain gold and antimony; are associated with an intrusive granite dyke, and occur both on the hanging and foot-walls; a part of these bunches of antimony ore are also met with in the dyke rock.

The Garabaldi Company were sinking their main shaft, and erecting extensive crushing machinery.

There are a few other mines on the table-land, but the principal work is now carried on down the falls. The vertical depth of which is 1,500 feet below the surface of the Ellenora Mine.

The Baker's Creek Mine has yielded large returns, no less than £72,000 having been paid in dividends in less than twelve months. The yield of gold has, however, greatly fallen off, principally due to the neglect of keeping progressive works ahead during the time the rich shoots of gold were working. Our mineral deposits generally occur either in shoots or bunches. Companies or miners should therefore keep their progressive works well ahead whilst their mine is paying, and thereby advance their own interest. A tramway has been constructed in connection with this mine from the table-land to the bottom of fall—the distance being 2,600 feet, or at an angle of about 31, as stated before, the perpendicular distance being 1,500 feet. As there is always a great risk of life to persons in ascending or descending in the trucks on this tram-line, I considered it my duty to serve the mining manager with a notice in writing not to allow any person to ascend or descend on fully-loaded trucks, and to limit the number of persons riding on the trucks at the one time.

The Primrose Mine adjoins that of the Baker's Creek on the north-western boundary. A main shaft being sunk, and winding and pumping gear in course of erection, and the prospects of the mine appear good.

North Baker's Creek has also good prospects, and is likely to become a dividend paying mine.

The Sunlight Mine, on the opposite side of the Falls, is situated about 1,000 feet above Baker's Creek. A small 5-stamp battery in connection with this mine has crushed during the year 874 tons of quartz, yielding 1,836 oz. of gold, valued at £6,440. A wire tram is connected with the mine and battery, but, owing to the contour of the country, causes frequent stoppages; but the Company ought at once to erect a better crushing plant, timber shoots, &c., as the prospects of the mine certainly warrant the outlay. The geological indications point to the belief that there are more than one payable vein in the Sunlight property.

At the Lady Carrington, Root Hog, Cosmopolitan, and others, in the granite formation, work is carried on, and the two former Companies intend immediately to erect machinery, and otherwise develop their mining properties. Taking the Hillgrove Gold-field as a whole, its permanency may be considered as assured, although the rugged nature of the country and the consequent difficulties of getting material and appliances from and to the mines will be at all times a stumbling block and cause loss of time and expenditure.

*Uralla.*—A new rush has set in near Uralla, at a place known as Enmore or Melrose, where several quartz-veins have been discovered during the year, some of which contain payable gold. These reefs have, however, not sufficiently developed to give anything like a correct opinion as to their value and permanency.

With the exception of Rice & Company, who obtained payable gold at a depth of 130 feet, with thickness of wash 5 feet, which yielded from 6 to 8 dwt. per ton, and who were assisted from the Prospecting Vote. Few, if any, alluvial claims are at present on payable gold; but I have no doubt whatever that Doherty's Hill will yet profitably employ a large number of miners, and recoup those who persevere to overcome the water difficulties.

At Moonbi, Bendemeer, and Tamworth, there are a few miners at work, but nothing of any consequence has been discovered during the year.

*The Denison Diggings and Stewart's Brook.*—These mines are situated about 40 miles from Scone, near the head of the Hunter River. The formation is Devonian shale, and carboniferous, in which the quartz occurs in fragments or shoots. The principal mine at work on the field is the Fuller's reef, which is being worked by tunnel, and at the time of inspection the tunnel was in 1,348 feet, near the end of which a quartz-vein, carrying rich coarse gold, was exposed to view; the thickness of vein being from 9 inches to 2 feet. No crushing had taken place, but a new crushing plant was in course of erection close to the mine, which consisted of a Huntingdon mill, Frew vanners, &c., and a great deal of interest was taken in the erection, as it was thought that the introduction of this plant would give a great impetus throughout the field. One-twelfth share out of this mine (which is mostly held by working miners) was sold for £900 cash. At Moonan Brook very little work has been done of late.

Mr. Arthur Wall, of Scone, has lately introduced fresh capital, and taken up several leases on different quartz-veins for the purpose of systematically working the same, either by tunnels or shafts. Some of these mines have a good prospect of success.

Stewart's Brook is reached from the Denison by climbing over a mountain range about 1,800 feet in height. The distance from Denison to Stewart's Brook is about 6½ miles. Here, too, the geological formation is Devonian and carboniferous. A large number of miners are prospecting on numerous reefs

or

or quartz-veins, several of which will no doubt prove payable if systematically worked, more especially so the Blue Reef, which seems so far to be the premier quartz-reef of the district. The Denison and Stewart's Brook Diggings are likely to sustain a fairly numerous mining population for many years to come, provided a proper system of developing the quartz-veins is adopted. The rugged nature of the country will, however, always be a kind of stumbling-block in bringing the quartz after it has been raised to the crushing and gold-saving plants, as road-making is costly, and cannot be undertaken by individual miners. There is a great probability that the aid granted out of the Prospecting Vote will have a beneficial effect in opening up the mines down to a greater depth, and it is to be hoped that the Vote will be the indirect cause of bringing improved gold-saving appliances into the district; and if this is done, this gold-field will be able to profitably support a flourishing mining population. A resident police officer and mining registrar and warden's clerk are sadly needed, as the population is large and permanent enough for the incurring of the expenditure for appointing and maintaining such officers in the district, as the three offices could be held by the one person.

*Copeland.*—The Lady Belmore Reef is the only one at present on payable gold, but other mines intend starting at an early date. Extensive machinery is to be erected on the left arm, and, considering all circumstances, the year 1890 is likely to bring forth favourable results in the mines recently retaken for future developments. On the Little River, Dungog, there are a few parties of miners at work with various success.

*Nana Creek.*—There are still several parties of miners at work on this field, but the yield of gold has not been large during the year. Several parties were aided out of the Prospecting Vote, and it is fully anticipated that good results will be obtained by some of the parties assisted.

*Lismore and Ballina.*—In these districts few gold deposits have been worked. At Peter's Grass, about 30 miles north of Lismore, a narrow belt of altered Devonian sandstone and slates forms the hills, which is traversed by quartz-reefs; and at Yankee Creek a quartz-reef has been tested which yielded by assays from 5 to 16 dwt. per ton; and about 6 miles west of Ballina a reef was tested by Mr. Coleman, of Lismore, which yielded 15 dwt. per ton.

About half a mile north of the entrance of the Richmond River is the Black Rock Mine, discovered and owned by Mr. Monro. As stated by Mr. Wilkinson and myself in our joint report when we visited the district as a Prospecting Board, the Black Rock is a perpendicular cliff, 30 feet high, facing the ocean, and composed at the base of hard dense basalt, then a bed 4 to 10 feet thick of scoriaceous volcanic agglomerate, overlaid by 15 to 20 feet of hard, dense, columnar basalt. Above this is about 30 feet of soft decomposed laminated basalt. A sample of 14 cwt. yielded at the rate of 9 dwt. 19 gr. of gold per ton; a total of about 7 tons 17 cwt. treated gave an average yield of 12 dwt. of gold per ton. These lodes have a slight dip inland, and could be easily worked. There is no doubt that the gold and platinum in the sand and gravel on the beach, which have for years past been worked to the north and south of Black Rock, have been derived from the denudation of the basalt—the rippling action of the ocean surf tending to throw back the gold with the black sand, and shingle drift about high-water level. One exceptionally rich patch of about 25 yards square, worked by Rowan and party, yielded for about 6 inches in depth of wash 75 oz. of gold. The gold occurs in very minute particles. Only one miner is now working on the beach here. There being abundance of water at hand the sand could readily be worked on a large scale, but this does not appear to have been adopted, probably owing to the patchy occurrence of the gold. On account of the special treatment required larger parcels than those hitherto tried should be operated upon, and should they prove payable—as they probably will—there is a sufficient material to warrant mining operations on an extensive scale. Special appliances will be needed for saving the gold from the basalt, for this rock, when crushed, forms a sludge which will carry off the fine particles of gold. The beach sand within the entrance of the Richmond River, near the North Head, has also proved gold-bearing. From the coast to Lismore, and the head of the Brunswick River, the basaltic rocks show evidences of great volcanic activity during a considerable period.

*Nambucca, Bellinger, and Upper Macleay.*—These districts were visited by me in company with Mr. Wilkinson, as members of the Prospecting Board, and the various gold and antimony mines were inspected. The country consists of hills of slate formation intruded by masses and dykes of granite rock. One of the intrusive granite masses forms a small conical hill, about 3 miles north of Deep Creek, and close to the main road from Nambucca to Fernmount. On the summit of the hill the rock contains arsenical pyrites in segregated patches of various sizes. Some of these have been opened out at the surface, and in a drive from a shaft at a depth of 100 feet one pyritous mass had been proved to be 17 feet wide; it appears to be a pipe load. In its vicinity the rock, which is of a very soft felspathic nature, has mispickel more or less disseminated through it. Samples assayed by the Department yielded from a few pennyweights to 17 oz. to the ton. As there is a large pipe mass, if systematically worked, it might give payable returns. As there are several of these granitic dykes in the locality they ought to be thoroughly prospected. The same may be said of the Bellinger, Bowenville, and Upper Macleay districts. In almost every instance where payable gold has been discovered in these districts, the gold, whether in quartz-veins associated with antimony, or in arsenical pyritous deposits, has been directly associated with granitic dykes. In fact, such is the case throughout the country traversed by us between Kempsey, *via* Bell Brook, Styx River, and on to Hillgrove, in the Armidale district.

*Blayney.*—Several of the mines in the vicinity of Blayney, such as the Brown's Creek mine, the Confidence and others have, for a time at least, stopped their mining operations. At King's Plains three mines were at work of which one, named the Last Chance, applied for aid out of the Prospecting Vote; but, on inspection, I considered the mine payable provided it was systematically worked. The reef occurs in a soft altered felspathic rock, in lenticular blocks, averaging about 3 feet in thickness, and containing fine gold presumably in payable quantities. Some pieces of quartz crushed in my presence, in which no gold could be seen, gave payable results.

*Molong and Cudal.*—At the former locality the mine known as Delany's Dyke is the principal at present working in the district. Here active mining operations are carried on, but at the time of my inspection work on the lower level had been temporarily suspended pending the erection of more extensive crushing and gold-saving appliances. All the mining properties, both north and south of Delany's Dyke Company's Mine, are idle, with the exception of No. 4 North, where probably the dyke may be discovered east of their workings. At Cudal the Boney Rocks Mines are again receiving public attention; they occur in the granite formation, and have formerly given large returns.

*Cargo.*

*Cargo.*—The principal mines at work are the Ironclad, Franks, Dalcouth, and one or two others. At the Ironclad the manager, Mr. Walter March, has erected extensive gold-saving machinery to treat the complex refractory ores occurring in the mine, and it is to be hoped that he will be successful. Gum Flat, which at one time supported a large mining population, has now merged into an agricultural centre, although it cannot be said that it has been thoroughly prospected, as the valley trends in a north and south direction for miles, and in its course receives several tributaries, some of which contained payable gold. This flat ought to be systematically prospected west of M'Guinness' reef, the sinking would probably be deep, but would be comparatively easy. If the inhabitants of Cargo would throw off their present lethargy, and, by a system of co-operation, develop the great mineral resources of their district, Cargo would become a flourishing mining and agricultural district capable of supporting a large population.

*Canowindra.*—The principal mining operations are carried on at the Blue Jacket Hill, Belmore, about  $1\frac{1}{2}$  miles easterly of Canowindra, where the Blue Jacket, No. 1 South, the Perseverance, and Hayes' reefs are at work. These reefs were first discovered during the years 1870 and 1871. The original shareholders during those days crushed from said reefs between 2,000 and 3000 tons of quartz, yielding an average of about 12 dwt. of gold per ton, the gold being of high quality. Owing to these quartz-veins occurring in lenticular blocks, the shareholders of that day considered their reef had run out, and instead of sinking and driving for fresh blocks of quartz they abandoned their holdings, causing this auriferous land to lay idle for several years.

In 1877 the whole of these reefs were fenced in and free selected; during the same year I inspected the Canowindra district, and strongly recommended the reservation of these auriferous reefs, urging that they had not been sufficiently prospected, and that sooner or later they would again be worked with payable results (see Annual Report, 1877, page 162). Had it not been for the Department of Mines in reserving these lands for mining purposes, and had not the fences of the free selectors been removed, the gold obtained from it during the last two years would still be undisturbed; and what now employs a large number of persons, and largely adds to the revenue of the country, would at the most only sustain a few score of sheep, as it is too rocky and unfit for agricultural purposes.

About two and a half years ago the Blue Jacket reefs were reopened under the ownership of Messrs. Mylecharane and Smith, who, up to the time of my inspection, crushed 445 tons of quartz yielding 820 oz. of gold. During my inspection the lowest level obtained in the mine was 220 feet from surface; at this level and about 200 feet north-west of the shaft the vein had faulted, and instead of quartz the hanging-wall rested on a clay vein (or dig) on which 8 feet in length had been driven and which if persevered with, would certainly lead on to the next lenticular block of quartz.

Following the underlay of the main shaft quartz was visible from about 80 feet from the surface down to the 200-foot level, on which level a fault occurs; but a winze, 20 feet south-easterly of whom shaft, again exposed to view a block of quartz from 12 to 18 inches in thickness. In connection with, but about  $1\frac{1}{2}$  miles from the mine, on the banks of the Belubula River, is a 5-stamp battery, to which the quartz intended to be crushed has to be carted.

No. 1 South were 105 feet in depth, still sinking on a small vein containing a little gold, but not payable.

A shaft is being sunk on the Perseverance Reef on a quartz-vein, about 3 feet in thickness, containing a small percentage of gold. It is a distinct reef to the Blue Jacket, and is well worth prospecting.

Hayes' Reef is on the Western side of the Belmore Hill, and distinct from the Blue Jacket Reef. The greatest depth obtained at the time of my inspection was 160 feet; thickness of vein, from 6 to 8 inches; and 183 tons quartz crushed yielded 146 oz. 15 dwt. of gold. The country rock in Hayes' Reef is a hard diorite and expensive to work.

From the above it will be seen that payable gold is likely to be obtainable for years to come; but mine owners must keep progressive work well ahead, such as sinking and driving. If such is not done, then it will only be a matter of time before these reefs will be again abandoned, as blanks are sure to be met with, which must be passed through wherever quartz veins or lodes occur in lenticular blocks.

About 3 miles south-easterly of Canowindra is a reef known as the Gospel Oak. This reef occurs in a very hard felspathic porphyry formation. A whim shaft, 150 feet in depth, has been sunk, and a level opened in an irregular mass of quartz-veins, the prospects of which are not encouraging. An excellent 10-stamp battery has been rather prematurely erected in connection with this mine. There are also a few other mines in the neighbourhood in which gold in patches has been obtained.

*Parkes.*—The alluvial workings in the neighbourhood of the Municipality of Parkes are almost nil; but the quartz veins have, during the year, kept up a high yield, the principal being those westerly of Welcome-street, known as the Bonny Dundee, and David Buchanan's Reefs. Out of one small mine alone, that known as Hazelhurst, several thousands of ounces have been won during the year. The full history of this mine has been given by me in former reports. Quails, the Day Spring, and several other quartz-mines are rapidly developing, and should the Huntingdon mills now introduced on the field become a success, then a great increase of the gold from the quartz-veins in the neighbourhood of Parkes may be looked forward to. Suffice it to say that, by the action of the Mines Department, the lands in which these auriferous quartz-veins occur were reserved from sale for mining purposes, to which some few years ago some of the principal townspeople of Parkes demurred, as they said it ought to be thrown open for settlement. Now, however, the general public can see that the officers of the Mines Department, whose duty it was to report on these lands some ten to twelve years ago, and who were treated very uncomplimentary by some of the good folks of Parkes, possessed greater foresight than those who opposed them, inasmuch as by their action a large number of miners are earning good wages out of the land which would probably have been held by one or two persons for speculative purposes. As was reported by me years ago, and on several occasions, Parkes is destined to be a wealthy quartz-reefing district.

*Alick's Flat.*—This new rush is about 15 miles north of Parkes. It derived its name from the fact that the three men who were the prospectors and first discoverers of payable gold on the Flat owned the christian name of Alexander (Alick), namely, Alexander Whitelaw, Alexander Paton, and Alexander Cameron. The lead of gold, which is not very regular, has been traced for fully  $1\frac{1}{2}$  miles in Crown lands south of Davey's

Davey's selection, where the sinking averages from 20 to 50 feet in depth. Generally the gold is found in the crevices of the slate rock, and, as a rule, from 6 to 9 inches is taken for wash-dirt. In some of the claims the width of the lead has been traced for 40 feet. Prospects as high as 15 dwt. of gold to the dish have been obtained, but those, no doubt, are isolated patches. My own impression is that there will be few, if any, rich finds at Alick's Flat, but there are likely to be a number of claims yielding miners' wages to those who work them systematically, and, if sufficient water can be stored, a few hundred miners will be able to make a living for a few years to come.

Peak Hill is situated about 16 miles north of Alick's Flat and 12 miles south of Tomingley. It is a high, rugged hill of felspathic rock, containing large masses of iron, ferruginous quartz and quartzite, but time will tell whether these can be worked with payable returns. Every ravine or gully contains more or less payable gold. Some of these gullies are worked only a few feet in width with 2 or 3 feet in depth, the whole thickness, when washed, yielding 1 dwt. to several ounces of gold per ton.

The prospecting claim, Fenton, Hayes, & Co., on the western side of the hill, were averaging about 14 dwt. of gold per ton from 18 inches thickness of wash-dirt and a depth of 12 feet. I saw several samples of gold whilst on the field, some of it coarse, but nearly all had iron attached to it. A thorough prospecting for alluvial may lead to important results.

I beg to reiterate the opinion expressed in my reports about ten years ago, that the whole country between Parkes and Tomingley, a distance of about 50 miles in a north and south direction, and over 10 miles east and west, is highly auriferous, and likely to sustain a large and industrious mining population. There may not be any long continuous leads, but payable patches of gold are likely to be discovered throughout this tract of auriferous country. Gold will also probably be discovered in the granite formation north of Tomingley, towards Narromine.

*Oberon.*—In the Oberon District the Homeward Bound, Luck's All, and a few other quartz mines were at work. The Homeward Bound reef, situated about  $1\frac{1}{2}$  miles westerly of Oberon, occurs in hornblende granite formation, the vein averages about 9 inches in thickness, and the present workings are about 84 feet below the surface just above the water level, but here the granite becomes hard and the veins occur very irregularly. A 10-stamp battery has been erected on the mine.

At the Luck's All Mine the quartz veins occur very irregularly, and the same may be said of all the quartz veins in the district. A Huntingdon ore crusher and concentrator has been erected at the Luck's All mine. Although Oberon may never become an extensive payable reefing district, there are nevertheless extensive areas of basaltic country containing Tertiary drifts in which payable auriferous deposits may be discovered. Some of these deposits are very favourably situated for tunnelling, but, as all these drifts generally dip into the hills, care must be taken to start the tunnels low enough, so as to have the wash or drift overhead in the deepest part of the channel. As the drift rests on decomposed granite, the driving is not very expensive. Mount Noonan, on the banks of the Fish River Creek, and about 6 miles E.N.E. of Oberon, is well worth prospecting, and should payable gold be obtained, it would be the means of employing a large number of persons.

*Locksley.*—The quartz-veins at Locksley are traversing a hard altered Silurian schist formation, the veins are very irregular and narrow, containing iron and arsenical pyrites; as the veins are not likely to increase in size as depth is reached, I do not think that they can be worked with payable results.

*Yalwal.*—The principal mines at work on this field are the Homeward Bound, the Caledonian, Pioneer, and Eclipse; work has also been started at the Buck, the Victory, and a few other mines. The auriferous workings termed the Yalwal Quartz-reefs, are beds of quartzite, which no doubt obtained their present condition by highly altered metamorphic action upon the slate and sandstone formations. Through the latter formation intrusive dykes of syenitic granite occur; one of these dykes is near the mouth of the Pinnacle Mine tunnel. Diorite also occurs in the immediate neighbourhood of the auriferous rocks. With the exception of a strip of country along Dangera Creek, which is about a mile in width, and in which the auriferous belt of country occurs, the higher hills of the locality are capped with carboniferous sandstone.

This gold-field was discovered and the principal mines opened about seventeen years ago, and have ever since been worked in a very primitive manner, under the wings of false economy without system, unless that of kyhooting or picking out the handiest patches of a mine can be called a system. These mines were also worked without any regard as to the safety of persons employed in or about the said mines.

A considerable amount of work has been done both in the Pioneer and Eclipse Mines; the ground has been taken out fully 60 feet in width; with various yields. At times as much as from 3 to 5 oz. of gold per ton have been obtained on an average of several weeks crushing. Several thousand tons of stuff has been crushed, but owing to the system adopted, and the want of proper gold-saving appliances, nothing under the yield of 10 dwt. of gold per ton, has been considered payable; whereas, considering the large mass obtainable, half of the above mentioned yield ought to give ample returns.

Large quantities of iron and arsenical pyritous stone are lying about the mines, containing gold, but cannot be treated by the primitive appliances at hand.

At the Pioneer and the Homeward Bound, which consists of an open quarry 50 feet in depth by 80 feet in length and 70 feet in width, the whole of the stone obtained from this quarry has been crushed; which yielded about £30,000 worth of gold. Although the whole of the stuff is being crushed it must not be taken for granted that the whole mass is payable, such is not the case, but small veins of rich auriferous quartz which occur in the mass of quartzite are so numerous that they cannot be separated from the latter, hence the whole mass has to be crushed. The mode of procedure is thus:—the auriferous rock is blasted down all around the quartz, broken into small pieces on the bottom, and thrown down a pass into trucks which convey the stuff through a boomerang-shaped tunnel to the drays which in turn take it down a zig zag road, about a mile in length, to the crushing machine. All this extra handling of the stuff is done notwithstanding that nature has provided a splendid machinery site, which could be connected with the workings by about 300 feet of shoots, or by a self-acting tram-line a few hundred feet in length.

Yalwal has the blessing of a Public School with an average attendance of about 40 children. At the time of my inspection the total population was about 100. But if a proper system of working these mines were introduced, there would be room for 300 miners alone for many years to come.

## SILVER.

The White Rock Mine was inspected by me during the year in company with Mr. C. S. Wilkinson, F.G.S., Chief Geologist, and our joint report on the mine is as follows:—About 2 miles south-west from Drake is the White Rock Silver Mine, under the management of Mr. J. Rossiter. Here the apex of an intrusive mass of white felsite rock has come to the surface and occupies an area of about 7 acres. It is surrounded by metamorphosed sedimentary strata of Devonian age; a network of small quartz-veins, with galena, zinc blende, pyrites, and occasionally native silver, traverses it; there are, besides, several larger veins of the same sulphides, varying in thickness up to 16 inches. The ore occurs not only in veins, but also in patches, and to some extent, throughout the mass of the rock which has been quarried, is an open face for about 400 feet on the north bank of a creek which has cut through it. Within about 200 yards to the north the felsite rises to about 100 feet above the bed of the creek; it can therefore be worked for a considerable time from an open face, and by thus excavating the rock bodily, a large quantity of ore can be sorted from it at a comparatively low cost, and sent down to the crushing plant by the self-acting inclined tramway which has been constructed. The manager informed us that nearly the whole of the felsite rock can be profitably treated, but from inspection of it in sight we are of opinion that a considerable portion of it will have to be rejected. However, this can only be determined by actual trial of large quantities of the stuff. The Company were erecting a very extensive crushing, concentrating, and amalgamating plant, and when the first difficulties of treating this complex ore efficiently have been overcome, this mine should give profitable results and employment to a large number of persons.

*Rivertree.*—This silver field was also inspected by Mr. C. S. Wilkinson and myself, and our joint report is as follows:—Rivertree is situated at the junction of Cullen's Creek with the Clarence River, where the formation is granite, surrounded by hills of Devonian strata. There gold and silver-bearing pyrites lead lodes are being opened under the management of Mr. J. W. Archibald, who had erected a small trial furnace for smelting the ore. The western, or "Wangobah" lode, has been sunk upon to a depth of 90 feet, and proved to be 15 feet wide, consisting of felspathic matrix, with quartz, calcite and sulphides of iron, lead, zinc, copper, and antimony. The ore occurs in patches of irregular thickness, and with proper appliances it could be readily concentrated. The lode dips E. 15' S. at 60°, and is seen for about 130 feet long at the surface; it has been traced in places for about a mile in a northerly direction.

About half-a-mile up Cullen's Creek is a lenticular vein, from 6 to 30 inches thick, of porous silicious ore, with carbonate of lead, said to be rich in silver; and three-quarters of a mile east of the junction of Cullen's Creek is another lode, called the "Silvery Wave." It occurs near the junction of the granite and slate formation, strikes N. 35' E., and averages about 3 feet wide. It consists of porous iron ore and quartz, containing nodular masses of argentiferous galena and carbonate of lead, with sulphide of iron and zinc. A shaft has been sunk upon it to a depth of 95 feet. We also saw on the south side of the river several smaller lodes containing lead ore. The lodes of this locality are well worth prospecting, and from them average bulk samples of ore should be sent to efficient works for trial, as their proper development may lead to the establishment of an important mining industry in the locality.

*Emmaville.*—Webb's Mines have been worked continuously during the year, with very slow development until toward the close of the year, when Mr. R. Adams took charge as general manager, and Capt. Dawes, from Nymagee, as underground manager. Since then the number of men has been largely increased, and the mine is now being opened up. 450 tons of ore have been despatched during the year.

Webb's South Mine has continued sinking during the year, and No. 2 West shaft on the main Webb lode is now down to the depth of 210 feet, at which level a cross-cut is about to be started for the lode.

Webb's South Extended No. 2 shaft has been sunk to a depth of 102 feet. In this case suspension of labour has been granted.

*Webb's Consols.*—Work has been carried on during the year. Good ore has been obtained, but heavy rains have greatly retarded progress. The same may be said of Mohan Hill P. Nine-mile.

*Castle Range Silver-mining Company.*—Machinery and reduction works are being erected, valued at £7,000. Eight tons of ore have been sent away for treatment.

Castle Range Extended, Castle Queen, Castle King, Castle Moat, Castle Prince, and others all situated near Deepwater, are more or less developing.

Mr. Thomas Chandler, J.P., a worthy, energetic manager, has the management of some of the above-mentioned mines.

*Wiseman's Creek.*—Work is carried on by E. A. Braker, Esq., J.P., and Sons at the Wiseman's Creek Silver and Copper Mine, formerly known as the South Mine. The geological formation consists of talcose schist, and is in close proximity to the granite formation. The ore occurs in shoots and bunches, and consists of carbonates, oxides, and sulphides of copper, carbonates of lead, galena and zinc blende, and iron and arsenical pyrites.

At present the ore obtained is taken by teams to the Brewongle Railway Station, and thence by railway to Eskbank, where it is smelted into matte, and forwarded to Swansea. Several shipments have already been made. The lode has an easterly underlay with a southerly dip.

A tunnel has been driven on the strike of the strata 300 feet in length. If this tunnel was extended underneath the old workings in a westerly direction it would prove these deposits fully 200 feet below the back or outcrop of the lode.

I also inspected Irwin's silver lode, situated on the right arm of the Bundandah Creek, Yalwal, in granite country. The latter is very hard and expensive to work, and the veins containing the mineral are narrow and irregular, associated with galena, but the prospects of a permanent lode are not encouraging.

In my last annual report I have given detailed descriptions of the principal mines of the Barrier Ranges. These silver mines have during the year given great results as to their yield and permanency, and have fully come up to expectation.

COPPER.

## COPPER.

The principal mine at work near Blayney is the Allendale Copper Mine, situated on an oblong hill about  $\frac{1}{2}$  mile westerly of Blayney Railway Station; but the Blayney to Carcoar railway crosses the property, and a siding about 5 chains in length could be constructed for about £700.

This mine was first opened in 1882, the then Company sinking several shafts, driving several tunnels, and raising and smelting large quantities of ore, but owing to the large expenditure incurred by forwarding and smelting the ore at Lithgow, in addition to the low price of copper, work was discontinued and the Company dissolved.

Latterly a Company consisting of local shareholders have again started to further develop the mine, and have obtained favourable prospects as to its payable capabilities. They have sunk a shaft 100 feet in depth and erected a whim; on the bottom of this shaft a lode about 40 feet in width containing yellow sulphides somewhat intermixed with country rock and earthy blue and green carbonates and black oxides of copper ore. The Company have also erected a furnace on the mine; and if a thorough system and economy is adopted in working the mine it ought to yield payable returns.

The geological formation of the Allendale hills is greenstone, or felspar of hornblende porphyry with epidote in the joints (variety of granite), a favourable rock for gold and other minerals.

Owing to the low price of copper, some of the north-western copper mines have temporarily suspended extensive mining operations.

## TIN.

During the year there has been a plentiful supply of water in most portions of the stanniferous districts, notably Vegetable Creek, enabling the tin miner to keep fairly well employed.

Vegetable Creek proper is being turned over and over again by Chinese on tribute, who are making small wages, the yield at per ton of earth becoming very low.

Several parties of tributors worked during the year in the Vegetable Creek Company's property, also in the Wesley and Seventeen-acre, all situated in Rose Valley, with various success, in most cases made wages.

Bailey's is again taken up by a party of tributors, who have sunk a shaft and are driving for the wash.

The Albion Company are opening up their mine, and have very fair prospects of success. Nothing in the way of prospecting has been done during the year on any of the land between the Albion Company and Kangaroo Flat.

Hall Bros., Kangaroo Flat, which mine is still under the able management of Mr. Thomas Chandler, J.P., continues to be worked with payable results. The yield for the year has been 52 tons of tin, in addition to which prospecting works are also carried on by the management.

At the Sugarloaf Mine, two parties of tributors are making wages, and at the Grampian three parties are making small wages. The Basaltic Prospecting Company, although they expended a sum of over £2,000, have so far not been successful; their main tunnel is now in 1,000 feet, the face showing at present 6 feet of cemented wash carrying a little tin all through it. The Company deserves every possible encouragement in their praiseworthy endeavour to discover a lead of payable tin.

Y. Water-holes, for many years the scene of industrious European miners, is now almost totally handed over to Chinese, who work on tribute or royalty and seem to eke out a living. There are still a few parties at work at the Gulf and table-land.

The Red Hill Company at the Nine-mile have employed a good number of men during the year, have erected steam-pumping machinery and otherwise tested their land by boring. Through this Company's energy a great impetus has been given to tin-mining in the locality. Jereny and party adjoin the Red Hill Company and have good prospects.

Prospecting for the deep lead is vigorously carried on in this part of the district.

## TIN LODES.

Very little work has been done at the Butler's during the year, and at the Torrington lode a few parties are making small wages under tribute. At the Dutchman's new machinery has been erected, and work has been vigorously carried on during part of the year. The Ottery lode has also been worked during the year, but the Dalcouth lode is now idle.

Tin-mining in the Tingha District and that of Inverell has not been as prosperous as in former years, although Chinese working on tribute seem to make a fair living, and some nice tin has also been obtained by Europeans at the Gil Gais and other parts of the district, but unfortunately the furnaces erected near Stannifer have been closed.

## ANTIMONY.

This mineral is likely to be worked in the Upper Nambucca, the Macleay, and Upper Macleay districts, where it occurs in bunches, some of which are large enough to yield payable returns.

I have, &c.,

W. H. J. SLEE, F.G.S.,  
Inspector of Mines.

---

SUPERINTENDENT

## SUPERINTENDENT OF DRILLS' REPORT.

Superintendent of Drills to The Under Secretary for Mines, reporting on the working of the Diamond-drills and Water-augers for the year 1889.

Sir,

Department of Mines, Diamond-drill Branch, Sydney.

In submitting my annual report on the working of the Diamond-drills and Water-augers for the year 1889, I do myself the honor to attach to said report the following appendices:—

*Diamond-drills.*

*Appendix A.*—Return showing the locality, strata, depth bored, percentage of core extracted, value of diamonds used during the year, and rate per foot, exclusive of office salaries, store wages, and rent, also Superintendent of Drills' travelling expenses.

*Appendix B.*—Summary of diamond-drills, showing the number of feet bored, total working cost to the Department, average cost per foot, and amount receivable for the year 1889.

*Appendix C.*—Balance-sheet for Diamond-drill.

*Appendix D.*—No. 1 to 13, sections of boring during the year 1889.

*Water-augers.*

*Appendix E.*—Return showing the locality depth bored, and rate per foot, exclusive of office salaries, store wages, and rent, also Superintendent of Drills' travelling expenses.

*Appendix F.*—Summary of water-augers showing the number of feet bored, total working cost to the Department, and average cost per foot during the year 1889.

*Appendix G.*—Balance-sheet for Water-augers.

*Appendix H.*—No. 1 to 4 sections of borings during the year 1889.

*Appendix I.*—Map of New South Wales showing position of wells and bores as published last year, with additions.

It is again my pleasing duty to chronicle another successful year in the working of the diamond-drills. Successful in every way as to the number of feet bored, the total cost per foot, the total earnings of the drills, wear and tear of diamonds, the percentage of core saved, and the otherwise general results obtained.

Several important bores at greater than the average depths of former years were completed during 1889, and others are still in progress.

With No. A drill two bores were completed at Joadja, 256 feet 8 inches, and 490 feet 11 inches respectively. With No. 3 drill a bore 1,300 feet in depth was completed at Lochend, near Cockle Creek, and with the same drill a bore was completed at Buttai, near East Maitland, 1,243 feet 5 inches in depth. No. 4 drill completed a bore at Woodford 1,394 feet 8 inches in depth, of which the last 709 feet 7 inches were bored during the year. The same drill completed a (4-in. diameter) bore at Fassifern 528 feet 9 inches in depth, after which No. 4 drill was despatched from Fassifern to Moorebank Estate Liverpool, for the purpose of completing a bore, commenced and discontinued by Mr. Coghlan, at the depth of 1,485 feet 2 inches, at which depth Mr. Coghlan lost his diamond bit and core-lifter coupling which formed an obstruction that had to be removed before boring could be commenced. The obstruction above referred to was successfully removed and brought to the surface, and the depth reached at the end of the year was 1,972 feet 10 inches, or 487 feet 8 inches since boring commenced with Government drill. Two bores (4-inch diameter each) were put down with No. 7 drill, one at Kahibah (Red Head) to a depth of 895 feet, the other at Joadja to the depth of 241 feet 5 inches. In the early part of the year a bore was also completed at Fassifern with No. 8 drill. This bore was started on the bottom of a pit 476 feet 8 inches in depth from surface, and completed at the depth of 1,153 feet 9 inches, of which 294 feet 5 inches were bored during 1888, and 882 feet 8 inches in the early part of 1889. Boring is still carried on with No. 11 drill at the Brisbane Block S.M.C. Broken Hill, which at the end of the year had reached the depth of 1,880 feet, of which 758 feet were bored during the year 1889. The strata passed through in this bore is hard quartzite and gneiss, and very destructive to diamonds. With No. 13 drill two bores were completed, and a third partly put down—the first bore at Ash Island, at a depth of 1,102 feet 4 inches, 393 feet 8 inches of which was bored during 1889; the second bore was put down at Glenoak, Langsland Estate, William's River, to a depth of 501 feet; and the third bore commenced with No. 13 drill, at Ravensworth (Northern Railway), which reached the depth of 529 feet by the end of the year.

From the above facts it will be seen that the average depth of the bores is considerably deeper than the average depth of bore-holes of any previous years since the Diamond-drill Branch was called into existence. This explains, without any further comments from me being necessary, that although 438 feet 5 inches less have been bored during the year 1889 than during the year 1888, more actual work has been accomplished in lowering and raising the boring-rods to and from such great depths as the majority of the bores attained during the year.

The total depth bored by diamond-drills during 1889 was 7,853 feet 14 inches, or 438 feet 5 inches less than in 1888.

The average cost per foot of boring, exclusive of office salaries, store wages, and rent, also Superintendent's travelling expenses, is 11s. 11½d., or 3s. per foot more than in 1888. The total working or field cost, exclusive of all office salaries, store wages, and rent, also Superintendent's travelling expenses, amounts to £4,701 11s. 2d.; but the total cost, inclusive of all office salaries and all other expenditure in connection with the Diamond-drill Branch, amounts to £5,604 16s. 10d., or at the rate of 14s. 3¼d. per foot; whereas the total earnings during the year amount to £7,722 8s. 1d., or 19s. 8d. per foot.

Percentage of core saved during the year is 89·33, or 6·1 more than during the year 1888, which was 83·32.

The loss of wear and tear of the diamonds in the bore-hole, and the cost of diamonds at per foot bored, has been 1s. 3½d., or 3d. per foot more than in 1888, which loss is principally due to two bores—that of Woodford and that of Broken Hill. In the Woodford bore several iron bands were met with in boring which caused several of the diamonds to fracture; and the tough quartzites and gneiss bored through at Broken Hill not only retard progress, but grind down the very best carbons and boarts (obtainable in the European and American markets) in a very short time to such small size as to unfit them for further use in boring operations.

In

In the face of the extra expenditure, caused by deeper borings, I am still able to report that, after deducting 5 per cent. for wear and tear of diamond-drill plant, there is still a fair profit remaining, proving beyond doubt that the Government diamond-drills can be worked without loss to the State; whilst it must be acknowledged by all that by the assistance of the diamond-drill the mineral resources of New South Wales have been very extensively but cheaply developed, and the better the diamond-drills become known, and the more they are brought into general use, the greater will they be appreciated.

The clerks in my branch, including Mr. J. S. Leigh, who has charge of the diamond-drill store, have given satisfaction, as they are doing their best to further the interest of the Department and public alike, and expedite the work entrusted to them,—more especially so, as a great deal of extra work has to be done in the Branch on account of the whole of the correspondence in connection with the several Prospecting Votes being done in it, which the returns of letters registered and written during 1889 proves, and which will still farther increase year by year, as it is impossible to have the vote distributed, and the prospecting work in connection therewith completed, within the limits of the year. Mr. M'Culloch has so far faithfully performed single-handed, the clerical work in connection with the above-named vote, although his undoubted energy is often taxed to its utmost strength; and through the latter not being able to do hardly any of the drill-work, Mr. N'Neil's work has been greatly increased but satisfactorily performed.

In conclusion, I beg to state that, although the diamond-drills have been self-supporting, the cost of the average rate per foot has been reduced during the year; and I hope, by strict economy, the employment of the most trustworthy men obtainable, and by good results to those who use these diamond-drills, to make them more popular; to recommend a lower rate for boring at per foot than hitherto, and, thereby, bring the use of the Government diamond-drills within the reach of persons of small means, who, on account of the cost of boring, have hitherto been unable to use them.

#### *Water-augers.*

The water boring on the west of the river Paroo, on the Wanaaring to Milparinka Road, has not progressed as favourably during the year 1889 as during the previous year, owing principally to the machinery in use, which consists of the Tiffin and Wright and Edward's water-augers, or boring machine. The former machine was only guaranteed to bore 300 feet, and the latter is not much better or more powerful. The consequence is that several breakages occurred during the year, which caused loss of time and expenditure. The depth of both bores, that at the 121-mile and that at the 106-mile, are now so great, the former being at the end of the year 1,025 feet 1 inch, and the latter 1,112 feet 11 inches, that I recommended the discarding of the iron rods at the 106-mile, and replacing them with wooden poles, boring rods, and connections to suit, which alteration also necessitated the strengthening of the derricks, and meant, for the time at least, the suspension of boring operations, and as the men's wages, during the time they had to fix and erect the new rig, went on, the cost on the rate of per foot boring was considerably increased on the year's work. No doubt these necessary alterations will have the effect of considerably reducing the rate of per foot during next year; nevertheless, as this is the first time that Tiffin machines have been rigged with wooden-pole rods, I am anxiously waiting results. If, as I think, the wooden-pole rig will prove a success, even on such slow machines as the Tiffin, or Wright and Edward's, as compared with the Canadian wooden-pole rigged machines, a considerable progress may be looked forward to during next year. The item of carriage alone has considerably increased the rate of boring per foot, and as the depths obtained on the Wanaaring to Milparinka Road are now 1,112 feet 11 inches and 1,025 feet 1 inch respectively, the tapping of artesian water may be looked forward to at any moment. Good fresh water has already been tapped in both bores, which stand within 200 feet from surface; but, as the object in starting these bores was to obtain artesian water, and as the bottom of the bores is still in the cretaceous formation, they will have to be continued until artesian water is tapped or the bed rock is reached, either of which may be looked forward to within the next 300 to 400 feet, or within the first six months of 1890.

Slow progress has also been made with No. 10 auger, at Tibooburra. The strata, which is cretaceous, had to be drilled through inch by inch, for which purpose I had especial tools, such as heavy steel chisel, drills, &c., made, as those belonging to the machine were totally unfit for the work required of them. At the end of the year the Tibooburra bore was down 349 feet 6 inches, had tapped a very large supply of good wholesome water, and, still being in the cretaceous formation, I have great hope that artesian water will be tapped before the depth of 500 feet is reached, which, if accomplished, would be an incalculable boon, and beneficial to the whole of Central Australia.

Considering all the difficulties to contend against, such as the severe drought through the principal part of the year, the long distance to which goods have to be forwarded, tools, ropes, &c., required during boring operations, and the great carriage rate which has to be paid for goods, especially those urgently required, which are taken by coach from Bourke to Wanaaring, a distance of 120 miles, or, in the case of the Tibooburra bore, from Silverton, by coach, to Tibooburra, a distance of over 200 miles, for which the rate of carriage charged is 6d. per pound, and, if the depth of the bores is considered, the rate per foot is not excessive.

Total number of feet bored during the year is 1,448 feet 9 inches, or 513 feet 3 inches less than during the year 1888.

Total cost of boring at per foot, inclusive of carriage, but exclusive of office expenditure, is 28s. 2½d., but, inclusive of all office salaries and all other expenditure to the Government, is 32s. 7½d. per foot, or 5s. 1d. more per foot than during the year 1888. This increase in the cost of the rate at per foot is entirely due to the greater depth of the bores and the difficulties above described.

Before I close this report I beg to express my regret in having lost during the year the services of Mr. D. C. Carmicheal, late foreman of the boring at Wanaaring Road. He is one of the few men who, having the ability and practical knowledge, has also the energy and perseverance to use these qualities to bring to a successful issue any work he undertakes. He left the Service on his own account, to better his pecuniary position, and I have no doubt that if Mr. Carmicheal goes on for himself as he has done for the Government, he must succeed, which I sincerely trust he will do.

I have, &c.,

W. H. J. SLEE, F.G.S.,  
Superintendent of Drills.

J.  
WELLS.

Nature of surrounding country.	Strata.	Remarks.
N., granite ridges; E. S., and W., ridges and plain.	Black soil, granite, rotten slaty bottom.	This well is only used in time of drought.
Forest, plain, and ridges, chiefly white gum timber.	Black soil, rotten granite and pipeclay.	Water stands 5' from the top in wet seasons.
N., barren ridges; E. and W., do.; S., forest and ridge.	Top brown soil, then basalt to bottom	
Black soil plains and open forest country.	Black soil 15', basalt 6'.	In a wet season overflows.
Undulating, ridges running into rocky mountains.	Black alluvial soil, pipeclay, and slate rock.	The well is believed to be down to the level of river water. The water is hard, but used for household purposes.
Low ranges, with creeks running to river.	Soft slaty rock	Sunk on a low ridge, believed to be down to level of river water; used for household purposes.
Salt-bush plains, lignum, S. side		Salt at 80'; got much better as we went deeper; last spring struck almost fresh, 100' open shaft, 89' bore, 3 1/2" diameter.
Salt and cotton bush, dark clayey soil.	Gypsum, sandstone, and clay	Salt at 50'; improved slightly when bored; open shaft 100', bore 62'.
Broken plains	Alluvial	Selection of site for well a matter of chance in some parts of Riverina. Good stock water is obtained at a depth of 100' to 130'; in other parts two wells within 1 mile of each other salt water was obtained; midway between another shaft was put down and good water obtained.
S., mallee and porcupine grass; W., N., and E., black oak.	Alluvial, 120' pipeclay and drift 30'.	This well is in a sandy box swamp, and gives one of the best supplies in the district; other shafts have been tried in the Mulga country and failed to strike water; two of them sunk 220'.
Pine ridges, mallee, porcupine grass, and saltbush.	Loamy soil 15', drift sand 55'.	This well is covered by the Murray water when in flood.
Red sandy soil or clay on saltbush plains.		One well on Gall Gall, C, we pumped for a considerable time in the summer, hoping the water would improve, but it did not do so.
Red sandy soil in belar or oak scrub		Have several soakage wells, with good stock water, all at shallow depths of not more than 20', all sunk in the beds of dry creeks where the flood waters back up, and all within 5 miles of the river; the supply is not good, and are only made useful by making large chambers and drives at bottom of shaft.
Red sandhills in mallee		
Red clayey soil in box flats		
White clay flats, with box timber		
Salt and cotton bush, light scrub, and undulating.	Hard clay, with gravel 100', alluvial 80', pipeclay and mica 30', soft sandstone rock and clay 70'.	Open shaft 200', bore 80'. This well is to be sunk to full depth of bore, when the supply is expected to increase. A Tiffen borer was used.
Sandhills and oak ridges, like decomposed limestone.	Pipeclay and drift	A good many trial shafts have been sunk on this run, salt water being struck in drift under 100' in all of them.
Open salt and cotton bush plains, with oak clumps, &c.	Alluvial 82', fine drift 18'	Have sunk fifty trial shafts on different parts of run, from 80 to 100'; salt water struck in all; unfit for use.
Open saltbush plains, with oak ridges, &c.	Clay throughout	50,000 gallons per day have been obtained, but the supply seems practically inexhaustible; slightly brackish.
Sandstone ridges; red clay flats; mulga pine; beefwood.	Alluvial 20', fine drift 58'	Cool, cloudy weather seems to increase the supply.
Pine sandhill; mulga and belar ridges	Alluvial gravel, cement and sandstone rock.	There is a 30' drive in this well.
Loamy flats, rocky ridge, and malee sandhills.	Gravel and cement 100', sandstone 60' cement and blue clay 40'.	" " "
Box flats and pine sandhills	Loam, clay, and cement 167'; drift 8'	8 miles from this well a trial shaft was sunk 188'; no water struck; half-a-mile from the above well a shaft 6' x 3' was sunk to a depth of 96', then a bore 130 = 226', no water being struck; boring still going on.
Red clay flats and pine sandhills	Alluvial 100', sandstone flags 70', water in blue clay.	
Open mulga, with ridges of malee	Cement and sandstone.	The sandstone rock in this well required to be blasted; it is intended to put a drive in this well to increase the supply.
Ironstone rises; box flats; mulga; &c.	Hard sandstone 69', chalk 1', hard sandstone 70'.	
Red flats and pine sandhills	Alluvial pipeclay, cement, and sandstone rock.	
Undulating	Pipeclay and cement, hard sandstone.	This well was sunk before present owners bought station. There are two long drives at bottom, not required for use.
Undulating barren and box flats and ironstone rises.	Blue slate	
Undulating ridges; volcanic hills	Cement and hard sandstone, water in sandstone.	
	Red clay 3', red sandy drift 4', coarse red drift 6', red clay 7', white sandy rock 10', pipeclay 3', white sandy rock 12', fireclay 4', white sandy rock, with occasional thin strata of fire and pipe clay 51'.	This well is not yet finished.
	Hard sandstone, rock, cement, quartz, and gravel.	
	Quartz, gravel, and hard sandstone.	A shaft put down here would make 6,000 gallons per day
	Hard slate, quartz, and hard rock, &c.	
	Pipeclay and cement	This well is in the bed of Tiltagoona Creek.
Cottonbush, mulga rises, and sandstone hills.		Government well condemned as being unfit for stock. A well half-a-mile to the N.W., good water, supposed to be soakage.
Undulating, red, volcanic hills and mulga.	Pipeclay, cement, and layers of drift	This well has never been used for stock purposes, owing to a 10,000-yard tank full of water in the vicinity.
Sandy pine ridges, then open box flats		Not required to be used.
Buthar and pine timbers, small clear patches of saltbush.	Sand	
	White loose sand	This well was cleared out in the dry time, and it watered the whole of the stock on the place in the summer of 1881 and 1882.

Superintendent of Drills.

## APPENDIX K.

REPORT of the Examiner of Coal-fields for the Colony of New South Wales,  
for the year 1889.

IN accordance with the provisions contained in the 26th section of the Coal Mines Regulation, 39 Vic. No. 31, I have the honor to submit reports from Messrs. Dixon and Bates, Inspectors of Collieries for coal-mines at work, and opening out in the Counties of Northumberland, Durham, Gloucester, Buckland, and Pottinger, called Northern District; and Mr. Rowan, Inspector of Collieries for coal-mines at work and opening out in the Counties of Cumberland, Camden, Cook, and Roxburgh, called the Southern and Western Districts—with this my general report for the year ending 31st December, 1889.

The information I have the honor to submit, with respect to the condition and progress, &c., of the different coal and boghead mineral mines during the year 1889, is as follows:—

*Number of accidents in 1887, 1888, and 1889.*

In 1887 there were ninety-four fatal and forty-five non-fatal accidents; eighty-one of the fatal accidents occurring through the Bulli disaster.

In 1888 fifteen fatal and forty-three non-fatal accidents.

In 1889, the year under notice, there have been forty-one fatal and fifty-seven non-fatal accidents. Eleven of the fatal ones happened from falls of coal; 12th to 22nd inclusive, from a crush at the A.A. Company's Hamilton Pit; 23rd to 26th inclusive, from over-winding and falling down the South Burwood sinking shaft; 27th and 28th, from falls of stone from roof of mine; 29th and 30th, from a stone falling and striking sinkers in sinking shafts; 31st and 32nd, through being jammed by skips; 33rd, through being thrown from a trolley; 34th, through being thrown amongst skips; 35th, from falling down a sinking shaft; 36th, through being knocked down by a locomotive; 37th, from an explosion of powder; 38th, through being crushed between trucks; 39th, from being injured by a fly-wheel; 40th, from a fall of timber and clay; and 41st, from an explosion of fire-damp at Monkwearmouth Colliery.

Twenty-four of the non-fatal accidents occurred from falls of coal; 25th to 29th inclusive, from a stone falling and striking sinkers whilst sinking shafts; 30th to 34th inclusive, by injuries received from loaded skips; 35th to 38th inclusive, by explosions of fire-damp at the Durham and Monkwearmouth Collieries; 39th and 40th, inclusive, from explosion of a shot; 41st to 43rd inclusive, from powder explosions; 44th and 45th, through falling from pit-top; 46th, through being knocked down by a truck; 47th, being knocked down by a trolley; 48th, by a loaded waggon; 49th, from a fall of stone; 50th, through a blow from a hauling rope; 51st, through falling from pit top; 52nd, from a fall of top-band coal; 53rd, from a fall of stone roof; 54th, from a hauling chain; 55th, by a blow from a prop; 56th, through falling off a skip; and 57th, by a steel drill.

All the above fatal and non-fatal accidents have been inquired into, the scene of them inspected, inquests attended and reports made thereon and forwarded for your information.

The names and occupations of the persons who died from injuries received, and those who have been seriously injured, as well as the names of the Collieries where the accidents occurred, are given in the following summary.

The returns of the collieries raising coal and shale (boghead mineral) which have been collected and forwarded to me by the Mining Department show the following figures for the year 1889:—

## COAL RETURN.

	Northern District.	Southern District.	Western District.	Total.

Decrease in 1889 .....	.....	107	9,881 6 0	13,677 1 11
Increase in 1889 .....	8	.....	.....	.....

From these returns we find that in the Northern District, in the year under notice, there has been an increase of 557,305 tons in the quantity of coal raised, and £239,202 7s. 7d. in the value of it, whilst in the previous year (1888), when there was a strike of thirteen weeks, there was a decrease of 176,749 tons, and in the value of the coal raised £12,165.

In the Southern District there has been a decrease of 95,234 tons, and in the value of £47,874, whilst in the previous year (1888), there was an increase of 420,228 tons, and in the value of £167,355. For the large increase in the output of coal in 1888, the Southern collieries were indebted to the Northern District thirteen weeks' strike.

In

In the Western District there has been a decrease of 9,881 tons, and in value of £13,677, whilst in the previous year (1888), there was an increase of 37,457 tons, and in value of £16,100. Last year's (1888) larger increase occurred through the Northern District strike.

The following table shows comparisons between the year under notice and two preceding years, as regards the exports of coal to foreign and intercolonial ports; the quantity used for home consumption; total output and value; tons of round and small coal raised for each person employed in and about the collieries; value of round and small coal raised for each person so employed; and the quantity of coal raised for each life lost.

NEW SHAFTS BEING SUNK AND MINES OPENING OUT OR IN COURSE OF DEVELOPMENT DURING THE YEAR 1889.

*West Maitland Coal Company.*

On January 10th, Mr. G. O. Hyde notified for himself and Mr. W. B. Bradley of having commenced operations near West Maitland, adjoining South Greta Colliery Company's property, to open a coal-mine, and let a contract to sink a shaft 14 feet diameter—probable depth 400 feet.

*Burwood Extended Coal-mining Company.*

On January 21st, Mr. Wilson Rennie, Colliery Manager, notified that he was preparing to unwater a shaft sunk to a depth of about 260 feet, and to continue until the borehole coal seam is tapped for the purpose of opening and developing the mine.

*Wallarah*

*Wailarah Coal Company.*

On March the 13th, Mr. Thomas Parton notified on behalf of the above-named Company of having opened a coal-mine by adit at Catherine Hill Bay, near Swansea, Lake Macquarie.

*South Wallsend Colliery, late Lymington Wallsend Colliery.*

Mr. J. Johnson notified on 28th March that the above-named Colliery Company were opening the tunnel over and above the shaft, situated at Cardiff, late Winding Creek.

*Sunderland Colliery.*

Mr. Matthew Tulip, on 4th April, gave notice that he had commenced to sink a shaft on the boundary of J. and A. Brown's land, situated about 600 yards east by south direction from the pit at present worked.

Mr. Thomas H. York, on April 23rd, notified his intention to mine for coal on the Gearie Station, parish of Micketymulga, county Lincoln, No. 162, standing in the name of Mackenzie on parish map (Railway Station), Mary Vale. Shaft sunk 63 feet, final depth 163 feet.

*Northumberland Coal and Land Company, Fassifern.*

Mr. James Pease on May 20th, gave notice that he proposes to work the upper coal seam, and also continue the sinking of the shaft simultaneously.

*Dunkirk Colliery, New Lambton.*

On May 20th, Mr. T. G. Griffiths notified his intention of reopening the old Dunkirk Mine at once.

*East Lambton, New Lambton.*

Mr. T. G. Griffiths notified, on August 12th, of having commenced to sink a shaft at south end of the old Waratah workings to work a 37-acre block of coal owned by Alexander Brown. Also, boundary coal owned by the Waratah Company at New Lambton.

*Fern Valley Colliery, near Adamstown.*

On August 5th, Mr. Henry Evans notified having commenced to open out a tunnel at the back of the New Lambton C pit, and were in about 12 to 15 yards.

*Thornley Colliery, Four-mile Creek.*

Mr. George Fishburne, on August 18th, notified having commenced opening up the bottom coal seam at this mine.

*Gartlee Colliery, Teralba.*

Mr. Andrew Sneddon, for himself and brother, notified, on September 11th, of having opened a tunnel at Teralba, near Railway Station, for the purpose of mining for coal.

*Heddon Greta Coal and Shale Company, near West Maitland.*

On October 25th, Mr. H. Trenchard notified, on behalf of the above-named Company, of having commenced to open a new mine for the purpose of mining for coal on mineral lease No. 14, parish of Stanford, 3,200 acres; mineral lease No. 29, parish of Heddon, county of Northumberland, 350 acres; also freehold grant to J. H. Garvin, 640, same parish. Working five men and one horse. Have driven one tunnel into coal and sunk two shallow shafts on the coal.

*Rose Hill Colliery.*

Mr. T. J. Evans notified, October 30th, that he had commenced a tunnel on the Waratah estate, Dark Creek, near North Lambton, with a view of working coal.

*Buttai Estate, near East Maitland.*

On November 7th, Mr. Donald Shaw notified that it was his intention to put a small tunnel, about 10 feet, in the outcrop of two coal-seams on Mrs. Price's land.

*Brown's Colliery, Minmi.*

On October 18th, Mr. William Brown notified having commenced sinking a shaft on the Minmi estate to the north-east of the No. 12 shaft, distance 34 chains, for the purpose of a down cast shaft.

*Morna Point, Port Stephens.*

On December 4th, M. G. J. Barry notified, on behalf of himself and others, to start a shaft for the purpose of sinking for coal and shale on land applied for at Morna Point.

*South Greta, Farley.*

On December 7th, Mr. E. S. Wight notified that operations would be commenced on the 9th to draw the water out of an old shaft known as the A pit, Stony Creek, on this property, with a view of examining the coal-seams at this point, sunk by the Honorable Bourne Russell a number of years ago.

COAL-MINES ABANDONED, OR OPERATIONS SUSPENDED, DURING THE YEAR 1889.

*East Waratah Colliery.*

Mr. Thos. G. Griffiths notified, on 31st May, that he would, on the morrow, close the tunnel known as East Waratah Colliery.

*New Duckenfield Colliery.*

Mr. M. Yates notified, on July 25th, that he had closed the above-named colliery, situated at New Lambton.

*Maryville Colliery.*

Mr. W. B. Bradley notified, on August 23rd, that this colliery has been finally closed and all the shafts filled in.

*Clay Cross, Lambton.*

Mr. Isaac Burnley notified that, on September 3rd, the Clay Cross Colliery was abandoned; rails and materials taken out.

*Sunderland Colliery.*

On September 5th, Mr. Matthew Tulip notified having abandoned the pit previously worked by him at Four-mile Creek in connection with this colliery.

*Great Northern Shale and Oil Company's Mine, near Murrurundi.*

On September 9th, Mr. Thos. Affleck notified that he had stopped work at the above mine, Dough-boy Hollow, pending negotiations with lessors, and will remain closed until further notice.

*South Greta Colliery.*

On October 18th, Mr. Brentnall, secretary, notified the Department that the directors had given instructions to temporarily suspend operations at the above-named colliery.

CHANGING NAME OF COLLIERY.

*Great Southern Colliery, late Berrima Colliery.*

On October 19th, Mr. Edward T. Kennedy notified, on behalf of the Great Southern Colliery Company (Limited), that the name of "Berrima Colliery" has been changed to the Great Southern Colliery.

AN account of Strata bored through by Messrs. Sands and Wildes' diamond rock drill on Mr. Justice Windeyer's estate at Tomago, about 3 chains from the Hunter River, and about 2½ miles south-east from the Old Tomago Pit. Furnished to the Examiner of Coal-fields by Mr. Wilson Rennie, of the Burwood Extended Coal Mining Company, who was in charge of the borings.

SECTION showing the thicknesses and character of the Borehole Coal-seam at the A.A. Co.'s new winning, taken in the north-east cross-cuts, by the Examiner and Mr. Paul Turnbull, at a distance of 28 chains from new winning shaft, and 11½ chains from the western boundary of the Company's "ocean leasehold."

ACCOUNT of strata and coal-seams sunk through the Borehole Coal-seam at the Australian Agricultural Company's new winning pit, adjacent to Darby-street, Newcastle, in county of Northumberland. Furnished to the Examiner of Coal-fields by Mr. Turnbull, the Company's Colliery Manager.

A DESCRIPTION of the Borehole seam at this colliery, and the appliances for developing and working it, are given in my 1889 report. Since then a considerable area of the seam has been worked, and on a late inspection of the mine I found that the scheme for opening out and working it is a most judicious one, and that it is the best laid-out colliery in New South Wales, and one such as consulting viewers and managers of new collieries opening out would do well to adopt.

ACCOUNT of strata and coal-seams sunk through the Borehole Coal-seam at the South Burwood Colliery, Redhead, in the parish of Kahibah, county of Northumberland. Furnished to the Examiner of Coal-fields by Mr. Harper, one of the proprietors.

THE first coal-seam, sunk through at a depth of 165 feet 10 inches, is the one formerly worked at the old Coal and Copper Co.'s tunnels at the Glebe, known as the "Burwood Coal-seam," notwithstanding the opinions advanced by some, who have actually given it as their opinion that the "Dirty Seam," sunk through at a depth of 400 feet 7 inches, is the "Burwood Seam."

A branch railway, about 4½ miles in length, is being constructed from the Homebush Railway at Adamstown past the Burwood Colliery, and through the South Burwood and Burwood Extended coal properties. Arrangements have been made by the South Burwood Co. to have their coal taken by it to the harbour of Newcastle.

The South Burwood Co. expect to have a branch line, of about 1 mile in length, constructed in June next, to connect their shafts with the Redhead branch railway, and to be shipping coal from the colliery.

This Company hold a portion of their land on mineral leases from the Crown, at a royalty of 6d. per ton on large and 3d. per ton on small coal raised.

Burwood coal-seam.

Dirty coal-seam.

Yard coal-seam.

Coal under Yard seam at A. A. Co.'s new winning pit.

A. A. Co. or Borehole coal-seam.

The above is a section of the Wallarah Coal-mining Company's No. 1 coal-seam, opened out by an adit, by Mr. Thomas Parton, F.C.S., at Catherine Hill Bay, near Lake Macquarie. It is a semi-bituminous coal, and dips about 1 in 30 to the south-west. The Company have 1,200 acres of freehold land, with a frontage of about 3 miles to the ocean, the lake forming a portion of the eastern boundary. The existence of several coal-seams cropping out in the gullies and cliffs, facing the sea, has long been known, and some years since the No. 3 was worked from a tunnel on the sea-beach, close to where the present Company have erected a substantial and well-constructed wharf, 1,060 feet in length, the planking being 30 feet above high water, so as to enable vessels of 3,000 tons to coal at the shoots.

There are two shoots, which can be adjusted to suit the state of the tide or the size of the ship, and it is estimated that 1,000 tons can be shipped in eight hours. The depth of water at the shoots is from 25 to 28 feet at low water, and as this amount exists for nearly 600 feet, there is ample room for a large steamer.

A railway  $2\frac{1}{2}$  miles long connects the colliery with the wharf, and is one of the best-laid lines in the Northern District; the rails are steel, weighing 70lb. to the yard. The Company have 100 hopper-shaped iron waggons, made to hold 10 tons. Two of Fowler's best locomotives haul the coal (which is 250 feet above sea-level) from the mine to the wharf. The Chairman of the Directors is Mr. W. Lund, one of the large steamship owners of England, and the Hon. S. A. Joseph is also a large shareholder.

AN account of Strata and Coal-seams sunk through the Borehole Coal-seam on Black's 2,560 acres of land at Cackle Creek, near the Sydney and Newcastle Railway, Teralba. Furnished to the Examiner of Coal-fields by Mr. Hepple, Manager:—

SECTION showing the thickness and character of the Borehole Coal-seam sunk through and worked at the Monk-Wearmouth Colliery, situated 1 mile from the West Wallsend Colliery, near Minmi, in the county of Northumberland, taken by myself and Mr. Inspector Dixon. The colliery is recently opened out, and is situated about 6 miles from the Homebush and Waratah Railway, near Cockle Creek. 1,227 tons of coal, valued at £593, were raised in the year under notice.

SECTION of the seam of coal, lying above the Burwood seam, worked at the West Burwood Colliery, on E. C. Merewether's property, at the Glebe, near Newcastle. Taken by Mr. Inspector Dixon and myself.

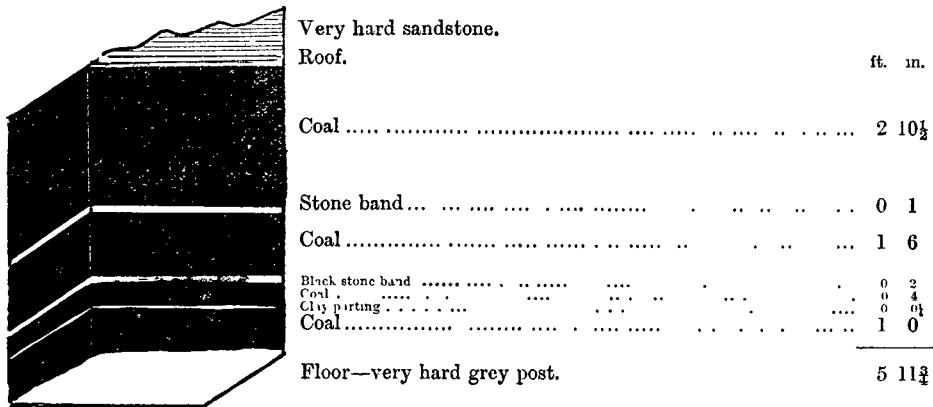

SECTION of the seam of coal, lying above the Burwood seam, worked at Fern Valley Colliery, on Messrs. Brown and Dibbs' property, near the New Lambton C Pit, in the Newcastle District. Taken by Mr. Inspector Dixon and myself.

SECTION showing thickness and character of the bituminous coal-seam lying 60 feet above Deihm's Kerosene Vale coal-seam, opened out by an adit by the Cullen Bullen Coal Company, at Cullen Bullen, in the county of Roxburgh. The Company are thinking of making coke from the 3 feet 1 inch of bituminous coal at the bottom of the seam.

SECTION showing the thickness and character of the coal-seam worked by Mr. Melvill at the Black Jack Colliery, in the county of Pottinger, near Gunnedah, taken by Mr. Inspector Dixon and myself. The coal is of good quality, and is worked from a shaft at a distance of about 7 miles from Gunnedah. 2,156 tons, valued at £1,050, was used for railway locomotive purposes in the year under notice.

SECTION showing the thickness and character of the coal-seam worked at the Springfield Colliery by Mr. Prior, at Black Jack, in the county of Pottinger, near Gunnedah, taken by Mr. Inspector Dixon and myself. The coal is of excellent quality, and is worked from an adit situated about 7 miles from Gunnedah. 1,861 tons, valued at £912, was used for railway locomotive purposes during the year under notice.

SECTION showing the thickness and character of the coal-seam worked at the Gladstone Colliery by Mr. M'Cosker, in the county of Pottinger, near Gunnedah. The coal is of excellent quality, and is worked from an adit situated about 5 miles from Gunnedah. 703½ tons, valued at £324, was used for railway locomotive purposes during the year under notice.

SECTION showing the thickness and character of the coal-seam newly opened out and worked by the Centenary Coal Co. at Curlewis, in the county of Pottinger. The coal is of excellent quality, and is worked from an adit situated 2 miles 4 chains from the Curlewis Railway Station. The Company have secured the Government railway contract for 1889. The seam has a slight dip north 60 west, and is about 1,220 feet above sea-level.

In conclusion, I have only to add that there were 104 collieries under inspection, and that notices have been received of 16 opening out and 8 abandoned; and that the year's returns show an increase in the Northern District of 557,305 tons of round and small coal raised, and £229,202 in value; in the Southern a decrease of 95,234 tons, and £47,874 in value; and in the Western District a decrease of 9,881 tons, and in the value of £13,677.

I have, &c.,  
 JOHN MACKENZIE, F.G.S.,  
 Examiner of Coal-fields

The Half-yearly Report on the Collieries in the Northern District in New South Wales, and Accidents therein investigated by the Inspectors of Collieries during the six months ending 31st December, 1889.

The Examiner of Coal-fields, Sydney,—  
Sir,

Newcastle, 30 January, 1890.

Pursuant to the provisions of clause 26 in the Coal Mines Regulation Act 1876, we have the honor to transmit to you this our six-monthly report on the state of the various collieries in the Northern District for the half-year ending December 31st, 1889.

The total number of collieries under inspection in the Northern District during the term embraced in this report is 67.

Two collieries, East Waratah and Brookstown are not included, as they are finally abandoned, but the following collieries have been added, viz., East Greta, Gartler, East Lambton, Fern Valley, Rosehill, Morisset, and Burwood New Winning.

In addition to the above one shale mine has been under inspection.

PRESENT STATE OF MINES.

*A.A. Co's. No. 2 and Hamilton Pits.*—About 320 men, &c., are now employed in this colliery on the day shift, and the total quantity of air circulating in the mine is about 100,000 cubic feet per minute. The districts are in accordance with the Act and none of them are overcrowded, and the provisions of the Act are also complied with in other respects.

*A.A. Co's. New Winning.*—About 210 men, &c., are employed in this colliery on the day shift. The total quantity of air circulating in the mine per minute is about 64,000 cubic feet. The workings are divided into separate districts none of which are overcrowded. The Act is also complied with in every other respect.

*Wallsend Colliery.*—About 800 men, &c., are employed in this mine in the day-time, and the total quantity of air circulating in the mine per minute is about 190,000 cubic feet. The face workings are divided into 17 splits or districts, each district being supplied with a separate and distinct current of air. None of the districts have more men than the Act requires. The Act in other respects also is complied with.

*Newcastle Co's. A and B Pits.*—About 440 men, &c., are employed in this colliery during the day-time, and the total quantity of air circulated in the mine per minute is about 86,000 cubic feet. The number of districts and number of men in each district are in compliance with the provisions of the Coal Mines Regulation Act, and the Act is also complied with in every other respect.

*Co operative Company.*—About 370 men, &c., employed in this mine during the day; and the total quantity of air circulating in the mine per minute is about 100,000 cubic feet. The face workings are divided into six separate and distinct districts, and the provisions of the Act are complied with.

*Lambton Colliery.*—There are about 400 men, &c., employed in this mine, and about 80,000 cubic feet of air per minute is circulated for the several districts. The face workings are divided into eight districts, and the number of men in each is in keeping with the provisions of the Act. The Act in other respects also is complied with.

*Burwood Colliery.*—About 310 men, &c., are employed in this colliery on the day shift; and the total quantity of air circulating in the mine is about 80,000 cubic feet per minute. The workings are divided into separate and distinct districts, none of which are overcrowded. The provisions of the Act are also complied with in every other respect.

*Burwood Sinking Pit.*—This pit is in connection with the Burwood Colliery, and when completed will be the third shaft. About 8 men are engaged in the bottom in one shift. The surface arrangements are very good, and the special sinking pit rules in force are fully carried out.

*Stockton Colliery.*—About 250 men, &c., are employed in this mine during the day-time. The total quantity of air circulating in the mine is about 84,000 cubic feet per minute. The face workings are divided into separate and distinct districts; and none of the districts have more men than the Act allows. The provisions of the Act are also carried out in other respects.

*Wickham and Bullock Island Colliery.*—About 310 men, &c., are employed in this colliery during the day-time; and the total quantity of air in circulation in the mine is about 60,000 cubic feet per minute. The districts, and number of men in each district, are in compliance with the provisions of the Coal Mines Regulation Act, and the Act is also complied with in every other respect.

*Hetton Colliery.*—About 160 men, &c., are employed in this colliery during the day-time; and the total quantity of air circulating in the mine is about 19,000 cubic feet per minute. The workings are divided into districts, according to the provisions of the Act, and none of the districts are overcrowded. The second opening to the day or surface has been completed during the past half-year; and the Coal Mines Regulation Act is complied with in every respect.

*Port Waratah Colliery.*—Work at this mine has been suspended for some time, and at present the shaft is nearly full of water.

*Ferndale Colliery.*—About 100 men, &c., are employed at this colliery during the day-time, and are supplied with about 12,000 cubic feet of air per minute. The provisions of the Act are complied with.

*Pride of Ferndale Colliery.*—About 8 men, &c., are employed in this mine. The ventilation is satisfactory, and the provisions of the Act are complied with.

*Brown's Colliery.*—About 270 men, &c., are employed in this mine during the day-time. The total quantity of air introduced into the mine per minute is about 50,000 cubic feet. The face districts are according to the Act, and the provisions of the Act in other respects also are complied with.

*Duckenfield Colliery.*—About 220 men, &c., are employed in this colliery during the day; and the total quantity of air circulating in the mine is about 50,000 cubic feet per minute. The mine is divided into separate districts, none of which are overcrowded. The Act is also complied with in other respects

*South Waratah Colliery.*—About 140 men, &c., are employed in this colliery during the day-time. There are two separate and distinct districts, neither of which is overcrowded. The total quantity of air circulating in the mine per minute is about 20,000 cubic feet. The Act is also complied with in every other respect.

*Linwood Colliery.*—About 40 men, &c., are employed in this mine during the day-time. The ventilation is satisfactory, and the provisions of the Act are complied with.

*New Lambton C Pit.*—About 25 men, &c., are employed in this mine during the day-time, and are supplied with about 25,000 cubic feet of air per minute in two separate and distinct currents. The provisions of the Act are complied with.

*Ebbw Vale Colliery* (formerly New Lambton C Pit Tunnel). About 15 men, &c., are employed in this mine, and are supplied with about 9,000 cubic feet of air per minute. The Act is complied with in other respects also.

*West Burwood Colliery.*—About 28 men, &c., are employed in this colliery during the day shift. The quantity of air circulating in the workings is according to the requirements of the Act, and the Act is also complied with in other respects.

*Fern Valley Colliery.*—This is a colliery newly opened out, and at present there are only 5 men employed. The ventilation is satisfactory, and the Act complied with in every respect.

*Rosehill Colliery.*—This mine is also newly opened, and at present there are only 2 men employed. The provisions of the Act are complied with.

*East Lambton Colliery.*—This is a new colliery in the vicinity of New Lambton. The work of opening out from the bottom of the pit has only lately been commenced. There are about 6 men employed under ground in one shift. The provisions of the Act are complied with.

*Summerhill Colliery.*—About 17 men, &c., are employed in this mine. The ventilation is good, and the provisions of the Act complied with in other respects also.

*Hillside Colliery, Burwood.*—This colliery has been under inspection during the greater portion of the six months, but is now abandoned.

*Hillend Colliery.*—Work at this colliery has been temporarily suspended during the past six months, but operations are about to be resumed.

*Thornton Colliery.*—About 7 men, &c., are employed in the two tunnels in connection with this mine. The ventilation is good, and the provisions of the Act complied with.

*Goose Colliery.*—About eight men, &c., are employed in this mine. The ventilation is satisfactory, and the Act complied with.

*South Burwood Colliery.*—The main or borehole seam of coal has been reached by this shaft during the past six months. But at the present time all work in the shaft is suspended until the erection of the permanent headgear, &c., has been completed.

*Durham Colliery.*—A second shaft in connection with this colliery has been commenced during the six months, and everything in connection with it appears to be in good order. The work in the main shaft, which is sunk to the borehole seam, has not been continuous. Sinking pit, special rules are in use at the second shaft, and sinking pit rules only at the main shaft when headings have been driven, but the attention of the manager has been drawn to this matter.

*Burwood Extended Colliery.*—In connection with this colliery, the borehole seam has been reached by the No. 1 shaft during the six months, and headings turned away in the seam. Only 5 men are employed below in one shift, and the ventilation is satisfactory. The No. 2 shaft is 20 feet in diameter, and has now reached the depth of about 380 feet from the surface. The provisions of the Coal Mines Regulation Act are complied with.

*Morisset Colliery.*—Only 2 men are employed in this mine. The ventilation is good and the provisions of the Act complied with in other respects also.

*Northumberland Colliery.*—Sinking operations are for the present suspended. Two tunnels are being driven to open up a seam of coal near the shafts, and about 20 men employed. The ventilation is satisfactory, and the provisions of the Act are carried out in other respects also.

*Great Northern Colliery.*—Work at this colliery is at present temporarily suspended, the pumps are kept going, and the mine is maintained in good order for resuming work.

*Gartlee Colliery.*—This is a new mine near Teralba. A tunnel has been driven, and about 4 men are employed under ground. The provisions of the Act are complied with.

*South Wallsend Colliery.*—All work at the main shaft at this colliery is suspended. In the tunnel in connection with this colliery, about 40 men, &c., are employed. The quantity of air circulating is in accordance with the requirements of the Act, and the Act in other respects also is complied with.

*Teralba Colliery.*—All work at this sinking shaft is at present temporarily suspended.

*West Wallsend Colliery.*—This colliery has been idle for several months past owing to a labour dispute. But everything in and about the colliery is kept in good order for the resumption of operations.

*Monkwearmouth Colliery.*—About 11 men, &c., are employed in this colliery on one shift of eight hours, and supplied with about 4,500 cubic feet of air per minute in one current. The coal is drawn from the No. 1 or upper pit. The work of erecting machinery, pit-head gear, and screens is being proceeded with at the No. 2 or lower pit, and will be shortly completed. The provisions of the Coal Mines Regulation Act are complied with.

*Killingworth Colliery, New Wallsend.*—Sinking operations are still being carried on at this colliery, and the main shaft has been sunk to the depth of about 470 feet. Special rules for sinking are in force, and their provisions are carried out.

*Young Wallsend Colliery.*—The under ground work in connection with this colliery has been suspended for some months past, for the erection of the permanent machinery, pit-head frame, screens, &c. But as the whole of the plant is now nearly completed, it is expected that operations in the mine will very shortly be resumed. The provisions of the Coal Mines Regulation Act are complied with in every particular.

*New Duckenfield Colliery.*—This colliery has been under inspection during the six months, but is now abandoned.

*Clay Cross Colliery.*—This colliery has been under inspection during the half year, but is now abandoned.

*Maryvale Colliery.*—This colliery has been under inspection during a portion of the half-year, but is now also abandoned.

*North Stockton Colliery.*—About 30 men are employed at this new winning. The provisions of the Act are complied with.

*Thornley Colliery.*—There are 10 men employed in this mine. The ventilation is good and the Act complied with.

*Bloomfield Colliery.*—Nine men are employed under ground in this mine. The ventilation is satisfactory and the provisions of the Act complied with.

*Sunderland Colliery.*—There are only 2 men employed in this mine. The ventilation is good and the provisions of the Act are complied with.

*Rathluba Colliery.*—All work in this mine is at present suspended.

*Buttai Colliery.*—All work is at present suspended.

*Richmond Vale Colliery.*—There are about 25 men employed in connection with this new winning. The provisions of the Act are complied with.

*Maitland Coal Company.*—About 30 men are employed at this new winning, and the provisions of the Act are complied with.

*South Greta Colliery.*—This colliery has been under inspection during the greater portion of the half-year, but work is at present suspended.

*East Greta Colliery.*—This is a new colliery near West Maitland. Two men are engaged in driving a tunnel. The ventilation is satisfactory, and the provisions of the Act complied with.

*Greta Colliery.*—In this colliery about 260 men are employed on the day shift. The total quantity of air introduced into the mine per minute is about 60,000 cubic feet. The face workings are divided into four separate and distinct districts, each district being supplied with a separate and distinct current of air. None of the splits have more men than required by the Act. The Act in other respects also is complied with.

*Leconfield Colliery.*—There are about 15 men employed in the two tunnels in this colliery. The ventilation is good and the Act complied with.

*New Anvil Creek Colliery.*—A shaft is being sunk at this colliery for ventilating purposes, and work in the mine is temporarily suspended. The Act is complied with.

*Ellesmere Colliery.*—About 30 men are employed in this mine. The ventilation is satisfactory and the Act complied with.

*The Park Colliery.*—About 15 men are employed in this colliery. The ventilation is good and the Act complied with.

*Elliott's Colliery.*—Only 2 men employed under ground at this mine. The ventilation is good and the Act complied with.

*Rosedale Colliery.*—Two men are employed in this mine. The ventilation is satisfactory and the Act complied with.

*Dulwich Colliery.*—Only 2 men occasionally employed at this mine. The ventilation is good. No cause of complaint.

*Gladstone Colliery.*—Only 5 men at present employed in this mine. The ventilation is good and the Act complied with in other respects also.

*Springfield Colliery.*—There are about 5 men, &c., employed in this colliery. The ventilation is good, and the Act complied with in every respect.

*Black Jack Colliery.*—About 5 men were employed in this colliery during a portion of the six months, but at present all operations are suspended. The provisions of the Act are fully complied with.

*Centennial Colliery.*—About 4 men are employed in this mine, and the provisions of the Act are carried out.

*Great Northern Shale Company's Mine.*—Operations in connection with this mine have been suspended for months past, but it is expected that work will be resumed again very shortly. The provisions of the Act are complied with.

#### ACCIDENTS IN MINES.

The accidents investigated by us in the Northern District during the six months ending December 31st, 1889, are forty-five in number. Of this number thirty-five were fully reported on at the time, and ten were found to be of a minor character, and full reports were not written thereon.

Of the thirty-five accidents in the annexed tabulated list, fourteen proved fatal—six from falls of coal, four from overwinding and falling down shaft, one by injuries received from fly-wheel of engine, one by fall of timber and clay, one by loaded skip, and one by the ignition of fire-damp.

The majority of the non-fatal accidents were caused by falls of coal, and four by the ignition of fire-damp.

The first of the fatal accidents happened to a miner named William Wear, by a fall of coal in the Newcastle Co.'s Colliery, on July 18th. On the following day, the District Coroner, G. C. Martin, Esq., held an inquest on the body of deceased. Inspector Dixon attended the inquest, and heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The second fatal accident happened to a miner named Christopher Elgey, by a fall of coal in the Newcastle Co.'s Colliery, on July 30th. The day following, the District Coroner, held an inquest on the body of deceased. Inspector Dixon attended the inquest, and heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The third fatal accident happened to a labourer named Giovanni Ghio, by injuries received by fly-wheel of engine, at Rathluba Colliery, on August 5th, and the injured man died at the Maitland Hospital, on August 7th. The District Coroner, A. Vindin, Esq., held an inquest on the body of deceased. Inspector Bates attended the inquest, and heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The fourth fatal accident happened to a wheeler named Alexander Sneddon, by a fall of timber and clay, at Summerhill Colliery, on August 14th. On the same day, the District Coroner, G. C. Martin, Esq., held an inquest on the body of deceased. Inspector Dixon attended the inquest, and heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The fifth fatal accident happened to a miner named James Flannigan, by a fall of coal, at New Lambton C Pit Tunnel, on August 16th. On the following day, the District Coroner, held an inquest on the body of deceased. Inspector Bates attended the inquest, and heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The sixth fatal accident happened to a miner named Carl Schneider, by a fall of coal, in A. A. Co.'s No. 2 Pit, on August 21st. The injured man died on September 4th. Inspector Bates attended the adjourned inquest, held by the District Coroner, on September 6th, heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The seventh fatal accident happened to a miner named William Williams, by a fall of coal, in Stockton Colliery, on September 25th. On the following day, the District Coroner, held an inquest on the body of deceased. Inspector Bates attended the inquest, and heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The eighth fatal accident occurred to a wheeler named Joseph Henry Dyson, by injuries by loaded skip, on November 21st, at Stockton Colliery. The injured man died on November 25th. On November 26th, the District Coroner, held an inquest on the body of deceased. Inspector Bates attended the inquest, and heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The ninth fatal accident resulted in the death of four sinkers, named Augustus White, John Whitehead, Patrick Ryan, and Edward King, by being overwound, and falling down the South Burwood sinking shaft, on November 21st. The District Coroner held an inquest on the bodies of deceased, on November 22nd. Inspector Dixon attended the inquest, and heard all the evidence, and fully agrees with the verdict of "accidental death," through falling down the shaft. The cause being overwinding.

The tenth fatal accident occurred to a miner named Frederick Fletcher, by a fall of coal, in the Stockton Colliery, on December 3rd. On the following day, the District Coroner held an inquest on the body of deceased. Inspector Bates attended the inquest, and heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The eleventh fatal accident occurred to a miner named Lewis Walters, by the ignition of fire-damp, in Monkwearmouth Colliery, on December 6th. The injured man died on December 13th.

The first of the non-fatal accidents occurred to an engine man named Michael Gray, by a fall from platform at Burwood Colliery, on 6th July, and resulted in broken arm and dislocation of shoulder.

The second occurred to a miner named W. J. Moody, by a fall of coal at the Newcastle Co.'s Colliery, on 12th July, and resulted in a compound fracture of the right thigh.

The third occurred to a miner named Hugh Johnston, by explosion of powder at Greta Colliery, on 29th July, and resulted in severe burns to face and hands.

The fourth was a fracture of thigh to a wheeler named John U. Metcalfe at Wallsend Colliery, on 8th August.

The fifth was caused by a fall of coal, and resulted in injury to hip to a miner named Richard Hooper at Wallsend Colliery, on 11th September.

The sixth occurred to a miner named Thomas Parry, by a fall of coal at Stockton Colliery, on 17th September, and resulted in injury to right side of body.

The seventh occurred to a trapper named William Hepple, by being run over with loaded skip at Co-operative Colliery, on 20th September, and resulted in severe injury to left leg, necessitating amputation.

The eighth occurred to a miner named John Robinson, by the ignition of fire-damp at Durham Colliery, and resulted in severe burns. A miner named James Jarvis was also severely burned at the same time.

The ninth occurred to a miner named James Young, by fall of coal in A.A. Co.'s pit, and resulted in fracture of pelvis.

The tenth occurred to a miner named John Lord, by fall of coal in the A.A. Co.'s pit, on 14th October, and resulted in injuries to neck and chest.

The eleventh was injuries to chest and hips to a miner named William Dunn, at the Co-operative Colliery, on 17th October, by fall of coal.

The twelfth occurred to two sinkers named John Henderson and George Wilson, by explosion of shot in the North Stockton sinking shaft, on 19th October.

The thirteenth was slight injury to the head to a sinker named Richard Edwards at Richmond Vale sinking shaft, by a stone falling down the shaft, on 4th November.

The fourteenth occurred to a miner named James Skilling, by fall of coal at Greta Colliery, on 12th November, and resulted in severe internal injuries, broken leg, and scalp wound.

The fifteenth occurred to a miner named William Smailes, by blow from prop at Burwood Colliery, on 21st November, and resulted in fracture of collar-bone.

The sixteenth occurred to a miner named William Hunter and a wheeler named Robert Hume, by ignition of fire-damp in the Monkwearmouth Colliery, on 6th December, and resulted in severe burns.

The seventeenth occurred to a driver named Robert Allen, by a loaded skip in the Wickham and Bullock Island Colliery, on 7th December, and resulted in fracture of left leg.

The eighteenth and last non-fatal accident occurred to a driver named Thomas Burrige at the A.A. Co.'s new winning, on 10th December, by a fall off skip and fracture of left leg.

The usual tabulated list of accidents is hereto appended.

We have, &c.,

JOHN DIXON,  
THOS. L. BATES,  
Inspectors of Collieries.

TABLED LIST of fatal and non-fatal accidents in the Northern Collieries of New South Wales, investigated by the Inspectors of Collieries during the half-year ending 31st December, 1889.

No.	Date.	Colliery.	Person killed or injured.	Occupation	Remarks on cause and extent of injuries.	Non-fatal.										Fatal.	Total

The Half-yearly Report of the Inspector of Collieries on the state of the Collieries in the Southern and Western Districts of the Colony of New South Wales, and accidents therein, for the half-year ending 31st December, 1889.

The Examiner of Coal-fields,—  
Sir,

Wollongong, 22 February, 1890.

In compliance with the requirements of clause 26 in the Coal Mines Regulation Act, 1876, I have the honor to transmit to you this my six-monthly report on the state of the various collieries for the half-year ending 31st December, 1889.

The total number of collieries under inspection in the Southern and Western Districts during the last six months is thirty-five.

Western District	16 coal-mines and 2 shale-mines.
Berrima	3 coal-mines and 1 shale-mine.
Southern	13 coal-mines.
Making in all 35 collieries.	

PRESENT STATE OF MINES.

Western District.

*Cullen Bullen Colliery.*—About 67 men are employed under ground, and served with 20,000 cubic feet of air per minute. The south side of the colliery is worked on the "double stall" system. The bords 20 yards wide, with a "pack wall" on each side, and chocks built every 5 yards apart. The pillars between each of the bords are about 11 yards in thickness. The Act in all respects complied with,

*The Vale Colliery.*—About 92 men are employed under ground, and served with 10,000 cubic feet of air per minute. The colliery is worked in two shifts, with 46 men on each shift. The second way to the day is now completed by means of a shaft; an engine is also ready for raising and lowering persons if required. The Act in all other matters complied with.

Oakey

*Oakey Park Colliery*.—During the last six months an average of four men has been employed. An air-shaft is being sunk, 8 feet in diameter. It is now down 100 feet, and is expected to reach the seam at a depth of 314 feet. The Act complied with.

*Hermitage Colliery*.—During the last six months extensive alterations have been made, viz., the main haulage way repaired, and the entrance to the mine built with brick-work, and an engine placed at the outside to draw the coals from the various stations in the mine. The Act complied with.

*Coerwull Mine*.—Only 2 men employed getting a few tons of coals weekly. The Act complied with.

*Rawden Colliery*.—Only 3 men employed during the last six months, on account of dull sale for the coal. The Act complied with.

*Irondale Colliery*.—Four men employed, and served with 10,000 cubic feet of air per minute. The Act complied with.

*Zig-Zag Colliery*.—About 40 men are employed under ground, and served with 15,000 cubic feet of air per minute. The bords are kept well timbered, and the ventilating current well sustained round the workings. The Act in all respects complied with.

*Vale of Clwydd Colliery*.—About 36 men employed under ground, and served with 8,000 cubic feet of air per minute. During the last six months the left-hand cross-cut has been opened out (where a heavy fall of "tops" had taken place), the sides and roof have been renewed with fresh timber and props. The mouth of the shaft has also been secured with substantial planking. The Act complied with.

*Esk Bank Colliery*.—During the last six months the mode of under ground haulage has been changed, viz., the tail-rope system being adopted; formerly the coals were drawn out of the mine by horses. About 20 men are employed, and served with 16,000 cubic feet of air per minute.

*Old Tunnel*.—Six men employed, and served with about 6,000 cubic feet of air per minute. The Act in all respects complied with.

*Lithgow Valley Colliery*.—About 30 men employed underground, and served with 18,000 cubic feet of air per minute. The intake and return air-ways, and second way to the day, in good order; the ventilation well conducted throughout the colliery. The Act in all respects complied with.

*Main Camp (Hartley Vale)*.—Twelve men are employed underground, and served with 20,000 cubic feet of air per minute. The Act in all respects complied with.

*N. S. Wales Shale Mines (Hartley Vale)*.—No. 3 tunnel, 20 men are employed taking out pillars, and served with 13,000 cubic feet of air per minute. New tunnel, 24 men employed. This tunnel is worked on the long-wall system; the places are well built with "pack walls." The Act in all respects complied with.

*Katoomba Shale Mines*.—Three tunnels have been opened out on the long-wall system. About 35 men are employed. The places are exceptionally well built with pack walls, and a strong current of air passing every working place. The Act in all respects complied with.

*Katoomba Colliery*.—About 40 men are employed, and served with 9,000 cubic feet of air. The intake and return air-ways, and second way to the day, in good order. The Act complied with.

*Retort Coal Mine (Hartley Vale)*.—During the last six months work has been suspended, owing to a dispute between the Company and the contractors.

*Carlo's Gap Colliery*.—During the last six months work has been suspended, owing to no sale for the coal.

#### BERRIMA DISTRICT.

*Australian Kerosene Oil Company's Shale Mines (Joadja Creek)*.—About 60 men are employed under ground, and served with 14,000 cubic feet of air per minute. The air current is brought in straight line with the working places, the long-wall system being the mode of working. Intake and return air-ways and second way to the day in good order. The Act in all respects complied with.

*Great Southern Colliery (late Berrima)*.—During the last six months the colliery has been taken on tribute by Mr. Kennedy, manager. About six men are employed, and served with 6,000 cubic feet of air per minute. The Act complied with.

*Mittagong Colliery*.—About 8 men are employed, and served with 7,000 cubic feet of air per minute. The intake and return air-ways and all other requirements of the Act complied with.

*Herd's Prospecting Mines (Joadja Creek)*.—Two men prospecting for shale.

#### SOUTHERN DISTRICT.

*Metropolitan Coal-mining Company (Helensburgh)*.—About 65 men are employed under ground, divided into three shifts, each shift of men supplied with 9,500 cubic feet of air per minute. The miners and wheelers are working with locked safety lamps, and every precaution is being taken by the management to ensure safety. The air-shaft is sunk to a depth of 1,020 feet, and will reach the seam at a depth of 1,060 feet; after which a large fan is to be erected capable of discharging 300,000 cubic feet of air per minute. The Act in every respect complied with.

*Coal Cliff Colliery*.—About 80 men are employed under ground, and served with 17,000 cubic feet of air per minute in three separate splits. The intake and return air-ways and second way to the day in good order. The Act complied with.

*North Illawarra Colliery*.—About 160 men employed under ground, and served with 35,000 cubic feet of air per minute, in four separate splits. About twenty bords are working on the "double stall" system. The centre pack walls are well built. The Act in all respects complied with.

*Prospecting Tunnel, North Illawarra*.—Three men driving a heading in order to test the thickness of the coal.

*Bulli Colliery*.—About 100 men employed under ground, and served with about 30,000 cubic feet of air per minute in two separate splits. The men in the Hill End District are working with locked safety lamps; 4-foot seam, 10 men employed, and served with 10,000 cubic feet of air per minute. The intake and return air-ways in good order. The Act in all respects complied with.

*Bellambi Colliery*.—About 72 men employed under ground, and served with 15,000 cubic feet of air in two separate splits. The colliery is well ventilated, and the Act complied with in all other matters.

*South*

*South Bulli Colliery.*—About 120 men are employed, and served with 15,000 cubic feet of air per minute in three separate splits. A new air-shaft is being put down, and will reach the seam at a depth of 80 feet from the surface, at the bottom of which a furnace will be built, which will prove a great benefit for the ventilation of the colliery. The Act complied with.

*Corramal Colliery.*—About 10 men have been employed, and served with 10,000 cubic feet of air per minute. About the end of December last the Company sold out their interest to the owners of the Southern Coal Company. Extensive alterations are being made to increase the output of coal. The Act in all respects complied with.

*Mount Pleasant Colliery.*—About 112 men are employed, and served with 16,000 cubic feet of air per minute in two separate splits. The bords are exceptionally well timbered. The Act in all respects complied with.

*Osborne Wallsend Colliery.*—About 140 men are employed, and served with 30,000 cubic feet of air per minute in three splits. About 20 men are on pillar work. Great care is taken with the propping and drawing of props where the men are extracting the pillars. The Act in all other matters complied with.

*Mount Kembla Colliery.*—About 160 men are employed under ground, and served with 28,000 cubic feet of air per minute, in four separate splits. A new air-shaft is sunk to a depth of 300 feet, and intended to reach the seam at 370 feet.

When the shaft is down and the furnace built the ventilation will be greatly increased throughout the colliery. The Act in all respects complied with.

*Southern Colliery.*—About 10 men are employed under ground driving headings to further prove the thickness and quality of the coal. All the requirements of the Act are complied with.

*Biggar's Prospecting Mines (Dapto).*—About 4 men employed prospecting for a seam of "black band ironstone."

ACCIDENTS IN MINES.

During the last six months, ending 31st December, 1889, I have investigated six separate accidents included in this list. The first fatal accident happened to a shunter named Charles Winchester by a loaded truck at Cullen Bullen Colliery, on 15th July last. The District Coroner, T. H. Neil, Esq., held an inquest on the body of deceased at Cullen Bullen on the day following the accident. I fully agree with the verdict of "accidental death," as returned by the jury.

The second fatal accident happened to a miner named Robert Moore, by a fall of stone from the roof in Bellambi Colliery on 4th September. The District Coroner, C. F. Smith, Esq., held an inquest as touching the death of deceased on 11th September, at the Royal Hotel, Bulli. I attended the inquest and heard all the evidence, and fully agree with the verdict of "accidental death," as returned by the jury.

The first non-fatal accident happened to a shift-man named Isaac Nixon, who had his leg broken by a fall of coal in the Mount Kembla Colliery on 3rd September.

The second non-fatal accident happened a miner named Albert Auston, who had his back hurt by a fall of stone from the roof at Coalcliff Colliery on September 13th.

The third non-fatal accident happened to a sinker named J. Hofferman, who received a nasty cut on the head by a stone falling in the Metropolitan Sinking Shaft on 9th November last.

The fourth non-fatal accident happened to a token-boy named William Hockings, who had his leg broken by a full skip on the surface incline at Katoomba Colliery on 21st November last.

I have also examined a few other accidents which were not of a serious nature, and are not included in this list. The usual tabulated list of accidents is hereto appended.

I have, &c.,

JAMES ROWAN,

Inspector of Collieries.

TABULATED LIST of fatal and non-fatal accidents in the Southern and Western Districts of New South Wales Collieries investigated by the Inspector of Collieries during the half-year ending 30th June, 1889.

APPENDIX L.

GEOLOGICAL SURVEY OF NEW SOUTH WALES.

Report of Progress for 1889 by the Geological Surveyor-in-Charge.

Sir,

I have the honor to submit the following report of progress of the Geological Survey Branch during the year 1889:—

Attention to the departmental work of this branch at the head office in Sydney has occupied a considerable portion of my time. However, as a member of the Prospecting Board, with Mr. W. H. J. Slee, F.G.S., the Inspector of Mines, I visited the Tenterfield, Drake, Rivertree, Poverty Point, Solferino, Lismore, Ballina, Nana Creek, Coaldale, and several other mining localities of the Clarence District; also the Lower and Upper Macleay, Nambucca, Bellinger, Kempsey, Hillgrove, Inverell, Cope's Creek, and Cameron's Creek Districts. In Appendix No. 1 A will be found a brief description of the mines and country inspected by us.

I visited the two diamond-drill bores which had been put down at Narrabeen by Mr. J. Coghlan to 1,950 feet and over 1,200 feet deep respectively, and from which "natural gas" issued in sufficient quantity to be collected and used on a small scale for domestic purposes. It is said to have been first noticed on drawing the boring-rods from a depth of 1,650 feet, the strata penetrated being the Narrabeen Series. At a depth of 90 feet, however, below recent alluvial deposits, an estuarine bed of shells was passed through, from which it is not improbable that the gas emanates: this could be readily proved by plugging the bore immediately below the shell bed, or by boring afresh. Dr. Helms has kindly furnished me with the following result of his analysis of the gas:—

In 100 volumes—	CO <sub>2</sub>	0.00
	O	0.433
	C <sub>2</sub> H <sub>4</sub>	1.501
	N	43.368
	H	6.413
	CH <sub>4</sub>	46.012
	CO	2.273
		100.000

It is probable that the Coal Measures underlie the Narrabeen Series in this locality within a workable depth from the surface.

I also inspected the old quarry at Pymont where inflammable gas issues from fissures in the sandstone rock; it evidently results from the decomposition of the organic matter in the town-rubbish with which the quarry has been partly filled. (See Appendix No. 1 B.)

On the South Metropolitan Company's property, near Otford, in a private diamond-drill bore, the same seams of coal that have been sunk through in the Metropolitan Coal Company's shaft were passed through. The boring through the seams was witnessed by Mr. Stonier and myself. (See Appendix No. 1 C.)

When at the Melbourne Exhibition, I delivered a lecture on the "Mineral Resources of New South Wales," drawing attention to the large display of minerals made by this Colony at the Exhibition.

Regarding the discovery of platinum *in situ* in a lode near Broken Hill. (See Appendix No. 1 D.)

In company with the Inspector of Mines I witnessed a successful trial of Mr. Charles Phillip's patent dry concentrator for separating gold from tailings in the dry state. (See Appendix No. 1 E.)

Mr. Geological-Surveyor David has been engaged during the year chiefly upon a geological examination of the Hunter River Coal-field—a work of great importance in reference to the further development of the Northern Coal-field. Mr. David has traced the extension of the Greta Coal Measures from West Maitland to near Port Stephens, thence to Morna Point on the coast—a distance of about 42 miles. In these measures it is believed that not only coal but also kerosene shale will be found. During the year the further opening up of the seam near West Maitland, which was discovered by Mr. David in 1888, has proved it to be of the great thickness of over 32 feet, with only a few bands. For further particulars regarding Mr. David's examination of the coal and iron ore deposits of this field see his progress report herewith. (Appendix No. 2.)

In Mr. Geological-Surveyor Anderson's progress report (Appendix No. 3) will be found reference to his inspection of the Fiery Creek Gold-field, near Cooma; the bismuth lodes east of Ben Lomond, in New England; the Kookarabookra Gold-field in the same district; the deep lead formations at Tumarumba, a geological map of which has been published; and the artesian water-bearing Cretaceous formation in the Upper Darling district,—the first of a series of maps of this country, embracing Bourke, has been issued.

Both

Both Mr. David and Mr. Anderson assisted the Prospecting Board in dealing with applications for aid out of the Prospecting Vote in various parts of the Colony.

On 5th November, Mr. G. A. Stonier, Field Assistant, was appointed Acting Geological Surveyor. He has shown much ability in carrying out his duties, and his energy in furthering the work of the Department is deserving of commendation. He examined the mineral samples sent to this office for determination during the absence of Mr. Carne at the Melbourne and New Zealand Exhibitions. Mr. Stonier also inspected and reported on the Mogood Gold-field, near Ulladulla (*Appendix No. 4A*); the tin-bearing deposits at Mandama, near Temora (*Appendix No. 4B*); Peak Hill (*Appendix No. 4C*); Forbes, Melrose, Adelong, Belubula, and Rock Flat, near Cooma.

From the progress report (*Appendix No. 5*) of Mr. Robert Etheridge, jun., it will be seen that in addition to his examination of fossils specially submitted, he has completed the sorting of the supplementary palæontological collections, preparatory to their further systematic classification when larger museum accommodation has been provided.

Under Mr. Etheridge's editorship, Memoir No. 3 of the Palæontological Series, on the "Palæozoic and Mesozoic Flora," by Dr. Ottakar Feistmantel, has almost been completed in the Government Printing Office, and will soon be issued.

Volume No. 1, in three Parts, of the "Records of the Geological Survey of New South Wales," has been completed, and the first Part of the second volume is being prepared for publication.

Mr. J. E. Carne, F.G.S., Curator and Mineralogist, was occupied for some time in preparing and arranging the mineral exhibits from New South Wales at the Melbourne and New Zealand Exhibitions; the able and satisfactory manner in which he performed his duty is very praiseworthy. The representation of the mineral resources of New South Wales at the New Zealand Exhibition is perhaps the most complete that has yet been made at any previous exhibition. Apart from these larger displays small collections of minerals have been prepared out of our large collections, and distributed partly as exchanges to other colonies and countries, and to the Schools of Arts and public institutions in New South Wales. These must have a good influence in making known the mineral wealth of our Colony. Of the numerous samples of minerals sent by the public to the Department for examination 3,287 were sent on for assay or analysis to the Laboratory. Reference to these subjects will be found in Mr. Carne's Progress Report (*Appendix No. 6*.)

I would again urge the necessity for the erection of a suitable Museum building being erected as soon as possible. Without it the valuable collections, which the Department now possesses, and which are rapidly increasing, cannot be arranged, and they are, therefore, not open for public inspection.

From the progress report (*Appendix No. 7*) of Mr. Mingaye, Assayer and Analyst, it will be seen that a considerable amount of useful work has been done by the Laboratory officers. The 3,287 samples received for assay or analysis during the year were all completed by the 7th January following.

Various important improvements have been made at the different caves, under the supervision of Mr. W. S. Leigh, the Superintendent of Caves, (*see* Mr. Leigh's progress report—*Appendix No. 8*.) By permission of the Superintendent of Telegraphs, Mr. E. C. Cracknell, Mr. J. S. Fitzmaurice, Electrician, supervised the purchase and erection of the new dynamo for the additional lighting of the Jenolan Caves.

Mr. A. H. Taylor was appointed Clerk and Draftsman on the 1st January, and Mr. P. T. Hammond as Clerk on 1st February.

#### APPENDIX M.

Prospecting Board—Progress Reports by C. S. Wilkinson and W. H. J. Slice.

Sir,

Drake, 12 March, 1889.

Having dealt with the applications at Boonoo Boonoo, Drake, Tooloom, Pretty Gully, and Rivertree Mining Districts, for aid out of the Prospecting Vote, we proceed to-morrow to the Timbarra, Solferino, Tabulam, Casino, Lismore, and Grafton districts.

The formation at Boonoo Boonoo is wholly granitic, and is traversed by auriferous and argentiferous quartz-reefs. Very little work, other than prospecting, is at present carried on, owing to the patchy nature of the metalliferous portions of the reefs; the association of the gold with sulphides of silver, lead, zinc, iron, and copper, renders it difficult to save by the ordinary crushing appliances. Although the reefs are with few exceptions small, we believe that they will afford profitable employment to numerous miners. There are at present two batteries on the field—one at the Lady Mary Claim, which is idle, and a larger plant at the Golden Crown Company's mine. From the latter mine some rich specimens of gold in quartz were shown to us. A little alluvial gold-mining is also carried on in the creeks. We next proceeded to the Fairfield District, of which Drake is the central township. Within 2 miles of Drake several reefs have been opened, which will doubtless become of considerable importance. The Adeline is the nearest mine to the town; it embraces a well-defined reef of a permanent character. As yet it has only been worked from near the surface, but the manager, Captain B. Bryant, is sinking a shaft to work the reef from the 100-foot level. The reef is from 2 to 6 feet thick, and has yielded some rich returns; it is very ferruginous from the oxidation of pyrites which, with other sulphides, will be found in large quantity in their undecomposed state below the water level; the gold is in very minute particles, in fact, as fine as flour, and consequently it is difficult to save. There are other reefs near this, and in the adjoining claim the Kelly Gold-Mining Company are raising very pyritous gold-bearing ore from a shaft 70 feet deep. At Mount Pleasant and at Sawpit Gully, immediately north of it, occur several reefs of a very promising character. In the Great Northern Company's property an auriferous copper lode from 2 to 4 feet wide is being worked.

Mr. W. J. Beglehole, the manager, informed us that 30 tons of the ore sent to Waratah for treatment yielded copper to the value of £14 and gold £4 per ton. From Scott's line of reef in the same Company's ground 1,200 tons crushed averaged 4 dwt. 14 gr. of gold per ton, and it has been estimated that the amount of gold lost in the tailings, owing to the finely divided gold in the stone, is greater than that saved in the crushing. The reef varies in thickness up to 14 feet, and will probably continue to a great depth. The reef on the Strauss Mine, which is said to have yielded up to 17 dwt. of gold per ton, has been from 3 to 10 feet wide; a long tunnel has been driven to intersect the reef at a lower level, but as yet it has not been successful. At Wann's mine, the White Rock Consols, a bed of pyritous agglomerate

has been excavated 30 feet wide and 23 feet deep; 90 tons from it are said to have yielded 94 oz. of gold and silver bullion valued at £181. There appears to be a large extent of this ore. At Mount Gladstone a reef from 2 to 3 feet thick has been worked to a depth of 70 feet. We were informed that 60 tons crushed from it gave a return of 11 dwt. of gold per ton. A tunnel is being driven by J. Watt and party to cut the reef at a greater depth. In the gully near this Dr. Watson is prospecting a lode of copper and iron pyrites 2 feet 6 inches wide. In the Mascotte Mine, 2 miles south-east from Drake, a good reef is being worked for silver and gold. The lowest depth reached is only 100 feet. From returns supplied by Captain Bryant the average yield is at the rate of about 1 ounce of gold and 45 ounces of silver per ton—one parcel, of 2 tons, sent to Clunes, in Victoria, having yielded at the rate of 2 oz. 5 dwt. of gold and 69 oz. of silver per ton.

About 2 miles south-west from Drake is the White Rock Silver Mine, under the management of Mr. J. Rossiter. Here the apex of an intrusive mass of white felsite rock has come to the surface, and occupies an area of about seven acres. It is surrounded by metamorphosed sedimentary strata of Devonian age. A net-work of small quartz-veins, with galena, zinc blende, pyrites, and occasionally native silver traverse it; there are besides several larger veins of the same sulphides, varying in thickness up to 16 inches. The ore occurs not only in veins but also in patches, and to some extent throughout the mass of the rock, which has been quarried in an open face for about 400 feet on the north bank of a creek which has cut through it. Within about 200 yards to the north, the felsite rises to about 100 feet above the bed of the creek. It can, therefore, be worked for a considerable time from an open face, and by thus excavating the rock bodily, a large quantity of payable ore can be sorted from it at a low cost, and sent down to the crushing-mill by the self-acting inclined tramway which has been constructed. The Manager informed us that nearly the whole of the felsite rock can be profitably treated; but from inspection of it *in situ* we are of opinion that a considerable portion of it will have to be rejected. However this can only be determined by actual trial of large quantities of the stone. The Company is erecting a very extensive crushing, concentrating, and amalgamating plant, and, when the first difficulties of treating this complex ore have been efficiently overcome, this mine should give profitable results, and employment to a large number of persons. We were informed that various parcels of the ore, amounting to 163 tons 10 cwt. 3 qr., that had been sent to Europe and elsewhere for treatment, produced silver to the value of £1,207 13s. 7d.

Near the White Rock, north-west from it, Mr. Besant has sunk a shaft 116 feet deep to test some ferruginous jasperoid reefs containing pyrites, galena, blende and a little gold. The alluvium in the gully immediately below the outcrop of the reefs has been worked for gold, which has probably been derived from these reefs.

At Red Rock, 9 miles northerly from Drake, a large area of siliceo-felspathic rock has been proved gold-bearing, and is likely to be extensively worked. Several different companies are at work. The "Great Red Rock Company" is sinking a main shaft, which is now 170 feet deep, and so far has proved two beds of ore-bearing rock—one 14 feet thick, the other 8 feet and not through it—containing galena, zinc blende, copper and iron pyrites, with gold and silver. The Manager, W. Beglehole, informed us that 1,211 tons of the oxidized ore taken from an open cutting near the surface, and crushed at a local mill, yielded at the rate of 6 dwt. 10 gr. of gold per ton, and that assays showed a loss of 13 dwt. of gold per ton in the tailings. A parcel of 11 cwt. of the ore, sent to Sandhurst for treatment, yielded on assay 1 oz. 3 dwt. 16 gr. of gold and 1 oz. 19 dwt. 6 gr. of silver per ton.

At Long Gully, 7 miles south from Drake, a ferruginous quartz-vein has been opened to a depth of 40 feet, containing bunches of zinc blende rich in gold, associated with galena, copper and iron pyrites.

In the same locality—Mathieson and party, at Long Creek, and R. B. Clarke and Lodge, on the range to the south-east, have discovered some irregular veins of the above-mentioned sulphides.

About 3 miles easterly from Drake Mr. T. Kelly and Bigley and party are prospecting some promising gold-bearing veins.

At Mount Rossitter, 6 miles E.S.E. from Drake, Mr. J. Rossiter is testing some massive beds of altered conglomerate containing gold and silver-bearing pyrites; and about 2 miles further Mr. W. Coghlan has discovered a large outcrop of ferruginous conglomerate, from the surface of any part of which free gold in minute particles, it is said, can be washed. A dyke of diorite runs alongside the conglomerate.

From the foregoing it will be seen that in this district there are numerous ore deposits containing gold, silver, copper, lead, zinc, &c. The gold hitherto worked in them is as a rule in a very fine state of division in iron-oxides or gossan-quartz from the upper portions of the reefs, and on this account cannot all be saved. When more efficient gold-saving appliances than those now in use on the field have been introduced steady and profitable yields may be anticipated. But the future prosperity of the mining industry in this field will mainly depend upon the successful treatment of the pyrites, and other sulphide ores, which will be the chief source of the gold and silver in all the reefs below the water level, and which can be more readily concentrated than the oxidized ores from nearer the surface.

Our next progress report will refer to the Lunatic, Pretty Gully, Tooloom, Rivertree, Timbarra, and Solferino districts.

Sir,

Lismore, 25 March, 1889.

In continuation of our former progress report, we have the honor to submit the following reference to the mining districts visited by us:—

About 7 miles north from Drake a Company is sinking a deep shaft on the Lunatic Reef, under the management of Mr. A. Ashbury. This reef strikes N. 10° W., and has been traced for a considerable distance. It was worked some years ago, but is now almost idle. In places the reef narrowed, and the gold in it proved to be in "shoots" associated with iron and copper pyrites and metallic arsenic; with the latter some rich patches of gold were obtained. About a quarter of a mile south from Ashbury's shaft the same reef has been worked from a shaft 116 feet deep now abandoned. About 200 yards to the west is the Old Antimony Reef, which T. Horton, Peter Gray, and party are now sinking upon to a depth of 35 feet. It is from 6 to 18 inches thick, and contains a large amount of antimony oxide and sulphide, besides some gold and pyrites. It appears to be a permanent reef. 1½ miles easterly from this are the two Victoria Reefs, one of which Mr. W. H. Pascoe is prospecting. In his shaft, 32 feet deep, the reef is 20 inches thick in soft felspathic rock; from the quartz raised 15 oz. of gold are said to have been

been picked out. About  $1\frac{1}{2}$  miles N.E. from Lunatic is the Perseverance Reef, which was formerly worked to a depth of 175 feet, but the shoot of gold was lost, and the reef abandoned. It has again been taken up by R. Hooton and party. The reef averages about 8 inches thick in blue pyritous slate and conglomerate, and contains gold, arsenical pyrites, antimony, and calcite. It is said that 119 tons raised from a shaft two claims to the south yielded 2 oz. of gold per ton. Half a mile west is the Golden Star Reef which is about to be worked by E. Martin and party. Diorite occurs near this reef; Pretty Gully, or Farley, is an old diggings 15 miles north from Drake. Messrs. Pearson and M'Laughlan and party have erected an 8-head stamper battery driven by a water wheel, for crushing the stone from their claim on the Lincolnshire Reef. This reef traverses conglomerate rock, shows free gold, and is from 6 to 30 inches thick, dipping E.N.E. They are about to cross-cut at the low level for another reef about 10 feet to the west from near the surface. Withers and party are prospecting a porous pyritous quartz reef 2 miles southerly from Pretty Gully. Other reefs occur in the locality, and some alluvial mining has been carried on in the "Two-mile," "Four-mile," and "Stockyard" Gullies, where the gold has been derived from the denudation of hills capped with carboniferous conglomerates. Mr. Smith, a prospector, obtained near here some carboniferous marine fossils, *Spirifer vespertilio*, &c.

Immediately to the north, between Pretty Gully and the Clarence River, is a high basaltic range, the basalt overlying Tertiary drift, the bed of the ancient stream, which, in the Tertiary period, drained the Clarence Valley. On the north slope of this range, at an elevation of 1,100 feet above the Clarence River, Messrs. Lay and Haeger, of the Tooloom and Rivertree Gold-mining Company, have put down a shaft 220 feet deep, and then drove 138 feet into the hill until heavy water stopped them. A little coarse gold was obtained, and as the slate bed rock continued dipping, they have commenced to sink a new shaft on the top of the range about 300 yards to the south-west, and may strike the lead at a depth of nearly 400 feet. It is to be hoped that this enterprising work will meet with the success it deserves. A deep lead undoubtedly exists here and extends for a considerable distance, and should it prove payable it will give employment to a large number of miners. At the end of the range, about 3 miles to the east, Messrs. Lay and party are also driving under the basalt, and have struck a coarse drift containing a little gold resting on a false bottom of carboniferous shale. Coarse gold is said to have been obtained in the gullies draining from this range. It has probably been derived from the denudation of both the Tertiary lead and the underlying carboniferous conglomerates.

On the opposite or north side of the Tooloom branch of the Clarence River, at an elevation of 1,250 feet above the river, pebble-drift crops out from under the basalt, but there is only a small extent of it. Near this, Hansen and party have sunk a shaft 230 feet deep in carboniferous sandstone and conglomerate. Excepting in patches this is not likely to prove payable. Some gold has been obtained in the recent alluvial in the gullies draining from it. Near the Tooloom River Mr. Paine lately took up an abandoned pyritous reef about 2 feet thick in altered felspathic sandstone. In one small portion of the reef he obtained 110 oz. of gold, some rich specimens of which, consisting of gold intermixed with quartz crystals, were shown to us.

At Rivertree, near the junction of Cullen's Creek with the Clarence River, where the formation is granite surrounded by hills of Devonian strata, three gold and silver-bearing pyritous lead lodes are being opened under the management of Mr. J. W. Archibald, who has erected a small trial furnace for smelting the ore. The Western or "Wongabah" lode has been sunk upon to a depth of 90 feet, and proved it to be 15 feet wide, consisting of felspathic matrix with quartz, calcite and sulphides of iron, lead, zinc, copper, and antimony. The ore occurs in patches of irregular thickness. With proper appliances it could be readily concentrated. The lode dips E.  $15^{\circ}$  S. at  $60^{\circ}$ , and is seen for about 130 feet long at the surface. It has been traced in places for about a mile in a northerly direction. About half a mile up Cullen's Creek is a lenticular vein, from 6 to 30 inches thick, of porous siliceous ore with carbonate of lead, said to be rich in silver; and three quarters of a mile east of Cullen's Creek is another lode called the "Silvery Wave." It occurs near the junction of the granite and slate formations, strikes N.  $35^{\circ}$  E., and averages about 3 feet wide. It consists of porous iron ore and quartz, containing nodular masses of argentiferous galena and carbonate of lead, with sulphides of iron and zinc. A shaft has been sunk upon it to a depth of 96 feet. We also saw on the south side of the river several smaller lodes containing lead ore that Messrs. Smith and Green have taken up, and we were shown samples of ore, consisting of quartz and gossan, containing sulphides of iron, lead, and zinc, said to give on assay good returns of gold and silver, from some lodes higher up Cullen's Creek; they are probably the continuation of the Rivertree lodes. The lodes of this locality are well worth prospecting, and from them average bulk samples of the ore should be sent to efficient works for trial, as their proper development may lead to the establishment of an important mining industry here.

From Rivertree we returned by the bridle-track down the Clarence Valley, crossing the river seventeen times in a distance of 12 miles owing to steep spurs from the ranges abutting upon the river on either side of it.

Leaving the river the track ascends the Tooloom Range, about 1,300 feet high, the flat top of which is formed of a great thickness of chocolate-coloured basaltic soil. The southern side of the range is covered with "brush"—a dense growth of splendid timber-trees, palms, ferns, &c., matted together, with vines and creepers which, with their rope-like stems, hang in festooned masses from the branches of the high trees. Mr. Easton has made a large clearing in this "brush," and the luxuriant growth of oranges and other fruits, grass, &c., upon it afford evidence of the richness of this basaltic soil for agricultural purposes.

From Drake we next proceeded to Timbarra, where, at the Table-top Mine, Messrs. Dixon and Rhodes are working auriferous granite, and have on the ground a small battery for crushing it. The granite has disseminated through it minute crystals of pyrites besides patches of pyrites up to a foot in diameter, and thin strings of quartz. Where the rock is soft it is stained yellow and red from the iron oxides, resulting from the decomposition of the pyrites, and it is this ferruginous rock which yields the most gold; two crushings of it are said to have yielded at the rate of 9 dwt. of gold per ton. As the granite is only pyritous in irregular patches, and the gold is evidently associated with the pyrites, a little also being visible in the small quartz strings, so the occurrence of payable stone must be very irregular and uncertain. There are, no doubt, many similar patches of auriferous granite in this locality, for over a considerable area gold has been profitably worked in the alluvial in the gullies draining from the granite hills.

About

About  $7\frac{1}{2}$  miles from Mr. Maher's post office store, Timbarra, two ferruginous quartz-veins, 18 and 6 inches thick respectively, cross the main road to Poverty Point. They traverse porphyritic granite and should be prospected.

At Surface Hill, Poverty Point, the granite for about 100 yards wide, N. and S., and 300 yards long, E. and W., has been proved gold-bearing. A portion of it, about  $1\frac{1}{2}$  acres, has been excavated, and ground-sluiced to a depth in places of 30 feet, where the granite is decomposed and soft, leaving the undecomposed rock standing in large kernel-like masses here and there. The granite, like that at the Table-top Mine, is gold-bearing where it is pyritous, and the gold is in minute free particles in the soft rock where the pyrites has decomposed into iron oxides. The manager, Mr. Robert Nicholson, informed us that this stone, when crushed, yielded from 2 to 5 dwt. of gold per ton, and that assays of it gave at the rate of 9 dwt. per ton—the loss in crushing being doubtless due to the minuteness of the particles of gold. A few small gold-bearing quartz-veins, up to  $2\frac{1}{2}$  inches thick, traverse the granite, which is said to be richer within a foot or so from these veins; probably the granite was originally permeated with thermal water, holding gold and sulphides in solution, issuing through these vein fissures. Molybdenite also occurs in the rock. On breaking the hard undecomposed granite, small crystals of pyrites are seen disseminated through it; and as the bulk of the gold-bearing rock is of this pyritous character, it will require, for successful treatment, crushing, concentrating, and roasting. Six similar auriferous granite areas are said to have been proved, in a belt of country, from the Big Hill workings, 1 mile south of Poverty Point, to Table-top, 12 miles distant on the north; also on a branch of M'Lean's Creek, Mr. Thomas Horton, sen., has opened an irregular mass of soft ferruginous granite to a depth of 30 feet, and crushed over 1,000 tons of it with a yield of 7 dwt. of gold per ton. The undecomposed fine-grained felspathic rock alongside it contains patches of arsenical pyrites and molybdenite. This is well worth opening further as Mr. Horton is about to do. There are probably other similar auriferous masses of granite in the locality, as the alluvial in one of the long gullies between here and Poverty Point, has been payably worked for gold.

After being hospitably received for the night at Mr. Stuart's homestead on the Timbarra or Rocky River, we next inspected the gold discovery recently made in the Malara Scrub, 7 miles distant on a high range. The discoverer is Mr. Paul Marcolini, of Grafton, the well-known, energetic, and fortunate prospector in the Solferino gold-field. His present claim consists of a patch of alluvial ground near the head of the gully, where it flows over pyritous dioritic and granitic rock and altered conglomerate; with crystalline quartz veins. Mr. Marcolini informed us that since the beginning of the year each man working had made £9 per week. The gold occurs in fine particles and in coarse pieces up to 8 dwt. The source of it has not yet been found, but the gold has probably been derived from the decomposition of the pyritous rock itself, and from quartz veins traversing it. The payable ground is confined to a small area, so far as that surrounding it has been proved, but a large extent of similar formations exists in the adjacent country which should be prospected. The ranges are covered with thick forest and dense undergrowth of scrub, through which it is difficult to penetrate. The old Malara diggings are situated 3 miles south-west from Marcolini's claim. Between this and Lionsville, near Solferino, the main range is largely formed of diorite and granite; but at Lionsville altered Devonian slates with dykes of granite appear. Here, in the altered sedimentary rocks, several lines of reef have been more or less worked:—the Lions, Garibaldi, Band of Hope, Lombardy, John Bull, and others. In some of them very rich shoots of gold have been obtained, but owing to the patchy occurrence of the gold in them the working of the reefs has been very irregular. In order that they be properly mined, progressive works, both in sinking and driving, should be carried ahead, so that the position of the shoots of gold might be ascertained, and the raising of payable stone, as well as prospecting, simultaneously carried on. A tunnel is now being driven to meet the old shaft on the Lions reef, that it may be more conveniently worked. An application for aid from the Government Prospecting Vote was made for further opening up the Garibaldi Reef, but after inspecting the reef, we cannot recommend that aid be granted, as we consider it to be a payable reef if more vigorously and systematically worked; at present only two men, Mr. Mark Udusich, the manager, and another are at work.

From Solferino we proceeded to Tabulam, where the Clarence series coal-measures, with seams of coal, are the prevailing formation, but about 5 miles to the west, the granite and altered sedimentary metalliferous formations of the Drake district form the hills, and here, on the Plumbago Creek, occur in close proximity large deposits of white marble limestone and iron ore, which will no doubt become of value in connection with the future working of the complex gold and silver-bearing ores of this promising mining field.

We beg to express our acknowledgements of the valuable assistance rendered us by Mr. Warden Graham, P.M., Mr. J. P. Curran, Mining Registrar, Mr. Archibald, of Rivertree, and other mining men of Drake, especially Mr. Thomas Horton, jun., who accompanied us through the principal parts of this mountainous district.

Sir,

Grafton, 8 April, 1889.

From Tabulam we proceeded *via* Casino to Lismore, passing over country composed of the "Clarencæ series" coal-bearing formation, with more or less extensive areas of basalt. In the road cuttings up the Sandilands Range the outcrops of several seams of coal may be seen. Casino is situated on the coal formation, and in the banks of the Richmond River near the town the general character of the strata of this series is well shown.

From Casino to Lismore the formation is chiefly basaltic, and the hills for miles around Lismore also consist of volcanic rocks, though to the north about 12 miles the sandstones with coal seams occur, and to the south Tertiary beds of white pipeclay (locally called meerschauum), containing impressions of fossil leaves, of which Mr. E. Coleman, of Lismore, procured for us a good collection for the Mining and Geological Museum. The decomposition of the volcanic rocks has produced the very rich soil for which this district is so noted; and which, as might be expected under the forcing influence of a semi-tropical climate and a large rainfall, supports a most luxuriant growth of vegetation—a dense "brush," or jungle of ferns, palms, and trees of all sizes, including splendid timber-trees. When cleared, this land is most productive, especially on the alluvial flats, for sugar-cane, corn, fruits, and grass, as may be seen in some of the well-cultivated farms scattered throughout the district. In fact, there are few, if any, other parts of the Colony where the soil offers such prospects of rich reward to the industrious farmer. At present the

the farmers have no regular outlet for their produce in consequence of the uncertainty of the steamers being able to cross the bar at the Richmond River Heads; when the proposed improvements to the bar have been carried out, this large and promising field for settlement will progress rapidly.

About 30 miles north of Lismore, at a place called Peter's Grass, a narrow belt of altered Devonian sandstones and slates form the hills, and is traversed by quartz-reefs.

On Yankee Creek, Messrs. Wetherspoon and party have opened one of these reefs, from which 1 ton crushed at the Mint yielded 5 dwt. of gold, and two samples yielded on assay at the rate of 16 dwt. per ton. Another ferruginous reef near this the party will prospect. About 3 miles N.N.E. from here Mr. Withers has also found a ferruginous quartz-reef, and some alluvial gold is said to have been obtained in the gullies. This is a locality well worth prospecting.

The road from Lismore to Ballina crosses a belt of Devonian sandstones and slates with quartz-reefs. One reef crosses the road at the foot of the hill, about 6 miles west of Ballina; and another reef occurs on the property of Mr. Coleman, about 9 miles west of Ballina. This reef runs in lenticular blocks up to 1 foot thick in siliceous blue slate; 1 ton crushed at the Mint is said to have yielded 15 dwt. of gold. At Ballina we received an application from Mr. J. S. M'Cullagh to inspect the seam of coal discovered 2 miles from Wardell. On visiting the place we found the prospecting shaft had fallen in and the seam could not be seen, but from the description given it contains too many bands to be profitably worked.

The Richmond River, below Wardell, flows through alluvial flats a few feet only above sea-level, consisting of an estuary deposit of marine shells, covered with fresh water alluvium, forming rich agricultural soil. The town of Ballina, which is immediately within the river entrance from the ocean, is situated on the flat; but the North Head of the entrance consists of a small hill of dense black basalt and blown sand. About half-a-mile further north is the Black Rock, a perpendicular cliff 30 feet high, facing the ocean, and composed at the base of hard dense basalt, then a bed, 4 to 10 feet thick, of scoriaceous volcanic agglomerate, overlaid by 15 to 20 feet of hard dense columnar basalt; above this is about 30 feet of soft decomposed laminated basalt. Mr. Munro informed us that from the lower agglomerate bed several parcels had been treated in Sydney—one of over 3 tons yielding at the rate of 2 dwt. 10 gr. of gold per ton, and another of 19 cwt. yielded 18 dwt. 11 gr. of gold per ton; a total of about 7 tons 17 cwt. treated gave an average yield of 12 dwt. per ton. These beds have a slight dip inland, and could be easily worked. There is no doubt that the gold and platinum in the sand and gravel on the beach, which has for years past been worked to the north and south of Black Rock, have been derived from the denudation of the basalt, the rippling action of the ocean surf tending to throw back the gold with the black sand and shingle drift about high-water level. One exceptionally rich patch of about 25 yards square, worked by Bevan and party, yielded, from about 6 inches of wash, 75 oz. of gold. The gold occurs in very minute particles. Only one miner is now working on the beach here. There being abundance of water at hand, the sand could readily be worked on a large scale; but this does not appear to have been attempted, probably owing to the patchy occurrence of the gold. Special appliances will be needed for saving gold from the basalt, for this rock when crushed forms sludge, which carries off the fine particles of gold. On account of the special treatment required larger parcels than those hitherto tried should be operated upon; and should they prove payable, as they probably will, there is sufficient material to warrant mining operations on an extensive scale. The beach sand within the entrance to the Richmond River, near the North Head, has also been proved gold-bearing. From this coast to Lismore and the head of the Brunswick River the basaltic rocks show evidence of great volcanic activity during a considerable period.

Sir,

Glen Innes, 15 April, 1889.

From the Richmond we proceeded to the Clarence River District, and first inspected the coal prospecting operations about 4 miles north-west of Chatsworth, for which Messrs. Watt and party had applied for aid from the Prospecting Vote. A shaft has been sunk 129 feet deep, passing through several small seams of coal, the thickest being 2 feet 3 inches of bituminous and splint coal. As the strata sunk through in the shaft seen outcropping at the surface, and there are no indication of a thicker seam, we could not recommend further sinking.

At the request of Mr. See, Mayor of Maclean, Mr. Jamieson, and others, we also inspected their coal prospecting works situated on the eastern slope of the Look-out Hill, where two shafts and a bore had been put down without success. Here an outcrop of coal is seen in a gully, showing coal with numerous bands, but as the whole thickness of the seam is not exposed, owing to a covering of alluvial deposit, we advised that it be sunk upon to prove if a workable thickness of coal existed, as the importance of obtaining a workable seam of coal in this district would be great.

At Grafton, Mr. S. See, the Mayor of the City, Mr. Rutledge, Mr. W. A. Smith, and other gentlemen interested in mining, informed us of the different parts of the district which it was proposed the Prospecting Board should visit. We proceeded to the Nana Creek Gold-field, and inspected the various claims for which application for aid had been made, viz.:—the Jubilee, Lady Matilda, Lady Carrington, Eureka, Waratah, Nymboi, New Year's Gift, Advance Australia, Jessie Smith, and Homeward Bound Reefs.

From several of these rich parcels of quartz have at times been crushed; but as the gold occurs chiefly in small shoots the returns are said to be poor compared with the labour incurred. Consequently, quartz-mining (there is no alluvial mining) on this field is at a low ebb, and only a few miners are now at work. We believe, however, that it will revive when the gold-bearing shoots in the reefs have been proved to continue to greater depths, as it is now proposed to do. Encouragement will then be afforded for working the reefs on a larger and more systematic scale than is possible by the few miners at present engaged. The Jessie Smith Reef is situated about 19 miles from Nana Creek. It averages about 9 inches thick, has been traced for about 300 yards, and has been opened by a small shaft and tunnel. A trial crushing of 2 tons is said to have yielded 12 dwt of gold per ton. The gold occurs in the reef in small shoots; unless these are proved on further prospecting to be larger, the reef could not be profitably worked. We saw numerous other unworked reefs cropping out in this gold-field. The formation is Devonian slates and sandstones, with diorite at the Nymboi Reef, and basalt at Bald Nob. The country consists of steep rugged ranges, densely timbered with splendid trees, and the soil is in places of the richest description. This land will be valuable land for agricultural settlement when it has been opened by roads to places where farmers could find a market for their produce.

On

On M'Guire's Creek, which crosses the road to Nana Creek, there is an outcrop of coal. The seam is 16 feet thick, with numerous bands; but, as the thickest layer of coal is only 9 inches, the seam would not be workable. The bottom of the seam, however, is not exposed, being covered by alluvial *débris*.

We next visited Mylne's Gap, near Coaldale, about 30 miles north-west from Grafton, where Mr. S. See and Mr. Whyman have had a shaft sunk, in which a seam of coal has been proved 37 feet thick, inclusive of numerous bands, but, as the top was in coal *débris*, the actual thickness of the seam has not been ascertained. On account of bands, the coal, if worked, would yield much ash, but it might be useful for local purposes, where this would not be a serious disadvantage. It is of a bituminous character, and portions of the seam contain inferior cannel coal. We have taken samples for analysis. The unproved upper portion of the seam, and two other seams which are seen outcropping at the surface higher up the range, should be prospected. About 10 miles further to the north-west, on Gordon Brook, we inspected the claim which is being prospected for copper by Messrs. Fisher and party. There is here no sign of a copper lode, the serpentine rock containing only small veins of copper ore of no value. Near Copmanhurst, Messrs. Fisher, Hicks, and party are prospecting for coal. They have sunk 5 feet into a seam of coal of fair quality, but containing too many bands to be profitably worked. They intend to sink deeper, as coal of workable thickness may occur in the lower untried portion of the seam, which is probably the equivalent of the Coaldale seam, and also of that near Maclean. This being so, the seam may pass under the city of Grafton, at a depth of from 500 to 600 feet. A detailed geological survey of the Clarence coal series would reveal the most suitable localities in which to prospect for coal by means of the diamond drill.

From Grafton we proceeded to the Dalmorton Gold-field, and inspected the Liberator and Isabella Reefs, for which aid out of the Prospecting Vote had been applied. These reefs are of a promising character, and are well worthy of being prospected. They occur in altered slate formation. Very little mining is at present carried on in this field. We were informed that Mr. Campbell had opened a payable reef, averaging 14 inches thick, and traced for 450 feet. It is situated about 4 miles south-south-west from Dalmorton.

Sir,

Nambucca, 12 October, 1889.

We have the honor to inform you that, in reference to the applications for aid out of the Prospecting Vote, we have inspected the gold and antimony mines situated between the Nambucca and Bellinger Rivers. The country consists of hills of slate formation, intruded by masses and dykes of granite rocks, and traversed by innumerable quartz-reefs. One of the intrusive granitic masses forms a small conical hill, about 3 miles north of Deep Creek, and close to the main road from Nambucca to Fernmount. On the summit of the hill the rock contains arsenical pyrites in segregated patches of various sizes. Some of these have been opened out at the surface, and in a drive from a shaft at a depth of 100 feet one pyritous mass has been proved to be 17 feet wide. It appears to be a "pipe-lode." In its vicinity the rock, which is of a very soft, felspathic nature, has mispickel more or less disseminated through it. Samples of the pyrites assayed by the Department have yielded from a few dwt. to 17 oz. of gold per ton. As there is a large quantity of the ore, if systematically worked, it should give payable returns. As yet the mispickel has only been found on the Nambucca Gold and Pyrites Company's lease, but the granitic formation extends into the adjoining leases of Friedlander, McNally and party, and Christisen and party, who are sinking prospecting shafts, but as yet without successful results. Gold is reported to have been found by assay in Nelson's claim, about a quarter of a mile to the south. About half a mile to the north-west, in the lease of Messrs. Lark and Becke, a quartz reef, from 2 inches to 15 inches wide, containing arsenical pyrites, occurs, associated with a small granitic dyke. It has a promising appearance. In the slate ranges about 3 miles northerly is Anderson's Reef, which has been sunk upon to a depth of 70 feet, and is from 20 to 24 inches wide. It contains oxide and sulphide of antimony, with native antimony, which Mr. Anderson informed us yielded, on assay, at the rate of 14 oz. of gold per ton. About 1 mile southerly Messrs. Powell, Buchanan, and party are also prospecting two antimony lodes, which afford encouraging prospects, the ore occurring with quartz in intrusive granitic dykes. As we observed many of these dykes in this locality, we believe that when they are prospected other auriferous antimony lodes will be found, and probably lead to the profitable employment of many miners. We also inspected some pyritous reefs, for which aid had been applied, near Mount Piggott, but found that they would not warrant aid being recommended, though the formations of the country—slate and granite—are favourable for the occurrence of payable reefs. From here we proceeded to inspect the antimony reefs in the Bowraville District. We have collected average samples for assay from the various reefs examined, in order to obtain reliable information regarding them.

Sir,

Kempsey, 18 October, 1889.

We have the honor to submit the following progress report upon the country inspected by us in the Nambucca district. Particulars regarding each mine for which aid out of the Prospecting Vote had been applied have already been forwarded to you.

The town of Bowra is situated at the head of the navigable water of the Nambucca River, and several antimony reefs have been in the locality. About  $2\frac{1}{2}$  miles northerly from Bowra is O'Donnell's Reef. It is a well-defined breccia quartz-reef, from 2 to 5 feet thick, containing sulphide of antimony and pyrites. A shaft has been sunk upon it to a depth of 80 feet. It now requires a bulk sample of several tons of the stone raised to test its value, and the reef should also be opened a little further to the south on its strike, south  $15^\circ$  east.

On a branch of the Buccra-Bendinni Creek, about 18 miles westerly from Bowra, Mr. P. McHugh and party are prospecting a quartz and antimony reef, which is from 3 inches to 3 feet wide. It is a true fissure reef, striking from north  $20^\circ$  east to north-east, formed along the line of a fault in the strata, and will be a permanent one. We saw two other parallel faults within a distance of half a mile, in which antimony will probably be found.

In the parish of Medlow, 13 miles south-westerly from Bowra, Mr. D. Graham and party have discovered a quartzite-reef crossing a creek flowing into Taylor's Arm Creek. It varies from 3 inches to 3 feet thick, and contains sulphide of antimony. In places the antimony ore occurs in solid masses, 3 inches thick. In others it is more or less scattered through the quartzite in small crystalline particles. It is nearly vertical, striking north north-east to north-east, and could readily be worked by tunnelling into the side of the hill. A few small antimony veins branch off from it on the west side. A smaller quartzite-reef occurs about 100 yards further down the creek.

As

As the antimony ore occurs in bunches irregularly distributed in the reefs their value can be better tested by raising bulk samples from different points along the course of the reefs than by sinking deep shafts, as the reefs are not likely to change in character in depth. The country consists of broken ranges, some attaining an elevation of over 3,000 feet above sea-level. They are composed of altered shales and sandstones traversed by quartz-veins and granitic dykes, but the latter are not so numerous as those in the country between the Nambucca and Bellinger Rivers. The geological formation is favourable for the occurrence of other similar antimony reefs. There is little doubt but that the reefs of this district will afford profitable employment to many small parties of miners, and that large quantities of antimony will be produced. It is reported that the antimony ore nearly always yields, on assay, some gold and silver. We have collected characteristic samples for assay from each reef inspected, as a guide to ascertaining their value.

Sir,

Hillgrove, 28 October, 1889.

We have the honor to furnish you with the following particulars of the places visited by us in dealing with the application for aid out of the Prospecting Vote.

About 2 miles south of Nambucca, Messrs. M'Kav and party have opened a breccia quartz-reef 12 feet wide to a depth of 45 feet, in slate formation, with a granite dyke near it on the west side. Mr. W. Sutton is prospecting for the reef about 10 chains to the north, and has struck several small pyritous veins, of which we obtained samples for assay. The results hitherto obtained can scarcely be considered payable. About a mile to the south, on Mr. Smith's property, a similar pyritous quartz reef, 18 inches wide, has been proved to a depth of 20 feet; and about 2 miles further south Messrs. A. Rudder and party have prospected a reef 2 feet 6 inches wide, to a depth of 30 feet, containing arsenical, iron, and copper pyrites, with blende and galena, which occur in bunchy veins. These reefs have been sufficiently opened to test their nature, and now bulk samples of several tons of the ore should be sent for treatment to determine its actual value, as assays of small samples are unreliable for this purpose. On Grant's Creek, in the same parish of Warrell, Mr. R. Hayes is prospecting a reef of granular quartz about 9 inches thick, containing pyrites and molybdenite; it dips north north west at 23 degrees in hard quartzite. In the same locality is Grant's Reef, which is a well defined reef over 15 feet thick, dipping north-west at 45 degrees, consisting of breccia quartz and quartzite containing pyrites; it has been opened to a depth of 40 feet, and is said to yield on assay 2 dwt. of gold to the ton; but it would be a more reliable test to have several tons treated. Mr. Hayes has sunk 10 feet deep into a similar reef further north-east, which is probably a continuation of this reef. Campbell's Reef, near the Yarrahappini Range, traverses hard granite in a direction north 15 degrees west. The mine had fallen in, but the stone from it shows nodules of limonite formed from the decomposition of pyrites, and is not of a promising character. We next inspected the Moonebah Reefs, about 10 miles west of Kempsey, where Messrs. Campbell and party have sunk 42 feet upon a felspathic quartz reef varying in width up to 30 inches, and containing arsenical and iron pyrites and a little galena. It traverses altered sandstone, and dips west 15 degrees north at 50 degrees. A bulk sample of the stone should now be sent for treatment, to determine whether the ore be payable or not. In the vicinity, two other reefs containing similar pyritous stone have been opened by Mr. Verge and Mr. E. Becke. Leaving Kempsey *en route* to New England, we stayed for the night at the Carangula mines, which are at present idle, but the manager, Mr. Becke, informed us that the Company would soon resume operations. They have hitherto been the chief antimony-producing mines in the Colony, and have only been worked to a depth of 193 feet. An able description of the characteristics of the lodes, by the late Mr. Lamont Young, was published in the Annual Report of the Department for 1880. It is worthy of further mention that the auriferous antimony lodes recently examined by us in the Bellinger and Nambucca Ranges are precisely similar to those of Carangula, in their occurrence in altered sedimentary strata, believed to be of Devonian age, and associated with intrusive dykes of very felspathic granite of the same description as that in which the Ellenora Reef at Hillgrove occurs. This is a very important feature to note, for the ranges extending from the New England table-land almost down to the coast appear to consist chiefly of the same geological formation; and as we have now observed evidence of the wide-spread disturbing effects of the intrusive metalliferous granite, we may anticipate the discovery of many other auriferous antimony lodes in this extensive district.

Sir,

Inverell, 2 November, 1889.

We have the honor to furnish you with the following particulars of the country visited by us in dealing with the application for aid out of the Prospecting Vote.

Westerly from the Carangula antimony mines, and about 40 miles up the Macleay River from Kempsey, near Tyne's selection at Pee Dee, we inspected the lode applied for by T. Russell. This is a siliceous lode about 10 feet wide, containing masses of pyrites irregularly distributed through it. It has not been tested, but this can readily be done, as it is exposed in a cliff and a bulk sample of several tons could at a small cost be raised from it. On the top of the cliff the lode is covered by the ancient river boulder deposit which may contain payable gold in patches. On the table-land, 3,100 feet above sea-level, and 10 miles west-south-west from the Long Flat Station on the Macleay River. Mr. Collas has sunk two shafts in felspathic granite containing arsenical and copper pyrites, and molybdenite, samples of which we took for assay. In the bed of a gully draining from the reef, Mr. M'Maugh has discovered small quantities of stream-tin and gold with topaz. The alluvial deposits here are not extensive, the altered slate and granite cropping up in the bed of the gully in places; but about 1 mile north, near the Carri Cattle Station Hut, are several long alluvial flats which appear to be favourable for the occurrence of payable deposits of tin ore. Mr. M'Maugh intends to prospect this locality; the country north from here to the Macleay River also deserves attention. Leaving the river at its junction with George's River we ascended the high range leading up to the eastern edge of the New England table-land, and inspected near the Styx River a pyritous quartz-vein which has been opened to a depth of 10 feet by Mr. Smith: it is not of a promising nature. At Long Point, about 4 miles south-east from Hillgrove, Messrs. Becke and party are prospecting an antimony reef which crops out on the eastern face of a steep range. It pinches out near the top of the range but widens lower down, and dips north-north-east at 60 degrees in jointed granite. Being associated with an intrusive dyke of granite like that which accompanies the Ellenora and other auriferous antimony reefs at Hillgrove, this reef should be prospected.

Since

Since our former visit to Hillgrove the reefs have been considerably worked, and afford additional evidence of the permanency of mining on this field which, with other discoveries likely to be made, will become of great importance. On Cameron's Creek Gold-field, Herbert Park, about 11 miles north-west from Hillgrove, the Devonian sedimentary formation is also intruded by dykes of granite which, like those of Hillgrove, have gold and antimony bearing reefs associated with them. Several of these reefs are being prospected. One has been sunk upon by Messrs. G. Jenkins to a depth of 119 feet; it varies from 3 to 9 inches thick, and contains pyrites and free gold. From another shaft at a depth of 92 feet, 4 tons of quartz are said to have yielded  $5\frac{1}{2}$  dwt. of gold per ton; but from a branch vein from the reef at 40-foot level, two parcels of 1 cwt. each treated in Sydney, yielded respectively at the rate of 2 oz. 19 dwt., and 6 oz. of gold to the ton. It is probable that further driving along the reef will prove the rich portions to run in shoots. The reef has a well-defined polished slickenside wall and appears to be a permanent one and worthy of being further tested. Another important feature regarding mining in this locality is the Tertiary drift under basalt. One of these ancient river deposits, where it crops out on the slope of a hill about a mile and a half east of Herbert Park House, and nearly 100 feet above the present river, has been more or less worked for gold. This lead, covered by basalt, extends for a considerable distance in an easterly direction. A Company has just taken up a large area of it to work, and if successful it will no doubt lead to other similar enterprises.

The Under Secretary for Mines.

We have, &c.,  
 { C. S. WILKINSON.  
 { W. H. J. SLEE.

#### APPENDIX N.

Sir,

15 January, 1889.

In company with Mr. J. E. Carne, I have examined the old quarry at Pymont, where a current of inflammable gas is issuing from fissures in the rock at the base of a sandstone cliff. The spot is on the south-west side of James-street and Quarry-street. Within a space of 25 feet the rock has been fissured in several places, and from these the gas on fire is issuing at times in a flame 2 feet long and 6 inches in diameter. Where the opening in the rock is large and where narrow it flows out 12 inches high for 4 feet along the fissure. I am of opinion that the gas is either a product of the decomposition of the organic matter in the refuse deposit with which the old quarry and Black Wattle Swamp have been filled, or it comes from the carbonaceous beds in the formations below. I believe that the former is the more probable source. The sandstone rock, which is under the deposits of *débris*, is traversed by vertical and nearly horizontal fissures, and it is no doubt that through these the gas finds its way to the opening whence it now issues. A dyke of igneous rock 15 feet wide intersects the sandstone formation about 200 yards northerly from this point. The odour of the gas is not that of ordinary coal gas.

I would suggest that steps be taken to have the nature and occurrence of the gas fully investigated.

I have, &c.,

The Under Secretary for Mines.

C. S. WILKINSON,  
 Geological Surveyor-in-Charge.

#### APPENDIX O.

Geological Survey Branch, Department of Mines,  
 Sydney, 21 November, 1889.

Sir,

In accordance with your instructions I have witnessed the boring through of the upper or main seam of coal in the property of the South Cumberland Coal-mining Company at Oxford. This bore, which has been put down by a diamond drill  $2\frac{3}{8}$  inches in diameter, is situated at the junction of Gardiner's Creek with Port Hacking Creek, and about 115 chains south-easterly from the Metropolitan Coal Company's shaft.

Mr. Sands, the manager in charge of the drill, informed me that the bore had reached a depth of 660 feet 10 inches, and he showed me the core obtained, which consists of sandstones, conglomerates, and shales of the Hawkesbury and Narrabeen series, similar to those passed through in sinking to the Metropolitan Company's seam, which was reached at a depth of 1,098 feet, and is the same seam that this bore has now pierced. According to these depths, therefore, the seam has a general dip of 1 in 23 to the north-west. The manager stated that the drill had already bored 3 inches into the coal, though on drawing the rods no core of it was obtained; the bottom of the core of the overlying bed of clay-shale showed 4 inches of hard, black, coaly shale, with a few streaks of bituminous coal. The rods, with the ordinary drill-barrel attached, were lowered in my presence, and the boring proceeded, with the following result:—

Thickness bored.	Core obtained.	
Ft. in.	ft. in.	
3 4 .....	1 0 .....	Consisting of broken pieces of core (the largest piece being $2\frac{1}{2}$ inches long) of semi-bituminous coal—see Analysis No. 1. There were two small loose fragments of rock on top of the core of coal.
3 5 .....	1 $2\frac{1}{2}$ .....	Broken pieces of core (largest piece 3 inches long) of less bituminous coal—see Analysis No. 2. There were three loose fragments of sandstone core on the top of the core of coal.
	0 $1\frac{1}{2}$ .....	
0 7 .....	0 $5\frac{1}{2}$ .....	Shaly band.
2 9 .....	0 4 .....	Solid core of hard, stony coal—see Analysis No. 3—with three loose fragments of sandy shale on top.
	2 $5\frac{1}{2}$ .....	Stony coal.
	1 2 .....	Hard white dolerite.
1 11 .....	0 3 .....	Hard, stony coal—bottom of seam, on black shale.
	0 2 .....	Hard, stony coal—bottom of seam, on black shale.

From the above it will be seen that the core obtained is much less than the thickness bored. This is, doubtless, owing to the *ordinary core-barrel*, and not the "*special barrel*," having been used, also to the loose fragments of rock-core which, on lowering the rods, had fallen from the sides of the bore on the coal, and ground it up during the process of boring; so that there can be little doubt that the missing core

core consisted of coal ground up and carried away by the strong current of water used in drilling. A sample of the disintegrated coal, collected from the surface of the water flowing from the bore whilst drilling through the coal, was analyzed with the result given in No. 4 in the following list.

No. 1. Sample of semi-bituminous coal core from upper portion of seam.

Proximate Analysis.	
Hygroscopic moisture .....	·46
Volatile hydrocarbons .....	17·99
Fixed carbon .....	68·90
Ash (white in colour) .....	12·65
	100·00
Sulphur in coal .....	trace.
Specific gravity .....	1·439
Coke.....	81·55 per cent.

The coke not much swollen, the grains of coal only being firmly fritted together.

No. 2. Sample of the upper portion of altered coal.

Proximate Analysis.	
Hygroscopic moisture .....	1·18
Volatile hydrocarbons .....	10·02
Fixed carbon .....	62·15
Ash .....	26·65
	100·00

Sulphur in coal .....

·411 per cent.

No true coke formed, only a loose powder being left after the ignition of the coal. Colour of ash—white

No. 3. Sample of lower portion of altered coal, nearer the dolerite.

Proximate Analysis.	
Hygroscopic moisture .....	·97
Volatile hydrocarbons .....	7·58
Fixed carbon .....	25·00
Ash .....	66·45
	100·00

Sulphur in coal .....

·411 per cent.

No true coke formed, only a loose dark powder being left after the ignition of the coal. Colour of ash—light grey.

No. 4. Sample of coal drillings collected from surface of water flowing from bore.

Proximate Analysis.	
Hygroscopic moisture.....	·95
Volatile hydrocarbons .....	19·20
Fixed carbon .....	69·35
Ash.....	10·50
	100·00
Sulphur in coal.....	·178 per cent.
Coke .....	79·85 „
Coke not well swollen, firm, but dull in colour.	Ash—light grey.

This sample contained small pieces of wood, therefore the ash found would be lower in a sample of the clean coal.

These analyses show that the coal from the upper portion of the seam (sample No. 1) is of better quality than that from the middle portion (Nos. 2 and 3). The latter has been altered by the intrusion, in a molten state, of an igneous rock, *dolerite*. The alteration in the coal is first noticeable in the 1 foot 2½ inches of core (sample 2). The top piece (3 inches long) of this core was not broken up, notwithstanding that upon it, in the core barrel, were found three loose worn fragments of sandstone core. It is probable, therefore, that the whole thickness bored from the bottom of the first layer of hard coaly shale to the top of this 14½ inches of core of altered coal, after allowing, say, 3½ inches for waste in boring the latter, represents the thickness, viz., 5 feet 3 inches, of good semi-bituminous coal of the same quality as that indicated in the analysis of sample No. 1. This would seem to be confirmed by the analysis, No. 4, of the dust coal collected from the drill water.

It is evident from the analyses Nos. 2 and 3 that the altered coal immediately above and below the intruded dolerite rock would not be of commercial value, owing to the high percentage of ash.

I understand that in a bore put down on another estate about a mile distant to the south, the coal was also found to be injured by contact with the igneous rock; but no such alteration in the coal has been observed to the north in the Metropolitan Company's Colliery, where the coal seam varies from 9 feet 11½ inches to 11 feet 7 inches. It is, of course, impossible without boring in other places to indicate the extent to which the seam has been affected by the intrusion of the dolerite; but it is probable that the seam will gradually improve in a northerly direction from this bore. The bore was continued through black clay, shales, &c., to a depth of 710 feet 8 inches, when the manager reported that a second seam of coal had been struck. My assistant, Mr. G. A. Stonier, witnessed the boring through of this seam, and reported as follows:—

On my arrival, the engineer informed me that the seam had already been pierced 9 inches.

The "special barrel" was lowered, and a distance of 3 feet 6½ inches bored. On the rods being drawn there was found to be a core consisting of—

Ft.	in.	
0	3	Course sandstone.
2	6	Semi-bituminous coal.
0	1	Inferior coal.
Total .....		2 10

It is probable that the 3 inches of sandstone had fallen from the sides of the bore, and that at starting, the drill was resting upon it, hence it should be deducted from the 3 feet 6½ inches bored, and will then reduce the first boring to 3 feet 3½ inches. Assuming that the length of core not accounted for was coal, ground up while boring, and then removed by the water pumped down the bore-hole, the thickness of the seam would be 3 feet 11½ inches, made up as follows:—

Ft.	in.	
0	9	Bored through by engineer previous to my arrival.
2	6	Coal core brought to surface.
0	8½	Coal ground up and washed away, as described above.
Total.....		3 11½

The barrel was again lowered, and a total distance of 2 feet 5½ inches bored, consisting of carbonaceous sandy clay shales. A good deal of coal-dust was brought up when pumping the bore-hole clean for the second boring."

The following is an analysis of an average sample of the coal-core from this seam:—

Proximate analysis.	
Hygroscopic mixture .....	1.00
Volatile hydrocarbons.....	18.35
Fixed carbon.....	68.10
Ash .....	12.55
100.00	
Coke .....	80.65 per cent.
Specific gravity .....	1.432
Sulphur in coal .....	.535 per cent.
Coke:—Not much swollen, dull in colour, covered with numerous excrescences. Ash—light grey in colour.	

From the foregoing it will be seen that the two seams of coal proved in various parts of the Southern Coal-field have been struck in this bore, the upper, or main seam, at a depth of 660 feet 10 inches, the other, or "Four foot" seam, at 710 feet 8 inches, and that the upper seam, has, to some extent, been altered by intrusive dolerite. To what extent this igneous rock may have affected the seam cannot be indicated without further boring in other places; but, in a shaft sunk about 115 chains north-westerly from this bore, the seam has been opened free from it. Though the core of coal obtained did not equal the thickness bored, it is believed that the upper seam contains a thickness of 5 feet 3 inches, and the lower seam 3 feet 11½ inches of marketable coal of similar quality, as the analysis show, to that wrought in the collieries in the Southern Coal-field.

I have, &c.,  
C. S. WILKINSON,  
Geological Surveyor-in-charge.

The Under Secretary.

#### APPENDIX P.

Geological Survey Branch, Department of Mines, Sydney, 27 September, 1889.

MEMORANDUM.—Amongst some mineral samples lately forwarded by Dr. Belgrave to this Department for examination, from a newly discovered lode in the Broken Hill District, were three in which the analyst, Mr. Mingaye, detected the presence of *platinum*. Sample No. 1, ochreous felspathic rock, yielded on assay, platinum at the rate of 1 oz. 9 dwt. 9 gr. per ton, gold a minute trace, no silver; No. 2, compact ferruginous claystone, yielded platinum 6 dwt. 12 gr. per ton, gold a minute trace, no silver; No. 3, ferruginous felspathic rock, with green carbonate of copper, yielded platinum a strong trace (under 5 dwt. per ton), no gold or silver, a small quantity of platinum metals, iridosmine, iridium, &c.

This discovery is of interest as it is the first recorded instance of the occurrence in New South Wales, of platinum *in situ* in a lode. Platinum has been found in *alluvial deposits* in the Bathurst, Clarence and Richmond Districts, but not in payable quantity.

The lode in which it occurs near Broken Hill should be further prospected. In other lodes also it should be sought for, as it occurs in silvery-looking metallic particles in a *free state*, like gold; its presence can readily be detected by pulverizing the ore or lodestuff and washing it in the ordinary way in a tin dish. The specific gravity of platinum is about the same as that of gold, from 16 to 19. Manufactured platinum is valued at from 25s. to 30s. per ounce.

C. S. WILKINSON,  
Geological Surveyor-in-charge.

The Under Secretary.

#### APPENDIX Q.

Report on Mr. C. Phillips' Patent "Dry Concentrator," by C. S. Wilkinson, and W. H. J. Snee.

MEMORANDUM.—We have inspected the working model of the "Dry Concentrator," patented by Mr. Charles Phillips. It consists of an inclined table about 12 feet long and 2 feet wide, upon which lies an endless canvas belt of the width of the table. This belt passing over rollers at the ends of the table, is made to travel up the incline. The gold-bearing material to be treated, falls upon the belt from a hopper placed between the middle and upper end of the table. The quartz and other light particles roll down the incline, while the gold and other heavy minerals are carried up by the belt, and collected by a single contrivance, near the end of the incline; as the belt travels, a sharp jiggling motion is imparted to the table in a longitudinal direction by a short eccentric.

In our presence Mr. Phillips put into the hopper about 1 cwt. of ordinary tailings of crushed quartz and ironstone, with which he mixed about 3 dwt. of gold, consisting of scaly and round particles from a pin's head in size down to fine dust. This was passed through in seven minutes, and the gold was found collected with a little of the heavier sand at the top of the table. A sample of the tailings that had passed down was then washed, and not a trace of gold detected. The machine worked satisfactorily.

The slope or incline of the table has to be adjusted according as the material to be operated on is fine or coarse; that is, it would not treat at one time stuff consisting of sand and pebbles mixed; such would

would have to be first sized by screening. To work on a large scale with mixed material, Mr. Phillips proposes to have three machines placed side by side, the table of each being adjusted at a different incline or slope, according to the size of the material. But the ordinary tailings from crushing machines do not require further screening, and can therefore be put through one machine,

We consider the "Dry Concentrator" to be very efficient for separating free gold from dry tailings or sand. A large machine of this kind is now being constructed at Messrs. Nelson's Works, Hay-street, for treating the ferruginous quartz ores containing fine gold, at the Junction Reefs Mine, on the Bellubula River, near Carcoar.

C. S. WILKINSON.  
W. H. J. SLEE.

#### APPENDIX R.

Progress Report for 1889, by Geological Surveyor T. W. Edgeworth David.

Sir,

East Maitland, 5 February, 1890.

I have the honor to furnish you with the following progress report of the work done by me during 1889:—

From January until February 16th I was absent on leave. From February 20th to February 22nd I was at Ash Island, near Hexham, at the Government diamond-drill bore, while the drill was proving the Tomago coal seams (*Appendix No. 2K*). From February 28th to March 2nd I was at Bathurst reporting on the underground water supply for that city. My report thereon forms *Appendix No. 2A*. From March 11th to March 31st I was partly at Ællalong, near Maitland, reporting on the occurrence of natural salt, and partly at Port Stephens, reporting on suitable sites for prospecting for coal in that district. My report on the salt at Ællalong forms *Appendix No. 2B*. From April 9th to April 13th I again visited the Government diamond-drill bore at Ash Island, and completed a section of the core. From April 30th to May 11th I was employed in continuing my geological examination of the Port Stephens District. From May 21st to May 23rd I was at the Government diamond-drill bore at Woodford, in the Blue Mountains, witnessing the boring through of a coal seam, and taking a complete section of the whole core. From June 11th to June 15th I was again at Port Stephens. From July 11th to July 13th I was absent at South Redhead, near Charlestown, Newcastle, witnessing the boring through of the Burwood coal seam with the Government diamond-drill.

From July 17th to July 20th I was engaged at the Government diamond-drill bores at Fassifern, near Lake Macquarie and Buttai, near Maitland, witnessing the boring through of certain seams, and measuring complete sections of the cores. On July 26th and 27th, in company with Mr. R. Etheridge, I inspected, at Maitland, Mr. J. Waterhouse's valuable collection of fossils from the Coal-measures, and selected therefrom a number of unique specimens, most of which Mr. Waterhouse has generously presented to the Mining and Geological Museum.

From August 1st to August 6th I was engaged in tracing the outcrop of the Greta coal seams, from Greta towards Black Creek, and in making a further examination of the Buttai bore. From August 12th to August 25th I was engaged in making a geological examination of the district near Clarencetown and Port Stephens. From October 3rd to October 12th, I was employed, at Maitland, completing my field work for the first sheet of the Geological Map of the Hunter River Coal-field.

From October 17th to October 21st, I was engaged in examining and reporting on the Peak Hill Gold-field, near Tomingley. My report thereon forms *Appendix No. 2D*. From October 28th to November 8th, and from November 14th to November 29th, and December 4th to December 23rd, I was engaged in geological field work, partly at Maitland, partly at Port Stephens, Stroud and Ward's River, and partly at Ællalong and Barraba, near Maitland, and at Wybong Creek, near Scone. My second report on the salt at Ællalong and the landslip, near Barraba, forms *Appendix No. 2C*; and my report on the deposit of iron ore at the Ironstone Mountain, Port Stephens, forms *Appendix No. 2E*. I have also furnished, from time to time, four progress reports (*See Appendices No. 2G to No. 2J*) on the Port Stephens District, all of which, together with my report on the Stroud and Ward's River Coal-fields, are embodied in my general report on the Port Stephens District, which forms *Appendix No. 2E*. During my examination of the Stroud and Ward's River Coal-fields, I had the advantage of the co-operation of Mr. R. Etheridge, the Palæontologist to the Geological Survey. Mr. R. Etheridge has also traversed with me most of the typical sections of the coal-measures at Maitland, collecting information for his memoirs on the fossils of the coal-measures. I have also furnished a report which forms *Appendix No. 2L*, on the probable depth of the coal-measures at Euroka Creek, near Penrith.

*Summary.*—During the course of the year I have, in accordance with instructions, furnished eleven reports, six of which relate to coal, two to salt, one to water supply, one to gold, and one to iron. Complete sections have been measured by me of the cores from the important bores for coal at Ash Island, Buttai, and Woodford. A general geological examination has been made of the Port Stephens District, and additional important information has been gained with reference to the coal-measures in the Maitland District. As a practical result from the assistance given to coal-mining in these districts, by the above geological examinations and reports, coal-mining near Maitland is being commenced on a far larger scale than it ever was before, a syndicate, with a large capital, having taken over the Silkstone Mine, at Deep Creek, where the occurrence of the Greta seam, as discovered by my party, was first reported by me to you in August, 1886; and four syndicates having subsequently leased large areas of reserved Crown lands, as well as freehold, and proved the coal along the line of outcrop indicated on the plan accompanying the geological report. In one place the upper seam is 30 feet thick, with only three small bands, and contains coal of excellent quality throughout, while only 50 feet below the floor of the upper seam is a second seam 12 feet thick, with a few small bands, also containing coal of excellent quality. Quite recently the same Greta seam has been proved at a point about 3 miles towards the dip from the above-mentioned outcrop, at a depth of 690 feet, by the Richmond Vale Company. As a further instance of the practical utility of the detailed geological examination of the coal-measures, the fact may be mentioned here that in consequence of the information gained by a geological examination of the Maitland district the Geological Survey was enabled to predict when the Ash Island bore was in progress, and the Tomago seams had all been passed through, that if the bore were continued a certain depth the Rathluba measures and coal seams would be reached—a prediction which was fully verified by the results of the bore, the Rathluba seam being subsequently struck at a workable depth, and proving equal to, if not better

better in quality than, the overlying Tomago seams. The Geological Survey was also enabled to choose a site for a diamond-drill bore between Raymond Terrace and Fullerton Cove, in which the main Tomago seam has lately been struck at a depth of only 327 feet, under a thickness of no less than 212 feet of alluvial deposit. The success in selecting the site for this bore was chiefly due to the kind permission given to the Geological Survey by Mr. R. Thomas, the consulting engineer to the Newcastle and Stockton Land and Coal Company, to examine the core from a previous bore put down by the same Company in the same neighbourhood. The geological examination of the Port Stephens District has also led to the tracing, by means of surface evidence of the Greta coal-measures into areas covered by blown sand and alluvial, where their existence was not before suspected. Aid has, accordingly, been granted out of the Prospecting Vote for last year to enable a syndicate to bore for the Greta coal-measures under these alluvials, near Morna Point, Port Stephens, and it is hoped that the result of these prospecting operations will be the discovery not only of the Greta coal-measures, but also of kerosene shale; and even if the first bore should fail to strike coal or kerosene shale, it should afford sufficiently definite information to admit of the next bore being so placed as to be successful.

The unsuccessful bore for coal at Langland's Estate, near Clarencetown, has quite confirmed your views that, so far as at present known, no payable coal-seams occur in those strata in New South Wales, in which *Rhacopteris* or *Lepidodendron* predominates. The proprietor was from the first advised by the Geological Surveyor not to bore in this locality. An adverse geological report was also given with reference to boring for the supposed rock-salt, near Aellalong. Bores, however, were put down, in spite of the advice given, but so far have not met with success.

The geological examination of the bed of iron ore at the Ironstone Mountain, Port Stephens, shows that deposit to be of considerable extent and some thickness, and analyses of the ore (made from samples selected by myself), by the Government Assayer and Analyst, show that it is fairly rich in metallic iron, but on account of the titaniferous iron and quartz sand associated with the magnetic iron, the ore will doubtless require a special method of treatment to overcome these somewhat refractory minerals. If, however, the difficulty of smelting the ore successfully can be got over, this is likely to prove a payable deposit, on account of its proximity to limestone, coal, and water carriage. Aid has been granted out of the Prospecting Vote for 1889, in accordance with the recommendations of the Prospecting Board, to enable the present proprietors to further prospect this ore deposit.

The geological examination of the Maitland district has entirely proved the correctness of your choice of Maitland as the type district to be worked out in detail, in order to arrive at a clear and comprehensive understanding of the succession and characteristics of the palæozoic coal-measures of New South Wales.

Probably nowhere else in Australia could better or more typical sections of the different palæozoic coal-measures and their associated strata be found than in the Maitland district, and my work here has been rendered comparatively easy through your pre-arrangement of the order in which the different portions of it should be taken, and through the information with which you supplied me at the outset.

Beginning with the lowest strata at the crown of the great anticline between Maitland and Greta, the first part of the work lay within an area sufficiently limited to be quickly grasped as a whole in its more important bearings, while the repetition of beds on opposite sides of the denuded anticline afforded ample opportunity for comparison and verification of measurements.

Following the natural order of geological succession, the work was extended from the lower and older into the higher and younger strata in a circle constantly widening around the base of the anticline, until the work gradually extended into districts where the coal-measures were only gently inclined or undulating over wide areas, and where, but for the knowledge gained in the type district, any attempt to reduce the apparently chaotic mass of sandstones and shales to anything like order would certainly have proved a task of great difficulty, perhaps resulting in partial failure. Now, however, several areas of the Hunter River coal-fields, likely to be of immediate importance, have been roughly mapped with tolerable accuracy, and the type district of Maitland has been carefully studied and mapped, and upon the completion of the field work, on which I am now engaged, the preparation of the geological maps, sections, and report will be expedited as much as possible.

While not engaged in field-work, I was employed at the office writing the report, which form the appendices, examining specimens of minerals brought for determination by the public to the Geological Survey Office, during your temporary absences, and dealing with various official papers, referred to me for report.

I have, &c.,

T. W. EDGEWORTH DAVID,  
Geological Surveyor.

The Geological Surveyor-in-Charge.

#### APPENDIX No. 2A.

Report on the advisability of employing the Government diamond-drill to bore from the bottom of the well-shaft at the Bathurst Waterworks, as proposed by the Municipal Council of Bathurst.

Sir,

Bathurst, 1 March, 1889.

In accordance with your instructions I have to-day examined the well-shaft at the Bathurst Waterworks, from the bottom of which the Municipal Council of Bathurst propose to bore with one of the Government diamond-drills, with a view to augmenting the present somewhat scanty supply of water for the city. The population of Bathurst is about 10,000, and the ordinary daily consumption of water is about 50,000 gallons in winter, and about 130,000 gallons in summer, but occasionally as much as 250,000 gallons have been used in twenty-four hours. At present, however, in consequence of the Macquarie River having ceased flowing, the water supply has had to be reduced to 60,000 gallons daily.

There are three natural sources of water supply at Bathurst, independent of artificially stored rainfall—(1) the Macquarie River; (2) the alluvial flats through which this river and its small local tributaries, such as Queen Charlotte's Vale Creek flow; and (3) the granite, which is the prevailing rock at Bathurst, and being decomposed to a considerable depth is capable of absorbing large quantities of water.

Until the erection of the present waterworks on the Macquarie River, a large proportion of the Bathurst water was derived from wells sunk in the decomposed granite. A remarkable instance of a well of this kind still in use is that owned by Mr. Webb. This well is situated on a flat from 40 to 45 feet

above

above the level of the bed of the Macquarie River, and near the base of a small granite hill. It is about 43 feet deep and 6 feet in diameter, and is sunk chiefly in decomposed soft granite. It yields about 30,000 gallons of water daily. Another remarkable instance of a well in granite, yielding large supplies of water, is the Locomotive Well, near the Bathurst Railway Station. Mr. J. Turton, Locomotive Inspector, informed me that the well can yield 150,000 gallons a day, and from 60,000 to 80,000 gallons are daily pumped from it, the water being of excellent quality. This well is 52½ feet deep, 10 feet in diameter at the top, and 5 feet at the bottom. In this case, however, the well was sunk for the first 16 feet in alluvial soil, with 6 feet of quick sand, and from 2 to 3 feet of river gravel next to the granite.

The strongest supply of water was derived from a fissure, 6 inches wide, in the soft granite, and filled with fine white sand. This fissure was struck at a depth of 35½ feet from the surface, and after it was tapped the supply of water rose suddenly from 30,000 gallons to 150,000 gallons of water daily.

The water in this fissure in the granite probably percolates from the overlying gravels and running sands, the adjoining alluvial flat, known as Queen Charlotte's Vale.

As the supply of water in the Macquarie River at Bathurst had practically failed in consequence of the prolonged drought, and in view of the hitherto almost uniform success which had attended the sinking of wells in the granite, it was resolved to sink a large well shaft close to the north bank of the Macquarie, at the Bathurst Waterworks.

A round well, having a diameter of 14½ feet, was accordingly sunk to the depth of 63 feet; two horizontal tunnels were also commenced from the present bottom of the well—one extending south-west about 18 feet, and the other south about 12 feet. At present the inflow of water into this well is equal to about 1,000 gallons per hour.

The following is a descending section of the formations met with in sinking the shaft:—

- 17 feet (about). Yellow sandy clay, with a little gravel.
- 23 feet. Granite, very soft and decomposed at the surface, but becoming harder downwards.
- 8 feet. Granite, requiring shooting; for the most part moderately hard, but very hard at the east side of the shaft.

The shaft is already 25 feet below the bed of the river, and is only 130 feet distant from the nearest point of the river bed. Its present yield of water is therefore small as compared with that of smaller and less favourably situated shafts. The reason for this is probably that a hard bar of granite, almost quite impervious to water, intervenes between it and the river-bed. This bar can be seen in the bank of the river next the well. The water at present percolating into the well is wholly derived from joints in the granite. Nearly all these dip W.S.W., their strike being N.N.W. and S.S.E. As the course of the river is almost parallel here with the strike of the joints, it follows that it is only those joints which outcrop in the bed of the river or under its alluvials which can form lines of water passage, the water soaking along them in a N.N.W. and S.S.E. direction, but not being free to pass to the E.N.E. or W.S.W., which latter is the direction in which the well-shaft lies with reference to the river at the nearest point.

At present the Municipal Council are somewhat uncertain as to the best means of improving the water supply in their well-shaft. They propose to do it by one of two methods—

- (1) By deepening the well-shaft; and
- (2) By tunnelling.

They are desirous however, before deepening their shaft further, of employing the Government diamond-drill to bore from the bottom of the shaft, to ascertain (*a*) whether the granite is softer at a greater depth than it is at the bottom of the shaft, and (*b*) whether there are any more joints in the granite likely to act as fresh feeders of water.

As regards (1), it would appear that if the Municipal Council are resolved on deepening their present shaft, then it would certainly be advisable for them to employ the diamond-drill to ascertain whether or not they would be justified in incurring such an expense.

Up to the present the sinking of the well (inclusive of bricking down to 43 feet), as I am informed by the Town Clerk Mr. Williamson, has cost considerably over £800, or about £13 per foot. If therefore, the shaft were sunk 50 feet deeper the cost would probably not be less than £650, whereas a diamond-drill bore could be put down to the same depth at a total cost, approximately calculated, of about £140 or £150. If therefore, the diamond-drill bore proved that further deepening of the shaft was useless, the loss would be, say, £150 instead of £650, and if the results of the bore justified the deepening of the shaft the bore-hole could probably be utilized to assist in removing the rock by blasting, &c. As regards (2), it appears to me that tunnelling offers greater chances of success than deepening the shaft. A tunnel from the present bottom of the shaft would pass below the bed of the Macquarie River, at the nearest point within a distance of 130 feet, and would intersect the joints in the granite at right angles, and if good supplies of water were not obtained within that distance, a further extension of the tunnel for a short distance under the river bed could not fail to attain the desired end, the total cost of such a tunnel at £3 per foot would amount to say, £390. It would probably be more advantageous to drive a tunnel as originally proposed, in a S.S.E. direction for about 80 feet from the present bottom of the shaft, and then bend the tunnel more easterly so as to pass around and beyond the southern limit of the belt of hard granite seen in the bar in the river bed, and underneath the large deep water-hole, now filled with sand above the bar. If the total length of this tunnel were 200 feet the cost might be £600, and I think it could not fail to strike strong supplies of water.

*Summary.*—It would probably be better for the Municipal Council of Bathurst to employ the Government Diamond-drill, than to continue deepening their shaft. The drill however, if employed will probably show that the granite does not become softer at a depth, and that the joints are closer together at a depth, and consequently of less water value than they are nearer the surface.

The best and cheapest course in the end, in my opinion, would be to tunnel at once from the bottom of the well shaft, which is already 25 feet below the bed of the river in a S.S.E. direction for 80 or 100 feet, then in a more easterly direction for, say, another 100 feet, until the end of the tunnel is well underneath the large deep water-hole on the western side of the extensive alluvial river flats, for draining water out of which this large water-hole should act as a natural sun p.

I have, &c.,

T. W. E. DAVID,

Geological Surveyor.

The Under Secretary.

## APPENDIX 2B.

Preliminary Report on the occurrence of salt at Ællalong, near Maitland.

Sir,

West Maitland, 14 March, 1889.

I have the honor to report that, in compliance with your verbal instructions, I inspected on March 12th and 13th the locality, where a considerable area of ground has recently been taken up for the purpose of mining for rock salt at Myall Range, near Ællalong. The occurrence of salt here is said to have been long known to the aborigines; and Mr. Keene, the late Examiner for Coal-fields, on one occasion, in company with Mr. Close, inspected this locality where the salt occurs, so that the discovery is by no means a recent one, though the attention which has lately been called to the matter has led to the salt being traced by Mr. Twine and others for a much greater distance than previously. The salt is found about half-way up the northern slope of Myall Range, close underneath the upper of two massive beds of sandstone, both of which contain abundant marine fossil shells belonging to the Upper Marine series (the formation which overlies the Great Coal-measures). The strata, for a short distance above and below the upper massive sandstone bed, being comparatively soft, the latter stands out in bold relief forming a conspicuous gently sloping rock shelter which dips E. 40° S. at 5°.

The lower part of this massive sandstone is much softer than the upper and consequently becomes more readily disintegrated by the action of the weather, the process of disintegration being no doubt accelerated by the salts contained in this bed. Hence the origin of the overhanging ledges of rock and numbers of small picturesque caverns by which it is everywhere characterized in this locality.

The salt occurs principally on the floors of these small caverns and of the shelter rocks, where it forms a crust from  $\frac{1}{2}$  to 2 in. thick, resting immediately on the rock and covered by a few inches of fine loose sand derived from the disintegration of the layer of soft sandstone. This salt is evidently of secondary origin, and there can be no doubt that its source is the stratum of soft sandstone immediately above it, which is salt-bearing for a thickness of 3 to 10 feet. Whenever this bed is sheltered it shows an efflorescence of salt 1-20th of an inch thick, and it is where there has been most disintegration combined with a maximum of shelter that the secondary deposits of salt are most extensive. The largest patches, however, are not more than about 20 feet long by from 2 to 4 feet wide, averaging about an inch in thickness. The water in the gullies above this bed is quite fresh, while the water below is very salt, especially after heavy rain. This fact, taken in conjunction with the impervious nature of the upper part of the massive sandstone above the salt, proves that the salt must have been derived from the porous saliferous sandstone and has not a source somewhere higher up the mountain.

Under the guidance of Messrs. Twine and Hall I was enabled to follow the line of outcrop of this saliferous sandstone for over  $2\frac{1}{2}$  miles and found it to be more or less salt-bearing at intervals for the whole of that distance.

After a careful examination I have come to the conclusion that it does not represent the edge of a deposit of rock salt, as has been supposed by some, the bed of salt being assumed to have perished away at the outcrop, or not to outcrop at all, so as to leave no trace of its presence except the efflorescence and secondary crust. There was no evidence, however, of any such perishing of a supposed stratum of rock salt having taken place and no evidence of brine springs, which latter, I think, is a very strong argument against the theory of this salt efflorescence being the outward sign of a bed of salt inside the mountain. If such a bed existed it could not fail to give rise to brine springs, or at all events to a constant ooze of briny water, along the particular horizon where the bed might exist. I think therefore that the crusts of salt on the floors of the caverns and shelter rocks, and the efflorescence of salt on the side of the caverns are derived simply from the salt which is contained in the interstices of the porous saliferous sandstone, and which is partly set free by its disintegration and partly dissolved out of it by the action of moisture. I do not know exactly what percentage of salt is contained in the saliferous sandstone, but it would certainly be too low to admit of the sandstone being profitably quarried for the purpose of extracting its salt. If however brine springs exist having their source in this particular stratum, it is conceivable that the water may be sufficiently saturated with salt to pay for the cost of evaporation, and it would be worth while to search for indications of brine springs within the area occupied by this formation, as it is one of the most favourable in New South Wales for the occurrence of rock salt, being the latest to the east of the Cordillera, of the groups of marine rocks, and so representing a period when in this part of New South Wales, oceanic conditions were being replaced by terrestrial and these are precisely the conditions which lead to the formation of rock salt through the isolation of portions of the ocean, and the subsequent evaporation of their contained salt water. Hence deposits of rock salt may possibly be found in this formation, but from the entire absence of the deposits of gypsum, which invariably accompany rock salt beds in other parts of the world, I do not think there is much likelihood of much deposits being extensive.

I would not advise the employment of the diamond-drill to bore for the supposed bed of rock salt at the spot proposed as shown on the accompanying plan and section; and if any further money is expended on the venture, I might perhaps be allowed to suggest that it would probably be better to institute a further search for brine springs than to bore as proposed.

My thanks are specially due to Mr. Twine, for much information and assistance.

I have, &c.,

T. W. E. DAVID,  
Geological Surveyor.

## APPENDIX No. 2C.

Second Report on the occurrence of salt near Ællalong, with description of the landslip near Barraba, and note on the occurrence of salt near Scone.

Sir,

Camp, East Maitland, 14 December, 1889.

In accordance with your instructions, with reference to the attached application for aid out of this year's Prospecting Vote, made by the Ællalong Salt Mining Company (Limited), I have re-examined their property, and inspected the site of the landslip near Barraba, (originally attributed by some to the dissolving

dissolving away of an underlying bed of rock salt), and have also visited Toll's Gap, and the Wybong Creek, near Scone, where salt was said to occur under somewhat similar circumstances to those which obtain at Ællalong, and I have now the honor to submit the following report:—

1. *The landslip at Coongewai Creek, near Barraba.*—Through the kindness of Mr. Frederick Dodds, of Barraba, and Mr. Walter Twine, I was enabled to visit the scene of this landslip on 6th December. Its approximate position is shown on plan No. 1 herewith, for which I am indebted to Mr. W. Twine, while the shape and extent of the slip is shown on plan No. 2 herewith, compiled from my own notes. At first sight the landslip has somewhat the appearance of a subsidence, as in two places, as shown on plan No. 2, the ground has subsided for a width of from  $\frac{1}{2}$  to 1 chain, and for a distance of from 3 to 4 chains, and a depth of from 1 to 8 feet, while there is no evidence lower down the hill of the turf having been broken, as might have been expected had an actual lateral displacement of the slipped material taken place. A close examination, however, showed that although the turf was not broken at the foot of the slip, it showed evidence of having been considerably bulged along certain definite lines, and the trees also on these lines showed confirmatory evidence of the lateral thrust and bulging to which the ground had here been subjected, being inclined at an angle of 70 degrees down the slope of the hill.

There is evidence in the gullies, which traverse the area of the landslip, of the presence of a soft sandy clay, or perhaps loose sand, lying at no great depth below the surface; and close below the point where the landslip commenced the ground is boggy and swampy.

In my opinion, therefore, this landslip is merely of a superficial character, and is due to the fact that during heavy rainfall the soft clayey sands, when charged with rain water, became semi-fluid, and gravitated down the hill, sliding over the underlying rocks of the coal-measures (or possibly an intervening bed of rubble), and merely bulging up, without breaking, the turf and subsoil at lower levels. There did not appear to me to be any evidence whatever of a deep-seated subsidence such as would be caused by the dissolution of a bed of rock salt.

The water draining from the gullies below the landslip was only slightly brackish at the time of my visit, but is said to be much more so in dry seasons. As, however, it is rather the rule than the exception for water draining from the marine beds of the coal-measures in New South Wales to be brackish, this fact is not necessarily of any special significance.

2. From the scene of the landslip, accompanied by Mr. W. Twine, I proceeded to Mr. W. Bridge's selection (the position of which is shown on plan No. 3, kindly supplied me by Mr. Twine), and examined the part of the gully where, in dry seasons, the water is said to be very salt. It was at the time of my visit only brackish. It lies at a lower level than the saliferous sandstone of the neighbouring Myall Range, described in my previous report, and probably its salinity is due to some source similar to that of this sandstone, though at present independent of it, and not to any bed of rock salt.

3. *Salt near Scone.*—In accordance with your instructions, I yesterday examined the country on Wybong Creek, half-way between Scone and Merriwa, where it was reported that a bed of rock salt occurred. Some land was taken up here many years ago, near Toll's Gap, about 8 miles from Scone, on the Merriwa Road, for mining for salt by Dr. Creed. I was informed also by Mr. E. Elliott, of Buttai, near East Maitland, that near Bradley's (now R. Palmer's) selection on, Wybong Creek, there was a patch of salt of several inches in thickness, which was used for salting purposes for some years by some of the surrounding selectors. Both at Toll's Gap and at Palmer's I found the same saliferous sandstone prevailed which occurs at Ællalong, and as at Ællalong it is characterized by its massiveness, by the bold contour line which its almost level outcrop makes in the hills, and by its weathering out into picturesque caverns and rock shelters. The salt here, as at Ællalong, occurs in small saucer-shaped incrustations lying on the floors of the small caverns, and the few tons which may occur in this manner are probably the result of a long process of percolation of rain-water through the saliferous sandstone, and of its evaporation at the sides and floors of the caverns, the small quantity of salt thus deposited having probably taken a great many years to accumulate, and representing the concentrated extract from possibly an acre or so of the saliferous sandstone. In my former report the statement was made by me that the saliferous sandstone was probably on a geological horizon, situated near the top of what is known as the permo-carboniferous Upper Marine series. The evidence, however, near Scone, suggests that possibly this view may have to be modified, and the saliferous sandstone relegated to the base of the Hawkesbury series. At Ællalong the Muree Rock of the Upper Marine series almost immediately underlies the saliferous sandstone, but I have not yet discovered marine fossils above it, and there may therefore be an unconformity here, which brings the Hawkesbury sandstone to rest immediately on the Upper Marine series, as is the case at the head of the Clyde River in the Illawarra Coal-field.

In view of the evidence above quoted, it appears to me that the suppositions as to the probable existence of a bed of rock salt at Ællalong rest on too slender a basis to justify the expenditure of any money out of the Prospecting Vote for further testing this ground, and I would therefore recommend that this application for aid be refused.

My thanks are specially due to Mr. Walter Twine for his sketch plans, and also to Mr. Frederick Dodds for his kind assistance.

I have, &c.,

T. W. E. DAVID,  
Geological Surveyor.

#### APPENDIX No. 2D.

##### Report on the Peak Gold-field.

Sir,

Department of Mines, Sydney, 23 October, 1889.

In accordance with your instructions I have visited the Peak Gold-field, and have now the honor to furnish you with the following report:—

The Peak is situated in the Tomingley Division of the Mudgee Gold-field, and is about 44 miles distant by road in a south-south-westerly direction from Dubbo, and is about the same distance from Molong (46 miles in a direct line).

The number of men on the field at the time of my visit was estimated to be about 1,600, and is continually increasing. The discovery of gold at the Peak is probably one of the most important which has been made in New South Wales for some years. Nothing however has been found up to the present to justify any further rush, as out of the total population of 1,600, probably only about 100 are at present working, and a much smaller proportion are actually getting gold.

Reports

Reports on this field have already been furnished first by Mr. G. A. Stonier, assistant Geological Surveyor, then by Mr. W. H. J. Slee, F.G.S., the Inspector of Mines, and lastly by Mr. E. F. Pittman, Assoc. R.S.M., the Chief Mining Surveyor.

### 1. *General Physical and Geological Features.*

The Peak lies in a belt of auriferous country, which, commencing at Parkes, trends north by west successively through Alick's Flat, the Ten-mile Ridge, the Peak, the New Rush (Macdonald's Flat), the Myall, and Tomingley, a total distance of 40 miles. The further extension of this belt in a northerly direction has still to be discovered.

The Peak is about 3 miles southerly from the New Rush, and 8 miles southerly from the Myall Gold Mines, and about 5 miles north-north-westerly from the Ten-mile Ridges mines. It is, therefore, situated in the auriferous belt midway between gold mines, some of which have already proved productive. From the Myall Mines as much as £10,000 worth of gold have been obtained in a single year, though last year the production fell to £3,000 worth of gold.

Travelling from Dubbo to the Peak the road for the first 6 miles passes over sandstones similar to the Sydney sandstones, which probably overlies a concealed coal-field, and near the town of Dubbo are covered by a thin capping of basalt. Reference has already been made to this concealed coal-field by Mr. C. S. Wilkinson, F.G.S., and Mr. E. F. Pittman.\* Beyond the boundary of the sandstone hard felsites succeed for a short distance, then a belt of slate, and at 10 miles from Dubbo granite commences, which, with the exception of a dyke of diorite at  $14\frac{1}{2}$  miles from Dubbo, extends without interruption to at least 24 miles southerly from Dubbo. For this distance the country is flat or undulating, with low hills, the most prominent of which mark the line of water-parting between the Macquarie and Bogan Rivers. Here and there in the flats which intervene between the low hills of granite are thin patches of granitic detritus recemented so as to form an arkose sandstone, through which in places fresh water springs have broken out, as at the old changing station at 15 miles on the road from Dubbo, and at  $20\frac{1}{2}$  miles. This sandstone may belong to the cretaceous formation, though possibly it may be of Tertiary or even Pleistocene age. Its occurrence here, if of cretaceous age, may have an important bearing on the future of the deep leads in this district, as will presently be explained.

From the 24-mile mark to Tomingley, 32 miles from Dubbo, the underlying formations are hidden by red soil flats.

At Tomingley the bed rock comes to the surface in a low hill of slate, somewhat talcose, of a greenish grey to mauve and reddish-purple colour. These slate rocks are traversed by belts of a very hornblende diorite, and reefs of white gold-bearing quartz.

The reefs strike about north 8 degrees west, and underlie to the east. They have been worked to a depth of about 190 feet. The gold is mostly free, but a little iron pyrites was found at about 70 feet below the surface. At the Myall Gold Mines, about 4 miles southerly from Tomingley, and 36 miles from Dubbo, the formation is very similar. The diorite dykes, however, contain a good deal of pyrites, and I was informed that pyrites was found to be tolerably abundant in the reefs at only 20 feet below the surface. The Myall reefs have been sunk on to a depth of 116 feet, and are said to still carry good gold at that level, and to have averaged nearly 1 oz. to the ton, while the yield of the Tomingley reefs is stated to have been at the rate of about half an ounce to the ton.

From the Myall to the New Rush (Macdonald's Flat), 41 miles from Dubbo, the country is mostly flat, with gentle undulations here and there, composed of slate or schist, with a thin capping of red soil, and angular quartz shed from underlying quartz reefs. At about half a mile before the New Rush is reached, and about 8 miles from Tomingley, is a well marked run of made ground, which, as suggested to me by the Warden, Mr. Caswell, appears to be a promising spot to prospect for alluvial gold. The flat is about quarter of a mile wide, and the bed rock, by which it is sharply bounded, is traversed on both sides of the lead by quartz-reefs, which, on the south side, are known to be auriferous. As this lead appears to intersect the belt of auriferous country nearly at right angles, its channel should have received a large quantity of disintegrated reef material, and the lead is therefore well worthy of attention. At the New Rush the formation appears to be somewhat similar to that at the Myall, but up to the present no important development has taken place there.

From the New Rush towards the Peak the road next passes over red soil flats, with bed-rock occasionally showing, and at about 1 mile northerly from the Peak a large mass of dark green diorite, which outcrops strongly at the surface in hard blocks, nearly bare of vegetation. Between this belt of diorite and the Peak is a stretch of alluvial ground, under which a deep lead is nearly certain to be found.

The Peak, as described in Mr. G. A. Stonier's report, is an isolated hill, about  $1\frac{3}{4}$  miles long, and rising about 200 feet above the level of the surrounding red soil country. All this country is timbered with pine and a species of ironbark, and is scrubby in places.

The Peak is distant about 4 miles in a direct line from the Bogan River, and 2 miles from the Ten-mile Creek.

The formation consists of a sandy talcose schist, much mineralized in places with oxides of iron, evidently resulting from the decomposition of iron pyrites, and traversed by large reefs of gold-bearing ferruginous quartz. The cleavage of the schists strikes about north 8 degrees, west, and south 8 degrees east, and dips easterly. The general trend of the hill is nearly due north and south, while the strike of these reefs is inclined to the west of north, varying from north 10 degrees west, to west 43 degrees north.

As the principal reefs outcrop on the north-west slope of the hill in a south-easterly direction, cross over its summit, and descend along the south-eastern slope, the best alluvial gold has consequently been obtained on the north-western and south-eastern slopes.

### 2. *Reefs.*

The reefs are of two kinds—(a) Reefs of white quartz, with little or no iron; and (b) reefs largely composed of oxides of iron, quartz, however, still predominating.

(a) The principal of the white quartz reefs is the one which strikes through Gorman and Porter's lease application, and is at least 9 feet wide. It strikes north 10 degrees west, and dips east 10 degrees north

\* Annual Report, Dept. of Mines, 1880, p.p. 239 and 243.

north at 50 degrees. As to its gold-bearing character I am unable to speak until the completion of the assays of my samples. Mr. Pittman, however, informs me that he saw a speck of free gold in a similar white quartz-reef at the head of the gully, near Rix's alluvial claim.

Near the head of Woodward's Gully is a reef, 2 feet thick, of brecciated white quartz, with a good deal of oxide of iron cementing the fragments. This reef has probably resulted from the fracturing of one of the white quartz-reefs along the line of crush, which extends in a north-west and south-east direction, which has produced the ferruginous reefs, and which is probably due to the intrusion of masses of diorite to the north and east of the Peak, which, like the Myall diorites, are probably pyritous in places.

(b) The ferruginous reefs are composed of cellular quartz permeated by oxides of iron, and they enclose portions of the country rock, which are also much silicified and mineralized.

These reefs are principally developed in Madden's and Williams' lease applications. Their general strike varies from north 30 degrees west to west 40 degrees north, and the underlie will probably be to the east, as the cleavage of the schists dips easterly, as do the white quartz-reefs.

These reefs are said to show free gold in places, but for the most part the gold is fine. Their principal development is near the north-west corner of Madden's application. The reef here is about 13 feet wide, and is composed of spongy quartz, hematite, and ferruginous schist with some stalactitic iron ore. As described by Mr. Slee in his report, this reef shows evidence of a great deal of secondary action, much of the quartz and iron originally contained in the reef having been redissolved and reprecipitated.

A number of samples were taken by me from this reef for assay, but the results are not yet known.

About a chain easterly from the preceding reef is a second reef of ferruginous quartz at least 2 feet wide, the full width having not yet been proved.

One sample taken from this reef by Mr. Pittman yielded by assay 14 oz. 18½ dwt. per ton.

On the boundary between Williams' and Madden's lease applications are several reefs of ferruginous quartz and quartzose country rock, which give approximately the following section, measured along the surface, commencing at the west side of the westernmost reef:—

6 feet.	Ferruginous quartz and quartzose schist, said to show free gold.
9 feet.	Talcose schist.
6 feet.	Quartzose talcose schist.
27 feet.	Talcose schist.
3 feet.	Talcose schist, veined with quartz and charged with iron.

None of these ferruginous reefs are bounded by well-defined walls, but merge gradually into the country rock. A sample taken by Mr. Pittman from one of these ferruginous reefs in Williams' application yielded merely traces of gold and silver.

The fact, however, of these reefs occupying the summit of the hill, as pointed out by Mr. Pittman, is strong evidence in favour of the strength of these reefs, and argues that they are possibly the main reefs in the hill rather than the big reef at Madden's shaft. It is evident that these reefs are the oxidized caps of pyritous gold-bearing quartz-veins, only from the experience of the Myall mines it is certain that at no great depth, say, within 100 feet from the surface, probably less, they will make into gold-bearing pyritous reefs.

These reefs have probably been formed by the crushing of the talcose schist, and perhaps of the older white quartz-reefs, by the intrusive masses of diorite, and their mineralization was probably chiefly due to this cause. There is, therefore, every reason to suppose that they will continue to be gold-bearing to considerable depths. As regards their average yield of gold nothing positive can be asserted at present, as the reefs have simply been trenched at the surface but not sunk upon, and no bulk trials of the stone have been made.

The assays of the samples selected by Mr. Pittman show that the gold in these reefs probably runs in shoots, as has been the experience in most of the gold reefs of New South Wales.

Rich patches will therefore probably be found in the reefs here and there, with areas of barren veinstone intervening. The best indirect evidence, however, as to the probable payability, at all events of the oxidized portions of the reef, is afforded by the richness of some of the small alluvial leads, the gold in which has been derived from these reefs.

Whether or not the reefs can be advantageously worked when the sulphide ores are reached is a matter that can only be decided by actual test when the reefs are further prospected.

The treatment of these pyritous ores will of course necessitate the employment of costly machinery.

There are, however, sufficient oxidized ores to furnish material for work on a moderately large scale for a considerable time.

### 3.—Alluvial.

(a) *Shallow alluvial.*—About nine small leads have been worked on the north-west slope of the Peak and two on the south-east slope. Although these leads have been rich in places, they have not extended more than about 10 chains each in length. They consist of rubble, derived from the wearing away of the rock and vein material of which the Peak is composed, and chiefly occupy the bottoms of the small gullies which radiate from the Peak, at the foot of which they pass gradually under the deep alluvials of the surrounding plains. The rubble varies in thickness from a foot or so up to 15 feet. At the Prospectors' Claim it is 14 feet thick, and in places is so firmly cemented by iron that it requires hammer and gad, and even powder, to break it up. The wash, which is a rubble of talcose schist and quartz, in fragments from 3 inches up to 1 foot in diameter, and similar to the overburden, averages 1 foot in thickness, and has yielded half-an-ounce of gold to the load of wash for a width of 18 yards measured along the working face, which, however, may not be exactly at right angles to the trend of the lead, though very nearly so.

At present it has to be carted to the Ten-mile Creek, a distance of two miles at a cost of 3s. per load. About 76 oz. of gold have already been obtained from the small portion of this claim which has been already worked, as I am informed by one of the holders, Mr. Ring. Some of the gold is coarse and angular, as though recently shed from the reef, while other fragments of gold are much waterworn.

Several pieces of alluvial gold have been won from this claim, weighing from a few pennyweights up to 15 pennyweights.

Since the heavy rain which fell on October 18th and 19th a small quantity of water had been caught in the dams hastily constructed across the gullies, sufficient to admit of the wash on the upper part of this shallow lead being treated by the old-fashioned method of cradling.

On Milane and Apps' claim, at the upper end of the Prospectors' shallow lead, and at a higher level than the Prospectors' claim, the gold is very much waterworn and shotty, varying from the size of small shot up to that of buck-shot. This wash has averaged 7 to 8 dwt. to the load for a width of 12 feet and a thickness of 1 foot, the depth of sinking being from 1 to 3 feet.

A similar shallow lead, worked by Gibson and others further north, also on the western slope of the Peak, yield water-worn gold with quartz as well as iron oxide adhering to the specimens. Most of the alluvial gold has a little iron oxide sticking to it, which was evidently originally associated with the gold when in the reefs, and is not a secondary coating formed subsequently.

This proves that the alluvial gold has been largely derived from the ferruginous quartz-veins. At Rix's claim, on the south-eastern slope of the Peak, the reputed largest nugget has been found, weighing 1 oz. 12 dwt. 3 gr.

Adjoining the preceding lead on the south is Aldridge's shallow lead. The sinking here is from 4 to 5 feet deep, and as much as 24 oz. of gold are said to have been obtained here from two loads of wash. Owing to the cleavage of the schists dipping to the east, and the drainage of the hill being also easterly at this locality, the surface of the schists has been worn into a succession of small bars, which have acted as effectual catches for the alluvial gold.

The yield above quoted is of course exceptional.

(b) *Deep Alluvial.*—Up to the time of my visit nothing more than traces of gold had been met with in the deep ground. A shaft had been sunk to the east of the Peak to a depth of 130 feet, showing that the bed-rock has a considerable dip in this direction.

To the west of the Peak also a shaft is being sunk, with Government aid, to test the deep ground, but had not been bottomed up to the time of my leaving the field. There is every probability that good deep alluvial gold will eventually be found, both to the east and west of the Peak. One of the most promising sites to be tested is the one to which Mr. Stonier has already called attention, viz., the strip of alluvial on the east of the Peak, between it and the diorite, which bounds the alluvial ground still further east.

Another promising site for deep alluvial gold is the lead to which Mr. Warden Caswell called my attention, situated 8 miles from Tomingley, and which I have already described.

As regards proving the alluvial ground on the west of the Peak, the most natural course would appear to be to follow the shallow leads downwards until they gradually make into the deep alluvial ground, and become confluent in a single large lead. Contrary however to expectation, all the nine shallow leads, worked on the west slope of the Peak, have so far been lost as soon as they reached the edge of the flat; and here the question suggests itself as to whether they may not have been cut off, and the contents of the leads have been redistributed by the waters of the cretaceous ocean.

The cretaceous ocean is known to have extended a long way inland from Bourke, at least as far as Nevertire, and probably for a considerable distance beyond Nevertire towards the Peak, as would appear from the occurrence of outlayers of Cretaceous-Tertiary (?) sandstone between Dubbo and Tomingley, as has been already mentioned.

If therefore the lower parts of the gullies and valleys which once emanated from the Peak, and which are now covered by alluvials, were at one time within reach of the wash of the waves, and had their auriferous gravels redistributed by marine action, the leads in the deep ground, if they exist, will partake rather of the character of a beach wash than of a river drift, and the gold in them will therefore not be quite so concentrated as it might otherwise have been. The future of the deep ground here depends therefore largely on the question as to what is the configuration of the surface of the bed-rock under the alluvials. If there are distinct old river valleys the channel of the leads will of course be well defined, but if through marine erosion the old hills and valleys have been reduced to a tolerably uniform level so as to leave merely successions of wide shallow basins intervening between the areas of slight elevation where the bed-rock now shows at the surface above the alluvial, the gold will of course be more widely scattered, and may not be sufficiently concentrated to be advantageously worked.

That considerable depressions however exist in the bed-rock has already been proved by the 130-foot shaft sunk in the alluvial to the east of the Peak, and also by the deep shaft now being sunk with Government aid on the west side of the Peak.

On the whole, however, I think it probable that the bed-rock under the deep alluvials will be found to partake more of the nature of an old sea-floor, than of that of a silted-up system of hills and valleys.

Wide basins will be found at intervals, their length perhaps coinciding with that of the old valleys which were excavated by the former representatives of the Bogan and Macquarie Rivers.

It is certain that a large amount of alluvial gold must have been shed from the denuded portions of the Peak gold-reefs, and as much of the gold in these reefs is fine, and nearly all the gold hitherto obtained from the shallow alluvial beds is coarse, it is evident that a large quantity of fine gold must have been swept beyond the shallow leads, where the coarse gold was dropped, into the deep alluvials to the east and west of the Peak.

To discover these channels or basins will be a work of time, and it can only be done practically by systematic sinking or boring.

As the cleavage of the schists runs about north by west, and the trend also of most of the reefs is also from north by west to north-west, it is probable that most of the channels in the deep ground will also have a general north-north-westerly trend, like the Bogan River in the neighbourhood of the Peak. As a general rule, therefore, it would be as well for systems of prospecting shafts to be sunk in lines running from west-south-west to east-north-east. It is, however, a question of great public importance to know whether payable deep alluvial gold exists in this district, for not only local interests are involved in the solution of this question, but also the whole future of alluvial mining along the wide stretches of similar flat auriferous country, which extends from Parkes to Narromine, a distance of 64 miles.

If therefore any parties of miners would undertake to prospect systematically such areas of alluvial ground in the neighbourhood of the Peak, as might be approved of by the Prospecting Board, I would venture to suggest that it would be a legitimate object upon which to expend a further portion of the Prospecting Vote. In accordance with Mr. Slee's recommendations, two parties have already been aided out of the Prospecting Vote for this year, to test the deep alluvials, one on the east side, and the other on the west side of the Peak; and if their prospecting operations are successful, a great impetus will be given to deep alluvial mining; but until something more definite is known about the character of the deep ground any further rush to the field is to be deprecated.

I would also venture to suggest that, with a view to assisting such systematic prospecting, a geological sketch map should at once be prepared, to show the probable approximate trend of the different runs of deep ground. Such a map could be got ready in a few weeks, and pending its publication a tracing of it might be forwarded to the office of the Warden's Clerk, to serve as a reference map for the use of the miners.

4.—*As to the appointment of a Warden's Clerk, and the securing of a suitable site for his office.*

Mr. Warden Caswell informs me that he has recommended that Senior Constable Bell, who now discharges the duties of Warden's Clerk at Tomingly, be removed to the Peak, to act as Warden's Clerk there. Temporary office accommodation might be offered by the police-tent.

5.—*Water supply.*

Mr. Boulton, of the Public Watering Places Branch of this Department, has examined the country in the neighbourhood of the Peak, with a view to recommending a suitable water supply; as his report deals fully with this important question, any reference to it by me is unnecessary.

My thanks are especially due to Mr. Warden Caswell, who accompanied me from Dubbo to the Peak, and supplied me with much useful information.

I have also to express my indebtedness to the reports already furnished by Messrs. Pittman, Slee, and Stonier, from which much of my information was borrowed, and to which the present report is merely supplementary.

I have, &c.,

T. W. EDGEWORTH DAVID,  
Geological Surveyor.

APPENDIX No. 2E.

Preliminary Report on the Magnetic Iron Ore Bed of the Ironstone Mountain, Port Stephens.

Sir,

Geological Branch, Department of Mines, Sydney, 9 January, 1890.

In accordance with your instructions, I have geologically examined the bed of magnetic ironstone at the above locality, on the church and school lands, leased by Messrs. Brackenridge and Watson, and on 24th December, furnished a report thereon in connection with an application for aid by this party out of the Prospecting Vote for 1889 to enable them to further test the iron ore on this property. In accordance with my suggestions and the Prospecting Board's recommendations, which have been approved by the Minister, aid has been granted to this party to make six open cuttings, each 4 feet wide and 20 long, to follow the ore bed in straight to the dip, and also to make twenty-five trenches for the purpose of ascertaining the true thickness and quality of the ore bed, both at the outcrop and also for a short distance in towards the dip. Until the completion of these prospecting works it would be premature to furnish a detailed report on this ore bed, as, owing to its outcrop being for the most part partially concealed by rubble, no estimate can be formed of its true thickness; and besides, samples taken from the outcrops of iron ore beds are usually somewhat richer in iron than those taken from a depth, owing to the iron in the surface stone having become somewhat concentrated through the action of rain water and the atmosphere, which leads to a constant dissolving and reprecipitation of the iron near the surface. In this process the lighter impurities in the ore, such as sand and clay, are partially removed, while the solution of iron sinks into the ore bed, following it a short distance down towards the dip, and consequently enriching it.

The analysis, therefore of the samples collected by me from the surface of the ore bed will probably prove a trifle richer in metallic iron than those which, it is hoped, may be obtained from the ore bed at a depth upon the completion of the above-mentioned prospecting works, which, if properly carried out, would necessitate the breaking down and removal of several hundred tons of the iron ore. These same works should decide the question as to whether there are two beds of iron ore in the locality, or only one bed, which may have had its outcrop repeated by a strike fault, in the manner suggested on the accompanying sketch plan, No. 2.

The iron ore bed outcrops in the Ironstone Mountain about 3 miles west of the Karua Wharf, on the Karua River, which may here be considered an arm of Port Stephen, being tidal and navigable for small craft up to this point.

There is a fall of between 300 and 400 feet from the various outcrops of the ironstone bed here to sea-level.

The greater part of the country intervening between the Ironstone Mountain and the Karua Wharf is either flat or undulating, becoming rocky and broken only in the immediate vicinity of the ironstone. There is abundance of good timber in the locality, so that there would be little difficulty in constructing a tram line or railway line from the mountain to the Karua River.

The formation in which the ironstone occurs is the "Rhacopteris Beds," which are probably of lower carboniferous age, and are certainly older, and underlie the Greta coal measures, and have never yet themselves been proved to contain productive coal seams.

The outcrop of the bed was traced by me for over a quarter of a mile, being bounded on the north by an intrusive felstone, while to the south it apparently thins out, though it is more than probable that the prospecting trenches will prove it to extend still further in this direction.

It is also nearly certain that its continuation still further north will be discovered on the north side of the dyke of felstone, as the same bed of iron ore is known to occur near Booral and to the west and east of Stroud, the bed dipping under Stroud from the west, then rising again to the surface to the east of Stroud, so that it lies in a complete trough or basin.

A partial section of the bed, in two places where it is obtainable in trenches already cut, shows that its thickness varies from 3 to 4 feet.

The dip is south-westerly, at from 20 to 30 degrees.

Assuming that the bed maintains an average thickness of 3 feet for a distance of, say, one quarter of a mile into the dip, and that the average yield of the ore is say one quarter less than it is at the surface, the total quantity of metallic iron here would be, roughly, 800,000 tons, equal to 5,000 tons per acre. This estimate is, of course, only very approximate, and is subject to correction when a truer estimate can be formed upon the completion of the present prospecting operations.

At-

At the Ironstone Mountain the ore bed dips towards the west, but at a short distance from the west the dip changes persistently to the east, so that the iron ore should rise to the surface again in this direction, and it would be advisable to prospect here for its western outcrop.

The iron ore at the Ironstone Mountain is interbedded with thick masses of volcanic sandstone (arkose), composed of tuffaceous material, ejected during volcanic eruptions, intermixed with sand. The ore bed has evidently been formed by the mechanical concentration of the minute crystals of magnetic iron contained in the tuffaceous sandstone by the agency of sea-water acting on a beach, which has thus produced a beach wash of magnetic iron-sand of Lower Carboniferous age similar to that which is at present being formed at Taranaki, in New Zealand. That this is the true origin of this bed of iron ore is also proved by the presence of titanitic acid, the analysis showing that there is as much as 7.30 per cent. of titanitic acid present, which is equal to from 16 to 17 per cent. of titaniferous iron. The analysis appended, by the Analyst and Assayer, Mr. J. C. H. Mingaye, F.C.S., shows that there is 18.70 per cent. of silica, and 5.28 per cent. of alumina present.

The presence of so much silica would certainly make the ore a refractory one to smelt, and its treatment would be rendered still more difficult by the presence of so much titaniferous iron. There is, however, a considerable quantity of earthy limestone, and a small bed of pure limestone close to the deposit of magnetic ironstone. This might serve as a flux, should it be decided to attempt to smelt the ironstone on the ground.

The value of this deposit will depend on—(1.) Its yield of metallic iron at a depth, this will be proved by the analyses hereafter to be made of the ore at a depth as exposed in the ends of the cuttings for which aid has been granted out of the Prospecting Vote.

(2.) Its average thickness, as will be proved by the trenches for which similar aid has been given.

(3.) On the possibility of smelting successfully an ore which contains so much silica and titanitic acid, so as to produce from it a marketable quality of iron.

Special reference will be made to this last question in my final report on this deposit.

Meanwhile, the thickness and extent of the ore bed, its richness in metallic iron, and its favorable situation with regard to limestone, coal, and water carriage, fully justify the expenditure of a small sum of money to assist in further testing it, as I have already recommended, and as has been approved in connection with the leaseholders' application for aid out of the Prospecting Vote for last year. Appended are two plans, showing the position and extent of the bed, and analyses of samples of the ore representing the full thickness of the bed, and selected by myself.

The Under Secretary.

I have, &c.,

T. W. E. DAVID,  
Geological Surveyor.

ANALYSES of iron ore from Ironstone Mountain, Port Stephens, by Mr. J. C. H. Mingaye, F.C.S., Analyst and Assayer:—

2860.—A sandy, magnetic ironstone, from Ironstone Mountain, 20 miles from Raymond Terrace, yielding—Metallic Iron, 44.79 per cent.
2861.—B, similar to A, from ditto, yielding—Metallic Iron, 40.77 per cent.
2862.—C, similar to A, from ditto, yielding—Metallic Iron, 44.99 per cent.
2863.—E, similar to A, from ditto, yielding—Metallic Iron, 48.33 per cent.
2864.—F, similar to A, from ditto, yielding—Metallic Iron, 44.57 per cent.
2165.—G, similar to A, from ditto, yielding—Metallic Iron, 37.71 per cent.
2947.—D, similar to A, from ditto, yielding—Metallic Iron, 42.35 per cent.

An average sample of A, B, C, E, F, and G, was analyzed, with the following result:—

Moisture at 100 degrees C. ....	67
Combed moisture .....	3.31
Iron peroxide (Fe <sub>2</sub> O <sub>3</sub> ).....	52.86
Iron protoxide (FeO) .....	7.79
Manganese protoxide .....	trace.
Alumina .....	5.21
Silica .....	18.70
* Iron peroxide (Fe <sub>2</sub> O <sub>3</sub> ) .....	75
Lime.....	1.12

Silver.....	"

\* Is insoluble in acids,

#### APPENDIX 2F.

General report on the coal, iron, and kerosene shale of the Port Stephens District, and on the Coal-measures near Stroud.

As the geology of the district will be described in some detail in my Memoir on the Maitland District, the present report will be confined to a bare summary of the facts which appear to be of the most immediate importance.

Parts of this district have already been reported on by Mr. F. Odenheimer; Mr. J. Mackenzie, F.G.S., the Examiner of Coal-fields, and yourself. Mr. Odenheimer's reports, as those of Mr. J. Mackenzie, were kindly placed at my disposal by Mr. Jesse Gregson, the local superintendent of the A. A. Company.

Mr. Odenheimer, who examined the northern portion of the Port Stephens district in 1855 and 1856, in company with Mr. Surveyor Herborn, opened out a number of coal-seams, some of which were discovered

discovered by him, and reported favourably on some of the seams, especially the 30-foot seam at Mamme Johnson Creek, and the smaller seams at the Ward's River. A bed of magnetic iron ore was also discovered, which was at first considered of value, but subsequently condemned on account of its refractory nature. Mr. Odenheimer considered that the sedimentary formations of the district belonged broadly to two groups—the coal-measures, and the older rocks, which he considered to be partly metamorphic. The coal-measures he considered as probably the equivalents of some part of the Newcastle series, and he described them as occurring in long narrow troughs or basins, shut in by the older metamorphic rocks. Later—in 1874-76, Mr. J. Mackenzie re-examined much of this country, and proved some more coal-seams, and by means of systematic trenching, discovered also that a few unworkable seams of rather dirty coal occurred in the rocks called metamorphic, by Odenheimer, and characterized by the presence of *Rhacopteris*, *Calamites*, and *Lepidodendron*. Mr. Mackenzie, however, considered the productive coal-measures of this district older than the Newcastle series, and probably a part of the series termed metamorphic, by Odenheimer. In 1879, when examining the Barrington Gold-field and the surrounding district, you record the occurrence of *Glossopteris* in the measures at the upper end of one of these productive coal-basins, near Gloucester.

My recent examination of the Stroud District, in company with Mr. R. Etheridge, shows that the formations here belong to two distinct groups,—the older characterized by the prevalence of *Rhacopteris* with *Lepidodendron* in the lower part of the series; and the newer by *Gangamopteris* and *Glossopteris*.

The older group, which may be called provisionally the *Rhacopteris Beds*, contains several small seams of coal, and one of some thickness. Mr. J. Mackenzie gives the following section of this last seam:—

ft.	in.	
		Roof.—Sandstone and chert, with plant impressions, overlaid by sandstone and shale containing <i>Otopteris</i> .
2	3	Inferior coal and indurated clay.
9	0	Chert, shale, and conglomerate, with a little coal.
5	0	Inferior coal, with a very irregular cleavage.

I can quite confirm Mr. Mackenzie's statement as to the occurrence of *Otopteris* (*Rhacopteris*) both above and below this seam, but as the shaft had fallen in I was unable to examine the coal. The coal appeared to be very inferior, as far as could be judged by an examination of fragments in the spoil bank round the shaft. Above this seam, according to Mr. Mackenzie's section, are about 2,100 feet of sandstone and conglomerate and cherty shale, the last containing *Otopteris*; and below it are similar strata for a thickness of about 3,550 feet, when marine beds of hard, siliceous shale are reached, containing *Conularia*, *Producta*, &c., and associated with *Knorria* and *Calamites*; and at a total depth of 4,550 feet below the 5-foot seam is a bed of very inferior magnetic iron—perhaps a continuation of the one which I have already described at the Ironstone Mountain, near Port Stephens. The total thickness of strata here characterized by *Rhacopteris* with associated tuffs and eruptive rocks, is, therefore, about 6,600 feet, and several hundred feet, or perhaps upwards of 1,000 feet below this, is a bed of ennerinital limestone from 8 to 12 feet (?) thick, which forms a well-marked horizon. This is probably the same bed of limestone which underlies the magnetic iron ore bed at the Ironstone Mountain. At Garrett's tunnel, at the Seven Mile on the Raymond Terrace to Stroud Road, I measured the following section of a seam of coal which I think is probably at the top of the *Rhacopteris* beds, and is more related to them than to the Greta series:—

ft.	in.		ft.	in.	
1	0	Coal, perished.	0	5	Coal, with two $\frac{1}{2}$ -in. bands,
0	1	Band, brown clay.	0	1 $\frac{1}{2}$	Band, white clay.
0	9	Coal, perished.	0	2	Coal.
0	3 $\frac{1}{2}$	Coal and bands, mixed.	0	0 $\frac{1}{2}$	Band, white clay.
0	3	Band of white clay.	0	3 $\frac{1}{2}$	Coal, perished.
0	3 $\frac{1}{2}$	Coal and bands.	0	8	Coaly shale.
0	3	Bands with streaks of coal.	0	8	White clay.
0	6	Coal, with $\frac{1}{2}$ -in. band at 1 in. from top.	0	1	Coal.
0	1 $\frac{1}{2}$	Band.	0	9	White clay.
0	6	Coal.	0	4 $\frac{1}{2}$	Coal, much perished.
0	7	Coal, dirty, speckled with clay.	0	6	White clay.
0	2	Coal, with two $\frac{1}{2}$ -in. clay bands.	0	2	Coal.
0	3	White clay.			
0	2 $\frac{1}{2}$	Coal, with thin bands.			
					Total 9 5 $\frac{1}{2}$

This seam is overlaid by hard white tuffaceous clay shales with abundant angular broken felspar crystals, quite free from decomposition, clearly showing that it is a volcanic tuff. These tuffs are very carbonaceous in places, and about 300 feet thick, graduating upwards into a decomposed scoriaceous lava which in turn passes into massive sheets of andesitic dolerite about 1,000 feet thick consisting of at least two flows with an intermediate bed of melaphyritic tuff. These massive eruptive rocks appear to close the eruptive series, for immediately above them, in that part of the basin which lies to the south of Port Stephens, are the marine series of the productive coal-measures. To the north of Port Stephen, however, near Stroud, I did not observe any such marine strata intervening between the productive coal-measures and the top of *Rhacopteris* beds. The junction line between the two formations was obscured by a mass of eruptive rock whenever I examined it. The productive coal-measures appear to lie principally in two long narrow basins separated from one another by an axis of eruptive rock. The west basin may be termed the Ward's River Basin, and the east the Mamme Johnson Basin. My examination was of too cursory a nature to enable me to trace the exact relation of these basins to one another. At Stony Creek, a tributary of the Ward's River, I measured the following section of a seam of anthracite coal in the bed of the creek:—

ft.	in.		ft.	in.	
		Roof.—Black shales with <i>Glossopteris</i> and <i>Gangamopteris</i> and a plant like <i>Vertebraria</i> .			
4	6 $\frac{1}{2}$	Coal, semi-anthracite, altered splint and bituminous coal.	0	4	Coal, dirty.
1	3	Band, chitter—shaly, hard, dirty coal.	4	2 $\frac{1}{2}$	Coal (?) partly hidden below water-level.
0	8	Coal.	2	0	Band, hard clayey sandstone.
2	5 $\frac{1}{2}$	Band, hard clays sandstone.	2	6 $\frac{1}{2}$	Coal.
3	2	Coal.			
					Total 20 8

Floor, pebbly dark grey carbonaceous sandstone with *Gangamopteris* and *Glossopteris*.

This

This seam dips east 10 degrees north at 45 degrees, and is probably identical with the 30-foot seam at Mamme Johnson Creek described by Mr. Odenheimer, and with the same seam described by Mr. Mackenzie at Barry's Gully, Relf's Creek. Mr. Mackenzie gives the following section of this seam at Barry's Gully:—

Roof—Conglomerate with 4 inches of clay next the coal.

ft. in.		ft. in.	
1 6	Coal.	0 5	Coal.
0 1	Band, clay.	0 1	Band, clay.
1 6	Coal.	0 7	Coal.
3 0	Coal and bands.	0 1	Band, clay.
1 0	Black shale.	1 1	Coal.
0 0½	Band, clay.	1 0	Band, clay.
0 8	Coal.	0 8	Coal and bands.
0 0½	Band, clay.	1 3	Coal.
1 8	Coal.	0 1¼	Band, clay.
0 0½	Clay band.	0 4	Coal.
1 6	Coal.	0 0½	Band, clay.
0 1	Band, clay.	1 6	Coal.
2 0	Coal.	2 3	Clay, bands and coal.
0 0½	Band, clay.	2 8	Coal.
1 0	Coal.	0 0½	Band, black.
0 1	Band, clay.	3 0	Coal.
0 6	Coal.	0 1	Black band.
0 0½	Band, clay.	0 8	Coal.
0 6	Coal.		
0 0½	Band, clay.		
		Total	31 0½

Mr. Mackenzie also measured a section of this same seam at Master's Creek, a short distance north of Barry's Gully, where the seam has thinned out to 25 feet 4 inches; and as already shown at Stony Creek, about 6 miles further north, the seam, which is probably the continuation of this, has thinned still further to about 20 feet 8 inches. At Coal Creek, just above where the Stroud to Gloucester Road crosses it, I measured the following section:—

ft. in.	
20 0	Sandstone and shale, with two small seams of coal and abundant <i>glossopteris</i> leaves next to seam.
0 6	Coal, good, bituminous.
	Floor, clayey sandstone, with <i>vertebraria</i> .

And 5 inches higher up the rocks:—

ft. in.		ft. in.	
20 0	Sandstone.	0 6	Coal, dirty.
0 7	Coal.	1 9	Clay shales, dark grey.
0 2	Band sandstone.	0 6	Coal.
0 4	Coal.	0 8	Black coaly shales.
0 4½	Band, clay.		

At a point on the road, about 13 miles from Stroud, towards Gloucester, and about 3 miles southerly from the "Willow Tree Inn," Mr. Etheridge and I obtained some very perfect impressions of *glossopteris* in sandstone, *glossopteris* here being very abundant. No *gangamopteris* were, however, observed. At Barry's Gully, Mr. Mackenzie measured the following descending section below the 30-foot seam:—

ft. in.	
1,442 0	Porphyries, sandstones, brecciated rock, and conglomerates (not proved).
1 6½	Coal, with a 2½-inch band.
126 0	Brecciated rock.
1 10	Shale.
34 3	Dirty seam of coal and shale.
268 2	Sandstones, conglomerates, brecciated rock, and shale, with <i>cyclopteris</i> and <i>glossopteris</i> , and four thin seams of coal and coaly shale.

The following is a detailed descending section of the 34 feet 3 inches seam of coal and bands, as measured by me:—Roof, conglomerate, fairly coarse, 3 feet thick, then soft sandstones with *vertebraria*, *gangamopteris*, and *glossopteris*.

ft. in.		ft. in.	
0 2	Coal.	0 1	Coal.
1 0	Dark shales.	2 6	Thin-bedded, tough, grey, fine sandstone.
0 2½	Coal.	2 0	Coal, perished.
0 6	Brown shales.	0 0½	Band white clay.
0 2½	Coal.	1 0	Coal.
1 0	Shale, brown, passing into rusty grey.	0 0½	Band whitish clay.
0 5	Coal.	0 3	Coal.
1 2	Brown, sandy shale.	0 1	Band brown shale.
0 7	Tough sandstone.	4 0	Crushed coal with a few bands.
0 7	Whitish-grey shales, with <i>glossopteris</i> and <i>gangamopteris</i> .	0 7	Dark grey clayey mudstone.
0 1	Coal.	1 3	Black and grey, coaly, sandy shale, with <i>gangamopteris</i> and <i>glossopteris</i> .
1 0	Brown and grey sandy shales.		
0 6	Coal.	Total	21 0
1 9	Grey shales.		

Floor, fine clayey sandstone and shale.

Mr. Etheridge and I were unable to find any true *cyclopteris* in the modern acceptance of the term in the strata associated with the above seam, but found *gangamopteris* in abundance and some *glossopteris*.

*glossopteris*. A generalized horizontal section of the strata which occur at the Ward's River Coal-field, and near Stroud, is given on the geological tracing accompanying this report, and the following is a generalized descending section of the strata:—

	ft.	in.	
	1,500	0	(About) chiefly sandstones, with occasional beds of conglomerate and shale, containing <i>glossopteris</i> . Seams of coal probably occur in this series.
	30	0	Mamme Johnson coal-seam, containing <i>gangamopteris</i> .
	1,442	0	Porphyries, sandstones, brecciated rock, and conglomerates.
	1	6½	Coal, with a 2½-inch band.
Permo carboniferous	126	0	Brecciated rock.
	1	10	Shale.
	34	9	Barry's Gully seam, with <i>gangamopteris</i> and <i>glossopteris</i> .
	268	0	Sandstone, conglomerate, brecciated rock, and shale, with <i>gangamopteris</i> and <i>glossopteris</i> .
Total	3,404	0	
			Break here—1,000 feet (?) Porphyry, perhaps intrusive.
	ft.	in.	
	2,100	0	Sandstones, conglomerate, and cherty shale, with <i>rhacopteris</i> .
	2	3	Inferior coal and indurated clay.
	2	0	Chert, shale, and conglomerate, with a little coal.
	5	0	Coal inferior.
	3,550	0	Sandstones, conglomerates, and cherty shales, with <i>rhacopteris</i> .
	10	0	Marine hard, calcareous shale, with <i>comularia</i> , <i>producta</i> , &c.
Lower carboniferous	4,550	0	Arkose sandstones and hard shale, with conglomerates contain <i>knorria</i> , <i>calamites</i> , and <i>rhacopteris</i> .
	2-3	0	Inferior magnetic ironstone.
	(?)1,000	0	Arkose sandstones and conglomerates, passing downwards into slightly oolitic earthy limestone.
	(?)8	0	Limestone, pure encrinital.
Total	11,241	0	
			feet.
Grand total			Permo-carboniferous strata ..... 3,404
			<i>Rhacopteris</i> beds and associated eruptives..... 11,241
			14,645

*Iron*.—A magnetic iron ore bed, perhaps the equivalent of the one mentioned in the above Section, and certainly on a similar geological horizon, occurs at the Ironstone Mountain, and my report thereon forms No. Appendix 2E.

The ore bed is from 3 to 4 feet thick at several points where it is capable of being measured, and yields over 40 per cent. of metallic iron. Aid has been given to Brackenridge and party, out of the Prospecting Vote, to further test the extent and thickness of this bed. The ore appears to be somewhat refractory for smelting, on account of the admixture of titaniferous iron with the magnetic, and on account of the silica present.

*Limestone*.—A bed of pure limestone occurs within about a mile of the bed of magnetic iron, and is associated with beds of earthy limestone and calcareous sandstone. It appeared to be about 6 feet or 8 feet thick, where I examined it at Joe's yard, about 4 miles westerly from the Half-way House. The outcrop was so rubbled over that the exact thickness of the bed could not be ascertained. This limestone would, of course, serve as a useful flux for the iron, if the latter can be profitably worked.

*Coal*.—The probable occurrence of the Greta and Tomago Coal-measures (the former under the formation Coloured Upper Marine on the accompanying geological map, and the latter under the area tinted sepia and ruled with horizontal sepia lines) within the area which lies between Raymond Terrace, the Half-way House, Morna Point and Stockton, has already been referred to by me in the Progress Reports herewith, which form Appendices Nos. 2G to No. 2J. It is quite possible that narrow basins or isolated patches of the Tomago measures, or even of the Newcastle may lie under the alluvial beyond the northernmost extension of the main Tomago basin, as shown on the plan, and the southern end of the Ward's River Coal-field. I was informed by Mr. Blows, of Booral, that drift coal was occasionally washed up in the gravel of the Karua River, at Booral Bridge, and this coal, from its comparatively angular nature, was thought to have come from some neighbouring outcrop. It is possible, therefore, that narrow basins of either the Tomago or Newcastle measures, extend through the church and school lands, along the centre of the main trough. The coal-measures, however, in these church- and school lands, which are likely to be most extensively developed are the Greta measures; and if, by means of the diamond-drill, these Greta measures be proved to contain seams of workable thickness and quality, there will be great natural facilities for shipping it at the harbour of Port Stephens.

The New Stockton and Newcastle Coal-mining Company have lately proved the Main Tomago Seam at the site indicated by me, under 212 feet of alluvial, at the spot shown on the geological map.

The Port Stephens Coal-mining Company are about to bore for coal on the church and school lands at Port Stephens, in company with Croker and others; while Delohery and party are commencing to bore for kerosene shale and the Greta coal-measures near Morna Point.

*Kerosene Shale*.—The probable occurrence of this mineral *in situ*, as evidenced by the occurrence of drift pebbles of it at Morna Point, and by general geological considerations, is discussed in my report which forms Appendix No. 2 J.

A geological sketch map of the country referred to in the report may be seen at the office of the Geological Survey, Department of Mines, Sydney.

I have, &c.,

T. W. E. DAVID,  
Geological Surveyor.

## APPENDIX No. 2G.

PROGRESS Report No. 1 for Port Stephens District, as to suitable sites for employing the Government diamond-drill to bore for coal on the property of the Newcastle and Stockton Land and Coal Company (Limited), Port Stephens District.

Sir,

Geological Branch, Department of Mines, 5 July, 1889.

In accordance with verbal instructions received from the Under Secretary for Mines, in connection with the accompanying application by Mr. Beeston, I have included the property of Mr. Beeston's Syndicate in my general examination of the Port Stephens District, with a view to determining a suitable site on which to employ the Government diamond-drill to bore for coal.

From my geological examination of the district, I have ascertained that there are certainly two, and perhaps three, formations in this property in which coal may occur. These three are found superposed in the following order, the first on the list being the newest:—

3. Tomago Coal-measures.
2. Greta Coal-measures.
1. Rhacopteris Beds.

Of these three the Greta Coal-measures would probably be the most important, and it is to this formation that I would advise prospecting operations to be specially directed. There is, however, a very important point which I have, as yet, been unable to elucidate satisfactorily, with regard to the occurrence of the Greta Coal-seams in this locality, and this is the question as to whether or not the seam of coal which has lately been opened at the Seven-mile, at Garrett's Tunnel, is in the *Rhacopteris Beds* or in the *Greta Coal-measures*. Fossil fragments of *Rhacopteris* were found by me in the shales almost immediately under this seam, but I was unable to find any above the seam or interbedded with it. It is therefore just possible that, supposing the *Lower Marine Beds* to have thinned out completely, this seam at Garrett's Tunnel is one of the Greta seams, though the evidence at present is strongly in favour of its being in the *Rhacopteris Beds*. Before anything is done, therefore, in the way of prospecting for the Greta Coal-measures by boring, I think it would be well to run a trench 2 or 3 feet deep, say, for 1 chain, in a south-easterly direction from Garrett's Tunnel, commencing at the roof of the seam. Such a trench would intersect any shaly bed likely to contain fossils above the seam, and if upon examination these fossils are found to be *Glossopteris* and not *Rhacopteris*, this seam will then be proved to be one of the Greta seams, and in that case the recommendations as to sites for bores contained in the latter part of this report would be useless. It would, therefore, be of great importance to establish the geological age of this coal-seam before commencing to bore at any of the sites hereinunder recommended. If such a trench, or, if necessary, several trenches, were cut in the direction described at Garrett's Tunnel, in view of the question being settled, having a wide influence on the whole question of the occurrence of coal in the district, the services of a Geological Surveyor might perhaps, I would venture to suggest, be spared to examine the trenches carefully, and report upon any evidence which they may supply as to the geological age of this coal-seam. The cutting of these trenches should, therefore, take precedence of any other operations, for the Greta Measures and the statements in the rest of this report will hold good only if, after such trenching, the seam at Garrett's Tunnel be proved to be unquestionably in the *Rhacopteris* beds and not in the Greta Coal-measures.

#### 1. *Rhacopteris Beds*.

A seam of coal occurs probably in this formation in the Syndicate's property, on what was formerly Mr. Garrett's land at the Seven-mile, on the Raymond Terrace to Stroud Road. The total thickness of this seam, including all the bands, is 9 feet 4½ inches. The seam dips E. 28° S. at 45°. The following is a descending section of this seam, as measured by me at *Garrett's tunnel*. Roof tuffaceous, whitish-grey clay shale decomposed, with fragments of broken felspar:—

ft. in.		ft. in.	
1 0	Coal perished.	0 5	Coal with two ½-in. bands
0 1	Band, brown clay.	0 1½	Band with clay.
0 9	Coal perished.	0 2	Coal.
0 3½	Coal and bands.	0 0½	Band white clay.
0 3	Band white clay.	0 3½	Coal perished.
0 3½	Coal and bands.	0 6	Coal shale.
0 3	Band with streaks of coal.	0 2	Coal and shale.
0 6	Coal with ½-inch band at 1 inch from top.	0 8	White clay.
0 1½	Band.	0 1	Coal.
0 6	Coal.	0 9	White clay.
0 7	Coal dirty, speckled with clay.	0 4½	Coal much perished.
0 2	Coal, with two ½-inch clay bands.	0 6	White clay.
0 3	White fireclay (?).	0 2	Coal.
0 2½	Coal with thin bands.		
		9 5½	Total.

Floor.—White tuffaceous clay, with broken crystals of pink felspar.

Note.—A decomposed porous grey lava overlies the white tuffaceous shales which form the roof of this seam.

The percentage of ash in this coal, as I was informed by Mr. Garrett, is rather high, being about 15 per cent. in the best samples analyzed. I was unable to procure suitable samples for analysis at the time of my visit, owing to the tunnel being partly filled with water so as to leave only the perished coal accessible to observation. This seam is the first of any thickness which I have observed in the *Rhacopteris* Beds, and a slight improvement in the quality of the coal, if accompanied by a thinning out of some of the bands, would probably render it workable. Owing, however, to its high angle of dip, inferior quality, and number of bands, I would not advise the expenditure of any money in prospecting this seam until the overlying Greta and Tomago measures have been thoroughly tested. The seam of coal discovered at Irrawang at the point shown on my geological map of the district accompanying my general report, is on approximately the same line of strike as Garrett's seam, and may be identical with it.

#### 2. *Greta Coal-measures*.

The Upper Marine Series, which in the Maitland District immediately overlies the Greta Coal-measures occupies part of the western portion of this property. Three suitable sites for bores have been selected by me in this series. The first is at the "Black Rock," 3 miles north-east from Raymond Terrace;

Terrace; the second, in Stone's Paddock, at  $6\frac{1}{2}$  miles north-east from the same town; and the third, in Dunn's selection. As regards the chances of striking the Greta seams in either of these bores, and their probable depths, the following facts may serve as guides:—

At West Maitland there is a thickness of 2,600 feet of strata belonging to the *Upper Marine Series* between the *Boolwarra conglomerate* and the *Greta Coal-measures*. The *Boolwarra conglomerate*, of West Maitland, is, I find, represented at Raymond Terrace by the *Muree sandstone* seen in Mr. Bishop's Muree Quarry and in the Reserve Quarry. At Raymond Terrace a thickness of about 2,000 feet of *Upper Marine Strata*, as measured by me, are exposed in section between the Muree Quarry and Patsy Hart's Farm on Mr. Richardson's property. The lowest visible strata in the *Upper Marine Series* rest at Patsy Hart's, on a massive bed of igneous *porphyrite*. It is uncertain whether the latter is intrusive and of subsequent date to the *Upper Marine Series*, or whether it is an older rock (perhaps an old andesite), which was erupted previous to the deposition of the *Upper Marine Series*. If it is an intrusive rock it must have burst out with remarkable evenness along the planes of bedding of the *Upper Marine Strata*, as it conforms almost exactly to their strike and dip.

The *Porphyrite*, however, rests immediately on the *Rhacopteris Beds*, without the intervention of the *Greta Coal-measures* or of the *Lower Marine Series*; so that it would appear that the *Greta Measures* have here been overlapped by the *Upper Marine Series*, and their outcrops consequently concealed in the manner shown on a diagram which may be seen at the office of the Geological Survey, Department of Mines.

The probability is, therefore, that the *Greta Coal-measures*, if they extend as far east as this property, as is probable, outcrop underneath the *Upper Marine Series* in the manner shown on the preceding section.

Should the *Upper Marine Series* at the "Black Rock" (No. 1 site for bore) be of the same thickness in this particular division of it (between the *Boolwarra conglomerate* and the *Greta seams*) as it is at West Maitland, a bore put down here would reach the *Greta* in about 2,800 feet. Possibly, however, the *Upper Marine Beds* may have thinned somewhat, though it is evident from the section at Raymond Terrace that the bore would have to penetrate a thickness of over 2,000 feet of strata at this particular point before it would reach the horizon of the *Greta Coal-measures*.

As regards the No. 2 site, 40 chains west from the south-east corner of Dunn's selection, if the bore were put down at the spot indicated, the *Greta measures* might perhaps be struck at a depth of 1,500 feet. It would be unsafe, I think, to bore much further to the west; for although such a bore would have a less thickness of *Upper Marine Beds* to penetrate, it might be so far west as to be beyond the concealed outcrop of the *Greta Coal-measures*, if they exist here, as is probable. If such a bore were put down at B on the preceding section it might miss the outcrop of the seams altogether.

If, however, the bore were commenced at the No. 3 site, at the line of the outcrop of the massive conglomeratic sandstone, full of marine shells, which runs through the southern half of Dunn's Selection, there would be from 500 feet to 600 less of *Upper Marine Strata* to penetrate than at the No. 2 site; so that the whole of the *Marine Series* might be passed through at a depth of 1,000 instead of about 1,500 feet, but that there would be the increased danger of missing the seams altogether through the *Upper Marine Series* resting immediately on the *Porphyrite*.

On the whole, therefore, if it be considered that the probable depth of a bore at the "Black Rock" would be too great to justify the expenditure, I think that the No. 2 site would be the best. If the existence of the *Greta Coal-measures* were proved here, they would certainly be proved to underlie a considerable area of the Syndicate's property. This site is also the one which has already been recommended by Mr. Richard Thomas, manager of the Stockton Colliery, who is acting as adviser to Mr. Beeston's Syndicate.

#### *Tomago Coal-measures (East Maitland Series).*

The coal-seams of the *Tomago Measures* probably outcrop under the alluvial deposits which conceal the bed-rock in the east and central portion of this property. The general thickness of these alluvials appears to vary from 100 to 200 feet. These alluvial deposits, capped by blown sand, are here so extensive that it is impossible to define the actual line of concealed outcrop of the *Tomago Coal-seams* with any precision. A bore, however, is now being put down by the Syndicate in these alluvials, the result of which should supply important evidence towards more precisely localizing the outcrops, even should it fail to strike the seams. The position of this bore was selected by the Syndicate prior to the time of my geological examination. The approximate trend of the *Tomago Coal-measures* through part of this property is shown on my general geographical map of the District, as is also the trend of the *Upper Marine Series* and dip of the strata wherever obtainable.

I have, &c.,

T. W. EDGEWORTH DAVID,  
Geological Surveyor.

#### APPENDIX No. 2H.

PROGRESS Report (No. 2) on the Port Stephens District, with special reference to the property of the Port Stephens Coal-mining Company, and to suitable sites thereon, for the employment of the Government diamond-drill to bore for coal.

Sir,

2 December, 1889.

In accordance with your instructions, I have the honor to furnish the accompanying report with special reference to the above property and to suitable sites for boring.

As shown on the accompanying plan, at least four distinct formations are represented in this area, three of which are sedimentary, and are probably more or less coal-bearing, while the fourth is igneous.

#### GROUP I.

*Igneous Rocks.*—These are of two kinds:—(a) Intrusive rocks allied to granites, either quartz-porphyrines or felsites, which are newer than any of the three groups of sedimentary rocks, and (b), andesitic dolerite, which appears to be older than groups II and III, but possibly newer or contemporaneous with Group IV.

(a) These intrusive igneous rocks are chiefly developed on the banks of the Karua River opposite Griffin's selection, and at the lower end of Humbug Reach, on the Karua River, and at Scobie's Mountain, and also to a small extent at the south-west corner of the property and more extensively still further west, where there is a powerful axis of upheaval.

The effect of the action of this western axis of intrusive rock has been to upheave the sedimentary rocks of Groups II, III, and IV, and cause them to dip easterly, whereas the intrusive axis on the Karua River, which has a north-north-west and south-south-east trend, has upheaved the same strata so as to cause them to dip in a west-south-west direction. The sedimentary rocks therefore, which have been intercepted between the two eruptive axes, have assumed the shape of a trough or basin, which gradually disappears when traced to the north.

(b) The dolerite, so far as at present known, is probably older than groups II and III, and dips in the same direction with them, though at a somewhat higher angle.

#### GROUP II.

Fresh water strata, newer than the Greta Coal-measures, and probably the equivalents of the Tomago or Newcastle Coal-measures. These strata are best seen at the head of Lizzie's Creek, where a thickness of 200 feet of them are exposed in flat section.

A small fossil tree, 3 inches thick and fossilized by clay ironstone, was observed by me in the soft thin-bedded sandstones in the left bank of Lizzie's Creek, near the furthest point to which the tide ascends.

These strata are dipping at 47 degrees, and occupy an area in the property of this Company of about one-half a square mile.

It is possible that these fresh water sandstones with plant remains are the equivalents of part of the Ward's River Coal-field, which Mr. R. Etheridge and I have recently explored between Stroud and Gloucester, at the Mammie Johnson Creek, Coal Creek, and the Ward's River, and which we believe to be probably the equivalents of the Newcastle Coal-measures.

There is in these measures in the Ward's River Coal-field a seam of coal 30 feet thick, inclusive of bands, and containing anthracitic coal of good quality.

If it were desired to test the strata of Group II, at Lizzie's Creek, the most favourable site for the first bore would be at the point where the fossil tree occurs, and if a bore put down here proves unsuccessful, according to the evidence of the core, the next bore should be commenced 500 feet to the east or a similar distance to the west of the first bore, as however there is no certainty of striking a payable seam of coal in these strata, and the area occupied by them is comparatively small, it would scarcely I think be worth the expense to put down a bore here, unless the bores for the Greta Measures, should they be put down, prove successful. It might then be expedient to prove this small patch of upper coal-measures, as although it would not pay to work by itself, even if containing a payable seam of coal, it might pay to work when taken in conjunction with the Greta Coal-measures.

*The Upper Marine formation, the greater part of which probably covers the Greta coal basin.*—The total superficial area here occupied by the upper marine formation is about 2,000 acres, and out of this, about 1,000 acres might contain the Greta Coal-measures within a workable depth, that is not exceeding 3,000 feet, owing however to the overlap of the Upper Marine Series over the Greta Measures, which has already been described by me in a previous report, the Greta Coal-measures do not outcrop in this property as far as I could ascertain. A particular bed of rock, however, containing marine fossils, and known as the "Muree Rock," has been traced by me through part of this property as shown. At West Maitland and Greta, this Muree Rock is about 2,400 feet above the Greta Coal-seams. Measuring back from this known horizon downwards through the measures, I find that about 1,900 feet of marine strata can be traced on the west side of this property near the old post office, before the belt of dolerite is reached. At Raymond Terrace the thickness of strata from the Muree Rock to the dolerite is approximately the same. It follows that the Upper Marine Series, as exposed at the surface, shows in this property about 500 feet less thickness than it should, and I have therefore assumed that there has been an overlap of the Upper Marine Series over the Greta to the extent of a thickness of about 500 feet of upper marine strata. If this were the exact extent of the overlap, and if the exact dip of the dolerite and the overlying Upper Marine Series could be ascertained here, it would be an easy matter to calculate at what depth the Greta Measures might be reached. This, however, is rendered impossible by the covering of sand and alluvial, which conceals the older rocks in the central part of the property. Assuming, however, that the dolerite dips at 45°, as it does at Garrett's tunnel (the nearest locality where a reliable dip is obtainable), and the Upper Marine strata at an average of 30°, it would be necessary to sink at a point about  $\frac{1}{4}$  of a mile east of the east side of the belt of dolerite, in order to allow of an increase of thickness of the Upper Marines of 500 feet. This would make the minimum depth at which the Greta seams might be struck about 1,300 feet. Such a calculation is, of course, necessarily only approximate. It is obviously possible that the Greta measures may be struck at a much shallower depth, but owing to the absence of any outcrop of Greta conglomerate, I think it is more than probable that the same overlap which obtains at Raymond Terrace exists here also, in which case the minimum depth of the Greta seams will be about as stated. The best site for a diamond-drill bore to prove the Greta Measures in this property would, in my opinion, be at a point  $\frac{1}{4}$  of a mile east of the culvert on the main Stroud road, over the upper end of Captain Hill's Creek, which would be about 30 chains east, 18° north, from the old post office. The average dip of the strata here is about 30°. As regards the probable quality of the Greta coal in this area it would be unsafe to offer any definite opinion in view of the distance of the locality from the nearest point at which the Greta Measures are being worked, viz., West Maitland. The Greta Measures, however, usually contain an aggregate thickness of 17 feet of coal, of excellent quality for shipping purposes on account of its hardness, and on this account the coal is much in demand at the San Francisco market. The occurrence of drift kerosene shale on the coast at Morna Point, near Port Stephens, favours the supposition that patches of kerosene shale will probably be found in the Greta Measures within this property, as the shale at Morna Point has probably been derived from a submarine outcrop of the Greta Measures south of Morna Point, and drift kerosene shale has also been found in the Hunter River, near Raymond Terrace and Morpeth, from outcrops of the Greta seams, the probable positions of which have been shown by me in my preceding report.

#### GROUP IV.

These strata, characterized by the presence of the fossil fern *Rhacopteris*, are the oldest and lowest here represented. They have already been so fully prospected at Sawyer's Point, and near Stroud, on the property of the A.A. Company, by Mr. J. Mackenzie, and found not to contain any seams of sufficient thickness to be workable, that it would, in my opinion, be unwise to expend any money in testing these same strata in this locality.

SUMMARY

## SUMMARY.

The Greta Measures would therefore be by far the most important to prove, and if seams of workable thickness and quality be found in them there would, of course, be great facilities for shipping the coal at Port Stephens, and the coal would probably also be of use for smelting the bed of iron-ore at the Ironstone Mountain, about 3 miles north of this property, should the ore there prove of marketable quality, as my recent examination inclines me to believe.

The geological features of this property will be more fully described by me in my general report on the Port Stephens District, which will be completed this month. My thanks are due to Messrs. Muston, senior and junior, for much kind assistance and information given me when making my geological examination of the above locality.

I have, &c.,  
T. W. E. DAVID,  
Geological Surveyor.

## APPENDIX No. 2I.

## Progress Report No. 3.—Port Stephens District.

With special reference to the probability of the occurrence of coal on that portion of the Church and School lands held by Mr. H. H. Brown, M.L.A., and others; and with reference to suitable sites for boring for coal with the diamond-drill.

Sir, Geological Survey Branch, Department of Mines, 4 December, 1889.

In accordance with your instructions, I have the honor to submit the following progress report on the above subject:—

The formations which prevail in this district having already been described by me in some detail in my progress reports Nos. 1 and 2, the present report will be confined strictly to the practical side of the question.

As shown on the accompanying sketch, geological map, there are four principal formations developed in this area. It is almost useless to search for coal in one of these, viz., the Rhacopteris Beds, and certainly useless to search for coal in either the intrusive felsite or the dolerite, both of these last rocks being of igneous origin. There remain two formations in connection with which coal may possibly occur. The upper and newer of these two is a freshwater formation, consisting in the upper part of thin bedded sandstones with occasional small fossil trees, and lower down of dark grey coaly shales with *Glossopteris* and yellow tuffaceous shales resembling fireclays, but containing, as has been proved by samples analyzed at the Department, too much iron to be of any value for making fire-bricks. In places these lower beds of the upper group are cherty, and, I believe, they belong to the Sanguinolites division of the Upper Marine Series. As no coal has, up to the present, been found in these lower beds where they have already been partially prospected, as at East Maitland, it probably would be too speculative a venture to expend money in boring for coal in them. Coal of workable thickness is more likely to occur in the sandstones of the upper part of the freshwater series, which is coloured dark grey on the plan. The area, however, occupied by this formation, in this property, is too small to justify the outlay of capital in boring for coal in it, in my opinion. The most important coal-measures to prove here are, in my opinion, the Greta Coal-measures. There are, however, considerable difficulties in the way of prospecting for these seams in this locality; for on the western side of the basin the Greta Measures are probably overlapped by the Upper Marine Series as shown on the accompanying section, and on the eastern side of the basin, where owing to denudation any pre-existing overlap has probably been removed, the whole of the bed rocks, with the exception of the barren Rhacopteris Beds, are covered over by sand drift and alluvial pebbly clays of some thickness.

The most suitable site for proving the possible existence here of the Greta Coal-seams would, I think, be at a point 20 chains east from the spot where the Swan Bay Road diverges from the Sawyer's Point Road.

A bore, however, put down here would probably have to be carried down to a minimum depth of 1,300 feet before it could be expected to reach the Greta seams. Owing to the overlap of the Upper Marine it is quite impossible to state the probable depth with any approximation to accuracy, but my reasons for stating 1,300 feet as the probable minimum depth are given in my progress report No. 2. Another favourable locality for bores in this property would be on the east side of the basin, anywhere along a line parallel with the trend of Scobie's Mount, and from 30 to 40 chains to the west of it. That the Greta Measures must probably underlie the greater part of the area occupied by the Upper Marine formation is, I think, extremely likely, and there is also a fair chance of patches of kerosene shale being found in the measures at intervals, the drift pebbles of kerosene shale on the coast near Moira Point, having probably been derived from a submarine outcrop of the Greta Coal-measures belonging to this same basin.

It would be useless to venture any opinion as to the probable quality of the Greta coal, if it exists here, as this locality is so far removed from the nearest point at which the Greta coal is at present being worked, West Maitland.

It is evident, therefore, that the difficulties in the way of proving the Greta Coal measures here are exceptionally great, but if proved and found to be of workable quality, the proximity to the navigable waters of Port Stephens will offer great facilities for its shipment.

The area over which this coal, should it exist here, may be considered workable, as far as depth is concerned, taking the limit at 3,000 feet, would be about 2,500 acres. The average dip is 20 degrees at the southern end of the property, increasing somewhat in a northerly direction. I am informed that Messrs. Brown, Croker, and party have a considerable area of Church and Schools Lands west of that shown on the accompanying geological sketch map, but as it lies wholly within the area occupied by the Rhacopteris Beds, it has not been shown on this plan, the principal object of which is to delineate the approximate area and boundaries within which there is a reasonable chance of finding the Greta Coal-measures.

APPENDIX No. 2J.  
Progress Report No. 4.

Geological survey of the Hunter River Coal-field. Occurrence of kerosene shale, and probably of the Greta Coal-measures, at Port Stephens, and the probable occurrence of the Greta Coal-measures and the kerosene shale near Morpeth.

Sir,

Camp, East Maitland, 18 November, 1889.

I have the honor to furnish you with the following progress report of my survey of the Hunter River Coal-field, with special reference to the subjects above specified:—

(1.) As to the probable occurrence of the Greta Coal-measures near Port Stephens, reference has already been made by me as to its probability in the Annual Report of the Department of Mines for 1887, page 149, and also in a report made to the Department, about a year ago, recommending the reservation of certain Crown lands in the parishes of Tomaree and Stowell, county of Gloucester. The statements in these reports were based entirely on geological indication, as nothing whatever is to be seen of the Coal-measures in the area in question, between Stockton and Port Stephens, and between Raymond Terrace and Tenilba and the ocean. At Raymond Terrace, however, the formation commonly known as the Upper Marine Series is strongly developed. This formation usually overlies the Greta Coal-measures. The strata at Raymond Terrace strike in a north-east and south-west direction, dipping south-easterly at from 16 degrees to 20 degrees. The strata so exposed are over 2,000 feet thick. The occurrence of intrusive igneous rocks at Port Stephens, as shown on the geological map of the Colony published under your direction, led to the inference that the strata of the Upper Marine Series, when traced north-easterly from Raymond Terrace towards the igneous rocks, would be found to dip off the latter, first southerly and then south-westerly, so that the outcrops of the Greta Coal-measures would be bent first east and then south-east, and would therefore strike to the ocean at a short distance south-south-west of Morna Point. During my recent examination of the Port Stephens District I found that such a change of dip actually occurred, for, at Tenilbra, the Rhacopteris Shales, which are older than, and consequently underlie the Greta Coal-measures, dip to the south-south-west at an angle of 12 degrees (1 in  $4\frac{1}{2}$ ). The overlying Greta Coal-measures must therefore outcrop under the sand-dunes south of Tenilba, unless they are prevented from outcropping by an overlap of the Upper Marine series, as shown in my report on the Raymond Terrace district, dated July 5th, 1889. This theory is corroborated by the fact that, as I was informed by Mr. Charles Blanch, drift fragments of kerosene shale are being continually washed ashore near Morna Point, close to his selection there, and he showed me a pebble of the shale much water-worn and covered with marine serpulæ, the pebble having been picked up by himself at Morna Point. A portion of this pebble which I took with me was analyzed by the Government Assayer, Mr. J. C. H. Mingaye, F.C.S., with the following result:—

	Proximate analysis.
Hygroscopic moisture .....	1.10
Volatile hydrocarbons.....	49.45
Fixed carbon.....	14.22
Ash .....	35.23

100.00

Ash—bulky, slate-coloured, no true coke formed, a loose black powder only being left on ignition. The specific gravity and sulphur not determined.

The above analysis shows the specimen to be of inferior quality, but the fact of its being much weathered must be taken into consideration. Mr. T. S. Huntley had informed me some time previously that drift kerosene shale was reported to occur in the parish of Tomaree, but this was the first occasion on which I was able to localise the spot. At this time Mr. R. Barry and party were sinking in the hope of discovering the shale in the granitic quartz-porphry of Anna Bay. Mr. Barry's shafts proving unsuccessful, he consulted me as to the best spot to prospect for the shale, and I referred him to my statement in the Annual Report for 1887, already quoted, to the effect that the Greta Coal-measures probably outcropped under the sand-dunes a short distance to the south of Morna Point, and I told him of your discovery that hitherto kerosene shale had invariably been found to be associated with the Greta Coal-measures. Mr. Barry now informs me that after some recent heavy weather along the Port Stephens coast he observed a few days ago that a considerable quantity of kerosene shale was washed up at a spot about 500 yards along the beach, south-south-west of Morna Point (for locality see plan No. 1 herewith). The pebbles of shale observed by Mr. Barry have evidently, I think, been broken off by the action of the waves from some submarine outcrop of the Greta Coal-measures a short distance south-south-west of Morna Point. From this spot the outcrop will probably extend inland in a west-north-west direction, and Mr. Barry expresses it as his intention to prospect for it with the Government diamond-drill. Before the site for the bore is determined on, as the submarine outcrop is probably not very much below the level of low water, otherwise it would be below the reach of the waves, it might be as well to drag the in-shore bottom from low-water mark out to a distance of a few hundred yards, with a heavily-weighted net or rope or small chain cable. If any portion of the bed of kerosene shale projects above the sand of the sea-bottom, its exact position might by this means be ascertained, and a diamond-drill bore could then be put down on the shore at a point south-west of the submarine outcrop with a certainty of striking the shale. Nothing of course can be predicted as to its probable thickness or quality, but it is more than probable that the quality of the unweathered portions will be better than the weather-beaten pebbles, which are the only specimens of the shale now accessible. There is also a strong probability of finding the Greta Coal Series in association with this kerosene shale. The supposed approximate position of the outcrop is shown on the accompanying plan, No. 1. The occurrence of the drift kerosene shale here has been known to old residents for the past twenty-six years.

Mention may here be made of another fact, first communicated to me by Mr. T. S. Huntley, that on Mr. Cromarty's farm, at the head of Bob's Farm Creek, kerosene oil is found, in dry seasons, floating on the water in a well about 8 feet deep, close to Mr. Cromarty's house. I visited Mr. Cromarty's farm, and Mr. Cromarty informed me that there could be no doubt as to the identity of this oil with kerosene. Either, therefore, there is a small quantity of rock oil here, locally distilled from the kerosene shale by the heat of the intrusive quartz-porphry of Morna Point, or it is a heavy oil derived from the peat beds known to underlie the alluvial here, and which may be referable to the oils which are obtainable from the Tertiary lignitic deposits at Twofold Bay and Kiandra.

No.

No. 2. As regards the probable occurrence of the Greta Coal-measures and kerosene shale near Morpeth, there are two kinds of evidence to be considered. The first is supplied by Mr. Keene, the late Examiner of Coal-fields, who, in an unpublished report now at the Geological Branch of the Department of Mines, relates that a piece of kerosene shale was dredged up from the bed of the Hunter River, near Morpeth, many years ago, and he also quotes an analysis of this fragment. The second kind of evidence is supplied by certain geological indications which I have observed within the last few weeks, in the course of my geological survey of the Maitland District. In the banks of the Hunter River, at Mount Pleasant (Aberbrothick), at Hinton, near Morpeth, the rocks of the Upper Marine Series are seen to dip to the S.S.W. at an angle of 50 degrees. In a N.N.E. direction from here to the Hinton to Raymond Terrace Road, a thickness of about 2,400 feet of Upper Marine strata is represented, and then at the N.N.E. end of the section, on a fall of the hill at the back of Mount Pleasant conglomerates are seen outcropping, which are the Greta conglomerates, and which probably here cover the Greta coal-seams. The occurrence of drift kerosene shale in the bed of the Hunter River, near Morpeth, as described by Mr. Keene, is therefore probably due to an outcrop of the shale in the present or a former channel of the Hunter River, near Morpeth. The approximate trend of the Greta measures, as traced by me, from here towards the Williams River is shown on the accompanying plan No. 2. Mr. T. Adam, the Mayor of Raymond Terrace, informs me that kerosene shale has been dredged up below Raymond Terrace, near the small island in the river opposite Kinross. This shale has probably been drifted from an outcrop of kerosene shale higher up the Hunter River, or possibly in the Williams River.

I have, &c.,

T. W. EDGEWORTH DAVID,  
Geological Surveyor.

The Geological Surveyor-in-Charge.

#### APPENDIX No. 2K.

##### ASH ISLAND BORE.

##### Preliminary Report.

Sir,

Geological Survey Branch, Department of Mines, Sydney, 5 April, 1889.

In accordance with your instructions, I was present at Ash Island, on February the 21st ultimo, and superintended the boring through of the Lower Rathluba seam, saw the core drawn, measured a section of it, and took samples of the core for analysis, the results of which are given herewith.

A seam of coal which I can identify with certainty as the "Lower Rathluba Seam," which has been for many years and is still being worked at Rathluba, was struck at a depth of 952 feet 10 inches, and proved to be 5 feet 7 inches in thickness, including two 1½-inch bands towards the middle of the seam, and a 1-inch band close to the top of the seam.

The seam was bored through with the ordinary core barrel instead of the duplex core barrel, and 3 feet 5 inches of core was obtained out of a total of 5 feet 7 inches, a fair result considering the friable nature of the coal in this seam, which is chiefly of a bright bituminous character.

The following is a descending section of the seam, arrived at from a comparison of the depth at which the seam was first struck with that at which it was passed through, as well as from the actual core obtained:—

Roof	ft.	in.	
.....	25	0	(about). Grey sandstone, clayey and carbonaceous at base of bed, hard and calcareous at top.
.....	2	3	Shale, black sandy.
Seam	0	0½	Coal, bituminous.
.....	0	1	Band coal and shale mixed.
.....	1	10½	Coal, chiefly bituminous, with about 6 inches of splint coal.
.....	0	1½	Band, black shale with streaks of coal.
.....	1	7	Coal, bituminous and splint.
.....	0	1½	Band, hard black shale with cony films.
.....	1	9	Coal, chiefly bituminous, with occasional layers of splint coal.
Total	5	7	
Floor	.....		Mudstone (clayey sandstone), dark-gray, bored into the depth of 8 inches.

The following analyses of the coal were made by Mr. H. P. White, F.C.S., Assistant Government Analyst and Assayer, from samples selected by myself:—

##### No. 416.—A mixed sample from different parts of the seam.

Hygrosopic moisture	Proximate analysis.	91
Volatile hydrocarbons		30.07
Fixed carbon		52.32
Ash		16.69
		100.00
Coke, 69.02%.		
Sp. gr. 1.41.		
Sulphur in coal, .682%.		
Coke well swollen up, fairly bright and hard; ash, light, gray, flocculent.		

No. 417.—Coal-dust derived from the borings of the seam carried up the pipes to the top of the bore-hole by the hydraulic feed-water.

Hygrosopic moisture	Proximate analysis.	90
Volatile hydrocarbons		33.19
Fixed carbon		60.80
Ash		5.11
		100.00
Coke, 51.91%.		
Sp. gr. 1.30.		
Sulphur in coal, .660%.		
Coke much swollen up, fairly bright and firm; ash, very light, red, flocculent.		

The

The percentage of ash in the first sample is rather high, but this is partly due to the fact that the harder splint portions of the seam, which of course contain more ash than the bituminous portions, were probably nearly all saved in the core brought up, from which the sample for analysis was taken, whereas the purer bituminous portions were nearly all crushed to powder and carried up to the top of the bore-hole, and washed away by the hydraulic feed-water. The average percentage of ash deduced from the above analysis would be 10.90, but this might perhaps be lower than the average of ash in the seam, as the coal-dust was purer probably than the portions of the seams from which it was derived, owing to all heavy impurities having been separated out of it by the water circulating through the pipes and bore-hole, which would thus clean the coal on the same principle as small (slack) coal is cleaned, by being washed. Against the possibility, however, of the general percentage of ash being higher than the average of these two analyses must be taken into consideration the fact that the proportion of bituminous coal in the seam is greater than that of the splint coal. I think, however, it may fairly be assumed, provisionally, that the average percentage of ash in this seam ranges approximately from 10 to 14 per cent. The coal is a mixed bituminous and splint coal, suitable for steam, gas, blacksmith, and household purposes.

Taking the specific gravity of this coal as 1.38, and the thickness of coal, after deducting bands, as 5 feet 2½ inches, this seam should yield, after allowing one-third for waste in getting faults, rolls, &c., and assuming that a quarter of the remainder would be small coal, in round numbers 4,360 tons of large coal and 1,460 tons of small coal per acre.

The relation of the seams proved in this bore to those of East Maitland will be treated of in my "Geology of the Maitland District," now in course of preparation; and a detailed section, in addition to the one already furnished by me to the Diamond-drill Branch, will be given of the strata passed through in the present bore and the previous one at Hexham Island.

I have, &c.,

T. W. EDGEWORTH DAVID,

The Government Geological Surveyor-in-charge.

Geological Surveyor.

## APPENDIX No. 2L.

### MEMORANDUM.

#### Diamond-drill Bore, Euroka Creek, near Penrith.

WITH reference to the attached letter from Mr. T. S. Parrott (Department of Mines, No. 10,213, 1889), the following facts may serve as some guide as to the probable depth of the coal below the bottom of the diamond-drill bore on the Nepean River, near Penrith.

The first seam of coal was struck in the bores recently completed at Woodford, in the No. 1 bore at 1,206 feet from the surface, and at the No. 2 bore at 1,194 feet 2 inches. No. 1 bore is about 2,129 feet, and No. 2 bore about 2,061 feet, above sea-level, while Mr. T. S. Parrott's bore near Penrith is about 35 feet above sea-level, and therefore about 2,026 feet at its point of commencement below the surface level of the No. 2 bore at Woodford. Assuming, however, that an east-north-east dip prevails between the No. 2 Woodford bore and the Penrith bore, and that the amount of dip is approximately the same as that observed by me between the No. 1 and No. 2 bores at Woodford, the coal-seams should theoretically have dipped from the No. 2 Woodford bore about 2,150 feet, or about 124 feet more than the difference between their surface levels. Consequently, assuming the same strata to maintain approximately the same thickness at Penrith as they do at Woodford, the first coal-seam at Penrith bore should be approximately 124 feet deeper than at the No. 2 Woodford bore, so that it should be about 1,318 feet below the surface, and about 884 feet below the bottom of the present bore.

A comparison also of the section, taken by the engineer, of the Penrith with my section of the No. 2 bore at Woodford shows it probable that the "gray and purple spotted shale," 9 feet thick, struck at 271 feet 4 inches in the Penrith bore, is identical with the mottled purple shale, 5 feet thick, struck at 149 feet 10 inches in the No. 2 Woodford bore. This evidence therefore also seems to show that the Penrith Bore will have to go about 121 feet deeper than the No. 2 Woodford bore before reaching the first coal. That is a total depth of about 1,315 feet; and the present bore being 434 feet deep, about 881 feet deeper than at present. The almost identical results of these two methods of calculation is simply a coincidence, and the estimated depths given must be looked upon as only very approximate, as a slight change of dip or a thinning or thickening of intermediate strata would materially alter the results of these methods of calculation.

A still more important element which may possibly quite upset these calculations is to be noted in the form of a mass of volcanic material which occurs at Euroka Farm, about half a mile south-westerly from the Penrith bore.

Euroka Creek at this point flows through an amphitheatrical hollow in the Hawkesbury Sandstones, about one-quarter of a mile in diameter, the bottom of which is occupied by a circular mass of grayish black volcanic rock, chiefly of fragmental origin. Under the microscope this rock is seen to consist chiefly of angular fragments of lava, angular grains of quartz, and numerous greenish and brownish-gray decomposed crystals, some of which appear to be augite. Fragments of volcanic glass with enclosed spherulitic fibrous radial mineral are occasionally observable, and there is a considerable amount of interstitial glassy material in places in the base. The rock is, I think, certainly of volcanic origin; but it is difficult to determine its relation to the Hawkesbury Sandstone which encircles it. It closely resembles the fragmental black volcanic rock which occurs in the Hawkesbury Sandstone at the Mittagong diamond-field, and has also some resemblance to the volcanic breccias at the Pennant Hills road-metal quarry.

A remarkable feature in connection with the volcanic rock at Euroka Farm is the occurrence close to its northern margin of portion of a seam of coal. By your advice, a small shaft was sunk on this seam of coal by Messrs. Mitchell and Parrott, in order to ascertain its true character, and, if possible, the reason of its occurrence in such a strange position in the midst of the Hawkesbury Sandstone. By your instruction, I visited this shaft when it was 12 feet deep, and obtained a section of the west side of the shaft.

It is evident from this section that the small crushed seam of coal, followed down in the shaft, dips towards the mass of volcanic tuff, and not away from it, as might have been expected. The maximum thickness of coal in this shaft was about 5 inches. I was unable to discover any fossils in the shales below the small seam, which would indicate whether it belonged to the Permo-Carboniferous productive coal-

measures

measures or to the Hawkesbury or Wianamatta formations. The Hawkesbury Sandstone surrounding the volcanic breccia appeared to be slightly bleached, but was otherwise unaltered and undisturbed.

The volcanic breccia at Euroka may perhaps be related, as you have suggested, to some remarkable conglomerates associated with trachyte at "The Valley," near Springwood, of which you have given the following description:—\* In the bottom of a gully called "The Valley," about 1 mile from Springwood, there outcrops a mass of altered conglomerate containing fragments of carbonized wood. I did not discover any fossils to enable me to determine the age of the beds, but in their lithological character they resemble the Lower Coal-measures of the Hunter River. Should they prove, on further examination, to belong to that series, it will show that there has been a disturbance of the coal-measures in this locality, and that the seams of coal now hidden by the overlying Hawkesbury rocks may have been brought nearer to the surface than the surrounding formations would seem to indicate. This is an important question which may be settled by a little prospecting. With these conglomerate beds occur some trachytic rocks, and in one place there is a spring deposit, about 50 feet in diameter, of brown iron-ore. Possibly therefore the mass of volcanic breccia at Euroka Creek may indicate something more than a mere local disturbance, and should it be met with in the Penrith bore it might, of course, seriously alter the correctness of the preceding calculations as to the probable depth of the coal-measures at that locality. The site, however, selected for the Penrith bore is, as you have already pointed out, a favourable one, and I think that, provided the volcanic rock has not extensively disturbed the measures, there is a reasonable probability that coal may be reached at about 900 feet below the bottom of the 434-foot bore, near Penrith—that is, at a total depth of between 1,300 feet and 1,400 feet below the surface at the Penrith bore.

T. W. E. DAVID,

4/7/89.

The Geological Surveyor-in-charge.

NOTE.—Copies of any plans, diagrams, maps, or sections accompanying the originals of the above reports can be obtained at the Department of Mines by making application in writing to the Under Secretary.

#### APPENDIX No. 3.

Sir,

Geological Survey Branch, Department of Mines, Sydney, 3 February, 1890.

I have the honor to furnish you with a progress report of the work upon which I have been engaged during 1889.

In the beginning of January I visited Glencoe and reported upon the occurrence of bismuth ores near Ben Lomond. This proved to be a small quartz vein carrying bismuth, traversing granite, but of too small dimensions to be of value to work. (*Appendix No. 3A.*)

From 16th January to 24th January I was in the Cooma District. I visited the mineral spring at Rock Flat, near Cooma. A description of this mineral water is given in the records of the survey, Part II, vol. I. I also dealt with prospecting papers relating to Paupong and Fiery Creek, and furnished you with a report on these two places. (*Appendix No. 3B.*)

From 2nd March to 23rd March I was away on my annual leave of absence.

On 11th April I proceeded to Bourke, and, until 10th May, was engaged mapping the boundary of the Cretaceo-Tertiary formation in that neighbourhood in connection with the probability of obtaining artesian water. Two sites were indicated on Yanda Run where there were evidences of the presence of small basins of the water-bearing formation. One of these has been tested by two bores, but no supply of artesian water was obtained. This was no doubt due to the fact that the Cretaceo-Tertiary formation, although here consisting of alternating clay and sandy beds, proved to be of so little depth, combined with the fact of the general thinning out of the whole formation southwards from the Darling River. The report, together with the geological map of this district, was published separately during the year.

In the middle of June I visited Marulan, and reported upon the newly-discovered caves at the Look Down, on the Shoalhaven River. (*Appendix No. 3C.*)

From 10th July to 19th July I was engaged reporting on the Kookarabooka Gold-field, to the east of Gyra.

From 2nd September to 18th September I was at Tumbarumba, and mapped the Tertiary deep lead, which occurs in close relation to the present valley of the Tumbarumba Creek, from Bago Inn to the junction of the Burra and Tumbarumba Creeks, a distance of 20 miles. The undenuded portions of this lead still existing under the basalt have not yet been tested, except in a very superficial way, owing to the presence of large quantities of water. The old channel is evidently present under a considerable portion of the run of basalt, and wherever the drift has been tried it has proved payably workable, while the Pleistocene drift of the present valley were very rich wherever they had derived material from the denudation of the Tertiary deep lead, so that there is every reason to believe that when the portions of the deep lead proper, which are still left intact under the basalt, can be advantageously worked, the results will be very good. (*See Records of Geological Survey, vol. II, Part I.*)

On October 11th I accompanied the Under Secretary, as a member of the Prospecting Board, to the southern coastal district, where we dealt with a large number of applications in the neighbourhood of the following places:—Tarago, Braidwood, Moruya, Mogo, Nerrigundah, Bega, Eden, Bombala, Delegete River, Craigie, Nimitybelle, Kydra, Cooma, Big Badga, Fiery Creek, Cowra Creek, Little Plains, Bredbo, Colinton, Michelago, and Bungendore. We returned to Sydney on November 1st. In the early part of November I was engaged in the office writing the reports and recommendations relating to the applications referring to the foregoing places.

From November 25th to December 16th I was engaged as a member of the Prospecting Board in the Hunter River and New England Districts. Numerous applications were dealt with in the vicinity of the following places:—Dungog, Copeland, Moonan Brook, Stewart's Brook, Tamworth, Bendemeer, and Uralla. The metal-bearing formation at the first four places and to the west of Tamworth is the same, and belongs to the Carboniferous period. It extends from the Hunter River District northwards in a continuous belt to the west of Bingera, and is separated from the older Siluro-Devonian rocks of the New England tableland by an intrusive dyke-mass which has been altered into serpentine. The fossil remains of *Lepidodendron* have been obtained at various places from Copeland to Bingera in this formation, as well as marine fossils which Mr. Etheridge informs me are of undoubted Carboniferous age. The strata have

not

not been much contorted nor altered, and as a rule the dip is never great except locally. The auriferous quartz reefs occurring in this formation are often of considerable extent and size, and in various localities have proved very rich. It is a curious fact that most of the reefs associated with this formation contain a certain proportion of calcite, and in fact reefs wholly composed of calcite are of common occurrence, some of them being gold-bearing. In various localities, such as Stewart's Brook and Copeland; payable reefs of a somewhat permanent character have been and are being opened out, and it is very probable that others will in course of time be discovered over the large area in which this formation is developed.

It will be seen from this report that for nearly three months of the year my time was taken up with prospecting work, in travelling in various parts of the Colony as a member of the Prospecting Board. At various periods of the year, when not engaged in the field, I have been employed in the office writing the reports mentioned above, supervising the preparation of the maps for publication connected with these reports, and other official work during your own and Mr. David's absences from the office.

I have, &c.,

WILLIAM ANDERSON,  
Geological Surveyor.

The Geological Surveyor-in-charge.

#### APPENDIX No. 3A.

##### Report on Bismuth Ores at Ben Lomond, near Glencoe.

Sir,

In accordance with your instructions, I have visited the Mount Mitchell District, near Glencoe, in which bismuth ores have recently been discovered. I have now the honor to furnish you with my report thereon.

The position of these bismuth-bearing veins is in the north-west corner of the parish of Coventry, county of Clarke, and is about a mile to the south-east of Mount Mitchell. The bismuth ores occur distributed in small irregular patches through a series of quartz-veins, averaging from half an inch up to 4 inches in thickness. The quartz is clear and translucent, and towards the centre of some of the veins is crystalline, the pyramidal apices of the crystals from opposite sides of the veins interlocking in the centre. The contained bismuth ore is in the form of oxide, sulphide, and carbonate of bismuth, which in many cases are found to cover a central nucleus of metallic bismuth. The veins traverse a ternary granite, whose general texture and mineral constituents vary very much. Their strike is south-west and north-east, and they pass downwards in a nearly vertical direction, with a slight inclination to each other, as if they would unite at a lower depth. Their outcrop can be traced for a considerable distance along the surface, and small quantities of bismuth can be washed from the soil in the immediate neighbourhood of the outcrop. The veins contain a fair percentage of free gold. Little or no work has yet been done in opening up or proving the extent of the bismuth-bearing veins. A couple of holes have been sunk averaging about 10 feet deep. The mode of occurrence of the bismuth ores here differs slightly from that at the Kingsgate mines, in that at the latter place they occur in pipe-veins near the junction of the granite with the slate; while here they are found in quartz-veins traversing the mass of the granite. Of two assays made of the quartz, one returned 5 per cent. of metallic bismuth, with traces of gold, and the other showed traces of metallic bismuth.

The only positions in granite in which large and permanent mineral-bearing lodes or reefs may be expected to be found are along the lines of junction of an intrusive granite mass or dyke with sedimentary or volcanic rocks, and within the area occupied by the granite wherever there is evidence of the presence of a line of weakness, such as a well-defined fault. When veins or reefs occur in granite where there is no evidence of faulting, as in the present case, they cannot be expected to be of any great size or permanency, because such veins doubtless occupy small fissures, which have been formed either during the cooling and crystallization of the granite, or subsequently by mechanical strain, which had not been sufficiently powerful to produce extensive faulting. Consequently it will no doubt be found, on proving these veins, that they are more or less lenticular in shape, thickening and thinning out, and running together in a very irregular manner, although probably on the same vertical line. They do not present, so far as one can judge from their present development, the same prospects of such large quantities of bismuth ore being obtained as in the case of the pipe-veins at Kingsgate.

In the immediate neighbourhood of this bismuth discovery large tracts of the country have been taken up for the purposes of alluvial tin-mining. The district consists of a tin-bearing granite, on which, in some localities, are undenuded portions of Tertiary basalt, which no doubt locally cover parts of tin-bearing Tertiary river-drifts.

Mount Mitchell itself is composed of this basalt, and from its conical shape and crateriform summit it appears to be the plug of one of the Tertiary volcanoes, which formed one of the centres of eruption for the basaltic lavas whose remnants are seen in isolated patches all over the district.

Although the granite itself has no doubt been the chief source of the alluvial tin, numerous tin-bearing lodes and veins must occur traversing it, for it is a common thing to pick out of the alluvium small pieces of tin, which have undoubtedly come from lodes or veins. One company are at present engaged laying pipes and making arrangements to begin sluicing operations as soon as possible, at a place called Lode Hill, in the vicinity of the bismuth veins. At this spot there is a considerable area covered with Pleistocene alluvial drift, carrying good tin. It occupies a small gully forming one of the sources of the Backwater Creek, a tributary of the Mitchell River. Although this alluvial is, in no case, of very great depth, still, if the sluicing be carried on with care and judgment, good returns may be expected. In numbers of the neighbouring gullies a good deal of prospecting work has been done, and there is little doubt that if this country was judiciously prospected considerable quantities of alluvial tin would be obtained, both in the Pleistocene deposits of the present gullies, and also in the Tertiary drifts, which occur in places under a covering of Tertiary basalt, in connection with which traces of gold have been got in various localities in the district, but they have never been followed up to any extent.

I have, &c.,

W. ANDERSON,  
Geological Surveyor.

The Geological Surveyor-in-charge.

## APPENDIX No. 3B.

Sir,

Geological Survey, Department of Mines, Sydney.

I have the honor to report that I have, according to your instructions, visited the Fiery Creek and Paupong mines, in the Cooma District. You have already received my special report on these mines referring to the granting of aid for the purpose of further prospecting these claims.

Fiery Creek lies about 20 miles from Cooma, in a northerly direction. The fundamental rock of the district consists of Siluro-Devonian slates, which, in different positions, have undergone various degrees of metamorphism. In some places they are little altered, and still show distinctly the original bedding planes, while in others they are highly altered and cleaved. They have been intruded in various places by granite, diorite, &c., and in the immediate vicinity of Cooma large areas of them are covered by Tertiary basalt. To the west of the village of Bunyan, some 5 miles north of Cooma, a series of more or less lenticular beds of limestones occur interbedded among the slates. At the head of Fiery Creek, where the mines occur, the rocks consist of clay slates, which have been considerably altered. Their strike is towards the north, 20 degrees west, and along these lines, whether bedding planes or cleavage lines, probably the former, numberless lenticular veins of auriferous quartz of all sizes are found. They are present throughout a belt of slate which is about a mile in width, and extends for a considerable distance in the direction of strike. They all occur interleaved in the bedding or cleavage of the slates. Numerous leases have been taken up along this belt, and a large amount of work has already been done in sinking and driving on these quartz veins. Their formation, no doubt, has been due to the fact that the strata have undergone great lateral pressure, which has been exerted in the direction of strike, with the consequence that the slates have become slightly crumpled, and lenticular openings have been formed along the planes of least resistance, that is along the planes of bedding. The auriferous quartz has been subsequently introduced into these openings. From the nature of their formation it will be seen that individually they will not be permanent reefs at a depth, but they will be found to follow the angle of dip of the slates, and either give out at a comparatively short distance or make their maximum thickness, and then gradually tail off to nothing. The probability is that they will not be found to occur persistently on one line of bedding when that is followed downwards, but after the giving out of one lenticular vein, the next one will most likely be found on another line of bedding, a few feet, or perhaps yards, to either side of the bedding plane on which the former one occurred. Individually, unless exceedingly rich, they are not likely to pay, for they will not as a rule be found to be of great extent; but if numbers of them were worked together to a depth such that the cost of mining would not be very great they could probably be worked to advantage.

The Paupong mines lie to the south-west of Cooma, in the parish of Wilson, county of Wallace. The country between Cooma and Paupong consists of granite, with here and there highly-altered Siluro-Devonian slates, and covered occasionally with patches of Tertiary basalt. Between Buckley's Crossing, on the Snowy River, and Paupong, the intrusive character of the granite is seen, the slates being highly altered and contorted near the junction. A couple of shafts have been sunk on Baloka Creek, but so far no returns have been obtained. There are indications on the surface of the presence of a lode or reef, and the position for such an occurrence is a favourable one, being in the immediate neighbourhood of the junction between the granite and the slate.

This district, particularly outside the granite areas, is certainly of a metalliferous character, and is one in which some payable reefs and lodes may yet be found. Although much of it has to a certain extent been prospected, it was in the old days of the Kiandra rush when gold was the one metal looked for, and little attention was paid to ores which might contain any of the other commercially valuable metals. In consequence of this there is a wide field in this southern mountainous part of the Colony for the prospecting and discovery of payable lodes and reefs, besides the possibility of patches of payable auriferous Tertiary drift being met with in connection with the undenuded remnants of the Tertiary basaltic lavas which covered so large an area in this part of the Colony.

The Geological Surveyor-in-charge.

I have, &amp;c.,

WILLIAM ANDERSON,

Geological Surveyor.

## APPENDIX No. 3C.

## Report on the Bungonia Caves.

Sir,

25 June, 1889.

I have the honor to report that, in accordance with your instructions, I have visited the newly-discovered caves in the vicinity of the Shoalhaven Valley, near Marulan.

They are situated in the parish of Inverary, county of Argyle, about 13 miles from Marulan and 24 from Goulburn, on the Southern Railway.

They can be reached from either of these places. From Goulburn, by Bungonia, there is a good metalled road to the "Look Down," close to the caves, and also from Marulan, close to Guymers' house, from which the caves are reached by taking a bush-track for about 4 miles down Jerrara Creek. This bush-track, which is a fairly good one, may be avoided by going on to Bungonia, and from thence to the caves, thus making the distance from Marulan 16 miles. It will be seen that the caves are within easy access of the railway, and no difficulty is experienced in reaching them. They are in close proximity to the place known as the "Look Down," which is greatly frequented, particularly during the summer, by people from the neighbouring towns. The "Look Down" is on the top of the outcrop of the limestone in which the caves recur, and from this position a magnificently picturesque view is obtained, looking into the Shoalhaven Valley at its junction with the Jerrara Creek, where there is almost a sheer drop of over a thousand feet, the precipice being formed by the limestone, which dips towards the main valley. The combined Jerrara and Bungonia Creeks, just before it enters the Shoalhaven River, has eroded a narrow, deep, and grand gorge in the limestone, in which there is a beautiful waterfall when there is any volume of water in the creek.

From Marulan to within a couple of miles of the caves the country consists of quartz-porphry, which has been intruded among a series of highly-metamorphosed sedimentary rocks. The limestone in which the caves occur forms part of this series. Its general strike is nearly north and south, and its dip is easterly. It is formed of a series of beds, and attains a considerable thickness. Its outcrop runs nearly parallel with the Shoalhaven Valley, and forms its western slope at this point. The surface of the ground ]

ground on the outcrop of the limestone is slightly undulating, and at intervals there are numerous local depressions, mostly of small size, which are analogous to the "swallow holes" occurring in the chalk formation of England, which have been dissolved out by surface waters finding their way down the joints, and gradually dissolving the lime and increasing their size until they form the entrance to extensive caverns. The majority of these depressions will, no doubt, be found, on exploration, to lead downwards into more or less extensive caves. It is in one such depression that the openings into the newly-discovered caves occurs. This depression is of considerable extent, and into the cave orifices at the bottom of it the surface drainage of the immediate neighbourhood finds its way, so that in times of storm a considerable amount of water flows into the caves.

At present there are two known entrances to the caves, some little distance apart, in the bottom of a somewhat extensive depression. Both are rather narrow, and cumbered with large loose blocks of limestone, which have fallen into the depression. The lower of the two passes immediately downwards, in a nearly vertical direction, so that a rope or ladder is necessary to effect an entrance by it. The other surface opening is a little higher up, and passing through it there is a gradual descent for some distance, when the cavern takes a sharp turn to the right, where there is a more or less vertical drop of about 20 feet, which can be descended by means of a rope. Near the foot of this the first-mentioned surface opening can be seen at a considerable height to the left. Proceeding a short distance in the direction of south 20 degrees east the floor takes another sudden drop, which, in the centre of the cavern, is quite vertical, having in that position been worn away by the water falling over it. The left side of this presents, however, a considerable slope about 30 feet long, which can be descended by means of a rope. At the bottom of this is the largest chamber yet discovered. From this chamber the cave divides into two, one branch taking a westerly and the other an easterly direction. The western one is very rugged and tortuous, the floor being strewn with great blocks of limestone, and at times these and the hollows between them are covered over with great quantities of vegetable debris, which has been carried in by recent rains, and the presence of which necessitates care in one's movements. This cave was followed for a considerable distance, and everywhere there are evidences of the recent presence of flowing water—in fact everything points to the conclusion that when water enters the caves from the surface this is the passage down which it now travels. It was, however, so rugged and difficult of access that we did not follow it to its termination, but so far as it was examined there were no stalactitic growths to be seen. This is no doubt due to the fact that this branch is of comparatively recent origin, and is the present channel by which the water passes downwards. The easterly branch is accessible for a much greater distance than the other, but for a good part of the way progression is chiefly by crawling and climbing. There are, however, a few places where an upright position can be maintained for short distances. In many places narrow and deep channels have been worn by running water in the stalagmitic floor, and these are at present the only pathways. Frequently the existing cavities have been formed by great masses of the roof having fallen in, leaving only very small apertures for exit. At intervals in this cave there occur, chiefly in small lateral cavities, some beautiful stalactitic growths, together with many stalagmitic surfaces, which present a minutely-rippled aspect, resembling in appearance the surface of some composite corals. Such stalactitic chambers are, however, isolated from each other, and are not uniformly distributed throughout the cave. The stalactitic growths are chiefly in the form of tapering acicular pendants of variable length and size, and the expanded leaf-like forms, known as "shaws," some of which are quite translucent. The surface of the floor, which everywhere is of the most uneven character, slopes more or less the whole way from the surface, and the deepest part, in the eastern branch, which was reached (and that not the end of the cave) was not less than 200 feet from the surface. These caves have certainly outlets at a lower level, and it is exceedingly probable that these are situated somewhere on the dip of the limestone, in the western slope of the Shoalhaven Valley, for the drainage must certainly find its way into the Shoalhaven River or into Jerrara Creek.

The close proximity of these caves to an already recognised public resort—the "Look Down"—enhances their value, and although, as yet, no decidedly wonderful stalactitic chambers have been discovered, doubtless numbers of people while visiting the former place will venture to examine them, and for this reason they ought, I think, to be taken charge of by the Government, and such improvements made in them as will secure the safety of visitors. They are undoubtedly of great extent, and it is not at all improbable that if systematically explored portions of them may be found containing such stalactitic growths that it would be advisable to have them preserved from injury, and made accessible to the public. I would, therefore, recommend that the Inspector of Caves be asked to visit them, and take steps to have the necessary improvements made, and to have them thoroughly explored.

The caves are included within a reserve.

I have, &c.,

WILLIAM ANDERSON,  
Geological Surveyor.

The Geological Surveyor-in-charge.

#### APPENDIX No. 4A.

##### Report on a new Gold discovery, County of St. Vincent.

Sir,

Geological Survey Branch, Department of Mines, 31 July, 1889.

In accordance with your instructions, I have visited the newly-discovered reef in the county of St. Vincent, Milton District, and have the honor to submit the following report:—

The reef is situated about 23 miles south-westerly from Ulladulla, and is distant 14 miles due west from the coast. It is readily approached from Milton, and the road, though at present very bad, owing to the exceptionally continuous rains, is fairly direct. Milton can be reached either by steamer to Ulladulla, or by train to Kiama, thence by coach through Nowra. Without actual survey the exact position cannot be given, but taking as starting-point the south-western corner of Moul's selection No. 5, it is in the parish of Currock, close to the western boundary of the parish of Mogood.

In going from Milton five distinct formations are passed over:—

- (1.) Porphyry.
- (2.) Coal-measures.
- (3.) Siluro-Devonian.
- (4.) Pleistocene.
- (5.) Recent.

(1.)

(1.) *Porphyry*.—For a radius of about 4 miles around Milton there is a mass of porphyry, and the soil produced by its decomposition is the mainstay of the district. The whole of the land has been cleared, and is utilized for dairy-farming. From any elevated point one can see where this formation ends and the useless—so far as farming operations are concerned—coal-measures commence.

(2.) *Coal-measures*.—These are met at Coe's turn-off, and extend for some 7 miles towards Burroman. They consist of massive clayey sandstones with occasional beds of shale. In the short time at disposal I was unable to determine whether they belong to the Upper or Lower Marine Series.

(3.) *Siluro-Devonian*.—These rocks occupy a large area, extending, as shown on the accompanying map, for at least 6 miles, and I am informed that for a radius of 5 miles around Messrs. Moulton and Rixon's reef there is no change. The beds consist of clay-schists, tilted at various angles. Leaders of quartz cross them in every direction. Several reefs are known, and with the exception of the one worked by Messrs. Moulton and Rixon they run parallel to the strike.

(4.) *Pleistocene*.—Patches of a loose conglomerate occur on Brimblamala Creek. In one place the top of the bed is about 80 feet above the present creek-level. It consists chiefly of well-rounded pebbles of sandstone, quartzite, &c.

(5.) *Alluvial—Recent*.—This occurs more or less as small patches throughout the district, and in several places contains payable gold. In most of the creeks and gullies colours can be got. On both the Clyde River and Brimblamala Creek patches have been worked. In Fenian Gully the sinking was 8 feet and the wash 2 inches, with a width of about  $1\frac{1}{2}$  chains. Several nuggets are said to have been found, the largest coming from Spur Gully.

*Moulton and Rixon's Reef*.—Gold was discovered in the gullies on both sides of this reef, and traced by Mr. Moulton up to the reef itself, and, as favourable prospects were obtained from the surface, the proprietors were induced to open it up. The dip is south, at 65 degrees; the walls are well defined, and the vein has been sunk on for a depth of 25 feet. The average width is not more than 18 inches, although at the surface there was a blow of about 5 feet; this soon pinched on the hanging-wall side, and at a depth of 10 feet is not more than 18 inches. It then widens slightly on the footwall side, and at the bottom of the shaft is again pinching.

At the surface the gold was coarse, but lower down is scaly. A sample, taken from the bottom of the shaft and crushed while I was at the reef, did not show any gold. Mr. Moulton, however, informs me that encouraging prospects have been obtained from the same level. In places the reef is solid or "bound," but, as a rule, it is rubbly. The quartz itself is compact, and, in addition to gold, contains, in small quantities, galena, zinc-blende, and copper and iron pyrites. So far as proved the gold is patchy, and probably runs in shoots, the extent of which can, of course, only be known by further prospecting to greater depths. Timber is in abundance for mining purposes, and Brimblamala Creek affords a good supply of water. For the last  $2\frac{1}{2}$  miles there is only a bridle-track. A road can readily be made, although the grades will be steep.

Owing to the rough nature of the country there has not been much prospecting, but, as alluvial gold has been found in various places, gold-bearing reefs must exist. The country is worth prospecting.

In conclusion, I desire to acknowledge the kind attention of Messrs. M'Arthur, C.P.S., Moulton and Rixon.

I have, &c.,

GEO. A. STONIER,

Assistant Geological Surveyor.

The Geological Surveyor-in-charge.

#### APPENDIX No. 4B.

##### Report on Tin-bearing Country in the County of Bourke.

Sir, Geological Survey Office, Department of Mines, 9 August, 1889.

In accordance with your instructions, received by me while at Temora, I visited the tin-mine near Broken Dam, and have now the honor to submit the following report:—

The mine is situated as shown upon the accompanying plan (No. 1), in the parish of Langi-kal-kal, County of Bourke, on the leasehold portion of West Mandamah Station, and is distant about 23 miles in a north-westerly direction from Temora. The most convenient railway-station is said to be Coolamon, on the Hay line; the distance, in a direct line, is about 38 miles.

Three leases—one 40 acres, one 60 acres, and the third 80 acres—have been applied for with a view of immediately working the ground.

The ridge, on which the tin was first found, forms a water-parting, and trends in a north-easterly direction. From it spurs run almost at right angles, and gently slope to flats on either side, while between them are patches of alluvial. It is in one of these gullies that the best prospects have up to the present been obtained. The top of the ridge is 290 feet above Mirrool Creek, at Broken Dam, which is about 4 miles distant in a south-easterly direction.

The formations represented are—

- (1.) Granite.
- (2.) Pliocene-Tertiary.
- (3.) Post-Pliocene.

(1.) *Granite*.—Granite is the only rock known for some distance around the leases, but it cannot occupy any great area, as the occurrence of slate has been noted within 4 miles on either side. Hard bosses show up through the soil in places, but there is an absence of "tors," and the rock is so readily decomposed that the crop is frequently much obscured. It consists of quartz, felspar, and mica, both muscovite and biotite. Two distinct kinds occur, and they differ, not in mineral components, but in degree of crystallization, that to the south of the leases containing porphyritic crystals of felspar, white and pinkish white, up to  $1\frac{1}{4}$  inches in length, many of them showing the twinning characteristic of orthoclase.

With the exception of one quartz-reef referred to by the Government Geologist, who visited the district in 1881, as occurring near the north-western corner of reserve 1,977, parish of Mandamah, no reefs of any size have yet been observed. In a tank which is being excavated on block 15, five small veins

veins have been exposed. The thickest is about 8 inches, and carries thin leaders of fine black crystallized tinstone through the quartz. The others vary from 2 inches to the thickness of a knife-blade, and it is stated that each is stanniferous. They run nearly parallel, bear about W. 20° S., and are almost vertical.

(2.) *Pliocene-Tertiary*.—This consists of a drift of quartz, angular and sub-angular, but chiefly well rounded. Some of the blocks are as much as 1 foot 3 inches in diameter. The occurrence of this deposit was noted by the Government Geologist in 1881, in a report on the Temora, Bland, and Merool districts (Annual Report, Department of Mines, 1881, page 138), but up to that time no importance was attached to it.

Several shafts have been sunk, but none have been bottomed, the deepest being 16 feet. In each case tin was found, though not in payable quantity.

These shafts should certainly be bottomed, in order to prove the channel of this ancient Tertiary lead, as it may contain, in places, rich deposits of tin-ore like the Tertiary leads in New England.

The attention of miners should be specially directed to the occurrence of this waterworn drift-deposit, as the old watercourse, of which it is a remnant, must have extended from an easterly to a westerly direction, and where it has crossed belts of gold-bearing formations there is also a probability of discovering payable gold-leads.

(3.) *Post-Pliocene*.—The enormous denudation to which the country has been subjected since Pliocene times has resulted in the Pliocene drift being naturally ground-sluiced, and the tin, contained therein, concentrated in another deposit consisting of the denuded portions of both the Pliocene and the granite. As would be expected, it consists not only of waterworn pebbles, but also mica and clay, the latter from the decomposition of the felspar.

Originally the tin has been derived from veins in the granite or adjoining formations, and doubtless, in various places, veins have directly influenced the richness of the Post-Pliocene lead, but it would seem that most of the ore has passed through the Pliocene drift.

The lead has been proved to the western boundary of Portion 17. Here it has been lost, and, so far, attempts to trace it have failed. At this point the alluvial is wide, but the width of the lead has not yet been determined. Owing to the recent rains, the shafts were full of water, so I was unable to examine any of them. Mr. Roberts informs me that the wash is 5 feet thick, with a good prospect of tin. Whether the lead continues, and is payable further west, can only be determined by actual prospecting work; but it probably does, for it has been the experience in New England, as Mr. Geological-Surveyor David has pointed out in his report on that district, that tin will travel as much as 2 miles from its parent source.

Starting from the western boundary of portion 17, the alluvial can be followed in an easterly direction to the north-western corner of portion 15, and here it receives a branch running parallel to the eastern boundary of that Portion, while the main body continues into Portion 16. No lead has been proved in the latter, hence it is uncertain whether that, which heads from the break in the drift, is the main or a branch lead. Up to this point the rise in the surface is but slight, but now in a distance of 14 chains there is a rise of 32 feet. This part of the lead has received more attention than any other, and it is here that operations are about to be commenced. From the break through the old drift the lead seems to turn east towards the south-eastern corner of Portion 16. The prospect work done has been very little, but in several places the presence of wash carrying good tin has been proved. Tin has also been obtained in the gully running south-westerly from the break, but not in payable quantity.

The tin itself is fine, with a few pieces up to  $\frac{3}{4}$ " in length. Most of it is angular and sub-angular, very few rounded pieces being noticeable. It has evidently not travelled very far from its original matrix. The colour varies from honey-yellow—sometimes translucent—to black. In some cases all the shades can be detected in the one specimen. The associated minerals are tourmaline, magnetic iron, and a little gold. Wolfram is said to occur, but of this I did not see any specimens.

The wash, as it results from the denudation of both the Pliocene drift and the granite, is composed of mica, clay, and irregularly-shaped grains of quartz, with larger and water-worn quartz pebbles. The cementing material is chiefly clay and red peroxide of iron. Its thickness varies from 2 to 5 feet, and the sinking from 10 to 15 feet.

Communication with the railway is easy, but a great difficulty will be the want of water. To meet this, a tank, already referred to, is being excavated on Portion 15, and this, when completed, will have a capacity of 4,000 cubic yards.

No bulk test has yet been made, but Mr. Roberts informs me that from 4 to 16 oz. of ore to the dish have been obtained.

Wherever the Pliocene Tertiary deposit occurs the alluvials resulting from its degradation are well worth testing for gold and tin.

In conclusion, I desire to acknowledge the kind attention of Mr. Surveyor Beasley and the Messrs. Roberts.

The Geological Surveyor-in-charge.

I have, &c.,  
GEO. A. STONIER,  
Assistant Geological Surveyor.

#### APPENDIX No. 4C.

##### Report on "The Peak."

Geological Survey Office, Department of Mines, 13 September, 1889.

Sir,

In accordance with your instructions; I have visited the new rush at the Peak, and have now the honor to submit the following report.

"The Peak" forms part of an isolated ridge, which is about  $1\frac{1}{2}$  miles long. It is situated in the parish of Mingelo, county of Narromine, and is distant about 41 miles from Dubbo, and 29 miles from Parkes. Its position, together with that of the new field at Alick's Flat, is shown on the plan (No. 1) attached. As will be seen, the trial survey line for a railway from Parkes to Dubbo, passes within 3 miles of the field.

The ridge runs in a northerly and southerly direction, has but one decided break, and is the only rise of any consequence in the vicinity. On the west it slopes to the Tertiary plain, the distance to the Bogan being about 3 miles. On the east the flat extends for some distance, and it is 7 miles before hills  
of

of any consequence are met with, viz., the Hervey Range; although, within a mile from the foot of the ridge, there is said to be a crop of diorite. In this alluvial a shaft has been sunk to a depth of 130 feet. The wash is 3 feet thick, and contains sub-angular pebbles of quartz and diorite, up to 8 inches in diameter, in a stiffish clay. So far, only a trace of gold has been obtained. The ground between this shaft and the Peak is well worth attention. The alluvial flat extends northward past the Peak, and then turns to the west, thus being bounded on the south by the Peak; its northern boundary is a low hill of diorite. At this place the width of the alluvial will be about three-quarters of a mile. It should certainly be tested, as it may prove to be the outlet for the lead proved in the 130-foot shaft already referred to. There is, however, said to be to the north-east another flat quite as favourable for an outlet. On the south-east there are several low gently-undulating hills of slate and diorite—the latter being readily recognized by the scanty vegetation it supports. These hills run towards the Ten-mile Ridge, where gold-bearing reefs have been already worked.

The Peak itself is rocky, rises to an elevation of about 200 feet above the Tertiary plain, and is timbered with box, pine, and, at certain elevations, currajong and ironbark. It consists of argillaceous schists, rather arenaceous, and in places talcose, the cleavage of which is all on edge, and running north and south. Parallel to the strike are massive reef-like outcrops of quartz, often cellular as if pyritous at a depth, and brown iron-ore; the latter, with the various striking tints assumed by oxide of iron. These hard masses have resisted the denuding agencies which soon levelled the softer schists, and particularly on the western side, near Madden's lease, they have been left as steps, as shown on the following sketch

section. In places the crop runs round the spur, more as if it were from a horizontal bed than a reef, but this feature is local, and may be due to local faulting, since what seems to be the same mass can be traced farther along. Near the foot of the ridge on the eastern side is a quartz reef, which can be traced north and south for a considerable distance; very little work has yet been done on it.

The slopes from the ridge are broken at the top by watercourses, partaking somewhat of the character of ravines, into spurs running east and west, which gradually flatten out, until what was a well-defined spur broadens into a general slope, with, in places, an almost imperceptible waterway, all trace of the old Pleistocene channels being completely hidden. The ravines have so far yielded most of the gold, as the upturned edges of the schists have acted as natural ripples. At the Peak proper each gully on the western side has been worked, but up to the present one only on the eastern side has yielded payable returns. This one had been passed over as valueless until a heavy storm had ground-slucied it, and proved the existence of payable surfacing. In the face of this fact the other gullies cannot be considered to have been proved.

Attempts to trace the leads into deep ground have not been attended with success. Most of the prospecting has been on the western side, and what appear to be two distinct runs of auriferous wash have been found, but the tracing of them into deeper ground is attended with difficulty, owing to the gradually-sloping and unbroken character of the surface. At the Prospector's claim the sinking is 16 feet, with a wash of 9 inches to 1 foot 5 inches, consisting of sub-angular quartz and ironstone up to 18 inches in diameter, evidently derived from the Peak. Some of the deep shafts have not been bottomed, a stratum of clay having been mistaken for bed-rock; in the former, lime concretions, somewhat resembling fossils, and pieces of magnesite (carbonate of magnesia) are of frequent occurrence.

The alluvial gold is coarse, the largest piece shown to me being 15 dwt. Most of it is coated with iron oxide, and it is but slightly water-worn. In one gully some with quartz attached is said to have been obtained. The gold, got by crushing samples from the ironstone masses, is chiefly fine, though coarse specks and one large piece have been noticed.

The southern end of the ridge, of which the Peak occupies the north, has not received much attention, but it is worth prospecting.

Water supply is a difficulty with which the district generally is troubled, and gilgies are at present the only source of supply for the field, as all the deep shafts about the Peak are dry. The conformation of the surface of the ground is favourable for the construction of tanks for the conservation of water.

The discovery of gold, both here and at Alicks' Flat, but serves to confirm the opinion expressed both by yourself and the Inspector of Mines as to the auriferous nature of this country; and it seems farther to prove the continuation of the auriferous belt of rocks from Forbes and Parkes northerly to Tomingley. This is a very important geological feature, for in the larger valleys, such as that of the Ten-mile Creek, where they have been eroded through this auriferous belt, rich deep leads are likely to exist, and the deep alluvial deposits in such valleys should therefore be well prospected.

In conclusion, I would acknowledge the kind assistance rendered to me by Mr. Gordon.

I have, &c.,

GEO. A. STONIER,

Assistant Geological Surveyor.

The Geological Surveyor-in-charge.

## APPENDIX No. 5.

## Annual Report of the Palæontologist for the year 1889.

Sir,

I have the honour to hand you herewith a progress report of the Palæontological work done during the past year, 1889.

*Memoirs.*—No portion of the Palæontological Memoirs appeared during the period in question, through the accumulation of work at the Government Printing Office. Dr. Feistmantel's Memoir on the Palæozoic and Secondary Plants, however, had at the close of the year all but passed through the press, and will be published shortly. The reading of the proofs and other matters connected with this important essay have occupied much of my attention.

*Supplementary Collection.*—The sorting and transfer of the supplementary collection from the old store-room in the outer basement to the shelves and trays in the new Fossil-room have been completed, and the entire non-exhibited portion of the Departmental Collection has now been examined in a preliminary manner. Nothing further can be done with this series on a large scale until some decisive action is taken in connection with a new Museum building, the amplification and extension of this large and important section of our gatherings having to remain lost to the public. The portions transferred during the past year are the remainder of the Palæozoic and the whole of the Mesozoic and Tertiary.

*Records of the Geological Survey.*—It affords me great pleasure, as editor, to call attention to the completion of the first volume, imparting, as it does, some of the more scientific results of the survey work. The first part of the second volume is in preparation, and well advanced.

*Miscellaneous Determinations.*—The more important miscellaneous determinations made during 1889 in connection with current work are the following:—

1. Recent shells from the Kitchenmidden at Forty Baskets Bay, North Harbour.\*
2. Shells from the Raised Beaches of the Hunter Valley, at Largs, consisting of twenty-four species, as follows:—

Triton piliaris, <i>Linn.</i>	Euchilus baccatus, <i>Menke.</i>
Triton costata, <i>Born.</i>	Ostrca angasi, <i>Sby.</i>
Fusus Hanleyi, <i>Angas.</i>	Anomalocardia trapezia, <i>Desh.</i>
Potamides ebeninus, <i>Brug.</i>	Chione Isabella, <i>Gray.</i>
Natica plumbea, <i>Lamk.</i>	Chione lamellata, <i>Lamk.</i>
Natica conica, <i>Lamk.</i>	Mytilus hirsutus, <i>Lamk.</i>
Nassa unicolor, <i>Kiener.</i>	Pecten tegula, <i>Wood.</i>
Nassa Jonasi, <i>Dunk.</i>	Pecten Strangei, <i>Reeve.</i>
Monilea lentiginosa, <i>Adams.</i>	Tapes turgida, <i>Lamk.</i>
Ricella lutea, <i>Quoy.</i>	Clementia papyracea, <i>Gray.</i>
Spisula cretacea, <i>Angas.</i>	Tellina deltoidea, <i>Lamk.</i>
Lampania australis, <i>Q. and G.</i>	Artemis sculpta, <i>Hanley.</i>

The rarity of raised beach beds along the coast of New South Wales renders the occurrence of these shells particularly interesting, especially as one species, *Pecten Strangei* shows evidence of a warmer climate, and is not known now so far south as the Hunter estuary.

3. Remains of the extinct turtle *Meiolania*, from the Pliocene drift of the Canadian lead, Gulgong; and plates of an extinct fresh-water turtle, allied to the living *Chelodina sulcifera*, Gray.<sup>1</sup>
4. Examination of the Tertiary fossils from New Guinea, collected at Yule Island and other localities during Sir W. Macleay's "Chevert" expedition; others obtained by the Australasian Geographical Society's explorers; and lastly, some specimens presented by Mr. E. Edelfelt.<sup>2</sup>
5. Plants from the measures of the Dubbo coal-field, collected by Mr. Geological-Surveyor Anderson.
6. Elucidation of the structure of two Palæozoic corals—one from the Upper Silurian rocks of Hatton's Corner, near Yass, and named *Tryplasma Lonsdalei*, the other from the Devonian beds of Tamworth, called *Diphyphyllum Porteri*.<sup>3</sup>
7. Preliminary examination of the plants from the fish and plant bed of the Talbrager River, made by the collector Mr. C. Cullen. These are of the highest possible interest, as indicating an alliance of these rocks with those of the Clarence Series of New South Wales, the Ipswich Series of Queensland, and the Wannan and Bellerine beds in Victoria. The most conspicuous plant is a *Teniopteris*, which Professor M'Coy is unable to distinguish from his *T. Daintreei*, so characteristic of the Victorian Mesozoic deposit. A selection of the fish remains has been sent to Mr. A. Smith Woodward, of the British Museum, London. This gentleman writes me that the fish are wholly specifically distinct from those of the Hawkesbury Series at Gosford.
8. Plants collected and presented, by Mr. B. Dunstan, from intercalated shale in the Hawkesbury Sandstone, near Manly. Amongst these is an *Oleandridium*, apparently identical with a similar plant found at Gosford, already in the collection. This is of interest, as showing an additional genus of the *Teniopterida* in the Hawkesbury rocks.
9. Plants from the Coal-Measures at Spicer's Creek, near Wellington, chiefly *Glossopteris*, collected by Mr. Geological-Surveyor Anderson.
10. Devonian fossils from near Mudjee, collected and presented by Mr. A. Lowe. (*See Appendix No. 5 A.*)
11. Fossils from Mr. C. A. Chesney, obtained near Grenfell Run, probably indicating a further locality for Devonian species. (*See Appendix No. 5 B.*)
12. Coal-measure fossils from the Irwin River Coal-field, Western Australia, presented by Mr. Paxton, showing a close identity with those of the New South Wales Coal-measures. (*See Appendix No. 5 C.*)
13. Fossils from a limestone on the Dungog Road, Port Stephens District, in the Lower Carboniferous Series, and revealing *Lepidodendron* in company with a marine fauna. The specimens were collected and presented by Mr. J. Waterhouse, M.A., Inspector of Schools. (*See Appendix No. 5 D.*)

14.

\* See Rec. Geol. Survey New South Wales, 1889, I, pt. 2, p. 142.

<sup>1</sup> Rec. Geol. Survey New South Wales, 1889, I, pt. 3, p. 152.<sup>2</sup> Rec. Geol. Survey New South Wales, 1889, I, pt. 3, p. 172.<sup>3</sup> Rec. Geol. Survey New South Wales, 1890, II, pt. 1 (*in lit.*).

14. Fossils from the new sinking of the Maitland Colliery, obtained and presented by the same gentleman. The organic remains are contained in hard spherical calcareous nodules from the Upper Marine group, and consist of *Conularia inornata*, Dana, associated with large quantities of fossil wood, and examples of *Hyolithes (Theca) lanceolata*, Morris.
15. Fossils from a new locality in the Lower Carboniferous Series, at Torryburn, near Paterson, obtained by the Rev. — Yarrington, M.A., &c., and in a very excellent state of preservation. Amongst them are several examples of a univalve, which enables me to add another genus to our Carboniferous fauna, viz., *Goslettia*, known in the Carboniferous Limestone of Belgium. (See Appendix No. 5E.)
16. Collection of plants from the Clarence River Series, made by yourself, during a late inspection by the Prospecting Board. Amongst these is a *Teniopteris*, near to *T. Daintreei*, which enables me to confirm the occurrence of this interesting genus in these beds, announced some years ago by Mr. E. F. Pittman, Chief Mining Surveyor.
17. The immense collection of mammalian remains made by Mr. C. Cullen, at Myall Creek, near Bingera, has been unpacked and casually examined. The remains of *Diprotodon* and *Nototherium* are very grand, and will enable a far better idea of these animals to be obtained than hitherto. There are numerous teeth of *Scœparnodon*, but we are still in ignorance of any other portion of this animal. There are several examples of strong and massive lower jaws, probably of a new genus allied to *Procoptodon*, Owen.

*Field Work.*—On two occasions during the past year I made an examination of the aboriginal carvings at the head of Bantry Bay, North Harbour. A full description of these remarkable evidences of native art has been prepared, and will appear in a forthcoming number of the Geological Records. I also took advantage of an excursion of the Linnean Society to the Quarantine Ground to examine, in company with Mr. J. Brazier, an excellent rock-shelter, immediately at the landing-stage of the reserve. No carvings or drawings were visible, but a good and untouched ash-talus would probably reward exploration. At the invitation of Mr. John Waterhouse, M.A., I paid a visit to West Maitland, in company with Mr. Geological-Surveyor David, to make a selection of his Permo-Carboniferous fossils from his fine collection previous to its being broken up. Towards the close of the year I made a tour of inspection, with the same officer, round the Maitland and Dungog Districts, with the view of assisting to settle, amongst other points, the stratigraphical position of certain coal-seams, supposed to be in the Lower Carboniferous Series. We obtained evidence of the occurrence of *Gangamopteris* very low in the Lower Marine Series, near Lochinvar, and proved the existence of this plant in company with *Glossopteris* in shales overlying thick coal-seams on the Mammy-Johnston Creek and Ward River. The occurrence of these plants at once removes the seams in question from their hitherto supposed position, and from the surrounding stratigraphical evidence Mr. David is now inclined to consider the seams as a part of the Newcastle or Upper Coal Measures.

*Dunedin Intercolonial Exhibition.*—The collection of New South Wales fossils to be exhibited was gone over, and revised from the condition in which it appeared in Melbourne, many additional forms, especially vertebrata, being added.

*Library.*—The works of reference continue to increase, our application for an interchange of publications with learned societies and other kindred bodies having been very successful.

I have, &c.,

R. ETHERIDGE, Junr.,

Palæontologist.

C. S. Wilkinson, Esq., Geological Surveyor-in-charge.

#### APPENDIX No. 5A.

Miscellaneous Contributions to the Palæontology of Australia.

No. 13.—Report on Palæozoic Fossils from near Mudgee, forwarded by Mr. S. E. Lowe, 6/7/89.

THE fossils, entirely the remains of Brachiopoda, are contained in a calcareous, felspathic, blue-gray rock, simulating the characters of a limestone.

The commonest form is a *Rhynchonella*, after the type of *R. cuboides*, Sby., accompanied by the internal cast of an indefinite *Orthis*, and a single example of a *Pentamerus*, possessing the appearance of a Devonian species.

With the foregoing is a piece of shaly mudstone containing the casts of Crinoid stems, apparently the remains of a coral, and the impression of another Brachiopod, either an *Orthis* or *Orthotetes*.

The general facies of these shells indicates either Upper Silurian or Devonian as the age of the deposit, but from the appearance of the *Rhynchonella*, and *Pentamerus*, I am inclined to ascribe it to the latter period.

The Geological Surveyor-in-charge.

R. E.,  
11/7/89.

#### APPENDIX No. 5B.

Miscellaneous Contributions to the Palæontology of Australasia.

No. 14.—On a probable additional locality for Devonian Fossils in New South Wales, Mount Grenfel Run, 30 miles N.W. of Cobar.

MR. C. A. CHESNEY, of Tindarey Station, near Cobar, has forwarded a small block of fine-grained whitish sandstone from the Mount Grenfel Run, 30 miles north-west of Cobar, containing plentifully internal casts and external impressions of a *Rhynchonella*.

The general appearance of this shell is of the type of the Devonian *Rhynchonella cuboides*, Sby., more particularly of the coarse ribbed varieties. The muscular impressions are well shown on some of our examples, but as those of *R. cuboides* are unknown to me, I simply indicate the alliance of the present fossil. It is distinct from the *Rhynchonella* of the Mount Lambie Devonian sandstone, associated with *Spirifera disjuncta*, Sby., and other fossils.

R. E., 7/9/89.

APPENDIX

## APPENDIX No. 5C.

## Miscellaneous Contributions to the Palæontology of Australasia.

## No. 15.—On Permo-Carboniferous Fossils from the Irwin River Coal-field, Western Australia.

THE fossils presented by Mr. J. M. Paxton, from rocks associated with certain coal-seams from the Irwin River Coal-field, are of great interest on account of the close resemblance they bear to those of the marine groups intercalated with the N.S. Wales Coal Measures, and from the few facts so far published concerning what will probably be a very important mineral-field in the future.

Amongst the fossils is a *Productus* closely allied to our common species *P. brachythærus*, but larger; a *Strophalosia* calling to mind *S. Gerardi*, found both here and in Queensland; a large *Chonetes*; an *Aviculopecten*; the dorsal valve of *Strophomena analoga*, also met with in the Permo-Carboniferous rocks of the two eastern provinces; a *Pleurophorus*, resembling an unnamed species from Greta, another small bivalve, apparently identical with *Parallelodon subarguta*, de Kon., from New South Wales, and other fragmentary shells.

The Irwin River coal-seams, although so long neglected, were certainly known as early as 1846, and a 6-foot seam was reported by Lieut. Helpman, R.N., in 1848.\* He describes the river as running through sandstone and shale.

In 1861, Mr. F. T. Gregory ascribed this coal to the Carboniferous Period† on the faith of a few fossils obtained there by him, such as *Cyathophyllum*, two or three species of *Spirifera*, a *Productus*, and fragmentary stems of Crinoids. So far as I am aware, nothing further has been done towards fixing the age of these mineral deposits, and consequently the fossils obtained through the instrumentality of Mr. Paxton are the more welcome, as sustaining the facts detailed in Mr. Gregory's paper. The latter refers to the Coal Measures on the Irwin as well defined, dipping at a considerable angle, and overlaid unconformably by other sedimentary beds, which he provisionally refers to the Cretaceous. Associated with the Carboniferous fossils presented by Mr. Paxton is a *Cucullæa*, of a totally different lithological aspect to the other fossils, clearly Mesozoic in type, and not far removed from *C. semistriata*, Moore,‡ from the Greenough District, Western Australia. This again lends considerable colour to the geological views of Mr. F. T. Gregory on this part of the Continent.

R.E., 14/9/89.

## APPENDIX No. 5D.

## Miscellaneous Contributions to the Palæontology of Australasia.

## No. 16.—Carboniferous Mollusca in the Lower Carboniferous or Rhacopteris Series of the Port Stephens District, New South Wales.

IN the "Mining and Mineral Statistics," 1875, Mr. J. Mackenzie, Examiner of Coal-fields, gave sections§ showing the occurrence of a marine Carboniferous fauna accompanying plants, such as *Lepidodendron*, *Knorria*, *Calamites*, *Otopteris* (*Rhacopteris*), &c., in strata denominated by him the Lower Coal Measures, but known to the Geological Survey as the Lower Carboniferous or Rhacopteris Series. Notwithstanding the fact that extensive collections have from time to time been made from these Rhacopteris beds, examples of an associated marine fauna have hitherto been lacking in the Mining and Geological Museum, and Mr. Mackenzie's observations seem to have been generally overlooked.

Some months ago Mr. John Waterhouse, M.A., Inspector of Schools, Dungog, presented a few fossils from the Dungog Road, 19 miles from West Maitland, especially drawing our attention to a *Lepidodendron* associated with the marine shells. The fossils are contained in a blue-gray felspathic mudstone, and from Mr. Waterhouse's description it would appear that this stratum forms a part of the above series. So far as determinable, the following is a list of the species:—

*Lepidodendron* (allied to *L. Veltheimianum*, *Sternberg*).  
*Stenopora*.  
*Penestella fossula*, *Lonsdale*.  
*Spirifera*, sp.  
*Rhynchonella pleurodon*, *Phillips*.  
*Retzia* (near *R. ulstrix*, *De Koninck*).  
*Productus* (dorsal valve of a species like *P. semireticulatus*).  
*Conocardium* (probably *C. australe*, *McCoy*).

When in Newcastle some few weeks since, Mr. Mackenzie's section was examined by Mr. T. W. E. David and myself, with the result that we are able to confirm his reported association of the Lower Carboniferous plants and a marine fauna. Still more recently Mr. David has obtained numerous examples of a flaggy shale with highly-decorated and decomposed mollusca, during his recent Port Stephens survey from Lindsay's Branch of Larpent Creek, Karua River, again a portion of the Rhacopteris beds. The species are:—

*Strophalosia*.  
*Athyris* (like *A. Roysii*, or *A. planosulcata*).  
*Platyschisma*, or depressed *Euomphalus*.  
*Naticopsis*, small species.  
*Loxonema*.  
*Bellerophon*.

A consideration of Mr. Mackenzie's original discovery, and the fossils detailed above, leads to the conclusion that the first appearance of Carboniferous Invertebrate life took place at a much lower horizon with us than has usually been admitted.

R.E., 20/9/89.

## APPENDIX No. 5E.

Miscellaneous Contributions to the Palæontology of Australasia.

No. 17.—Additional Carboniferous Mollusca in the Lower Carboniferous Series of the Port Stephens District, New South Wales.

IN Report No. 16 I called attention to the occurrence of marine fossils generally in the beds hitherto termed by the Geological Survey the Lower Carboniferous or Rhacopteris beds. The Rev. Mr. Yarrington has recently presented a small collection from a dam excavation in the same series of rocks, at a new locality, Torryburn, on the station of Mr. R. Logan, twelve miles beyond Paterson, an exceedingly interesting set from their great resemblance to the true Carboniferous Limestone fossils of Europe, and their good state of preservation. The determinable forms are—

- |  |   |
|--|---|
| * <i>Spirifera bisulcata</i> , var <i>crassa</i> , de Kon. (common). | <i>Archæocidaris</i> ? (small spine).                     |
| <i>Productus semireticulatus</i> , Martin.                           | <i>Bellerophon</i> , sp.                                  |
| <i>Strophalosia</i> , or <i>Productus</i> ?                          | <i>Gosseletia</i> ( <i>G. australis</i> , Eth. fl., m.s.) |
| * <i>Orthis australis</i> , McCoy.                                   | <i>Baylea</i> ( <i>B. Koninckii</i> , Eth. fl., m.s.)     |
| <i>Dielasma</i> , sp.  | <i>Loxonema</i> , sp.                                     |

Of this series, only four, those denoted with an \*, are so far known to the writer to occur in either of the Marine Groups of the higher Permo-Carboniferous Series. As a whole, they are exceedingly interesting, because they tend to support fast accumulating evidence of the strong relation which appears to exist palæontologically between our Lower Carboniferous beds and the European Carboniferous Limestone generally; and from their excellent state of preservation.

The *Orthis australis*, McCoy, is one of the group of *O. Michelini*, Lev., very characteristic of such rocks in Great Britain. *Gosseletia* is a univalve, found in the Carboniferous Limestone of Belgium, and now for the first time recognized in Australia. *Baylea*, again a Belgian shell, is already known to me from the Permo-Carboniferous rocks of Queensland. Both the *Athyris* and *Chonetes* are also very characteristic Old World Carboniferous species.

R.E., 6/11/89.

## APPENDIX No. 6.

Geological Survey Branch, Department of Mines, Sydney, 21 February, 1890.

Sir,

I have the honor to hand you the following report upon the work performed during 1889, in connection with exhibitions, examination and testing of specimens, the Mining and Geological Museum and Library, donations received, and collections prepared and dispatched.

*Exhibitions.*

The Melbourne International Exhibition closed on the 26th January. In accordance with your instructions, I proceeded to Melbourne a few days prior to that date, to arrange for the packing and return of the New South Wales mineral exhibits. This work was delayed, by order of the Executive Commissioner, for one week after the official closing, pending the decision of the New South Wales Government with reference to the representation of the Colony at the Paris Exhibition; the proposal having been negatived, dismantling was begun and vigorously carried on. Having supervised the packing and dispatch of the most important of the mineral exhibits, I returned to Sydney, leaving Mr. Ford to complete the work.

The large additions to the departmental collections received as donations from exhibitors at the Adelaide and Melbourne Exhibitions necessitated increased storage room; this was obtained by renting two flats of Messrs. Wall and Molesworth's store in Loftus-street, to which the exhibits and the show-cases mentioned in my last report were removed.

A few months after the completion of this work the importance of New South Wales being represented at the New Zealand and South Seas Exhibition was recognized by the Government. The Honorable the Minister for Mines thereupon directed that the collection, preparation, and arrangement of all the mineral exhibits of the Colony should be undertaken by the Department of Mines. I was deputed by you to carry out this work (*See Appendix 6A*). Having the large collections above alluded to in hand, it was only necessary to procure exhibits from mines or deposits not previously represented or developed to complete the display.

Having been allowed the services of Mr. Ford, who had assisted me in preparing for several previous Exhibitions, the dispatch of exhibits from the departmental store was early begun, so that upon my arrival in Dunedin, on the morning of the 22nd October, the great bulk of the mineral exhibits were in the Court ready for the work of arrangement. Up to the end of the year 1,266 packages were dispatched by the Department.

I am pleased to report that the mineral court was in perfect order on the opening day, and that the representation of the mineral resources of the Colony contained therein, is the most complete yet made at any Exhibition; this is due to the large collections of the Department being in hand at the commencement of arrangements, and thus enabling the proper grouping of the various ores to be carried out, an object not alway attainable at previous Exhibitions, owing to late or non-arrival of private exhibits intended for definite positions in the plan of arrangement.

The mineral court embraces an area of a little over 10,000 square feet, and is admirably situated, the best position in the space allotted to New South Wales, having been set aside by the Commissioner for this purpose.

The exhibits are mostly the property of the Department, thus, out of 169 entries in the mineral section, 139 are by the Minister for Mines, the remainder being private exhibits collected by his direction.

The large departmental collections of timbers, engraving-woods, barks, gums, resins, seeds, &c., occupy a prominent position on the north side of the Court, facing the main cross-avenue.

The

The extensiveness and completeness of the display made by New South Wales in the mineral section evoked very favourable comment and considerable astonishment, and is acknowledged to be one of the features of the whole Exhibition.

While upon the subject of Exhibitions, I venture to make a few remarks upon the part taken by the Department of Mines, in connection with the representation of the Colony, at the various Exhibitions in which it has taken part, and to offer some suggestions for facilitating and cheapening the work to be performed in the future. I do this in the light of experience gained in connection with the practical work of each important Exhibition at which the Colony has been represented, from the Sydney International of 1879 to the present. During that period scarcely a year has passed without New South Wales participating in Exhibitions held either abroad or in the neighbouring Colonies, until of late the representations and work connected therewith have become almost continuous.

The preparation of a thoroughly representative exhibit of the mineral resources *de novo* on each occasion involves considerable labour and expense; to obviate this the Department has since the Adelaide Exhibition of 1887 secured and retained all suitable exhibits for further exhibition and museum purposes; having these in hand, it only becomes necessary on succeeding occasions to obtain exhibits from the more recently developed or discovered deposits. The wisdom of thus retaining a bulk supply is fully exemplified by the reduced expenditure, and greater facility for proper arrangement.

As the Department possesses the requisite organization, and an intimate knowledge of the occurrence and extent of the natural resources under its control, I beg to suggest, with a view to expedition and economy, that it be solely entrusted with the preparation and arrangement of future mineral displays; as a matter of fact it has been virtually so entrusted, but in a roundabout way through Commissions. By adopting the suggestion here made, and having this portion of the representation of the Colony's resources under the direct control of the responsible Minister, the Commissions would be enabled to devote their attention to the other resources and miscellaneous exhibits; and the Department, in its work, would be free to act without the delay of filtering every little detail of initial work connected with a subject requiring special knowledge through a body less qualified to deal with it, and one which meets only at intervals.

It would be advantageous also to have the expenditure and control in connection with the arrangement and charge of the Mineral Courts under the responsible Minister.

The success which has attended the mineral displays of the Colony has undoubtedly resulted from the action of the Department of Mines, and justifies the belief that, if the control be centered and simplified in the manner indicated, economy will be no less signalized than successful display.

#### *Assays.*

The demand for examination and testing of samples has continued during the year, though not to the same extent as in the previous year, when the silver boom was at its height, but still sufficiently to show that this aid to the development of the mineral resources of the Colony is greatly appreciated by the public.

Of the large number of samples submitted to the Department during the year, 3,287 were selected for treatment in the laboratory; of these, 3,221 were completed by the end of the year. Though the number of samples sent to the laboratory during 1889 is considerably less than during the previous year, it is still 1,001 in excess of the number in any other year.

Full particulars of the work performed by the Assayer and Analyst, Mr. J. C. H. Mingaye, and his Assistants, will be found in the accompanying analytical return prepared for insertion in the Annual Report of the Under Secretary for Mines, under the heads of the different metals and minerals; also in Mr. Mingaye's Report (Appendix No. 7).

#### *Mining and Geological Museum.*

In addition to the numerous donations of minerals and fossils to the Mining and Geological Museum, as seen in the appended list, Appendix No. 6 B, the collection has been enriched by large additions of specimens collected by the Geological Surveyor-in-charge, in the Tenterfield, Clarence, and Richmond River Districts, and other localities; from the Hunter River Coal-field and various other districts, by Mr. Geological-surveyor David; from the Broken Hill District, by the Chief Inspector of Mines; from Rouchel Brook, Scone, Wilbertree, near Mudgee, Goodiman, near Gulgong, and from Denison Town, by the Collector, Mr. C. Cullen.

Regularly each year since the destruction of the Garden Palace, the necessity for a proper building to serve as a Mining and Geological Museum has been urged; the accumulation of valuable specimens and the development of mining each succeeding year have added weight to the representations made, until at the present time the evidence is overwhelming as to the urgency of putting the Museum on a proper footing, when, in conjunction with the Geological Survey and the proposed Metallurgical Works, it would form an important and necessary means of education in this rich mining country. The present structure is not only utterly inadequate, but thoroughly unweathertight, and in spite of constant patching is becoming worse each year, until at last it has become necessary to cover the show-cases with oilcloth when it rains, and to prop the maps, photos., &c., out from the walls. There is little doubt but that we possess at the present time ample material for the grandest display of its kind in the Southern Hemisphere, and almost all the show-cases required, together with the desire to make it what it should be, a credit to the Colony possessing such magnificent natural resources, instead of the undoubted reproach which it is.

#### *Library.*

During the year, 578 volumes and parts of volumes have been added to the Library of the Mining and Geological Museum. The distribution of the departmental publications to kindred surveys, scientific societies, and individuals engaged in scientific pursuits, has resulted in many instances in the establishment of regular exchanges of publications, to the mutual advantage of each, and the dissemination of valuable information regarding the resources of this Colony in many parts of the world.

The Library now contains upwards of 2,940 publications. (*See Appendix No. 6 C.*)

#### *Collections.*

*Collections.*

Collections of economic minerals were prepared during the year for the following Institutions and individuals, those marked with an asterisk being in return for donations received :—

Germany.—German Government.	
"    *Royal Saxonian Mineralogical and Geological Museum, Dresden.	
Denmark.—Danish Government.	
Holland.—Hamburgh Exhibition.	
California.—*G. Campbell, Grose Valley.	
Victoria.—*J. Mitchell.	
"    *Technological Museum.	
Tasmania.—*Hobart Museum.	
"    *Launceston Museum.	
Queensland.—*Per Secretary, Queensland Commission, Melbourne Exhibition.	
South Australia.—*School of Mines, Adelaide.	
"    *J. G. Knight, Northern Territory.	
New Zealand.—*Mines Department, per Inspector of Mines.	
Bingera, New South Wales.—School of Arts.	
Berry,                   "                  "	(Broughton's Creek.)
Cobar,                   "                  "	
Cobargo,               "                  "	
Candelo,               "                  "	
Gulgong,               "                  "	Free Public Library.
Glen Innes,           "                  "	
Grafton,               "                  "	School of Arts.

Gunnedah,            "                  "	Lands Office.
Mudgee,               "                  "	School of Arts.
Moruya,               "                  "	
Nowra,                "                  "	
Richmond,            "                  "	
Singleton,            "                  "	
Sydney,               "                  "	Marist's Brothers School.
Wellington,           "                  "	Free Public Library.
Wolumla,             "                  "	School of Arts.
Ulladulla,            "                  "	Agricultural Society.

During my absence in the early and latter parts of the year in connection with the Melbourne and New Zealand Exhibitions, my office duties were performed by Mr. G. A. Stonier, Assistant Geological Surveyor.

The clerical work in connection with the examination and assay of samples has been very heavy, but the returns have received prompt dispatch, either on the day received from the Laboratory or the day following.

My Assistant, Mr. Whittel, has been most assiduous in attention to his duties, and by his steady application at the mineralogy and chemistry classes at the Technical College, and the practical work of the office, has qualified himself to be of great assistance in connection with the examination of specimens, in addition to the clerical work connected therewith.

The temporary assistant—Malcolm Morrison—has been diligent and painstaking in the work entrusted to him.

A number of ornamental stones and other specimens for exhibition and museum purposes have been cut and polished by W. H. Gelding, who also rendered general assistance as required.

I have, &c.,

JOSEPH E. CARNE, F.G.S.,

Curator.

The Geological Surveyor-in-charge.

---

APPENDIX No. 6A.

Sir,                   Geological Survey Branch, Department of Mines, Sydney, 20 December, 1889.  
I have the honour to inform you of my return from the New Zealand and South Seas Exhibition.

The Honourable the Minister for Mines having directed that the collection, preparation, and arrangement of all the mineral exhibits from New South Wales should be undertaken by the Department of Mines, you deputed me to carry out this duty. Having completed the arrangement of the Mineral Court before my departure from New Zealand, I am happy to state that this representation of the mineral resources of the Colony is more complete than any made at previous Exhibitions. This is chiefly owing to the principal collections from the Adelaide and Melbourne Exhibitions, which were handed over to the Department, having been supplemented by additions recently obtained.

Mr. O. Meyer, Commissioner for New South Wales, afforded every facility for carrying out the work entrusted to me, and granted the best and most prominent position for the Mineral Court in the space allotted to New South Wales in the Exhibition.

The Mineral Court occupies an area of over 10,000 square feet, and presents a very massive appearance, owing to the numerous bulky trophies arranged therein, which impress visitors with a sense of the abundance of the ores thus represented.

In the portion of the catalogue devoted to this section it will be seen that of 169 entries, 139 are by the Minister for Mines, the balance being private exhibits collected by his direction. The 139 entries represent single important or bulk exhibits, and large general collections.

In addition to the minerals, in the Forestry and Educational Exhibits the Minister for Mines has twelve entries, which embrace the large collections of timbers, engraving-woods, &c., and publications of the Department.

1,266 packages of exhibits and show-cases were dispatched from the departmental store.

The aggregate value of the exhibits cannot be less than £10,000. The reef and alluvial gold specimens, which are attracting great attention, are alone intrinsically worth £3,000.

If the actual cost to the country of obtaining the exhibits from all parts of the Colony be estimated, I have little doubt that the above sum would be doubled; hence the wisdom and economy of keeping such a collection permanently in hand is very apparent, to which can be added from time to time exhibits from new discoveries.

Briefly

Briefly noting the various exhibits—the display of coal and shale is very good; the full sections of the seams worked in some of the principal collieries, which are exhibited, afford convincing evidence of the character and extent of the coal resources of the Colony. The richness of the petroleum oil cannel coal is well illustrated by the products obtained from it by the Australian Kerosene Oil Company at Joadja Creek. The splendid section of coal exhibited by the Centenary Coal and Coke Company, Curlewis, may be mentioned without invidious distinction, because it represents a further development of our immense coal resources at a distance 256 miles north-west of Sydney.

Gold and gold-bearing ores are well represented, care being taken to have the diverse associations of this metal with other baser metals fully exemplified.

The display of silver ores is very extensive. It is to be regretted, however, that the directors of the principal Broken Hill mines could not see their way clear to supplement the exhibits of the Department from their mines, by others which would have rendered them as prominent in the Mineral Court as they are in the commercial world as sterling investments, which could have been done with very little expense.

I was enabled in several instances to arrange trophies of silver ores showing the change from easily-reducible oxidised ores to refractory sulphides and arsenides at the water-level, for the purpose of drawing attention to the latter, upon the economical treatment of which depends the ultimate successful working of many argentiferous deposits in the Colony.

Tin ores are well represented from the New England and Barrier Range Tin-fields. Copper ores also form a prominent feature. Antimony, lead, iron, manganese, bismuth, &c., occupy conspicuous places, whilst the non-metallic economic minerals, including gem-stones, are fairly represented.

The occurrence of the diamond in New South Wales is well illustrated by large samples of the diamondiferous drift from New England.

Building and ornamental stones, with brick-earths and shales, form a feature in the Court.

From the principal sedimentary formations of the Colony is exhibited a large and instructive suite of characteristic fossils.

The maps and publications of this Department complete the display.

It would be entirely beyond the scope of this brief report to specifically, or even generally, describe the contents of the Mineral Court, which is admitted to be—as at Adelaide and Melbourne—one of the features of the whole Exhibition; but, as one deeply interested in this branch of the practical work of the Department, and qualified by some considerable experience gained at several Exhibitions, I venture to respectfully urge the expediency and wisdom of keeping alive the interest which international displays awaken in these natural, essential, elements of national progress and prosperity. This can best be done by having a display of the mineral treasures of the Colony permanently on view within its borders, in addition to adequate representation at International Exhibitions.

The present unsuitable structure in use as a Mining and Geological Museum provides space for only about one-fourth of the glass show-cases in hand, and an infinitesimal proportion of the vast collections available for museum as well as exhibition purposes.

A proper museum in connection with the Geological Survey and Metallurgical Works would form an important and necessary means of education in this rich mining country.

It is always with a feeling of keen regret that I demolish the magnificent displays which New South Wales makes of her mineral wealth at exhibitions, and bury them away in the gloom of store and cellar, to be resurrected for brief intervals from time to time.

In connection with exhibition work, the successful illustration of the mineral resources of New South Wales at the principal exhibitions of late years, in which the Colony has taken part, has been undoubtedly due to the Department of Mines undertaking the duty of preparation and arrangement, and justifies the opinion that, if entrusted solely with the work on such occasions, greater simplicity and economy in carrying out the necessary arrangements would be secured.

I beg to tender my thanks to the Commissioner for his courtesy and assistance, and to acknowledge the great services rendered by Mr. H. Winchester, of the Coal-fields Office, Newcastle, and Mr. T. Ford, the latter of whom remains in charge of the Court.

I desire also to express my appreciation of the able and willing assistance rendered me by the decorator (Mr. W. C. Hibble), and the foremen of the carpenters and labourers (M. Hemme and H. Potier).

I have, &c.,

JOSEPH E. CARNE, F.G.S.,  
Curator and Mineralogist.

The Geological Surveyor-in-charge.

#### APPENDIX No. 6B.

#### DONATIONS to the Mining and Geological Museum during 1889.

Donor.	Donation.	Locality.
Mr. J. P. Abbott, M.P. ...	Agates .....	Near Mount Wingen.
Mr. J. Abigail .....	Auriferous quartz .....	Mountain Maid, Coolongolook.
Mr. A. H. Barclay .....	do .....	Herbert Park, near Armidale.
Mr. J. J. R. Bignell .....	Collection of various minerals .....	Victoria.
Mr. J. B. Bouregard .....	Silver ore .....	Koh-i-noor Mine, Captain's Flat.
Mr. A. T. Brooke .....	Metacarpal bone of kangaroo .....	Bingera.
Mr. W. Brown, M.P. ....	Galena with fluorspar .....	Alla Mine, Purnamoota.
Mr. J. B. Byrnes .....	Fragments of teeth and bones of <i>Diprotodon</i> <i>Australis</i> .	Bingera.
Rev. J. Campbell .....	Quartz, with telluride of gold and silver .....	Waihi, New Zealand.
Mr. Campbell .....	Rock crystals .....	Clarence District.
Mr. H. Copeland, M.P. ...	Pyrophyllite .....	Craigie.
Hon. J. Davies, C.M.G., M.L.C.	Zircon sand .....	George's River.
Mr. H. Dawson, M.P. ...	Agates, quartz, &c. ....	Crewah River, near Bibbenluke.
Mr. S. Dixon .....	Auriferous ores .....	Braidwood.
Mr. S. Dodds .....	Collection of Carboniferous marine fossils ...	Mount Vincent, Maitland District.
Mr. A. H. Doudney .....	Fossil wood and ironstone concretion .....	Mount Poole.

Mr. A. Hollings .....	Bright bituminous coal .....	Buttat Creek.
Mr. D. Howison .....	Fossil plants, coal, quartz, and calcite with pyrites, and calcite showing cone in cone structure.	Potts' Hill Reservoir.
Mr. J. K. Hume .....	Plant impressions .....	Nepean Creek, Mount Gilead.
Mr. Hutchinson .....	Blown sand .....	McGregor Ranges, Queensland.
Mr. E. Irby .....	Collection of silver ores .....	Homeward Bound Silver-mining Company's property, Pye's Creek.
Do .....	Cassiterite .....	Near Tenterfield.
Mr. J. C. Irving .....	Basalt with glassy felspar .....	Sandlands Range, between Clarence and Richmond Rivers.
Mr. J. Irwin .....	Baryta and pyromorphite .....	Braidwood District.
Mr. S. H. Jones .....	Pseudomorphs of limonite after pyrites, with gold.	Malara Scrub, 20 miles south-west of Solferino.
Do .....	Auriferous quartz .....	Nymboida Reef, west of Nana Creek.
Messrs. Kennedy and Bateman.	Tin ore .....	Balladine, near Tenterfield.
Mr. La Meslé .....	Quartz crystal with tourmaline .....	New South Wales.
Mr. C. Loutzen .....	Coal .....	Lane Cove River.
Mr. W. R. Marsh .....	Zircon .....	Launceston, Tasmania.
Mr. F. McIntosh .....	Siliceous clay-shale, showing rectangular fracture.	Gordon, Lane Cove River.
Mr. A. Molyneux .....	Auriferous quartz .....	Adelong.
Mr. A. Morton (Curator, Tasmanian Museum).	Skulls of Tasmanian devil and Tasmanian tiger.	Tasmania.
Do .....	Zirconite with hydro-nickel-magnesite .....	Whyte River, North-west Tasmania.
Mr. Moseley .....	Gold-bearing wash .....	The Needles, 18 miles from Carcoar.
Mr. Moulton .....	Quartz showing free gold .....	Bimbermalla, Clyde River.
Mr. D. Munro .....	Infusorial earth .....	Parish of North Codrington.
Mr. W. E. Myring .....	Quartz with stibnite .....	Malina, Western Australia.
Mr. A. Nicholson .....	Auriferous quartz .....	Jubilee Claim, Nana Creek.
Mr. L. Nicholson .....	Silver ores and associated rocks .....	Mount Costigan Silver Mine.
Mr. W. C. Ord .....	Silver ore .....	New England Broken Hill Mine, near Deepwater.
Mr. H. Parkes .....	Cerussite .....	Parkes Silver Mine, Right Arm Creek, Yalwal.
Mr. J. Paul .....	Silver ore .....	North Dalcoath Mine, Camborne, Cornwall.
Mr. Paul .....	Quartz and felspathic lodestuff showing free gold.	Yalwal.
Mr. W. H. Rands .....	Cinnabar .....	Kilkivan, Queensland.
Mr. T. Rault .....	Tin ore .....	Mount Bischoff, Tasmania.
Mr. C. P. Richards .....	Auriferous and argentiferous ores .....	Croydon, Queensland.
Mr. W. M. Richards .....	Auriferous quartz .....	Mountain Maid Gold Mine, Coolooloolook.
Mr. Rossiter .....	Silver ore .....	White Rock Silver Mine, Drake.
Mr. D. Shaw .....	Coal .....	Buttat Colliery.
Mr. F. G. Simpson .....	Collection of bismuth ores and associated rocks.	Mount Shamrock, Queensland.
Mr. G. Smith .....	Quartz with gold and stibnite .....	Baker's Creek Gold Mine, Hillgrove, near Armidale.
Mr. Smithers .....	Quartz with mispickel .....	Hillgrove.
Mr. H. Southey .....	Gem drift .....	Nepean River, near Mittagong.
Mr. H. L. Steel .....	Quartz .....	Green Cape.
Dr. Storer .....	Petroleum oil .....	Near Gisborne, New Zealand.
Do .....	Stibnite .....	Bundaberg Mine Queensland.
Do .....	Tertiary leaves .....	Under cobalt beds at Bungonia.
Do .....	Mica .....	Macdonald Ranges, Central Australia.
Do .....	Gold-bearing quartz veins in slate .....	Raul Pahang, Malay Peninsula.
Mr. E. G. Street .....	Opals in vesicular basalt .....	Rocky Ridge Creek, Abercrombie.
Mr. J. Tat .....	Dolomite .....	Sydney Mt Claim, Coroia.
Do .....	Silver ore .....	The Parkes Silver Mine, Right Arm Creek, near Yalwal, Shoalhaven.
The Manager, Donkey Hill Mine, Adelong.	Auriferous pyritous quartz .....	Donkey Hill Mine, Adelong.
The Secretary, Australian Alum Co.	Alunite and alum prepared therefrom .....	Buladelah.
Mr. Train, Chairman New Bathurst Gold-mining Co.	Pyritous quartz showing gold freely .....	New Bathurst Gold Mine, near Trunkey.
Mr. W. T. L. Travers, F.L.S.	Sand-worn stone .....	Evans Bay, New Zealand.
Mr. J. Waterhouse, M.A.	Shells .....	A raised sea-beach at Largs.
Mr. W. Waugh .....	Silver ore .....	Pye's Creek Silver-mining Co's property, Pye's Creek.
Mr. Withers .....	Lignite .....	Fly Brook, north-east of Cape Lewis, Western Australia.
Mr. C. Wooller .....	Allophane .....	Undercliff Station, Wilson's Downfall, New England.

## APPENDIX No. 7.

## Progress Report for 1889.

Sir, Department of Mines, Geological Survey Branch Laboratory, Sydney, 3 February, 1890.

I have the honor to furnish you with the following report respecting the work performed in the Laboratory, and progress made during the year 1889.

3,287 numbered samples were received for analyses and assay, they being all completed and reported upon by the 7th January, 1890. 151 ultimate and proximate analyses were made, and 29 samples submitted to qualitative analyses. In addition to these analyses, many of the samples were examined, when thought necessary, for the presence of the rarer metals.

1,481	samples assayed for silver, yielded nil.
1,378	" " " under 20 oz. per ton.
150	" " " over 20 oz. "
1,763	" " for gold, nil.
909	" " " under 10 dwt. "
335	" " " over 10 dwt. "

The following assays were made during the year:—

ANTIMONY.—Twenty samples.	MANGANESE.—Three samples.
BISMUTH.—Eighteen samples.	PLATINUM.—Seven samples.
COPPER.—Fifty-four samples.	TIN.—Twenty-seven samples.
COBALT and NICKEL.—Eleven samples.	ZINC.—Two samples.
IRON.—Twenty-four samples.	GOLD.—3,007 samples.
LEAD.—Thirty-two samples.	SILVER.—3,009 samples.

The

The following analyses were made during the year :—

COAL.—Ninety-one samples.  
SHALE.—Twenty-five samples.  
COKE.—Two samples.  
LIMESTONES, &c.—Nine samples.  
IRON ORE.—Five samples.

PHOSPHATIC EARTHS.—Three samples.  
POTABLE WATER.—Five samples.  
OTHER THAN POTABLE WATERS.—Four samples.  
MISCELLANEOUS ANALYSES.—Seven samples.

The following shows the number of samples received from the year 1883 to 1889 :—

Year 1883.....	242 samples.	Year 1887.....	2,222 samples.
„ 1884.....	664 „	„ *1888.....	5,245 „
„ 1885.....	1,428 „	„ 1889.....	3,287 „
„ 1886.....	1,807 „		

Full particulars of most of these analyses and assays will be found in the report furnished by the Under Secretary to The Honorable the Minister for Mines.

On comparing the number of analyses and assays made this year with those for all previous years, excepting for 1888, the year of the great Mining Boom, it will be noticed that they have considerably increased in quantity.

A large number of the analyses made have been complicated, and taken up a considerable amount of time and careful work on the part of the Assistant (Mr. H. P. White) and myself.

Acting on instructions received from the Department, on the 12th January, I visited the Parramatta Water Supply, and obtained samples of the water, as supplied to the town, for the purpose of ascertaining its purity for drinking purposes. An analysis and report was furnished on the 16th January.

Waters from the "Jenolan Caves" and a well at "Lewis Ponds" were examined, with a view of ascertaining their suitability for drinking purposes; also samples from "Rockdale," mineral water from a thermal spring at Cliefden, and from a bore put down at Cuttaburra. With reference to the latter samples an analysis gave as follows :—

Total solid residue, 396·872 grains per gallon.

Analysis.	Grains per gallon.
Silica .....	1·596
Protoxide of iron .....	0·112
Alumina .....	trace
Carbonate of lime .....	6·664
Carbonate of magnesia .....	0·336
Chloride of magnesium .....	4·190
Chloride of sodium .....	349·040
Chloride of potassium .....	trace
Chloride of calcium .....	27·580
Chloride of ammonium .....	0·642
Alkaline carbonates, organic matter, strong trace of bromine, trace of iodine, lithia, nitrates, &c., &c. ....	6·712
	<b>396·872</b>

Water clear, free from odour. On tasting, was strongly saline, due to the chloride of sodium (common salt) present. The small quantity of water received prevented a more exhaustive analysis being made.

The presence of bromine and iodine in a water of this description is uncommon. Iodine is stated by many authorities to be present in most samples of potable waters, it being derived from the fresh-water plants, which mostly contain traces. The Government Analyst informs me that on one occasion he detected iodine in traces present in a water submitted to him for analysis.

Several light-coloured powders, probably sinters from mineral-water spring deposits, were quantitatively and qualitatively examined and reported upon.

Two teeth, covered with a steel-gray coating, stated to have been taken from a supposed diseased calf, were received for analysis and report. The analysis made proved the deposit to consist of phosphates of lime and magnesia, organic matter, animal matter, and a strong trace of manganese, to which no doubt it owes its colour. This deposit is salivary calculus or tartar, which may have been the means of causing sickness among the young animals by acting on the gums and periosteum, thus keeping up chronic inflammation.

Several samples of limestone were examined for their hydraulic properties, and submitted to analysis with the view of ascertaining their suitability for the manufacture of Portland cement. This article of commerce has, I believe, not as yet been manufactured on a large scale in the Colony, but I have no doubt the difficulties experienced will be overcome in time.

Analyses of fire-clays were made, and the samples tested as to whether a good description of fire-bricks and tiles could be made from the clays, and many crucibles tested which had been made from the various clays around Sydney. Platinum was detected *in situ* in small quantities in three minerals obtained from the Broken Hill District. The samples yielded on assay as follows :—

Mark No. 1,911. (Ochreous felspathic lodestuff).

Platinum—1 oz. 9 cwt. 9 gr. per ton.

Mark No. 1,912. (Compact ferruginous clay-stone.)

Platinum—6 dwt. 12 gr. per ton.

Mark No. 1,913. (Ferruginous felspathic rock, with green carbonate of copper.)

Platinum—a strong trace (under 5 dwt. per ton).

The platinum occurs associated with the metals which usually accompany it in a very fine disseminated state through the lode, bearing material so fine that I doubt if it could be extracted by concentration and after treatment. The quantity present in the samples is too small to pay to profitably extract.

Three samples of phosphatic earths taken from the Moruya Caves were examined, the constituents determined being the phosphoric acid, nitrogen, carbonate of lime, insoluble matter, &c. The samples yielded from 22·64 to 65·12 per cent. of tricalcic phosphate ( $\text{Ca}_3\text{P}_2\text{O}_8$ ), and nitrogen existing as azotised organic matter, &c., equal to ammonia, from 4·53 per cent. to 3·52 per cent. This deposit, even in small quantities, is valuable as a fertilizer.

For

\* The large increase this year due to the Mining Boom.

For some years a highly resinous substance, the composition consisting largely of lime existing in the state of carbonate, has come under my notice, and twice this year a substance similar in appearance and composition was received for analysis. On the 3rd March, during my absence on leave, the Assistant furnished a partial analysis of a sample stated to have been obtained from the Moruya District. His report is as follows:—

Matters volatile at red heat.....	39.48 per cent.
Non-volatile „ .....	60.52 „
	100.00

The non-volatile portion was found to consist of carbonate of lime, with a small quantity of silica, alumina, magnesia, &c., the volatile of resinous matters.

On the 26th June a sample similar in appearance was received for analysis from the Candelo District. The specimen yielded as follows:—

ANALYSIS.	
Volatile at red heat .....	38.92
Carbonate of lime (by diff.).....	59.10
Silica .....	1.02
Alumina .....	.80
Moisture.....	.16
Traces of oxide of iron, manganese, magnesia, alkalis, and phosphoric acid.....	...
	100.00

38.85 per cent., or practically the whole of the volatile portion, was found soluble in alcohol, forming a yellow-coloured solution, somewhat resembling the article sold under the name of "oak varnish." On burning the extract off, it gave the smell peculiar to resinous matters, as well as a dense smoky flame.

This substance was reported upon some years ago by the late Government Analyst (Mr. Watt), who gave it as his opinion that it was an artificial product. Some say that it has been used by the Telegraph Department, but I have instituted every inquiry, with the result that the substance was not in any case recognized by them.

On my suggestions, a sum, not exceeding £60, was made available by the Department for the purpose of obtaining chemical apparatus, pure chemicals, &c. The apparatus ordered are of the latest design, and comprise a complete set of appliances for water analysis, this being greatly needed in order to carry out the many analyses of potable and mineral waters received in the Laboratory.

A complete set of Classen's apparatus for the electrolytic deposition of metals was ordered, the force employed being a Clamond thermo-pile of 156 elements. This apparatus will be used chiefly for the estimation of copper, cobalt, and nickel. The other apparatus ordered are varied and useful, most of them being required in every-day uses in the Laboratory.

I have much pleasure in reporting that the apparatus and appliances in use are in good order, the Laboratory being well found in pure reagents, the most of which will hold out till the supply ordered arrives from England.

In conclusion, I would venture to touch on a matter which is very beneficial to the prospectors, who chiefly avail themselves of the assays made by the Department, and that is, a thorough and systematic manner of taking samples before submitting same for assay. The taking of a thorough average of a sample is, as you are aware, not a difficult matter, but only requires a little trouble, which is well paid for, as the assays furnished will then represent fairly a yield from an average of the lode, which a few pieces taken indiscriminately do not, but are often misleading.

I would respectfully suggest for your consideration that a printed slip be attached to each assay certificate issued by the Department, giving the fullest information on the subject. These circulars would, by this means, be thoroughly distributed among the prospectors, and it would only be a matter of time before average samples would be forwarded for assay.

During the time I was away on leave of absence the Assistant (Mr. H. P. White, F.C.S.) ably performed the duties connected with supervising the work of the Laboratory. My thanks are due to him, also to the Second Assistant (Mr. Neilson) and C. Hilderbrant for the help they have given me in carrying out the large amount of work received in the Laboratory during the year.

I have, &c.,  
JOHN C. H. MINGAYE, F.C.S.,  
Analyst and Assayer.

The Geological Surveyor-in-charge.

#### APPENDIX No. 8.

Sir, Department of Mines, Geological Survey Branch, January, 1890.

I have the honor to submit the following progress report on the caves for the year 1889.

During the year I have paid visits of inspection to the different caves, and supervised the carrying out of such works for their improvement and protection as was thought advisable, and the funds available admit of.

The most extensive operations in this respect have been undertaken at Jenolan, the principal and most extensive caves, where important improvements are now in course of progress.

New caves have been discovered at the following places, viz.:—Bungonia, reported on by Mr. Anderson, G.S. (*see Appendix No. 3C*), and extensions to same, reported on by myself (*see Appendix No. 8A*), at Uranbene, near Moruya, the discovery of which was reported to Department by Mr. Warden Maunsell. Also at Yessabah, particulars of which, accompanied by a recommendation to reserve an area of land as a cave reserve, were furnished by yourself.

The first-mentioned caves, viz., Bungonia, have been brought under Government supervision, and a keeper placed in charge, and preliminary improvements carried out. The caves at Moruya and Yessabah not having been thoroughly inspected, it has not yet been deemed advisable to appoint keepers for those places, but if, after inspection, they are considered of sufficient importance, such appointment may be recommended.

A comparatively small but very pretty cave has been discovered at Wombeyan by the keeper, Mr. M. Chalker, in close proximity to the splendid cave discovered in 1888. (*See Appendix No. 8C*)

In

In October last, acting under your instructions, I inspected and reported on a proposed road from the Jenolan Caves to the Kowmung Walls and Waterfall, a picturesquely-situated spot, commanding extensive views of good mountain scenery, situated on the Kowmung River, about 15 miles east of the Caves. (*See Appendix No. 8B*).

The total number of visitors to the different caves during the year was 5,119, being an increase of 1,011 on those of the year previous.

Following are particulars of the number of visitors, improvements, &c., at the different caves for the year 1889, viz. :—

*Jenolan Caves.*

Number of visitors, 1,657, a slight decrease, as compared with the previous year, which may perhaps be accounted for by the number of people attracted to two of the other colonies by their respective exhibitions. The district people visiting these caves form a very small minority, whereas at most of the other caves they make up the greater bulk of the visitors. The most important of the improvements carried out here is the erection of Turbine for driving the Electric Light. The work has been well executed, and a most satisfactory trial as to its power has been made. The turbine will replace the steam-engine at present in use, and its motive-power being water a large saving annually in the cost of firewood, &c., will result. A new 100-light dynamo has been placed in position, which will, without delay, be connected to the existing lamps of the Imperial cave, and at an early date extended to a system of lamps intended for the Lucas and Easter caves. Thus by the new arrangement provision will be made for lighting by electricity a space threetimes larger than at present, and at a greatly reduced cost. The other improvements comprise the erection of a cottage for the engine driver, also the building of new stables, now in course of progress, and minor improvements in and about the caves. Tenders have been received for the building of a new dam on creek, capable of storing three months' supply of water for the Accommodation House, &c.

*Wombeyan Caves.*

Number of visitors, 373, about equal to the number for last year. A good Accommodation House has just been erected, which was greatly needed. The lack of such accommodation, necessitating visitors camping out in the open, was the cause of a large number of intending visitors postponing their visit until the house was completed. Further improvements have been carried out in the caves, and the new cave recently discovered will be protected and opened up directly the necessary material can be prepared.

*Wellington Caves.*

Number of visitors, 2,637, being a large increase on those of the previous year. An open shelter-shed for the use of visitors has been erected, and the surroundings planted with suitable trees, shrubs, &c., which will tend to make the cave precincts both ornamental and pleasing.

*Yarrangobilly Caves.*

Number of visitors, 112. Full number not recorded; those for January and February, two of the busiest months, were omitted, the first signatures in book dating from March. The full returns would probably show a good increase on last year. During the three winter months very few people visit these caves on account of the extreme cold.

*Abercrombie Caves.*

Number of visitors, 248. This being the first year the number has been recorded, the first appointment of keeper being in January, 1889, who reports that visitors from most of the other colonies have inspected the caves during the year.

*Bungonia Caves.*

Number of visitors, 92. This return embraces only the latter part of the year. Portions of these caves were discovered about six months ago by Mr. Louis Guymier (*See Appendices Nos. 3C and 8A*), who was eventually appointed keeper. They are situated about 4 miles from Bungonia, at a place locally known as the "Look Down," by which name the caves were known for a time, but not being considered appropriate, it was decided by the Minister that they should be called by their present name.

In reference to the discovery of these caves, Mr. E. Du Faur, F.R.G.S., states :—"Fully twenty years ago, E. Twynam, then District Surveyor, Goulburn, J. Allworth, L.S., and myself, returning from an official trip down the Shoalhaven (*via* Marulan), noticed a considerable tract of country which had no apparent outlet for flood-waters, unless underground. Clearing away some rubbish at the lowest point, we penetrated a large cavern, but, having only one candle, we could not go very far. We came to the edge of a precipice, down which we could hear the stones we threw clattering for several seconds. But we did not pretend to have discovered the caves, as their existence had been known for many years previously, and there was a tradition that an early French settler, Huon, was lost in them. My friend Mr. Twynam tells me that he revisited these caves about five years since with friends. On our first visit, 1868 or '69, we had the idea of returning to them with better appliances, and by throwing a few bags of sawdust down the precipice before referred to, we thought that after rain, Mr. Allworth, who was surveying the Shoalhaven River, might be able to trace the connection from the caves into that river, which must receive the overflow water, but, like many another pleasant plan, circumstances prevented our ever carrying it out."

Superintendent of Caves.

The Geological Surveyor-in-charge, Department of Mines.

APPENDIX No. 8A.

Sir,

Department of Mines, Geological Survey Branch, 5 August, 1889.

I have the honor to report, in accordance with instructions, having visited the Bungonia Caves, near Marulan, with a view to submitting recommendations for their preservation and improvement, and also to report on the latest discoveries there. Since Mr. Geological-Surveyor Anderson's visit the following new discoveries have been made, viz. :—First, in the large or main cave (previously reported on), at a point about midway between the mouth and the present terminus of cave, and in direction due north from entrance, is found one of the prettiest spots as yet known of this extensive cave. It is in the form of a fine collection of snowy-white stalactites, stalagmites, &c., thickly covering an area of about 150 square feet, in a horizontal fissure-like cavity, formed in the side wall about 12 feet above the floor, and beyond

beyond the reach of the waters periodically flowing through the cave. These dripstone formations are necessarily smaller than usual owing to the narrowness of the cavity, which does not average more than 2 feet from floor to roof. By ascending an easy gradient, a good view of the whole formation can be obtained from the edge of cavity without entering. Lighted with the magnesium lamp, this branch contrasts remarkably with the immense sombre rugged rocks in the immediate vicinity, wedged together in all conceivable shapes.

Another cave, discovered by the same person (Mr. Louis Guymet), apparently quite distinct from, and situated about 300 yards north-east of the entrance to main cave, is remarkable, in that the sides and roof appear to be almost entirely made up of Silurian fossils. On the whole they are very clear and distinct, owing to the frequent washings the passages are subjected to by storm-waters; this is especially noticeable in one part, where the otherwise lofty passage is followed by a long tunnel-like aperture through which one is just able to make headway in a lying posture. The circular roof of this natural tunnel being almost polished by the action of water, &c., presents clear and sharp outlines of different fossils the whole distance, about 50 feet. In this cave, as far as explored (about 300 feet), a pretty crystal-like formation takes the place of the more general stalactitic growths found in the other caves; but this may not be the case further, on where the cave appears to branch off into many different directions. Three vertical drops of 30 feet, 15 feet, and 10 feet each were met with, which monopolised all our available ropes, and so precluded us from proceeding much further than the distance named. This cave might very appropriately be termed the Fossil Cave.

The other cave, discovered by Mr. Wm. Hogan, is within 100 yards of the one last described, which, in some respects, it much resembles on a larger scale. After a gradual descent of about 50 feet in a westerly direction, you find yourself on the edge of a sheer drop of from 40 to 50 feet. This wall of rock forms the northern end of an immense chasm, bounded on each side by perpendicular walls, thus forming a spacious and lofty cave, gradually decreasing in size at the southern end until it becomes quite a narrow passage, the flooring being made up of large broken boulders.

It will take some time, even with the best appliances, to thoroughly explore the caves herein referred to; it will then, I think, be found that they are connected—their general bearing being towards a common channel, and all more or less become subterranean watercourses during the time of heavy storms.

The large area of limestone country in this neighbourhood offers a splendid field for exploration, and, if carried out systematically, I have no doubt but that the result will be most satisfactory.

I have, &c.,

W. S. LEIGH,

Superintendent of Caves.

The Geological Surveyor-in-charge.

#### APPENDIX No. 8B.

##### Report on proposed Road to the Kowmung Walls and Waterfall.

Sir,

24 October, 1889.

I have the honor to report, as requested, on the proposed road to the Kowmung Walls and Waterfall. The Kowmung Walls are situated in the county of Westmoreland, about 15 miles east of the Jenolan Caves, and 28 miles from the town of Oberon. The present bridle-track branches off from the Oberon to Caves Road, at a point about 4 miles from the caves, and 14 miles from Oberon. It runs in a south-easterly direction, over an undulating country thickly timbered with the gum and blackbut, and passing from Green Camp Hill at 2 miles, and C. Whalan's selection at 7 miles, intersects the Boyd River at 14 miles from the "Turn Off" or starting-point on the Oberon Road. The country here becomes comparatively level, and occasionally large open grassy flats, somewhat swampy, are crossed. Outcrops of granite occur at different points on the road, and at 17 miles, the track bearing south, a number of large boulders of the same class of rock are found piled up on each other. From the top of these a splendid view of mountain scenery, embracing more than half the horizon, meets the eye. From this point the track takes an easterly course 3 miles over a flat country thickly covered with Mallee scrub, and passing through this it descends abruptly a deep gully, forming the northern boundary of the Kowmung Walls, and terminates at the foot of the Walls beneath an immense overhanging rock, or rock-shelter, the camping ground.

What is known as the Kowmung Walls is an elevated tract of clear grassy level land, in area about 2,500 acres, branching off from a narrow neck of land at the northern end into three arms running south and south-east. This plateau is bounded on all sides by precipitous walls of hard pebbly sandstone and conglomerate, from which it takes the name of the "Walls." From almost any point on the plateau a wide range of some of the wildest, most rugged, and picturesque mountain scenery meets the view. After a sheer drop, in some places of 500 feet, without a break in the face of this massive formation, the base of the wall is lost amidst the thick vegetation covering the hill-sides which descend to the centre of the gorges on every side at depths varying from 1,000 feet to 1,500 feet below the top of the precipices. From the northern end of the Walls, looking north-west up the Konangaroo River, which bounds this part of the plateau, can be seen, about 1½ mile distant, one of the prettiest and largest waterfalls met with on the mountains. This fall, at the time of my visit, was most remarkable, compared with other falls in the mountain district, for the large volume of water falling over the precipice, with scarcely a break, to a depth of close on 500 feet, into a large natural basin, from which it boils over, and breaking away over immense boulders, loses itself amidst a labyrinth of ferns and other vegetation in the gorge hundreds of feet below.

Viewed from the point named, no less than six other waterfalls of different depths can be seen in the vicinity of the large fall, these, of course, adding greatly to the beauty of the scene in this particular direction.

Other points of interest are the coal-seam and some supposed aboriginal drawings on the walls. The outcrop of coal is at the southern end of the middle arm of the plateau, the exposed face of which is about 500 feet in length, by an average thickness of 5 feet, a rough section of which is appended. Above the coal a good view is obtained of the country in the direction of Camden, and directly opposite, across the gully, a large table-topped mountain, known as Big Rick, stands out very prominently, and near this is Burns Gap, an immense natural cutting in the mountain range, which serves as an outlet to places lying east, such as Picton, Camden, &c.

The supposed aboriginal chalkings appear under a rock-shelter at the base of the precipitous wall edging the south-eastern arm of the Kowmung. There are about a dozen different sketches representing human beings in the most fantastic attitudes, varying in height from 6 inches to 2 feet. An aboriginal tomahawk and spear were found in close proximity to the drawings.

On

On the whole, the Kowmung Walls scenery compares favourably with any other portion of the Blue Mountains, and, from a sportsman's point of view, surpasses most other mountain resorts. Almost every class of game common to Australia is met with in abundance in the vicinity—in fact, the kangaroos and wallabies appeared to hold undisputed possession of large tracts in this locality; lyre birds and pigeons are also very plentiful, and splendid fishing can be obtained on the Kowmung River, a mile or two distant.

Some of the most generally-known timbers found in the district are the gum, blackbutt, sassafras, cedar, &c. The last-named, I understand, exists in large quantities in the surrounding gullies, a large trade in which would be opened up in the event of better means of access being provided. Some of this timber has already reached the market by way of Cox's River, but as it can only be carried down the creeks to the river in times of flood, which occur at long intervals, this means has proved most unsatisfactory.

To conclude, the Kowmung Walls and surroundings present a new field to the tourist and sportsman alike, and on this account, and for other reasons mentioned below, I would strongly recommend that the wishes of the Oberon Progress Committee and residents generally be favourably considered, and that a road be cleared to connect with the Oberon Road 4 miles above the caves, the approximate position of which is shown on tracing herewith. The proposed road would run through almost level country the whole distance, and as only three or four culverts and little cutting would be necessary, I consider the total cost would not reach £500.

1. The track runs through Crown lands, and by carrying out the work before the land is taken up, the road could be constructed so as to embrace the best views and retain the level country.

2. Many visitors to the caves would take advantage of this road in order to do a few days shooting or sight-seeing of newly opened-up mountain scenery.

3. Most of the road would run through excellent country, and thus open it up to the selector.

4. A selector has already cleared a dray-track 7 or 8 miles, which, at little cost, could be made into a good buggy-track.

5. By means of the proposed road the Kowmung cedar could be transported at a far less cost than the present system admits of, and it is stated a large trade in this direction would be the result.

I have, &c.,

W. S. LEIGH.

The Geological Surveyor-in-charge.

#### APPENDIX No. 8C.

Sir,

Department of Mines, Geological Survey Branch, 28 January, 1889.

I have the honor to report the discovery of a new cave by Mr. M. Chalker, keeper at the Wombeyan Caves. Having just visited these caves in connection with other matters, I, at the same time, made an inspection of the new discovery. The entrance is situated on the same hillside, and within about 3 chains of the splendid cave discovered here in 1888, which was the means of bringing Wombeyan into greater prominence as a resort for sightseers of this class of natural wonders. The discovery under notice adds still further to the importance of these caves as a whole, for, although not so large as the one above referred to, yet, if we consider the great variety of form and colour assumed by its stalactitic growths, it is, if anything, more beautiful. A connection between the two caves may eventually be discovered, and very probably extensions in other directions found, but the passage through as far as explored could be accomplished nicely in one and a half hours, yet I can safely assert that in this short space of time the visitor would behold almost as much pure glistening dripstone formation as could be seen in some of the best-known stalactite caves taking three times as long to explore. It might be compared with one of the branches of the Imperial Caves at Jenolan, with the greater part of its beautiful stalactite formations packed together and only occupying about one-quarter of the space. The interior is gained by descending about 30 feet through a funnel-like opening, just sufficiently large to squeeze oneself through, when you find yourself on a kind of balcony overlooking the main chamber of the cave. This chamber is built up of fallen rocks, piled together in a very irregular fashion, and is about 100 feet in length by 80 feet in width, and from 50 to 60 feet in height. The floor is reached by a gradual descent, and from this point the cave is explored by first ascending on an inclined plane about 20 feet, and thereby landing on a kind of gallery projecting from the side wall to the right of entrance. By following this elevated platform or gallery an undulating circular course is traversed, which, after leading into small branches and to the extreme end of cave as far as yet explored, brings you back to the starting-point, thus doing away with the necessity for retracing your steps, as is generally found necessary in other caves.

Almost every known kind of stalactitic growth is met with, ranging from the fine needle-like pendants thickly studding the roof to the immense pure white fluted columns, apparently designed to support the mass of rock overhead. One part of the cave bears a striking resemblance to a ruined mansion, the columns and the ceiling, with its innumerable stalactites, having fallen together in a confused heap. Some of these stalactites have continued to grow even after the fall of the parent mass, and thereby present a very peculiar appearance, in that they are elbowed, as if bent by the fall.

A splendid stalagmite, 10 feet in height, standing alone, and very similar to the "Lot's Wife" of the Jenolan Caves, is met with; also a large crystallized mound, resembling, in miniature, a range of mountains, with their dividing gullies, the whole having a coating resembling pure snow, some of which, having become dissolved as it were, has formed lakes with glistening crystal-like surfaces at the base of mountains. From some of the large projecting rocks, hang gracefully thin sheets of pure white and coloured transparent drapery-like formations, similar to the "shawls" and "fringes" so much admired in other well-known caves. At the extreme end of the cave is a long, narrow chamber, the formations in which are grouped very uniformly, and resemble in colour and shape the finest terra-cotta ware, the stalactites being particularly noticeable on account of their long, narrow, tapering points.

In its present state the cave is rather rough to explore, and I would suggest that it be improved, protected, and opened up as soon as the necessary material can be provided, particulars of which will be submitted on a separate paper. Temporary provision has been made for its protection.

I have, &c.,

W. S. LEIGH,

Superintendent of Caves.

1890.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

**MINING.**

(REPORT ON PEAK HILL GOLD-FIELD.)

*Ordered by the Legislative Assembly to be printed, 1 July, 1890.*

The Geological Surveyor to The Under Secretary for Mines.

Sir, Geological Survey Branch, Department of Mines, Sydney, 17 June, 1890.

I have the honor to report that, in accordance with your verbal instructions, given me on June 12th, I left Sydney the same evening for Peak Hill, accompanied by Mr. Geological-Surveyor Stonier, and as far as the limited time prescribed to us in our instructions would admit, we inquired into the general state of mining there, with special reference to the nature of the veins where they had been sunk upon to any depth.

Owing to the very boggy state of the road between Molong and Peak Hill we were unable to reach the latter locality until the afternoon of June 14th, and had to leave on the following afternoon in order to reach Sydney this morning.

The present population of the field is estimated by the Warden to be about 1,000, though some are of opinion that there may be as many as 1,200 (including women and children). Of this number, perhaps, between 200 or 300 are engaged in alluvial gold-mining, and about fifty are employed on wages working on the leases. The remainder are either occupied in business pursuits, arising out of the requirements of the new township, which is fast springing up around Peak Hill, or are watching the course of events.

Mr. Tempest, the manager of the Australian Joint Stock Bank at Peak Hill, informed me that, to his knowledge, at least 15,000 oz. of gold had already been obtained from this field, worth on the average £4 0s. 9d. per oz. when cleaned. The total value of the gold known to have been won from this field up to date, according to this lowest estimate would, therefore, be worth about £60,562.

Of the alluvial mines we examined a lead now being worked principally on Toroni's and M'Donald's claims, running parallel to Aldridge's Lead, and a short distance to the north of it. The sinking here is said to be from 25 ft. to 30 ft., the gutter 5 ft. wide, and the wash to be about 1 ft. 6 in. thick, and the yield about 3 oz. of gold to the load. We were informed that about 150 oz. of gold had been won from Donald M'Donald's claim in an area hardly as large as three men's ground. Lindberg and party, near here, have won about 50 oz. of gold in a similar area. The sinking is stated to be from 3 ft. to 22 ft. At the Bolder Lead, at the north-east end of Peak Hill, a gutter has been worked for a length of about 300 yards, trending from south to north. The gutter is said to be about 10 ft. wide, the wash 1 ft. thick, and to have averaged about  $\frac{1}{2}$  oz. of gold to the load, and depth of sinking to vary from a few feet to 27 ft. Some of the water-worn blocks of quartz in this lead are from 1 ft. to 2 ft. in diameter.

On the west side of Peak Hill, and to the north of the township, an alluvial lead is being traced in a west-north-westerly direction, near to the north-west corner of lease application G.L. 140, and this lead has already been worked for a distance of about 14 chains. As regards the reefs, the principal work with reference to testing them at a depth appears to have been done on Madden's, Williams', and Kelly's leases. At the north-west corner of Williams' lease a shaft has been sunk to a depth of 32 ft., and at 13 ft. westerly from the bottom of the shaft a reef has been cut, and a drive, which has already been proved for a thickness of 5 ft. 6 in. This reef is composed of drusy quartz, much coated and stained with oxides of iron. The foot-wall of this reef is very well defined, and consists of talc slate, very soft and of a deep brownish-red colour next to the reef. The hanging wall had not been reached up to the date of our inspection. The reef dips west 38 degrees north at 80 degrees. Three samples, selected by Mr. Stonier and myself, each representing as far as possible a third of the whole width of the reef, have been assayed to-day by Mr. J. C. H. Mingaye, F.C.S., the Department's analyst and assayer, with the following results:—No. 1,433, next foot-wall yielding

Gold, a trace under 2 dwt. per ton.

Silver, 5 dwt. 20 grs. per ton.

No. 1,432. Middle portion of vein yielding—

Gold, a trace per ton.

Silver, 4 dwt. 5 grs. per ton.

No. 1,431. Portion of vein seen west of and next to preceding, yielding—

Gold, a trace per ton.

Silver, 2 dwt. 14 grs. per ton.

The results of these assays do not of course necessarily imply that this reef may not be payable gold-bearing, for in the first place, however carefully samples may be selected from a reef, and however accurately they may be assayed, they do not always represent a fair average of what the reef would yield on a large scale, which can only be ascertained by bulk crushings; and, in the second place, it is always possible that the part of the reef from which samples are taken belong to one of the belts of barren vein-stone which have so often been proved by experience, especially in the case of New South Wales gold reefs, to intervene between the payable gold-bearing shoots in the veins. The mere fact that these assays show the reef at this spot to be poor in gold cannot be taken as any criterion that the yield of the reefs will diminish at a depth, for on Madden's lease, as will presently be shown, the reefs at a depth of 86 ft. appear to be—locally, at any rate—as rich in gold as they are at the surface. In the 32-ft shaft above referred to, from which the drive has been extended to intersect the 5 ft. 6 in. reef, a section is exposed of a vein of porous ferruginous quartz from 2 in. to 9 in. wide. The shape of this vein is very irregular, but one at least of the walls shows strong evidence slickensides, as does the footwall of the 5 ft. 6 in. reef.

Mr. Williams informed us that he had lately forwarded to the Clyde Crashing and Chlorination Works, near Parramatta, 2 tons of ore, chiefly from the surface at the top of the hill in his lease, and the return showed the amount of gold per ton to be 19 dwt. 10 grs.

In Dennis Madden and party's lease we examined a large open excavation and cross-cut at a depth of 37 ft., which intersects several veins of ferruginous porous quartz, and intervening masses of country rock, consisting of talc slate charged with iron and silica. This mass is locally known as the dyke. The total length of the crosscut is 36 ft., and its direction is E. 30° N. and W. 30° S., whereas the strike of the quartz-veins in this mass is chiefly in an east and west direction. Six samples, selected as far as possible as fair representatives of the parts of the ore body from which they were taken, were broken off the following portions of the mass by Mr. Stonier and myself, and have been assayed by the Department's Assayer and Analyst, with the following results:—

Each sample represents the length specified, taken along the mass on a bearing east 30° north, and commencing at the western end of the crosscut, No. 1,436, representing 0 ft. to 5 ft.

A silicated ferruginous talc slate, with numerous minute cavities, soft and friable, from decomposition, yielding,—

Gold, 2 dwt. 14 gr. per ton.

Silver, 2 dwt. 6 gr. „

No. 1,437, representing 5 ft. to 10 ft. Sample to the preceding, but a trifle more silicated, yielding—

Gold, 3 dwt. 6 gr. per ton.

Silver, a trace.

No. 1,438, representing 10 ft. to 15 ft. Sample similar to 1,436, yielding—

Gold, 17 dwt. 15 gr. per ton.

Silver, a trace.

No. 1,439, representing 15 ft. to 20 ft. Sample similar to 1,437, yielding—

Gold, 7 dwt. 4 gr. per ton.

Silver, a trace.

No. 1,440, representing 20 to 28 ft. Sample similar to No. 1,437, but containing some true quartz and a good deal of highly silicated talc slate yielding,—

Gold, 1 oz. 1 dwt. 13 gr. per ton.

Silver, 6 dwt. 12 gr. per ton.

No. 1,441, representing 28 to 36 ft. Sample similar to preceding, yielding,—

Gold, 7 dwt. 20 gr. per ton.

Silver, 2 dwt. 14 gr. per ton.

These assays, especially the last four, are very encouraging, but, as already stated, such tests do not necessarily form a fair criterion of the probable average yield of this mass.

The prospecting works on this mass were not sufficiently far advanced to enable us to form even an approximate idea of its dimensions, which, however, must be considerable.

Near the north-western corner of the same lease a shaft has been sunk to a depth of 86 ft. upon a nearly vertical vein of ferruginous talc slate, somewhat silicified with thin veins of porous quartz and oxides of iron. The strike of the vein at the bottom of the shaft is east 25 degrees south and west 25 degrees north, but this direction of strike may be purely local. As yet the eastern wall only has been proved in the shaft, and consists of a whitish-grey talcose slate. The vein dips slightly to the east to a depth of 70 ft., and thence to the 86-ft. level it dips slightly to the west.

At 8 ft. above the bottom of the shaft a strongly-marked oblique fissure or floor intersects the vein at an angle of about 30 degrees from the horizontal, and dips about S.S.W. Several cavities or vughs are observable in this floor, partly filled with earthy oxides of iron.

The vein material, even at the bottom of the shaft, is quite soft and friable from decomposition, and apparently does not contain pyrites, at all events in any appreciable quantity. This vein, at the 86-foot level, has already been proved for a width of 4 ft. 3 in., but the western wall has not yet been reached.

Samples selected by Mr. Stonier and myself have been assayed by the Government Assayer and Analyst, with the following results:—

No. 1,434 sample, representing one-half of the portion of the vein exposed in shaft next to the eastern wall, yielding—

Gold, 5 dwt. 5 gr. per ton.

Silver, 2 dwt. 13 gr. per ton.

No. 1,435 sample, representing western half of the portion of the vein exposed in the shaft yielding—

Gold, 3 oz. 15 dwt. 18 gr. per ton.

Silver, a trace.

The respective portions of the vein from which these samples were taken do not exhibit any striking dissimilarity in appearance, and yet their respective yields of gold, as proved by the assays, are very different—a fact to be taken probably rather as an indication of the uneven distribution of the gold throughout the vein-stone than of the gold being confined chiefly to one side of the vein. The uneven distribution of gold in the Peak Hill veins is a subject which has already been commented on by Mr. E. F. Pittman, Associate R.S.M., the Chief Mining Surveyor, in his report, already furnished.

The

The results of these assays and explorations are, in our opinion, particularly encouraging, for two reasons:—(1) They prove that the veins continue to be gold-bearing to a depth of at least 86 ft., and that the vein at this depth is in places, at any rate, rich in gold. The surface of the ground at this shaft is moreover about 120 ft. below the level of the reefs at the highest point of Peak Hill, so that it may reasonably be expected that the latter will be gold-bearing to a depth of at least 120 ft., plus 86 ft., equals 206 ft. (2) The highly decomposed state of the vein material at the bottom of the 86-ft. shaft, in spite of the shaft being already below the level of part of the adjoining plain, together with the apparent entire absence of pyrites, shows that the zone of sulphide ores, which must underlie these upper oxidized portions, may not be expected to be reached for perhaps a considerable depth yet, a supposition which is somewhat confirmed by the general absence of water in the alluvials which mantle round the base of the Peak. The question as to the maximum depth to which these oxidized ores extend is one of vital importance to the future of this field, and it would, in our opinion, be very advantageous if one or more shafts were carried right down through the upper oxidized portions of the veins into the sulphide ores. The leaseholders would then know approximately what quantity of ore they would have at their disposal capable of being treated by the usual processes of crushing and amalgamation, combined with special appliances for saving the fine gold, and what quantity would perhaps require to be chlorinated. Near the surface of this 86-ft. shaft in Madden's lease a mass of ferruginous quartz and silicified talc slate strikes about east 5 degrees south. The mass is 4 ft. 6 in. in width, and passes at the sides into ochreous yellow and dark-reddish purple talc slate, and is considered by Mr. Gibson, the manager, to be a continuation of the vein just described, although the strike differs considerably from that of the one seen at the bottom of the 86-ft. shaft. The large reef of white quartz in Gorman's lease has not yet been sunk upon to any depth. The general strike of this reef, as proved by recent openings along its line of outcrop, is north 5 degrees east, and at a shaft at the north-east end of the reef the reef underlies at 47 degrees to the east.

Want of time did not admit of our inspecting several important properties on this field, all of us visiting the New Rush, about 3 miles in a southerly direction from Peak Hill towards the Ten Mile.

*Ridges.*—Loose blocks of gold-bearing quartz are reported to have been discovered here, and efforts are being made to trace them up to their parent reef.

#### SUMMARY.

The chief conclusions to be drawn, in our opinion, from the reports already furnished by the various officers of this department, and from what we were able to observe on this occasion, are:—(1) That there is still a considerable amount of alluvial gold to be won from this field, which will probably give employment to a number of miners for some time to come; and (2) that there is a large body of oxidized ore, some of which will probably prove payably auriferous down to the water-level, and the working of which should afford employment to a number of miners.

It is, however, impossible at present, until prospecting works are further advanced, to form even an approximate estimate of the quantity of oxidized ore available.

It is questionable whether these reefs will be sufficiently rich in gold to pay for working the sulphide ores below the water-level. We would venture, therefore, to make the suggestion that any companies or syndicates proposing to work these veins would perhaps find it advantageous to first thoroughly test the depth to which the line of oxidation in the veins extends before incurring the expense of purchasing and erecting gold-saving machinery. It is also desirable that bulk samples should be sent for treatment from time to time to works whose reputation is well established, with a view to ascertain not only the actual yield of the vein-stone but also the most suitable kind of machinery to be employed in the extraction of the Peak Hill gold, the fine state of division of some of which will probably necessitate great care and the use of special appliances.

EXTRACTS FROM THE VOTES AND PROCEEDINGS OF THE  
LEGISLATIVE ASSEMBLY.

VOTES No. 52. TUESDAY, 26 AUGUST, 1890.

14. CLAIMS OF WILLIAM TOM, JAMES TOM, AND J. H. A. LISTER, AS THE FIRST DISCOVERERS OF GOLD IN AUSTRALIA:—Mr. Dalton moved, pursuant to Notice,—
- (1.) That a Select Committee be appointed, with power to send for persons and papers, to inquire into and report upon the claims (if any) of William Tom, James Tom, and J. H. A. Lister, for remuneration as the first discoverers of gold in Australia.
- (2.) That such Committee consist of Mr. Sydney Smith, Mr. Tonkin, Mr. Street, Mr. Chanter, Mr. Torpy, Mr. Wright, Mr. Lee, Mr. Plumb, Mr. Jones, and the Mover.
- Debate ensued.  
Question put and passed.

VOTES No. 69. THURSDAY, 2 OCTOBER, 1890.

6. CLAIMS OF WILLIAM TOM, JAMES TOM, AND J. H. A. LISTER, AS THE FIRST DISCOVERERS OF GOLD IN AUSTRALIA (*Formal Motion*):—Mr. Torpy moved, pursuant to Notice, That the Select Committee now sitting on "Claims of William Tom, James Tom, and J. H. A. Lister, as the first discoverers of gold in Australia," be authorised to make visits to, and hold inquiries at, the residence of Mr. E. H. Hargraves, for the purpose of examining him upon the subject under consideration, that gentleman being incapacitated by reason of illness from attending as a witness.
- Question put and passed.

VOTES No. 76. TUESDAY, 21 OCTOBER, 1890.

6. CLAIMS OF WILLIAM TOM, JAMES TOM, AND J. H. A. LISTER, AS THE FIRST DISCOVERERS OF GOLD IN AUSTRALIA:—
- (1.) Mr. Dalton presented a Petition from William Tom, of Guyong, near Orange, praying that he may be heard by Counsel or Attorney before the Select Committee appointed to inquire into and report upon the "Claims of William Tom, James Tom, and J. H. A. Lister as the first discoverers of gold in Australia."
- At the request of Mr. Dalton, the Petition was read by the Clerk, by direction of Mr. Speaker,—and received.
- (2.) Mr. Dalton (*by consent*) moved, without Notice, That the prayer of the Petitioner be granted.
- Question put and passed.

VOTES No. 110. THURSDAY, 18 DECEMBER, 1890.

7. CLAIMS OF WILLIAM TOM, JAMES TOM, AND J. H. A. LISTER, AS THE FIRST DISCOVERERS OF GOLD IN AUSTRALIA:—Mr. Dalton, as Chairman, brought up the Report from, and laid upon the Table the Minutes of Proceedings of, and Evidence taken before, the Select Committee for whose consideration and Report this subject was referred on 26th August, 1890; together with Appendices.
- Ordered to be printed.

**CLAIMS OF WILLIAM TOM, JAMES TOM, AND J. H. A. LISTER AS THE FIRST  
DISCOVERERS OF GOLD IN AUSTRALIA.**

**REPORT.**

The SELECT COMMITTEE of the Legislative Assembly, appointed on the 20th August, 1890, "*with power to send for persons and papers, to inquire into and report upon the claims (if any) of William Tom, James Tom, and J. H. A. Lister, for remuneration as the first discoverers of gold in Australia,*"—have agreed to the following Report:—

1. Your Committee having examined the witnesses named in the list,\* \* See list, page 6. whose evidence will be found appended hereto, find as follows:—

- (1.) That although Mr. E. H. Hargraves is entitled to the credit of having taught the claimants, Messrs. W. and J. Tom and Lister, the use of the dish and cradle and otherwise the proper methods of searching for gold, which his then recent visit to the Californian gold-fields enabled him to do, your Committee are satisfied that the Messrs. Tom and Lister were undoubtedly the first discoverers of gold obtained in Australia in payable quantity.
- (2.) It has been alleged that the existence of gold in the Colony of New South Wales was known and that small quantities or "colours" had been found; but, so far as your Committee have been able to gain any information on the subject, what is now known to practical miners as "payable gold" was not known until the month of April, 1851, when the Messrs. Tom and Lister, after persistent and determined search, under very great difficulties, unearthed about 4 oz. of the precious metal, which being handed to Mr. E. H. Hargraves were, by that gentleman, exhibited to the then Colonial Secretary, Mr. E. Deas Thomson, whereupon Mr. Hargraves was thus recognised as the first discoverer of gold in Australia, and subsequently was rewarded by a gratuity of £10,000 from the Government of this Colony, and upwards of £2,300 from the Colony of Victoria, and in addition to these sums has been in receipt for several years of a pension of £250 per annum from this Colony.
- (3.) Considering the severe depression, almost stagnation, of trade and of business generally, which existed prior to the discovery of gold, and the marked improvement which immediately followed and has since continued, enriching the Colonies to an extent that can scarcely be even estimated, your Committee are of opinion that the Messrs. Tom and Lister have not received that consideration which the magnitude and importance of their discovery entitled them to.
- (4.) Mr. Hargraves appears to have abandoned the search for gold after his first course of prospecting with the Messrs. Tom and Lister, until they informed him that they had found the 4 oz. of gold, which, according to his own evidence, they discovered when he was not within 100 miles of them; and as he acknowledges to having received such 4 oz. of gold from them on the 6th May, 1851, and that he immediately took it to the Colonial Secretary, your Committee have no doubt that this was the cause of the issue of the famous proclamation of gold announcing the discovery eight days afterwards,

afterwards, on the 14th May, 1851, from which may be dated the new era and the commencement of the sudden and marvellous increase in the value of all kinds of property and of the great strides in progress which the Colonies have since made.

- (5.) Your Committee regret that they have to report the death of one of the party, Mr. J. H. A. Lister, who expired on the day upon which he was to have given his evidence ; but a few days before his death he had written a full statement of his case, which is appended to this Report, and which your Committee believe to be quite truthful.
- (6.) Your Committee therefore recommend the claim of Messrs. William Tom, James Tom, and J. H. A. Lister to the favourable consideration of the Government.

THOMAS DALTON,  
Chairman.

*No. 3 Committee Room,  
Sydney, 17 December, 1890.*

---

## PROCEEDINGS OF THE COMMITTEE.

WEDNESDAY, 10 SEPTEMBER, 1890.

MEMBERS PRESENT:—

Mr. Dalton,		Mr. Plumb,
Mr. Chanter,		Mr. Torpy,
Mr. Lee,		Mr. Jones.

Mr. Dalton called to the Chair.

Entry from Votes and Proceedings appointing the Committee *read* by the Clerk.

Ordered,—That Messrs. J. H. A. Lister and Wm. Tom be summoned to give evidence next meeting.

[Adjourned till Wednesday next, at *Two* o'clock.]

WEDNESDAY, 17 SEPTEMBER, 1890.

MEMBERS PRESENT:—

Mr. Lee,		Mr. Jones,
		Mr. Torpy.

Mr. Dalton in the Chair.

Chairman read letter, stating that Messrs. Lister and Tom were unable to attend owing to serious illness.

[Adjourned till to-morrow at *Two* o'clock.]

THURSDAY, 18 SEPTEMBER, 1890.

MEMBERS PRESENT:—

Mr. Lee,		Mr. Plumb.
----------	--	------------

In the absence of a Quorum, the meeting called for this day lapsed.

THURSDAY, 25 SEPTEMBER, 1890.

MEMBERS PRESENT:—

Mr. Lee,		Mr. Torpy,
		Mr. Plumb.

Mr. Dalton in the Chair.

The Chairman stated that Mr. J. H. A. Lister had died since last meeting. James Tom called in, sworn, and examined.

Witness withdrew.

William Henry Tom called in, sworn, and examined.

Witness handed in written statement of J. H. A. Lister, *re* Gold Discovery in Australia. [See *Appendix A.*]

Witness withdrew.

[Adjourned till Wednesday next, at *Two* o'clock.]

WEDNESDAY, 1 OCTOBER, 1890.

MEMBERS PRESENT:—

Mr. Jones,		Mr. Torpy,
Mr. Street,		Mr. Plumb.

Mr. Dalton in the Chair.

The Chairman read a letter received from Mr. E. H. Hargraves, stating his inability to attend to give evidence, and asking that he may be examined at his own residence.

Chairman also read a letter from Mr. J. H. A. Lister, written shortly before his death, and a copy was handed in by the Chairman. [See *Appendix B.*]

John Charles M'Lachlan called in, sworn, and examined.

Witness withdrew.

William Tom called in and further examined.

Witness withdrew.

William Henry Tom called in and further examined.

Committee deliberated.

Resolved,—That Chairman obtain leave to visit Mr. Hargraves' residence and take his evidence thereat.

Reassembling of the Committee to be arranged by the Chairman.

[Adjourned.]

THURSDAY, 23 OCTOBER, 1890.

MEMBERS PRESENT:—

Mr. Lee,		Mr. Torpy,
Mr. Plumb,		Mr. Jones.

Mr. Dalton in the Chair.

Entry from Votes and Proceedings, granting leave to Mr. William Tom to be represented by Counsel or Attorney; also granting leave to the Committee to make visits to and hold inquiries at the residence of Mr. E. H. Hargraves, *read* by the Clerk.

Present:—J. C. M'Lachlan, Esq. (*Solicitor for William Tom*).

The

The Committee then proceeded to Westmoreland-street, Forest Lodge, the residence of Mr. E. H. Hargraves, who was confined to his bed owing to physical injuries.

Edward Hammond Hargraves sworn and examined.

Cross-examined by Mr. M'Lachlan.

Witness handed in his history of the Discovery of Gold. [See Appendix C.]

Committee deliberated.

Reassembling of the Committee to be arranged by the Chairman.

[Adjourned.]

THURSDAY, 13 NOVEMBER, 1890.

MEMBERS PRESENT:—

Mr. Dalton in the Chair.

Mr. Lee,		Mr. Chanter,
Mr. Street,		Mr. Torpy.

Present:—J. C. M'Lachlan, Esq. (*Solicitor for William Tom*.)

Thomas Brown called in, sworn, and examined.

Witness withdrew.

The Clerk submitted a claim for witnesses expenses (Thomas Brown, *senr.*), £6 12s. 6d.

Claim considered and passed.

Committee deliberated.

Ordered,—That Mrs. Lister be summoned, under the Parliamentary Evidence Act of 1881, to give evidence next meeting.

[Adjourned to Friday, 21st November, at *Two* o'clock.]

FRIDAY, 21 NOVEMBER, 1890.

MEMBERS PRESENT:—

Mr. Dalton in the Chair.

Mr. Plumb,		Mr. Chanter,
Mr. Torpy,		Mr. Jones.

Present:—J. C. M'Lachlan, Esq. (*Solicitor for William Tom*.)

Mrs. Ann Lister called in, sworn, and examined.

Witness withdrew.

John Hardman Lister called in, sworn, and examined.

Witness withdrew.

The Clerk submitted claim for expenses of Mrs. Ann Lister, £4 18s.

Claim considered and passed.

Committee deliberated.

Chairman to submit Draft Report next meeting.

Reassembling of the Committee to be arranged by the Chairman.

[Adjourned.]

THURSDAY, 27 NOVEMBER, 1890.

MEMBERS PRESENT:—

None.

In the absence of a Quorum, the meeting called for this day lapsed.

WEDNESDAY, 17 DECEMBER, 1890.

MEMBERS PRESENT:—

Mr. Dalton in the Chair.

Mr. Wright,		Mr. Plumb,
		Mr. Torpy.

Chairman submitted Draft Report.

Same read, amended, and agreed to.

Chairman to report to the House.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON THE

CLAIMS OF WILLIAM TOM, JAMES TOM, AND J. H. A. LISTER,  
AS THE FIRST DISCOVERERS OF GOLD IN AUSTRALIA.

THURSDAY, 25 SEPTEMBER, 1890.

Present:—

MR. DALTON,  
MR. LEE,

MR. PLUMB,  
MR. TORPY.

T. DALTON, ESQ., IN THE CHAIR.

Mr. James Tom called in, sworn, and examined:—

1. *Chairman.*] Where do you reside? At Chintin, Victoria.
2. You lived at one time at a place called Guyong, near Cornish Settlement? Yes.
3. In what year was that? I was there in 1851, and many years previously.
4. What were you doing in 1851? I was living with my father.
5. You know something about the first discovery of payable gold in New South Wales? Yes.
6. Will you tell us what you know about it? About the middle of February, 1851—either on the 14th, 15th, or 16th of the month, I am not sure which—Mr. J. H. A. Lister, in company with Mr. Edmund Hammond Hargraves, called at our place, and they stopped and had a conversation with a few of us. I could not tell you exactly who were there, but I was there at all events; and they intimated to me very strongly that they wanted a person who had some experience of the country and understood its geography, and they found out that I thoroughly understood all that country. I had been reared there very nearly, and understood it all; and I went with them, and joined with them to be a participator in any good results that might come.
7. Did they disclose to you their mission in calling upon you? Oh, yes.
8. What did they say? They showed me a very small sample of gold which they had found two or three days before.
9. Where did they say they found it? They said they found it at Lewis Ponds Creek. Hargraves found it on the 12th February.
10. They said Hargraves found it? That he and Lister found it together, and Lister was a joint partner with Hargraves right through the whole transaction.
11. What other conversation took place when they called at your father's house on the 15th or 16th February? We conjointly agreed that we should all go in partnership with everything that transpired.
12. What was to transpire;—to search for gold? Yes, relative to the gold discovery; and I went with them on that understanding. It was a bad season, and we had to undergo great difficulties in getting horses.
13. How long was it before you started on your journey? We started on the same day.
14. Where did you reach that night? I think we camped at Calela, on the public road near Mr. Kater's flour-mills.
15. And what did you do next morning? Next morning we proceeded towards Burrangong, which is about 70 miles from where we started the first day. It would take us two days to get there. I expect it took us two and a half days, but I cannot recollect. Then we came back up the river.

Mr. J. Tom.  
25 Sept., 1890.

- Mr. J. Tom. 16. You struck the river at Burrangong? We struck the river inside of Burrangong—the Macquarie River—the same river that goes down to Bourke.
- 25 Sept., 1890. 17. What did you do when you struck the river? We followed it up backwards again.
18. But did you search for gold at the spot where you struck the river? I do not know that we searched exactly at that spot.
19. Did you pan out any earth there? We washed at dozens of places going up the river for nearly 100 miles, following the zig-zag course of the river.
20. Then you kept to the banks of the river? No, we kept in the bed of the river, the banks of which are precipitous. We washed, I suppose, at dozens of places, and we always got a little gold—what they call “the colour.”
21. You always got the colour? I do not think we ever washed without getting the colour. Then we came to the junction of the Summer Hill and Lewis Ponds Creeks with the Macquarie River.
22. Did you follow up the course of the creek? We did not follow up the course of the creek all the way, because the ground was too precipitous.
23. You followed it up as far as possible? Yes. We had occasionally to diverge from the creek.
24. Did you search for gold up this creek? No. I think that by the time we got there we had become pretty well exhausted from searching. I do not think we ever washed after we came to Summer Hill Creek, until we reached that night's stage, where we stopped at a station. It was my uncle's station, but they did not know me any more than if I was a complete stranger.
25. How far up the creek was this station from the Macquarie? It was not more than 10 miles, but those 10 miles were equal to 40 miles of ordinary country.
26. You stopped there that night? Yes.
27. The party consisted of Edmund Hammond Hargraves, J. H. A. Lister, and yourself? Yes.
28. You slept there that night; what did you do next morning? We were then within about 15 miles of my father's place, and next morning—I knew the country well enough—we went down to a place called Yorky's Corner, now known as Ophir, and Mr. Hargraves himself washed a pan of earth there, and he did not get the colour of gold.
29. Did Mr. Lister or yourself wash any dirt there at that time? No. We were trusting to Mr. Hargraves' washing.
30. What did you do after that? We went up to my father's place that night, and of course I stopped there. I forget now, but I suppose Hargraves and Lister went home to Lister's mother's place, because Hargraves and Lister were acquainted. But I cannot recollect what became of Hargraves after we came home to my father's place. I cannot tell you now at this distance of time whether Hargraves stopped at our place that night or went to Mrs. Lister's.
31. What time elapsed from the time when you left your father's house in the first instance until you returned? It must have been seven or eight days, but I could not state exactly. I know by the distance we went, and the poor state of the country in regard to horse feed—for we had no fodder for our horses beyond what they could pick up naturally—that it must have been seven or eight days.
32. When did the party meet again? I could not tell the exact date, but we came to a regular understanding that all the gold we had found was a mere bagatelle. I thoroughly understood from what I had read that gold was more universally dispersed over the world than any other metal, and that in fact it was even in the dust of the air.
33. What the Committee want to know is, what occurred after the party returned? We made an arrangement between ourselves, that if we could not find gold that would pay £1 a day for working we would never bring it before the public.
34. Did Hargraves agree to that? Yes. At that time wages were very low in the Colony—only 5s. a-week for shepherds, and all that sort of thing,—and we knew that if we could only find gold that would pay 5s. a-day the effect would be to ruin the country.
35. You mean it would take the shepherds and others away from their legitimate occupations? Yes, it would draw all the shepherds and labouring men of the Colony into the gold-fields.
36. Then the Committee understand that there was an understanding between the three of you that until you could discover payable gold that would produce £1 a-day for working you would not make known the discovery of any gold that you might find? Yes. We never meant to make it public until we found gold that would pay £1 a-day.
37. What did you do after that; when did you start out again? I went with Lister then. Hargraves started away; he came down to Sydney, and was going to Brisbane.
38. I understand that subsequently to his going to Moreton Bay he went to Wellington? Yes; he went up to a place there called Mitchell's Creek, some 15 or 20 miles from Wellington.
39. He went there for the purpose of finding gold? He went to look for it, but never got any.
40. How do you know he did not get any gold? Well, he never reported it to us. We considered ourselves partners with him, and he would have told us if he got it.
41. You say that Lister, yourself, and Hargraves, were mates? Yes, decidedly.
42. Were any of your brothers connected with the party? My brother William came in afterwards, when Hargraves was leaving the district. My brother William is a bit of a mechanic, and I remember Hargraves showing him how to make a cradle.
43. Where was this? At Springfield—my father's place.
44. Did your brother William make the cradle under Hargraves' instructions? Yes.
45. What did you do with that cradle? I think my brother William has got it yet. Myself and my brothers William and Henry went down and washed out, and that was the first formidable day's work that ever was done in Australia with a cradle. We washed out 16 grains of gold.
46. When was that? I could not tell you the date.
47. *Mr. Torpy.*] Where was it? In Lewis Ponds Creek.
48. *Chairman.*] What part of the creek? About 3 or 4 miles from the junction of the Summer Hill and Lewis Ponds Creeks.
49. Who was present at the finding of the 16 grains of gold? Myself and my brothers William and Henry. Henry came as a volunteer. He just came to get a little experience in the washing.
50. Where is your brother Henry now? At Charlesville, in Queensland, 500 miles from Brisbane.
51. He makes no claim for compensation? No.

52. About what date did you find the 16 grains of gold? I think it must have been about March, but I really could not say. Mr. J. Tom.  
25 Sept., 1890.
53. About the middle of March? I really could not tell the date. Before this washing of gold I had bought a lot of cattle, and I had arranged to go and receive them by a certain date.
54. I believe as a matter of fact you wanted to go on the Bogan about that time to receive some cattle you had purchased? Yes; 300 head of cattle. I cannot therefore tell within ten days what was the date when we washed the 16 grains of gold.
55. *Mr. Torpy.*] Can you tell the month? It must have been in March.
56. *Chairman.*] Were you present at the finding of any gold other than the 16 grains, just referred to, and the colour that was found on the Macquarie River previously? No.
57. You have informed the Committee that Hargraves went to Mitchell's Creek, near Wellington, and that he did not get any gold; what did he tell you when he came back? He expressed himself as if all he had seen was nothing, and said he would go back to California.
58. Did he say there was not a payable gold-field in the western districts, or anything to that effect? He said that if he could not find anything better than what he had seen he would return to California, that he would not be bothered looking any more, but meant to go to Brisbane and to Gundagai.
59. He told you that? Yes.
60. Do you recollect the date when he started for those places? It was in March or April—either the latter end of March or the beginning of April, I cannot say which.
61. Did Lister accompany Hargraves a part of the way on his return to Sydney? Yes. He came down with him as far as the Fish River,—as far as Mutton's Falls.
62. That was not on the direct road to Sydney; what took him that way? Lister had a large interest in some land out there; I believe it belonged to his family somehow or other, but I think it must have been involved. Lister took him out that way to show him some places where gold might be found, but when they got there there was nothing, and then they separated, Lister leaving Hargraves at Mutton's Falls.
63. Lister left Hargraves at Mutton's Falls and returned to Guyong? Yes.
64. How long was Lister away until he returned to Guyong? I think it would be about four days.
65. What transpired during his absence;—what were you and your brother doing? I think we were lying pretty dormant in regard to gold discovery during those four days, but I cannot distinctly recollect what we were doing.
66. After Lister returned what were you doing? I had to start for Adelaide, and after Lister returned me and my brother William went exploring. This was after I had been to the Turon.
67. Who started out to the Turon? Myself and Lister. While Hargraves was absent at Mitchell's Creek, Lister and myself started for the Turon where we found a good speck of gold. I found it myself, but Lister was with me. It was a nice granular nugget of gold about the size of a pin's head.
68. Was that all the gold you found at the Turon? We found the colour in all the washings we did.
69. How long did you remain at the Turon? We had to travel 40 miles down a creek, and then about 20 miles up the Macquarie River, before we came to the confluence of the Turon with the Macquarie. That would be a distance of about 60 miles, and we could not have done it in less than a week. It would take I should say about seven or eight days, as we had to travel without any fodder for our horses.
70. When Hargraves returned from Mitchell's Creek did you report to him your success at the Turon? Oh, we always made a report of everything. That was a mutual arrangement. We always reported everything to each other.
71. Can you tell us how the 4 oz. of gold was discovered? I had a pre-arrangement about some cows which I bought. I purchased 300 head out of a man's herd. I went away for the purpose of taking delivery, but it was an awfully bad season, and when I got up to the place I found that if I attempted to take them the result would be to kill both the cattle and the horses. I then travelled on towards my father's station on the Lachlan, and after I had got about 100 miles from where I had to take the cattle my brother Charles overtook me with a letter from my brother William to say that they had found a gold-field that would pay £1 a day, and it was on that gold-field that the 4 oz. of gold was found, which was subsequently produced in Sydney, and which created all the excitement.
72. Then you were not at the finding? I was not at the finding of the 4 oz. I was only a colleague. I was at the finding of the 16 grains, but I was not at the finding of the 4 oz.
73. Mr. Hargraves was not present at the finding of the 16 grains of gold? No.
74. Nor at the finding of the 4 oz.? No. I know he was not present at the finding of the 4 oz., because he was at the time in Sydney or Brisbane.
75. He could not have been there? It is not possible he could have been there without my knowledge.
76. In 1853 was there not a Parliamentary inquiry into your case and that of Hargraves? Yes; somewhere about that date.
77. Were you examined at that inquiry? No.
78. Were you at Cornish Settlement at the time it took place? I was busy travelling. I was always travelling in those days.
79. You knew the inquiry was held? Yes.
80. Were you at home at the time it was held? No; I do not think I was. I think I was away up the Murray somewhere.
81. The Governor-in-Council, I think, in those days gave you a gratuity? Yes.
82. How much? £333 6s. 8d.
83. That is £1,000 altogether? Yes, £1,000 between the three of us.
84. You are aware that they gave Hargraves £10,000? I believe they gave him £9,000, and they gave us £1,000 between us.
85. Did he not get £1,000 before that? I know nothing about that.
86. Will you tell us the understanding between yourself, Mr. Lister, and your brother William as to the partnership that existed between yourselves and Mr. Hargraves? Yes. I never was a pauper. I always considered myself nearly as good a man as Hargraves, and I never considered myself as one to be ordered about by any man in the world, and I went in with Hargraves, myself and Lister, as equal.
87. Was not William of the party? William came in afterwards. Myself, and Lister and Hargraves went in as mates, or, as I call it, colleagues.

- Mr. J. Tom.  
25 Sept., 1890.
88. *Mr. Lee.*] Can you inform the Committee why Mr. Hargraves left your brother William and Lister, and returned to Sydney. You have told us that he came up for the purpose of getting you and others to go with him to search for gold, and that you did search for gold with very poor results; and then you told us that at a certain point Mr. Hargraves started to go back to Sydney. Now, will you tell us why he started to go back to Sydney? Because he considered that the country was not sufficiently promising for him to stop any longer, and he said he would go back to California if he could not find anything more promising than what he had seen.
89. Then the Committee understand from that, that your mission with Hargraves in searching for gold had failed? Yes, decidedly. As far as he was concerned it was a total failure.
90. In mining parlance, then, he looked upon that country as a "duffer"? Yes, exactly.
91. Not worth bothering with? Yes, not payable.
92. Why did he instruct your brother how to make a cradle, if he believed the country was not payable? Just because he thought we would have a chance of experimenting. We knew nothing about it before that—we wanted to experiment.
93. Was there any arrangement between the party that you should go on prospecting in his absence? Yes, we had all mutually agreed that whatever one of us found, no matter where we got it—whether in Adelaide, Brisbane, Gundagai, Queensland, or anywhere—we all had to communicate with the others.
94. Then it was arranged that during the absence of Hargraves your party should go on prospecting? Yes.
95. Was he going on to Moreton Bay for the purpose of prospecting for gold? He said he was.
96. How long had he been away before the 16 grains of gold were found? I think he had been away pretty nearly a month—it might have been only three weeks, but I really could not tell the date. I think it was nearly three weeks, but it might have been only two or three days.
97. You were present at the finding of the 16 grains of gold? It was I who humped a good deal of the clay from which it was washed. I was personally present.
98. What was your idea when you got those 16 grains; did you think you had struck payable gold? No, I did not. I thought it was only another evidence that gold was more universally dispersed than any other metal.
99. You thought it was not payable? I knew 16 grains would not pay three men's wages.
100. Did you go on prospecting after that? I am not sure whether Lister and myself did not go to the Turon after that—it was either afterwards or before; it all happened within a few days.
101. Did you and Mr. Lister report to Mr. Hargraves the finding of the 16 grains of gold? Yes, through our secretary.
102. Who was he? William Tom, one of our party.
103. How did he communicate with Mr. Hargraves? By letter.
104. Where to, to Sydney, or to any other address? We all had each others address.
105. Did Mr. Hargraves reply to that letter? I could not tell you, but I expect he did.
106. Did he act upon the letter in any way? I do not know; we left that to our secretary.
107. Did he return to your district in consequence of having received that letter? No, he did not; he did not think it worth his while.
108. Did he induce the Government to inspect the district in consequence of the discovery of this 16 grains of gold? No. As I have already stated, we had agreed that we would not divulge any discovery of gold until we got something that would pay £1 a-day. The 16 grains would not pay 2s. a-day.
109. When you participated in the Government reward to the extent of £333 you knew that Mr. Hargraves was receiving £10,000. Did you ever protest against that amount being paid to him? Well, we thought that we got a very small atom, and that he had received the lion's share.
110. Did you think then that your party were the real discoverers of gold and not Mr. Hargraves? Yes. We were the people who found the available gold, though we have always admitted that Hargraves showed us the process of washing for gold.
111. If you really gave the information that led up to the discovery of payable gold, why did you stand by and see Hargraves get £10,000 while your party only got £333 a piece? We did not stand by; we have been writing letters about it ever since. There have been hundreds of letters in the papers; in fact this has gone on to such an extent that the breath is nearly out of my body.
112. Did you make a protest to the Government of the day against paying Hargraves this large amount? Well, in those days we did not understand much about protests. We were not so clever as are the lawyers of to-day.
113. Many years have elapsed since that gratuity was given? Thirty-eight or thirty-nine years.
114. Have you slept upon your alleged rights since that time, or have you made application for any further gratuity? We have been applying every year through the public press.
115. *Chairman.*] And to the Parliament? Yes; and we look now upon the press as our great fortification.
116. *Mr. Lee.*] Do you consider that you are entitled to further consideration from the Government as being one of the early gold discoverers? Considering the progress that has been made in Australia since the discovery of gold, and the great prosperity that has been brought about, I believe we are entitled to something tangible. There were no railways in the country until we found gold.
117. You are asking now for some consideration from the State, and of course we are bound to ask you upon what you base your claim. You have given us a very fair and succinct account of the proceedings up to the present time, but you must bear in mind that a long time has elapsed since the Government voted money for this purpose, and we are now entitled to ask you why you come in and make application again? Do I not tell you that every year since it happened we have been applying through the public press for the consideration we believe we deserve.
118. Your ground, then, is that the country has become so enriched in consequence of the discovery of gold, that you, claiming to be one of the first discoverers of gold, consider you are entitled to more consideration than you have received? Yes. I claim that myself, my brother William, and John Lister, were the real discoverers of payable gold, which induced the first rush of immigration into Australia. I say that in consequence of that discovery Australia has benefited directly and indirectly to the extent of about £100,000,000,000. That discovery of gold made the Colony. Before then you would hardly ever see a pound note or half-a-sovereign, and if you got a good beef-steak you were very lucky, although beef-steaks were only 1½d. per lb. The Colony was benefited to an extent that is hardly conceivable.

119. Then you are of opinion that the small gratuity granted to yourself, your brother William, and Lister, was quite inadequate, considering the immense advantage that has accrued to the country? I do; and I do not believe Hargraves got a penny too much. Mr. J. Tom.  
25 Sept., 1890.

120. You consider that rather as a matter of grace than as a matter of right the State should reconsider your claim, and grant you a further gratuity? Yes; with all deference I think we are entitled to consideration as a matter of right, though it is a case in which I think the State might be disposed to concede our claim as a matter of grace.

121. *Mr. Torpy.*] Is it not a fact that you and your brothers have been agitating incessantly for some thirty years to get your claim considered? Yes.

122. Almost continuously? Yes, continuously. Periodical representations have been made through the press almost every year.

123. Did you not ask several Members of Parliament to take up your case on several occasions? I did not; perhaps my brother William did.

124. *Chairman.*] What is your age? I am in my 69th year.

125. How old were you when you came to the Colony? Eighteen months.

126. What was the age of your brother William when he came to the Colony? He was born off the coast of Tasmania before we landed here. He was born at Point Desolation on the day the ship got wrecked; he is one year and a half younger than me.

127. Do you know anything of a letter written by Mr. Hargraves, dated the 19th May, 1851? I have seen a copy of it.

128. Did you ever have any conversation with Lister about it? I believe Lister did tell me about it. He said he thought it was rather a disparaging thing against some of us I think. That is all I know about it.

129. The letter is alleged to have been written by Mr. Hargraves for the press to be signed by Lister? There is a declaration by me about that letter, sworn before a magistrate in Melbourne. It is as follows:—

I HAVE most attentively perused the foregoing history of the gold discovery of 1851, which is signed by William Tom, junr., and J. H. A. Lister, and I believe the whole of it to be correct; the parts that refer to my personal knowledge I know to be true. I could not say the exact day that I and my brothers got the 16 grains in weight of gold, but I know it was some days before I started to Adelaide, and I started (or I believe I did) on the 1st April, 1851. We got the 16 grains of gold in the latter end of March, 1851, and I know it was before William Tom and John Lister got the 4 oz. of gold. With regard to No. 1 letter, which is a tissue of falsehood, Mr. Hargraves was out only twice prospecting while he was in the Bathurst district. The first time was on the 12th February, 1851, when John Lister was with him, and the other time was directly after, when John Lister and I were both with him. We went down the Macquarie on the second occasion, and we were away from seven to ten days. I never knew Mr. Hargraves experience more hardship or difficulty than he might have experienced at a picnic on the same rough ground. I do not believe he saw a native blackfellow, of Australian birth, while he was in the Bathurst district.

As witness my hand, at Melbourne, Victoria, this nineteenth day of October, in the year of our Lord one thousand eight hundred and seventy-six.

Signed and delivered in my presence,—

RICH. GIBSON, J.P., for New South Wales.

JAMES TOM.

130. Why did you make the reference to "a native blackfellow, of Australian birth"? That is really true. We never saw a native blackfellow all the time we were travelling.

131. And you had no blackfellows as guides? No, not one, and not even a half-caste.

132. Then the letter signed by Wm. Tom, junr., and J. H. A. Lister is true? Yes, it is absolutely true.

Mr. William Tom called in, sworn, and examined:—

133. *Chairman.*] You were formerly known as William Tom, junior? Yes, during my father's lifetime. Mr. W. Tom.  
25 Sept., 1890.

134. And you are the William Tom whose name is mentioned in these Parliamentary papers? I am.

135. On the 2nd April, 1887, you forwarded a letter to the Colonial Secretary, enclosing a history of the first gold discovery? Yes; it was first directed to the Governor, who returned it with instructions that it should be sent to the Colonial Secretary.

136. Do you hand in to the Committee manuscript of letters and other papers relating to your claim, copies of which are given in the Parliamentary paper before the Committee, ordered to be printed by the Legislative Assembly on the 28th November, 1888? Yes. [*See Appendix.*] I tender this as part of my evidence, and I know it to be true in every particular.

137. Were you present at your father's house at Cornish Settlement, early in February, 1851, when Mr. Hargraves and Mr. Lister first visited your place? No; I do not know anything about Mr. Hargraves when he first visited the place.

138. Mr. Hargraves showed you how to construct a cradle, did he not? Yes; he suggested the form.

139. Did he do so verbally, or by a plan? He merely told me how to construct it.

140. Was he present while you were making it? No; he was not. Mr. Hargraves has stated that the carpenter at Springfield made the cradle, but that is not true—I made it myself.

141. About what date did you make it? It was before he went away and he saw it made, and we went down to try and wash some gold with it just by my father's house at Springfield, but we did not succeed in getting anything—it was only to try the cradle. In confirmation of my evidence as to the construction of the cradle I wish to read the following letter:—

Young, 23rd May, 1890.

It having been reported by Mr. Hargraves that I made the first gold cradle while I was a carpenter at Springfield, near Guyong, I beg to say that I did not make it. It was made by Mr. William Tom, junr., of Springfield, sometime in February or March, 1851.

Witness—LINA L. TOM.

THOMAS BROWN.

142. Can you tell the Committee for what purpose you made this cradle? With the prospect of getting gold by washing earthy matter through it. Mr. Hargraves told us we could get gold with it, and we did get gold.

143. Did you enter into an arrangement with Hargraves before you made this cradle that you would be partners, mates, or colleagues with him? Beyond the cradle I had nothing at all to do with Hargraves until he was going away, and I never went to look for gold until after he had gone. He went away about the 20th March. I am pretty sure it was on the 20th March, but it was certainly before the 24th March. John Lister went with him as far as the Fish River, and while they were away together at Fish River myself and my brother James and Henry went down the creek and got 16 grains in weight of gold.

- Mr. W. Tom. 144. About what date was it? It was between the 20th and the 24th March, 1851, and when John Lister came back I had sent the information away to Hargraves, and I believe it got to Sydney as soon as he did.
- 25 Sept., 1890. 145. What information did you send? That we got the 16 grains of gold, and how we got it and all the particulars.
146. Did you get a reply to that letter? Yes; but I have never been able to hunt it up. I believe I brought it here when I was examined before, but it appears that the papers were all lost.
147. A Committee sat on your case in 1853 I believe? Yes; I believe it was in 1853.
148. Were you examined before that Committee? I was.
149. Who else was examined? Lister for one, and I believe also Mr. E. Deas-Thomson.
150. And Mr. Hargraves? I suppose he was. Of my own knowledge I do not know that Lister was examined, but he came down for the purpose.
151. The result of that inquiry was that you got £1,000 between the three of you? Yes.
152. You got your individual share I suppose? I did.
153. And you believe Lister got his £333? Yes. He has admitted so to me.
154. What about letter No. 1, dated 19th May, 1851, which is said to have been written by Mr. Hargraves? It is a tissue of falsehoods.
155. You know that Mr. Lister is dead? Yes, he died about a week ago.
156. Have you the original of this letter? I have not. I believe it was lost with the other papers that were placed before the Committee.
157. Did you have a conversation with Lister about this letter? I saw it in Hargraves' own handwriting, and I know it was a most abominable falsehood.
158. Did Lister show it to you? Yes, and I blamed him for not showing it to me sooner, for I suggested a reply. He told me that it was all lies, and that he could not sign his name to such a thing. That I knew without his telling me. As for the statements about the blacks, Hargraves never saw a blackfellow, I believe, while he was in the district. To show that we got the 16 gr. of gold, I should like to read to the Committee a letter written by a gentleman who was manager at the time of the Carrangarra Copper-mine. My brother James showed him the gold that had been got, so that he would know how to proceed with regard to the management of his copper-mine in the event of a gold-field breaking out. The letter is as follows:—

To whom it may concern, Forbes, 7 March, 1889.  
 IN 1851 I saw some fine gold, some grains in weight, I think, with Mr. James Tom. I believe it was some time in March or April of that year. I know it was before the discovery of gold was made public, for James Tom told me that as the discovery of gold would soon be announced, it would upset all mining for copper; and as I was interested at that time in the Carrangarra copper-mines, I had better make my arrangements in respect thereof before the discovery of gold was made known. The foregoing I most solemnly declare to be true and correct.  
 Witness—CHAS. PROWS, J.P. T. G. LANE.

I should also like to produce to the Committee a paper which was given me by Hargraves, and which is in his own handwriting, when I gave him the 4 oz. of gold. He gave us this paper on the evening of the 6th May, 1851. That was the evening when he got the 4 oz. of gold from us. The paper is as follows:—

On Her Majesty's Service.

THIS is to certify that the Australian Gold Company are hereby authorised and empowered to occupy the following Bars \* \* \* \* \* in gold-mining, and to prevent all parties from intruding thereon, viz., Fitzroy's Bar, Hargraves' Bar, Lister's Bar, and Tom's Bar.  
 6th May, 1851. E. H. HARGRAVES.

With the permission of the Committee, I should like to read a paper which I prepared some time ago for Mr. Francis Abigail, giving some of the chief facts regarding the discovery of gold in 1851. It is as follows:—

Mr. Hargraves came to Guyong on the 10th of February, 1851, and remained in the Bathurst and Wellington districts till the 20th, 21st, or 22nd March of the same year, and all the gold got during that time (from 10th of February till 22nd March) by John Lister, James Tom, and Hargraves did not amount in value to one penny, the bulk of which was got on the Turon River, by James Tom and John Lister while Hargraves was away in the Wellington district. What we have now mentioned is all Mr. Hargraves did when in the actual search for gold. All he did was to wash a small proportion of less than a penny's worth of gold he was taken to by John Lister and James Tom. Mr. Hargraves took his *final* leave of the Bathurst and Wellington districts on either the 20th, 21st, or 22nd of March, 1851. John Lister went with him as far as Mutton's Falls, on the Fish River, and there almost the last thing Hargraves said to Lister was, that he would go off to California, and take Lister with him, if he were willing to go, if no more gold were found. From this saying it is quite clear that in Hargraves' own opinion, no gold of importance had up till that time been discovered. After he said he would go off to California he went on to Sydney, and all the gold he could show to the Government, by the evidence of the late Sir E. Deas-Thomson (the Colonial Secretary), given before a Select Committee of the honorable Legislative Assembly, 1853, only amounted to a few almost invisible specks. (See Sir E. Deas-Thomson's evidence in the Archives of the House.) Before John Lister returned from seeing Hargraves as far as the Fish River, on his way to Sydney, William Tom, junr., had posted a letter to Hargraves, telling him that James Tom and he himself had got 16 grains in weight of gold over *only a yard or two of ground*. This letter to Hargraves must have been in Sydney as soon as Hargraves himself was there, or not more than a day after; and we feel quite sure it was the information this letter gave to Mr. Hargraves that induced him to make his proposition to the Government to the effect that he would show any officer of the Government that might be sent with him a payable gold-field. From his experience in California he knew very well that 16 grains in weight of gold from *only a yard or two of ground* was a pretty sure indication of a payable gold-field. Not having said anything about the 16 grains in weight, when we were examined by a Select Committee, proved fatal to our cause. After the 16 grains were discovered, no more gold was got till between the mornings of the 7th and 12th April, 1851, when we found 4 oz. These 4 oz. of gold were got at Ophir when Mr. Hargraves was away from the scene of our operations. The finding of these 4 oz. we made Hargraves acquainted with at the very earliest opportunity, and he came from Sydney and received them from us at Springfield, Guyong, on the evening of the 6th of May, 1851.

The question naturally arises, why did he (Hargraves) ride 300 miles for these 4 oz. of gold if he had found gold enough himself to convince the Government a payable gold-field had been discovered. Most surely it requires no philosopher, no man with the calibre of a Socrates, to believe that gold got in payable quantities by Mr. Hargraves would have convinced the Government that a payable gold-field was discovered, as well as gold got by Lister and Tom would have done it.

No use for Mr. Hargraves to deny having come from Sydney, and getting the 4 oz. of gold from us on the 6th of May, 1851, for we have at this present moment in our possession a paper of that date, written and dated by Mr. Hargraves, giving us permission, in the name of the Government, to dig for gold, and we can swear Hargraves gave the paper to us when we gave him the gold. He had no more authority at the time to give us a paper of the kind than we had to give him one. The reason why Mr. Hargraves could not find gold in 1851 was this:—He was too lazy to look for it in a proper manner; he always experimented on the higher instead of the lower strata of the alluvial deposits he was taken to. Almost every practical digger knows that all loose substances in alluvial deposits, arrange themselves in the order of their specific gravity, and gold being the heaviest substance in nature except platinum, Hargraves ought to have dug to the bottoms of alluvial deposits. Failing to do this he failed in the discovery

discovery of a payable gold-field. While in the Bathurst district Hargraves never dug a hole a foot deep. Mr. Hargraves was appointed a prospecting Commissioner for some considerable time after the gold discovery of 1851, but during the whole of the time he was looking for gold under the auspices of the Government, it is not on record that he ever found either a payable or an unpayable gold-field, although he travelled over many parts of the country, which since have been proved to be wonderfully rich in that metal.

We believe all the main features of the first gold discovery of 1851 are now in the possession of our worthy Government, and we think it will reflect credit on the honorable members of the Government to see that justice is shown to the individuals whom they may believe to be the real discoverers of the first payable gold-field ever worked on the Australian continent.

We would remark here that when Wm. Tom, junior, was examined by a Select Committee in 1853, he was asked by a member of that Committee if he thought Hargraves ever found as much as 18 grains of gold (Mr. W. Tom thinks it was 18 grains; it was some number under 20 however), and he said he might have found that many grains. W. Tom has often thought since that what the Committee understood him to mean was 18 grains *in weight*—what he meant was 18 *individual specks*. They did not amount to *one-eighth of a grain in weight*, as may be learnt from Sir E. Deas-Thomson's evidence given before the same Committee. Our evidence against Mr. Hargraves is so *circumstantial* that it is more reliable than positive oaths; for how could we make all the circumstances named here and elsewhere agree without even a seeming contradiction, if they had not actually transpired. Utterly impossible? It seems to us that partnership alone ought to have placed us on an equal footing with Mr. Hargraves, to say nothing of our having found all the gold except the bare colour.

In other matters the fact of partnership would have been proof conclusive against him; then why it is not so in the matter of the first gold discovery becomes a puzzle to us which we are quite unable to solve. Some persons have told us that the length of time since the first gold discovery shuts out our chances of success. As the length of time has not been caused by us we do not think we ought to suffer for it. We have been trying by all legitimate means through the last quarter of a century to be reheard. We had a petition in the late Mr. (after Sir) James Martin's hands in 1864. However, much may be said about the length of time that has gone by, we cannot think that such length of time should legalise the dishonesty of one party and cancel the merits of the other.

159. You have a distinct recollection of Mr. Hargraves leaving Guyong for Sydney with Mr. Lister? Yes, I have a distinct recollection of that.

160. They went together as far as the Fish River? Yes.

161. Mr. Lister bade good bye to Mr. Hargraves there and returned? Yes. The last words Hargraves said to Lister were that unless more gold was found he should go to California and take Lister with him if Lister was willing to go.

162. Did you hear Hargraves say it was his opinion that there was not a payable gold-field about Guyong? Through Lister I did.

163. Lister told you so? Yes, on many occasions.

164. *Mr. Torpy.*] On what date did Hargraves leave Guyong? On the 20th, 21st, or 22nd March, 1851, and we got the 16 grains there on the second or third day after he left. I am sure it was the second day after he went away that we got the 16 grains.

165. *Chairman.*] We want to find out more especially about the 4 oz. of gold? On Monday morning, the 7th April, 1851, accompanied by John Lister, I went to a place that is now called Ophir, and which I believe was then known as Yorky's Corner. We were advised by Hargraves to go to a low point some 15 miles down—I think it was on the Macquarie—and we started with the intention of going there; but when we got to Ophir, to a place where we had some refreshment, I told John Lister that we had better stop there, and prospect that day, as Lane's shepherd some years previously had picked up a piece of gold of about 2 or 3 oz., which was afterwards sold for £15. That induced Lister to agree to the proposal that we should let out our horses there and prospect that evening. We had some refreshment, and afterwards went down into the creek, and I was only there a few minutes when I saw a piece of gold just lying in an indent of the rock.

166. A nugget? It was found to be worth £2 10s., so you may call it what you like. I was buttoning the brace of my trousers at the time, and I said to Lister, "Here is a bit of gold," and he said, "William, you are only joking." "Well," I said, "It is either gold or brass"; and he came over, and I picked it up—or I do not know whether he did not pick it up. We then decided to set aside the journey down the river, and prepared to wash the next day.

167. *Mr. Torpy.*] Where did you find the gold;—in the bed of the river, or on the bank? In the bed of the river, in an indent of the rock, within 100 yards of the junction of Summer Hill and Lewis Ponds Creeks. Next day we got the cradle down, and began to wash in form. While I was washing, John was picking it up, and he said, "Look, William, here is a piece of gold," and I said, "Yes; that is gold," and it was exactly the weight of one new sovereign. We continued to wash for a day or two, and we got 2 ounces. Then we proposed going down the creek, and as John and I were on our horses—the head of his horse being opposite to that of mine—and he said, "There is a bit of gold," and jumped off his horse. I will not say that I saw it before he got hold of it, but he said, "There is a stick right through it," and he broke the stick off. It was through the gold, but how it got through I do not know. However, it weighed exactly 2 ounces. Then we camped for the night.

168. Where was this? About a mile from the junction. That was the last gold we got. We were satisfied that payable gold had been discovered, and, until that gold was shown to the Government, Hargraves was not recognised.

169. When you found that gold, John Lister wrote to him? Yes.

170. How soon afterwards? As soon as he had an opportunity. I did not see him write the letter, but I have heard him say so.

171. You had a weekly mail at that time? Yes, I think so; it might have been bi-weekly.

172. Did Hargraves come up from Sydney? He did. He arrived at Springfield on the 6th May, 1851. He came up and received the gold from me.

173. How did you know that you had 4 oz. of gold; how did you weigh it? We had sixteen new sovereigns from Mrs. Lister, and we balanced it, and the weight of sixteen new sovereigns is equivalent to 4 ounces.

174. You gave the gold to Hargraves? I gave it to Hargraves, and he took it to Sydney, and he was then recognised, and has been ever since, as the first discoverer of gold.

175. You were at that time mates? I should say so, when he took our gold and divided it between himself and us.

176. He took it to Sydney, and brought it back again? He brought just the one bit back; I had expressed a wish to get that.

177. You have a bit of the gold now in your possession? Yes.

178. You have now in your possession a portion of the original 4 oz. of gold? I have.

- Mr. W. Tom. 179. Mr. Hargraves brought it back from Sydney? He did, and delivered it to me.
- 25 Sept., 1890. 180. There was a division of the proceeds of the gold? The value of the gold was £3 10s. an ounce, and the proceeds were divided into four equal parts—the piece of gold that was brought back for me being included in the division. I produce the piece of gold for the inspection of the Committee.
181. You consider that you are entitled to some compensation from the State for the discovery of the gold? I do. I consider that we were more entitled to compensation than was Mr. Hargraves. It was owing to our discovery of gold that such a flourishing state was brought about in the Colony.
182. You recollect the discovery of gold in California in those days? Yes. There was a great hubbub made here about it.
183. And a large number of persons emigrated from this Colony to California? Yes. Mr. Hargraves was among them, I believe, and he came back with the view of going to M'Gregor's Reef.
184. You know of your own knowledge that the Government in those days were making every effort to find gold in the country so as to keep the people from going away to California? I believe so.
185. Did you know the late Mr. Stutchbury personally? Yes.
186. You know that he came out here as Government Geologist for the purpose of gold discovery? I know he was sent up for the purpose of seeing whether or not we had a payable gold-field.
187. Did he report on the Ophir gold-reef? I believe he did, but I never read his report. He was blamed by the Colonial Secretary for having written his report in pencil instead of ink.
188. To your knowledge did Mr. Stutchbury ever find any gold himself? No.
189. Did he point out any part in this Colony where gold was found? Never to me.
190. Then where you found this 4 oz. of gold was where the first rush took place? Yes. All Melbourne rushed there, and people from everywhere else.
191. Then, in your opinion, you are the real discoverers of the first payable gold-field in Australia? It is not my opinion, but I am sure of it. I got the gold, Hargraves took it to Sydney, and it resulted at once in bringing all Sydney up to the place.
192. Mr. Lee.] That being the case, why did you stand on one side when £10,000 was paid to Mr. Hargraves, and you and your mates only got £333 6s. 8d. each? We saw clearly enough that they would give us no more. They examined us here, and when the examination was over they decided on giving us only £1,000, and Hargraves £10,000. We considered that very unfair, and have been protesting against it ever since.
193. Were you examined on that occasion as to your knowledge of the discovery? Yes; I was examined here.
194. Did you then state what you have now told the Committee about finding the 4 oz. of gold? Of course I did.
195. Chairman.] And about the finding of the 16 grains? No; that is where I made a mess of it. I believe we should have succeeded if it had not been for that.
196. Mr. Lee.] You did not tell the Committee then about the 16 grains? No, not a word.
197. Mr. Torpy.] But you did about the 4 oz.? Yes. We got the 4 oz. between the morning of the 7th April and the 12th April; I did not tell the Committee on the former occasion about the finding of the 16 grains of gold, because we did not consider that that quantity was payable.
198. Mr. Lee.] Notwithstanding that Mr. Hargraves received £10,000, and you and your brother and Lister only received £333 6s. 8d. each, you have never ceased to assert your right as being the first discoverers of gold? No; we have always asserted our claim.
199. Chairman.] I believe a Select Committee of the Assembly was appointed to inquire into your case in the year 1876? Yes.
200. What was the result of that inquiry? The House broke up before the Committee reported.
201. Mr. Torpy.] You have not ceased to agitate your claim for the last thirty years? No;—almost from the time when we were examined. I did not, of course, go home and write a letter against the decision on that day, but I have been protesting against it ever since.

WEDNESDAY, 1 OCTOBER, 1890.

Present:—

MR. PLUMB,		MR. JONES,
MR. STREET,		MR. TORPY.

T. DALTON, Esq., IN THE CHAIR.

John Charles M'Lachlan, Esq., called in, sworn, and examined:—

- J. C. M'Lachlan. Esq. 202. Chairman.] What are you? A solicitor, practising in Sydney, and formerly in Orange for about twenty-three years.
- 1 Oct., 1890. 203. Do you know the handwriting of the late Mr. J. H. A. Lister? Yes; he was a client of mine.
204. Is this paper [*Appendix B.*] which has been handed into the Committee headed "Memo. re gold discovery" in the handwriting of Mr. Lister? It is.
205. Mr. Jones.] Do you know how long that paper was written before Mr. Lister's death? No, I do not.

Mr. William Tom recalled and further examined:—

- Mr. W. Tom. 206. Chairman.] Do you know the handwriting of this paper headed "Memo. re gold discovery"? I think it is John Lister's.
- 1 Oct., 1890. 207. Are you certain? I would not swear it, but it resembles his handwriting very much.

Mr. William Henry Tom called in, sworn, and examined:—

- Mr. W. H. Tom. 208. Chairman.] Where do you reside? Near Guyong.
- 1 Oct., 1890. 209. You are the son of William Tom? Yes.
210. Do you know the handwriting of the late Mr. J. H. A. Lister? I do.

211. Is this paper, headed "Memo. *re* gold discovery," in his handwriting? Yes, to the best of my belief.
212. Did you often visit his house? Yes.
213. Did you visit his house a week or so before his death? I was there a few days before he died.
214. Did you hear anything about a paper like this being written by Mr. Lister? Yes.
215. What did you hear about it? His son told me that he had written several pages concerning the discovery of gold.
216. *Mr. Street.*] In what state of mind was Mr. Lister when you last saw him just before his death:—was he sensible? Yes, he was quite sensible when I saw him, about two days before he died.
217. And you understood then that he had completed a statement in writing? I understood from his people that he was writing a statement.
218. And you considered him of sound mind at the time? Yes.
219. Quite capable of bearing in mind incidents that occurred many years before? Yes.
220. *Chairman.*] Is this like his ordinary handwriting when in health? Yes.

Mr.  
W. H. Tom  
1 Oct., 1890

THURSDAY, 23 OCTOBER, 1890.

Present:—

MR. JONES,  
MR. TORPY,

MR. LEE,  
MR. PLUMB.

T. DALTON, Esq., IN THE CHAIR.

J. C. McLachlan, Esq., appeared as Solicitor for Messrs. Tom and Lister.

Mr. Edward Hammand Hargraves sworn and examined:—

221. *Chairman.*] I believe you resided at one time at Gosford? No; at Brisbane Water.
222. What year was that? I was at Brisbane Water for several years prior to my going to California.
223. When did you go to California? In 1849.
224. How long did you remain in that country? About fifteen months.
225. You then returned to New South Wales? Yes.
226. When did you arrive in New South Wales? I think it was on the 7th January, 1851.
227. William Tom, James Tom, and J. H. A. Lister make a claim to Parliament, alleging that they are the first discoverers of gold conjointly with you? That is not the case.
228. Perhaps you will make a statement to the Committee on the subject? On my return from California I saw my friend Mr. Norton—the late Honorable James Norton—and he said, "Well, you are very foolish to come back from California, Mr. Hargraves; see the state of this country." "But," I said, "I came back to make the country." "Oh, nonsense!" he said. "You are like my friend Tom Icely; you are mad on this subject." "No," I said; "I am perfectly sane on the subject." I saw Mr. Icely, and he invited me to his house, and offered me any assistance he could give. This was in Sydney. I accepted his invitation, and met him at King's Plains, and had lunch with him. He was coming down to Sydney, where he had particular business at the time. He came down to prosecute Dr. Lang; and he said, "I cannot go back with you now." "Well," I said, "I will go across the ridge to Guyong. I think I can make my way there." And I did so, and went to Mrs. Lister's, who kept an inn. I had known her in her husband's lifetime. I said nothing to her that day, but next day I asked her if she could get me a blackfellow; that I wanted to go down to Tom Jamieson's old station, which was not very far from Green's old station.
229. That was on the Macquarie River? No; it was at Lewis Ponds Creek. Mrs. Lister said, "I suppose you are going to look for gold, Mr. Hargraves?" "Well," I said, "something like it;" and she said, "Don't get a blackfellow—take my son." I said, "If your son will keep the matter perfectly secret I have no objection to do so at your request;" and the next morning I did so. I stated where I wanted to go and Lister said, "I will take you through the bush so that we will not see any one." It was a very dry year in 1851, and going down the creek I asked him if he knew where there was any water, and he said, "No, I do not think there is any water until we get to Yorkey's corner." "Well," I said, "how far is that?" and he said it was only about a mile. When we got to Yorkey's corner there was a waterhole there, and I said, "Hobble out the horses and we will have a pot of tea," and when he was going across the creek I said, "Where you walk across the creek there is gold." As soon as we had something to eat, a little beef and damper, I washed out five pans of earth. I first removed with a trowel some very fine schist stones, and took a little earth, and the first pan had a good grain of gold in it and the others likewise.
230. Do you mean a grain of gold in weight or just a speck? It was more than a speck—a nice little piece of gold.
231. What do you think was about the weight of it? I washed five pans, and there was gold in every one.
232. *Mr. Jones.*] What quantity of gold had you after washing the five pans? I never took particular notice.
233. Did it amount to grains or dwts.? About as much as would lie on a 3d. piece.
234. *Mr. Plumb.*] Did you save the washings? Yes.
235. And you did not weigh them? I did not weigh them. Lister said, "I never knew there was gold here in the earth—I thought it was in the rocks," and I said, "Well you see it is in the dirt now." I took a slip of a newspaper—the old *Empire* newspaper—and wrote in pencil: "Gold discovered in alluvial at Lewis Ponds Creek, this 12th day of February, 1851," and then I remarked, "This is a memorable day in the history of New South Wales" and signed it. I gave that to the Colonial Secretary and I daresay it is amongst the records now.
236. *Mr. Jones.*] You gave it to the Colonial Secretary on your return to Sydney? Yes.

Mr. E. H.  
Hargraves  
23 Oct., 1890

Mr. E. H.  
Hargraves.  
23 Oct., 1890.

237. And you gave him the gold as well? Yes.
238. You cannot say what it weighed? No, it was no very great quantity. I knew very well what the consequences would be if we attempted to work; the whole country would be on fire in a moment.
239. *Chairman.*] Do I understand that the reason why you did not prosecute your work in that particular spot was because you were afraid that you would leave some tracks behind you and other people would be able to work the ground—why did you not go on with the prospecting? Because I thought it would be folly to do so.
240. Why? There was no water to be got, and I thought that if a gold-field were opened out there would be a rush. James Tom was very anxious to go to work but I told him it would be a silly thing to do.
241. Was James Tom with you on that occasion? There was no one but Lister and myself on the 12th February.
242. You said there was no water; but there must have been water to enable you to wash the five pans of earth? There was water at Yorkey's Corner. In continuing my statement, I may say that I wanted to go to Dubbo to see my friend Mr. Cruickshank, whose son is now a Member of the Legislative Assembly; but I said I would like to go down as far as the old Government stockyards, and then strike the Macquarie, and come up the Macquarie. Lister said he did not know the way, and I said, "See Tom then, if he will keep the matter secret," and he said he was sure he would; then in a few days we went on the expedition and struck the Macquarie, and came up the Macquarie as far as the junction with Summer Hill Creek. I said, "There is plenty of gold here." I washed several pans and threw it out, it was small gold; they said, "Would it not be better to go to work," but I said, "No, I want to go to Dubbo," and I went to Dubbo and saw Mr. Cruickshank. I stayed a day or two there and washed out; Mrs. Cruickshank washed out as much as would make a ring; she was the second person who washed a pan of earth in New South Wales. I then returned to Guyong, and they were very anxious about going to work. I said, "Well, I do not intend to go to work; I will put you to work, and I will go into Bathurst and get a hopper punched;" and the only thing I know about William Tom is that I asked him for a packing-case to make a cradle. They were building a new house at the time and he said he would try and get his father to let us have some cedar, and the carpenter working at the new house made the cradle.
243. Did you see the carpenter make the cradle? I gave him instructions to make it.
244. Do you remember his name? No. I went to Bathurst, accompanied by Lister, and I got a blacksmith to punch the hopper and brought it back again. "Now," I said, "as soon as the rain comes you will be able to go to work, but not for three weeks—you must lock the cradle up in the cellar for three weeks." I thought that would give me time to get to Sydney and make arrangements with the Government; but before that time expired they broke faith with me by taking the cradle out. All I had promised them was to show them the way to work, which I did near Mr. Tom's old house. About sixteen years previously I had been all about that country. I was at that former period superintending Captain Hector's station, near Bathurst, and I received instructions from Sydney to purchase wheat, and get it ground, and sent on to Boree, and I did so. Three days afterwards the bullock-drivers came back. I think there were three teams. They said they had lost the bullocks. I went off immediately, and the bullocks were picked up and put on the road. I then went on to Guyong, and there I met Tom Jamieson, half-brother to the late Sir John Jamieson, who had a cattle station down there. I was out of meat at the station, and I bargained with him for four bullocks. He said, "You had better come down to my station to-night, and we will go out and cut the bullocks out and bring them to our yard." I am not certain whether it was that day or the next morning that we got the bullocks. He said, "We will go and ask Parson Tom to let us put the bullocks in the yard." He referred to old Mr. Tom, commonly known as Parson Tom. I knew nothing of geology, except what I had learnt as a boy; but on going on the run I saw some splendid dykes, but did not know what they were. I did not know whether there was gold or anything about it. As a proof that I was there, I may mention that when we stayed at Tom's. Miss Tom (now, I think, Mrs. Webb) produced some missionary box, and Tom Jamieson put his name down for £3, and I put my name down for £2, thinking very little about it. When I returned in 1851 I was called upon to pay the money and did so, and I have no doubt this will appear in the books of the church. So that I had been all about Ophir and Green's station with the bullocks, and observing these rocks I wondered a good deal. I had no knowledge at the time, but I wondered a good deal at them. There were dykes in an inverted position which you could trace for miles. When California broke out I had a cattle station on the Manning River, and, deciding to go to California, I sold my cattle for 5s. a head, and gave the station in. Shortly after arriving in California I went to the mines, and there I saw the same class of rocks and schists of various kinds that I had seen in this country, and reasoning from analogy and having faith in the uniformity of nature, I said, "Surely we have got all this formation in New South Wales; there must be gold there;" and I wrote to several friends mentioning it, but none of them took any notice of me, and thought I was a madman or a fool. I wrote a letter to an old friend of mine, named Samuel Peake, who was afterwards drowned in the "Dunbar." I have the original of that letter now. It is dated, "San Francisco, California, 5th March, 1850," and amongst other things I wrote as follows:—"I am very forcibly impressed that I have been in a gold region in New South Wales, within 300 miles of Sydney; and unless you knew how to find it you might live for a century in the region and know nothing of its existence." In those days the only communication between this country and California was by colliers trading to Newcastle, and the mail-bags were sent from Newcastle to Sydney unopened. It will be seen that the letter from which I have quoted bears the post-mark, "Sydney, May 18, 1850."
245. *Mr. M'Lachlan.*] You say that the gold that you got on the 12th February was not weighed;—was not its weight estimated at 16 grains? I do not know.
246. *Mr. Jones.*] You do not know that it was weighed before you gave it to the Colonial Secretary? I know it was not, because it was in my possession all the time.
247. *Mr. M'Lachlan.*] Did not the Colonial Secretary, Mr. E. Deas-Thomson, say in evidence before a Select Committee what its weight was? I do not know.
248. Was it anything more than a few specks of gold? I suppose it was about as much as would go on a three-penny piece.
249. How much do you suppose that would be? About half a pennyweight.
250. Do you remember telling Mr. E. Deas-Thomson where that gold came from? I did not tell him where it came from until I had made an arrangement with the Government.

Mr. E. H.  
Hargraves.  
23 Oct., 1890.

251. You told him then? Yes; I told him exactly where it was obtained, and he asked me whether there was any more, and I said I had not the slightest doubt there were tons.
252. And where did you tell him it was from? I told him it was from Lewis Ponds Creek.
253. You did not say it was from the Turon? No.
254. Did you say what part of Lewis Ponds Creek or did you merely say Lewis Ponds Creek? I merely said Lewis Ponds Creek, I think.
255. Was the cradle made while you were at Mr. Tom's? Yes; it was made by my instructions, and I showed them how to work it.
256. Did you see them making it? I cannot say that I did. It was brought in skeleton fashion, and I instructed them how to fix the wash-board and so forth.
257. Do you not know that William Tom made that cradle under your directions? I do not believe he did.
258. Do you know whether he did or not? I have no recollection of his doing so. The carpenter came to me about it and I gave him instructions.
259. William Tom has sworn that he made it;—are you prepared to contradict that? I will not swear he did not make it. There was a good deal of bother about getting the wood, and I said an old packing-case would do. The only thing I know of William Tom is his getting the wood to make the cradle.
260. You say that you were well acquainted with the locality sixteen years before;—did you know it well or did you merely pass through it? I went with Tom Jamieson to get the bullocks.
261. Was that the only knowledge you had of the place? That was the only knowledge. We were two days getting the bullocks.
262. What arrangement had you with either James Tom, William Tom, or Lister? I had no arrangement whatever except that I would get the cradle for them and instruct them how to use it, and then I said, "You are on the high road to fortune."
263. Were you in no sense partners or mates? Not in any sense.
264. What evidence was it that induced the Government to recognise you as the first gold discoverer;—was it simply the production of the gold you got on the 12th February? That was the commencement of it.
265. What other evidence induced them to recognise your claim? They recognised me at once; there was nothing further.
266. But was not a quantity of gold of about 4 oz. used for the purpose? On my return, after my appointment as Commissioner of Crown Lands, I said to one of the Toms, I do not know which, "That is the first fruit of the cradle; I would like to have that 4 oz."; and I bought it from him.
267. But before buying that 4 oz. had you been recognised by the Government as the discoverer? Yes.
268. Can you remember the date on which you were officially recognised as the discoverer;—was it after the 12th February? Yes.
269. How long after? I suppose about a fortnight.
270. In what way were you recognised. I suppose Mr. E. Deas-Thomson was the Colonial Secretary at that time? Yes; he said, "Well Mr. Hargraves, we are going to have a grand thing now, and I wish you to return." There was a meeting of the Executive Council, and I think that must have been in April.
271. But you said just now about a fortnight after the 12th February? Well, forty years is a long time, and it is difficult to remember the exact date.
272. Gold was proclaimed on the 14th May, 1851—perhaps that will guide you? The proclamation had been printed but not distributed.
273. It was not printed any considerable time before the 14th May? Yes; it was some time.
274. How long? I cannot tell you the date. The Colonial Secretary sent for the American Consul who said that it must all be an imposition, and that I must be an imposter, that the mountains here were not high enough for a gold country.
275. At all events you swear that you were recognised as the discoverer of gold before the 1st May? Yes.
276. Is it not a fact that they refused to recognise you until you brought the 4 oz. of gold, which you say you brought from one of the Toms? I suppose that was in May.
277. On the 6th May they gave you the 4 oz. of gold? I gave that gold to the Colonial Secretary.
278. Tom and Lister gave it to you on the 6th May? They did not give it to me. I bought it.
279. However, you got the gold on the 6th May? Yes.
280. And within eight days of that the proclamation was made? No; that had nothing to do with it.
281. Had the 4 oz. of gold nothing to do with your being recognised as the discoverer? Nothing whatever.
282. You are sure of that? Quite sure. The letters from Tom, telling me what they had been doing, I handed to the Colonial Secretary.
283. When you went away from the district after the 12th February, did you not simply go saying that you did not see that there was anything there worth working for, and that if you did not see anything better you would go to California? No; that is all a fabrication.
284. Did not the Toms or Lister write to you intimating what they had found, and asking you to come up? Yes; it was agreed that they were to do that.
285. You said that there was no agreement just now? It was not an agreement, but only a verbal arrangement.
286. Did you not stipulate when you were going away that a full account should be sent to you of all their transactions? Yes.
287. And they wrote to you intimating what they had done? Yes.
288. Have you any of those letters? No, I gave them to the Colonial Secretary.
289. How many letters did you receive from them? I do not think I had more than one or two.
290. You gave them to the Colonial Secretary? Yes. I kept him posted up in everything that was doing.
291. Do you remember their telling you by letter that they had found about 16 grains of gold? I have rather an indistinct recollection of it.
292. Did you afterwards get that small quantity of gold from them by purchase or otherwise? No. They wrote to me, saying, that the cradle had commenced work, and the result was 16 grains of gold.
293. In consequence of getting that letter did you go up to see them? I informed them of the time I should be there, and I went up and saw them all busy at work lower down the creek.

- Mr. E. H. Hargraves.  
23 Oct., 1890.
294. That was before the 4 oz. of gold were got? No, afterwards. They wrote to me, telling me that they had used the cradle by my instructions in such a place, and had got 4 oz. of gold.
295. Do you know when it was you got that letter? I cannot tell.
296. Was it about the beginning of May or the end of April? I cannot tell you—it is forty years ago. On my returning they were furious about my telling the Government. They said they might have worked a long time and got a lot of gold; I said, “Oh, nonsense, if you work you will dirty the water, and when shepherds come to water their sheep you are sure to be discovered. You would not work for twenty-four hours without being discovered.”
297. *Chairman.*] Do you remember giving this certificate?

On Her Majesty's Service.

This is to certify that the Australian Gold Company are hereby authorised and empowered to occupy the following Bars \* \* \* \* \* in gold-mining, and to prevent all parties from intruding thereon, viz., Fitzroy's Bar Hargraves' Bar, Lister's Bar, and Tom's Bar.  
6th May, 1851.

E. H. HARGRAVES.

Yes. That is a memorandum which I wrote at the mines at their request. They came to me complaining that they would require some protection.

298. *Mr. Jones.*] Were Tom and Lister shareholders in the company mentioned? There was no company that I know of.”

299. *Mr. M'Lachlan.*] The letter speaks of the “Australian Gold Company”—were they shareholders in that company? Yes, they were—The Toms and Lister and the family.

300. Then the Australian Gold Company was composed of the Toms and Lister and yourself? No, not myself.

301. You were not one of the company? No.

302. Of whom was the company composed, as far as you remember? I think there were three Toms and Lister. There was Wesley Tom, a butcher.

303. They were all local men? Yes.

304. *Mr. Jones.*] If you were not a shareholder in the company, why did you sign that letter? I did so at their request. They said they could not keep the people off.

305. *Mr. M'Lachlan.*] You say you paid them for the 4 oz. of gold? Yes.

306. How much? I forget.

307. Do you remember in what way you paid them? I think it was by cheque on the Bank of New South Wales.

308. The Sydney office, or the branch office? The Sydney office.

309. You kept your banking account there at the time? Yes.

310. If it were a cheque, it must have been on the Bank of New South Wales? Yes.

311. You are not certain whether it was a cheque or not? I am almost certain it was a cheque. I do not recollect the amount. Gold was selling very cheaply then—£2 an ounce; but I think I gave them £3 an ounce.

312. Did you deduct anything for yourself? No, I did not.

313. A fourth, or a third, or any part? No part whatever.

314. Do you remember writing a letter for Lister, intended to be published in the *Sydney Morning Herald*;—the letter is dated Ophir, 19th May, 1851, and is as follows:—

GENTLEMEN,—A report having been spread abroad by some malicious person, who evidently is jealous of Mr. Hargraves' great discovery, to the effect that I was the party who made it and communicated it to him, I beg leave most unreservedly to contradict this false report, although having been upwards of two years searching for it—one time with two geologists and mineralogists, who told me there were indications, but could not find the gold. Mr. Hargraves, during his explorations, called on me as an old friend of my late respected father, and in course of conversation he told me this was a gold country, and if I would keep it quiet he would combine me. This I agreed to. He was as good as his word, and scarcely ever made a failure. Where he said gold was to be found, he found it. I neither understand geology or mineralogy, but I am convinced my friend Mr. Hargraves knows where and how to find gold, and all honor and reward in the late discovery belong to him alone. Indeed, few men would have done what he has—intersecting the country with blacks; sometimes alone, sometimes with my friend, Mr. James Tom; and during his explorations had rain set in, from the imperfect manner in which we were equipped, starvation and death must have been the result. Trusting you will give this publicity in the columns of your valuable journal,—I am, &c.

Do you remember writing that letter for Mr. Lister to sign? At his request I recollect writing a copy of a letter for him—it was something like that. He said he did not understand much about writing, and would I put the matter together.

315. He dictated it and you wrote it? Yes.

316. And, as near as you can remember, in the words I have just read? Yes, I think so.

317. There is also this postscript:—

[Here Lister's name was written by Mr. Hargraves.]

P.S.—I have also heard it reported that Mr. Hargraves had not acted fairly towards me. I beg most distinctly to state that in all transactions with that gentleman he has acted strictly honorably with me and friends in the secret of the great discovery. Mr. Hargraves is now no longer connected with me or my party at Ophir; and wherever he may be he has my best wishes, and I believe of all who have known him in the district of Bathurst.

You say you believe you wrote such a letter at his dictation? I am certain I did.

318. Did he sign it? I did not see him sign it.

319. You wrote it in his presence? Yes.

320. Do you not know whether he signed it or not? No. He said, “I will keep this and send it on.”

321. Do you know whether he did so or not? I do not. I never troubled my head about it.

322. Do you remember such a letter as this which refers to the one just read?

THE foregoing is a copy of a document which Mr. Hargraves wrote and gave me, requesting I would send it to the *Sydney Morning Herald* for publication. I declined doing this because I could not subscribe my name to the untruths it contained, for I never knew him travel with a blackfellow in my life, neither am I aware of any extraordinary difficulties or dangers to which Mr. Hargraves was exposed. Furthermore, by my complying with his request, I should have betrayed Messrs. James and William Tom, who were the prospecting colleagues of Mr. Hargraves, and who, with myself, were at all the expense and most of the pains when actually searching for gold; and, further, Mr. Hargraves certainly sometimes found the horse he rode himself, but the other necessary horses and provisions were not one farthing expense to him. While living at my place, during the business of the gold search, he was entertained free of cost. I also assert, in plain words, that Mr. James Tom and I never travelled with Mr. Hargraves with any other understanding than that we were his prospecting colleagues, and concerned equally with himself in any favourable result that might accrue from our journey or journeys. I do not mean to assert that the Messrs. Tom and myself expected to get a share of what Mr. Hargraves might obtain from the Government,  
or

or even in the shape of public subscriptions, but only of the profitable results of our explorations. I expected Mr. Hargraves to make a truthful representation to the Government of how the first gold was obtained, that the Government might have had the opportunity of judging and rewarding each individual concerned according to his merits in the discovery. Messrs. James and William Tom can bear testimony to the truth of what I have now written.

Mr. E. H.  
Hargraves.  
23 Oct., 1890.

J. H. A. LISTER.

P.S.—The early history of the discovery will appear in next Saturday's paper.

—? No I do not.

323. You do not recollect any such letter? No.

324. Did you never know that Lister refused to sign the letter which you wrote? No. I was under the impression that he said—"I will copy this in my own handwriting and send it away."

325. But you acknowledge that it was in your handwriting? Yes.

326. That being so, I supposed it contained nothing that you knew to be a mis-statement? No; it was all true.

327. Is this part true: "Mr. Hargraves, during his explorations, called on me as an old friend of my late respected father"? I have said that I called at Mrs. Lister's, having known her during her husband's lifetime.

328. The letter goes on to say: "And, in course of conversation, he told me this was a gold country, and if I would keep it quiet he would combine with me";—what did you mean by combining with him? I do not recollect every word in the letter. I recollect writing the letter at his dictation. Whatever he said I put down.

329. Did you say this: "Indeed, few men would have done what he did—intersecting the country with blacks; sometimes alone, sometimes with my friend, Mr. James Tom." According to what you have said to-day, that would hardly be a true description of the transaction? Yes. I told you before that we went down to the company's old cattle-station, and came up the bed of the Macquarie to Summer Hill Creek.

330. Then there is this statement in the postscript: "Mr. Hargraves is now no longer connected with me or my party at Ophir";—did you write that? I was never connected with them, except promising to show them.

331. Would it not be incorrect to say you were no longer connected with them, if you never had been connected with them? They were connected with me so far for their own good while I instructed them.

332. *Mr. Torpy.*] Of what description of gold was the 4 oz.—was it coarse nuggetty gold or fine gold? It was nuggetty gold. There was one piece I think a couple of ounces in weight.

333. And the other pieces were smaller? There were several other pieces.

334. *Mr. M'Lachlan.*] Referring to the letter you wrote for John Lister, which was intended for publication, do you not think it strange that he should not have signed it at once after it was written? I do not think anything about it.

335. How did the letter come to be written at all? It was written at the request of Lister.

336. Did he tell you why he wanted you to write such a letter—because it was more in your interests than in his? No; he asked me to write it.

337. He did not give any reason? No.

338. Is it not a fact that you wrote that letter of your own motion, and asked him to sign it? No; it is not a fact.

339. You wrote this pamphlet, headed "The Gold Discovery of the 12th of February, 1851"? Yes.

340. Do you put that in evidence? Yes. [*Appendix C.*]

341. In that pamphlet you admit that you had to make some untruthful excuses, so that it might not be known that gold was discovered. You say, for instance, that you had a fertile imagination, and no doubt your excuses were very ridiculous? I had to make excuses, or else they would have set to work right off the reel.

342. What harm would that have done? A great deal of harm.

343. You say in your pamphlet: "So I made, no doubt, numberless excuses for doing so, all of which were, of course, believed, and I cannot now say what they were; but they were sufficient for my purpose, and ridiculous enough, I dare say"? One funny thing occurred: When Lister was so astonished at finding the gold, I said, "This is a great matter; I will be made a baronet, you will be made a knight, and my old horse will be stuffed and put into the British Museum." Lister afterwards told me I had not performed my promise.

344. *Chairman.*] I believe that when you were returning to Sydney, Lister accompanied you as far as the Fish River? No; I do not think so.

345. Did he go with you to Bathurst? I do not think so.

346. He has sworn that he went with you as far as Mutton's Falls on the Fish River;—is that untrue? I cannot say that it is untrue, but I have no recollection of it.

347. *Mr. M'Lachlan.*] When you were parting with him did you say, "If we cannot see anything better than what we have seen I shall go back to California"? No.

348. You do not remember his saying that if you were going he would go with you? No; I did not.

349. *Chairman.*] I believe you first obtained a gratuity from the Government of £1,000? No; £500.

350. And, subsequently, you got a further grant of £9,000? Yes.

351. You are aware that when you got that grant the Toms and Lister were awarded between them £1,000? Yes; I saw that in the papers.

352. It would appear from the records that you have received altogether from the State £10,000? Yes.

353. You have only accounted for £9,500;—at what period did you get the other £500; there is no record of that? The first sum granted to me was £500, the second was £5,000, and the third was £4,000.

354. Can you explain, after what you have said, on what grounds the Parliament of the country awarded £1,000 to the Messrs. Tom and Lister? Mr. Wentworth took the case up for them, and they said they thought they were entitled to something; and after the vote several members said that if they had known what they knew then they would not have sanctioned the grant of £1,000 to the Messrs. Tom and Lister, because they thought they had been very well paid.

355. By what you had given them for the 4 oz.? No; but they had been well paid for what they did in assisting me.

356. How had they been well paid? They were previously out at elbows. I was told that they were very poor, and it was a great God-send to them that I came along.

357.

Mr. E. H.  
Hargraves.  
3 Oct., 1890.

357. *Mr. Jones.*] It was the discovery of gold in California which induced you to sell your station and go to that country? Yes; I brought seventy bullocks up to Maitland, and could not get £1 per head for them.
358. When you saw that the auriferous country in California resembled the country about Lewis Ponds, you came back to mine at Lewis Ponds? I came back, not to mine, but to make the discovery.
359. Having obtained a certain practical knowledge of mining, you came back with the intention of discovering gold in New South Wales? Yes.
360. You say you got young Lister as your guide? When Mrs. Lister begged of me to take her son, I told him where I wanted to go to, and he took me down the creek.
361. And did you tell him that he would be well rewarded on your discovering gold; that the discovery of gold would reward him? No; I told him that he could go to work and earn plenty of money.
362. What did you mean by that;—did you take him in as a mate? No.
363. Simply as a guide? Yes; I wanted a blackfellow at first.
364. With your practical knowledge of mining in California, did you believe that the small portion of gold you first discovered was a payable prospect? Yes; I had seen some very rich country. I told them, "I am not going to open it out now, but you will get pieces of gold as big as your foot."
365. You instructed Tom and Lister how to make a cradle, and how to work it? Yes; I showed them how to work the cradle by using some loose dirt about the place.
366. Then you went away? Yes.
367. When you went away and left them, did you recognise them as your mining mates? No.
368. That was not the combination you entered into with Lister? No.
369. To use a mining phrase, they jumped your claim;—that is, they took the cradle and went out to prospect for themselves independently of you altogether? It was understood that the cradle should be locked up for three weeks, and that then they should take it out and work it, and write to me the daily results.
370. But they did not wait for the time specified? No.
371. They acted on your information and went and discovered the 4 oz. of gold themselves? Yes; and a great many other ounces.
372. Did you base your claim for the reward on the information you gave these men as to how to look for the 4 oz. of gold they got while working for themselves? I did not.
373. You based your claim for the reward on the small quantity of gold you showed the Colonial Secretary? Yes. I could have shown ounces had I chosen. I had passed over 70 miles of auriferous country.
374. *Mr. Torpy.*] What did the Victorian Government allow you? They voted me £5,000, but only gave me £2,381.
375. *Chairman.*] It has been stated in evidence before the Committee that the 4 oz. of gold found by William and James Tom and J. H. A. Lister was divided into four equal parts? No such thing—it is a perfect fabrication.
376. *Mr. Jones.*] You did not claim any portion of the 4 oz. as a mining partner? No.
377. *Mr. M'Lachlan.*] You say you paid for the 4 oz. of gold by cheque;—would you have any objection to that cheque being obtained from the Bank of New South Wales? I am not certain, but I think I gave Mrs. Lister a cheque for £9 for horse-feed.
378. Then you gave a cheque to Mrs. Lister? Yes.
379. What was that for? Hay for my horse.
380. That cheque had nothing to do with the purchase of gold? No; nothing whatever.
381. Did you give a separate cheque for the gold? I am not certain.
382. How did you pay them;—you told us you paid by cheque? I thought I did, but I will not be sure; forty years is a long time ago.
383. *Mr. Lee.*] After you left Lister and James Tom, and after you left the district, where did you intend to go to? I told them I was going home to Brisbane Water.
384. Had you any intention of going to Moreton Bay? No. Perhaps that was one of the ruses I used. There was a vast amount of excitement at the time.
385. You might have said so; but if you did it would have been a ruse? Yes. I wanted to get away, and they were not anxious for me to go.
386. While you were away did you get a letter from either Lister or Tom, informing you that they had found some gold? Yes, I did; 16 grains of gold.
387. On receipt of that letter did you return to the district? I went to Sydney and gave Mr. Thomson the letter; but I do not think it was accompanied by any gold.
388. But on receipt of the letter did you return to the district? I could not say.
389. You are clear that it was not the finding of the 16 grains of gold that induced you to go back? No; it was not that.
390. Was there not a tacit understanding between yourself, the Toms, and Lister that no gold-field would be any good unless it gave wages at the rate of £1 a day? No; I told them that the junction of the Macquarie would give very fair wages—I think 15s. a day.
391. But did you consider that a gold-field was not payable unless it gave £1 a day per man? No.
392. In consequence of the discovery of the 16 grains of gold, did you induce the Government to have the district inspected? No; I returned to Mr. Icely's, and we had a long talk about the matter. He said to me, "Do you think there is any gold about here Mr. Hargraves?" and I said, "Yes; I think there is gold here"; and he brought a cradle up for me in his carriage. I went down to the creek and washed a pan of earth, and got a piece of gold as big as a grain of wheat. Then, in the afternoon, Mr. Icely and the Misses Icely took the cradle down to the creek and washed a good bit of gold.
393. You returned to the district after you got the knowledge of the 4 oz. of gold? No; I had not the knowledge of the 4 oz. that I am aware of, until they told me.
394. Were you in the district at the time they told you? I must have been in the district.
395. They did not communicate with you by letter? I have no recollection of it. Everybody was very much excited at the time.
396. Do the Committee clearly understand from you that the first gold you actually found you preserved, and brought it down and gave it to the then Colonial Secretary? Yes.
397. And that was the first gold the discovery of which was reported to the authorities? Yes.
398. And upon that was based your claim to be the first discoverer of gold? Yes; and I think rightly so.

399. *Chairman.*] You have said that the 4 oz. of gold found by the Messrs. Tom and Lister was nuggetty gold? Yes.
400. Do you remember a piece of that gold that was the shape of a heart? No; I do not. I should very likely remember it if it were so.
401. When you purchased the 4 oz. of gold from them, did you bring it all to Sydney? Yes.
402. Did you take any of it back again? No; I gave it to the Colonial Secretary.
403. The whole of the 4 oz.? Yes.
404. Then you did not give William Tom a small nugget of gold in the shape of a heart, part of the 4 oz.? No.
405. If Mr. William Tom swears that he took a fancy to one of the nuggets in the parcel of 4 oz., and asked as a special favour that it should be handed back to him, is that true? I have no recollection of it, and my memory is pretty good for a man seventy-four years of age.
406. *Mr. Torpy.*] What, in your opinion, is the weight of the gold you first showed to Mr. E. Deas-Thomson? I do not think it was above  $\frac{1}{2}$  dwt.—it might have been more.
407. What reason did the Government of Victoria assign for not paying you the whole of the amount voted? Well, James Tom was down there, and he made interest against me.
408. *Mr. Mc Lachlan.*] Was there an investigation there about it? Yes.
409. *Chairman.*] Are you aware of any other person whose evidence would throw any light upon this inquiry? No.

Mr. E. H.  
Hargraves.

23 Oct., 1890.

THURSDAY, 13 NOVEMBER, 1890.

Present:—

MR. CHANTER,  
MR. STREET,MR. LEE,  
MR. TORPY.

T. DALTON, ESQ., IN THE CHAIR.

Mr. Thomas Brown called in, sworn, and examined:—

410. *Chairman.*] I believe you are a builder by trade residing at Young? Yes.
411. How long have you lived at Young? Ever since 1861.
412. Previously to that I believe you lived at Cornish Settlement, near Guyong, with Mr. Tom, commonly known as Parson Tom? Yes.
413. You were there in 1851 were you not? Yes, I was working for Mr. Tom from 1846 until 1853.
414. When did you leave Cornish Settlement? In 1861.
415. Of course you remember the time of the gold discovery at Ophir? Yes.
416. Did you ever see Mr. Hargraves? Yes, I saw him many times.
417. Did you see him at Mr. Toms? Yes; it was there I first saw him.
418. Do you recollect when that was? It was either in the months of January, February, and March, or February, March, and April, in the year 1851. It is a long time ago, and I am not positive as to the months.
419. Did you have any conversation with Mr. Hargraves? I never spoke to Mr. Hargraves in my life—never had a word with him.
420. What do you know about the gold? I know very little about the gold. All I know is that the first gold I ever saw was in the possession of Mr. Tom. I know nothing at all about the getting of it except by hearsay. But Mr. Hargraves was not there when I saw the gold. He was away many times during the two or three months that he was there. I could not say how many times he went away. I was the only man who was there, and there was no one to tell me only just themselves.
421. Then you did not hear any conversation between Mr. Hargraves and either of the Toms? I never heard a word between them. I was always at work, and they were always away, or very nearly so. If they were not away together, Mr. Hargraves was very often away by himself.
422. Did you see them together? Very often.
423. Which of the Toms was with Mr. Hargraves? They were both with him pretty often; but I think that, if either, James was the principal man with Mr. Hargraves, because he was a good bushman, and knew all that part of the country without going near any road, and he and Mr. Hargraves used generally to go together to different places—round to the Turon and several times backwards and forwards to Ophir.
424. I suppose you used to mix a good deal with the people about there, not only about Cornish Settlement and Guyong, but about Orange? Orange was nothing then. It was merely a road running through at that time.
425. But you knew all the people about there? I knew what people were living there.
426. And what was the impression about the finding of gold. Who were the real finders of the gold. What was the impression of the people and of yourself about it? My impression so far as I know about it is that Mr. William Tom, James Tom, and John Lister.—There was a man named John Lister; but I have not seen any of them for the last thirty years, because I have not been down that way since I came from Orange.
427. Then I understand you to say that you have had no communication with either William or James Tom or John Lister during the last thirty years? None whatever.
428. Have they mentioned anything to you recently about this case in a letter or otherwise? No; they never mentioned anything to me about it or about any letters. But about two or three months ago Mr. William Tom sent his daughter to where I was living at Young with a letter which he wanted me to sign, and which was to the effect that I had nothing to do with the making of the cradle.
429. *Chairman.*] Is this the letter:

Mr.  
T. Brown.

13 Nov., 1890.

Young, 23 May, 1890.  
It having been reported by Mr. Hargraves that I made the first gold cradle while I was a carpenter at Springfield, near Guyong, I beg to say that I did not make it. It was made by Mr. William Tom, jun., of Springfield, sometime in February or March, 1851.

Witness—LINA L. TOM.

THOMAS BROWN.

?—Yes.

430.

Mr.  
T. Brown.  
13 Nov., 1890.

430. Is that correct? Yes; quite correct. The names Springfield and Cornish Settlement apply to the same place.
431. If a witness has sworn that you are the person who made the cradle he must be in error? Yes; he would be telling a falsehood.
432. Did you take any part at all in the construction of the cradle? No; I never drove a nail in it. William Tom made the cradle himself. I used to work pretty late in the evening at that time. The house was not quite completed, and I was working in a large parlour making some things for the up-stairs portion of the building. After I left off work at night William Tom took my tools and my bench and made the cradle. He never said anything to me about it. I heard him at work, but did not go into the parlour to see what he was making, because there were three or four boys, and they were very ingenious and very handy, and were always anxious to be doing a little carpentering work. I did not therefore take any notice of the hammering at night; and when I got up in the morning, to my surprise, I saw the cradle underneath the back verandah. I said to Henry Tom, who is now in Queensland, "What, in the name of fortune, is that?" and he said, "That is a bird-cage." I said, "What is it for?" and he said, "To catch birds." I said, "What sort of birds?" and he replied, "Very valuable birds?"; and I said, "Where do you catch them?" and he said, "On the Canobla Mountain; every one caught will be worth a pound." I did not know any better, and took it for granted. But the youngest daughter, who was about 9 or 10 years old, used to be always coming about where I was at work, and I said to her one day, "What is that thing that William made last night?" and she said, "If I tell you you won't tell?" and I said, "No"; and then she said, "That is a cradle to get gold with." That will give you an idea that I had nothing to do with the making of the cradle.
433. Do you know anything about Mr. Hargraves going to Bathurst for the purpose of getting a hopper for the cradle? No.
434. Where was the hopper obtained, and who punched it? I do not know anything about the hopper, but I do not think that can be true, for I do not see how Mr. Hargraves could have had to go so far for a bit of sheet-iron or for a piece of tin, because in those times anything would do for the bottom of a cradle.
435. Did you see the hopper made? No.
436. *Mr. Chanter.*] When you saw the cradle in the morning did it have the sheathing on? Yes.
437. A punched plate? Yes, it was complete—handle and all.
438. Do you recollect what the bottom was constructed of—whether it was tin or sheet-iron? I could not tell; I did not take such particular notice. I thought at first it was to catch birds. That was the only time I saw the cradle so far as my recollection goes, because very soon after it was made it was taken down to Ophir.
439. *Chairman.*] Did the Messrs. Tom show you the gold they had found? Mr. Tom showed me some gold; I do not know whether it was that or not.
440. About how much? I could not tell you now because not being acquainted at that time with the bulk of an ounce of gold I could not form any idea; but I rather think it might have been two or three ounces. I think it was more than an ounce because an ounce of gold is very little in bulk.
441. Did you see the Toms take the cradle away from Springfield? No, I did not.
442. They kept the matter very secret? They did. They took the cradle away at 12 o'clock at night. The little girl told me they were going away at the dead hour of the night. Mr. Hosie, a surveyor, who is now at Young, lived about a mile and a half up the creek, and I used very often to go and see him, and it happened that I was there the very night they took the cradle away. When I came back in the morning they had gone to the Ophir prospecting.
443. *Mr. Torpy.*] Was that creek called the Ophir in those days? I think Mr. Hargraves gave it the name of Ophir.
444. What was it called before that? I think it used to be called Lewis Ponds Creek.
445. *Chairman.*] It has been stated to individual members of the Committee that you are of opinion that the Messrs. Toms and J. H. Lister were the real finders of the gold? Yes.
446. Will you state to the Committee what reason you have for thinking so? Why, because I never saw Mr. Hargraves having anything to do with any gold that was found on the Ophir, because he never was there—he was absent; and I saw the gold they got myself.
447. How do you know Mr. Hargraves was not there? I know he was not there, because no one belonging to the place could be away without my knowing it, and they would tell me themselves.
448. *Mr. Street.*] Did you ever hear Mr. Hargraves' name mentioned in connection with the discovery of gold? No; I never heard his name mentioned about getting any gold. I have heard them say myself that he never found a speck of gold.
449. *Chairman.*] Whom did you hear say that? I have heard William Tom say so many a time.
450. Anybody else? No; John Lister was a principal man too in this affair; but it was very seldom that you could see him at Tom's, because his place was very near, and he was always at home. He had no father, and he was then keeping a public-house, and had to look after the business as well as the business at the Ophir.
451. *Mr. Street.*] What did you suppose caused the Messrs. Tom to commence looking for gold? I was employed by Mr. William Tom, sen., to do carpentering and general work, and in 1851 I was the only man there besides themselves. While I was employed at the building Mr. Hargraves came there for the purpose of searching for gold.
452. *Mr. Chanter.*] How long was it after Mr. Hargraves came that they made the cradle? I do not think he was there more than about six weeks or a couple of months.
453. *Mr. Street.*] Did you ever hear any talk about a discovery of gold before Mr. Hargraves came there? Yes; I heard some of them say that John Lister had found gold in some place or other, but I could not say where. That was before Mr. Hargraves came. Twelve months before that I was up at Dubbo myself. I used to go about shearing in those days, at which I could make more money than at carpentering. There was a place called Mitchell's Creek, at Dubbo, and there was great talk about this Mitchell's Creek. It was rumoured amongst the people round about the Orange district that there was a man getting gold at Mitchell's Creek, and taking it to Sydney and selling it.
454. That was McGregor I suppose? I think the man's name was something like that. Mr. Hosie and myself went to Mitchell's Creek and commenced poking about looking for gold. Like all new chums just come to the country we thought we should be able to pick it up and put it in our pockets, but we soon

soon got tired of looking for gold and left. The reported discovery of gold at Mitchell's Creek was the first I ever heard of in this country, and then I heard of John Lister finding it somewhere.

455. *Mr. Street.*] Was that before Mr. Hargraves appeared in the district? Yes.

456. *Chairman.*] Did you hear anything about a Company being formed at Ophir immediately after the gold discovery? I heard that the Toms and Lister were partners.

457. Did you ever hear of a Company called the Australian Gold-mining Company? I do not recollect. I never heard of the name of the Company, but I heard of the Messrs. Toms and Lister and Hargraves being partners.

458. You think the prevailing opinion amongst the people in the locality was that the Toms were the real finders of the gold? Yes, that was the prevailing opinion. Everyone used to say so, and everyone thought so who knew them—that they were the first men who found gold; and I am perfectly satisfied that they must have been, for they strove hard enough for it, and Mr. Hargraves was not there when it was found. When Mr. Hargraves was away they were always at the Ophir. They took the cradle away and left it there, and every opportunity they got they were off seeking for gold.

459. Did you hear anything amongst the young ladies of Springfield about a subscription to a church which Mr. Hargraves paid? No; I never heard anything of the sort. I think if it happened I should have heard of it, for I knew just as much about their business as they did themselves. I was working for them for six or seven years on and off, and for five years continuously.

460. You knew all the young ladies? Yes.

461. Can you inform the Committee which of the young ladies married Mr. Webb, of Bathurst, now the Hon. Mr. Webb? That was one of the daughters, called Selina Tom.

462. Was she the eldest daughter? No, the youngest but one.

463. How old was she then? I do not think she was more than about seventeen.

464. Was she in the habit of collecting money for the church then? No; not when I was there. There never was any collection for the church.

465. *Mr. Torpy.*] With regard to the cradle, I suppose you did not even saw the timber for it? No.

466. You had nothing at all to do with making the cradle? Nothing whatever.

467. *Chairman.*] I suppose you knew Mr. Lister's family very well? I knew them all, including the father and the mother.

468. Did you know a young lady named Anne Lister? Yes.

469. Where was she living then? At Guyong.

470. At what age were you at that time? About 30. I am now 69.

471. I suppose your hours of work were pretty long? I used to work sometimes all night.

472. What were the ordinary wages for carpenters in those days? My wages were £1 per week and rations, which were cooked for me. A good carpenter in those days got about 25s. or 30s. a week and find himself.

FRIDAY, 21 NOVEMBER, 1890.

Present:—

MR. PLUMB,  
MR. JONES,

MR. CHANTER,  
MR. TORPY.

T. DALTON, ESQ., IN THE CHAIR.

J. C. McLachlan, Esq., appeared as Solicitor for Messrs. Tom and Lister.

Mrs. Ann Lister called in, sworn, and examined:—

473. *Chairman.*] You are the widow of the late John A. H. Lister, and you reside at Millthorpe? Yes.

474. Do you remember some time in February, 1851, being at the house of Mrs. Lister at Guyong? Yes.

475. I believe you were staying there at the time on a visit? Yes.

476. Do you remember seeing Mr. Hargraves coming to the house? Yes; I saw Mr. Hargraves come there some time in the day. I could not say exactly whether it was in the morning or the afternoon.

477. Can you recollect the date? I do not recollect the exact date, but to the best of my belief it was early in February.

478. How did Mr. Hargraves come? On horseback.

479. Did you see him approach the house? Yes; I saw him coming down the hill to Mrs. Lister's, from Orange way.

480. Did he put up at Mrs. Lister's? Yes, but how long he stayed there I could not tell.

481. Subsequently to your seeing him approach the house on horseback you saw him in the house? Yes.

482. Do you know of any occurrence that took place? Only that he saw some specimens on the mantel-piece, and wanted to know from Mrs. Lister where they came from, as they were gold-bearing stones. This was not in the room he came into first, but in a little sitting-room off that. Mrs. Lister told him that her son got them, and that if he liked her son would take him to the place where he obtained them.

483. *Mr. McLachlan.*] Do you remember Mrs. Lister making any remark about what her son had been in the habit of doing? Yes; she told him that her son had always been in the habit of looking for gold; that he had been looking for years to find gold, and he believed those were gold-bearing stones.

484. *Chairman.*] You made a statement before a Justice of the Peace at Millthorpe? Yes.

485. Is this the statement?—

Messrs. Laurence and McLachlan.  
Sirs,

“Annandale,” Millthorpe, 3 November, 1890.

On the ninth page of Mr. Hargraves' evidence you will see the following:—“233. Did it amount to grains or dwts.? About as much as would lie on a threepenny-piece.” Mr. Hargraves brought the gold to my father's place in Bathurst that he said he got on 12th February, 1851, in the Lewis Ponds Creek, and it was shown to me under a glass tumbler, and when looking through the tumbler I said “Do you call that gold? I cannot see any”; then I exclaimed, “Oh I do see a few almost invisible specks.” What I have now written is in effect all I said or thought. I am quite sure five hundred times as much gold as was shown to me under the tumbler could lie on a threepenny-piece.

Witness to signature,—GEORGE HAWKE, J.P.

ANN LISTER.

653—E

Yes;

Mr.  
T. Brown.

13 Nov., 1890.

Mrs.  
A. Lister.

21 Nov., 1890.

- Mrs. A. Lister.  
21 Nov., 1890.
- Yes; I signed that paper before Mr. Hawke, and the contents are perfectly true.
486. Had you at that time any idea of the weight of gold? I had not the slightest.
487. But you saw only a few specks? Yes, almost invisible specks.
488. I believe your father resided at Bathurst? Yes.
489. What was his name? James Arthur.
490. And Mr. Hargraves knew your father? I do not think he knew him until then.
491. But he was stopping at your father's house and exhibited these specks of gold? Yes.
492. Did you hear him say anything else about the gold? No I did not.
493. Who was with him at the time? Mr. Lister, my late husband.
494. Where were they going? I could not say. I did not take much interest in gold then, I was only a girl.
495. You did not hear Mr. Hargraves say anything about going to the Fish River? No; but I have often heard Mr. Lister say that is where he parted with Mr. Hargraves—at the Fish River.
496. *Mr. Plumb.*] Was it during your visit to Mrs. Lister's place that this discovery was made? I saw Mr. Lister take Mr. Hargraves on the way to Ophir. It was right opposite Mrs. Lister's place. I saw them go away from the house.
497. And did they discover this gold during your stay there? I do not know. I went away from there and went home. It was after I came home that I saw the gold.
498. Did you know or hear of any arrangement of partnership having been made between Mr. Lister and Mr. Hargraves? No, except what I have heard Mr. Lister say himself.
499. *Chairman.*] What did he say? Well, he always said they were partners; and that at the time the 4 oz. of gold were found they sent for Mr. Hargraves, asking him to come up; and he went to the house at Springfield, where they divided the 4 oz., each taking his own share. That is what I have always heard.
500. *Mr. Plumb.*] It is only hearsay? Yes, of course. All I can speak to of my own personal knowledge is the arrival of Mr. Hargraves at Mrs. Lister's house, and seeing the small specks of gold afterwards. Everything else I know of is from hearsay.
501. On the first occasion when you saw Mr. Hargraves, do you know whether he was coming back from Wellington? I could not say.
502. You heard nothing from the people about where he came from? No.
503. And the specks of gold to which you refer were found immediately after you left Guyong? Yes, it must have been very soon after.
504. *Chairman.*] Do you remember at that time a young man named Wesley Tom? Yes.
505. Was he a butcher? Never to my knowledge; I never heard of his being a butcher.
506. He is now, I think, a barrister? Yes, he has been a barrister for many years.
507. And if anyone has sworn that he was a butcher it would be an error? Yes, I think so; I never heard of his being a butcher, or any of the Toms.
508. We have your evidence to the effect that your late husband accompanied Mr. Hargraves to your father's house at Bathurst, and that you saw them both there. If anyone should swear that that is not the case he would be in error? I swear that it was the case, because I saw them there, and I saw the gold there.
509. *Mr. McLachlan.*] Did they say where they got these specks of gold from? I always understood they got them from Lewis Ponds or Ophir. I always understood it was the first gold they got.
510. You understood that from Mr. Hargraves as well as from Mr. Lister? Yes; they were both there; I understood it from both of them.
511. *Mr. Torpy.*] When you say they were minute specks of gold what do you mean;—would they be the size of pin's heads or pin's points? They were more like pin's points than pin's heads. They were so small that I made the remark, "Why do you call that gold? I can see nothing," and I looked through the tumbler and there were only a few small specks.
512. *Mr. Chanter.*] You say the quantity you saw was nothing like sufficient to cover a threepenny-piece? Oh, dear no, you could hardly see them.
513. *Mr. Torpy.*] It was what the miners call "the colour"? Well, just the colour.
514. *Mr. McLachlan.*] Although you did not know anything about gold then you learnt a good deal about it shortly afterwards? Yes.
515. *Chairman.*] Will you look at this manuscript paper headed "Memo. re Gold Discovery," and say whether the writing, including the signature, is the handwriting of your late husband? Yes; I can swear that it is in his handwriting.
516. Did you see him write it? Yes.
517. Was it long before his death that he wrote it? Perhaps a fortnight. Occasionally when he got a little spare time he would come in and write. He finished it on the Thursday or Friday night before he was taken ill.
518. Why did he write it? Because he expected to be called before this Committee, and wished to refresh his memory as to the facts.
519. *Mr. McLachlan.*] I believe your mother was present when the specks of gold were exhibited, and could give similar evidence to yours, but that she is too old? Yes; she is very old and infirm.
520. *Mr. Plumb.*] At the time when Mr. Lister took Mr. Hargraves down to the river were any of the Toms with them? No, they were alone.

Mr. John Hardman Lister called in, sworn, and examined:—

- Mr. J. H. Lister.  
21 Nov., 1890.
521. *Chairman.*] You are the son of the late Mr. J. H. Lister? Yes.
522. About a week or so before your father's death did you see him writing a paper? Yes. He used to write a little at night and when he had time, and he finished it three or four days before he was taken suddenly ill.
523. Will you swear that the paper now produced is in your father's handwriting? Yes.
524. When did your father die? On the 17th September last.
525. Were you present? Yes, I saw him die.
526. At any time did your father take you to a place at Lewis Ponds or Ophir? Yes, he did on one occasion when we were going down to Ophir. I think we were then going prospecting.

527. When was this? I think it was about nine or ten years ago; I cannot remember exactly. As we were going down he pointed out the spot where he and Mr. Hargraves got the first few colours the first time they went out. It was a spot near Ophir, on Lewis Ponds Creek.

Mr. J. H.  
Lister.  
21 Nov., 1890.

528. Is there any particular name for the spot now? Not that I know of. He just showed me the spot as we were going along.

529. Not far from Yorkey's corner? It was about  $2\frac{1}{2}$  or 3 miles from the Junction.

530. *Mr. Torpy.*] Was it near the bluff of quartz near Ophir? No; it was in the Lewis Ponds Creek. My father also showed me where they got the 4 ounces. It was just at the junction of Summer Hill Creek and Lewis' Ponds.

531. Was it in the bed of the creek? Yes; it was just like in a big reef going across near the junction. My father also told me that when they parted at Fish River Mr. Hargraves said he considered he had seen nothing payable where my father had taken him to at Ophir and up in the country near Lewis' Ponds.

532. Mr. Hargraves was then going to Sydney? Yes; he left for Sydney, and my father went back to my uncle and they discovered the 4 ounces.

533. *Mr. Plumb.*] Do you know if there is anyone alive now at Fish River who would be able to testify to your father and Mr. Hargraves having been in company there together? I could not say.

## CLAIMS OF MESSRS. TOM AND LISTER.

## APPENDIX.

[To evidence of Mr. W. Tom.]

## A.

## THE FIRST GOLD DISCOVERY.

Sunrise, Guyong, August, 1884.

THE following evidence touching the first gold discovery in Australia was prepared by us in 1876, and will read accordingly. It was prepared to read to a Committee of the New South Wales Parliament, but having tried by all legitimate means for twenty years to obtain a hearing by that astute body without success, we now adopt the Press (the only alternative left to us), in order that the public mind may be disabused of its error in supposing Mr. Hargraves to be the sole discoverer of the first payable gold, or in supposing that he ever did more to the discovery than introducing the tin-dish system, and finding something less than a farthing's worth of gold, to which he was taken by John Lister and James Tom. We can assign no reason whatever why the public mind should not receive the truth and be undeceived. Certainly we not being able to obtain a hearing by Parliament can be considered no proper reason. We wish readers of the following to consider well the letter No. 1, and the circumstances under which it was written. If this letter, under the circumstances it was written, does not show most clearly to the reader the unfair, wily, and deep-designing character of Mr. Hargraves, whom we have had to contend with, we have no idea of anything that will show him. We think it will show the full extent of Mr. Hargraves' honor to the Government, to the public, and to us in 1851. It will show most clearly how he wished to hoodwink the Government, to deceive the public, and bamboozle us and Mr. James Tom, in all of which he has tolerably well succeeded. It may not be out of place to remark here that our Petition, through the last twenty years, has been presented to, and received by various Parliaments of New South Wales, and on one occasion the members of a Select Committee for inquiry were named, but by a breaking up of Parliament the matter could not be proceeded with. The fact, however, shows clearly enough that various Parliaments have said that we ought to be heard.

The following history has been most solemnly attested before a magistrate, and challenges contradiction.

WILLIAM TOM, JUN.  
J. H. A. LISTER.

*Evidence prepared to read to a Committee of Legislative Assembly.*

A. D. 1876.

Mr. Chairman, and Honorable gentlemen of your Committee,—

With your permission, we may perhaps be allowed to preface the remarks we have to make touching the first gold discovery by stating that Mr. James Tom and we always acted up to the letter and spirit of every arrangement we made with Mr. Hargraves, which he did not do with us, and we feel confident the nearer we can come to the truth about such gold discovery the better our case will appear.

We will first acquaint your honorable Committee with all Mr. Hargraves did towards the discovery, and afterwards with permission we will state the part we took in the matter. When Mr. Hargraves visited Bathurst, or rather the Guyong neighbourhood, he called on Mr. John Lister, and told him he was on *his way to Wellington*, in search of a gold-field, upon which Lister told him he had been in search of gold himself, and showed him some stones, which they both supposed were stones of an auriferous character. From this information they joined each other in the character of *partners*. Accordingly Mr. Hargraves abandoned the idea, at least for the present, of going to Wellington, and instead of which he allowed Mr. Lister to take him to a spot near Ophir, where Mr. Hargraves washed four or five pans of earth, and obtained a few very minute specks of gold. This was on the 12th of February, 1851. They returned to Mr. Lister's in the evening, and did not go prospecting any more till they were joined by Mr. James Tom. After being joined by him they started on a prospecting trip down the Macquarie, and were away some nine or ten days, and got nothing more than the colour of gold during the whole of that time. After this trip Mr. Hargraves went to Wellington, where he *originally intended to go*, and was away some two or three weeks, and when he returned he could not show us a speck of gold;—we suppose for the simple reason he did not get one to show. Beyond suggesting how to make a cradle, everything Mr. Hargraves did towards the first gold discovery was *now done*, and all the gold that was got by James Tom, Mr. Hargraves, and Mr. John Lister, before Mr. Hargraves took his *final* departure from the Bathurst district, did not amount to more than one-eighth of a grain in weight. Were we to say Mr. Hargraves did more than we have already mentioned we should be guilty of the most positive falsehood. We believe the Rev. W. B. Clarke got nearly, if not quite, as much gold from a scientific experiment he made on some stones he got from the Vale of Clwydd, in 1848 or 1849, as Mr. Hargraves got all the time he was prospecting in the Bathurst and Wellington districts (see "Clarke's Southern Gold-fields.") We believe the Rev. W. B. Clarke found gold in this Colony as early as 1841, which was no accidental discovery, as Mr. Hargraves, in his book, has been pleased to term all discoveries made before his own; for, if we conceive aright, Mr. Clarke's discoveries were the result of scientific research, and if his discoveries did no other good, whether made by accident or otherwise, they established the fact that the quartz-reefs of Australia were auriferous, and thereby, in some probability, induced many people over the various colonies to search for gold till a payable gold-field was fully developed. Long before Mr. Hargraves went to California, in 1849, it was generally known, by report at least, that several small parcels of gold from Macgregor's Reef, at Wellington, had been sold in New South Wales. We think it was a knowledge of this fact, and what was proved by Mr. Clarke, that helped Mr. Hargraves in California to come to a right conclusion, when in the fulness of his geological knowledge he instituted a comparison between the rocks of that place and the rocks of Australia. We only mention this particular that honorable members may see it is quite possible Mr. Hargraves spoke the truth when he *first* called at Guyong, in February, 1851, and told Lister's family he was on his way to Wellington in search of a gold-field. We believe he was on his way thither to test the soil about Macgregor's Reef, which, within a month after, he did test without the least success. We have no doubt, from Mr. Hargraves' antecedents, he would now like to make the public believe he came from California on purpose to prospect the very rod of ground at Ophir which we first found to be payable. When Mr. Hargraves was on the eve of his *last* departure before the discovery of a payable gold-field, he said he *was sure* no place he had seen would *pay for working*. We can bring one person, besides ourselves, if not several persons, who heard Mr. Hargraves say this, if necessary, and he himself proposed an arrangement to the following effect, namely, that he would return to his home, and after he had set his domestic matter in order, he would go to Moreton Bay, and make a prospecting trip through that country, and if he succeeded in finding any gold, he would acquaint us with the fact at the earliest date. We were to remain at home and prospect the Bathurst district, and do precisely the same with him, if we were successful. Well, not longer than *three* days after, Mr. Hargraves left Guyong for Sydney, James and William Tom took a cradle, which had been made by Wm. Tom for prospecting purposes, and went down a creek to where, at the end of a long sheet of water, they determined on making a trial to get some gold. The spot they decided on trying was partially under water, and to get the soil from between the rocks they found it necessary to pull their trousers off. This being done, they commenced washing, and in the course of a few hours they succeeded in procuring 16 grains in weight of gold over only a few yards of ground. They weighed the gold with small medicine scales, which had formerly belonged to the late Captain Lister. With this gold in their possession they returned home the evening of the same day they got the gold, and on that *very evening* William Tom wrote to Mr. Hargraves, acquainting him with every particular of the find. The letter acquainting him with this must have been in Sydney, as soon as Mr. Hargraves himself was there, or not more than a day after. It had been sent away, when Mr. Jno. Lister, who saw Mr. Hargraves as far on his way to Sydney as the Fish River returned, and he returned on the

the *fifth day*, after he left with Mr. Hargraves. Not having mentioned anything about these 16 grains of gold when we were examined by a Select Committee of the Legislative Assembly in 1853, proved *fatal* to our cause on that occasion, for we believe, in fact we have not the slightest doubt, that it was on the information received from the letter respecting them that Mr. Hargraves based his proposition to the Government, which was made on the 3rd April, 1851. In that proposition we believe he told the Government he would show any officer sent with him a payable gold-field. It is quite clear to our minds that Mr. Hargraves had never found any place he could say was a payable gold-field, never having discovered more than the bare colour of gold in any one place; but from his experience in California he knew very well that the place where James and William Tom had procured 16 grains in weight on a few yards of ground, he might point out to the Government as a payable gold-field, without running much risk of failure. However, we ourselves took very little notice of the 16 grains, as we did not think *at the time*, that their discovery would establish the fact that Australian soil would pay for working—that is, in a *general way*. Mr. Hargraves replied to the information about the 16 grains in weight, on the 5th of April, 1851, and in his reply he signified his intention to return to Bathurst. We believe, when he wrote his reply, he thought if he came up he would be able to get as much gold where James and William Tom got the 16 grains, or in that immediate neighbourhood, as would force the Government to notice his claim. However this may be, he did not come to Bathurst for some four or five weeks after he got our letter. The 16 grains of gold were got by James and William Tom about the 23rd or 24th of March, 1851, and we could not make it convenient to start on another prospecting trip till the morning of the 7th of April, when we started, and upon arriving at what is now called Ophir, William Tom proposed stopping in that neighbourhood to prospect the creek, the remainder of that day, assigning as a reason for his proposal, that a shepherd of Mr. Lane had some years before that time picked up a piece of gold in that locality, which a Mr. Trappitt, now of Orange, had sold for some £7 or £8. Mr. Lister falling in with the proposal, we hobbled out our horses, and after partaking of some refreshment, we went down upon the bed of the creek, and we were not there many minutes before William Tom picked up a bit of gold which was afterwards found to be worth £2 10s. This bit of gold having been discovered it was determined that we should that evening clear away a lot of heavy stones in the bed of the creek, and commence washing in form on the following day. To this end we got the cradle from the mountains the next morning where it was left for prospecting purposes. When James and William Tom got the 16 grains of gold, and that day we succeeded in getting one lump the exact weight of a new sovereign, and some 20s. worth of gold-dust; we continued to wash and got about 30s. worth of gold a day for two or three days, when we arranged to go further down the creek; accordingly we started and when we got about a mile and a half further down the creek than where we had been working Lister picked up a bit of gold which weighed exactly 2 oz. This was the last gold we found, and it being late in the evening we formed our camp for the night. We were at this time quite out of provisions, but if honorable gentlemen will pardon a moment's digression we will state that as William Tom was crossing the creek about sundown he heard a loud splash between some boulders which were partially immersed in water, and upon stooping he saw and caught two fish, each of which would weigh between 3 and 4 lb.; one of these fishes was swallowing the other—whether it was the larger swallowing the smaller, or the smaller swallowing the larger William Tom could not tell, they were so nearly of one size; but he has many times since thought, that as far as the swallowing was concerned, it was typical of the unceremonious way in which Mr. Hargraves swallowed his partners. However we cooked one of the fish for tea that evening, and the other the next morning for breakfast, and then we started home. Upon arriving home pursuant to an arrangement with Mr. Hargraves we immediately acquainted him with the particulars of how we had discovered 4 oz. of gold, and we believe we requested him to come to Bathurst, and we would hand them over to him that he might convince the Government of the discovery of gold in *payable quantities*. However Mr. Hargraves did not make his appearance; we waited week after week and did not know the cause of his long absence, but we now believe he was trying to work out his salvation with the Government, but whether he was or was not we will refer honorable members to the honorable Sir E. Deas-Thomson, who was then Colonial Secretary, and by whose evidence, so far as that honorable gentleman was acquainted with facts, we are willing to stand or fall. The honorable A. Lloyd, ex-Colonial Treasurer, is reported to have said in his place in the House that he had seen Mr. Hargraves with many beautiful samples of gold in his possession—meaning of course *Colonial gold*, and that they were samples of gold got by Mr. Hargraves himself before we had found gold in payable quantities; if this is not what was meant we fail to see the force of that honorable gentleman's operation. As it was Mr. Hargraves' *desire* to convince the Government that a payable gold-field was discovered, we think it must appear clear to every man of the commonest sense that if he had any beautiful samples of gold in his possession he would have shown them to the Honorable Colonial Secretary (now Sir E. Deas-Thomson), when he showed him the few minute specks when he first visited Sydney, or, again if he had found the beautiful samples of gold in question when he was looking for the first payable gold-field, it would be most wonderful indeed that no mention of the circumstance appears in his own book. We wish it to be remembered that Mr. Hargraves never returned to Bathurst *after* he showed the few specks to the Honorable Colonial Secretary till some four weeks after we got the 4 oz. of gold at Ophir. The beautiful samples of gold could not have been shown to the Honorable Mr. Lloyd *earlier* than the 6th of May, 1851, and we therefore believe that honorable gentleman must have spoken from wrong impressions and not from any knowledge of *dates*. It is quite clear to our minds that, commercially speaking, Mr. Hargraves never had a penny's worth of *Colonial gold* in his possession till we delivered him the 4 oz. on the night of the 6th of May, 1851, only a few days before the first general rush to Ophir set in. If we had not been the *partners* of Mr. Hargraves, and *under promise to him*, it is not very likely we would have placed these 4 oz. of gold in his possession. We think we had intelligence enough ourselves to have satisfied the Government they had been found by us, without troubling Mr. Hargraves. Any person now coming in from the country, and saying he had found a payable gold-field, and could show no more gold than Mr. Hargraves got the whole of the time he was prospecting, would only be laughed at for his pains. We know many places, from each of which more gold could be got from a pan of earth than Mr. Hargraves got all the time he was in the Bathurst and Wellington districts, and yet no one of these places is likely to ever become a payable gold-field. Many people think we made no claim on the Government till after Mr. Hargraves was rewarded, and therefore, in justice to ourselves, we believe it only right to say that on the 6th of June, 1851, William Tom, junr., wrote to the Honorable Colonial Secretary (now Sir E. Deas-Thomson), and on the 22nd of December, 1851, to the Governor-General (Sir Chas. Fitzroy) giving an explanation of how matters stood between Mr. Hargraves and ourselves.

We thought at the time, and we still think, that these two letters ought to have suggested the propriety of an inquiry, before Mr. Hargraves was given to understand he would be allowed to extract from the Treasury as the *first* and *sole* discoverer of payable gold. We may state that Messrs. Lister and James Tom took Mr. Hargraves, when they were prospecting together, to what is now called Fitzroy Bar. This bar was found to be the richest part of Ophir. It is about 200 yards long, and is the place where we first found payable gold (after the 16 grains were found).

We have no doubt half a million pounds worth of gold has been taken from this bar since it was first worked on or about the 8th or 9th of May, 1851. Mr. Hargraves took several pans of earth from this place, and could not obtain the colour of gold from any one of them. We believe a person of Mr. Hargraves' leviathan stature and Californian experience could have got gold in payable quantities at this place, as well as at many other places he was taken to, if he had only dug and looked for it in a proper manner; but this, we are of opinion, he was too lazy to do. We have heard some people say that what Mr. Hargraves did on the 12th of February, 1851, led to the discovery of a payable gold-field. Admitting such to be the case, what *led* to the discovery and the *discovery itself* are two distinct things. It may also be said, and we think with almost equal propriety, that the first gold found in California led to the discovery in the same sense, only more remotely, as it was there Mr. Hargraves was first taught the use of the tin dish, which he simply taught us the use of after he came from that place. It may also be said that the bit of gold found at Ophir by Mr. Lane's shepherd *led* to the discovery, for it was because of that we stopped there to prospect, which resulted in the find of the 4 oz. of gold. Or, again, it may be said that Mr. Jno. Lister, having stopped Mr. Hargraves when going to Wellington, and having *taken him to Ophir*, led to the discovery, for if it had not been for that circumstance, Mr. Hargraves would have never seen Ophir. In short, a hundred circumstances may be said to have *led* to the first discovery of a payable gold-field; but, after all, it is quite clear that in one of these circumstances, nor the whole of them put together would be the *discovery itself*.

Mr. Hargraves has denied ever having received *as his own* the fourth part of the 4 oz. of gold which we procured at Ophir while he was in Sydney, or 150 miles away from us. We have no doubt Mr. Hargraves denies having received this gold, because he sees that his acceptance of it *as his own* involves a *proof of partnership* with us. When Mr. Hargraves took these 4 oz. of gold from us, he valued them at £3 10s. per ounce, and we now plainly and distinctly assert that Mr. Hargraves, according to this value, not only got his share, or one-fourth of the 4 oz., but we also unhesitatingly affirm that it is quite impossible he can have forgotten the circumstance. We will explain why: Soon after the first rush to Ophir set in Mr. John Lister accompanied Mr. Hargraves to that place. (Mr. Hargraves was going there to

to show the late Mr. Stutchbury, the Government geologist, that a payable gold-field had been discovered), and on the road Mr. Hargraves told Lister that he did not think that William Tom was entitled to a part of the 4 oz. of gold, as he was not a partner with John Lister, James Tom, and himself, in the discovery. This expression of Mr. Hargraves' opinion somewhat annoyed Mr. Lister, and produced some angry words between them. When Lister got to Ophir he told Mr. Tom about what had passed on the road, upon which Mr. Tom asked Mr. Hargraves if such were the case, and he said that what Mr. Lister had told Mr. William Tom was quite true, but that upon reflection he was very sorry he should have spoken to Mr. Lister as he did, as William Tom, in his opinion, was as much entitled to a share of the gold as any of them, and he begged that William Tom would take no further notice of anything that had passed, upon which William Tom was satisfied, and as Mr. Hargraves had expressed his sorrow for what had been said he dismissed the matter from his mind. Well, after all this Mr. Hargraves returned to the "Guyong Inn"—pretended to be very ill and took to his bed, saying he was "so very much grieved" that he and the son of his old friend (naming the late Capt. Lister) should have had any angry words. We are now aware that Mr. Hargraves was "so very much grieved" to think that the unpleasantness which had passed might lead to a full disclosure of all the particulars of how the first gold discovery was made, and, in his opinion, it was rather too soon for such disclosure to take place, as he had not as yet received from the Government his anticipated reward. We think what we have said on this part of the subject is sufficient. It may be said again, as it has often been said, that Mr. Hargraves came from California on purpose to make the discovery of a payable gold-field in Australia. All we say in answer to such a saying is that *having come to find* a payable gold-field and *finding* one are two very different things. Mr. Hargraves, after he took his final departure from Bathurst came to Sydney, and showed all the gold which James Tom, John Lister, and he himself had discovered, which, it will appear by the evidence the Honorable Colonial Secretary (Sir E. Deas-Thomson) gave before a Select Committee of the Legislative Assembly in June, 1853, amounted to only a few almost invisible specks. (Mr. Hargraves, on the 119th page of his own book, says that Lister and James Tom brought some fine gold from the Turon; no doubt that gold was some of which was shown to the Honorable Colonial Secretary.) Upon showing this gold he received no other encouragement from the Government than that the discovery of gold would be rewarded in proportion to its value. We wish honorable gentlemen to take particular notice of the part we are now describing, as it will show that the Government did not intend to reward Mr. Hargraves for *what he had already done*—on the 12th of February, for instance, nor for what he had done at any other time subsequently. In the opinion of the Government something *all-important* had yet to be done to merit a reward. Well now we unhesitatingly assert that after this assurance from the Government that the discovery would be rewarded in proportion to its value. Mr. Hargraves never prospected *one moment* on the western side of the Blue Mountains till he came to Guyong on the 6th of May, 1851 (he did not prospect then either), and received the 4 oz. of gold from us, which upon being made known resulted in the first rush to a gold-field which ever took place in New South Wales. We think it will be seen by this fact that Mr. Hargraves has been rewarded with £12,381 and an annuity of £250 for his natural life for our first procuring gold in payable quantities (the 16 grains and the 4 oz.) when he was 150 miles away from the scene of our operations—that is, when he was in Sydney and we at Ophir. We may, perhaps, be kindly allowed to say a word or two about the Mandurama Diggings, by way of making it obvious that the discovery of small quantities of gold is no proof of a payable gold-field. The Mandurama Estate of Mr. Icely was opened on the 26th of January last by Mr. Icely and some 3,000 or 4,000 diggers, many scores of whom got several grains in weight of gold each, and yet it is well known that the Mandurama is not a payable diggings. It is also a well-known fact that hundreds of other localities which have yielded a little gold have been well tried, without any profitable results. We think these facts alone afford the very clearest evidence, and that, too, in the most practical way, that the discovery of even 6 or 7 grains in weight of gold (although fifty or sixty times more than Mr. Hargraves ever got) is not the discovery of a payable gold-field. Without hesitation we affirm it as our positive opinion that if Mr. Hargraves be the first and sole discoverer of the first payable gold in New South Wales, he is such without ever having found a farthing's worth of gold, for we are quite positive if a new sovereign were divided into 960 equal parts (the number of farthings in a pound) each part would be heavier than all the gold Mr. Hargraves got while he was in the Bathurst district.

We believe one rub of an old file would take more gold off a sovereign than Mr. Hargraves got altogether, and we do not think 960 such rubs would reduce a new sovereign to gold-dust.

The Honorable Capt. Charles is reported in the *Sydney Morning Herald* of the 3rd of February last as having said in the House that we only followed in the wake of Mr. Hargraves. Perhaps that honorable gentleman is not aware that at the very time Mr. Hargraves got the *very little gold* he did get that some of us were with him as *bona-fide partners* in all profitable results.

We think Mr. Icely, of Mandurama, would not be very much displeased if two or three individuals had followed in the wake of his 3,000 or 4,000 diggers with the same result as we followed in the wake of Mr. Hargraves at and about Ophir. Although what Mr. Hargraves did towards the first gold discovery was brought to a profitable issue by us and Mr. James Tom, we by no means wish to speak disparagingly of his introduction of the tin dish, by showing us how to use it. We think this fact alone rendered him entitled to a handsome reward (*keeping in view* the vast issues and commercial importance of the discovery) for we do not think it will be denied that at the very time we discovered gold in payable quantities the whole of Australia was very little better than on the eve of bankruptcy, whereas now, by virtue of that discovery, she is one of the most prosperous and flourishing places in the world. It may be remarked, and we think with propriety, as it involves a principle, that we bore Mr. Hargraves' expenses during the time of prospecting, and not he ours, which shows that we could not in any way be regarded as his subordinates (we believe he represented Messrs. Lister and James Tom to the Government as such), and, in consequence, subject to his orders. The fact of the whole matter is simply this (with due deference, of course, to whatever some people may say or think to the contrary), that if matters remained where Mr. Hargraves left them no payable gold-field would have been discovered *till this day*. It was by our *perseverance* after Mr. Hargraves took his *final leave* of the district that the *first gold* in payable quantities was discovered, and which made us the first *practical* discoverers, producing, as it did, that *practical result of digging* which has now continued for something over twenty-five years, and resulted, in all the Colonies, to the enormous yield of something like £300,000,000 worth of gold. Should any honorable members have any doubts about anything we have advanced in this paper, or anywhere else, we would request such honorable members to give Mr. Hargraves the full benefit of all such doubts, for we are most certainly of opinion that if Mr. Hargraves be the *sole* discoverer of the *first payable gold* (which he says he is) he cannot be dealt too liberally with. In fact, we believe that if he be the sole cause of £1,000,000 worth of gold having been unearthed over the Colonies every month for the last twenty-five years, that he ought, so far as the external appearances are concerned, to be made a gentleman of while he lives. On the other hand, if what we have said be considered true and correct, we hope and believe your honorable Committee will not withhold from us a simple and fair acknowledgment of the fact that we were the persons who first discovered gold in payable quantities, which brought about a general digging over Australia. We admit others had found gold before us, but their discoveries, unlike ours, did not produce any *public and payable gold-fields*. We hope our opinions are expressed in such a way that honorable members may see that we wish all parties concerned to base their conclusions on what they think is just and fair. We have given the whole of the foregoing statement a well-matured and most candid consideration, and we have come to the unavoidable conclusion that we have either a strong claim for consideration, not only on the Parliament of New South Wales but on the Parliament of each Colony of Australia, or that our minds must have become most peculiarly infatuated.

Which of the two we most respectfully leave to the judgment and justice of your honorable Committee to decide.

WILLIAM TOM, JUNIOR.  
J. H. A. LISTER.

The foregoing history of the first gold discovery in Australia, to which our names are appended, we most solemnly declare, to the best of our belief, to be true and correct, and what refers to our individual knowledge we solemnly declare to be true.

Witness to signatures,—JAMES TORPY, J.P.  
Orange, August 15, 1854.

WILLIAM TOM, JUNIOR.  
J. H. A. LISTER.

After all we did in the matter of the gold-discovery which we have truthfully narrated in the foregoing history, Mr. Hargraves had the astounding impudence (using the mildest term which is at all appropriate), to write a letter, of which the following is a *verbatim* copy. This letter, which is a tissue of falsehood and exaggeration from beginning to end, Mr. Hargraves put John Lister's name to, and asked John Lister to send it to the *Sydney Morning Herald* for publication.

We

We do not read it to your honorable Committee to gratify any morbid feeling of animosity, for we hope we do not entertain any such feeling. We read it simply that honorable members may see that our word is, at least, as worthy of credence as that of Mr. Hargraves. The letter to which we refer, and Lister's reply thereto, are both subjoined. They appeared in the *Bathurst Free Press* newspaper of January, in the year 1852.

WILLIAM TOM, JUN.  
J. H. A. LISTER.

A true copy of the letter Mr. Hargraves wrote, and asked John Lister to publish :

(No. 1 letter.)  
Editor, *Sydney Morning Herald*.  
The Gold discovery.

Gentlemen,

A report having been spread abroad by some malicious person, who evidently is jealous of Mr. Hargraves' great discovery, to the effect that I was the party who made it, and communicated it to him, I beg leave, most unreservedly to contradict this false report. Although having been upwards of two years searching for it—one time with two geologists and mineralogists, who told me there were indications—but could not find the gold, Mr. Hargraves, during his explorations, called on me as an old friend of my late respected father, and in course of conversation he told me this was a gold country, and if I would keep it secret he would combine with me. This I agreed to. He was as good as his word, and scarcely ever made a failure. Where he said gold was to be found he found it. I neither understood geology or mineralogy but I am convinced my friend Mr. Hargraves knows where and how to find gold, and all honor and reward in the late discovery belongs to him alone.

Indeed, few men would have done what he has—intersecting the country with blacks, sometimes alone, sometimes with my friend Mr. James Tom, and during his explorations had rain set in, from the imperfect manner in which we were equipped, starvation and death must have been the result. Trusting you will give this publicity in the columns of your valuable journal,

I am, gentlemen,

Your most obedient servant,

[Here Lister's name was written by Mr. Hargraves.]

P.S.—I have also heard it reported that Mr. Hargraves had not acted fairly towards me. I beg most distinctly to state that in all transactions with that gentleman, he has acted strictly honorable with me and friends in the secret of the great discovery. Mr. Hargraves is now no longer connected with me or my party at Ophir, and wherever he may be he has my best wishes, and I believe of all who have known him in the district of Bathurst.

(No. 2 letter.)

True copy of Mr. Jno. Lister's reply to the above No. 1 letter :—  
Editor of *Bathurst Free Press*.

THE foregoing is a copy of a document which Mr. Hargraves wrote and gave me, requesting I would send it to the *Sydney Morning Herald* for publication. I declined doing this, because I could not subscribe my name to the untruths it contained, for I never knew him travel with a blackfellow in my life, neither am I aware of any extraordinary difficulties or dangers to which Mr. Hargraves was exposed. Furthermore, by my complying with his request I should have betrayed Messrs. James and William Tom, who were the prospecting colleagues of Mr. Hargraves, and who, with myself, were at all the expense and most of the pains when actually searching for gold; and further, Mr. Hargraves certainly, sometimes, found the horse he rode himself, but the other necessary horses and provisions were not one farthing expense to him. While living at my place during the business of the gold search he was entertained free of cost. I also assert, in plain words, that Mr. James Tom and I never travelled with Mr. Hargraves with any other understanding than that we were his prospecting colleagues, and concerned equally with himself in any favourable result that might accrue from our journey or journeys. I do not mean to assert that the Messrs. Tom and myself expected to get a share of what Mr. Hargraves might obtain from the Government, or even in the shape of public subscriptions, but only of the profitable results of our explorations.\* Messrs. James and William Tom can bear testimony to the truth of what I have now written.

J. H. A. LISTER.

P.S.—The early history of the discovery will appear in next Saturday's paper.

\* I expected Mr. Hargraves to make a truthful representation to the Government of how the first gold was obtained, that the Government might have had the opportunity of judging and rewarding each individual concerned according to his merits in the discovery.—J. H. A. LISTER.

I HAVE most attentively perused the foregoing history of the gold discovery of 1851, which is signed by William Tom, junior, and John H. A. Lister, and I believe the whole of it to be correct. The parts which refer to my *personal knowledge* I know to be true. I could not say the exact day that I and my brothers got the 16 grains in weight of gold, but I know it was some days before I started to Adelaide, and I started, or I believe I did, on the 1st April, 1851. We got the 16 grains of gold in the latter end of March, 1851, and I know it was before William Tom and John Lister got the 4 oz. of gold. With regard to No. 1 letter, which is a tissue of falsehoods, Mr. Hargraves was out only twice prospecting while he was in the Bathurst district. The first time was on the 12th February, 1851, when John Lister was with him, and the other time was directly after, when John Lister and I were both with him. We went down the Macquarie on the second occasion, and we were away from seven to ten days. I never knew Mr. Hargraves experience more hardship or difficulty than he might have experienced at a *picnic* on the same rough ground. I do not believe he saw a native blackfellow of Australian birth while he was in the Bathurst district.

As witness my hand at Melbourne, Victoria, this 19th day of October, in the year }  
of our Lord one thousand eight hundred and seventy-six,— }

JAMES TOM.

Signed and delivered in my presence,—

RICH. GIBSON, J.P. (for New South Wales).

WE will now acquaint your honorable Committee with the fact that Mr. Henry Tom assisted in getting the 16 grains in weight of gold, which were discovered just after Mr. Hargraves left the Bathurst district. Our reasons for not having mentioned his name before now in connection with the first gold discovery are as follows :—In the first place, when we and James Tom published a pamphlet in 1870, Wm. Tom, who wrote the pamphlet, had forgotten which brother it was who made the third individual of his party. He felt sure it was his brother Henry, but he did not know, and as Henry and Charles Tom were living in Queensland, he did not feel disposed to put off the publication of the pamphlet till he had made inquiry. In the second place, we were well aware that the brother of Wm. Tom (whichever it was) had no intention of making a claim on the Government, for although he was at the getting of a hundred times more gold than Mr. Hargraves ever got he did not think that so small a quantity as only 16 grains in weight would warrant an application to the public purse. In the third place, Wm. Tom knew if he omitted the name of his brother (whichever it was) the omission would not in any way interfere with the truth and correctness of the pamphlet. We assign this latter reason for not having mentioned Henry Tom's name in the foregoing history. What Henry Tom says about the matter is as follows :—

"I remember that at some time about the middle of March, 1851, that James Tom, William Tom, and myself started from Springfield about sundown, taking with us one horse named *Dash*, provisions sufficient for three days, pick, spade, and a cradle for washing gold, and that we travelled till nearly midnight, when we arrived at a point on Lewis Ponds Creek, about 2½ miles above the junction of that creek with the Summer Hill creek, now known as Ophir, where we camped till morning, when we commenced to wash for gold. I dug the earth and filled the buckets. James Tom carried the earth to the cradle, and William Tom washed it. We continued at this work until some time in the afternoon, when we collected the gold from the cradle, hid the cradle on a mountain close by, and started for home, where we arrived about 9 o'clock p.m., when the gold we produced was weighed and found to be little over 16 grains."

I, Henry Tom, do solemnly declare the above to be true and correct to the best of my knowledge and belief,—

HENRY TOM.

Declared before me, at Wanongain, Queensland, this 3rd day of March, 1877,—

HENRY G. BISCOE, J.P.

Dear

Dear William,

You wish me to let you know how much gold Mr. Hargraves brought to Guyong on the evening of the 12th of February, 1851. Mr. Hargraves showed me the gold he brought there on that evening through a small magnifying glass which was carried about by himself. There were three specks, and they were so very small I could not see them distinctly with the naked eye.

17 August, 1876.

Yours, &c.,  
E. BATE.

The above, to which my name is appended, I most solemnly declare to be true.

E. BATE.

Declared before me, at Blayney, this 30th day of August, 1890,—

R. A. COLLIE, J.P.

[*Handed in by the Chairman.*]

## B.

*Memos. re Gold Discovery.*

E. H. HARGRAVES came to Mrs. Lister's house at Guyong about 10th February, 1851. Hargraves noticed some stones, samples of quartz and mica slate on the mantelpiece. He (Hargraves) proposed to J. H. A. Lister if he would go with him and show him the country he could find gold, and whatever we found we should share alike in the discovery. *This offer Lister accepted.* On the 12th day of February, 1851, we started down the creek from my mother's house, Guyong, about 14 miles, and there prospected a bar on Lewis Ponds Creek, about 2½ miles from the junction. Washed seven pans of earth, and procured *six very fine colours of gold, so small that Hargraves got them out of the tin-dish with his penknife and put them on a sheet of note-paper, took them home to my mother's house that evening, and when he showed the colours to my mother and family the gold was so very fine Hargraves placed a glass tumbler over the gold to make it look larger in size and prevent it blowing away. This was the first gold we washed from the soil in New South Wales.* Hargraves remarked it was a proof there was gold in the soil, but it would require far better prospects than those to be of any value.

E. H. Hargraves then proposed for me to find a *pack-horse*, also saddle-horse for myself, also chaff and corn to pack for the horses on the trip and rations for the road. This I did at my own expense. You will please understand this was a very dry season, little or no grass.

In a few days all was ready for a start prospecting, intending to go to Burrandong, on the Macquarie River, and then follow it up to the Turon River. We started and travelled about 4 miles—there called upon Mr. W. Tom, senr. Mr. Tom proposed for one of his sons to go with us, Lister, and Hargraves, prospecting. Old Mr. Tom said his sons knew the country on the river well, having had sheep stations there. Mr. Hargraves stayed at Mr. Tom's house talking with old Mr. Tom for a short time after Lister had wished them good-bye and gone a piece on the road leading a pack-horse and riding another.

This is a *part to be particularly remembered* in the history of the *gold discovery, viz.*—E. H. Hargraves rode after Lister and proposed to Lister to take James Tom, and said we could put Tom's to hobble the horses, and make fires, and get the meals, when we, Hargraves, and Lister were prospecting. Lister said that would never answer, and if he went with us he would have to go as mates, as he would not have any of the Tom's family to go on those *terms*. Hargraves then agreed if I was willing to take him. Just at this time or moment James Tom came up to where Hargraves and Lister were talking the matter over, when James Tom proposed to go with us prospecting, find and pay his own expenses, and to go as *mates*, with a distinct understanding he should *share* equally with Hargraves and Lister in anything got from our *discoveries*. Hargraves and Lister agreed to the terms, remarking they had proved gold to be in the soil, and it was now left to prove if it was to be found payable. With this, having a good and thorough understanding, we had joined as mates, gold-diggers, "*we then returned to Mr. W. Tom, senr's. house, and had dinner. Mr. James Tom provided himself with saddle-horse, blankets, and rations for the road, and we started same evening and camped in the bush for the night, in the Mullion, about 10 miles west of Orange. This was the first night we had been together as three mates looking for gold, and the evening was spent principally talking on our prospects. We reached the Macquarie River, above Burrandong, in due time, and followed the said river up to the junction of the Summer Hill Creek, taking some days feeding our horses with oak tops, and corn and chaff, Lister had packed on the horse, there being no grass, and the bed of the Macquarie River not running, and dry (for half-mile in a stretch in places). We washed a great many pans of earth in different places along the bed of this river, getting a bare colour of gold occasionally. Mr. James Tom and Lister often wished to sink on some of the bars, but Hargraves was either too lazy, or would not, saying he could always tell what was likely to be payable from the top prospects, and expressed himself disappointed, not finding anything worth notice.*"

From the junction of Summer Hill Creek we left the Macquarie River for old Mrs. Lister's at Guyong, prospecting with the tin-dish as we went in several places, "one in particular a bar on the Summer Hill Creek, now known as Ophir, and on this bar we washed several pans of earth without getting a colour of gold. This is worthy of note, as you will hereafter observe, that J. H. A. Lister and Mr. Tom, jun., after E. H. Hargraves had left the district, and stated he had seen nothing likely to be of any value in gold (Hargraves at the time being 200 miles away), when Lister and William Tom prospected this very bar, and got and proved it payable, and procured 4 oz. of gold, then returned to Guyong." Lister, according to agreement with his mates, Hargraves and James Tom, wrote them at once, giving particulars of the discovery. James Tom had started overland to Adelaide at this time, and Hargraves at Brisbane Water, near Sydney.

We are now back to Mrs. Lister's, at Guyong, after travelling between 200 and 300 miles, and finding no place E. H. Hargraves considered worth notice.

E. H. Hargraves then proposed for himself to go up to Deluntus, near Dubbo, a selection of his, and try and find the place a man, by name Macgregor, had found gold, as Hargraves stated, and sold to a jeweller in Sydney; and for James Tom and Lister to go to the Lower Turon River, and try that part of the country, while he was at or near Dubbo.

John H. A. Lister and James Tom prospected the Lower Turon River from the junction with the Macquarie River for some miles up, procuring fine colours of gold in several places, but nothing worth notice and returned home. E. H. Hargraves did not return to Guyong for some days after, but with the same result, stating then he would not prospect this part any further, and then proposed as James Tom was going over to Adelaide with cattle he could prospect that country and for Lister to go further north-west and prospect that country, and that he (Hargraves) would return to Sydney, put things straight at home, he would go to Brisbane and give that country a prospecting for gold; and E. H. Hargraves, John H. A. Lister, and James Tom each agreed to write the result of their discoveries of gold, still continuing mates in anything we discovered. When Hargraves was leaving Guyong for Sydney he expressed a wish for John Lister to go as far as Bathurst, Campbell River, and Fish River with him. To this J. H. A. Lister consented, and they were prospecting some days and at length parted at Mutton's Falls, on the Fish River, when Hargraves expressed himself disappointed in not finding sufficient gold at any place we had prospected. He (Hargraves) then proposed if neither of us three—that was E. H. Hargraves, J. H. A. Lister, or Jas. Tom—did not find any place worth working in the country we had agreed to prospect as before stated, E. H. Hargraves said he would return to California, and proposed for me, J. H. A. Lister to go with him. Lister agreed to the proposal—said he would go there, as mates, gold-digging with Hargraves. Before leaving Guyong, James Tom promised to try the cradle on the Lewis Ponds Creek for a few hours. This he and his brothers William and Henry and himself did, and procured 16 grains in weight. Mr. W. Tom, junr., wrote E. H. Hargraves full particulars of before I returned from the Fish River, seeing Hargraves so far on his way to Sydney. Hargraves would get this letter about the time he arrived in Sydney on horseback.

J. H. A. Lister on his return to Guyong, after leaving Hargraves at Mutton's Falls, on the Fish River, found Mr. James Tom had started overland for Adelaide. Lister then got Mr. W. Tom, junr., to go with him prospecting for gold, and followed the Lewis Ponds Creek down from Guyong to the junction on the Summer Hill Creek to a place now known as Ophir. Mr. William Tom, junr., in crossing the creek, picked up a piece of gold, called out to Lister, and said he had what we were looking for. Lister went over, cut it with his knife, and sure enough it proved to be a piece of gold worth 50s. This was the first piece of gold of any magnitude. We then prospected on both sides of the lead of quartz the gold was found on and could procure over 1s. worth to each dish of dirt. The next day we brought the cradle that was planted some few miles away in the Lewis Ponds Creek and washed for some hours, getting good returns. The second day our rations were short, when we determined upon returning to Guyong. We saddled up our horses and followed the creek down about 1 mile, when J. H. A. Lister picked up a piece of the precious metal exactly 2 oz. in weight. We then agreed to turn our horses hobbled loose and prospect. Not having any food all day, and being late in the evening, Mr. W. Tom, junr., proposed to muddy one of the waterholes, and try and get a fish for supper. The first waterhole we came to was hundreds of fish

fish to be seen coming up a narrow channel towards us. We both jumped into the water; W. Tom had caught a fish, Lister none. When Mr. Tom came out of the water he found the fish, as he thought, had two tails. In place of this it was a codfish had swallowed a bream fish, nearly as large as himself. This gave us food for the night and next day. When we arrived at Mr. W. Tom's, senr., in the evening he was inclined to find fault at our waste of time, looking for what he considered we could not find. However we asked him to procure us a sheet of white paper, which he did. Then taking the different prospect out of a leather pouch his son William had fastened by his side, and placing them one by one on the paper, the old gentleman said it would never do to make the discovery known, for all the men would leave their employments; the sheep and cattle would go wild in the bush, and the country would be ruined.

The next day J. H. A. Lister wrote his mate Hargraves, giving every particular, when and how the gold was found, and where and by whom, requesting Hargraves to come up, as we had 4 oz. This is the part I wish the world to know of E. H. Hargraves' treatment to me and our mates—James and W. Tom, junr.

E. H. Hargraves comes to my mother's house, who I and J. H. A. Lister were keeping, as well as all my younger brothers and sisters. After my late respected father's (Captain J. H. Lister) death, J. H. A. Lister paid all E. H. Hargraves' expenses prospecting, his horse and self stabled and fed during all the time we were at home or travelling prospecting. E. H. Hargraves came up from Sydney to Guyong, when he gave me and Mr. W. Tom, junr., to understand he had represented the case fairly to the Government, mentioning our names the same as himself, and wanted the 4 oz. of gold Mr. W. Tom, junr., and J. H. A. Lister had washed and found, when Hargraves was 200 miles away from the district, and given up the search. At this time we put Hargraves in trust of the gold, as mates, and handed the 4 oz. over to him to show the Government, to prove the discovery, believing Hargraves to act honestly. He took the gold to Sydney.

Shortly after, E. H. Hargraves comes up to Guyong, and proposes to Lister to divide the 4 oz. of gold between himself, James Tom, and J. H. A. Lister, leaving W. Tom, junr., out. This Lister refuses to, and had words with Hargraves attempting such a dirty action. Hargraves sulked for two days, and kept his bed-room. A Mr. Stutchbury then comes to see Hargraves, to be shown the gold country. Hargraves not knowing the spot, we, W. Tom, junr., and J. H. A. Lister had procured the 4 oz. of gold, asked me to go with them, and show them the place, which I did. I then told W. Tom, junr., that Hargraves did not wish to acknowledge him in the discovery, and would not agree for him to have the fourth of the 4 oz. of gold found by W. Tom, junr., and J. H. A. Lister,—as spoken of before in this history. This was on the diggings at Ophir. William Tom, junr., then told Hargraves what I had said, when E. H. Hargraves said he was sorry for mentioning about it, and was willing, and did pay each their one-fourth share, keeping his own one-fourth share of the 4 oz. of gold that was procured when Hargraves and J. Tom was hundreds of miles away. Under the impression Hargraves had shown the 4 oz. of gold to the Government, we thought, as he promised he had represented us fairly as himself, we should soon see or hear something from the Government, and the matter went on some time before we wrote. At last Mr. W. Tom, junr., wrote to the Honorable E. Deas-Thomson to know if our names were mentioned by Hargraves in the gold discovery. The reply was, there were no names mentioned but his (Hargraves), and having miners at work for him.

Any person that will take the trouble to read this history can rely upon the whole as being the truth of the particulars of the history of the agreement between E. H. Hargraves, John H. A. Lister, Jas. Tom, and William Tom, junr.

JOHN H. A. LISTER.

[To Evidence of Mr. E. H. Hargraves.]

C.

THE GOLD DISCOVERY OF THE 12TH OF FEBRUARY, 1851.

To the Members of both Houses of the Legislatures of New South Wales and Victoria.

Gentlemen,

A short time since I did myself the honor to address you on the subject of my claims on the country in connection with the above discovery. In that communication I stated that I was prepared to meet any objections that could be raised or urged against the justice and equity of these claims. Since the publication of my letter I have received through the post a pamphlet, printed at the *Western Examiner* office, and signed "William Tom, junior, J. H. A. Lister, and James Tom," without date. It has, no doubt, been widely distributed. The object, and only object, in view by the writers is evidently to detract from the importance of my public services. I deem it necessary to expose the futility of their representations. That the persons referred to have completely *outwitted themselves*, can be established beyond a doubt; and in order to evince the untruthfulness of their whole narrative I submit a true statement of facts, and reprint the pamphlet in question in the left-hand column, which I ask you, gentlemen, to be good enough to read and carefully note dates. For further information I respectfully refer you to "Australia and its Gold-fields," by E. H. Hargraves, published by H. Ingram & Co., Milford House, Strand, London, 1855.

I have the honour to remain,  
Gentlemen,

Your obedient servant,  
E. H. HARGRAVES.

Noraville, Cooranbong, 22nd November, 1870.

THE GOLD DISCOVERY.

DISCOVERY OF THE OPHIR GOLD-FIELD.

THE following history of the discovery of the first New South Wales Gold-field will doubtless be interesting, not only in view of a recent application on the part of Mr. Hargraves for the payment of a further sum, to which he deems himself entitled as the discoverer, but on the broader principle of giving "Honour to whom honour is due."

EARLY in February, 1851, Mr. E. H. Hargraves came to Mrs. John Lister's, Guyong, and told her and her family that he was on his way to Wellington in search of a gold-field. Mrs. Lister's eldest son, John, upon hearing his business, exhibited some stones, which appeared to Mr. Hargraves to be of an auriferous character, and upon being informed by Mr. Lister as to where he had got them, he proposed joining Lister as a colleague in the search of a gold-field in the direction Lister had been previously prospecting. Accordingly, on the 12th day of February, 1851, John Lister took

I WROTE from San Francisco, Alta California, to a friend in Sydney, New South Wales, in the early part of 1850 (letter now extant), expressing my belief in the existence of gold in New South Wales. I had known the Western District, which was afterwards found to be auriferous, sixteen or seventeen years previous to the 12th of February, 1851. On my arrival at the gold diggings in California late in 1849, I compared the gold-bearing rocks I was then working amongst with those at Lewis Ponds and Emu Creek, in the counties of Bathurst and Wellington, in New South Wales, and reasoning from analogy, and having faith in the uniformity of nature, I came to the conclusion that New South Wales was auriferous. I put my opinion on record, and mentioned it to my companions. I was laughed at, and finding that I could get no credence, endeavoured to convince them thus: I said, "Like produces like. In England an apple-tree produces apples; it does the same in New South Wales. I know that a similar geological structure of country exists in New South Wales, and we know that these rocks produce gold, so therefore will those. Nature is uniform in all her laws, and I cannot be deceived in the rocks; so there must be a gold-field in New South Wales." *Science*, as I understand it, is the result of observation and reflection; and I contend that I not only made the practical discovery on the 12th of February, 1851, but the scientific also a year previously at a distance of 12,000 miles. I landed in Sydney in January, 1851, and mentioned my projects to my friends. The late Hon. James Norton said, "You are mad on that point evidently. I have a friend suffering under the same malady, and I am sure you will be very happy together. I will write you a letter of introduction to him." Mr. Norton handed me a letter addressed to "Thomas Icely, Esq." I called on that gentleman at the Australian Club, and explained fully my views and opinions with respect to our western country. Mr. Icely assured me that he had no doubt about the correctness of my views, and invited me to make Coombing at Carcoar my base of operations, and in a week or ten days I started alone for Coombing, and on the 10th day of February met him (Mr. Icely) at the inn on King's Plains, en route to Sydney. Mr. Icely was called to Sydney on urgent business, or would have returned with me. I suggested that I should go to my gold-field first, and visit him on his return from Sydney, which was agreed upon. I had known Mrs. Lister in her husband's lifetime, and knowing

him to a spot on the Lewis Ponds Creek, some four or five miles south of what now bears the name of Ophir, where Mr. Hargraves washed some earth in a pan or tin dish, and succeeded in procuring one or two very minute specks of gold. On the evening of the day these few specks were obtained Mr. Hargraves and Mr. Lister returned to the "Guyong Inn," the residence of the latter, and remained there for some days, and upon Mr. Lister informing Mr. Hargraves that Mr. James Tom was a good hushman, and that he was well acquainted with the country on both sides of the Macquarie River in the direction of Wellington, it was agreed between them that he should, if he thought proper, join them as a partner. Finding Jas. Tom agreeable to this arrangement in the search of a gold-field they decided upon making a tour through the mountains in the direction of Wellington, with the understanding that in case they discovered gold they should share equally in the results—just as a party of six men would share in any profitable results that might arise from their prospecting together. After being away on this prospecting tour for some ten or twelve days, they returned home, and although they found a few minute specks of gold in many places they did not succeed in getting a grain in weight altogether, including the specks that were got on the 12th February on the Lewis Ponds Creek. Matters not being as satisfactory to Mr. Hargraves as he wished, he determined upon carrying out his original intention of prospecting the Wellington district, and accordingly started by himself for that locality; but after a fruitless search of two or three weeks he returned to Guyong, and although he told us he had discovered some small quantities of gold he did not show us any. After this trip to Wellington Mr. Hargraves prospected no more. He told us that he had seen nothing that would pay for working, and that as he had to return to his home on matters of private nature, he would leave the prospecting on this side of the Blue Mountains with us. It was however arranged between Mr. Hargraves and ourselves, before he left to go home, that we should continue prospecting in this neighbourhood, and that when he had arranged his private matters at home he would make a prospecting tour through the country of Moreton Bay, and that if either party (his or ours) should be successful the other should share equally in the advantages that might accrue therefrom. This was the expressed arrangement when Mr. Hargraves took his final departure from the Bathurst district. Mr. Jas. Tom having to start to Adelaide about the time Mr. Hargraves left, William Tom, jun., took his place, and after prospecting matters had been suspended for a few days, William Tom, jun., and John Lister started on the morning of the 7th April, 1851, for a point low down on the Macquarie, near Wellington, where Mr. Hargraves wished us to give a good trial; but in going to this place Mr. W. Tom proposed to Mr. Lister when they got to Ophir, about 1 o'clock of the day they started, that they should stop there and

that she kept an inn at Guyong, I told Mr. Icely that I would cross the Plains after luncheon and go to Mrs. Lister's. I did so. On the 11th of February I asked Mrs. Lister if she could get me a black who knew the country between there and the Macquarie, and told her privately my business. She begged of me to take her son, "*as it might do him some good.*" I consented, in consideration of his observing strict secrecy in everything *he heard me say, or saw me do.* This being agreed upon I requested the loan of a tin-dish, a bricklayer's trowel, and a small pick. I asked my guide to be in readiness early the next morning, 12th of February, 1851, and to conduct me through the bush (avoiding habitations) to Lewis Ponds Creek, which place I had known seventeen years previously. Shortly after passing Mr. Tom's residence I told my guide that we were now on a gold-field, and inquired if there was any water to be had near; to which he replied, "No, not for a long distance, until we pass Green's old sheep-station." (Such of you, gentlemen, who were in the Colony in the early part of 1851 will recollect that it was a time of severe drought.) On passing the old station my guide said, "There is a waterhole not far from here." In 10 minutes we came to it, and hobbled our horses and ate dinner. I then said to him (Lister), "When you walked across the dry bed of the creek to get the water you were walking on gold, and now I will show it to you." I then took the trowel, and removed the drift from the top of a schistose dyke running at right angles across the dry bed, and took a panful of earth and washed it. The result was a *good grain of gold.* I washed five or six pans, all, excepting one, producing a prospect. I said to my guide, "This is a memorable day in the history of New South Wales," and wrote in pencil on the spot on the margin of an old newspaper the following:—"Gold in alluvium discovered this 12th day of February, 1851, at Lewis Ponds Creek. This is a memorable day in the history of New South Wales.—E. H. HARGRAVES." I afterwards presented it to the Hon. E. Deas Thomson as a memorial of the great event. My long-cherished hope was realised, and I returned full of thankfulness and thought. I knew perfectly well that to attempt to open out the field would be madness, and defeat my object; so I made, no doubt, numberless excuses for not doing so, all of which were, of course, believed, and I cannot now say what they were, but they were sufficient for my purpose, and ridiculous enough, I dare say. I had read an account written by an American in California, who boldly declared that gold was released by "terrestrial electricity" from its matrix (the quartz rocks), and only particular zones were thus acted upon. On my passage from California it occurred to me thus:—"I know I am correct so far as the rocks go, but if the American is right, and the rocks in New South Wales have not *been acted upon*, I shall have done a very foolish thing to have left California, with its bright prospects." I may here state that very little was then known, or is even now known, of the natural processes which result in the production of gold. However, at the period referred to, I imagined that I knew a great deal more on the subject than I do now.

My guide looked upon me with reverential awe, and said he thought it (the gold) was in the rocks and not in the earth. After a day's rest, and earnest consideration, I determined *not to open out the diggings in any way*, but to intersect the country and find out the area of the auriferous rocks, and to this end I wished to travel about 50 miles parallel to the Macquarie River, at a distance of 10 or 15 miles, so as to cross the creeks running into that river at right angles to my course. Lister could not conduct me, not knowing the country, but said that James Tom knew that part of the country well, and would only be too glad to have an opportunity to learn something about gold, and assured me *he could be depended upon in keeping it secret.* I thus made a second convert, and in a few days started on the projected tour and struck the Macquarie as proposed, passing over a good deal of promising country, but not finding a drop of water until we reached the river, and then only in shallow holes at intervals. We travelled up its dry bed generally. I produced a *few specks of gold only when urged* by my companions, and thus followed up to the junction of Summer Hill Creek with the Macquarie, and from thence by that creek and Lewis Ponds to Guyong, the point of departure, having travelled over at least 70-lineal miles of auriferous country. I had promised my guides to instruct them to make and work a cradle, by using which only they could succeed in obtaining gold in quantity for the market, and would do so on my return from Wellington. I had heard, *for the first time*, at an inn in the Vale of Clyde, on my way to Bathurst, that one Macgregor, a shepherd, had brought "gold in the stone" from Wellington some years ago, and had shown to him (the innkeeper) "*some little white stones with something like gold in them.*" I made further inquiry at Guyong, and felt anxious to know where he obtained it. At this time my guide's faith, it appeared to me, was a little shaken, having lost time without any apparent tangible result. Parson Tom himself (father of Wm. Tom, this pamphleteer, and so called on account of his local preachings), as Lister informed me, was not pleased at "James losing his time." This suited me exactly, as I wished to go to Wellington by myself. However, I promised on my return to instruct them to make a cradle and produce gold for the market, which was so satisfactory that I again regained my whole ascendancy over my converts and the "Local" himself, and engaged them to remain quiet until I returned, when I promised I would soon fill their pockets. I was absent some two or three weeks, having gone to Dubbo, where I received from my friend, Alexander Cruikshank, Esq., the most genuine hospitality and every requisite assistance. After dinner I produced fine gold in the Macquarie, and instructed Mrs. Cruikshank in the mystery of gold-washing. She also produced gold, being, so far as my memory serves me, the second person in New South Wales that did so, as I do not think that either of my old guides, Messrs. Lister and James Tom, were so far advanced in the art. I told Mr. Cruikshank that I was too far away from the mountains except for very fine gold, and that my object was to find out where one Macgregor had been shepherding, as I wished to see the country; to which he replied, "Oh, that is Mitchell's Creek, and when you wish to return I will send a blackfellow with you." In a few days I started with my sable friend, and near the old station saw the quartz dyke where he, no doubt, had obtained his gold from. The weather was still dry; in fact, clouds of dust were flying in the bush, and the sheep were pawing up and eating the grass roots. On my return to Guyong my guides called upon me to perform my promise with reference to the cradle, and set them to work. I had now further convinced myself of a large extent of promising country, and proposed to go to Bathurst and buy "a plate for the hopper," the use of which Lister, who accompanied me, could not divine. The drought still continued, which *greatly favoured my excuses*,

prospect that locality through the course of the afternoon—urging that as a man in the employ of Mr. William Lane, sen., had picked up a bit of gold in that locality some years previously, it would be wise to do so. Mr. Lister falling in with the proposal, they turned out their horses, and after having partaken of some refreshment they went into the bed of the creek, and, when they had been looking about for some few minutes, Mr. William Tom, jun., called to Mr. Lister, saying he had found a bit of gold, when Lister remarked, “You are only joking”; but upon being reassured Lister examined the nugget himself, and pronounced it to be worth £2. (Its value was about £2 10s.) W. Tom and Lister now decided upon getting a cradle which had been made by W. Tom, jun., and kept in the mountains for the purpose of prospecting. This cradle being procured, they commenced on the morning of the following day to wash some soil from the bed of what now has the honour of being named the “Fitz Roy Bar,” and by carrying soil in two three-bushel bags, and washing the same for about four hours, they succeeded in obtaining from the cradle about 30s. worth of gold dust, besides a nugget that weighed one quarter of an ounce. Thus was the fact that Australian soil would pay for working first established, and to us verified most pleasingly. After procuring two ounces of the precious metal from the “Fitz Roy Bar,” Mr. Lister and Wm. Tom proceeded lower down on the same course of water, and where a tributary creek joins the main one, Mr. Lister, while he sat on his horse, saw a bit of gold above the ground, and when he got off his horse and attempted to pick it up he found it was wrapped round a root, presenting an appearance of the root having grown quite through it. This nugget weighed two ounces, and was the last gold we found. As we were now quite out of provisions, we camped for the night and started for home early on the following morning, carrying, of course, our four ounces of the precious metal along with us. After arriving home we communicated all the particulars of what had transpired to Mr. Hargraves, who arrived at Guyong about a fortnight after, and as we regarded him as the principal of our party we placed the four ounces of gold in his possession, that he might convince the Government that the discovery of a payable gold-field had been actually made, and that he might also represent our respective merits to the Government in as fair and impartial a manner as his sense of honor might dictate.

The four ounces of gold placed in the possession of Mr. Hargraves by us was sold by him, and divided equally by him between himself and us. We have no wish to detract from the merits of Mr. Hargraves in the first gold discovery; in proof whereof we have in many of our letters given him the full credit of having first introduced the tin-dish system into New South Wales, and of having suggested the form of the first gold cradle, which was made by Mr. W. Tom, jun.;

as I frequently told them that without water we could do nothing. When in Bathurst I had my horse shod ready for my return to Sydney. The blacksmith, Mr. Walker, from whom I purchased the sheet of iron, punched it for me, and while doing so said, “What can this be for, sir, if its a fair question?” In reply I told him that the cockatoos I was collecting always ate away the wood, and I thought the perforated iron would stop them, as it was only the wooden bars that they worked through, where the light showed. He then said, “I suppose these small holes are for the little ones to see through,” to which I assented. Mr. Walker had not the sized punch that I required, and I got him to make rows between the larger ones of a smaller size. I saw Mr. Walker in Melbourne in 1868, and had another laugh about the first cradle-plate punched in New South Wales. He said, “I thought you were cranky when you wanted the small holes for the little birds to see through.” Next day I returned to Guyong, and the following to Parson Tom, and by great interest through Mr. William Tom obtained from his father sufficient cedar to make a cradle, which was constructed by the carpenter engaged in fitting up a new house. I then gave them (Messrs. Lister and James Tom) *full instructions how to use the cradle and where to use it*, but stipulated that it was to be locked up in the cellar for fourteen or twenty-one days, as I did not wish them to use it before, for fear of being discovered, and assured them that when used they would be on the high road to fortune. *Of the individual William Tom I know nothing, except that he used his interest to get the cedar for the cradle. The only promise I had ever made my guides had now been fully and faithfully performed, viz., to construct a cradle, and show them how and where to use it*,—so that they and their friends should have the first digging; and I further told them that probably they would be discovered (as they were) by some shepherd before they had worked three days. A gentleman in the district having heard that I had been searching for gold, and whom I met there, said, “These people are very shrewd in their way at what they call outwitting; I call it by another name, and I would advise you to be very careful.” I took the hint and a farewell of my companions, restipulating the time for using the cradle, which was to produce the golden baby, and on the following morning started for Sydney, where I arrived about the beginning of the last week of March. I cannot exactly say what my excuse was for visiting Sydney *without working the cradle first myself*, but having a fertile imagination no doubt I satisfied them. They frequently urged me to do so, fearing that when I left them they would not get on as well. I could not see it, and assured them that they would. I stipulated that a “full, true, and particular account” of their success should be immediately communicated to me by post, and then all transactions between us were at an end.

What my business in Sydney was will be best understood by reading my letter\* to the Colonial Secretary of the 3rd of April, 1851 (see *their own account of their alleged discovery on the 7th, four days afterwards*), and the reply, dated the 15th of the same month.

About the 18th or 20th following I received a letter from Lister or Tom, which I handed to Mr. Thomson. The letter set forth that they had gone on with the cradle according to my instructions, and had procured so many grains, which in the aggregate came to something about four ounces. In the meantime I had disclosed the locality of the auriferous country, and handed their letter to the Colonial Secretary, and was instructed to point out the gold-field to Mr. Stutchbury, the Government Geologist; in fact, I was on the eve of leaving Sydney for the diggings a second time when I got their letter. It was arranged that I was to go to Coombing and meet Mr. Stutchbury there, which I did, and rode with him to Ophir, where I found the Tom family and Lister at work, and making money quite as fast as I had promised them. Nothing could exceed the praises heaped on me by my old guides. I instructed Mr. Stutchbury in pan and cradle washing, and told him he would find the formation extensive—(I was fortunate in obtaining good prospects)—and towards evening Mr. Stutchbury gave me a letter to Mr. Thomson fully confirming (and more) every word I had said or written to him. There were fifty or sixty persons at the diggings, or probably more. Mr. Byrnes, M.P., was there, at the request of the working men of Parramatta, to report on the rumours about the newly-discovered gold-fields. I was introduced to him by one of the Toms and walked down the creek with him, talking of the great event. I was instructing new arrivals, and frequently had offers of gold if I would superintend parties only. I told the parties that I had come from California for the purpose of making the discovery, but not with the intention of working; neither was it my intention to dirty my fingers with it, but rely wholly on the Government for my reward, which I had duly stipulated for. The Hon. Alexander Campbell was at the diggings, and bought, with some other gentlemen, 11 lb. or 13 lb. weight of gold (I forget which), to be delivered in Bathurst. Either Lister or one of the Toms (I forget which) asked me if I would like to have the first four ounces of gold they had obtained. I said, “Yes, I will purchase it,” which I did, and paid more than its full market value, and forwarded it to Mr. Thomson, requesting that the 2-oz. specimen might be presented to the Governor-General. I have never sold a single farthing’s worth of Australian gold, or retained a single grain for my own use, invariably giving prospects to the parties accompanying me, or forwarding them to the Government. On my third visit to Guyong I was then Commissioner of Crown Lands for the exploration of the gold districts. The Toms and Lister asked me in what way I had represented their claims to the Government, as they were not satisfied with Mr. Thomson’s reply to their letter. This was the first knowledge I had received of their having written or made a claim. I could only say that I never knew they had any claim. I was certainly unaware of it, and in entire ignorance of their having made any; and to this very day I cannot understand on what principle, except that of a very clumsy and impudent attempt at “outwitting,” they could claim anything. These children of nature, as I once supposed them to be, were, excepting Lister, born and bred on the gold-field, and had never seen a grain of gold in their whole lives, except in jewellery, or bearing the impress of Queen Victoria, King William, or one of the Georges, and very few of them. They were thus solely indebted to me for a great step in material prosperity, freely accorded at the time. After a lapse of nearly twenty years they make another impudent attempt to put forward their claim in conjunction with mine—for what purpose, except that of pure malice, it is not easy to conceive. The Legislative Council awarded them £1,000 for assisting in the development of my discovery, but on what grounds I am utterly at

but while we freely accord to Mr. Hargraves the full merit of these particulars, we unhesitatingly deny that he, by his own personal exertions, brought his original intentions of finding a payable gold-field to a successful issue. We think it will be seen by the foregoing history that it was only by virtue of collegueship with us (which Mr. Hargraves ignores) that he is entitled to any credit in the actual discovery of the first payable gold-field, for we have shown beyond contradiction that such discovery was made by us when Mr. Hargraves was on the opposite side of the Blue Mountains, or 150 miles away from the scene of our labours. It may be remarked, we bore all the expenses of prospecting; and, in conclusion, if we had not played the part we did in the discovery of the first payable gold-field, we would most respectfully submit the question: When would such discovery have been made, and by whom?

WILLIAM TOM, JUN.  
J. H. A. LISTER.  
JAMES TOM.

a loss to understand, except that Mr. Wentworth struck hands with them "because they were natives, and had something to do with the gold." This is the only explanation I have ever heard.

Now, as to the "honour of the discovery," I have always thought it of trifling importance, as any person of ordinary observation might have done the same as myself; but the impudent pretensions put forward by persons for the purpose of gain, only on mere speculation, is to be deplored. I look upon it as a disgrace to the country to have rewarded such charlatans in any way. The first complaint after my return (in power) was that "I had no right to have told the Government, and they might have worked a long time." The second complaint was, that "I had not represented their claims to the Government as I ought to have done." At the time the Hon. Alexander Campbell purchased the 11 lb. or 13 lb. weight of gold the Messrs. Tom and Lister had some £240 or £340 worth, which they sold in Bathurst, and at the diggings, a day or two previous, asked me if I would accept of a portion, which I declined. The whole party (five or six) said they considered themselves so much indebted to me that they were unanimous in their desire to present me with a portion, and intended to do so in Bathurst. This was the first and last I heard of the testimonial. I saw them at Bathurst, at "Arthur's Hotel," for the last time. The brothers were fighting, and I parted them, at the expense of a tooth loosened and a cut lip. That blow was from Mr. William Tom, and intended for his brother James.

I am quite aware that this explanation is unnecessary to such of you, gentlemen, as were in the Colony in 1851, when the subject was fully inquired into by a Select Committee, and the pretensions set up found not proven and disallowed. Notwithstanding, after a lapse of nearly twenty years, the old farce is attempted to be played over again, with slight variations to suit the times. I shall not take the slightest notice of any more tomfoolery which may be hereafter produced by the writers of this dateless pamphlet.

I have the honor to remain,  
Gentlemen,

Your obedient servant,  
Noraville, Cooranbong, 22nd November, 1870. E. H. HARGRAVES.

\* In that letter I stated that I had "made very satisfactory discoveries of the existence of the precious metal on Crown lands," and that my first discovery was made on the 12th of February (then) last, and submitted certain propositions as to the conditions on which I would make the discovery public. See my Address to the Legislatures of New South Wales and Victoria of 8th September, 1870, and "Australia and its Gold-fields," by E. H. Hargraves, p. 170.

## APPENDIX.

THE following is an extract from the *Empire* of 16th December, 1867, which I republish as a testimony in corroboration of my statement that I returned to Sydney from California with the intention of discovering a gold-field here. In further confirmation of the same I may refer to Joseph Walford, Esq., J.P., of Sofala, the owner of the vessel in which I arrived, and a fellow-passenger with me, who often ridiculed the ideas I expressed concerning the auriferous character of New South Wales, but who subsequently became one of the first and most sincere converts to the doctrine:—

MR. E. H. HARGRAVES.

In connection with the petition from Mr. E. H. Hargraves, presented to the Assembly on Thursday by Mr. Cunneen, we have been requested to publish the subjoined letters:—

"Dear Sir,

"May I ask you to be good enough to state the conversation and circumstances attending the purchase of gold made by you from me—January, 1851.

"A. Blau, Esq.

"Dear Sir,

"In reply to your note of this day's date, I beg to say that I have a distinct recollection of purchasing gold from you in January, 1851, on your return from California, and after handing you a cheque for the amount of your gold I remarked what a fine country this would be if we had gold like California, to which you replied, saying, 'You have abundance of gold in this country, and in three weeks I will prove it.' I laughed at the idea, and turned it into ridicule. You then asked for a slip of paper, and wrote about the following:—

"Gold will be discovered in New South Wales within three weeks from this date.—E. H. HARGRAVES."

"I took the memorandum in my hand and read it, laughing and joking about what I then considered an absurdity. You then said, 'Take care of that memorandum, and you will recollect me again when you hear of the discovery.' I kept the memorandum in my cash-box, and sure enough you made the grand discovery about the time you named. I have that memorandum in my possession, and had it in my hands about two months ago. It has, however, been mislaid amongst my numerous papers; but I shall, no doubt, soon lay my hands on it again. I will show it then to any one you may wish, but I will not part with it. You are at liberty to make any use of this letter you wish.

"I remain, Sir, yours truly,  
"A. BLAU."

1890.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

---

CLAIMS OF WILLIAM TOM, JAMES TOM, AND J. H. A. LISTER, AS  
THE FIRST DISCOVERERS OF GOLD IN AUSTRALIA.

(PETITION FROM WILLIAM TOM, TO BE HEARD BY COUNSEL OR ATTORNEY BEFORE THE SELECT  
COMMITTEE ON.)

---

*Received by the Legislative Assembly, 21 October, 1890.*

---

To the Honorable the Speaker and the Honorable Members of the Legislative Assembly of the Colony of  
New South Wales, in Parliament assembled.

The Petition of William Tom, of Guyong, near Orange, in the Colony of New South Wales,—

HUMBLY SHOWETH:—

1. That on the 26th day of August, in the year of our Lord one thousand eight hundred and ninety, your Honorable House appointed a Select Committee, with power to send for persons and papers, to inquire into and report upon the claims (if any) of William Tom, James Tom, and J. H. A. Lister, for remuneration as the first discoverers of gold in Australia.

2. That your Petitioner humbly prayeth that he may be represented by Counsel or Attorney before the Select Committee of your Honorable House, appointed to inquire into and report on the said matter, with the right to call witnesses and adduce evidence, and examine and cross-examine such witnesses as may give evidence before the said Committee.

And your Petitioner, as in duty bound, will ever pray.

WILLIAM TOM.

1890.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

**GOLD LEASES AT COBAR.**

(CORRESPONDENCE, RESPECTING.)

*Ordered by the Legislative Assembly to be printed, 1 May, 1890.*

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated the 12th July, 1889, That there be laid upon the Table of this House,—

“Copies of all applications for leases, minutes, or other documents, having reference to gold lease, 88–24, and gold lease, 88–40, at Cobar.”

(*Mr. McCourt.*)

SCHEDULE.

No.	PAGE.
1. Application 88–24 Cobar, Philip Oakden and Charles Albert Moore, for gold-mining lease at Mount Billagoe, forms attached. 26 May, 1888 .....	2
2. Notice to make survey. 30 May, 1888.....	3
3. The Under Secretary for Mines to Mr. C. A. Moore. 12 July, 1888.....	3
4. Memo. to Warden's Clerk, Cobar. 12 July, 1888 .....	3
5. Mr. Licensed-Surveyor Bridges to the Chief Mining Surveyor, plan. 24 August, 1888 .....	4
6. Messrs. Goold and Watt to the Secretary for Mines, minutes and enclosures. 25 August, 1888 .....	4
7. Executive Council minute, refusing application 88–24. 7 September, 1888.....	5
8. Mr. C. A. Moore to the Secretary for Mines. 15 September, 1888 .....	5
9. Statement by Mr. Moore, with reference to application 88–24, minute .....	5
10. Mr. R. W. Thompson to the Secretary for Mines, minute. 22 September, 1888 .....	5
11. The Under Secretary for Mines to Mr. C. A. Moore. 26 September, 1888 .....	6
12. Same to Mr. Mining-Surveyor King. 29 September, 1888 .....	6
13. Mr. King in reply to above, enclosure. 3 October, 1888 .....	6
14. Mr. C. A. Moore to the Under Secretary for Mines, minutes. 8 October, 1888.....	6
15. Beforehand notice to Mr. Oakden. 5 November, 1888.....	7
16. <i>Gazette</i> Notice, refusal of application 88–24. 13 November, 1888 .....	7
17. Mr. Licensed-Surveyor King to the Under Secretary for Mines, minute. 13 November, 1888 .....	7
18. The Under Secretary for Mines to Mr. P. Oakden and another. 14 November, 1888 .....	8
19. Application 88–40, at Cobar, Archibald Roxburgh, for gold-mining lease at Mount Billagoe, forms enclosed. 19 November, 1888 .....	8
20. Mr. C. A. Moore to the Warden, Cobar. 22 November, 1888.....	9
21. Telegram from Warden, Cobar. 27 November, 1888.....	9
22. The Under Secretary for Mines to Mr. C. W. King. 29 November, 1888 .....	10
23. Copy of evidence taken at inquiry. 3 December, 1888.....	10
24. The Warden, Cobar, to the Under Secretary for Mines. 5 December, 1888.....	12
25. Mr. C. A. Moore to the Under Secretary for Mines, minutes. 13 December, 1888 .....	13
26. Same to same, minutes. 13 December, 1888 .....	13
27. Same to same, minutes. 16 January, 1889 .....	13
28. The Under Secretary for Mines to Mr. Licensed-Surveyor King. 16 January, 1889 .....	13
29. Mr. Licensed-Surveyor King in reply to above, minutes. 17 January, 1889 .....	13
30. The Under Secretary for Mines to the Under Secretary for Finance and Trade. 5 March, 1889 .....	14
31. Memo. to the Warden, Cobar, and reply thereto. 30 March, 1889 .....	14
32. The Under Secretary for Mines to Mr. C. W. King. 3 April, 1888 .....	14
33. Memo. to the Warden, Cobar, and reply thereto. 24 April, 1889.....	14
34. Memo. to the Warden's Clerk, Cobar, enclosures. 22 May, 1889 .....	15
35. Mr. C. A. Moore to the Secretary for Mines, enclosures. 29 June, 1889 .....	15

## GOLD LEASES AT COBAR.

No. 1.

Application by P. Oakden and C. A. Moore for Gold-mining Lease at Mount Billagoe.

Application No. 88-24 at Cobar for a gold lease.

1. By whom application was received? Warden's clerk.
2. At what place? Cobar.
3. Date and hour when received? 26th May, 1888, at 10.30 a.m.
4. Receipt for 1st year's rent, No. 24? 26th May, 1888.
5. To whom receipt was issued? Charles A. Moore.
6. Date when notice to survey was sent to surveyor? 26th May, 1888.
7. Names of objectors, and dates on which they lodged their objections? None.
8. Dates of inquiry? None.
9. Are the applicants holders of miners' rights? Yes.
10. Is the land applied for exempted from leasing under the 34th section of the Mining Act 1874? No.
11. Is the time proposed for commencing work reasonable? Yes.
12. Is the number of men proposed to be employed reasonable? Yes.

THOMAS C. K. M'KELL.

Ask for schedule 6, and refer to Warden as to lodgment before three clear days had elapsed.—G.E.H., (for U.S.), 11/7/88.

I, PHILIP OAKDEN, of Lerida Station, Cobar, do hereby authorize Charles A. Moore, of Billagoe, to act, as my agent in respect of applying for a gold lease conjointly with himself at Mount Billagoe—and I hereby agree that all, and whatever, the said Charles A. Moore shall lawfully do under this authority shall to all intents and purposes be considered good and valid as my own act or deed.

Dated at Mount Billagoe, this 21st day of May, 1888.

PHILIP OAKDEN,  
Manager.

Mount Billagoe Prospecting Syndicate.  
Witness to Signature,—ARCHIBALD ROXBURGH.

Questions to be answered by applicants to lease.

WHEN receiving an application to lease land for mining purposes, the Warden, Warden's Clerk, or an agent, as the case may be, shall require the applicant or applicants, or his or their agent, to answer the following questions, and shall take down such answers in writing. The statement when complete to be read over to and signed by the person furnishing the answers:—

- In regard to an application for a gold lease:—1. Were you or each of you (applicants) the holder of a miner's right in force at the date of taking possession of the land referred to in application No. 24? Yes. 2. Do you produce them? Yes.
3. What was the date and hour of the day when you took possession of the land referred to in application No 24? 23rd May, 1888, at 1 a.m.
  4. Did you take possession by erecting posts and cutting trenches at each angle of the land? Yes.  
If No. 4 be replied to in the affirmative, then 5, 6, and 7.
  5. What was the diameter of the posts? 3 inches.
  6. How high did they project above the surface when fixed in the ground? Over 3 feet.
  7. What was the length of each arm of each trench, and what was the depth of each trench? 6 feet long and 9 inches deep.
  8. If a substitute for post or trench was used, describe it? None.
  9. At which angle of the land is the datum post fixed? West.
  10. Did you affix a board or metal plate to the datum post? A board.
  11. What was written or painted on each board or plate? Applied for gold lease; 4 acres; Charles Albert Moore and Philip Oakden (with addresses).
  12. Where did you post the notices, schedule 1? Court-house and Post Office, Cobar.
  13. When did you post such notices? 23rd May, 1888.
  14. Did anybody claim or appear to be in possession of the land applied for, or any portion of it? No.
  15. Did you serve notice in the form schedule 1 upon every such person, and when? None required.
  16. Have you obtained the consent of every such person to the granting of the lease for which you apply? None required.

I, CHARLES A. MOORE, on behalf of myself and another, declare that the foregoing questions have been answered by me truthfully in every particular, and the answers thereto have been read over to me and are correctly taken down in writing.

C. A. MOORE.

Witness to signature,—T. C. K. M'KELL.

Gold-mining Lease Regulations.—Schedule 2.—Application for Gold-mining Leases.

To the Honorable The Secretary for Mines, Sydney.  
Sir,

Cobar, 26 May, 1888.

We hereby make application for a gold-mining lease of that piece or parcel of land situated at Mount Billagoe, in the Bogan gold-field, containing 4 acres, of which we took possession on the 23rd day of May, at the hour of 1 o'clock in the forenoon a.m., for the purpose of mining thereon and therein  
for

for gold, for a period of fifteen years, by erecting posts and digging trenches at each angle thereof. The datum post is distant about 120 yards in an easterly direction from a box-tree marked broad arrow over ML over 18 over 19.

Notice of our intention to make this application has been given in accordance with the regulations in that behalf, and we also hand herewith the sum of £4, being the first year's rent in advance of the said land, and the sum of £1 10s. to cover the cost of survey. And we hereby request that survey may forthwith be made of the said piece or parcel of land.

We hereby acknowledge that this application is made upon the distinct understanding and condition that if we shall abandon or fail to proceed with it, or if it is refused, the Secretary for Mines for the time being may deduct from the sum of £4 deposited as aforesaid any cost to which, in his opinion, the Crown may have been put in, or about, or in respect of this application, and this application shall thereupon become and be void, and the possession aforesaid shall cease and determine. And if the lease shall be granted we shall and will commence mining operations upon, or in connection with the demised land within seven days from and after the granting thereof, and shall and will employ upon such land not less than two men during the first six months of the term thereby created, and not less than three men during the remainder of such term. And shall and will at any time when called upon in terms of the regulations relating to gold mining leases, to do so, execute, and take delivery of such lease, or failing therein for a period of fourteen days, after being so called upon, we shall and will forfeit the said sum of £4, and all right, title, or interest in and to the said land and the possession thereof, and the said lease shall be forthwith cancelled.

We have, &c.,

PHILIP OAKDEN,

Cobar.

By his Agent, C. A. MOORE.

CHARLES ALBERT MOORE,

Tindary, Cobar.

Miners' rights, No. 46, Cobar, 6th January, 1888; No. 226, Cobar, 21st May, 1888. This application was received by me this 26th day of May, 1888, at the hour of 10'30 o'clock in the forenoon, and is numbered 24.—THOMAS C. K. M'KELL.

### No. 2.

#### Notice to make survey.

Sir,

Department of Mines, Sydney, 30 May, 1888.

An application for a gold lease, particulars as per margin, having been lodged in this office, I request you will be good enough to survey, in accordance, with the regulations relating to gold leases, the area so applied for, and to furnish me, at your earliest convenience, with a plan and report.

Your attention is particularly directed to the regulations for mineral leases, numbered respectively 2, 3, 12, 13, and 14 [or to the regulations relating to gold-mining leases, numbered respectively 1, 2, 3, 4, 5, 14, and 15.]

I have, &c.,

EDWD. F. PITTMAN,

Chief Mining Surveyor.

Copy of description of the land as given in the application:—Four acres, situate at Mount Billagoe, in the Bogan gold-field. The datum post is distant about 120 yards in an easterly direction from a box-tree marked broad arrow over ML over 18 over 19.

Transferred to Mr. Licensed Surveyor C. B. Bridges, 29/6/88.

No. of application, 88-24; lodged at Cobar; area, 4 acres; names and addresses of applicants, Philip Oakden, Cobar, by his agent, C. A. Moore; Charles Albert Moore, Tindary, Cobar.

### No. 3.

#### The Under Secretary for Mines to Mr. C. A. Moore.

Sir,

Department of Mines, Sydney, 12 July, 1888.

Referring to your gold-mining lease application No. 88-24 at Cobar, on behalf of yourself and Philip Oakden, I have the honor to enclose herewith a form of schedule 6, and to request that you will be good enough to fill in, sign, and return same to this office with as little delay as possible, as the document ought to have accompanied your application.

I have, &c.,

HARRIE WOOD,

Under Secretary.

### No. 4.

#### Memo to Warden's Clerk, Cobar.

Department of Mines, Sydney, 12 July, 1888.

GOLD-LEASE application No. 88-24, for land at Mount Billagoe, Bogan gold-field, Charles A. Moore, for self and Philip Oakden. Please say if the above application was lodged forthwith, as you have not noted same on papers.

HARRIE WOOD,

Under Secretary.

The above application is for gold. Not compulsory to lodge forthwith.—J. V. FOLEY, Warden's Clerk, 16/7/88.

This memo. was sent in error. The Warden's Clerk should have been asked if dates are correct, as, if so, three clear days were not allowed to elapse after possession was taken before application was made, and same will have to be refused.—G.E.H., B.C. (for U.S.), 30/7/88.

Dates, as written in application herewith, are correct.—J. V. FOLEY, Warden's clerk, 6/8/88. Application 88-24, Cobar, must be refused, as three clear days were not allowed to elapse after possession was taken before application was made.—G.E.H. (for U.S.) 21/8/88. Submitted. Approved.—F.A., 25/8/88. The Minister desires that beforehand notice of this be given to Mr. Oakden.—H.W., 31/8/88.

Mr.

## No. 5.

## Mr. Licensed-Surveyor Bridges to The Chief Mining Surveyor.

Sir,

Cobar, 24 August, 1888.

See Appendix A.

I have the honor to transmit herewith the plan\* of gold lease 29, Oakden and Moore, application 88-24, 4 acres applied for, 2 acres 3 roods 6 perches available, situate at Billagoe, county of Robinson, measured by me in accordance with instructions No. 136, of 29th June, 1888, from Mr. District-Surveyor Macfarlane. This land is part of the prospecting area originally marked out by Martin Henderson, and adjoins the Billagoe Company's claim, held under a mineral permit. "B" and "C," were two corners of the prospecting area, and "A" and "B" are points in the north-west and south-east boundaries of said area.

I have, &amp;c.,

W. B. BRIDGES,

Licensed Surveyor.

## No. 6.

## Messrs. Pierce Goold and George W. Watt to The Secretary for Mines.

Sir,

Cobar, 25 August, 1888.

We beg to make application for about 3 acres of land situated between the Mount Billagoe prospecting claim and 10-acre lease taken up by Mr. C. A. Chesney, No. 88-2, on the 4th February, and since transferred to a syndicate which we have the honor to represent.

Our grounds for applying for the 3 acres referred to, are as follows:—

- 1st. When making application for the above lease (10 acres), Mr. Chesney applied for it to start from the western boundary of the Mount Billagoe prospecting property, not knowing at the time that the said property was incorrectly pegged out by the prospectors.
- 2nd. As Mr. King, the then Government surveyor, was employed to survey the different leases, it was his duty to bring under the notice of the different lessees the fact that they had pegged out too much, thus giving them an opportunity of shifting their pegs back to the starting point as applied for.
- 3rd. Persons making application for mineral leases as a rule are not surveyors, and are therefore not supposed to be exact in the amount or measurement of the ground pegged out by them.
- 4th. Mr. King, by virtue of his position as a Government surveyor, and thereby being in possession of information, which he, as a public servant only is able to gain, should not be allowed to use this information in any way, except for the benefit of the department he represents, or the public whom he is supposed to serve.
- 5th. When the 10-acre lease, which we represent, was applied for by Mr. Chesney no other ground had been applied for in the locality, and Mr. Chesney had specific reasons for applying for the property to start from the western boundary of the prospecting claim.
- 6th. The Mount Billagoe prospecting claim was proved to be valuable before Mr. King made the survey of the properties referred to, otherwise he would not have taken up the insignificant strip of 3 acres, and thus separate the two properties which he knew the lessees intended to amalgamate, and would therefore be compelled to buy him out at a very high price.

We are aware Mr. King has evaded the law to a certain extent by applying for the property in the name of his brother-in-law, but we trust you as a lover of justice, will in this case see the fairness of our request, and allow us to shift our pegs up to the boundary, thereby taking in the narrow strip which now separates the two properties.

Trusting this will receive your careful consideration.

We have, &amp;c.,

PIERCE GOOLD.

GEORGE W. WATT.

From what I heard of this while in Cobar, it would appear that these applicants are the people most entitled to the land. I wish a careful report upon the matter.—F.A., 27/8/88. How does this matter stand.—H.W., 27/8/88. Not yet dealt with—plan just in.—E.C.P., 29/8/88. This matter cannot be satisfactorily reported upon till the plans are received. Submitted.—H.W. Approved.—F.A., 1/9/88.

This letter evidently refers to application 88-24, Cobar (Oakden and Moore), which is going on for refusal, having been lodged within three clear days of the time of taking possession. The area originally formed part of the Mount Billagoe prospector's claim, but their pegs appear to have been shifted back eastwards because they (the prospectors), had pegged out more than they were entitled to hold. Mr. C. A. Chesney (for the Company), appears to have pegged out and applied for the adjoining land on the east and west of the prospectors' claim (applications 88-1 and 88-2), with the object of amalgamating their property. This being the case Mr. King should have surveyed application 88-2, so as to adjoin the prospectors' claim when he reduced the latter; in place of this it is asserted that he holds an interest in the spare ground which was applied for by his brother-in-law (Moore) and Oakden. As Mr. King was acting at the time in the capacity of a Government mining surveyor, the assertions appear to me to convey a very grave charge against him, and I think he should be asked for an immediate explanation.—E.F.P., 20/9/88.

Submitted.—H.W., 20/9/88.

I am informed that Mr. King has left the Government employ, and if this be so, I do not think he will furnish any satisfactory explanation. If he is still in the service of the department he should be asked to explain his conduct.—F.A., 20/9/88.

Mr. King has not yet been paid in full for his services in this department, and it might be desirable to have the explanation before paying him in full. Submitted.—H.W., 21/9/88. Very well; ask him to supply it.—F.A., 21/9/88.

## No. 7.

## Minute for Executive Council.

Recommending the refusal of certain application for gold-mining lease.

Department of Mines, Sydney, 7 September, 1888.

It is recommended to His Excellency the Governor and the Executive Council that the application for the gold-mining lease of Crown lands specified in the annexed schedule be refused, as three clear days were not allowed to elapse after possession was taken, &c.

FRANCIS ABIGAIL.

The Executive Council advise that the recommendation herein set forth be approved, and the necessary notices issued.—A. C. BUDGE, Clerk of the Council. Min. 88-44, 19/9/88. Confirmed, 25/9/88. Approved, CARRINGTON, 19/9/88.

## SCHEDULE ALLUDED TO.

Cobar Mining District.—Cobar 88-24; P. Oakden and another; Mount Billagoe; 4 acres; applied for on 26th May, 1888.

## No. 8.

## Mr. C. A. Moore to The Secretary for Mines.

Sir, 367, Crown-street, Surry Hills, Sydney, 15 September, 1888.

I should feel obliged if you would let me know when the surveyor's plan of Oakden and Moore's gold lease, 88-24 Cobar, is received into the Mines Department, as I am anxious to return to Mount Billagoe.

I wrote the Warden of Cobar asking him to register my address at 221, Riley-street, Surry Hills, Sydney, and have not as yet received any reply. I enclosed two shillings and sixpence in stamps to cover cost of registration.

I now desire to register my address at 367, Crown-street, Surry Hills, Sydney, and should the department require to notice me *re* any mining at Mount Billagoe, Tindary, Cobar, I desire the notices will be forwarded direct to me at 367, Crown-street, Surry Hills, Sydney.

Trusting you will give my letter your early attention.

Yours, &c.,  
C. A. MOORE.

## No. 9.

## Statement by Mr. Moore.

Gold Lease, 88-24 Cobar.

THAT he had to ride 25 miles into Cobar to post up the notices, and was informed by the Warden that if such notices were posted up before 9 o'clock a.m. on Wednesday, May 23rd, he would be in good time and could legally lodge the application for the land at any hour after 9 o'clock a.m. on Saturday, May 26th. He filled up the notices at his camp, before proceeding to take possession of the land, and inserted 1 o'clock of Wednesday morning, estimating that it would be about that hour before the posting, trenching, and nailing up the notice board, &c., would be completed, but, as a matter of fact, he had completed all necessary marking and was in possession of the land pursuant to the regulations at ten minutes before midnight on Tuesday, May 22nd, 1888, although his application states the time to be 1 o'clock a.m. on Wednesday; he did not consider it of any importance or necessary to alter his notices, and filled up the blanks in the printed form of application accordingly on Saturday, May 26th, 1888, and was informed by the Warden that everything had been properly done to comply with the regulations. He is prepared to make a declaration to the effect, and now respectfully applies for permission to amend his application, in order to show that he was in possession of the land applied for prior to midnight of Tuesday, May 22nd, 1888, and have therefore strictly complied with the regulation requiring that an applicant should lodge his application not more than ten days and not less than three days after taking possession.

OAKDEN AND MOORE,

*per* C. A. MOORE.

The writer may be informed that it is now too late to receive evidence from him to contradict his own declaration made at the time of lodging his application.—H.W., 20/9/88. Submitted. Approved. F.A., 21/9/88.

## No. 10.

## Mr. R. W. Thompson to The Secretary for Mines.

Dear Sir, West Maitland, 22 September, 1888.

Referring to our conversation of yesterday relative to the gold claim next to the prospecting claim of the Mount Billagoe Gold Company, I am authorized by my client to say that if you have determined to give the land to the Billagoe Company he will be absolutely contented, as he wishes that the Company should get it rather than that it should be lost to them, and therefore, on that understanding, he will at once withdraw his application, whether it is of any value or not. At the same time, Mr. King, whom I saw immediately after our talk, informs me that you are under a misapprehension as to the survey matter.

Will you, therefore, be good enough not to have the matter gazetted, but deal with it in such a way as will put it into the Company, with whom my client desires to act in perfect good faith.

Yours, &c.,

R. W. THOMPSON.

This letter may be accepted, and the previous decision may be adhered to.—F.A., 25/9/88.

No. 11.

## No. 11.

## The Under Secretary for Mines to Mr. C. A. Moore.

Sir,

Department of Mines, Sydney, 26 September, 1888.

Referring to the statement forwarded by you with reference to gold lease application 80-24, at Cobar, I am directed by the Secretary for Mines to inform you that it is now too late to receive evidence from you to contradict your own declaration made at the time of lodging your application.

I have, &amp;c.,

HARRIE WOOD,

Under Secretary.

## No. 12.

## The Under Secretary for Mines to Mr. Mining-Surveyor King.

Sir,

Department of Mines, Sydney, 29 September, 1888.

I have the honor to inform you that it has been asserted that when surveying gold lease application 88-2, at Cobar, you shifted back the prospectors' pegs eastwards, because they had too much ground, and that instead of measuring such application so as to join the Mount Billagoe Prospectors' claim, you surveyed it in accordance with the applicant's pegs, thus leaving an intervening piece of vacant ground, which has been applied for under gold lease application 88-24, at Cobar, by Messrs. Moore and Oakden, and in which it is stated you hold an interest. As you were at the time a mining surveyor in the employ of this department, I am directed by the Secretary for Mines to request you to furnish an immediate explanation why you moved the prospectors' pegs, or induced them to move them, except for the purpose of including the ground held by them in excess in the area comprised under application 88-2.

I have, &amp;c.,

HARRIE WOOD,

Under Secretary.

## No. 13.

## Mr. Licensed-Surveyor King to The Under Secretary for Mines.

Sir,

Bell's Chambers, 129, Pitt-street, Sydney, 3 October, 1888.

Replying to your letter of 29th September, requesting an immediate explanation why I moved the prospectors' pegs, or induced them to do so, except for the purpose of including the ground held by them in excess of the area comprised under application gold lease 88-2, which application is made and the land described within it held by entirely different people, who have for some time, and are at the present moment trying to sell this land to the proprietors of the prospecting claim, which fact may or may not be known to you.

I have simply to say that I neither moved the pegs nor induced them to do so, and I did not see the land referred to from May 14th to June 10th, nor have I seen it since.

I am surprised that you should ask me to explain why I did not include in the measurement of gold lease 88-2, ground pegged out and lawfully held by other people outside the applicant's pegs, when there was an excessive area within them, and I refer you to general remarks by Chief Mining Surveyor Pittman of April 4th, 1888, to District Surveyor M'Farlane, a copy of which I enclose.

As regards my being a mining surveyor in the employ of the department, being simply a contractor, I ceased to be such on May 19th, 1888. When I discontinued work all unacted on instructions were returned by me on 21st May. Under these circumstances, I cannot admit your right to call upon me for this explanation.

I now make application for a copy of the papers referring to me directly or indirectly, and to which I feel that I am entitled.

I am, &amp;c.,

C. W. KING,

Licensed Surveyor.

## [Enclosure.]

## General Remarks by Chief Mining Surveyor Pittman.

4. If an applicant pegs out less land than he applies for, and the surrounding land has been pegged out by others the surveyor must measure the deficient area only, taking care that he does not exceed the prescribed dimensions in the case of gold-mining leases.

5. If an applicant pegs out more than he applies for, the surveyor should start from the datum peg and measure only the full area applied for within the applicant's pegs.

6. The excessive area over and above that surveyed (*vide* last paragraph), is not available to any other applicants until the application for which the first survey was made has been granted or refused by the Governor (*vide* short Act, 46 Vic. No. 7), the surveyor must, therefore, be careful not to include any so-called spare land which has been excluded by survey in the case of an area found to be pegged out in excess in any surveys he may make of adjoining application. If in any doubt, the surveyor cannot go wrong if he makes it a general rule to survey always within the applicant's pegs, for no applicant can have a legal claim to more land than he has actually pegged out.

E. F. PITTMAN,

Chief Mining Surveyor.

4 April, 1888.

## No. 14.

## Mr. C. A. Moore to The Under Secretary for Mines.

Sir,

Mount Billagoe, Cobar, 8 October, 1888.

Up to the present time I have said nothing *re* the department's action in the matter of gold lease 88-24, Cobar, applied for in the joint names of Oakden and Moore. In the first place, I do not see what right the department have in trying to find out how I became interested in the gold lease. Is it usual for the department to make inquiries into a man's private affairs and transactions in mining to enable them to refuse or grant a gold lease to a person who has every right to the said lease. In fact, you do not know all about it, as you told me you did. I am of opinion that you are all in error, and that  
your

your informant is, to say the least, anything but a just man, or he would have told the truth. However, it does not matter. I must inform you it was Mr. Oakden who took me in conjointly with him, but I who allowed Mr. Oakden to share the lease with me, and this I would not have done had it not been for Mr. King, for I knew the land was to be got, and I had made up my mind to be one of the first to peg it out when the chance came. I have served my time in the field, and think I have every right to use my knowledge of surveying as it pleases me.

It is a recognised fact about here that the lease is to be refused. They have no doubt about it; and yet I have only been told by the department that the lease would most likely have to be refused. How is it that the public about Mount Billagoe and Cobar know all about this matter, and I am supposed to know nothing? However, I have now only to inform you that the refusal of gold lease 88-24 will not alter my title to the land, as I first took it up as a mineral claim for silver, on 21st May, 1888, and still continue to hold the said land as a mineral claim, under mineral license No. 80, issued at Cobar, 16th May, 1888.

It is a great pity, as you are so anxious to investigate this matter, that you do not try to get at the truth, and not take so much notice of the private letters forwarded to the department from persons who are only trying to get possession of the land themselves. Why did they not lodge any objections they had within the fourteen days? Because they had none. They had to take time to concoct some objection.

I care very little what you do, for as long as I hold a mineral license nobody shall take possession of the land held by virtue of such license. And further, now that I have been forced to take action in the matter, I will see that what has already taken place is brought before the House, for I, as a miner, have as much right to be considered by the department as any squatter who happens to have a little influence. Further, I am given to understand that it is useless my trying to get it as a gold lease, as the department would only refuse my application again.

I find the department have power to alter applications if the flaw was caused by the neglect of the Warden or any other officer. The flaw the department have been good enough to have found in my application 88-24, Cobar, was caused by the Warden at Cobar, which I can prove; yet, I am of opinion that the department will not use the power they have in such cases on my behalf, as others are doing their best to get possession of the land, although other applicants have been more fortunate with their applications, and greater flaws have existed than the flaw found in my application.

Yours, &c.,

C. A. MOORE.

The writer appears to be in error, as to the action of the department in refusing the application. I think I am correct in saying no application lodged before the expiry of the three days has been granted to anyone. I doubt whether the title under mineral license, if ever good, has not been swept away by the possession and application for a gold-mining lease.—H.W., 24/10/88.

Submitted. Approved. The refusal may go on. Oakden to have beforehand notices.—F.A., 25/10/88.

#### No. 15.

#### The Under Secretary for Mines to Mr. P. Oakden.

Sir,

Department of Mines, Sydney, 5 November, 1888.

I am directed by the Secretary for Mines to inform you that your application for the gold-mining lease noted in the margin will be refused as three clear days were not allowed to elapse after possession was taken, &c.

No. 88-24,  
Cobar.

If you still desire to lease the land, you can, after the notification of refusal which will appear in the *Government Gazette* of the 13th November, take possession after 12 o'clock at night of that day, and apply afresh, in accordance with the regulations. The money already deposited can be applied to the fresh application.

I have, &c.,

GERARD E. HERRING,

(For the Under Secretary for Mines.)

The Under Secretary for Mines to Mr. P. Oakden and another.

No. 88-24.

Sirs,

Department of Mines, Sydney, 14 November, 1888.

I am directed by the Secretary for Mines to inform you that your application for the gold lease noted in the margin has been refused, as three clear days were not allowed to elapse after possession was taken, &c.

I have, &c.,  
GERARD E. HERRING,  
(For the Under Secretary for Mines.)

### No. 19.

Application by A. Roxburgh for Gold-mining Lease at Mount Billagoe.

Application No. 88-40, at Cobar, for a gold lease.

1. By whom application was received? Warden's clerk.
2. At what place? Cobar.
3. Date and hour when received? 19th November, 1888, at 10 a.m.
4. Receipt for first year's rent, No. 37? 19th November, 1888.
5. To whom receipt was issued? Archibald Roxburgh.
6. Date when notice to survey was sent to surveyor? 19th November, 1888.
8. Names of objectors, and dates on which they lodged their objections? Charles Albert Moore, 22 November, 1888.
9. Date of inquiry? 3rd December, 1888.
10. Are the applicants holders of miners' rights? Yes.
11. Is the land applied for exempted from leasing under the 34th section of the Mining Act, 1874? No.
12. Is the time proposed for commencing work reasonable? Yes.
13. Is the number of men proposed to be employed reasonable? Yes.

J. V. FOLEY,  
Warden's Clerk.

Questions to be answered by applicants to lease.

When receiving an application to lease land for mining purposes, the Warden, Warden's clerk, or an agent, as the case may be, shall require the applicant or applicants, or his or their agent, to answer the following questions, and shall take down such answers in writing. The statement, when complete, to be read over to, and signed by, the person furnishing the answers:—

In regard to an application for a gold lease,—1. Were you or each of you (applicants) the holder of a miner's right in force at the date of taking possession of the land referred to in application No. 40? Yes. 2. Do you produce them? Archibald Roxburgh, No. 62, 17th January, 1888.

3. What was the date and hour of the day when you took possession of the land referred to in application No. 40? Three minutes past 12 o'clock on the morning of 14th November.

4. Did you take possession by erecting posts and cutting trenches at each angle of the land? Yes. If No. 4 be replied to in the affirmative, then 5, 6, and 7.

5. What was the diameter of the posts? 3 inches.

6. How high did they project above the surface when fixed in the ground? 3 feet.

7. What was the length of each arm of each trench, and what was the depth of each trench? 6 feet long; 9 inches deep.

8. If a substitute for post or trench was used, describe it? None used.

9. At which angle of the land is the datum post fixed? N.E. angle.

10. Did you affix a board or metal plate to the datum post? A board was affixed.

11. What was written or painted on each board or plate? Gold lease, 3 acres, applied for by A. Roxburgh, miner's right No. 62.

12. Where did you post the notices, schedule 1? At Court-house and Post Office, Cobar.

13. When did you post such notices? On 14th November, 1888.

14. Did anybody claim or appear to be in possession of the land applied for, or any portion of it? C. A. Moore claimed land as a mineral claim.

15. Did you serve notice in the form schedule 1 upon every such person, and when? Yes; on 17th November.

16. Have you obtained the consent of every such person to the granting of the lease for which you apply? No.

I, ARCHIBALD ROXBURGH declare that the foregoing questions have been answered by me truthfully in every particular, and the answers thereto have been read over to me and are correctly taken down in writing.

ARCHIBALD ROXBURGH.

Witness to signature,—J. V. FOLEY.

Schedule

## Schedule 1.—Notice of intention to apply for a Gold-mining Lease.

NOTICE is hereby given, that the undermentioned persons intend applying for a gold-mining lease of about 3 acres of land, situated at Mount Billagoe, being measured portion gold lease 29.

Possession of the said land was taken by erecting posts and clearing out L trenches at each angle thereof, on the 14th day of November, 1888, at the hour of 12.3 o'clock in the forenoon, and the datum post is adjoining the north-west corner of the Mount Billagoe Prospecting Syndicates prospecting claim.

Application for the said lease will be lodged with Warden's clerk, at Cobar, on the 19th day of November.

Dated, at Cobar, this 14th day of November, 1888.

ARCHIBALD ROXBURGH,  
Cobar.

## Gold-mining Lease Regulations.—Schedule 6.—Notice of Application and Deposit.

Sir,

Cobar, 19 November, 1888.

I have the honor to inform you that I have this day deposited with Warden's clerk, at Cobar, the sum of £3, being the first year's rent in advance of 3 acres of land at Billagoe, for the purpose of gold-mining, and the sum of £1 10s., being the fees for survey of the said land. The number of my application is 40.

I have, &c.,

The Under Secretary for Mines, Sydney.

ARCHIBALD ROXBURGH.

## Gold-mining Lease Regulations.—Schedule 2.—Application for Gold-mining Leases.

To the Honorable the Secretary for Mines, Sydney.

Sir,

Cobar, 19 November, 1888.

I hereby make application for a gold-mining lease of that piece or parcel of land situated at Mount Billagoe, being measured portion gold lease 29, containing about 3 acres, of which I took possession on the 14th day of November, at the hour of 12.3 o'clock in the forenoon, for the purpose of mining thereon and therein for gold, for a period of fifteen years, by erecting posts and cutting trenches at each angle thereof. The datum post is adjoining the north-west corner of the Mount Billagoe Prospecting Syndicates prospecting claim.

Notice of my intention to make this application has been given in accordance with the regulations in that behalf, and I hand herewith a list of the persons who occupy or claim a right to the land aforesaid, or any part thereof, together with such contents as I have obtained. I also hand herewith £3, being the first years rent in advance of the said land, and £1 10s to cover the cost of survey. And I hereby request that survey may forthwith be made of the said piece or parcel of land.

I hereby acknowledge that this application is made upon the distinct understanding and condition that if I shall abandon or fail to proceed with it, or if it is refused, the Secretary for Mines for the time being may deduct from the sum of £3 deposited as aforesaid any cost to which, in his opinion, the Crown may have been put in or about or in respect of this application; and this application shall thereupon become and be void, and the possession aforesaid shall cease and determine. And if the lease shall be granted I shall and will commence mining operations upon or in connection with the demised land within fourteen days from and after the granting thereof, and shall and will employ upon such land not less than two men during the first six months of the term thereby created, and not less than four men during the remainder of such term. And shall and will at any time when called upon in terms of the regulations relating to gold-mining leases, to do so, execute, and take delivery of such lease, or failing therein for a period of fourteen days, after being so called upon, I shall and will forfeit the said sum of £3, and all right, title, or interest in and to the said land and the possession thereof, and the said lease shall be forthwith cancelled.

I have, &c.,

ARCHIBALD ROXBURGH,  
Cobar.

Miners' right dated at Cobar, 17th January, 1888, No. 62. This application was received by me this 19th day of November, 1888, at the hour of 10 o'clock in the forenoon, and is numbered 40.—J. V. FOLEY, Warden's clerk.

## No. 20.

Mr. C. A. Moore to The Warden, Cobar.

Sir,

Cobar, 22 November, 1888.

I hereby object to the issue of a gold lease to Archibald Roxburgh, in virtue of his application No. 40-88, Cobar, on the grounds that the land is, and has been, in my possession under and by virtue of mineral license No. 80, Cobar, as a mineral claim to work for and win silver since 21st May, 1888.

2. That the said Archibald Roxburgh did not comply with the requirements of regulations No. 4 of the gold-mining lease regulations, of the 13th July, 1874, in respect to his above application No. 40-88.

3. That the said Archibald Roxburgh took forcible possession of the said land applied to be leased by him referred to herein as application No. 40-88, contrary to the Mining Act and regulations.

I have deposited £5 with the Warden's clerk.

CHARLES ALBERT MOORE.

## No. 21.

Telegram from Mr. Warden M'Kell.

Cobar, 27 November, 1888.

PLEASE forward me, first post, Oakden and Moore's application for gold lease 88-24; urgently required for Warden's Court on 3rd December.

T. C. K. M'KELL,  
Warden.

Forward papers, as requested.—H.W., 20/11/88. Mr. Warden M'Kell.—Papers returned.—T.C.K. M'K, Warden, 6/12/88.

## No. 22.

## The Under Secretary for Mines to Mr. C. W. King.

Sir,

Department of Mines, Sydney, 29 November, 1888.

Referring to your letter of the 13th instant, requesting to be supplied with copies of certain papers connected with Messrs. Oakden and Moore's gold lease application 88-24, at Cobar, I have the honor to inform you that the papers are urgently required by the Warden, but your request will be considered as soon as they are returned.

2. With regard to your request for speedy payment of fees, owing you by this department, I may inform you that the fees, if any due, will be paid speedily.

I have, &amp;c.,

HARRIE WOOD,  
Under Secretary.

## No. 23.

## Inquiry.

3 December, 1888.

INQUIRY held before the Warden, at Cobar, into the objection by Charles Albert Moore, against the granting of gold lease application 88-40, lodged by Archibald Roxburgh.

Mr. Hogan for objector, and Mr. Bolton for applicant.

*By Mr. Hogan:*—*Charles Albert Moore*, on oath, saith: I am the objector in this case; I produce a receipt from the Warden's clerk, Cobar, for £5; the notice produced was lodged by me, on 22nd November last, and is signed by me; prior to that, I received the notice produced (Exhibit C) from Mr. Roxburgh; I know the land referred to in Exhibit C; I was in possession of that land on 14th November last, and was in possession of it since 21st May last; I held possession by virtue of my mineral license, which I produce, and which is dated at Cobar, 16th May, 1888, and numbered 80; the land measures in area about 3 acres; on 22nd May I applied to be registered as the holder of the land conditionally; on 21st May last I took possession by erecting posts and cutting L trenches of the required dimensions; I posted a notice on the datum post as follows:—Mineral claim for silver, held by C. A. Moore, 21st May, 1888; on 26th May I applied for this land as a gold lease, of 4 acres, in the name of Philip Oakden and myself, after re-taking possession on 23rd May; my intention was to convert the land from a mineral claim to a gold lease; on the 13th November last the land was gazetted as refused; in October last I started work on the land; on the night of the 13th November and the next morning I was on this land; I saw Mr. Roxburgh then, and told him not to peg the land out, as I held it as a mineral claim; I saw Mr. Roxburgh put the point of one peg on my land; he did not cut any trenches; at this time I made him acquainted with my claim to the land; on the south-west corner of the land I observed that a trench had been cleaned out; the other trenches remained undug by Mr. Roxburgh; I saw his datum post; on it is a board, on which was written "Gold lease, 3 acres, A. Roxburgh"; the date is also on the board on the datum post, and the number of Mr. Roxburgh's miner's right; since then I have observed that the words "Applied for by" have been added to what was formerly on the board; on the 2nd or 3rd of October I started continuous work on the land; I claim that Mr. Roxburgh took forcible possession of the land, and I claim possession of the land by virtue of my mineral license.

*By Mr. Bolton:*—Before the 26th May I pegged out this land twice (application 88-24 and questions put in); although I applied for the land as a gold lease, I considered I held possession of the land by virtue of my mineral license; I did not get suspension from work from the Warden; I did not work on the claim after I applied for it as a gold lease; after the gold lease application was refused I did not re-peg the land; I put up a notice as follows:—"Mineral claim held by C. A. Moore for silver mining purposes in virtue of mineral license, No. 80, 14th November, 1888"; this notice was put up before Mr. Roxburgh took possession; I heard Mr. Roxburgh call out something, and it was then I put the notice up before Mr. Roxburgh put in pegs or cut trenches; I put my notice over my original notice; the land is now a surveyed portion, and was at the time Mr. Roxburgh took possession; the surveyors pegs are still standing; I cannot swear if the alteration of Mr. Roxburgh's notice was made before or after Mr. Roxburgh left the place; a man was not paid from 26th May to 13th November to look after the land; the answer to question No. 3 on schedule of questions attached to my application for gold lease produced is untrue; question No. 4 is also untrue; the Warden told me to go out and re-peg; he told me it was only necessary to touch the pegs that had been already erected; at this time I was applying for the land as a gold lease, and had not pegged out as such; the Warden knew that I had pegged out the land as a mineral claim; when I applied to be registered as the holder of this land as a mineral claim the Warden told me he could not register me as the holder of the land as there were not 4 acres in it, and he told me to apply direct to the Department of Mines.

*To Mr. Hogan:*—I do not wish to impute anything wrong to the Warden; whatever contention has arisen between us is on a matter of law; it is through a misapprehension on my part that the answers to questions which accompany my application for gold lease are incorrect; I saw Mr. Roxburgh's notice on 14th November; also saw it on 15th November; I did not examine the notice on the 15th instant; I again saw the notice about a week later, and saw that something had been added to it by the Warden; the application produced is my application for the land, and the authority produced is the authority I received from Mr. Oakden to sign his name to the application; nothing was said about the mineral claim when I applied for the land as a gold lease; I do not know that land held under a mineral license when applying to be leased must be noted on the application; I have filled in the schedule of questions which accompany gold lease applications; the reason I did not tell the Warden that the land I applied for as a gold lease included my mineral claim was that I did not think it mattered; the mineral claim was not in the names of Oakden and Moore, but solely in my own name; I have served my time in the field as a surveyor, and I have assisted in making surveys under Mining Act and Regulations; I am not thoroughly acquainted with those regulations; the land held by me by virtue of my mineral license is over 3 acres and under 4 acres in area.

Sworn before me at Cobar, 3rd December, 1888,—

THOMAS C. K. M'KELL, Warden.

C. A. MOORE.

By

*By Mr. Hogan:—John William Fox, on oath, saith: I am a barman at the hotel at Billagoe; I know the applicant and the objector; I know the land in dispute; before 13th November I knew nothing of the pegs on the land; on that date, about 12 o'clock at night, I was with Mr. Moore, the objector, on the land; I saw Mr. Roxburgh put a peg in the land about 3 feet back from the original pegs; it was afterwards moved to the original peg into the trench that was already made; Mr. Roxburgh did not, to my knowledge, interfere in any way with the trench; at one corner a trench had been cleared out indicating the boundary of the land; the trenches at the other corners remained untouched; Mr. Moore made a claim to the land; he told Mr. Roxburgh the land was his, and if he (Mr. Roxburgh) put a peg in he would "posh him;" Mr. Roxburgh did take possession of the land, and he meted a notice as follows:—"Gold lease, 3 acres, applied for by A. Roxburgh, 14th November, 1888, miner's right, 62;" when I first saw the notice I do not think the words "gold lease applied for" were written on it; two men named Turner and Kemp were also on the land assisting Mr. Roxburgh; there is a shaft sunk on the land about 10 or 12 feet in depth; I cannot say who sunk the shaft; I saw Mr. Kemp put in a peg; Mr. Roxburgh was not at the peg at the time, he was on the land, but not at the corner where Kemp put the peg in.*

*To Mr. Bolton:—It was moonlight at the time; I saw everybody that was on the land; I saw Mr. Roxburgh put in one peg, and saw Turner put one in; I cannot say how the pegs were put in.*

*By Warden:—I struck a match, and read the notice Mr. Roxburgh put up; Mr. Moore also read the notice; I saw Mr. Moore put up a notice; I did not read it; the notice put up by Mr. Roxburgh was written on a board; it was put up on the peg erected by Mr. Roxburgh; I went around the land with Mr. Moore; I saw pegs had been erected; there were also trenches indicating the boundaries of the land; I do not know who made the trenches; I heard Mr. Moore claim them; it was during the pegging out that the datum peg was put into its proper position.*

J. W. H. FOX.

Sworn before me, at Cobar, 3rd December, 1888.—

THOMAS C. K. M'KELL, Warden.

*By Mr. Hogan:—Richard Frainy, on oath, saith: I am a miner, and reside at Billagoe; I know the land in dispute; I was on the land in October last; Mr. Moore was then in possession; before Mr. Roxburgh took possession (in October last) I noticed the trenches had been cleaned out; at this time I was working on the land for Mr. Moore; I worked for three or four weeks; Mr. Moore was working on the land about the beginning of November; in November I put a shot or two in the shaft on the land; I saw the land since Mr. Roxburgh pegged out; the trenches have not apparently been touched since Mr. Moore cleaned them out in October; on 21st May last I saw a board with a notice on it; mineral something was written on it—I cannot say what; I have not seen it since; in October last I did see some notice on the land, but cannot say what it was; I saw the land last Saturday, and I also saw it before the date on which Mr. Roxburgh is alleged to have pegged out; I was not present at the pegging out, and cannot say whether Mr. Roxburgh pegged it out properly or not.*

R. FRAINY.

Sworn before me, at Cobar, 3rd December, 1888.—

THOMAS C. K. M'KELL, Warden.

*By Mr. Bolton:—Archibald Roxburgh, on oath, saith: I am a general agent, and reside at Cobar; I am the applicant for a gold lease at Billagoe; the application produced is mine, and the questions attached have been answered by me; the answers are true; I took possession of land in the manner described in form of questions attached to my application; I produce my miner's right; I put in my datum post and cleaned out the trench myself with a pick and shovel; I went to the other trenches and assisted in putting in posts and cleaning out the trenches; I cleaned out the trench myself at the datum post, and afterwards went to the other three corners of the land and touched the trenches and claimed possession.*

*By Mr. Hogan:—I affixed a board on the datum post; on it is written: Gold lease, 3 acres, applied for by A. Roxburgh, November 14th, 1888, miner's right, No. 62; I am certain that this is written on the board, and was written at the time I affixed it; exhibit C is the notice I served on objector; Mr. Moore claimed the land as a mineral claim when I took possession; I was present when Mr. Moore took possession of the land in May last as a mineral claim; Turner and Kemp assisted me at my request to peg the land out; they did not hold any authority from me under the Mining Act.*

*By Warden:—I produce a Gazette showing that Oakden and Moore's lease, of 4 acres, No. 24 of 1888, at Mount Billagoe, has been refused; Gazette notice is dated 13th November, 1888; when I took possession of the land Mr. Moore claimed to be in possession; I took no notice of his claim, but took possession and served him with notice (schedule 1); the writing was on the board when I put it up; I saw it on Saturday; it has not been interfered with, and is exactly the same as when I put it up; it took me about 15 or 20 minutes to take possession of the land; I did not peg out the land by telegraph time, I pegged out by local or mean time; as I drove my datum peg in Mr. Moore put a piece of paper on a nail, and claimed to be in possession of the land.*

ARCHIBALD ROXBURGH.

Sworn before me, at Cobar, 3rd December, 1888.—

THOMAS C. K. M'KELL, Warden.

*By Mr. Bolton:—Francis Kemp, on oath, saith: I am a miner, and reside at Billagoe; I saw Mr. Roxburgh at Billagoe on night of 13th November last; he asked me to go and help him peg out a piece of ground; it is the piece of ground in dispute; a Mr. Turner went with Mr. Roxburgh and myself to the land; we pegged out the ground; I put in pegs at two corners; I saw pegs at the other two corners; the pegs were of the dimensions required by law; I cleaned out the trenches at the corners where I fixed the posts; the trenches were of the required length and depth; the trenches were, I believe, made by the surveyor; the land is surveyed; the other trenches were also cleaned out, and were of the required dimensions; I saw a board on Mr. Roxburgh's datum post; I do not know what was written on the board.*

*By Mr. Hogan:—I know Moore, the objector; I have seen him working on the ground in dispute, but I cannot say if it was in October or not; I have no interest in the land; I went to assist Mr. Roxburgh merely*

merely at his request; I had no authority from Mr. Roxburgh in writing to peg out the land; Mr. Moore did not speak to me until after I had finished marking the two corners; I cleaned out the two corners; I cleaned out the two trenches with a shovel; I afterwards walked round with Mr. Roxburgh, and saw the other two trenches had been cleaned out; I won't swear the trenches were made by the surveyor in the first instance; I won't swear whether or not there was a board on the datum post before Mr. Roxburgh took possession; I saw one about May last; the night I assisted Mr. Roxburgh to peg out; Mr. Moore told me he had possession of the land or something to that effect; the posts I put in were afterwards touched by Mr. Roxburgh.

F. KEMP.

Sworn before me, at Cobar, 3rd December, 1888,—

THOMAS C. K. M'KELL, Warden.

*By Mr. Bolton:—Andrew Turner, on oath, saith: I am a miner, and reside at Billagoe; on 13th ultimo, I remember seeing Mr. Roxburgh at Billagoe; he asked me to assist him in pegging out a piece of ground; I did so; it is the ground in dispute; I affixed a post of the required dimensions at one corner of the land; there was a trench at the place where I put in the peg; I cleaned it out; the trenches at the other corners of the land did not appear to be cleaned; I did not examine them; immediately after fixing the post, I ran the shovel along the trenches; I have no interest in the land; Mr. Roxburgh did not tell me who he was pegging out for; about a fortnight before, Mr. Roxburgh took possession, Mr. Moore was frequently on the ground; previous to 14th ultimo, I saw a board on the land, but don't know what was written on it.*

*By Mr. Hogan:—The night Mr. Roxburgh pegged out, I heard some altercation; I heard Mr. Moore say, this is my land; I did not notice what was written on the board affixed by Mr. Roxburgh on the 14th or 15th instant.*

*By Warden:—For a month previous to Mr. Roxburgh pegging out, Mr. Moore was working on and off on the ground; for some months previous, Mr. Moore had been away from Billagoe; he returned about six weeks ago; I have no interest in the land; I estimate that £15 would cover the costs of all work done on the land; for about a fortnight before Mr. Roxburgh pegged out, Mr. Moore was not working on the land; I believe he was unwell; the land in dispute is a surveyed portion, and I believe the trenches were dug in the first instance by the surveyor.*

A. TURNER.

Sworn before me, at Cobar, 3rd December, 1888,—

THOMAS C. K. M'KELL, Warden.

#### No. 24.

#### The Warden, Cobar, to The Under Secretary for Mines.

Sir,

Warden's Office, Cobar, 5 December, 1888.

I have the honor to forward herewith an application, 88-40, of Mr. Archibald Roxburgh, of Cobar, for a gold lease of 3 acres of land, situated at Mount Billagoe, near Cobar, together with the usual forms.

On the 22nd ultimo a notice of objection was lodged by Mr. Charles A. Moore, of Cobar, and in accordance with the regulations an inquiry was held before me on the 3rd instant, and I now forward herewith the depositions and several exhibits for the consideration and decision of the Minister.

From the evidence it appears that the land in dispute was taken possession of by Mr. Moore on the 21st May last, under a mineral license, but no work was done, as required by the 5th regulation, of 12th March, 1885, but instead of working two days afterwards, on 23rd May, Mr. Moore retook possession of the land in the names of himself and Philip Oakden for gold-mining purposes, and on the 26th applied for a gold lease in the conjoint names, and signed as agent for Mr. Oakden.

The usual questions were answered and the declaration made by Mr. Moore as to the correctness of the application, but nothing was said, either in the application or questions as required to show that Mr. Moore held the land under a mineral license, but it is clearly stated, in answer to questions 14 and 15, "that nobody claimed or appeared to be in possession of the land applied for or any portion of it, and that no consent to the granting of the lease applied for was required,"—thus clearly showing that Mr. Moore did not claim the land nor intend to rely upon his previous possession, having abandoned it for the purpose of applying in different names and for a different purpose, viz., gold-mining instead of silver-mining.

The first time Mr. Moore worked on the land was in October last—a little over four months after his first pegging—when the gold lease application was pending, and it was in consequence of having heard there was a likelihood of the lease being refused.

Regulation 2, of March, 1855, enables the holder of a mineral license for the purpose of working for and winning minerals other than gold or coal, to take possession of and hold 4 acres of Crown land. The land in dispute is under 4 acres—about 3 acres;—the question then arises, has the holder of a license any right to take possession of less than 4 acres? If not, Mr. Moore could not claim the land under a mineral license, being less than 4 acres, and even if he could he failed to prosecute continuously the search for minerals thereby forfeiting any claim that he may have had to the land.

On the 13th November last the application 88-24, of Messrs. Oakden and Moore was gazetted refused, and the land again thrown open to the public, and on the 14th the land was pegged out by Mr. Roxburgh, in accordance with the gold-mining lease regulations, in the presence of Mr. Moore, who did not re-peg, but simply posted up the following notice:—"Mineral claim held by C. A. Moore, for silver-mining purposes, in virtue of mineral license No. 80, 14th November, 1888.

After carefully considering the evidence and Mr. Moore's action in connection with the land I am of opinion that the objections filed have not been supported, and Mr. Roxburgh having complied with the regulations when taking possession of the land on the 14th ultimo, I would recommend that Mr. Moore's claim be not sustained, and that the lease be granted to Mr. Roxburgh.

I have, &c.,

THOMAS C. K. M'KELL,

Warden.

No. 25.

13

## No. 25.

Mr. C. A. Moore to The Under Secretary for Mines.

Sir, 367, Crown-street, Surry Hills, Sydney, 13 December, 1888.

I have the honor to apply for a refund of £4, being the first year's rent paid to the Warden at Cobar on May 26th, 1888, on gold lease application 88-24 Cobar and refused by the Mines Department November 13th, 1888, and to request that such rent may be paid to me or my order at your earliest convenience.

I acted as agent for P. Oakden and C. A. Moore under registered authority, and hold all receipts for rent, survey fees, and registration of authority.

I paid the fees myself, as I held and hold this land as a mineral claim under my mineral license No. 80, Cobar.

My address was properly registered in the Warden's office, and in the Mines Department, yet in the face of those facts known to you, the notice of refusal was sent addressed to P. Oakden and another, Cobar; and I have reason to believe that information was sent to P. Oakden prior to refusal of the said lease, informing him the day it would be gazetted.

I desire to inform you that in due time I will have the matter properly investigated.

I have, &amp;c.,

C. A. MOORE.

Gold lease application 88-24 Cobar refused. Deposit may, I presume, be refunded?—H.W., 3/1/89. Submitted. Approved.—F.A., 4/1/89. Refund voucher to Mr. Moore.—9/1/89.

## No. 26.

Mr. C. A. Moore to The Under Secretary for Mines.

Sir, 367, Crown-street, Surry Hills, Sydney, 13 December, 1888.

I have the honor to apply for a copy of all depositions, papers, and Warden's report, on gold lease application 88-40 Cobar, applied for by Archibald Roxburgh, November 19th, 1888, and to inform you that I applied for same at the Warden's office on Tuesday, December 4th, the day after the inquiry, but was informed that the papers had all been sent on to Sydney, and that I could get a copy there, and request that no delay will occur in supplying me with same.

I have, &amp;c.,

C. A. MOORE.

Copy may be supplied on the usual terms.—H.W., 17/12/88. Copy supplied.—W.H.T., 20/12/88.

The view expressed by the Warden, namely, that Mr. Moore, by taking possession of the land and applying for a gold lease in the name of himself and Mr. Oakden abandoned any claim he may have had to the land as a mineral claim, and the evidence appears to bear out the Warden's recommendation that the objection be disallowed and the application to lease No. 88-40 be allowed to go on. The Warden's recommendation may, therefore, be adopted.—H.W., 2/2/89.

Submitted. If the above submission be approved of, ask Warden what order he has made or intends to make respecting the objector's deposit.—H.W., 2/2/89. Approved.—J.M.C., 6/2/89.

## No. 27.

Mr. C. A. Moore to The Under Secretary for Mines.

Sir, 367, Crown-street, Surry Hills, Sydney, 16 January, 1889.

Herewith I enclose you account, signed by myself, for a refund of £4, rent deposited on gold lease application, 88-24; also a statutory declaration setting forth that the money was paid by myself, and that P. Oakden neither directly or indirectly paid any portion of it, and I further state that he has no claim to the money, and I request you to be good enough to pay to me at your earliest convenience.

Yours, &amp;c.,

C. A. MOORE.

This is a declaration from C. A. Moore that he paid the money deposited with gold lease application, 88-24, Cobar. Submitted that in view of this declaration the Treasury be asked to make the refund to the order of C. A. Moore.—E.F., 22/1/89.

Submitted.—H.W., 20/2/89. Approved.—J.M.C., 21/2/89.

## No. 28.

The Under Secretary for Mines to Mr. Licensed-Surveyor King.

Sir, Department of Mines, Sydney, 16 January, 1889.

Adverting to your letter of the 13th November last, applying for copies of certain papers, I have the honor to request you to specify the papers, copies of which you desire to obtain.

I have, &amp;c.,

HARRIE WOOD,

Under Secretary.

## No. 29.

Mr. Licensed-Surveyor C. W. King to The Under Secretary for Mines.

Sir, Bell's Chambers, 129, Pitt-street, Sydney, 17 January, 1889.

In reply to your letter of yesterday, I have the honor to request a copy of all the papers in reference to gold lease, 88-24, at Cobar, including all Ministerial minutes, departmental reports, and outside correspondence.

During

During my long connection with the Lands Department I have always received from them the greatest amount of courtesy and consideration, a state of affairs I regret to say I have not received at the hands of the late Minister for Mines.

I hope you will see your way clear to supply me with the copy asked for, failing which I shall be obliged to have the papers moved for in the Legislative Assembly, a course I do not wish to follow.

I have, &c.,

C. W. KING.

Early reply is requested. I doubt whether this request should be complied with. Mr. King was asked to specify the papers copies of which he required, and in reply he asks for copies of all papers.—H.W., 8/2/89.

Submitted. I see no reason why copies should be supplied to Mr. King.—S.S., 29/3/89. Mr. Moore, the objector, wishes that action may be stayed on this case till Mr. De Courcy Browne has an opportunity of seeing the Minister.—H.W., 7/2/89. Submitted. How does this matter stand?—S.S. Mr. De Courcy Browne has called, and says he does not intend to move in this matter, as he concurs in the view taken in this department.—H.W., 21/3/89. Submitted. Seen.—S.S., 21/3/89.

---

No. 30.

The Under Secretary for Mines to The Under Secretary for Finance and Trade.

Sir,

Department of Mines, Sydney, 5 March, 1889.

I have the honor to forward herewith a voucher upon which the Secretary for Mines has approved of a refund being made to C. A. Moore, in view of the declaration attached, without the signature of the other applicants as follows:—P. Oakden and C. A. Moore, £4, deposit lodged with gold lease application 88-24. Cobar.

I have, &c.,

HARRIE WOOD,

Under Secretary.

---

No. 31.

Memo. to Mr. Warden M'Kell, Cobar.

Gold lease application 88-40, Cobar, A. Roxburgh, and C. A. Moore's objections thereto.

Department of Mines, Sydney, 30 March, 1889.

Will the Warden please say what order he has made, or intends to make, respecting the objector's deposit in the above matter?

GERARD E. HERRING

(For the Under Secretary.)

My report of 5th December, 1888, was forwarded to the department with the papers in it. I recommended the lease being granted to Mr. Roxburgh, for reasons therein stated.—T. K. M'KELL, Warden, Cobar, 3/4/89.

I cannot find that the Warden has made any order as regards objector's deposit; if not, ask him again.—G.E.H. (for U.S.), 16/4/89.

---

No. 32.

The Under Secretary for Mines to Mr. C. W. King.

Sir,

Department of Mines, Sydney, 3 April, 1889.

Adverting to your letter of the 17th January last, requesting to be supplied with copies of all papers in reference to gold lease 88-24, at Cobar, including all Ministerial minutes, departmental reports, and outside correspondence, I am directed to inform you that the Secretary for Mines cannot see any reason why you should be supplied with copies of the papers referred to.

I have, &c.,

HARRIE WOOD,

Under Secretary.

---

No. 33.

Memo. to Mr. Warden M'Kell, Cobar.

Gold lease application 88-40, A. Roxburgh, and C. A. Moore's objection thereto.

Department of Mines, 24 April, 1889.

The Warden does not appear to have made any order as regards objector's deposit. Will he be good enough to say what order he has made, or intends to make, respecting the same.

GERARD E. HERRING

(For the Under Secretary.)

I never made any order respecting the objector's deposit, believing that the disposition thereof rested with the Minister, who finally dealt with the matter. My decision was against the depositor, and therefore, as the applicant was put to legal costs, he should be allowed at least two guineas.—T. K. M'KELL, Warden.

Two pounds out of the deposit may be paid to the applicant for costs, and the balance of the deposit be refunded to the objector. Submitted.—H.W., 17/5/89. Approved.—S.S., 17/5/89.

## No. 34.

## Memo. to The Warden's Clerk, Cobar.

Department of Mines, 22 May, 1889.

WILL the Warden's clerk please fill in particulars as to number and date of Treasury receipt on enclosed vouchers, and, if possible, obtain signatures of applicants and return to this office.

GERARD E. HERRING,  
(For the Under Secretary.)

Particulars filled in as requested, and Mr. Roxburgh's signature obtained. I have requested Moore to call at your office and sign.—J. V. FOLEY, Warden's clerk, 31/5/89.

[Enclosure.]

## REFUND VOUCHER.

Department of Mines, Dr. to Archibald Roxburgh.

	Amount to be refunded.		
	£	s.	d.
For the following refund, viz.:—Part of deposit lodged on objection to gold lease 88-40, Cobar, by C. A. Moore; date of Treasury receipt, 3rd December, 1888; number of Treasury receipt, 36,191; by whom paid in, J. V. Foley, Warden's clerk, Cobar .....	2	0	0

I hereby authorize and direct the above-mentioned amount to be paid on my behalf to Commercial Bank, Cobar.

ARCHIBALD ROXBURGH.

Witness—J. V. FOLEY.

## REFUND VOUCHER.

Department of Mines, Dr. to C. A. Moore.

	Amount to be refunded.		
	£	s.	d.
For the following refund, viz.:—Balance of deposit lodged on objection to gold lease, 88-40, Cobar; date of Treasury receipt, 3rd December, 1888; number of Treasury receipt, 36,191; by whom paid in, J. V. Foley, Warden's clerk, Cobar .....	3	0	0

## No. 35.

## Mr. C. A. Moore to The Secretary for Mines.

Sir,

Sydney, 29 June, 1889.

My case is with reference to a mineral claim held by me, a gold lease application, No. 88-24, Cobar, in the joint names of Oakden and Moore, and a gold lease application, No. 88-40, Cobar, by Archibald Roxburgh, all of which refer to the same piece of land.

Up to the present date I have not bothered to bring my case under your notice, but I now desire you will be good enough to see into the matter independently of the Under Secretary for Mines, Mr. H. Wood, as you will see further on I have reason to complain of Mr. Wood's treatment as Under Secretary for Mines.

On the night of May the 21st, 1888, between the hours of 10 and 11 p.m., I took possession of the land now applied for as gold lease, by Archibald Roxburgh, under application 88-40, Cobar, as a mineral claim of 4 acres, for the purpose of working and mining silver, in virtue of my mineral license, No. 80, Cobar, and renewed in Sydney, January 1st, 1889.

The witnesses to my pegging the land, &c., as a mineral claim were Mr. M. Henderson, of Cobar, and Mr. A. Roxburgh, of Cobar. I may here mention that Mr. A. Roxburgh carried my mineral claim notice board up to the land for me on the night of May 21st, and he is the person who is now the applicant for the land under application 88-40, Cobar.

On May 22nd, 1888, I applied to the office of the Registrar, at Cobar, to conditionally register the mineral claim.

The Registrar, Mr. M'Kell, was absent, but I saw Mr. Foley, Mr. M'Kell's clerk. The clerk said he did not understand it, as he had only been in the office a week or so, and therefore could not act. I then asked the clerk to make a note of the time, which he did, and I deposited £1 to cover the cost of conditional registration fees, as the clerk could not tell me what charge would be made. No receipt was given for the £1 deposited. The clerk promised to tell Mr. M'Kell—Mr. M'Kell was acting as Warden and Registrar at the time—as soon as he came in.

I walked over to the Post Office about half an hour after leaving the Warden's office, and at the Post Office door met Mr. M'Kell and his clerk; it was after office hours. Mr. M'Kell upon seeing me remarked, "You were up at the office, and I was out?" I answered, Yes. Mr. M'Kell then said, "You can't take up that land like that; you cannot hold it; I can't register it; come up to the office and I will show you you cannot hold it as a mineral lease." I accompanied them to the Warden's office. Mr. M'Kell then produced the Mining Act, and attempted to show me that I could not hold a mineral claim of 4 acres in virtue of my mineral license. I directed his attention to the clause in the regulations relating to mineral licenses, under which I had taken up the mineral claim, and upon his reading it he seemed surprised, and remarked, "Oh! Well I can't help it; I have no authority to register it, you had better apply to the Minister for Mines."

I then informed him it was my intention to conditionally register the mineral claim, and then convert it into a gold lease in the joint names of Oakden and Moore. He said the only way I could convert it into a gold lease was by re-pegging, etc. I then asked him "Had I to mark fresh trenches?" He answered, "Oh! no; just touch the old pegs and clean out the trenches again." At this stage Mr. Oakden and Mr. A. Roxburgh entered. Mr. M'Kell remarked, "I suppose they must not know," or something to that effect. I said, "Oh! its all right, they know all about it," after which Mr. M'Kell repeated to them his version of the mineral claim, holding, etc., and informed Mr. Oakden and myself that it would be our only course in converting the mineral claim into a gold lease for me to go out and re-peg the land, etc. Mr. M'Kell seemed to think the land could not be held as a mineral claim.

Mr. M'Kell advised I should go and re-peg, etc.; just touch the old pegs and trenches, and post another notice on the land, and have schedule 1 of the gold-mining lease re-posted at the Court-house and Post Office before 9 a.m. on the morning of May 23rd, 1888, so that it could be applied for on Saturday morning, May 26th, 1888, and that the application would have to be lodged before 10 a.m., May 26th, 1888, as he would be too busy with the License Court after that hour and he would be away on the following Monday. Mr. M'Kell then asked Mr. Oakden if he could be in before 10 a.m. Saturday, May 26th, 1888, to sign the gold lease application with me, and he said he thought so. Mr. M'Kell then said, "In case you are not in you had better sign this and I will witness it," at the same time producing a blank gold lease form. Mr. Oakden duly signed it, and Mr. M'Kell witnessed it. I may here mention that Mr. Foley, Mr. M'Kell's clerk, was a witness in the room during the whole conversation.

Outside the Warden's office it was agreed between Mr. P. Oakden and myself that I should go out and re-peg, as directed by the Warden, for the purpose of converting the mineral claim into a gold lease in the joint names of Oakden and Moore.

I rode out to the land and did as directed, without disturbing my mineral claim board, or pegs, or trenches, and on the morning of Wednesday, May 23rd, 1888, posted notices, schedule 1 of gold-mining regulations, at the Court-house and Post Office as required. The time of re-pegging was stated on the notices as having been done at 1 o'clock p.m., Wednesday, May 23rd, which was an error, as explained in my statement lodged with the Under Secretary for Mines about September 20th, 1888, which he refused to accept.

After posting notices, schedule 1 of gold-mining regulations, as required, I told Warden M'Kell that I had done so, and he again requested me to be in to lodge the gold lease application before 10 a.m., Saturday May 26th, 1888, and I promised to be there in time. Mr. Foley, the clerk, then, at my request, returned the £1 deposited by me on May 21st.

Between the hours of 9:30 and 10:30 a.m., Saturday, May 26th, I informed Mr. M'Kell, at the office in Cobar, that I was ready to lodge the gold lease application of Oakden and Moore. Mr. M'Kell then produced the blank gold lease application form mentioned previously, signed by Mr. Oakden on the afternoon of May 21st, and requested me to fill it in, which I declined to do, as I doubted the legality of the affair, as Mr. Oakden might have died in the meantime. Mr. M'Kell then told me he knew what he was about. I said, "I prefer to use Mr. Oakden's authority, and I would rather sign his name under the authority." Mr. M'Kell then took the authority, upon which I paid the £1 stamp duty, and he then handed me a fresh gold lease application form, which I filled in, Mr. M'Kell doing the other part of the business; when he had filled in schedule of the gold-mining regulations, Mr. M'Kell pushed the schedule towards me and said, "Sign it please." I attempted to read it, but he said, "Can't you understand plain English—sign it, I have no time to waste now;" so I signed it, and Mr. M'Kell assured me everything was all right. I may here mention that I did mention in the application that I held the land under a prior right, viz., a mineral claim under a mineral license, and that I had no objection to the mineral claim being contained in the gold lease of Oakden and Moore. I was not aware at the time that it was necessary as I was one of the applicants. Mr. Oakden then came into the Warden's office and said, "Have you done that Moore—has everything been done all right?" I told him I thought so, and that I had used his authority in taking up the gold lease conjointly, in preference to filling in the gold lease application form he had signed and left with the Warden. Oakden said, "That's all right, but come round and see Mr. M'Kell." We then went to M'Kell. Mr. Oakden, addressing M'Kell, said, "Has Moore taken up the lease all right?" M'Kell answered, "Moore has used your authority and taken up the lease conjointly; he would not fill in the form you had signed." Oakden said, "That's all right, but is everything else correct?" M'Kell answered, "Yes, I have seen to everything."

Mr. Oakden then said, "Mr. Moore wishes to transfer a claim to me as legal manager for the Mount Billagoe Prospecting Syndicate." Mr. M'Kell filled in the transfer form, and asked what the consideration money was. I said, "Oh, it's nominal, as I am transferring it on account of an interest in with Mr. Oakden with the other land," so the nominal amount was named as five shillings. Mr. Oakden and I signed the paper. Oakden then said, "Now everything is all right and the papers are filled up properly." Mr. M'Kell answered, "Yes." Mr. Oakden, Mr. Roxburgh and I then left the office. Roxburgh was present all the time.

I paid all the money in connection with taking up the gold lease. Mr. Oakden did not contribute anything, but he should have paid his share as agreed.

Upon returning to Mount Billagoe I found that schedule 6 of the gold-mining regulations had not been forwarded to the Minister for Mines, so I wrote and forwarded, as soon as possible, in registered letter, and telegraphed the Minister I had done so. (See registered letter receipt marked A attached hereto).

The land being originally abandoned land, and the working of the mineral claim being protected during the pendency of Oakden and Moore's gold lease application 88-24, and no objection to the application being lodged within the fourteen days, I left the land, and left a person in charge to keep my pegs and notices erected until the survey was completed, and to the best of my belief, to wit, a miner attended to them, and he was paid for so doing. Shortly after this I came to Sydney, inquired at the Mines Department, and was informed everything was going on all right. Shortly after I received the letter attached hereto marked H, with its contents, also marked H. You will, by these papers, be good enough to notice that they were with reference to gold lease application 88-24, Cobar, of Oakden and Moore, and I was recognized as the proper person to write to, but when notice of refusal of gold lease application 88-24 was sent, it was addressed to Cobar to Oakden and another, and was opened by Mr. A. Roxburgh.

On September 15th, 1888, I wrote the Secretary for Mines (copy of letter attached hereto, marked B). In the face of this letter the notice of refusal was sent to Cobar, addressed to Oakden and another. Shortly

See No. 3.

See No. 8.

Shortly after this Messrs. Abigail and Inglis, M's.L.A., took a trip to Cobar, and while at the banquet Mr. Abigail was heard to promise some persons who owned the adjoining land to my mineral claim that Moore would not get the lease.

I heard it reported in Sydney shortly after their return from Cobar that my gold lease application 88-24, Cobar, would be refused. I can give the names of the parties who had this information, yet I could not obtain such information. After hearing the report I went to the Mines Department, and was informed that the lease would most likely have to be refused, as the application had been lodged too soon. (See paper attached hereto, marked C.)

I then prepared a statement, in which I desired to alter part of my application. (See statement handed to Under Secretary for Mines about September 20th, 1888, which he refused to accept). I then called upon him, he quietly informed me he knew all about the matter, and insinuated that I got the land illegally, and finished up by telling me I would get no beforehand notice of refusal, and that it was the Company's land, and they would get it. I therefore saw that Mr. Wood had been posted up by somebody, and that he thought they were telling the truth.

My solicitor, Mr. Thompson, M.L.A., called upon Mr. Abigail, the Minister for Mines, and Mr. Abigail told Mr. Thompson that the land belonged to the Company, and they would get it, &c., &c. I therefore knew that the lease would be refused, but upon what date I could not find out, so I at once went to Mr. De Courcy Browne, and stated a case, and was informed by him that my title to the mineral claim was indefeasible, and not to mind what the Mines Department said.

I then returned to Mount Billagoe and worked the land as my mineral claim, so as to be in possession as soon as the lease was refused. Shortly after arriving at Mount Billagoe I wrote a letter to the Under Secretary for Mines, stating that I did not care whether the lease was refused or granted, as I held the land under a prior right, viz., a mineral claim, in virtue of my mineral license No. 80, Cobar, &c., &c.

On November 13th, 1888, I received a telegram at Mount Billagoe, from a friend in Sydney acquainting me that the lease had been refused as per *Gazette* of that date, so I went up to my mineral claim, being the land applied for in 88-24, Cobar, half an hour before midnight of that date. (See evidence See No. 20. given in Court of Inquiry *re* this matter.) I also hand herewith copy of objections lodged against application for gold lease 88-24, Cobar. The enquiry was anything but a just one, in fact it was an acknowledged fact that Mr. M'Kell would give a recommendation against me, and as soon as I got into the witness box I found that I was going to get a very poor hearing. I was called first, and then my witnesses, after which the Warden adjourned the court, thereby giving Mr. Roxburgh a chance to have a chat with his witnesses, if this was justice I am greatly surprised, in fact the whole enquiry to my belief was an understood thing. Evidence and questions asked during the enquiry never appearing in any of the depositions, as can easily be proved by the fact that the Warden upon my solicitor applying for a suspension of the work on the mineral claim for me granted or requested that neither parties need work until the dispute was settled, and that such a request was made is proven by the Warden's letter, copy of which I herewith attach marked E.

Some of the questions asked at the enquiry were put in such a manner that a person could not well answer them without doing harm to my case.

I attach, hereto, a letter forwarded to a friend of mine marked D, and can get other witnesses who were disgusted with the enquiry, and who left the court.

I applied personally to the Registrar and Warden's clerk at Cobar on December 4th, 1888, for copies of depositions and Warden's report, and was informed I could not get them as they had been sent on to Sydney, this was false, as they were not in Sydney when I went to the Mines Department some days afterwards to make enquiries.

Before leaving Cobar I registered my address and deposited 2s. 6d. to cover cost of same. When I received a copy of depositions and Warden's report from the Mines Department I found there was no mention of suspension of work having been granted by the Warden so I wrote him, copy attached hereto marked F, and received reply, copy attached hereto marked O. I again wrote as they would not acknowledge that a suspension of work had been granted, copy of letter hereto attached marked G, to which I received reply, copy of same marked E herewith attached to sheet 8.

I again called on the Under Secretary but to no purpose, as he informed me that he was of the same opinion as the Warden, and that he had recommended that Roxburgh's application 88-40 be gone on with. I then requested that the case be held in abeyance until Mr. De Courcy Browne had interviewed the Minister on my behalf, which request I think Mr. Wood asked of the Minister.

I heard nothing more about the matter until I received letter herewith marked X. I have not received any official notice from the Mines Department or from the Warden, that the Court of Enquiry has been decided against me, and upon what grounds.

I have seen the Under Secretary since, and upon my giving him an idea of my opinion of the matter he told me he knew his business, and that he did not care about arguing the point with the outside public.

In conclusion I beg to request you to give the matter your personal consideration. The Mines Department have no power to deal with a mineral license holding when there is a District Warden, and no objection having been brought against my mineral claim, and all other conditions having been fulfilled I fail to see any flaw in my title, and should you issue a lease to A. Roxburgh in virtue of his application I will action him the moment he attempts to take possession of the land.

I have, &c.,  
C. A. MOORE.

[Enclosures.]

C.

Department of Mines, Inquiry Branch, 18 September, 1888.

C. A. Moore, 367, Crown-street, Surry Hills, Sydney  
(late of Mount Billagoe, Tindary, Cobar),—

HAVE you received plan of Oakden and Moore's gold lease 88-24, Cobar, and when will lease be issued, as I do not wish to leave town until I get same?

C. A. MOORE.

The application does not appear to have been made in accordance with the regulations, and will most likely have to be refused.

18.

D.

Dear Sir,

Cobar, 3 December, 1888.

I was in town to-day, as Charley told me he would want me to swear to some of his pegs, but he was afraid to call me on account of the questions being asked, principal questions apparently were taken no notice of, and from what I heard, the whole court was against him, and his solicitor, to my belief, did not question referring to the case half enough as he should have done, and if there is an appeal, be sure and have it in Sydney, for I noticed whenever Charley's solicitor asked a question, the opposite one would refer to the Warden, and of course it was decided in his favour, in fact the whole of Cobar mining people are against him, and the whole court throughout, and I heard whenever Charley went to give an explanation on the case, he was stopped immediately, and my opinion on the case in Cobar is very slight.

Evidently they did not want Charley to give a true explanation of the case as it would implicate too many to my belief. Referring to myself, I am getting on very well; next week I am going to drive the cart for my uncle; so that is all this time. And remain your faithful servant,

PHILIP HENNESSY,  
Cobar.

E.

Sir,

Warden's Office, Cobar, 2 January, 1889.

Your letter of 31st December last, addressed to the Warden and Mining Registrar, duly to hand, and in reply thereto, I have the honor to inform you that there is no record in this office of suspension of work being granted you in connection with gold lease application 40 of 1888, now in dispute between yourself and Mr. Roxburgh, as no such order was made.

A verbal request was, however, made by the Warden in open court that neither party should interfere with the land in dispute until the matter was decided by the Department of Mines. I beg to return you herewith your enclosure of stamps, value 1s. 6d.

I have, &c.,  
J. V. FOLEY,  
Mining Registrar.

Mr. C. A. Moore, 129 Pitt-street, Sydney.

F.

The Warden, Bogan Gold-field, Cobar,—

129, Pitt-street, Sydney, 22 December, 1888.

Sir,  
Kindly send me a copy of the order of court suspending work on my mineral claim, pending dispute, applied for in open court by my solicitor, on 4th December. I applied to the Warden's clerk at Cobar for copies of all depositions and Wardens' reports, &c., in reference to my mineral claim dispute. The clerk, after seeing the Warden, informed me that the papers had all gone to Sydney. Yet, upon applying at the Mines Department, I find that such was not the case, and that the Warden's report, forwarding papers, &c., was dated at Cobar on 5th December, 1888, an apparent discrepancy which I should like you to explain.

I left 2s. 6d. with the clerk to register my address. I find there is no fee for such registration; therefore it will cover cost of copy of court order above referred to. An early reply will oblige.]

Yours, &c.,  
C. A. MOORE.

G.

T. C. K. M'Kell, Esq., Warden and Mining Registrar, Cobar,—

129, Pitt-street, Sydney, 31 December, 1888.

Sir,  
Referring to letter dated 27th December, 1888, from the Warden's clerk, I herewith enclose you 1s. 6d. in stamps, being the prescribed fee, and request you to be good enough to register suspension order on my mineral claim at Mount Billagoe, granted in open court on the application of my solicitor, on 3rd December, 1888. The cost of copying such from the records of the Warden's court, if noted there, will be 1s. 6d.: stamps for same herewith.

I applied to you for a copy of the order in my letter of 22nd December, 1888, for the purpose of this registration, as such does not appear in the copy of the papers supplied to me by the Mines Department.

Yours, &c.,  
C. A. MOORE.

O.

Sir,

Warden's Office, Cobar, 27 December, 1889.

I have been instructed by Mr. Warden M'Kell to acknowledge the receipt of your letter of 22nd inst., and have the honor to inform you that all papers in connection with the application of Archibald Roxburgh for a gold lease at Billagoe, No. 88-40, were forwarded by me to the Under Secretary for Mines, from whom, no doubt, any copies you may require may be procured.

I find that a sum of 5s., as fee for registering your address, was received in error at this office, and beg to return same herewith.

I have, &c.,  
J. V. FOLEY,  
Warden's Clerk.

Mr. Moore, 129 Pitt-street, Sydney.

X.

Sir,

Cobar, 31 May, 1888.

I have this day forwarded to the Department of Mines a refund voucher for £3 in your favour. Be good enough to call at that office and sign same at your convenience.

Yours, &c.,  
J. V. FOLEY,  
Warden's Clerk.

Mr. C. A. Moore, Sydney.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

LINWOOD COLLIERY.

(REPORTS OF INSPECTOR OF COLLIERIES ON.)

*Ordered by the Legislative Assembly to be printed, 22 May, 1890.*

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 14th May, 1890, That there be laid upon the Table of this House,—

“Copies of the Reports of the Examiner of Coal-fields and the Inspector of Collieries on the recent subsidence at Linwood Colliery.”

(*Mr. Burns.*)

No. 1.

Report of Mr. Inspector Dixon on the Linwood Colliery.

Sir,

Merewether, 18 April, 1890.

I have the honor to report inspection of the Linwood Colliery on Monday last, 14th instant, as follows:—

There were about thirty men, &c., employed in the mine, and supplied with 5,000 cubic feet of air per minute.

The whole of the working bords (ten in number) were on the west side of Hannell-street, and skirting the southern boundary of the Maryville Coal Company's land. These bords were about 6 yards wide, and only the height of the bottom section of coal (about 5 feet 7 inches). In this portion of the mine the top section of coal has been denuded, and in several places I saw a mixture of sand and gravel down on to the morgan, and, in parts, even lower than the morgan. As a rule, the timber is set to the 4-inch coal and morgan, but in several places I noticed where this roof had crumbled away over the timber and given vent to the sand and gravel which is to be seen lying on the morgan. Every bord was thickly timbered, but notwithstanding this the roof was cutting up along the sides of the pillars. I did not hear any move in the roof during my visit, and therefore did not deem the bords dangerous enough to justify me in withdrawing the men. However, I served the manager (Mr. M. Yates) with notice, under the 25th section of the Coal Mines Regulation Act, 1876, a copy of which notice I herewith beg to forward.

In conclusion, I beg to state that in my opinion the Linwood Colliery has about reached its margin of safety in every direction, and I should be glad if you could make it convenient to pay a visit to it at an early date, so that some definite course may be taken as soon as possible.

I have, &c.,

JOHN DIXON,  
Inspector of Collieries.

[*Enclosure.*]

Notice under section 25 of 39 Vic. No. 31.

Sir,

Merewether, 14 April, 1890.

Finding on my inspection of the Linwood Colliery to-day (Monday), of which mine you are the agent, that the practice exists of allowing several bords to be driven in a portion of said mine, where sand and gravel is found lying on the lower or bottom section of the coal-seam, I hereby give you notice that the said practice is dangerous, so as, in my opinion, to threaten the bodily injury of the persons working in said bords.

The particulars in which I consider the said practice to be dangerous are:—

1. That the upper portion of the coal-seam known as the “big tops” has entirely disappeared in that part of the workings.
2. That the 4-inch coal and morgan, which forms the roof in some parts of said bords, is of an extremely tender nature, and crumbles away over the lids and cap-pieces to an extent which renders timber practically useless.

3.

248—

[870 copies—Approximate Cost of Printing (labour and material), £9 1s. 1d.]

3. That the nature of the roof is such as to cause the whole weight of superincumbent strata in each bord to rest on the timber over the area of each bord, as the said roof is liable to cut up along the side of each pillar, and consequently a sudden collapse of roof might at any time, and without any warning, take place in any or all of the bords where such roof obtains.

Having thus given you notice of the practice at present existing in the Linwood Colliery, I accordingly require the same to be remedied.

M. Yates, Esq., Manager, Linwood Colliery.

I have, &c.,

JOHN DIXON,  
Inspector of Collieries.

### No. 2.

#### Further Report of Mr. Inspector Dixon on the Linwood Colliery.

Sir,

Merewether, 24 April, 1890.

Referring to my report of the Linwood Colliery, dated 18th April instant, I have the honor to state that I made another inspection of said colliery yesterday (Wednesday), and found that the bords complained of by me, in my notice of 14th instant, had fallen, and that there was no work being done in the mine, with the exception of pulling up rails, &c., by two men and one boy. I was informed by the manager (Mr. Yates) that on Friday last (in the evening) the roof over some of the bords began to give way, and during the night two of the bords fell. The roof continued to work over the weak end, and on Monday last all the miners were discharged. The bords coloured yellow on the accompanying tracing have all fallen in, and those coloured blue were very much disturbed during my inspection yesterday. I was further informed by the manager that his orders were to keep the pit open for a few days, until the shareholders could be got together, in order to settle about future operations.

In conclusion, I beg to state that only a very small quantity of water came off when this fall took place, and with the exception of the bords coloured blue, the roof everywhere was quiet when I was in the mine yesterday.

I have, &c.,

JOHN DIXON,  
Inspector of Collieries.

### No. 3.

#### Report of the Examiner of Coal-fields on the Linwood Colliery.

Sir,

Coal-fields Office, Newcastle, 1 May, 1890.

Referring to the Honorable the Minister for Mines' minute on the Mayor of Wickham's wire of 24th ultimo, respecting a subsidence of the surface at the Linwood Colliery, forwarded me under your blank cover of 25th idem, I have the honor to enclose herewith a tracing showing the colliery workings (copied from record tracing), &c., and to report that I proceeded to the colliery with Mr. Inspector Dixon on the 28th ultimo, and found that the greatest depth of the subsidence was about 1 foot (*vide* letter A on tracing), and that a four-roomed brick house (lettered B) was cracked in several places, and that the only damage done to four-roomed weatherboard house (lettered C), appeared to be a disarrangement of the spouting. Another four-roomed weatherboard house (lettered D) has sunk about 6 inches on its eastern side, and a paling fencing running alongside it.

2. At the time of my visit there was no work being done in or about the mine. Steam had been let down, engine-house closed, and manager informed me that the mine would not be reopened for two months, if then.

I have, &c.,

JOHN MACKENZIE,  
Examiner of Coal-fields.

LEGISLATIVE ASSEMBLY:  
NEW SOUTH WALES.

---

COAL MINES REGULATION BILL.

(MESSAGE No. 5.)

---

*Ordered by the Legislative Assembly to be printed, 14 May, 1890.*

---

CARRINGTON,  
*Governor.*

*Message No. 5.*

In accordance with the provisions contained in the 54th section of the Constitution Act, the Governor recommends, for the consideration of the Legislative Assembly, the expediency of making provision to meet the requisite expenses in connection with a Bill to make better provision for the regulation of coal mines and collieries, and for other purposes connected therewith.

*Government House,  
Sydney, 14th May, 1890.*
